<td>For an array type T, the same result as has_unique_object_-representations_-v&lt;remove_all_extents_-t&lt;T&gt;&gt;, otherwise see below.</td>
<td>T shall be a complete type, cv void, or an array of unknown bound.</td>
</tr>
</tbody>
</table>

5 [Example:

is_const_v<volatile int> // true
is_const_v<int*> // false
is_const_v<int&> // false
is_const_v<int[3]> // false
is_const_v<const int[3]> // true

— end example]

6 [Example:
remove_const_t<const volatile int> // volatile int
remove_const_t<const int* const> // const int*
remove_const_t<const int&> // const int&

— end example

Example:

// Given:
struct P final { };
union U1 { };
union U2 final { };

// the following assertions hold:
static_assert(!is_final_v<int>);
static_assert(is_final_v<P>);
static_assert(!is_final_v<U1>);
static_assert(is_final_v<U2>);

— end example

The predicate condition for a template specialization `is_constructible<T, Args...>` shall be satisfied if and only if the following variable definition would be well-formed for some invented variable `t`:

```
T t(declval<Args>()...);
```

[Note: These tokens are never interpreted as a function declaration. —end note] Access checking is performed as if in a context unrelated to `T` and any of the `Args`. Only the validity of the immediate context of the variable initialization is considered. [Note: The evaluation of the initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. —end note]

The predicate condition for a template specialization `has_unique_object_representations<T>` shall be satisfied if and only if:

1. `T` is trivially copyable, and
2. any two objects of type `T` with the same value have the same object representation, where two objects of array or non-union class type are considered to have the same value if their respective sequences of direct subobjects have the same values, and two objects of union type are considered to have the same value if they have the same active member and the corresponding members have the same value.

The set of scalar types for which this condition holds is implementation-defined. [Note: If a type has padding bits, the condition does not hold; otherwise, the condition holds true for integral types. —end note]

### 19.15.5 Type property queries

This subclause contains templates that may be used to query properties of types at compile time.

<table>
<thead>
<tr>
<th>Template</th>
<th>Value</th>
</tr>
</thead>
</table>
| template<class T> | `alignof(T)`.
| struct alignment_of; | Requires: `alignof(T)` shall be a valid expression (7.6.2.6) |
| template<class T> | If `T` names an array type, an integer value representing the number of dimensions of `T`; otherwise, 0. |
| struct rank; | |
| template<class T, unsigned I = 0> | If `T` is not an array type, or if it has rank less than or equal to `I`, or if `I` is 0 and `T` has type “array of unknown bound of `U`”, then 0; otherwise, the bound (9.2.3.4) of the `I`th dimension of `T`, where indexing of `I` is zero-based |
| struct extent; | |

Each of these templates shall be a `Cpp17UnaryTypeTrait` (19.15.1) with a base characteristic of `integral_constant<size_t, Value>`.

[Example:]

§ 19.15.5 670
// the following assertions hold:
assert(rank_v<int> == 0);
assert(rank_v<int[2]> == 1);
assert(rank_v<int[][4]> == 2);
—end example]

[Example:
// the following assertions hold:
assert(extent_v<int> == 0);
assert(extent_v<int[2]> == 2);
assert(extent_v<int>[2][4]> == 2);
assert(extent_v<int>[][4]> == 0);
assert((extent_v<int, 1)> == 0);
assert((extent_v<int[2], 1)> == 0);
assert((extent_v<int[2][4], 1)> == 4);
assert((extent_v<int[], 1)> == 4);
—end example]

19.15.6 Relationships between types
[meta.rel]

This subclause contains templates that may be used to query relationships between types at compile time.

Each of these templates shall be a `Cpp17BinaryTypeTrait` (19.15.1) with a base characteristic of `true_type` if the corresponding condition is true, otherwise `false_type`.

Table 49 — Type relationship predicates

<table>
<thead>
<tr>
<th>Template</th>
<th>Condition</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>template&lt;class T, class U&gt; struct is_same;</code></td>
<td>T and U name the same type with the same cv-qualifications</td>
<td>If Base and Derived are non-union class types and are not possibly cv-qualified versions of the same type, Derived shall be a complete type. [Note: Base classes that are private, protected, or ambiguous are, nonetheless, base classes. — end note]</td>
</tr>
<tr>
<td><code>template&lt;class Base, class Derived&gt; struct is_base_of;</code></td>
<td>Base is a base class of Derived (10.6) without regard to cv-qualifiers or Base and Derived are not unions and name the same class type without regard to cv-qualifiers</td>
<td></td>
</tr>
<tr>
<td><code>template&lt;class From, class To&gt; struct is_convertible;</code></td>
<td><code>see below</code></td>
<td>From and To shall be complete types, arrays of unknown bound, or <code>cv void</code> types.</td>
</tr>
<tr>
<td><code>template&lt;class From, class To&gt; struct is_nothrow_convertible;</code></td>
<td><code>is_convertible_v&lt;From, To&gt;</code> is true and the conversion, as defined by <code>is_convertible</code>, is known not to throw any exceptions (7.6.2.7)</td>
<td>From and To shall be complete types, arrays of unknown bound, or <code>cv void</code> types.</td>
</tr>
<tr>
<td><code>template&lt;class Fn, class... ArgTypes&gt; struct is_invocable;</code></td>
<td>The expression <code>INVOKE(declval&lt;Fn&gt;(), declval&lt;ArgTypes&gt;...)</code> is well-formed when treated as an unevaluated operand</td>
<td>Fn and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <code>cv void</code>, or arrays of unknown bound.</td>
</tr>
<tr>
<td><code>template&lt;class R, class Fn, class... ArgTypes&gt; struct is_invocable_r;</code></td>
<td>The expression <code>INVOKE&lt;R&gt;(declval&lt;Fn&gt;(), declval&lt;ArgTypes&gt;...)</code> is well-formed when treated as an unevaluated operand</td>
<td>Fn, R, and all types in the template parameter pack <code>ArgTypes</code> shall be complete types, <code>cv void</code>, or arrays of unknown bound.</td>
</tr>
</tbody>
</table>

§ 19.15.6
Table 49 — Type relationship predicates (continued)

<table>
<thead>
<tr>
<th>Template</th>
<th>Condition</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class Fn, class... ArgTypes&gt;</td>
<td>is_invocable_v&lt;Fn, ArgTypes...&gt;</td>
<td>is true and the expression</td>
</tr>
<tr>
<td>is_nothrow_invocable;</td>
<td>is_invocable_v&lt;Fn, ArgTypes...&gt;</td>
<td>is known not to throw any exceptions</td>
</tr>
<tr>
<td>template&lt;class R, class Fn, class... ArgTypes&gt;</td>
<td>is_invocable_r_v&lt;R, Fn, ArgTypes...&gt;</td>
<td>is known not to throw any exceptions</td>
</tr>
</tbody>
</table>

For the purpose of defining the templates in this subclause, a function call expression declval<T>() for any type T is considered to be a trivial (6.7, 10.3.3) function call that is not an odr-use (6.2) of declval in the context of the corresponding definition notwithstanding the restrictions of 19.2.6.

Example:

```cpp
struct B {}
struct B1 : B {}
struct B2 : B {}
struct D : private B1, private B2 {};

is_base_of_v<B, D> // true
is_base_of_v<const B, D> // true
is_base_of_v<B, const D> // true
is_base_of_v<B, const B> // true
is_base_of_v<D, B> // false
is_base_of_v<B&, D&> // false
is_base_of_v<B[3], D[3]> // false
is_base_of_v<int, int> // false
```

The predicate condition for a template specialization is_convertible<From, To> shall be satisfied if and only if the return expression in the following code would be well-formed, including any implicit conversions to the return type of the function:

```cpp
To test() {
  return declval<From>();
}
```

Note: This requirement gives well-defined results for reference types, void types, array types, and function types. — end note] Access checking is performed in a context unrelated to To and From. Only the validity of the immediate context of the expression of the return statement (8.6.3) (including initialization of the returned object or reference) is considered. [Note: The initialization can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — end note]

19.15.7 Transformations between types [meta.trans]

This subclause contains templates that may be used to transform one type to another following some predefined rule.

1 Each of the templates in this subclause shall be a Cpp17TransformationTrait (19.15.1).

19.15.7.1 Const-volatile modifications [meta.trans.cv]
19.15.7.2 Reference modifications

Table 51 — Reference modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt; struct remove_reference;</td>
<td>If T has type “reference to T1” then the member typedef type names T1; otherwise, type names T.</td>
</tr>
<tr>
<td>template&lt;class T&gt; struct add_lvalue_reference;</td>
<td>If T names a referenceable type (15.3.22) then the member typedef type names T&amp;; otherwise, type names T. [Note: This rule reflects the semantics of reference collapsing (9.2.3.2). — end note]</td>
</tr>
<tr>
<td>template&lt;class T&gt; struct add_rvalue_reference;</td>
<td>If T names a referenceable type then the member typedef type names T&amp;&amp;; otherwise, type names T. [Note: This rule reflects the semantics of reference collapsing (9.2.3.2). For example, when a type T names a type T1&amp;, the type add_rvalue_reference_t&lt;T&gt; is not an rvalue reference. — end note]</td>
</tr>
</tbody>
</table>

19.15.7.3 Sign modifications

Table 52 — Sign modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class T&gt; struct make_signed;</td>
<td>If T names a (possibly cv-qualified) signed integer type (6.7.1) then the member typedef type names the type T; otherwise, if T names a (possibly cv-qualified) unsigned integer type then type names the corresponding signed integer type, with the same cv-qualifiers as T; otherwise, type names the signed integer type with smallest rank (6.7.4) for which sizeof(T) == sizeof(type), with the same cv-qualifiers as T. Requires: T shall be a (possibly cv-qualified) integral type or enumeration but not a bool type.</td>
</tr>
</tbody>
</table>
Table 52 — Sign modifications (continued)

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
</table>
| template<class T> struct make_unsigned; | If \( T \) names a (possibly cv-qualified) unsigned integer type (6.7.1) then the member typedef \( \text{type} \) names the type \( T \); otherwise, if \( T \) names a (possibly cv-qualified) signed integer type then \( \text{type} \) names the corresponding unsigned integer type, with the same cv-qualifiers as \( T \); otherwise, \( \text{type} \) names the unsigned integer type with smallest rank (6.7.4) for which \( \text{sizeof}(T) == \text{sizeof}(\text{type}) \), with the same cv-qualifiers as \( T \).

Requires: \( T \) shall be a (possibly cv-qualified) integral type or enumeration but not a bool type.

19.15.7.4 Array modifications

Table 53 — Array modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
</table>
| template<class T> struct remove_extent; | If \( T \) names a type “array of \( U \)”, the member typedef \( \text{type} \) shall be \( U \), otherwise \( T \). [Note: For multidimensional arrays, only the first array dimension is removed. For a type “array of \( \text{const} U \)”, the resulting type is \( \text{const} U \). — end note]
| template<class T> struct remove_all_extents; | If \( T \) is “multi-dimensional array of \( U \)”, the resulting member typedef \( \text{type} \) is \( U \), otherwise \( T \).

1 [Example:

```cpp
// the following assertions hold:
assert((is_same_v<remove_extent_t<int>, int>));
assert((is_same_v<remove_extent_t<int[2]>, int>));
assert((is_same_v<remove_extent_t<int[2][3]>, int[3]>>));
assert((is_same_v<remove_extent_t<int[][3]>, int[3]>>));
—end example]
```

2 [Example:

```cpp
// the following assertions hold:
assert((is_same_v<remove_all_extents_t<int>, int>));
assert((is_same_v<remove_all_extents_t<int[2]>, int>));
assert((is_same_v<remove_all_extents_t<int[2][3]>, int>));
assert((is_same_v<remove_all_extents_t<int[]>[3]>, int>));
—end example]
```

19.15.7.5 Pointer modifications

Table 54 — Pointer modifications

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
</table>
| template<class T> struct remove_pointer; | If \( T \) has type “(possibly cv-qualified) pointer to \( T1 \)” then the member typedef \( \text{type} \) names \( T1 \); otherwise, it names \( T \).
| template<class T> struct add_pointer; | If \( T \) names a referenceable type (15.3.22) or a cv void type then the member typedef \( \text{type} \) names the same type as \( \text{remove_reference_t} \ast<T> \); otherwise, \( \text{type} \) names \( T \).

19.15.7.6 Other transformations

§ 19.15.7.6
### Table 55 — Other transformations

<table>
<thead>
<tr>
<th>Template</th>
<th>Comments</th>
</tr>
</thead>
</table>
| `template<class T>
 struct type_identity;` | The member typedef `type` names the type `T`. |
| `template<size_t Len, size_t Align = default-alignment>
 struct aligned_storage;` | The value of `default-alignment` shall be the most stringent alignment requirement for any C++ object type whose size is no greater than `Len` (6.7). The member typedef `type` shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`. 
Requires: `Len` shall not be zero. `Align` shall be equal to `alignof(T)` for some type `T` or to `default-alignment`. |
| `template<size_t Len, class... Types>
 struct aligned_union;` | The member typedef `type` shall be a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in `Types`; its size shall be at least `Len`. The static member `alignment_value` shall be an integral constant of type `size_t` whose value is the strictest alignment of all types listed in `Types`. 
Requires: At least one type is provided. Each type in the template parameter pack `Types` shall be a complete object type. |
| `template<class T>
 struct remove_cvref;` | The member typedef `type` names the same type as `remove_cv_t<remove_reference_t<T>>`. |
| `template<class T>
 struct decay;` | Let `U` be `remove_reference_t<T>`. If `is_array_v<U>` is true, the member typedef `type` shall equal `remove_extent_t<U>`. If `is_function_v<U>` is true, the member typedef `type` shall equal `add_pointer_t<U>`. Otherwise the member typedef `type` equals `remove_cv_t<U>`. [Note: This behavior is similar to the lvalue-to-rvalue (7.3.1), array-to-pointer (7.3.2), and function-to-pointer (7.3.3) conversions applied when an lvalue is used as an rvalue, but also strips cv-qualifiers from class types in order to more closely model by-value argument passing. —end note] |
| `template<bool B, class T = void>
 struct enable_if;` | If `B` is true, the member typedef `type` shall equal `T`; otherwise, there shall be no member `type`. |
| `template<bool B, class T, class F>
 struct conditional;` | If `B` is true, the member typedef `type` shall equal `T`. If `B` is false, the member typedef `type` shall equal `F`. |
| `template<class... T>
 struct common_type;` | Unless this trait is specialized (as specified in Note B, below), the member `type` shall be defined or omitted as specified in Note A, below. If it is omitted, there shall be no member `type`. Each type in the template parameter pack `T` shall be complete, `cv` void, or an array of unknown bound. |
| `template<class, class, template<class> class, template<class> class>
 struct basic_common_reference;` | Unless this trait is specialized (as specified in Note D, below), there shall be no member `type`. |
| `template<class... T>
 struct common_reference;` | The member `typedef-name type` is defined or omitted as specified in Note C, below. Each type in the parameter pack `T` shall be complete or `cv` void. |
| `template<class T>
 struct underlying_type;` | The member typedef `type` names the underlying type of `T`. 
Requires: `T` shall be a complete enumeration type (9.6). |
Table 55 — Other transformations (continued)

<tr>
<td>template&lt;class Fn, class... ArgTypes&gt; struct invoke_result;</td>
<td>If the expression <code>INVOKE(declval&lt;Fn&gt;(), declval&lt;ArgTypes&gt;()...)</code> is well-formed when treated as an unevaluated operand (7.2), the member typedef type names the type \texttt{decltype(<code>INVOKE(declval&lt;Fn&gt;(), declval&lt;ArgTypes&gt;()...)</code>)}; otherwise, there shall be no member type. Access checking is performed as if in a context unrelated to <code>Fn</code> and <code>ArgTypes</code>. Only the validity of the immediate context of the expression is considered. [Note: The compilation of the expression can result in side effects such as the instantiation of class template specializations and function template specializations, the generation of implicitly-defined functions, and so on. Such side effects are not in the “immediate context” and can result in the program being ill-formed. — end note]</td>
</tr>
</tbody>
</table>

Requires: `Fn` and all types in the template parameter pack `ArgTypes` shall be complete types, `cv void`, or arrays of unknown bound.

1 [Note: A typical implementation would define `aligned_storage` as:

```cpp
template<size_t Len, size_t Alignment>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};

— end note]

2 Let:

(2.1) — `CREF(A)` be `add_lvalue_reference_t<\text{const remove_reference_t<A>}>`,

(2.2) — `XREF(A)` denote a unary alias template `T` such that `T<\text{U}>` denotes the same type as \text{U} with the addition of \text{U}'s cv and reference qualifiers, for a non-reference cv-unqualified type \text{U},

(2.3) — `COPYCV(FROM, TO)` be an alias for type `TO` with the addition of FROM's top-level cv-qualifiers. [Example: `COPYCV(const int, volatile short)` is an alias for `const volatile short`. — end example]

(2.4) — `COND_RES(X, Y)` be `decltype(false ? declval<X(&)()>()() : declval<Y(&)()>()())`.

Given types `A` and `B`, let `X` be `remove_reference_t<A>`, let `Y` be `remove_reference_t<B>`, and let `COMMON_REF(A, B)` be:

(2.5) — If `A` and `B` are both lvalue reference types, `COMMON_REF(A, B)` is `COND_RES(COPYCV(X, Y) &`, `COPYCV(Y, X) &)` if that type exists and is a reference type.

(2.6) — Otherwise, let `C` be `remove_reference_t<COMMON_REF(Xk, Yk)>&k`. If `A` and `B` are both rvalue reference types, `C` is well-formed, and `is_convertible_v<C, A> & & is_convertible_v<B, C>` is true, then `COMMON_REF(A, B)` is `C`.

(2.7) — Otherwise, let `D` be `COMMON_REF(const Xk, Yk)`. If `A` is an rvalue reference and `B` is an lvalue reference and `D` is well-formed and `is_convertible_v<A, D>` is true, then `COMMON_REF(A, B)` is `D`.

(2.8) — Otherwise, if `A` is an lvalue reference and `B` is an rvalue reference, then `COMMON_REF(A, B)` is `COMMON_REF(B, A)`.

(2.9) — Otherwise, `COMMON_REF(A, B)` is ill-formed.

If any of the types computed above is ill-formed, then `COMMON_REF(A, B)` is ill-formed.

3 Note A: For the `common_type` trait applied to a template parameter pack `T` of types, the member `type` shall be either defined or not present as follows:

(3.1) — If `sizeof...(T)` is zero, there shall be no member `type`.

(3.2) — If `sizeof...(T)` is one, let `T0` denote the sole type constituting the pack `T`. The member `typedef-name type` shall denote the same type, if any, as `common_type_t<T0, T0>`; otherwise there shall be no member `type`.

§ 19.15.7.6 676
— If `sizeof...(T)` is zero, there shall be no member `type`.

— Otherwise, if `sizeof...(T)` is one, let `T0` denote the sole type in the pack `T`. The member `typedef` shall denote the same type as `T0`.

— Otherwise, if `sizeof...(T)` is two, let `T1` and `T2` denote the two types in the pack `T`. Then
  
  — If `T1` and `T2` are reference types and `COMMON_REF(T1, T2)` is well-formed, then the member `typedef` shall denote the same type as `T0`.

  — Otherwise, if `basic_common_reference<remove_cvref_t<T1>, remove_cvref_t<T2>, XREF(T1), XREF(T2)>::type` is well-formed, then the member `typedef` shall denote the same type as `T0`.

  — Otherwise, if `COND_RES(T1, T2)` is well-formed, then the member `typedef` shall denote the same type as `T0`.

  — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member `typedef` shall denote the same type as `T0`.

— Otherwise, there shall be no member `type`.

— Otherwise, if `sizeof...(T)` is greater than two, let `T1`, `T2`, and `Rest`, respectively, denote the first, second, and (pack of) remaining types comprising `T`. Let `C` be the type `common_reference_t<T1, T2>`. Then:
  
  — If there is such a type `C`, the member `typedef` shall denote the same type as `T0`, that is, as `common_reference_t<C, Rest...>`.

— Otherwise, there shall be no member `type`.

Note B: Notwithstanding the provisions of 19.15.2, and pursuant to 15.5.4.2.1, a program may specialize `common_type<T1, T2>` for types `T1` and `T2` such that `is_same_v<T1, decay_t<T1>>` and `is_same_v<T2, decay_t<T2>>` are each `true`. [Note: Such specializations are needed when only explicit conversions are desired between the template arguments. — end note] Such a specialization need not have a member named `type`, but if it does, that member shall be a `typedef-name` for an accessible and unambiguous cv-unqualified non-reference type `C` to which each of the types `T1` and `T2` is explicitly convertible. Moreover, `common_type_t<T1, T2>` shall denote the same type as `T0`, if any, as `common_type_t<T2, T1>`.

Note C: For the `common_reference` trait applied to a parameter pack `T` of types, the member `typedef` shall be either defined or not present as follows:

— If `sizeof...(T)` is zero, there shall be no member `type`.

— Otherwise, if `sizeof...(T)` is one, let `T0` denote the sole type in the pack `T`. The member `typedef` shall denote the same type as `T0`.

— Otherwise, if `sizeof...(T)` is two, let `T1` and `T2` denote the two types in the pack `T`. Then
  
  — If `T1` and `T2` are reference types and `COMMON_REF(T1, T2)` is well-formed, then the member `typedef` shall denote the type.

  — Otherwise, if `basic_common_reference<remove_cvref_t<T1>, remove_cvref_t<T2>, XREF(T1), XREF(T2)>::type` is well-formed, then the member `typedef` shall denote the same type as `T0`.

  — Otherwise, if `COND_RES(T1, T2)` is well-formed, then the member `typedef` shall denote the type.

  — Otherwise, if `common_type_t<T1, T2>` is well-formed, then the member `typedef` shall denote the same type as `T0`.

— Otherwise, there shall be no member `type`.

Note D: Notwithstanding the provisions of 19.15.2, and pursuant to 15.5.4.2.1, a program may partially specialize `basic_common_reference<T, U, TQual, UQual>` for types `T` and `U` such that `is_same_v<T, decay_t<T>>` and `is_same_v<U, decay_t<U>>` are each `true`. [Note: Such specializations can be used to influence the result of `common_reference`, and are needed when only explicit conversions are desired between the template arguments. — end note] Such a specialization need not have a member named `type`, but if it does, that member shall be a `typedef-name` for an accessible and unambiguous type `C` to which each of the types.
TQual<T> and UQual<U> is convertible. Moreover, basic_common_reference<T, U, TQual, UQual>::type shall denote the same type, if any, as does basic_common_reference<U, T, UQual, TQual>::type. No diagnostic is required for a violation of these rules.

Example: Given these definitions:

```cpp
using PF1 = bool (*)(void);
using PF2 = short (*)(long);
struct S {
  operator PF2() const;
  double operator() (char, int&);
  void fn(long) const;
  char data;
};
using PMF = void (S::*)(long) const;
using PMD = char S::*;
```

the following assertions will hold:

```cpp
static_assert(is_same_v<invoke_result_t<S, int>, short>);
static_assert(is_same_v<invoke_result_t<S&, unsigned char, int&>, double>);
static_assert(is_same_v<invoke_result_t<PF1>, bool>);
static_assert(is_same_v<invoke_result_t<PMF, unique_ptr<S>, int>, void>);
static_assert(is_same_v<invoke_result_t<PMD, S>, char&&>);
static_assert(is_same_v<invoke_result_t<PMD, const S*>, const char&>);
```

--- end example ---

19.15.8 Logical operator traits

This subclause describes type traits for applying logical operators to other type traits.

```cpp
template<class... B> struct conjunction :
  see below
;
```

The class template conjunction forms the logical conjunction of its template type arguments.

For a specialization conjunction<B1, ..., BN>, if there is a template type argument Bi for which bool(Bi::value) is false, then instantiating conjunction<B1, ..., BN>::value does not require the instantiation of Bj::value for j > i. [Note: This is analogous to the short-circuiting behavior of the built-in operator &&. —end note]

Every template type argument for which Bi::value is instantiated shall be usable as a base class and shall have a member value which is convertible to bool, is not hidden, and is unambiguously available in the type.

The specialization conjunction<B1, ..., BN> has a public and unambiguous base that is either

- the first type Bj in the list true_type, B1, ..., BN for which bool(Bj::value) is false, or
- if there is no such Bj, the last type in the list.

[Note: This means a specialization of conjunction does not necessarily inherit from either true_type or false_type. —end note]

The member names of the base class, other than conjunction and operator=, shall not be hidden and shall be unambiguously available in conjunction.

```cpp
template<class... B> struct disjunction :
  see below
;
```

The class template disjunction forms the logical disjunction of its template type arguments.

For a specialization disjunction<B1, ..., BN>, if there is a template type argument Bi for which bool(Bi::value) is true, then instantiating disjunction<B1, ..., BN>::value does not require the instantiation of Bj::value for j > i. [Note: This is analogous to the short-circuiting behavior of the built-in operator ||. —end note]

Every template type argument for which Bi::value is instantiated shall be usable as a base class and shall have a member value which is convertible to bool, is not hidden, and is unambiguously available in the type.

The specialization disjunction<B1, ..., BN> has a public and unambiguous base that is either
The first type \( B_i \) in the list \( \text{false_type}, B_1, \ldots, B_N \) for which \( \text{bool}(B_i::\text{value}) \) is \textit{true}, or if there is no such \( B_i \), the last type in the list. 

\[ \text{Note: This means a specialization of disjunction does not necessarily inherit from either true_type or false_type.} \]

The member names of the base class, other than \( \text{disjunction} \) and \( \text{operator=} \), shall not be hidden and shall be unambiguously available in \( \text{disjunction} \).

\begin{verbatim}
template<class B> struct negation : see below { }; // The class template negation forms the logical negation of its template type argument. The type negation<B> is a Cpp17UnaryTypeTrait with a base characteristic of bool_constant<!bool(B::value)>.
\end{verbatim}

19.15.9 Endian

Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```cpp
enum class endian {
    little = see below,
    big = see below,
    native = see below
};
```

If all scalar types have size 1 byte, then all of \( \text{endian::little}, \text{endian::big}, \) and \( \text{endian::native} \) have the same value. Otherwise, \( \text{endian::little} \) is not equal to \( \text{endian::big} \). If all scalar types are big-endian, \( \text{endian::native} \) is equal to \( \text{endian::big} \). If all scalar types are little-endian, \( \text{endian::native} \) is equal to \( \text{endian::little} \). Otherwise, \( \text{endian::native} \) is not equal to either \( \text{endian::big} \) or \( \text{endian::little} \).

19.16 Compile-time rational arithmetic

19.16.1 In general

This subclause describes the ratio library. It provides a class template \textit{ratio} which exactly represents any finite rational number with a numerator and denominator representable by compile-time constants of type \textit{intmax_t}.

Throughout this subclause, the names of template parameters are used to express type requirements. If a template parameter is named \( R1 \) or \( R2 \), and the template argument is not a specialization of the \textit{ratio} template, the program is ill-formed.
19.16.2 Header `<ratio>` synopsis

```cpp
namespace std {
    // 19.16.3, class template ratio
    template<intmax_t N, intmax_t D = 1> class ratio;

    // 19.16.4, ratio arithmetic
    template<class R1, class R2> using ratio_add = see below;
    template<class R1, class R2> using ratio_subtract = see below;
    template<class R1, class R2> using ratio_multiply = see below;
    template<class R1, class R2> using ratio_divide = see below;

    // 19.16.5, ratio comparison
    template<class R1, class R2> struct ratio_equal;
    template<class R1, class R2> struct ratio_not_equal;
    template<class R1, class R2> struct ratio_less;
    template<class R1, class R2> struct ratio_less_equal;
    template<class R1, class R2> struct ratio_greater;
    template<class R1, class R2> struct ratio_greater_equal;
    template<class R1, class R2>
    inline constexpr bool ratio_equal_v = ratio_equal<R1, R2>::value;
    template<class R1, class R2>
    inline constexpr bool ratio_not_equal_v = ratio_not_equal<R1, R2>::value;
    template<class R1, class R2>
    inline constexpr bool ratio_less_v = ratio_less<R1, R2>::value;
    template<class R1, class R2>
    inline constexpr bool ratio_less_equal_v = ratio_less_equal<R1, R2>::value;
    template<class R1, class R2>
    inline constexpr bool ratio_greater_v = ratio_greater<R1, R2>::value;
    template<class R1, class R2>
    inline constexpr bool ratio_greater_equal_v = ratio_greater_equal<R1, R2>::value;

    // 19.16.6, convenience SI typedefs
    using yocto = ratio<1, 1'000'000'000'000'000'000'000'000'; // see below
    using zepto = ratio<1, 1'000'000'000'000'000'000'000'; // see below
    using atto = ratio<1, 1'000'000'000'000'; // see below
    using femto = ratio<1, 1'000'000'000'; // see below
    using pico = ratio<1, 1'000'000'; // see below
    using nano = ratio<1, 1'000'; // see below
    using micro = ratio<1, 1'; // see below
    using milli = ratio<1, 1'> // see below
    using centi = ratio<1, 1'00'> // see below
    using deci = ratio<1, 1'0'> // see below
    using deca = ratio<1, 1'> // see below
    using hecto = ratio<1, 1'0'> // see below
    using kilo = ratio<1, 1'> // see below
    using mega = ratio<1, 1'> // see below
    using giga = ratio<1, 1'> // see below
    using tera = ratio<1, 1'> // see below
    using peta = ratio<1, 1'> // see below
    using exa = ratio<1, 1'> // see below
    using zetta = ratio<1, 1'> // see below
    using yotta = ratio<1, 1'> // see below
}
```

19.16.3 Class template ratio

```cpp
namespace std {
    template<intmax_t N, intmax_t D = 1> class ratio {
        public:
            static constexpr intmax_t num;
            static constexpr intmax_t den;
            using type = ratio<num, den>;
    }
```
If the template argument \( D \) is zero or the absolute values of either of the template arguments \( N \) and \( D \) is not representable by type \( \text{intmax}_t \), the program is ill-formed. [Note: These rules ensure that infinite ratios are avoided and that for any negative input, there exists a representable value of its absolute value which is positive. This excludes the most negative value. —end note]

The static data members \( \text{num} \) and \( \text{den} \) shall have the following values, where \( \text{gcd} \) represents the greatest common divisor of the absolute values of \( N \) and \( D \):

\[
\begin{align*}
\text{(2.1)} & \quad \text{num} \text{ shall have the value } \frac{\text{sign}(N) \times \text{sign}(D) \times \text{abs}(N)}{\text{gcd}}. \\
\text{(2.2)} & \quad \text{den} \text{ shall have the value } \frac{\text{abs}(D)}{\text{gcd}}. 
\end{align*}
\]

### 19.16.4 Arithmetic on ratios

Each of the alias templates \( \text{ratio_add}, \text{ratio_subtract}, \text{ratio_multiply}, \) and \( \text{ratio_divide} \) denotes the result of an arithmetic computation on two ratios \( R1 \) and \( R2 \). With \( X \) and \( Y \) computed (in the absence of arithmetic overflow) as specified by Table 56, each alias denotes a \( \text{ratio}<U, V> \) such that \( U \) is the same as \( \text{ratio}<X, Y>:\text{num} \) and \( V \) is the same as \( \text{ratio}<X, Y>:\text{den} \).

If it is not possible to represent \( U \) or \( V \) with \( \text{intmax}_t \), the program is ill-formed. Otherwise, an implementation should yield correct values of \( U \) and \( V \). If it is not possible to represent \( X \) or \( Y \) with \( \text{intmax}_t \), the program is ill-formed unless the implementation yields correct values of \( U \) and \( V \).

#### Table 56 — Expressions used to perform ratio arithmetic

<table>
<thead>
<tr>
<th>Type</th>
<th>Value of ( X )</th>
<th>Value of ( Y )</th>
</tr>
</thead>
<tbody>
<tr>
<td>( \text{ratio_add}&lt;R1, R2&gt; )</td>
<td>( R1:\text{num} \times R2:\text{den} + R1:\text{den} \times R2:\text{den} )</td>
<td>( R2:\text{num} \times R1:\text{den} )</td>
</tr>
<tr>
<td>( \text{ratio_subtract}&lt;R1, R2&gt; )</td>
<td>( R1:\text{num} \times R2:\text{den} - R1:\text{den} \times R2:\text{den} )</td>
<td>( R2:\text{num} \times R1:\text{den} )</td>
</tr>
<tr>
<td>( \text{ratio_multiply}&lt;R1, R2&gt; )</td>
<td>( R1:\text{num} \times R2:\text{num} )</td>
<td>( R1:\text{den} \times R2:\text{den} )</td>
</tr>
<tr>
<td>( \text{ratio_divide}&lt;R1, R2&gt; )</td>
<td>( R1:\text{num} \times R2:\text{den} )</td>
<td>( R1:\text{den} \times R2:\text{num} )</td>
</tr>
</tbody>
</table>

[Example:

```cpp
class ratio{ 
    int num, den; 
    ratio(int n, int d) : num(n), den(d) {} 
} 

template<class R1, class R2> 
struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { }; 

template<class R1, class R2> 
struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { }; 
```

—end example]

### 19.16.5 Comparison of ratios

```cpp
template<class R1, class R2> 
struct ratio_equal : bool_constant<R1::num == R2::num && R1::den == R2::den> { }; 

template<class R1, class R2> 
struct ratio_not_equal : bool_constant<!ratio_equal_v<R1, R2>> { }; 
```
template<class R1, class R2>
struct ratio_less : bool_constant<see below> { };  
1 If R1::num × R2::den is less than R2::num × R1::den, ratio_less<R1, R2> shall be derived from 
bool_constant<true>; otherwise it shall be derived from bool_constant<false>. Implementations 
may use other algorithms to compute this relationship to avoid overflow. If overflow occurs, the program 
is ill-formed.

template<class R1, class R2>
struct ratio_less_equal : bool_constant<!ratio_less_v<R2, R1>> { };  

template<class R1, class R2>
struct ratio_greater : bool_constant<ratio_less_v<R2, R1>> { };  

template<class R1, class R2>
struct ratio_greater_equal : bool_constant<!ratio_less_v<R1, R2>> { };  

19.16.6 SI types for ratio

1 For each of the typedef-names yocto, zepto, zetta, and yotta, if both of the constants used in its specification 
are representable by intmax_t, the typedef shall be defined; if either of the constants is not representable by 
intmax_t, the typedef shall not be defined.

19.17 Class type_index

19.17.1 Header <typeindex> synopsis

namespace std {

class type_index;

template<class T> struct hash;

template<> struct hash<type_index>;
}

19.17.2 type_index overview

namespace std {

class type_index {

public:

type_index(const type_info& rhs) noexcept;
bool operator==(const type_info& rhs) const noexcept;
bool operator!=(const type_info& rhs) const noexcept;
bool operator< (const type_info& rhs) const noexcept;
bool operator> (const type_info& rhs) const noexcept;
bool operator<=(const type_info& rhs) const noexcept;
bool operator>=(const type_info& rhs) const noexcept;
size_t hash_code() const noexcept;
const char* name() const noexcept;

private:

const type_info* target; // exposition only
// Note that the use of a pointer here, rather than a reference,
// means that the default copy/move constructor and assignment
// operators will be provided and work as expected.
};
}

1 The class type_index provides a simple wrapper for type_info which can be used as an index type in 
associative containers (21.4) and in unordered associative containers (21.5).

19.17.3 type_index members

type_index(const type_info& rhs) noexcept;

1 Effects: Constructs a type_index object, the equivalent of target = &rhs.

bool operator==(const type_info& rhs) const noexcept;

2 Returns: *target == *rhs.target.
bool operator!= (const type_index& rhs) const noexcept;

Returns: *target != *rhs.target.

bool operator<(const type_index& rhs) const noexcept;

Returns: target->before(*rhs.target).

bool operator>(const type_index& rhs) const noexcept;

Returns: rhs.target->before(*target).

bool operator<=(const type_index& rhs) const noexcept;

Returns: !rhs.target->before(*target).

bool operator>=(const type_index& rhs) const noexcept;

Returns: !target->before(*rhs.target).

size_t hash_code() const noexcept;

Returns: target->hash_code().

const char* name() const noexcept;

Returns: target->name().

19.17.4 Hash support

template<> struct hash<type_index>;

For an object index of type type_index, hash<type_index>()(index) shall evaluate to the same result as index.hash_code().

19.18 Execution policies

19.18.1 In general

This subclause describes classes that are execution policy types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions. [Example:

```cpp
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());
```

—end example] [Note: Because different parallel architectures may require idiosyncratic parameters for efficient execution, implementations may provide additional execution policies to those described in this standard as extensions. —end note]

19.18.2 Header <execution> synopsis

namespace std {

// 19.18.3, execution policy type trait
template<class T> struct is_execution_policy;
template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

§ 19.18.2
namespace std::execution {
    // 19.18.4, sequenced execution policy
    class sequenced_policy;

    // 19.18.5, parallel execution policy
    class parallel_policy;

    // 19.18.6, parallel and unsequenced execution policy
    class parallel_unsequenced_policy;

    // 19.18.7, execution policy objects
    inline constexpr sequenced_policy seq{ unspecified };  
    inline constexpr parallel_policy par{ unspecified };  
    inline constexpr parallel_unsequenced_policy par_unseq{ unspecified };
}

19.18.3 Execution policy type trait

```cpp
template<class T> struct is_execution_policy { see below };
```

1. `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

2. `is_execution_policy<T>` shall be a `Cpp17UnaryTypeTrait` with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[Note: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — end note]

3. The behavior of a program that adds specializations for `is_execution_policy` is undefined.

19.18.4 Sequenced execution policy

```cpp
class execution::sequenced_policy { unspecified };
```

1. The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.

2. During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` shall be called.

19.18.5 Parallel execution policy

```cpp
class execution::parallel_policy { unspecified };
```

1. The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.

2. During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` shall be called.

19.18.6 Parallel and unsequenced execution policy

```cpp
class execution::parallel_unsequenced_policy { unspecified };
```

1. The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

2. During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an uncaught exception, `terminate()` shall be called.

19.18.7 Execution policy objects

```cpp
inline constexpr execution::sequenced_policy execution::seq{ unspecified };
inline constexpr execution::parallel_policy execution::par{ unspecified };
```
inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };

The header `<execution>` declares global objects associated with each type of execution policy.

19.19 Primitive numeric conversions [charconv]

19.19.1 Header `<charconv>` synopsis [charconv.syn]

namespace std {
namespace { // floating-point format for primitive numerical conversion
enum class chars_format {
    scientific = unspecified,
    fixed = unspecified,
    hex = unspecified,
    general = fixed | scientific
};

// 19.19.2, primitive numerical output conversion
struct to_chars_result {
    char* ptr;
    errc ec;
};

to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
to_chars_result to_chars(char* first, char* last, float value);
to_chars_result to_chars(char* first, char* last, double value);
to_chars_result to_chars(char* first, char* last, long double value);
to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);
to_chars_result to_chars(char* first, char* last, float value, chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, double value, chars_format fmt, int precision);
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt, int precision);
}

// 19.19.3, primitive numerical input conversion
struct from_chars_result {
    const char* ptr;
    errc ec;
};

from_chars_result from_chars(const char* first, const char* last, see below value, int base = 10);
from_chars_result from_chars(const char* first, const char* last, float& value,
chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value,
chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value,
chars_format fmt = chars_format::general);
}

1 The type `chars_format` is a bitmask type (15.4.2.1.4) with elements scientific, fixed, and hex.

19.19.2 Primitive numeric output conversion [charconv.to.chars]

All functions named `to_chars` convert `value` into a character string by successively filling the range `[first, last)`, where `[first, last)` is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec`
has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range `[first, last)` are unspecified.

2 The functions that take a floating-point `value` but not a `precision` parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers `value` exactly. [Note: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — end note] If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (16.3.3.1).

3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows: The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading "0x" in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

4 Requires: `base` has a value between 2 and 36 (inclusive).
5 Effects: The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a`..`z`. If `value` is less than zero, the representation starts with `-`.
6 Throws: Nothing.
7 Remarks: The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

8 Requires: `fmt` has the value of one of the enumerators of `chars_format`.
9 Effects: `value` is converted to a string in the style of `printf` in the "C" locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.
10 Throws: Nothing.
11 Remarks: The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

12 Requires: `fmt` has the value of one of the enumerators of `chars_format`.
13 Effects: `value` is converted to a string in the style of `printf` in the "C" locale.
14 Throws: Nothing.
15 Remarks: The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

16 See also: ISO C 7.21.6.1

19.19.3 Primitive numeric input conversion  
[charconv.from.chars]

All functions named `from_chars` analyze the string `[first, last)` for a pattern, where `[first, last)` is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`. [Note: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — end note] Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of `value`. The member `ptr` of the return value points to the first character not

§ 19.19.3 686
matching the pattern, or has the value \texttt{last} if all characters match. If the parsed value is not in the range representable by the type of \texttt{value}, \texttt{value} is unmodified and the member \texttt{ec} of the return value is equal to \texttt{errc::result_out_of_range}. Otherwise, \texttt{value} is set to the parsed value, after rounding according to \texttt{round_to_nearest} (16.3.3.1), and the member \texttt{ec} is value-initialized.

\begin{verbatim}
from_chars_result from_chars(const char* first, const char* last, value, int base = 10);

2 Requires: base has a value between 2 and 36 (inclusive).
3 Effects: The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for \texttt{strtol}, except that no "0x" or "0X" prefix shall appear if the value of \texttt{base} is 16, and except that '-' is the only sign that may appear, and only if \texttt{value} has a signed type.
4 Throws: Nothing.
5 Remarks: The implementation shall provide overloads for all signed and unsigned integer types and \texttt{char} as the referenced type of the parameter \texttt{value}.

\begin{verbatim}
from_chars_result from_chars(const char* first, const char* last, float& value, chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value, chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value, chars_format fmt = chars_format::general);
\end{verbatim}

6 Requires: \texttt{fmt} has the value of one of the enumerators of \texttt{chars_format}.
7 Effects: The pattern is the expected form of the subject sequence in the "C" locale, as described for \texttt{strtol}, except that
8
(7.1) — the sign '+' may only appear in the exponent part;
(7.2) — if \texttt{fmt} has \texttt{chars_format::scientific} set but not \texttt{chars_format::fixed}, the otherwise optional exponent part shall appear;
(7.3) — if \texttt{fmt} has \texttt{chars_format::fixed} set but not \texttt{chars_format::scientific}, the optional exponent part shall not appear; and
(7.4) — if \texttt{fmt} is \texttt{chars_format::hex}, the prefix "0x" or "0X" is assumed. [Example: The string \texttt{0x123} is parsed to have the value 0 with remaining characters \texttt{x123}. — end example]

In any case, the resulting \texttt{value} is one of at most two floating-point values closest to the value of the string matching the pattern.

8 Throws: Nothing.

20 Strings library [strings]

20.1 General [strings.general]

1 This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.7) type. Such types are called char-like types, and objects of char-like types are called char-like objects or simply characters.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 57.

Table 57 — Strings library summary

20.2 Character traits [char.traits]

1 This subclause defines requirements on classes representing character traits, and defines a class template char_traits<CharT>, along with five specializations, char_traits<char>, char_traits<char8_t>, char_traits<char16_t>, char_traits<char32_t>, and char_traits<wchar_t>, that satisfy those requirements.

2 Most classes specified in 20.3, 20.4, and Clause 28 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by each such template. This subclause defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (15.3.3) C, that and its related character traits class X are passed as a pair of parameters to the string, string view, or iostream template as parameters charT and traits. If X::char_type is not the same type as C, the program is ill-formed.

20.2.1 Character traits requirements [char.traits.require]

1 In Table 58, X denotes a traits class defining types and functions for the character container type C; c and d denote values of type C; p and q denote values of type const C*; s denotes a value of type C*; n, i and j denote values of type size_t; e and f denote values of type X::int_type; pos denotes a value of type X::pos_type; and r denotes an lvalue of type C. Operations on X shall not throw exceptions.

2 The class template
   template<class charT> struct char_traits;

is provided in the header `<string>` as a basis for explicit specializations.

20.2.2 Traits typedefs

using int_type = see below;

1 Expects: int_type shall be able to represent all of the valid characters converted from the corresponding char_type values, as well as an end-of-file value, eof().

using state_type = see below;

2 Requires: state_type shall meet the Cpp17Destructible (Table 30), Cpp17CopyAssignable (Table 29), Cpp17CopyConstructible (Table 27), and Cpp17DefaultConstructible (Table 25) requirements.

20.2.3 char_traits specializations

namespace std {
   template<> struct char_traits<char> {
      using char_type = char;
      using int_type = int;
      using off_type = streamoff;
      using pos_type = streampos;
      using state_type = mbstate_t;
      static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
      static constexpr bool eq(char_type c1, char_type c2) noexcept;
      static constexpr bool lt(char_type c1, char_type c2) noexcept;
      static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
      static constexpr size_t length(const char_type* s);
      static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
      static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
      static constexpr char_type* assign(char_type* s, size_t n, char_type a);
   }

224) If eof() can be held in char_type then some iostreams operations can give surprising results.

§ 20.2.3.1
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};

1 The type mbstate_t is defined in <cwchar> and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

2 The two-argument member assign is defined identically to the built-in operator =. The two-argument members eq and lt are defined identically to the built-in operators == and < for type unsigned char.

3 The member eof() returns EOF.

20.2.3.2 struct char_traits<char8_t>

namespace std {
    template<> struct char_traits<char8_t> {
        using char_type = char8_t;
        using int_type = unsigned int;
        using off_type = streamoff;
        using pos_type = u8streampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static char_type* move(char_type* s1, const char_type* s2, size_t n);
        static char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and < respectively.

2 The member eof() returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

20.2.3.3 struct char_traits<char16_t>

namespace std {
    template<> struct char_traits<char16_t> {
        using char_type = char16_t;
        using int_type = uint_least16_t;
        using off_type = streamoff;
        using pos_type = u16streampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static char_type* move(char_type* s1, const char_type* s2, size_t n);
        static char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

§ 20.2.3.3
The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.
static constexpr bool lt(char_type c1, char_type c2) noexcept;
static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
static constexpr size_t length(const char_type* s);
static constexpr const char_type* find(const char_type* s, size_t n,
    const char_type& a);
static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* assign(char_type* s, size_t n, char_type a);
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.
2 The member eof() returns WEOF.

20.3 String classes

The header <string> defines the basic_string class template for manipulating varying-length sequences of char-like objects and five typedef-names, string, u8string, u16string, u32string, and wstring, that name the specializations basic_string<char>, basic_string<char8_t>, basic_string<char16_t>, basic_string<char32_t>, and basic_string<wchar_t>, respectively.

20.3.1 Header <string> synopsis

#include <initializer_list>

namespace std {
    // 20.2, character traits
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;

§ 20.3.1
20.3.2 Class template `basic_string`

The class template `basic_string` describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of this Clause, the type of the char-like objects held in a `basic_string` object is designated by `charT`.

A specialization of `basic_string` is a contiguous container (21.2.1).

In all cases, `[data(), data() + size()]` is a valid range, `data() + size()` points at an object with value `charT()` (a “null terminator”), and `size() <= capacity()` is true.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
    public:
        // types
        using traits_type = traits;
        using value_type = charT;
        using allocator_type = Allocator;
        using size_type = typename allocator_traits<Allocator>::size_type;
        using difference_type = typename allocator_traits<Allocator>::difference_type;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using iterator = implementation-defined; // see 21.2
        using const_iterator = implementation-defined; // see 21.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        static const size_typenpos = -1;

        // 20.3.2.2, construct/copy/destroy
        basic_string() noexcept(noexcept(Allocator())) : basic_string(Allocator()) { }
        explicit basic_string(const Allocator& a) noexcept;
        basic_string(const basic_string& str);

  basic_string(InputIterator, InputIterator, Allocator = Allocator())
  -> basic_string<typename iterator_traits<InputIterator>::value_type,
                 char_traits<typename iterator_traits<InputIterator>::value_type>,
                 Allocator>;

template<class charT,
  class traits,
  class Allocator = allocator<charT>>
  explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
  -> basic_string<charT, traits, Allocator>;

template<class charT,
  class traits,
  class Allocator = allocator<charT>>
  basic_string(basic_string_view<charT, traits>,
               typename see below::size_type, typename see below::size_type,
               const Allocator& = Allocator())
  -> basic_string<charT, traits, Allocator>;

A size_type parameter type in a basic_string deduction guide refers to the size_type member type of the type deduced by the deduction guide.

20.3.2.1 General requirements [string.require]

1 If any operation would cause size() to exceed max_size(), that operation throws an exception object of type length_error.

2 If any member function or operator of basic_string throws an exception, that function or operator has no other effect on the basic_string object.

3 In every specialization basic_string<charT, traits, Allocator>, the type allocator_traits<Allocator>::value_type shall name the same type as charT. Every object of type basic_string<charT, traits, Allocator> uses an object of type Allocator to allocate and free storage for the contained charT objects as needed. The Allocator object used is obtained as described in 21.2.1. In every specialization basic_string<charT, traits, Allocator>, the type traits shall satisfy the character traits requirements (20.2). [Note: The program is ill-formed if traits::char_type is not the same type as charT. — end note]

§ 20.3.2.1 701
References, pointers, and iterators referring to the elements of a basic_string sequence may be invalidated by the following uses of that basic_string object:

1. Passing as an argument to any standard library function taking a reference to non-const basic_string as an argument.
2. Calling non-const member functions, except operator[], at, data, front, back, begin, rbegin, end, and rend.

20.3.2.2 Constructors and assignment operators

explicit basic_string(const Allocator& a) noexcept;
Ensures: size() is equal to 0.

basic_string(const basic_string& str);
basic_string(basic_string&& str) noexcept;
Effects: Constructs an object whose value is that of str prior to this call.
Remarks: In the second form, str is left in a valid but unspecified state.

basic_string(const basic_string& str, size_type pos, const Allocator& a = Allocator());
basic_string(const basic_string& str, size_type pos, size_type n, const Allocator& a = Allocator());
Effects: Let n be npos for the first overload. Equivalent to:
basic_string(basic_string_view<charT, traits>(str).substr(pos, n), a)

template<class T>
basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.
Effects: Creates a variable, sv, as if by basic_string_view<charT, traits> sv = t; and then behaves the same as:
basic_string(sv.substr(pos, n), a);

template<class T>
explicit basic_string(const T& t, const Allocator& a = Allocator());
Constraints:
(7.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(7.2) is_convertible_v<const T&, const charT*> is false.
Effects: Creates a variable, sv, as if by basic_string_view<charT, traits> sv = t; and then behaves the same as basic_string(sv.data(), sv.size(), a).

basic_string(const charT* s, size_type n, const Allocator& a = Allocator());
Effects: Constructs an object whose initial value is the range [s, s + n].
Ensures: size() is equal to n, and traits::compare(data(), s, n) is equal to 0.

basic_string(const charT* s, const Allocator& a = Allocator());
Constraints: Allocator is a type that qualifies as an allocator (21.2.1). [Note: This affects class
template argument deduction. —end note]
Effects: Equivalent to: basic_string(s, traits::length(s), a).

basic_string(size_type n, charT c, const Allocator& a = Allocator());
Constraints: Allocator is a type that qualifies as an allocator (21.2.1). [Note: This affects class
template argument deduction. —end note]
Effects: Constructs an object whose value consists of n copies of c.

225) For example, as an argument to non-member functions swap() (20.3.3.3), operator>>() (20.3.3.4), and getline() (20.3.3.4), or as an argument to basic_string::swap().
template<class InputIterator>
    basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());

    // Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
    // Effects: Constructs a string from the values in the range [begin, end), as indicated in Table 66.

basic_string(initializer_list<charT> il, const Allocator& a = Allocator());

    // Effects: Equivalent to basic_string(il.begin(), il.end(), a).

basic_string(const basic_string& str, const Allocator& alloc);
    basic_string(basic_string&& str, const Allocator& alloc);

    // Effects: Constructs an object whose value is that of str prior to this call. The stored allocator is
    // constructed from alloc. In the second form, str is left in a valid but unspecified state.
    // Throws: The second form throws nothing if alloc == str.get_allocator().

    template<class InputIterator,
             class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
    basic_string(InputIterator, InputIterator, Allocator = Allocator());

    // Constraints: InputIterator is a type that qualifies as an input iterator, and Allocator is a type that
    // qualifies as an allocator (21.2.1).

    template<class charT,
             class traits,
             class Allocator = allocator<charT>>
    explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;

    template<class charT,
             class traits,
             class Allocator = allocator<charT>>
    basic_string(basic_string_view<charT, traits>,
                 typename see below::size_type, typename see below::size_type,
                 const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;

    // Constraints: Allocator is a type that qualifies as an allocator (21.2.1).

    basic_string& operator=(const basic_string& str);

    // Effects: If *this and str are the same object, has no effect. Otherwise, replaces the value of *this
    // with a copy of str.
    // Returns: *this.

    basic_string& operator=(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
             allocator_traits<Allocator>::is_always_equal::value);

    // Effects: Move assigns as a sequence container (21.2), except that iterators, pointers and references may
    // be invalidated.
    // Returns: *this.

    template<class T>
    basic_string& operator=(const T& t);

    // Constraints:
    // (27.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
    // (27.2) is_convertible_v<const T&, const charT*> is false.
    // Effects: Equivalent to:
    // basic_string_view<charT, traits> sv = t;

§ 20.3.2.2
return assign(sv);

basic_string& operator=(const charT* s);

Effects: Equivalent to: return *this = basic_string_view<charT, traits>(s);

basic_string& operator=(charT c);

Effects: Equivalent to:
return *this = basic_string_view<charT, traits>(addressof(c), 1);

basic_string& operator=(initializer_list<charT> il);

Effects: Equivalent to:
return *this = basic_string_view<charT, traits>(il.begin(), il.size());

20.3.2.3 Iterator support

iterator begin() noexcept;
const_iterator begin() const noexcept;
const_iterator cbegin() const noexcept;

Returns: An iterator referring to the first character in the string.

iterator end() noexcept;
const_iterator end() const noexcept;
const_iterator cend() const noexcept;

Returns: An iterator which is the past-the-end value.

reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator crbegin() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(end()).

reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crend() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(begin()).

20.3.2.4 Capacity

size_type size() const noexcept;
size_type length() const noexcept;

Returns: A count of the number of char-like objects currently in the string.

Complexity: Constant time.

size_type max_size() const noexcept;

Returns: The largest possible number of char-like objects that can be stored in a basic_string.

Complexity: Constant time.

void resize(size_type n, charT c);

Effects: Alters the value of *this as follows:
(5.1) If n <= size(), erases the last size() - n elements.
(5.2) If n > size(), appends n - size() copies of c.

void resize(size_type n);

Effects: Equivalent to resize(n, charT()).

size_type capacity() const noexcept;

Returns: The size of the allocated storage in the string.

Complexity: Constant time.
void reserve(size_type res_arg);

Effects: A directive that informs a basic_string of a planned change in size, so that the storage allocation can be managed accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve().

Throws: length_error if res_arg > max_size() or any exceptions thrown by allocator_traits<Allocator>::allocate.

void shrink_to_fit();

Effects: shrink_to_fit is a non-binding request to reduce capacity() to size(). [Note: The request is non-binding to allow latitude for implementation-specific optimizations. — end note] It does not increase capacity(), but may reduce capacity() by causing reallocation.

Complexity: Linear in the size of the sequence.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator. If no reallocation happens, they remain valid.

void clear() noexcept;

 Effects: Equivalent to: erase(begin(), end());

[[nodiscard]] bool empty() const noexcept;

Effects: Equivalent to: return size() == 0;

20.3.2.5 Element access [string.access]

const_reference operator[](size_type pos) const;
reference operator[](size_type pos);

1 Expects: pos <= size().
2 Returns: *(begin() + pos) if pos < size(). Otherwise, returns a reference to an object of type charT with value charT(), where modifying the object to any value other than charT() leads to undefined behavior.
3 Throws: Nothing.
4 Complexity: Constant time.

const_reference at(size_type pos) const;
reference at(size_type pos);

5 Throws: out_of_range if pos >= size().
6 Returns: operator[](pos).

const charT& front() const;
charT& front();

7 Expects: !empty().
8 Effects: Equivalent to: return operator[](0);

const charT& back() const;
charT& back();

9 Expects: !empty().
10 Effects: Equivalent to: return operator[](size() - 1);

20.3.2.6 Modifiers [string.modifiers]
20.3.2.6.1 basic_string::operator+= [string.op.append]

basic_string& operator+=(const basic_string& str);

1 Effects: Equivalent to: return append(str);
template<class T>
    basic_string& operator+=(const T& t);
Constraints:
(2.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(2.2) — is_convertible_v<const T&, const charT*> is false.
Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return append(sv);

basic_string& operator+=(const charT* s);
Effects: Equivalent to: return append(s);

basic_string& operator+=(charT c);
Effects: Equivalent to: return append(size_type{1}, c);

basic_string& operator+=(initializer_list<charT> il);
Effects: Equivalent to: return append(il);

20.3.2.6.2 basic_string::append

basic_string& append(const basic_string& str);
Effects: Equivalent to: return append(str.data(), str.size());

basic_string& append(const basic_string& str, size_type pos, size_type n = npos);
Effects: Equivalent to:
    return append(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
    basic_string& append(const T& t);
Constraints:
(3.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2) — is_convertible_v<const T&, const charT*> is false.
Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return append(sv.data(), sv.size());

template<class T>
    basic_string& append(const T& t, size_type pos, size_type n = npos);
Constraints:
(5.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2) — is_convertible_v<const T&, const charT*> is false.
Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return append(sv.substr(pos, n));

basic_string& append(const charT* s, size_type n);
Effects: [s, s + n) is a valid range.
Effects: Appends a copy of the range [s, s + n) to the string.
Returns: *this.

basic_string& append(const charT* s);
Effects: Equivalent to: return append(s, traits::length(s));
basic_string& append(size_type n, charT c);

   Effects: Appends n copies of c to the string.
   Returns: *this.

template<class InputIterator>
   basic_string& append(InputIterator first, InputIterator last);

   Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
   Effects: Equivalent to: return append(basic_string(first, last, get_allocator()));

basic_string& append(initializer_list<charT> il);

   Effects: Equivalent to: return append(il.begin(), il.size());

void push_back(charT c);

   Effects: Equivalent to append(size_type{1}, c).

20.3.2.6.3 basic_string::assign

   [string.assign]

basic_string& assign(const basic_string& str);

   Effects: Equivalent to: return *this = str;

basic_string& assign(basic_string&& str)
   noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
   allocator_traits<Allocator>::is_always_equal::value);

   Effects: Equivalent to: return *this = std::move(str);

basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);

   Effects: Equivalent to:
   return assign(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
   basic_string& assign(const T& t);

   Constraints:
   (4.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
   (4.2) is_convertible_v<const T&, const charT*> is false.

   Effects: Equivalent to:
   basic_string_view<charT, traits> sv = t;
   return assign(sv.data(), sv.size());

template<class T>
   basic_string& assign(const T& t, size_type pos, size_type n = npos);

   Constraints:
   (6.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
   (6.2) is_convertible_v<const T&, const charT*> is false.

   Effects: Equivalent to:
   basic_string_view<charT, traits> sv = t;
   return assign(sv.substr(pos, n));

basic_string& assign(const charT* s, size_type n);

   Expects: [s, s + n) is a valid range.
   Effects: Replaces the string controlled by *this with a copy of the range [s, s + n).
   Returns: *this.

basic_string& assign(const charT* s);

   Effects: Equivalent to: return assign(s, traits::length(s));
basic_string& assign(initializer_list<charT> il);

Effects: Equivalent to: return assign(il.begin(), il.size());

basic_string& assign(size_type n, charT c);

Effects: Equivalent to:
  clear();
  resize(n, c);
  return *this;

template<class InputIterator>
  basic_string& assign(InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).

Effects: Equivalent to: return assign(basic_string(first, last, get_allocator()));

20.3.2.6.4 basic_string::insert [string.insert]

basic_string& insert(size_type pos, const basic_string& str);

Effects: Equivalent to: return insert(pos, str.data(), str.size());

basic_string& insert(size_type pos1, const basic_string& str, size_type pos2, size_type n = npos);

Effects: Equivalent to:
  return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);

template<class T>
  basic_string& insert(size_type pos, const T& t);

Constraints:
  (3.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
  (3.2) is_convertible_v<const T&, const charT*>> is false.

Effects: Equivalent to:
  basic_string_view<charT, traits> sv = t;
  return insert(pos, sv.data(), sv.size());

template<class T>
  basic_string& insert(size_type pos1, const T& t, size_type pos2, size_type n = npos);

Constraints:
  (5.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
  (5.2) is_convertible_v<const T&, const charT*>> is false.

Effects: Equivalent to:
  basic_string_view<charT, traits> sv = t;
  return insert(pos1, sv.substr(pos2, n));

basic_string& insert(size_type pos, const charT* s, size_type n);

Expects: [s, s + n) is a valid range.

Throws:
  (8.1) out_of_range if pos > size(),
  (8.2) length_error if n > max_size() - size(), or
  (8.3) any exceptions thrown by allocator_traits<Allocator>::allocate.

Effects: Inserts a copy of the range [s, s + n) immediately before the character at position pos if pos < size(), or otherwise at the end of the string.

Returns: *this.

basic_string& insert(size_type pos, const charT* s);

Effects: Equivalent to: return insert(pos, s, traits::length(s));
basic_string& insert(size_type pos, size_type n, charT c);

Throws:
— out_of_range if pos > size(),
— length_error if n > max_size() - size(), or
— any exceptions thrown by allocator_traits<Allocator>::allocate.

Effects: Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the end of the string.

iterator insert(const_iterator p, charT c);

Expects: p is a valid iterator on *this.
Effects: Inserts a copy of c at the position p.
Returns: An iterator which refers to the inserted character.

iterator insert(const_iterator p, size_type n, charT c);

Expects: p is a valid iterator on *this.
Effects: Inserts n copies of c at the position p.
Returns: An iterator which refers to the first inserted character, or p if n == 0.

template<class InputIterator>
iterator insert(const_iterator p, InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (21.2.1).
Expects: p is a valid iterator on *this.
Effects: Equivalent to insert(p - begin(), basic_string(first, last, get_allocator())).
Returns: An iterator which refers to the first inserted character, or p if first == last.

iterator insert(const_iterator p, initializer_list<charT> il);

Effects: Equivalent to: return insert(p, il.begin(), il.end());

20.3.2.6.5 basic_string::erase

basic_string& erase(size_type pos = 0, size_type n = npos);

Throws: out_of_range if pos > size().
Effects: Determines the effective length xlen of the string to be removed as the smaller of n and size() - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen].
Returns: *this.

iterator erase(const_iterator p);

Expects: p is a valid dereferenceable iterator on *this.
Throws: Nothing.
Effects: Removes the character referred to by p.
Returns: An iterator which points to the element immediately following p prior to the element being erased. If no such element exists, end() is returned.

iterator erase(const_iterator first, const_iterator last);

Expects: first and last are valid iterators on *this. [first, last) is a valid range.
Throws: Nothing.
Effects: Removes the characters in the range [first, last).
Returns: An iterator which points to the element pointed to by last prior to the other elements being erased. If no such element exists, end() is returned.

void pop_back();

Expects: !empty().

§ 20.3.2.6.5
20.3.2.6.6  basic_string::replace

basic_string& replace(size_type pos1, size_type n1, const basic_string& str);

Effects: Equivalent to return replace(pos1, n1, str.data(), str.size());

Effects: Equivalent to:

    return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));

template<class T>
    basic_string& replace(size_type pos1, size_type n1, const T& t);

Constraints:

(3.1)  —  is_convertible_v<const T &, basic_string_view<charT, traits>> is true
(3.2)  —  is_convertible_v<const T &, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());

template<class T>
    basic_string& replace(size_type pos1, size_type n1, const T& t, size_type pos2, size_type n2 = npos);

Constraints:

(5.1)  —  is_convertible_v<const T &, basic_string_view<charT, traits>> is true
(5.2)  —  is_convertible_v<const T &, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));

basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);

Effects: Equivalent to: return replace(pos1, n1, s, traits::length(s));

basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);

Effects: Equivalent to: return replace(pos1, n1, size_type n2, charT c);

Throws:

(12.1)  —  out_of_range if pos1 > size(),
(12.2)  —  length_error if the length of the resulting string would exceed max_size() (see below), or
(12.3)  —  any exceptions thrown by allocator_traits<Allocator>::allocate.
**basic_string.replace(const_iterator i1, const_iterator i2, const basic_string& str);**

**Effects:** Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(str));

**template<class T>**

basic_string& replace(const_iterator i1, const_iterator i2, const T& t);

**Effects:** Equivalent to:

basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());

basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);

**Effects:** Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s, n));

basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);

**Effects:** Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s));

basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);

**Effects:** Equivalent to: return replace(i1 - begin(), i2 - i1, n, c);

**template<class InputIterator>**

basic_string& replace(const_iterator i1, const_iterator i2, InputIterator j1, InputIterator j2);

**Constraints:** InputIterator is a type that qualifies as an input iterator (21.2.1).

**Effects:** Equivalent to: return replace(i1, i2, basic_string(j1, j2, get_allocator()));

basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);

**Effects:** Equivalent to: return replace(i1, i2, il.begin(), il.size());

---

**20.3.2.6.7** basic_string::copy [string.copy]

size_type copy(charT* s, size_type n, size_type pos = 0) const;

**Effects:** Equivalent to: return basic_string_view<charT, traits>(*(this).copy(s, n, pos));

[Note: This does not terminate s with a null object. — end note]

---

**20.3.2.6.8** basic_string::swap [string.swap]

void swap(basic_string& s);

noexcept(allocation_traits<Allocator>::propagate_on_container_swap::value ||
allocation_traits<Allocator>::is_always_equal::value);

**Effects:** allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == s.get_allocator().

**Ensures:** *(this) contains the same sequence of characters that was in s, s contains the same sequence of characters that was in *(this).

**Throws:** Nothing.

**Complexity:** Constant time.
20.3.2.7 String operations

20.3.2.7.1 Accessors

const charT* c_str() const noexcept;
const charT* data() const noexcept;

Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].
Complexity: Constant time.
Remarks: The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

charT* data() noexcept;

Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].
Complexity: Constant time.
Remarks: The program shall not modify the value stored at p + size() to any value other than charT(); otherwise, the behavior is undefined.

operator basic_string_view<charT, traits>() const noexcept;

Effects: Equivalent to: return basic_string_view<charT, traits>(data(), size());

allocator_type get_allocator() const noexcept;

Returns: A copy of the Allocator object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

20.3.2.7.2 Searching

Let F be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

1. Each member function of the form
   size_type F(const basic_string& str, size_type pos) const noexcept;
   has effects equivalent to: return F(basic_string_view<charT, traits>(str), pos);

2. Each member function of the form
   size_type F(const charT* s, size_type pos) const;
   has effects equivalent to: return F(basic_string_view<charT, traits>(s), pos);

3. Each member function of the form
   size_type F(const charT* s, size_type pos, size_type n) const;
   has effects equivalent to: return F(basic_string_view<charT, traits>(s, n), pos);

4. Each member function of the form
   size_type F(charT c, size_type pos) const noexcept;
   has effects equivalent to:
   return F(basic_string_view<charT, traits>(addressof(c), 1), pos);

template<class T>
size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);

Constraints:

1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.

Effects: Let \( G \) be the name of the function. Equivalent to:

\[
\text{basic_string_view}<\text{charT}, \text{traits} s = \ast \text{this}, \sv = t; \\
\text{return } s.G(\sv, \pos);
\]

Remarks: The expression inside noexcept is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

20.3.2.7.3 basic_string::substr

basic_string substr(size_type pos = 0, size_type n = npos) const;

Effects: out_of_range if pos > size().

Returns: basic_string(data()+pos, rlen).

20.3.2.7.4 basic_string::compare

template<class T>
int compare(const T& t) const noexcept(see below);

Constraints:

(1.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(1.2) — is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to: return basic_string_view<charT, traits>(*this).compare(t);

Remarks: The expression inside noexcept is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

template<class T>
int compare(size_type pos1, size_type n1, const T& t) const;

Constraints:

(4.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2) — is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);

template<class T>
int compare(size_type pos1, size_type n1, const basic_string& str) const;

Effects: Equivalent to: return compare(basic_string_view<charT, traits>(str));

int compare(size_type pos1, size_type n1, const basic_string& str) const;

Effects: Equivalent to: return compare(pos1, n1, basic_string_view<charT, traits>(str));

int compare(size_type pos1, size_type n1, const basic_string& str,
size_type pos2, size_type n2 = npos) const;

Effects: Equivalent to:

return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);
int compare(const charT* s) const;

11  Effects: Equivalent to: return compare(basic_string_view<charT, traits>(s));

int compare(size_type pos, size_type n1, const charT* s) const;

12  Effects: Equivalent to: return compare(pos, n1, basic_string_view<charT, traits>(s));

int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;

13  Effects: Equivalent to: return compare(pos, n1, basic_string_view<charT, traits>(s, n2));

20.3.2.7.5 basic_string::starts_with

bool starts_with(basic_string_view<charT, traits> x) const noexcept;
bool starts_with(charT x) const noexcept;
bool starts_with(const charT* x) const;

1  Effects: Equivalent to:
   return basic_string_view<charT, traits>((data(), size()).starts_with(x);

20.3.2.7.6 basic_string::ends_with

bool ends_with(basic_string_view<charT, traits> x) const noexcept;
bool ends_with(charT x) const noexcept;
bool ends_with(const charT* x) const;

1  Effects: Equivalent to:
   return basic_string_view<charT, traits>((data(), size()).ends_with(x);

20.3.3 Non-member functions

20.3.3.1 operator+

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
          const basic_string<charT, traits, Allocator>& rhs);

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
          const charT* rhs);

1  Effects: Equivalent to:
   basic_string<charT, traits, Allocator> r = lhs;
   r.append(rhs);
   return r;

template<class charT, class traits, class Allocator>
basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,

 r.push_back(rhs);
 return r;

 template<class charT, class traits, class Allocator>
 basic_string<charT, traits, Allocator>
 operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);

 Effects: Equivalent to:
 lhs.push_back(rhs);
 return std::move(lhs);
\end{verbatim}

\textbf{20.3.3.2 Non-member comparison functions} [\textit{string.cmp}]

\begin{verbatim}
 template<class charT, class traits, class Allocator>
 bool operator==(const basic_string<charT, traits, Allocator>& lhs,
                 const basic_string<charT, traits, Allocator>& rhs) noexcept;

 template<class charT, class traits, class Allocator>
 bool operator==(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
\end{verbatim}
template<class charT, class traits, class Allocator>
bool operator==(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
bool operator!=(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs) noexcept;

template<class charT, class traits, class Allocator>
bool operator!=(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);

template<class charT, class traits, class Allocator>
bool operator!=(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

template<class charT, class traits, class Allocator>
bool operator< (const basic_string<charT, traits, Allocator>& lhs, const basic_string<charT, traits, Allocator>& rhs) noexcept;

template<class charT, class traits, class Allocator>
bool operator< (const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);

template<class charT, class traits, class Allocator>
bool operator< (const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

Effects: Let op be the operator. Equivalent to:

return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);  

20.3.3.3 swap

template<class charT, class traits, class Allocator>
void swap(basic_string<charT, traits, Allocator>& lhs, basic_string<charT, traits, Allocator>& rhs) noexcept(noexcept(lhs.swap(rhs)));

Effects: Equivalent to lhs.swap(rhs).

20.3.3.4 Inserters and extractors

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&& is, basic_string<charT, traits, Allocator>&& str);

Effects: Behaves as a formatted input function (28.7.4.2.1). After constructing a sentry object, if the sentry converts to true, calls str.erase() and then extracts characters from is and appends them to str as if by calling str.append(1, c). If is.width() is greater than zero, the maximum number n of characters appended is is.width(); otherwise n is str.max_size(). Characters are extracted and appended until any of the following occurs:
(1.1) — n characters are stored;
(1.2) — end-of-file occurs on the input sequence;
(1.3) — isspace(c, is.getloc()) is true for the next available input character c.

2 After the last character (if any) is extracted, is.width(0) is called and the sentry object is destroyed.
3 If the function extracts no characters, it calls is.setstate(ios::failbit), which may throw ios_base::failure (28.5.5.4).

Returns: is.

template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
const basic_string<charT, traits, Allocator>& str);

Effects: Equivalent to: return os << basic_string_view<charT, traits>(str);

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
basic_string<charT, traits, Allocator>& str,
charT delim);

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
basic_string<charT, traits, Allocator>& str,
charT delim);

Effects: Behaves as an unformatted input function (28.7.4.3), except that it does not affect the value returned by subsequent calls to basic_istream<>::gcount(). After constructing a sentry object, if the sentry converts to true, calls str.erase() and then extracts characters from is and appends them to str as if by calling str.append(1, c) until any of the following occurs:

(6.1) — end-of-file occurs on the input sequence (in which case, the getline function calls is.setstate(ios_base::eofbit)).
(6.2) — traits::eq(c, delim) for the next available input character c (in which case, c is extracted but not appended) (28.5.5.4)
(6.3) — str.max_size() characters are stored (in which case, the function calls is.setstate(ios_base::failbit)) (28.5.5.4)

The conditions are tested in the order shown. In any case, after the last character is extracted, the sentry object is destroyed.

7 If the function extracts no characters, it calls is.setstate(ios_base::failbit) which may throw ios_base::failure (28.5.5.4).

Returns: is.

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
basic_string<charT, traits, Allocator>& str,
charT delim);

Returns: getline(is, str, is.widen(‘\n’)).

20.3.3.5 Erasure [string.erasurer]

template <class charT, class traits, class Allocator, class U>
void erase(basic_string<charT, traits, Allocator>& c, const U& value);

Effects: Equivalent to: c.erase(remove(c.begin(), c.end(), value), c.end());
template <class charT, class traits, class Allocator, class Predicate>
void erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);

Effects: Equivalent to: c.erase(remove_if(c.begin(), c.end(), pred), c.end());

### 20.3.4 Numeric conversions

```c
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

Effects: The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base), strtoll(str.c_str(), ptr, base), and stoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

`Throws`: invalid_argument if `strtol`, `strtoul`, `strtoll`, or `stoull` reports that no conversion could be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `stoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```c
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stold(const string& str, size_t* idx = nullptr);
```

Effects: These functions call `strtof(str.c_str(), ptr), strtod(str.c_str(), ptr), and strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != 0`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

`Throws`: invalid_argument if `strtof`, `strtod`, or `strtold` reports that no conversion could be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```c
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);
```

Returns: Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of "%d", "%u", "%ld", "%lu", "%lld", "%llu", "%f", "%F", or "%Lf", respectively, where `buf` designates an internal character buffer of sufficient size.

```c
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

Effects: The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base), wcstoll(str.c_str(), ptr, base), and wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store
at *idx. If the function does not throw an exception and idx != 0, the function stores in *idx the index of the first unconverted element of str.

Returns: The converted result.

Throws: invalid_argument if wcstol, wcstoul, wcstoll, or wcstoull reports that no conversion could be performed. Throws out_of_range if the converted value is outside the range of representable values for the return type.

float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);

Effects: These functions call wcstof(str.c_str(), ptr), wcstod(str.c_str(), ptr), and wcstold(str.c_str(), ptr), respectively. Each function returns the converted result, if any. The argument ptr designates a pointer to an object internal to the function that is used to determine what to store at *idx. If the function does not throw an exception and idx != 0, the function stores in *idx the index of the first unconverted element of str.

Returns: The converted result.

Throws: invalid_argument if wcstof, wcstod, or wcstold reports that no conversion could be performed. Throws out_of_range if wcstof, wcstod, or wcstold sets errno to ERANGE.

wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);

Returns: Each function returns a wstring object holding the character representation of the value of its argument that would be generated by calling swprintf(buf, buffsz, fmt, val) with a format specifier of L"%d", L"%u", L"%ld", L"%lu", L"%lld", L"%llu", L"%lf", L"%llu", or L"%Lf", respectively, where buf designates an internal character buffer of sufficient size buffsz.

20.3.5 Hash support

```
template<> struct hash<string>;
template<> struct hash<u8string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;
template<> struct hash<wstring>;
template<> struct hash<pmr::string>;
template<> struct hash<pmr::u8string>;
template<> struct hash<pmr::u16string>;
template<> struct hash<pmr::u32string>;
template<> struct hash<pmr::wstring>;
```

If $S$ is one of these string types, $SV$ is the corresponding string view type, and $s$ is an object of type $S$, then hash<$S>()($s) == hash<$SV>()($SV($s)).

20.3.6 Suffix for basic_string literals

```
string operator"s(const char* str, size_t len);
Returns: string{str, len}.
u8string operator"s(const char8_t* str, size_t len);
Returns: u8string{str, len}.
u16string operator"s(const char16_t* str, size_t len);
Returns: u16string{str, len}.
```

§ 20.3.6
u32string operator"s(const char32_t* str, size_t len);
4  Returns: u32string{str, len}.

wstring operator"s(const wchar_t* str, size_t len);
5  Returns: wstring{str, len}.
6  [Note: The same suffix is used for chrono:duration literals denoting seconds but there is no conflict,
since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end
note]

20.4  String view classes  
1  The class template basic_string_view describes an object that can refer to a constant contiguous sequence
of char-like (20.1) objects with the first element of the sequence at position zero. In the rest of this subclause,
the type of the char-like objects held in a basic_string_view object is designated by charT.
2  [Note: The library provides implicit conversions from const charT* and std::basic_string<charT,
...> to std::basic_string_view<charT, ...> so that user code can accept just std::basic_string_view
as a non-templated parameter wherever a sequence of characters is expected. User-defined types should define
their own implicit conversions to std::basic_string_view in order to interoperate with these functions. — end
note]

20.4.1  Header <string_view> synopsis

namespace std {
  // 20.4.2, class template basic_string_view
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view;

  // 20.4.3, non-member comparison functions
  template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> x,
                             basic_string_view<charT, traits> y) noexcept;
  template<class charT, class traits>
  constexpr bool operator!=(basic_string_view<charT, traits> x,
                             basic_string_view<charT, traits> y) noexcept;
  template<class charT, class traits>

    operator<<(basic_ostream<charT, traits>& os,
                basic_string_view<charT, traits> str);

  // basic_string_view typedef names
  using string_view  = basic_string_view<char>;
  using u8string_view = basic_string_view<char8_t>;
  using u16string_view = basic_string_view<char16_t>;
  using u32string_view = basic_string_view<char32_t>;
  using wstring_view  = basic_string_view<wchar_t>;

§ 20.4.1  720
// 20.4.5, hash support
template<class T> struct hash;
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;

inline namespace literals {
inline namespace string_view_literals {
constexpr string_view operator"sv(const char* str, size_t len) noexcept;
constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;
constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;
constexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;
constexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;
}
}

The function templates defined in 19.2.2 and 22.7 are available when <string_view> is included.

20.4.2 Class template basic_string_view

```cpp
template<class charT, class traits = char_traits<charT>>
class basic_string_view { public:
    // types
    using traits_type = traits;
    using value_type = charT;
    using pointer = value_type*;
    using const_pointer = const value_type*;
    using reference = value_type&;
    using const_reference = const value_type&;
    using const_iterator = implementation-defined; // see 20.4.2.2
    using iterator = const_iterator;
    using const_reverse_iterator = reverse_iterator<const_iterator>;
    using reverse_iterator = const_reverse_iterator;
    using size_type = size_t;
    using difference_type = ptrdiff_t;
    static constexpr size_type npos = size_type(-1);

    // 20.4.2.1, construction and assignment
    constexpr basic_string_view() noexcept;
    constexpr basic_string_view(const basic_string_view&) noexcept = default;
    constexpr basic_string_view(const charT* str);
    constexpr basic_string_view(const charT* str, size_type len);

    // 20.4.2.2, iterator support
    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr const_iterator cbegin() const noexcept;
    constexpr const_iterator cend() const noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr const_reverse_iterator rend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;

    friend constexpr const_iterator begin(basic_string_view sv) noexcept { return sv.begin(); }
    friend constexpr const_iterator end(basic_string_view sv) noexcept { return sv.end(); }
}
```

226) Because basic_string_view refers to a constant sequence, iterator and const_iterator are the same type.

private:
    const_pointer data_; // exposition only
    size_type size_;      // exposition only
};

1 In every specialization basic_string_view<charT, traits>, the type traits shall satisfy the character traits requirements (20.2). [Note: The program is ill-formed if traits::char_type is not the same type as charT. —end note]

2 The type iterator satisfies the constexpr iterator requirements (22.3.1).

3 The complexity of basic_string_view member functions is \(O(1)\) unless otherwise specified.

### 20.4.2.1 Construction and assignment

```cpp
constexpr basic_string_view() noexcept;
```

1 Effects: Constructs an empty basic_string_view.

2 Ensures: size_ == 0 and data_ == nullptr.

```cpp
constexpr basic_string_view(const charT* str);
```

3 Expects: \([\text{str}, \text{str} + \text{traits::length}(	ext{str}))\] is a valid range.

4 Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with traits::length(str).

5 Complexity: \(O(\text{traits::length}(	ext{str}))\).

```cpp
constexpr basic_string_view(const charT* str, size_type len);
```

6 Expects: \([\text{str}, \text{str} + \text{len})\] is a valid range.

7 Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.

### 20.4.2.2 Iterator support

```cpp
using const_iterator = implementation-defined;
```

1 A type that meets the requirements of a constant Cpp17RandomAccessIterator (22.3.5.6) and models ContiguousIterator (22.3.4.14), whose value_type is the template parameter charT.

2 For a basic_string_view str, any operation that invalidates a pointer in the range \([\text{str.data()}, \text{str.data()} + \text{str.size()}]\) invalidates pointers, iterators, and references returned from str's member functions.

3 All requirements on container iterators (21.2) apply to basic_string_view::const_iterator as well.

```cpp
constexpr const_iterator begin() const noexcept;
```

4 Returns: An iterator such that

\[(4.1)\] if \(!\text{empty()}, \text{addressof}(*\text{begin()}) == \text{data_}\],

\[(4.2)\] otherwise, an unspecified value such that \([\text{begin()}, \text{end()}]\) is a valid range.

```cpp
constexpr const_iterator cbegin() const noexcept;
```

5 Returns: begin() + size().

```cpp
constexpr const_reverse_iterator rbegin() const noexcept;
```

6 Returns: const_reverse_iterator(end()).

```cpp
constexpr const_reverse_iterator crbegin() const noexcept;
```

```cpp
constexpr const_reverse_iterator rend() const noexcept;
```

§ 20.4.2.2
constexpr const_reverse_iterator crend() const noexcept;

Returns: const_reverse_iterator(begin()).

20.4.2.3 Capacity

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

Returns: size_.

constexpr size_type max_size() const noexcept;

Returns: The largest possible number of char-like objects that can be referred to by a basic_string_view.
[[nodiscard]] constexpr bool empty() const noexcept;

Returns: size_ == 0.

20.4.2.4 Element access

constexpr const_reference operator[](size_type pos) const;

Expects: pos < size().
Returns: data_[pos].
Throws: Nothing.

[Note: Unlike basic_string::operator[], basic_string_view::operator[](size()) has undefined behavior instead of returning charT(). — end note]

constexpr const_reference at(size_type pos) const;

Throws: out_of_range if pos >= size().
Returns: data_[pos].

constexpr const_reference front() const;

Expects: !empty().
Returns: data_[0].
Throws: Nothing.

constexpr const_reference back() const;

Expects: !empty().
Returns: data_[size() - 1].
Throws: Nothing.

constexpr const_pointer data() const noexcept;

Returns: data_.

[Note: Unlike basic_string::data() and string literals, data() may return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a function that takes just a const charT* and expects a null-terminated string. — end note]

20.4.2.5 Modifiers

constexpr void remove_prefix(size_type n);

Expects: n <= size().
Effects: Equivalent to: data_ += n; size_ -= n;

constexpr void remove_suffix(size_type n);

Expects: n <= size().
Effects: Equivalent to: size_ -= n;
constexpr void swap(basic_string_view & s) noexcept;

Effects: Exchanges the values of this and s.

20.4.2.6 String operations [string.view.ops]

constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;

1 Let rlen be the smaller of n and size() - pos.
2 Throws: out_of_range if pos > size().
3 Expects: [s, s + rlen) is a valid range.
4 Effects: Equivalent to traits::copy(s, data() + pos, rlen).
5 Returns: rlen.
6 Complexity: $O(rlen)$.

constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;

7 Let rlen be the smaller of n and size() - pos.
8 Throws: out_of_range if pos > size().
9 Effects: Determines rlen, the effective length of the string to reference.
10 Returns: basic_string_view(data() + pos, rlen).

constexpr int compare(basic_string_view str) const noexcept;

11 Let rlen be the smaller of size() and str.size().
12 Effects: Determines rlen, the effective length of the strings to compare. The function then compares
13 the two strings by calling traits::compare(data(), str.data(), rlen).
14 Complexity: $O(rlen)$.
15 Returns: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as
16 indicated in Table 59.

Table 59 — compare() results

<table>
<thead>
<tr>
<th>Condition</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>size() &lt; str.size()</td>
<td>&lt; 0</td>
</tr>
<tr>
<td>size() == str.size()</td>
<td>0</td>
</tr>
<tr>
<td>size() &gt; str.size()</td>
<td>&gt; 0</td>
</tr>
</tbody>
</table>

constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;

15 Effects: Equivalent to: return substr(pos1, n1).compare(str);

constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
size_type pos2, size_type n2) const;

16 Effects: Equivalent to: return substr(pos1, n1).compare(str.substr(pos2, n2));

constexpr int compare(const charT* s) const;

17 Effects: Equivalent to: return compare(basic_string_view(s));

constexpr int compare(size_type pos1, size_type n1, const charT* s) const;

18 Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s));

constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;

19 Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s, n2));

constexpr bool starts_with(basic_string_view x) const noexcept;

20 Effects: Equivalent to: return compare(0, npos, x) == 0;
constexpr bool starts_with(charT x) const noexcept;
  
  Effects: Equivalent to: return starts_with(basic_string_view(addressof(x), 1));

constexpr bool starts_with(const charT* x) const;
  
  Effects: Equivalent to: return starts_with(basic_string_view(x));

constexpr bool ends_with(basic_string_view x) const noexcept;
  
  Effects: Equivalent to:
  
  return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;

constexpr bool ends_with(charT x) const noexcept;
  
  Effects: Equivalent to: return ends_with(basic_string_view(addressof(x), 1));

constexpr bool ends_with(const charT* x) const;
  
  Effects: Equivalent to: return ends_with(basic_string_view(x));

20.4.2.7 Searching

Member functions in this subclause have complexity $O(size() \times str.size())$ at worst, although implementations should do better.

Let $F$ be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

— Each member function of the form
  
  constexpr return-type $F$(const charT* s, size_type pos) const;

has effects equivalent to: return $F$(basic_string_view(s), pos);

— Each member function of the form
  
  constexpr return-type $F$(const charT* s, size_type pos, size_type n) const;

has effects equivalent to: return $F$(basic_string_view(s, n), pos);

— Each member function of the form
  
  constexpr return-type $F$(charT c, size_type pos) const noexcept;

has effects equivalent to: return $F$(basic_string_view(addressof(c), 1), pos);

constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;

Let $xpos$ be the lowest position, if possible, such that the following conditions hold:

— $pos <= xpos$
— $xpos + str.size() <= size()$
— traits::eq(at($xpos + I$), str.at(I)) for all elements $I$ of the string referenced by $str$.

Effects: Determines $xpos$.

Returns: $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns npos.

constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;

Let $xpos$ be the highest position, if possible, such that the following conditions hold:

— $xpos <= pos$
— $xpos + str.size() <= size()$
— traits::eq(at($xpos + I$), str.at(I)) for all elements $I$ of the string referenced by $str$.

Effects: Determines $xpos$.

Returns: $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns npos.

constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;

Let $xpos$ be the lowest position, if possible, such that the following conditions hold:

— $pos <= xpos$
— $xpos < size()$
— traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```cpp
constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;
```

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```cpp
constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;
```

Let xpos be the lowest position, if possible, such that the following conditions hold:

- pos <= xpos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

```cpp
constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;
```

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

### 20.4.3 Non-member comparison functions [string.view.comparison]

Let S be `basic_string_view<charT, traits>`, and sv be an instance of S. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object t with an implicit conversion to S can be compared according to Table 60.

Table 60 — Additional `basic_string_view` comparison overloads

<table>
<thead>
<tr>
<th>Expression</th>
<th>Equivalent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>t == sv</td>
<td>S(t) == sv</td>
</tr>
<tr>
<td>sv == t</td>
<td>sv == S(t)</td>
</tr>
<tr>
<td>t != sv</td>
<td>S(t) != sv</td>
</tr>
<tr>
<td>sv != t</td>
<td>sv != S(t)</td>
</tr>
<tr>
<td>t &lt; sv</td>
<td>S(t) &lt; sv</td>
</tr>
<tr>
<td>sv &lt; t</td>
<td>sv &lt; S(t)</td>
</tr>
<tr>
<td>t &gt; sv</td>
<td>S(t) &gt; sv</td>
</tr>
<tr>
<td>sv &gt; t</td>
<td>sv &gt; S(t)</td>
</tr>
<tr>
<td>t &lt;= sv</td>
<td>S(t) &lt;= sv</td>
</tr>
<tr>
<td>sv &lt;= t</td>
<td>sv &lt;= S(t)</td>
</tr>
<tr>
<td>t &gt;= sv</td>
<td>S(t) &gt;= sv</td>
</tr>
<tr>
<td>sv &gt;= t</td>
<td>sv &gt;= S(t)</td>
</tr>
</tbody>
</table>

[Example: A sample conforming implementation for `operator==` would be:]
template<class charT, class traits>
constexpr bool operator===(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                        type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

template<class charT, class traits>
constexpr bool operator==(type_identity_t<basic_string_view<charT, traits>> lhs,
                        basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

—end example

template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) == 0.

template<class charT, class traits>
constexpr bool operator!=(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) != 0.

template<class charT, class traits>
constexpr bool operator<(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) < 0.

template<class charT, class traits>
constexpr bool operator>(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) > 0.

template<class charT, class traits>
constexpr bool operator<=(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) <= 0.

template<class charT, class traits>
constexpr bool operator>=(basic_string_view<charT, traits> lhs,
                        basic_string_view<charT, traits> rhs) noexcept;

Returns: lhs.compare(rhs) >= 0.

20.4.4 Inserters and extractors

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<<basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);

Effects: Behaves as a formatted output function (28.7.5.2.1) of os. Forms a character sequence seq,
initially consisting of the elements defined by the range [str.begin(), str.end()). Determines
padding for seq as described in 28.7.5.2.1. Then inserts seq as if by calling os.rdbuf()->sputn(seq,
n), where n is the larger of os.width() and str.size(); then calls os.width(0).

Returns: os

20.4.5 Hash support

template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;

1 The specialization is enabled (19.14.18). [Note: The hash value of a string view object is equal to the hash value of the corresponding string object (20.3.5). — end note]

20.4.6 Suffix for basic_string_view literals

20.5 Null-terminated sequence utilities

20.5.1 Header <cctype> synopsis

namespace std {
    int isalnum(int c);
    int isalpha(int c);
    int isblank(int c);
    int iscntrl(int c);
    int isdigit(int c);
    int isgraph(int c);
    int islower(int c);
    int isprint(int c);
    int ispunct(int c);
    int isspace(int c);
    int isupper(int c);
    int isxdigit(int c);
    int tolower(int c);
    int toupper(int c);
}

1 The contents and meaning of the header <cctype> are the same as the C standard library header <ctype.h>. See also: ISO C 7.4

20.5.2 Header <cwctype> synopsis

namespace std {
    using wint_t = see below;
    using wctrans_t = see below;
    using wctype_t = see below;

    int iswalnum(wint_t wc);
    int iswalpha(wint_t wc);
    int iswblank(wint_t wc);
    int iswcntrl(wint_t wc);
    int iswdigit(wint_t wc);
    int iswgraph(wint_t wc);
    int iswlower(wint_t wc);
    int iswprint(wint_t wc);
    int iswpunct(wint_t wc);
    int iswupper(wint_t wc);
}
int iswspace(wint_t wc);
int iswupper(wint_t wc);
int iswxdigit(wint_t wc);
int iswctype(wint_t wc, wctype_t desc);
wctype_t wctype(const char* property);
wint_t towlower(wint_t wc);
wint_t towupper(wint_t wc);
wint_t towctrans(wint_t wc, wctrans_t desc);
wctrans_t wctrans(const char* property);
}

#define WEOF see below

1 The contents and meaning of the header <cwctype> are the same as the C standard library header <wctype.h>.
See also: ISO C 7.30

20.5.3 Header <cstring> synopsis
namespace std { [cstring.syn]
       using size_t = see 16.2.4;

       void* memcpy(void* s1, const void* s2, size_t n);
       void* memmove(void* s1, const void* s2, size_t n);
       char* strcpy(char* s1, const char* s2);
       char* strncpy(char* s1, const char* s2, size_t n);
       char* strcat(char* s1, const char* s2);
       char* strcoll(const char* s1, const char* s2);
       int memcmp(const void* s1, const void* s2, size_t n);
       void* memchr(const void* s, int c, size_t n);
       const void* memchr(void* s, int c, size_t n);
       const char* strchr(const char* s, int c);
       char* strchr(char* s, int c);
       size_t strcspn(const char* s1, const char* s2);
       const char* strpbrk(const char* s1, const char* s2);
       char* strpbrk(char* s1, const char* s2);
       const char* strrchr(const char* s, int c);
       char* strrchr(char* s, int c);
       size_t strspn(const char* s1, const char* s2);
       const char* strstr(const char* s1, const char* s2);
       char* strstr(char* s1, const char* s2);
       char* strtok(char* s1, const char* s2);
       void* memset(void* s, int c, size_t n);
       char* strerror(int errnum);
       size_t strlen(const char* s);
}

#define NULL see 16.2.3
1 The contents and meaning of the header <cstring> are the same as the C standard library header <string.h>.
2 The functions strerror and strtok are not required to avoid data races (15.5.5.9).
3 The functions memcpy and memmove are signal-safe (16.12.4).
4 [Note: The functions strchr, strpbrk, strrchr, strstr, and memchr, have different signatures in this
document, but they have the same behavior as in the C standard library (15.2). — end note]

    size_t mbtowc(const char* s, wchar_t* wcs, size_t n, mbstate_t* ps);
    size_t mbstowcs(const char** src, wchar_t* wdst, size_t len, mbstate_t* ps);
    size_t wcstombs(const wchar_t* src, char* wdst, size_t len, mbstate_t* ps);
}

1 The contents and meaning of the header <uchar> are the same as the C standard library header <uchar.h>, except that it declares the additional mbtowc and mbstowcs functions and does not declare types char16_t nor char32_t.

See also: ISO C 7.28

20.5.6 Multibyte / wide string and character conversion functions
[ mb.wcs]

1 [Note: The headers <cstdlib> (16.2.2), <cuchar> (20.5.5), and <uchar> (20.5.4) declare the functions described in this subclause. —end note]

int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(const char* s, wchar_t* wdst, size_t len);
size_t wcstombs(const wchar_t* src, char* wdst, size_t len);

2 Effects: These functions have the semantics specified in the C standard library.

See also: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

int mbtowc(const char* s, wchar_t* wcs, size_t n);
int wcstombs(const wchar_t* src, char* wdst, size_t len);

3 Effects: These functions have the semantics specified in the C standard library.

Remarks: Calls to these functions may introduce a data race (15.5.5.9) with other calls to the same function.

See also: ISO C 7.22.7

size_t mblen(const char* s, size_t n, mbstate_t* ps);
size_t mbtowc(const char* s, wchar_t* wcs, size_t n, mbstate_t* ps);
size_t wcstombs(const wchar_t* src, char* wdst, size_t len, mbstate_t* ps);
size_t mbstowcs(const char** src, wchar_t* wdst, size_t len, mbstate_t* ps);

§ 20.5.6 732
size_t wcstombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);

Effects: These functions have the semantics specified in the C standard library.

Remarks: Calling these functions with an mbstate_t* argument that is a null pointer value may introduce a data race (15.5.5.9) with other calls to the same function with an mbstate_t* argument that is a null pointer value.

See also: ISO C 7.29.6.3

size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to mbrtoc8(nullptr, "", 1, ps). Otherwise, the function inspects at most n bytes beginning with the byte pointed to by s to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if pc8 is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by pc8. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000, the resulting state described is the initial conversion state.

Returns: The first of the following that applies (given the current conversion state):

(8.1) — 0, if the next n or fewer bytes complete the multibyte character that corresponds to the U+0000 Unicode character (which is the value stored).

(8.2) — between 1 and n inclusive, if the next n or fewer bytes complete a valid multibyte character (which is the value stored); the value returned is the number of bytes that complete the multibyte character.

(8.3) — (size_t)(-3), if the next character resulting from a previous call has been stored (no bytes from the input have been consumed by this call).

(8.4) — (size_t)(-2), if the next n bytes contribute to an incomplete (but potentially valid) multibyte character, and all n bytes have been processed (no value is stored).

(8.5) — (size_t)(-1), if an encoding error occurs, in which case the next n or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro EILSEQ is stored in errno, and the conversion state is unspecified.

size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to c8rtomb(buf, u8'\0', ps) where buf is an internal buffer. Otherwise, if c8 completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by s. At most MB_CUR_MAX bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

Returns: The number of bytes stored in the array object (including any shift sequences). If c8 does not contribute to a sequence of char8_t corresponding to a valid multibyte character, the value of the macro EILSEQ is stored in errno, (size_t) (-1) is returned, and the conversion state is unspecified.

Remarks: Calls to c8rtomb with a null pointer argument for s may introduce a data race (15.5.5.9) with other calls to c8rtomb with a null pointer argument for s.
21 Containers library

21.1 General

This Clause describes components that C++ programs may use to organize collections of information.

The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 61.

21.2 Container requirements

21.2.1 General container requirements

Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects. [Example: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — end example]

For the components affected by this subclause that declare an `allocator_type`, objects stored in these components shall be constructed using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroyed using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy` (19.10.9.2), where `U` is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container’s element type, not for internal types used by the container. [Note: This means, for example, that a node-based container might need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — end note]

In Tables 62, 63, and 64 `X` denotes a container class containing objects of type `T`, `a` and `b` denote values of type `X`, `u` denotes an identifier, `r` denotes a non-const value of type `X`, and `rv` denotes a non-const rvalue of type `X`.

<td>constant</td>
</tr>
</tbody>
</table>

Those entries marked “(Note A)” or “(Note B)” have linear complexity for array and have constant complexity for all other standard containers. [Note: The algorithm `equal()` is defined in Clause 24. — end note]

5 The member function `size()` returns the number of elements in the container. The number of elements is defined by the rules of constructors, inserts, and erases.

6 `begin()` returns an iterator referring to the first element in the container. `end()` returns an iterator which is the past-the-end value for the container. If the container is empty, then `begin()` == `end()`.

7 In the expressions
   
   i == j
   i != j
   i < j
   i <= j
   i >= j
   i > j
   i - j

where i and j denote objects of a container’s `iterator` type, either or both may be replaced by an object of the container’s `const_iterator` type referring to the same element with no change in semantics.

8 Unless otherwise specified, all containers defined in this clause obtain memory using an allocator (see 15.5.3.5). [Note: In particular, containers and iterators do not store references to allocated elements other than through the allocator’s pointer type, i.e., as objects of type P or `pointer_traits<P>::template rebind<unspecified>`, where P is `allocator_traits<allocator_type>::pointer`. — end note] Copy constructors for these container types obtain an allocator by calling `allocator_traits<allocator_type>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument. [Note: If an invocation of a
constructor uses the default value of an optional allocator argument, then the allocator type must support
value-initialization. — end note] A copy of this allocator is used for any memory allocation and element
construction performed, by these constructors and by all member functions, during the lifetime of each
container object or until the allocator is replaced. The allocator may be replaced only via assignment or
\swap(). Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator
only if allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value, allocator_traits<allocator_type>::propagate_on_container_move_assignment::value, or allocator_traits<allocator_type>::propagate_on_container_swap::value is true within the implementation
of the corresponding container operation. In all container types defined in this Clause, the member
\get_allocator() returns a copy of the allocator used to construct the container or, if that allocator has
been replaced, a copy of the most recent replacement.

The expression a\swap(b), for containers a and b of a standard container type other than \texttt{array}, shall
exchange the values of a and b without invoking any move, copy, or swap operations on the individual container
elements. Lvalues of any \texttt{Compare}, \texttt{Pred}, or \texttt{Hash} types belonging to a and b shall be swappable and shall be
exchanged by calling \texttt{swap} as described in 15.5.3.2. If allocator_traits<allocator_type>::propagate_on_container_swap::value is true, then lvalues of type allocator_type shall be swappable and the allocators of a and b shall also be exchanged by calling \texttt{swap} as described in 15.5.3.2. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless a.\get_allocator() == b.\get_allocator(). Every iterator referring to an element in one container before the swap shall refer to the same
element in the other container after the swap. It is unspecified whether an iterator with value a.end() before
the swap will have value b.end() after the swap.

If the iterator type of a container belongs to the bidirectional or random access iterator categories (22.3), the
container is called reversible and satisfies the additional requirements in Table 63.

</tbody>
</table>

11 Unless otherwise specified (see 21.2.6.1, 21.2.7.1, 21.3.8.4, and 21.3.11.5) all container types defined in this
Clause meet the following additional requirements:

(11.1) — if an exception is thrown by an \texttt{insert()} or \texttt{emplace()} function while inserting a single element, that
function has no effects.

(11.2) — if an exception is thrown by a \texttt{push_back()}, \texttt{push_front()}, \texttt{emplace_back()}, or \texttt{emplace_front()} function, that function has no effects.

(11.3) — no \texttt{erase()}, \texttt{clear()}, \texttt{pop_back()} or \texttt{pop_front()} function throws an exception.

(11.4) — no copy constructor or assignment operator of a returned iterator throws an exception.

(11.5) — no \texttt{swap()} function throws an exception.

§ 21.2.1
— no `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped. [Note: The `end()` iterator does not refer to any element, so it may be invalidated. — end note]

12 Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

13 A contiguous container is a container whose member types `iterator` and `const_iterator` meet the Cpp17RandomAccessIterator requirements (22.3.5.6) and model `ContiguousIterator` (22.3.4.14).

14 Table 64 lists operations that are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics described in Table 64 unless otherwise stated. If the iterators passed to `lexicographical_compare` satisfy the constexpr iterator requirements (22.3.1) then the operations described in Table 64 are implemented by constexpr functions.

Table 64 — Optional container operations

</tr>
</tbody>
</table>

[Note: The algorithm `lexicographical_compare()` is defined in Clause 24. — end note]

15 All of the containers defined in this Clause and in 20.3.2 except `array` meet the additional requirements of an allocator-aware container, as described in Table 65.

Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type (possibly `const`) `T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

(15.1) — `T` is Cpp17DefaultInsertable into `X` means that the following expression is well-formed:

`allocator_traits<A>::construct(m, p)`

(15.2) — An element of `X` is default-inserted if it is initialized by evaluation of the expression

`allocator_traits<A>::construct(m, p)`

where `p` is the address of the uninitialized storage for the element allocated within `X`.

(15.3) — `T` is Cpp17MoveInsertable into `X` means that the following expression is well-formed:

`allocator_traits<A>::construct(m, p, rv)`

and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation. [Note: `rv` remains a valid object. Its state is unspecified — end note]

(15.4) — `T` is Cpp17CopyInsertable into `X` means that, in addition to `T` being Cpp17MoveInsertable into `X`, the following expression is well-formed:

`allocator_traits<A>::construct(m, p, v)`

and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

§ 21.2.1
— T is Cpp17EmplaceConstructible into X from args, for zero or more arguments args, means that the following expression is well-formed:

```
allocator_traits<A>::construct(m, p, args)
```

(15.6) — T is Cpp17Erasable from X means that the following expression is well-formed:

```
allocator_traits<A>::destroy(m, p)
```

[Note: A container calls allocator_traits<A>::construct(m, p, args) to construct an element at p using args, with m == get_allocator(). The default construct in allocator will call ::new((void*)p) T(args), but specialized allocators may choose a different definition. — end note]

In Table 65, X denotes an allocator-aware container class with a value_type of T using allocator of type A, u denotes a variable, a and b denote non-const lvalues of type X, t denotes an lvalue or a const rvalue of type X, rv denotes a non-const rvalue of type X, and m is a value of type A.

</tbody>
</table>

17 The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type A shall not qualify as an allocator unless it satisfies both of the following conditions:

(17.1) — The qualified-id A::value_type is valid and denotes a type (12.9.2).

(17.2) — The expression declval<A&>().allocate(size_t{}) is well-formed when treated as an unevaluated operand.

21.2.2 Container data races [container.requirements.dataraces]

1 For purposes of avoiding data races (15.5.5.9), implementations shall consider the following functions to be const: begin, end, rbegin, rend, front, back, data, find, lower_bound, upper_bound, equal_range, at and, except in associative or unordered associative containers, operator[].

2 Notwithstanding 15.5.5.9, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting vector<bool>, are modified concurrently.

3 [Note: For a vector<int> x with a size greater than one, x[1] = 5 and *x.begin() = 10 can be executed concurrently without a data race, but x[0] = 5 and *x.begin() = 10 executed concurrently may result in a data race. As an exception to the general rule, for a vector<bool> y, y[0] = true may race with y[1] = true. — end note]

21.2.3 Sequence containers [sequence.reqmts]

1 A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: vector, forward_list, list, and deque. In addition, array is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as stacks or queues, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user might define).

2 [Note: The sequence containers offer the programmer different complexity trade-offs and should be used accordingly. vector is the type of sequence container that should be used by default. array should be used when the container has a fixed size known during translation. list or forward_list should be used when there are frequent insertions and deletions from the middle of the sequence. deque is the data structure of choice when most insertions and deletions take place at the beginning or at the end of the sequence. When choosing a container, remember vector is best; leave a comment to explain if you choose from the rest! — end note]

3 In Tables 66 and 67, X denotes a sequence container class, a denotes a value of type X containing elements of type T, u denotes the name of a variable being declared, A denotes X::allocator_type if the qualified-id
X::allocator_type is valid and denotes a type (12.9.2) and allocator<T> if it doesn’t. i and j denote iterators satisfying input iterator requirements and refer to elements implicitly convertible to value_type. [i, j) denotes a valid range, il designates an object of type initializer_list<value_type>, n denotes a value of type X::size_type, p denotes a valid constant iterator to a, q denotes a valid dereferenceable constant iterator to a, t denotes a valid range of constant iterators in a, and rv denotes a non-const rvalue of X::value_type. Args denotes a template parameter pack; args denotes a function parameter pack with the pattern Args&&. The complexities of the expressions are sequence dependent.

</tr>
</tbody>
</table>

5 The iterator returned from \( \text{a.insert(p, t)} \) points to the copy of \( t \) inserted into a.

6 The iterator returned from \( \text{a.insert(p, rv)} \) points to the copy of \( rv \) inserted into a.
The iterator returned from `a.insert(p, n, t)` points to the copy of the first element inserted into `a`, or `p` if `n == 0`.

The iterator returned from `a.insert(p, i, j)` points to the copy of the first element inserted into `a`, or `p` if `i == j`.

The iterator returned from `a.insert(p, il)` points to the copy of the first element inserted into `a`, or `p` if `il` is empty.

The iterator returned from `aemplace(p, args)` points to the new element constructed from `args` into `a`.

The iterator returned from `a.erase(q)` points to the element immediately following `q` prior to the element being erased. If no such element exists, `a.end()` is returned.

The iterator returned by `a.erase(q1, q2)` points to the element pointed to by `q2` prior to any elements being erased. If no such element exists, `a.end()` is returned.

For every sequence container defined in this Clause and in Clause 20:

(13.1) — If the constructor

```
template<class InputIterator>
X(InputIterator first, InputIterator last,
   const allocator_type& alloc = allocator_type());
```

is called with a type `InputIterator` that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(13.2) — If the member functions of the forms:

```
template<class InputIterator>
return-type F(const_iterator p,
              InputIterator first, InputIterator last); // such as insert
```

```
template<class InputIterator>
return-type F(InputIterator first, InputIterator last); // such as append, assign
```

```
template<class InputIterator>
return-type F(const_iterator i1, const_iterator i2,
              InputIterator first, InputIterator last); // such as replace
```

are called with a type `InputIterator` that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

(13.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.

Table 67 lists operations that are provided for some types of sequence containers but not others. An implementation shall provide these operations for all container types shown in the “container” column, and shall implement them so as to take amortized constant time.

<td>deque, forward_list, list</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Requires: a.empty() shall be false.</td>
<td></td>
</tr>
<tr>
<td>a.pop_back()</td>
<td>void</td>
<td>Destroys the last element.</td>
<td>basic_string, deque, list, vector</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Requires: a.empty() shall be false.</td>
<td></td>
</tr>
<tr>
<td>a[n]</td>
<td>reference; const_reference for constant a</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>((a\text{.begin()} + n))</td>
<td>basic_string, array, deque, vector</td>
</tr>
<tr>
<td>a.at(n)</td>
<td>reference; const_reference for constant a</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>((a\text{.begin()} + n))</td>
<td>basic_string, array, deque, vector</td>
</tr>
</tbody>
</table>

15 The member function `at()` provides bounds-checked access to container elements. `at()` throws `out_of_range` if \(n \geq a\text{.size()}\).

### 21.2.4 Node handles

#### 21.2.4.1 Overview

A node handle is an object that accepts ownership of a single element from an associative container (21.2.6) or an unordered associative container (21.2.7). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 68.

2 If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.
Table 68 — Container types with compatible nodes

3 Class node-handle is for exposition only.
4 If a user-defined specialization of pair exists for pair<const Key, T> or pair<Key, T>, where Key is the container’s key_type and T is the container’s mapped_type, the behavior of operations involving node handles is undefined.

```cpp
template<unspecialized>
class node-handle {
public:
    // These type declarations are described in Tables 69 and 70.
    using value_type = see below;  // not present for map containers
    using key_type = see below;    // not present for set containers
    using mapped_type = see below; // not present for set containers
    using allocator_type = see below;

private:
    using container_node_type = unspecified;
    using ator_traits = allocator_traits<allocator_type>;

    typename ator_traits::rebind_traits<container_node_type>::pointer ptr_;
    optional<allocator_type> alloc_;

public:
    // 21.2.4.2, constructors, copy, and assignment
    constexpr node-handle() noexcept : ptr_(), alloc_() {}
    node-handle(node-handle&&) noexcept;
    node-handle& operator=(node-handle&&);  

    // 21.2.4.3, destructor
    ~node-handle();

    // 21.2.4.4, observers
    value_type& value() const;       // not present for map containers
    key_type& key() const;           // not present for map containers
    mapped_type& mapped() const;    // not present for map containers

    allocator_type get_allocator() const;
    explicit operator bool() const noexcept;
    [[nodiscard]] bool empty() const noexcept;

    // 21.2.4.5, modifiers
    void swap(node-handle&&) noexcept;

    friend void swap(node-handle& x, node-handle& y) noexcept(x.swap(y)) {
        x.swap(y);
    }
};
```
21.2.4.2 Constructors, copy, and assignment

```cpp
node-handle(node-handle&& nh) noexcept;
```

1. **Effects:** Constructs a `node-handle` object initializing `ptr_` with `nh.ptr_`. Move constructs `alloc_` with `nh.alloc_`. Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

```cpp
node-handle operator=(node-handle&& nh);
```

2. **Requires:** Either `!alloc_`, or `ator_traits::propagate_on_container_move_assignment` is true, or `alloc_ == nh.alloc_`.

3. **Effects:**
   1. If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::rebind_traits<container_node_type>::deallocate`.
   2. Assigns `nh.ptr_` to `ptr_`.
   3. If `!alloc_` or `ator_traits::propagate_on_container_move_assignment` is true, move assigns `nh.alloc_` to `alloc_`.
   4. Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

4. **Returns:** `*this`.
5. **Throws:** Nothing.

21.2.4.3 Destructor

```cpp
~node-handle();
```

1. **Effects:** If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::rebind_traits<container_node_type>::deallocate`.

21.2.4.4 Observers

```cpp
value_type& value() const;
```

1. **Requires:** `empty() == false`.
2. **Returns:** A reference to the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.
3. **Throws:** Nothing.

```cpp
key_type& key() const;
```

4. **Requires:** `empty() == false`.
5. **Returns:** A non-const reference to the `key_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.
6. **Throws:** Nothing.
7. **Remarks:** Modifying the key through the returned reference is permitted.

```cpp
mapped_type& mapped() const;
```

8. **Requires:** `empty() == false`.
9. **Returns:** A reference to the `mapped_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.
10. **Throws:** Nothing.

```cpp
allocator_type get_allocator() const;
```

11. **Requires:** `empty() == false`.
12. **Returns:** `*alloc_`.
13. **Throws:** Nothing.
explicit operator bool() const noexcept;

Returns: ptr_ != nullptr.

[[nodiscard]] bool empty() const noexcept;

Returns: ptr_ == nullptr.

### 21.2.4.5 Modifiers

```c++
void swap(node-handle& nh)
  noexcept(ator_traits::propagate_on_container_swap::value ||
            ator_traits::is_always_equal::value);
```

**Requires:** !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap is true, or
alloc_ == nh.alloc_.

**Effects:** Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap is true calls swap(alloc_, nh.alloc_).

### 21.2.5 Insert return type

```
template<class Iterator, class NodeType>
struct insert-return-type
{
  Iterator position;
  bool inserted;
  NodeType node;
};
```

The name `insert-return-type` is exposition only. `insert-return-type` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

### 21.2.6 Associative containers

```
Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: set, multiset, map and multimap.
```

Each associative container is parameterized on `Key` and an ordering relation `Compare` that induces a strict weak ordering (24.7) on elements of `Key`. In addition, `map` and `multimap` associate an arbitrary mapped type `T` with the `Key`. The object of type `Compare` is called the `comparison object` of a container.

The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys `k1` and `k2` are considered to be equivalent if for the comparison object `comp`, `comp(k1, k2) == false && comp(k2, k1) == false`. [Note: This is not necessarily the same as the result of `k1 == k2`. — end note] For any two keys `k1` and `k2` in the same container, calling `comp(k1, k2)` shall always return the same value.

An associative container supports `unique keys` if it may contain at most one element for each key. Otherwise, it supports `equivalent keys`. The `set` and `map` classes support unique keys; the `multiset` and `multimap` classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.

`iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type. [Note: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]

The associative containers meet all the requirements of Allocator-aware containers (21.2.1), except that for `map` and `multimap`, the requirements placed on `value_type` in Table 65 apply instead to `key_type`.
and `mapped_type`. [Note: For example, in some cases `key_type` and `mapped_type` are required to be `Cpp17CopyAssignable` even though the associated `value_type`, `pair<const key_type, mapped_type>`, is not `Cpp17CopyAssignable`. — end note]

In Table 69, `X` denotes an associative container class, `a` denotes a value of type `X`, `a2` denotes a value of a type with nodes compatible with type `X` (Table 68), `b` denotes a possibly `const` value of type `X`, `u` denotes the name of a variable being declared, `a_uniq` denotes a value of type `X` when `X` supports unique keys, `a_eq` denotes a value of type `X` when `X` supports multiple keys, `a_tran` denotes a possibly `const` value of type `X` when the qualified-id `X::key_compare::is_transparent` is valid and denotes a type (12.9.2), `i` and `j` satisfy input iterator requirements and refer to elements implicitly convertible to `value_type`, `[i, j)` denotes a valid range, `p` denotes a valid constant iterator to `a`, `q` denotes a valid dereferenceable constant iterator to `a`, `r` denotes a valid dereferenceable iterator to `a`. `(q1, q2)` denotes a valid range of constant iterators in `a`, `il` designates an object of type `initializer_list<value_type>`, `t` denotes a value of type `X::value_type`, `k` denotes a value of type `X::key_type` and `c` denotes a possibly `const` value of type `X::key_compare`; `kl` is a value such that `a` is partitioned (24.7) with respect to `c(r, kl)`, with `r` the key value of `e` and `e` in `a`; `ku` is a value such that `a` is partitioned with respect to `!c(ku, r)`; `ke` is a value such that `a` is partitioned with respect to `c(r, ke)` and `!c(ke, r)`, with `c(r, ke)` implying `!c(ke, r)`.

A denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise, `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`.

</tr>
</tbody>
</table>

9 The `insert` and `emplace` members shall not affect the validity of iterators and references to the container, and the `erase` members shall invalidate only iterators and references to the erased elements.

10 The `extract` members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is undefined behavior. References and pointers to an element obtained while it is owned by a `node_type` are invalidated if the element is successfully inserted.

11 The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators `i` and `j` such that distance from `i` to `j` is positive, the following condition holds:

   \[ \text{value_comp}(*j, *i) = \text{false} \]

12 For associative containers with unique keys the stronger condition holds:

   \[ \text{value_comp}(*i, *j) \neq \text{false} \]

13 When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, either through a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.
The member function templates `find`, `count`, `contains`, `lower_bound`, `upper_bound`, and `equal_range` shall not participate in overload resolution unless the qualified-id `Compare::is_transparent` is valid and denotes a type (12.9.2).

A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

1. It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
2. It has an `Allocator` template parameter and a type that does not qualify as an allocator is deduced for that parameter.
3. It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

### 21.2.6.1 Exception safety guarantees

For associative containers, no `clear()` function throws an exception. The `erase(k)` does not throw an exception unless that exception is thrown by the container’s `Compare` object (if any).

For associative containers, if an exception is thrown by any operation from within an `insert` or `emplace` function inserting a single element, the insertion has no effect.

For associative containers, no `swap` function throws an exception unless that exception is thrown by the swap of the container’s `Compare` object (if any).

### 21.2.7 Unordered associative containers

Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: `unordered_set`, `unordered_map`, `unordered_multiset`, and `unordered_multimap`.

Unordered associative containers conform to the requirements for Containers (21.2), except that the expressions `a == b` and `a != b` have different semantics than for the other container types.

Each unordered associative container is parameterized by `Key`, by a function object type `Hash` that meets the `Cpp17Hash` requirements (15.5.3.4) and acts as a hash function for argument values of type `Key`, and by a binary predicate `Pred` that induces an equivalence relation on values of type `Key`. Additionally, `unordered_map` and `unordered_multimap` associate an arbitrary `mapped` type `T` with the `Key`.

The container’s object of type `Hash` — denoted by `hash` — is called the `hash function` of the container. The container’s object of type `Pred` — denoted by `pred` — is called the `key equality predicate` of the container.

Two values `k1` and `k2` are considered equivalent if the container’s key equality predicate `pred(k1, k2)` is valid and returns `true` when passed those values. If `k1` and `k2` are equivalent, the container’s hash function shall return the same value for both. [Note: Thus, when an unordered associative container is instantiated with a non-default `Pred` parameter it usually needs a non-default `Hash` parameter as well. — end note] For any two keys `k1` and `k2` in the same container, calling `pred(k1, k2)` shall always return the same value. For any key `k` in a container, calling `hash(k)` shall always return the same value.

An unordered associative container supports `unique keys` if it may contain at most one element for each key. Otherwise, it supports `equivalent keys`. `unordered_set` and `unordered_map` support unique keys. `unordered_multiset` and `unordered_multimap` support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into `equivalent-key groups` such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

For `unordered_set` and `unordered_multiset` the value type is the same as the key type. For `unordered_map` and `unordered_multimap` it is `pair<const Key, T>`.

For unordered containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type. [Note: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]
The elements of an unordered associative container are organized into buckets. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For unordered_multiset and unordered_multimap, rehashing preserves the relative ordering of equivalent elements.

The unordered associative containers meet all the requirements of Allocator-aware containers (21.2.1), except that for unordered_map and unordered_multimap, the requirements placed on value_type in Table 65 apply instead to key_type and mapped_type. [Note: For example, key_type and mapped_type are sometimes required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. — end note]

---

12 Two unordered containers `a` and `b` compare equal if `a.size() == b.size()` and, for every equivalent-key group `[Ea1, Ea2)` obtained from `a.equal_range(Ea1)`, there exists an equivalent-key group `[Eb1, Eb2)` obtained from `b.equal_range(Ea1)`, such that `is_permutation(Ea1, Ea2, Eb1, Eb2)` returns `true`. For `unordered_set` and `unordered_map`, the complexity of `operator==` (i.e., the number of calls to the == operator of the `value_type`, to the predicate returned by `key_eq()`, and to the hasher returned by `hash_function()`) is proportional to `N` in the average case and to `N^2` in the worst case, where `N` is `a.size()`. For `unordered_multiset` and `unordered_multimap`, the complexity of `operator==` is proportional to \( \sum E_i^2 \) in the average case and to `N^2` in the worst case, where `N` is `a.size()`, and `E_i` is the size of the `i`th equivalent-key group in `a`. However, if the respective elements of each corresponding pair of equivalent-key groups `Ea_i` and `Eb_i` are arranged in the same order (as is commonly the case, e.g., if `a` and `b` are unmodified copies of the same container), then the average-case complexity for `unordered_multiset` and `unordered_multimap` becomes proportional to `N` (but worst-case complexity remains \( O(N^2) \), e.g., for a pathologically bad hash function). The behavior of a program that uses `operator==` or `operator!=` on unordered containers is undefined unless the `Pred` function object has the same behavior for both containers and the equality comparison function for `Key` is a refinement\(^{227}\) of the partition into equivalent-key groups produced by `Pred`.

13 The iterator types `iterator` and `const_iterator` of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the `key type` and `value type` are the same, both `iterator` and `const_iterator` are constant iterators.

14 The `insert` and `emplace` members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The `erase` members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

15 The `insert` and `emplace` members shall not affect the validity of iterators if \((N+n) \leq z \times B\), where `N` is the number of elements in the container prior to the `insert` operation, `n` is the number of elements inserted, `B` is the container’s bucket count, and `z` is the container’s maximum load factor.

16 The `extract` members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a `node_type` is

\(^{227}\) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.
undefined behavior. References and pointers to an element obtained while it is owned by a node_type are invalid if the element is successfully inserted.

17 If the qualified-id Hash::transparent_key_equal is valid and denotes a type (12.9.2), then the program is ill-formed if either:

(17.1) qualified-id Hash::transparent_key_equal::is_transparent is not valid or does not denote a type, or

(17.2) Pred is a different type than equal_to<Key> or Hash::transparent_key_equal.

The member function templates find, count, equal_range, and contains shall not participate in overload resolution unless the qualified-id Hash::transparent_key_equal is valid and denotes a type (12.9.2).

18 A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

(18.1) It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(18.2) It has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(18.3) It has a Hash template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.

(18.4) It has a Pred template parameter and a type that qualifies as an allocator is deduced for that parameter.

21.2.7.1 Exception safety guarantees [unord.req.except]

1 For unordered associative containers, no clear() function throws an exception. erase(k) does not throw an exception unless that exception is thrown by the container’s Hash or Pred object (if any).

2 For unordered associative containers, if an exception is thrown by any operation other than the container’s hash function from within an insert or emplace function inserting a single element, the insertion has no effect.

3 For unordered associative containers, no swap function throws an exception unless that exception is thrown by the swap of the container’s Hash or Pred object (if any).

4 For unordered associative containers, if an exception is thrown from within a rehash() function other than by the container’s hash function or comparison function, the rehash() function has no effect.

21.3 Sequence containers [sequences]

21.3.1 In general [sequences.general]

1 The headers <array>, <deque>, <forward_list>, <list>, and <vector> define class templates that meet the requirements for sequence containers.

2 The following exposition-only alias template may appear in deduction guides for sequence containers:

```
template<class InputIterator>
using iter_value_type = typename iterator_traits<InputIterator>::value_type;  // exposition only
```

21.3.2 Header <array> synopsis [array.syn]

```cpp
#include <initializer_list>

namespace std {
  // 21.3.7, class template array
  template<class T, size_t N> struct array;

  template<class T, size_t N>
  constexpr bool operator===(const array<T, N>& x, const array<T, N>& y);

  template<class T, size_t N>
  constexpr bool operator!=(const array<T, N>& x, const array<T, N>& y);

  template<class T, size_t N>
  constexpr bool operator< (const array<T, N>& x, const array<T, N>& y);

  template<class T, size_t N>
  constexpr bool operator> (const array<T, N>& x, const array<T, N>& y);
```

21.3.7 Class template array

21.3.7.1 Overview

The header <array> defines a class template for storing fixed-size sequences of objects. An array is a contiguous container (21.2.1). An instance of array<T, N> stores N elements of type T, so that size() == N is an invariant.

An array is an aggregate (9.3.1) that can be list-initialized with up to N elements whose types are convertible to T.

An array satisfies all of the requirements of a container and of a reversible container (21.2), except that a default constructed array object is not empty and that swap does not have constant complexity. An array satisfies some of the requirements of a sequence container (21.2.3). Descriptions are provided here only for operations on array that are not described in one of these tables and for operations where there is additional semantic information.

The types iterator and const_iterator satisfy the constexpr iterator requirements (22.3.1).
namespace std {
    template<class T, size_t N>
    struct array {
        // types
        using value_type = T;
        using pointer = T*;
        using const_pointer = const T*;
        using reference = T&;
        using const_reference = const T&;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        using iterator = implementation-defined; // see 21.2
        using const_iterator = implementation-defined; // see 21.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

        // no explicit construct/copy/destroy for aggregate type
        constexpr void fill(const T& u);
        constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

        // iterators
        constexpr iterator begin() noexcept;
        constexpr const_iterator begin() const noexcept;
        constexpr iterator end() noexcept;
        constexpr const_iterator end() const noexcept;
        constexpr reverse_iterator rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;
        constexpr const_iterator cbegin() const noexcept;
        constexpr const_iterator cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;

        // capacity
        [[nodiscard]] constexpr bool empty() const noexcept;
        constexpr size_type size() const noexcept;
        constexpr size_type max_size() const noexcept;

        // element access
        constexpr reference operator[](size_type n);
        constexpr const_reference operator[](size_type n) const;
        constexpr reference at(size_type n);
        constexpr const_reference at(size_type n) const;
        constexpr reference front();
        constexpr const_reference front() const;
        constexpr reference back();
        constexpr const_reference back() const;

        constexpr T* data() noexcept;
        constexpr const T* data() const noexcept;
    };

    template<class T, class... U>
    array(T, U...) -> array<T, 1 + sizeof...(U)>;
}

21.3.7.2 Constructors, copy, and assignment

1 The conditions for an aggregate (9.3.1) shall be met. Class array relies on the implicitly-declared special
member functions (10.3.4.1, 10.3.6, and 10.3.4.2) to conform to the container requirements table in 21.2. In
addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for `array` require that `T` be `Cpp17MoveConstructible` or `Cpp17MoveAssignable`, respectively.

```cpp
template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;
```

2 Requires: `(is_same_v<T, U> && ...)` is true. Otherwise the program is ill-formed.

21.3.7.3 Member functions

```cpp
constexpr size_type size() const noexcept;
```

1 Returns: `N`.

```cpp
constexpr T* data() noexcept;
cconstexpr const T* data() const noexcept;
```

2 Returns: A pointer such that `[data(), data() + size())` is a valid range. For a non-empty array, `data() == addressof(front())`.

```cpp
constexpr void fill(const T& u);
```

3 Effects: As if by `fill_n(begin(), N, u)`.

```cpp
constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);
```

4 Effects: Equivalent to `swap_ranges(begin(), end(), y.begin())`.

5 [Note: Unlike the `swap` function for other containers, `array::swap` takes linear time, may exit via an exception, and does not cause iterators to become associated with the other container. —end note]

21.3.7.4 Specialized algorithms

```cpp
template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
```

1 Remarks: This function shall not participate in overload resolution unless `N == 0` or `is_swappable_v<T>` is true.

2 Effects: As if by `x.swap(y)`.

3 Complexity: Linear in `N`.

21.3.7.5 Zero-sized arrays

```cpp
array
shall provide support for the special case `N == 0`.
```

2 In the case that `N == 0`, `begin() == end() == unique value. The return value of `data()` is unspecified.

3 The effect of calling `front()` or `back()` for a zero-sized array is undefined.

4 Member function `swap()` shall have a non-throwing exception specification.

21.3.7.6 Tuple interface

```cpp
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };  
tuple_element<I, array<T, N>>::type
```

1 Requires: `I < N`. The program is ill-formed if `I` is out of bounds.

2 Value: The type `T`.

```cpp
template<size_t I, class T, size_t N>
cconstexpr T& get(array<T, N>&& a) noexcept;
ttemplate<size_t I, class T, size_t N>
cconstexpr T&& get(array<T, N>&& a) noexcept;
ttemplate<size_t I, class T, size_t N>
cconstexpr const T& get(const array<T, N>& a) noexcept;
ttemplate<size_t I, class T, size_t N>
cconstexpr const T&& get(const array<T, N>&& a) noexcept;
```

3 Requires: `I < N`. The program is ill-formed if `I` is out of bounds.
Returns: A reference to the $i$th element of $a$, where indexing is zero-based.

21.3.8 Class template `deque`

21.3.8.1 Overview

A `deque` is a sequence container that supports random access iterators (22.3.5.6). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.

A `deque` satisfies all of the requirements of a container, of a reversible container (given in tables in 21.2), of a sequence container, including the optional sequence container requirements (21.2.3), and of an allocator-aware container (Table 65). Descriptions are provided here only for operations on `deque` that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
    template<typename T, class Allocator = allocator<T>>
    class deque {
        public:
            // types
            using value_type = T;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 21.2
            using difference_type = implementation-defined; // see 21.2
            using iterator = implementation-defined; // see 21.2
            using const_iterator = implementation-defined; // see 21.2
            using reverse_iterator = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 21.3.8.2, construct/copy/destroy
            deque() : deque(Allocator()) { }
            explicit deque(const Allocator&); // see 21.3.8.2
            explicit deque(size_type n, const Allocator& = Allocator());
            deque(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
            deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
            deque(const deque& x);
            deque(deque&&);
            deque(const deque&, const Allocator&);
            deque(deque&&, const Allocator&);
            deque(initializer_list<T>, const Allocator& = Allocator());

            ~deque();
            deque& operator=(const deque& x);
            deque& operator=(deque&& x) noexcept;
            deque& operator=(initializer_list<T>);
            template<class InputIterator>
            void assign(InputIterator first, InputIterator last);
            void assign(size_type n, const T& t);
            void assign(initializer_list<T>);
            allocator_type get_allocator() const noexcept;

            // iterators
            iterator begin() noexcept;
            const_iterator begin() const noexcept;
            iterator end() noexcept;
            const_iterator end() const noexcept;
            reverse_iterator rbegin() noexcept;
            const_reverse_iterator rbegin() const noexcept;
            reverse_iterator rend() noexcept;
        }
    }
}```
const_reverse_iterator rend() const noexcept;
const_iterator cbegin() const noexcept;
const_iterator cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// § 21.3.8.3, capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
void resize(size_type sz);
void resize(size_type sz, const T& c);
void shrink_to_fit();

// § 21.3.8.4, modifiers
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter_value_type<InputIterator>>>
deque<InputIterator, Allocator> = allocator<iter_value_type<InputIterator>, Allocator>();

// swap
template<class T, class Allocator>
void swap(deque<T, Allocator>& x, deque<T, Allocator>& y) noexcept(except(x.swap(y)));
21.3.8.2 Constructors, copy, and assignment

explicit deque(const Allocator&);
1
   Effects: Constructs an empty deque, using the specified allocator.
2
   Complexity: Constant.

explicit deque(size_type n, const Allocator& = Allocator());
3
   Effects: Constructs a deque with n default-inserted elements using the specified allocator.
4
   Requires: T shall be Cpp17DefaultInsertable into *this.
5
   Complexity: Linear in n.

deque(size_type n, const T& value, const Allocator& = Allocator());
6
   Effects: Constructs a deque with n copies of value, using the specified allocator.
7
   Requires: T shall be Cpp17CopyInsertable into *this.
8
   Complexity: Linear in n.

template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
9
   Effects: Constructs a deque equal to the range [first, last), using the specified allocator.
10
   Complexity: Linear in distance(first, last).

21.3.8.3 Capacity

void resize(size_type sz);
1
   Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends
2
   sz - size() default-inserted elements to the sequence.
3
   Requires: T shall be Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.

void resize(size_type sz, const T& c);
4
   Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends
5
   sz - size() copies of c to the sequence.
6
   Requires: T shall be Cpp17CopyInsertable into *this.

void shrink_to_fit();
7
   Requires: T shall be Cpp17MoveInsertable into *this.
8
   Effects: shrink_to_fit is a non-binding request to reduce memory use but does not change the
9
   size of the sequence. [Note: The request is non-binding to allow latitude for implementation-specific
10
   optimizations. —end note] If an exception is thrown other than by the move constructor of a
11
   non-Cpp17CopyInsertable T there are no effects.
12
   Complexity: Linear in the size of the sequence.
13
   Remarks: shrink_to_fit invalidates all the references, pointers, and iterators referring to the elements
14
   in the sequence as well as the past-the-end iterator.

21.3.8.4 Modifiers

iterator insert(const_iterator position, const T& x);
1
iterator insert(const_iterator position, T&& x);
2
iterator insert(const_iterator position, size_type n, const T& x);
3
template<class InputIterator>
   iterator insert(const_iterator position,
                  InputIterator first, InputIterator last);
4
template<class... Args>
   iterator insert(const_iterator position, Args&&... args);
5
void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);

1 Effects: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 Remarks: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

3 Complexity: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element either at the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();

4 Effects: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque. [Note: pop_front and pop_back are erase operations. — end note]

5 Complexity: The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

6 Throws: Nothing unless an exception is thrown by the assignment operator of T.

21.3.8.5 Erasure [deque.eraisure]

template <class T, class Allocator, class U>
void erase(deque<T, Allocator>& c, const U& value);

1 Effects: Equivalent to: c.erase(remove(c.begin(), c.end(), value), c.end());

template <class T, class Allocator, class Predicate>
void erase_if(deque<T, Allocator>& c, Predicate pred);

2 Effects: Equivalent to: c.erase(remove_if(c.begin(), c.end(), pred), c.end());

21.3.9 Class template forward_list [forwardlist]

21.3.9.1 Overview [forwardlist.overview]

1 A forward_list is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported. [Note: It is intended that forward_list have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — end note]

2 A forward_list satisfies all of the requirements of a container (Table 62), except that the size() member function is not provided and operator== has linear complexity. A forward_list also satisfies all of the requirements for an allocator-aware container (Table 65). In addition, a forward_list provides the assign member functions (Table 66) and several of the optional container requirements (Table 67). Descriptions are provided here only for operations on forward_list that are not described in that table or for operations where there is additional semantic information.

3 [Note: Modifying any list requires access to the element preceding the first element of interest, but in a forward_list there is no constant-time way to access a preceding element. For this reason, ranges that are modified, such as those supplied to erase and splice, must be open at the beginning. — end note]
namespace std {
    template<class T, class Allocator = allocator<T>>
    class forward_list {
    public:
      // types
      using value_type = T;
      using allocator_type = Allocator;
      using pointer = typename allocator_traits<Allocator>::pointer;
      using const_pointer = typename allocator_traits<Allocator>::const_pointer;
      using reference = value_type&;
      using const_reference = const value_type&;
      using size_type = implementation_defined; // see 21.2
      using difference_type = implementation_defined; // see 21.2
      using iterator = implementation_defined; // see 21.2
      using const_iterator = implementation_defined; // see 21.2

      // 21.3.9.2, construct/copy/destroy
      forward_list() : forward_list(Allocator()) { }
      explicit forward_list(const Allocator&);
      explicit forward_list(size_type n, const Allocator& = Allocator());
      forward_list(size_type n, const T& value, const Allocator& = Allocator());
      template<class InputIterator>
      forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
      forward_list(const forward_list& x);
      forward_list(forward_list&& x);
      forward_list(const forward_list& x, const Allocator&);
      forward_list(forward_list&& x, const Allocator&);
      forward_list(initializer_list<T>, const Allocator& = Allocator());
      ~forward_list();
      forward_list& operator=(const forward_list& x);
      forward_list& operator=(forward_list&& x) noexcept(allocator_traits<Allocator>::is_always_equal::value);
      forward_list& operator=(initializer_list<T>);

      // 21.3.9.3, iterators
      iterator before_begin() noexcept;
      const_iterator before_begin() const noexcept;
      iterator begin() noexcept;
      const_iterator begin() const noexcept;
      iterator end() noexcept;
      const_iterator end() const noexcept;
      const_iterator cbegin() const noexcept;
      const_iterator cbefore_begin() const noexcept;
      const_iterator cend() const noexcept;

      // capacity
      [[nodiscard]] bool empty() const noexcept;
      size_type max_size() const noexcept;

      // 21.3.9.4, element access
      reference front();
      const_reference front() const;

      // 21.3.9.5, modifiers
      template<class... Args>
      reference emplace_front(Args&&... args);
      void push_front(const T& x);
      void push_front(T&& x);
      void pop_front();
    }
An incomplete type T may be used when instantiating forward_list if the allocator satisfies the allocator completeness requirements (15.5.3.5.1). T shall be complete before any member of the resulting specialization of forward_list is referenced.

### 21.3.9.2 Constructors, copy, and assignment

```cpp
explicit forward_list(const Allocator&);
```

**Effects:** Constructs an empty forward_list object using the specified allocator.

**Complexity:** Constant.
explicit forward_list(size_type n, const Allocator& = Allocator());

Effects: Constructs a forward_list object with n default-inserted elements using the specified allocator.
Requires: T shall be Cpp17DefaultInsertable into *this.
Complexity: Linear in n.

forward_list(size_type n, const T& value, const Allocator& = Allocator());

Effects: Constructs a forward_list object with n copies of value using the specified allocator.
Requires: T shall be Cpp17CopyInsertable into *this.
Complexity: Linear in n.

template<class InputIterator>
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());

Effects: Constructs a forward_list object equal to the range [first, last).
Complexity: Linear in distance(first, last).

21.3.9.3 Iterators

iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;

Returns: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by begin().
Effects: cbefore_begin() is equivalent to const_cast<forward_list const&>(*this).before_begin().
Remarks: before_begin() == end() shall equal false.

21.3.9.4 Element access

reference front();
const_reference front() const;

Returns: *begin()

21.3.9.5 Modifiers

template<class... Args> reference emplace_front(Args&&... args);

Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...) at the beginning of the list.

void push_front(const T& x);
void push_front(T&& x);

Effects: Inserts a copy of x at the beginning of the list.

void pop_front();

Effects: As if by erase_after(before_begin()).

iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
Effects: Inserts a copy of x after position.
Returns: An iterator pointing to the copy of x.
iterator insert_after(const_iterator position, size_type n, const T& x);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
Effects: Inserts n copies of x after position.
Returns: An iterator pointing to the last inserted copy of x or position if n == 0.

template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
first and last are not iterators in *this.
Effects: Inserts copies of elements in [first, last) after position.
Returns: An iterator pointing to the last inserted element or position if first == last.

iterator insert_after(const_iterator position, initializer_list<T> il);

Effects: insert_after(p, il.begin(), il.end()).
Returns: An iterator pointing to the last inserted element or position if il is empty.

template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...)
after position.
Returns: An iterator pointing to the new object.

iterator erase_after(const_iterator position);

Requires: The iterator following position is dereferenceable.
Effects: Erases the element pointed to by the iterator following position.
Returns: An iterator pointing to the element following the one that was erased, or end() if no such
element exists.
Throws: Nothing.

iterator erase_after(const_iterator position, const_iterator last);

Requires: All iterators in the range (position, last) are dereferenceable.
Effects: Erases the elements in the range (position, last).
Returns: last.
Throws: Nothing.

void resize(size_type sz);

Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list.
Otherwise, inserts sz - distance(begin(), end()) default-inserted elements at the end of the list.
Requires: T shall be Cpp17DefaultInsertable into *this.

void resize(size_type sz, const value_type& c);

Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list.
Otherwise, inserts sz - distance(begin(), end()) copies of c at the end of the list.
Requires: T shall be Cpp17CopyInsertable into *this.

void clear() noexcept;

Effects: Erases all elements in the range [begin(), end()).
Remarks: Does not invalidate past-the-end iterators.
21.3.9.6 Operations

In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall satisfy the corresponding requirements in 24.2. For `merge` and `sort`, the definitions and requirements in 24.7 apply.

```cpp
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
get_allocator() == x.get_allocator(). addressof(x) != this.

Effects: Inserts the contents of x after position, and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: θ(distance(x.begin(), x.end()))
```

```cpp
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
The iterator following i is a dereferenceable iterator in x. get_allocator() == x.get_allocator().

Effects: Inserts the element following i into *this, following position, and removes it from x. The result is unchanged if position == i or position == ++i. Pointers and references to *++i continue to refer to the same element but as a member of *this. Iterators to *++i continue to refer to the same element, but now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: θ(1)
```

```cpp
void splice_after(const_iterator position, forward_list& x,
const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x,
const_iterator first, const_iterator last);

Requires: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
(first, last) is a valid range in x, and all iterators in the range (first, last) are dereferenceable.
position is not an iterator in the range (first, last). get_allocator() == x.get_allocator().

Effects: Inserts elements in the range (first, last) after position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Complexity: θ(distance(first, last))
```

```cpp
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

Effects: Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value (for remove()), pred(*i) is true (for remove_if()). Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the equality comparison or the predicate.

Remarks: Stable (15.5.5.7).

Complexity: Exactly distance(begin(), end()) applications of the corresponding predicate.
```

```cpp
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate pred);

Effects: Erases all but the first element from every consecutive group of equal elements referred to by the iterator i in the range [first + 1, last) for which *i == *(i-1) (for the version with no arguments) or pred(*i, *(i - 1)) (for the version with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.
```

§ 21.3.9.6 782
Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the equality comparison or the predicate.

Complexity: If the range \([\text{first}, \text{last})\) is not empty, exactly \((\text{last} - \text{first}) - 1\) applications of the corresponding predicate, otherwise no applications of the predicate.

```cpp
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);
```

Requires: \(*\text{this}\) and \(x\) are both sorted with respect to the comparator \(\text{operator}<\) (for the first two overloads) or \(\text{comp}\) (for the last two overloads), and \(\text{get_allocator()} == x.\text{get_allocator()}\) is true.

Effects: Merges the two sorted ranges \([\text{begin()}, \text{end()}]\) and \([x.\text{begin()}, x.\text{end()}]\). \(x\) is empty after the merge. If an exception is thrown other than by a comparison there are no effects. Pointers and references to the moved elements of \(x\) now refer to those same elements but as members of \(*\text{this}\). Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \(*\text{this}\), not into \(x\).

Remarks: Stable (15.5.5.7). The behavior is undefined if \(\text{get_allocator()} != x.\text{get_allocator()}\).

Complexity: At most \(\text{distance(\text{begin()}, \text{end()})} + \text{distance(x.\text{begin()}, x.\text{end()})} - 1\) comparisons.

```cpp
void sort();
template<class Compare> void sort(Compare comp);
```

Effects: Sorts the list according to the \(\text{operator}<\) or the \(\text{comp}\) function object. If an exception is thrown, the order of the elements in \(*\text{this}\) is unspecified. Does not affect the validity of iterators and references.

Remarks: Stable (15.5.5.7).

Complexity: Approximately \(N \log N\) comparisons, where \(N\) is \(\text{distance(\text{begin()}, \text{end()})}\).

```cpp
void reverse() noexcept;
```

Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

Complexity: Linear time.

### 21.3.9.7 Erasure

```cpp
template <class T, class Allocator, class U>
void erase(forward_list<T, Allocator>& c, const U& value);
```

Effects: Equivalent to: \(\text{erase_if(c, \&(auto\& elem) return elem == value; )}\);

```cpp
template <class T, class Allocator, class Predicate>
void erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

Effects: Equivalent to: \(c.\text{remove_if(pred)}\);

### 21.3.10 Class template list

#### 21.3.10.1 Overview

A list is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (21.3.11) and deques (21.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

A list satisfies all of the requirements of a container, of a reversible container (given in two tables in 21.2), of a sequence container, including most of the optional sequence container requirements (21.2.3), and of an allocator-aware container (Table 65). The exceptions are the \(\text{operator[]}\) and at member functions, which are not provided. These member functions are only provided by containers whose iterators are random access iterators.

228) These member functions are only provided by containers whose iterators are random access iterators.
namespace std {

template<class T, class Allocator = allocator<T>>
class list {
public:

    // types

    void resize(size_type sz, const T& c); // see 21.2

    // 21.3.10.1 784
}

§ 21.3.10.1 784
// element access
reference front();
const_reference front() const;
reference back();
const_reference back() const;

// 21.3.10.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
void pop_front();
void push_back(const T& x);
void push_back(T&& x);
void pop_back();

template<class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T> il);

iterator erase(const_iterator position);
iterator erase(const_iterator position, const_iterator last);
void swap(list&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;

// 21.3.10.5, list operations
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);
void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);
void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

size_type unique();
template<class BinaryPredicate>
    size_type unique(BinaryPredicate binary_pred);

void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);

void reverse() noexcept;
};

template<class InputIterator, class Allocator = allocator<
    iter_value_type<InputIterator>>>
    list(InputIterator, InputIterator, Allocator = Allocator())
    -> list<
        iter_value_type<InputIterator>, Allocator>;

// swap
template<class T, class Allocator>
    void swap(list<T, Allocator>& x, list<T, Allocator>& y)
        noexcept(noexcept(x.swap(y)));
}
An incomplete type T may be used when instantiating list if the allocator satisfies the allocator completeness requirements (15.5.3.5.1). T shall be complete before any member of the resulting specialization of list is referenced.

21.3.10.2 Constructors, copy, and assignment

```cpp
explicit list(const Allocator&);
```

*Effects:* Constructs an empty list, using the specified allocator.

*Complexity:* Constant.

```cpp
explicit list(size_type n, const Allocator& = Allocator());
```

*Effects:* Constructs a list with n default-inserted elements using the specified allocator.

*Requires:* T shall be `Cpp17DefaultInsertable` into *this.

*Complexity:* Linear in n.

```cpp
list(size_type n, const T& value, const Allocator& = Allocator());
```

*Effects:* Constructs a list with n copies of value, using the specified allocator.

*Requires:* T shall be `Cpp17CopyInsertable` into *this.

*Complexity:* Linear in n.

```cpp
template<class InputIterator>
list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

*Effects:* Constructs a list equal to the range [first, last).

*Complexity:* Linear in distance(first, last).

21.3.10.3 Capacity

```cpp
void resize(size_type sz);
```

*Effects:* If size() < sz, appends sz - size() default-inserted elements to the sequence. If sz <= size(), equivalent to:

```
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

*Requires:* T shall be `Cpp17DefaultInsertable` into *this.

```cpp
void resize(size_type sz, const T& c);
```

*Effects:* As if by:

```
if (sz > size())
    insert(end(), sz-size(), c);
else if (sz < size()) {
    iterator i = begin();
    advance(i, sz);
    erase(i, end());
} else
    // do nothing
```

*Requires:* T shall be `Cpp17CopyInsertable` into *this.

21.3.10.4 Modifiers

```cpp
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T>);
```
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);

void push_front(const T& x);
void push_front(T&& x);
void push_back(const T& x);
void push_back(T&& x);

1 Remarks: Does not affect the validity of iterators and references. If an exception is thrown there are no effects.
2 Complexity: Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);

void pop_front();
void pop_back();
void clear() noexcept;

3 Effects: Invalidates only the iterators and references to the erased elements.
4 Throws: Nothing.
5 Complexity: Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

21.3.10.5 Operations [list.ops]

Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them. In this subclause, arguments for a template parameter named Predicate or BinaryPredicate shall satisfy the corresponding requirements in 24.2. For merge and sort, the definitions and requirements in 24.7 apply.

list provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if get_allocator() != x.get_allocator().

void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);

3 Requires: addressof(x) != this.
4 Effects: Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.
5 Throws: Nothing.
6 Complexity: Constant time.

void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);

7 Requires: i is a valid dereferenceable iterator of x.
8 Effects: Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if position == i or position == ++i. Pointers and references to *i continue to refer to this same element but as a member of *this. Iterators to *i (including i itself) continue to refer to the same element, but now behave as iterators into *this, not into x.
9 Throws: Nothing.
10 Complexity: Constant time.

229) As specified in 15.5.3.5, the requirements in this Clause apply only to lists whose allocators compare equal.
void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

Requires: \([\text{first}, \text{last})\) is a valid range in \(x\). The program has undefined behavior if \(\text{position}\) is an iterator in the range \([\text{first}, \text{last})\).

Effects: Inserts elements in the range \([\text{first}, \text{last})\) before \(\text{position}\) and removes the elements from \(x\). Pointers and references to the moved elements of \(x\) now refer to those same elements but as members of \(*\text{this}\). Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \(*\text{this}\), not into \(x\).

Throws: Nothing.

Complexity: Constant time if \&\(x\) == \&\(*\text{this}\); otherwise, linear time.

size_type remove(const T& value);

template<class Predicate> size_type remove_if(Predicate pred);

Effects: Erases all the elements in the list referred to by a list iterator \(i\) for which the following conditions hold: \(*i\) == \(\text{value}\), \(\text{pred}(\*i) \neq \text{false}\). Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by \(*i\) == \(\text{value}\) or \(\text{pred}(\*i) \neq \text{false}\).

Remarks: Stable \((15.5.5.7)\).

Complexity: Exactly \(\text{size()}\) applications of the corresponding predicate.

size_type unique();

template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

Effects: Erases all but the first element from every consecutive group of equal elements referred to by the iterator \(i\) in the range \([\text{first} + 1, \text{last})\) for which \(*i\) == \(*(i-1)\) (for the version of \(\text{unique}\) with no arguments) or \(\text{pred}(\*i, *(i - 1))\) (for the version of \(\text{unique}\) with a predicate argument) holds. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by \(*i\) == \(*(i-1)\) or \(\text{pred}(\*i, *(i - 1))\)

Complexity: If the range \([\text{first}, \text{last})\) is not empty, exactly \((\text{last} - \text{first}) - 1\) applications of the corresponding predicate, otherwise no applications of the predicate.

void merge(list& x);
void merge(list&& x);

template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);

Requires: Both the list and the argument list shall be sorted with respect to the comparator \(\text{operator<}\) (for the first two overloads) or \(\text{comp}\) (for the last two overloads).

Effects: If \&\(x\) == \&\(*\text{this}\), does nothing; otherwise, merges the two sorted ranges \([\text{begin()}, \text{end}())\) and \([\text{x.begin()}, \text{x.end}())\). The result is a range in which the elements will be sorted in non-decreasing order according to the ordering defined by \(\text{comp}\); that is, for every iterator \(i\), in the range other than the first, the condition \(\text{comp}(\*i, *(i - 1))\) will be \text{false}. Pointers and references to the moved elements of \(x\) now refer to those same elements but as members of \(*\text{this}\). Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \(*\text{this}\), not into \(x\).

Remarks: Stable \((15.5.5.7)\). If \&\(x\) != \&\(*\text{this}\), the range \([\text{x.begin()}, \text{x.end}())\) is empty after the merge. No elements are copied by this operation. The behavior is undefined if \(\text{get_allocator()}\) != \(x\).get_allocator().

Complexity: At most \(\text{size()} + \text{x.size()} - 1\) applications of \(\text{comp}\) if \&\(x\) != \&\(*\text{this}\); otherwise, no applications of \(\text{comp}\) are performed. If an exception is thrown other than by a comparison there are no effects.
void reverse() noexcept;

Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

Complexity: Linear time.

void sort();
template<class Compare> void sort(Compare comp);

Effects: Sorts the list according to the operator< or a Compare function object. If an exception is thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and references.

Remarks: Stable (15.5.5.7).

Complexity: Approximately $N \log N$ comparisons, where $N == \text{size}()$.

### 21.3.10.6 Erasure

```cpp
template <class T, class Allocator, class U>
void erase(list<T, Allocator>& c, const U& value);
```

Effects: Equivalent to:
```cpp
erase_if(c, [&](auto& elem) return elem == value; );
```

```cpp
template <class T, class Allocator, class Predicate>
void erase_if(list<T, Allocator>& c, Predicate pred);
```

Effects: Equivalent to: `c.remove_if(pred);`

### 21.3.11 Class template vector

#### 21.3.11.1 Overview

A vector is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.

A vector satisfies all of the requirements of a container and of a reversible container (given in two tables in 21.2), of a sequence container, including most of the optional sequence container requirements (21.2.3), of an allocator-aware container (Table 65), and, for an element type other than bool, of a contiguous container (21.2.1). The exceptions are the push_front, pop_front, and emplace_front member functions, which are not provided. Descriptions are provided here only for operations on vector that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
        public:
            // types
            using value_type = T;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 21.2
            using difference_type = implementation-defined; // see 21.2
            using iterator = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;

            // 21.3.11.2, construct/copy/destroy
            vector() noexcept(noexcept(Allocator())) : vector(Allocator()) {}
            explicit vector(const Allocator&) noexcept;
            explicit vector(size_type n, const Allocator& = Allocator());
            vector(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>
            vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
```
vector(const vector& x);
vector(vector&&) noexcept;
vector(const vector&, const Allocator&);
vector(vector&, const Allocator&);
vector(initializer_list<T>, const Allocator& = Allocator());
~vector();

iterator insert(const_iterator position, T& x);
iterator insert(const_iterator position, size_type n, const T& x);

template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<T> il);
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);

void swap(vector&)
    noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
             allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;

};

template<class InputIterator, class Allocator = allocator<
    iter-value-type<InputIterator>>> vector(InputIterator, InputIterator, Allocator = Allocator())
  -> vector<
    iter-value-type<InputIterator>, Allocator>;

// swap
template<class T, class Allocator>
void swap(vector<T, Allocator>& x, vector<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));

An incomplete type T may be used when instantiating vector if the allocator satisfies the allocator completeness requirements (15.5.3.5.1). T shall be complete before any member of the resulting specialization of vector is referenced.

21.3.11.2 Constructors, copy, and assignment

explicit vector(const Allocator&) noexcept;

1 Effects: Constructs an empty vector, using the specified allocator.
2 Complexity: Constant.

explicit vector(size_type n, const Allocator& = Allocator());

3 Effects: Constructs a vector with n default-inserted elements using the specified allocator.
4 Requires: T shall be Cpp17DefaultInsertable into *this.
5 Complexity: Linear in n.

vector(size_type n, const T& value,
        const Allocator& = Allocator());

6 Effects: Constructs a vector with n copies of value, using the specified allocator.
7 Requires: T shall be Cpp17CopyInsertable into *this.
8 Complexity: Linear in n.

template<class InputIterator>
vector(InputIterator first, InputIterator last,
       const Allocator& = Allocator());

9 Effects: Constructs a vector equal to the range [first, last), using the specified allocator.
10 Complexity: Makes only N calls to the copy constructor of T (where N is the distance between first and last) and no reallocations if iterators first and last are of forward, bidirectional, or random access categories. It makes order N calls to the copy constructor of T and order log N reallocations if they are just input iterators.

21.3.11.3 Capacity

size_type capacity() const noexcept;

1 Returns: The total number of elements that the vector can hold without requiring reallocation.
2 Complexity: Constant time.
void reserve(size_type n);

Requires: T shall be Cpp17MoveInsertable into *this.

Effects: A directive that informs a vector of a planned change in size, so that it can manage the storage allocation accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve(). If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable type, there are no effects.

Complexity: It does not change the size of the sequence and takes at most linear time in the size of the sequence.

Throws: length_error if n > max_size().

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. After a call to reserve() until the time when an insertion would make the size of the vector greater than the value of capacity().

void shrink_to_fit();

Requires: T shall be Cpp17MoveInsertable into *this.

Effects: shrink_to_fit is a non-binding request to reduce capacity() to size(). [Note: The request is non-binding to allow latitude for implementation-specific optimizations. — end note] It does not increase capacity(), but may reduce capacity() by causing reallocation. If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T there are no effects.

Complexity: Linear in the size of the sequence.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator. If no reallocation happens, they remain valid.

void swap(vector&amp; x)
    noexcept(algorithm_traits<Allocator>::propagate_on_container_swap::value ||
              algorithm_traits<Allocator>::is_always_equal::value);

Effects: Exchanges the contents and capacity() of *this with that of x.

Complexity: Constant time.

void resize(size_type sz);

Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

Requires: T shall be Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T there are no effects.

void resize(size_type sz, const T&amp; c);

Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

Requires: T shall be Cpp17CopyInsertable into *this.

Remarks: If an exception is thrown there are no effects.

21.3.11.4 Data

T* data() noexcept;
const T* data() const noexcept;

Returns: A pointer such that [data(), data() + size()) is a valid range. For a non-empty vector, data() == addressof(front()).

Complexity: Constant time.

230) reserve() uses Allocator::allocate() which may throw an appropriate exception.
### 21.3.11.5 Modifiers

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator insert(const_iterator position, const T&amp; x);</td>
<td>insert element at specified position</td>
</tr>
<tr>
<td>iterator insert(const_iterator position, T&amp;&amp; x);</td>
<td>insert element by move reference</td>
</tr>
<tr>
<td>iterator insert(const_iterator position, size_type n, const T&amp; x);</td>
<td>insert n elements at specified position</td>
</tr>
<tr>
<td>template&lt;class InputIterator&gt; iterator insert(const_iterator position, InputIterator first, InputIterator last);</td>
<td>insert elements from range specified by iterators</td>
</tr>
<tr>
<td>template&lt;class... Args&gt; reference emplace_back(Args&amp;&amp;... args);</td>
<td>insert element at end of vector</td>
</tr>
<tr>
<td>template&lt;class... Args&gt; iterator emplace(const_iterator position, Args&amp;&amp;... args);</td>
<td>insert element at specified position</td>
</tr>
<tr>
<td>void push_back(const T&amp; x);</td>
<td>add element at end of vector</td>
</tr>
<tr>
<td>void push_back(T&amp;&amp; x);</td>
<td>add element by move reference</td>
</tr>
</tbody>
</table>

**Remarks:**
- Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. If no reallocation happens, all the iterators and references before the insertion point remain valid. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T or by any InputIterator operation there are no effects. If an exception is thrown while inserting a single element at the end and T is Cpp17CopyInsertable or is_nothrow_move_constructible_v<T> is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

**Complexity:** The complexity is linear in the number of elements inserted plus the distance to the end of the vector.

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>iterator erase(const_iterator position);</td>
<td>erase element at specified position</td>
</tr>
<tr>
<td>iterator erase(const_iterator first, const_iterator last);</td>
<td>erase elements from range specified by iterators</td>
</tr>
<tr>
<td>void pop_back();</td>
<td>remove last element</td>
</tr>
</tbody>
</table>

**Effects:** Invalidate iterators and references at or after the point of the erase.

**Complexity:** The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.

**Throws:** Nothing unless an exception is thrown by the assignment operator or move assignment operator of T.

### 21.3.11.6 Erasure

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template &lt;class T, class Allocator, class U&gt; void erase(vector&lt;T, Allocator&gt;&amp; c, const U&amp; value);</td>
<td>erase all elements equal to value</td>
</tr>
<tr>
<td>template &lt;class T, class Allocator, class Predicate&gt; void erase_if(vector&lt;T, Allocator&gt;&amp; c, Predicate pred);</td>
<td>erase elements for which predicate is true</td>
</tr>
</tbody>
</table>

**Effects:** Equivalent to: c.erase(remove(c.begin(), c.end(), value), c.end());
Equivalent to: c.erase(remove_if(c.begin(), c.end(), pred), c.end());

### 21.3.12 Class vector<bool>

To optimize space allocation, a specialization of vector for bool elements is provided:

```cpp
namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
    public:
        // types
        using value_type = bool;
        using allocator_type = Allocator;
        using pointer = implementation-defined;
        using const_pointer = implementation-defined;
        using const_reference = bool;
        using size_type = implementation-defined; // see 21.2
        using difference_type = implementation-defined; // see 21.2
        using iterator = implementation-defined; // see 21.2
        using const_iterator = implementation-defined; // see 21.2
    }
}
```

§ 21.3.12
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// bit reference
class reference {
    friend class vector;
    reference() noexcept;
public:
    reference(const reference&) = default;
    ~reference();
    operator bool() const noexcept;
    reference& operator=(const bool x) noexcept;
    reference& operator=(const reference& x) noexcept;
    void flip() noexcept; // flips the bit
};

// construct/copy/destroy
vector() : vector(Allocator()) { }
explicit vector(const Allocator&);
vector(size_type n, const Allocator& = Allocator());
template<class InputIterator>
    vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
vector(const vector& x);
vector(vector& x);
vector(const vector& x, const Allocator&);
vector(const vector&, const Allocator&);
vector(initializer_list<bool>, const Allocator& = Allocator());
    ~vector();
    vector& operator=(const vector& x);
    vector& operator=(vector&& x);
    void assign(InputIterator first, InputIterator last);
    void assign(size_type n, const bool& t);
    void assign(initializer_list<bool>);
    allocator_type get_allocator() const noexcept;

// iterators
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;
reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_iterator cbegin() const noexcept;
const_iterator cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
size_type capacity() const noexcept;
void resize(size_type sz, bool c = false);
void reserve(size_type n);
void shrink_to_fit();

// element access
reference operator[](size_type n);
const_reference operator[](size_type n) const;
const_reference at(size_type n) const;
reference at(size_type n);
reference front();
const_reference front() const;
reference back();
const_reference back() const;

// modifiers
template<class... Args> reference emplace_back(Args&&... args);
void push_back(const bool& x);
void pop_back();
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
iterator insert(const_iterator position, const bool& x);
iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<bool> il);
iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(vector&);
static void swap(reference x, reference y) noexcept;
void flip() noexcept; // flips all bits
void clear() noexcept;
};

2 Unless described below, all operations have the same requirements and semantics as the primary vector template, except that operations dealing with the bool value type map to bit values in the container storage and allocator_traits::construct (19.10.9.2) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of bool values. A space-optimized representation of bits is recommended instead.

4 reference is a class that simulates the behavior of references of a single bit in vector<bool>. The conversion function returns true when the bit is set, and false otherwise. The assignment operator sets the bit when the argument is (convertible to) true and clears it otherwise. flip reverses the state of the bit.

void flip() noexcept;

5 Effects: Replaces each element in the container with its complement.

static void swap(reference x, reference y) noexcept;

6 Effects: Exchanges the contents of x and y as if by:
    bool b = x;
    x = y;
    y = b;

    template<class Allocator> struct hash<vector<bool, Allocator>>;

7 The specialization is enabled (19.14.18).

21.4 Associative containers [associative]

21.4.1 In general [associative.general]

1 The header <map> defines the class templates map and multimap; the header <set> defines the class templates set and multiset.

2 The following exposition-only alias templates may appear in deduction guides for associative containers:

    template<class InputIterator>
        using iter_value_type = typename iterator_traits<InputIterator>::value_type; // exposition only
    template<class InputIterator>
        using iter_key_type = remove_const_t<typename iterator_traits<InputIterator>::value_type::first_type>; // exposition only

§ 21.4.1
template<class InputIterator>
using iter-mapped-type =
typename iterator_traits<InputIterator>::value_type::second_type;  // exposition only

template<class InputIterator>
using iter-to-alloc-type = pair<
  add_const_t<typename iterator_traits<InputIterator>::value_type::first_type>,
typename iterator_traits<InputIterator>::value_type::second_type>;  // exposition only

21.4.2 Header <map> synopsis

#include <initializer_list>

namespace std {
  // 21.4.4, class template map
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>
    class map;
  template<class Key, class T, class Compare, class Allocator>
    bool operator==(const map<Key, T, Compare, Allocator>& x,
                   const map<Key, T, Compare, Allocator>& y);
  template<class Key, class T, class Compare, class Allocator>
    bool operator!=(const map<Key, T, Compare, Allocator>& x,
                   const map<Key, T, Compare, Allocator>& y);
  template<class Key, class T, class Compare, class Allocator>

}

21.4.4 Class template map

21.4.4.1 Overview

A map is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. The map class supports bidirectional iterators.

A map satisfies all of the requirements of a container, of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). A map also provides most operations described in 21.2.6 for unique keys. This means that a map supports the \texttt{a\_uniq} operations in 21.2.6 but not the \texttt{a\_eq} operations. For a map<\texttt{Key},T> the \texttt{key\_type} is Key and the \texttt{value\_type} is pair<const Key, T>. Descriptions are provided here only for operations on map that are not described in one of those tables or for operations where there is additional semantic information.

namespace std {
    template<class Key, class T, class Compare = less<Key>,
    class Allocator = allocator<pair<const Key, T>>>
    class map {
        public:
            // types
        using key_type = Key;
        using mapped_type = T;
        using value_type = pair<const Key, T>;
        using key_compare = Compare;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;

21.4.4.2 Constructors, copy, and assignment [map.cons]

explicit map(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty map using the specified comparison object and allocator.
Complexity: Constant.

```cpp
template<class InputIterator>
map(InputIterator first, InputIterator last,
    const Compare& comp = Compare(), const Allocator& = Allocator());
```

Effects: Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`. Complexity: Linear in $N$ if the range `[first, last)` is already sorted using `comp` and otherwise $N \log N$, where $N$ is `last - first`.

### 21.4.4.3 Element access

[mmap.access]

```cpp
mapped_type& operator[](const key_type& x);
```

Effects: Equivalent to: `return try_emplace(x).first->second;`

```cpp
mapped_type& operator[](key_type&& x);
```

Effects: Equivalent to: `return try_emplace(move(x)).first->second;`

```cpp
mapped_type& at(const key_type& x);
```

Returns: A reference to the mapped_type corresponding to `x` in this.

Throws: An exception object of type `out_of_range` if no such element is present.

Complexity: Logarithmic.

### 21.4.4.4 Modifiers

[mmap.modifiers]

```cpp
template<class P>
pair<iterator, bool> insert(P&& x);
```

```cpp
template<class P>
iterator insert(const_iterator position, P&& x);
```

Effects: The first form is equivalent to `return emplace(std::forward<P>(x));`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x));`.

Remarks: These signatures shall not participate in overload resolution unless `is_constructible_v<value_type, P&&>` is true.

```cpp
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```

```cpp
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

Requires: `value_type` shall be `Cpp17EmplaceConstructible` into `map` from `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

Effects: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(k)`, `forward_as_tuple(std::forward<Args>(args)...)`.

Returns: In the first overload, the bool component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```cpp
template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
```

```cpp
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

Requires: `value_type` shall be `Cpp17EmplaceConstructible` into `map` from `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.

Effects: If the map already contains an element whose key is equivalent to `k`, there is no effect. Otherwise inserts an object of type `value_type` constructed with `piecewise_construct`, `forward_as_tuple(std::move(k))`, `forward_as_tuple(std::forward<Args>(args)...)`.
Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to $k$.

Complexity: The same as emplace and emplace_hint, respectively.

```cpp
template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
```

```
requires: is_assignable_v<mapped_type&, M&&> shall be true. value_type shall be Cpp17Emplace-Constructible into map from $k$, forward<M>(obj).
```

Effects: If the map already contains an element $e$ whose key is equivalent to $k$, assigns std::forward<M>(obj) to $e$. Otherwise inserts an object of type value_type constructed with $k$, std::forward<M>(obj).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to $k$.

Complexity: The same as emplace and emplace_hint, respectively.

```cpp
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
```

```
requires: is_assignable_v<mapped_type&, M&&> shall be true. value_type shall be Cpp17Emplace-Constructible into map from move($k$), forward<M>(obj).
```

Effects: If the map already contains an element $e$ whose key is equivalent to $k$, assigns std::forward<M>(obj) to $e$. Otherwise inserts an object of type value_type constructed with std::move($k$), std::forward<M>(obj).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to $k$.

Complexity: The same as emplace and emplace_hint, respectively.

### 21.4.4.5 Erasure

Erasure

```cpp
template <class Key, class T, class Compare, class Allocator, class Predicate>
void erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

Effects: Equivalent to:

```cpp
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

### 21.4.5 Class template multimap

#### 21.4.5.1 Overview

A multimap is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type $T$ based on the keys. The multimap class supports bidirectional iterators.

A multimap satisfies all of the requirements of a container and of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). A multimap also provides most operations described in 21.2.6 for equal keys. This means that a multimap supports the a_eq operations in 21.2.6 but not the a_uniq operations. For a multimap<Key, T> the key_type is Key and the value_type is pair<const Key, T>. Descriptions are provided here only for operations on multimap that are not described in one of those tables or for operations where there is additional semantic information.
namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class multimap {

21.4.5.2 Constructors

explicit multimap(const Compare& comp, const Allocator& = Allocator());

1 Effects: Constructs an empty multimap using the specified comparison object and allocator.

2 Complexity: Constant.

template<class InputIterator>
multimap(InputIterator first, InputIterator last,
const Compare& comp = Compare(),
const Allocator& = Allocator());

3 Effects: Constructs an empty multimap using the specified comparison object and allocator, and inserts
elements from the range [first, last).
4 \textit{Complexity:} Linear in $N$ if the range $[\text{first}, \text{last})$ is already sorted using $\text{comp}$ and otherwise $N \log N$, where $N$ is $\text{last} - \text{first}$. \hfill{[multimap.modifiers]}

21.4.5.3 Modifiers \hfill{[multimap.modifiers]}

\texttt{template<class P> iterator insert(P&& x);} \\
\texttt{template<class P> iterator insert(const_iterator position, P&& x);} \\
\begin{enumerate}[1] 
\item Effects: The first form is equivalent to return \texttt{emplace(std::forward<P>(x))}. The second form is equivalent to return \texttt{emplace_hint(position, std::forward<P>(x))}. \hfill{[multimap.modifiers]}
\item Remarks: These signatures shall not participate in overload resolution unless \texttt{is_constructible_-v<value_type, P&&> is true}. \hfill{[multimap.modifiers]}
\end{enumerate}

21.4.5.4 Erasure \hfill{[multimap.easrasure]}

\texttt{template <class Key, class T, class Compare, class Allocator, class Predicate>} \\
\texttt{void erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);} \\
\begin{enumerate}[1] 
\item Effects: Equivalent to: 
\texttt{for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
\}} \hfill{[multimap.easrasure]}
\end{enumerate}

21.4.6 Class template set \hfill{[set]}

21.4.6.1 Overview \hfill{[set.overview]}

1 A \texttt{set} is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The \texttt{set} class supports bidirectional iterators. \hfill{[set.overview]}

2 A \texttt{set} satisfies all of the requirements of a container, of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). A \texttt{set} also provides most operations described in 21.2.6 for unique keys. This means that a \texttt{set} supports the \texttt{a\_uniq} operations in 21.2.6 but not the \texttt{a\_eq} operations. For a \texttt{set<Key>} both the \texttt{key\_type} and \texttt{value\_type} are \texttt{Key}. Descriptions are provided here only for operations on \texttt{set} that are not described in one of these tables and for operations where there is additional semantic information.

### [set.cons]

**explicit set(const Compare& comp, const Allocator& = Allocator());**

*Effects:* Constructs an empty set using the specified comparison objects and allocator.

*Complexity:* Constant.

**template<class InputIterator>**

```
sset(InputIterator first, InputIterator last, const Compare& comp = Compare(), const Allocator& = Allocator());
```

*Effects:* Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range \([\text{first}, \text{last})\).

*Complexity:* Linear in \(N\) if the range \([\text{first}, \text{last})\) is already sorted using \(\text{comp}\) and otherwise \(N \log N\), where \(N = \text{last} - \text{first}\).

### 21.4.6.3 Erasure

**template <class Key, class Compare, class Allocator, class Predicate>**

```
void erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

*Effects:* Equivalent to:

```
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
```

### 21.4.7 Class template multiset

#### 21.4.7.1 Overview

**multiset**

A **multiset** is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The **multiset** class supports bidirectional iterators.

A **multiset** satisfies all of the requirements of a container, of a reversible container (21.2), of an associative container (21.2.6), and of an allocator-aware container (Table 65). **multiset** also provides most operations described in 21.2.6 for duplicate keys. This means that a **multiset** supports the **a_eq** operations in 21.2.6 but not the **a_uniq** operations. For a **multiset** of **Key** both the **key_type** and **value_type** are **Key**. Descriptions are provided here only for operations on **multiset** that are not described in one of these tables and for operations where there is additional semantic information.

```cpp
namespace std {
  template<class Key, class Compare = less<Key>,
           class Allocator = allocator<Key>>
  class multiset {
    public:
      // types
      using key_type = Key;
  }
}  // end namespace std
```

21.4.7.2 Constructors

explicit multiset(const Compare& comp, const Allocator& = Allocator());
1 Effects: Constructs an empty multiset using the specified comparison object and allocator.
2 Complexity: Constant.

template<class InputIterator>
multiset(InputIterator first, InputIterator last, Compare, Allocator& = Allocator());
3 Effects: Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range [first, last).
4 Complexity: Linear in \(N\) if the range [first, last) is already sorted using \(\text{comp}\) and otherwise \(N \log N\), where \(N = \text{last} - \text{first}\).

21.4.7.3 Erasure

template <class Key, class Compare, class Allocator, class Predicate>
void erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);
1 Effects: Equivalent to:
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}

21.5 Unordered associative containers

21.5.1 In general

The header <unordered_map> defines the class templates unordered_map and unordered_multimap; the header <unordered_set> defines the class templates unordered_set and unordered_multiset.
The exposition-only alias templates \textit{iter-value-type}, \textit{iter-key-type}, \textit{iter-mapped-type}, and \textit{iter-to-alloc-type} defined in 21.4.1 may appear in deduction guides for unordered containers.

21.5.2 Header <unordered_map> synopsis

```cpp
#include <initializer_list>

namespace std {
    // 21.5.4, class template unordered_map
template<class Key, class T, class Hash = hash<Key>,
    class Pred = equal_to<Key>,
    class Alloc = allocator<pair<const Key, T>>>
    class unordered_map;

    // 21.5.5, class template unordered_multimap
template<class Key, class T, class Hash = hash<Key>,
    class Pred = equal_to<Key>,
    class Alloc = allocator<pair<const Key, T>>>
    class unordered_multimap;

    template<class Key, class T, class Hash, class Pred, class Alloc>
    bool operator==(const unordered_map<Key, T, Hash, Pred, Alloc>& a,
        const unordered_map<Key, T, Hash, Pred, Alloc>& b);

    template<class Key, class T, class Hash, class Pred, class Alloc>
    bool operator!=(const unordered_map<Key, T, Hash, Pred, Alloc>& a,
        const unordered_map<Key, T, Hash, Pred, Alloc>& b);

    template<class Key, class T, class Hash, class Pred, class Alloc>
    void swap(unordered_map<Key, T, Hash, Pred, Alloc>& x,
        unordered_map<Key, T, Hash, Pred, Alloc>& y)
        noexcept(noexcept(x.swap(y)));

    template<class Key, class T, class Hash, class Pred, class Alloc>
    void erase_if(unordered_map<Key, T, Hash, Pred, Alloc>& c, Predicate pred);

    template<class Key, class T, class Hash, class Pred, class Alloc>
    void erase_if(unordered_multimap<Key, T, Hash, Pred, Alloc>& c, Predicate pred);

    namespace pmr {
        template<class Key, class T, class Hash = hash<Key>,
            class Pred = equal_to<Key>>
            using unordered_map =

21.5.4 Class template unordered_map

21.5.4.1 Overview

An unordered_map is an unordered associative container that supports unique keys (an unordered_map contains at most one of each key value) and that associates values of another type mapped_type with the keys. The unordered_map class supports forward iterators.

An unordered_map satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_map supports the a_uniq operations in that table, not the a_eq operations. For an unordered_map<Key, T> the key type is Key, the mapped type is T, and the value type is pair<const Key, T>.

This subclause only describes operations on unordered_map that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key, 
    class T, 
    class Hash = hash<Key>, 
    class Pred = equal_to<Key>, 
    class Allocator = allocator<pair<const Key, T>>>
    class unordered_map {
    public:
        // types
        using key_type = Key;
        using mapped_type = T;
        using value_type = pair<const Key, T>;

        Allocator>;

template<class InputIterator, class Allocator>
    unordered_map<InputIterator, InputIterator, typename
        see below::size_type, Hash, Allocator)
    -> unordered_map<
        iter-key-type<
            InputIterator>,
        iter-mapped-type<
            InputIterator>,
        Hash,
        equal_to<
            iter-key-type<
                InputIterator>>,
        Allocator>;

§ 21.5.4.1
template<class Key, class T, class Allocator>
unordered_map(initializer_list<pair<Key, T>>, typename
see below::size_type,Allocator)
-> unordered_map<Key, T, hash<Key>, equal_to<Key>, Allocator>;

template<class Key, class T, class Allocator>
unordered_map(initializer_list<pair<Key, T>>, Allocator)
-> unordered_map<Key, T, hash<Key>, equal_to<Key>, Allocator>;

template<class Key, class T, class Hash, class Allocator>
unordered_map(initializer_list<pair<Key, T>>, typename
see below::size_type, Hash,
Allocator)
-> unordered_map<Key, T, Hash, equal_to<Key>, Allocator>;

// swap
template<class Key, class T, class Hash, class Pred, class Alloc>
void swap(unordered_map<Key, T, Hash, Pred, Alloc>& x,
unordered_map<Key, T, Hash, Pred, Alloc>& y)
noexcept(noexcept(x.swap(y)));

A size_type parameter type in an unordered_map deduction guide refers to the size_type member type of the type deduced by the deduction guide.

21.5.4.2 Constructors

unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.

template<class InputIterator>
unordered_map(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

unordered_map(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l) for the first form, or from the range [il.begin(), il.end()) for the second form. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

21.5.4.3 Element access

mapped_type& operator[] (const key_type& k);

Effects: Equivalent to: return try_emplace(k).first->second;

mapped_type& operator[] (key_type& k);

Effects: Equivalent to: return try_emplace(move(k)).first->second;
mapped_type& at(const key_type& k);

const mapped_type& at(const key_type& k) const;

Returns: A reference to x.second, where x is the (unique) element whose key is equivalent to k.

Throws: An exception object of type out_of_range if no such element is present.

21.5.4.4 Modifiers

template<class P>
pair<iterator, bool> insert(P&& obj);

Effects: Equivalent to: return emplace(std::forward<P>(obj));

Remarks: This signature shall not participate in overload resolution unless is_constructible_v<value_type, P&&> is true.

template<class P>
iterator insert(const_iterator hint, P&& obj);

Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

Remarks: This signature shall not participate in overload resolution unless is_constructible_v<value_type, P&&> is true.

template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);

Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.

template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);

Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);

Effects: If the map already contains an element whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with k, std::forward<M>(obj).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.
16  **Complexity:** The same as `emplace` and `emplace_hint`, respectively.

```cpp
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
```

```cpp
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

**Requires:** `is_assignable_v<mapped_type&, M&&>` shall be true. `value_type` shall be `Cpp17Emplace-Constructible` into `unordered_map` from `std::move(k), std::forward<M>(obj)`.

**Effects:** If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise inserts an object of type `value_type` constructed with `std::move(k), std::forward<M>(obj)`.

**Returns:** In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

**Complexity:** The same as `emplace` and `emplace_hint`, respectively.

### 21.5.4.5 Erasure

```cpp
template <class K, class T, class H, class P, class A, class Predicate>
void erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

### 21.5.5 Class template unordered_multimap

#### 21.5.5.1 Overview

*An unordered_multimap* is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.

*An unordered_multimap* satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.

This subclause only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```cpp
namespace std {
    template<class Key,
             class T,
             class Hash = hash<Key>,
             class Pred = equal_to<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class unordered_multimap {
    public:
        // types
        using key_type = Key;
        using mapped_type = T;
        using value_type = pair<const Key, T>;
        using hasher = Hash;
        using key_equal = see 21.2.7;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
    }
```
using size_type = implementation-defined; // see 21.2
using difference_type = implementation-defined; // see 21.2
using iterator = implementation-defined; // see 21.2
using const_iterator = implementation-defined; // see 21.2
using local_iterator = implementation-defined; // see 21.2
using const_local_iterator = implementation-defined; // see 21.2
using node_type = unspecified;

// 21.5.5.2, construct/copy/destroy

unordered_multimap(initializer_list<pair<Key, T>>, Allocator)
-> unordered_multimap<Key, T, Hash<Key>, equal_to<Key>, Allocator>;

§ 21.5.5.1
template<class Key, class T, class Hash, class Allocator>
unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type,
Hash, Allocator)
-> unordered_multimap<Key, T, Hash, equal_to<Key>, Allocator>;

// swap
template<class Key, class T, class Hash, class Pred, class Alloc>
void swap(unordered_multimap<Key, T, Hash, Pred, Alloc>& x,
unordered_multimap<Key, T, Hash, Pred, Alloc>& y)
noexcept(noexcept(x.swap(y)));

A size_type parameter type in an unordered_multimap deduction guide refers to the size_type member
type of the type deduced by the deduction guide.

21.5.5.2 Constructors
[unord.multimap.cnstr]
unordered_multimap() : unordered_multimap(size_type(see below)) { }
explicit unordered_multimap(size_type n,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality
predicate, and allocator, and using at least n buckets. For the default constructor, the number of
buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.

template<class InputIterator>
unordered_multimap(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality
predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is
implementation-defined. Then inserts elements from the range [f, l) for the first form, or from the
range [il.begin(), il.end()) for the second form. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

21.5.5.3 Modifiers
[unord.multimap.modifiers]
template<class P>
iterator insert(P&& obj);

Effects: Equivalent to: return emplace(std::forward<P>(obj));

Remarks: This signature shall not participate in overload resolution unless is_constructible_<
v<value_type, P&&> is true.

template<class P>
iterator insert(const_iterator hint, P&& obj);

Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

Remarks: This signature shall not participate in overload resolution unless is_constructible_<
v<value_type, P&&> is true.
21.5.5.4 Erasure

```
template <class K, class T, class H, class P, class A, class Predicate>
void erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);
```

1. **Effects:** Equivalent to:

   ```
   for (auto i = c.begin(), last = c.end(); i != last; ) {
     if (pred(*i)) {
       i = c.erase(i);
     } else {
       ++i;
     }
   }
   ```

21.5.6 Class template `unordered_set`

21.5.6.1 Overview

1. An `unordered_set` is an unordered associative container that supports unique keys (an `unordered_set` contains at most one of each key value) and in which the elements’ keys are the elements themselves. The `unordered_set` class supports forward iterators.

2. An `unordered_set` satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for unique keys; that is, an `unordered_set` supports the `a_uniq` operations in that table, not the `a_eq` operations. For an `unordered_set<Key>` the key type and the value type are both `Key`. The `iterator` and `const_iterator` types are both constant iterator types. It is unspecified whether they are the same type.

3. This subclause only describes operations on `unordered_set` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
    template<class Key,
        class Hash = hash<Key>,
        class Pred = equal_to<Key>,
        class Allocator = allocator<Key>>
    class unordered_set {
        public:
            // types
            using key_type = Key;
            using value_type = Key;
            using hasher = Hash;
            using key_equal = see 21.2.7;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 21.2
            using difference_type = implementation-defined; // see 21.2
            using iterator = implementation-defined; // see 21.2
            using const_iterator = implementation-defined; // see 21.2
            using local_iterator = implementation-defined; // see 21.2

void swap(unordered_set<Key, Hash, Pred, Alloc>& x,
        unordered_set<Key, Hash, Pred, Alloc>& y)
noexcept(noexcept(x.swap(y)));

A size_type parameter type in an unordered_set deduction guide refers to the size_type member type of the type deduced by the deduction guide.

21.5.6.2 Constructors

unordered_set() : unordered_set(size_type(see below)) { }
explicit unordered_set(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eqi = key_equal(),
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_set using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.
template<class InputIterator>
unordered_set(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

unordered_set(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_set using the specified hash function, key equality predicate, and allocator, and using at least \( n \) buckets. If \( n \) is not provided, the number of buckets is implementation-defined. Then inserts elements from the range \([f, l)\) for the first form, or from the range \([il.begin(), il.end())\) for the second form. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

21.5.6.3 Erasure

[unord.set.erasure]

template <class K, class H, class P, class A, class Predicate>
void erase_if(unordered_set<K, H, P, A>& c, Predicate pred);

Effects: Equivalent to:

```cpp
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
```

21.5.7 Class template unordered_multiset

[unord.multiset]

21.5.7.1 Overview

[unord.multiset.overview]

An unordered_multiset is an unordered associative container that supports equivalent keys (an instance of unordered_multiset may contain multiple copies of the same key value) and in which each element’s key is the element itself. The unordered_multiset class supports forward iterators.

An unordered_multiset satisfies all of the requirements of a container, of an unordered associative container, and of an allocator-aware container (Table 65). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multiset supports the a_eq operations in that table, not the a_uniq operations. For an unordered_multiset<Key> the key type and the value type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

This subclause only describes operations on unordered_multiset that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key, 
        class Hash = hash<Key>,

  -> unordered_multiset<T, hash<T>, equal_to<T>, Allocator>;

template<class T, class Hash, class Allocator>
unordered_multiset(initializer_list<T>, typename see below::size_type, Hash, Allocator)
  -> unordered_multiset<T, Hash, equal_to<T>, Allocator>;

// swap
template<class Key, class Hash, class Pred, class Alloc>
void swap(unordered_multiset<Key, Hash, Pred, Alloc>& x, unordered_multiset<Key, Hash, Pred, Alloc>& y)
  noexcept(noexcept(x.swap(y)));
}
A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 21.5.7.2 Constructors

```
unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
```

**Effects:** Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

**Complexity:** Constant.

```
template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
```

**Effects:** Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)` for the first form, or from the range `[il.begin(), il.end())` for the second form. `max_load_factor()` returns 1.0.

**Complexity:** Average case linear, worst case quadratic.

### 21.5.7.3 Erasure

```
template <class K, class H, class P, class A, class Predicate>
void erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);
```

**Effects:** Equivalent to:
```
for (auto i = c.begin(), last = c.end(); i != last; ) {
    i = c.erase(i);
} else {
    ++i;
}
```

### 21.6 Container adaptors

#### 21.6.1 In general

The headers `<queue>` and `<stack>` define the container adaptors `queue`, `priority_queue`, and `stack`.

The container adaptors each take a `Container` template parameter, and each constructor takes a `Container` reference argument. This container is copied into the `Container` member of each adaptor. If the container takes an allocator, then a compatible allocator may be passed in to the adaptor’s constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter `T` of the container adaptors shall denote the same type as `Container::value_type`.

For container adaptors, no `swap` function throws an exception unless that exception is thrown by the swap of the adaptor’s `Container` or `Compare` object (if any).

A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:
— It has an \texttt{InputIterator} template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

— It has a \texttt{Compare} template parameter and a type that qualifies as an allocator is deduced for that parameter.

— It has a \texttt{Container} template parameter and a type that qualifies as an allocator is deduced for that parameter.

— It has an \texttt{Allocator} template parameter and a type that does not qualify as an allocator is deduced for that parameter.

— It has both \texttt{Container} and \texttt{Allocator} template parameters, and \texttt{uses_allocator_v<Container, Allocator>} is false.

21.6.2 Header \texttt{<queue>} synopsis

\begin{verbatim}
#include <initializer_list>

namespace std {
    template<class T, class Container = deque<T>> class queue;
    template<class T, class Container = vector<T>,
             class Compare = less<typename Container::value_type>>
    class priority_queue;

    template<class T, class Container>
    bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
    template<class T, class Container>

    template<class T, class Container>
    bool operator>(const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
    bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
    template<class T, class Container>
    bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);

    template<class T, class Container>
    void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
}
\end{verbatim}
template<class T, class Container>
    void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
}

21.6.4 Class template queue
21.6.4.1 Definition

Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate queue. In particular, list (21.3.10) and deque (21.3.8) can be used.

namespace std {
    template<class T, class Container = deque<T>>
    class queue {
public:
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;

protected:
    Container c;

template<class Alloc> explicit queue(const Container&);
    template<class Alloc> explicit queue(Container&&);
    template<class Alloc> explicit queue(const Alloc&);
    template<class Alloc> queue(const Container&, const Alloc&);
    template<class Alloc> queue(Container&&, const Alloc&);
    template<class Alloc> queue(const queue&, const Alloc&);
    template<class Alloc> queue(queue&&, const Alloc&);

    [[nodiscard]] bool empty() const { return c.empty(); }
    size_type size() const { return c.size(); }
    reference front() { return c.front(); }
    const_reference front() const { return c.front(); }
    reference back() { return c.back(); }
    const_reference back() const { return c.back(); }
    void push(const value_type& x) { c.push_back(x); }
    void push(value_type&& x) { c.push_back(std::move(x)); }
    template<class... Args>
    decltype(auto) emplace(Args&&... args)
    { return c.emplace_back(std::forward<Args>(args)...); }
    void pop() { c.pop_front(); }
    void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
    { using std::swap; swap(c, q.c); }
    
};

    template<class Container>
    queue(Iterator) -> queue<typename Container::value_type, Container>;

    template<class Container, class Allocator>
    queue(Container, Allocator) -> queue<typename Container::value_type, Container>;

    template<class T, class Container>
    void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

    template<class T, class Container, class Alloc>
    struct uses_allocator<queue<T, Container>, Alloc>
        : uses_allocator<Container, Alloc>::type { }
};
21.6.4.2 Constructors

explicit queue(const Container& cont);
   Effects: Initializes c with cont.

explicit queue(Container&& cont);
   Effects: Initializes c with std::move(cont).

21.6.4.3 Constructors with allocators

If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit queue(const Alloc& a);
   Effects: Initializes c with a.

template<class Alloc> queue(const container_type& cont, const Alloc& a);
   Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> queue(container_type&& cont, const Alloc& a);
   Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> queue(const queue& q, const Alloc& a);
   Effects: Initializes c with q.c as the first argument and a as the second argument.

template<class Alloc> queue(queue&& q, const Alloc& a);
   Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.

21.6.4.4 Operators

template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
   Returns: x.c == y.c.

template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
   Returns: x.c != y.c.

template<class T, class Container>
bool operator<(const queue<T, Container>& x, const queue<T, Container>& y);
   Returns: x.c < y.c.

template<class T, class Container>
bool operator>(const queue<T, Container>& x, const queue<T, Container>& y);
   Returns: x.c > y.c.

template<class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
   Returns: x.c <= y.c.

template<class T, class Container>
bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);
   Returns: x.c >= y.c.

21.6.4.5 Specialized algorithms

template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
   Remarks: This function shall not participate in overload resolution unless is_swappble_v<Container> is true.
Effects: As if by `x.swap(y)`.

21.6.5 Class template `priority_queue`  

21.6.5.1 Overview

Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate `priority_queue`. In particular, `vector` (21.3.11) and `deque` (21.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (24.7).

```cpp
namespace std {
    template<class T, class Container = vector<T>,

                void push(const value_type& x);  
                void push(value_type&& x);  
                template<... Args> void emplace(Args&&... args);  
                void pop();  
                void swap(priority_queue& q) noexcept(is_nothrow_swappable_v<Container> &&
                          is_nothrow_swappable_v<Compare>)
                { using std::swap; swap(c, q.c); swap(comp, q.comp); }
            }

            template<class Compare, class Container>
            priority_queue(Compare, Container)
                -> priority_queue<typename Container::value_type, Container, Compare>;
```
template<
class InputIterator,
class Compare = less<typename iterator_traits<InputIterator>::value_type>,
class Container = vector<typename iterator_traits<InputIterator>::value_type>>
priority_queue(InputIterator, InputIterator, Compare = Compare(), Container = Container())
-> priority_queue<typename iterator_traits<InputIterator>::value_type, Container, Compare>;

template<class Compare, class Container, class Allocator>
priority_queue(Compare, Container, Allocator)
-> priority_queue<typename Container::value_type, Container, Compare>;

// no equality is provided

template<class T, class Container, class Compare>
void swap(priority_queue<T, Container, Compare>& x,
priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

template<class T, class Container, class Compare, class Alloc>
struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>
: uses_allocator<Container, Alloc>::type { };

21.6.5.2 Constructors

priority_queue(const Compare& x, const Container& y);
priority_queue(const Compare& x, Container&& y);

1 Requires: x shall define a strict weak ordering (24.7).
2 Effects: Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare(),
Container&& y = Container());

3 Requires: x shall define a strict weak ordering (24.7).
4 Effects: Initializes comp with x and c with y (copy constructing or move constructing as appropriate); calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

21.6.5.3 Constructors with allocators

1 If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit priority_queue(const Alloc& a);

2 Effects: Initializes c with a and value-initializes comp.

template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);

3 Effects: Initializes c with a and initializes comp with compare.

template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);

4 Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

template<class Alloc>
priority_queue(const Compare& compare, Container&& cont, const Alloc& a);

5 Effects: Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);

6 Effects: Initializes c with q.c as the first argument and a as the second argument, and initializes comp with q.comp.

§ 21.6.5.3
template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);

Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument, and initializes comp with std::move(q.comp).

21.6.5.4 Members

void push(const value_type& x);

Effects: As if by:

c.push_back(x);
push_heap(c.begin(), c.end(), comp);

void push(value_type&& x);

Effects: As if by:

c.push_back(std::move(x));
push_heap(c.begin(), c.end(), comp);

template<class... Args> void emplace(Args&&... args)

Effects: As if by:

c.emplace_back(std::forward<Args>(args)...);
push_heap(c.begin(), c.end(), comp);

void pop();

Effects: As if by:

c.pop_heap(c.begin(), c.end(), comp);
c.pop_back();

21.6.5.5 Specialized algorithms

template<class T, class Container, class Compare>
void swap(priority_queue<T, Container, Compare>& x,
          priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

Remarks: This function shall not participate in overload resolution unless is_swappable_v<Container>
is true and is_swappable_v<Compare> is true.

Effects: As if by x.swap(y).

21.6.6 Class template stack

Any sequence container supporting operations back(), push_back() and pop_back() can be used to instantiate stack. In particular, vector (21.3.11), list (21.3.10) and deque (21.3.8) can be used.

21.6.6.1 Definition

namespace std {

template<class T, class Container = deque<T>>
class stack {

public:

using value_type = typename Container::value_type;
using reference = typename Container::reference;
using const_reference = typename Container::const_reference;
using size_type = typename Container::size_type;
using container_type = Container;

protected:

Container c;

public:

stack() : stack(Container()) {} explicit stack(const Container&);
explicit stack(Container&&);
template<class Alloc> explicit stack(const Alloc&);
template<class Alloc> stack(const Container&, const Alloc&);
template<class Alloc> stack(Container&&, const Alloc&);

§ 21.6.6.1

841
template<class Alloc> stack(const stack&, const Alloc&);
template<class Alloc> stack(stack&&, const Alloc&);

[[nodiscard]] bool empty() const { return c.empty(); }
size_type size() const { return c.size(); }
reference top() { return c.back(); }
const_reference top() const { return c.back(); }
void push(const value_type& x) { c.push_back(x); }
void push(value_type&& x) { c.push_back(std::move(x)); }

template<class... Args>
decltype(auto) emplace(Args&&... args)
{ return c.emplace_back(std::forward<Args>(args)...); }
void pop() { c.pop_back(); }
void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
{ using std::swap; swap(c, s.c); }

};
template<class Container>
stack(Container) -> stack<typename Container::value_type, Container>;
template<class Container, class Allocator>
stack(Container, Allocator) -> stack<typename Container::value_type, Container>;
template<class T, class Container, class Alloc>
struct uses_allocator<stack<T, Container>, Alloc>
: uses_allocator<Container, Alloc>::type { }

21.6.6.2 Constructors [stack.cons]
explicit stack(const Container& cont);
Effects: Initializes c with cont.
explicit stack(Container&& cont);
Effects: Initializes c with std::move(cont).

21.6.6.3 Constructors with allocators [stack.cons.alloc]
If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.
template<class Alloc> explicit stack(const Alloc& a);
Effects: Initializes c with a.
template<class Alloc> stack(const container_type& cont, const Alloc& a);
Effects: Initializes c with cont as the first argument and a as the second argument.
template<class Alloc> stack(container_type&& cont, const Alloc& a);
Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.
template<class Alloc> stack(const stack& s, const Alloc& a);
Effects: Initializes c with s.c as the first argument and a as the second argument.
template<class Alloc> stack(stack&& s, const Alloc& a);
Effects: Initializes c with std::move(s.c) as the first argument and a as the second argument.

21.6.6.4 Operators [stack.ops]
template<class T, class Container>
bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
Returns: x.c == y.c.
template<class T, class Container>
bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);

Returns: x.c != y.c.

template<class T, class Container>
bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);

Returns: x.c < y.c.

template<class T, class Container>
bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);

Returns: x.c > y.c.

template<class T, class Container>
bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);

Returns: x.c <= y.c.

template<class T, class Container>
bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);

Returns: x.c >= y.c.

21.6.6.5 Specialized algorithms

template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));

Remarks: This function shall not participate in overload resolution unless is_swappable_v<Container> is true.

Effects: As if by x.swap(y).

21.7 Views

21.7.1 General

The header <span> defines the view span.

21.7.2 Header <span> synopsis

namespace std {
   // constants
   inline constexpr ptrdiff_t dynamic_extent = -1;

   // 21.7.3, class template span
   template<class ElementType, ptrdiff_t Extent = dynamic_extent>
   class span;

   // 21.7.3.7, views of object representation
   template<class ElementType, ptrdiff_t Extent>
   span<const byte, Extent>
   as_bytes(span<ElementType, Extent> s) noexcept;

   template<class ElementType, ptrdiff_t Extent>
   span<byte, Extent>
   as_writable_bytes(span<ElementType, Extent> s) noexcept;
}

21.7.3 Class template span

21.7.3.1 Overview

A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.
The iterator types `span::iterator` and `span::const_iterator` model `ContiguousIterator` (22.3.4.14), meet the `Cpp17RandomAccessIterator` requirements (22.3.5.6), and meet the requirements for constexpr iterators (22.3.1). All requirements on container iterators (21.2) apply to `span::iterator` and `span::const_iterator` as well.

All member functions of `span` have constant time complexity.

```cpp
namespace std {
    template<class ElementType, ptrdiff_t Extent = dynamic_extent>
    class span {
        public:
            using element_type = ElementType;
            using value_type = remove_cv_t<ElementType>;
            using index_type = ptrdiff_t;
            using difference_type = ptrdiff_t;
            using pointer = element_type*;
            using reference = element_type&;
            using iterator = implementation-defined;
            using const_iterator = implementation-defined;
            using reverse_iterator = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;
            static constexpr index_type extent = Extent;

            // 21.7.3.2, constructors, copy, and assignment
            constexpr span() noexcept;
            constexpr span(pointer ptr, index_type count);
            constexpr span(pointer first, pointer last);
            template<size_t N>
                constexpr span(element_type (&arr)[N]) noexcept;
            template<size_t N>
                constexpr span(array<value_type, N>& arr) noexcept;
            template<size_t N>
                constexpr span(const array<value_type, N>& arr) noexcept;
            template<class Container>
                constexpr span(Container& cont);
            template<class Container>
                constexpr span(const Container& cont);
            constexpr span(const span& other) noexcept = default;
            template<class OtherElementType, ptrdiff_t OtherExtent>
                constexpr span(const span<OtherElementType, OtherExtent>& s) noexcept;
            ~span() noexcept = default;
            constexpr span& operator=(const span& other) noexcept = default;

            // 21.7.3.3, subviews
            template<ptrdiff_t Count>
                constexpr span<element_type, Count> first() const;
            template<ptrdiff_t Count>
                constexpr span<element_type, Count> last() const;
            template<ptrdiff_t Offset, ptrdiff_t Count = dynamic_extent>
                constexpr span<element_type, see below> subspan() const;
            constexpr span<element_type, dynamic_extent> first(index_type count) const;
            constexpr span<element_type, dynamic_extent> last(index_type count) const;
            constexpr span<element_type, dynamic_extent> subspan(
                index_type offset, index_type count = dynamic_extent) const;

            // 21.7.3.4, observers
            constexpr index_type size() const noexcept;
            constexpr index_type size_bytes() const noexcept;
            constexpr bool empty() const noexcept;
    }
```
// 21.7.3.5, element access
constexpr reference operator[](index_type idx) const;
constexpr reference operator()(index_type idx) const;
constexpr pointer data() const noexcept;

// 21.7.3.6, iterator support
constexpr iterator begin() const noexcept;
constexpr iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

template<typename T, size_t N>
span(T (&)[N]) -> span<T, N>;
template<typename T, size_t N>
span(array<T, N>&) -> span<T, N>;
template<typename T, size_t N>
span(const array<T, N>&) -> span<const T, N>;
template<typename Container>
span(Container&) -> span<typename Container::value_type>;
template<typename Container>
span(const Container&) -> span<const typename Container::value_type>;

ElementType is required to be a complete object type that is not an abstract class type.
If Extent is negative and not equal to dynamic_extent, the program is ill-formed.

### 21.7.3.2 Constructors, copy, and assignment [span.cons]

constexpr span() noexcept;

Ensures: size() == 0 && data() == nullptr.
Remarks: This constructor shall not participate in overload resolution unless Extent <= 0 is true.

constexpr span(pointer ptr, index_type count);

Requires: [ptr, ptr + count) shall be a valid range. If extent is not equal to dynamic_extent, then count shall be equal to extent.
Effects: Constructs a span that is a view over the range [ptr, ptr + count).
Ensures: size() == count && data() == ptr.
Throws: Nothing.

constexpr span(pointer first, pointer last);

Requires: [first, last) shall be a valid range. If extent is not equal to dynamic_extent, then last - first shall be equal to extent.
Effects: Constructs a span that is a view over the range [first, last).
Ensures: size() == last - first && data() == first.
Throws: Nothing.

template<typename N> constexpr span(element_type (&arr)[N]) noexcept;
template<typename N> constexpr span(array<value_type, N>& arr) noexcept;
template<size_t N> constexpr span(const array<value_type, N>& arr) noexcept;

11 Effects: Constructs a span that is a view over the supplied array.
12 Ensures: size() == N && data() == data(arr).
13 Remarks: These constructors shall not participate in overload resolution unless:
14 — extent == dynamic_extent || N == extent is true, and
15 — remove_pointer_t<decay_type(data(arr))>(*)[] is convertible toElementType(*)(*)[].

template<class Container> constexpr span(Container& cont);
template<class Container> constexpr span(const Container& cont);

14 Requires: [data(cont), data(cont) + size(cont)] shall be a valid range. If extent is not equal
to dynamic_extent, then size(cont) shall be equal to extent.
15 Effects: Constructs a span that is a view over the range [data(cont), data(cont) + size(cont)].
16 Ensures: size() == size(cont) && data() == data(cont).
17 Throws: What and when data(cont) and size(cont) throw.
18 Remarks: These constructors shall not participate in overload resolution unless:
19 — Container is not a specialization of span,
20 — Container is not a specialization of array,
21 — is_array_v<Container> is false,
22 — data(cont) and size(cont) are both well-formed, and
23 — remove_pointer_t<decay_type(data(cont))>(*)[] is convertible toElementType(*)(*)[].

constexpr span(const span& other) noexcept = default;

19 Ensures: other.size() == size() && other.data() == data().

template<class OtherElementType, ptrdiff_t OtherExtent>
constexpr span(const span<OtherElementType, OtherExtent>& s) noexcept;

20 Effects: Constructs a span that is a view over the range [s.data(), s.data() + s.size()).
21 Ensures: size() == s.size() && data() == s.data().
22 Remarks: This constructor shall not participate in overload resolution unless:
23 — Extent == dynamic_extent || Extent == OtherExtent is true, and
24 — OtherElementType(*)[] is convertible toElementType(*)(*)[].

constexpr span& operator=(const span& other) noexcept = default;

23 Ensures: size() == other.size() && data() == other.data().

21.7.3.3 Subviews [span.sub]

template<ptrdiff_t Count> constexpr span<element_type, Count> first() const;
1 Requires: 0 <= Count && Count <= size().
2 Effects: Equivalent to: return {data(), Count};

template<ptrdiff_t Count> constexpr span<element_type, Count> last() const;
3 Requires: 0 <= Count && Count <= size().
4 Effects: Equivalent to: return {data() + (size() - Count), Count};

template<ptrdiff_t Offset, ptrdiff_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;
5 Requires:
0 <= Offset && Offset <= size())
&& (Count == dynamic_extent || Count >= 0 && Offset + Count <= size())
6 Effects: Equivalent to:
return span<ElementType, see below>(
    data() + Offset, Count != dynamic_extent ? Count : size() - Offset);

Remarks: The second template argument of the returned span type is:
    Count != dynamic_extent ? Count
    : (Extent != dynamic_extent ? Extent - Offset
    : dynamic_extent)

constexpr span<element_type, dynamic_extent> first(index_type count) const;
Requires: 0 <= count && count <= size().
Effects: Equivalent to: return {data(), count};

constexpr span<element_type, dynamic_extent> last(index_type count) const;
Requires: 0 <= count 0 && count <= size().
Effects: Equivalent to: return {data() + (size() - count), count};

constexpr span<element_type, dynamic_extent> subspan(
    index_type offset, index_type count = dynamic_extent) const;
Requires:
    (0 <= offset && offset <= size())
    && (count == dynamic_extent || count >= 0 && offset + count <= size())
Effects: Equivalent to:
    return {data() + offset, count == dynamic_extent ? size() - offset : count};

21.7.3.4 Observers [span.obs]
constexpr index_type size() const noexcept;
Effects: Equivalent to: return size_;

constexpr index_type size_bytes() const noexcept;
Effects: Equivalent to: return size() * sizeof(element_type);

constexpr bool empty() const noexcept;
Effects: Equivalent to: return size() == 0;

21.7.3.5 Element access [span.elem]
constexpr reference operator[](index_type idx) const;
constexpr reference operator()(index_type idx) const;
Requires: 0 <= idx && idx < size().
Effects: Equivalent to: return *(data() + idx);

constexpr pointer data() const noexcept;
Effects: Equivalent to: return data_;

21.7.3.6 Iterator support [span.iterators]
constexpr iterator begin() const noexcept;
Returns: An iterator referring to the first element in the span. If empty() is true, then it returns the
same value as end().

constexpr iterator end() const noexcept;
Returns: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() const noexcept;
Effects: Equivalent to: return reverse_iterator(end());

constexpr reverse_iterator rend() const noexcept;
Returns: Equivalent to: return reverse_iterator(begin());
constexpr const_iterator cbegin() const noexcept;

Returns: A constant iterator referring to the first element in the span. If empty() is true, then it returns the same value as cend().

constexpr const_iterator cend() const noexcept;

Returns: A constant iterator which is the past-the-end value.

constexpr const_reverse_iterator crbegin() const noexcept;

Effects: Equivalent to: return const_reverse_iterator(cend());

constexpr const_reverse_iterator crend() const noexcept;

Effects: Equivalent to: return const_reverse_iterator(cbegin());

21.7.3.7 Views of object representation

template<class ElementType, ptrdiff_t Extent>
span<const byte, Extent == dynamic_extent ? dynamic_extent : static_cast<ptrdiff_t>(sizeof(ElementType)) * Extent> as_bytes(span<ElementType, Extent> s) noexcept;

Effects: Equivalent to: return {reinterpret_cast<const byte*>(s.data()), s.size_bytes()};

template<class ElementType, ptrdiff_t Extent>
span<byte, Extent == dynamic_extent ? dynamic_extent : static_cast<ptrdiff_t>(sizeof(ElementType)) * Extent> as_writable_bytes(span<ElementType, Extent> s) noexcept;

Effects: Equivalent to: return {reinterpret_cast<byte*>(s.data()), s.size_bytes()};

Remarks: This function shall not participate in overload resolution unless is_const_v<ElementType> is false.
22 Iterators library

22.1 General

This Clause describes components that C++ programs may use to perform iterations over containers (Clause 21), streams (28.7), stream buffers (28.6), and other ranges (Clause 23).

The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 71.

Table 71 — Iterators library summary

22.3 Iterator requirements

22.3.1 In general

Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator i supports the expression *i, resulting in a value of some object type T, called the value type of the iterator. An output iterator i has a

§ 22.3.1

855
non-empty set of types that are writable to the iterator; for each such type T, the expression \(*i = o\) is valid where \(o\) is a value of type T. For every iterator type \(X\), there is a corresponding signed integer type called the difference type of the iterator.

Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: input iterators, output iterators, forward iterators, bidirectional iterators, random access iterators, and contiguous iterators, as shown in Table 72.

Table 72 — Relations among iterator categories

<table>
<thead>
<tr>
<th>Contiguous</th>
<th>Random Access</th>
<th>Bidirectional</th>
<th>Forward</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
</table>

The six categories of iterators correspond to the iterator concepts InputIterator (22.3.4.9), OutputIterator (22.3.4.10), ForwardIterator (22.3.4.11), BidirectionalIterator (22.3.4.12) RandomAccessIterator (22.3.4.13), and ContiguousIterator (22.3.4.14), respectively. The generic term iterator refers to any type that models the Iterator concept (22.3.4.6).

Forward iterators satisfy all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also satisfy all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also satisfy all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also satisfy all the requirements of random access iterators and can be used whenever a random access iterator is specified.

Iterators that further satisfy the requirements of output iterators are called mutable iterators. Nonmutable iterators are referred to as constant iterators.

In addition to the requirements in this subclause, the nested typedef-names specified in 22.3.2.3 shall be provided for the iterator type. [Note: Either the iterator type must provide the typedef-names directly (in which case iterator_traits pick them up automatically), or an iterator_traits specialization must provide them. — end note]

Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. These values are called past-the-end values. Values of an iterator \(i\) for which the expression \(*i\) is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. [Example: After the declaration of an uninitialized pointer \(x\) (as with \(\text{int}^* x;\)), \(x\) must always be assumed to have a singular value of a pointer. — end example] Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that satisfy the Cpp17DefaultConstructible requirements, using a value-initialized iterator as the source of a copy or move operation. [Note: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note] In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A range is an iterator and a sentinel that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.\(^{231}\)

An iterator and a sentinel denoting a range are comparable. A range \([i, s]\) is empty if \(i == s\); otherwise, \([i, s]\) refers to the elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the first iterator \(j\) such that \(j == s\).

A sentinel \(s\) is called reachable from an iterator \(i\) if and only if there is a finite sequence of applications of the expression \(++i\) that makes \(i == s\). If \(s\) is reachable from \(i\), \([i, s]\) denotes a valid range.

A counted range \([i, n]\) is empty if \(n == 0\); otherwise, \([i, n]\) refers to the \(n\) elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the

\(^{231}\) The sentinel denoting the end of a range may have the same type as the iterator denoting the beginning of the range, or a different type.
result of \(n\) applications of \(++i\). A counted range \([i, n)\) is valid if and only if \(n == 0\); or \(n\) is positive, \(i\) is dereferenceable, and \([++i, --n)\) is valid.

12 The result of the application of library functions to invalid ranges is undefined.

13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.

15 An invalid iterator is an iterator that may be singular.\(^{232}\)

16 Iterators are called constexpr iterators if all operations provided to meet iterator category requirements are constexpr functions, except for

\[\begin{align*}
(16.1) & \quad \text{a pseudo-destructor call (7.5.4.3), and} \\
(16.2) & \quad \text{the construction of an iterator with a singular value.}
\end{align*}\]

[Note: For example, the types “pointer to int” and reverse_iterator<int*> are constexpr iterators. — end note]

### 22.3.2 Associated types

#### [iterator.assoc.types]

#### [incrementable.traits]

1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if \(WI\) is the name of a type that models the WeaklyIncrementable concept (22.3.4.4), the type

\[
\text{iter_difference_t}<\text{WI}>
\]

be defined as the incrementable type’s difference type.

```cpp
namespace std {
    template<class> struct incrementable_traits { };

    template<class T>
    requires is_object_v<T>
    struct incrementable_traits<T> { 
        using difference_type = ptrdiff_t;
    };

    template<class I>
    struct incrementable_traits<const I> : incrementable_traits<I> { };

    template<class T>
    requires requires { typename T::difference_type; }
    struct incrementable_traits<T> { 
        using difference_type = typename T::difference_type;
    };

    template<class T>
    requires (!requires { typename T::difference_type; } &&
              requires(const T& a, const T& b) { (a - b) -> Integral; })
    struct incrementable_traits<T> { 
        using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
    };

    template<class T>
    using iter_difference_t = see below;
}
```

2 The type \text{iter_difference_t}\(<\text{I}>\) denotes

\(^{232}\) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.
(2.1) \ — \ incrementable_traits<I>::difference_type if iterator_traits<I> names a specialization generated from the primary template, and

(2.2) \ — \ iterator_traits<I>::difference_type otherwise.

3 Users may specialize incrementable_traits on program-defined types.

22.3.2.2 Readable traits [readable.traits]

1 To implement algorithms only in terms of readable types, it is often necessary to determine the value type that corresponds to a particular readable type. Accordingly, it is required that if \( R \) is the name of a type that models the Readable concept (22.3.4.2), the type

\[
\text{iter_value_t<R>}
\]

be defined as the readable type's value type.

\[
\begin{align*}
\text{template<class> struct cond-value-type \{ \};} & \quad \text{// exposition only} \\
\text{template<class T> requires is_object_v<T> struct cond-value-type \{} & \quad \text{using value_type = remove_cv_t<T>;} \\
\text{\};} & \\
\text{template<class T> struct readable_traits \{ \};} & \\
\text{template<class T> struct readable_traits<T> : cond-value-type<T> \{ \};} & \\
\text{template<class I> requires is_array_v<I> struct readable_traits<I> \{} & \quad \text{using value_type = remove_cv_t<remove_extent_t<I>>;} \\
\text{\};} & \\
\text{template<class I> struct readable_traits<const I> : readable_traits<I> \{ \};} & \\
\text{template<class T> requires requires \{ typename T::value_type; \} struct readable_traits<T> : cond-value-type<typename T::value_type> \{ \};} & \\
\text{template<class T> requires requires \{ typename T::element_type; \} struct readable_traits<T> : cond-value-type<typename T::element_type> \{ \};} & \\
\text{template<class T> using iter_value_t = see below;} & \\
\end{align*}
\]

2 The type \text{iter_value_t<I>} denotes

(2.1) \ — \ readable_traits<I>::value_type if iterator_traits<I> names a specialization generated from the primary template, and

(2.2) \ — \ iterator_traits<I>::value_type otherwise.

3 Class template readable_traits may be specialized on program-defined types.

4 [\textbf{Note:} Some legacy output iterators define a nested type named value_type that is an alias for void. These types are not Readable and have no associated value types. \ — \textit{end note}]  

5 [\textbf{Note:} Smart pointers like \textit{shared_ptr<int>} are Readable and have an associated value type, but a smart pointer like \textit{shared_ptr<void>} is not Readable and has no associated value type. \ — \textit{end note}]
22.3.2.3 Iterator traits

To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if $I$ is the type of an iterator, the type

\[
\text{iterator_traits}\langle I \rangle::\text{iterator_category}
\]

be defined as the iterator's iterator category. In addition, the types

\[
\text{iterator_traits}\langle I \rangle::\text{pointer} \\
\text{iterator_traits}\langle I \rangle::\text{reference}
\]

shall be defined as the iterator's pointer and reference types; that is, for an iterator object $a$ of class type, the same type as $\text{decltype}(a.\text{operator->}())$ and $\text{decltype}(\*a)$, respectively. The type $\text{iterator_traits}\langle I \rangle::\text{pointer}$ shall be void for an iterator of class type $I$ that does not support $\text{operator->}$. Additionally, in the case of an output iterator, the types

\[
\text{iterator_traits}\langle I \rangle::\text{value_type} \\
\text{iterator_traits}\langle I \rangle::\text{difference_type} \\
\text{iterator_traits}\langle I \rangle::\text{reference}
\]

may be defined as void.

The definitions in this subclause make use of the following exposition-only concepts:

```cpp
// 22.3.2.3 859

template<class I>
concept cpp17-iterator = 
    Copyable<I> && requires(I i) {
        { *i } -> can-reference;
        { ++i } -> Same<I&>;
        { *i++ } -> can-reference;
    };

template<class I>
concept cpp17-input-iterator = 
    cpp17-iterator<I> && EqualityComparable<I> && requires(I i) {
        typename incrementable_traits<I>::difference_type;
        typename readable_traits<I>::value_type;
        typename common_reference_t<iter_reference_t<I> &&, 
                                   typename readable_traits<I>::value_type &>;
        *i++;
        typename common_reference_t<decltype(*i++) &&, 
                                   typename readable_traits<I>::value_type &>;
    requires SignedIntegral<typename incrementable_traits<I>::difference_type>;
    };

template<class I>
concept cpp17-forward-iterator = 
    cpp17-input-iterator<I> && Constructible<I> && 
    is_value_reference_v<iter_reference_t<I>> &&
    Same<remove_cvref_t<iter_reference_t<I>>, typename readable_traits<I>::value_type> && 
    requires(I i) {
        { i++ } -> const I&;
        { *i++ } -> Same<iter_reference_t<I>>;
    };

template<class I>
concept cpp17-bidirectional-iterator = 
    cpp17-forward-iterator<I> && requires(I i) {
        { --i } -> Same<I&>;
        { i-- } -> const I&;
        { *i-- } -> Same<iter_reference_t<I>>;
    };

template<class I>
concept cpp17-random-access-iterator = 
    cpp17-bidirectional-iterator<I> && StrictTotallyOrdered<I> &&
```
The members of a specialization `iterator_traits<I>` generated from the `iterator_traits` primary template are computed as follows:

1. If `I` has valid (12.9.2) member types `difference_type`, `value_type`, `reference`, and `iterator_category`, then `iterator_traits<I>` has the following publicly accessible members:
   ```
   using iterator_category = typename I::iterator_category;
   using value_type = typename I::value_type;
   using difference_type = typename I::difference_type;
   using pointer = see below;
   using reference = typename I::reference;
   ```
   If the `qualified-id` `I::*pointer` is valid and denotes a type, then `iterator_traits<I>::pointer` names that type; otherwise, it names `void`.

2. Otherwise, if `I` satisfies the exposition-only concept `cpp17-input-iterator`, `iterator_traits<I>` has the following publicly accessible members:
   ```
   using iterator_category = see below;
   using value_type = typename readable_traits<I>::value_type;
   using difference_type = typename incrementable_traits<I>::difference_type;
   using pointer = see below;
   using reference = see below;
   ```
   If the `qualified-id` `I::*pointer` is valid and denotes a type, `pointer` names that type. Otherwise, `pointer` names `void`.

3. Otherwise, if `I` satisfies the exposition-only concept `cpp17-input-iterator`, `iterator_traits<I>` has the following publicly accessible members:
   ```
   using iterator_category = output_iterator_tag;
   using value_type = void;
   using difference_type = see below;
   using pointer = void;
   using reference = void;
   ```
   If the `qualified-id` `incrementable_traits<I>::difference_type` is valid and denotes a type, `difference_type` names that type; otherwise, it names `void`.

4. Otherwise, `iterator_traits<I>` has no members by any of the above names.

5. Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (22.3.4).

`iterator_traits` is specialized for pointers as

```
namespace std {
    template<class T>
```
requires is_object_v<T>
struct iterator_traits<T*> {
    using iterator_concept = contiguous_iterator_tag;
    using iterator_category = random_access_iterator_tag;
    using value_type = remove_cv_t<T>;
    using difference_type = ptrdiff_t;
    using pointer = T*;
    using reference = T&;
}

[Example: To implement a generic \texttt{reverse} function, a C++ program can do the following:

\begin{verbatim}
template<class BI>
void reverse(BI first, BI last) {
    typename iterator_traits<BI>::difference_type n =
    distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BI>::value_type
        tmp = *first;
        *first++ = *--last;
        *last = tmp;
        n -= 2;
    }
}
\end{verbatim}

—end example]

22.3.3 Customization points

22.3.3.1 iter\_move

The name \texttt{iter\_move} denotes a customization point object (15.4.2.1.6). The expression \texttt{ranges::iter\_move(E)} for some subexpression \(E\) is expression-equivalent to the following:

\begin{enumerate}
\item \texttt{iter\_move(E)}, if that expression is valid, with overload resolution performed in a context that does not include a declaration of \texttt{ranges::iter\_move}.
\item Otherwise, if the expression \texttt{*E} is well-formed:
\begin{enumerate}
\item if \texttt{*E} is an lvalue, \texttt{std\::move(*E)};
\item otherwise, \texttt{*E}.
\end{enumerate}
\item Otherwise, \texttt{ranges::iter\_move(E)} is ill-formed. [Note: This case can result in substitution failure when \texttt{ranges::iter\_move(E)} appears in the immediate context of a template instantiation. —end note]
\end{enumerate}

If \texttt{ranges::iter\_move(E)} is not equal to \texttt{*E}, the program is ill-formed with no diagnostic required.

22.3.3.2 iter\_swap

The name \texttt{iter\_swap} denotes a customization point object (15.4.2.1.6) that exchanges the values (17.4.9) denoted by its arguments.

Let \texttt{iter\_exchange\_move} be the exposition-only function:

\begin{verbatim}
template<class X, class Y>
constexpr iter_value_t<remove_reference_t<X>> iter\_exchange\_move(X&& x, Y&& y)
    noexcept(noexcept(iter_value_t<remove_reference_t<X>>(iter\_move(x)))
        && noexcept(*x = iter\_move(y)));
\end{verbatim}

\begin{enumerate}
\item Effects: Equivalent to:
\begin{verbatim}
    iter_value_t<remove_reference_t<X>> old_value(iter\_move(x));
    *x = iter\_move(y);
    return old_value;
\end{verbatim}
\item The expression \texttt{ranges::iter\_swap(E1, E2)} for some subexpressions \(E1\) and \(E2\) is expression-equivalent to the following:
\end{enumerate}
(4.1) — (void)iter_swap(E1, E2), if that expression is valid, with overload resolution performed in a context that includes the declaration

```cpp
-template<class I1, class I2>
  void iter_swap(I1, I2) = delete;
```

and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by E1 and E2, the program is ill-formed with no diagnostic required.

(4.2) — Otherwise, if the types of E1 and E2 each model `Readable`, and if the reference types of E1 and E2 model `SwappableWith` (17.4.9), then `ranges::swap(*E1, *E2)`.

(4.3) — Otherwise, if the types T1 and T2 of E1 and E2 model `IndirectlyMovableStorable<T1, T2>` and `IndirectlyMovableStorable<T2, T1>`, then (void)(*E1 = iter-exchange-move(E2, E1)), except that E1 is evaluated only once.

(4.4) — Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed. [Note: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation. —end note]

22.3.4 Iterator concepts

22.3.4.1 General

1 For a type I, let `ITER_TRAITS(I)` denote the type I if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, `ITER_TRAITS(I)` denotes `iterator_traits<I>`.

(1.1) — If the qualified-id `ITER_TRAITS(I)::iterator_concept` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.

(1.2) — Otherwise, if the qualified-id `ITER_TRAITS(I)::iterator_category` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.

(1.3) — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`.

(1.4) — Otherwise, `ITER_CONCEPT(I)` does not denote a type.

2 [Note: `ITER_TRAITS` enables independent syntactic determination of an iterator’s category and concept. —end note] [Example:]

```cpp
struct I {
  using value_type = int;
  using difference_type = int;

  int operator*() const;
  I& operator++();
  I operator++(int);
  I& operator--();
  I operator--(int);

  bool operator==(I) const;
  bool operator!=(I) const;
};
```

`iterator_traits<I>::iterator_category` denotes `input_iterator_tag`, and `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`. —end example]

22.3.4.2 Concept Readable

1 Types that are readable by applying `operator*` model the `Readable` concept, including pointers, smart pointers, and iterators.

```cpp
-template<class In>
concept Readable =
  requires {
    typename iter_value_t<In>;
    typename iter_reference_t<In>;
    typename iter_rvalue_reference_t<In>;
  } &
```
22.3.4.3 Concept Writable [iterator.concept.writable]

The **Writable** concept specifies the requirements for writing a value into an iterator's referenced object.

```cpp
template<class Out, class T>
concept Writable =
    requires(Out&& o, T&& t) {
        *o = std::forward<T>(t); // not required to be equality-preserving
        *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*o) = 
            std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) = 
            std::forward<T>(t); // not required to be equality-preserving
    };
```

2. Let \( E \) be an expression such that `decltype((E))` is `T`, and let \( o \) be a dereferenceable object of type `Out`. `Out` and `T` model `Writable<Out, T>` only if

(2.1) — If `Out` and `T` model `Readable<Out> && Same<iter_value_t<Out>, decay_t<T>>`, then `*o` after any above assignment is equal to the value of `E` before the assignment.

3. After evaluating any above assignment expression, `o` is not required to be dereferenceable.

4. If `E` is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (15.5.5.15).

5. [Note: The only valid use of an `operator*` is on the left side of the assignment statement. Assignment through the same value of the writable type happens only once. — end note]

6. [Note: `Writable` has the awkward `const_cast` expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit `const` rvalue assignment. Consequently, an iterator type `I` that returns `std::string` by value does not model `Writable<I, std::string>`. — end note]

22.3.4.4 Concept WeaklyIncrementable [iterator.concept.winc]

The **WeaklyIncrementable** concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be `EqualityComparable`.

```cpp
template<class I>
concept WeaklyIncrementable =
    Semiregular<I> &&
    requires(I i) {
        typename iter_difference_t<I>; // not required to be equality-preserving
        requires SignedIntegral<iter_difference_t<I>>;
        { ++i } -> Same<I&>; // not required to be equality-preserving
        i++; // not required to be equality-preserving
    };
```

2. Let `i` be an object of type `I`. When `i` is in the domain of both pre- and post-increment, `i` is said to be **incrementable**. `I` models `WeaklyIncrementable<I>` only if

(2.1) — The expressions `++i` and `i++` have the same domain.

(2.2) — If `i` is incrementable, then both `++i` and `i++` advance `i` to the next element.

(2.3) — If `i` is incrementable, then `addressof(;++i)` is equal to `addressof(i)`.

3. [Note: For `WeaklyIncrementable` types, `a` equals `b` does not imply that `++a` equals `++b`. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on weakly incrementable types should never attempt to pass through the same incrementable value twice. They should be single-pass algorithms. These algorithms can be used with `istream_iterator` as the source of the input data through the `istream_iterator` class template. — end note]
Concept Incrementable

The Incrementable concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be EqualityComparable. [Note: This supersedes the annotations on the increment expressions in the definition of WeaklyIncrementable. — end note]

```cpp
template<class I>
concept Incrementable =
  Regular<I> &&
  WeaklyIncrementable<I> &&
  requires(I i) {
    { i++ } -> Same<I>;
  };
```

Let a and b be incrementable objects of type I. I models Incrementable only if

1. If bool(a == b) then bool(a++ == b).
2. If bool(a == b) then bool(((void)a++, a) == ++b).

[Note: The requirement that a equals b implies ++a equals ++b (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model Incrementable. — end note]

Concept Iterator

The Iterator concept forms the basis of the iterator concept taxonomy; every iterator models Iterator. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (22.3.4.7), to read (22.3.4.9) or write (22.3.4.10) values, or to provide a richer set of iterator movements (22.3.4.11, 22.3.4.12, 22.3.4.13).

```cpp
template<class I>
concept Iterator =
  requires(I i) {
    *i -> can-reference;
  } &&
  WeaklyIncrementable<I>;
```

Concept Sentinel

The Sentinel concept specifies the relationship between an Iterator type and a Semiregular type whose values denote a range.

```cpp
template<class S, class I>
concept Sentinel =
  Semiregular<S> &&
  Iterator<I> &&
  weakly-equality-comparable-with<S, I>; // See 17.5.3
```

Let s and i be values of type S and I such that [i, s) denotes a range. Types S and I model Sentinel<S, I> only if

1. i == s is well-defined.
2. If bool(i != s) then i is dereferenceable and [++i, s) denotes a range.

The domain of == is not static. Given an iterator i and sentinel s such that [i, s) denotes a range and i != s, i and s are not required to continue to denote a range after incrementing any other iterator equal to i. Consequently, i == s is no longer required to be well-defined.

Concept SizedSentinel

The SizedSentinel concept specifies requirements on an Iterator and a Sentinel that allow the use of the - operator to compute the distance between them in constant time.

```cpp
template<class S, class I>
concept SizedSentinel =
  Sentinel<S, I> &&
  !disable_sized_sentinel<remove_cv_t<S>, remove_cv_t<I>> &&
  requires(const I& i, const S& s) {
    ...
  };
```
Let $i$ be an iterator of type $I$, and $s$ a sentinel of type $S$ such that $[i, s)$ denotes a range. Let $N$ be the smallest number of applications of $++i$ necessary to make $\text{bool}(i == s)$ be true. $S$ and $I$ model \texttt{SizedSentinel<S, I>}, $I$ only if

1. If $N$ is representable by $\text{iter_difference_t<I>}$, then $s - i$ is well-defined and equals $N$.
2. If $-N$ is representable by $\text{iter_difference_t<I>}$, then $i - s$ is well-defined and equals $-N$.

[Note: $\texttt{disable_sized_sentinel}$ allows use of sentinels and iterators with the library that satisfy but do not in fact model $\texttt{SizedSentinel}$. — end note]

[Example: The $\texttt{SizedSentinel}$ concept is modeled by pairs of $\texttt{RandomAccessIterator}$s (22.3.4.13) and by counted iterators and their sentinels (22.5.6.1). — end example]

### 22.3.4.9 Concept InputIterator

The InputIterator concept defines requirements for a type whose referenced values can be read (from the requirement for Readable (22.3.4.2)) and which can be both pre- and post-incremented. [Note: Unlike the $\texttt{Cpp17InputIterator}$ requirements (22.3.5.2), the InputIterator concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

```cpp
template<class I>  
concept InputIterator =  
  Iterator<I> &&  
  Readable<I> &&  
  requires { typename ITER_CONCEPT(I); } &&  
  DerivedFrom<ITER_CONCEPT(I), input_iterator_tag>;
```

### 22.3.4.10 Concept OutputIterator

The OutputIterator concept defines requirements for a type that can be used to write values (from the requirement for Writable (22.3.4.3)) and which can be both pre- and post-incremented. [Note: Output iterators are not required to model EqualityComparable. — end note]

```cpp
template<class I, class T>  
concept OutputIterator =  
  Iterator<I> &&  
  Writable<I, T> &&  
  requires(I i, T&& t) {  
    *i++ = std::forward<T>(t); // not required to be equality-preserving  
  };
```

Let $E$ be an expression such that $\text{decltype}((E))$ is $T$, and let $i$ be a dereferenceable object of type $I$. $I$ and $T$ model OutputIterator$<I, T>$ only if $*i++ = E$; has effects equivalent to:

1. $*i = E$;
2. $++i$;
3. [Note: Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single-pass algorithms. — end note]

### 22.3.4.11 Concept ForwardIterator

The ForwardIterator concept adds equality comparison and the multi-pass guarantee, specified below.

```cpp
template<class I>  
concept ForwardIterator =  
  InputIterator<I> &&  
  DerivedFrom<ITER_CONCEPT(I), forward_iterator_tag> &&  
  Incrementable<I> &&  
  Sentinel<I, I>;
```

The domain of $==$ for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]
Pointers and references obtained from a forward iterator into a range \([i, s)\) shall remain valid while \([i, s)\) continues to denote a range.

Two dereferenceable iterators \(a\) and \(b\) of type \(X\) offer the multi-pass guarantee if:

\[
\begin{align*}
\text{(4.1)} \quad & a == b \text{ implies } ++a == ++b \\
\text{(4.2)} \quad & \text{The expression } ((\text{void}[])(X x){++x;}(a), *a) \text{ is equivalent to the expression } *a.
\end{align*}
\]

[Note: The requirement that \(a == b\) implies \(++a == ++b\) and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — end note]

22.3.4.12 Concept BidirectionalIterator

The BidirectionalIterator concept adds the ability to move an iterator backward as well as forward.

\[
\begin{align*}
\text{template<class I>}
& \text{concept BidirectionalIterator =} \\
& \text{ForwardIterator<I> \&\&} \\
& \text{DerivedFrom<ITER_CONCEPT(I), bidirectional_iterator_tag> \&\&} \\
& \text{requires(I i) \{} \\
& \{ --i \} \to \text{Same<I>}; \\
& \{ i-- \} \to \text{Same<I>}; \\
& \};
\end{align*}
\]

A bidirectional iterator \(r\) is decrementable if and only if there exists some \(q\) such that \(++q == r\). Decrementable iterators \(r\) shall be in the domain of the expressions \(--r\) and \(r--\).

Let \(a\) and \(b\) be equal objects of type \(I\). \(I\) models BidirectionalIterator only if:

\[
\begin{align*}
\text{(3.1)} \quad & \text{If } a\text{ and } b\text{ are decrementable, then all of the following are true:} \\
\text{(3.1.1)} \quad & \text{addressof}(-a) == \text{addressof}(a) \\
\text{(3.1.2)} \quad & \text{bool}(a-- == b) \\
\text{(3.1.3)} \quad & \text{after evaluating both } a-- \text{ and } --b \text{ bool}(a == b) \text{ is still true} \\
\text{(3.1.4)} \quad & \text{bool}(++(-a) == b) \\
\text{(3.2)} \quad & \text{If } a\text{ and } b\text{ are incrementable, then bool}((-a++) == b).
\end{align*}
\]

22.3.4.13 Concept RandomAccessIterator

The RandomAccessIterator concept adds support for constant-time advancement with \(\+=\), \(+\), \(-=\), and \(-\), as well as the computation of distance in constant time with \(-\). Random access iterators also support array notation via subscripting.

\[
\begin{align*}
\text{template<class I>}
& \text{concept RandomAccessIterator =} \\
& \text{BidirectionalIterator<I> \&\&} \\
& \text{DerivedFrom<ITER_CONCEPT(I), random_access_iterator_tag> \&\&} \\
& \text{StrictTotallyOrdered<I> \&\&} \\
& \text{SizedSentinel<I, I> \&\&} \\
& \text{requires(I i, const I j, const iter_difference_t<I> n) \{} \\
& \{ i += n \} \to \text{Same<I>}; \\
& \{ j + n \} \to \text{Same<I>}; \\
& \{ n + j \} \to \text{Same<I>}; \\
& \{ i -= n \} \to \text{Same<I>}; \\
& \{ j - n \} \to \text{Same<I>}; \\
& \{ j[n] \} \to \text{Same<iter_reference_t<I>>}; \\
& \};
\end{align*}
\]

Let \(a\) and \(b\) be valid iterators of type \(I\) such that \(b\) is reachable from \(a\) after \(n\) applications of \(++a\), let \(D\) be \(\text{iter_difference_t<I>}\), and let \(n\) denote a value of type \(D\). \(I\) models RandomAccessIterator only if

\[
\begin{align*}
\text{(2.1)} \quad & (a += n) \text{ is equal to } b. \\
\text{(2.2)} \quad & \text{addressof}(a += n) \text{ is equal to } \text{addressof}(a). \\
\text{(2.3)} \quad & (a + n) \text{ is equal to } (a += n). \\
\text{(2.4)} \quad & \text{For any two positive values } x \text{ and } y \text{ of type } D, \text{ if } (a + D(x+y)) \text{ is valid, then } (a + D(x+y)) \text{ is equal to } ((a + x) + y).
\end{align*}
\]
(2.5) \((a + D(0))\) is equal to \(a\).

(2.6) If \((a + D(n - 1))\) is valid, then \((a + n)\) is equal to \(+a + D(n - 1)\).

(2.7) \((b += -n)\) is equal to \(a\).

(2.8) \(b -= n\) is equal to \(a\).

(2.9) \(addressof(b -= n)\) is equal to \(addressof(b)\).

(2.10) \((b - n)\) is equal to \((b -= n)\).

(2.11) If \(b\) is dereferenceable, then \(a[n]\) is valid and is equal to \(*b\).

(2.12) \(bool(a <= b)\) is true.

### 22.3.4.14 Concept ContiguousIterator

The ContiguousIterator concept provides a guarantee that the denoted elements are stored contiguously in memory.

```cpp
template<class I>
concept ContiguousIterator =
    RandomAccessIterator<I> &&
    DerivedFrom<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    Same<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>>;
```

Let \(a\) and \(b\) be dereferenceable iterators of type \(I\) such that \(b\) is reachable from \(a\), and let \(D\) be \(iter_-difference_t<I>\). The type \(I\) models ContiguousIterator only if \(addressof(*a + D(b - a))\) is equal to \(addressof(*a) + D(b - a)\).

### 22.3.5 C++17 iterator requirements

The Cpp17Iterator requirements form the basis of the iterator taxonomy; every iterator satisfies the Cpp17Iterator requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (22.3.5.2) or write (22.3.5.3) values, or to provide a richer set of iterator movements (22.3.5.4, 22.3.5.5, 22.3.5.6).

2 A type \(X\) satisfies the Cpp17Iterator requirements if:

(2.1) \(X\) satisfies the Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (15.5.3.1) and lvalues of type \(X\) are swappable (15.5.3.2), and

(2.2) the expressions in Table 73 are valid and have the indicated semantics.

#### Table 73 — Cpp17Iterator requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>(*r)</td>
<td>unspecified</td>
<td></td>
<td>Requires: (r) is dereferenceable.</td>
</tr>
<tr>
<td>(++r)</td>
<td>(X&amp;)</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### 22.3.5.2 Input iterators

A class or pointer type \(X\) satisfies the requirements of an input iterator for the value type \(T\) if \(X\) satisfies the Cpp17Iterator (22.3.5.1) and Cpp17EqualityComparable (Table 23) requirements and the expressions in Table 74 are valid and have the indicated semantics.

2 In Table 74, the term the domain of \(==\) is used in the ordinary mathematical sense to denote the set of values over which \(==\) is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of \(==\) for the iterator values it uses. These requirements can be inferred from
the uses that algorithm makes of == and !=. [Example: The call \texttt{find(a,b,x)} is defined only if the value of \texttt{a} has the property \texttt{p} defined as follows: \texttt{b} has property \texttt{p} and \texttt{a} value \texttt{i} has property \texttt{p} if \((\ast i==x)\) or if \((\ast i!=x \text{ and } ++i \text{ has property } p)\). — end example]

Table 74 — \textit{Cpp17InputIterator} requirements (in addition to \textit{Cpp17Iterator})

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{a \neq b}</td>
<td>contextually convertible to \texttt{bool}</td>
<td>!((a == b))</td>
<td>Requires: ((a, b)) is in the domain of \texttt{==}.</td>
</tr>
<tr>
<td>\texttt{*a}</td>
<td>reference, convertible to \texttt{T}</td>
<td>Requires: \texttt{a} is dereferenceable. \texttt{The expression} ((\texttt{void})*a, *a) \texttt{is equivalent to} \texttt{*a}. If \texttt{a == b} and ((a, b)) \texttt{is in the domain of} \texttt{==} \texttt{then} \texttt{*a} \texttt{is equivalent to} \texttt{*b}.</td>
<td></td>
</tr>
<tr>
<td>\texttt{a-&gt;m}</td>
<td>\texttt{(*a).m}</td>
<td>Requires: \texttt{a} is dereferenceable.</td>
<td></td>
</tr>
<tr>
<td>\texttt{++r}</td>
<td>\texttt{X&amp;}</td>
<td>Requires: \texttt{r} is dereferenceable. \texttt{Ensures: r} \texttt{is dereferenceable or} \texttt{r} \texttt{is past-the-end; any copies of the previous value of} \texttt{r} \texttt{are no longer required to be dereferenceable nor to be in the domain of} \texttt{==}.</td>
<td></td>
</tr>
<tr>
<td>\texttt{(void)++r}</td>
<td></td>
<td>equivalent to \texttt{(void)++r}</td>
<td></td>
</tr>
<tr>
<td>\texttt{*r++}</td>
<td>convertible to \texttt{T}</td>
<td>{ \texttt{T tmp = *r; ++r; return tmp; } }</td>
<td></td>
</tr>
</tbody>
</table>

3 \textit{[Note: For input iterators,} \texttt{a == b} \texttt{does not imply} \texttt{++a == ++b. (Equality does not guarantee the substitution property or referential transparency.) Algorithms on input iterators should never attempt to pass through the same iterator twice. They should be single pass algorithms. Value type \texttt{T} \texttt{is not required to be a} \texttt{Cpp17CopyAssignable} \texttt{type (Table 29). These algorithms can be used with istreams as the source of the input data through the} \texttt{istream\_iterator} \texttt{class template}. — end note]}

22.3.5.3 Output iterators

A class or pointer type \texttt{X} satisfies the requirements of an output iterator if \texttt{X} satisfies the \textit{Cpp17Iterator} requirements (22.3.5.1) and the expressions in Table 75 are valid and have the indicated semantics.

Table 75 — \textit{Cpp17OutputIterator} requirements (in addition to \textit{Cpp17Iterator})

</tr>
<tr>
<td>*r++ = o</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation <code>r</code> is not required to be dereferenceable. Ensures: <code>r</code> is incrementable.</td>
</tr>
</tbody>
</table>

2 [Note: The only valid use of an operator* is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Algorithms on output iterators should never attempt to pass through the same iterator twice. They should be single-pass algorithms. Equality and inequality might not be defined. —end note]

22.3.5.4 Forward iterators

1 A class or pointer type `X` satisfies the requirements of a forward iterator if

(1.1) `X` satisfies the Cpp17InputIterator requirements (22.3.5.2),
(1.2) `X` satisfies the Cpp17DefaultConstructible requirements (15.5.3.1),
(1.3) if `X` is a mutable iterator, `reference` is a reference to `T`; if `X` is a constant iterator, `reference` is a reference to `const T`,
(1.4) the expressions in Table 76 are valid and have the indicated semantics, and
(1.5) objects of type `X` offer the multi-pass guarantee, described below.

2 The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type. [Note: Value-initialized iterators behave as if they refer past the end of the same empty sequence. —end note]

3 Two dereferenceable iterators `a` and `b` of type `X` offer the multi-pass guarantee if:

(3.1) `a == b` implies `++a == ++b` and
(3.2) `X` is a pointer type or the expression `(void)++X(a), *a` is equivalent to the expression `*a`.

4 [Note: The requirement that `a == b` implies `++a == ++b` (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. —end note]

Table 76 — Cpp17ForwardIterator requirements (in addition to Cpp17InputIterator)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>r++</td>
<td>convertible to <code>const X&amp;</code></td>
<td><code>{ X tmp = r; ++r; return tmp; }</code></td>
<td></td>
</tr>
<tr>
<td>*r++</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
If \( a \) and \( b \) are equal, then either \( a \) and \( b \) are both dereferenceable or else neither is dereferenceable.

If \( a \) and \( b \) are both dereferenceable, then \( a == b \) if and only if \(*a\) and \(*b\) are bound to the same object.

### 22.3.5.5 Bidirectional iterators

A class or pointer type \( X \) satisfies the requirements of a bidirectional iterator if, in addition to satisfying the \textit{Cpp17ForwardIterator} requirements, the following expressions are valid as shown in Table 77.

#### Table 77 — \textit{Cpp17BidirectionalIterator} requirements (in addition to \textit{Cpp17ForwardIterator})

<table>
<thead>
<tr>

<tbody>
<tr>
<td>(--r)</td>
<td>&amp;&amp;</td>
<td></td>
<td>Requires: there exists ( s ) such that ( r == ++s ). Ensures: ( r ) is dereferenceable. --(++r) == r. --r == --s implies ( r == s ). addressof(r) == addressof(--r).</td>
</tr>
<tr>
<td>( r-- )</td>
<td>convertible to &amp; | const &amp;&amp;</td>
<td>{ ( X) tmp = r; ( r)--; } return tmp; }</td>
<td></td>
</tr>
<tr>
<td>(*r--)</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

[Note: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — end note]

### 22.3.5.6 Random access iterators

A class or pointer type \( X \) satisfies the requirements of a random access iterator if, in addition to satisfying the \textit{Cpp17BidirectionalIterator} requirements, the following expressions are valid as shown in Table 78.

#### Table 78 — \textit{Cpp17RandomAccessIterator} requirements (in addition to \textit{Cpp17BidirectionalIterator})

22.3.6 Indirect callable requirements

22.3.6.1 General

There are several concepts that group requirements of algorithms that take callable objects (19.14.3) as arguments.

22.3.6.2 Indirect callables

The indirect callable concepts are used to constrain those algorithms that accept callable objects (19.14.2) as arguments.

```cpp
namespace std {
    template<class F, class I>
    concept IndirectUnaryInvocable =
        Readable<I> &&
        CopyConstructible<F> &&
        Invocable<F, iter_value_t<I>&> &&
        Invocable<F, iter_reference_t<I>> &&
        Invocable<F, iter_common_reference_t<I>> &&
        CommonReference<
            invoke_result_t<F&, iter_value_t<I>&>,
            invoke_result_t<F&, iter_reference_t<I>>;>

template<class F, class I>
    concept IndirectRegularUnaryInvocable =
        Readable<I> &&
        CopyConstructible<F> &&
        RegularInvocable<F, iter_value_t<I>&> &&
        RegularInvocable<F, iter_reference_t<I>> &&
        RegularInvocable<F, iter_common_reference_t<I>> &&
        CommonReference<
            invoke_result_t<F&, iter_value_t<I>&>,
            invoke_result_t<F&, iter_reference_t<I>>;>

template<class F, class I>
    concept IndirectUnaryPredicate =
        Readable<I> &&
        CopyConstructible<F> &&
        Predicate<F, iter_value_t<I>&> &&
        Predicate<F, iter_reference_t<I>> &&
        Predicate<F, iter_common_reference_t<I>>;>
```
template<class F, class I1, class I2 = I1>
concept IndirectRelation =
  Readable<I1> && Readable<I2> &&
  CopyConstructible<F> &&
  Relation<F, iter_value_t<I1>&, iter_value_t<I2>&> &&
  Relation<F, iter_value_t<I1>&, iter_reference_t<I2>> &&
  Relation<F, iter_reference_t<I1>, iter_value_t<I2>&> &&
  Relation<F, iter_reference_t<I1>, iter_reference_t<I2>> &&
  Relation<F, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;

template<class F, class I1, class I2 = I1>
concept IndirectStrictWeakOrder =
  Readable<I1> && Readable<I2> &&
  CopyConstructible<F> &&
  StrictWeakOrder<F, iter_value_t<I1>&, iter_value_t<I2>&> &&
  StrictWeakOrder<F, iter_value_t<I1>&, iter_reference_t<I2>> &&
  StrictWeakOrder<F, iter_reference_t<I1>, iter_value_t<I2>&> &&
  StrictWeakOrder<F, iter_reference_t<I1>, iter_reference_t<I2>> &&
  StrictWeakOrder<F, iter_common_reference_t<I1>, iter_common_reference_t<I2>>;

22.3.6.3 Class template projected

Class template projected is used to constrain algorithms that accept callable objects and projections (15.3.21). It combines a Readable type I and a callable object type Proj into a new Readable type whose reference type is the result of applying Proj to the iter_reference_t of I.

namespace std {
  template<Readable I, IndirectRegularUnaryInvocable<I> Proj>
  struct projected {
    using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
    indirect_result_t<Proj&, I> operator*() const; // not defined
  };

  template<WeaklyIncrementable I, class Proj>
  struct incrementable_traits<projected<I, Proj>> {
    using difference_type = iter_difference_t<I>;
  };
}

22.3.7 Common algorithm requirements

22.3.7.1 General

There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between Readable and Writable types: IndirectlyMovable, IndirectlyCopyable, and IndirectlySwappable. There are three relational concepts for rearrangements: Permutable, Mergeable, and Sortable. There is one relational concept for comparing values from different sequences: IndirectlyComparable.

[Note: The ranges::less< function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (19.14.8). — end note]

22.3.7.2 Concept IndirectlyMovable

The IndirectlyMovable concept specifies the relationship between a Readable type and a Writable type between which values may be moved.

template<class In, class Out>
concept IndirectlyMovable =
  Readable<In> &&
  Writable<Out, iter_rvalue_reference_t<In>>;

The IndirectlyMovableStorable concept augments IndirectlyMovable with additional requirements enabling the transfer to be performed through an intermediate object of the Readable type's value type.
template<class In, class Out>
concept IndirectlyMovableStorable =
    IndirectlyMovable<In, Out> &&
    Writable<Out, iter_value_t<In>> &&
    Movable<iter_value_t<In>> &&
    Constructible<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
    Assignable<iter_value_t<In>&, iter_rvalue_reference_t<In>>;

3 Let \( i \) be a dereferenceable value of type \( \text{In} \). \( \text{In} \) and \( \text{Out} \) model \text{IndirectlyMovableStorable}<\text{In}, \text{Out}> only if after the initialization of the object \( \text{obj} \) in

\[
\text{iter\_value\_t<In>} \text{ obj(ranges::iter\_move}(i)));
\]

\( \text{obj} \) is equal to the value previously denoted by \( \ast i \). If \( \text{iter\_rvalue\_reference\_t<In>} \) is an rvalue reference type, the resulting state of the value denoted by \( \ast i \) is valid but unspecified (15.5.5.15).

22.3.7.3 Concept IndirectlyCopyable

1 The \text{IndirectlyCopyable} concept specifies the relationship between a \text{Readable} type and a \text{Writable} type between which values may be copied.

\[
\text{template<class In, class Out>}
\text{concept IndirectlyCopyable} =
\text{Readable<In> && Writable<Out, iter_reference_t<In>>};
\]

2 The \text{IndirectlyCopyableStorable} concept augments \text{IndirectlyCopyable} with additional requirements enabling the transfer to be performed through an intermediate object of the \text{Readable} type’s value type. It also requires the capability to make copies of values.

\[
\text{template<class In, class Out>}
\text{concept IndirectlyCopyableStorable} =
\text{IndirectlyCopyable<In, Out> && Writable<Out, const iter_value_t<In>&> && Copyable<iter_value_t<In>> && Constructible<iter_value_t<In>, iter_reference_t<In>> && Assignable<iter_value_t<In>&, iter_reference_t<In>>};
\]

3 Let \( i \) be a dereferenceable value of type \( \text{In} \). \( \text{In} \) and \( \text{Out} \) model \text{IndirectlyCopyableStorable}<\text{In}, \text{Out}> only if after the initialization of the object \( \text{obj} \) in

\[
\text{iter\_value\_t<In>} \text{ obj(*i)};
\]

\( \text{obj} \) is equal to the value previously denoted by \( \ast i \). If \( \text{iter\_reference\_t<In>} \) is an rvalue reference type, the resulting state of the value denoted by \( \ast i \) is valid but unspecified (15.5.5.15).

22.3.7.4 Concept IndirectlySwappable

1 The \text{IndirectlySwappable} concept specifies a swappable relationship between the values referenced by two \text{Readable} types.

\[
\text{template<class I1, class I2 = I1>}
\text{concept IndirectlySwappable} =
\text{Readable<I1> && Readable<I2> && requires(I1& i1, I2& i2) {
    ranges::iter\_swap(i1, i1);
    ranges::iter\_swap(i2, i2);
    ranges::iter\_swap(i1, i2);
    ranges::iter\_swap(i1, i2);
}};
\]

22.3.7.5 Concept IndirectlyComparable

1 The \text{IndirectlyComparable} concept specifies the common requirements of algorithms that compare values from two different sequences.

\[
\text{template<class I1, class I2, class R, class P1 = identity, class P2 = identity>}
\text{concept IndirectlyComparable} =
\text{IndirectRelation<R, projected<I1, P1>, projected<I2, P2>>};
\]
22.3.7.6 Concept Permutable

The Permutable concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```cpp
template<class I>
concept Permutable =
  ForwardIterator<I> &&
  IndirectlyMovableStorable<I, I> &&
  IndirectlySwappable<I, I>;
```

22.3.7.7 Concept Mergeable

The Mergeable concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```cpp
template<class I1, class I2, class Out, class R = ranges::less<>,
  class P1 = identity, class P2 = identity>
concept Mergeable =
  InputIterator<I1> &&
  InputIterator<I2> &&
  WeaklyIncrementable<Out> &&
  IndirectlyCopyable<I1, Out> &&
  IndirectlyCopyable<I2, Out> &&
  IndirectStrictWeakOrder<R, projected<I1, P1>, projected<I2, P2>>;
```

22.3.7.8 Concept Sortable

The Sortable concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., sort).

```cpp
template<class I, class R = ranges::less<>, class P = identity>
concept Sortable =
  Permutable<I> &&
  IndirectStrictWeakOrder<R, projected<I, P>>;
```

22.4 Iterator primitives

To simplify the task of defining iterators, the library provides several classes and functions:

22.4.1 Standard iterator tags

It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces category tag classes which are used as compile time tags for algorithm selection. They are: output_iterator_tag, input_iterator_tag, forward_iterator_tag, bidirectional_iterator_tag, random_access_iterator_tag, and contiguous_iterator_tag. For every iterator of type I, iterator_traits<I>::iterator_category shall be defined to be a category tag that describes the iterator’s behavior. Additionally, iterator_traits<I>::iterator_concept may be used to indicate conformance to the iterator concepts (22.3.4).

```cpp
namespace std {
  struct output_iterator_tag { };  // output_iterator_tag
  struct input_iterator_tag { };   // input_iterator_tag
  struct forward_iterator_tag: public input_iterator_tag { };  // forward_iterator_tag
  struct bidirectional_iterator_tag: public forward_iterator_tag { };  // bidirectional_iterator_tag
  struct random_access_iterator_tag: public bidirectional_iterator_tag { };  // random_access_iterator_tag
  struct contiguous_iterator_tag: public random_access_iterator_tag { };  // contiguous_iterator_tag
}
```

Example: For a program-defined iterator BinaryTreeIterator, it could be included into the bidirectional iterator category by specializing the iterator_traits template:

```cpp
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {  // BinaryTreeIterator
  using iterator_category = bidirectional_iterator_tag;
  using difference_type = ptrdiff_t;
  using value_type = T;
  using pointer = T*;
  using reference = T&;
};
```
Example: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```cpp
template<class BidirectionalIterator>
inline void
evolve(BidirectionalIterator first, BidirectionalIterator last) {
    evolve(first, last,
        typename iterator_traits<BidirectionalIterator>::iterator_category());
}

template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
    bidirectional_iterator_tag) {
    // more generic, but less efficient algorithm
}

template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
    random_access_iterator_tag) {
    // more efficient, but less generic algorithm
}
```

—end example—

22.4.2 Iterator operations

Since only random access iterators provide `+` and `-` operators, the library provides two function templates `advance` and `distance`. These function templates use `+` and `-` for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use `++` to provide linear time implementations.

```cpp
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);

Expects: `n` is negative only for bidirectional iterators.

Effects: Increments `i` by `n` if `n` is non-negative, and decrements `i` by `-n` otherwise.
```

```cpp
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);

Expects: `last` is reachable from `first`, or `InputIterator` meets the Cpp17RandomAccessIterator requirements and `first` is reachable from `last`.

Effects: If `InputIterator` meets the Cpp17RandomAccessIterator requirements, returns `(last - first)`; otherwise, returns the number of increments needed to get from `first` to `last`.
```

```cpp
template<class InputIterator>
constexpr InputIterator next(InputIterator x,
    typename iterator_traits<InputIterator>::difference_type n = 1);

Effects: Equivalent to: `advance(x, n); return x;`
```

```cpp
template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x,
    typename iterator_traits<BidirectionalIterator>::difference_type n = 1);

Effects: Equivalent to: `advance(x, -n); return x;`
```

22.4.3 Range iterator operations

The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type. [Example: `ranges::advance` uses the `+` operator to move a RandomAccessIterator forward `n` steps in constant time. For an iterator type that does not model RandomAccessIterator, `ranges::advance` instead performs `n` individual increments with the `++` operator. —end example]
The function templates defined in this subclause are not found by argument-dependent name lookup (6.4.2). When found by unqualified (6.4.1) name lookup for the postfix-expression in a function call (7.6.1.2), they inhibit argument-dependent name lookup.

**Example:**
```cpp
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
    distance(begin(vec), end(vec)); // #1
}
```

The function call expression at #1 invokes `std::ranges::distance`, not `std::distance`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::distance` is more specialized (12.6.6.2) than `std::ranges::distance` since the former requires its first two parameters to have the same type. — end example]

The number and order of deducible template parameters for the function templates defined in this subclause is unspecified, except where explicitly stated otherwise.

### 22.4.3.1 `ranges::advance`

```cpp
template<Iterator I>
constexpr void advance(I& i, iter_difference_t<I> n);
```

**Expects:** If `I` does not model `BidirectionalIterator`, `n` is not negative.

**Effects:**
- (2.1) If `I` models `RandomAccessIterator`, equivalent to `i += n`.
- (2.2) Otherwise, if `n` is non-negative, increments `i` by `n`.
- (2.3) Otherwise, decrements `i` by `-n`.

```cpp
template<Iterator I, Sentinel<I> S>
constexpr void advance(I& i, S bound);
```

**Expects:** `[i, bound)` denotes a range.

**Effects:**
- (4.1) If `I` and `S` model `Assignable<I&, S>`, equivalent to `i = std::move(bound)`.
- (4.2) Otherwise, if `S` and `I` model `SizedSentinel<S, I>`, equivalent to `ranges::advance(i, bound - i)`.
- (4.3) Otherwise, while `bool(i != bound)` is true, increments `i`.

```cpp
template<Iterator I, Sentinel<I> S>
constexpr iter_difference_t<I> advance(I& i, iter_difference_t<I> n, S bound);
```

**Expects:** If `n > 0`, `[i, bound)` denotes a range. If `n == 0`, `[i, bound)` or `(bound, i)` denotes a range. If `n < 0`, `(bound, i)` denotes a range, `I` models `BidirectionalIterator`, and `I` and `S` model `Same<I, S>`.

**Effects:**
- (6.1) If `S` and `I` model `SizedSentinel<S, I>`:
  - (6.1.1) If `|n| > |bound - i|`, equivalent to `ranges::advance(i, bound)`.
  - (6.1.2) Otherwise, equivalent to `ranges::advance(i, n)`.
- (6.2) Otherwise,
  - (6.2.1) If `n` is non-negative, while `bool(i != bound)` is true, increments `i` but at most `n` times.
  - (6.2.2) Otherwise, while `bool(i != bound)` is true, decrements `i` but at most `-n` times.

**Returns:** `n - M`, where `M` is the difference between the ending and starting positions of `i`.

### 22.4.3.2 `ranges::distance`

```cpp
template<Iterator I, Sentinel<I> S>
```

§ 22.4.3.2
constexpr iter_difference_t<I> distance(I first, S last);

1 Expects: [first, last) denotes a range, or (last, first) denotes a range and S and I model Same<S, I> &amp; SizedSentinel<S, I>.

2 Effects: If S and I model SizedSentinel<S, I>, returns (last - first); otherwise, returns the number of increments needed to get from first to last.

template<Range R>
constexpr iter_difference_t<iterator_t<R>> distance(R&amp; r);

3 Effects: If R models SizedRange, equivalent to:

    return ranges::size(r);

    // 23.4.1

Otherwise, equivalent to:

    return ranges::distance(ranges::begin(r), ranges::end(r));  // 23.3

22.4.3.3 ranges::next

    template&lt;Iterator I&gt;
    constexpr I next(I x);

1 Effects: Equivalent to: ++x; return x;

    template&lt;Iterator I&gt;
    constexpr I next(I x, iter_difference_t&lt;I&gt; n);

2 Effects: Equivalent to: ranges::advance(x, n); return x;

    template&lt;Iterator I, Sentinel&lt;I&gt; S&gt;
    constexpr I next(I x, S bound);

3 Effects: Equivalent to: ranges::advance(x, n, S bound);

    template&lt;Iterator I, Sentinel&lt;I&gt; S&gt;
    constexpr I next(I x, iter_difference_t&lt;I&gt; n, S bound);

4 Effects: Equivalent to: ranges::advance(x, n, bound); return x;

22.4.3.4 ranges::prev

    template&lt;BidirectionalIterator I&gt;
    constexpr I prev(I x);

1 Effects: Equivalent to: --x; return x;

    template&lt;BidirectionalIterator I&gt;
    constexpr I prev(I x, iter_difference_t&lt;I&gt; n);

2 Effects: Equivalent to: ranges::advance(x, -n); return x;

    template&lt;BidirectionalIterator I&gt;
    constexpr I prev(I x, iter_difference_t&lt;I&gt; n, I bound);

3 Effects: Equivalent to: ranges::advance(x, -n, bound); return x;

22.5 Iterator adaptors

22.5.1 Reverse iterators

1 Class template reverse_iterator is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

22.5.1.1 Class template reverse_iterator

    namespace std {
    template&lt;class Iterator&gt;
    class reverse_iterator {
    public:
        using iterator_type = Iterator;
        using iterator_concept = see below;
        using iterator_category = see below;
        using value_type = iter_value_t&lt;Iterator&gt;;
    }
using difference_type = iter_difference_t<Iterator>;
using pointer = typename iterator_traits<Iterator>::pointer;
using reference = iter_reference_t<Iterator>;

constexpr reverse_iterator();
constexpr explicit reverse_iterator(Iterator x);
template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

constexpr Iterator base() const;
constexpr reference operator*() const;
constexpr pointer operator->() const requires
see below;

constexpr reverse_iterator& operator++();
constexpr reverse_iterator operator++(int);
constexpr reverse_iterator& operator--();
constexpr reverse_iterator operator--(int);

constexpr reverse_iterator operator+ (difference_type n) const;
constexpr reverse_iterator& operator+=(difference_type n);
constexpr reverse_iterator operator- (difference_type n) const;
constexpr reverse_iterator& operator-=(difference_type n);
constexpr unspecified operator[](difference_type n) const;

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(see below);
template<IndirectlySwappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const reverse_iterator& x,
const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:
Iterator current;
};

template<class Iterator1, class Iterator2>
constexpr bool operator==(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator!=(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator<(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator>(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr bool operator>=(const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y);
template<class Iterator1, class Iterator2>
constexpr auto operator- (const reverse_iterator<Iterator1>& x,
const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(  
    typename reverse_iterator<Iterator>::difference_type n,  
    const reverse_iterator<Iterator>& x):

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

template<class Iterator1, class Iterator2>
requires (!SizedSentinel<Iterator1, Iterator2>)
inline constexpr bool disable_sized_sentinel<reverse_iterator<Iterator1>,  
    reverse_iterator<Iterator2>> = true;

The member typedef-name iterator_concept denotes
— random_access_iterator_tag if Iterator models RandomAccessIterator, and
— bidirectional_iterator_tag otherwise.

The member typedef-name iterator_category denotes
— random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models DerivedFrom<random_access_iterator_tag>, and
— iterator_traits<Iterator>::iterator_category otherwise.

22.5.1.2 Requirements

1 The template parameter Iterator shall either meet the requirements of a Cpp17BidirectionalIterator (22.3.5.5) or model BidirectionalIterator (22.3.4.12).

2 Additionally, Iterator shall either meet the requirements of a Cpp17RandomAccessIterator (22.3.5.6) or model RandomAccessIterator (22.3.4.13) if the definitions of any of the members
— operator+, operator-, operator+=, operator-= (22.5.1.6), or
— operator[] (22.5.1.5),

or the non-member operators (22.5.1.7)
— operator<, operator>, operator<=, operator>=, operator-, or operator+ (22.5.1.8)

are instantiated (12.8.1).

22.5.1.3 Construction and assignment

constexpr reverse_iterator();
1 Effects: Value-initializes current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.

constexpr explicit reverse_iterator(Iterator x);
2 Effects: Initializes current with x.

template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
3 Effects: Initializes current with u.current.

template<class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);
4 Effects: Assigns u.base() to current.
5 Returns: *this.

22.5.1.4 Conversion

constexpr Iterator base() const; // explicit
1 Returns: current.
22.5.1.5 Element access

```cpp
constexpr reference operator*() const;
```

**Effects:** As if by:

```cpp
Iterator tmp = current;
return *--tmp;
```

```cpp
constexpr pointer operator->() const
requires (is_pointer_v<Iterator> ||
requires (const Iterator i) { i.operator->(); });
```

**Effects:**

1. If `Iterator` is a pointer type, equivalent to:
   ```cpp
   return prev(current);
   ```
2. Otherwise, equivalent to:
   ```cpp
   return prev(current).operator->();
   ```

```cpp
constexpr unspecified operator[](difference_type n) const;
```

**Returns:** `current[-n-1]`.

22.5.1.6 Navigation

```cpp
constexpr reverse_iterator operator+(difference_type n) const;
```

**Returns:** `reverse_iterator(current-n)`.

```cpp
constexpr reverse_iterator operator-(difference_type n) const;
```

**Returns:** `reverse_iterator(current+n)`.

```cpp
constexpr reverse_iterator& operator++();
```

**Effects:** As if by:

```cpp
--current;
```

**Returns:** `*this`.

```cpp
constexpr reverse_iterator& operator++(int);
```

**Effects:** As if by:

```cpp
reverse_iterator tmp = *this;
--current;
return tmp;
```

**Returns:** `*this`.

```cpp
constexpr reverse_iterator& operator--();
```

**Effects:** As if by `++current`.

**Returns:** `*this`.

```cpp
constexpr reverse_iterator& operator--(int);
```

**Effects:** As if by:

```cpp
reverse_iterator tmp = *this;
++current;
return tmp;
```

**Returns:** `*this`.

```cpp
constexpr reverse_iterator& operator+=(difference_type n);
```

**Effects:** As if by:

```cpp
current -= n;
```

**Returns:** `*this`.

```cpp
constexpr reverse_iterator& operator-=(difference_type n);
```

**Effects:** As if by:

```cpp
current += n;
```

**Returns:** `*this`.

22.5.1.7 Comparisons

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator==(const reverse_iterator<Iterator1>& x,
```

§ 22.5.1.7
const reverse_iterator<Iterator2>& y);

Constraints: The expression x.current == y.current shall be valid and convertible to bool.
Returns: x.current == y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator!=(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y);

Constraints: The expression x.current != y.current shall be valid and convertible to bool.
Returns: x.current != y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator<(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: The expression x.current < y.current shall be valid and convertible to bool.
Returns: x.current < y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: The expression x.current <= y.current shall be valid and convertible to bool.
Returns: x.current <= y.current.

template<class Iterator1, class Iterator2>
constexpr bool operator>=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

Constraints: The expression x.current >= y.current shall be valid and convertible to bool.
Returns: x.current >= y.current.

template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());

Returns: y.current - x.current.

22.5.1.8 Non-member functions [reverse.iter.nonmember]

template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());

Returns: y.current - x.current.

template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(typename reverse_iterator<Iterator>::difference_type n, const reverse_iterator<Iterator>& x);

Returns: reverse_iterator<Iterator> (x.current + n).

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(see below);

Effects: Equivalent to:
auto tmp = i.current;
return ranges::iter_move(--tmp);
 Remarks: The expression in noexcept is equivalent to:

    is_nothrow_copy_constructible_v<Iterator> &&
    noexcept(ranges::iter_move(--declval<Iterator&>()))

template<IndirectlySwappable<Iterator> Iterator2>
friend constexpr void
    iter_swap(const reverse_iterator& x,
              const reverse_iterator<Iterator2>& y) noexcept(see below);

 Effects: Equivalent to:

    auto xtmp = x.current;
    auto ytmp = y.current;
    ranges::iter_swap(--xtmp, --ytmp);

 Remarks: The expression in noexcept is equivalent to:

    is_nothrow_copy_constructible_v<Iterator> &&
    is_nothrow_copy_constructible_v<Iterator2> &&
    noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

 Returns: reverse_iterator<Iterator>(i).

22.5.2 Insert iterators [insert.iterators]

1 To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called insert iterators, are provided in the library. With regular iterator classes, 

    while (first != last) *result++ = *first++;

causes a range [first, last) to be copied into a range starting with result. The same code with result being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the insert mode instead of the regular overwrite mode.

2 An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators satisfy the requirements of output iterators. operator* returns the insert iterator itself. The assignment

    operator=(const T& x)

is defined on insert iterators to allow writing into them, it inserts x right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. back_insert_iterator inserts elements at the end of a container, front_insert_iterator inserts elements at the beginning of a container, and insert_iterator inserts elements where the iterator points to in a container. back_inserter, front_inserter, and inserter are three functions making the insert iterators out of a container.

22.5.2.1 Class template back_insert_iterator [back.insert.iterator]

namespace std {
    template<class Container>
    class back_insert_iterator {
protected:
        Container* container = nullptr;

public:
    using iterator_category = output_iterator_tag;
    using value_type = void;
    using difference_type = ptrdiff_t;
    using pointer = void;
    using reference = void;
    using container_type = Container;

    constexpr back_insert_iterator() noexcept = default;
    constexpr explicit back_insert_iterator(Container& x);
    constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr back_insert_iterator& operator=(typename Container::value_type& value);

§ 22.5.2.1 882
constexpr back_insert_iterator& operator*();
constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator operator++(int);

};

template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);

22.5.2.1.1 Operations

constexpr explicit back_insert_iterator(Container& x);

Effects: Initializes container with addressof(x).

constexpr back_insert_iterator& operator=(const typename Container::value_type& value);

Effects: As if by: container->push_back(value);

Returns: *this.

constexpr back_insert_iterator& operator=(typename Container::value_type&& value);

Effects: As if by: container->push_back(std::move(value));

Returns: *this.

constexpr back_insert_iterator& operator*();

Returns: *this.

constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator operator++(int);

Returns: *this.

22.5.2.1.2 back_inserter

template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);

Returns: back_insert_iterator<Container>(x).

22.5.2.2 Class template front_insert_iterator

namespace std {

template<class Container>
class front_insert_iterator {

protected:
    Container* container = nullptr;

public:
    using iterator_category = output_iterator_tag;
    using value_type = void;
    using difference_type = ptrdiff_t;
    using pointer = void;
    using reference = void;
    using container_type = Container;

    constexpr front_insert_iterator(Container& x) noexcept = default;
    constexpr explicit front_insert_iterator(Container& x);
    constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
    constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

    constexpr front_insert_iterator& operator*();
    constexpr front_insert_iterator& operator++();
    constexpr front_insert_iterator operator++(int);

};

§ 22.5.2.2
```cpp
template<class Container>
constexpr front_insert_iterator<Container> front_inserter(Container& x);

22.5.2.2.1 Operations

constexpr explicit front_insert_iterator(Container& x);

1 Effects: Initializes container with addressof(x).

constexpr front_insert_iterator& operator=(const typename Container::value_type& value);

2 Effects: As if by: container->push_front(value);

3 Returns: *this.

constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

4 Effects: As if by: container->push_front(std::move(value));

5 Returns: *this.

constexpr front_insert_iterator& operator*();

6 Returns: *this.

constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator operator++(int);

7 Returns: *this.

22.5.2.22 front_inserter

template<class Container>
constexpr front_insert_iterator<Container> front_inserter(Container& x);

1 Returns: front_insert_iterator<Container>(x).

22.5.2.3 Class template insert_iterator

namespace std {
  template<class Container>
  class insert_iterator {
    protected:
      Container* container = nullptr;
      iterator_t<Container> iter = iterator_t<Container>();

    public:
      using iterator_category = output_iterator_tag;
      using value_type = void;
      using difference_type = ptrdiff_t;
      using pointer = void;
      using reference = void;
      using container_type = Container;

      insert_iterator() = default;
      constexpr insert_iterator(Container& x, iterator_t<Container> i);
      constexpr insert_iterator& operator=(const typename Container::value_type& value);
      constexpr insert_iterator& operator=(typename Container::value_type&& value);

      constexpr insert_iterator& operator*();
      constexpr insert_iterator& operator++();
      constexpr insert_iterator& operator++(int);
    }

    template<class Container>
    constexpr insert_iterator<Container> inserter(Container& x, iterator_t<Container> i);
  };

§ 22.5.2.3 884
```
22.5.2.3.1 Operations

```cpp
castexpr insert_iterator(Container& x, iterator_t<Container> i);
/// Effects: Initializes container with addressof(x) and iter with i.

castexpr insert_iterator& operator=(const typename Container::value_type& value);
/// Effects: As if by:
/// iter = container->insert(iter, value);
/// ++iter;

returns *this.

castexpr insert_iterator& operator=(typename Container::value_type&& value);
/// Effects: As if by:
/// iter = container->insert(iter, std::move(value));
/// ++iter;

returns *this.

returns *this.

returns *this.

returns *this.
```

22.5.2.3.2 inserter

```cpp
template<class Container>
castexpr insert_iterator<Container>
inserter(Container& x, iterator_t<Container> i);
/// Returns: insert_iterator<Container>(x, i).
```
constexpr move_iterator();
constexpr explicit move_iterator(Iterator i);
template<class U> constexpr move_iterator(const move_iterator<U>& u);
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

constexpr iterator_type base() const;
constexpr reference operator*() const;
constexpr pointer operator->() const;

constexpr move_iterator& operator++();
constexpr auto operator++(int);
constexpr move_iterator& operator--();
constexpr move_iterator operator--(int);

constexpr move_iterator operator+(difference_type n) const;
constexpr move_iterator& operator+=(difference_type n);
constexpr move_iterator operator-(difference_type n) const;
constexpr move_iterator& operator-=(difference_type n);

constexpr reference operator[](difference_type n) const;

template<Sentinel<Iterator> S>
friend constexpr bool operator==(const move_iterator& x, const move_sentinel<S>& y);

§ 22.5.3.1 886
template<class Iterator1, class Iterator2>
constexpr bool operator<=(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

template<class Iterator1, class Iterator2>
constexpr bool operator>=(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const move_iterator<Iterator1>& x,
    const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());

template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);

template<class Iterator>
constexpr move_iterator<Iterator>
make_move_iterator(Iterator i);

1 The member typedef-name iterator_category denotes
 — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models DerivedFrom<random_access_iterator_tag>, and
 — iterator_traits<Iterator>::iterator_category otherwise.

22.5.3.2 Requirements

The template parameter Iterator shall either meet the Cpp17InputIterator requirements (22.3.5.2) or model InputIterator (22.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the Cpp17BidirectionalIterator requirements (22.3.5.5) or model BidirectionalIterator (22.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the Cpp17RandomAccess Iterator requirements (22.3.5.6) or model RandomAccessIterator (22.3.4.13).

22.5.3.3 Construction and assignment

constexpr move_iterator();

Effects: Constructs a move_iterator, value-initializing current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.

constexpr explicit move_iterator(Iterator i);

Effects: Constructs a move_iterator, initializing current with i.

template<class U> constexpr move_iterator(const move_iterator<U>& u);

Effects: Constructs a move_iterator, initializing current with u.base().

Requires: U shall be convertible to Iterator.

template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

Effects: Assigns u.base() to current.

Requires: U shall be convertible to Iterator.

22.5.3.4 Conversion

constexpr Iterator base() const;

Returns: current.

22.5.3.5 Element access

constexpr reference operator*() const;

Effects: Equivalent to: return ranges::iter_move(current);
constexpr pointer operator->() const;

Returns: current.

constexpr reference operator[](difference_type n) const;

Effects: Equivalent to: ranges::iter_move(current + n);

22.5.3.6 Navigation [move.iter.nav]

constexpr move_iterator& operator++();

Effects: As if by ++current.

Returns: *this.

constexpr auto operator++(int);

Effects: If Iterator models ForwardIterator, equivalent to:

move_iterator tmp = *this;
++current;
return tmp;

Otherwise, equivalent to ++current.

constexpr move_iterator& operator--();

Effects: As if by --current.

Returns: *this.

constexpr move_iterator operator--(int);

Effects: As if by:

move_iterator tmp = *this;
--current;
return tmp;

constexpr move_iterator operator+(difference_type n) const;

Returns: move_iterator(current + n).

constexpr move_iterator& operator+=(difference_type n);

Effects: As if by:

current += n;

Returns: *this.

constexpr move_iterator operator-(difference_type n) const;

Returns: move_iterator(current - n).

constexpr move_iterator& operator-=(difference_type n);

Effects: As if by:

current -= n;

Returns: *this.

22.5.3.7 Comparisons [move.iter.op.comp]

template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

template<Sentinel<Iterator> S>
frend constexpr bool operator==(const move_iterator& x, const move_sentinel<S>& y);

template<Sentinel<Iterator> S>
frend constexpr bool operator==(const move_sentinel<S>& x, const move_iterator& y);

Constraints: The expression x.base() == y.base() shall be valid and convertible to bool.

Returns: x.base() == y.base().

§ 22.5.3.7 888
template<class Iterator1, class Iterator2>
constexpr bool operator!=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Constraints: The expression x.base() == y.base() shall be valid and convertible to bool.

Returns: !(x == y).

template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Constraints: The expression x.base() < y.base() shall be valid and convertible to bool.

Returns: x.base() < y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator!=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Constraints: The expression y.base() < x.base() shall be valid and convertible to bool.

Returns: y < x.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

Constraints: The expression y.base() < x.base() shall be valid and convertible to bool.

Returns: !(y < x).

template<class Iterator1, class Iterator2>
constexpr auto operator-(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());

template<SizedSentinel<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);

Returns: x.base() - y.base().

22.5.3.8 Non-member functions

template<class Iterator1, class Iterator2>
constexpr move_iterator<Iterator1> operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator1>& x);

Constraints: The expression x + n shall be valid and have type Iterator.

Returns: x + n.

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

Effects: Equivalent to: return ranges::iter_move(i.current);
template<IndirectlySwappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
    noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);

Returns: move_iterator<Iterator>(i).

22.5.3.9 Class template move_sentinel [move.sentinel]
1 Class template move_sentinel is a sentinel adaptor useful for denoting ranges together with move_iterator. When an input iterator type I and sentinel type S model Sentinel<S, I>, move_sentinel<S> and move_iterator<I> model Sentinel<move_sentinel<S>, move_iterator<I>> as well.

[Example: A move_if algorithm is easily implemented with copy_if using move_iterator and move_sentinel:

```cpp
template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, 
IndirectUnaryPredicate<I> Pred>
    requires IndirectlyMovable<I, O>
void move_if(I first, S last, O out, Pred pred) {
    std::ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
```
— end example]

namespace std {
    template<Semiregular S>
    class move_sentinel {
        public:
            constexpr move_sentinel();
            constexpr explicit move_sentinel(S s);
            template<class S2>
                requires ConvertibleTo<const S2&, S>
            constexpr move_sentinel(const move_sentinel<S2>& s);
            template<class S2>
                requires Assignable<S&, const S2&>
            constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

            constexpr S base() const;
        private:
            S last;    // exposition only
    };
}

22.5.3.10 Operations [move.sent.ops]

constexpr move_sentinel();

Effects: Value-initializes last. If is_trivially_default_constructible_v<S> is true, then this constructor is a constexpr constructor.

constexpr explicit move_sentinel(S s);

Effects: Initializes last with std::move(s).

template<class S2>
    requires ConvertibleTo<const S2&, S>
constexpr move_sentinel(const move_sentinel<S2>& s);

Effects: Initializes last with s.last.

template<class S2>
    requires Assignable<S&, const S2&>
constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

Effects: Equivalent to: last = s.last; return *this;
22.5.4 Common iterators

22.5.4.1 Class template common_iterator

Class template common_iterator is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

[Note: The common_iterator type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — end note]

[Example:

```cpp
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
```
—end example]

namespace std {
  template<Iterator I, Sentinel<I> S>
  requires (!Same<I, S>)
  class common_iterator {
    public:
      constexpr common_iterator() = default;
      constexpr common_iterator(I i);
      constexpr common_iterator(S s);
      template<class I2, class S2>
        requires ConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S>
        constexpr common_iterator(const common_iterator<I2, S2>& x);
      template<class I2, class S2>
        requires ConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S> &&
          Assignable<I&, const I2&> && Assignable<S&, const S2&>
        common_iterator& operator=(const common_iterator<I2, S2>& x);
      decltype(auto) operator*();
      decltype(auto) operator*() const
        requires dereferenceable<const I>;
      decltype(auto) operator->() const
        requires see below;
      common_iterator& operator++();
      decltype(auto) operator++(int);
      template<class I2, Sentinel<I> S2>
        requires Sentinel<S, I2>
        friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
      template<class I2, Sentinel<I> S2>
        requires Sentinel<S, I2> && EqualityComparableWith<I, I2>
        friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
      template<class I2, Sentinel<I> S2>
        requires Sentinel<S, I2>
        friend bool operator!=(const common_iterator& x, const common_iterator<I2, S2>& y);
      template<SizedSentinel<I> I2, SizedSentinel<I> S2>
        requires SizedSentinel<S, I2>
        friend iter_difference_t<I2> operator-;
    } // class common_iterator
  } // template
} // namespace std
22.5.4.2 Associated types

1 The nested typedef-names of the specialization of iterator_traits for common_iterator<I, S> are defined as follows.

1.1 iterator_concept denotes forward_iterator_tag if I models ForwardIterator; otherwise it denotes input_iterator_tag.

1.2 iterator_category denotes forward_iterator_tag if iterator_traits<I>::iterator_category models DerivedFrom<forward_iterator_tag>; otherwise it denotes input_iterator_tag.

1.3 If the expression a.operator->() is well-formed, where a is an lvalue of type const common_iterator<I, S>, then pointer denotes the type of that expression. Otherwise, pointer denotes void.

22.5.4.3 Constructors and conversions

constexpr common_iterator(I i);

1 Effects: Initializes v_ as if by v_{in_place_type<I>, std::move(i)}.

constexpr common_iterator(S s);

2 Effects: Initializes v_ as if by v_{in_place_type<S>, std::move(s)}.

template<class I2, class S2>

requiresConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S>

constexpr common_iterator(const common_iterator<I2, S2>& x);

3 Expects: x.v_.valueless_by_exception() is false.

4 Effects: Initializes v_ as if by v_{in_place_index<i>, get<i>(x.v_)}, where i is x.v_.index().

template<class I2, class S2>

requiresConvertibleTo<const I2&, I> && ConvertibleTo<const S2&, S> && Assignable<I&, const I2&> && Assignable<S&, const S2&>

common_iterator& operator=(const common_iterator<I2, S2>& x);

5 Expects: x.v_.valueless_by_exception() is false.

6 Effects: Equivalent to:
If $v_.index() == x.v_.index()$, then $\text{get<i>(v_\_)} = \text{get<i>(x.v_\_)}.\$

Otherwise, $v_.emplace<i>(\text{get<i>(x.v_\_)})$.

where $i$ is $x.v_.index()$.

Returns: *this

22.5.4.4 Accessors  

decltype(auto) operator*();
decltype(auto) operator*() const  
requires dereferenceable<\text{const I}>;  

Effects: Equivalent to: return \text{get<i>(v_\_)}.\$

decltype(auto) operator->() const  
requires see below;  

The expression in the requires clause is equivalent to:

\begin{verbatim}
Read<\text{const I}> &&
(requires(\text{const I} & i) { i.operator->(); } ||
is_reference_v<\text{iter_reference_t}<\text{I}> ||
Constructible<\text{iter_value_t}<\text{I}>, \text{iter_reference_t}<\text{I}>)
\end{verbatim}

Effects: holds_alternative<\text{I}>(v_\_).\$

22.5.4.5 Navigation

common_iterator& operator++();  

Effects: Equivalent to ++\text{get<i>(v_\_)}.\$

decltype(auto) operator++(int);  

Effects: If I models ForwardIterator, equivalent to:

\begin{verbatim}
common_iterator tmp = *this;
++*this;
return tmp;
\end{verbatim}

Otherwise, equivalent to: return get<i>(v_\_)++;\$

§ 22.5.4.5
22.5.4.6 Comparisons

template<class I2, Sentinel<I> S2>
    requires Sentinel<S, I2>
friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);

1 Expects: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
2 Returns: true if i == j, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

template<class I2, Sentinel<I> S2>
    requires Sentinel<S, I2> && EqualityComparableWith<I, I2>
friend bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);

3 Expects: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
4 Returns: true if i and j are each 1, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

template<class I2, Sentinel<I> S2>
    requires Sentinel<S, I2>
friend bool operator!=(const common_iterator& x, const common_iterator<I2, S2>& y);

5 Effects: Equivalent to: return !(x == y);

template<SizedSentinel<I> I2, SizedSentinel<I> S2>
    requires SizedSentinel<S, I2>
friend iter_difference_t<I2> operator-(const common_iterator& x, const common_iterator<I2, S2>& y);

6 Expects: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
7 Returns: 0 if i and j are each 1, and otherwise get<i>(x.v_) - get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

22.5.4.7 Customization

friend iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
    noexcept(noexcept(ranges::iter_move(declval<const I&>())))
    requires InputIterator<I>;

1 Expects: holds_alternative<I>(v_).
2 Effects: Equivalent to: return ranges::iter_move(get<I>(i.v_));

template<IndirectlySwappable<I> I2, class S2>
friend void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))

3 Expects: holds_alternative<I>(x.v_) and holds_alternative<I2>(y.v_) are each true.
4 Effects: Equivalent to ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_)).

22.5.5 Default sentinels

namespace std {
    struct default_sentinel_t { };
}

1 Class default_sentinel_t is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., counted_iterator (22.5.6.1)).

22.5.6 Counted iterators

22.5.6.1 Class template counted_iterator

1 Class template counted_iterator is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with default_-

§ 22.5.6.1
sentinel in calls to generic algorithms to operate on a range of \( N \) elements starting at a given position without needing to know the end position a priori.

2 \[\text{Example:}\]

```cpp
list<string> s;
// populate the list \( s \) with at least 10 strings
vector<string> v;
// copies 10 strings into \( v \):
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
```

—end example

3 Two values \( i_1 \) and \( i_2 \) of types `counted_iterator`\(<I_1>` and `counted_iterator`\(<I_2>` refer to elements of the same sequence if and only if `next(i_1.base(), i_1.count())` and `next(i_2.base(), i_2.count())` refer to the same (possibly past-the-end) element.

```cpp
namespace std {
    template<Iterator I>
    class counted_iterator {
    public:
        using iterator_type = I;

        constexpr counted_iterator() = default;
        constexpr counted_iterator(I x, iter_difference_t<I> n);
        template<class I2>
        requires ConvertibleTo<const I2&, I>
        constexpr counted_iterator(const counted_iterator<I2>& x);
        template<class I2>
        requires Assignable<I&, const I2&>
        constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

        constexpr I base() const;
        constexpr iter_difference_t<I> count() const noexcept;
        constexpr decltype(auto) operator*() const requires dereferenceable<const I>;
        constexpr counted_iterator& operator++();
        decltype(auto) operator++(int);
        constexpr counted_iterator operator++(int) requires ForwardIterator<I>;
        constexpr counted_iterator& operator--();
        constexpr counted_iterator operator--(int) requires BidirectionalIterator<I>;
        constexpr counted_iterator operator+(iter_difference_t<I> n) const requires RandomAccessIterator<I>;
        friend constexpr counted_iterator operator+(iter_difference_t<I> n, const counted_iterator& x) requires RandomAccessIterator<I>;
        constexpr counted_iterator& operator+=(iter_difference_t<I> n) requires RandomAccessIterator<I>;
        constexpr counted_iterator operator-(iter_difference_t<I> n) const requires RandomAccessIterator<I>;
        template<Common<I> I2>
        friend constexpr iter_difference_t<I2> operator-(
            const counted_iterator& x, const counted_iterator<I2>& y);
        friend constexpr counted_iterator operator-(
            const counted_iterator& x, default_sentinel_t);
        friend constexpr counted_iterator operator-(
            default_sentinel_t, const counted_iterator& y);
```
constexpr counted_iterator& operator-=(iter_difference_t<I> n)  
requires RandomAccessIterator<I>;

constexpr decltype(auto) operator[](iter_difference_t<I> n) const  
requires RandomAccessIterator<I>;

template<Common<I> I2>  
friend constexpr bool operator==(  
    const counted_iterator& x, const counted_iterator<I2>& y);  
friend constexpr bool operator==(  
    const counted_iterator& x, default_sentinel_t);  
friend constexpr bool operator==(  
    default_sentinel_t, const counted_iterator& x);

template<Common<I> I2>  
friend constexpr bool operator!=(  
    const counted_iterator& x, const counted_iterator<I2>& y);  
friend constexpr bool operator!=(  
    const counted_iterator& x, default_sentinel_t y);  
friend constexpr bool operator!=(  
    default_sentinel_t x, const counted_iterator& y);

template<Common<I> I2>  
friend constexpr bool operator<(  
    const counted_iterator& x, const counted_iterator<I2>& y);  

22.5.6.2 Constructors and conversions [counted.iter.const]  
constexpr counted_iterator(I i, iter_difference_t<I> n);  

1  
Expects: n >= 0.  
Effects: Initializes current with i and length with n.
template<class I2>
    requires ConvertibleTo<const I2&, I>
    constexpr counted_iterator(const counted_iterator<I2>& x);

    Effects: Initializes current with x.current and length with x.length.

template<class I2>
    requires Assignable<I&, const I2&>
    constexpr counted_iterator& operator=(const counted_iterator<I2>& x);

    Effects: Assigns x.current to current and x.length to length.
    Returns: *this.

22.5.6.3 Accessors
    [counted.iter.access]

castexpr I base() const;
    Effects: Equivalent to: return current;

constexpr iter_difference_t<I> count() const noexcept;
    Effects: Equivalent to: return length;

22.5.6.4 Element access
    [counted.iter.elem]

castexpr decltype(auto) operator*();
    constexpr decltype(auto) operator*() const
        requires dereferenceable<const I>;
    Effects: Equivalent to: return *current;

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
    requires RandomAccessIterator<I>;
    Effects: n < length.
    Returns: current[n];

22.5.6.5 Navigation
    [counted.iter.nav]

castexpr counted_iterator& operator++();
    Effects: length > 0.
    Returns: current++;

    Effects: Equivalent to:
    ++current;
    --length;
    return *this;

decltype(auto) operator++(int);
    Effects: length > 0.
    Returns: current++;
    try { return current++; } catch(...) { ++length; throw; }

castexpr counted_iterator operator++(int)
    requires ForwardIterator<I>;
    Effects: Equivalent to:
    counted_iterator tmp = *this;
    ++*this;
    return tmp;

castexpr counted_iterator& operator--();
    requires BidirectionalIterator<I>
    Effects: Equivalent to:
    --current;
constexpr counted_iterator operator--(int) requires BidirectionalIterator<I>;

Effects: Equivalent to:
        counted_iterator tmp = *this;
        --*this;
        return tmp;

constexpr counted_iterator operator+(iter_difference_t<I> n) const requires RandomAccessIterator<I>;

Effects: Equivalent to:
        return counted_iterator(current + n, length - n);

friend constexpr counted_iterator operator+(iter_difference_t<I> n, const counted_iterator& x) requires RandomAccessIterator<I>;

Effects: Equivalent to: return x + n;

constexpr counted_iterator& operator+=(iter_difference_t<I> n) requires RandomAccessIterator<I>;

Effects: Equivalent to:
        current += n;
        length -= n;
        return *this;

constexpr counted_iterator operator-(iter_difference_t<I> n) const requires RandomAccessIterator<I>;

Effects: Equivalent to: return counted_iterator(current - n, length + n);

template<Common<I> I2>
friend constexpr iter_difference_t<I2> operator-(
        const counted_iterator& x, const counted_iterator<I2>& y);

Effects: x and y refer to elements of the same sequence (22.5.6.1).

friend constexpr iter_difference_t<I> operator-(
        const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: return -x.length;

friend constexpr iter_difference_t<I> operator-(
        default_sentinel_t, const counted_iterator& y);

Effects: Equivalent to: return y.length;

constexpr counted_iterator& operator-=(iter_difference_t<I> n) requires RandomAccessIterator<I>;

Effects: Equivalent to:
        current -= n;
        length += n;
        return *this;

22.5.6.6 Comparisons [counted.iter.cmp]

template<Common<I> I2>
friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);

Effects: x and y refer to elements of the same sequence (22.5.6.1).
Effects: Equivalent to: return x.length == y.length;

friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);
friend constexpr bool operator==(default_sentinel_t, const counted_iterator& x);
Effects: Equivalent to: return x.length == 0;

template<Common<I> I2>
friend constexpr bool operator!=(const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr bool operator!=(const counted_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(default_sentinel_t x, const counted_iterator& y);
Effects: Equivalent to: return !(x == y);

template<Common<I> I2>
friend constexpr bool operator<(const counted_iterator& x, const counted_iterator<I2>& y);
Effects: Equivalent to: return y.length < x.length;

[Note: The argument order in the Effects element is reversed because length counts down, not up. —end note]

template<Common<I> I2>
friend constexpr bool operator<(const counted_iterator& x, const counted_iterator<I2>& y);
Effects: Equivalent to: return y < x;

template<Common<I> I2>
friend constexpr bool operator<=(const counted_iterator& x, const counted_iterator<I2>& y);
Effects: Equivalent to: return !(y < x);

template<Common<I> I2>
friend constexpr bool operator>=(const counted_iterator& x, const counted_iterator<I2>& y);
Effects: Equivalent to: return !(x < y);

22.5.6.7 Customizations

friend constexpr iter_rvalue_reference_t<I> iter_move(const counted_iterator& i) noexcept(noexcept(ranges::iter_move(i.current))) requires InputIterator<I>;
Effects: Equivalent to: return ranges::iter_move(i.current);

template<IndirectlySwappable<I> I2>
friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y) noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

22.5.7 Unreachable sentinel

22.5.7.1 Class unreachable_sentinel_t

Class unreachable_sentinel_t can be used with any WeaklyIncrementable type to denote the “upper bound” of an open interval.

[Example:
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');

Provided a newline character really exists in the buffer, the use of unreachable_sentinel above potentially makes the call to find more efficient since the loop test against the sentinel does not require a conditional branch. — end example]

```cpp
namespace std {
    struct unreachable_sentinel_t {
        template<WeaklyIncrementable I>
        friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept;
        template<WeaklyIncrementable I>
        friend constexpr bool operator==(const I&, unreachable_sentinel_t) noexcept;
        template<WeaklyIncrementable I>
        friend constexpr bool operator!=(unreachable_sentinel_t, const I&) noexcept;
        template<WeaklyIncrementable I>
        friend constexpr bool operator!=(const I&, unreachable_sentinel_t) noexcept;
    };
}
```

22.5.7.2 Comparisons

```cpp
template<WeaklyIncrementable I>
friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept;
template<WeaklyIncrementable I>
friend constexpr bool operator==(const I&, unreachable_sentinel_t) noexcept;
1 Returns: false.

template<WeaklyIncrementable I>
friend constexpr bool operator!=(unreachable_sentinel_t, const I&) noexcept;
template<WeaklyIncrementable I>
friend constexpr bool operator!=(const I&, unreachable_sentinel_t) noexcept;
2 Returns: true.
```

22.6 Stream iterators

To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[Example:
```
partial_sum(istream_iterator<double, char>(cin),
           istream_iterator<double, char>(),
           ostream_iterator<double, char>(cout, "\n"));
```
reads a file containing floating-point numbers from cin, and prints the partial sums onto cout. — end example]

22.6.1 Class template istream_iterator

The class template istream_iterator is an input iterator (22.3.5.2) that reads (using operator>>) successive elements from the input stream for which it was constructed. After it is constructed, and every time ++ is used, the iterator reads and stores a value of T. If the iterator fails to read and store a value of T (fail() on the stream returns true), the iterator becomes equal to the end-of-stream iterator value. The constructor with no arguments istream_iterator() always constructs an end-of-stream input iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-stream iterator is not defined. For any other iterator value a const T& is returned. The result of operator-> on an end-of-stream iterator is not defined. For any other iterator value a const T* is returned. The behavior of a program that applies operator++() to an end-of-stream iterator is undefined. It is impossible to store things into istream iterators. The type T shall satisfy the Cpp17DefaultConstructible, Cpp17CopyConstructible, and Cpp17CopyAssignable requirements.

2 Two end-of-stream iterators are always equal. An end-of-stream iterator is not equal to a non-end-of-stream iterator. Two non-end-of-stream iterators are equal when they are constructed from the same stream.
namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>,
        class Distance = ptdiff_t>
    class istream_iterator {
public:
    using iterator_category = input_iterator_tag;
    using value_type = T;
    using difference_type = Distance;
    using pointer = const T*;
    using reference = const T&;
    using char_type = charT;
    using traits_type = traits;
    using istream_type = basic_istream<charT,traits>;

    constexpr istream_iterator();
    constexpr istream_iterator(default_sentinel_t);
    istream_iterator(istream_type& s);
    istream_iterator(const istream_iterator& x) = default;
    ~istream_iterator() = default;
    istream_iterator& operator=(const istream_iterator&);

    const T& operator*() const;
    const T* operator->() const;
    istream_iterator& operator++();
    istream_iterator operator++(int);

    friend bool operator==(const istream_iterator& i, default_sentinel_t);
    friend bool operator==(default_sentinel_t, const istream_iterator& i);
    friend bool operator!=(const istream_iterator& x, default_sentinel_t y);
    friend bool operator!=(default_sentinel_t x, const istream_iterator& y);

private:
    basic_istream<charT,traits>* in_stream;  // exposition only
    T value;  // exposition only
。

    template<class T, class charT, class traits, class Distance>
    bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
            const istream_iterator<T,charT,traits,Distance>& y);

    template<class T, class charT, class traits, class Distance>
    bool operator!=(const istream_iterator<T,charT,traits,Distance>& x,
            const istream_iterator<T,charT,traits,Distance>& y);
};

22.6.1.1 Constructors and destructor

constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
1  Effects: Constructs the end-of-stream iterator. If is_trivially_default_constructible_v<T> is
ture, then these constructors are constexpr constructors.

2  Ensures: in_stream == 0.

istream_iterator(istream_type& s);
3  Effects: Initializes in_stream with addressof(s). value may be initialized during construction or the
first time it is referenced.

4  Ensures: in_stream == addressof(s).

istream_iterator(const istream_iterator& x) = default;
5  Effects: Constructs a copy of x. If is_trivially_copy_constructible_v<T> is true, then this
constructor is a trivial copy constructor.

6  Ensures: in_stream == x.in_stream.
~istream_iterator() = default;

Effects: The iterator is destroyed. If is_trivially_destructible_v<T> is true, then this destructor is trivial.

### 22.6.1.2 Operations

```cpp
const T& operator*() const;

Returns: value.
```

```cpp
const T* operator->() const;

Returns: addressof(operator*()).
```

```cpp
istream_iterator& operator++();

Requires: in_stream != 0.

Effects: As if by: *in_stream >> value;

Returns: *this.
```

```cpp
istream_iterator operator++(int);

Requires: in_stream != 0.

Effects: As if by:

```cpp
istream_iterator tmp = *this;
*in_stream >> value;
return (tmp);
```

```cpp
template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
               const istream_iterator<T,charT,traits,Distance>& y);

Returns: x.in_stream == y.in_stream.
```

```cpp
friend bool operator==(default_sentinel_t, const istream_iterator& i);
friend bool operator==(const istream_iterator& i, default_sentinel_t);

Returns: !i.in_stream.
```

```cpp
template<class T, class charT, class traits, class Distance>
bool operator!=(const istream_iterator<T,charT,traits,Distance>& x,
               const istream_iterator<T,charT,traits,Distance>& y);

friend bool operator!=(default_sentinel_t x, const istream_iterator& y);
friend bool operator!=(const istream_iterator& x, default_sentinel_t y);

Returns: !(x == y)
```

### 22.6.2 Class template ostream_iterator

```cpp
ostream_iterator writes (using operator<<) successive elements onto the output stream from which it was constructed. If it was constructed with charT* as a constructor argument, this string, called a delimiter string, is written to the stream after every T is written. It is not possible to get a value out of the output iterator. Its only use is as an output iterator in situations like

```cpp
while (first != last)
  *result++ = *first++;
```

ostream_iterator is defined as:

```cpp
namespace std {
  template<class T, class charT = char, class traits = char_traits<charT>>
  class ostream_iterator {
    public:
      using iterator_category = output_iterator_tag;
      using value_type = void;
      using difference_type = ptrdiff_t;
      using pointer = void;
      using reference = void;
      using char_type = charT;
  }

```
using traits_type = traits;
using ostream_type = basic_ostream<charT, traits>;

constexpr ostreambuf_iterator() noexcept = default;
ostream_iterator(ostream_type& s);
ostream_iterator(ostream_type& s, const charT* delimiter);
ostream_iterator(const ostream_iterator& x);
~ostream_iterator();
ostream_iterator& operator=(const ostream_iterator&);
ostream_iterator& operator=(const T& value);
ostream_iterator& operator*();
ostream_iterator& operator++();
ostream_iterator& operator++(int);

private:
  basic_ostream<charT, traits>* out_stream = nullptr;  // exposition only
  const charT* delim = nullptr;  // exposition only
};

22.6.2.1 Constructors and destructor

ostream_iterator(ostream_type& s);

Effects: Initializes out_stream with addressof(s) and delim with null.

ostream_iterator(ostream_type& s, const charT* delimiter);

Effects: Initializes out_stream with addressof(s) and delim with delimiter.

ostream_iterator(const ostream_iterator& x);

Effects: Constructs a copy of x.

~ostream_iterator();

Effects: The iterator is destroyed.

22.6.2.2 Operations

ostream_iterator& operator=(const T& value);

Effects: As if by:
  *out_stream << value;
  if (delim != 0)
    *out_stream << delim;
  return *this;

ostream_iterator& operator*();

Returns: *this.

ostream_iterator& operator++();
ostream_iterator& operator++(int);

Returns: *this.

22.6.3 Class template istreambuf_iterator

The class template istreambuf_iterator defines an input iterator (22.3.5.2) that reads successive characters from the streambuf for which it was constructed. operator* provides access to the current input character, if any. Each time operator++ is evaluated, the iterator advances to the next input character. If the end of stream is reached (streambuf_type::sgetc() returns traits::eof()), the iterator becomes equal to the end-of-stream iterator value. The default constructor istreambuf_iterator() and the constructor istreambuf_iterator(0) both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of istreambuf_iterator shall have a trivial copy constructor, a constexpr default constructor, and a trivial destructor.
The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator a `char_type`
value is returned. It is impossible to assign a character via an input iterator.

namespace std {

    template<class charT, class traits = char_traits<charT>>
    class istreambuf_iterator {

public:

    using iterator_category = input_iterator_tag;
    using value_type = charT;
    using difference_type = typename traits::off_type;
    using pointer = unspecified;
    using reference = charT;
    using char_type = charT;
    using traits_type = traits;
    using int_type = typename traits::int_type;
    using streambuf_type = basic_streambuf<charT,traits>;
    using istream_type = basic_istream<charT,traits>;

    class proxy;  // exposition only

    constexpr istreambuf_iterator() noexcept;
    constexpr istreambuf_iterator(default_sentinel_t) noexcept;
    istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
    ~istreambuf_iterator() = default;
    istreambuf_iterator(istream_type& s) noexcept;
    istreambuf_iterator(streambuf_type* s) noexcept;
    istreambuf_iterator(const proxy& p) noexcept;
    istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
    charT operator*() const;
    istreambuf_iterator& operator++();
    proxy operator++(int);
    bool equal(const istreambuf_iterator& b) const;
    friend bool operator==(default_sentinel_t s, const istreambuf_iterator& i);
    friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
    friend bool operator!=(default_sentinel_t a, const istreambuf_iterator& b);
    friend bool operator!=(const istreambuf_iterator& a, default_sentinel_t b);

private:

    streambuf_type* sbuf_;  // exposition only
    }

    template<class charT, class traits>
    bool operator==(const istreambuf_iterator<charT,traits>& a, const istreambuf_iterator<charT,traits>& b);
    template<class charT, class traits>
    bool operator!=(const istreambuf_iterator<charT,traits>& a, const istreambuf_iterator<charT,traits>& b);
    }

22.6.3.1 Class `istreambuf_iterator::proxy`  [istreambuf.iterator.proxy]

namespace std {

    template<class charT, class traits>
    class istreambuf_iterator<charT, traits>::proxy {  // exposition only

    charT keep_;  
    basic_streambuf<charT,traits>* sbuf_;  
    proxy(charT c, basic_streambuf<charT,traits>* sbuf)
    : keep_(c), sbuf_(sbuf) { }  

public:

    charT operator*() { return keep_; }
    }

1 Class `istreambuf_iterator<charT,traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator`
iterator<charT, traits>::proxy provides a temporary placeholder as the return value of the post-increment operator (operator++). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

22.6.3.2 Constructors

For each istreambuf_iterator constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member sbuf_ is initialized with a null pointer value.

```cpp
cconstexpr istreambuf_iterator() noexcept;
cconstexpr istreambuf_iterator(default_sentinel_t) noexcept;
cconstexpr istreambuf_iterator(istream_type& s) noexcept;
cistreambuf_iterator(streambuf_type* s) noexcept;
cistreambuf_iterator(const proxy& p) noexcept;
```

22.6.3.3 Operations

```cpp
ccharT operator*() const
cci
Returns: The character obtained via the streambuf member sbuf_\_\_sgetc().
cc`
cistreambuf_iterator& operator++();
cci
Effects: As if by sbuf_\_\_sbumpc().
cc`
ocproxy operator++(int);
cci
Returns: proxy(sbuf_\_\_sbumpc(), sbuf_\_)
cc`
bool equal(const istreambuf_iterator& b) const;
cci
Returns: true if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what streambuf object they use.
cc`
```

22.6.4 Class template ostreambuf_iterator

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
class ostreambuf_iterator {
            using iterator_category = output_iterator_tag;
            using value_type = void;
```
using difference_type = ptdiff_t;
using pointer = void;
using reference = void;
using char_type = charT;
using traits_type = traits;
using streambuf_type = basic_streambuf<charT,traits>;
using ostream_type = basic_ostream<charT,traits>;

constexpr ostreambuf_iterator() noexcept = default;
ostreambuf_iterator(ostream_type & s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);
ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:

streambuf_type* sbuf_ = nullptr;    // exposition only
};

1 The class template ostreambuf_iterator writes successive characters onto the output stream from which it was constructed. It is not possible to get a character value out of the output iterator.

22.6.4.1 Constructors

ostreambuf_iterator(ostream_type& s) noexcept;

1 Requires: s.rdbuf() shall not be a null pointer.
2 Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;

3 Requires: s shall not be a null pointer.
4 Effects: Initializes sbuf_ with s.

22.6.4.2 Operations

ostreambuf_iterator& operator=(charT c);

1 Effects: If failed() yields false, calls sbuf_->sputc(c); otherwise has no effect.
2 Returns: *this.

ostreambuf_iterator& operator*();

3 Returns: *this.

ostreambuf_iterator& operator++();

4 Returns: *this.

ostreambuf_iterator& operator++(int);

5 Returns: *this.

bool failed() const noexcept;

6 Returns: true if in any prior use of member operator=, the call to sbuf_->sputc() returned traits::eof(); or false otherwise.

22.7 Range access

In addition to being available via inclusion of the <iterator> header, the function templates in 22.7 are available when any of the following headers are included: <array>, <deque>, <forward_list>, <list>, <map>, <regex>, <set>, <span>, <string>, <string_view>, <unordered_map>, <unordered_set>, and <vector>. Each of these templates is a designated customization point (15.5.4.2.1).

template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());

Returns: c.begin().

template<class C> constexpr auto end(const C& c) -> decltype(c.end());

Returns: c.end().

template<class C> constexpr auto end(C& c) -> decltype(c.end());

Returns: c.end().

template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;

Returns: array.

template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;

Returns: array + N.

template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c))) -> decltype(std::begin(c));

Returns: std::begin(c).

template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c))) -> decltype(std::end(c));

Returns: std::end(c).

template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());

Returns: c.rbegin().

template<class C> constexpr auto rend(C& c) -> decltype(c.rend());

Returns: c.rend().

template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);

Returns: reverse_iterator<T*>(array + N).

template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);

Returns: reverse_iterator<T*>(array).

template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.end()).

template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.begin()).

template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));

Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));

Returns: std::rend(c).

22.8 Container and view access

In addition to being available via inclusion of the <iterator> header, the function templates in 22.8 are available when any of the following headers are included: <array>, <deque>, <forward_list>, <list>, <map>, <regex>, <set>, <span>, <string>, <string_view>, <unordered_map>, <unordered_set>, and <vector>. Each of these templates is a designated customization point (15.5.4.2.1).

template<class C> constexpr auto size(const C& c) -> decltype(c.size());

Returns: c.size().

template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;

Returns: N.
template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
4
   Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
5
   Returns: false.

template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
6
   Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
7
   Returns: c.data().

template<class C> constexpr auto data(const C& c) -> decltype(c.data());

    Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
8
   Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;

    Returns: il.begin().
# 23 Ranges library

## 23.1 General

1. This clause describes components for dealing with ranges of elements.
2. The following subclauses describe range and view requirements, and components for range primitives as summarized in Table 79.

### Table 79 — Ranges library summary

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>23.3</td>
<td>&lt;ranges&gt;</td>
</tr>
<tr>
<td>23.4</td>
<td></td>
</tr>
<tr>
<td>23.5</td>
<td>Requirements</td>
</tr>
<tr>
<td>23.6</td>
<td>Range utilities</td>
</tr>
<tr>
<td>23.7</td>
<td>Range adaptors</td>
</tr>
</tbody>
</table>

3. Several places in this clause use the expression DECAY_COPY(x) with semantics as defined in 31.2.6.

## 23.2 Header <ranges> synopsis

```cpp
#include <initializer_list>
#include <iterator>

namespace std::ranges {
  // 23.3, range access
  inline namespace unspecified {
    inline constexpr unspecified begin = unspecified;
    inline constexpr unspecified end = unspecified;
    inline constexpr unspecified cbegin = unspecified;
    inline constexpr unspecified cend = unspecified;
    inline constexpr unspecified rbegin = unspecified;
    inline constexpr unspecified rend = unspecified;
    inline constexpr unspecified crbegin = unspecified;
    inline constexpr unspecified crend = unspecified;
  }

  // 23.4, range primitives
  inline constexpr unspecified size = unspecified;
  inline constexpr unspecified empty = unspecified;
  inline constexpr unspecified data = unspecified;
  inline constexpr unspecified cdata = unspecified;
}

// 23.5.2, ranges

      using type = S;
    };
}

23.3 Range access

In addition to being available via inclusion of the <ranges> header, the customization point objects in 23.3 are available when <iterator> is included.

23.3.1 ranges::begin

The name ranges::begin denotes a customization point object (15.4.2.1.6). The expression ranges::begin(E) for some subexpression E is expression-equivalent to:

1.  E + 0 if E is an lvalue of array type (6.7.2).
2.  Otherwise, if E is an lvalue, DECAY_COPY(E.begin()) if it is a valid expression and its type I models Iterator.
3.  Otherwise, DECAY_COPY(begin(E)) if it is a valid expression and its type I models Iterator with overload resolution performed in a context that includes the declarations:
   template<class T> void begin(T&&) = delete;
   template<class T> void begin(initializer_list<T>&&) = delete;

   and does not include a declaration of ranges::begin.
4.  Otherwise, ranges::begin(E) is ill-formed. [Note: This case can result in substitution failure when ranges::begin(E) appears in the immediate context of a template instantiation. — end note]

2 [Note: Whenever ranges::begin(E) is a valid expression, its type models Iterator. — end note]

23.3.2 ranges::end

The name ranges::end denotes a customization point object (15.4.2.1.6). The expression ranges::end(E) for some subexpression E is expression-equivalent to:

1.  E + extent_v<T> if E is an lvalue of array type (6.7.2) T.
2.  Otherwise, if E is an lvalue, DECAY_COPY(E.end()) if it is a valid expression and its type S models Sentinel<decltype(ranges::begin(E))>. 

§ 23.3.2
Otherwise, \texttt{DECAY\_COPY(end(E))} if it is a valid expression and its type \texttt{S} models \texttt{Sentinel<decltype(ranges::begin(E))> with overload resolution performed in a context that includes the declarations:

```cpp
template<class T> void end(T&&) = delete;
template<class T> void end(initializer_list<T>&&) = delete;
```

and does not include a declaration of \texttt{ranges::end}.

Otherwise, \texttt{ranges::end(E)} is ill-formed. [\textit{Note: This case can result in substitution failure when \texttt{ranges::end(E)} appears in the immediate context of a template instantiation. -- end note}]

\section*{23.3.3 ranges::cbegin [range.access.cbegin]}

The name \texttt{ranges::cbegin} denotes a customization point object (15.4.2.1.6). The expression \texttt{ranges::cbegin(E)} for some subexpression \texttt{E} of type \texttt{T} is expression-equivalent to:

\begin{enumerate}
\item If \texttt{E} is an lvalue, \texttt{DECAY\_COPY(E.rbegin())} if it is a valid expression and its type \texttt{I} models \texttt{Iterator}.
\item Otherwise, \texttt{make_reverse_iterator(ranges::end(E))} if both \texttt{ranges::begin(E)} and \texttt{ranges::end(E)} are valid expressions of the same type \texttt{I} which models \texttt{BidirectionalIterator} (22.3.4.12).
\end{enumerate}

\section*{23.3.4 ranges::cend [range.access.cend]}

The name \texttt{ranges::cend} denotes a customization point object (15.4.2.1.6). The expression \texttt{ranges::cend(E)} for some subexpression \texttt{E} of type \texttt{T} is expression-equivalent to:

\begin{enumerate}
\item If \texttt{E} is an lvalue, \texttt{DECAY\_COPY(rbegin(E))} if it is a valid expression and its type \texttt{I} models \texttt{Iterator}.
\item Otherwise, \texttt{make_reverse_iterator(ranges::end(E))} if it is a valid expression and its type \texttt{I} models \texttt{Iterator} with overload resolution performed in a context that includes the declaration:

```cpp
template<class T> void rbegin(T&&) = delete;
```

and does not include a declaration of \texttt{ranges::rbegin}.

\section*{23.3.5 ranges::rbegin [range.access.rbegin]}

The name \texttt{ranges::rbegin} denotes a customization point object (15.4.2.1.6). The expression \texttt{ranges::rbegin(E)} for some subexpression \texttt{E} is expression-equivalent to:

\begin{enumerate}
\item If \texttt{E} is an lvalue, \texttt{DECAY\_COPY(E.rbegin())} if it is a valid expression and its type \texttt{I} models \texttt{Iterator}.
\item Otherwise, \texttt{make_reverse_iterator(ranges::end(E))} if both \texttt{ranges::begin(E)} and \texttt{ranges::end(E)} are valid expressions of the same type \texttt{I} which models \texttt{BidirectionalIterator} (22.3.4.12).
\end{enumerate}

\section*{23.3.6 ranges::rend [range.access.rend]}

The name \texttt{ranges::rend} denotes a customization point object (15.4.2.1.6). The expression \texttt{ranges::rend(E)} for some subexpression \texttt{E} is expression-equivalent to:

\begin{enumerate}
\item If \texttt{E} is an lvalue, \texttt{DECAY\_COPY(E.rend())} if it is a valid expression and its type \texttt{S} models \texttt{Sentinel<decltype(ranges::begin(E))>}}.
\item Otherwise, \texttt{DECAY\_COPY(rbegin(E))} if it is a valid expression and its type \texttt{S} models \texttt{Sentinel<decltype(ranges::rbegin(E))>}} with overload resolution performed in a context that includes the declaration:

```cpp
template<class T> void rend(T&&) = delete;
```

and does not include a declaration of \texttt{ranges::rend}. 

\section*{§ 23.3.6 913}
23.3.7 ranges::crbegin

The name ranges::crbegin denotes a customization point object (15.4.2.1.6). The expression ranges::
crbegin(E) for some subexpression E of type T is expression-equivalent to:

(1.1) ranges::rbegin(static_cast<const T&>(E)) if E is an lvalue.

(1.2) Otherwise, ranges::rbegin(static_cast<const T&&>(E)).

[Note: Whenever ranges::crbegin(E) is a valid expression, its type models Iterator. — end note]

23.3.8 ranges::crend

The name ranges::crend denotes a customization point object (15.4.2.1.6). The expression ranges::
crend(E) for some subexpression E of type T is expression-equivalent to:

(1.1) ranges::rend(static_cast<const T&>(E)) if E is an lvalue.

(1.2) Otherwise, ranges::rend(static_cast<const T&&>(E)).

[Note: Whenever ranges::crend(E) is a valid expression, the types S and I of ranges::crend(E) and
ranges::crbegin(E) model Sentinel<S, I>. — end note]

23.4 Range primitives

In addition to being available via inclusion of the <ranges> header, the customization point objects in 23.4
are available when <iterator> is included.

23.4.1 size

The name size denotes a customization point object (15.4.2.1.6). The expression ranges::size(E) for some
subexpression E with type T is expression-equivalent to:

(1.1) DECAY_COPY(extent_v<T>) if T is an array type (6.7.2).

(1.2) Otherwise, if disable_sized_range<remove_cv_t<T>> (23.5.3) is false:

(1.2.1) DECAY_COPY(E.size()) if it is a valid expression and its type I models Integral.

(1.2.2) Otherwise, DECAY_COPY(size(E)) if it is a valid expression and its type I models Integral with
overload resolution performed in a context that includes the declaration:

    template<class T> void size(T&&) = delete;

and does not include a declaration of ranges::size.

(1.3) Otherwise, (ranges::end(E) - ranges::begin(E)) if it is a valid expression and the types I and
S of ranges::begin(E) and ranges::end(E) model SizedSentinel<S, I> (22.3.4.8) and Forward-
Iterator<I>. However, E is evaluated only once.

(1.4) Otherwise, ranges::size(E) is ill-formed. [Note: This case can result in substitution failure when
ranges::size(E) appears in the immediate context of a template instantiation. — end note]

[Note: Whenever ranges::size(E) is a valid expression, its type models Integral. — end note]

23.4.2 empty

The name empty denotes a customization point object (15.4.2.1.6). The expression ranges::empty(E) for
some subexpression E is expression-equivalent to:

(1.1) bool(E.empty()) if it is a valid expression.

(1.2) Otherwise, (ranges::size(E) == 0) if it is a valid expression.

(1.3) Otherwise, EQ, where EQ is bool(ranges::begin(E) == ranges::end(E)) except that E is only evalu-
ated once, if EQ is a valid expression and the type of ranges::begin(E) models ForwardIterator.
---

(1.4) — Otherwise, `ranges::empty(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::empty(E)` appears in the immediate context of a template instantiation. — end note]

2 [Note: Whenever `ranges::empty(E)` is a valid expression, it has type `bool`. — end note]

### 23.4.3 data

The name `data` denotes a customization point object (15.4.2.1.6). The expression `ranges::data(E)` for some subexpression `E` is expression-equivalent to:

(1.1) — If `E` is an lvalue, `DECAY_COPY(E.data())` if it is a valid expression of pointer to object type.

(1.2) — Otherwise, if `ranges::begin(E)` is a valid expression whose type models `ContiguousIterator`, `ranges::begin(E) == ranges::end(E) ? nullptr : addressof(*ranges::begin(E))` except that `E` is evaluated only once.

(1.3) — Otherwise, `ranges::data(E)` is ill-formed. [Note: This case can result in substitution failure when `ranges::data(E)` appears in the immediate context of a template instantiation. — end note]

2 [Note: Whenever `ranges::data(E)` is a valid expression, it has type `bool`. — end note]

### 23.4.4 cdata

The name `cdata` denotes a customization point object (15.4.2.1.6). The expression `ranges::cdata(E)` for some subexpression `E` is expression-equivalent to:

(1.1) — `ranges::data(static_cast<const T&>(E))` if `E` is an lvalue.

(1.2) — Otherwise, `ranges::data(static_cast<const T&&>(E))`.

2 [Note: Whenever `ranges::cdata(E)` is a valid expression, it has type `pointer to object type`. — end note]

### 23.5 Range requirements

#### 23.5.1 General

Ranges are an abstraction that allow a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `Iterator` (22.3.4.6). Calling `ranges::end` on a range returns an object whose type models `Sentinel<S, I>`, together with the type `I` of the object returned by `ranges::begin`, models `SizedRange`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

The `Range` concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `SizedRange` concept refines `Range` with the requirement that the number of elements in the range can be determined in constant time using the `ranges::size` function. The `View` concept specifies requirements on a `Range` type with constant-time copy and assign operations.

Several refinements of `Range` group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `RandomAccessIterator` (22.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

#### 23.5.2 Ranges

The `Range` concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```cpp
template<class T>
concept range-impl = // exposition only
    requires(T&& t) {
        ranges::begin(std::forward<T>(t)); // sometimes equality-preserving (see below)
        ranges::end(std::forward<T>(t));
    };

template<class T>
concept Range = range-impl<T&>;
```

§ 23.5.2 915
template<class T>
concept forwarding-range = // exposition only
Range<T> && range-impl<T>;

The required expressions ranges::begin(std::forward<T>(t)) and ranges::end(std::forward<T>(t)) of the range-impl concept do not require implicit expression variations (17.2).

Given an expression E such that decltype((E)) is T, T models range-impl only if

1. ranges::begin(E), ranges::end(E) denotes a range (22.3.1),
2. both ranges::begin(E) and ranges::end(E) are amortized constant time and non-modifying, and
3. if the type of ranges::begin(E) models ForwardIterator, ranges::begin(E) is equality-preserving.

[Note: Equality preservation of both ranges::begin and ranges::end enables passing a Range whose iterator type models ForwardIterator to multiple algorithms and making multiple passes over the range by repeated calls to ranges::begin and ranges::end. Since ranges::begin is not required to be equality-preserving when the return type does not model ForwardIterator, repeated calls might not return equal values or might not be well-defined; ranges::begin should be called at most once for such a range. —end note]

Given an expression E such that decltype((E)) is T and an lvalue t that denotes the same object as E, T models forwarding-range only if

1. ranges::begin(E) and ranges::begin(t) are expression-equivalent,
2. ranges::end(E) and ranges::end(t) are expression-equivalent, and
3. the validity of iterators obtained from the object denoted by E is not tied to the lifetime of that object.

[Note: Since the validity of iterators is not tied to the lifetime of an object whose type models forwarding-range, a function can accept arguments of such a type by value and return iterators obtained from it without danger of dangling. —end note]

23.5.3 Sized ranges

The SizedRange concept specifies the requirements of a Range type that knows its size in constant time with the size function.

Given an lvalue t of type remove_reference_t<T>, T models SizedRange only if

1. ranges::size(t) is &O(1), does not modify t, and is equal to ranges::distance(t), and
2. if iterator_t<T> models ForwardIterator, ranges::size(t) is well-defined regardless of the evaluation of ranges::begin(t). [Note: ranges::size(t) is otherwise not required to be well-defined after evaluating ranges::begin(t). For example, ranges::size(t) might be well-defined for a SizedRange whose iterator type does not model ForwardIterator only if evaluated before the first call to ranges::begin(t). —end note]

[Note: The complexity requirement for the evaluation of ranges::size is non-amortized, unlike the case for the complexity of the evaluations of ranges::begin and ranges::end in the Range concept. —end note]

[Note: disable_sized_range allows use of range types with the library that satisfy but do not in fact model SizedRange. —end note]
23.5.4 Views [range.view]

The View concept specifies the requirements of a Range type that has constant time copy, move, and assignment operators; that is, the cost of these operations is not proportional to the number of elements in the View.

[Example: Examples of Views are:
  (2.1) — A Range type that wraps a pair of iterators.
  (2.2) — A Range type that holds its elements by shared_ptr and shares ownership with all its copies.
  (2.3) — A Range type that generates its elements on demand.

Most containers (Clause 21) are not views since copying the container copies the elements, which cannot be done in constant time. — end example]

template<class T>
inline constexpr bool enable_view = see below;

template<class T>
concept View =
  Range<T> && Semiregular<T> && enable_view<T>;

Since the difference between Range and View is largely semantic, the two are differentiated with the help of enable_view.

For a type T, the default value of enable_view<T> is:

(4.1) — If DerivedFrom<T, view_base> is true, true.
(4.2) — Otherwise, if T is a specialization of class template initializer_list (16.10), set (21.4.6), multiset (21.4.7), unordered_set (21.5.6), unordered_multiset (21.5.7), or match_results (29.10), false.
(4.3) — Otherwise, if both T and const T model Range and iter_reference_t<iterator_t<T>> is not the same type as iter_reference_t<iterator_t<const T>>, false. [Note: Deep const-ness implies element ownership, whereas shallow const-ness implies reference semantics. — end note]
(4.4) — Otherwise, true.

Pursuant to 15.5.4.2.1, users may specialize enable_view to true for types which model View, and false for types which do not.

23.5.5 Common range refinements [range.refinements]

The OutputRange concept specifies requirements of a Range type for which ranges::begin returns a model of OutputIterator (22.3.4.10). InputRange, ForwardRange, BidirectionalRange, and RandomAccessRange are defined similarly.

template<class R, class T>
concept OutputRange =
  Range<R> && OutputIterator<iterator_t<R>, T>;

template<class T>
concept InputRange =
  Range<T> && InputIterator<iterator_t<T>>;

template<class T>
concept ForwardRange =
  InputRange<T> && ForwardIterator<iterator_t<T>>;

template<class T>
concept BidirectionalRange =
  ForwardRange<T> && BidirectionalIterator<iterator_t<T>>;

template<class T>
concept RandomAccessRange =
  BidirectionalRange<T> && RandomAccessIterator<iterator_t<T>>;
ContiguousRange additionally requires that the `ranges::data` customization point (23.4.3) is usable with the range.

```cpp
template<class T>
concept ContiguousRange =
    RandomAccessRange<T> && ContiguousIterator<iterator_t<T>> &&
    requires(T& t) {
        { ranges::data(t) } -> Same<add_pointer_t<iter_reference_t<iterator_t<T>>>; }
    }
```

The CommonRange concept specifies requirements of a `Range` type for which `ranges::begin` and `ranges::end` return objects of the same type. [Example: The standard containers (Clause 21) model CommonRange. — end example]

```cpp
template<class T>
concept CommonRange =
    Range<T> && Same<iterator_t<T>, sentinel_t<T>>;
```

The ViewableRange concept specifies the requirements of a `Range` type that can be converted to a `View` safely.

```cpp
template<class T>
concept ViewableRange =
    Range<T> && (forwarding-range<T> || View<decay_t<T>>);
```

### 23.6 Range utilities

1. The components in this subclause are general utilities for representing and manipulating ranges.

#### 23.6.1 Helper concepts

1. Many of the types in this subclause are specified in terms of the following exposition-only concepts:

```cpp
template<class R>
concept simple_view =
    View<R> && Range<const R> &&
    Same<iterator_t<R>, iterator_t<const R>> &&
    Same<sentinel_t<R>, sentinel_t<const R>>;
```

```cpp
template<InputIterator I>
concept has_arrow =
    is_pointer_v<I> || requires(I i) { i.operator->(); };
```

```cpp
template<class T, class U>
concept not_same_as =
    !Same<remove_cvref_t<T>, remove_cvref_t<U>>;
```

#### 23.6.2 View interface

1. The class template `view_interface` is a helper for defining `View`-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```cpp
namespace std::ranges {
    template<Range R>
    struct range_common_iterator_impl { // exposition only
        using type = common_iterator<iterator_t<R>, sentinel_t<R>>;
    };
    template<CommonRange R>
    struct range_common_iterator_impl<R> { // exposition only
        using type = iterator_t<R>;
    };
    template<Range R>
    using range_common_iterator = // exposition only
typename range_common_iterator_impl<R>::type;
}
```
template<class D>
requires is_class_v<D> && Same<D, remove_cv_t<D>>
class view_interface : public view_base {

private:
const D& derived() noexcept {
    // exposition only
    return static_cast<D&>(*this);
}
constexpr const D& derived() const noexcept {
    // exposition only
    return static_cast<const D&>(*this);
}

public:
constexpr bool empty() requires ForwardRange<D> {
    return ranges::begin(derived()) == ranges::end(derived());
}
constexpr bool empty() const requires ForwardRange<const D> {
    return ranges::begin(derived()) == ranges::end(derived());
}

constexpr explicit operator bool() requires requires { ranges::empty(derived()); } {
    return !ranges::empty(derived());
}
constexpr explicit operator bool() const requires requires { ranges::empty(derived()); } {
    return !ranges::empty(derived());
}

constexpr auto data() requires ContiguousIterator<iterator_t<D>> {
    return ranges::empty(derived()) ? nullptr : addressof(*ranges::begin(derived()));
}
constexpr auto data() const requires Range<const D> && ContiguousIterator<iterator_t<const D>> {
    return ranges::empty(derived()) ? nullptr : addressof(*ranges::begin(derived()));
}

constexpr auto size() requires ForwardRange<D> && SizedSentinel<sentinel_t<D>, iterator_t<D>> {
    return ranges::end(derived()) - ranges::begin(derived());
}
constexpr auto size() const requires ForwardRange<const D> && SizedSentinel<sentinel_t<const D>, iterator_t<const D>> {
    return ranges::end(derived()) - ranges::begin(derived());
}

constexpr decltype(auto) front() requires ForwardRange<D>;
constexpr decltype(auto) front() const requires ForwardRange<const D>;

constexpr decltype(auto) back() requires BidirectionalRange<D> && CommonRange<D>;
constexpr decltype(auto) back() const requires BidirectionalRange<const D> && CommonRange<const D>;

template<RandomAccessRange R = D>
constexpr decltype(auto) operator[](iter_difference_t<iterator_t<R>> n) {
    return ranges::begin(derived())[n];
}

};

};
The template parameter \( D \) for `view_interface` may be an incomplete type. Before any member of the resulting specialization of `view_interface` other than special member functions is referenced, \( D \) shall be complete, and model both `DerivedFrom\langle view_interface\langle D \rangle \rangle` and `View`.

### 23.6.2.1 Members

```cpp
constexpr decltype(auto) front() requires ForwardRange\langle D \rangle;
constexpr decltype(auto) front() const requires ForwardRange\langle const D \rangle;
```

1. Expects: `!empty()`.
2. **Effects**: Equivalent to: `return *ranges::begin(derived())`.

```cpp
constexpr decltype(auto) back() requires BidirectionalRange\langle D \rangle && CommonRange\langle D \rangle;
constexpr decltype(auto) back() const requires BidirectionalRange\langle const D \rangle && CommonRange\langle const D \rangle;
```

4. **Effects**: Equivalent to: `return *ranges::prev(ranges::end(derived()))`.

### 23.6.3 Sub-ranges

The `subrange` class template combines together an iterator and a sentinel into a single object that models the `View` concept. Additionally, it models the `SizedRange` concept when the final template parameter is `subrange_kind::sized`.

```cpp
namespace std::ranges {
  template<class T>
  concept pair-like = // exposition only
    !is_reference_v<T> && requires(T t) {
      typename tuple_size<T>::type; // ensures tuple_size<T> is complete
      requires DerivedFrom\langle tuple_size<T>, integral_constant\langle size_t, 2 \rangle \rangle;
      typename tuple_element_t<0, remove_const_t<T>>;
      typename tuple_element_t<1, remove_const_t<T>>;
      get<0>(t) -> const tuple_element_t<0, T>&;
      get<1>(t) -> const tuple_element_t<1, T>&;
    };

  template<class T, class U, class V>
  concept pair-like-convertible-to = // exposition only
    !Range<T> && pair-like-convertible_from<T, U, V> &&
    requires(T&& t) {
      get<0>(std::forward<T>(t)) -> ConvertibleTo\langle U \rangle;
      get<1>(std::forward<T>(t)) -> ConvertibleTo\langle V \rangle;
    };

  template<class T, class U, class V>
  concept pair-like-convertible-from = // exposition only
    !Range<T> && pair-like<T> && Constructible\langle T, U, V \rangle;

  template<class T>
  concept iterator-sentinel-pair = // exposition only
    !Range<T> && pair-like<T> && Sentinel\langle tuple_element_t<1, T>, tuple_element_t<0, T> \rangle;

  template<Iterator I, Sentinel<I> S = I, subrange_kind K =
    SizedSentinel\langle S, I \rangle ? subrange_kind::sized : subrange_kind::unsized>
  requires (K == subrange_kind::sized || !SizedSentinel\langle S, I \rangle)
  class subrange : public view_interface\langle subrange\langle I, S, K \rangle \rangle {
    private:
      static constexpr bool StoreSize = // exposition only
        K == subrange_kind::sized && !SizedSentinel\langle S, I \rangle;
      I begin_ = I(); // exposition only
      S end_ = S(); // exposition only
      iter_difference_t<I> size_ = 0; // exposition only; present only
  }
}
```
public:

    subrange() = default;

    constexpr subrange(I i, S s) requires (!StoreSize);
    constexpr subrange(I i, S s, iter_difference_t<I> n)
        requires (K == subrange_kind::sized);

    template<not_same_as<subrange> R>
        requires forwarding_range<R> &&
           ConvertibleTo<iterator_t<R>, I> && ConvertibleTo<sentinel_t<R>, S>
    constexpr subrange(R&& r) requires (!StoreSize || SizedRange<R>);

    template<forwarding_range R>
        requires ConvertibleTo<iterator_t<R>, I> && ConvertibleTo<sentinel_t<R>, S>
    constexpr subrange(R&& r, iter_difference_t<I> n)
        requires (K == subrange_kind::sized)
            : subrange{ranges::begin(r), ranges::end(r), n} {}

    template<not_same_as<subrange> PairLike>
        requires pair_like_convertible_to<PairLike, I, S>
    constexpr subrange(PairLike&& r) requires (!StoreSize)
        : subrange{std::get<0>(std::forward<PairLike>(r)),
                   std::get<1>(std::forward<PairLike>(r))} {}

    template<pair_like_convertible_to<I, S> PairLike>
    constexpr subrange(PairLike&& r, iter_difference_t<I> n)
        requires (K == subrange_kind::sized)
            : subrange{std::get<0>(std::forward<PairLike>(r)),
                       std::get<1>(std::forward<PairLike>(r)), n} {}

    template<not_same_as<subrange> PairLike>
        requires pair_like_convertible_from<PairLike, const I&, const S&>
    constexpr operator PairLike() const;

    constexpr I begin() const;
    constexpr S end() const;

    constexpr bool empty() const;
    constexpr iter_difference_t<I> size() const
        requires (K == subrange_kind::sized);

    [[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const;
    [[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1)
        requires BidirectionalIterator<I>;

    constexpr subrange& advance(iter_difference_t<I> n);

    friend constexpr I begin(subrange&& r) { return r.begin(); }
    friend constexpr S end(subrange&& r) { return r.end(); };

    template<Iterator I, Sentinel<I> S>
    subrange(I, S, iter_difference_t<I>) -> subrange<I, S, subrange_kind::sized>;

    template<iterator_sentinel_pair P>
    subrange(P) -> subrange<tuple_element_t<P, 0>, P>, tuple_element_t<P, 1>, P>>;

    template<iterator_sentinel_pair P>
    subrange(P, iter_difference_t<tuple_element_t<P, 0>>, P>)
        -> subrange<tuple_element_t<P, 0>, P>, tuple_element_t<P, 1>, P>, subrange_kind::sized>;}
23.6.3.1 Constructors and conversions

```cpp
constexpr subrange(I i, S s) requires (!StoreSize);

Effects: Initializes begin_ with i and end_ with s.

constexpr subrange(I i, S s, iter_difference_t<I> n)
requires (K == subrange_kind::sized);

Effects: n == ranges::distance(i, s).

Effects: Initializes begin_ with i and end_ with s. If StoreSize is true, initializes size_ with n.

[Note: Accepting the length of the range and storing it to later return from size() enables subrange to model SizedRange even when it stores an iterator and sentinel that do not model SizedSentinel. —end note]
```

```cpp
template<not_same_as[subrange] R>
requires forwarding-range<R> &&
ConvertibleTo<iterator_t<R>, I> && ConvertibleTo<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || SizedRange<R>);

Effects: Equivalent to:

(5.1) If StoreSize is true, subrange{ranges::begin(r), ranges::end(r), ranges::size(r)}.

(5.2) Otherwise, subrange{ranges::begin(r), ranges::end(r)}.
```

```cpp
template<not_same_as[subrange] PairLike>
requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;

Effects: Equivalent to: return PairLike(begin_, end_);
```

23.6.3.2 Accessors

```cpp
constexpr I begin() const;

Effects: Equivalent to: return begin_;
```

```cpp
constexpr S end() const;

Effects: Equivalent to: return end_;
```

```cpp
constexpr bool empty() const;

Effects: Equivalent to: return begin_ == end_;
```

```cpp
constexpr iter_difference_t<I> size() const
requires (K == subrange_kind::sized);

Effects:

(4.1) If StoreSize is true, equivalent to: return size_;
```
(4.2) Otherwise, equivalent to: return end_ - begin_.

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const;

Effects: Equivalent to:
auto tmp = *this;
tmp.advance(n);
return tmp;

[Note: If I does not model ForwardIterator, next can invalidate *this. — end note]

[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const requires BidirectionalIterator<I>;

Effects: Equivalent to:
auto tmp = *this;
tmp.advance(-n);
return tmp;

constexpr subrange& advance(iter_difference_t<I> n);

Effects: Equivalent to:
— (8.1)
If StoreSize is true,
size_ -= n - ranges::advance(begin_, n, end_);
return *this;

— (8.2)
Otherwise,
ranges::advance(begin_, n, end_);
return *this;

template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(const subrange<I, S, K>& r);

Effects: Equivalent to:
if constexpr (N == 0)
return r.begin();
else
return r.end();

23.7 Range adaptors

This subclause defines range adaptors, which are utilities that transform a Range into a View with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

Range adaptors are declared in namespace std::ranges::view.

The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

[Example:
vector<int> ints{0,1,2,3,4,5};
auto even = [](int i){ return 0 == i % 2; }; auto square = [](int i) { return i * i; };
for (int i : ints | view::filter(even) | view::transform(square)) {
cout << i << ' '; // prints: 0 4 16
}
assert(ranges::equal(ints | view::filter(even), view::filter(ints, even)));
— end example]

23.7.1 Range adaptor objects

A range adaptor closure object is a unary function object that accepts a ViewableRange argument and returns a View. For a range adaptor closure object C and an expression R such that decltype((R)) models ViewableRange, the following expressions are equivalent and yield a View:
Given an additional range adaptor closure object D, the expression C | D is well-formed and produces another range adaptor closure object such that the following two expressions are equivalent:

R | C | D
R | (C | D)

2 A range adaptor object is a customization point object (15.4.2.1.6) that accepts a ViewableRange as its first argument and returns a View.

3 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

4 If a range adaptor object accepts more than one argument, then the following expressions are equivalent:

    adaptor(range, args...)
    adaptor(args...)(range)
    range | adaptor(args...)

In this case, adaptor(args...) is a range adaptor closure object.

23.7.2 Semiregular wrapper

1 Many of the types in this subclause are specified in terms of an exposition-only class template semiregular. semiregular<T> behaves exactly like optional<T> with the following differences:

1 (1) — semiregular<T> constrains its type parameter T with CopyConstructible<T> & is_object_v<T>.
1 (2) — If T models DefaultConstructible, the default constructor of semiregular<T> is equivalent to:

    constexpr semiregular() noexcept(is_nothrow_default_constructible_v<T>)
    : semiregular(in_place)
    {
    }

1 (3) — If Assignable<T&, const T&> is not satisfied, the copy assignment operator is equivalent to:

    semiregular& operator=(const semiregular& that)
    noexcept(is_nothrow_copy_constructible_v<T>)
    {
      if (that) emplace(*that);
      else reset();
      return *this;
    }

1 (4) — If Assignable<T&, T> is not satisfied, the move assignment operator is equivalent to:

    semiregular& operator=(semiregular&& that)
    noexcept(is_nothrow_move_constructible_v<T>)
    {
      if (that) emplace(std::move(*that));
      else reset();
      return *this;
    }

23.7.3 All view

1 view::all returns a View that includes all elements of its Range argument.

2 The name view::all denotes a range adaptor object (23.7.1). For some subexpression E, the expression view::all(E) is expression-equivalent to:

2 (1) — DECAY_COPY(E) if the decayed type of E models View.
2 (2) — Otherwise, ref-view(E) if that expression is well-formed, where ref-view is the exposition-only View specified below.
2 (3) — Otherwise, subrange(E).

23.7.3.1 ref-view

namespace std::ranges {
    template<Range R>
    requires is_object_v<R>
    class ref-view : public view_interface<ref-view<R>> {

§ 23.7.3.1
private:
    R* r_ = nullptr; // exposition only
public:
    constexpr ref-view() noexcept = default;

    template<not same-as<ref-view> T>
    requires see below
    constexpr ref-view(T&& t);

    constexpr R& base() const { return *r_; }
    constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
    constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

    constexpr bool empty() const
        requires requires { ranges::empty(*r_); } { return ranges::empty(*r_); }
    constexpr auto size() const
        requires SizedRange<R> { return ranges::size(*r_); }
    constexpr auto data() const
        requires ContiguousRange<R> { return ranges::data(*r_); }

    friend constexpr iterator_t<R> begin(ref-view r)
    { return r.begin(); }
    friend constexpr sentinel_t<R> end(ref-view r)
    { return r.end(); }
};

namespace std::ranges {
    template<InputRange V, IndirectUnaryPredicate<iterator_t<V>> Pred>
    requires View<V> && is_object_v<Pred>
    class filter_view : public view_interface<filter_view<V, Pred>> {

    private:
        V base_ = V(); // exposition only
        semiregular<Pred> pred_; // exposition only

    § 23.7.4.2 925
class iterator;  // exposition only
class sentinel;  // exposition only

class filter_view {  // exposition only
private:
  iterator_t<V> current_;  // exposition only
  filter_view* parent_;  // exposition only
public:
  using iterator_concept = see below;
  using iterator_category = see below;
  using value_type = iter_value_t<iterator_t<V>>;
  using difference_type = iter_difference_t<iterator_t<V>>;

  iterator() = default;
  constexpr iterator(filter_view& parent, iterator_t<V> current);

  constexpr V base() const;
  constexpr iterator begin();
  constexpr auto end() {
    if constexpr (CommonRange<V>)
      return iterator{*this, ranges::end(base_)};
    else
      return sentinel{*this};
  }

  template<class R, class Pred>
  constexpr filter_view(R&& r, Pred pred) ;

  constexpr V base() const;
  constexpr iterator begin();

  template<InputRange R>
  requires ViewableRange<R> && Constructible<V, all_view<R>>
 constexpr filter_view(R&& r, Pred pred);

  template<class R, class Pred>
  constexpr filter_view(R&&, Pred) -> filter_view<all_view<R>, Pred> ;

  Effects: Initializes base_ with std::move(base) and initializes pred_ with std::move(pred).

  template<InputRange R>
  requires ViewableRange<R> && Constructible<V, all_view<R>>
  constexpr filter_view(R&& r, Pred pred);
  Effects: Initializes base_ with view::all(std::forward<R>(r)) and initializes pred_ with std::move(pred).

  constexpr V base() const;
  Effects: Equivalent to: return base_.

  constexpr iterator begin();
  Expects: pred_.has_value().
  Returns: {*this, ranges::find_if(base_, ref(*pred_))}.
  Remarks: In order to provide the amortized constant time complexity required by the Range concept, this function caches the result within the filter_view for use on subsequent calls.

23.7.4.3 Class filter_view::iterator

namespace std::ranges {
  template<class V, class Pred>
  class filter_view<V, Pred>::iterator {
private:
  iterator_t<V> current_ = iterator_t<V>();  // exposition only
  filter_view* parent_ = nullptr;  // exposition only
public:
  using iterator_concept = see below;
  using iterator_category = see below;
  using value_type = iter_value_t<iterator_t<V>>;
  using difference_type = iter_difference_t<iterator_t<V>>;

  iterator() = default;
  constexpr iterator(filter_view& parent, iterator_t<V> current);

  constexpr iterator_t<V> base() const;
  constexpr iter_reference_t<iterator_t<V>> operator*() const;

§ 23.7.4.3 926
constexpr iterator_t<V> operator->() const
    requires has-arrow<iterator_t<V>>;

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires ForwardRange<V>;

constexpr iterator& operator--() requires BidirectionalRange<V>;
constexpr iterator operator--(int) requires BidirectionalRange<V>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires EqualityComparable<iterator_t<V>>;
friend constexpr bool operator!=(const iterator& x, const iterator& y)
    requires EqualityComparable<iterator_t<V>>;

friend constexpr iter_rvalue_reference_t<iterator_t<V>> iter_move(const iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current_)));
friend constexpr void iter_swap(const iterator& x, const iterator& y)
    noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
    requires IndirectlySwappable<iterator_t<V>>;

} // namespace ranges

1 Modification of the element a `filter_view::iterator` denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 `iterator::iterator_concept` is defined as follows:
   - If `V` models `BidirectionalRange`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
   - Otherwise, if `V` models `ForwardRange`, then `iterator_concept` denotes `forward_iterator_tag`.
   - Otherwise, `iterator_concept` denotes `input_iterator_tag`.

3 `iterator::iterator_category` is defined as follows:
   - Let `C` denote the type `iterator_traits<iterator_t<V>>::iterator_category`.
   - If `C` models `DerivedFrom<bidirectional_iterator_tag>`, then `iterator_category` denotes `bidirectional_iterator_tag`.
   - Otherwise, if `C` models `DerivedFrom<forward_iterator_tag>`, then `iterator_category` denotes `forward_iterator_tag`.
   - Otherwise, `iterator_category` denotes `input_iterator_tag`.

constexpr iterator(filter_view& parent, iterator_t<V> current);
   Effects: Initializes `current_` with `current` and `parent_` with `addressof(parent)`.

constexpr iterator_t<V> base() const;
   Effects: Equivalent to: `return current_`;

constexpr iter_reference_t<iterator_t<V>> operator*() const;
   Effects: Equivalent to: `return *current_`;

constexpr iterator_t<V> operator->() const
    requires has-arrow<iterator_t<V>>;
   Effects: Equivalent to: `return current_`;

constexpr iterator& operator++();
   Effects: Equivalent to:
   - `current_ = ranges::find_if(++current_, ranges::end(parent_->base_), ref(*parent_->pred_));`
   - `return *this;`

constexpr void operator++(int);
   Effects: Equivalent to `**this`. 

§ 23.7.4.3
constexpr iterator operator++(int) requires ForwardRange<V>;

**Effects:** Equivalent to:
```cpp
auto tmp = *this;
++*this;
return tmp;
```

constexpr iterator& operator--() requires BidirectionalRange<V>;

**Effects:** Equivalent to:
```cpp
do
  --current_;
while (!invoke(*parent_->pred_, *current_))
return *this;
```

constexpr iterator operator--(int) requires BidirectionalRange<V>;

**Effects:** Equivalent to:
```cpp
auto tmp = *this;
--*this;
return tmp;
```

friend constexpr bool operator==(const iterator& x, const iterator& y) requires EqualityComparable<iterator_t<V>>;

**Effects:** Equivalent to:
```cpp
return x.current_ == y.current_;
```

friend constexpr bool operator!=(const iterator& x, const iterator& y) requires EqualityComparable<iterator_t<V>>;

**Effects:** Equivalent to:
```cpp
return !(x == y);
```

friend constexpr iter_rvalue_reference_t<iterator_t<V>> iter_move(const iterator& i) noexcept(noexcept(ranges::iter_move(i.current_)));

**Effects:** Equivalent to:
```cpp
return ranges::iter_move(i.current_);
```

friend constexpr void iter_swap(const iterator& x, const iterator& y) requires IndirectlySwappable<iterator_t<V>>;

**Effects:** Equivalent to:
```cpp`ranges::iter_swap(x.current_, y.current_`.```
friend constexpr bool operator==(const iterator& x, const sentinel& y);

3 Effects: Equivalent to: return x.current_ == y.end_
friend constexpr bool operator==(const sentinel& x, const iterator& y);

4 Effects: Equivalent to: return y == x;
friend constexpr bool operator!=(const iterator& x, const sentinel& y);

5 Effects: Equivalent to: return !(x == y);
friend constexpr bool operator!=(const sentinel& x, const iterator& y);

6 Effects: Equivalent to: return !(y == x);

23.7.4.5 view::filter

The name view::filter denotes a range adaptor object (23.7.1). For some subexpressions E and P, the expression view::filter(E, P) is expression-equivalent to filter_view{E, P}.

23.7.5 Transform view

23.7.5.1 Overview

transform_view presents a View of an underlying sequence after applying a transformation function to each element.

2 Example:
vector<int> is{ 0, 1, 2, 3, 4 };
transform_view squares{is, [](int i) { return i * i; }};
for (int i : squares)
  cout << i << ' '; // prints: 0 1 4 9 16
—end example]

23.7.5.2 Class template transform_view

namespace std::ranges {
template<InputRange V, CopyConstructible F>
  requires View<V> && is_object_v<F> &&
    RegularInvocable<F&, iter_reference_t<iterator_t<V>>> class transform_view : public view_interface<transform_view<V, F>> {
private:
template<bool> struct iterator; // exposition only
template<bool> struct sentinel; // exposition only
V base_ = V(); // exposition only
semiregular<F> fun_; // exposition only
public:
  transform_view() = default;
  constexpr transform_view(V base, F fun);
  template<InputRange R>
    requires ViewableRange<R> && Constructible<V, all_view<R>>
    constexpr transform_view(R&& r, F fun);
  constexpr V base() const;
  constexpr iterator<false> begin();
  constexpr iterator<true> begin() const
    requires RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
  constexpr sentinel<false> end();
  constexpr iterator<false> end() requires CommonRange<V>;
  constexpr sentinel<true> end() const
    requires RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;

§ 23.7.5.2
constexpr iterator<true> end() const
    requires CommonRange<const V> &&
    RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;

constexpr auto size() requires SizedRange<const V> { return ranges::size(base_); }
constexpr auto size() const requires SizedRange<const V>
{ return ranges::size(base_); }
};

template<class R, class F>
    transform_view(R&&, F) -> transform_view<all_view<R>, F>;
}constexpr transform_view(V base, F fun);
1
Effects: Initializes base_ with std::move(base) and fun_ with std::move(fun).

template<InputRange R>
    requires ViewableRange<R> && Constructible<V, all_view<R>>
constexpr transform_view(R&& r, F fun);
2
Effects: Initializes base_ with view::all(std::forward<R>(r)) and fun_ with std::move(fun).

constexpr V base() const;
3
Effects: Equivalent to: return base_.

constexpr iterator<false> begin();
4
Effects: Equivalent to:
    return iterator<false>(*this, ranges::begin(base_));

constexpr iterator<true> begin() const
    requires Range<const V> &&
    RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
5
Effects: Equivalent to:
    return iterator<true>(*this, ranges::begin(base_));

constexpr sentinel<false> end();
6
Effects: Equivalent to:
    return sentinel<false>(ranges::end(base_));

constexpr iterator<false> end() requires CommonRange<V>;
7
Effects: Equivalent to:
    return iterator<false>(*this, ranges::end(base_));

constexpr sentinel<true> end() const
    requires Range<const V> &&
    RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
8
Effects: Equivalent to:
    return sentinel<true>(ranges::end(base_));

constexpr iterator<true> end() const
    requires CommonRange<const V> &&
    RegularInvocable<const F&, iter_reference_t<iterator_t<const V>>>;
9
Effects: Equivalent to:
    return iterator<true>(*this, ranges::end(base_));

23.7.5.3 Class template transform_view::iterator

namespace std::ranges {
    template<class V, class F>
    template<bool Const>
    class transform_view<V, F>::iterator {

§ 23.7.5.3

930
private:
using Parent = conditional_t<Const, const transform_view, transform_view>;
using Base = conditional_t<Const, const V, V>;
iterator_t<Base> current_ = iterator_t<Base>();
Parent* parent_ = nullptr;

public:
using iterator_concept = see below;
using iterator_category = see below;
using value_type = remove_cvref_t<invoke_result_t<F&, iter_reference_t<iterator_t<Base>>>;
using difference_type = iter_difference_t<iterator_t<Base>>;

iterator() = default;
constexpr iterator(Parent& parent, iterator_t<Base> current);
constexpr iterator(iterator<!Const> i) requires Const && ConvertibleTo<iterator_t<V>, iterator_t<Base>>;
constexpr iterator_t<Base> base() const;
constexpr decltype(auto) operator*() const { return invoke(*parent_->fun_, *current_); }
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires ForwardRange<Base>;
constexpr iterator& operator--() requires BidirectionalRange<Base>;
constexpr iterator operator--(int) requires BidirectionalRange<Base>;
constexpr iterator& operator+=(difference_type n) requires RandomAccessRange<Base>;
constexpr iterator& operator-=(difference_type n) requires RandomAccessRange<Base>;

noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
requires IndirectlySwappable<iterator_t<Base>>;
   Effects: Equivalent to ranges::iter_swap(x.current_, y.current_).

23.7.5.4 Class template transform_view::sentinel [range.transform.sentinel]

namespace std::ranges {
    template<class V, class F>
    § 23.7.5.4 933
template<
    bool Const
>
class transform_view<V, F>::sentinel {
private:
    using Parent = conditional_t<Const, const transform_view, transform_view>;
    using Base = conditional_t<Const, const V, V>;
    sentinel_t<Base> end_ = sentinel_t<Base>();
public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end);
    constexpr sentinel(sentinel<!Const> i)
        requires Const &&ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;
    constexpr sentinel_t<Base> base() const;
    friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);
    friend constexpr bool operator==(const sentinel& x, const iterator<Const>& y);
    friend constexpr bool operator!=(const iterator<Const>& x, const sentinel& y);
    friend constexpr bool operator!=(const sentinel& x, const iterator<Const>& y);
    friend constexpr iter_difference_t<iterator_t<Base>> operator-(const iterator<Const>& x, const sentinel& y)
        requires SizedSentinel<sentinel_t<Base>, iterator_t<Base>>;
    friend constexpr iter_difference_t<iterator_t<Base>> operator-(const sentinel& y, const iterator<Const>& x)
        requires SizedSentinel<sentinel_t<Base>, iterator_t<Base>>;
};

constexpr explicit sentinel(sentinel_t<Base> end);

1 Effects: Initializes end_ with end.

constexpr sentinel(sentinel<!Const> i)
    requires Const &&ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;

2 Effects: Initializes end_ with std::move(i.end_).

constexpr sentinel_t<Base> base() const;

3 Effects: Equivalent to: return end_;

friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);

4 Effects: Equivalent to: return x.current_ == y.end_;

friend constexpr bool operator==(const sentinel& x, const iterator<Const>& y);

5 Effects: Equivalent to: return y == x;

friend constexpr bool operator!=(const iterator<Const>& x, const sentinel& y);

6 Effects: Equivalent to: return !(x == y);

friend constexpr bool operator!=(const sentinel& x, const iterator<Const>& y);

7 Effects: Equivalent to: return !(y == x);

friend constexpr iter_difference_t<iterator_t<Base>> operator-(const iterator<Const>& x, const sentinel& y)
    requires SizedSentinel<sentinel_t<Base>, iterator_t<Base>>;

8 Effects: Equivalent to: return x.current_ - y.end_;

friend constexpr iter_difference_t<iterator_t<Base>> operator-(const sentinel& y, const iterator<Const>& x)
    requires SizedSentinel<sentinel_t<Base>, iterator_t<Base>>;

9 Effects: Equivalent to: return x.end_ - y.current_;
23.7.5.5  view::transform

The name view::transform denotes a range adaptor object (23.7.1). For some subexpressions E and F, the expression view::transform(E, F) is expression-equivalent to transform_view{E, F}.

23.7.6  Iota view

23.7.6.1  Overview

iota_view generates a sequence of elements by repeatedly incrementing an initial value.

[Example:
for (int i : iota_view(1, 10))
    cout << i << ' '; // prints: 1 2 3 4 5 6 7 8 9
—end example]

23.7.6.2  Class template iota_view

namespace std::ranges {
    template<class I>
    concept Decrementable = // exposition only
        see below;

template<class I>
    concept Advanceable = // exposition only
        see below;

template<WeaklyIncrementable W, Semiregular Bound = unreachable_sentinel_t>
    requires weakly-equality-comparable-with<W, Bound>
    class iota_view : public view_interface<iota_view<W, Bound>> {
        private:
            struct iterator; // exposition only
            struct sentinel; // exposition only
            W value_ = W(); // exposition only
            Bound bound_ = Bound(); // exposition only
        public:
            iota_view() = default;
            constexpr explicit iota_view(W value);
            constexpr iota_view(type_identity_t<W> value,
                type_identity_t<Bound> bound);
            constexpr iterator begin() const;
            constexpr sentinel end() const;
            constexpr iterator end() const requires Same<W, Bound>;
            constexpr auto size() const
                requires (Same<W, Bound> && Advanceable<W>) ||
                    (Integral<W> && Integral<Bound>) ||
                    SizedSentinel<Bound, W>
                    { return bound_ - value_; }
            ;

            template<class W, class Bound>
            requires (!(Integral<W> || !Integral<Bound> || is_signed_v<W> == is_signed_v<Bound>)
                iota_view(W, Bound) -> iota_view<W, Bound>;
    }

1 The exposition-only Decrementable concept is equivalent to:

    template<class I>
    concept Decrementable =
        Incrementable<I> && requires(I i) {
            {-i} -> Same<I&>;
            { i-- } -> Same<I>;
        };

2 When an object is in the domain of both pre- and post-decrement, the object is said to be decrementable.

3 Let a and b be equal objects of type I. I models Decrementable only if
If a and b are decrementable, then the following are all true:

- $\text{addressof}(-a) == \text{addressof}(a)$
- $\text{bool}(a-- == b)$
- $\text{bool}(((\text{void})a--, a) == --b)$
- $\text{bool}(++(--)a == b)$.

If a and b are incrementable, then $\text{bool}(--(++a) == b)$.

The exposition-only Advanceable concept is equivalent to:

```cpp
template<class I>
concept Advanceable =
  Decrementable<I> && StrictTotallyOrdered<I> &&
  requires(I i, const I j, const iter_difference_t<I> n) {
    { i += n } -> Same<I&>;
    { i += n } -> Same<I>;
    { j + n } -> Same<I>;
    { j - n } -> Same<I>;
    { j - j } -> Same<iter_difference_t<I>>;
  };
```

Let a and b be objects of type I such that b is reachable from a after $n$ applications of $++a$, for some value $n$ of type $\text{iter_difference_t}<I>$. I models Advanceable only if

- $(a += n)$ is equal to b.
- $\text{addressof}(a += n)$ is equal to $\text{addressof}(a)$.
- $(a + n)$ is equal to $(a += n)$.
- For any two positive values x and y of type D, if $(a + D(x + y))$ is well-defined, then $(a + D(x + y))$ is equal to $(a + x) + y$.
- $(a + D(0))$ is equal to a.
- If $(a + D(n - 1))$ is well-defined, then $(a + n)$ is equal to $++(a + D(n - 1))$.
- $(b += -n)$ is equal to a.
- $(b -= n)$ is equal to a.
- $\text{addressof}(b -= n)$ is equal to $\text{addressof}(b)$.
- $(b - n)$ is equal to $(b -= n)$.
- $(b - a)$ is equal to n.
- $(a - b)$ is equal to $-n$.
- $\text{bool}(a <= b)$ is true.

```cpp
constexpr explicit iota_view(W value);
```

*Effects:* Bound denotes unreachable_sentinel_t or Bound() is reachable from value.

```cpp
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

*Effects:* Initializes value_ with value and bound_ with bound.

```cpp
constexpr iterator begin() const;
```

*Effects:* Equivalent to: return iterator{value_};

```cpp
constexpr sentinel end() const;
```

*Effects:* Equivalent to: return sentinel{bound_};

```cpp
constexpr iterator end() const requires Same<W, Bound>;
```

*Effects:* Equivalent to: return iterator{bound_};
23.7.6.3 Class iota_view::iterator

namespace std::ranges {
    template<class W, class Bound>
    struct iota_view<W, Bound>::iterator {
        private:
            W value_; // exposition only
        public:
            using iterator_category = see below;
            using value_type = W;
            using difference_type = iter_difference_t<W>;
            iterator() = default;
            constexpr explicit iterator(W value);
            constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
            constexpr iterator& operator++();
            constexpr void operator++(int);
            constexpr iterator operator++(int) requires Incrementable<W>;
            constexpr iterator operator--() requires Decrementable<W>;
            constexpr iterator operator--(int) requires Decrementable<W>;
            constexpr iterator& operator+=(difference_type n) requires Advanceable<W>;
            constexpr iterator& operator-=(difference_type n) requires Advanceable<W>;
            constexpr W operator[](difference_type n) const requires Advanceable<W>;
            friend constexpr bool operator==(const iterator& x, const iterator& y) requires EqualityComparable<W>;

friend constexpr bool operator!=(const iterator& x, const sentinel& y);
  
  Effects: Equivalent to: return !(x == y);
friend constexpr bool operator!=(const sentinel& x, const iterator& y);

Effects: Equivalent to: return !(y == x);

23.7.6.5 view::iota

The name view::iota denotes a customization point object (15.4.2.1.6). For some subexpressions E and F, the expressions view::iota(E) and view::iota(E, F) are expression-equivalent to iota_view{E} and iota_view{E, F}, respectively.

23.7.7 Take view

23.7.7.1 Overview

take_view produces a View of the first N elements from another View, or all the elements if the adapted View contains fewer than N.

[Example:

```cpp
vector<int> is{0,1,2,3,4,5,6,7,8,9};
take_view few{is, 5};
for (int i : few)
    cout << i << ' ';  // prints: 0 1 2 3 4
```

—end example]

23.7.7.2 Class template take_view

```cpp
namespace std::ranges {
    template<View V>
    class take_view : public view_interface<take_view<V>> {
    private:
        V base_ = V();    // exposition only
        iter_difference_t<iterator_t<V>> count_ = 0;   // exposition only
        template<bool> struct sentinel;   // exposition only
    public:
        take_view() = default;
        constexpr take_view(V base, iter_difference_t<iterator_t<V>> count);
        template<ViewableRange R>
            requires Constructible<V, all_view<R>>
        constexpr take_view(R&& r, iter_difference_t<iterator_t<V>> count);

    constexpr V base() const;
    constexpr auto begin() requires (!simple_view<V>) {
        if constexpr (SizedRange<V>) {
            if constexpr (RandomAccessRange<V>)
                return ranges::begin(base_);
            else
                return counted_iterator{ranges::begin(base_), size()};
        } else
            return counted_iterator{ranges::begin(base_), count_};
    }

    constexpr auto begin() const requires Range<const V> {
        if constexpr (SizedRange<const V>) {
            if constexpr (RandomAccessRange<const V>)
                return ranges::begin(base_);
            else
                return counted_iterator{ranges::begin(base_), size()};
        } else
            return counted_iterator{ranges::begin(base_), count_};
    }

    constexpr auto end() requires (!simple_view<V>) {
        if constexpr (SizedRange<V>) {
            if constexpr (RandomAccessRange<V>)
                return ranges::begin(base_) + size();
            else
                return counted_iterator{ranges::begin(base_), size()};
        } else
            return counted_iterator{ranges::begin(base_), count_};
    }

    } // class take_view
}
```
```cpp
else
    return default_sentinel;
} else
    return sentinel<false>{ranges::end(base_)};
}

constexpr auto end() const requires Range<const V> {
    if constexpr (SizedRange<const V>) {
        if constexpr (RandomAccessRange<const V>)
            return ranges::begin(base_) + size();
        else
            return default_sentinel;
    } else
        return sentinel<true>{ranges::end(base_)};
}

constexpr auto size() requires SizedRange<V> {

    return iterator<true>{*this, ranges::end(base_)};
  else
    return sentinel<true>{*this};
}
};

template<class R>
explicit join_view(R&&) -> join_view<all_view<R>>;

constexpr explicit join_view(V base);

  Effects: Initializes base_ with std::move(base).

template<InputRange R>
  requires ViewableRange<R> && Constructible<V, all_view<R>>
constexpr explicit join_view(R&& r);

  Effects: Initializes base_ with view::all(std::forward<R>(r)).

23.7.8.3 Class template join_view::iterator

1 namespace std::ranges {
  template<class V>
    template<bool Const>
      struct join_view<V>::iterator {
        private:
          using Parent = // exposition only
            conditional_t<Const, const join_view, join_view>;
          using Base = conditional_t<Const, const V, V>; // exposition only

          static constexpr bool ref_is_glvalue = // exposition only
            is_reference_v<iter_reference_t<iterator_t<Base>>>;

1 § 23.7.8.3
iterator_t<Base> outer_ = iterator_t<Base>();  // exposition only
iterator_t<iter_reference_t<iterator_t<Base>>> inner_ =  // exposition only
iterator_t<iter_reference_t<iterator_t<Base>>>();
Parent* parent_ = nullptr;  // exposition only
constexpr void satisfy();  // exposition only

public:
using iterator_concept = see below;
using iterator_category = see below;
using value_type = iter_value_t<iterator_t<iter_reference_t<iterator_t<Base>>>>;
using difference_type = see below;
iterator() = default;
constexpr iterator(Parent& parent, iterator_t<V> outer);  
constexpr iterator(iterator<!Const> i)  
  requires Const &&  
 ConvertibleTo<iterator_t<V>, iterator_t<Base>> &&  
ConvertibleTo<iterator_t<InnerRng>,  
iterator_t<iter_reference_t<iterator_t<Base>>>>;
constexpr decltype(auto) operator*() const { return *inner_; }
constexpr iterator_t<Base> operator->() const  
  requires has-arrow<iterator_t<Base>>;
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int)  
  requires ref_is_glvalue && ForwardRange<Base> &&  
ForwardRange<iter_reference_t<iterator_t<Base>>>;
constexpr iterator& operator--();  
  requires ref_is_glvalue && BidirectionalRange<Base> &&  
BidirectionalRange<iter_reference_t<iterator_t<Base>>>;
constexpr iterator operator--(int)  
  requires ref_is_glvalue && BidirectionalRange<Base> &&  
BidirectionalRange<iter_reference_t<iterator_t<Base>>>;
friend constexpr bool operator==(const iterator& x, const iterator& y)  
  requires ref_is_glvalue && EqualityComparable<iterator_t<Base>> &&  
EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>>;
friend constexpr bool operator!=(const iterator& x, const iterator& y)  
  requires ref_is_glvalue && EqualityComparable<iterator_t<Base>> &&  
EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>>;
friend constexpr decltype(auto) iter_move(const iterator& i)  
noexcept(noexcept(ranges::iter_move(i.inner_))) {  
  return ranges::iter_move(i.inner_);  
}
friend constexpr void iter_swap(const iterator& x, const iterator& y)  
  noexcept(ranges::iter_swap(x.inner_, y.inner_));

2 iterator::iterator_concept is defined as follows:

(2.1) — If ref_is_glvalue is true,

(2.1.1) — If Base and iter_reference_t<iterator_t<Base>> each model BidirectionalRange, then  
iterator_concept denotes bidirectional_iterator_tag.
Otherwise, if `Base` and `iter_reference_t<iterator_t<Base>>` each model `ForwardRange`, then `iterator_concept` denotes `forward_iterator_tag`.

Otherwise, `iterator_concept` denotes `input_iterator_tag`.

`iterator_concept::iterator_category` is defined as follows:

- Let `OUTERC` denote `iterator_traits<iterator_t<Base>>::iterator_category`, and let `INNERC` denote `iterator_traits<iterator_t<iter_reference_t<iterator_t<Base>>>>::iterator_category`.

- If `ref_is_glvalue` is true,

  - If `OUTERC` and `INNERC` each model `DerivedFrom<bidirectional_iterator_tag>`, `iterator_concept` denotes `bidirectional_iterator_tag`.

  - Otherwise, if `OUTERC` and `INNERC` each model `DerivedFrom<forward_iterator_tag>`, `iterator_concept` denotes `forward_iterator_tag`.

- Otherwise, `iterator_concept` denotes `input_iterator_tag`.

`iterator::iterator_category` is defined as follows:

- Let `OUTERC` denote `iterator_traits<iterator_t<Base>>::iterator_category`, and let `INNERC` denote `iterator_traits<iterator_t<iter_reference_t<iterator_t<Base>>>>::iterator_category`.

- If `ref_is_glvalue` is true,

  - If `OUTERC` and `INNERC` each model `DerivedFrom<bidirectional_iterator_tag>`, `iterator_concept` denotes `bidirectional_iterator_tag`.

  - Otherwise, if `OUTERC` and `INNERC` each model `DerivedFrom<forward_iterator_tag>`, `iterator_concept` denotes `forward_iterator_tag`.

- Otherwise, `iterator_concept` denotes `input_iterator_tag`.

`iterator::difference_type` denotes the type:

```cpp
common_type_t<
  iter_difference_t<iterator_t<Base>>,
  iter_difference_t<iterator_t<iter_reference_t<iterator_t<Base>>>>
```

join_view iterators use the `satisfy` function to skip over empty inner ranges.

```cpp
constexpr void satisfy(); // exposition only
```

**Effects:** Equivalent to:
```
auto update_inner = [this](iter_reference_t<iterator_t<Base>> x) -> decltype(auto) {
  if constexpr (ref_is_glvalue) // x is a reference
    return (x);
  else
    return (parent_->inner_ = view::all(x));
};
```

```cpp
for (; outer_ != ranges::end(parent_->base_); ++outer_) {
  auto& inner = update_inner(*outer_);
  inner_ = ranges::begin(inner);
  if (inner_ != ranges::end(inner))
    return;
}
```

```cpp
if constexpr (ref_is_glvalue)
  inner_ = iterator_t<iter_reference_t<iterator_t<Base>>>();
```

**Effects:** Initializes `outer_` with `outer` and `parent_` with `addressof(parent)`; then calls `satisfy()`.

```cpp
constexpr iterator(iterator<!Const> i)
  requires Const &&
 ConvertibleTo<iterator_t<V>, iterator_t<Base>> &&
 ConvertibleTo<iterator_t<InnerRng>,
  iterator_t<iter_reference_t<iterator_t<Base>>>;
```

**Effects:** Initializes `outer_` with `std::move(i.outer_)`, `inner_` with `std::move(i.inner_)`, and `parent_` with `i.parent_`.

```cpp
constexpr iterator_t<Base> operator->() const
  requires has_arrow<iterator_t<Base>>;
```

**Effects:** Equivalent to `return inner_`.

```cpp
constexpr iterator& operator++();
```

Let `inner-range` be:

- If `ref_is_glvalue` is true, `*outer_`

- Otherwise, `parent_->inner_`
Effects: Equivalent to:
auto&& inner_rng = inner_range;
if (++inner_ == ranges::end(inner_rng)) {
  ++outer_;
  satisfy();
} return *this;

constexpr void operator++(int);
Effects: Equivalent to: ++this.

constexpr iterator operator++(int)
requires ref_is_glvalue & ForwardRange<Base> &
   ForwardRange<iter_reference_t<iterator_t<Base>>>;
Effects: Equivalent to:
  auto tmp = *this;
  ++*this;
  return tmp;

constexpr iterator& operator--()
requires ref_is_glvalue & BidirectionalRange<Base> &
   BidirectionalRange<iter_reference_t<iterator_t<Base>>>;
Effects: Equivalent to:
  auto tmp = *this;
  --*this;
  return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires ref_is_glvalue & EqualityComparable<iterator_t<Base>> &
   EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>;
Effects: Equivalent to: return x.outer_ == y.outer_ && x.inner_ == y.inner_;

friend constexpr bool operator!=(const iterator& x, const iterator& y)
requires ref_is_glvalue & EqualityComparable<iterator_t<Base>> &
   EqualityComparable<iterator_t<iter_reference_t<iterator_t<Base>>>;
Effects: Equivalent to: return !(x == y);

friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)));
Effects: Equivalent to: return ranges::iter_swap(x.inner_, y.inner_);
using Base = conditional_t<Const, const V, V>;    // exposition only
sentinel_t<Base> end_ = sentinel_t<Base>();    // exposition only

public:
  sentinel() = default;
  constexpr explicit sentinel(Parent& parent);
  constexpr sentinel(sentinel<!Const> s)
    requires Const && ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;

friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);
friend constexpr bool operator==(const sentinel& x, const iterator<Const>& y);
friend constexpr bool operator!=(const iterator<Const>& x, const sentinel& y);
friend constexpr bool operator!=(const sentinel& x, const iterator<Const>& y);
};

constexpr explicit sentinel(Parent& parent);

Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel(sentinel<!Const> s)
  requires Const && ConvertibleTo<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes end_ with std::move(s.end_).

friend constexpr bool operator==(const iterator<Const>& x, const sentinel& y);

Effects: Equivalent to: return x.outer_ == y.end_;

friend constexpr bool operator==(const sentinel& x, const iterator<Const>& y);

Effects: Equivalent to: return y == x;

friend constexpr bool operator!=(const iterator<Const>& x, const sentinel& y);

Effects: Equivalent to: !(x == y);

friend constexpr bool operator!=(const sentinel& x, const iterator<Const>& y);

Effects: Equivalent to: !(y == x);

23.7.8.5 view::join

The name view::join denotes a range adaptor object (23.7.1). For some subexpression E, the expression
view::join(E) is expression-equivalent to join_view{E}.

23.7.9 Empty view

23.7.9.1 Overview

empty_view produces a View of no elements of a particular type.

[Example:
 empty_view<int> e;
 static_assert(ranges::empty(e));
 static_assert(0 == e.size());
 —end example]

23.7.9.2 Class template empty_view

namespace std::ranges {
  template<class T>
    requires is_object_v<T>
  class empty_view : public view_interface<empty_view<T>> {
    public:
      static constexpr T* begin() noexcept { return nullptr; }
      static constexpr T* end() noexcept { return nullptr; }
      static constexpr T* data() noexcept { return nullptr; }
      static constexpr ptrdiff_t size() noexcept { return 0; }
      static constexpr bool empty() noexcept { return true; }
  };
}
friend constexpr T* begin(empty_view) noexcept { return nullptr; }
friend constexpr T* end(empty_view) noexcept { return nullptr; }
};

23.7.10 Single view

23.7.10.1 Overview

single_view produces a View that contains exactly one element of a specified value.

[Example:
  single_view s{4};
  for (int i : s)
    cout << i; // prints 4
  — end example]

23.7.10.2 Class template single_view

namespace std::ranges {
  template<CopyConstructible T>
  requires is_object_v<T>
  class single_view : public view_interface<single_view<T>> {
    private:
      semiregular<T> value_; // exposition only
    public:
      single_view() = default;
      constexpr explicit single_view(const T& t);
      constexpr explicit single_view(T&& t);
      template<class... Args>
        requires Constructible<T, Args...>
        constexpr single_view(in_place_t, Args&&... args);
      
      constexpr T* begin() noexcept;
      constexpr const T* begin() const noexcept;
      constexpr T* end() noexcept;
      constexpr const T* end() const noexcept;
      static constexpr ptrdiff_t size() noexcept;
      constexpr T* data() noexcept;
      constexpr const T* data() const noexcept;
  };

  constexpr explicit single_view(const T& t);

  Effects: Initializes value_ with t.

  constexpr explicit single_view(T&& t);

  Effects: Initializes value_ with std::move(t).

  template<class... Args>
    constexpr single_view(in_place_t, Args&&... args);

  Effects: Initializes value_ as if by value_{in_place, std::forward<Args>(args)...}.

  constexpr T* begin() noexcept;
  constexpr const T* begin() const noexcept;

  Effects: Equivalent to: return data();

 constexpr T* end() noexcept;
  constexpr const T* end() const noexcept;

  Effects: Equivalent to: return data() + 1;

  static constexpr ptrdiff_t size() noexcept;

  Effects: Equivalent to: return 1;

§ 23.7.10.2
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

7 Effects: Equivalent to: return value_.operator->();

23.7.10.3 view::single [range.single.adaptor]
1 The name view::single denotes a customization point object (15.4.2.1.6). For some subexpression E, the expression view::single(E) is expression-equivalent to single_view(E).

23.7.11 Split view [range.split]
23.7.11.1 Overview [range.split.overview]
1 split_view takes a View and a delimiter, and splits the View into subranges on the delimiter. The delimiter can be a single element or a View of elements.

2 [Example:

```cpp
string str{"the quick brown fox");
split_view sentence{str, ' ');
for (auto word : sentence) {
  for (char ch : word)
    cout << ch;
  cout << '*';
}
// The above prints: the*quick*brown*fox*
```

—end example]

23.7.11.2 Class template split_view [range.split.view]

```cpp
namespace std::ranges {
  template<class R> struct require-constant; // exposition only

template<class R>
  concept tiny-range = // exposition only
    SizedRange<R> &&
    requires { typename require-constant<remove_reference_t<R>::size>(); } &&
    (remove_reference_t<R>::size() <= 1);

template<InputRange V, ForwardRange Pattern>
  requires View<V> && View<Pattern> &&
  IndirectlyComparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to<>> &&
  (ForwardRange<V> || tiny-range<Pattern>)
  class split_view : public view_interface<split_view<V, Pattern>> {
private:
  V base_ = V(); // exposition only
  Pattern pattern_ = Pattern(); // exposition only
  iterator_t<V> current_ = iterator_t<V>(); // exposition only, present only if !ForwardRange<V>
  template<bool> struct outer_iterator; // exposition only
  template<bool> struct inner_iterator; // exposition only
public:
  split_view() = default;
  constexpr split_view(V base, Pattern pattern);

template<InputRange R, ForwardRange P>
  requires Constructible<V, all_view<R>> &&
  Constructible<Pattern, all_view<P>>
  constexpr split_view(R&& r, P&& p);

template<InputRange R>
  requires Constructible<V, all_view<R>> &&
  Constructible<Pattern, single_view<iter_value_t<iterator_t<R>>>>
  constexpr split_view(R&& r, iter_value_t<iterator_t<R>> e);
```
constexpr auto begin() {
    if constexpr (ForwardRange<V>)
        return outer_iterator<simple_view<V>>{*this, ranges::begin(base_)};
    else {
        current_ = ranges::begin(base_);
        return outer_iterator<false>{*this};
    }
}

constexpr auto begin() const requires ForwardRange<V> && ForwardRange<const V> {
    return outer_iterator<true>{*this, ranges::begin(base_)};
}

constexpr auto end() requires ForwardRange<V> && CommonRange<V> {
    return outer_iterator<simple_view<V>>{*this, ranges::end(base_)};
}

constexpr auto end() const {
    if constexpr (ForwardRange<V> && ForwardRange<const V> && CommonRange<const V>)
        return outer_iterator<true>{*this, ranges::end(base_)};
    else
        return default_sentinel;
}

};

template<class R, class P>
split_view(R&&, P&&) -> split_view<all_view<R>, all_view<P>>;

template<InputRange R>
split_view(R&&, iter_value_t<iterator_t<R>>) -> split_view<all_view<R>, single_view<iter_value_t<iterator_t<R>>>>;

constexpr split_view(V base, Pattern pattern);

1 Effects: Initializes base_ with std::move(base), and pattern_ with std::move(pattern).

template<InputRange R, ForwardRange P>
requires Constructible<V, all_view<R>> &&
    Constructible<Pattern, all_view<P>>
constexpr split_view(R&& r, P&& p);

2 Effects: Initializes base_ with view::all(std::forward<R>(r)) and pattern_ with view::all(std::forward<P>(p)).

template<InputRange R>
requires Constructible<V, all_view<R>> &&
    Constructible<Pattern, single_view<iter_value_t<iterator_t<R>>>>
constexpr split_view(R&& r, iter_value_t<iterator_t<R>> e);

3 Effects: Initializes base_ with view::all(std::forward<R>(r)) and pattern_ with single_view{std::move(e)}.

23.7.11.3 Class template split_view::outer_iterator

namespace std::ranges {

    template<class V, class Pattern>
    template<bool Const>
    struct split_view<V, Pattern>::outer_iterator {
        private:
            using Parent = // exposition only
                conditional_t<Const, const split_view, split_view>;
            using Base = // exposition only
                conditional_t<Const, const V, V>;

            Parent* parent_ = nullptr; // exposition only
            iterator_t<Base> current_ = // exposition only, present only if V models ForwardRange
                iterator_t<Base>();

    };

§ 23.7.11.3

950
public:
using iterator_concept =
    conditional_t<ForwardRange<Base>, forward_iterator_tag, input_iterator_tag>;
using iterator_category = input_iterator_tag;
struct value_type;  // see 23.7.11.4
using difference_type = iter_difference_t<iterator_t<Base>>;

outer_iterator() = default;
constexpr explicit outer_iterator(Parent& parent)
    requires (!ForwardRange<Base>);
constexpr outer_iterator(Parent& parent, iterator_t<Base> current)
    requires ForwardRange<Base>;
constexpr outer_iterator(outer_iterator<!Const> i)
    requires Const && ConvertibleTo<iterator_t<V>, iterator_t<const V>>;

constexpr value_type operator*() const;
constexpr outer_iterator& operator++();
constexpr decltype(auto) operator++(int) {
    if constexpr (ForwardRange<Base>) {
        auto tmp = *this;
        +++this;
        return tmp;
    } else
        +++this;
}

friend constexpr bool operator==(const outer_iterator& x, const outer_iterator& y)
    requires ForwardRange<Base>;
friend constexpr bool operator!=(const outer_iterator& x, const outer_iterator& y)
    requires ForwardRange<Base>;
friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);
friend constexpr bool operator==(default_sentinel_t, const outer_iterator& x);
friend constexpr bool operator!=(const outer_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(default_sentinel_t y, const outer_iterator& x);

1 Many of the following specifications refer to the notional member `current` of `outer_iterator`. `current` is equivalent to `current_` if `V` models `ForwardRange`, and `parent_->current_` otherwise.

    constexpr explicit outer_iterator(Parent& parent)
        requires (!ForwardRange<Base>);
    Effects: Initializes `parent_` with `addressof(parent)`.

    constexpr outer_iterator(Parent& parent, iterator_t<Base> current)
        requires ForwardRange<Base>;
    Effects: Initializes `parent_` with `addressof(parent)` and `current_` with `current`.

    constexpr outer_iterator(outer_iterator<!Constr> i)
        requires Const && ConvertibleTo<iterator_t<V>, iterator_t<const V>>;
    Effects: Initializes `parent_` with `i.parent_` and `current_` with `std::move(i.current_)`.

    constexpr value_type operator*() const;
    Effects: Equivalent to: `return value_type{*this};`

    constexpr outer_iterator& operator++();
    Effects: Equivalent to:
        const auto end = ranges::end(parent_->base_);
        if (current == end) return *this;
        const auto [pbegin, pend] = subrange{parent_->pattern_};

§ 23.7.11.3
if (pbegin == pend) ++current;
else {
    do {
        const auto [b, p] = ranges::mismatch(current, end, pbegin, pend);
        if (p == pend) {
            current = b; // The pattern matched; skip it
            break;
        }
    } while (++current != end);
}
return *this;

friend constexpr bool operator==(const outer_iterator& x, const outer_iterator& y) requires ForwardRange<Base>;
7 Effects: Equivalent to: return x.current_ == y.current_;
friend constexpr bool operator!=(const outer_iterator& x, const outer_iterator& y) requires ForwardRange<Base>;
8 Effects: Equivalent to: return !(x == y);
friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);
friend constexpr bool operator==(default_sentinel_t, const outer_iterator& x);
9 Effects: Equivalent to: return x.current_ == ranges::end(x.parent_->base_);
friend constexpr bool operator!=(const outer_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(default_sentinel_t y, const outer_iterator& x);
10 Effects: Equivalent to: return !(x == y);

23.7.11.4 Class split_view::outer_iterator::value_type [range.split.outer.value]
namespace std::ranges {
    template<class V, class Pattern>
    template<bool Const>
    struct split_view<V, Pattern>::outer_iterator<Const>::value_type {
private:
        outer_iterator i_ = outer_iterator(); // exposition only
public:
        value_type() = default;
        constexpr explicit value_type(outer_iterator i);
        constexpr inner_iterator<Const> begin() const;
        constexpr default_sentinel_t end() const;
    };
    constexpr explicit value_type(outer_iterator i);
1 Effects: Initializes i_ with i.
    constexpr inner_iterator<Const> begin() const;
2 Effects: Equivalent to: return inner_iterator<Const>{i_};
    constexpr default_sentinel_t end() const;
3 Effects: Equivalent to: return default_sentinel;

23.7.11.5 Class template split_view::inner_iterator [range.split.inner]
namespace std::ranges {
    template<class V, class Pattern>
    template<bool Const>
    struct split_view<V, Pattern>::inner_iterator {

friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
    noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
    requires IndirectlySwappable<iterator_t<Base>>;
};

1 The typedef-name iterator_category denotes forward_iterator_tag if iterator_traits<iterator_t<Base>>::iterator_category models DerivedFrom<forward_iterator_tag>, and input_iterator_tag otherwise.

custom explicit inner_iterator(outer_iterator<Const> i);

2 Effects: Initializes i_ with i.
custom inner_iterator& operator++() const;

3 Effects: Equivalent to:
    incremented_ = true;
    if constexpr (!ForwardRange<Base>) {
        if constexpr (Pattern::size() == 0) {
            return *this;
        }
        +++i_.current;
    }
    return *this;

§ 23.7.11.5
friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y) requires ForwardRange<Base>;
Effects: Equivalent to: return x.i_.current_ == y.i_.current_;
friend constexpr bool operator!=(const inner_iterator& x, const inner_iterator& y) requires ForwardRange<Base>;
Effects: Equivalent to: return !(x == y);
friend constexpr bool operator==(const inner_iterator& x, default_sentinel_t);
friend constexpr bool operator==(default_sentinel_t, const inner_iterator& x);
Effects: Equivalent to:
auto cur = x.i_.current;
auto end = ranges::end(x.i_.parent_->base_);
if (cur == end) return true;
auto [pcur, pend] = subrange{x.i_.parent_->pattern_};
if (pcur == pend) return x.incremented_;
do {
  if (*cur != *pcur) return false;
  if (++pcur == pend) return true;
} while (++cur != end);
return false;
friend constexpr bool operator!=(const inner_iterator& x, default_sentinel_t y);
friend constexpr bool operator!=(default_sentinel_t y, const inner_iterator& x);
Effects: Equivalent to: return !(x == y);
friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y) noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current))) requires IndirectlySwappable<iterator_t<Base>>;
Effects: Equivalent to: ranges::iter_swap(x.i_.current, y.i_.current).

23.7.11.6 view::split
The name view::split denotes a range adaptor object (23.7.1). For some subexpressions E and F, the expression view::split(E, F) is expression-equivalent to split_view{E, F}.

23.7.12 Counted view
The name view::counted denotes a customization point object (15.4.2.1.6). Let E and F be expressions, and let T be decay_t<decltype((E))>. Then the expression view::counted(E, F) is expression-equivalent to:

(1.1) — If T models Iterator and decltype(F) models ConvertibleTo<iter_difference_t<T>>,
(1.1.1) — subrange{E, E + static_cast<iter_difference_t<T>>(F)} if T models RandomAccessIterator.
(1.1.2) — Otherwise, subrange{counted_iterator(E, F), default_sentinel}.
(1.2) — Otherwise, view::counted(E, F) is ill-formed. [Note: This case can result in substitution failure when view::counted(E, F) appears in the immediate context of a template instantiation. — end note]

23.7.13 Common view

23.7.13.1 Overview
common_view takes a View which has different types for its iterator and sentinel and turns it into a View of the same elements with an iterator and sentinel of the same type.

[Note: common_view is useful for calling legacy algorithms that expect a range’s iterator and sentinel types to be the same. — end note]

[Example:
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);
]
template<ForwardRange R>
void my_algo(R&& r) {
  auto&& common = common_view(r);
  auto cnt = count(common.begin(), common.end());
  // ...
}

-- end example]

23.7.13.2 Class template common_view

namespace std::ranges {
  template<View V>
  requires (!CommonRange<V>)
  class common_view : public view_interface<common_view<V>> {
    private:
      V base_ = V(); // exposition only
    public:
      common_view() = default;
      constexpr explicit common_view(V r);
      template<ViewableRange R>
      requires (!CommonRange<R> && Constructible<V, all_view<R>>)
      constexpr explicit common_view(R&& r);
      constexpr V base() const;
      constexpr auto size() requires SizedRange<V> {
        return ranges::size(base_);
      }
      constexpr auto size() const requires SizedRange<const V> {
        return ranges::size(base_);
      }
      constexpr auto begin() {
        if constexpr (RandomAccessRange<V> && SizedRange<V>)
          return ranges::begin(base_);
        else
          return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
      }
      constexpr auto begin() const requires Range<const V> {
        if constexpr (RandomAccessRange<const V> && SizedRange<const V>)
          return ranges::begin(base_);
        else
          return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
      }
      constexpr auto end() {
        if constexpr (RandomAccessRange<V> && SizedRange<V>)
          return ranges::begin(base_) + ranges::size(base_);
        else
          return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
      }
      constexpr auto end() const requires Range<const V> {
        if constexpr (RandomAccessRange<const V> && SizedRange<const V>)
          return ranges::begin(base_) + ranges::size(base_);
        else
          return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
      }
  };

§ 23.7.13.2 955
template<class R>
    common_view(R&&) -> common_view<all_view<R>>;
}

constexpr explicit common_view(V base);
1  Effects: Initializes base_ with std::move(base).

template<ViewableRange R>
    requires (!CommonRange<R> && Constructible<V, all_view<R>>)
    constexpr explicit common_view(R&& r);
2  Effects: Initializes base_ with view::all(std::forward<R>(r)).

constexpr V base() const;
3  Effects: Equivalent to: return base_;
constexpr auto size() requires SizedRange<V> {
    return ranges::size(base_);
}
constexpr auto size() const requires SizedRange<const V> {
    return ranges::size(base_);
}
}
}
}
}
}

1

Effects: Initializes base_ with std::move(base).

2

Effects: Initializes base_ with view::all(std::forward<R>(r)).

3

Effects: Equivalent to: return base_;

4

Returns:
    make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_))

5

Remarks: In order to provide the amortized constant time complexity required by the Range concept, this function caches the result within the reverse_view for use on subsequent calls.

6

Effects: Equivalent to: return make_reverse_iterator(ranges::end(base_));

7

Effects: Equivalent to: return make_reverse_iterator(ranges::begin(base_));

23.7.14.3  view::reverse

The name view::reverse denotes a range adaptor object (23.7.1). For some subexpression E, the expression view::reverse(E) is expression-equivalent to reverse_view(E).
24 Algorithms library [algorithms]

24.1 General [algorithms.general]

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 21) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 80.

Table 80 — Algorithms library summary

<table>
<thead>
<tr>
<th>Subclause</th>

<tr>
<td>24.9 Generalized numeric operations</td>
<td>&lt;numeric&gt;</td>
</tr>
<tr>
<td>24.10 C library algorithms</td>
<td>&lt;cstdlib&gt;</td>
</tr>
</tbody>
</table>

24.2 Algorithms requirements [algorithms.requirements]

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the std::ranges namespace in this Clause are not found by argument-dependent name lookup (6.4.2). When found by unqualified (6.4.1) name lookup for the postfix-expression in a function call (7.6.1.2), they inhibit argument-dependent name lookup.

[Example:

```cpp
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
    find(begin(vec), end(vec), 2); // #1
}
```

The function call expression at #1 invokes std::ranges::find, not std::find, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::find is more specialized (12.6.6.2) than std::ranges::find since the former requires its first two parameters to have the same type. —end example]

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) — If an algorithm’s template parameter is named InputIterator, InputIterator1, or InputIterator2, the template argument shall satisfy the Cpp17InputIterator requirements (22.3.5.2).

(4.2) — If an algorithm’s template parameter is named OutputIterator, OutputIterator1, or OutputIterator2, the template argument shall satisfy the Cpp17OutputIterator requirements (22.3.5.3).

(4.3) — If an algorithm’s template parameter is named ForwardIterator, ForwardIterator1, or ForwardIterator2, the template argument shall satisfy the Cpp17ForwardIterator requirements (22.3.5.4).

(4.4) — If an algorithm’s template parameter is named BidirectionalIterator, BidirectionalIterator1, or BidirectionalIterator2, the template argument shall satisfy the Cpp17BidirectionalIterator requirements (22.3.5.5).

(4.5) — If an algorithm’s template parameter is named RandomAccessIterator, RandomAccessIterator1, or RandomAccessIterator2, the template argument shall satisfy the Cpp17RandomAccessIterator requirements (22.3.5.6).
If an algorithm’s Effects: element specifies that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall satisfy the requirements of a mutable iterator (22.3). [Note: This requirement does not affect arguments that are named OutputIterator, OutputIterator1, or OutputIterator2, because output iterators must always be mutable, nor does it affect arguments that are constrained, for which mutability requirements are expressed explicitly. —end note]

Both in-place and copying versions are provided for certain algorithms.\(^{233}\) When such a version is provided for algorithm it is called algorithm_copy. Algorithms that take predicates end with the suffix _if (which follows the suffix _copy).

When not otherwise constrained, the Predicate parameter is used whenever an algorithm expects a function object (19.14) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as true. In other words, if an algorithm takes Predicate pred as its argument and first as its iterator argument with value type T, it should work correctly in the construct pred(*first) contextually converted to bool (7.3). The function object pred shall not apply any non-constant function through the dereferenced iterator. Given a glvalue u of type (possibly const) T that designates the same object as *first, pred(u) shall be a valid expression that is equal to pred(*first).

When not otherwise constrained, the BinaryPredicate parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type T when T is part of the signature returns a value testable as true. In other words, if an algorithm takes BinaryPredicate binary_pred as its argument and first1 and first2 as its iterator arguments with respective value types T1 and T2, it should work correctly in the construct binary_pred(*first1, *first2) contextually converted to bool (7.3). Unless otherwise specified, BinaryPredicate always takes the first iterator’s value_type as its first argument, that is, in those cases when T value is part of the signature, it should work correctly in the construct binary_pred(*first1, value) contextually converted to bool (7.3). binary_pred shall not apply any non-constant function through the dereferenced iterators. Given a glvalue u of type (possibly const) T1 that designates the same object as *first1, and a glvalue v of type (possibly const) T2 that designates the same object as *first2, binary_pred(u, *first2), binary_pred(u, v), and binary_pred(u, v) shall each be a valid expression that is equal to binary_pred(*first1, *first2), and binary_pred(u, value) shall be a valid expression that is equal to binary_pred(*first1, value).

The parameters UnaryOperation, BinaryOperation, BinaryOperation1, and BinaryOperation2 are used whenever an algorithm expects a function object (19.14).

[Note: Unless otherwise specified, algorithms that take function objects as arguments are permitted to copy those function objects freely. Programmers for whom object identity is important should consider using a wrapper class that points to a noncopied implementation object such as reference_wrapper<T> (19.14.5), or some equivalent solution. —end note]

When the description of an algorithm gives an expression such as *first == value for a condition, the expression shall evaluate to either true or false in boolean contexts.

In the description of the algorithms, operator + is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of a + n are the same as those of

\[
\begin{align*}
\text{auto tmp } &= a; \\
&\text{for (; n < 0; ++n) } --\text{tmp;}
\end{align*}
\]

Similarily, operator − is used for some combinations of iterators and sentinel types for which it does not have to be defined. If \( [a, b] \) denotes a range, the semantics of \( b - a \) in these cases are the same as those of

\[
\begin{align*}
\text{iter_difference_t<remove_reference_t<decltype(a)>> } n &\text{ = 0;}
&\text{for (auto tmp = a; tmp }!= b; ++\text{tmp) } ++\text{n;}
\end{align*}
\]

and if \( [b, a] \) denotes a range, the same as those of

\[
\begin{align*}
\text{iter_difference_t<remove_reference_t<decltype(b)>> } n &\text{ = 0;}
&\text{for (auto tmp = b; tmp }!= a; ++\text{tmp) } --\text{n;}
\end{align*}
\]

---

\(^{233}\) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, sort_copy is not included because the cost of sorting is much more significant, and users might as well do copy followed by sort.
return n;

13 In the description of algorithm return values, a sentinel value \( s \) denoting the end of a range \( (i, s) \) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using `ranges::next(i, s)`.

14 Overloads of algorithms that take `Range` arguments (23.5.2) behave as if they are implemented by calling `ranges::begin` and `ranges::end` on the `Range(s)` and dispatching to the overload in namespace `ranges` that takes separate iterator and sentinel arguments.

15 The number and order of deducible template parameters for algorithm declarations are unspecified, except where explicitly stated otherwise. [Note: Consequently, the algorithms may not be called with explicitly-specified template argument lists. — end note]

16 The class templates `binary_transform_result`, `for_each_result`, `minmax_result`, `mismatch_result`, `copy_result`, and `partition_copy_result` have the template parameters, data members, and special members specified above. They have no base classes or members other than those specified.

### 24.3 Parallel algorithms

This subclause describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

#### 24.3.1 Terms and definitions

A **parallel algorithm** is a function template listed in this document with a template parameter named `ExecutionPolicy`.

2 Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

- All operations of the categories of the iterators that the algorithm is instantiated with.
- Operations on those sequence elements that are required by its specification.
- User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
- Operations on those function objects required by the specification. [Note: See 24.2. — end note]

These functions are herein called **element access functions**. [Example: The `sort` function may invoke the following element access functions:

- Operations of the random-access iterator of the actual template argument (as per 22.3.5.6), as implied by the name of the template parameter `RandomAccessIterator`.
- The `swap` function on the elements of the sequence (as per the preconditions specified in 24.7.1.1).
- The user-provided `Compare` function object. — end example]

#### 24.3.2 Requirements on user-provided function objects

Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, `BinaryOperation2`, and the operators used by the analogous overloads to these parallel algorithms that could be formed by the invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

#### 24.3.3 Effect of execution policies on algorithm execution

Parallel algorithms have template parameters named `ExecutionPolicy` (19.18) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object. [Note: For example, `swap()`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — end note]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are true. [Note:
This implies that user-supplied function objects should not rely on object identity of arguments for such input sequences. Users for whom the object identity of the arguments to these function objects is important should consider using a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (19.14.5) or some equivalent solution. — end note

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution. [Note: The invocations are not interleaved; see 6.8.1. — end note]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute in either the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by `thread` (31.3.2) provide concurrent forward progress guarantees (6.8.2.2), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other. [Note: It is the caller’s responsibility to ensure that the invocation does not introduce data races or deadlocks. — end note] [Example:

```c++
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
    v.push_back(i*2+1); // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — end example]

[Example:

```c++
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    x.fetch_add(1, std::memory_order::relaxed);
    // spin wait for another iteration to change the value of x
    while (x.load(std::memory_order::relaxed) == 1) {} // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — end example] [Example:

```c++
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);
    ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — end example]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees. [Note: This means that multiple function object invocations may be interleaved on a single thread of execution, which overrides the usual guarantee from 6.8.1 that function executions do not interleave with one another. — end note]

Since `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. Thus, the synchronization with `execution::parallel_unsequenced_policy` is restricted as follows: A standard library function is `vectorization-unsafe` if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function. Vectorization-unsafe standard library functions may not be invoked by user code called from `execution::parallel_unsequenced_policy` algorithms. [Note: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — end note] [Example:
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [](int) {
    std::lock_guard<mutex> guard(m); // incorrect: lock_guard constructor calls m.lock()
    ++x;
});

The above program may result in two consecutive calls to m.lock() on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. — end example] [Note: The semantics of the execution::parallel_policy or the execution::parallel_unsequenced_policy invocation allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation due to lack of resources. — end note]

7 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either
(7.1) temporarily block with forward progress guarantee delegation (6.8.2.2) on the completion of these library-managed threads of execution, or
(7.2) eventually execute an element access function;
the thread of execution will continue to do so until the algorithm is finished. [Note: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — end note]

8 The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.

24.3.4 Parallel algorithm exceptions [algorithms.parallel.exceptions]
1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a bad_alloc exception.
2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the ExecutionPolicy.

24.3.5 ExecutionPolicy algorithm overloads [algorithms.parallel.overloads]
1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named ExecutionPolicy, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type ExecutionPolicy&&, which is the first function parameter. [Note: Not all algorithms have parallel algorithm overloads. — end note]
2 Unless otherwise specified, the semantics of ExecutionPolicy algorithm overloads are identical to their overloads without.
3 Unless otherwise specified, the complexity requirements of ExecutionPolicy algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most expr” or “exactly expr” and does not specify the number of assignments or swaps, and expr is not already expressed with $O()$ notation, the complexity of the algorithm shall be $O(expr)$.
4 Parallel algorithms shall not participate in overload resolution unless is_execution_policy_v<remove_cvref_t<ExecutionPolicy>> is true.

24.5 Non-modifying sequence operations

24.5.1 All of

template<class InputIterator, class Predicate>
constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);

namespace ranges {
    template<InputIterator I, Sentinel<I> S, class Proj = identity,
IndirectUnaryPredicate<projected<I, Proj>> Pred>
    constexpr bool all_of(I first, S last, Pred pred, Proj proj = {});
    template<InputRange R, class Proj = identity,
IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
    constexpr bool all_of(R&& r, Pred pred, Proj proj = {});
}

Let $E$ be $\text{pred}(\ast i)$ and invoke($\text{pred}$, invoke($\text{proj}$, $\ast i$)) for the overloads in namespace std and std::ranges, respectively.

Returns: false if $E$ is false for some iterator $i$ in the range [first, last), and true otherwise.
24.5.2 Any of

\texttt{template<class InputIterator, class Predicate>}
\texttt{constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);}  
\texttt{template<class ExecutionPolicy, class ForwardIterator, class Predicate>}
\texttt{bool any_of(ExecutionPolicy\&\& exec, ForwardIterator first, ForwardIterator last,}
\texttt{ Predicate pred);}  
\texttt{namespace ranges {}
\texttt{ template<InputIterator I, Sentinel<I> S, class Proj = identity,}
\texttt{ IndirectUnaryPredicate<projected<I, Proj>> Pred>}
\texttt{constexpr bool any_of(I first, S last, Pred pred, Proj proj = {});}
\texttt{ template<InputRange R, class Proj = identity,}
\texttt{ IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>}
\texttt{constexpr bool any_of(R\&\& r, Pred pred, Proj proj = {});}
\texttt{}}

1. Let \( E \) be \( \text{pred(*i)} \) and \( \text{invoke(pred, invoke(proj, *i))} \) for the overloads in namespace \texttt{std} and \texttt{std::ranges}, respectively. \textit{Returns:} \texttt{true} if \( E \) \texttt{is true} for some iterator \( i \) in the range \( [\text{first}, \text{last}) \), and \texttt{false} otherwise.

24.5.3 None of

\texttt{template<class InputIterator, class Predicate>}
\texttt{constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);}  
\texttt{template<class ExecutionPolicy, class ForwardIterator, class Predicate>}
\texttt{bool none_of(ExecutionPolicy\&\& exec, ForwardIterator first, ForwardIterator last,}
\texttt{ Predicate pred);}  
\texttt{namespace ranges {}
\texttt{ template<InputIterator I, Sentinel<I> S, class Proj = identity,}
\texttt{ IndirectUnaryPredicate<projected<I, Proj>> Pred>}
\texttt{constexpr bool none_of(I first, S last, Pred pred, Proj proj = {});}
\texttt{ template<InputRange R, class Proj = identity,}
\texttt{ IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>}
\texttt{constexpr bool none_of(R\&\& r, Pred pred, Proj proj = {});}
\texttt{}}

1. Let \( E \) be \( \text{pred(*i)} \) and \( \text{invoke(pred, invoke(proj, *i))} \) for the overloads in namespace \texttt{std} and \texttt{std::ranges}, respectively. \textit{Returns:} \texttt{false} if \( E \) \texttt{is true} for some iterator \( i \) in the range \( [\text{first}, \text{last}) \), and \texttt{true} otherwise.

24.5.4 For each

\texttt{template<class InputIterator, class Function>}
\texttt{constexpr Function for_each(InputIterator first, InputIterator last, Function f);}  
\texttt{Requires:} Function shall satisfy the \texttt{Cpp17MoveConstructible} requirements (Table 26). [\textit{Note:} Function need not meet the requirements of \texttt{Cpp17CopyConstructible} (Table 27). — end note]

2. Effects: Applies \( f \) to the result of dereferencing every iterator in the range \( [\text{first}, \text{last}) \), starting from \( \text{first} \) and proceeding to \( \text{last} - 1 \). [\textit{Note:} If the type of \( \text{first} \) satisfies the requirements of a mutable iterator, \( f \) may apply non-constant functions through the dereferenced iterator. — end note]

3. Returns: \( f \).

4. Complexity: Applies \( f \) exactly \( \text{last} - \text{first} \) times.

5. Remarks: If \( f \) returns a result, the result is ignored.
template<class ExecutionPolicy, class ForwardIterator, class Function>
void for_each(ExecutionPolicy&& exec,
     ForwardIterator first, ForwardIterator last,
     Function f);

Requires: Function shall satisfy the Cpp17CopyConstructible requirements.

Effects: Applies f to the result of dereferencing every iterator in the range [first, last). [Note: If the type of first satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — end note]

Complexity: Applies f exactly last - first times.

Remarks: If f returns a result, the result is ignored. Implementations do not have the freedom granted under 24.3.3 to make arbitrary copies of elements from the input sequence. [Note: Does not return a copy of its Function parameter, since parallelization may not permit efficient state accumulation. — end note]

namespace ranges {

template<InputIterator I, Sentinel<I> S, class Proj = identity,
        IndirectUnaryInvocable<projected<I, Proj>> Fun>
constexpr for_each_result<I, Fun>
for_each(I first, S last, Fun f, Proj proj = {});

template<InputRange R, class Proj = identity,
        IndirectUnaryInvocable<projected<iterator_t<R>, Proj>> Fun>
constexpr for_each_result<safe_iterator_t<R>, Fun>
for_each(R&& r, Fun f, Proj proj = {});
}

Effects: Calls invoke(f, invoke(proj, *i)) for every iterator i in the range [first, last), starting from first and proceeding to last - 1. [Note: If the result of invoke(proj, *i) is a mutable reference, f may apply non-constant functions. — end note]

Returns: {last, std::move(f)}.

Complexity: Applies f and proj exactly last - first times.

Remarks: If f returns a result, the result is ignored. [Note: The overloads in namespace ranges require Fun to model CopyConstructible. — end note]

template<class InputIterator, class Size, class Function>
constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);

Requires: Function shall satisfy the Cpp17MoveConstructible requirements [Note: Function need not meet the requirements of Cpp17CopyConstructible. — end note]

Requires: n >= 0.

Effects: Applies f to the result of dereferencing every iterator in the range [first, first + n) in order. [Note: If the type of first satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — end note]

Returns: first + n.

Remarks: If f returns a result, the result is ignored.

template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n, Function f);

Requires: Function shall satisfy the Cpp17CopyConstructible requirements.

Requires: n >= 0.

Effects: Applies f to the result of dereferencing every iterator in the range [first, first + n). [Note: If the type of first satisfies the requirements of a mutable iterator, f may apply non-constant functions through the dereferenced iterator. — end note]

Returns: first + n.

Remarks: If f returns a result, the result is ignored. Implementations do not have the freedom granted under 24.3.3 to make arbitrary copies of elements from the input sequence.

§ 24.5.4 999
24.5.5 Find

template<class InputIterator, class T>
constexpr InputIterator find(InputIterator first, InputIterator last, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr InputIterator find_if(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

template<class InputIterator, class Predicate>
constexpr InputIterator find_if_not(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator find_if_not(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {
  template<InputIterator I, Sentinel<I> S, class T, class Proj = identity>
  requires IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T*>  
  constexpr I find(I first, S last, const T& value, Proj proj = {});

  template<InputRange R, class T, class Proj = identity>
  requires IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T*>  
  constexpr safe_iterator_t<R> find(R&& r, const T& value, Proj proj = {});

  template<InputIterator I, Sentinel<I> S, class Proj = identity, 
  IndirectUnaryPredicate<projected<I, Proj>> Pred>
  constexpr I find_if(I first, S last, Pred pred, Proj proj = {});

  template<InputRange R, class Proj = identity, 
  IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr safe_iterator_t<R> find_if(R&& r, Pred pred, Proj proj = {});

  template<InputIterator I, Sentinel<I> S, class Proj = identity, 
  IndirectUnaryPredicate<projected<I, Proj>> Pred>
  constexpr I find_if_not(I first, S last, Pred pred, Proj proj = {});

  template<InputRange R, class Proj = identity, 
  IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
  constexpr safe_iterator_t<R> find_if_not(R&& r, Pred pred, Proj proj = {});
}

Let $E$ be:

- $i == \text{value for find}$,
- $\text{pred}(i) != \text{false for find_if}$,
- $\text{pred}(i) == \text{false for find_if_not}$,
- $\text{invoke(proj, i)} == \text{value for ranges::find}$,
- $\text{invoke(pred, invoke(proj, i)) != \text{false for ranges::find_if}}$,
- $\text{invoke(pred, invoke(proj, i)) == \text{false for ranges::find_if_not}}$.

Returns: The first iterator $i$ in the range $[\text{first, last})$ for which $E$ is true. Returns $\text{last}$ if no such iterator is found.

Complexity: At most $\text{last} - \text{first}$ applications of the corresponding predicate and any projection.
24.5.6 Find end

\[alg.find.end\]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);
```

```
namespace ranges {
    template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2,
             class Pred = ranges::equal_to<>, class Proj1 = identity, class Proj2 = identity>
    requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
    constexpr subrange<I1>
    find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
             Proj1 proj1 = {}, Proj2 proj2 = {});
    template<ForwardRange R1, ForwardRange R2,
             class Pred = ranges::equal_to<>, class Proj1 = identity, class Proj2 = identity>
    requires IndirectlyComparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
    constexpr safe_subrange_t<R1>
    find_end(R1&& r1, R2&& r2, Pred pred = {},
             Proj1 proj1 = {}, Proj2 proj2 = {});
}
```

1 Let:

- \((1.1)\) \(\text{pred}\) be \(\text{equal}\_\text{to}\{\}\) for the overloads with no parameter \(\text{pred}\).

- \((1.2)\) \(E\) be:
  - \((1.2.1)\) \(\text{pred}(*(i + n), *(first2 + n))\) for the overloads in namespace std,
  - \((1.2.2)\) \(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *(i + n)), \text{invoke}(\text{proj2}, *(first2 + n)))\) for the overloads in namespace ranges.

- \((1.3)\) \(i\) be \(\text{last1}\) if \([\text{first2}, \text{last2})\) is empty, or if \((\text{last2} - \text{first2}) > (\text{last1} - \text{first1})\) is true, or if there is no iterator in the range \([\text{first1}, \text{last1} - (\text{last2} - \text{first2}))\) such that for every non-negative integer \(n < (\text{last2} - \text{first2})\), \(E\) is true. Otherwise \(i\) is the last such iterator in \([\text{first1}, \text{last1} - (\text{last2} - \text{first2}))\).

2 Returns:

- \((2.1)\) \(i\) for the overloads in namespace std, and
- \((2.2)\) \([i, i + (i == \text{last1} ? 0 : \text{last2} - \text{first2}))\) for the overloads in namespace ranges.

3 Complexity: At most \((\text{last2} - \text{first2}) \ast (\text{last1} - \text{first1} - (\text{last2} - \text{first2}) + 1)\) applications of the corresponding predicate and any projections.

24.5.7 Find first

\[alg.find.first.of\]

```
template<class InputIterator, class ForwardIterator>
```

\§ 24.5.7 1001
constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
    ForwardIterator first2, ForwardIterator last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
    ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator, class ForwardIterator,
    class BinaryPredicate>
    constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
    ForwardIterator first2, ForwardIterator last2,
    BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
    class BinaryPredicate>
    ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2,
    BinaryPredicate pred);

namespace ranges {
    template<InputIterator I1, Sentinel<I1> S1, ForwardIterator I2, Sentinel<I2> S2,
        class Proj1 = identity, class Proj2 = identity,
        IndirectRelation<projected<I1, Proj1>,
            projected<I2, Proj2>> Pred = ranges::equal_to<>>
    constexpr I1 find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
        Pred pred = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});  

template<InputRange R1, ForwardRange R2, class Proj1 = identity,
    class Proj2 = identity,
    IndirectRelation<iterator_t<R1>, Proj1>,
    IndirectRelation<iterator_t<R2>, Proj2>> Pred = ranges::equal_to<>>
    constexpr safe_iterator_t<R1>
    find_first_of(R1&& r1, R2&& r2,
        Pred pred = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});  
}

Let $E$ be:

1. $i == j$ for the overloads with no parameter $\text{pred}$,
2. $\text{pred}(*i, *j) != \text{false}$ for the overloads with a parameter $\text{pred}$ and no parameter $\text{proj1}$,
3. $\text{invoke(pred, invoke(proj1, *i), invoke(proj2, *j)) != false}$ for the overloads with parameters $\text{pred}$ and $\text{proj1}$.

Effects: Finds an element that matches one of a set of values.

Returns: The first iterator $i$ in the range $[\text{first1}, \text{last1})$ such that for some iterator $j$ in the range $[\text{first2}, \text{last2})$ $E$ holds. Returns $\text{last1}$ if $[\text{first2}, \text{last2})$ is empty or if no such iterator is found.

Complexity: At most $(\text{last1}-\text{first1}) \times (\text{last2}-\text{first2})$ applications of the corresponding predicate and any projections.
template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last,
    BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last,
    BinaryPredicate pred);

namespace ranges {

template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
    IndirectRelation<projected<I, Proj>> Pred = ranges::equal_to<>>
constexpr I adjacent_find(I first, S last, Pred pred = {},
    Proj proj = {});

template<ForwardRange R, class Proj = identity,
    IndirectRelation<projected<iterator_t<R>, Proj>> Pred = ranges::equal_to<>>
constexpr safe_iterator_t<R>
adjacent_find(R&& r, Pred pred = {}, Proj proj = {});
}

1
Let $E$ be:

1. $i == *(i + 1)$ for the overloads with no parameter $pred$,
2. $pred(i, *(i + 1)) != false$ for the overloads with a parameter $pred$ and no parameter $proj$,
3. invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1))) != false for the overloads with both parameters $pred$ and $proj$.

2
Returns: The first iterator $i$ such that both $i$ and $i + 1$ are in the range $[first, last)$ for which $E$ holds. Returns $last$ if no such iterator is found.

3
Complexity: For the overloads with no $ExecutionPolicy$, exactly
$$\min((i - first) + 1, (last - first) - 1)$$
applications of the corresponding predicate, where $i$ is $adjacent\_find$'s return value. For the overloads with an $ExecutionPolicy$, $O(last - first)$ applications of the corresponding predicate, and no more than twice as many applications of any projection.

### 24.5.9 Count

template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class T>
typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {

template<InputIterator I, Sentinel<I> S, class T, class Proj = identity>
requires IndirectRelation<ranges::equal_to<>?, projected<I, Proj>, const T*>
constexpr iter_difference_t<I>
count(I first, S last, const T& value, Proj proj = {});

template<InputRange R, class T, class Proj = identity>
requires IndirectRelation<ranges::equal_to<>?, projected<iterator_t<R>, Proj>, const T*>
constexpr iter_difference_t<iterator_t<R>>
count(R&& r, const T& value, Proj proj = {});

§ 24.5.9
Let $E$ be:

1. $i == \text{value}$ for the overloads with no parameter $\text{pred}$ or $\text{proj}$,
2. $\text{pred}(i) != \text{false}$ for the overloads with a parameter $\text{pred}$ but no parameter $\text{proj}$,
3. $\text{invoke}(\text{proj}, i) == \text{value}$ for the overloads with a parameter $\text{proj}$ but no parameter $\text{pred}$,
4. $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, i)) != \text{false}$ for the overloads with both parameters $\text{proj}$ and $\text{pred}$.

**Effects:** Returns the number of iterators $i$ in the range $[\text{first}, \text{last})$ for which $E$ holds.

**Complexity:** Exactly $\text{last} - \text{first}$ applications of the corresponding predicate and any projection.

### Mismatch

```cpp
template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2);
```

```cpp
template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, BinaryPredicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, BinaryPredicate pred);
```

```cpp
template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);
```

```cpp
template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, BinaryPredicate pred);
```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2,
    BinaryPredicate pred);

namespace ranges {
    template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2, class Proj1 = identity, class Proj2 = identity,
        IndirectRelation<projected<I1, Proj1>, projected<I2, Proj2>> Pred = ranges::equal_to<>>
    constexpr mismatch_result<I1, I2> mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});
    template<InputRange R1, InputRange R2, class Proj1 = identity, class Proj2 = identity,
        IndirectRelation<iterator_t<R1>, iterator_t<R2>> Pred = ranges::equal_to<>>
    constexpr mismatch_result<safe_iterator_t<R1>, safe_iterator_t<R2>> mismatch(R1&& r1, R2&& r2, Pred pred = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});
}

1 Let last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2.

2 Let E be:
   \[ (2.1) \quad \neg((\text{first1} + n) == (\text{first2} + n)) \]
   for the overloads with no parameter pred,
   \[ (2.2) \quad \neg\text{pred}(\text{first1} + n), \neg((\text{first2} + n)) == \text{false} \]
   for the overloads with a parameter pred and no parameter proj1,
   \[ (2.3) \quad \neg\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, (\text{first1} + n)), \text{invoke}(\text{proj2}, (\text{first2} + n))) \]
   for the overloads with both parameters pred and proj1.

3 Returns: \{ first1 + n, first2 + n \}, where n is the smallest integer such that E holds, or
   \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}) if no such integer exists.

4 Complexity: At most \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}) applications of the corresponding predicate and any projections.

24.5.11 Equal [alg.equal]

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool equal(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2);
Let:

1. \( \text{last2 be } \text{first2} + (\text{last1} - \text{first1}) \) for the overloads with no parameter \( \text{last2} \) or \( r2 \),
2. \( \text{pred be } \text{equal_to}() \) for the overloads with no parameter \( \text{pred} \),
3. \( E \) be:
   - \( \text{pred(*i, *(first2 + (i - first1)))} \) for the overloads with no parameter \( \text{proj1} \),
   - \( \text{invoke}(<\text{pred}, \text{invoke}(<\text{proj1}, *i), \text{proj2}, *(first2 + (i - first1)))>) \) for the overloads with parameter \( \text{proj1} \).

Returns: If \( \text{last1} - \text{first1} != \text{last2} - \text{first2} \), return \text{false}. Otherwise return \text{true} if \( E \) holds for every iterator \( i \) in the range \([\text{first1}, \text{last1})\). Otherwise, returns \text{false}.

Complexity: If the types of \( \text{first1}, \text{last1}, \text{first2}, \text{and last2} \):

1. meet the \text{Cpp17RandomAccessIterator} requirements (22.3.5.6) for the overloads in namespace \text{std},
2. or
   - pairwise model \text{SizedSentinel} (22.3.4.8) for the overloads in namespace \text{ranges},

   and \( \text{last1} - \text{first1} != \text{last2} - \text{first2} \), then no applications of the corresponding predicate and each projection; otherwise,
3. For the overloads with no \text{ExecutionPolicy}, at most \( \text{min(last1} - \text{first1, last2} - \text{first2}) \) applications of the corresponding predicate and any projections,
4. For the overloads with an \text{ExecutionPolicy}, \( O(\text{min(last1} - \text{first1, last2} - \text{first2})) \) applications of the corresponding predicate.

24.5.12 \text{Is permutation} 

\[ \text{alg.is_permutation} \]
template<class ForwardIterator1, class ForwardIterator2, 
    class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, BinaryPredicate pred);

template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2, 
    class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2, 
    BinaryPredicate pred);

1 Requires: ForwardIterator1 and ForwardIterator2 shall have the same value type. The comparison function shall be an equivalence relation.

2 Remarks: If last2 was not given in the argument list, it denotes first2 + (last1 - first1) below.

3 Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, first2 + (last1 - first1)), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin) returns true or equal(first1, last1, begin, pred) returns true; otherwise, returns false.

4 Complexity: No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2) would return true if pred was not given in the argument list or equal(first1, last1, first2, last2, pred) would return true if pred was given in the argument list; otherwise, at worst $O(N^2)$, where $N$ has the value last1 - first1.

namespace ranges {
    template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, 
        Sentinel<I2> S2, class Pred = ranges::equal_to<>, class Proj1 = identity, 
        class Proj2 = identity>
    requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
    constexpr bool is_permutation(I1 first1, S1 last1, I2 first2, S2 last2,
        Pred pred = {}, 
        Proj1 proj1 = {}, Proj2 proj2 = {});

    template<ForwardRange R1, ForwardRange R2, class Pred = ranges::equal_to<>, 
        class Proj1 = identity, class Proj2 = identity>
    requires IndirectlyComparable<iterator_<R1>, iterator_<R2>, Pred, Proj1, Proj2>
    constexpr bool is_permutation(R1&& r1, R2&& r2, Pred pred = {}, 
        Proj1 proj1 = {}, Proj2 proj2 = {});
}

5 Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), bounded by [pfirst, plast), such that ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2) returns true; otherwise, returns false.

6 Complexity: No applications of the corresponding predicate and projections if:

(6.1) — S1 and I1 model SizedSentinel,

(6.2) — S2 and I2 model SizedSentinel, and

(6.3) — last1 - first1 != last2 - first2.

Otherwise, exactly last1 - first1 applications of the corresponding predicate and projections if ranges::equal(first1, last1, first2, last2, pred, proj1, proj2) would return true; otherwise, at worst $O(N^2)$, where $N$ has the value last1 - first1.

24.5.13 Search [alg.search]

template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1 search(ForwardIterator1 first1, ForwardIterator1 last1, 
    ForwardIterator2 first2, ForwardIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
    search(ExecutionPolicy&& exec,
            ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2, 
         class BinaryPredicate>
constexpr ForwardIterator1
    search(ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
         class BinaryPredicate>
ForwardIterator1
    search(ExecutionPolicy&& exec,
           ForwardIterator1 first1, ForwardIterator1 last1,
           ForwardIterator2 first2, ForwardIterator2 last2,
           BinaryPredicate pred);

Returns: The first iterator \(i\) in the range \([first1, last1 - (last2 - first2))\) such that for every non-negative integer \(n\) less than \(last2 - first2\) the following corresponding conditions hold: \(*(i + n) == *(first2 + n)\) and \(\text{pred}(*(i + n), *(first2 + n)) != \text{false}\). Returns \(first1\) if \([first2, last2)\) is empty, otherwise returns \(last1\) if no such iterator is found.

Complexity: At most \((last1 - first1) \times (last2 - first2)\) applications of the corresponding predicate.

namespace ranges {
    template<ForwardIterator I1, Sentinel<I1> S1, ForwardIterator I2, 
             Sentinel<I2> S2, class Pred = ranges::equal_to<>,
             class Proj1 = identity, class Proj2 = identity>
    requires IndirectlyComparable<I1, I2, Pred, Proj1, Proj2>
    constexpr subrange<I1>
        search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
               Proj1 proj1 = {}, Proj2 proj2 = {});

    template<ForwardRange R1, ForwardRange R2, class Pred = ranges::equal_to<>,
             class Proj1 = identity, class Proj2 = identity>
    requires IndirectlyComparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
    constexpr safe_subrange_t<R1>
        search(R1&& r1, R2&& r2, Pred pred = {},
               Proj1 proj1 = {}, Proj2 proj2 = {});
}

Returns:

(3.1) \{i, i + (last2 - first2)\}, where \(i\) is the first iterator in the range \([first1, last1 - (last2 - first2))\) such that for every non-negative integer \(n\) less than \(last2 - first2\) the condition

\[
\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *(i + n)), \text{invoke}(\text{proj2}, *(first2 + n))))
\]

is true:

(3.2) \{last1, last1\} if no such iterator exists.

Complexity: At most \((last1 - first1) \times (last2 - first2)\) applications of the corresponding predicate and projections.

template<class ForwardIterator, class Size, class T>
constexpr ForwardIterator
    search_n(ForwardIterator first, ForwardIterator last,
            Size count, const T& value);
template<class ForwardIterator, class Size, class T, 
class BinaryPredicate> 
constexpr ForwardIterator 
search_n(ForwardIterator first, ForwardIterator last, 
Size count, const T& value, 
BinaryPredicate pred);

namespace ranges {
    template<ForwardIterator I, Sentinel<I> S, class T,

    requires IndirectlyCopyable<I, O>
    \begin{verbatim}
}
\end{verbatim}
\end{verbatim}
Let \( E \) be:

\[
\begin{align*}
(14.1) & \quad \text{bool(pred(*i)) for the overloads in namespace std, or} \\
(14.2) & \quad \text{bool(invokes(pred, invoke(proj, *i))) for the overloads in namespace ranges.}
\end{align*}
\]

and \( N \) be the number of iterators \( i \) in the range \([\text{first}, \text{last})\) for which the condition \( E \) holds.

**Requires:** The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) shall not overlap.

**Effects:** Copies all of the elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) is true.

**Returns:**

\[
\begin{align*}
(17.1) & \quad \text{result} + N \text{ for the overloads in namespace std, or} \\
(17.2) & \quad \{\text{last}, \text{result} + N\} \text{ for the overloads in namespace ranges.}
\end{align*}
\]

**Complexity:** Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

**Remarks:** Stable (15.5.5.7).

## 24.6.2 Move

\[
\text{template<class InputIterator, class OutputIterator> } \\
\text{constexpr OutputIterator move(InputIterator first, InputIterator last, } \\
\text{OutputIterator result);} \\
\]

\[\text{234) copy_backward should be used instead of copy when last is in the range [result - N, result).}\]
namespace ranges {
    template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O>
    requires IndirectlyMovable<I, O>
    constexpr move_result<I, O>
    move(I first, S last, O result);
    template<InputRange R, WeaklyIncrementable O>
    requires IndirectlyMovable<iterator_t<R>, O>
    constexpr move_result<safe_iterator_t<R>, O>
    move(R&& r, O result);
}

Let $E$ be

(1.1) \( \text{std::move(*(first + n))} \)

(1.2) \( \text{ranges::iter_move(first + n)} \)

for the overload in namespace std, or

Let $N$ be $\text{last - first}$.

Requires: $\text{result}$ shall not be in the range $[\text{first, last})$.

Effects: Moves elements in the range $[\text{first, last})$ into the range $[\text{result, result + N})$ starting from $\text{first}$ and proceeding to $\text{last}$. For each non-negative integer $n < N$, performs $*(\text{result + n}) = E$.

Returns:

(4.1) $\text{result + N}$ for the overload in namespace std, or

(4.2) $\{\text{last, result + N})$ for the overloads in namespace ranges.

Complexity: Exactly $N$ assignments.

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 move(ExecutionPolicy&& policy,
    ForwardIterator1 first, ForwardIterator1 last,
    ForwardIterator2 result);

Let $N$ be $\text{last - first}$.

Requires: The ranges $[\text{first, last})$ and $[\text{result, result + N})$ shall not overlap.

Effects: Moves elements in the range $[\text{first, last})$ into the range $[\text{result, result + N})$. For each non-negative integer $n < N$, performs $*(\text{result + n}) = \text{std::move(*(first + n)})$.

Returns: $\text{result + N}$.

Complexity: Exactly $N$ assignments.

template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2
move_backward(BidirectionalIterator1 first, BidirectionalIterator1 last,
    BidirectionalIterator2 result);

namespace ranges {
    template<BidirectionalIterator I1, Sentinel<I1> S1, BidirectionalIterator I2>
    requires IndirectlyMovable<I1, I2>
    constexpr move_backward_result<I1, I2>
    move_backward(I1 first, S1 last, I2 result);
    template<BidirectionalRange R, BidirectionalIterator I>
    requires IndirectlyMovable<iterator_t<R>, I>
    constexpr move_backward_result<safe_iterator_t<R>, I>
    move_backward(R&& r, I result);
}

Let $E$ be

(11.1) \( \text{std::move(*(last - n))} \)

(11.2) \( \text{ranges::iter_move(last - n)} \)

for the overload in namespace std, or

Let $N$ be $\text{last - first}$.

Requires: $\text{result}$ shall not be in the range $[\text{first, last})$.
Effects: Moves elements in the range \([\text{first, last})\) into the range \([\text{result} - N, \text{result})\) starting from \(\text{last} - 1\) and proceeding to \(\text{first}.\) For each positive integer \(n \leq N\), performs \(*\text{(result} - n) = E.*\)

Returns:

\begin{align*}
&\text{— result} - N \text{ for the overload in namespace std, or} \\
&\text{— } \{\text{last, result} - N\} \text{ for the overloads in namespace ranges.}
\end{align*}

Complexity: Exactly \(N\) assignments.

### 24.6.3 Swap

\[\text{alg.swap}\]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
swap_ranges(ExecutionPolicy&& exec,
            ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```
namespace ranges {
  template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2>
  requires IndirectlySwappable<I1, I2>
  constexpr swap_ranges_result<I1, I2>
  swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
  template<InputRange R1, InputRange R2>
  requires IndirectlySwappable<iterator_t<R1>, iterator_t<R2>>
  constexpr swap_ranges_result<safe_iterator_t<R1>, safe_iterator_t<R2>>
  swap_ranges(R1&& r1, R2&& r2);
}
```

1. Let:

\begin{align*}
&\text{— last2 be first2 + (last1 - first1) for the overloads with no parameter named last2, and} \\
&\text{— } M \text{ be } \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}).
\end{align*}

2. Requires: The two ranges \([\text{first1, last1})\) and \([\text{first2, last2})\) shall not overlap. For the overloads in namespace std, \(*\text{(first1} + n)\) shall be swappable with \((15.5.3.2) *\text{(first2} + n)\).

3. Effects: For each non-negative integer \(n < M\) performs:

\begin{align*}
&\text{— swap(*\text{(first1} + n), *\text{(first2} + n)) for the overloads in namespace std, or} \\
&\text{— ranges::iter_swap(first1} + n, first2} + n) \text{ for the overloads in namespace ranges.}
\end{align*}

4. Returns:

\begin{align*}
&\text{— last2 for the overloads in namespace std, or} \\
&\text{— } \{\text{first1} + M, \text{first2} + M\} \text{ for the overloads in namespace ranges.}
\end{align*}

5. Complexity: Exactly \(M\) swaps.

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

6. Requires: \(a\) and \(b\) shall be dereferenceable. \(*a\) shall be swappable with \((15.5.3.2) *b\).

7. Effects: As if by \(\text{swap(*a, *b)}\).

### 24.6.4 Transform

\[\text{alg.transform}\]

```
template<class InputIterator, class OutputIterator, 
         class UnaryOperation>
constexpr OutputIterator
transform(InputIterator first1, InputIterator last1,
          OutputIterator result, UnaryOperation op);
```

\(\text{move_backward}\) should be used instead of \(\text{move}\) when last is in the range \([\text{result} - N, \text{result}).\)
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class UnaryOperation>
ForwardIterator2
transform(ExecutionPolicy& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 result, UnaryOperation op);

template<class InputIterator1, class InputIterator2, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
transform(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2, OutputIterator result,
    BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator, class BinaryOperation>
ForwardIterator
transform(ExecutionPolicy& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator result,
    BinaryOperation binary_op);

namespace ranges {

template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, CopyConstructible F, class Proj = identity>
requires Writable<O, indirect_result_t<F&, projected<I, Proj>>
constexpr unary_transform_result<I, O> transform(I first1, S last1, O result, F op, Proj proj = {});

template<InputRange R, WeaklyIncrementable O, CopyConstructible F, class Proj = identity>
requires Writable<O, indirect_result_t<F&, projected<iterator_t<R>, Proj>>
constexpr unary_transform_result<safe_iterator_t<R>, O> transform(R&& r, O result, F op, Proj proj = {});

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2, WeaklyIncrementable O, CopyConstructible F, class Proj1 = identity, class Proj2 = identity>
requires Writable<O, indirect_result_t<F&, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr binary_transform_result<I1, I2, O> transform(I1 first1, S1 last1, I2 first2, S2 last2, O result,
    F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

template<InputRange R1, InputRange R2, WeaklyIncrementable O, CopyConstructible F, class Proj1 = identity, class Proj2 = identity>
requires Writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>, projected<iterator_t<R2>, Proj2>>
constexpr binary_transform_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O> transform(R1&& r1, R2&& r2, O result,
    F binary_op, Proj1 proj1 = {},Proj2 proj2 = {});
}

1 Let:

(1.1) last2 be first2 + (last1 - first1) for the overloads with parameter first2 but no parameter last2,

(1.2) N be last1 - first1 for unary transforms, or \text{min}(last1 - first1, last2 - first2) for binary transforms, and

(1.3) E be

(1.3.1) op(*(first1 + (i - result))) for unary transforms defined in namespace std,

(1.3.2) binary_op(*(first1 + (i - result)), *(first2 + (i - result))) for binary transforms defined in namespace std,

(1.3.3) invoke(op, invoke(proj, *(first1 + (i - result)))) for unary transforms defined in namespace ranges, or
invoke(binary_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result)))) for binary transforms defined in namespace ranges.

Requires: op and binary_op shall not invalidate iterators or subrange, or modify elements in the ranges

---

Effects: Assigns through every iterator i in the range [result, result + N) a new corresponding value equal to E.

Returns:

---

Complexity: Exactly N applications of op or binary_op, and any projections. This requirement also applies to the overload with an ExecutionPolicy.

Remarks: result may be equal to first1 or first2.

### 24.6.5 Replace

<table>
<thead>
<tr>
<th>Template</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>template&lt;class ForwardIterator, class T&gt; constexpr void replace(ForwardIterator first, ForwardIterator last, const T&amp; old_value, const T&amp; new_value);</td>
<td></td>

<tr>
<td>namespace ranges { template&lt;InputIterator I, Sentinel&lt;I&gt; S, class T1, class T2, class Proj = identity&gt; requires Writable&lt;I, const T2&amp;&gt; &amp;&amp; IndirectRelation&lt;ranges::equal_to&lt;&gt;, projected&lt;I, Proj&gt;, const T1*&gt; constexpr I replace(I first, S last, const T1&amp; old_value, const T2&amp; new_value, Proj proj = {}); template&lt;InputRange R, class T1, class T2, class Proj = identity&gt; requires Writable&lt;iterator_t&lt;R&gt;, const T2&amp;&gt; &amp;&amp; IndirectRelation&lt;ranges::equal_to&lt;&gt;, projected&lt;iterator_t&lt;R&gt;, Proj&gt;, const T1*&gt; constexpr safe_iterator_t&lt;R&gt; replace(R&amp;&amp; r, const T1&amp; old_value, const T2&amp; new_value, Proj proj = {}); template&lt;InputIterator I, Sentinel&lt;I&gt; S, class T, class Proj = identity, IndirectUnaryPredicate&lt;projected&lt;I, Proj&gt;&gt; Pred&gt; requires Writable&lt;I, const T&amp;&gt; constexpr I replace_if(I first, S last, Pred pred, const T&amp; new_value, Proj proj = {}); template&lt;InputRange R, class T, class Proj = identity, IndirectUnaryPredicate&lt;projected&lt;iterator_t&lt;R&gt;, Proj&gt;&gt; Pred&gt; requires Writable&lt;iterator_t&lt;R&gt;, const T&amp;&gt; constexpr safe_iterator_t&lt;R&gt; replace_if(R&amp;&amp; r, Pred pred, const T&amp; new_value, Proj proj = {});</td>
<td></td>
</tr>
</tbody>
</table>

---

236) The use of fully closed ranges is intentional.

§ 24.6.5
Let $E$ be

(1.1) $\text{bool}(*i == \text{old_value})$ for replace,

(1.2) $\text{bool}((\text{pred}(*i))$ for replace_if,

(1.3) $\text{bool}((\text{invoke}(\text{proj}, *i) == \text{old_value})$ for ranges::replace, or

(1.4) $\text{bool}((\text{invoke}((\text{pred}, (\text{invoke}(\text{proj}, *i))))$ for ranges::replace_if.

Requires: The expression $\text{*first} = \text{new_value}$ shall be valid.

Effects: Substitutes elements referred by the iterator $i$ in the range $[\text{first}, \text{last})$ with new_value, when $E$ is true.

Returns: last for the overloads in namespace ranges.

Complexity: Exactly last - first applications of the corresponding predicate and any projection.
template<InputRange R, class T, OutputIterator<const T&> O, class Proj = identity, 
IndirectUnaryPredicate<projected<iterator_t<R>, Proj>>, Pred>
requires IndirectlyCopyable<iterator_t<R>, O>
constexpr replace_copy_if_result<safe_iterator_t<R>, O>
replace_copy_if(R&& r, O result, Pred pred, const T& new_value, 
Proj proj = {});

Let $E$ be

$E \leftarrow \begin{align*}
&- \text{ bool}(*\text{first} + (i - \text{result}) == \text{old_value}) \quad \text{for replace_copy}, \\
&- \text{ bool}(\text{pred}(*\text{first} + (i - \text{result}))) \quad \text{for replace_copy_if}, \\
&- \text{ bool}(\text{invoke}(\text{proj}, *\text{first} + (i - \text{result})) == \text{old_value}) \quad \text{for ranges::replace_copy,} \\
&- \text{ bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *\text{first} + (i - \text{result})))) \quad \text{for ranges::replace_copy_if.}
\end{align*}$

$E \leftarrow \begin{align*}
&- \text{ bool}(*\text{first} + (i - \text{result}) == \text{old_value}) \quad \text{for replace_copy}, \\
&- \text{ bool}(\text{pred}(*\text{first} + (i - \text{result}))) \quad \text{for replace_copy_if}, \\
&- \text{ bool}(\text{invoke}(\text{proj}, *\text{first} + (i - \text{result})) == \text{old_value}) \quad \text{for ranges::replace_copy,} \\
&- \text{ bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *\text{first} + (i - \text{result})))) \quad \text{for ranges::replace_copy_if.}
\end{align*}$

$E \leftarrow \begin{align*}
&- \text{ bool}(*\text{first} + (i - \text{result}) == \text{old_value}) \quad \text{for replace_copy}, \\
&- \text{ bool}(\text{pred}(*\text{first} + (i - \text{result}))) \quad \text{for replace_copy_if}, \\
&- \text{ bool}(\text{invoke}(\text{proj}, *\text{first} + (i - \text{result})) == \text{old_value}) \quad \text{for ranges::replace_copy,} \\
&- \text{ bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, *\text{first} + (i - \text{result})))) \quad \text{for ranges::replace_copy_if.}
\end{align*}$

Requirements: The results of the expressions $*\text{first}$ and new_value shall be writable (22.3.1) to the result output iterator. The ranges $[\text{first}, \text{last})$ and $[\text{result}, \text{result} + (\text{last} - \text{first})]$ shall not overlap.

Effects: Assigns to every iterator $i$ in the range $[\text{result}, \text{result} + (\text{last} - \text{first})]$ either new_value or $*\text{(first} + (i - \text{result})$ depending on whether $E$ holds.

Returns:

$E \leftarrow \begin{align*}
&- \text{ result} + (\text{last} - \text{first}) \quad \text{for the overloads in namespace std, or} \\
&- \{\text{last}, \text{result} + (\text{last} - \text{first})\} \quad \text{for the overloads in namespace ranges.}
\end{align*}$

Complexity: Exactly last - first applications of the corresponding predicate and any projection.

### 24.6.6 Fill [alg.fill]

template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);

void fill(ExecutionPolicy&& exec, 
first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);

ForwardIterator fill_n(ExecutionPolicy&& exec, 
first, Size n, const T& value);

namespace ranges {

template<class T, OutputIterator<const T&> O, Sentinel<O> S>
constexpr O fill(O first, S last, const T& value);

template<class T, OutputRange<const T&> R>
constexpr safe_iterator_t<R> fill(R&& r, const T& value);

template<class T, OutputIterator<const T&> O>
constexpr O fill_n(O first, iter_difference_t<O> n, const T& value);

}  

Let $N$ be max(0, n) for the fill_n algorithms, and last - first for the fill algorithms.

Requirements: The expression value shall be writable (22.3.1) to the output iterator. The type Size shall be convertible to an integral type (7.3.8, 10.3.7).

Effects: Assigns value through all the iterators in the range [first, first + $N$).

Returns: first + $N$.

Complexity: Exactly $N$ assignments.
24.6.7 Generate

\[\text{template} \langle \text{class ForwardIterator}, \text{class Generator} \rangle \]
\[\text{constexpr void generate(ForwardIterator first, ForwardIterator last,} \]
\[\text{Generator gen);} \]
\[\text{template} \langle \text{class ExecutionPolicy}, \text{class ForwardIterator}, \text{class Generator} \rangle \]
\[\text{void generate(ExecutionPolicy}\&\& \text{ exec,} \]
\[\text{ForwardIterator first, ForwardIterator last,} \]
\[\text{Generator gen);} \]
\[\text{template} \langle \text{class OutputIterator, class Size, class Generator} \rangle \]
\[\text{constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);} \]
\[\text{template} \langle \text{class ExecutionPolicy, class ForwardIterator, class Size, class Generator} \rangle \]
\[\text{ForwardIterator generate_n(ExecutionPolicy}\&\& \text{ exec,} \]
\[\text{ForwardIterator first, Size n, Generator gen);} \]

namespace ranges {
\[\text{template} \langle \text{Iterator O, Sentinel<O> S, CopyConstructible F}\rangle \]
\[\text{requires Invocable<F&> && Writable<O, invoke_result_t<F&>>} \]
\[\text{constexpr O generate(O first, S last, F gen);} \]
\[\text{template} \langle \text{class R, CopyConstructible F}\rangle \]
\[\text{requires Invocable<F&> && OutputRange<R, invoke_result_t<F&>>} \]
\[\text{constexpr safe_iterator_t<R> generate(R\&\& r, F gen);} \]
\[\text{template} \langle \text{Iterator O, CopyConstructible F}\rangle \]
\[\text{requires Invocable<F&> && Writable<O, invoke_result_t<F&>>} \]
\[\text{constexpr O generate_n(O first, iter_difference_t<O> n, F gen);} \]
}

1 Let \( N \) be \( \max(0, n) \) for the generate_n algorithms, and \( \text{lant} - \text{first} \) for the generate algorithms.

2 Requires: \( \text{Size} \) shall be convertible to an integral type (7.3.8, 10.3.7).

3 Effects: Assigns the result of successive evaluations of \( \text{gen}() \) through each iterator in the range \( \{\text{first}, \text{first} + N\} \).

4 Returns: \( \text{first} + N \).

5 Complexity: Exactly \( N \) evaluations of \( \text{gen}() \) and assignments.

24.6.8 Remove

\[\text{template} \langle \text{class ForwardIterator, class T}\rangle \]
\[\text{constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,} \]
\[\text{const T& value);} \]
\[\text{template} \langle \text{class ExecutionPolicy, class ForwardIterator, class T}\rangle \]
\[\text{ForwardIterator remove(ExecutionPolicy}\&\& \text{ exec,} \]
\[\text{ForwardIterator first, ForwardIterator last,} \]
\[\text{const T& value);} \]
\[\text{template} \langle \text{class ForwardIterator, class Predicate}\rangle \]
\[\text{constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,} \]
\[\text{Predicate pred);} \]
\[\text{template} \langle \text{class ExecutionPolicy, class ForwardIterator, class Predicate}\rangle \]
\[\text{ForwardIterator remove_if(ExecutionPolicy}\&\& \text{ exec,} \]
\[\text{ForwardIterator first, ForwardIterator last,} \]
\[\text{Predicate pred);} \]

namespace ranges {
\[\text{template} \langle \text{Permutable I, Sentinel<I> S, class T, class Proj = identity}\rangle \]
\[\text{requires IndirectRelation<ranges::equal_to<>, projected<I, Proj>, const T*>} \]
\[\text{constexpr I remove(I first, S last, const T& value, Proj proj = {});} \]
\[\text{template} \langle \text{ForwardRange R, class T, class Proj = identity}\rangle \]
\[\text{requires Permutable<iterator_t<R>> &&} \]
\[\text{IndirectRelation<ranges::equal_to<>, projected<iterator_t<R>, Proj>, const T*>} \]
\[\text{constexpr safe_iterator_t<R> remove(R\&\& r, const T& value, Proj proj = {});} \]

\[\text{§ 24.6.8} \]
Let $E$ be

1. $\text{bool}(\ast i == \text{value})$ for remove,
2. $\text{bool}(\text{pred}(\ast i))$ for remove_if,
3. $\text{bool}(\text{invoke(proj, } \ast i) == \text{value})$ for ranges::remove, or
4. $\text{bool}(\text{invoke(pred, invoke(proj, } \ast i)))$ for ranges::remove_if.

**Requires:** For the algorithms in namespace std, the type of $\ast \text{first}$ shall meet the Cpp17MoveAssignable requirements (Table 28).

**Effects:** Eliminates all the elements referred to by iterator $i$ in the range [first, last) for which $E$ holds.

**Returns:** The end of the resulting range.

**Remarks:** Stable (15.5.5.7).

**Complexity:** Exactly last - first applications of the corresponding predicate and any projection.

*[Note: Each element in the range [ret, last), where ret is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — end note]*

---

**§ 24.6.8 1019**
remove_copy(R&& r, 0 result, const T& value, Proj proj = {});

remove_copy_if_result<I, O> remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});

remove_copy_if_result<safe_iterator_t<R>, O> remove_copy_if(R&& r, O result, Pred pred, Proj proj = {});

Let $E$ be

- bool(*i == value) for remove_copy,
- bool(pred(*i)) for remove_copy_if,
- bool(invoke(proj, *i) == value) for ranges::remove_copy, or
- bool(invoke(pred, invoke(proj, *i))) for ranges::remove_copy_if.

Let $N$ be the number of elements in [first, last) for which $E$ is false.

Requires: The ranges [first, last) and [result, result + (last - first)) shall not overlap. The expression *result = *first shall be valid. [Note: For the overloads with an ExecutionPolicy, there may be a performance cost if iterator_traits<ForwardIterator1>::value_type does not meet the Cpp17MoveConstructible (Table 26) requirements. —end note]

Effects: Copies all the elements referred to by the iterator $i$ in the range [first, last) for which $E$ is false.

Returns: $\begin{cases} \text{result + } N, \text{ for the algorithms in namespace std, or} \\ \{\text{last, result + } N\}, \text{ for the algorithms in namespace ranges.} \end{cases}$

Complexity: Exactly last - first applications of the corresponding predicate and any projection.

Remarks: Stable (15.5.5.7).

24.6.9 Unique

template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last, BinaryPredicate pred);

namespace ranges {

    template<Permutable I, Sentinel<I> S, class Proj = identity,
             IndirectRelation<projected<I>, Proj>> C = ranges::equal_to>>
    constexpr I unique(I first, S last, C comp = {}, Proj proj = {});

template<ForwardRange R, class Proj = identity,
         IndirectRelation<projected<iterator_t<R>>, Proj>> C = ranges::equal_to>>
    requires Permutable<iterator_t<R>>
    constexpr safe_iterator_t<R> unique(R&& r, C comp = {}, Proj proj = {});

}
— bool(pred(*(i - 1), *i)) for the overloads in namespace std, or

— bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i))) for the overloads in namespace ranges.

**Requires:** For the overloads in namespace std, `pred` shall be an equivalence relation and the type of `*first` shall meet the Cpp17MoveAssignable requirements (Table 28).

**Effects:** For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator `i` in the range `[first + 1, last)` for which `E` is `true`.

**Returns:** The end of the resulting range.

**Complexity:** For nonempty ranges, exactly \((last - first) - 1\) applications of the corresponding predicate and no more than twice as many applications of any projection.

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last, OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryPredicate>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last, OutputIterator result, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, BinaryPredicate pred);

namespace ranges {
    template<InputIterator I, Sentinel<I> S, WeaklyIncrementable O, class Proj = identity, IndirectRelation<projected<I, Proj>> C = ranges::equal_to<>>
    requires IndirectlyCopyable<I, O> &&
    (ForwardIterator1<I> ||
     (InputIterator1<O> && Same<iter_value_t<I>, iter_value_t<O>>) ||
     IndirectlyCopyableStorable<I, O>)
    constexpr unique_copy_result<I, O>
    unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});

template<InputRange R, WeaklyIncrementable O, class Proj = identity, IndirectRelation<projected<iterator_t<R>, Proj>> C = ranges::equal_to<>>
    requires IndirectlyCopyable<iterator_t<R>, O> &&
    (ForwardIterator<iterator_t<R>> ||
     (InputIterator0<O> && Same<iter_value_t<iterator_t<R>>, iter_value_t<O>>) ||
     IndirectlyCopyableStorable<iterator_t<R>, O>)
    constexpr unique_copy_result<safe_iterator_t<R>, O>
    unique_copy(R&& r, O result, C comp = {}, Proj proj = {});
}
```

Let `pred` be `equal_to()` for the overloads in namespace std with no parameter `pred`, and let `E` be

— `bool(pred(*i, *(i - 1)))` for the overloads in namespace std, or

— `bool(invoke(comp, invoke(proj, *(i - 1)), invoke(proj, *i)))` for the overloads in namespace ranges.

**Requires:**

— The ranges `[first, last)` and `[result, result+(last-first))` shall not overlap.

— For the overloads in namespace std:
The comparison function shall be an equivalence relation.

The expression \( \ast \text{result} = \ast \text{first} \) shall be valid.

For the overloads with no `ExecutionPolicy`, let \( T \) be the value type of `InputIterator`. If `InputIterator` meets the `Cpp17ForwardIterator` requirements, then there are no additional requirements for \( T \). Otherwise, if `OutputIterator` meets the `Cpp17ForwardIterator` requirements and its value type is the same as \( T \), then \( T \) shall meet the `Cpp17CopyAssignable` (Table 29) requirements. Otherwise, \( T \) shall meet both the `Cpp17CopyConstructible` (Table 27) and `Cpp17CopyAssignable` requirements.

Note: For the overloads with an `ExecutionPolicy`, there may be a performance cost if the value type of `ForwardIterator1` does not meet both the `Cpp17CopyConstructible` and `Cpp17CopyAssignable` requirements. — end note

Effects: Copies only the first element from every consecutive group of equal elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

Returns:

1. \( \text{result} + N \) for the overloads in namespace `std`, or
2. \{last, \text{result} + N\} for the overloads in namespace `ranges`

Complexity: Exactly \( \text{last} - \text{first} - 1 \) applications of the corresponding predicate and no more than twice as many applications of any projection.

### 24.6.10 Reverse

```cpp
template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);

// Overloads with an ExecutionPolicy

// Overloads in namespace `ranges`
namespace ranges {
    template<BidirectionalIterator I, Sentinel<I> S>
    requires Permutable<I>
    constexpr I reverse(I first, S last);
    template<BidirectionalRange R>
    requires Permutable<iterator_t<R>>
    constexpr safe_iterator_t<R> reverse(R&& r);
}
```

Requires: For the overloads in namespace `std`, `BidirectionalIterator` shall meet the `Cpp17Value-Swappable` requirements (15.5.3.2).

Effects: For each non-negative integer \( i < (\text{last} - \text{first}) / 2 \), applies `std::iter_swap`, or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators \( \text{first} + i, (\text{last} - i) - 1 \).

Returns: \( \text{last} \) for the overloads in namespace `ranges`.

Complexity: Exactly \( (\text{last} - \text{first})/2 \) swaps.

```cpp
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
                                       OutputIterator result);

// Overloads with an ExecutionPolicy

// Overloads in namespace `ranges`
namespace ranges {
    template<BidirectionalIterator I, Sentinel<I> S, WeaklyIncrementable O>
    requires IndirectlyCopyable<I, O>
    constexpr reverse_copy_result<I, O> reverse_copy(I first, S last, O result);
}
```
template<BidirectionalRange R, WeaklyIncrementable O>
requires IndirectlyCopyable<iterator_t<R>, O>
constexpr reverse_copy_result<safe_iterator_t<R>, O>
reverse_copy(R&& r, O result);

Let \( N \) be \( \text{last} - \text{first} \).

Requires: The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + N)\) shall not overlap.

Effects: Copies the range \([\text{first}, \text{last})\) to the range \([\text{result}, \text{result} + N)\) such that for every non-negative integer \( i < N \) the following assignment takes place: \( *(\text{result} + N - 1 - i) = *(\text{first} + i) \).

Returns:

(8.1) \( \text{result} + N \) for the overloads in namespace \( \text{std} \), or
(8.2) \( \{\text{last}, \text{result} + N) \) for the overloads in namespace \( \text{ranges} \).

Complexity: Exactly \( N \) assignments.

### 24.6.11 Rotate

[alg.rotate]

template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator middle, ForwardIterator last);

namespace ranges {

template<Permutable I, Sentinel<I> S>
constexpr subrange<I> rotate(I first, I middle, S last);
}

Requires: \([\text{first}, \text{middle})\) and \([\text{middle}, \text{last})\) shall be valid ranges. For the overloads in namespace \( \text{std} \), \( \text{ForwardIterator} \) shall meet the \( \text{Cpp17ValueSwappable} \) requirements (15.5.3.2), and the type of \( *\text{first} \) shall meet the \( \text{Cpp17MoveConstructible} \) (Table 26) and \( \text{Cpp17MoveAssignable} \) (Table 28) requirements.

Effects: For each non-negative integer \( i < (\text{last} - \text{first}) \), places the element from the position \( \text{first} + i \) into position \( \text{first} + (i + (\text{last} - \text{middle})) \% (\text{last} - \text{first}) \). [Note: This is a left rotate. — end note]

Returns:

(3.1) \( \text{first} + (\text{last} - \text{middle}) \) for the overloads in namespace \( \text{std} \), or
(3.2) \( \{\text{first} + (\text{last} - \text{middle}), \text{last}\} \) for the overload in namespace \( \text{ranges} \).

Complexity: At most \( \text{last} - \text{first} \) swaps.

namespace ranges {

template<ForwardRange R>
requires Permutable<iterator_t<R>>
constexpr safe_subrange_t<R> rotate(R&& r, iterator_t<R> middle);
}

Effects: Equivalent to: \( \text{return ranges::rotate(ranges::begin(r), middle, ranges::end(r));} \)

§ 24.6.11 1023
namespace ranges {
    template<ForwardIterator I, Sentinel<I> S, WeaklyIncrementable O>
    requires IndirectlyCopyable<I, O>
    constexpr rotate_copy_result<I, O>
    rotate_copy(I first, I middle, S last, O result);
}

Let $N$ be last - first.

Requires: [first, middle) and [middle, last) shall be valid ranges. The ranges [first, last) and [result, result + $N$) shall not overlap.

Effects: Copies the range [first, last) to the range [result, result + $N$) such that for each non-negative integer $i < N$ the following assignment takes place: *(result + i) = *(first + (i + (middle - first)) \% $N$).

Returns:
9.1 result + $N$ for the overloads in namespace std, or
9.2 {last, result + $N$} for the overload in namespace ranges.

Complexity: Exactly $N$ assignments.

namespace ranges {
    template<ForwardRange R, WeaklyIncrementable O>
    requires IndirectlyCopyable<iterator_t<R>, O>
    constexpr rotate_copy_result<safe_iterator_t<R>, O>
    rotate_copy(R&& r, iterator_t<R> middle, O result);
}

Effects: Equivalent to:
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), result);

24.6.12 Sample

```cpp
template<class PopulationIterator, class SampleIterator,
    class Distance, class UniformRandomBitGenerator>
SampleIterator sample(PopulationIterator first, PopulationIterator last,
    SampleIterator out, Distance n,
    UniformRandomBitGenerator&& g);
```

Requires:
1.1 PopulationIterator shall satisfy the Cpp17InputIterator requirements (22.3.5.2).
1.2 SampleIterator shall satisfy the Cpp17OutputIterator requirements (22.3.5.3).
1.3 SampleIterator shall satisfy the Cpp17RandomAccessIterator requirements (22.3.5.6) unless PopulationIterator satisfies the Cpp17ForwardIterator requirements (22.3.5.4).
1.4 PopulationIterator’s value type shall be writable (22.3.1) to out.
1.5 Distance shall be an integer type.
1.6 remove_reference_t<UniformRandomBitGenerator> shall satisfy the requirements of a uniform random bit generator type (25.6.2.3) whose return type is convertible to Distance.
1.7 out shall not be in the range [first, last).

Effects: Copies min(last - first, n) elements (the sample) from [first, last) (the population) to out such that each possible sample has equal probability of appearance. [Note: Algorithms that obtain such effects include selection sampling and reservoir sampling. — end note]

Returns: The end of the resulting sample range.

Complexity: $O(last - first)$.

Remarks:
5.1 Stable if and only if PopulationIterator satisfies the Cpp17ForwardIterator requirements.
5.2 To the extent that the implementation of this function makes use of random numbers, the object g shall serve as the implementation’s source of randomness.
24.6.13 Shuffle

```cpp
template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
             RandomAccessIterator last,
             UniformRandomBitGenerator&& g);
```

```cpp
namespace ranges {
    template<RandomAccessIterator I, Sentinel<I> S, class Gen>
    requires Permutable<I> &&
            UniformRandomBitGenerator<remove_reference_t<Gen>>
    I shuffle(I first, S last, Gen&& g);
    template<RandomAccessRange R, class Gen>
    requires Permutable<iterator_t<R>> &&
            UniformRandomBitGenerator<remove_reference_t<Gen>>
    safe_iterator_t<R> shuffle(R&& r, Gen&& g);
}
```

1. **Requires**: For the overload in namespace `std`:
   
   1.1. `RandomAccessIterator` shall meet the `Cpp17ValueSwappable` requirements (15.5.3.2).
   
   1.2. The type `remove_reference_t<UniformRandomBitGenerator>` shall meet the uniform random bit generator (25.6.2.3) requirements.

2. **Effects**: Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

3. **Returns**: `last` for the overloads in namespace `ranges`.

4. **Complexity**: Exactly `(last - first) - 1` swaps.

5. **Remarks**: To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation’s source of randomness.

24.6.14 Shift

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
          typename iterator_traits<ForwardIterator>::difference_type n);
```

1. **Requires**: The type of `*first` shall satisfy the `Cpp17MoveAssignable` requirements.

2. **Effects**: If `n <= 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + i` into position `first + i` for each non-negative integer `i < (last - first) - n`. In the first overload case, does so in order starting from `i = 0` and proceeding to `i = (last - first) - n - 1`.

3. **Returns**: `first + (last - first - n)` if `n` is positive and `n < last - first`, otherwise `first` if `n` is positive, otherwise `last`.

4. **Complexity**: At most `(last - first) - n` assignments.

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
shift_right(ForwardIterator first, ForwardIterator last,
           typename iterator_traits<ForwardIterator>::difference_type n);
```

5. **Requires**: The type of `*first` shall satisfy the `Cpp17MoveAssignable` requirements. `ForwardIterator` shall meet the `Cpp17BidirectionalIterator` requirements (22.3.5.5) or the `Cpp17ValueSwappable` requirements.
Effects: If \( n \leq 0 \) or \( n \geq \text{last} - \text{first} \), does nothing. Otherwise, moves the element from position \( \text{first} + i \) into position \( \text{first} + n + i \) for each non-negative integer \( i < (\text{last} - \text{first}) - n \). In the first overload case, if \text{ForwardIterator} \ satisfies the \text{Cpp17BidirectionalIterator} requirements, does so in order starting from \( i = (\text{last} - \text{first}) - n - 1 \) and proceeding to \( i = 0 \).

Returns: \( \text{first} + n \) if \( n \) is positive and \( n < \text{last} - \text{first} \), otherwise \( \text{last} \) if \( n \) is positive, otherwise \( \text{first} \).

Complexity: At most \( (\text{last} - \text{first}) - n \) assignments or swaps.

24.7 Sorting and related operations

The operations in 24.7 defined directly in namespace \text{std} \ have two versions: one that takes a function object of type \text{Compare} \ and one that uses an \text{operator<}.

\text{Compare} \ is a function object type (19.14) that meets the requirements for a template parameter named \text{BinaryPredicate} (24.2). The return value of the function call operation applied to an object of type \text{Compare}, when contextually converted to \text{bool} (7.3), yields \text{true} if the first argument of the call is less than the second, and \text{false} otherwise. \text{Compare} \ comp is used throughout for algorithms assuming an ordering relation.

For all algorithms that take \text{Compare}, there is a version that uses \text{operator<} instead. That is, \text{comp(*i, *j)} != \text{false} defaults to \text{*i < *j} != \text{false}. For algorithms other than those described in 24.7.3, \text{comp} \ shall induce a strict weak ordering on the values.

The term \text{strict} refers to the requirement of an irreflexive relation (\text{!comp}(x, x) \ for \text{all} \ x), and the term \text{weak} to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define \text{equiv}(a, b) as \text{!comp}(a, b) \&\& \text{!comp}(b, a), then the requirements are that \text{comp} \ and \text{equiv} \ both be transitive relations:

\begin{align*}
- \text{comp}(a, b) \&\& \text{comp}(b, c) \implies \text{comp}(a, c) \\
- \text{equiv}(a, b) \&\& \text{equiv}(b, c) \implies \text{equiv}(a, c)
\end{align*}

\[\text{Note: Under these conditions, it can be shown that}\]

\begin{align*}
- \text{equiv} \text{ is an equivalence relation,} \\
- \text{comp} \text{ induces a well-defined relation on the equivalence classes determined by equiv, and} \\
- \text{the induced relation is a strict total ordering.}
\end{align*}

\[\text{—end note}\]

A sequence is \text{sorted with respect to a \text{comp} and \text{proj}} \ for a comparator and projection \text{comp} \ and \text{proj} if for every iterator \( i \) pointing to the sequence and every non-negative integer \( n \) such that \( i + n \) is a valid iterator pointing to an element of the sequence,

\[\text{bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i))}\]

is \text{false}.

A sequence \([\text{start}, \text{finish})\] is \text{partitioned with respect to an expression} \( f(e) \) if there exists an integer \( n \) such that for all \( 0 \leq i < (\text{finish} - \text{start}), f(*(\text{start} + i)) \) is \text{true} if and only if \( i < n \).

In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an \text{operator==}, but an equivalence relation induced by the strict weak ordering. That is, two elements \( a \) and \( b \) are considered equivalent if and only if \( !(a < b) \&\& !(b < a) \).

24.7.1 Sorting

24.7.1.1 sort

\begin{verbatim}
template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last);
template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                     Compare comp);
\end{verbatim}
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec,
          RandomAccessIterator first, RandomAccessIterator last,
          Compare comp);

namespace ranges {
  template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
           class Proj = identity>
    requires Sortable<I, Comp, Proj>
  constexpr I
    sort(I first, S last, Comp comp = {}, Proj proj = {});

template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
    requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr safe_iterator_t<R>
    sort(R&& r, Comp comp = {}, Proj proj = {});
}

1 Let \( \text{comp} \) be \( \text{less}{} \) and \( \text{proj} \) be \( \text{identity}{} \) for the overloads with no parameters by those names.

2 Requires: For the overloads in namespace \( \text{std} \), \( \text{RandomAccessIterator} \) shall meet the \( \text{Cpp17Value-Swappable} \) requirements (15.5.3.2) and the type of \( \_\_\_\_\_\_\_\_\_\text{first} \) shall meet the \( \text{Cpp17MoveConstructible} \) (Table 26) and \( \text{Cpp17MoveAssignable} \) (Table 28) requirements.

3 Effects: Sorts the elements in the range \([\text{first}, \text{last})\) with respect to \( \text{comp} \) and \( \text{proj} \).

4 Returns: \( \text{last} \), for the overloads in namespace \( \text{ranges} \).

5 Complexity: Let \( N \) be \( \text{last} - \text{first} \). \( \Theta(N \log N) \) comparisons and projections.

### 24.7.1.2 stable_sort

[stable.sort]

template<class RandomAccessIterator>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);

namespace ranges {
  template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
           class Proj = identity>
    requires Sortable<I, Comp, Proj>
  constexpr I
    stable_sort(I first, S last, Comp comp = {}, Proj proj = {});

  template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
    requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr safe_iterator_t<R>
    stable_sort(R&& r, Comp comp = {}, Proj proj = {});
}

1 Let \( \text{comp} \) be \( \text{less}{} \) and \( \text{proj} \) be \( \text{identity}{} \) for the overloads with no parameters by those names.

2 Requires: For the overloads in namespace \( \text{std} \), \( \text{RandomAccessIterator} \) shall meet the \( \text{Cpp17Value-Swappable} \) requirements (15.5.3.2) and the type of \( \_\_\_\_\_\_\_\_\text{first} \) shall meet the \( \text{Cpp17MoveConstructible} \) (Table 26) and \( \text{Cpp17MoveAssignable} \) (Table 28) requirements.

3 Effects: Sorts the elements in the range \([\text{first}, \text{last})\) with respect to \( \text{comp} \) and \( \text{proj} \).

4 Returns: \( \text{last} \) for the overloads in namespace \( \text{ranges} \).

5 Complexity: Let \( N \) be \( \text{last} - \text{first} \). If enough extra memory is available, \( N \log(N) \) comparisons. Otherwise, at most \( N \log^2(N) \) comparisons. In either case, twice as many projections as the number of comparisons.
Remarks: Stable (15.5.5.7).

24.7.1.3 partial_sort

```cpp
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
                            RandomAccessIterator middle,
                            RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first,
                 RandomAccessIterator middle,
                 RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
                            RandomAccessIterator middle,
                            RandomAccessIterator last,
                            Compare comp);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first,
                 RandomAccessIterator middle,
                 RandomAccessIterator last,
                 Compare comp);
```

namespace ranges {
  template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
            class Proj = identity>
  requires Sortable<I, Comp, Proj>
  constexpr I
  partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
}

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

2 Requires: [first, middle) and [middle, last) shall be valid ranges. For the overloads in namespace
std.RandomAccessIterator shall meet the Cpp17ValueSwappable requirements (15.5.3.2) and the type
of *first shall meet the Cpp17MoveConstructible (Table 26) and Cpp17MoveAssignable (Table 28)
requirements.

Effects: Places the first middle - first elements from the range [first, last) as sorted with
respect to comp and proj into the range [first, middle). The rest of the elements in the range
[middle, last) are placed in an unspecified order.

Returns: last for the overload in namespace ranges.

Complexity: Approximately (last - first) * log(middle - first) comparisons, and twice as
many projections.

namespace ranges {
  template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
  requires Sortable<iterator_t<R>, Comp, Proj>
  constexpr safe_iterator_t<R>
  partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
}

Effects: Equivalent to:

```cpp
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

24.7.1.4 partial_sort_copy

```cpp
template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
                  RandomAccessIterator result_first,
                  RandomAccessIterator result_last);
```
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last,
   RandomAccessIterator result_first,
   RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
   class Compare>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
   RandomAccessIterator result_first,
   RandomAccessIterator result_last,
   Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
   class Compare>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last,
   RandomAccessIterator result_first,
   RandomAccessIterator result_last,
   Compare comp);

namespace ranges {

template<InputIterator I1, Sentinel<I1> S1, RandomAccessIterator I2, Sentinel<I2> S2,
class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
requires IndirectlyCopyable<I1, I2> && Sortable<I2, Comp, Proj2> &&
IndirectStrictWeakOrder<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr I2
partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
   Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<InputRange R1, RandomAccessRange R2, class Comp = ranges::less<>,
class Proj1 = identity, class Proj2 = identity>
requires IndirectlyCopyable<iterator_t<R1>, iterator_t<R2>> &&
Sortable<iterator_t<R2>, Comp, Proj2> &&
IndirectStrictWeakOrder<Comp, projected<iterator_t<R1>, Proj1>, projected<iterator_t<R2>, Proj2>>
constexpr safe_iterator_t<R2>
partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
   Proj1 proj1 = {}, Proj2 proj2 = {});
}

Let $N$ be $\min(last - first, result_last - result_first)$. Let $\text{comp}$ be $\text{less}()$, and $\text{proj1}$ and $\text{proj2}$ be $\text{identity}()$ for the overloads with no parameters by those names.

**Requires:** For the overloads in namespace std, RandomAccessIterator shall meet the Cpp17Value-Swappable requirements (15.5.3.2), the type of $\text{*result_first}$ shall meet the Cpp17MoveConstructible (Table 26) and Cpp17MoveAssignable (Table 28) requirements, and the expression $\text{*first}$ shall be writable (22.3.1) to result_first.

**Expects:** For iterators $a1$ and $b1$ in $[\text{first}, \text{last})$, and iterators $x2$ and $y2$ in $[\text{result_first}, \text{result_last})$, after evaluating the assignment $\text{*y2} = \text{*b1}$, let $E$ be the value of

$$\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj1}, \text{*a1}), \text{invoke}(\text{proj2}, \text{*y2}))).$$

Then, after evaluating the assignment $\text{*x2} = \text{*a1}, E$ is equal to

$$\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, \text{*x2}), \text{invoke}(\text{proj2}, \text{*y2}))).$$

**Note:** Writing a value from the input range into the output range does not affect how it is ordered by comp and proj1 or proj2. — end note

**Effects:** Places the first $N$ elements as sorted with respect to comp and proj2 into the range $[\text{result_first}, \text{result_first} + N)$.

**Returns:** result_first + $N$.

**Complexity:** Approximately $(last - first) \times \log N$ comparisons, and twice as many projections.
24.7.1.5 is_sorted

```cpp
template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
1 Effects: Equivalent to: return is_sorted_until(first, last) == last;
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);
2 Effects: Equivalent to:
             return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```cpp
template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                        Compare comp);
3 Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);
4 Effects: Equivalent to:
           return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last
```

```cpp
namespace ranges {
    template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
             IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
    constexpr bool is_sorted(I first, S last, Comp comp = {}, Proj proj = {});
    template<ForwardRange R, class Proj = identity,
             IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    constexpr bool is_sorted(R&& r, Comp comp = {}, Proj proj = {});
}
5 Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ForwardIterator, class Compare>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last,
               Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);
```

```cpp
namespace ranges {
    template<ForwardIterator I, Sentinel<I> S, class Proj = identity,
             IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
    constexpr I is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
    template<ForwardRange R, class Proj = identity,
             IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    constexpr safe_iterator_t<R>
is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
}
```

6 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
Returns: The last iterator \( i \) in \([\text{first}, \text{last}]\) for which the range \([\text{first}, i)\) is sorted with respect to \( \text{comp} \) and \( \text{proj} \).

Complexity: Linear.

### 24.7.2 Nth element

```cpp
template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);
```

```cpp
namespace ranges {
    template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
             class Proj = identity>
    requires Sortable<I, Comp, Proj>
    constexpr I
    nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});
}
```

Let \( \text{comp} \) be \( \text{less}\{\} \) and \( \text{proj} \) be \( \text{identity}\{\} \) for the overloads with no parameters by those names.

Requires: \([\text{first}, \text{nth})\) and \([\text{nth}, \text{last})\) shall be valid ranges. For the overloads in namespace \( \text{std} \), \( \text{RandomAccessIterator} \) shall meet the \( \text{Cpp17ValueSwappable} \) requirements (15.5.3.2), and the type of \( *\text{first} \) shall meet the \( \text{Cpp17MoveConstructible} \) (Table 26) and \( \text{Cpp17MoveAssignable} \) (Table 28) requirements.

Effects: After \( \text{nth_element} \) the element in the position pointed to by \( \text{nth} \) is the element that would be in that position if the whole range were sorted with respect to \( \text{comp} \) and \( \text{proj} \), unless \( \text{nth} == \text{last} \). Also for every iterator \( i \) in the range \([\text{first}, \text{nth})\) and every iterator \( j \) in the range \([\text{nth}, \text{last})\) it holds that: bool(invoke(comp, invoke(proj, *j), invoke(proj, *i))) is false.

Returns: last for the overload in namespace \( \text{ranges} \).

Complexity: For the overloads with no \( \text{ExecutionPolicy} \), linear on average. For the overloads with an \( \text{ExecutionPolicy} \), \( O(N) \) applications of the predicate, and \( O(N \log N) \) swaps, where \( N = \text{last} - \text{first} \).

```cpp
namespace ranges {
    template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
    requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr safe_iterator_t<R>
    nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});
}
```

Effects: Equivalent to:

```
return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
```

### 24.7.3 Binary search

All of the algorithms in this subclause are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.
24.7.3.1 lower_bound

```cpp
template<class ForwardIterator, class T>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last,
const T& value, Compare comp);
```

namespace ranges {
```cpp
template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
constexpr I lower_bound(I first, S last, const T& value, Comp comp = {},
Proj proj = {});

template<ForwardRange R, class T, class Proj = identity,
IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp =
ranges::less<>>
constexpr safe_iterator_t<R>
lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```
}

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
2 Requires: The elements `e` of `[first, last)` shall be partitioned with respect to the expression
   `bool(invoke(comp, invoke(proj, e), value))`.
3 Returns: The furthermost iterator `i` in the range `[first, last)` such that for every iterator `j` in the
   range `[first, i), bool(invoke(comp, invoke(proj, *j), value))` is true.
4 Complexity: At most \(\log_2(last - first) + \Theta(1)\) comparisons and projections.

24.7.3.2 upper_bound

```cpp
template<class ForwardIterator, class T>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last,
const T& value, Compare comp);
```

namespace ranges {
```cpp
template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
constexpr I upper_bound(I first, S last, const T& value, Comp comp = {},
Proj proj = {});

template<ForwardRange R, class T, class Proj = identity,
IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp =
ranges::less<>>
constexpr safe_iterator_t<R>
upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});
```
}

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
2 Requires: The elements `e` of `[first, last)` shall be partitioned with respect to the expression
   `!bool(invoke(comp, value, invoke(proj, e)))`.
3 Returns: The furthermost iterator `i` in the range `[first, last)` such that for every iterator `j` in the
   range `[first, i), !bool(invoke(comp, value, invoke(proj, *j)))` is true.
4 Complexity: At most \(\log_2(last - first) + \Theta(1)\) comparisons and projections.
24.7.3.3 equal_range

```cpp
template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value);
```

```cpp
template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value,
            Compare comp);
```

namespace ranges {
```cpp
namespace ranges {
    template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
             IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
    constexpr subrange<I>
equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

    template<ForwardRange R, class T, class Proj = identity,
             IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    constexpr safe_subrange_t<R>
equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});
}
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 Requires: The elements `e` of `[first, last)` shall be partitioned with respect to the expressions
`bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` shall imply `!bool(comp(value, e))` for the overloads in namespace `std`.

3 Returns:

(3.1) — For the overloads in namespace `std`:
```
\{lower_bound(first, last, value, comp),
  upper_bound(first, last, value, comp)\}
```

(3.2) — For the overloads in namespace `ranges`: `{ranges::lower_bound(first, last, value, comp, proj),
  ranges::upper_bound(first, last, value, comp, proj)}`

4 Complexity: At most $2 \cdot \log_2(last - first) + O(1)$ comparisons and projections.

24.7.3.4 binary_search

```cpp
template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
              const T& value);
```

```cpp
template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,
              const T& value, Compare comp);
```

namespace ranges {
```cpp
namespace ranges {
    template<ForwardIterator I, Sentinel<I> S, class T, class Proj = identity,
             IndirectStrictWeakOrder<const T*, projected<I, Proj>> Comp = ranges::less<>>
    constexpr bool binary_search(I first, S last, const T& value, Comp comp = {},
                                  Proj proj = {});

    template<ForwardRange R, class T, class Proj = identity,
             IndirectStrictWeakOrder<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    constexpr bool binary_search(R&& r, const T& value, Comp comp = {},
                                  Proj proj = {});
}
```

1 Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.
Requires: The elements e of [first, last) shall be partitioned with respect to the expressions
bool(invoke(comp, invoke(proj, e), value)) and !bool(invoke(comp, value, invoke(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) shall imply !bool(comp(value, e)) for the overloads in namespace std.

Returns: true if and only if for some iterator i in the range [first, last), !bool(invoke(comp, invoke(proj, *i), value)) & & !bool(invoke(comp, value, invoke(proj, *i))) is true.

Complexity: At most $\log_2(last - first) + \Theta(1)$ comparisons and projections.

24.7.4 Partitions

```cpp
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator partition(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {
    template<Permutable I, Sentinel<I> S, class Proj = identity, 
             IndirectUnaryPredicate<projected<I, Proj>> Pred>
    constexpr ForwardIterator partition(I first, S last, Pred pred, Proj proj = {});
    template<ForwardRange R, class Proj = identity, 
             IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
    requires Permutable<iterator_t<R>>
    constexpr safe_iterator_t<R> partition(R&& r, Pred pred, Proj proj = {});
}
```

Let proj be `identity{}` for the overloads with no parameter named proj.

Returns: true if and only if the elements e of [first, last) are partitioned with respect to the expression bool(invoke(pred, invoke(proj, e))).

Complexity: Linear. At most last - first applications of pred and proj.

```cpp
template<class ForwardIterator, class Predicate>
constexpr ForwardIterator partition(ForwardIterator first, ForwardIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator partition(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {
    template<Permutable I, Sentinel<I> S, class Proj = identity, 
             IndirectUnaryPredicate<projected<I, Proj>> Pred>
    constexpr I partition(I first, S last, Pred pred, Proj proj = {});
    template<ForwardRange R, class Proj = identity, 
             IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
    requires Permutable<iterator_t<R>>
    constexpr I partition(R&& r, Pred pred, Proj proj = {});
}
```

Let proj be `identity{}` for the overloads with no parameter named proj and let $E(x)$ be bool(invoke(pred, invoke(proj, x))).

Requires: For the overloads in namespace std, ForwardIterator shall meet the Cpp17ValueSwappable requirements (15.5.3.2).

Effects: Places all the elements e in [first, last) that satisfy $E(e)$ before all the elements that do not.

Returns: An iterator i such that $E(*j)$ is true for every iterator j in [first, i) and false for every iterator j in [i, last).

Complexity: Let $N = last - first$: 

§ 24.7.4
— For the overload with no `ExecutionPolicy`, exactly \( N \) applications of the predicate and projection. At most \( N/2 \) swaps if the type of `first` meets the `Cpp17BidirectionalIterator` requirements for the overloads in namespace `std` or models `BidirectionalIterator` for the overloads in namespace `ranges`, and at most \( N \) swaps otherwise.

— For the overload with an `ExecutionPolicy`, \( O(N \log N) \) swaps and \( O(N) \) applications of the predicate.

template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(ExecutionPolicy&& exec, 
                   BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

namespace ranges {

    template<class BidirectionalIterator, Sentinel<BidirectionalIterator> S, class Proj = identity, 
                IndirectUnaryPredicate<projected<BidirectionalIterator, Proj>> Pred>
    requires Permutable<BidirectionalIterator>
    I stable_partition(I first, S last, Pred pred, Proj proj = {});

    template<class BidirectionalRange R, class Proj = identity, 
                IndirectUnaryPredicate<projected<iterator_t<R>, Proj>> Pred>
    requires Permutable<iterator_t<R>>
    safe_iterator_t<R> stable_partition(R&& r, Pred pred, Proj proj = {});

}  // namespace ranges

Let `proj` be `identity{}` for the overloads with no parameter named `proj` and let \( E(x) \) be `bool:invoke(pred, invoke(proj, x))`.  

Requires: For the overloads in namespace `std`, `BidirectionalIterator` shall meet the `Cpp17Value-Swappable` requirements (15.5.3.2) and the type of `*first` shall meet the `Cpp17MoveConstructible` (Table 26) and `Cpp17MoveAssignable` (Table 28) requirements.

Effects: Places all the elements `e` in `[first, last)` that satisfy \( E(e) \) before all the elements that do not. The relative order of the elements in both groups is preserved.

Returns: An iterator `i` such that for every iterator `j` in `[first, i)`, \( E(*j) \) is `true` and for every iterator `j` in the range `[i, last)`, \( E(*j) \) is `false`.

Complexity: Let \( N = \text{last} - \text{first} \):

- For the overloads with no `ExecutionPolicy`, at most \( N \log N \) swaps, but only \( O(N) \) swaps if there is enough extra memory. Exactly \( N \) applications of the predicate and projection.

- For the overload with an `ExecutionPolicy`, \( O(N \log N) \) swaps and \( O(N) \) applications of the predicate.
template<InputRange R, WeaklyIncrementable O1, WeaklyIncrementable O2, 
   class Proj = identity, 
   IndirectUnaryPredicate projected<iterator_t<R>, Proj>> Pred> 
requires IndirectlyCopyable<iterator_t<R>, O1> && 
   IndirectlyCopyable<iterator_t<R>, O2> 
constexpr partition_copy_result<safe_iterator_t<R>, O1, O2> 
   partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});

Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke( 
   pred, invoke(proj, x))).

Requires: The input range and output ranges shall not overlap. For the overloads in namespace std, 
the expression *first shall be writable (22.3.1) to out_true and out_false. [Note: For the overload 
with an ExecutionPolicy, there may be a performance cost if first's value type does not meet the 
Cpp17CopyConstructible requirements. —end note]

Effects: For each iterator i in [first, last), copies *i to the output range beginning with out_true 
if E(*i) is true, or to the output range beginning with out_false otherwise.

Returns: Let o1 be the end of the output range beginning at out_true, and o2 the end of the output 
range beginning at out_false. Returns

   — {o1, o2} for the overloads in namespace std, or
   — {last, o1, o2} for the overloads in namespace ranges.

Complexity: Exactly last – first applications of pred and proj.

template<class ForwardIterator, class Predicate> 
constexpr ForwardIterator 
   partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {
   template<ForwardIterator I, Sentinel<I> S, class Proj = identity, 
      IndirectUnaryPredicate projected<I, Proj>> Pred> 
   constexpr I partition_point(I first, S last, Pred pred, Proj proj = {});
   template<ForwardRange R, class Proj = identity, 
      IndirectUnaryPredicate projected<iterator_t<R>, Proj>> Pred> 
   constexpr safe_iterator_t<R> 
      partition_point(R&& r, Pred pred, Proj proj = {});
}

Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke( 
   pred, invoke(proj, x))).

Requires: The elements e of [first, last) shall be partitioned with respect to E(e).

Returns: An iterator mid such that E(*i) is true for all iterators i in [first, mid), and false for 
all iterators i in [mid, last)

Complexity: $\Theta(log(last – first))$ applications of pred and proj.

24.7.5 Merge [alg.merge]

template<class InputIterator1, class InputIterator2, 
   class OutputIterator> 
constexpr OutputIterator 
   merge(InputIterator1 first1, InputIterator1 last1, 
      InputIterator2 first2, InputIterator2 last2, 
      OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
   class ForwardIterator> 
   ForwardIterator 
      merge(ExecutionPolicy&& exec, 
             ForwardIterator1 first1, ForwardIterator1 last1, 
             ForwardIterator2 first2, ForwardIterator2 last2, 
             ForwardIterator result);
template<class InputIterator1, class InputIterator2,  
  class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,  
  InputIterator2 first2, InputIterator2 last2,  
  OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,  
  class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,  
  ForwardIterator1 first1, ForwardIterator1 last1,  
  ForwardIterator2 first2, ForwardIterator2 last2,  
  ForwardIterator result, Compare comp);

namespace ranges {

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,  
  WeaklyIncrementable O, class Comp = ranges::less<>, class Proj1 = identity,  
  class Proj2 = identity>
requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr merge_result<I1, I2, O>
merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,  
  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<InputRange R1, InputRange R2, WeaklyIncrementable O, class Comp = ranges::less<>,  
  class Proj1 = identity, class Proj2 = identity>
requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr merge_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
merge(R1&& r1, R2&& r2, O result,  
  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
}

Let \( N \) be \((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})\). Let \( \text{comp} \) be \( \text{less}() \), \( \text{proj1} \) be \( \text{identity}() \), and \( \text{proj2} \) be \( \text{identity}() \), for the overloads with no parameters by those names.

Requires: The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) shall be sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively. The resulting range shall not overlap with either of the original ranges.

Effects: Copies all the elements of the two ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) into the range \([\text{result}, \text{result_last})\), where \( \text{result_last} \) is \( \text{result} + N \). If an element \( a \) precedes \( b \) in an input range, \( a \) is copied into the output range before \( b \). If \( e_1 \) is an element of \([\text{first1}, \text{last1})\) and \( e_2 \) of \([\text{first2}, \text{last2})\), \( e_2 \) is copied into the output range before \( e_1 \) if and only if \( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, e_2), \text{invoke}(\text{proj1}, e_1))) \) is true.

Returns:

(4.1) — \( \text{result_last} \) for the overloads in namespace \std, or
(4.2) — \( \{\text{first1}, \text{first2}, \text{result_last}\} \) for the overloads in namespace \ranges.

Complexity:

(5.1) — For the overloads with no \ExecutionPolicy, at most \( N - 1 \) comparisons and applications of each projection.
(5.2) — For the overloads with an \ExecutionPolicy, \( O(N) \) comparisons.

Remarks: Stable (15.5.5.7).

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,  
  BidirectionalIterator middle,  
  BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,  
  BidirectionalIterator first,  
  BidirectionalIterator middle,  
  BidirectionalIterator last);
template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
BidirectionalIterator middle,
BidirectionalIterator last, Compare comp);

template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
BidirectionalIterator first,
BidirectionalIterator middle,
BidirectionalIterator last, Compare comp);

namespace ranges {

template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
class Proj = identity>
requires Sortable<I, Comp, Proj>
I inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});
}

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Requires: [first, middle) and [middle, last) shall be valid ranges sorted with respect to comp
and proj. For the overloads in namespace std, BidirectionalIterator shall meet the Cpp17Value-Swappable requirements (15.5.3.2) and the type of *first shall meet the Cpp17MoveConstructible (Table 26) and Cpp17MoveAssignable (Table 28) requirements.

Effects: Merges two sorted consecutive ranges [first, middle) and [middle, last), putting the
result of the merge into the range [first, last). The resulting range is sorted with respect to comp
and proj.

Returns: last for the overload in namespace ranges.

Complexity: Let N = last - first:
(11.1) — For the overloads with no ExecutionPolicy, and if enough additional memory is available, exactly
N − 1 comparisons.
(11.2) — Otherwise, O(N log N) comparisons.

In either case, twice as many projections as comparisons.

Remarks: Stable (15.5.5.7).

namespace ranges {

template<BidirectionalRange R, class Comp = ranges::less<>, class Proj = identity>
requires Sortable<iterator_t<R>, Comp, Proj>
safe_iterator_t<R>
inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
}

Effects: Equivalent to:
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);

24.7.6 Set operations on sorted structures

This subclause defines all the basic set operations on sorted structures. They also work with multisets (21.4.7)
containing multiple copies of equivalent elements. The semantics of the set operations are generalized to
multisets in a standard way by defining set_union() to contain the maximum number of occurrences of
every element, set_intersection() to contain the minimum, and so on.

24.7.6.1 includes

template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2);
Let \( \text{comp} \) be \( \text{less}{} \), \( \text{proj}1 \) be \( \text{identity}{} \), and \( \text{proj}2 \) be \( \text{identity}{} \), for the overloads with no parameters by those names.

Requires: The ranges \([\text{first}1, \text{last}1)\) and \([\text{first}2, \text{last}2)\) shall be sorted with respect to \(\text{comp}\) and \(\text{proj}1\) or \(\text{proj}2\), respectively.

Returns: \( \text{true} \) if and only if \([\text{first}2, \text{last}2)\) is a subsequence of \([\text{first}1, \text{last}1)\). [Note: A sequence \(S\) is a subsequence of another sequence \(T\) if \(S\) can be obtained from \(T\) by removing some, all, or none of \(T\)'s elements and keeping the remaining elements in the same order. — end note]

Complexity: At most \(2 \ast ((\text{last}1 - \text{first}1) + (\text{last}2 - \text{first}2)) - 1\) comparisons and applications of each projection.

### 24.7.6.2 `set_union` [set.union]

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
          InputIterator2 first2, InputIterator2 last2,
          OutputIterator result);

template<class ExecutionPolicy&, class ForwardIterator1, class ForwardIterator2, class ForwardIterator, class Compare>
ForwardIterator
set_union(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 first2, ForwardIterator2 last2,
          ForwardIterator result, Compare comp);
```

§ 24.7.6.2
namespace ranges {

    template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
             WeaklyIncrementable O, class Comp = ranges::less<>,
             class Proj1 = identity, class Proj2 = identity>
    requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>
    constexpr set_union_result<I1, I2, O>
    set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
              Proj1 proj1 = {}, Proj2 proj2 = {});

    template<InputRange R1, InputRange R2, WeaklyIncrementable O,
             class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
    requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
    constexpr set_union_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
    set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
              Proj1 proj1 = {}, Proj2 proj2 = {});
}

Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by those names.

Requires: The ranges [first1, last1) and [first2, last2) shall be sorted with respect to comp and proj1 or proj2, respectively. The resulting range shall not overlap with either of the original ranges.

Effects: Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

Returns: Let result_last be the end of the constructed range. Returns

\[ \text{(4.1)} \]
— result_last for the overloads in namespace std, or

\[ \text{(4.2)} \]
— {last1, last2, result_last} for the overloads in namespace ranges.

Complexity: At most \[ 2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1 \] comparisons and applications of each projection.

Remarks: Stable (15.5.5.7). If [first1, last1) contains \( m \) elements that are equivalent to each other and [first2, last2) contains \( n \) elements that are equivalent to them, then all \( m \) elements from the first range are copied to the output range, in order, and then the final \( \max(n - m, 0) \) elements from the second range are copied to the output range, in order.

### 24.7.6.3 set_intersection

\[ \text{set.intersection} \]

```cpp
// 24.7.6.3 set_intersection

template<class InputIterator1, class InputIterator2,
         class OutputIterator>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                 InputIterator2 first2, InputIterator2 last2,
                 OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
                ForwardIterator1 first1, ForwardIterator1 last1,
                ForwardIterator2 first2, ForwardIterator2 last2,
                ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
                 InputIterator2 first2, InputIterator2 last2,
                 OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class Compare>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
```

§ 24.7.6.3
namespace ranges {
   template<ForwardIterator1 I1, Sentinel<I1> S1, ForwardIterator1 I2, Sentinel<I2> S2,  
      WeaklyIncrementable O, class Comp = ranges::less<>,  
      class Proj1 = identity, class Proj2 = identity>  
   requires Mergeable<I1, I2, O, Comp, Proj1, Proj2>  
   constexpr set_intersection_result<I1, I2, O>  
   set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,  
      Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});  
}

Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by  
those names.

Requires: The ranges [first1, last1) and [first2, last2) shall be sorted with respect to comp  
and proj1 or proj2, respectively. The resulting range shall not overlap with either of the original  
ranges.

Effects: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements  
that are present in both of the ranges.

Returns: Let result_last be the end of the constructed range. Returns

(4.1) — result_last for the overloads in namespace std, or
(4.2) — {last1, last2, result_last} for the overloads in namespace ranges.

Complexity: At most 2 * ((last1 - first1) + (last2 - first2)) - 1 comparisons and applications  
of each projection.

Remarks: Stable (15.5.5.7). If [first1, last1) contains m elements that are equivalent to each other  
and [first2, last2) contains n elements that are equivalent to them, the first min(m, n) elements  
are copied from the first range to the output range, in order.

24.7.6.4 set_difference

template<class InputIterator1, class InputIterator2,  
       class OutputIterator>  
constexpr OutputIterator  
set_difference(InputIterator1 first1, InputIterator1 last1,  
               InputIterator2 first2, InputIterator2 last2,  
               OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,  
       class ForwardIterator>  
ForwardIterator  
set_difference(ExecutionPolicy&& exec,  
               ForwardIterator1 first1, ForwardIterator1 last1,  
               ForwardIterator2 first2, ForwardIterator2 last2,  
               ForwardIterator result);

template<class InputIterator1, class InputIterator2,  
       class OutputIterator, class Compare>  
constexpr OutputIterator  
set_difference(InputIterator1 first1, InputIterator1 last1,  
               InputIterator2 first2, InputIterator2 last2,  
               OutputIterator result, Compare comp);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
    class ForwardIterator, class Compare>
ForwardIterator
set_difference(ExecutionPolicy&& exec, 
    ForwardIterator1 first1, ForwardIterator1 last1, 
    ForwardIterator2 first2, ForwardIterator2 last2, 
    ForwardIterator result, Compare comp);

namespace ranges {

#define FIRST1(first) {first}
define SECOND1(last) {last}
define FIRST2(first) {first}
define SECOND2(last) {last}
define FIRST3(result) {result}
define SECOND3(type) {type}
define FIRST4(exec) {exec}

// Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by 
// those names.

// Requires: The ranges [first1, last1) and [first2, last2) shall be sorted with respect to comp 
// and proj1 or proj2, respectively. The resulting range shall not overlap with either of the original ranges.

// Effects: Copies the elements of the range [first1, last1) which are not present in the range 
// [first2, last2) to the range beginning at result. The elements in the constructed range are sorted.

// Returns: Let result_last be the end of the constructed range. Returns 
// (4.1) result_last for the overloads in namespace std, or 
// (4.2) {last1, result_last} for the overloads in namespace ranges.

// Complexity: At most 2 * ((last1 - first1) + (last2 - first2)) - 1 comparisons and applications of each projection.

// Remarks: If [first1, last1) contains m elements that are equivalent to each other and [first2, last2) contains n elements that are equivalent to them, the last max(m - n, 0) elements from [first1, last1) is copied to the output range, in order.

24.7.6.5 set_symmetric_difference

template<class InputIterator1, class InputIterator2, 
    class OutputIterator, class Compare>
OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1, 
    InputIterator2 first2, InputIterator2 last2, 
    OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
    class ForwardIterator>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec, 
    ForwardIterator1 first1, ForwardIterator1 last1, 
    ForwardIterator2 first2, ForwardIterator2 last2, 
    ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1, 
    InputIterator2 first2, InputIterator2 last2, 
    OutputIterator result, Compare comp);
OutputIterator result, Compare comp);

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);
```

```
namespaces {

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
         WeaklyIncrementable O, class Comp = ranges::less<>,
         class Proj1 = identity, class Proj2 = identity>
requires Mergeable<I1, I2, 0, Comp, Proj1, Proj2>
constexpr set_symmetric_difference_result<I1, I2, 0>
set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = {}, Proj1 proj1 = {},
Proj2 proj2 = {});

template<InputRange R1, InputRange R2, WeaklyIncrementable O,
         class Comp = ranges::less<>, class Proj1 = identity, class Proj2 = identity>
requires Mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr set_symmetric_difference_result<safe_iterator_t<R1>, safe_iterator_t<R2>, O>
set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
}
```

Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

2
`Requires:` The resulting range shall not overlap with either of the original ranges. The ranges `[first1, last1)` and `[first2, last2)` shall be sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range shall not overlap with either of the original ranges.

3
`Effects:` Copies the elements of the range `[first1, last1)` that are not present in the range `[first2, last2)`, and the elements of the range `[first2, last2)` that are not present in the range `[first1, last1)` to the range beginning at `result`. The elements in the constructed range are sorted.

4
`Returns:` Let `result_last` be the end of the constructed range. Returns

4.1 — `result_last` for the overloads in namespace `std`, or
4.2 — `{last1, last2, result_last}` for the overloads in namespace `ranges`.

5
`Complexity:` At most `2 * ((last1 - first1) + (last2 - first2)) - 1` comparisons and applications of each projection.

6
`Remarks:` Stable (15.5.5.7). If `[first1, last1)` contains `m` elements that are equivalent to each other and `[first2, last2)` contains `n` elements that are equivalent to them, then `|m - n|` of those elements shall be copied to the output range: the last `m - n` of these elements from `[first1, last1)` if `m > n`, and the last `n - m` of these elements from `[first2, last2)` if `m < n`. In either case, the elements are copied in order.

24.7.7 Heap operations

A random access range `[a, b)` is a heap with respect to `comp` and `proj` for a comparator and projection function if its elements are organized such that:

1.1 — With `N = b - a`, for all `i`, `0 < i < N`, `bool:invoke(comp, invoke(proj, a[\lfloor{\frac{i-1}{2}\rfloor}]), invoke(proj, a[i]))` is false.
1.2 — `*a` may be removed by `pop_heap`, or a new element added by `push_heap`, in `\Theta(log N)` time.

2 These properties make heaps useful as priority queues.

3 `make_heap` converts a range into a heap and `sort_heap` turns a heap into a sorted sequence.

24.7.7.1 push_heap

```
template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);
```
template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
Compare comp);

namespace ranges {
    template<typename I, Sentinel<I> S, class Comp = ranges::less<>,
    class Proj = identity>
    requires Sortable<I, Comp, Proj>
    constexpr I
    push_heap(I first, S last, Comp comp = {}, Proj proj = {});
    template<typename RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
    requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr safe_iterator_t<R>
    push_heap(R&& r, Comp comp = {}, Proj proj = {});
}

1. Let comp be `less{}` and proj be `identity{}` for the overloads with no parameters by those names.
2. **Requires:** The range `[first, last - 1)` shall be a valid heap with respect to comp and proj. For the overloads in namespace std, the type of `*first` shall meet the Cpp17MoveConstructible requirements (Table 26) and the Cpp17MoveAssignible requirements (Table 28).
3. **Effects:** Places the value in the location `last - 1` into the resulting heap `[first, last)`.
4. **Returns:** last for the overloads in namespace ranges.
5. **Complexity:** At most log(last - first) comparisons and twice as many projections.

### 24.7.7.2 pop_heap

template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
Compare comp);

namespace ranges {
    template<typename I, Sentinel<I> S, class Comp = ranges::less<>,
    class Proj = identity>
    requires Sortable<I, Comp, Proj>
    constexpr I
    pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
    template<typename RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
    requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr safe_iterator_t<R>
    pop_heap(R&& r, Comp comp = {}, Proj proj = {});
}

1. Let comp be `less{}` and proj be `identity{}` for the overloads with no parameters by those names.
2. **Requires:** The range `[first, last - 1)` shall be a valid non-empty heap with respect to comp and proj. For the overloads in namespace std, RandomAccessIterator shall meet the Cpp17ValueSwappable requirements (15.5.3.2) and the type of `*first` shall meet the Cpp17MoveConstructible requirements (Table 26) and Cpp17MoveAssignible (Table 28) requirements.
3. **Effects:** Swaps the value in the location `first` with the value in the location `last - 1` and makes `[first, last - 1)` into a heap with respect to comp and proj.
4. **Returns:** last for the overloads in namespace ranges.
5. **Complexity:** At most 2 log(last - first) comparisons and twice as many projections.

### 24.7.7.3 make_heap

template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
Compare comp);
template<class RandomAccessIterator, class Compare>
    constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                            Compare comp);

namespace ranges {
    template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
             class Proj = identity>
        requires Sortable<I, Comp, Proj>
        constexpr I
        make_heap(I first, S last, Comp comp = {}, Proj proj = {});
    template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
        requires Sortable<iterator_t<R>, Comp, Proj>
        constexpr safe_iterator_t<R>
        make_heap(R&& r, Comp comp = {}, Proj proj = {});
}

1. Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2. Requires: For the overloads in namespace std, the type of *first shall meet the Cpp17Move-Constructible (Table 26) and Cpp17MoveAssignable (Table 28) requirements.
3. Effects: Constructs a heap with respect to comp and proj out of the range [first, last).
4. Returns: last for the overloads in namespace ranges.
5. Complexity: At most 3(last - first) comparisons and twice as many projections.

24.7.7.4 sort_heap

template<class RandomAccessIterator>
    constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last,
                             Compare comp);

namespace ranges {
    template<RandomAccessIterator I, Sentinel<I> S, class Comp = ranges::less<>,
             class Proj = identity>
        requires Sortable<I, Comp, Proj>
        constexpr I
        sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
    template<RandomAccessRange R, class Comp = ranges::less<>, class Proj = identity>
        requires Sortable<iterator_t<R>, Comp, Proj>
        constexpr safe_iterator_t<R>
        sort_heap(R&& r, Comp comp = {}, Proj proj = {});
}

1. Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2. Requires: The range [first, last) shall be a valid heap with respect to comp and proj. For the
   overloads in namespace std, RandomAccessIterator shall meet the Cpp17ValueSwappable requirements
   (15.5.3.2) and the type of *first shall meet the Cpp17MoveConstructible (Table 26) and
   Cpp17MoveAssignable (Table 28) requirements.
3. Effects: Sorts elements in the heap [first, last) with respect to comp and proj.
4. Returns: last for the overloads in namespace ranges.
5. Complexity: At most 2N log N comparisons, where N = last - first, and twice as many projections.

24.7.7.5 is_heap

template<class RandomAccessIterator>
    constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);

1. Effects: Equivalent to: return is_heap_until(first, last) == last;
template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);

Effects: Equivalent to:
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);

Effects: Equivalent to: return is_heap_until(first, last, comp) == last;

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);

Effects: Equivalent to:
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

namespace ranges {
  template<RandomAccessIterator I, Sentinel<I> S, class Proj = identity,
           IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
  constexpr bool is_heap(I first, S last, Comp comp = {}, Proj proj = {});
  template<RandomAccessRange R, class Proj = identity,
           IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
  constexpr safe_iterator_t<R> is_heap_until(R&& r, Comp comp = {}, Proj proj = {});
}

Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

template<class RandomAccessIterator>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
             Compare comp);

namespace ranges {
  template<RandomAccessIterator I, Sentinel<I> S, class Proj = identity,
           IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
  constexpr I is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});
  template<RandomAccessRange R, class Proj = identity,
           IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
  constexpr safe_iterator_t<R> is_heap_until(R&& r, Comp comp = {}, Proj proj = {});
}

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Returns: The last iterator i in [first, last] for which the range [first, i) is a heap with respect
to comp and proj.

Complexity: Linear.
24.7.8 Minimum and maximum

template<class T> constexpr const T& min(const T& a, const T& b);
template<class T, class Compare>
    constexpr const T& min(const T& a, const T& b, Compare comp);

namespace ranges {
    template<class T, class Proj = identity,
        IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>
    
    constexpr const T& min(const T& a, const T& b, Comp comp = {}, Proj proj = {});
}

Requires: For the first form, type T shall be Cpp17LessThanComparable (Table 24).

Returns: The smaller value.

Remarks: Returns the first argument when the arguments are equivalent. An invocation may explicitly
specify an argument for the template parameter T of the overloads in namespace std.

Complexity: Exactly one comparison and two applications of the projection, if any.

template<class T>
    constexpr T min(initializer_list<T> r);
template<class T, class Compare>
    constexpr T min(initializer_list<T> r, Compare comp);

namespace ranges {
    template<Copyable T, class Proj = identity,
        IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>
        requires IndirectlyCopyableStorable<iterator_t<R>, iter_value_t<iterator_t<R>>
    
    constexpr T min(initializer_list<T> r, Comp comp = {}, Proj proj = {});
}

Requires: ranges::distance(r) > 0. For the overloads in namespace std, T shall be Cpp17Copy-Constructible. For the first form, type T shall be Cpp17LessThanComparable.

Returns: The smallest value in the input range.

Remarks: Returns a copy of the leftmost element when several elements are equivalent to the smallest. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the projection, if any.

template<class T> constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
    constexpr const T& max(const T& a, const T& b, Compare comp);

namespace ranges {
    template<class T, class Proj = identity,
        IndirectStrictWeakOrder<projected<const T*, Proj>> Comp = ranges::less<>
    
    constexpr const T& max(const T& a, const T& b, Comp comp = {}, Proj proj = {});
}

Requires: For the first form, type T shall be Cpp17LessThanComparable (Table 24).

Returns: The larger value.

Remarks: Returns the first argument when the arguments are equivalent. An invocation may explicitly
specify an argument for the template parameter T of the overloads in namespace std.

Complexity: Exactly one comparison and two applications of the projection, if any.

template<class T>
    constexpr T max(initializer_list<T> r);
template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);

namespace ranges {
    template<Copyable T, class Proj = identity,
             IndirectStrictWeakOrder<Projected<const T*, Proj>> Comp = ranges::less<>>
    constexpr T max(initializer_list<T> r, Comp comp = {}, Proj proj = {});
    template<InputRange R, class Proj = identity,
             IndirectStrictWeakOrder<Projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    requires IndirectlyCopyableStorable<iterator_t<R>, iter_value_t<iterator_t<R>>>
    constexpr iter_value_t<iterator_t<R>>
    max(R&& r, Comp comp = {}, Proj proj = {});
}

Requires: ranges::distance(r) > 0. For the overloads in namespace std, T shall be Cpp17CopyConstructible. For the first form, type T shall be Cpp17LessThanComparable.

Returns: The largest value in the input range.

Remarks: Returns a copy of the leftmost element when several elements are equivalent to the largest. An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the projection, if any.

template<class T> constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

namespace ranges {
    template<class T, class Proj = identity,
             IndirectStrictWeakOrder<Projected<const T*, Proj>> Comp = ranges::less<>>
    constexpr minmax_result<const T&>
    minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});
}

Requires: For the first form, type T shall be Cpp17LessThanComparable (Table 24).

Returns: {b, a}) if b is smaller than a, and {a, b} otherwise.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

Complexity: Exactly one comparison and two applications of the projection, if any.

template<class T>
constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);

namespace ranges {
    template<Copyable T, class Proj = identity,
             IndirectStrictWeakOrder<Projected<const T*, Proj>> Comp = ranges::less<>>
    constexpr minmax_result<T>
    minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});
    template<InputRange R, class Proj = identity,
             IndirectStrictWeakOrder<Projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    requires IndirectlyCopyableStorable<iterator_t<R>, iter_value_t<iterator_t<R>>>
    constexpr minmax_result<iter_value_t<iterator_t<R>>>
    minmax(R&& r, Comp comp = {}, Proj proj = {});
}

Requires: ranges::distance(r) > 0. For the overloads in namespace std, T shall be Cpp17CopyConstructible. For the first form, type T shall be Cpp17LessThanComparable.

Returns: Let X be the return type. Returns Xx, y, where x is a copy of the leftmost element with the smallest and y a copy of the rightmost element with the largest value in the input range.
Remarks: An invocation may explicitly specify an argument for the template parameter \( T \) of the overloads in namespace \( \text{std} \).

Complexity: At most \( (3/2)\text{ranges}::\text{distance}(r) \) applications of the corresponding predicate and twice as many applications of the projection, if any.

```cpp
template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
                          ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                          Compare comp);

namespace ranges {
    template<class ForwardIterator I, Sentinel<I> S, class Proj = identity,
             IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
    constexpr I min_element(I first, S last, Comp comp = {}, Proj proj = {});

    template<class ForwardRange R, class Proj = identity,
             IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    constexpr safe_iterator_t<R>
    min_element(R&& r, Comp comp = {}, Proj proj = {});
}
```

Let \( \text{comp} \) be \( \text{less\{} \) and \( \text{proj} \) be \( \text{identity\{} \) for the overloads with no parameters by those names.

Returns: The first iterator \( i \) in the range \([\text{first}, \text{last})\) such that for every iterator \( j \) in the range \([\text{first}, \text{last})\),

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \ast j), \text{invoke}(\text{proj}, \ast i)))
\]

is \( \text{false} \). Returns \( \text{last} \) if \( \text{first} == \text{last} \).

Complexity: Exactly \( \text{max}(\text{last} - \text{first} - 1, 0) \) comparisons and twice as many projections.

```cpp
template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator max_element(ExecutionPolicy&& exec,
                          ForwardIterator first, ForwardIterator last);

namespace ranges {
    template<class ForwardIterator I, Sentinel<I> S, class Proj = identity,
             IndirectStrictWeakOrder<projected<I, Proj>> Comp = ranges::less<>>
    constexpr I max_element(I first, S last, Comp comp = {}, Proj proj = {});

    template<class ForwardRange R, class Proj = identity,
             IndirectStrictWeakOrder<projected<iterator_t<R>, Proj>> Comp = ranges::less<>>
    constexpr safe_iterator_t<R>
    max_element(R&& r, Comp comp = {}, Proj proj = {});
}
```

Let \( \text{comp} \) be \( \text{less\{} \) and \( \text{proj} \) be \( \text{identity\{} \) for the overloads with no parameters by those names.
Returns: The first iterator \(i\) in the range \([\text{first}, \text{last})\) such that for every iterator \(j\) in the range \([\text{first}, \text{last})\),

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \star i), \text{invoke}(\text{proj}, \star j)))
\]

is false. Returns \text{last} if \text{first} == \text{last}.

Complexity: Exactly \(\max(\text{last} - \text{first} - 1, 0)\) comparisons and twice as many projections.

```cpp
template<class ForwardIterator>
constexpr pair<ForwardIterator, ForwardIterator> minmax_element(ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
pair<ForwardIterator, ForwardIterator> minmax_element(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator> minmax_element(ForwardIterator first, ForwardIterator last, Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator> minmax_element(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, Compare comp);
```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
lexicographical_compare(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class Compare>
bool
lexicographical_compare(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
Compare comp);

namespace ranges {

template<InputIterator I1, Sentinel<I1> S1, InputIterator I2, Sentinel<I2> S2,
class Proj1 = identity, class Proj2 = identity,
IndirectStrictWeakOrder<projected<I1, Proj1>,
projected<I2, Proj2>> Comp = ranges::less<>>
constexpr bool
lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<InputRange R1, InputRange R2, class Proj1 = identity,
class Proj2 = identity,
IndirectStrictWeakOrder<projected<iterator_t<R1>, Proj1>,
projected<iterator_t<R2>, Proj2>> Comp = ranges::less<>>
constexpr bool
lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
}

Returns: true if and only if the sequence of elements defined by the range [first1, last1) is
lexicographically less than the sequence of elements defined by the range [first2, last2).

Complexity: At most 2\min(last1 - first1, last2 - first2) applications of the corresponding
comparison and each projection, if any.

Remarks: If two sequences have the same number of elements and their corresponding elements (if
any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is
a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence.
Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of
the first corresponding pair of elements that are not equivalent.

[Example: ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2) could be
implemented as:
for (; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
    if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
} return first1 == last1 && first2 != last2;
—end example]

[Note: An empty sequence is lexicographically less than any non-empty sequence, but not less than any
empty sequence. —end note]

24.7.11 Three-way comparison algorithms

template<class T, class U> constexpr auto compare_3way(const T& a, const U& b);

Effects: Compares two values and produces a result of the strongest applicable comparison category
type:

§ 24.7.11 1051
— Returns a <=> b if that expression is well-formed.

— Otherwise, if the expressions a == b and a < b are each well-formed and convertible to bool, returns strong_ordering::equal when a == b is true, otherwise returns strong_ordering::less when a < b is true, and otherwise returns strong_ordering::greater.

— Otherwise, if the expression a == b is well-formed and convertible to bool, returns strong_equality::equal when a == b is true, and otherwise returns strong_equality::nonequal.

— Otherwise, the function is defined as deleted.

template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
lexicographical_compare_3way(InputIterator1 b1, InputIterator1 e1,
InputIterator2 b2, InputIterator2 e2,
Cmp comp)
-> common_comparison_category_t<decltype(comp(*b1, *b2)), strong_ordering>;

Requires: Cmp shall be a function object type whose return type is a comparison category type.

Effects: Lexicographically compares two ranges and produces a result of the strongest applicable comparison category type. Equivalent to:

```cpp
for ( ; b1 != e1 && b2 != e2; void(++b1), void(++b2) )
    if (auto cmp = comp(*b1,*b2); cmp != 0)
        return cmp;
    if (b1 != e1)
        return strong_ordering::greater;
    if (b2 != e2)
        return strong_ordering::less;
    return strong_ordering::equal;
```

template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_3way(InputIterator1 b1, InputIterator1 e1,
InputIterator2 b2, InputIterator2 e2);

Effects: Equivalent to:

```cpp
return lexicographical_compare_3way(b1, e1, b2, e2,
[](const auto& t, const auto& u) {
    return compare_3way(t, u);
});
```

24.7.12 Permutation generators

```cpp
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
BidirectionalIterator last, Compare comp);
```

namespace ranges {
    template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
            class Proj = identity>
        requires Sortable<I, Comp, Proj>
    constexpr bool
        next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
    template<BidirectionalRange R, class Comp = ranges::less<>,
            class Proj = identity>
        requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr bool
        next_permutation(R&& r, Comp comp = {}, Proj proj = {});
}

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

2 Requires: For the overloads in namespace std, BidirectionalIterator shall meet the Cpp17Value-Swappable requirements (15.5.3.2).
Effects: Takes a sequence defined by the range \([\text{first, last})\) and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \(\text{comp}\) and \(\text{proj}\). If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

Returns: true if and only if a next permutation was found.

Complexity: At most \((\text{last} - \text{first}) / 2\) swaps.

```cpp
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
                                 BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
                                 BidirectionalIterator last, Compare comp);
```

namespace ranges {
    template<BidirectionalIterator I, Sentinel<I> S, class Comp = ranges::less<>,
             class Proj = identity>
    requires Sortable<I, Comp, Proj>
    constexpr bool prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});

    template<BidirectionalRange R, class Comp = ranges::less<>,
             class Proj = identity>
    requires Sortable<iterator_t<R>, Comp, Proj>
    constexpr bool prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
}

Let \(\text{comp}\) be \text{less\{\}} and \(\text{proj}\) be \text{identity\{\}} for overloads with no parameters by those names.

Requires: For the overloads in namespace \text{std}, \text{BidirectionalIterator} shall meet the \text{Cpp17Value-Swappable} requirements (15.5.3.2).

Effects: Takes a sequence defined by the range \([\text{first, last})\) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \(\text{comp}\) and \(\text{proj}\). If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

Returns: true if and only if a previous permutation was found.

Complexity: At most \((\text{last} - \text{first}) / 2\) swaps.

### 24.8 Header <numeric> synopsis

constexpr common_type_t<M, N> gcd(M m, N n);

// 24.9.14, least common multiple
template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);

24.9 Generalized numeric operations
[numeric.ops]
[Note: The use of closed ranges as well as semi-open ranges to specify requirements throughout this subclause is intentional. — end note]

24.9.1 Definitions
[numerics.defns]
Define GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) as follows:
(1.1) a1 when N is 1, otherwise
(1.2) op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK),
      GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) for any K where 1 < K + 1 = M ≤ N.

Define GENERALIZED_SUM(op, a1, ..., aN) as GENERALIZED_NONCOMMUTATIVE_SUM(op, b1, ..., bN),
where b1, ..., bN may be any permutation of a1, ..., aN.

24.9.2 Accumulate
[accumulate]
template<class InputIterator, class T>
T accumulate(InputIterator first, InputIterator last, T init);
template<class InputIterator, class T, class BinaryOperation>
T accumulate(InputIterator first, InputIterator last, T init,
BinaryOperation binary_op);

Requires: T shall satisfy the Cpp17CopyConstructible (Table 27) and Cpp17CopyAssignable (Table 29) requirements. In the range [first, last), binary_op shall neither modify elements nor invalidate iterators or subranges.

Effects: Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.

24.9.3 Reduce
[reduce]
template<class InputIterator>
typename iterator_traits<InputIterator>::value_type
reduce(InputIterator first, InputIterator last);
template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type
reduce(ExecutionPolicy&& exec,
      ForwardIterator first, ForwardIterator last);

Effects: Equivalent to:

238) The use of fully closed ranges is intentional.
239) accumulate is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.
template<class InputIterator, class T>
T reduce(InputIterator first, InputIterator last, T init);

Effects: Equivalent to:
return reduce(first, last, init, plus<>());

template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, T init);

Effects: Equivalent to:
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());

template<class InputIterator, class T, class BinaryOperation>
T reduce(InputIterator first, InputIterator last, T init,
BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, T init,
BinaryOperation binary_op);

Requires:
— T shall be Cpp17MoveConstructible (Table 26).
— All of binary_op(init, *first), binary_op(*first, init), binary_op(init, init), and
  binary_op(*first, *first) shall be convertible to T.
— binary_op shall neither invalidate iterators or subranges, nor modify elements in the range
  [first, last].

Returns: GENERALIZED_SUM(binary_op, init, *i, ...) for every i in [first, last).

Complexity: \(O(\text{last} - \text{first})\) applications of binary_op.

Note: The difference between reduce and accumulate is that reduce applies binary_op in an
unspecified order, which yields a nondeterministic result for non-associative or non-commutative
binary_op such as floating-point addition. — end note]

24.9.4 Inner product

template<class InputIterator1, class InputIterator2, class T>
T inner_product(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, T init);

Effects: Computes its result by initializing the accumulator acc with the initial value init and then
modifying it with acc = std::move(acc) + (*i1) * (*i2) or acc = binary_op1(std::move(acc),
binary_op2(*i1, *i2)) for every iterator i1 in the range [first1, last1) and iterator i2 in the
range [first2, first2 + (last1 - first1)) in order.

24.9.5 Transform reduce
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());

template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T>
    T transform_reduce(ExecutionPolicy&& exec,
                        ForwardIterator1 first1, ForwardIterator1 last1,
                        ForwardIterator2 first2,
                        T init);

Effects: Equivalent to:

    return transform_reduce(\(\text{std::forward<ExecutionPolicy>(exec)}\),
                             first1, last1, first2, init, plus<>(), multiplies<>());

template<class InputIterator1, class InputIterator2, class T,
    class BinaryOperation1, class BinaryOperation2>
    T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                        InputIterator2 first2,
                        T init,
                        BinaryOperation1 binary_op1,
                        BinaryOperation2 binary_op2);

template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T,
    class BinaryOperation1, class BinaryOperation2>
    T transform_reduce(ExecutionPolicy&& exec,
                        ForwardIterator1 first1, ForwardIterator1 last1,
                        ForwardIterator2 first2,
                        T init,
                        BinaryOperation1 binary_op1,
                        BinaryOperation2 binary_op2);

Requires:

(3.1) — T shall be Cpp17MoveConstructible (Table 26).

(3.2) — All of

(3.2.1) — binary_op1(init, init),
(3.2.2) — binary_op1(init, binary_op2(*first1, *first2)),
(3.2.3) — binary_op1(binary_op2(*first1, *first2), init), and
(3.2.4) — binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))
    shall be convertible to T.

(3.3) — Neither binary_op1 nor binary_op2 shall invalidate subranges, or modify elements in the ranges
        [first1, last1] and [first2, first2 + (last1 - first1)].

Returns:

\(\text{GENERALIZED\_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)}\)

for every iterator i in [first1, last1).

Complexity: \(O((\text{last1 - first1})\) applications each of binary_op1 and binary_op2.

template<class InputIterator, class T,
    class BinaryOperation, class UnaryOperation>
    T transform_reduce(InputIterator first, InputIterator last, T init,
                        BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
    class ForwardIterator, class T,
    class BinaryOperation, class UnaryOperation>
    T transform_reduce(ExecutionPolicy&& exec,
                        ForwardIterator first, ForwardIterator last,
                        T init, BinaryOperation binary_op, UnaryOperation unary_op);

Requires:

(6.1) — T shall be Cpp17MoveConstructible (Table 26).

(6.2) — All of
shall be convertible to T.

— Neither unary_op nor binary_op shall invalidate subranges, or modify elements in the range [first, last].

Returns:

```
GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)
```

for every iterator i in [first, last).

Complexity: $\Theta(last - first)$ applications each of unary_op and binary_op.

[Note: transform_reduce does not apply unary_op to init. — end note]

### 24.9.6 Partial sum

```
template<class InputIterator, class OutputIterator>
OutputIterator partial_sum(
    InputIterator first, InputIterator last,
    OutputIterator result);
```

Requires: InputIterator’s value type shall be constructible from the type of *first. The result of the expression `std::move(acc) + *i` or `binary_op(std::move(acc), *i)` shall be implicitly convertible to InputIterator’s value type. acc shall be writable (22.3.1) to the result output iterator. In the ranges [first, last] and [result, result + (last - first)] binary_op shall neither modify elements nor invalidate iterators or subranges.

Effects: For a non-empty range, the function creates an accumulator acc whose type is InputIterator’s value type, initializes it with *first, and assigns the result to *result. For every iterator i in [first + 1, last) in order, acc is then modified by acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) and the result is assigned to *(result + (i - first)).

Returns: result + (last - first).

Complexity: Exactly (last - first) - 1 applications of the binary operation.

Remarks: result may be equal to first.

### 24.9.7 Exclusive scan

```
template<class InputIterator, class OutputIterator, class T>
OutputIterator exclusive_scan(InputIterator first, InputIterator last, OutputIterator result, T init);
```

Effects: Equivalent to:

```
return exclusive_scan(first, last, result, init, plus<>());
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, T init);
```

Effects: Equivalent to:

```
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
    first, last, result, init, plus<>());
```

241) The use of fully closed ranges is intentional.
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
OutputIterator exclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, T init, BinaryOperation binary_op);

template<class ExecutionPolicy,
class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2 exclusive_scan(ExecutionPolicy& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, T init, BinaryOperation binary_op);

Requires:

(3.1) T shall be Cpp17MoveConstructible (Table 26).
(3.2) All of binary_op(init, init), binary_op(init, *first), and binary_op(*first, *first)
shall be convertible to T.
(3.3) binary_op shall neither invalidate iterators or subrange,
or modify elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of:

\[
\text{GENERALIZED NONCOMMUTATIVE SUM} \\
\text{binary_op, init, *(first + 0), *(first + 1), \ldots, *(first + K - 1)}
\]

Returns: The end of the resulting range beginning at result.

Complexity: $O(last - first)$ applications of binary_op.

Remarks: result may be equal to first.

[Note: The difference between exclusive_scan and inclusive_scan is that exclusive_scan
excludes the $i$th input element from the $i$th sum. If binary_op is not mathematically associative,
the behavior of exclusive_scan may be nondeterministic. — end note]

24.9.8 Inclusive scan

template<class InputIterator, class OutputIterator>
OutputIterator inclusive_scan(InputIterator first, InputIterator last, OutputIterator result);

Effects: Equivalent to:

return inclusive_scan(first, last, result, plus<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 inclusive_scan(ExecutionPolicy& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result);

Effects: Equivalent to:

return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());

template<class InputIterator, class OutputIterator, class BinaryOperation>
OutputIterator inclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class BinaryOperation>
ForwardIterator2 inclusive_scan(ExecutionPolicy& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, BinaryOperation binary_op);

template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
OutputIterator inclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op, T init);

template<class ExecutionPolicy, 
class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2 inclusive_scan(ExecutionPolicy& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, BinaryOperation binary_op, T init);

Requires:
— If \textit{init} is provided, \( T \) shall be \textit{Cpp17MoveConstructible} (Table 26); otherwise, \textit{ForwardIterator1}'s value type shall be \textit{Cpp17MoveConstructible}.

— If \textit{init} is provided, all of \( \textit{binary_op}(\textit{init}, \textit{init}), \textit{binary_op}(\textit{init}, \textit{*first}), \text{ and } \textit{binary_op}(\textit{*first}, \textit{*first}) \) shall be convertible to \( T \); otherwise, \( \textit{binary_op}(\textit{*first}, \textit{*first}) \) shall be convertible to \textit{ForwardIterator1}'s value type.

— \( \textit{binary_op} \) shall neither invalidate iterators or subranges, nor modify elements in the ranges \([\textit{first}, \textit{last}]\) or \([\textit{result}, \textit{result} + (\textit{last} - \textit{first})]\).

\( \textit{Effects: } \) For each integer \( K \) in \([0, \textit{last} - \textit{first}]\) assigns through \( \textit{result} + K \) the value of

\( \textit{GENERALIZED_NONCOMMUTATIVE_SUM} \)

\[
\textit{binary_op}, \textit{init}, *(\textit{first} + 0), *(\textit{first} + 1), \ldots, *(\textit{first} + K)
\]

if \textit{init} is provided, or

\( \textit{GENERALIZED_NONCOMMUTATIVE_SUM} \)

\[
\textit{binary_op}, *(\textit{first} + 0), *(\textit{first} + 1), \ldots, *(\textit{first} + K)
\]

otherwise.

\( \textit{Returns: } \) The end of the resulting range beginning at \( \textit{result} \).

\( \textit{Complexity: } \Theta(\textit{last} - \textit{first}) \) applications of \( \textit{binary_op} \).

\( \textit{Remarks: } \) result may be equal to \( \textit{first} \).

[\textit{Note: } The difference between \textit{exclusive_scan} and \textit{inclusive_scan} is that \textit{inclusive_scan} includes the \( i^{\text{th}} \) input element in the \( i^{\text{th}} \) sum. If \( \textit{binary_op} \) is not mathematically associative, the behavior of \textit{inclusive_scan} may be nondeterministic. — end note]
[Note: The difference between `transform_exclusive_scan` and `transform_inclusive_scan` is that `transform_exclusive_scan` excludes the \( i \)th input element from the \( i \)th sum. If `binary_op` is not mathematically associative, the behavior of `transform_exclusive_scan` may be nondeterministic. `transform_exclusive_scan` does not apply `unary_op` to `init`. — end note]

### 24.9.10 Transform inclusive scan

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation>
OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
                                        OutputIterator result,
                                        BinaryOperation binary_op, UnaryOperation unary_op);
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation>
ForwardIterator2 transform_inclusive_scan(ExecutionPolicy&& exec,
                                        ForwardIterator1 first, ForwardIterator1 last,
                                        ForwardIterator2 result,
                                        BinaryOperation binary_op, UnaryOperation unary_op);
```

```
template<class InputIterator, class OutputIterator,
         class BinaryOperation, class UnaryOperation, class T>
OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
                                        OutputIterator result,
                                        BinaryOperation binary_op, UnaryOperation unary_op,
                                        T init);
```

```
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2 transform_inclusive_scan(ExecutionPolicy&& exec,
                                        ForwardIterator1 first, ForwardIterator1 last,
                                        ForwardIterator2 result,
                                        BinaryOperation binary_op, UnaryOperation unary_op,
                                        T init);
```

---

1. **Requires:**
   - If `init` is provided, `T` shall be `Cpp17MoveConstructible` (Table 26); otherwise, `ForwardIterator1`'s value type shall be `Cpp17MoveConstructible`.
   - If `init` is provided, all of
     - `binary_op(init, init),`
     - `binary_op(init, unary_op(*first)),` and
     - `binary_op(unary_op(*first), unary_op(*first))`
   shall be convertible to `T`; otherwise, `binary_op(unary_op(*first), unary_op(*first))` shall be convertible to `ForwardIterator1`'s value type.
   - Neither `unary_op` nor `binary_op` shall invalidate iterators or subranges, nor modify elements in the ranges `[first, last]` or `[result, result + (last - first)]`.

2. **Effects:** For each integer \( K \) in \([0, \text{last} - \text{first})\) assigns through `result + K` the value of
   - `GENERALIZED_NONCOMMUTATIVE_SUM(
     binary_op, init, unary_op(*((first + 0)), unary_op(*((first + 1)), ..., unary_op(*((first + K))))
   ` if `init` is provided, or
   - `GENERALIZED_NONCOMMUTATIVE_SUM(
     binary_op, unary_op(*((first + 0)), unary_op(*((first + 1)), ..., unary_op(*((first + K))))
   ` otherwise.

3. **Returns:** The end of the resulting range beginning at `result`.
4. **Complexity:** \( \Theta(\text{last} - \text{first}) \) applications each of `unary_op` and `binary_op`.
5. **Remarks:** `result` may be equal to `first`.
[Note: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_inclusive_scan includes the $i^{th}$ input element in the $i^{th}$ sum. If binary_op is not mathematically associative, the behavior of transform_inclusive_scan may be nondeterministic. transform_inclusive_scan does not apply unary_op to init. — end note]

24.9.11 Adjacent difference

template<class InputIterator, class OutputIterator>
OutputIterator
adjacent_difference(InputIterator first, InputIterator last, OutputIterator result);

ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, BinaryOperation binary_op);

1 Let $T$ be the value type of decltype(first). For the overloads that do not take an argument binary_op, let binary_op be an lvalue that denotes an object of type minus<>

2 Requires:

(2.1) For the overloads with no ExecutionPolicy, T shall be Cpp17MoveAssignable (Table 28) and shall be constructible from the type of *first. acc (defined below) shall be writable (22.3.1) to the result output iterator. The result of the expression binary_op(val, std::move(acc)) shall be writable to the result output iterator.

(2.2) For the overloads with an ExecutionPolicy, the result of the expressions binary_op(*first, *first) and *first shall be writable to result.

(2.3) For all overloads, in the ranges [first, last] and [result, result + (last - first)], binary_op shall neither modify elements nor invalidate iterators or subranges.

3 Effects: For the overloads with no ExecutionPolicy and a non-empty range, the function creates an accumulator acc of type $T$, initializes it with *first, and assigns the result to *result. For every iterator $i$ in [first + 1, last) in order, creates an object val whose type is $T$, initializes it with *i, computes binary_op(val, std::move(acc)), assigns the result to *(result + (i - first)), and move assigns from val to acc.

For the overloads with an ExecutionPolicy and a non-empty range, performs *result = *first. Then, for every $d$ in [1, last - first - 1], performs *(result + $d$) = binary_op(*(first + $d$), *(first + (d - 1))).

4 Returns: result + (last - first).

5 Complexity: Exactly (last - first) - 1 applications of the binary operation.

6 Remarks: For the overloads with no ExecutionPolicy, result may be equal to first. For the overloads with an ExecutionPolicy, the ranges [first, last) and [result, result + (last - first)) shall not overlap.

24.9.12 Iota

template<class ForwardIterator, class T>
void iota(ForwardIterator first, ForwardIterator last, T value);

1 Requires: $T$ shall be convertible to ForwardIterator’s value type. The expression ++val, where val has type $T$, shall be well-formed.

§ 24.9.12 1064
Effects: For each element referred to by the iterator \(i\) in the range \([\text{first}, \text{last})\), assigns \(i = \text{value}\) and increments \text{value} as if by \(++\text{value}\).

Complexity: Exactly \(\text{last} - \text{first}\) increments and assignments.

### 24.9.13 Greatest common divisor

```cpp
template<class M, class N>
constexpr common_type_t<M,N> gcd(M m, N n);
```

Requires: \(|m|\) and \(|n|\) shall be representable as a value of \(\text{common_type}_t\langle M, N \rangle\). [Note: These requirements ensure, for example, that \(\text{gcd}(m, m) = |m|\) is representable as a value of type \(M\). — end note]

Remarks: If either \(M\) or \(N\) is not an integer type, or if either is \(cv\ \text{bool}\), the program is ill-formed.

Returns: Zero when \(m\) and \(n\) are both zero. Otherwise, returns the greatest common divisor of \(|m|\) and \(|n|\).

Throws: Nothing.

### 24.9.14 Least common multiple

```cpp
template<class M, class N>
constexpr common_type_t<M,N> lcm(M m, N n);
```

Requires: \(|m|\) and \(|n|\) shall be representable as a value of \(\text{common_type}_t\langle M, N \rangle\). The least common multiple of \(|m|\) and \(|n|\) shall be representable as a value of type \(\text{common_type}_t\langle M, N \rangle\).

Remarks: If either \(M\) or \(N\) is not an integer type, or if either is \(cv\ \text{bool}\) the program is ill-formed.

Returns: Zero when either \(m\) or \(n\) is zero. Otherwise, returns the least common multiple of \(|m|\) and \(|n|\).

Throws: Nothing.

### 24.10 C library algorithms

```cpp
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
               c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
               compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

Effects: These functions have the semantics specified in the C standard library.

Remarks: The behavior is undefined unless the objects in the array pointed to by \text{base} are of trivial type.

Throws: Any exception thrown by \text{compar()} (15.5.5.12).

25 Numerics library

25.1 General

This Clause describes components that C++ programs may use to perform seminumerical operations.

The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical functions for floating-point types, as summarized in Table 81.

Table 81 — Numerics library summary

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header(s)</th>

<tr>
<td>25.8</td>
<td>Mathematical functions for floating-point types</td>
</tr>
</tbody>
</table>

25.2 Numeric type requirements

The complex and valarray components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a type $T$ that satisfies the following requirements:

1. $T$ is not an abstract class (it has no pure virtual member functions);
2. $T$ is not a reference type;
3. $T$ is not cv-qualified;
4. If $T$ is a class, it has a public default constructor;
5. If $T$ is a class, it has a public copy constructor with the signature $T::T(const T&)$
6. If $T$ is a class, it has a public destructor;
7. If $T$ is a class, it has a public assignment operator whose signature is either $T& T::operator=(const T&)$ or $T& T::operator=(T)$
8. If $T$ is a class, its assignment operator, copy and default constructors, and destructor shall correspond to each other in the following sense:
   8.1. Initialization of raw storage using the copy constructor on the value of $T()$, however obtained, is semantically equivalent to value-initialization of the same raw storage.
   8.2. Initialization of raw storage using the default constructor, followed by assignment, is semantically equivalent to initialization of raw storage using the copy constructor.
   8.3. Destruction of an object, followed by initialization of its raw storage using the copy constructor, is semantically equivalent to assignment to the original object.

[Note: This rule states, in part, that there shall not be any subtle differences in the semantics of initialization versus assignment. This gives an implementation considerable flexibility in how arrays are initialized.]

[Example: An implementation is allowed to initialize a valarray by allocating storage using the new operator (which implies a call to the default constructor for each element) and then assigning each...]

---

243 In other words, value types. These include arithmetic types, pointers, the library class complex, and instantiations of valarray for value types.
element its value. Or the implementation can allocate raw storage and use the copy constructor to initialize each element. —end example]

If the distinction between initialization and assignment is important for a class, or if it fails to satisfy any of the other conditions listed above, the programmer should use vector (21.3.11) instead of valarray for that class. —end note]

1.9 — If T is a class, it does not overload unary operator&.

2 If any operation on T throws an exception the effects are undefined.

3 In addition, many member and related functions of valarray<T> can be successfully instantiated and will exhibit well-defined behavior if and only if T satisfies additional requirements specified for each such member or related function.

4 [Example: It is valid to instantiate valarray<complex>, but operator() will not be successfully instantiated for valarray<complex> operands, since complex does not have any ordering operators. —end example]

25.3 The floating-point environment [cfenv]

25.3.1 Header <cfenv> synopsis [cfenv.syn]

```cpp
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below // optional
#define FE_INEXACT see below // optional
#define FE_INVALID see below // optional
#define FE_OVERFLOW see below // optional
#define FE_UNDERFLOW see below // optional
#define FE_DOWNWARD see below // optional
#define FE_TONEAREST see below // optional
#define FE_TOWARDZERO see below // optional
#define FE_UPWARD see below // optional
#define FE_DFL_ENV see below
```

namespace std {
  // types
  using fenv_t = object type;
  using fexcept_t = integer type;

  // functions
  int feclearexcept(int except);
  int fegetexceptflag(fexcept_t* pflag, int except);
  int feharderexcept(int except);
  int fesetexceptflag(const fexcept_t* pflag, int except);
  int fetestexcept(int except);
  int fegetround();
  int fesetround(int mode);

  int fegetenv(fenv_t* penv);
  int feholdexcept(fenv_t* penv);
  int fesetenv(const fenv_t* penv);
  int feupdateenv(const fenv_t* penv);
}
```

1 The contents and meaning of the header <cfenv> are the same as the C standard library header <fenv.h>. [Note: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (14.6) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. —end note]

2 The floating-point environment has thread storage duration (6.6.4.2). The initial state for a thread’s floating-point environment is the state of the floating-point environment of the thread that constructs the
corresponding thread object (31.3.2) at the time it constructed the object. [Note: That is, the child thread gets the floating-point state of the parent thread at the time of the child’s creation. — end note]

3 A separate floating-point environment shall be maintained for each thread. Each function accesses the environment corresponding to its calling thread.

See also: ISO C 7.6

25.4 Complex numbers [complex.numbers]

1 The header <complex> defines a class template, and numerous functions for representing and manipulating complex numbers.

2 The effect of instantiating the template complex for any type other than float, double, or long double is unspecified. The specializations complex<float>, complex<double>, and complex<long double> are literal types (6.7).

3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

4 If z is an lvalue of type cv complex<T> then:

(4.1) — the expression reinterpret_cast<cv T(&)[2]>(z) shall be well-formed,

(4.2) — reinterpret_cast<cv T(&)[2]>(z)[0] shall designate the real part of z, and

(4.3) — reinterpret_cast<cv T(&)[2]>(z)[1] shall designate the imaginary part of z.

Moreover, if a is an expression of type cv complex<T>* and the expression a[i] is well-defined for an integer expression i, then:

(4.4) — reinterpret_cast<cv T*>(a)[2*i] shall designate the real part of a[i], and

(4.5) — reinterpret_cast<cv T*>(a)[2*i + 1] shall designate the imaginary part of a[i].

25.4.1 Header <complex> synopsis [complex.syn]

namespace std {
  // 25.4.2, class template complex
  template<class T> class complex;

  // 25.4.3, specializations
  template<> class complex<float>;

template<class T> complex<T> sqrt(const complex<T>&);

template<class T> complex<T> tan(const complex<T>&);

template<class T> complex<T> tanh(const complex<T>&);

// 25.4.10, complex literals
inline namespace literals {
inline namespace complex_literals {
constexpr complex<long double> operator"il(long double);
constexpr complex<long double> operator"il(unsigned long long);
constexpr complex<double> operator"i(long double);
constexpr complex<double> operator"i(unsigned long long);
constexpr complex<float> operator"if(long double);
constexpr complex<float> operator"if(unsigned long long);
}
}

25.4.2 Class template complex

namespace std {
    template<class T> class complex {

    } // class complex
public:
    using value_type = T;

    constexpr complex(const T& re = T(), const T& im = T());
    constexpr complex(const complex&);
    template<class X> constexpr complex(const complex<X>&);

    constexpr T real() const;
    constexpr void real(T);
    constexpr T imag() const;
    constexpr void imag(T);

    constexpr complex& operator=(const T&);
    constexpr complex& operator+=(const T&);
    constexpr complex& operator-=(const T&);
    constexpr complex& operator*=(const T&);
    constexpr complex& operator/=(const T&);
    constexpr complex& operator=(const complex&);
    template<class X> constexpr complex& operator=(const complex<X>&);
    template<class X> constexpr complex& operator+=(const complex<X>&);
    template<class X> constexpr complex& operator-=(const complex<X>&);
    template<class X> constexpr complex& operator*=(const complex<X>&);
    template<class X> constexpr complex& operator/=(const complex<X>&);

1 The class complex describes an object that can store the Cartesian components, real() and imag(), of a complex number.

25.4.3 Specializations

namespace std {
    template<> class complex<float> {
    public:
        using value_type = float;

        constexpr complex(float re = 0.0f, float im = 0.0f);
        constexpr complex(const complex<float>&) = default;
        constexpr explicit complex(const complex<double>&);
        constexpr explicit complex(const complex<long double>&);

        constexpr float real() const;
        constexpr void real(float);
        constexpr float imag() const;
        constexpr void imag(float);

        constexpr complex& operator=(float);
        constexpr complex& operator+=(float);
        constexpr complex& operator-=(float);
        constexpr complex& operator*=(float);
        constexpr complex& operator/=(float);
        constexpr complex& operator=(const complex&);
        template<class X> constexpr complex& operator=(const complex<X>&);
        template<class X> constexpr complex& operator+=(const complex<X>&);
        template<class X> constexpr complex& operator-=(const complex<X>&);
        template<class X> constexpr complex& operator*=(const complex<X>&);
        template<class X> constexpr complex& operator/=(const complex<X>&);
    };

    template<> class complex<double> {
    public:
        using value_type = double;

    };

§ 25.4.3 1070
25.4.4 Member functions

\[ \text{template\textless T\textgreater \ constexpr \ complex(T\& re = T(), T\& im = T());} \]

1. **Effects:** Constructs an object of class `complex`.
2. **Ensures:** `real() == re && imag() == im`.
3. **Returns:** The value of the real component.
constexpr void real(T val);

  Effects: Assigns val to the real component.

constexpr T imag() const;

  Returns: The value of the imaginary component.

constexpr void imag(T val);

  Effects: Assigns val to the imaginary component.

### 25.4.5 Member operators

```cpp
constexpr complex& operator+=(const T& rhs);

  Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

  Returns: *this.
```

```cpp
constexpr complex& operator-=(const T& rhs);

  Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

  Returns: *this.
```

```cpp
constexpr complex& operator*=(const T& rhs);

  Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.

  Returns: *this.
```

```cpp
constexpr complex& operator/=(const T& rhs);

  Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.

  Returns: *this.
```

```cpp
template<class X> constexpr complex& operator+=(const complex<X>& rhs);

  Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.

  Returns: *this.
```

```cpp
template<class X> constexpr complex& operator-=(const complex<X>& rhs);

  Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.

  Returns: *this.
```

```cpp
template<class X> constexpr complex& operator*=(const complex<X>& rhs);

  Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.

  Returns: *this.
```

```cpp
template<class X> constexpr complex& operator/=(const complex<X>& rhs);

  Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.

  Returns: *this.
```

### 25.4.6 Non-member operations

```cpp
template<class T> constexpr complex<T> operator+(const complex<T>& lhs);

  Returns: complex<T>(lhs).

  Remarks: unary operator.
```

```cpp
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);

  Returns: complex<T>(lhs) += rhs.
```
template<class T> constexpr complex<T> operator-(const complex<T>& lhs) {
    Returns: complex<T>(-lhs.real(), -lhs.imag()).
    Remarks: unary operator.
}

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) -= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);
template<class T> constexpr bool operator==(const T& lhs, const complex<T>& rhs);

Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().
Remarks: The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T> constexpr bool operator!=(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator!=(const complex<T>& lhs, const T& rhs);
template<class T> constexpr bool operator!=(const T& lhs, const complex<T>& rhs);

Returns: rhs.real() != lhs.real() || rhs.imag() != lhs.imag().

§ 25.4.6 1073
25.4.7 Value operations

```
template<class T> constexpr T real(const complex<T>& x);
  Returns: x.real().

template<class T> constexpr T imag(const complex<T>& x);
  Returns: x.imag().

template<class T> T abs(const complex<T>& x);
  Returns: The magnitude of x.

template<class T> T arg(const complex<T>& x);
  Returns: The phase angle of x, or atan2(imag(x), real(x)).

template<class T> T norm(const complex<T>& x);
  Returns: The squared magnitude of x.

template<class T> complex<T> conj(const complex<T>& x);
  Returns: The complex conjugate of x.

template<class T> complex<T> proj(const complex<T>& x);
  Returns: The projection of x onto the Riemann sphere.

template<class T> complex<T> polar(const T& rho, const T& theta = T());
  Requires: rho shall be non-negative and non-NaN. theta shall be finite.
  Returns: The complex value corresponding to a complex number whose magnitude is rho and whose phase angle is theta.
```

25.4.8 Transcendentals

```
template<class T> complex<T> acos(const complex<T>& x);
  Returns: The complex arc cosine of x.

template<class T> complex<T> asin(const complex<T>& x);
  Returns: The complex arc sine of x.

template<class T> complex<T> atan(const complex<T>& x);
  Returns: The complex arc tangent of x.

template<class T> complex<T> acosh(const complex<T>& x);
  Returns: The complex arc hyperbolic cosine of x.

template<class T> complex<T> asinh(const complex<T>& x);
  Returns: The complex arc hyperbolic sine of x.

template<class T> complex<T> atanh(const complex<T>& x);
  Returns: The complex arc hyperbolic tangent of x.
```

§ 25.4.8
template<class T> complex<T> cos(const complex<T>& x);

// Returns: The complex cosine of x.

template<class T> complex<T> cosh(const complex<T>& x);

// Returns: The complex hyperbolic cosine of x.

template<class T> complex<T> exp(const complex<T>& x);

// Returns: The complex base-e exponential of x.

template<class T> complex<T> log(const complex<T>& x);

// Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval [-π, π]. [Note: The semantics of this function are intended to be the same in C++ as they are for clog in C. — end note]

// Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> log10(const complex<T>& x);

// Returns: The complex common (base-10) logarithm of x, defined as log(x) / log(10).

// Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);

// Returns: The complex power of base x raised to the yth power, defined as exp(y * log(x)). The value returned for pow(0, 0) is implementation-defined.

// Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> sin(const complex<T>& x);

// Returns: The complex sine of x.

template<class T> complex<T> sinh(const complex<T>& x);

// Returns: The complex hyperbolic sine of x.

template<class T> complex<T> sqrt(const complex<T>& x);

// Returns: The complex square root of x, in the range of the right half-plane. [Note: The semantics of this function are intended to be the same in C++ as they are for csqrt in C. — end note]

// Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> tan(const complex<T>& x);

// Returns: The complex tangent of x.

template<class T> complex<T> tanh(const complex<T>& x);

// Returns: The complex hyperbolic tangent of x.

25.4.9 Additional overloads

The following function templates shall have additional overloads:

arg norm
conj proj
imag real

where norm, conj, imag, and real are constexpr overloads.

The additional overloads shall be sufficient to ensure:

(2.1) — If the argument has type long double, then it is effectively cast to complex<long double>.

(2.2) — Otherwise, if the argument has type double or an integer type, then it is effectively cast to complex<double>.

(2.3) — Otherwise, if the argument has type float, then it is effectively cast to complex<float>.
Function template pow shall have additional overloads sufficient to ensure, for a call with at least one argument of type complex<T>:

1. If either argument has type complex<long double> or type long double, then both arguments are effectively cast to complex<long double>.
2. Otherwise, if either argument has type complex<double>, double, or an integer type, then both arguments are effectively cast to complex<double>.
3. Otherwise, if either argument has type complex<float> or float, then both arguments are effectively cast to complex<float>.

25.4.10 Suffixes for complex number literals

This subclause describes literal suffixes for constructing complex number literals. The suffixes i, il, and if create complex numbers of the types complex<double>, complex<long double>, and complex<float> respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```cpp
constexpr complex<long double> operator"il(long double d);
constexpr complex<long double> operator"il(unsigned long long d);

Returns: complex<long double>{0.0L, static_cast<long double>(d)}.
```

```cpp
constexpr complex<double> operator"i(long double d);
constexpr complex<double> operator"i(unsigned long long d);

Returns: complex<double>{0.0, static_cast<double>(d)}.
```

```cpp
constexpr complex<float> operator"if(long double d);
constexpr complex<float> operator"if(unsigned long long d);

Returns: complex<float>{0.0f, static_cast<float>(d)}.
```

25.5 Bit manipulation

25.5.1 General

The header <bit> provides components to access, manipulate and process both individual bits and bit sequences.

25.5.2 Header <bit> synopsis

```cpp
namespace std {
    // 25.5.3, bit_cast
    template<typename To, typename From>
    constexpr To bit_cast(const From& from) noexcept;

    // 25.5.4, integral powers of 2
    template<class T>
    constexpr bool ispow2(T x) noexcept;
    template<class T>
    constexpr T ceil2(T x) noexcept;
    template<class T>
    constexpr T floor2(T x) noexcept;
    template<class T>
    constexpr T log2p1(T x) noexcept;
}
```

25.5.3 Function template bit_cast

```cpp
template<typename To, typename From>
constexpr To bit_cast(const From& from) noexcept;

Returns: An object of type To. Each bit of the value representation of the result is equal to the corresponding bit in the object representation of from. Padding bits of the To object are unspecified. If there is no value of type To corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified.
```

Remarks: This function shall not participate in overload resolution unless:

1. `sizeof(To) == sizeof(From)` is true;
This function shall be constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:

- is_trivially_copyable_v<To> is true; and
- is_trivially_copyable_v<From> is true.

This function shall be constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:

1. is_union_v<T> is false;
2. is_pointer_v<T> is false;
3. is_member_pointer_v<T> is false;
4. is_volatile_v<T> is false; and
5. T has no non-static data members of reference type.

### 25.5.4 Integral powers of 2

#### [bit.pow.two]

**template<class T>**

```cpp
constexpr bool ispow2(T x) noexcept;
```

1. **Returns:** true if x is an integral power of two; false otherwise.
2. **Remarks:** This function shall not participate in overload resolution unless T is an unsigned integer type (6.7.1).

**template<class T>**

```cpp
constexpr T ceil2(T x) noexcept;
```

3. **Returns:** The minimal value y such that ispow2(y) is true and y >= x; if y is not representable as a value of type T, the result is an unspecified value.
4. **Remarks:** This function shall not participate in overload resolution unless T is an unsigned integer type (6.7.1).

**template<class T>**

```cpp
constexpr T floor2(T x) noexcept;
```

5. **Returns:** If x == 0, 0; otherwise the maximal value y such that ispow2(y) is true and y <= x.
6. **Remarks:** This function shall not participate in overload resolution unless T is an unsigned integer type (6.7.1).

**template<class T>**

```cpp
constexpr T log2p1(T x) noexcept;
```

7. **Returns:** If x == 0, 0; otherwise one plus the base-2 logarithm of x, with any fractional part discarded.
8. **Remarks:** This function shall not participate in overload resolution unless T is an unsigned integer type (6.7.1).

### 25.6 Random number generation

**[rand]**

This subclause defines a facility for generating (pseudo-)random numbers.

In addition to a few utilities, four categories of entities are described: uniform random bit generators, random number engines, random number engine adaptors, and random number distributions. These categorizations are applicable to types that satisfy the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated. [Note: These entities are specified in such a way as to permit the binding of any uniform random bit generator object e as the argument to any random number distribution object d, thus producing a zero-argument function object such as given by bind(d,e). — end note]

Each of the entities specified via this subclause has an associated arithmetic type (6.7.1) identified as `result_type`. With T as the `result_type` thus associated with such an entity, that entity is characterized:

1. as boolean or equivalently as boolean-valued, if T is bool;
2. otherwise as integral or equivalently as integer-valued, if numeric_limits<T>::is_integer is true;
3. otherwise as floating or equivalently as real-valued.

If integer-valued, an entity may optionally be further characterized as signed or unsigned, according to numeric_limits<T>::is_signed.
Unless otherwise specified, all descriptions of calculations in this subclause use mathematical real numbers. Throughout this subclause, the operators `bitand`, `bitor`, and `xor` denote the respective conventional bitwise operations. Further:

(5.1) — the operator `rshift` denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

(5.2) — the operator `lshift_w` denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo $2^w$.

25.6.1 Header `<random>` synopsis

```cpp
#include <initializer_list>

namespace std {
  // 25.6.2.3, uniform random bit generator requirements
  template<class G>

    class cauchy_distribution;
25.6.2 Requirements [rand.req]

25.6.2.1 General requirements [rand.req.genl]

1 Throughout this subclause 25.6, the effect of instantiating a template:

(1.1) — that has a template type parameter named Sseq is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of seed sequence (25.6.2.2).

(1.2) — that has a template type parameter named URBG is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of uniform random bit generator (25.6.2.3).

(1.3) — that has a template type parameter named Engine is undefined unless the corresponding template argument is cv-unqualified and satisfies the requirements of random number engine (25.6.2.4).

(1.4) — that has a template type parameter named RealType is undefined unless the corresponding template argument is cv-unqualified and is one of float, double, or long double.

(1.5) — that has a template type parameter named IntType is undefined unless the corresponding template argument is cv-unqualified and is one of short, int, long, long long, unsigned short, unsigned int, unsigned long, or unsigned long long.

(1.6) — that has a template type parameter named UIntType is undefined unless the corresponding template argument is cv-unqualified and is one of unsigned short, unsigned int, unsigned long, or unsigned long long.

2 Throughout this subclause 25.6, phrases of the form “x is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “x is a value of a type satisfying the requirements of the specified iterator type”.

3 Throughout this subclause 25.6, any constructor that can be called with a single argument and that satisfies a requirement specified in this subclause shall be declared explicit.

25.6.2.2 Seed sequence requirements [rand.req.seedseq]

1 A seed sequence is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values \( i \), \( 0 \leq i < 2^{32} \), based on the consumed data. [Note: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]

2 A class \( S \) satisfies the requirements of a seed sequence if the expressions shown in Table 82 are valid and have the indicated semantics, and if \( S \) also satisfies all other requirements of this subclause 25.6.2.2. In that Table and throughout this subclause:

(2.1) — \( T \) is the type named by \( S \)'s associated result_type;

(2.2) — \( q \) is a value of \( S \) and \( r \) is a possibly const value of \( S \);

(2.3) — \( \text{ib} \) and \( \text{ie} \) are input iterators with an unsigned integer value_type of at least 32 bits;
— rb and re are mutable random access iterators with an unsigned integer value_type of at least 32 bits;
— ob is an output iterator; and
— il is a value of initializer_list<T>.

<td>$O(r.size())$</td>
</tr>
</tbody>
</table>

25.6.2.3 Uniform random bit generator requirements

A uniform random bit generator g of type G is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned. [Note: The degree to which g’s results approximate the ideal is often determined statistically. — end note]

```cpp
template<class G>
concept UniformRandomBitGenerator =
    Invocable<G&> && UnsignedIntegral<invoke_result_t<G&>> &&
    requires {
        { G::min() } -> Same<invoke_result_t<G&>>;
        { G::max() } -> Same<invoke_result_t<G&>>;
    };
```

Let g be an object of type G. G models UniformRandomBitGenerator only if

— both G::min() and G::max() are constant expressions (7.7),
— G::min() < G::max(),
A class $G$ meets the uniform random bit generator requirements if $G$ models `UniformRandomBitGenerator`, `invoke_result_t<G&>` is an unsigned integer type (6.7.1), and $G$ provides a nested typedef-name `result_type` that denotes the same type as `invoke_result_t<G&>`.

### 25.6.2.4 Random number engine requirements

A random number engine (commonly shortened to engine) $e$ of type $E$ is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

At any given time, $e$ has a state $e_i$ for some integer $i \geq 0$. Upon construction, $e$ has an initial state $e_0$. An engine's state may be established via a constructor, a `seed` function, assignment, or a suitable `operator>>`.

$E$'s specification shall define:

1. The size of $E$’s state in multiples of the size of `result_type`, given as an integral constant expression;
2. The transition algorithm $TA$ by which $e$’s state $e_i$ is advanced to its successor state $e_{i+1}$; and
3. The generation algorithm $GA$ by which an engine’s state is mapped to a value of type `result_type`.

A class $E$ that satisfies the requirements of a uniform random bit generator (25.6.2.3) also satisfies the requirements of a random number engine if the expressions shown in Table 83 are valid and have the indicated semantics, and if $E$ also satisfies all other requirements of this subclause 25.6.2.4. In that Table and throughout this subclause:

- $T$ is the type named by $E$’s associated `result_type`;
- $e$ is a value of $E$, $v$ is an lvalue of $E$, $x$ and $y$ are (possibly const) values of $E$;
- $s$ is a value of $T$;
- $q$ is an lvalue satisfying the requirements of a seed sequence (25.6.2.2);
- $z$ is a value of type `unsigned long long`;
- $os$ is an lvalue of the type of some class template specialization `basic_ostream<charT, traits>`; and
- $is$ is an lvalue of the type of some class template specialization `basic_istream<charT, traits>`;

Table 83: Random number engine requirements

<table>
<thead>
<tr>

<td>With os.fmtflags set to ios_base::dec_ios_base::left and the fill character set to the space character, writes to os the textual representation of x’s current state. In the output, adjacent numbers are separated by one or more space characters. Ensures: The os.fmtflags and fill character are unchanged.</td>
<td>$\mathcal{O}$(size of state)</td>
</tr>
<tr>
<td>is &gt;&gt; v</td>
<td>reference to the type of is</td>
<td>With is.fmtflags set to ios_base::dec, sets v’s state as determined by reading its textual representation from is. If bad input is encountered, ensures that v’s state is unchanged by the operation and calls is.setstate(ios::failbit) (which may throw ios::failure (28.5.5.4)). If a textual representation written via os &lt;&lt; x was subsequently read via is &gt;&gt; v, then x == v provided that there have been no intervening invocations of x or of v. Requires: is provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of is, and whose type’s template specialization arguments charT and traits were respectively the same as those of is. Ensures: The is.fmtflags are unchanged.</td>
<td>$\mathcal{O}$(size of state)</td>
</tr>
</tbody>
</table>

5 E shall satisfy the Cpp17CopyConstructible (Table 27) and Cpp17CopyAssignable (Table 29) requirements. These operations shall each be of complexity no worse than $\mathcal{O}$(size of state).

245) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes $z$ consecutive calls e().
25.6.2.5 Random number engine adaptor requirements

A random number engine adaptor (commonly shortened to adaptor) a of type A is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine b of type B adapted in this way is termed a base engine in this context. The expression a.base() shall be valid and shall return a const reference to a’s base engine.

The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

A::A();

Effects: The base engine is initialized as if by its default constructor.

bool operator==(const A& a1, const A& a2);

Returns: true if a1’s base engine is equal to a2’s base engine. Otherwise returns false.

A::A(result_type s);

Effects: The base engine is initialized with s.

template<class Sseq> A::A(Sseq& q);

Effects: The base engine is initialized with q.

void seed();

Effects: With b as the base engine, invokes b.seed().

void seed(result_type s);

Effects: With b as the base engine, invokes b.seed(s).

template<class Sseq> void seed(Sseq& q);

Effects: With b as the base engine, invokes b.seed(q).

A shall also satisfy the following additional requirements:

— The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.

— The state of A shall include the state of its base engine. The size of A’s state shall be no less than the size of the base engine.

— Copying A’s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.

— The textual representation of A shall include the textual representation of its base engine.

25.6.2.6 Random number distribution requirements

A random number distribution (commonly shortened to distribution) d of type D is a function object returning values that are distributed according to an associated mathematical probability density function \( p(z) \) or according to an associated discrete probability function \( P(z_i) \). A distribution’s specification identifies its associated probability function \( p(z) \) or \( P(z_i) \).

An associated probability function is typically expressed using certain externally-supplied quantities known as the parameters of the distribution. Such distribution parameters are identified in this context by writing, for example, \( p(z \mid a, b) \) or \( P(z_i \mid a, b) \), to name specific parameters, or by writing, for example, \( p(z \mid \{p\}) \) or \( P(z_i \mid \{p\}) \), to denote a distribution’s parameters \( p \) taken as a whole.

A class D satisfies the requirements of a random number distribution if the expressions shown in Table 84 are valid and have the indicated semantics, and if D and its associated types also satisfy all other requirements of this subclause 25.6.2.6. In that Table and throughout this subclause,

— T is the type named by D’s associated result_type;

— P is the type named by D’s associated param_type;

— d is a value of D, and x and y are (possibly const) values of D;
glb and lub are values of \( T \) respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by \( d \)'s \texttt{operator()} as determined by the current values of \( d \)'s parameters;

\( p \) is a (possibly \texttt{const}) value of \( P \);

\( g, \ g_1, \ \text{and} \ g_2 \) are lvalues of a type satisfying the requirements of a uniform random bit generator (25.6.2.3);

\( \text{os} \) is an lvalue of the type of some class template specialization \texttt{basic_ostream<
charT, traits>}; and

\( \text{is} \) is an lvalue of the type of some class template specialization \texttt{basic_istream<
charT, traits>};

where \( \text{charT} \) and \( \text{traits} \) are constrained according to Clause 20 and Clause 28.

Table 84 — Random number distribution requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Pre/post-condition</th>
<th>Complexity</th>
</tr>
</thead>
</table>
| \( D::\text{result
type} \) | \( T \) | \( T \) is an arithmetic type (6.7.1). | compile-time |
| \( D::\text{param
type} \) | \( P \) | | compile-time |
<p>| ( D() ) | | Creates a distribution whose behavior is indistinguishable from that of any other newly default-constructed distribution of type ( D ). | constant |
| ( D(p) ) | | Creates a distribution whose behavior is indistinguishable from that of a distribution newly constructed directly from the values used to construct ( p ). | same as ( p )'s construction |
| ( d.\text{reset}() ) | \text{void} | Subsequent uses of ( d ) do not depend on values produced by any engine prior to invoking \texttt{reset}. | constant |
| ( x.\text{param}() ) | ( P ) | Returns a value ( p ) such that ( D(p).\text{param}() == p. ) | no worse than the complexity of ( D(p) ) |
| ( d.\text{param}(p) ) | \text{void} | \text{Ensures:} ( d.\text{param}() == p. ) | no worse than the complexity of ( D(p) ) |
| ( d(g) ) | ( T ) | With ( p = d.\text{param}() ), the sequence of numbers returned by successive invocations with the same object ( g ) is randomly distributed according to the associated ( p(z \mid {p}) ) or ( P(z_i \mid {p}) ) function. | amortized constant number of invocations of ( g ) |
| ( d(g, p) ) | ( T ) | The sequence of numbers returned by successive invocations with the same objects ( g ) and ( p ) is randomly distributed according to the associated ( p(z \mid {{p}}) ) or ( P(z_i \mid {{p}}) ) function. | amortized constant number of invocations of ( g ) |
| ( x.\text{min}() ) | ( T ) | Returns ( \text{glb} ). | constant |
| ( x.\text{max}() ) | ( T ) | Returns ( \text{lub} ). | constant |</p>

Requires: <code>is</code> provides a textual representation that was previously written using an <code>os</code> whose imbued locale and whose type’s template specialization arguments <code>charT</code> and <code>traits</code> were the same as those of <code>is</code>. Ensures: The <code>is.fmtflags</code> are unchanged.</td>
<td></td>
</tr>
</tbody>
</table>

4 D shall satisfy the *Cpp17CopyConstructible* (Table 27) and *Cpp17CopyAssignable* (Table 29) requirements.
5 The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of `D` between any of the invocations `d(g)`.
6 If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.
7 It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 25.6, declarations of `D::param_type` are in the form of `typedefs` for convenience of exposition only.
8 P shall satisfy the *Cpp17CopyConstructible* (Table 27), *Cpp17CopyAssignable* (Table 29), and *Cpp17Equality-Comparable* (Table 23) requirements.
9 For each of the constructors of `D` taking arguments corresponding to parameters of the distribution, P shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of `D` that return values corresponding to parameters of the distribution, P shall have a corresponding member function with the identical name, type, and semantics.
10 P shall have a declaration of the form

```cpp
using distribution_type = D;
```
25.6.3 Random number engine class templates

Each type instantiated from a class template specified in this subclause 25.6.3 satisfies the requirements of a random number engine (25.6.2.4) type.

Except where specified otherwise, the complexity of each function specified in this subclause 25.6.3 is constant.

Except where specified otherwise, no function described in this subclause 25.6.3 throws an exception.

Every function described in this subclause 25.6.3 that has a function parameter q of type Sseq& for a template type parameter named Sseq that is different from type seed_seq throws what and when the invocation of q.generate throws.

Descriptions are provided in this subclause 25.6.3 only for engine operations that are not described in 25.6.2.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

Each template specified in this subclause 25.6.3 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

For every random number engine and for every random number engine adaptor X defined in this subclause (25.6.3) and in subclause 25.6.4:

(7.1) — if the constructor
template<class Sseq> explicit X(Sseq& q);

is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function
template<class Sseq> void seed(Sseq& q);

is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

25.6.3.1 Class template linear_congruential_engine

A linear_congruential_engine random number engine produces unsigned integer random numbers. The state $x_i$ of a linear_congruential_engine object $x$ is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form $TA(x_i) = (a \cdot x_i + c) \mod m$; the generation algorithm is $GA(x_i) = x_i + 1$.

template<class UIntType, UIntType a, UIntType c, UIntType m>
class linear_congruential_engine {
public:
  // types
  using result_type = UIntType;

  // engine characteristics
  static constexpr result_type multiplier = a;
  static constexpr result_type increment = c;
  static constexpr result_type modulus = m;
  static constexpr result_type min() { return c == 0u ? 1u : 0u; }
  static constexpr result_type max() { return m - 1u; }
  static constexpr result_type default_seed = 1u;

  // constructors and seeding functions
  linear_congruential_engine() : linear_congruential_engine(default_seed) {} 
  explicit linear_congruential_engine(result_type s) ;
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
  void seed(result_type s = default_seed);
template<class Sseq> void seed(Sseq& q);

§ 25.6.3.1
Let \( a \lt m \) and \( c \lt m \).

The textual representation consists of the value of \( x_i \).

```cpp
explicit linear_congruential_engine(result_type s);
```

**Effects:** Constructs a \( \text{linear_congruential_engine} \) object. If \( c \mod m = 0 \) and \( s \mod m = 0 \), sets the engine's state to 1, otherwise sets the engine's state to \( s \mod m \).

```cpp
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

**Effects:** Constructs a \( \text{linear_congruential_engine} \) object. With \( k = \left\lfloor \log_2 m \right\rfloor \) and \( a \) an array (or equivalent) of length \( k + 3 \), invokes \( q \cdot \text{generate} \) \((a + 0, a + k + 3)\) and then computes \( S = \left( \sum_{j=0}^{k-1} a_{j+3} \cdot 2^j \right) \mod m \). If \( c \mod m = 0 \) and \( S = 0 \), sets the engine's state to 1, else sets the engine's state to \( S \).

### 25.6.3.2 Class template mersenne_twister_engine

A **mersenne_twister_engine** random number engine produces unsigned integer random numbers in the closed interval \([0, 2^{32} - 1]\). The state \( x_i \) of a **mersenne_twister_engine** object \( x \) is of size \( n \) and consists of a sequence of \( n \) values of the type delivered by \( x \); all subscripts applied to \( x \) are to be taken modulo \( n \).

The transition algorithm employs a twisted generalized feedback shift register defined by shift values \( n \) and \( m \), a twist value \( r \), a conditional xor-mask \( a \). To improve the uniformity of the result, the bits of the raw shift register are additionally tempered (i.e., scrambled) according to a bit-scrambling matrix defined by values \( u, d, s, b, t, c, \) and \( \ell \).

The state transition is performed as follows:

1. Concatenate the upper \( w - r \) bits of \( X_{i-n} \) with the lower \( r \) bits of \( X_{i+1-n} \) to obtain an unsigned integer value \( Y \).
2. With \( \alpha = a \cdot (Y \& 1) \), set \( X_i \) to \( X_{i+m-n} \oplus (Y \ll r) \oplus \alpha \).

The sequence \( X \) is initialized with the help of an initialization multiplier \( f \).

The generation algorithm determines the unsigned integer values \( z_1, z_2, z_3, z_4 \) as follows, then delivers \( z_4 \) as its result:

1. Let \( z_1 = X_i \oplus ((X_i \ll s) \& d) \).
2. Let \( z_2 = z_1 \oplus ((z_1 \ll w) \& b) \).
3. Let \( z_3 = z_2 \oplus ((z_2 \ll t) \& c) \).
4. Let \( z_4 = z_3 \oplus (z_3 \ll f) \).

```cpp
template<class UIntType, size_t w, size_t n, size_t m, size_t r,
        UIntType a, size_t u, UIntType d, size_t s,
        UIntType b, size_t t,
        UIntType c, size_t l, UIntType f>
class mersenne_twister_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);
};
```

---

246) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.
The generation algorithm is given by
\[ X_{n+1} = (X_n \times \text{carry}_{\text{sub}}) \mod 2^w. \]

Effects: Constructs a \texttt{mersenne_twister_engine} object. Sets \( X_n \) to value \( 2^w \). Then, iteratively for \( i = 1 - n, \ldots, -1 \), sets \( X_i \) to
\[ f \cdot (X_{i-1} \oplus (X_{i-1} \text{rshift} (w - 2))) + i \mod n \] mod \( 2^w \).

Complexity: \( \Theta(n) \).

### 25.6.3.3 Class template subtract_with_carry_engine

A \texttt{subtract_with_carry_engine} random number engine produces unsigned integer random numbers.

The state \( x_i \) of a \texttt{subtract_with_carry_engine} object \( x \) is of size \( \Theta(r) \) and consists of a sequence \( X \) of \( r \) integer values \( 0 \leq X_i < m = 2^w \); all subscripts applied to \( X \) are to be taken modulo \( r \). The state \( x_i \) additionally consists of an integer \( c \) (known as the carry) whose value is either 0 or 1.

The state transition is performed as follows:

\[ Y = X_{i-s} - X_{i-r} - c. \]

\[ X_i \text{ to } y = Y \mod m. \text{ Set } c \text{ to 1 if } Y < 0, \text{ otherwise set } c \text{ to 0.} \]

**Note:** This algorithm corresponds to a modular linear function of the form \( TA(x_i) = (a \cdot x_i) \mod b \), where \( b \) is of the form \( m^r - m^s + 1 \) and \( a = b - (b - 1)/m. \text{ — end note} \)

The generation algorithm is given by \( GA(x_i) = y \), where \( y \) is the value produced as a result of advancing the engine’s state as described above.

\section{Complexity}

\[ \Theta(n). \]
template<class UIntType, size_t w, size_t s, size_t r>
class subtract_with_carry_engine {
public:
  // types
  using result_type = UIntType;

  // engine characteristics
  static constexpr size_t word_size = w;
  static constexpr size_t short_lag = s;
  static constexpr size_t long_lag = r;
  static constexpr result_type min() { return 0; }
  static constexpr result_type max() { return m - 1; }
  static constexpr result_type default_seed = 19780503u;

  // constructors and seeding functions
  subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {
  }
  explicit subtract_with_carry_engine(result_type value);
  template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
  void seed(result_type value = default_seed);
  template<class Sseq> void seed(Sseq& q);

  // generating functions
  result_type operator()();
  void discard(unsigned long long z);
};

The following relations shall hold: 0u < s, s < r, 0 < w, and w <= numeric_limits<UIntType>::digits.

The textual representation consists of the values of \(X_{i-r}, \ldots, X_{i-1}\), in that order, followed by c.

explicit subtract_with_carry_engine(result_type value);

Effects: Constructs a subtract_with_carry_engine object. Sets the values of \(X_{i-r}, \ldots, X_{i-1}\), in that order, as specified below. If \(X_{i-1}\) is then 0, sets c to 1; otherwise sets c to 0.

To set the values \(X_k\), first construct e, a linear_congruential_engine object, as if by the following definition:

\[
\text{linear_congruential_engine<result_type, 40014u, 0u, 2147483563u> } e(\text{value} == 0u \ ? \ default_seed : \text{value});
\]

Then, to set each \(X_k\), obtain new values \(z_0, \ldots, z_{n-1}\) from \(n = \lceil w/32 \rceil\) successive invocations of e taken modulo \(2^{32}\). Set \(X_k\) to \(\left(\sum_{j=0}^{n-1} z_j \cdot 2^{32j}\right) \mod m\).

Complexity: Exactly \(n \cdot r\) invocations of e.

template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);

Effects: Constructs a subtract_with_carry_engine object. With \(k = \lceil w/32 \rceil\) and a an array (or equivalent) of length \(r \cdot k\), invokes q.generate(a + 0, a + r \cdot k) and then, iteratively for \(i = -r, \ldots, -1\), sets \(X_i\) to \(\left(\sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j}\right) \mod m\). If \(X_{-1}\) is then 0, sets c to 1; otherwise sets c to 0.

25.6.4 Random number engine adaptor class templates

In general

Each type instantiated from a class template specified in this subclause 25.6.4 satisfies the requirements of a random number engine adaptor (25.6.2.5) type.

Except where specified otherwise, the complexity of each function specified in this subclause 25.6.4 is constant.

Except where specified otherwise, no function described in this subclause 25.6.4 throws an exception.

Every function described in this subclause 25.6.4 that has a function parameter q of type Sseq& for a template type parameter named Sseq that is different from type seed_seq throws what and when the invocation of q.generate throws.

Descriptions are provided in this subclause 25.6.4 only for adaptor operations that are not described in subclause 25.6.2.5 or for operations where there is additional semantic information. In particular, declarations
for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

Each template specified in this subclause 25.6.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

### 25.6.4.2 Class template discard_block_engine

**A discard_block_engine random number engine adaptor** produces random numbers selected from those produced by some base engine `e`. The state `x_i` of a `discard_block_engine` engine adaptor object `x` consists of the state `e_i` of its base engine `e` and an additional integer `n`. The size of the state is the size of `e`'s state plus 1.

The transition algorithm discards all but `r > 0` values from each block of `p ≥ r` values delivered by `e`. The state transition is performed as follows: If `n ≥ r`, advance the state of `e` from `e_i` to `e_{i+p-r}` and set `n` to 0. In any case, then increment `n` and advance `e`'s then-current state `e_j` to `e_{j+1}`.

The generation algorithm yields the value returned by the last invocation of `e()` while advancing `e`'s state as described above.

```cpp
template<class Engine, size_t p, size_t r>
class discard_block_engine {
public:
  // types
  using result_type = typename Engine::result_type;

  // engine characteristics
  static constexpr size_t block_size = p;
  static constexpr size_t used_block = r;
  static constexpr result_type min() { return Engine::min(); }
  static constexpr result_type max() { return Engine::max(); }

  // constructors and seeding functions
  discard_block_engine();
  explicit discard_block_engine(const Engine& e);
  explicit discard_block_engine(Engine&& e);
  explicit discard_block_engine(result_type s);
  template<class Sseq> explicit discard_block_engine(Sseq& q);
  void seed();
  void seed(result_type s);
  template<class Sseq> void seed(Sseq& q);

  // generating functions
  result_type operator()();
  void discard(unsigned long long z);

  // property functions
  const Engine& base() const noexcept { return e; };

private:
  Engine e; // exposition only
  int n; // exposition only
};
```

The following relations shall hold: `0 < r` and `r <= p`.

The textual representation consists of the textual representation of `e` followed by the value of `n`.

In addition to its behavior pursuant to subclause 25.6.2.5, each constructor that is not a copy constructor sets `n` to 0.

### 25.6.4.3 Class template independent_bits_engine

**An independent_bits_engine random number engine adaptor** combines random numbers that are produced by some base engine `e`, so as to produce random numbers with a specified number of bits `w`. The state `x_i` of an `independent_bits_engine` engine adaptor object `x` consists of the state `e_i` of its base engine `e`; the size of the state is the size of `e`'s state.
The transition and generation algorithms are described in terms of the following integral constants:

(2.1) Let \( R = e.\text{max}() - e.\text{min}() + 1 \) and \( m = \lfloor \log_2 R \rfloor \).

(2.2) With \( n \) as determined below, let \( w_0 = \lfloor w/n \rfloor \), \( n_0 = n - w \mod n \), \( y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor \), and \( y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor \).

(2.3) Let \( n = \lfloor w/m \rfloor \) if and only if the relation \( R - y_0 \leq \lfloor y_0/n \rfloor \) holds as a result. Otherwise let \( n = 1 + \lfloor w/m \rfloor \).

[Note: The relation \( w = n_0 w_0 + (n - n_0)(w_0 + 1) \) always holds. — end note]

The transition algorithm is carried out by invoking \( e() \) as often as needed to obtain \( n_0 \) values less than \( y_0 + e.\text{min}() \) and \( n_0 \) values less than \( y_1 + e.\text{min}() \).

The generation algorithm uses the values produced while advancing the state as described above to yield a quantity \( S \) obtained as if by the following algorithm:

```cpp
S = 0;
for (k = 0; k != n_0; k++) {
    do u = e() - e.\text{min}(); while (u >= y_0);
    S = 2^{w_0} \cdot S + u \mod 2^{w_0};
}
for (k = n_0; k != n; k++) {
    do u = e() - e.\text{min}(); while (u >= y_1);
    S = 2^{w_0+1} \cdot S + u \mod 2^{w_0+1};
}
```

```cpp
template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w - 1; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }
private:
    Engine e;  // exposition only
};
```

The following relations shall hold: \( 0 < w \) and \( w \leq \text{numeric\_limits<result\_type>::digits} \).

The textual representation consists of the textual representation of \( e \).

### 25.6.4.4 Class template shuffle_order_engine

A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine \( e \), but delivers them in a different sequence. The state \( x_i \) of a `shuffle_order_engine` engine adaptor object \( x \) consists of the state \( e_x \) of its base engine \( e \), an additional value \( Y \) of the type delivered by \( e \), and an additional sequence \( V \) of \( k \) values also of the type delivered by \( e \). The size of the state is the size of \( e \)’s state plus \( k + 1 \).
The transition algorithm permutes the values produced by \( e \). The state transition is performed as follows:

1. Calculate an integer \( j = \lfloor k \cdot \frac{Y - e_{\text{min}}}{e_{\text{max}} - e_{\text{min}} + 1} \rfloor \).
2. Set \( Y \) to \( V_j \) and then set \( V_j \) to \( e() \).

The generation algorithm yields the last value of \( Y \) produced while advancing \( e \)'s state as described above.

```cpp
template<class Engine, size_t k>
class shuffle_order_engine {
public:
  // types
  using result_type = typename Engine::result_type;

  // engine characteristics
  static constexpr size_t table_size = k;
  static constexpr result_type min() { return Engine::min(); }
  static constexpr result_type max() { return Engine::max(); }

  // constructors and seeding functions
  shuffle_order_engine();
  explicit shuffle_order_engine(const Engine& e);
  explicit shuffle_order_engine(Engine&& e);
  explicit shuffle_order_engine(result_type s);
  template<class Sseq> explicit shuffle_order_engine(Sseq& q);
  void seed();
  void seed(result_type s);
  template<class Sseq> void seed(Sseq& q);

  // generating functions
  result_type operator()();
  void discard(unsigned long long z);

  // property functions
  const Engine& base() const noexcept { return e; }
private:
  Engine e;  // exposition only
  result_type V[k];  // exposition only
  result_type Y;  // exposition only
};
```

The following relation shall hold: \( 0 < k \).

The textual representation consists of the textual representation of \( e \), followed by the \( k \) values of \( V \), followed by the value of \( Y \).

In addition to its behavior pursuant to subclause 25.6.2.5, each constructor that is not a copy constructor initializes \( V[0], \ldots, V[k-1] \) and \( Y \), in that order, with values returned by successive invocations of \( e() \).

### 25.6.5 Engines and engine adaptors with predefined parameters [rand.predef]

**using minstd_rand0 =**

```cpp
linear_congruential_engine<uint_fast32_t, 16807, 0, 2147483647>;
```

**Required behavior:** The 10000\(^{th}\) consecutive invocation of a default-constructed object of type `minstd_rand0` shall produce the value 1043618065.

**using minstd_rand =**

```cpp
linear_congruential_engine<uint_fast32_t, 48271, 0, 2147483647>;
```

**Required behavior:** The 10000\(^{th}\) consecutive invocation of a default-constructed object of type `minstd_rand` shall produce the value 399268537.

**using mt19937 =**

```cpp
mersenne_twister_engine<uint_fast32_t,`
```
Required behavior: The 10000th consecutive invocation of a default-constructed object of type `mt19937` shall produce the value 4123659995.

using `mt19937_64 =
  mersenne_twister_engine<uint_fast64_t,
  64,312,156,31,0xb5026f5aa96619e9,29,
  0x5555555555555555,17,
  0x71d67fffed60000,37,
  0xffffee000000000,43,
  6364136223846793005>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type `mt19937_64` shall produce the value 9981545732273789042.

using `ranlux24_base =
  subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type `ranlux24_base` shall produce the value 7937952.

using `ranlux48_base =
  subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type `ranlux48_base` shall produce the value 61839128582725.

using `ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type `ranlux24` shall produce the value 9901578.

using `ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type `ranlux48` shall produce the value 249142670248501.

using `knuth_b = shuffle_order_engine<minstd_rand0,256>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type `knuth_b` shall produce the value 1112339016.

using `default_random_engine = implementation-defined;`

Remarks: The choice of engine type named by this typedef is implementation-defined. [Note: The implementation may select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations may select different underlying engine types, code that uses this typedef need not generate identical sequences across implementations. —end note]

### 25.6.6 Class `random_device`

A `random_device` uniform random bit generator produces nondeterministic random numbers.

If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```cpp
class random_device {
  public:
    // types
    using result_type = unsigned int;

    // generator characteristics
    static constexpr result_type min() { return numeric_limits<result_type>::min(); }
    static constexpr result_type max() { return numeric_limits<result_type>::max(); }

    // constructors
    explicit random_device(implementation-defined) {}
}
```
// generating functions
result_type operator()();

// property functions
double entropy() const noexcept;

// no copy functions
random_device(const random_device&) = delete;
void operator=(const random_device&) = delete;

explicit random_device(const string& token);

Effects: Constructs a random_device nondeterministic uniform random bit generator object. The semantics of the token parameter and the token value used by the default constructor are implementation-defined.247

Throws: A value of an implementation-defined type derived from exception if the random_device could not be initialized.

double entropy() const noexcept;

Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate248 for the random numbers returned by operator(), in the range min() to \( \log_2(\text{max()} + 1) \).

result_type operator()();

Returns: A nondeterministic random value, uniformly distributed between min() and max(), inclusive. It is implementation-defined how these values are generated.

Throws: A value of an implementation-defined type derived from exception if a random number could not be obtained.

25.6.7 Utilities [rand.util]

25.6.7.1 Class seed_seq [rand.util.seedseq]

class seed_seq {
public:
    // types
    using result_type = uint_least32_t;

    // constructors
    seed_seq();
    template<class T>
    seed_seq(initializer_list<T> il);
    template<class InputIterator>
    seed_seq(InputIterator begin, InputIterator end);

    // generating functions
    template<class RandomAccessIterator>
    void generate(RandomAccessIterator begin, RandomAccessIterator end);

    // property functions
    size_t size() const noexcept;
    template<class OutputIterator>
    void param(OutputIterator dest) const;

    // no copy functions
    seed_seq(const seed_seq&) = delete;
    void operator=(const seed_seq&) = delete;

247) The parameter is intended to allow an implementation to differentiate between different sources of randomness.
248) If a device has \( n \) states whose respective probabilities are \( P_0, \ldots, P_{n-1} \), the device entropy \( S \) is defined as
\[
S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i.
\]
private:
    vector<result_type> v; // exposition only
};

seed_seq();

Effects: Constructs a seed_seq object as if by default-constructing its member v.

Throws: Nothing.

template<class T>
seed_seq(initializer_list<T> il);

Requires: T shall be an integer type.

Effects: Same as seed_seq(il.begin(), il.end()).

template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);

Requires: InputIterator shall satisfy the Cpp17InputIterator requirements (22.3.5.2). Moreover, iterator_traits<InputIterator>::value_type shall denote an integer type.

Effects: Constructs a seed_seq object by the following algorithm:

for (InputIterator s = begin; s != end; ++s)
    v.push_back((*s) mod2^{32});

template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);

Requires: RandomAccessIterator shall satisfy the Cpp17RandomAccessIterator requirements (22.3.5.6) and the requirements of a mutable iterator. Moreover, iterator_traits<RandomAccessIterator>::value_type shall denote an unsigned integer type capable of accommodating 32-bit quantities.

Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin, end) according to the following algorithm in which each operation is to be carried out modulo 2^{32}, each indexing operator applied to begin is to be taken modulo n, and T(x) is defined as x xor (x rshift 27):

(8.1) — By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let p = (n - t)/2 and let q = p + t, where

\[ t = (n \geq 623) \ ? 11 : (n \geq 68) \ ? 7 : (n \geq 39) \ ? 5 : (n \geq 7) \ ? 3 : (n - 1)/2; \]

(8.2) — With m as the larger of s + 1 and n, transform the elements of the range: iteratively for \( k = 0, \ldots, m - 1 \), calculate values

\[ r_1 = 1664525 \cdot T(begin[k] xor begin[k + p] xor begin[k - 1]) \]
\[ r_2 = r_1 + \begin{cases} 
    s, & k = 0 \\
    k \ mod \ n + v[k - 1], & 0 < k \leq s \\
    k \ mod \ n, & s < k 
\end{cases} \]

and, in order, increment begin[k + p] by r_1, increment begin[k + q] by r_2, and set begin[k] to r_2.

(8.3) — Transform the elements of the range again, beginning where the previous step ended: iteratively for \( k = m, \ldots, m + n - 1 \), calculate values

\[ r_3 = 1566083941 \cdot T(begin[k] + begin[k + p] + begin[k - 1]) \]
\[ r_4 = r_3 - (k \ mod \ n) \]

and, in order, update begin[k + p] by xoring it with r_3, update begin[k + q] by xoring it with r_4, and set begin[k] to r_4.

Throws: What and when RandomAccessIterator operations of begin and end throw.

size_t size() const noexcept;

Returns: The number of 32-bit units that would be returned by a call to param().

Complexity: Constant time.
## 25.6.7.2 Function template generate_canonical

### Description

Each function instantiated from the template described in this subclause 25.6.7.2 maps the result of one or more invocations of a supplied uniform random bit generator \( g \) to one member of the specified \( \text{RealType} \) such that, if the values \( g_i \) produced by \( g \) are uniformly distributed, the instantiation’s results \( t_j, 0 \leq t_j < 1 \), are distributed as uniformly as possible as specified below.

### Implementation

#### Complexity

Exactly \( k = \max(1, \lceil b/\log_2 R \rceil) \) invocations of \( g \), where \( b \) is the lesser of \( \text{numeric_limits<RealType>::digits} \) and \( \text{bits} \), and \( R \) is the value of \( g.\text{max}() - g.\text{min}() + 1 \).

#### Effects

Invokes \( g() \) \( k \) times to obtain values \( g_0, \ldots, g_{k-1} \), respectively. Calculates a quantity

\[
S = \sum_{i=0}^{k-1} (g_i - g.\text{min}) \cdot R^i
\]

using arithmetic of type \( \text{RealType} \).

#### Returns

\( S/R^k \).

#### Throws

What and when \( g \) throws.

---

### 25.6.8 Random number distribution class templates

#### In general

Each type instantiated from a class template specified in this subclause 25.6.8 satisfies the requirements of a random number distribution (25.6.2.6) type.

Descriptions are provided in this subclause 25.6.8 only for distribution operations that are not described in 25.6.2.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

The algorithms for producing each of the specified distributions are implementation-defined.

The value of each probability density function \( p(z) \) and of each discrete probability function \( P(z_i) \) specified in this subclause is 0 everywhere outside its stated domain.

#### Uniform distributions

A \text{uniform_int_distribution} random number distribution produces random integers \( i, a \leq i \leq b \), distributed according to the constant discrete probability function

\[
P(i \mid a, b) = 1/(b - a + 1).
\]
template<class IntType = int>
class uniform_int_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    uniform_int_distribution() : uniform_int_distribution(0) {}
    explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
    explicit uniform_int_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

2 Requires: a \leq b.

3 Effects: Constructs a uniform_int_distribution object; a and b correspond to the respective parameters of the distribution.

result_type a() const;
4 Returns: The value of the a parameter with which the object was constructed.

result_type b() const;
5 Returns: The value of the b parameter with which the object was constructed.

25.6.8.2.2 Class template uniform_real_distribution [rand.dist.uni.real]
A uniform_real_distribution random number distribution produces random numbers \( x, a \leq x < b \), distributed according to the constant probability density function
\[
p(x | a, b) = \frac{1}{b - a}.
\]

[Note: This implies that \( p(x | a, b) \) is undefined when \( a == b \). — end note]

template<class RealType = double>
class uniform_real_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    uniform_real_distribution() : uniform_real_distribution(0.0) {}
    explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);

§ 25.6.8.2.2
template<class URBG>
  result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

// Requires: a ≤ b and b − a ≤ numeric_limits<RealType>::max().
// Effects: Constructs a uniform_real_distribution object; a and b correspond to the respective parameters of the distribution.

result_type a() const;
  // Returns: The value of the a parameter with which the object was constructed.
result_type b() const;
  // Returns: The value of the b parameter with which the object was constructed.

25.6.8.3 Bernoulli distributions [rand.dist.bern]
25.6.8.3.1 Class bernoulli_distribution [rand.dist.bern.bernoulli]

A bernoulli_distribution random number distribution produces bool values b distributed according to the discrete probability function

\[ P(b|p) = \begin{cases} p & \text{if } b = \text{true}, \\
1 - p & \text{if } b = \text{false}. \end{cases} \]

class bernoulli_distribution {
public:
  // types
  using result_type = bool;
  using param_type = unspecified;

  // constructors and reset functions
  bernoulli_distribution() : bernoulli_distribution(0.5) {}
  explicit bernoulli_distribution(double p);
  explicit bernoulli_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<class URBG>
    result_type operator()(URBG& g);
  template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

  // property functions
  double p() const;
  param_type param() const;
  void param(const param_type& parm);
  result_type min() const;
  result_type max() const;
};

explicit bernoulli_distribution(double p);

// Requires: 0 ≤ p ≤ 1.
// Effects: Constructs a bernoulli_distribution object; p corresponds to the parameter of the distribution.
double p() const;

Returns: The value of the \( p \) parameter with which the object was constructed.

25.6.8.3.2 Class template binomial_distribution

A \texttt{binomial_distribution} random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i \mid t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i}.
\]

\[
\text{template\texttt{<class IntType = int>}}
\]

\[
\text{class binomial\texttt{\_distribution} \{ public: // types using result\_type = IntType; using param\_type = unspecified; // constructors and reset functions binomial\_distribution() : binomial\_distribution(1) {} explicit binomial\_distribution(IntType t, double p = 0.5); explicit binomial\_distribution(const param\_type& parm); void reset(); // generating functions template<class URBG> result\_type operator()(URBG& g); template<class URBG> result\_type operator()(URBG& g, const param\_type& parm); // property functions IntType t() const; double p() const; param\_type param() const; void param(const param\_type& parm); result\_type min() const; result\_type max() const; \}};
\]

\[
\text{explicit binomial\_distribution(IntType t, double p = 0.5);} \]

\[
\text{2 Requires: } 0 \leq p \leq 1 \text{ and } 0 \leq t.
\]

\[
\text{3 Effects: Constructs a binomial\_distribution object; } t \text{ and } p \text{ correspond to the respective parameters of the distribution.}
\]

\[
\text{IntType t() const;}
\]

\[
\text{4 Returns: The value of the } t \text{ parameter with which the object was constructed.}
\]

double p() const;

\[
\text{5 Returns: The value of the } p \text{ parameter with which the object was constructed.}
\]

25.6.8.3.3 Class template geometric_distribution

A \texttt{geometric_distribution} random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i \mid p) = p \cdot (1 - p)^i.
\]

\[
\text{template\texttt{<class IntType = int>}}
\]

\[
\text{class geometric\texttt{\_distribution} \{ public: // types using result\_type = IntType; using param\_type = unspecified;}
\]

\[
\text{§ 25.6.8.3.3 1100}
\]
// constructors and reset functions
geometric_distribution() : geometric_distribution(0.5) {}  
explicit geometric_distribution(double p);  
explicit geometric_distribution(const param_type& parm);  
void reset();

// generating functions
template<class URBG>
result_type operator()(URBG& g);

template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

explicit geometric_distribution(double p);

Requires: 0 < p < 1.

Effects: Constructs a geometric_distribution object; p corresponds to the parameter of the distribution.

double p() const;

Returns: The value of the p parameter with which the object was constructed.

25.6.8.3.4 Class template negative_binomial_distribution

A negative_binomial_distribution random number distribution produces random integers $i \geq 0$ distributed according to the discrete probability function

$$P(i | k, p) = \binom{k+i-1}{i} \cdot p^k \cdot (1 - p)^i.$$ 

[Note: This implies that $P(i | k, p)$ is undefined when $p == 1$. — end note]

template<class IntType = int>
class negative_binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructor and reset functions
    negative_binomial_distribution() : negative_binomial_distribution(1) {}  
    explicit negative_binomial_distribution(IntType k, double p = 0.5);  
    explicit negative_binomial_distribution(const param_type& parm);  
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    IntType k() const;
    double p() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
explicit negative_binomial_distribution(IntType k, double p = 0.5);

2

Requires: 0 < p ≤ 1 and 0 < k.

3

Effects: Constructs a negative_binomial_distribution object; k and p correspond to the respective parameters of the distribution.

IntType k() const;

4

Returns: The value of the k parameter with which the object was constructed.

double p() const;

5

Returns: The value of the p parameter with which the object was constructed.

25.6.8.4 Poisson distributions [rand.dist.pois]

25.6.8.4.1 Class template poisson_distribution [rand.dist.pois.poisson]

1

A poisson_distribution random number distribution produces integer values i ≥ 0 distributed according to the discrete probability function

\[ P(i \mid \mu) = \frac{e^{-\mu} \mu^i}{i!} . \]

The distribution parameter \( \mu \) is also known as this distribution’s mean.

\[
\text{template<class IntType = int>}
\text{class poisson_distribution}
\{
\text{public:}
\text{// types}
\text{using result_type = IntType;}
\text{using param_type = unspecified;}
\text{// constructors and reset functions}
\text{poisson_distribution() : poisson_distribution(1.0) {}}
\text{explicit poisson_distribution(double mean);} 
\text{explicit poisson_distribution(const param_type& parm);} 
\text{void reset();}
\text{// generating functions}
\text{template<class URBG>}
\text{result_type operator()(URBG& g);} 
\text{template<class URBG>}
\text{result_type operator()(URBG& g, const param_type& parm);} 
\text{// property functions}
\text{double mean() const;}
\text{param_type param() const;}
\text{void param(const param_type& parm);} 
\text{result_type min() const;}
\text{result_type max() const;}
\};
\]

\[
\text{explicit poisson_distribution(double mean);} 
\]

2

Requires: 0 < mean.

3

Effects: Constructs a poisson_distribution object; mean corresponds to the parameter of the distribution.

double mean() const;

4

Returns: The value of the mean parameter with which the object was constructed.

25.6.8.4.2 Class template exponential_distribution [rand.dist.pois.exp]

1

An exponential_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[ p(x \mid \lambda) = \lambda e^{-\lambda x} . \]
template<class RealType = double>
class exponential_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    exponential_distribution() : exponential_distribution(1.0) {}
    explicit exponential_distribution(RealType lambda);
    explicit exponential_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType lambda() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit exponential_distribution(RealType lambda);

2
Requires: 0 < lambda.
3
Effects: Constructs an exponential_distribution object; lambda corresponds to the parameter of
the distribution.

RealType lambda() const;
4
Returns: The value of the lambda parameter with which the object was constructed.

25.6.8.4.3 Class template gamma_distribution

[rand.dist.pois.gamma]
A gamma_distribution random number distribution produces random numbers $x > 0$ distributed according
to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$  

template<class RealType = double>
class gamma_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    gamma_distribution() : gamma_distribution(1.0) {}
    explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
    explicit gamma_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
// property functions
RealType alpha() const;
RealType beta() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;
};

explicit gamma_distribution(RealType alpha, RealType beta = 1.0);

Requires: 0 < alpha and 0 < beta.
Effects: Constructs a gamma_distribution object; alpha and beta correspond to the parameters of the distribution.

RealType alpha() const;
Returns: The value of the alpha parameter with which the object was constructed.

RealType beta() const;
Returns: The value of the beta parameter with which the object was constructed.

25.6.8.4.4 Class template weibull_distribution [rand.dist.pois.weibull]
A weibull_distribution random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x \mid a, b) = \frac{a}{b} \left( \frac{x}{b} \right)^{a-1} \exp \left( - \left( \frac{x}{b} \right)^{a} \right).
\]

template<class RealType = double>
class weibull_distribution {
public:
   // types
   using result_type = RealType;
   using param_type = unspecified;

   // constructor and reset functions
   weibull_distribution() : weibull_distribution(1.0) {}
   explicit weibull_distribution(RealType a, RealType b = 1.0);
   explicit weibull_distribution(const param_type& parm);
   void reset();

   // generating functions
   template<class URBG>  
   result_type operator()(URBG& g);
   template<class URBG>  
   result_type operator()(URBG& g, const param_type& parm);

   // property functions
   RealType a() const;
   RealType b() const;
   param_type param() const;
   void param(const param_type& parm);
   result_type min() const;
   result_type max() const;
};

explicit weibull_distribution(RealType a, RealType b = 1.0);

Requires: 0 < a and 0 < b.
Effects: Constructs a weibull_distribution object; a and b correspond to the respective parameters of the distribution.

RealType a() const;
Returns: The value of the a parameter with which the object was constructed.
Returns: The value of the \( b \) parameter with which the object was constructed.

25.6.8.4.5 Class template `extreme_value_distribution` [rand.dist.pois.extreme]

An `extreme_value_distribution` random number distribution produces random numbers \( x \) distributed according to the probability density function\(^{250}\)

\[
p(x \mid a, b) = \frac{1}{b} \cdot \exp \left( \frac{a - x}{b} - \exp \left( \frac{a - x}{b} \right) \right).
\]

```
template<class RealType = double>
class extreme_value_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type = unspecified;
    
    // constructor and reset functions
    extreme_value_distribution() : extreme_value_distribution(0.0) {}  
    explicit extreme_value_distribution(RealType a, RealType b = 1.0);  
    explicit extreme_value_distribution(const param_type& parm);  
    void reset();
    
    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);  
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
    
    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
  }

explicit extreme_value_distribution(RealType a, RealType b = 1.0);
```

Requires: \( 0 < b \).

Effects: Constructs an `extreme_value_distribution` object; \( a \) and \( b \) correspond to the respective parameters of the distribution.

RealType `a()` const;

Returns: The value of the \( a \) parameter with which the object was constructed.

RealType `b()` const;

Returns: The value of the \( b \) parameter with which the object was constructed.

25.6.8.5 Normal distributions [rand.dist.norm]

25.6.8.5.1 Class template `normal_distribution` [rand.dist.norm.normal]

A `normal_distribution` random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \cdot \exp \left( - \frac{(x - \mu)^2}{2\sigma^2} \right).
\]

The distribution parameters \( \mu \) and \( \sigma \) are also known as this distribution’s mean and standard deviation.

\(^{250}\) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.
template<class RealType = double>
class normal_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    normal_distribution() : normal_distribution(0.0) {}  
    explicit normal_distribution(RealType mean, RealType stddev = 1.0);
    explicit normal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType mean() const;
    RealType stddev() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit normal_distribution(RealType mean, RealType stddev = 1.0);

Requires: 0 < stddev.
Effects: Constructs a normal_distribution object; mean and stddev correspond to the respective parameters of the distribution.

RealType mean() const;
Returns: The value of the mean parameter with which the object was constructed.

RealType stddev() const;
Returns: The value of the stddev parameter with which the object was constructed.

25.6.8.5.2 Class template lognormal_distribution [rand.dist.norm.lognormal]
A lognormal_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function
\[
p(x \mid m, s) = \frac{1}{sx\sqrt{2\pi}} \exp\left(\frac{-(\ln x - m)^2}{2s^2}\right).
\]

template<class RealType = double>
class lognormal_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    lognormal_distribution() : lognormal_distribution(0.0) {}  
    explicit lognormal_distribution(RealType m, RealType s = 1.0);
    explicit lognormal_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
}
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType m() const;
    RealType s() const;
    param_type param() const;
    void param(const param_type& parm);  
    result_type min() const;
    result_type max() const;
};

explicit lognormal_distribution(RealType m, RealType s = 1.0);

2
    Requires: 0 < s.
3
    Effects: Constructs a lognormal_distribution object; m and s correspond to the respective parameters of the distribution.

RealType m() const;
4
    Returns: The value of the m parameter with which the object was constructed.

RealType s() const;
5
    Returns: The value of the s parameter with which the object was constructed.

25.6.8.5.3 Class template chi_squared_distribution [rand.dist.norm.chisq]

1 A chi_squared_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x \mid n) = \frac{x^{(n/2) - 1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.
\]

template<class RealType = double>
    class chi_squared_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    chi_squared_distribution() : chi_squared_distribution(1) {}  
    explicit chi_squared_distribution(RealType n);  
    explicit chi_squared_distribution(const param_type& parm);  
    void reset();

    // generating functions
    template<class URBG>
        result_type operator()(URBG& g);
    template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};

explicit chi_squared_distribution(RealType n);

2
    Requires: 0 < n.
3
    Effects: Constructs a chi_squared_distribution object; n corresponds to the parameter of the distribution.
Returns: The value of the \( n \) parameter with which the object was constructed.

### 25.6.8.5.4 Class template cauchy_distribution

A `cauchy_distribution` random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid a, b) = \left( \pi b \left(1 + \left(\frac{x-a}{b}\right)^2\right)\right)^{-1}.
\]

```cpp
template<class RealType = double>
class cauchy_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    cauchy_distribution() : cauchy_distribution(0.0) {} // default constructor
    explicit cauchy_distribution(RealType a, RealType b = 1.0);
    explicit cauchy_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

#### Requires: \( 0 < b \).

**Effects:** Constructs a `cauchy_distribution` object; \( a \) and \( b \) correspond to the respective parameters of the distribution.

#### Returns: The value of the \( a \) parameter with which the object was constructed.

#### Returns: The value of the \( b \) parameter with which the object was constructed.

### 25.6.8.5.5 Class template fisher_f_distribution

A `fisher_f_distribution` random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x \mid m, n) = \frac{
\Gamma((m+n)/2)}{
\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{mx}{n}\right)^{-(m+n)/2}.
\]

```cpp
template<class RealType = double>
class fisher_f_distribution {
public:
    // types
    using result_type = RealType;
```
using param_type = unspecified;

// constructor and reset functions
fisher_f_distribution() : fisher_f_distribution(1) {}
explicit fisher_f_distribution(RealType m, RealType n = 1);
explicit fisher_f_distribution(const param_type& parm);
void reset();

// generating functions
template<class URBG>
  result_type operator()(URBG& g);
template<class URBG>
  result_type operator()(URBG& g, const param_type& parm);

// property functions
RealType m() const;
RealType n() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

};

explicit fisher_f_distribution(RealType m, RealType n = 1);

2 Requires: 0 < m and 0 < n.
3 Effects: Constructs a fisher_f_distribution object; m and n correspond to the respective parameters of the distribution.

RealType m() const;
4 Returns: The value of the m parameter with which the object was constructed.

RealType n() const;
5 Returns: The value of the n parameter with which the object was constructed.

25.6.8.5.6 Class template student_t_distribution [rand.dist.norm.t]
A student_t_distribution random number distribution produces random numbers x distributed according to the probability density function
\[
p(x | n) = \frac{1}{\sqrt{n\pi}} \cdot \frac{\Gamma((n + 1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.
\]

template<class RealType = double>
class student_t_distribution {
public:
  // types
  using result_type = RealType;
  using param_type = unspecified;

  // constructor and reset functions
  student_t_distribution() : student_t_distribution(1) {}
  explicit student_t_distribution(RealType n);
  explicit student_t_distribution(const param_type& parm);
  void reset();

  // generating functions
template<class URBG>
    result_type operator()(URBG& g);
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
## 25.6.8.6 Sampling distributions

### Class template `discrete_distribution` [rand.dist.samp.discrete]

A `discrete_distribution` random number distribution produces random integers `i, 0 ≤ i < n`, distributed according to the discrete probability function

\[
P(i|p_0, \ldots, p_{n-1}) = p_i.
\]

Unless specified otherwise, the distribution parameters are calculated as: \(p_k = w_k/S\) for `k = 0, \ldots, n - 1`, in which the values `w_k`, commonly known as the `weights`, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \(0 < S = w_0 + \cdots + w_{n-1}\).

```cpp
template<class IntType = int>
class discrete_distribution {
public:
  // types
  using result_type = IntType;
  using param_type = unspecified;

  // constructor and reset functions
  discrete_distribution();
  template<class InputIterator>
  discrete_distribution(InputIterator firstW, InputIterator lastW);
  discrete_distribution(initializer_list<double> wl);
  template<class UnaryOperation>
  discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

  explicit discrete_distribution(const param_type& parm);
  void reset();

  // generating functions
  template<class URBG>
  result_type operator()(URBG& g);
  template<class URBG>
  result_type operator()(URBG& g, const param_type& parm);

  // property functions
  vector<double> probabilities() const;
  param_type param() const;
  void param(const param_type& parm);
  result_type min() const;
  result_type max() const;
};
```

### 25.6.8.6.1 1110

**Effects:** Constructs a `discrete_distribution` object with \(n = 1\) and \(p_0 = 1\). [Note: Such an object will always deliver the value 0. — end note]
template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);

Requires: InputIterator shall satisfy the Cpp17InputIterator requirements (22.3.5.2). Moreover, iterator_traits<InputIterator>::value_type shall denote a type that is convertible to double. If firstW == lastW, let n = 1 and \( w_0 = 1 \). Otherwise, \([\text{firstW, lastW}]\) shall form a sequence \( w \) of length \( n > 0 \).

Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

discrete_distribution(initializer_list<double> wl);

Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

Requires: Each instance of type UnaryOperation shall be a function object (19.14) whose return type shall be convertible to double. Moreover, double shall be convertible to the type of UnaryOperation’s sole parameter. If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin)/n \) shall hold.

Effects: Constructs a discrete_distribution object with probabilities given by the formula above, using the following values: If \( nw = 0 \), let \( w_0 = 1 \). Otherwise, let \( w_k = fw(xmin + k \cdot \delta + \delta/2) \) for \( k = 0, \ldots, n-1 \).

Complexity: The number of invocations of \( fw \) shall not exceed \( n \).

vector<double> probabilities() const;

Returns: A vector<double> whose size member returns \( n \) and whose operator[] member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1 \).

25.6.8.6.2 Class template piecewise_constant_distribution [rand.dist.samp.pconst]

A piecewise_constant_distribution random number distribution produces random numbers \( x, b_0 \leq x < b_n \), uniformly distributed over each subinterval \([b_i, b_{i+1})\) according to the probability density function

\[
p(x|b_0, \ldots, b_n, \rho_0, \ldots, \rho_{n-1}) = \rho_i \text{, for } b_i \leq x < b_{i+1}.
\]

The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution’s interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n - 1 \). Unless specified otherwise, the remaining \( n \) distribution parameters are calculated as:

\[
\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n - 1,
\]

in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).

template<class RealType = double>
class piecewise_constant_distribution {
public:
  // types
  using result_type = RealType;
  using param_type = unspecified;

  // constructor and reset functions
  piecewise_constant_distribution();
  template<class InputIteratorB, class InputIteratorW>
  piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                 InputIteratorW firstW);
  template<class UnaryOperation>
  piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
  template<class UnaryOperation>
  piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                  UnaryOperation fw);
  explicit piecewise_constant_distribution(const param_type& parm);
  void reset();
};
// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<result_type> intervals() const;
vecto<result_type> densities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with \( n = 1 \), \( \rho_0 = 1 \), \( b_0 = 0 \), and \( b_1 = 1 \).

template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
InputIteratorW firstW);

Requires: InputIteratorB and InputIteratorW shall each satisfy the Cpp17InputIterator requirements (22.3.5.2). Moreover, the id-expressions iterator_traits<InputIteratorB>::value_type and iterator_traits<InputIteratorW>::value_type shall each denote a type that is convertible to double. If firstB == lastB or ++firstB == lastB, let \( n = 1 \), \( w_0 = 1 \), \( b_0 = 0 \), and \( b_1 = 1 \). Otherwise, \([firstB,lastB)\) shall form a sequence \( b \) of length \( n + 1 \), the length of the sequence \( w \) starting from firstW shall be at least \( n \), and any \( w_k \) for \( k \geq n \) shall be ignored by the distribution.

Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

Requires: Each instance of type UnaryOperation shall be a function object (19.14) whose return type shall be convertible to double. Moreover, double shall be convertible to the type of UnaryOperation’s sole parameter.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If bl.size() < 2, let \( n = 1 \), \( w_0 = 1 \), \( b_0 = 0 \), and \( b_1 = 1 \). Otherwise, let \([bl.begin(),bl.end())\) form a sequence \( b_0, \ldots, b_n \), and let \( w_k = fw((b_{k+1} + b_k) / 2) \) for \( k = 0, \ldots, n-1 \).

Complexity: The number of invocations of \( fw \) shall not exceed \( n \).

template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

Requires: Each instance of type UnaryOperation shall be a function object (19.14) whose return type shall be convertible to double. Moreover, double shall be convertible to the type of UnaryOperation’s sole parameter. If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin)/n \) shall hold.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: Let \( b_k = xmin + k \cdot \delta \) for \( k = 0, \ldots, n \), and \( w_k = fw(b_k + \delta/2) \) for \( k = 0, \ldots, n-1 \).

Complexity: The number of invocations of \( fw \) shall not exceed \( n \).

vector<result_type> intervals() const;
Returns: A vector<result_type> whose size member returns \( n + 1 \) and whose operator[] member returns \( b_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n \).

vector<result_type> densities() const;
Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member returns \( \rho_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1 \).
25.6.8.6.3 Class template piecewise_linear_distribution

A piecewise_linear_distribution random number distribution produces random numbers \( x, \ b_0 \leq x < b_n \), distributed over each subinterval \( [b_i, b_{i+1}) \) according to the probability density function

\[
p(x | b_0, \ldots, b_n, \rho_0, \ldots, \rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.
\]

The \( n+1 \) distribution parameters \( b_i \), also known as this distribution’s interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n-1 \). Unless specified otherwise, the remaining \( n+1 \) distribution parameters are calculated as \( \rho_k = w_k / S \) for \( k = 0, \ldots, n \), in which the values \( w_k \), commonly known as the weights at boundaries, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

\[
0 < S = \frac{1}{2} \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).
\]

```cpp
template<class RealType = double>
class piecewise_linear_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    piecewise_linear_distribution();
    template<class InputIteratorB, class InputIteratorW>
    piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                InputIteratorW firstW);
    template<class UnaryOperation>
    piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
    template<class UnaryOperation>
    piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
    explicit piecewise_linear_distribution(const param_type& parm);
    void reset();

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    vector<result_type> intervals() const;
    vector<result_type> densities() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
};
```

Effects: Constructs a piecewise_linear_distribution object with \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1 \).

```cpp
template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                               InputIteratorW firstW);
```

Requires: InputIteratorB and InputIteratorW shall each satisfy the Cpp17InputIterator requirements (22.3.5.2). Moreover, the id-expressions iterator_traits<InputIteratorB>::value_type and iterator_traits<InputIteratorW>::value_type shall each denote a type that is convertible to double. If firstB == lastB or ++firstB == lastB, let \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1 \).
Otherwise, \([\text{firstB}, \text{lastB}]\) shall form a sequence \(b\) of length \(n+1\), the length of the sequence \(w\) starting from \(\text{firstW}\) shall be at least \(n+1\), and any \(w_k\) for \(k \geq n+1\) shall be ignored by the distribution.

**Effects:** Constructs a `piecewise_linear_distribution` object with parameters as specified above.

```cpp
template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
```

**Requires:** Each instance of type `UnaryOperation` shall be a function object (19.14) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`’s sole parameter.

**Effects:** Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: If `bl.size() < 2`, let \(n = 1\), \(\rho_0 = \rho_1 = 1\), \(b_0 = 0\), and \(b_1 = 1\). Otherwise, let \([\text{bl.begin()}, \text{bl.end()}]\) form a sequence \(b_0, \ldots, b_n\), and let \(w_k = \text{fw}(b_k)\) for \(k = 0, \ldots, n\).

**Complexity:** The number of invocations of \(\text{fw}\) shall not exceed \(n + 1\).

```cpp
template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
```

**Requires:** Each instance of type `UnaryOperation` shall be a function object (19.14) whose return type shall be convertible to `double`. Moreover, `double` shall be convertible to the type of `UnaryOperation`’s sole parameter. If \(nw = 0\), let \(n = 1\), otherwise let \(n = nw\). The relation \(0 < \delta = (\text{xmax} - \text{xmin})/n\) shall hold.

**Effects:** Constructs a `piecewise_linear_distribution` object with parameters taken or calculated from the following values: Let \(b_k = \text{xmin} + k \cdot \delta\) for \(k = 0, \ldots, n\), and \(w_k = \text{fw}(b_k)\) for \(k = 0, \ldots, n\).

**Complexity:** The number of invocations of \(\text{fw}\) shall not exceed \(n + 1\).

```cpp
vector<result_type> intervals() const;
```

**Returns:** A `vector<result_type>` whose `size` member returns \(n + 1\) and whose `operator[]` member returns \(b_k\) when invoked with argument \(k\) for \(k = 0, \ldots, n\).

```cpp
vector<result_type> densities() const;
```

**Returns:** A `vector<result_type>` whose `size` member returns \(n\) and whose `operator[]` member returns \(\rho_k\) when invoked with argument \(k\) for \(k = 0, \ldots, n\).

### 25.6.9 Low-quality random number generation

**Note:** The header `<cstdlib>` (16.2.2) declares the functions described in this subclause. — end note]

```cpp
int rand();
void srand(unsigned int seed);
```

**Effects:** The `rand` and `srand` functions have the semantics specified in the C standard library.

**Remarks:** The implementation may specify that particular library functions may call `rand`. It is implementation-defined whether the `rand` function may introduce data races (15.5.5.9). [Note: The other random number generation facilities in this document (25.6) are often preferable to `rand`, because `rand`’s underlying algorithm is unspecified. Use of `rand` therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — end note]

See also: ISO C 7.22.2

### 25.7 Numeric arrays

#### 25.7.1 Header `valarray` synopsis

```cpp
#include <initializer_list>

namespace std {
    template<class T> class valarray;  // An array of type T
class slice;  // a BLAS-like slice out of an array
template<class T> class slice_array;  // a generalized slice out of an array
class gslice;  // a masked array
template<class T> class gslice_array;
template<class T> class indirect_array;  // an indirected array
}
```

§ 25.7.1 1114
template<class T> void swap(valarray<T>&, valarray<T>&) noexcept;

template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> operator* (const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> operator>>(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);

§ 25.7.1
template<class T> valarray<bool> operator&&(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<bool> operator||(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);

template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);

template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);

template<class T> valarray<bool> abs (const valarray<T>&);

template<class T> valarray<T> acos (const valarray<T>&);

template<class T> valarray<T> asin (const valarray<T>&);

template<class T> valarray<T> atan (const valarray<T>&);

template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> cos (const valarray<T>&);

template<class T> valarray<T> cosh (const valarray<T>&);

template<class T> valarray<T> exp (const valarray<T>&);

template<class T> valarray<T> log (const valarray<T>&);

template<class T> valarray<T> log10(const valarray<T>&);

template<class T> valarray<T> pow(const valarray<T>&, const valarray<T>&);

§ 25.7.1 1116
template<class T> valarray<T> sin (const valarray<T>&);  
template<class T> valarray<T> sinh (const valarray<T>&);  
template<class T> valarray<T> sqrt (const valarray<T>&);  
template<class T> valarray<T> tan (const valarray<T>&);  
template<class T> valarray<T> tanh (const valarray<T>&);  

template<class T> unspecified1 begin(valarray<T>& v);  
template<class T> unspecified2 begin(const valarray<T>& v);  
template<class T> unspecified1 end(valarray<T>& v);  
template<class T> unspecified2 end(const valarray<T>& v);  
}

The header <valarray> defines five class templates (valarray, slice_array, gslice_array, mask_array, and indirect_array), two classes (slice and gslice), and a series of related function templates for representing and manipulating arrays of values.

The valarray array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

Any function returning a valarray<T> is permitted to return an object of another type, provided all the const member functions of valarray<T> are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.  

Implementations introducing such replacement types shall provide additional functions and operators as follows:

1. For every function taking a const valarray<T>& other than begin and end (25.7.10), identical functions taking the replacement types shall be added;
2. For every function taking two const valarray<T>& arguments, identical functions taking every combination of const valarray<T>& and replacement types shall be added.

In particular, an implementation shall allow a valarray<T> to be constructed from such replacement types and shall allow assignments and compound assignments of such types to valarray<T>, slice_array<T>, gslice_array<T>, mask_array<T> and indirect_array<T> objects.

These library functions are permitted to throw a bad_alloc (16.6.3.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

25.7.2 Class template valarray

25.7.2.1 Overview

namespace std {
    template<class T> class valarray {
        public:
            using value_type = T;

            // 25.7.2.2, construct/destroy
            valarray();
            explicit valarray(size_t);
            valarray(const T&, size_t);
            valarray(const T*, size_t);
            valarray(const valarray&);
            valarray(valarray&&) noexcept;
            valarray(const slice_array<T>&);
            valarray(const gslice_array<T>&);
            valarray(const mask_array<T>&);
            valarray(const indirect_array<T>&);
            valarray(initializer_list<T>);
            ~valarray();

            // 25.7.2.3, assignment
            valarray& operator=(const valarray&);
            valarray& operator=(valarray&&) noexcept;
            valarray& operator=(initializer_list<T>);
        }
    }

251) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.
valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

// 25.7.2.4, element access
const T& operator[](size_t) const;
T& operator[](size_t);

// 25.7.2.5, subset operations
valarray operator[](slice) const;
slice_array<T> operator[](slice);
valarray operator[](const gslice&); // missing definition
gslice_array<T> operator[](const gslice&);
valarray operator[](const valarray<bool>&) const;
mask_array<T> operator[](const valarray<bool>&);
valarray operator[](const valarray<size_t>&) const;
indirect_array<T> operator[](const valarray<size_t>&);

// 25.7.2.6, unary operators
valarray operator+(const T&); // missing definition
valarray operator-(const T&); // missing definition
valarray operator~(const T&); // missing definition
valarray operator!(const T&); // missing definition

// 25.7.2.7, compound assignment
valarray& operator*= (const T&);
valarray& operator/= (const T&);
valarray& operator%= (const T&);
valarray& operator+= (const T&);
valarray& operator-= (const T&);
valarray& operator^= (const T&);
valarray& operator&= (const T&);
valarray& operator|= (const T&);
valarray& operator<<=(const T&);
valarray& operator>>=(const T&);
valarray& operator*= (const valarray&);
valarray& operator/= (const valarray&);
valarray& operator%= (const valarray&);
valarray& operator+= (const valarray&);
valarray& operator-= (const valarray&);
valarray& operator^= (const valarray&);
valarray& operator|= (const valarray&);
valarray& operator<<=(const valarray&);
valarray& operator>>=(const valarray&);

// 25.7.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;
T sum() const;
T min() const;
T max() const;
valarray shift (int) const;
valarray cshift(int) const;
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
void resize(size_t sz, T c = T());

§ 25.7.2.1
template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;

The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 25.7. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.\(^\text{252}\)

### 25.7.2.2 Constructors

- `valarray();`
  - **Effects:** Constructs a `valarray` that has zero length.\(^\text{253}\)
- `explicit valarray(size_t n);`
  - **Effects:** Constructs a `valarray` that has length \(n\). Each element of the array is value-initialized (9.3).
- `valarray(const T& v, size_t n);`
  - **Effects:** Constructs a `valarray` that has length \(n\). Each element of the array is initialized with \(v\).
  - **Requires:** \(p\) points to an array (9.2.3.4) of at least \(n\) elements.
  - **Effects:** Constructs a `valarray` that has length \(n\). The values of the elements of the array are initialized with the first \(n\) values pointed to by the first argument.\(^\text{254}\)
- `valarray(const valarray& v);`
  - **Effects:** Constructs a `valarray` that has the same length as \(v\). The elements are initialized with the values of the corresponding elements of \(v\).\(^\text{255}\)
- `valarray(valarray&& v) noexcept;`
  - **Effects:** Constructs a `valarray` that has the same length as \(v\). The elements are initialized with the values of the corresponding elements of \(v\).
  - **Complexity:** Constant.
- `valarray(initializer_list<T> il);`
  - **Effects:** Equivalent to `valarray(il.begin(), il.size())`.
- `valarray(const slice_array<T>&);`  
  `valarray(const gslice_array<T>&);`  
  `valarray(const mask_array<T>&);`  
  `valarray(const indirect_array<T>&);`
  - These conversion constructors convert one of the four reference templates to a `valarray`.
- `~valarray();`
  - **Effects:** The destructor is applied to every element of `*this`; an implementation may return all allocated memory.

### 25.7.2.3 Assignment

- `valarray& operator=(const valarray& v);`
  - **Effects:** Each element of the `*this` array is assigned the value of the corresponding element of \(v\). If the length of \(v\) is not equal to the length of `*this`, resizes `*this` to make the two arrays the same length, as if by calling `resize(v.size())`, before performing the assignment.

\(^{252}\) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.\(^{253}\) This default constructor is essential, since arrays of `valarray` may be useful. After initialization, the length of an empty array can be increased with the `resize` member function.\(^{254}\) This constructor is the preferred method for converting a C array to a `valarray` object.\(^{255}\) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.
Ensures: size() == v.size().

Returns: *this.

valarray& operator=(valarray&& v) noexcept;
Effects: *this obtains the value of v. The value of v after the assignment is not specified.
Returns: *this.
Complexity: Linear.

valarray& operator=(initializer_list<T> il);
Effects: Equivalent to: return *this = valarray(il);

valarray& operator=(const T& v);
Effects: Assigns v to each element of *this.
Returns: *this.

valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);
Requires: The length of the array to which the argument refers equals size(). The value of an element in the left-hand side of a valarray assignment operator does not depend on the value of another element in that left-hand side.
These operators allow the results of a generalized subscripting operation to be assigned directly to a valarray.

25.7.2.4 Element access

const T& operator[](size_t n) const;
T& operator[](size_t n);
Requires: n < size().
Returns: A reference to the corresponding element of the array. [Note: The expression (a[i] = q, a[i]) == q evaluates to true for any non-constant valarray<T> a, any T q, and for any size_t i such that the value of i is less than the length of a. — end note]

Remarks: The expression &a[i+j] == &a[i] + j evaluates to true for all size_t i and size_t j such that i+j < a.size().
The expression &a[i] != &b[j] evaluates to true for any two arrays a and b and for any size_t i and size_t j such that i < a.size() and j < b.size(). [Note: This property indicates an absence of aliasing and may be used to advantage by optimizing compilers. Compilers may take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from operator new, and other techniques to generate efficient valarrays. — end note]
The reference returned by the subscript operator for an array shall be valid until the member function resize(size_t, T) (25.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

25.7.2.5 Subset operations

The member operator[] is overloaded to provide several ways to select sequences of elements from among those controlled by *this. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new valarray object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of operator= and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

valarray operator[](slice slicearr) const;
Returns: A valarray containing those elements of the controlled sequence designated by slicearr.
Example:
const valarray<char> v0("abcdefghijkmnop", 16);
slice_array<T> operator[](slice slicearr);

Returns: An object that holds references to elements of the controlled sequence selected by slicearr.

Example:
```c++
valarray<char> v0("abcdefgijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("aAbDeBghCjkDmnEp", 16);
```

valarray operator[](const gslice& gslicearr) const;

Returns: A valarray containing those elements of the controlled sequence designated by gslicearr.

Example:
```c++
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
```

gslice_array<T> operator[](const gslice& gslicearr);

Returns: An object that holds references to elements of the controlled sequence selected by gslicearr.

Example:
```c++
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEF", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```

valarray operator[](const valarray<bool>& boolarr) const;

Returns: A valarray containing those elements of the controlled sequence designated by boolarr.

Example:
```c++
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
```

mask_array<T> operator[](const valarray<bool>& boolarr);

Returns: An object that holds references to elements of the controlled sequence selected by boolarr.

Example:
```c++
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeGhijklmnop", 16)
```

valarray operator[](const valarray<size_t>& indarr) const;

Returns: A valarray containing those elements of the controlled sequence designated by indarr.

Example:
```c++
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("abcdefgijklmnop", 16);
valarray<char> v2("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
```
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
— end example

indirect_array<T> operator[](const valarray<size_t>& indarr);

Returns: An object that holds references to elements of the controlled sequence selected by indarr.
[Example:
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
— end example]

25.7.2.6 Unary operators [valarray.unary]

valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

Requires: Each of these operators may only be instantiated for a type T to which the indicated operator
can be applied and for which the indicated operator returns a value which is of type T (bool for
operator!) or which may be unambiguously implicitly converted to type T (bool for operator!).

Returns: A valarray whose length is size(). Each element of the returned array is initialized with
the result of applying the indicated operator to the corresponding element of the array.

25.7.2.7 Compound assignment [valarray.cassign]

valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);

Requires: size() == v.size(). Each of these operators may only be instantiated for a type T if the
indicated operator can be applied to two operands of type T. The value of an element in the left-hand
side of a valarray compound assignment operator does not depend on the value of another element in
that left hand side.

Effects: Each of these operators performs the indicated operation on each of the elements of *this and
the corresponding element of v.

Returns: *this.

Remarks: The appearance of an array on the left-hand side of a compound assignment does not
invalidate references or pointers.

valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);
valarray& operator>>=(const T& v);

Requires: Each of these operators may only be instantiated for a type T if the indicated operator can be applied to two operands of type T.

Effects: Each of these operators applies the indicated operation to each element of *this and v.

Returns: *this

Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

25.7.2.8 Member functions

void swap(valarray& v) noexcept;

Effects: *this obtains the value of v. v obtains the value of *this.

Complexity: Constant.

size_t size() const;

Returns: The number of elements in the array.

Complexity: Constant time.

T sum() const;

Requires: size() > 0. This function may only be instantiated for a type T to which operator+= can be applied.

Returns: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying operator+= to a copy of an element of the array and all other elements of the array in an unspecified order.

T min() const;

Requires: size() > 0

Returns: The minimum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

T max() const;

Requires: size() > 0.

Returns: The maximum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

valarray shift(int n) const;

Returns: A valarray of length size(), each of whose elements I is (*this)[I + n] if I + n is non-negative and less than size(), otherwise T(). [Note: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. —end note]

[Example: If the argument has the value -2, the first two elements of the result will be value-initialized (9.3); the third element of the result will be assigned the value of the first element of the argument; etc. —end example]

valarray cshift(int n) const;

Returns: A valarray of length size() that is a circular shift of *this. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right −n places.

valarray apply(T func(T)) const;
valarray apply(T func(const T&) const);

Returns: A valarray whose length is size(). Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of *this.
void resize(size_t sz, T c = T());

*Effects:* Changes the length of the *this array to* sz and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

### 25.7.3 `valarray` non-member operations

#### 25.7.3.1 Binary operators

```
template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator* (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator/ (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator% (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator+ (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator- (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator^ (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator| (const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const typename valarray<T>::value_type&);
```

*Requires:* Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T or which can be unambiguously implicitly converted to type T. The argument arrays have the same length.

*Returns:* A `valarray` whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
template<class T> valarray<T> operator>>(const typename valarray<T>::value_type&, const valarray<T>&);

Requires: Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type T or which can be unambiguously implicitly converted to type T.

Returns: A valarray whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

25.7.3.2 Logical operators

template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&, const valarray<T>&);

Requires: Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type bool or which can be unambiguously implicitly converted to type bool. The two array arguments have the same length.

Returns: A valarray<bool> whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

template<class T> valarray<bool> operator==(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator==(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator!=(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator!=(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator<(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator>(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator<=(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator<=(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator>=(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator>=(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator&&(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&, const valarray<T>&);
template<class T> valarray<bool> operator||(const valarray<T>&, const typename valarray<T>::value_type&);
template<class T> valarray<bool> operator||(const typename valarray<T>::value_type&, const valarray<T>&);

Requires: Each of these operators may only be instantiated for a type T to which the indicated operator can be applied and for which the indicated operator returns a value which is of type bool or which can be unambiguously implicitly converted to type bool.
Returns: A `valarray<bool>` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

25.7.3.3 Transcendentals

```
template<class T> valarray<T> abs (const valarray<T>&);  // Returns: abs(abs(x)) for each element in the array.
template<class T> valarray<T> acos (const valarray<T>&);  // Returns: acos(x) for each element in the array.
template<class T> valarray<T> asin (const valarray<T>&);  // Returns: asin(x) for each element in the array.
template<class T> valarray<T> atan (const valarray<T>&);  // Returns: atan(x) for each element in the array.
template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);  // Returns: atan2(x, y) for each pair of elements in the arrays.
template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);  // Returns: atan2(x, y) for each element in the array.
template<class T> valarray<T> cos (const valarray<T>&);  // Returns: cos(x) for each element in the array.
template<class T> valarray<T> cosh (const valarray<T>&);  // Returns: cosh(x) for each element in the array.
template<class T> valarray<T> exp (const valarray<T>&);  // Returns: exp(x) for each element in the array.
template<class T> valarray<T> log (const valarray<T>&);  // Returns: log(x) for each element in the array.
template<class T> valarray<T> log10(const valarray<T>&);  // Returns: log10(x) for each element in the array.
template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);  // Returns: x^y for each pair of elements in the arrays.
template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);  // Returns: x^y for each element in the array.
template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);  // Returns: x^y for each element in the array.
template<class T> valarray<T> sin (const valarray<T>&);  // Returns: sin(x) for each element in the array.
template<class T> valarray<T> sinh (const valarray<T>&);  // Returns: sinh(x) for each element in the array.
template<class T> valarray<T> sqrt (const valarray<T>&);  // Returns: sqrt(x) for each element in the array.
template<class T> valarray<T> tan (const valarray<T>&);  // Returns: tan(x) for each element in the array.
template<class T> valarray<T> tanh (const valarray<T>&);  // Returns: tanh(x) for each element in the array.
```

Requires: Each of these functions may only be instantiated for a type T to which a unique function with the indicated name can be applied (unqualified). This function shall return a value which is of type T or which can be unambiguously implicitly converted to type T.

25.7.3.4 Specialized algorithms

```
template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;  // Returns: Equivalent to x.swap(y).
```

25.7.4 Class slice

25.7.4.1 Overview

```
namespace std {
    class slice {
        public:
            slice();
            slice(size_t t, size_t t, size_t t);

            size_t start() const;
            size_t size() const;
            size_t stride() const;
        }
    }
```

The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.256

25.7.4.2 Constructors

```
slice();
slice(size_t start, size_t length, size_t stride);
slice(const slice&);
```

The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

---

256 BLAS stands for Basic Linear Algebra Subprograms. C++ programs may instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.
Example: slice(3, 8, 2) constructs a slice which selects elements 3, 5, 7, ..., 17 from an array. — end example

25.7.4.3 Access functions
size_t start() const;
size_t size() const;
size_t stride() const;

Returns: The start, length, or stride specified by a slice object.

Complexity: Constant time.

25.7.5 Class template slice_array

25.7.5.1 Overview

namespace std {

template<class T> class slice_array {

public:

using value_type = T;

void operator= (const valarray<T>&) const;
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
slice_array(const slice_array&);
~slice_array();
const slice_array& operator=(const slice_array&) const;
void operator=(const T&) const;
slice_array() = delete; // as implied by declaring copy constructor above

};
}

This template is a helper template used by the slice subscript operation

slice_array<T> valarray<T>::operator[] (slice);

It has reference semantics to a subset of an array specified by a slice object. [Example: The expression a[slice(1, 5, 3)] = b; has the effect of assigning the elements of b to a slice of the elements in a. For the slice shown, the elements selected from a are 1, 4, ..., 13. — end example]

25.7.5.2 Assignment

void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which the slice_array object refers.

25.7.5.3 Compound assignment

void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
void operator<<(const valarray<T>&) const;
void operator>>(const valarray<T>&) const;

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the slice_array object refers.

25.7.5.4 Fill function

```cpp
template<class T>
void operator=(const T&) const;
```

This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the slice_array object refers.

25.7.6 The gslice class

```cpp
namespace std {
    class gslice {
        public:
            gslice();
            gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);
            size_t start() const;
            valarray<size_t> size() const;
            valarray<size_t> stride() const;
    }
}
```

This class represents a generalized slice out of an array. A gslice is defined by a starting offset (s), a set of lengths (l), and a set of strides (d). The number of lengths shall equal the number of strides.

A gslice represents a mapping from a set of indices (i), equal in number to the number of strides, to a single index k. It is useful for building multidimensional array classes using the valarray template, which is one-dimensional. The set of one-dimensional index values specified by a gslice are

\[ k = s + \sum_{j} i_j d_j \]

where the multidimensional indices i_j range in value from 0 to \( l_j - 1 \).

[Example: The gslice specification]

```cpp
start = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```

yields the sequence of one-dimensional indices

\[ k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1 \]

which are ordered as shown in the following table:

<table>
<thead>
<tr>
<th>(i_0, i_1, i_2, k)</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>(0, 0, 0, 3)</td>
<td></td>
</tr>
<tr>
<td>(0, 0, 1, 4)</td>
<td></td>
</tr>
<tr>
<td>(0, 0, 2, 5)</td>
<td></td>
</tr>
<tr>
<td>(0, 1, 0, 7)</td>
<td></td>
</tr>
<tr>
<td>(0, 1, 1, 8)</td>
<td></td>
</tr>
<tr>
<td>(0, 1, 2, 9)</td>
<td></td>
</tr>
<tr>
<td>(0, 2, 0, 11)</td>
<td></td>
</tr>
<tr>
<td>(0, 2, 1, 12)</td>
<td></td>
</tr>
<tr>
<td>(0, 2, 2, 13)</td>
<td></td>
</tr>
<tr>
<td>(0, 3, 0, 15)</td>
<td></td>
</tr>
<tr>
<td>(0, 3, 1, 16)</td>
<td></td>
</tr>
<tr>
<td>(0, 3, 2, 17)</td>
<td></td>
</tr>
<tr>
<td>(1, 0, 0, 22)</td>
<td></td>
</tr>
</tbody>
</table>
That is, the highest-ordered index turns fastest. — end example]

It is possible to have degenerate generalized slices in which an address is repeated.

[Example: If the stride parameters in the previous example are changed to \{1, 1, 1\}, the first few elements of the resulting sequence of indices will be

\[
(0, 0, 0, 3),
(0, 0, 1, 4),
(0, 1, 0, 4),
(0, 1, 1, 5),
(0, 1, 2, 6),
\ldots
\]

— end example]

If a degenerate slice is used as the argument to the non-\texttt{const} version of \texttt{operator[]}(\texttt{const gslice&}), the behavior is undefined.

25.7.6.2 Constructors

\texttt{gslice();}
\texttt{gslice(size_t start, const valarray\textless size_t\textgreater & lengths,}
\texttt{const valarray\textless size_t\textgreater & strides);}
\texttt{gslice(const gslice&);}  

The default constructor is equivalent to \texttt{gslice(0, valarray\textless size_t\textgreater (), valarray\textless size_t\textgreater ())}. The constructor with arguments builds a \texttt{gslice} based on a specification of start, lengths, and strides, as explained in the previous subclause.

25.7.6.3 Access functions

\texttt{size_t start() const;}
\texttt{valarray\textless size_t\textgreater size() const;}
\texttt{valarray\textless size_t\textgreater stride() const;}

\texttt{size_t start() const;}

\begin{itemize}
\item \texttt{start()} returns the representation of the start, lengths, or strides specified for the \texttt{gslice}.
\item \texttt{size()} and \texttt{stride()} are linear in the number of strides.
\end{itemize}

25.7.7 Class template \texttt{gslice_array}

25.7.7.1 Overview

namespace std {

\begin{verbatim}
\template<class T> class gslice_array {
public:
  using value_type = T;

  void operator= (const valarray\textless T\textgreater &) const;
  void operator\*= (const valarray\textless T\textgreater &) const;
  void operator/= (const valarray\textless T\textgreater &) const;
  void operator\%= (const valarray\textless T\textgreater &) const;
  void operator\+= (const valarray\textless T\textgreater &) const;
  void operator\-= (const valarray\textless T\textgreater &) const;
  void operator\^= (const valarray\textless T\textgreater &) const;
  void operator\&= (const valarray\textless T\textgreater &) const;
  void operator\|= (const valarray\textless T\textgreater &) const;
  void operator\ll=(const valarray\textless T\textgreater &) const;
  void operator\gg=(const valarray\textless T\textgreater &) const;
\end{verbatim}

\section*{§ 25.7.7.1}
gslice_array(const gslice_array&);
~gslice_array();
const gslice_array& operator=(const gslice_array&) const;
void operator=(const T&) const;

gslice_array() = delete;       // as implied by declaring copy constructor above
};

1 This template is a helper template used by the gslice subscript operator

gslice_array<T> valarray<T>::operator[](const gslice);

2 It has reference semantics to a subset of an array specified by a gslice object. Thus, the expression

a[gslice(1, length, stride)] = b has the effect of assigning the elements of b to a generalized slice of
the elements in a.

25.7.7.2 Assignment

void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array
elements to selected elements of the valarray<T> object to which the gslice_array object refers.

25.7.7.3 Compound assignment

void operator==(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements
of the argument array and selected elements of the valarray<T> object to which the gslice_array object refers.

25.7.7.4 Fill function

void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the
valarray<T> object to which the gslice_array object refers.

25.7.8 Class template mask_array

25.7.8.1 Overview

namespace std {

    template<class T> class mask_array {

    public:
        using value_type = T;

        void operator==(const valarray<T>&) const;
        void operator/==(const valarray<T>&) const;
        void operator%==(const valarray<T>&) const;
        void operator^==(const valarray<T>&) const;
        void operator&==(const valarray<T>&) const;
        void operator|==(const valarray<T>&) const;
        void operator<<==(const valarray<T>&) const;

  }
This template is a helper template used by the mask subscript operator:

```cpp
definition
mask_array<T> valarray<T>::operator[] (const valarray<bool>&).
```

It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

### 25.7.8.2 Assignment

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which it refers.

### 25.7.8.3 Compound assignment

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the mask object refers.

### 25.7.8.4 Fill function

This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.

### 25.7.9 Class template indirect_array

#### 25.7.9.1 Overview

```cpp
definition
namespace std {

template<class T> class indirect_array {
public:
using value_type = T;

void operator= (const valarray<T>&) const;
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
}
}
```
indirect_array(const indirect_array&);
~indirect_array();
const indirect_array& operator=(const indirect_array&) const;
void operator=(const T&) const;

indirect_array() = delete; // as implied by declaring copy constructor above
};

This template is a helper template used by the indirect subscript operator

indirect_array<T> valarray<T>::operator[] (const valarray<size_t>&).

It has reference semantics to a subset of an array specified by an indirect_array. Thus, the expression

a[indirect] = b;

has the effect of assigning the elements of b to the elements in a whose indices appear in indirect.

25.7.9.2 Assignment

void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which it refers.

If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

[Example:
int addr[] = {2, 3, 1, 4, 4};
valarray<size_t> indirect(addr, 5);
valarray<double> a(0., 10), b(1., 5);
a[indirect] = b;
results in undefined behavior since element 4 is specified twice in the indirection. — end example]

25.7.9.3 Compound assignment

void operator*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator%=(const valarray<T>&) const;
void operator+=(const valarray<T>&) const;
void operator-=(const valarray<T>&) const;
void operator^=(const valarray<T>&) const;
void operator&=(const valarray<T>&) const;
void operator|=(const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the indirect_array object refers.

If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

25.7.9.4 Fill function

void operator=(const T&) const;

This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the indirect_array object refers.

25.7.10 valarray range access

In the begin and end function templates that follow, unspecified1 is a type that meets the requirements of a mutable Cpp17RandomAccessIterator (22.3.5.6) and models ContiguousIterator (22.3.4.14), whose value_type is the template parameter T and whose reference type is Tk. unspecified2 is a type that
meets the requirements of a constant \texttt{Cpp17RandomAccessIterator} and models \texttt{ContiguousIterator}, whose \texttt{value
type} is the template parameter \texttt{T} and whose \texttt{reference} type is \texttt{const T}. 

The iterators returned by \texttt{begin} and \texttt{end} for an array are guaranteed to be valid until the member function \texttt{resize(size_t, T)} (25.7.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

\begin{verbatim}
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);

Returns: An iterator referencing the first value in the array.

\end{verbatim}

\begin{verbatim}
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);

Returns: An iterator referencing one past the last value in the array.
\end{verbatim}

// 25.8.5.21, spherical Neumann functions;
// spherical Bessel functions of the second kind
double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);

1 The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (25.8.3) and the mathematical special functions described in 25.8.5. [Note: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (15.2). — end note]

2 For each set of overloaded functions within `<cmath>`, with the exception of `abs`, there shall be additional overloads sufficient to ensure:

1. If any argument of arithmetic type corresponding to a `double` parameter has type `long double`, then all arguments of arithmetic type (6.7.1) corresponding to `double` parameters are effectively cast to `long double`.
2. Otherwise, if any argument of arithmetic type corresponding to a `double` parameter has type `double` or an integer type, then all arguments of arithmetic type corresponding to `double` parameters are effectively cast to `double`.
3. Otherwise, all arguments of arithmetic type corresponding to `double` parameters have type `float`.

[Note: `abs` is exempted from these rules in order to stay compatible with C. — end note]

See also: ISO C 7.12
25.8.2 Absolute values

[Note: The headers <cstdlib> (16.2.2) and <cmath> (25.8.1) declare the functions described in this subclause.
— end note]

int abs(int j);
long int abs(long int j);
long long int abs(long long int j);
float abs(float j);
double abs(double j);
long double abs(long double j);

2 Effects: The abs functions have the semantics specified in the C standard library for the functions abs,
labs, llabs, fabsf, fabs, and fabsl.

Remarks: If abs() is called with an argument of type X for which is_unsigned_v<X>
is true and if X cannot be converted to int by integral promotion (7.3.6), the program is ill-formed. [Note: Arguments
that can be promoted to int are permitted for compatibility with C. — end note]

See also: ISO C 7.12.7.2, 7.22.6.1

25.8.3 Three-dimensional hypotenuse

float hypot(float x, float y, float z);
double hypot(double x, double y, double z);
long double hypot(long double x, long double y, long double z);

1 Returns: $\sqrt{x^2 + y^2 + z^2}$.

25.8.4 Classification / comparison functions

[Note: The classification / comparison functions behave the same as the C macros with the corresponding names
defined in the C standard library. Each function is overloaded for the three floating-point types.

See also: ISO C 7.12.3, 7.12.4]

25.8.5 Mathematical special functions

[Note: If any argument value to any of the functions specified in this subclause is a NaN (Not a Number), the
function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a
domain error for just those argument values for which:

(1.1) — the function description’s Returns: clause explicitly specifies a domain and those argument values fall
outside the specified domain, or

(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or

(1.3) — the corresponding mathematical function is not mathematically defined.257

2 Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive
infinity.

25.8.5.1 Associated Laguerre polynomials

double assoc_laguerre(unsigned n, unsigned m, double x);
float assoc_laguerref(unsigned n, unsigned m, float x);
long double assoc_laguerrel(unsigned n, unsigned m, long double x);

1 Effects: These functions compute the associated Laguerre polynomials of their respective arguments
n, m, and x.

2 Returns:

$$L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \text{ for } x \geq 0,$$

where n is n, m is m, and x is x.

3 Remarks: The effect of calling each of these functions is implementation-defined if n \geq 128 or if m \geq 128.

257) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that
set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.
25.8.5.2 Associated Legendre functions

double assoc_legendre(unsigned l, unsigned m, double x);
float assoc_legendref(unsigned l, unsigned m, float x);
long double assoc_legendrel(unsigned l, unsigned m, long double x);

1 Effects: These functions compute the associated Legendre functions of their respective arguments \( l, m, \) and \( x \).

2 Returns:
\[ P^m_\ell(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_\ell(x), \quad \text{for } |x| \leq 1, \]
where \( l \) is \( l \), \( m \) is \( m \), and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

25.8.5.3 Beta function

double beta(double x, double y);
float betaf(float x, float y);
long double betal(long double x, long double y);

1 Effects: These functions compute the beta function of their respective arguments \( x \) and \( y \).

2 Returns:
\[ B(x,y) = \frac{\Gamma(x)\Gamma(y)}{\Gamma(x+y)}, \quad \text{for } x > 0, \ y > 0, \]
where \( x \) is \( x \) and \( y \) is \( y \).

25.8.5.4 Complete elliptic integral of the first kind

double comp_ellint_1(double k);
float comp_ellint_1f(float k);
long double comp_ellint_1l(long double k);

1 Effects: These functions compute the complete elliptic integral of the first kind of their respective arguments \( k \).

2 Returns:
\[ K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1, \]
where \( k \) is \( k \).

3 See also 25.8.5.11.

25.8.5.5 Complete elliptic integral of the second kind

double comp_ellint_2(double k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);

1 Effects: These functions compute the complete elliptic integral of the second kind of their respective arguments \( k \).

2 Returns:
\[ E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1, \]
where \( k \) is \( k \).

3 See also 25.8.5.12.

25.8.5.6 Complete elliptic integral of the third kind

double comp_ellint_3(double k, double nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);

1 Effects: These functions compute the complete elliptic integral of the third kind of their respective arguments \( k \) and \( \nu \).

2 Returns:
\[ \Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1, \]
where $k$ is $k$ and $\nu$ is $\text{nu}$.

3 See also 25.8.5.13.

### 25.8.5.7 Regular modified cylindrical Bessel functions

```c
double cyl_bessel_i(double nu, double x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

1 **Effects:** These functions compute the regular modified cylindrical Bessel functions of their respective arguments $\nu$ and $x$.

2 **Returns:**

$$I_\nu(x) = i^{-\nu}J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where $\nu$ is $\text{nu}$ and $x$ is $x$.

3 **Remarks:** The effect of calling each of these functions is implementation-defined if $\nu \geq 128$.

### 25.8.5.8 Cylindrical Bessel functions of the first kind

```c
double cyl_bessel_j(double nu, double x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

1 **Effects:** These functions compute the cylindrical Bessel functions of the first kind of their respective arguments $\nu$ and $x$.

2 **Returns:**

$$J_\nu(x) = \sum_{k=0}^{\infty} (-1)^k \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0,$$

where $\nu$ is $\text{nu}$ and $x$ is $x$.

3 **Remarks:** The effect of calling each of these functions is implementation-defined if $\nu \geq 128$.

### 25.8.5.9 Irregular modified cylindrical Bessel functions

```c
double cyl_bessel_k(double nu, double x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

1 **Effects:** These functions compute the irregular modified cylindrical Bessel functions of their respective arguments $\nu$ and $x$.

2 **Returns:**

$$K_\nu(x) = \frac{\pi}{2} \left( \frac{1 - I_\nu(x)}{\sin \nu \pi} \right) + \frac{\pi}{2} \lim_{\nu \to \nu} \frac{1 - I_\nu(x)}{-x^{\nu+1}} \left( \frac{1}{\sin \nu \pi} \right), \quad \text{for } x \geq 0 \text{ and integral } \nu$$

where $\nu$ is $\text{nu}$ and $x$ is $x$.

3 **Remarks:** The effect of calling each of these functions is implementation-defined if $\nu \geq 128$.

### 25.8.5.10 Cylindrical Neumann functions

```c
double cyl_neumann(double nu, double x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

1 **Effects:** These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments $\nu$ and $x$. 

§ 25.8.5.10
Returns:

\[ N_{\nu}(x) = \begin{cases} 
\frac{J_{\nu}(x) \cos \nu \pi - J_{-\nu}(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\
\lim_{\mu \to \nu} \frac{J_{\mu}(x) \cos \mu \pi - J_{-\mu}(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu 
\end{cases} \]

where \( \nu \) is \( \nu \) and \( x \) is \( x \).

Remarks: The effect of calling each of these functions is implementation-defined if \( \nu \geq 128 \).

See also 25.8.5.8.

25.8.5.11 Incomplete elliptic integral of the first kind \[ \text{sf.cmath.ellint_1} \]

\[
\text{ellint}_1(k, \phi) = \int_{0}^{\phi} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,
\]

where \( k \) is \( k \) and \( \phi \) is \( \phi \).

Effects: These functions compute the incomplete elliptic integral of the first kind of their respective arguments k and \( \phi \) (\( \phi \) measured in radians).

25.8.5.12 Incomplete elliptic integral of the second kind \[ \text{sf.cmath.ellint_2} \]

\[
\text{ellint}_2(k, \phi) = \int_{0}^{\phi} \sqrt{1 - k^2 \sin^2 \theta} d\theta, \text{ for } |k| \leq 1,
\]

where \( k \) is \( k \) and \( \phi \) is \( \phi \).

Effects: These functions compute the incomplete elliptic integral of the second kind of their respective arguments k and \( \phi \) (\( \phi \) measured in radians).

25.8.5.13 Incomplete elliptic integral of the third kind \[ \text{sf.cmath.ellint_3} \]

\[
\text{ellint}_3(k, \nu, \phi) = \int_{0}^{\phi} \frac{d\theta}{(1 - \nu \sin^2 \theta) \sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,
\]

where \( \nu \) is \( \nu \), \( k \) is \( k \), and \( \phi \) is \( \phi \).

Effects: These functions compute the incomplete elliptic integral of the third kind of their respective arguments \( k, \nu, \) and \( \phi \) (\( \phi \) measured in radians).

25.8.5.14 Exponential integral \[ \text{sf.cmath.expint} \]

\[
\text{expint}(x) = \ln e = \int_{-x}^{\infty} \frac{e^{-t}}{t} dt,
\]

where \( x \) is \( x \).

Effects: These functions compute the exponential integral of their respective arguments \( x \).
25.8.5.15 Hermite polynomials

double hermite(unsigned n, double x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);

1 Effects: These functions compute the Hermite polynomials of their respective arguments \( n \) and \( x \).

2 Returns:
\[
H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}
\]
where \( n \) is \( n \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

25.8.5.16 Laguerre polynomials

double laguerre(unsigned n, double x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);

1 Effects: These functions compute the Laguerre polynomials of their respective arguments \( n \) and \( x \).

2 Returns:
\[
L_n(x) = e^{-x} \frac{d^n}{dx^n} (x^n e^{-x}) , \text{ for } x \geq 0,
\]
where \( n \) is \( n \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

25.8.5.17 Legendre polynomials

double legendre(unsigned l, double x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);

1 Effects: These functions compute the Legendre polynomials of their respective arguments \( l \) and \( x \).

2 Returns:
\[
P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l, \text{ for } |x| \leq 1,
\]
where \( l \) is \( l \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( l >= 128 \).

25.8.5.18 Riemann zeta function

double riemann_zeta(double x);
float riemann_zetaf(float x);
long double riemann_zetal(long double x);

1 Effects: These functions compute the Riemann zeta function of their respective arguments \( x \).

2 Returns:
\[
\zeta(x) = \begin{cases}
\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\
\frac{1}{1-2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\
2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1 - x) \zeta(1 - x), & \text{for } x < 0
\end{cases}
\]
where \( x \) is \( x \).
25.8.5.19 Spherical Bessel functions of the first kind

double sph_bessel(unsigned n, double x);
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);

1 Effects: These functions compute the spherical Bessel functions of the first kind of their respective arguments \( n \) and \( x \).
2 Returns:
\[ j_n(x) = (\pi/2x)^{1/2}J_{n+1/2}(x), \quad \text{for } x \geq 0, \]
where \( n \) is \( n \) and \( x \) is \( x \).
3 Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).
4 See also 25.8.5.8.

25.8.5.20 Spherical associated Legendre functions

double sph_legendre(unsigned l, unsigned m, double theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);

1 Effects: These functions compute the spherical associated Legendre functions of their respective arguments \( l \), \( m \), and \( \theta \) (\( \theta \) measured in radians).
2 Returns:
\[ Y^m_l(\theta, 0) \]
where
\[ Y^m_l(\theta, \phi) = (-1)^m \left[ \frac{(2\ell + 1)(\ell - m)!}{4\pi (\ell + m)!} \right]^{1/2} P^m_l(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq \ell, \]
and \( l \) is \( l \), \( m \) is \( m \), and \( \theta \) is \( \theta \).
3 Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).
4 See also 25.8.5.2.

25.8.5.21 Spherical Neumann functions

double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);

1 Effects: These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments \( n \) and \( x \).
2 Returns:
\[ n_n(x) = (\pi/2x)^{1/2}N_{n+1/2}(x), \quad \text{for } x \geq 0, \]
where \( n \) is \( n \) and \( x \) is \( x \).
3 Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).
4 See also 25.8.5.10.
26 Time library

26.1 General

This Clause describes the chrono library (26.2) and various C functions (26.13) that provide generally useful time utilities, as summarized in Table 85.

Table 85 — Time library summary

26.3 **Cpp17Clock requirements**

A clock is a bundle consisting of a `duration`, a `time_point`, and a function `now()` to get the current `time_point`. The origin of the clock’s `time_point` is referred to as the clock’s *epoch*. A clock shall satisfy the requirements in Table 86.

In Table 86 C1 and C2 denote clock types. t1 and t2 are values returned by C1::now() where the call returning t1 happens before (6.8.2) the call returning t2 and both of these calls occur before C1::time_point::max().

[Note: This means C1 did not wrap around between t1 and t2. — end note]

<table>

<th>Operational semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1::now()</td>
<td>C1::time_point</td>
<td>Returns a time_point object representing the current point in time.</td>
</tr>
</tbody>
</table>

3 [Note: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — end note]

4 A type TC meets the Cpp17TrivialClock requirements if:

(4.1) — TC satisfies the Cpp17Clock requirements (26.3),
(4.2) — the types TC::rep, TC::duration, and TC::time_point satisfy the Cpp17EqualityComparable (Table 23), Cpp17LessThanComparable (Table 24), Cpp17DefaultConstructible (Table 25), Cpp17CopyConstructible (Table 27), Cpp17CopyAssignable (Table 29), and Cpp17Destructible (Table 30) requirements and the requirements of numeric types (25.2). [Note: This means, in particular, that operations on these types will not throw exceptions. — end note]
(4.3) — lvalues of the types TC::rep, TC::duration, and TC::time_point are swappable (15.5.3.2),
(4.4) — the function TC::now() does not throw exceptions, and
(4.5) — the type TC::time_point::clock meets the Cpp17TrivialClock requirements, recursively.

26.4 Time-related traits [time.traits]

26.4.1 treat_as_floating_point [time.traits.is_fp]

template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> {
};

1 The duration template uses the treat_as_floating_point trait to help determine if a duration object can be converted to another duration with a different tick period. If treat_as_floating_point_v<Rep> is true, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations. [Note: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If treat_as_floating_point_v<Rep> is false, Rep will be treated as if it behaved like an integral type for the purpose of these conversions. — end note]

26.4.2 duration_values [time.traits.duration_values]

template<class Rep>
struct duration_values {
public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};

1 The duration template uses the duration_values trait to construct special values of the duration’s representation (Rep). This is done because the representation might be a class type with behavior which requires some other implementation to return these special values. In that case, the author of that class type should specialize duration_values to return the indicated values.

static constexpr Rep zero() noexcept;

2 Returns: Rep(0). [Note: Rep(0) is specified instead of Rep() because Rep() may have some other meaning, such as an uninitialized value. — end note]

3 Remarks: The value returned shall be the additive identity.

static constexpr Rep min() noexcept;

4 Returns: numeric_limits<Rep>::lowest().

5 Remarks: The value returned shall compare less than or equal to zero().
static constexpr Rep max() noexcept;

Returns: numeric_limits<Rep>::max().

Remarks: The value returned shall compare greater than zero().

### 26.4.3 Specializations of \texttt{common\_type}

```c++
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

The period of the duration indicated by this specialization of \texttt{common\_type} shall be the greatest common divisor of Period1 and Period2. \textit{[Note: This can be computed by forming a ratio of the greatest common divisor of Period1::num and Period2::num and the least common multiple of Period1::den and Period2::den. —end note]}

```c++
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

The common type of two \texttt{time\_point} types is a \texttt{time\_point} with the same clock as the two types and the common type of their two durations.

### 26.4.4 Class template \texttt{is\_clock}

```c++
template<class T> struct is_clock;
```

\texttt{is\_clock} is a \textit{Cpp17UnaryTypeTrait} (19.15.1) with a base characteristic of \texttt{true\_type} if \texttt{T} meets the \textit{Cpp17Clock} requirements (26.3), otherwise \texttt{false\_type}. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the \textit{Cpp17Clock} requirements is unspecified, except that as a minimum a type \texttt{T} shall not qualify as a \textit{Cpp17Clock} unless it satisfies all of the following conditions:

- the \textit{qualified-ids} \texttt{T::rep}, \texttt{T::period}, \texttt{T::duration}, and \texttt{T::time\_point} are valid and each denotes a type (12.9.2),
- the expression \texttt{T::is\_steady} is well-formed when treated as an unevaluated operand,
- the expression \texttt{T::now()} is well-formed when treated as an unevaluated operand.

The behavior of a program that adds specializations for \texttt{is\_clock} is undefined.

### 26.5 Class template \texttt{duration}

```c++
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
        public:
            using rep = Rep;
            using period = typename Period::type;

        private:
            rep rep_;
            // exposition only

        public:
            // 26.5.1, construct/copy/destroy
            constexpr duration() = default;
    };
}
```

A \texttt{duration} type measures time between two points in time (\texttt{time\_points}). A \texttt{duration} has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template \texttt{ratio}.
template<class Rep2>
    constexpr explicit duration(const Rep2& r);

template<class Rep2, class Period2>
    constexpr duration(const duration<Rep2, Period2>& d);

~duration() = default;
duration(duration&) = default;
duration& operator=(const duration&) = default;

// 26.5.2, observer
    constexpr rep count() const;

// 26.5.3, arithmetic
    constexpr common_type_t<duration> operator+() const;
    constexpr common_type_t<duration> operator-() const;
    constexpr duration& operator++();
    constexpr duration operator++(int);
    constexpr duration& operator--();
    constexpr duration operator--(int);

    constexpr duration& operator+=(const duration& d);
    constexpr duration& operator-=(const duration& d);

    constexpr duration& operator*=(const rep& rhs);
    constexpr duration& operator/=(const rep& rhs);
    constexpr duration& operator%=(const rep& rhs);
    constexpr duration& operator%=(const duration& rhs);

// 26.5.4, special values
    static constexpr duration zero() noexcept;
    static constexpr duration min() noexcept;
    static constexpr duration max() noexcept;
};

2 Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.

3 If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.

4 Members of duration shall not throw exceptions other than those thrown by the indicated operations on their representations.

5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep_ for copy and move, respectively, would satisfy the requirements for a constexpr function.

6 [Example:

duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long long, milli> d1; // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of \frac{1}{30} of a second
   // (30 Hz) using a double

   — end example]

26.5.1 Constructors

template<class Rep2>
    constexpr explicit duration(const Rep2& r);

Remarks: This constructor shall not participate in overload resolution unless Rep2 is implicitly convertible to rep and

(1.1) — treat_as_floating_point_v<rep> is true or

(1.2) — treat_as_floating_point_v<Rep2> is false.

[Example:

duration<int, milli> d(3); // OK

§ 26.5.1
duration<int, milli> d(3.5); // error
—end example]  
Effects: Constructs an object of type duration.
Ensures: count() == static_cast<rep>(r).

template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);

Remarks: This constructor shall not participate in overload resolution unless no overflow is induced in the conversion and treat_asFloatingPoint_v<rep> is true or both ratio_divide<Period2, period>::den is 1 and treat_asFloatingPoint_v<Rep2> is false. [Note: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction could easily lead to confusion about the value of the duration. —end note] [Example:

duration<int, milli> ms(3);
duration<int, micro> us = ms; // OK
duration<int, milli> ms2 = us; // error
—end example]
Effects: Constructs an object of type duration, constructing rep_ from duration_cast<duration>(d).count().

26.5.2 Observer
constexpr rep count() const;
Returns: rep_.

26.5.3 Arithmetic
constexpr common_type_t<duration> operator+(int) const;
Returns: common_type_t<duration>(*this).

constexpr common_type_t<duration> operator-(int) const;
Returns: common_type_t<duration>(-rep_).

constexpr duration& operator++();
Effects: As if by ++rep_.
Returns: *this.

constexpr duration operator++(int);
Returns: duration(rep_++).

constexpr duration& operator--();
Effects: As if by --rep_.
Returns: *this.

constexpr duration operator--(int);
Returns: duration(rep_--).

constexpr duration& operator+=(const duration& d);
Effects: As if by: rep_ += d.count();
Returns: *this.

constexpr duration& operator-=(const duration& d);
Effects: As if by: rep_ -= d.count();
Returns: *this.
constexpr duration& operator*=(const rep& rhs);

Effects: As if by: rep_ *= rhs;

Returns: *this.

constexpr duration& operator/=(const rep& rhs);

Effects: As if by: rep_ /= rhs;

Returns: *this.

constexpr duration& operator%=(const rep& rhs);

Effects: As if by: rep_ %= rhs;

Returns: *this.

constexpr duration& operator%=(const duration& rhs);

Effects: As if by: rep_ %= rhs.count();

Returns: *this.

26.5.4 Special values

static constexpr duration zero() noexcept;

Returns: duration(duration_values<rep>::zero()).

static constexpr duration min() noexcept;

Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;

Returns: duration(duration_values<rep>::max()).

26.5.5 Non-member arithmetic

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() + CD(rhs).count()).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() - CD(rhs).count()).

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& rhs, const Rep2& s);

Remarks: This operator shall not participate in overload resolution unless Rep2 is implicitly convertible to common_type_t<Rep1, Rep2>.

Returns: CD(CD(d).count() * s).

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);

Remarks: This operator shall not participate in overload resolution unless Rep1 is implicitly convertible to common_type_t<Rep1, Rep2>.

Returns: d * s.
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator/(const duration<Rep1, Period>& d, const Rep2& s);

Remarks: This operator shall not participate in overload resolution unless Rep2 is implicitly convertible to common_type_t<Rep1, Rep2> and Rep2 is not a specialization of duration.

Returns: CD(CD(d).count() / s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.

Returns: CD(lhs).count() / CD(rhs).count().

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%(const duration<Rep1, Period>& d, const Rep2& s);

Remarks: This operator shall not participate in overload resolution unless Rep2 is implicitly convertible to common_type_t<Rep1, Rep2> and Rep2 is not a specialization of duration.

Returns: CD(CD(d).count() % s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() % CD(rhs).count()).

26.5.6 Comparisons [time.duration.comparisons]

In the function descriptions that follow, CT represents common_type_t<A, B>, where A and B are the types of the two arguments to the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() == CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator!=(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: !(lhs == rhs).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<="(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() < CT(rhs).count().

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<="(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: rhs < lhs.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<="(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: !(rhs < lhs).

§ 26.5.6
26.5.7  duration_cast  

\[
\text{template<}\text{class ToDuration, class Rep, class Period>}
\text{constexpr ToDuration duration_cast(const duration<Rep, Period>& d);}\]

1  
*Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration.

2  
*Returns:* Let CF be ratio\_divide<Period, typename ToDuration::\text{period}>, and CR be common\_type<

\[
\text{typename ToDuration::\text{rep, Rep, intmax_t::\text{type}}.}
\]

\[
(2.1) \quad \text{If CF::num} = 1 \text{ and CF::den} = 1, \text{returns}
\]

\[
\text{ToDuration(static\_cast<

\[
\text{typename ToDuration::\text{rep}(d.\text{count}())})
\]

\[
(2.2) \quad \text{otherwise, if CF::num} \neq 1 \text{ and CF::den} = 1, \text{returns}
\]

\[
\text{ToDuration(static\_cast<

\[
\text{typename ToDuration::\text{rep}((

\[
\text{static\_cast<CR>(d.\text{count}()) * static\_cast<CR>(CF::num))})
\]

\[
(2.3) \quad \text{otherwise, if CF::num} = 1 \text{ and CF::den} \neq 1, \text{returns}
\]

\[
\text{ToDuration(static\_cast<

\[
\text{typename ToDuration::\text{rep}((

\[
\text{static\_cast<CR>(d.\text{count}()) / static\_cast<CR>(CF::den))})
\]

\[
(2.4) \quad \text{otherwise, returns}
\]

\[
\text{ToDuration(static\_cast<

\[
\text{typename ToDuration::\text{rep}((

\[
\text{static\_cast<CR>(d.\text{count}()) * static\_cast<CR>(CF::num) / static\_cast<CR>(CF::den))})
\]

\[
\text{[Note: This function does not use any implicit conversions; all conversions are done with static\_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — end note]}
\]

\[
\text{template<}\text{class ToDuration, class Rep, class Period>}
\text{constexpr ToDuration floor(const duration<Rep, Period>& d);}\]

4  
*Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration.

5  
*Returns:* The greatest result \( t \) representable in ToDuration for which \( t \leq d \).

\[
\text{template<}\text{class ToDuration, class Rep, class Period>}
\text{constexpr ToDuration ceil(const duration<Rep, Period>& d);}\]

6  
*Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration.

7  
*Returns:* The least result \( t \) representable in ToDuration for which \( t \geq d \).

\[
\text{template<}\text{class ToDuration, class Rep, class Period>}
\text{constexpr ToDuration round(const duration<Rep, Period>& d);}\]

8  
*Remarks:* This function shall not participate in overload resolution unless ToDuration is a specialization of duration, and treat\_as\_floating\_point\_v<typename ToDuration::\text{rep}> is false.

9  
*Returns:* The value of ToDuration that is closest to \( d \). If there are two closest values, then return the value \( t \) for which \( t \% 2 = 0 \).

26.5.8  Suffixes for duration literals  

1  
This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and nanoseconds respectively if they are applied to integral literals.

2  
If any of these suffixes are applied to a floating-point literal the result is a chrono::duration literal with an unspecified floating-point representation.

3  
If any of these suffixes are applied to an integer literal and the resulting chrono::duration value cannot be represented in the result type because of overflow, the program is ill-formed.

4  
*Example:* The following code shows some duration literals.

\[
\text{using namespace std::chrono\_literals;}
\]

§ 26.5.8  1170
auto constexpr aday = 24h;
auto constexpr lesson = 45min;
auto constexpr halfanhour = 0.5h;

constexpr chrono::hours operator""h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator""h(long double hours);

5 Returns: A duration literal representing hours hours.

constexpr chrono::minutes operator""min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator""min(long double minutes);

6 Returns: A duration literal representing minutes minutes.

constexpr chrono::seconds operator""s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator""s(long double sec);

7 Returns: A duration literal representing sec seconds.

[Note: The same suffix s is used for basic_string but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

constexpr chrono::milliseconds operator""ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator""ms(long double msec);

9 Returns: A duration literal representing msec milliseconds.

constexpr chrono::microseconds operator""us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator""us(long double usec);

10 Returns: A duration literal representing usec microseconds.

constexpr chrono::nanoseconds operator""ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);

11 Returns: A duration literal representing nsec nanoseconds.

26.5.9 Algorithms

template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);

1 Remarks: This function shall not participate in overload resolution unless numeric_limits<Rep>::is_signed is true.

2 Returns: If d >= d.zero(), return d, otherwise return -d.

26.5.10 I/O

template<class charT, class traits, class Rep, class Period>
basic ostream<charT, traits>&
operator<<(basic ostream<charT, traits>& os, const duration<Rep, Period>& d);

1 Requires: Rep is an integral type whose integer conversion rank (6.7.4) is greater than or equal to that of short, or a floating point type. charT is char or wchar_t.

2 Effects: Forms a basic_string<charT, traits> from d.count() using to_string if charT is char, or to_wstring if charT is wchar_t. Appends the units suffix described below to the basic_string. Inserts the resulting basic_string into os. [Note: This specification ensures that the result of this streaming operation will obey the width and alignment properties of the stream. — end note]

The units suffix depends on the type Period::type as follows:

(3.1) If Period::type is atto, the suffix is "as".
(3.2) Otherwise, if Period::type is femto, the suffix is "fs".
(3.3) Otherwise, if Period::type is pico, the suffix is "ps".
(3.4) Otherwise, if Period::type is nano, the suffix is "ns".
(3.5) Otherwise, if Period::type is micro, the suffix is "µs" ("\u00b5\u0073").
— Otherwise, if Period::type is milli, the suffix is "ms".
— Otherwise, if Period::type is centi, the suffix is "cs".
— Otherwise, if Period::type is deci, the suffix is "ds".
— Otherwise, if Period::type is ratio<1>, the suffix is "s".
— Otherwise, if Period::type is deca, the suffix is "das".
— Otherwise, if Period::type is hecto, the suffix is "hs".
— Otherwise, if Period::type is kilo, the suffix is "ks".
— Otherwise, if Period::type is mega, the suffix is "Ms".
— Otherwise, if Period::type is giga, the suffix is "Gs".
— Otherwise, if Period::type is tera, the suffix is "Ts".
— Otherwise, if Period::type is peta, the suffix is "Ps".
— Otherwise, if Period::type is exa, the suffix is "Es".
— Otherwise, if Period::type is ratio<60>, the suffix is "min".
— Otherwise, if Period::type is ratio<3600>, the suffix is "h".
— Otherwise, if Period::type::den == 1, the suffix is "[num]s".
— Otherwise, the suffix is "[num/\text{den}]s".

In the list above the use of num and den refer to the static data members of Period::type, which are converted to arrays of charT using a decimal conversion with no leading zeroes.

4 If Period::type is micro, but the character \text{U+00B5} cannot be represented in the encoding used for charT, the unit suffix "us" is used instead of "µs".

Returns: os.

```cpp
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt,
const duration<Rep, Period>& d);
```

Effects: Streams d into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.

Returns: os.

```cpp
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, duration<Rep, Period>& d, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);
```

Effects: Attempts to parse the input stream is into the duration d using the format flags given in the NTCTS fmt as specified in 26.12. If the parse parses everything specified by the parsing format flags without error, and yet none of the flags impacts a duration, d will be assigned a zero value. If \%Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If \%z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

### 26.6 Class template time_point

```cpp
class time_point {
public:
    using clock = Clock;
    using duration = Duration;
    using rep = typename duration::rep;
    using period = typename duration::period;
}
```
// exposition only

class time_point {
  private:
    duration d_; // exposition only

  public:
    // 26.6.1, construct
    constexpr time_point(); // has value epoch
    constexpr explicit time_point(const duration& d); // same as time_point() + d
    template<class Duration2>
      constexpr time_point(const time_point<clock, Duration2>& t);

    // 26.6.2, observer
    constexpr duration time_since_epoch() const;

    // 26.6.3, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 26.6.4, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
  }

1 Clock shall either satisfy the Cpp17Clock requirements (26.3) or be the type local_t.
2 If Duration is not an instance of duration, the program is ill-formed.

26.6.1 Constructors
  [time.point.cons]

    constexpr time_point();
    Effects: Constructs an object of type time_point, initializing d_ with duration::zero(). Such a time_point object represents the epoch.

    constexpr explicit time_point(const duration& d);
    Effects: Constructs an object of type time_point, initializing d_ with d. Such a time_point object represents the epoch + d.

    template<class Duration2>
      constexpr time_point(const time_point<clock, Duration2>& t);
    Remarks: This constructor shall not participate in overload resolution unless Duration2 is implicitly convertible to duration.
    Effects: Constructs an object of type time_point, initializing d_ with t.time_since_epoch().

26.6.2 Observer
  [time.point.observer]

    constexpr duration time_since_epoch() const;
    Returns: d_.

26.6.3 Arithmetic
  [time.point.arithmetic]

    constexpr time_point& operator++();
    Effects: ++d_.
    Returns: *this.

    constexpr time_point operator++(int);
    Returns: time_point(d_++).
constexpr time_point& operator--();
   Effects: --d_
   Returns: *this.

constexpr time_point operator--(int);
   Returns: time_point{d--}.

constexpr time_point& operator+=(const duration& d);
   Effects: As if by: d_ += d;
   Returns: *this.

constexpr time_point& operator-=(const duration& d);
   Effects: As if by: d_ -= d;
   Returns: *this.

26.6.4 Special values [time.point.special]

static constexpr time_point min() noexcept;
   Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;
   Returns: time_point(duration::max()).

26.6.5 Non-member arithmetic [time.point.nonmember]

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
   Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
constexpr time_point operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
   Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
constexpr time_point operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
   Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.

template<class Clock, class Duration1, class Duration2>
constexpr time_point operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
   Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

26.6.6 Comparisons [time.point.comparisons]

template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
   Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator!=(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);
   Returns: !(lhs == rhs).
template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,
const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() < rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,
const time_point<Clock, Duration2>& rhs);

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,
const time_point<Clock, Duration2>& rhs);

Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,
const time_point<Clock, Duration2>& rhs);

Returns: !(lhs < rhs).

26.6.7 time_point_cast

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization of duration.

Returns:

time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

Remarks: This function shall not participate in overload resolution unless ToDuration is a specialization of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch()))

26.7 Clocks

The types defined in this subclause shall satisfy the Cpp17TrivialClock requirements (26.3) unless otherwise specified.

26.7.1 Class system_clock

26.7.1.1 Overview

namespace std::chrono {

class system_clock {

public:

using rep       = see below;
using period    = ratio<unspecified, unspecified>;

}
using duration = chrono::duration<rep, period>;
using time_point = chrono::time_point<system_clock>;
static constexpr bool is_steady = unspecified;

static time_point now() noexcept;

// mapping to/from C type time_t
static time_t to_time_t(const time_point& t) noexcept;
static time_point from_time_t(time_t t) noexcept;

1 Objects of type `system_clock` represent wall clock time from the system-wide realtime clock. Objects of type `sys_time<Duration>` measure time since (and before) 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as `Unix time`. This measure facilitates an efficient mapping between `sys_time` and calendar types (26.8). [Example:

```cpp
sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
```
— end example]

26.7.1.2 Members

1 Requires: `system_clock::duration::min() < system_clock::duration::zero()` shall be true.
[Note: This implies that `rep` is a signed type. — end note]

26.7.1.3 Non-member functions

```
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);
```

Remarks: This operator shall not participate in overload resolution if `treat_as_floating_point_-v<typename Duration::rep>` is true, or if `Duration{1} >= days{1}`.

Effects:
```
auto const dp = floor<days>(tp);
os << year_month_day(dp) << ' ' << time_of_day(tp-dp);
```

Returns: os.

[Example:
```
cout << sys_seconds{0s} << '\n';  // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';  // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';  // 2000-01-01 01:02:03
— end example]
```

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);
```

Effects: os << year_month_day(dp).

Returns: os.
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
  to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const sys_time<Duration>& tp);

Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with "UTC" widened to charT. If %z is used (or a modified variant of %z), an offset of 0min will be formatted.

Returns: os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt, 
              sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, 
              minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the sys_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

26.7.2 Class utc_clock

26.7.2.1 Overview

```cpp
namespace std::chrono {
  class utc_clock {
    public:
      using rep = a signed arithmetic type;
      using period = ratio<unspecified, unspecified>;
      using duration = chrono::duration<rep, period>;
      using time_point = chrono::time_point<utc_clock>;
      static constexpr bool is_steady = unspecified;
      static time_point now();
    };
}
```

In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC. [Example: clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s. clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s, which is 10'957 * 86'400s + 22s. —end example]

utc_clock is not a Cpp17TrivialClock unless the implementation can guarantee that utc_clock::now() does not propagate an exception. [Note: noexcept(from_sys(system_clock::now())) is false. —end note]

26.7.2.2 Member functions

```cpp
static time_point now();
```

Returns: from_sys(system_clock::now()), or a more accurate value of utc_time.
template<typename Duration>
static sys_time<common_type_t<Duration, seconds>>
    to_sys(const utc_time<Duration>& u);

Returns: A sys_time t, such that from_sys(t) == u if such a mapping exists. Otherwise u represents
a time_point during a leap second insertion and the last representable value of sys_time prior to the
insertion of the leap second is returned.

template<typename Duration>
static utc_time<common_type_t<Duration, seconds>>
    from_sys(const sys_time<Duration>& t);

Returns: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the
number of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap
second insertion, then the conversion counts that leap second as inserted.

[Example:
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
- end example]

26.7.2.3 Non-member functions

template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);

Effects: Calls to_stream(os, fmt, t), where fmt is a string containing "%F %T" widened to charT.

Returns: os.

template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
        to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const utc_time<Duration>& t);

Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the
rules specified in 26.11. If %Z is used, it will be replaced with "UTC" widened to charT. If %z is used
(or a modified variant of %z), an offset of Min will be formatted. If tp represents a time during a leap
second insertion, and if a seconds field is formatted, the integral portion of that format shall be "60"
widened to charT.

Returns: os.

[Example:
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC\n";

Produces this output:
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC
2015-06-30 23:59:60.250 UTC
2015-06-30 23:59:60.500 UTC
2015-06-30 23:59:60.750 UTC
2015-07-01 00:00:00.000 UTC

§ 26.7.2.3
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>

basic_istream<charT, traits>&

from_stream(basic_istream<charT, traits>& is, const charT* fmt, utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the utc_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

26.7.3 Class tai_clock

26.7.3.1 Overview

namespace std::chrono {

class tai_clock {

public:

using rep = a signed arithmetic type;

using period = ratio<unspecified, unspecified>;

using duration = chrono::duration<rep, period>;

using time_point = chrono::time_point<tai_clock>;

static constexpr bool is_steady = unspecified;

static time_point now();

template<class Duration>

static utc_time<common_type_t<Duration, seconds>>

to_utc(const tai_time<Duration>&) noexcept;

};
}

The clock tai_clock measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC falls another second behind TAI. For example by 2000-01-01 there had been 22 leap seconds inserted so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

tai_clock is not a Cpp17TrivialClock unless the implementation can guarantee that tai_clock::now() does not propagate an exception. [Note: noexcept(from_utc(tai_clock::now())) is false. — end note]

26.7.3.2 Member functions

static time_point now();

Returns: from_utc(tai_clock::now()), or a more accurate value of tai_time.

template<class Duration>

static utc_time<common_type_t<Duration, seconds>>

to_utc(const tai_time<Duration>& t) noexcept;

Returns:

utc_time<common_type_t<Duration, seconds>>(t.time_since_epoch()) - 378691210s

[Note:

378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s

§ 26.7.3.2 1179
template<class Duration>
    static tai_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>& t) noexcept;

Returns:
    tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s

[Note:
    378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
    
    — end note]

26.7.3.3 Non-member functions

    template<class charT, class traits, class Duration>
        basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);

    Effects: Calls to_stream(os, fmt, t), where fmt is a string containing "%F %T" widened to charT.

    Returns: os.

    template<class charT, class traits, class Duration>
        basic_ostream<charT, traits>&
            to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const tai_time<Duration>& tp);

    Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with "TAI". If %z is used (or a modified variant of %z), an offset of 0min will be formatted. The date and time formatted shall be equivalent to that formatted by a sys_time initialized with:
        sys_time<Duration>{tp.time_since_epoch()} -
        (sys_days{1970y/January/1} - sys_days{1958y/January/1})

    Returns: os.

    [Example:
        auto st = sys_days{2000y/January/1};
        auto tt = clock_cast<tai_clock>(st);
        cout << format("%F %T %Z == ", st) << format("%F %T %Z\n", tt);
    
        Produces this output:
            2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
    
    — end example]

    template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
        basic_istream<charT, traits>&
            from_stream(basic_istream<charT, traits>& is, const charT* fmt, tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

    Effects: Attempts to parse the input stream is into the tai_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

    Returns: is.

26.7.4 Class gps_clock 

26.7.4.1 Overview 

    namespace std::chrono {
        class gps_clock {

§ 26.7.4.1
The clock `gps_clock` measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC falls another second behind GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

`gps_clock` is not a `Cpp17TrivialClock` unless the implementation can guarantee that `gps_clock::now()` does not propagate an exception. [Note: `noexcept(from_utc(utc_clock::now()))` is false. — end note]

### 26.7.4.2 Member functions

**static time_point now();**

*Returns:* `from_utc(utc_clock::now())`, or a more accurate value of `gps_time`.

**template<class Duration>*

**static utc_time<common_type_t<Duration, seconds>> to_utc(const gps_time<Duration>& t) noexcept;**

*Returns:* `gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s`

*[Note: 315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s — end note]*

**template<class Duration>*

**static gps_time<common_type_t<Duration, seconds>> from_utc(const utc_time<Duration>& t) noexcept;**

*Returns:* `gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s`

*[Note: 315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s — end note]*

### 26.7.4.3 Non-member functions

**template<class charT, class traits, class Duration>*

**basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);**

*Effects:* Calls `to_stream(os, fmt, t)`, where `fmt` is a string containing "%F %T" widened to `charT`.

*Returns:* `os`.
template<class charT, class traits, class Duration>
  basic_ostream<charT, traits>&
  to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const gps_time<Duration>& tp);

Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with “GPS”. If %z is used (or a modified variant of %z), an offset of 0min will be formatted. The date and time formatted shall be equivalent to that formatted by a sys_time initialized with:

\[\text{sys\_time<Duration>}(\text{tp.time\_since\_epoch()}) + (\text{sys\_days{1980y/January/Sunday[1]}} - \text{sys\_days{1970y/January/1}})\]

Returns: os.

[Example:

  auto st = sys_days{2000y/January/1};
  auto gt = clock_cast<gps_clock>(st);
  cout << format("%F %T %Z == ", st) << format("%F %T %Z\n", gt);

  Produces this output:

  2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS

  —end example]

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt,
              gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
              minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the gps_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

26.7.5 Type file_clock

26.7.5.1 Overview

namespace std::chrono {
  using file_clock = see below;
}

file_clock is an alias for a type meeting the Cpp17TrivialClock requirements (26.3), and using a signed arithmetic type for file_clock::rep. file_clock is used to create the time_point system used for file_time_type (28.11). Its epoch is unspecified, and noexcept(file_clock::now()) is true. [Note: The type that file_clock denotes may be in a different namespace than std::chrono, such as std::filesystem. —end note]

26.7.5.2 Member functions

The type denoted by file_clock provides precisely one of the following two sets of static member functions:

```cpp
template<class Duration>
  static sys_time<see below>
  to_sys(const file_time<Duration>&);

template<class Duration>
  static file_time<see below>
  from_sys(const sys_time<Duration>&);
```

or:

```cpp
template<class Duration>
  static utc_time<see below>
  to_utc(const file_time<Duration>&);
```
These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`.

### 26.7.5.3 Non-member functions

**template<class charT, class traits, class Duration>**

```cpp
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
```

1. **Effects:** Calls `to_stream(os, fmt, t)`, where `fmt` is a string containing "%F %T" widened to `charT`.
2. **Returns:** `os`.

**template<class charT, class traits, class Duration>**

```cpp
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const file_time<Duration>& tp);
```

3. **Effects:** Streams `tp` into `os` using the format specified by the NTCTS `fmt`. `fmt` encoding follows the rules specified in 26.11. If `%Z` is used, it will be replaced with "UTC" widened to `charT`. If `%z` is used (or a modified variant of `%z`), an offset of 0min will be formatted. The date and time formatted shall be equivalent to that formatted by a `sys_time` initialized with `clock_cast<system_clock>(tp)`, or by a `utc_time` initialized with `clock_cast<utc_clock>(tp)`.
4. **Returns:** `os`.

**template<class charT, class traits, class Duration, class Alloc = allocator<charT>>**

```cpp
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

5. **Effects:** Attempts to parse the input stream `is` into the `file_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 26.12. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` shall be called and `tp` shall not be modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.
6. **Returns:** `is`.

### 26.7.6 Class steady_clock

**namespace std::chrono {**

```cpp
class steady_clock {
public:
  using rep = unspecified;
  using period = ratio<unspecified, unspecified>;
  using duration = chrono::duration<rep, period>;
  using time_point = chrono::time_point<unspecified, duration>;
  static constexpr bool is_steady = true;

  static time_point now() noexcept;
};
```

1. Objects of class `steady_clock` represent clocks for which values of `time_point` never decrease as physical time advances and for which values of `time_point` advance at a steady rate relative to real time. That is, the clock may not be adjusted.
26.7.7 Class high_resolution_clock

namespace std::chrono {
    class high_resolution_clock {
    public:
        using rep = unspecified;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;
    }
}

1 Objects of class high_resolution_clock represent clocks with the shortest tick period. high_resolution_clock may be a synonym for system_clock or steady_clock.

26.7.8 Local time

1 The family of time points denoted by local_time<Duration> are based on the pseudo clock local_t. local_t has no member now() and thus does not meet the clock requirements. Nevertheless local_time<Duration> serves the vital role of representing local time with respect to a not-yet-specified time zone. Aside from being able to get the current time, the complete time_point algebra is available for local_time<Duration> (just as for sys_time<Duration>).

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);

2 Effects:
    os << sys_time<Duration>{lt.time_since_epoch()};

3 Returns: os.

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const local_time<Duration>& tp,
          const string* abbrev = nullptr, const seconds* offset_sec = nullptr);

4 Effects: Streams tp into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11. If %Z is used, it will be replaced with *abbrev if abbrev is not equal to nullptr. If abbrev is equal to nullptr (and %Z is used), os.setstate(ios_base::failbit) shall be called. If %z is used (or a modified variant of %z), it will be formatted with the value of *offset_sec if offset_sec is not equal to nullptr. If %z (or a modified variant of %z) is used, and offset_sec is equal to nullptr, then os.setstate(ios_base::failbit) shall be called.

5 Returns: os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
           local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
           minutes* offset = nullptr);

6 Effects: Attempts to parse the input stream is into the local_time tp using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) shall be called and tp shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

7 Returns: is.

26.7.9 time_point conversions

26.7.9.1 Class template clock_time_conversion

namespace std::chrono {
    template<class DestClock, class SourceClock>
struct clock_time_conversion {};

clock_time_conversion serves as a trait which can be used to specify how to convert a source time_point of type `time_point<SourceClock, Duration>` to a destination time_point of type `time_point<DestClock, Duration>` via a specialization: `clock_time_conversion<DestClock, SourceClock>`. A specialization of `clock_time_conversion<DestClock, SourceClock>` shall provide a const-qualified operator() that takes a parameter of type `time_point<SourceClock, Duration>` and returns a `time_point<DestClock, OtherDuration>` representing an equivalent point in time. `OtherDuration` is a `chrono::duration` whose specialization is computed from the input `Duration` in a manner which can vary for each `clock_time_conversion` specialization. A program may specialize `clock_time_conversion` if at least one of the template parameters is a user-defined clock type.

Several specializations are provided by the implementation, as described in 26.7.9.2, 26.7.9.3, 26.7.9.4, and 26.7.9.5.

### 26.7.9.2 Identity conversions

```cpp
template<typename Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
    time_point<Clock, Duration>
    operator()(const time_point<Clock, Duration>& t) const;
};
```

Returns: `t`.

```cpp
template<>
struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
    sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;
};
```

Returns: `t`.

```cpp
template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
    utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;
};
```

Returns: `t`.

### 26.7.9.3 Conversions between `system_clock` and `utc_clock`

```cpp
template>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
    utc_time<Common_type_t<Duration, seconds>>
    operator()(const sys_time<Duration>& t) const;
};
```

§ 26.7.9.3
template<class Duration>
utc_time<common_type_t<Duration, seconds>>
operator()(const sys_time<Duration>& t) const;

1 Returns: utc_clock::from_sys(t).

template<class Duration>
sys_time<common_type_t<Duration, seconds>>
operator()(const utc_time<Duration>& t) const;

2 Returns: utc_clock::to_sys(t).

26.7.9.4 Conversions between system_clock and other clocks

[time.clock.cast.sys]
template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
  template<class Duration>
  auto operator()((const time_point<SourceClock, Duration>& t) const
  -> decltype(SourceClock::to_sys(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
-> decltype(SourceClock::to_sys(t));

1 Remarks: This function does not participate in overload resolution unless SourceClock::to_sys(t) is well-formed. If SourceClock::to_sys(t) does not return sys_time<Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.

2 Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
  template<class Duration>
  auto operator()(const sys_time<Duration>& t) const
  -> decltype(DestClock::from_sys(t));
};

template<class Duration>
auto operator()(const sys_time<Duration>& t) const
-> decltype(DestClock::from_sys(t));

3 Remarks: This function does not participate in overload resolution unless DestClock::from_sys(t) is well-formed. If DestClock::from_sys(t) does not return time_point<DestClock, Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.

4 Returns: DestClock::from_sys(t).

26.7.9.5 Conversions between utc_clock and other clocks

[time.clock.cast.utc]
template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
  template<class Duration>
  auto operator()((const time_point<SourceClock, Duration>& t) const
  -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()((const time_point<SourceClock, Duration>& t) const
-> decltype(SourceClock::to_utc(t));

1 Remarks: This function does not participate in overload resolution unless SourceClock::to_utc(t) is well-formed. If SourceClock::to_utc(t) does not return utc_time<Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.
Returns: SourceClock::to_utc(t).

```cpp
template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
};
```

Returns: DestClock::from_utc(t).

Remarks: This function does not participate in overload resolution unless DestClock::from_utc(t) is well-formed. If DestClock::from_utc(t) does not return time_point<DestClock, Duration>, where Duration is a valid chrono::duration specialization, the program is ill-formed.

26.7.9.6 Function template clock_cast

```cpp
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);
```

Remarks: This function does not participate in overload resolution unless at least one of the following clock time conversion expressions is well-formed:

1. clock_time_conversion<DestClock, SourceClock>{}(t)
2. clock_time_conversion<DestClock, system_clock>{}(
   clock_time_conversion<system_clock, SourceClock>{}(t))
3. clock_time_conversion<DestClock, utc_clock>{}(
   clock_time_conversion<utc_clock, SourceClock>{}(t))
4. clock_time_conversion<DestClock, utc_clock>{}(
   clock_time_conversion<utc_clock, system_clock>{}(
   clock_time_conversion<system_clock, SourceClock>{}(t))))
5. clock_time_conversion<DestClock, system_clock>{}(
   clock_time_conversion<system_clock, utc_clock>{}(
   clock_time_conversion<utc_clock, SourceClock>{}(t))))

A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer operator() calls on clock_time_conversion specializations. If, among the well-formed clock time conversion expressions from the above list, there is not a unique best expression, the clock_cast is ambiguous and the program is ill-formed.

Returns: The best well-formed clock time conversion expression in the above list.

26.8 The civil calendar

26.8.1 In general

The types in 26.8 describe the civil (Gregorian) calendar and its relationship to sys_days and local_days.

26.8.2 Class last_spec

```cpp
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
```

The type last_spec is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.
26.8.3 Class day

26.8.3.1 Overview

namespace std::chrono {
    class day {
        unsigned char d_; // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;

        constexpr day& operator++() noexcept;
        constexpr day operator++(int) noexcept;

        constexpr day& operator--() noexcept;
        constexpr day operator--(int) noexcept;

        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;

        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into day’s unspecified internal storage. day is Cpp17EqualityComparable (Table 23) and Cpp17LessThanComparable (Table 24), and participates in basic arithmetic with days objects, which represent a difference between two day objects.

day is a trivially copyable and standard-layout class type.

26.8.3.2 Member functions

    constexpr explicit day(unsigned d) noexcept;
        Effects: Constructs an object of type day by initializing d_ with d. The value held is unspecified if d is not in the range [0, 255].

    constexpr day& operator++() noexcept;
        Effects: ++d_.
        Returns: *this.

    constexpr day operator++(int) noexcept;
        Effects: ++(*this).
        Returns: A copy of *this as it existed on entry to this member function.

    constexpr day& operator--() noexcept;
        Effects: --d_.
        Returns: *this.

    constexpr day operator--(int) noexcept;
        Effects: --(*this).
        Returns: A copy of *this as it existed on entry to this member function.

    constexpr day& operator+=(const days& d) noexcept;
        Effects: *this = *this + d.
        Returns: *this.

    constexpr day& operator-=(const days& d) noexcept;
        Effects: *this = *this - d.
        Returns: *this.
constexpr explicit operator unsigned() const noexcept;

Returns: d_.

constexpr bool ok() const noexcept;

Returns: 1 <= d_ && d_ <= 31.

### 26.8.3.3 Non-member functions

constexpr bool operator==(const day &x, const day &y) noexcept;

Returns: unsigned{x} == unsigned{y}.

constexpr bool operator<(const day &x, const day &y) noexcept;

Returns: unsigned{x} < unsigned{y}.

constexpr day operator+(const day &x, const days &y) noexcept;

Returns: day(unsigned{x} + y.count()).

constexpr day operator+(const days &x, const day &y) noexcept;

Returns: y + x.

constexpr day operator-(const day &x, const days &y) noexcept;

Returns: x + -y.

constexpr days operator-(const day &x, const day &y) noexcept;

Returns: days{int(unsigned{x}) - int(unsigned{y})}.

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const day &d);

Effects: Inserts format(fmt, d) where fmt is "%d" widened to charT. If !d.ok(), appends with " is not a valid day".

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const day &d);

Effects: Streams d into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.

Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, days &d, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the day d using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid day, is.setstate(ios_base::failbit) shall be called and d shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

constexpr day operator"d(unsigned long long d) noexcept;

Returns: day{static_cast<unsigned>(d)}.

### 26.8.4 Class month

#### 26.8.4.1 Overview
class month {
    unsigned char m_;  // exposition only
public:
    month();             // exposition only
    constexpr explicit month(unsigned m) noexcept;
    constexpr month& operator++() noexcept;
    constexpr month operator++(int) noexcept;
    constexpr month& operator--() noexcept;
    constexpr month operator--(int) noexcept;
    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;
    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};

1 month represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into month’s unspecified internal storage. month is Cpp17EqualityComparable (Table 23) and Cpp17LessThanComparable (Table 24), and participates in basic arithmetic with months objects, which represent a difference between two month objects.

2 month is a trivially copyable and standard-layout class type.

26.8.4.2 Member functions

    constexpr explicit month(unsigned m) noexcept;

1 Effects: Constructs an object of type month by initializing m_ with m. The value held is unspecified if m is not in the range \([0, 255]\).

    constexpr month& month::operator++() noexcept;

2 Effects: *this += months\{1\}.
3 Returns: *this.

    constexpr month operator++(int) noexcept;

4 Effects: ++(*this).
5 Returns: A copy of *this as it existed on entry to this member function.

    constexpr month& month::operator--() noexcept;

6 Effects: *this -= months\{1\}.
7 Returns: *this.

    constexpr month operator--(int) noexcept;

8 Effects: --(*this).
9 Returns: A copy of *this as it existed on entry to this member function.

    constexpr month& operator+=(const months& m) noexcept;

10 Effects: *this = *this + m.
11 Returns: *this.

    constexpr month& operator-=(const months& m) noexcept;

12 Effects: *this = *this - m.
13 Returns: *this.

    constexpr explicit month::operator unsigned() const noexcept;

14 Returns: m_.

§ 26.8.4.2
constexpr bool month::ok() const noexcept;  
Returns: \(1 \leq m_\_ \&\& m_\_ \leq 12\).

26.8.4.3 Non-member functions

constexpr bool operator==(const month& x, const month& y) noexcept;  
Returns: unsigned{x} == unsigned{y}.

constexpr bool operator<(const month& x, const month& y) noexcept;  
Returns: unsigned{x} < unsigned{y}.

constexpr month operator+(const month& x, const months& y) noexcept;  
Returns: month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
where modulo(n, 12) computes the remainder of n divided by 12 using Euclidean division. [Note: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of \([0, 11]\). Assuming no overflow in the signed summation, this operation results in a month holding a value in the range \([1, 12]\) even if !x.ok(). —end note] [Example: February + months{11} == January. —end example]

constexpr month operator+(const months& x, const month& y) noexcept;  
Returns: y + x.

constexpr month operator-(const month& x, const months& y) noexcept;  
Returns: x + -y.

constexpr months operator-(const month& x, const month& y) noexcept;  
Returns: If x.ok() == true and y.ok() == true, returns a value m in the range \([\text{months}0], \text{months}{11}\) satisfying y + m == x. Otherwise the value returned is unspecified. [Example: January - February == months{11}. —end example]

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month& m);
Effects: If m.ok() == true inserts format(os.getloc(), fmt, m) where fmt is "%b" widened to charT. Otherwise inserts unsigned{m} << " is not a valid month".
Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const month& m);
Effects: Streams m into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.
Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, 
month& m, basic_string<charT, traits, Alloc>** abbrev = nullptr, 
minutes* offset = nullptr);
Effects: Attempts to parse the input stream is into the month m using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid month, is.setstate(ios_base::failbit) shall be called and m shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.
Returns: is.
26.8.5 Class year

26.8.5.1 Overview
	namespace std::chrono {

class year {
    short y_; // exposition only

global:
    year() = default;
    constexpr explicit year(int y) noexcept;
    constexpr year& operator++() noexcept;
    constexpr year operator++(int) noexcept;
    constexpr year& operator--() noexcept;
    constexpr year operator--(int) noexcept;
    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;
    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;
    constexpr bool is_leap() const noexcept;
    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;

    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
};
}

1 year represents a year in the civil calendar. It can represent values in the range \([\text{min()}, \text{max()}]\). It can be constructed with any \(\text{int}\) value, which will be subsequently truncated to fit into year’s unspecified internal storage. year is Cpp17EqualityComparable (Table 23) and Cpp17LessThanComparable (Table 24), and participates in basic arithmetic with years objects, which represent a difference between two year objects.

2 year is a trivially copyable and standard-layout class type.

26.8.5.2 Member functions

constexpr explicit year(int y) noexcept;

1 Effects: Constructs an object of type year by initializing \(y_\) with \(y\). The value held is unspecified if \(y\) is not in the range \([-32767, 32767]\).

constexpr year& operator++() noexcept;

2 Effects: ++\(y_\).
3 Returns: *this.

constexpr year operator++(int) noexcept;

4 Effects: ++(*this).
5 Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator--() noexcept;

6 Effects: --\(y_\).
7 Returns: *this.

constexpr year operator--(int) noexcept;

8 Effects: --(*this).
9 Returns: A copy of *this as it existed on entry to this member function.
constexpr year& operator+=(const years& y) noexcept;
Effects: *this = *this + y.
Returns: *this.

constexpr year& operator-=(const years& y) noexcept;
Effects: *this = *this - y.
Returns: *this.

constexpr year operator+() const noexcept;
Returns: *this.

constexpr year year::operator-() const noexcept;
Returns: year{-y_}.

constexpr bool is_leap() const noexcept;
Returns: y_ % 4 == 0 && (y_ % 100 != 0 || y_ % 400 == 0).

constexpr explicit operator int() const noexcept;
Returns: y_.

constexpr bool ok() const noexcept;
Returns: min() <= y_ && y_ <= max().

static constexpr year min() noexcept;
Returns: year{-32767}.

static constexpr year max() noexcept;
Returns: year{32767}.

26.8.5.3 Non-member functions [time.cal.year.nonmembers]

constexpr bool operator==(const year& x, const year& y) noexcept;
Returns: int{x} == int{y}.

constexpr bool operator<(const year& x, const year& y) noexcept;
Returns: int{x} < int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;
Returns: year{int{x} + y.count()}.

constexpr year operator+(const years& x, const year& y) noexcept;
Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;
Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;
Returns: years{int{x} - int{y}}.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);
Effects: Inserts format(fmt, y) where fmt is "%Y" widened to charT. If !y.ok(), appends with " is not a valid year".
Returns: os.
template<class charT, class traits>
    basic_ostream<charT, traits>&
    to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const year& y);

Effects: Streams y into os using the format specified by the NTCTS fmt. fmt encoding follows the
rules specified in 26.11.

Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year y using the format flags given in the NTCTS
fmt as specified in 26.12. If the parse fails to decode a valid year, is.setstate(ios_base::failbit)
shall be called and y shall not be modified. If %Z is used and successfully parsed, that value will be
assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed,
that value will be assigned to *offset if offset is non-null.

Returns: is.

constexpr year operator""y(unsigned long long y) noexcept;

Returns: year{static_cast<int>(y)}.

26.8.6 Class weekday

26.8.6.1 Overview

namespace std::chrono {
    class weekday {
        unsigned char wd_; // exposition only
        public:
            weekday() = default;
            constexpr explicit weekday(unsigned wd) noexcept;
            constexpr weekday(const sys_days& dp) noexcept;
            constexpr explicit weekday(const local_days& dp) noexcept;
            constexpr weekday& operator++() noexcept;
            constexpr weekday operator++(int) noexcept;
            constexpr weekday& operator--() noexcept;
            constexpr weekday operator--(int) noexcept;
            constexpr weekday& operator+=(const days& d) noexcept;
            constexpr weekday& operator-=(const days& d) noexcept;
            constexpr explicit operator unsigned() const noexcept;
            constexpr bool ok() const noexcept;
            constexpr weekday_indexed operator[](unsigned index) const noexcept;
            constexpr weekday_last operator[](last_spec) const noexcept;
    };
}

weekday represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6,
corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It
can be constructed with any unsigned value, which will be subsequently truncated to fit into weekday’s
unspecified internal storage. weekday is Cpp17EqualityComparable (Table 23). [Note: weekday is not
Cpp17LessThanComparable because there is no universal consensus on which day is the first day of the week.
weekday’s arithmetic operations treat the days of the week as a circular range, with no beginning and no
end. — end note]

weekday is a trivially copyable and standard-layout class type.
26.8.6.2  Member functions

```cpp
constexpr explicit weekday(unsigned wd) noexcept;
    Effects: Constructs an object of type weekday by initializing wd_ with wd. The value held is unspecified if wd is not in the range [0, 255].

constexpr weekday(const sys_days& dp) noexcept;
    Effects: Constructs an object of type weekday by computing what day of the week corresponds to the sys_days dp, and representing that day of the week in wd_.
    [Example: If dp represents 1970-01-01, the constructed weekday represents Thursday by storing 4 in wd_. — end example]

constexpr explicit weekday(const local_days& dp) noexcept;
    Effects: Constructs an object of type weekday by computing what day of the week corresponds to the local_days dp, and representing that day of the week in wd_.
    Remarks: The value after construction is identical to that constructed from sys_days{dp.time_-since_epoch()}. 

constexpr weekday& operator++() noexcept;
    Effects: *this += days{1}.
    Returns: *this.

constexpr weekday operator++(int) noexcept;
    Effects: ++(*this).
    Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator--() noexcept;
    Effects: *this -= days{1}.
    Returns: *this.

constexpr weekday operator--(int) noexcept;
    Effects: --(*this).
    Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator+=(const days& d) noexcept;
    Effects: *this = *this + d.
    Returns: *this.

constexpr weekday& operator-=(const days& d) noexcept;
    Effects: *this = *this - d.
    Returns: *this.

constexpr explicit operator unsigned() const noexcept;
    Returns: wd_.

constexpr bool ok() const noexcept;
    Returns: wd_ <= 6.

constexpr weekday_indexed operator[](unsigned index) const noexcept;
    Returns: {*this, index}.

constexpr weekday_last operator[](last_spec) const noexcept;
    Returns: weekday_last{*this}.
```
26.8.6.3 Non-member functions

constexpr bool operator==(const weekday& x, const weekday& y) noexcept;

Returns: unsigned{x} == unsigned{y}.

constexpr weekday operator+(const weekday& x, const days& y) noexcept;

Returns:
weekday(modulo(static_cast<long long>(unsigned{x}) + y.count(), 7))
where modulo(n, 7) computes the remainder of n divided by 7 using Euclidean division. [Note: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 6]. Assuming no overflow in the signed summation, this operation results in a weekday holding a value in the range [0, 6] even if !x.ok(). —end note] [Example: Monday + days(6) == Sunday. —end example]

constexpr weekday operator+(const days& x, const weekday& y) noexcept;

Returns: y + x.

constexpr weekday operator-(const weekday& x, const days& y) noexcept;

Returns: x + -y.

constexpr days operator-(const weekday& x, const weekday& y) noexcept;

Returns: If x.ok() == true and y.ok() == true, returns a value d in the range [days{0}, days{6}] satisfying y + d == x. Otherwise the value returned is unspecified. [Example: Sunday - Monday == days{6}. —end example]

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const weekday& wd);

Effects: If wd.ok() == true inserts format(os.getloc(), fmt, wd) where fmt is "%a" widened to charT. Otherwise inserts unsigned{wd} << " is not a valid weekday".

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const weekday& wd);

Effects: Streams wd into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.

Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>&& is, const charT* fmt, weekday& wd, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the weekday wd using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid weekday, is.setstate(ios_base::failbit) shall be called and wd shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

26.8.7 Class weekday_indexed

26.8.7.1 Overview

namespace std::chrono {

class weekday_indexed {

chrono::weekday wd_; // exposition only
unsigned char index_; // exposition only

§ 26.8.7.1 1196
1 \texttt{weekday\_indexed} represents a \texttt{weekday} and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

2 \textbf{[Note:} A \texttt{weekday\_indexed} object can be constructed by indexing a \texttt{weekday} with an unsigned. \textit{— end note]} \textbf{[Example:]}

\begin{verbatim}
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
\end{verbatim}

\textit{— end example}\]

3 \texttt{weekday\_indexed} is a trivially copyable and standard-layout class type.

26.8.7.2 Member functions
\[\text{time.cal.wdidx.members}\]

\begin{verbatim}
constexpr weekday\_indexed(const chrono::weekday& wd, unsigned index) noexcept;
\end{verbatim}

1 \textbf{Effects:} Constructs an object of type \texttt{weekday\_indexed} by initializing \texttt{wd\_} with \texttt{wd} and \texttt{index\_} with \texttt{index}. The values held are unspecified if \texttt{!wd.ok()} or \texttt{index} is not in the range \[1, 5\].

\begin{verbatim}
constexpr chrono::weekday weekday() const noexcept;
\end{verbatim}

2 \textbf{Returns:} \texttt{wd\_}.

\begin{verbatim}
constexpr unsigned index() const noexcept;
\end{verbatim}

3 \textbf{Returns:} \texttt{index\_}.

\begin{verbatim}
constexpr bool ok() const noexcept;
\end{verbatim}

4 \textbf{Returns:} \texttt{wd\_.ok()} \&\& 1 <= \texttt{index\_} \&\& \texttt{index\_} <= 5.

26.8.7.3 Non-member functions
\[\text{time.cal.wdidx.nonmembers}\]

\begin{verbatim}
constexpr bool operator==(const weekday\_indexed& x, const weekday\_indexed& y) noexcept;
\end{verbatim}

1 \textbf{Returns:} \texttt{x.weekday()} == \texttt{y.weekday()} \&\& \texttt{x.index()} == \texttt{y.index()}.

\begin{verbatim}
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday\_indexed& wdi);
\end{verbatim}

2 \textbf{Effects:} \texttt{os} \texttt{\&\& wdi.weekday() \&\& wdi.index() \&\& wdi}.

3 \textbf{Returns:} \texttt{os}.

26.8.8 Class \texttt{weekday\_last}
\[\text{time.cal.wdlast}\]

26.8.8.1 Overview
\[\text{time.cal.wdlast.overview}\]

\begin{verbatim}
namespace std::chrono {

    class weekday\_last {
        chrono::weekday wd_; // exposition only

        public:
            constexpr explicit weekday\_last(const chrono::weekday& wd) noexcept;
            constexpr chrono::weekday\_last(const chrono::weekday\_last& wdl) noexcept;
            constexpr chrono::weekday\_last(chrono::weekday wd) constexpr noexcept;
            constexpr bool ok() const noexcept;
    }
}
\end{verbatim}

§ 26.8.8.1 1197
weekday_last represents the last weekday of a month.

[Note: A weekday_last object can be constructed by indexing a weekday with last. — end note] [Example:
```cpp
constexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
—end example]
weekday_last is a trivially copyable and standard-layout class type.

### 26.8.8.2 Member functions

```cpp
constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

**Effects:** Constructs an object of type weekday_last by initializing wd_ with wd.

```cpp
constexpr chrono::weekday weekday() const noexcept;
```

**Returns:** wd_.

```cpp
constexpr bool ok() const noexcept;
```

**Returns:** wd_.ok().

### 26.8.8.3 Non-member functions

```cpp
constexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

**Returns:** x.weekday() == y.weekday().

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

**Returns:** os << wdl.weekday() << "[last]".

### 26.8.9 Class month_day

#### 26.8.9.1 Overview

```cpp
namespace std::chrono {
    class month_day {
        chrono::month m_; // exposition only
        chrono::day d_; // exposition only

        public:
        month_day() = default;
        constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr bool ok() const noexcept;
    }
}
```

month_day represents a specific day of a specific month, but with an unspecified year. month_day is Cpp17EqualityComparable (Table 23) and Cpp17LessThanComparable (Table 24).

month_day is a trivially copyable and standard-layout class type.

#### 26.8.9.2 Member functions

```cpp
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

**Effects:** Constructs an object of type month_day by initializing m_ with m, and d_ with d.

```cpp
constexpr chrono::month month() const noexcept;
```

**Returns:** m_.

```cpp
constexpr chrono::day day() const noexcept;
```

**Returns:** d_.
constexpr bool ok() const noexcept;

Returns: true if m_.ok() is true, \(1d \leq d\), and \(d\) is less than or equal to the number of days in month \(m\); otherwise returns false. When \(m\) == February, the number of days is considered to be 29.

### 26.8.9.3 Non-member functions

**constexpr bool operator==(const month_day& x, const month_day& y) noexcept;**

Returns: \(x.month() == y.month() && x.day() == y.day()\).

**constexpr bool operator<(const month_day& x, const month_day& y) noexcept;**

Returns: If \(x.month() < y.month()\) returns true. Otherwise, if \(x.month() > y.month()\) returns false. Otherwise, returns \(x.day() < y.day()\).

**template<class charT, class traits>**

- **basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const month_day& md);**

  Returns: \(os \ll md.month() \ll '/' \ll md.day()\).

- **template<class charT, class traits>**

  - **basic_ostream<charT, traits>& to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const month_day& md);**

    Effects: Streams \(md\) into \(os\) using the format specified by the NTCTS \(fmt\). \(fmt\) encoding follows the rules specified in 26.11.

    Returns: \(os\).

**template<class charT, class traits, class Alloc = allocator<charT>>**

- **basic_istream<charT, traits>& from_stream(basic_istream<charT, traits>& is, const charT* fmt, month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);**

  Effects: Attempts to parse the input stream \(is\) into the month_day \(md\) using the format flags given in the NTCTS \(fmt\) as specified in 26.12. If the parse fails to decode a valid month_day, \(is.setstate(ios_base::failbit)\) shall be called and \(md\) shall not be modified. If \%Z is used and successfully parsed, that value will be assigned to \(*abbrev\) if \(abbrev\) is non-null. If \%z (or a modified variant) is used and successfully parsed, that value will be assigned to \(*offset\) if \(offset\) is non-null.

  Returns: \(is\).

### 26.8.10 Class month_day_last

```cpp
namespace std::chrono {
    class month_day_last {
        chrono::month m_;  // exposition only

        public:
            constexpr month_day_last(const chrono::month& m) noexcept;

            constexpr chrono::month month() const noexcept;
            constexpr bool ok() const noexcept;
    };
}
```

**month_day_last** represents the last day of a month.

[Note: A month_day_last object can be constructed using the expression \(m/last\) or \(last/m\), where \(m\) is an expression of type month. — end note]

**Example:**

```cpp
constexpr auto mdl = February/last;  // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
```

**month_day_last** is a trivially copyable and standard-layout class type.
constexpr explicit month_day_last(const chrono::month& m) noexcept;

**Effects:** Constructs an object of type `month_day_last` by initializing `m_` with `m`.

constexpr month month() const noexcept;

**Returns:** `m_`.

constexpr bool ok() const noexcept;

**Returns:** `m_.ok()`.

constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;

**Returns:** `x.month() == y.month()`.

constexpr bool operator<(const month_day_last& x, const month_day_last& y) noexcept;

**Returns:** `x.month() < y.month()`.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);

**Returns:** `os << mdl.month() << "/last"`.

### 26.8.11 Class `month_weekday` [time.cal.mwd]

#### 26.8.11.1 Overview [time.cal.mwd.overview]

```cpp
namespace std::chrono {

class month_weekday {
    chrono::month m_;        // exposition only
    chrono::weekday_indexed wdi_;  // exposition only

public:
    constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

    constexpr month month() const noexcept;

    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

    constexpr bool ok() const noexcept;

};
}
```

`month_weekday` represents the `n`th weekday of a month, of an as yet unspecified year. To do this the `month_weekday` stores a `month` and a `weekday_indexed`.

**Example:**

```cpp
cconstexpr auto mwd = February/Tuesday[3];       // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

`— end example`

`month_weekday` is a trivially copyable and standard-layout class type.

#### 26.8.11.2 Member functions [time.cal.mwd.members]

```cpp
cconstexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

**Effects:** Constructs an object of type `month_weekday` by initializing `m_` with `m`, and `wdi_` with `wdi`.

constexpr chrono::month month() const noexcept;

**Returns:** `m_`.

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

**Returns:** `wdi_`.

constexpr bool ok() const noexcept;

**Returns:** `m_.ok() && wdi_.ok()`.
```
26.8.11.3 Non-member functions

```
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

1

Returns: \( x.\text{month}() == y.\text{month}() \&\& x.\text{weekday_indexed}() == y.\text{weekday_indexed}() \).

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

2

Returns: \( os << mwd.\text{month}() << '/' << mwd.\text{weekday_indexed}() \).

26.8.12 Class month_weekday_last

26.8.12.1 Overview

```
namespace std::chrono {
    class month_weekday_last {
        chrono::month m_;  // exposition only
        chrono::weekday_last wdl_;  // exposition only
    public:
        constexpr month_weekday_last(const chrono::month& m, const chrono::weekday_last& wdl) noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::weekday_last weekday_last() const noexcept;
        constexpr bool ok() const noexcept;
    }
}
```

1

month_weekday_last represents the last weekday of a month, of an as yet unspecified year. To do this the month_weekday_last stores a month and a weekday_last.

```
constexpr auto mwd
    = February/Tuesday[last];  // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_last() == Tuesday[last]);
```

1 Example:

2

3 month_weekday_last is a trivially copyable and standard-layout class type.

26.8.12.2 Member functions

```
constexpr month_weekday_last(const chrono::month& m, const chrono::weekday_last& wdl) noexcept;
```

1

Effects: Constructs an object of type month_weekday_last by initializing \( m_ \) with \( m \), and \( wdl_ \) with \( wdl \).

```
constexpr chrono::month month() const noexcept;
```

2

Returns: \( m_ \).

```
constexpr chrono::weekday_last weekday_last() const noexcept;
```

3

Returns: \( wdl_ \).

```
constexpr bool ok() const noexcept;
```

4

Returns: \( m_.\text{ok}() \&\& wdl_.\text{ok}() \).

26.8.12.3 Non-member functions

```
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

1

Returns: \( x.\text{month}() == y.\text{month}() \&\& x.\text{weekday_last}() == y.\text{weekday_last}() \).
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);

Returns: os << mwdl.month() << '/' << mwdl.weekday_last().

26.8.13 Class year_month
26.8.13.1 Overview

namespace std::chrono {

class year_month {
    chrono::year y_;              // exposition only
    chrono::month m_;             // exposition only

public:
    year_month() = default;
    constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr year_month& operator+=(const months& dm) noexcept;
    constexpr year_month& operator-=(const months& dm) noexcept;
    constexpr year_month& operator+=(const years& dy) noexcept;
    constexpr year_month& operator-=(const years& dy) noexcept;
    constexpr bool ok() const noexcept;
};
}

1 year_month represents a specific month of a specific year, but with an unspecified day. year_month is
a field-based time point with a resolution of months. year_month is Cpp17EqualityComparable (Table 23) and
Cpp17LessThanComparable (Table 24).

2 year_month is a trivially copyable and standard-layout class type.

26.8.13.2 Member functions

constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

1 Effects: Constructs an object of type year_month by initializing y_ with y, and m_ with m.

constexpr chrono::year year() const noexcept;

2 Returns: y_.

constexpr chrono::month month() const noexcept;

3 Returns: m_.

constexpr year_month& operator+=(const months& dm) noexcept;

4 Effects: *this = *this + dm.

5 Returns: *this.

constexpr year_month& operator-=(const months& dm) noexcept;

6 Effects: *this = *this - dm.

7 Returns: *this.

constexpr year_month& operator+=(const years& dy) noexcept;

8 Effects: *this = *this + dy.

9 Returns: *this.

constexpr year_month& operator-=(const years& dy) noexcept;

10 Effects: *this = *this - dy.

11 Returns: *this.

§ 26.8.13.2

26.8.13.3 Non-member functions

constexpr bool ok() const noexcept;

Returns: y_.ok() && m_.ok().

12

26.8.13.3 Non-member functions

constexpr bool operator==(const year_month& x, const year_month& y) noexcept;

Returns: x.year() == y.year() && x.month() == y.month().

1

constexpr bool operator<(const year_month& x, const year_month& y) noexcept;

Returns: If x.year() < y.year() returns true. Otherwise, if x.year() > y.year() returns false. Otherwise, returns x.month() < y.month().

2

constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;

Returns: A year_month value z such that z - ym == dm.
Complexity: $O(1)$ with respect to the value of dm.

3

constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;

Returns: ym + dm.

4

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;

Returns: ym + -dm.

5

constexpr months operator-(const year_month& x, const year_month& y) noexcept;

Returns:

x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
static_cast<int>(unsigned{y.month()})}

6

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;

Returns: (ym.year() + dy) / ym.month().

7

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;

Returns: ym + dy.

8

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;

Returns: ym + -dy.

9

template<class charT, class traits>

basic_ostream<charT, traits>&

operator<<(basic_ostream<charT, traits>& os, const year_month& ym);

Returns: os << ym.year() << '/' << ym.month().

10

template<class charT, class traits>

basic_ostream<charT, traits>&

to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const year_month& ym);

Effects: Streams ym into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.

11

template<class charT, class traits, class Alloc = allocator<charT>>

basic_istream<charT, traits>&

from_stream(basic_istream<charT, traits>& is, const charT* fmt, year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month ym using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid year_month, is.setstate(ios_base::failbit) shall be called and ym shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

13
26.8.14 Class year_month_day

26.8.14.1 Overview

namespace std::chrono {
    class year_month_day {
        chrono::year y_; // exposition only
        chrono::month m_;  // exposition only
        chrono::day d_;    // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m, const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;
        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;
        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

1 year_month_day represents a specific year, month, and day. year_month_day is a field-based time point with a resolution of days. [Note: year_month_day supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. —end note] year_month_day is Cpp17EqualityComparable (Table 23) and Cpp17LessThanComparable (Table 24),

2 year_month_day is a trivially copyable and standard-layout class type.

26.8.14.2 Member functions

constexpr year_month_day(const chrono::year& y, const chrono::month& m, const chrono::day& d) noexcept;
1 Effects: Constructs an object of type year_month_day by initializing y_ with y, m_ with m, and d_ with d.

constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
2 Effects: Constructs an object of type year_month_day by initializing y_ with ymdl.year(), m_ with ymdl.month(), and d_ with ymdl.day(). [Note: This conversion from year_month_day_last to year_month_day may be more efficient than converting a year_month_day_last to a sys_days, and then converting that sys_days to a year_month_day. —end note]

constexpr year_month_day(const sys_days& dp) noexcept;
3 Effects: Constructs an object of type year_month_day that corresponds to the date represented by dp.

Remarks: For any value ymd of type year_month_day for which ymd.ok() is true, ymd == year_month_day(sys_days{ymd}) is true.

constexpr explicit year_month_day(const local_days& dp) noexcept;
5 Effects: Constructs an object of type year_month_day that corresponds to the date represented by dp.

Remarks: Equivalent to constructing with sys_days(dp.time_since_epoch()).
constexpr year_month_day& operator+=(const months& m) noexcept;
7 Effects: *this = *this + m.
8 Returns: *this.

constexpr year_month_day& operator-=(const months& m) noexcept;
9 Effects: *this = *this - m.
10 Returns: *this.

constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;
11 Effects: *this = *this + y.
12 Returns: *this.

constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;
13 Effects: *this = *this - y.
14 Returns: *this.

constexpr chrono::year year() const noexcept;
15 Returns: y_.

constexpr chrono::month month() const noexcept;
16 Returns: m_.

constexpr chrono::day day() const noexcept;
17 Returns: d_.

constexpr operator sys_days() const noexcept;
18 Returns: If ok(), returns a sys_days holding a count of days from the sys_days epoch to *this (a negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok() && m_.ok() is true, returns a sys_days which is offset from sys_days{y_/m_/last}.day() by the number of days d_ is offset from sys_days{y_/m_/last}.day(). Otherwise the value returned is unspecified.

Remarks: A sys_days in the range [days{-12687428}, days{11248737}] which is converted to a year_month_day shall have the same value when converted back to a sys_days.
19 [Example:
20 static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
21 static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
22 static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
23 —end example]

constexpr explicit operator local_days() const noexcept;
21 Returns: local_days{sys_days{*this}.time_since_epoch()}.

constexpr bool ok() const noexcept;
22 Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d, (y_/m_/last).day()], then returns true; otherwise returns false.

### 26.8.14.3 Non-member functions

**[time.cal.ymd.nonmembers]**

constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;
1 Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

constexpr bool operator<(const year_month_day& x, const year_month_day& y) noexcept;
2 Returns: If x.year() < y.year(), returns true. Otherwise, if x.year() > y.year(), returns false. Otherwise, if x.month() < y.month(), returns true. Otherwise, if x.month() > y.month(), returns false. Otherwise, returns x.day() < y.day().

§ 26.8.14.3
constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;
3
Returns: (ymd.year() / ymd.month() + dm) / ymd.day().
4
[Note: If ymd.day() is in the range [1d, 28d], ok() will return true for the resultant year_month_day.
—end note]

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;
5
Returns: ymd + dm.

constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;
6
Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;
7
Returns: (ymd.year() + dy) / ymd.month() / ymd.day().
8
[Note: If ymd.month() is February and ymd.day() is not in the range [1d, 28d], ok() may return false for the resultant year_month_day. —end note]

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;
9
Returns: ymd + dy.

constexpr year_month_day operator-(const year_month_day& ymd, const years& dy) noexcept;
10
Returns: ymd + (-dy).

template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);
11
Effects: Inserts format(fmt, ymd) where fmt is "%F" widened to charT. If !ymd.ok(), appends with " is not a valid date".
12
Returns: os.

template<class charT, class traits>
 basic_ostream<charT, traits>&
 to_stream(basic_ostream<charT, traits>& os, const charT* fmt, const year_month_day& ymd);
13
Effects: Streams ymd into os using the format specified by the NTCTS fmt. fmt encoding follows the rules specified in 26.11.
14
Returns: os.

template<class charT, class traits, class Alloc = allocator<charT>>
 basic_istream<charT, traits>&
 from_stream(basic_istream<charT, traits>& is, const charT* fmt,
 year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
 minutes* offset = nullptr);
15
Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags given in the NTCTS fmt as specified in 26.12. If the parse fails to decode a valid year_month_day, is.setstate(ios_base::failbit) shall be called and ymd shall not be modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.
16
Returns: is.

26.8.15 Class year_month_day_last
26.8.15.1 Overview

namespace std::chrono {
 class year_month_day_last {
 chrono::year y_; // exposition only
 chrono::month_day_last mdl_; // exposition only

§ 26.8.15.1 1206
public:

constexpr year_month_day_last(const chrono::year& y, 
    const chrono::month_day_last& mdl) noexcept;

constexpr year_month_day_last& operator+=(const months& m) noexcept;
constexpr year_month_day_last& operator-=(const months& m) noexcept;
constexpr year_month_day_last& operator+=(const years& y) noexcept;
constexpr year_month_day_last& operator-=(const years& y) noexcept;

constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::month_day_last month_day_last() const noexcept;
constexpr chrono::day day() const noexcept;
constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;

};

§ 26.8.15.2 Member functions

constexpr year_month_day_last(const chrono::year& y, 
    const chrono::month_day_last& mdl) noexcept;

Effects: Constructs an object of type year_month_day_last by initializing y_ with y and mdl_ with mdl.

constexpr year_month_day_last& operator+=(const months& m) noexcept;
Effects: *this = *this + m.

Returns: *this.

constexpr year_month_day_last& operator-=(const months& m) noexcept;
Effects: *this = *this - m.

Returns: *this.

constexpr year_month_day_last& operator+=(const years& y) noexcept;
Effects: *this = *this + y.

Returns: *this.

constexpr year_month_day_last& operator-=(const years& y) noexcept;
Effects: *this = *this - y.

Returns: *this.

constexpr chrono::year year() const noexcept;
Returns: y_.

constexpr chrono::month month() const noexcept;
Returns: mdl_.month().

constexpr chrono::month_day_last month_day_last() const noexcept;
Returns: mdl_.

year_month_day_last represents the last day of a specific year and month. year_month_day_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month. [Note: year_month_day_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note] year_month_day_last is Cpp17EqualityComparable (Table 23) and Cpp17LessThanComparable (Table 24).

year_month_day_last is a trivially copyable and standard-layout class type.
constexpr chrono::day day() const noexcept;

Returns: A day representing the last day of the (year, month) pair represented by *this.

[Note: This value may be computed on demand. —end note]

constexpr operator sys_days() const noexcept;

Returns: sys_days(year()/month()/day()).

cconstexpr explicit operator local_days() const noexcept;

Returns: local_days{sys_days{*this}.time_since_epoch()}. 

cconstexpr bool ok() const noexcept;

Returns: y_.ok() && mdl_.ok().

26.8.15.3 Non-member functions [time.cal.ymdlast.nonmembers]

cconstexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;

Returns: x.year() == y.year() && x.month_day_last() == y.month_day_last().

cconstexpr bool operator<(const year_month_day_last& x, const year_month_day_last& y) noexcept;

Returns: If x.year() < y.year(), returns true. Otherwise, if x.year() > y.year(), returns false. 
Otherwise, returns x.month_day_last() < y.month_day_last() .

cconstexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const months& dm) noexcept;

Returns: (ymdl.year() / ymdl.month() + dm) / last.

cconstexpr year_month_day_last
operator+(const months& dm, const year_month_day_last& ymdl) noexcept;

Returns: ymdl + dm.

cconstexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const months& dm) noexcept;

Returns: ymdl + (-dm).

cconstexpr year_month_day_last
operator+(const years& dy, const year_month_day_last& ymdl) noexcept;

Returns: ymdl + dy.

cconstexpr year_month_day_last
operator-(const years& dy, const year_month_day_last& ymdl) noexcept;

Returns: ymdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);

Returns: os << ymdl.year() << '/' << ymdl.month_day_last().

26.8.16 Class year_month_weekday [time.cal.ymwd]
26.8.16.1 Overview [time.cal.ymwd.overview]

namespace std::chrono {

class year_month_weekday {

chrono::year y_; // exposition only
 chrono::month m_; // exposition only
 chrono::weekday_indexed wdi_; // exposition only

}}
public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
    const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;
    constexpr year_month_weekday& operator+=(const months& m) noexcept;
    constexpr year_month_weekday& operator-=(const months& m) noexcept;
    constexpr year_month_weekday& operator+=(const years& y) noexcept;
    constexpr year_month_weekday& operator-=(const years& y) noexcept;
    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned index() const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
    constexpr operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};

1. year_month_weekday represents a specific year, month, and n-th weekday of the month. year_month_weekday is a field-based time point with a resolution of days. [Note: year_month_weekday supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. —end note] year_month_weekday is Cpp17EqualityComparable (Table 23).

2. year_month_weekday is a trivially copyable and standard-layout class type.

26.8.16.2 Member functions

constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
const chrono::weekday_indexed& wdi) noexcept;

Effects: Constructs an object of type year_month_weekday by initializing y_ with y, m_ with m, and wdi_ with wdi.

constexpr year_month_weekday(const sys_days& dp) noexcept;

Effects: Constructs an object of type year_month_weekday which corresponds to the date represented by dp.

Remarks: For any value ymdl of type year_month_weekday for which ymdl.ok() is true, ymdl == year_month_weekday{sys_days{ymdl}} is true.

constexpr explicit year_month_weekday(const local_days& dp) noexcept;

Effects: Constructs an object of type year_month_weekday that corresponds to the date represented by dp.

Remarks: Equivalent to constructing with sys_days{dp.time_since_epoch()}.

constexpr year_month_weekday& operator+=(const months& m) noexcept;

Effects: *this = *this + m.

Returns: *this.

constexpr year_month_weekday& operator-=(const months& m) noexcept;

Effects: *this = *this - m.

Returns: *this.

constexpr year_month_weekday& operator+=(const years& y) noexcept;

Effects: *this = *this + y.
11    Returns: *this.
constexpr year_month_weekday& operator-=(const years& y) noexcept;
12    Effects: *this = *this - y.
13    Returns: *this.
constexpr chrono::year year() const noexcept;
14    Returns: y_.
constexpr chrono::month month() const noexcept;
15    Returns: m_.
constexpr chrono::weekday weekday() const noexcept;
16    Returns: wdi_.weekday().
constexpr unsigned index() const noexcept;
17    Returns: wdi_.index().
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
18    Returns: wdi_.
constexpr operator sys_days() const noexcept;
19    Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents
20          the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
21          the returned sys_days represents the date 7 days prior to the first weekday() of year()/month(). Otherwise the returned value is unspecified.
constexpr explicit operator local_days() const noexcept;
22    Returns: local_days{sys_days{*this}.time_since_epoch()}.
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);

Returns: os << ymwdi.year() << '/' << ymwdi.month() << '/' << ymwdi.weekday_indexed().

26.8.17 Class year_month_weekday_last

26.8.17.1 Overview

namespace std::chrono {
  class year_month_weekday_last {
    chrono::year y_; // exposition only
    chrono::month m_; // exposition only
    chrono::weekday_last wdl_; // exposition only
  }

  public:
    constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
    const chrono::weekday_last& wdl) noexcept;
    constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
    constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
    constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::weekday weekday() const noexcept;
    constexpr chrono::weekday_last weekday_last() const noexcept;
    constexpr operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  }
};

1 year_month_weekday_last represents a specific year, month, and last weekday of the month. year_month_rank_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last weekday of a year and month. [Note: year_month_weekday_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note] year_month_weekday_last is Cpp17EqualityComparable (Table 23).

26.8.17.2 Member functions

1 constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m, const chrono::weekday_last& wdl) noexcept;

Effects: Constructs an object of type year_month_weekday_last by initializing y_ with y, m_ with m, and wdl_ with wdl.

constexpr year_month_weekday_last& operator+=(const months& m) noexcept;

Effects: *this = *this + m.

Returns: *this.

constexpr year_month_weekday_last& operator-=(const months& m) noexcept;

Effects: *this = *this - m.

Returns: *this.

constexpr year_month_weekday_last& operator+=(const years& y) noexcept;

Effects: *this = *this + y.

Returns: *this.
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;

Effects: \(*this = *this - y.\)

Returns: \(*this.\)

constexpr chrono::year year() const noexcept;

Returns: y_.

constexpr chrono::month month() const noexcept;

Returns: m_.

constexpr chrono::weekday weekday() const noexcept;

Returns: wdl_.weekday().

constexpr chrono::weekday_last weekday_last() const noexcept;

Returns: wdl_.

constexpr operator sys_days() const noexcept;

Returns: If ok() == true, returns a sys_days that represents the last weekday() of year()/month(). Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;

Returns: local_days{sys_days{*this}.time_since_epoch()}.  

constexpr bool ok() const noexcept;

Returns: y_.ok() && m_.ok() && wdl_.ok().

26.8.17.3 Non-member functions [time.cal.ymwdlast.nonmembers]

constexpr bool operator==(const year_month_weekday_last& x,  
const year_month_weekday_last& y) noexcept;

Returns: x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last();

constexpr year_month_weekday_last  
operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;

Returns: (ymwdl.year() / ymwdl.month() + dm) / ymwdl.weekday_last().

constexpr year_month_weekday_last  
operator+(const months& dm, const year_month_weekday_last& ymwdl) noexcept;

Returns: ymwdl + dm.

constexpr year_month_weekday_last  
operator-(const year_month_weekday_last& ymwdl, const months& dm) noexcept;

Returns: ymwdl + (-dm).

constexpr year_month_weekday_last  
operator+(const year_month_weekday_last& ymwdl, const years& dy) noexcept;

Returns: \{ymwdl.year()+dy, ymwdl.month(), ymwdl.weekday_last()\}.

constexpr year_month_weekday_last  
operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;

Returns: ymwdl + dy.

constexpr year_month_weekday_last  
operator-(const year_month_weekday_last& ymwdl, const years& dy) noexcept;

Returns: ymwdl + (-dy).
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);

Returns: os << ymwdl.year() << '/' << ymwdl.month() << '/' << ymwdl.weekday_last().

26.8.18 Conventional syntax operators

A set of overloaded operator/ functions provides a conventional syntax for the creation of civil calendar dates.

[Note: The year, month, and day are accepted in any of the following 3 orders:

year/month/day
month/day/year
day/month/year

Anywhere a day is required, any of the following can also be specified:

last
weekday[i]
weekday[last]

—end note]

[Note: Partial-date types such as year_month and month_day can be created by not applying the second division operator for any of the three orders. For example:

year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;

—end note]

[Example:

auto a = 2015/4/4;    // a == int(125)
auto b = 2015y/4/4;   // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;  // error: no viable operator/ for first /
auto d = 2015/April/4;  // error: no viable operator/ for first /

—end example]

constexpr year_month
operator/(const year& y, const month& m) noexcept;

Returns: {y, m}.

constexpr year_month
operator/(const year& y, int m) noexcept;

Returns: y / month(m).

constexpr month_day
operator/(const month& m, const day& d) noexcept;

Returns: {m, d}.

constexpr month_day
operator/(const month& m, int d) noexcept;

Returns: m / day(d).

constexpr month_day
operator/(int m, const day& d) noexcept;

Returns: month(m) / d.

constexpr month_day
operator/(const day& d, const month& m) noexcept;

Returns: m / d.
constexpr month_day
operator/(const day& d, int m) noexcept;

Returns: month(m) / d.

constexpr month_day_last
operator/(const month& m, last_spec) noexcept;

Returns: month_day_last(m).

constexpr month_day_last
operator/(int m, last_spec) noexcept;

Returns: month(m) / last.

constexpr month_day_last
operator/(last_spec, const month& m) noexcept;

Returns: m / last.

constexpr month_day_last
operator/(last_spec, int m) noexcept;

Returns: month(m) / last.

constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;

Returns: {m, wdi}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;

Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;

Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;

Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;

Returns: {m, wdl}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;

Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;

Returns: m / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;

Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;

Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;

Returns: ym / day(d).
constexpr year_month_day
    operator/(const year& y, const month_day& md) noexcept;

Returns: y / md.month() / md.day().

constexpr year_month_day
    operator/(int y, const month_day& md) noexcept;

Returns: year(y) / md.

constexpr year_month_day
    operator/(const month_day& md, const year& y) noexcept;

Returns: y / md.

constexpr year_month_day
    operator/(const month_day& md, int y) noexcept;

Returns: year(y) / md.

constexpr year_month_day_last
    operator/(const year_month& ym, last_spec) noexcept;

Returns: {ym.year(), month_day_last{ym.month()}}.

constexpr year_month_day_last
    operator/(const year& y, const month_day_last& mdl) noexcept;

Returns: {y, mdl}.

constexpr year_month_day_last
    operator/(int y, const month_day_last& mdl) noexcept;

Returns: year(y) / mdl.

constexpr year_month_day_last
    operator/(const month_day_last& mdl, const year& y) noexcept;

Returns: y / mdl.

constexpr year_month_day_last
    operator/(const month_day_last& mdl, int y) noexcept;

Returns: year(y) / mdl.

constexpr year_month_weekday
    operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;

Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
    operator/(const year& y, const month_weekday& mwd) noexcept;

Returns: {y, mwd.month(), mwd.weekday_indexed()}.

constexpr year_month_weekday
    operator/(int y, const month_weekday& mwd) noexcept;

Returns: year(y) / mwd.

constexpr year_month_weekday
    operator/(const month_weekday& mwd, const year& y) noexcept;

Returns: y / mwd.

constexpr year_month_weekday
    operator/(const month_weekday& mwd, int y) noexcept;

Returns: year(y) / mwd.

constexpr year_month_weekday_last
    operator/(const year_month& ym, const weekday_last& wdl) noexcept;

Returns: {ym.year(), ym.month(), wdl}.
constexpr year_month_weekday_last
operator/(const year& y, const month_weekday_last& mwdl) noexcept;

Returns: \{y, mwdl.month(), mwdl.weekday_last()\}.

constexpr year_month_weekday_last
operator/(int y, const month_weekday_last& mwdl) noexcept;

Returns: year(y) / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;

Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;

Returns: year(y) / mwdl.

26.9 Class template time_of_day

26.9.1 Overview

namespace std::chrono {
    template<class Duration> class time_of_day;
    template<> class time_of_day<hours>;
    template<> class time_of_day<minutes>;
    template<> class time_of_day<seconds>;
    template<class Rep, class Period> class time_of_day<duration<Rep, Period>>;
}

1 The time_of_day class template splits a duration representing the time elapsed since midnight into a “broken down” time of day such as hours:minutes:seconds. The Duration template parameter dictates the precision to which the time is broken down. [Note: This can vary from a coarse precision of hours to a very fine precision of nanoseconds. —end note] A time_of_day object also tracks whether it should be output as a 12-hour time format or a 24-hour time format.

2 The primary time_of_day template is not defined. Four specializations are provided to handle four different levels of precision.

3 Each specialization of time_of_day is a trivially copyable and standard-layout class type.

26.9.2 Hours precision

namespace std::chrono {
    template<>
    class time_of_day<hours> {
    public:
        using precision = chrono::hours;
        time_of_day() = default;
        constexpr explicit time_of_day(chrono::hours since_midnight) noexcept;
        constexpr chrono::hours hours() const noexcept;
        constexpr explicit operator precision() const noexcept;
        constexpr precision_to_duration() const noexcept;
        constexpr void make24() noexcept;
        constexpr void make12() noexcept;
    };

1 [Note: This specialization handles hours since midnight. —end note]

constexpr explicit time_of_day(chrono::hours since_midnight) noexcept;

2 Effects: Constructs an object of type time_of_day in 24-hour format corresponding to since_midnight hours after 00:00:00.
Ensures: `hours()` returns the integral number of hours since_midnight is after 00:00:00.

```cpp
constexpr chrono::hours hours() const noexcept;
```

Returns: The stored hour of *this.

```cpp
constexpr explicit operator precision() const noexcept;
```

Returns: The number of hours since midnight.

```cpp
constexpr precision to_duration() const noexcept;
```

Returns: `precision{*this}`.

```cpp
constexpr void make24() noexcept;
```

Effects: If *this is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

```cpp
constexpr void make12() noexcept;
```

Effects: If *this is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

### 26.9.3 Minutes precision

[time.tod.minutes]

```cpp
namespace std::chrono {
    template<>
    class time_of_day<minutes> {
    public:
        using precision = chrono::minutes;
        time_of_day() = default;
    
    constexpr explicit time_of_day(minutes since_midnight) noexcept;
        
    constexpr chrono::hours hours() const noexcept;
        
    constexpr chrono::minutes minutes() const noexcept;
        
    constexpr explicit operator precision() const noexcept;
        
    constexpr precision to_duration() const noexcept;
        
    constexpr void make24() noexcept;
    
    constexpr void make12() noexcept;
    
    };
}
```

[Note: This specialization handles hours and minutes since midnight. — end note]

```cpp
constexpr explicit time_of_day(minutes since_midnight) noexcept;
```

Effects: Constructs an object of type `time_of_day` in 24-hour format corresponding to `since_midnight` minutes after 00:00:00.

Ensures: `hours()` returns the integral number of hours since_midnight is after 00:00:00. `minutes()` returns the integral number of minutes since_midnight is after (00:00:00 + hours()).

```cpp
constexpr chrono::hours hours() const noexcept;
```

Returns: The stored hour of *this.

```cpp
constexpr chrono::minutes minutes() const noexcept;
```

Returns: The stored minute of *this.

```cpp
constexpr explicit operator precision() const noexcept;
```

Returns: The number of minutes since midnight.

```cpp
constexpr precision to_duration() const noexcept;
```

Returns: `precision{*this}`.

```cpp
constexpr void make24() noexcept;
```

Effects: If *this is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.
```cpp
constexpr void make12() noexcept;

Effects: If *this is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.4 Seconds precision

namespace std::chrono {

template<class Rep, class Period>

class time_of_day<duration<Rep, Period>> {

public:

    using precision = duration<Rep, Period>;

    time_of_day() = default;
    constexpr explicit time_of_day(duration<Rep, Period> since_midnight) noexcept;

    constexpr chrono::hours hours() const noexcept;
    constexpr chrono::minutes minutes() const noexcept;
    constexpr chrono::seconds seconds() const noexcept;
    constexpr explicit operator precision() const noexcept;
    constexpr precision to_duration() const noexcept;

    constexpr void make24() noexcept;
    constexpr void make12() noexcept;

};
}

1 [Note: This specialization handles hours, minutes, and seconds since midnight. — end note]

constexpr explicit time_of_day(seconds since_midnight) noexcept;
2 Effects: Constructs an object of type time_of_day in 24-hour format corresponding to since_midnight seconds after 00:00:00.
3 Ensures: hours() returns the integral number of hours since_midnight is after 00:00:00. minutes() returns the integral number of minutes since_midnight is after (00:00:00 + hours()). seconds() returns the integral number of seconds since_midnight is after (00:00:00 + hours() + minutes()).

constexpr chrono::hours hours() const noexcept;
4 Returns: The stored hour of *this.

constexpr chrono::minutes minutes() const noexcept;
5 Returns: The stored minute of *this.

constexpr chrono::seconds seconds() const noexcept;
6 Returns: The stored second of *this.

constexpr explicit operator precision() const noexcept;
7 Returns: The number of seconds since midnight.

constexpr precision to_duration() const noexcept;
8 Returns: precision{*this}.

constexpr void make24() noexcept;
9 Effects: If *this is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

constexpr void make12() noexcept;
10 Effects: If *this is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.5 Sub-second precision

namespace std::chrono {

template<class Rep, class Period>

class time_of_day<duration<Rep, Period>> {

public:

};
}
```

using precision = duration<Rep, Period>;

time_of_day() = default;
constexpr explicit time_of_day(precision since_midnight) noexcept;

constexpr chrono::hours hours() const noexcept;
constexpr chrono::minutes minutes() const noexcept;
constexpr chrono::seconds seconds() const noexcept;
constexpr precision subseconds() const noexcept;

constexpr explicit operator precision() const noexcept;
constexpr precision_to_duration() const noexcept;

constexpr void make24() noexcept;
constexpr void make12() noexcept;
};

This specialization shall not exist unless treat_as_floating_point_v<Rep> is false and duration<Rep, Period> is not convertible to seconds. [Note: This specialization handles hours, minutes, seconds, and fractional seconds since midnight. Typical uses are with milliseconds, microseconds and nanoseconds. — end note]

constexpr explicit time_of_day(precision since_midnight) noexcept;

Effects: Constructs an object of type time_of_day in 24-hour format corresponding to since_midnight fractional seconds after 00:00:00.

Ensures: hours() returns the integral number of hours since_midnight is after 00:00:00. minutes() returns the integral number of minutes since_midnight is after (00:00:00 + hours()). seconds() returns the integral number of seconds since_midnight is after (00:00:00 + hours() + minutes()). subseconds() returns the integral number of fractional seconds since_midnight is after (00:00:00 + hours() + minutes() + seconds()).

constexpr chrono::hours hours() const noexcept;

Returns: The stored hour of *this.

constexpr chrono::minutes minutes() const noexcept;

Returns: The stored minute of *this.

constexpr chrono::seconds seconds() const noexcept;

Returns: The stored second of *this.

constexpr duration<Rep, Period> subseconds() const noexcept;

Returns: The stored subsecond of *this.

constexpr explicit operator precision() const noexcept;

Returns: The number of subseconds since midnight.

constexpr precision to_duration() const noexcept;

Returns: precision{*this}.

constexpr void make24() noexcept;

Effects: If *this is a 12-hour time, converts to a 24-hour time. Otherwise, no effects.

constexpr void make12() noexcept;

Effects: If *this is a 24-hour time, converts to a 12-hour time. Otherwise, no effects.

26.9.6 Formatted output

template<class charT, class traits>
basic_ostream<charT, traits>&

§ 26.9.6
operator<<(basic_ostream<charT, traits>& os, const time_of_day<hours>& t);

Effects: If \( t \) is a 24-hour time, outputs to \( os \) according to the format "\%H00" (26.11). Otherwise outputs to \( os \) according to the format "\%I%p" (26.11).

Returns: \( os \).

[Example:
for (hours h : {1h, 18h}) {
    time_of_day<hours> tod(h);
    os << tod << ' \n';
    tod.make12();
    os << tod << ' \n';
}

Produces the output:
0100
1am
1800
6pm
— end example]

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const time_of_day<minutes>& t);

Effects: If \( t \) is a 24-hour time, outputs to \( os \) according to the format "\%H:\%M" (26.11). Otherwise outputs to \( os \) according to the format "\%I:\%M%p" (26.11).

Returns: \( os \).

[Example:
for (minutes m : {68min, 1095min}) {
    time_of_day<minutes> tod(m);
    os << tod << ' \n';
    tod.make12();
    os << tod << ' \n';
}

Produces the output:
01:08
1:08am
18:15
6:15pm
— end example]

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const time_of_day<seconds>& t);

Effects: If \( t \) is a 24-hour time, outputs to \( os \) according to the format "\%T" (26.11). Otherwise outputs to \( os \) according to the format "\%I:\%M:%S%p" (26.11).

Returns: \( os \).

[Example:
for (seconds s : {4083s, 65745s}) {
    time_of_day<seconds> tod(s);
    os << tod << ' \n';
    tod.make12();
    os << tod << ' \n';
}

Produces the output:
01:08:03
1:08:03am

§ 26.9.6 1220
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const time_of_day<duration<Rep, Period>>& t);

Effects: If \( t \) is a 24-hour time, outputs to \( os \) according to the format "%T" (26.11). Otherwise outputs to \( os \) according to the format "%I:%M:%S%p" (26.11).

Returns: \( os \).

[Example:

```
for (milliseconds ms : {4083007ms, 65745123ms}) {
    time_of_day<seconds> tod(ms);
    os << tod << '\n';
    tod.make12();
    os << tod << '\n';
}
```

Produces the output:

```
01:08:03.007
1:08:03.007am
18:15:45.123
6:15:45.123pm
```

—end example]
26.10.2.2 Class tzdb_list

namespace std::chrono {
    class tzdb_list {
        public:
            tzdb_list(const tzdb_list&) = delete;
            tzdb_list& operator=(const tzdb_list&) = delete;

            // unspecified additional constructors

            class const_iterator;

            const tzdb& front() const noexcept;
            const_iterator erase_after(const_iterator p);

            const_iterator begin() const noexcept;
            const_iterator end() const noexcept;

            const_iterator cbegin() const noexcept;
            const_iterator cend() const noexcept;
    };
}

The tzdb_list database is a singleton; the unique object of type tzdb_list can be accessed via the get_tzdb_list() function. [Note: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the front() of this list via the read-only namespace scope functions get_tzdb(), locate_zone(), and current_zone(). — end note] The tzdb_list object contains a list of tzdb objects.

const tzdb& front() const noexcept;

Returns: A reference to the first tzdb in the container.

Remarks: This operation is thread-safe with respect to reload_tzdb(). [Note: reload_tzdb() pushes a new tzdb onto the front of this container. — end note]

const_iterator erase_after(const_iterator p);

Requires: The iterator following p is dereferenceable.

Effects: Erases the tzdb referred to by the iterator following p.

Returns: An iterator pointing to the element following the one that was erased, or end() if no such element exists.

Remarks: No pointers, references, or iterators are invalidated except those referring to the erased tzdb. [Note: It is not possible to erase the tzdb referred to by begin(). — end note]

Throws: Nothing.

const_iterator begin() const noexcept;

Returns: An iterator referring to the first tzdb in the container.

const_iterator end() const noexcept;

Returns: An iterator referring to the position one past the last tzdb in the container.

const_iterator cbegin() const noexcept;

Returns: begin().

const_iterator cend() const noexcept;

Returns: end().
26.10.2.3 Time zone database access

```cpp
tzdb_list& get_tzdb_list();
```

1. **Effects:** If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a `tzdb_list` holding a single initialized `tzdb`.
2. **Returns:** A reference to the database.
3. **Remarks:** It is safe to call this function from multiple threads at one time.
4. **Throws:** `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb_list` containing one or more valid `tzdb`.

```cpp
const tzdb& get_tzdb();
```

5. **Returns:** `get_tzdb_list().front()`.

```cpp
const time_zone* locate_zone(string_view tz_name);
```

6. **Returns:** `get_tzdb().locate_zone(tz_name)`.
7. **[Note: The time zone database will be initialized if this is the first reference to the database. — end note]**

```cpp
const time_zone* current_zone();
```

8. **Returns:** `get_tzdb().current_zone()`.

26.10.2.4 Remote time zone database support

```cpp
const tzdb& reload_tzdb();
```

1. **Effects:** This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the `tzdb_list` accessed by `get_tzdb_list()`.
2. **Returns:** `get_tzdb_list().front()`.
3. **Remarks:** No pointers, references, or iterators are invalidated.
4. **Remarks:** This function is thread-safe with respect to `get_tzdb_list().front()` and `get_tzdb_list().erase_after()`.
5. **Throws:** `runtime_error` if for any reason a reference cannot be returned to a valid `tzdb`.

```cpp
string remote_version();
```

6. **Returns:** The latest remote database version.
7. **[Note: This can be compared with `get_tzdb().version` to discover if the local and remote databases are equivalent. — end note]**

26.10.3 Exception classes

26.10.3.1 Class nonexistent_local_time

```cpp
namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
    public:
        template<class Duration>
        nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    }
}
```

1. **nonexistent_local_time** is thrown when an attempt is made to convert a non-existent `local_time` to a `sys_time` without specifying `choose::earliest` or `choose::latest`. 

§ 26.10.3.1
template<class Duration>
    nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);

    Requires: i.result == local_info::nonexistent.

    Effects: Constructs a nonexistent_local_time by initializing the base class with a sequence of char
equivalent to that produced by os.str() initialized as shown below:

    ostringstream os;
    os << tp << " is in a gap between\n" << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ', ' << i.first.abbrev << " and\n" << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ', ' << i.second.abbrev
" which are both equivalent to\n" << i.first.end << " UTC";

    [Example:

    #include <chrono>
    #include <iostream>

    int main() {
        using namespace std::chrono;
        try {
            auto zt = zoned_time("America/New_York", 
                local_days{Sunday[2]/March/2016} + 2h + 30min);
        } catch (const nonexistent_local_time& e) {
            std::cout << e.what() << '\n';
        }
    }

    Produces the output:
    2016-03-13 02:30:00 is in a gap between
    2016-03-13 02:00:00 EST and
    2016-03-13 03:00:00 EDT which are both equivalent to
    2016-03-13 07:00:00 UTC

    — end example]

26.10.3.2 Class ambiguous_local_time

    namespace std::chrono {
        class ambiguous_local_time : public runtime_error {
            public:
                template<class Duration>
                    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
            }
        }

    ambiguous_local_time is thrown when an attempt is made to convert an ambiguous
    local_time to a sys_time without specifying choose::earliest or choose::latest.

    template<class Duration>
        ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);

        Requires: i.result == local_info::ambiguous.

        Effects: Constructs an ambiguous_local_time by initializing the base class with a sequence of char
equivalent to that produced by os.str() initialized as shown below:

        ostringstream os;
        os << tp << " is ambiguous. It could be\n" << tp << ' ' << i.first.abbrev << " == " << tp - i.first.offset << " UTC or\n" << tp << ' ' << i.second.abbrev << " == " << tp - i.second.offset << " UTC";

        [Example:
```cpp
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
                               local_days{Sunday[1]/November/2016} + 1h + 30min);
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '
';
    }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

— end example]~

26.10.4 Information classes

26.10.4.1 Class sys_info

```cpp
namespace std::chrono {
    struct sys_info {
        system_seconds begin;
        system_seconds end;
        seconds offset;
        minutes save;
        string abbrev;
    };
}
```

1 A `sys_info` object can be obtained from the combination of a `time_zone` and either a `sys_time` or `local_time`. It can also be obtained from a `zoned_time`, which is effectively a pair of a `time_zone` and `sys_time`.

2 [Note: This type provides a low-level interface to time zone information. Typical conversions from `sys_time` to `local_time` will use this class implicitly, not explicitly. — end note]

3 The `begin` and `end` data members indicate that, for the associated `time_zone` and `time_point`, the `offset` and `abbrev` are in effect in the range `[begin, end)`. This information can be used to efficiently iterate the transitions of a `time_zone`.

4 The `offset` data member indicates the UTC offset in effect for the associated `time_zone` and `time_point`. The relationship between `local_time` and `sys_time` is:

```
offset = local_time - sys_time
```

5 The `save` data member is extra information not normally needed for conversion between `local_time` and `sys_time`. If `save` != 0min, this `sys_info` is said to be on “daylight saving” time, and `offset - save` suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin, end)` (if `save != 0min` for this `sys_info`).

6 The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```cpp
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const sys_info& r);  
```

7 **Effects:** Streams out the `sys_info` object `r` in an unspecified format.
26.10.4.2 Class \texttt{local\_info} \hfill \textit{[time.zone.info.local]}

namespace std::chrono {
    struct local\_info {
        static constexpr int unique = 0;
        static constexpr int nonexistent = 1;
        static constexpr int ambiguous = 2;

        int result;
        sys\_info first;
        sys\_info second;
    };
}

1 \textit{[Note: This type provides a low-level interface to time zone information. Typical conversions from \texttt{local\_time} to \texttt{sys\_time} will use this class implicitly, not explicitly. — end note]}

2 Describes the result of converting a \texttt{local\_time} to a \texttt{sys\_time} as follows:

\begin{itemize}
    \item [(2.1)] When a \texttt{local\_time} to \texttt{sys\_time} conversion is unique, result == unique, first will be filled out with the correct sys\_info, and second will be zero-initialized.
    \item [(2.2)] If the conversion stems from a nonexistent \texttt{local\_time} then result == nonexistent, first will be filled out with the sys\_info that ends just prior to the \texttt{local\_time}, and second will be filled out with the sys\_info that begins just after the \texttt{local\_time}.
    \item [(2.3)] If the conversion stems from an ambiguous \texttt{local\_time}, then result == ambiguous, first will be filled out with the sys\_info that ends just after the \texttt{local\_time}, and second will be filled out with the sys\_info that starts just before the \texttt{local\_time}.
\end{itemize}

\begin{verbatim}
    template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local\_info& r);
\end{verbatim}

3 Streams out the local\_info object \texttt{r} in an unspecified format.

26.10.5 Class \texttt{time\_zone} \hfill \textit{[time.zone.timezone]}

26.10.5.1 Overview \hfill \textit{[time.zone.overview]}

namespace std::chrono {
    class time\_zone {
        public:
            time\_zone(time\_zone&&) = default;
            time\_zone& operator=(time\_zone&&) = default;

            // unspecified additional constructors

            string\_view name() const noexcept;

            template<class Duration> sys\_info get\_info(const sys\_time<Duration>& st) const;
            template<class Duration> local\_info get\_info(const local\_time<Duration>& tp) const;

            template<class Duration>
            sys\_time<common\_type_t<Duration, seconds>>
            to\_sys(const local\_time<Duration>& tp) const;

            template<class Duration>
            sys\_time<common\_type_t<Duration, seconds>>
            to\_sys(const local\_time<Duration>& tp, choose z) const;

            template<class Duration>
            local\_time<common\_type_t<Duration, seconds>>
            to\_local(const sys\_time<Duration>& tp) const;
    };
}
A \texttt{time_zone} represents all time zone transitions for a specific geographic area. \texttt{time_zone} construction is unspecified, and performed as part of database initialization. [Note: \texttt{const time_zone} objects can be accessed via functions such as \texttt{locate_zone}. — end note]

### 26.10.5.2 Member functions

- \texttt{string_view name() const noexcept;}
  
  Returns: The name of the \texttt{time_zone}.

  [Example: "America/New_York". — end example]

- \texttt{template<class Duration>
  sys_info get_info(const sys_time<Duration>& st) const;}
  
  Returns: A \texttt{sys_info} \(i\) for which \(st\) is in the range \([i.begin, i.end)\).

- \texttt{template<class Duration>
  local_info get_info(const local_time<Duration>& tp) const;}
  
  Returns: A \texttt{local_info} for \(tp\).

- \texttt{template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
  to_sys(const local_time<Duration>& tp) const;}
  
  Returns: A \texttt{sys_time} that is at least as fine as \texttt{seconds}, and will be finer if the argument \(tp\) has finer precision. This \texttt{sys_time} is the UTC equivalent of \(tp\) according to the rules of this \texttt{time_zone}.

  Throws: If the conversion from \(tp\) to a \texttt{sys_time} is ambiguous, throws \texttt{ambiguous_local_time}. If the \(tp\) represents a non-existent time between two UTC \texttt{time_points}, throws \texttt{nonexistent_local_time}.

- \texttt{template<class Duration>
  sys_time<common_type_t<Duration, seconds>>
  to_sys(const local_time<Duration>& tp, choose z) const;}
  
  Returns: A \texttt{sys_time} that is at least as fine as \texttt{seconds}, and will be finer if the argument \(tp\) has finer precision. This \texttt{sys_time} is the UTC equivalent of \(tp\) according to the rules of this \texttt{time_zone}. If the conversion from \(tp\) to a \texttt{sys_time} is ambiguous, returns the earlier \texttt{sys_time} if \(z == \text{choose::earliest}\), and returns the later \texttt{sys_time} if \(z == \text{choose::latest}\). If the \(tp\) represents a non-existent time between two UTC \texttt{time_points}, then the two UTC \texttt{time_points} will be the same, and that UTC \texttt{time_point} will be returned.

- \texttt{template<class Duration>
  local_time<common_type_t<Duration, seconds>>
  to_local(const sys_time<Duration>& tp) const;}
  
  Returns: The \texttt{local_time} associated with \(tp\) and this \texttt{time_zone}.

### 26.10.5.3 Non-member functions

- \texttt{bool operator==(const time_zone& x, const time_zone& y) noexcept;}
  
  Returns: \(x.name() == y.name()\).

- \texttt{bool operator<(const time_zone& x, const time_zone& y) noexcept;}
  
  Returns: \(x.name() < y.name()\).

### 26.10.6 Class template \texttt{zoned_traits}

- \texttt{namespace std::chrono {
  template<class T>
  struct zoned_traits {};
} }

\texttt{zoned_traits} provides a means for customizing the behavior of \texttt{zoned_time<Duration, TimeZonePtr>} for the \texttt{zoned_time} default constructor, and constructors taking \texttt{string_view}. A specialization for \texttt{const time_zone*} is provided by the implementation:

- \texttt{namespace std::chrono {
  template<> struct zoned_traits<const time_zone*> {
    static const time_zone* default_zone();
} }

§ 26.10.6
static const time_zone* locate_zone(string_view name);
};

static const time_zone* default_zone();

Returns: std::chrono::locate_zone("UTC").

static const time_zone* locate_zone(string_view name);

Returns: std::chrono::locate_zone(name).

26.10.7 Class template zoned_time

26.10.7.1 Overview

namespace std::chrono {

template<class Duration, class TimeZonePtr = const time_zone*> 
class zoned_time {

public:
    using duration = common_type_t<Duration, seconds>;

private:
    TimeZonePtr zone_;  // exposition only
    sys_time<duration> tp_;  // exposition only

    using traits = zoned_traits<TimeZonePtr>;
    // exposition only

    public:
    zoned_time();
    zoned_time(const zoned_time&) = default;
    zoned_time& operator=(const zoned_time&) = default;

    template<class Duration2>
    zoned_time(const zoned_time<Duration2, TimeZonePtr>& zt) noexcept;

    zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
    zoned_time(string_view name, const sys_time<Duration>& st);

    zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
    zoned_time(string_view name, const local_time<Duration>& tp);

    template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt);

    zoned_time(string_view name, const zoned_time<Duration>& zt);

    zoned_time& operator=(const sys_time<Duration>& st);
    zoned_time& operator=(const local_time<Duration>& ut);

    operator sys_time<duration>() const;
    explicit operator local_time<duration>() const;

    TimeZonePtr get_time_zone() const;
    local_time<duration> get_local_time() const;
    sys_time<duration> get_sys_time() const;
    sys_info get_info() const;
};
zoned_time() -> zoned_time<seconds>;

template<class Duration>
  zoned_time(sys_time<Duration>)
  -> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtr, class Duration>
  zoned_time(TimeZonePtr, sys_time<Duration>)
  -> zoned_time<common_type_t<Duration, seconds>, TimeZonePtr>;

template<class TimeZonePtr, class Duration>
  zoned_time(TimeZonePtr, local_time<Duration>, choose = choose::earliest)
  -> zoned_time<common_type_t<Duration, seconds>, TimeZonePtr>;

zoned_time(string_view) -> zoned_time<seconds>;

zoned_time() -> zoned_time<seconds>;

26.10.7.2 Constructors

zoned_time();

1 Remarks: This constructor does not participate in overload resolution unless traits::default_zone() is a well-formed expression.

2 Effects: Constructs a zoned_time by initializing zone_ with traits::default_zone() and default constructing tp_.

zoned_time(const sys_time<Duration>& st);

3 Remarks: This constructor does not participate in overload resolution unless traits::default_zone() is a well-formed expression.

4 Effects: Constructs a zoned_time by initializing zone_ with traits::default_zone() and tp_ with st.

explicit zoned_time(TimeZonePtr z);

5 Requires: z refers to a time zone.

6 Effects: Constructs a zoned_time by initializing zone_ with std::move(z).

explicit zoned_time(string_view name);

7 Remarks: This constructor does not participate in overload resolution unless traits::locate_zone(string_view{}) is a well-formed expression and zoned_time is constructible from the return type of traits::locate_zone(string_view{}).
Effects: Constructs a `zoned_time` by initializing `zone_` with `traits::locate_zone(name)` and default constructing `tp_`.

```cpp
template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y) noexcept;
```

Remarks: Does not participate in overload resolution unless `sys_time<Duration2>` is implicitly convertible to `sys_time<Duration>`.

Effects: Constructs a `zoned_time` by initializing `zone_` with `y.zone_` and `tp_` with `y.tp_`.

```cpp
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
```

Requires: `z` refers to a time zone.

Effects: Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `st`.

```cpp
zoned_time(string_view name, const sys_time<Duration>& st);
```

Remarks: This constructor does not participate in overload resolution unless `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `st`.

Effects: Equivalent to construction with `{traits::locate_zone(name), st}`.

```cpp
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
```

Requires: `z` refers to a time zone.

Remarks: This constructor does not participate in overload resolution unless `decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{})` is convertible to `sys_time<duration>`.

Effects: Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `zone_`→`to_sys(tp)`.

```cpp
zoned_time(string_view name, const local_time<Duration>& tp);
```

Remarks: This constructor does not participate in overload resolution unless `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and `tp`.

Effects: Equivalent to construction with `{traits::locate_zone(name), tp}`.

```cpp
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
```

Requires: `z` refers to a time zone.

Remarks: This constructor does not participate in overload resolution unless `decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{}, choose::earliest))` is convertible to `sys_time<duration>`.

Effects: Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `zone_`→`to_sys(tp, c)`.

```cpp
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

Remarks: This constructor does not participate in overload resolution unless `zoned_time` is constructible from the return type of `traits::locate_zone(name), local_time<Duration>, and choose`.

Effects: Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```cpp
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Remarks: Does not participate in overload resolution unless `sys_time<Duration2>` is implicitly convertible to `sys_time<Duration>`.

Requires: `z` refers to a valid time zone.

Effects: Constructs a `zoned_time` by initializing `zone_` with `std::move(z)` and `tp_` with `y.tp_`.

```cpp
template<class Duration2, class TimeZonePtr2>
§ 26.10.7.2 1230
```
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

    Remarks: Does not participate in overload resolution unless sys_time<Duration2> is implicitly convertible to sys_time<Duration>.

    Requires: z references to a valid time zone.

    Effects: Equivalent to construction with {z, y}.

    [Note: The choose parameter has no effect. —end note]

zoned_time(string_view name, const zoned_time<Duration>& y);

    Remarks: This constructor does not participate in overload resolution unless zoned_time is constructible from the return type of traits::locate_zone(name) and zoned_time.

    Effects: Equivalent to construction with {traits::locate_zone(name), y}.

zoned_time(string_view name, const zoned_time<Duration>& y, choose c);

    Remarks: This constructor does not participate in overload resolution unless zoned_time is constructible from the return type of traits::locate_zone(name), zoned_time, and choose.

    Effects: Equivalent to construction with {traits::locate_zone(name), y, c}.

    [Note: The choose parameter has no effect. —end note]

26.10.7.3 Member functions

zoned_time& operator=(const sys_time<Duration>& st);

    Effects: After assignment, get_sys_time() == st. This assignment has no effect on the return value of get_time_zone().

    Returns: *this.

zoned_time& operator=(const local_time<Duration>& lt);

    Effects: After assignment, get_local_time() == lt. This assignment has no effect on the return value of get_time_zone().

    Returns: *this.

operator sys_time<duration>() const;

    Returns: get_sys_time().

explicit operator local_time<duration>() const;

    Returns: get_local_time().

TimeZonePtr get_time_zone() const;

    Returns: zone_.

local_time<duration> get_local_time() const;

    Returns: zone_->to_local(tp_).

sys_time<duration> get_sys_time() const;

    Returns: tp_.

sys_info get_info() const;

    Returns: zone_->get_info(tp_).

26.10.7.4 Non-member functions

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x, 
    const zoned_time<Duration2, TimeZonePtr>& y);

    Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.
template<class Duration1, class Duration2, class TimeZonePtr>
bool operator!=(const zoned_time<Duration1, TimeZonePtr>& x,
const zoned_time<Duration2, TimeZonePtr>& y);

Returns: !(x == y).

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
const zoned_time<Duration, TimeZonePtr>& t);

Effects: Streams the value returned from t.get_local_time() to os using the format "%F %T %Z".

Returns: os.

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
to_stream(basic_ostream<charT, traits>& os, const charT* fmt,
const zoned_time<Duration, TimeZonePtr>& tp);

Effects: First obtains a sys_info via tp.get_info() which for exposition purposes will be referred to as info. Then calls to_stream(os, fmt, tp.get_local_time(), &info.abbrev, &info.offset).

Returns: os.

### 26.10.8 Class leap

#### 26.10.8.1 Overview

namespace std::chrono {
  class leap {
  public:
    leap(const leap&) = default;
    leap& operator=(const leap&) = default;

    // unspecified additional constructors

    constexpr sys_seconds date() const noexcept;
  }
}

Objects of type `leap` representing the date of the leap second insertions are constructed and stored in the time zone database when initialized.

**Example:**

```cpp
for (auto l : get_tzdb().leaps)
  if (l <= 2018y/March/17d)
    cout << l.date() << '\n';
```

Produces the output:

1972-07-01 00:00:00
1973-01-01 00:00:00
1974-01-01 00:00:00
1975-01-01 00:00:00
1976-01-01 00:00:00
1977-01-01 00:00:00
1978-01-01 00:00:00
1979-01-01 00:00:00
1980-01-01 00:00:00
1981-07-01 00:00:00
1982-07-01 00:00:00
1983-07-01 00:00:00
1985-07-01 00:00:00
1988-01-01 00:00:00
1990-01-01 00:00:00
1991-01-01 00:00:00
1992-07-01 00:00:00
1993-07-01 00:00:00
1994-07-01 00:00:00

§ 26.10.8.1
26.10.8.2 Member functions

```cpp
constexpr sys_seconds date() const noexcept;
```

*Returns:* The date and time at which the leap second was inserted.

26.10.8.3 Non-member functions

```cpp
constexpr bool operator==(const leap& x, const leap& y) noexcept;
```

*Returns:* \(x\text{.date()} == y\text{.date()}\).

```cpp
constexpr bool operator<(const leap& x, const leap& y) noexcept;
```

*Returns:* \(x\text{.date()} < y\text{.date()}\).

```cpp
template<class Duration>
constexpr bool operator==(const leap& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* \(x\text{.date()} == y\).

```cpp
template<class Duration>
constexpr bool operator!=(const leap& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* !(\(x == y\)).

```cpp
template<class Duration>
constexpr bool operator<(const leap& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* \(x < y\text{.date()}\).

```cpp
template<class Duration>
constexpr bool operator>(const leap& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* \(y < x\).

```cpp
template<class Duration>
constexpr bool operator<=(const leap& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* !(\(y < x\)).
template<class Duration>
constexpr bool operator<=(const sys_time<Duration>& x, const leap& y) noexcept;

Returns: !(y < x).

template<class Duration>
constexpr bool operator>=(const leap& x, const sys_time<Duration>& y) noexcept;

Returns: !(x < y).

template<class Duration>
constexpr bool operator>=(const sys_time<Duration>& x, const leap& y) noexcept;

Returns: !(x < y).

26.10.9 Class link

26.10.9.1 Overview

namespace std::chrono {
    class link {
    public:
        link(link&&) = default;
        link& operator=(link&&) = default;

        // unspecified additional constructors

        string_view name() const noexcept;
        string_view target() const noexcept;
    }
}

A link specifies an alternative name for a time_zone. links are constructed when the time zone database is initialized.

26.10.9.2 Member functions

string_view name() const noexcept;

Returns: The alternative name for the time zone.

string_view target() const noexcept;

Returns: The name of the time_zone for which this link provides an alternative name.

26.10.9.3 Non-member functions

bool operator==(const link& x, const link& y) noexcept;

Returns: x.name() == y.name().

bool operator<(const link& x, const link& y) noexcept;

Returns: x.name() < y.name().

26.11 Formatting

Each format overload specified in this subclause calls to_stream unqualified, so as to enable argument dependent lookup (6.4.2).

template<class charT, class Streamable>
basic_string<charT> format(const charT* fmt, const Streamable& s);

Remarks: This function shall not participate in overload resolution unless
to_stream(declval<basic_ostream<charT>&>(), fmt, s)
is a valid expression.

Effects: Constructs a local variable of type basic_ostringstream<charT> (named os for exposition purposes). Executes os.exceptions(ios::failbit | ios::badbit). Then calls to_stream(os, fmt, s).
Returns: os.str().

```cpp
template<class charT, class Streamable>
  basic_string<charT>
  format(const locale& loc, const charT* fmt, const Streamable& s);
```

Remarks: This function shall not participate in overload resolution unless
to_stream(declval<basic_ostream<charT>&>(), fmt, s)
is a valid expression.

Effects: Constructs a local variable of type basic_ostringstream<charT> (named os for exposition purposes). Executes os.exceptions(ios::failbit | ios::badbit). Then calls to_stream(os, fmt, s).

Returns: os.str().

```cpp
template<class charT, class traits, class Alloc, class Streamable>
  basic_string<charT, traits, Alloc>
  format(const basic_string<charT, traits, Alloc>& fmt, const Streamable& s);
```

Remarks: This function shall not participate in overload resolution unless
to_stream(declval<basic_ostringstream<charT, traits, Alloc>&>()(fmt.c_str(), s)
is a valid expression.

Effects: Constructs a local variable of type basic_ostringstream<charT, traits, Alloc> (named os for exposition purposes). Executes os.exceptions(ios::failbit | ios::badbit). Then calls to_stream(os, fmt.c_str(), s).

Returns: os.str().

```cpp
template<class charT, class traits, class Alloc, class Streamable>
  basic_string<charT, traits, Alloc>
  format(const locale& loc, const basic_string<charT, traits, Alloc>& fmt, const Streamable& s);
```

Remarks: This function shall not participate in overload resolution unless
to_stream(declval<basic_ostringstream<charT, traits, Alloc>&>()(fmt.c_str(), s)
is a valid expression.

Effects: Constructs a local variable of type basic_ostringstream<charT, traits, Alloc> (named os for exposition purposes). Then calls os.imbue(loc). Executes os.exceptions(ios::failbit | ios::badbit). Then calls to_stream(os, fmt.c_str(), s).

Returns: os.str().

The `format` functions call a `to_stream` function with a basic_ostream, a formatting string specifier, and a Streamable argument. Each `to_stream` overload is customized for each Streamable type. However all `to_stream` overloads treat the formatting string specifier according to the following specification:

The `fmt` string consists of zero or more conversion specifiers and ordinary multibyte characters. A conversion specifier consists of a % character, possibly followed by an E or O modifier character (described below), followed by a character that determines the behavior of the conversion specifier. All ordinary multibyte characters (excluding the terminating null character) are streamed unchanged into the basic_ostream.

Each conversion specifier is replaced by appropriate characters as described in Table 87. Some of the conversion specifiers depend on the locale which is imbued to the basic_ostream. If the Streamable object does not contain the information the conversion specifier refers to, the value streamed to the basic_ostream is unspecified.

Unless explicitly specified, Streamable types will not contain time zone abbreviation and time zone offset information. If available, the conversion specifiers %Z and %z will format this information (respectively). If the information is not available, and %Z or %z are contained in fmt, os.setstate(ios_base::failbit) shall be called.
<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>The locale’s abbreviated weekday name. If the value does not contain a valid weekday, <code>setstate(ios::failbit)</code> is called.</td>
</tr>
<tr>
<td>%A</td>
<td>The locale’s full weekday name. If the value does not contain a valid weekday, <code>setstate(ios::failbit)</code> is called.</td>
</tr>
<tr>
<td>%b</td>
<td>The locale’s abbreviated month name. If the value does not contain a valid month, <code>setstate(ios::failbit)</code> is called.</td>
</tr>
<tr>
<td>%B</td>
<td>The locale’s full month name. If the value does not contain a valid month, <code>setstate(ios::failbit)</code> is called.</td>
</tr>

</tbody>
</table>

26.12 Parsing [time.parse]

1 Each parse overload specified in this subclause calls from_stream unqualified, so as to enable argument dependent lookup (6.4.2).

```cpp
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);
```

2 Remarks: This function shall not participate in overload resolution unless

```cpp
  from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp)
```

is a valid expression.

3 Returns: A manipulator that, when extracted from a basic_istream<charT, traits> is, calls

```cpp
  from_stream(is, fmt.c_str(), tp).
```

```cpp
template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
       basic_string<charT, traits, Alloc>& abbrev);
```

4 Remarks: This function shall not participate in overload resolution unless

```cpp
  from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp, addressof(abbrev))
```

is a valid expression.

5 Returns: A manipulator that, when extracted from a basic_istream<charT, traits> is, calls

```cpp
  from_stream(is, fmt.c_str(), tp, addressof(abbrev)).
```
template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
minutes& offset);

6 Remarks: This function shall not participate in overload resolution unless
from_stream(declval<basic_istream<charT, traits>&>(), fmt.c_str(), tp, nullptr, &offset)
is a valid expression.

7 Returns: A manipulator that, when extracted from a basic_istream<charT, traits> is, calls
from_stream(is, fmt.c_str(), tp, nullptr, &offset).

template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
basic_string<charT, traits, Alloc>& abbrev, minutes& offset);

8 Remarks: This function shall not participate in overload resolution unless
from_stream(declval<basic_istream<charT, traits>&>(),
fmt.c_str(), tp, addressof(abbrev), &offset)
is a valid expression.

9 Returns: A manipulator that, when extracted from a basic_istream<charT, traits> is, calls
from_stream(is, fmt.c_str(), tp, addressof(abbrev), &offset).

10 All from_stream overloads behave as unformatted input functions, except that they have an unspecified
effect on the value returned by subsequent calls to basic_istream>::gcount(). Each overload takes a
format string containing ordinary characters and flags which have special meaning. Each flag begins with a %.
Some flags can be modified by E or O. During parsing each flag interprets characters as parts of date and time
types according to the table below. Some flags can be modified by a width parameter given as a positive
decimal integer called out as N below which governs how many characters are parsed from the stream in
interpreting the flag. All characters in the format string that are not represented in the table below, except
for white space, are parsed unchanged from the stream. A white space character matches zero or more white
space characters in the input stream.

If the from_stream overload fails to parse everything specified by the format string, or if insufficient
information is parsed to specify a complete duration, time point, or calendrical data structure, setstate(ios_base::failbit) is called on the basic_istream.

Table 88 — Meaning of parse flags

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td>%a</td>
<td>The locale’s full or abbreviated case-insensitive weekday name.</td>
</tr>
<tr>
<td>%A</td>
<td>Equivalent to %a.</td>
</tr>
<tr>
<td>%b</td>
<td>The locale’s full or abbreviated case-insensitive month name.</td>
</tr>
<tr>
<td>%B</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>%c</td>
<td>The locale’s date and time representation. The modified command %Ec interprets the locale’s alternate date and time representation.</td>
</tr>
<tr>
<td>%C</td>
<td>The century as a decimal number. The modified command %NC specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified commands %EC and %OC interpret the locale’s alternative representation of the century.</td>
</tr>
<tr>
<td>%d</td>
<td>The day of the month as a decimal number. The modified command %Nd specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Ed interprets the locale’s alternative representation of the day of the month.</td>
</tr>
<tr>
<td>%D</td>
<td>Equivalent to %m/%d/%y.</td>
</tr>
<tr>
<td>%e</td>
<td>Equivalent to %d and can be modified like %d.</td>
</tr>
<tr>
<td>%F</td>
<td>Equivalent to %Y-%m-%d. If modified with a width N, the width is applied to only %Y.</td>
</tr>
<tr>
<td>%g</td>
<td>The last two decimal digits of the ISO week-based year. The modified command %Ng specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td>%y</td>
<td>The ISO week-based year as a decimal number. The modified command %N%G specifies the maximum number of characters to read. If N is not specified, the default is 4. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%b</td>
<td>Equivalent to %d.</td>
</tr>
<tr>
<td>%H</td>
<td>The hour (24-hour clock) as a decimal number. The modified command %N%H specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OH interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%i</td>
<td>The hour (12-hour clock) as a decimal number. The modified command %N%i specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%j</td>
<td>The day of the year as a decimal number. Jan 1 is 1. The modified command %N%j specifies the maximum number of characters to read. If N is not specified, the default is 3. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>%m</td>
<td>The month as a decimal number. Jan is 1. The modified command %N%m specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %Om interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%M</td>
<td>The minutes as a decimal number. The modified command %N%M specifies the maximum number of characters to read. If N is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command %OM interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%n</td>
<td>Matches one white space character. [Note: %n, %t, and a space can be combined to match a wide range of white-space patterns. For example, &quot;%n &quot; matches one or more white space characters, and &quot;%n%t%t&quot; matches one to three white space characters. — end note]</td>
</tr>
<tr>
<td>%p</td>
<td>The locale’s equivalent of the AM/PM designations associated with a 12-hour clock. The command %I must precede %p in the format string.</td>
</tr>
<tr>
<td>%r</td>
<td>The locale’s 12-hour clock time.</td>
</tr>
<tr>
<td>%S</td>
<td>The seconds as a decimal number. The modified command %N%S specifies the maximum number of characters to read. If N is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %OS interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%t</td>
<td>Matches zero or one white space characters.</td>
</tr>
<tr>
<td>%T</td>
<td>Equivalent to %H:%M.</td>
</tr>
<tr>
<td>%s</td>
<td>The seconds as a decimal number. The modified command %N%S specifies the maximum number of characters to read. If N is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command %OS interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%u</td>
<td>The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %Nu specifies the maximum number of characters to read. If N is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command %Ou interprets the locale’s alternative representation.</td>
</tr>

<tr>
<td>%Y</td>
<td>The year as a decimal number. The modified command %Ny specifies the maximum number of characters to read. If N is not specified, the default is 4. Leading zeroes are permitted but not required. The modified command %Ey interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td>%z</td>
<td>The offset from UTC in the format [+-]hh[mm]. For example -0430 refers to 4 hours 30 minutes behind UTC, and 04 refers to 4 hours ahead of UTC. The modified commands %Ez and %Oz parse a : between the hours and minutes and render leading zeroes on the hour field optional: [+-]h[hm]. For example -04:30 refers to 4 hours 30 minutes behind UTC, and 4 refers to 4 hours ahead of UTC.</td>
</tr>
<tr>
<td>%Z</td>
<td>The time zone abbreviation or name. A single word is parsed. This word can only contain characters from the basic source character set (5.3) that are alphanumeric, or one of ‘’, ‘/’, ‘-’, or ‘+’.</td>
</tr>
<tr>
<td>%</td>
<td>A % character is extracted.</td>
</tr>
</tbody>
</table>

### 26.13 Header <ctime> synopsis

```c
#define NULL see 16.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {
    using size_t = see 16.2.4;
    using clock_t = see below;
    using time_t = see below;

    struct timespec;
    struct tm;

clock_t clock();
double diffftime(time_t time1, time_t time0);
time_t mktime(struct tm* timeptr);
time_t time(time_t* timer);
int timespec_get(timespec* ts, int base);
char* asctime(const struct tm* timeptr);
char* ctime(const time_t* timer);
struct tm* gmtime(const time_t* timer);
struct tm* localtime(const time_t* timer);
size_t strftime(char* s, size_t maxsize, const char* format, const struct tm* timeptr);
}
```

1. The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.

258 strftime supports the C conversion specifiers C, D, E, F, G, h, r, S, t, T, u, V, and z, and the modifiers E and O.
The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (15.5.5.9).

27 Localization library

27.1 General

This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

2 The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 89.

27.2 Header <locale> synopsis

```cpp
namespace std {
    // 27.3.1, locale
    class locale;
    template<class Facet> const Facet& use_facet(const locale&);
    template<class Facet> bool has_facet(const locale&) noexcept;

    // 27.3.3, convenience interfaces
    template<class charT> bool isspace (charT c, const locale& loc);
    template<class charT> bool isprint (charT c, const locale& loc);
    template<class charT> bool iscntrl (charT c, const locale& loc);
    template<class charT> bool isupper (charT c, const locale& loc);
    template<class charT> bool islower (charT c, const locale& loc);
    template<class charT> bool isalpha (charT c, const locale& loc);
    template<class charT> bool isdigit (charT c, const locale& loc);
    template<class charT> bool ispunct (charT c, const locale& loc);
    template<class charT> bool isxdigit(charT c, const locale& loc);
    template<class charT> bool isalnum (charT c, const locale& loc);
    template<class charT> bool isgraph (charT c, const locale& loc);
    template<class charT> bool isblank (charT c, const locale& loc);
    template<class charT> charT toupper(charT c, const locale& loc);
    template<class charT> charT tolower(charT c, const locale& loc);

    // 27.4.1, ctype
    class ctype_base;
    template<class charT> class ctype;
    template<> class ctype<char>;
    // specialization
    template<class charT> class ctype_byname;
    class codecvt_base;
    template<class internT, class externT, class stateT> class codecvt;
    template<class internT, class externT, class stateT> class codecvt_byname;

    // 27.4.2, numeric
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get;
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put;
    template<class charT>
    class numwidth;
    template<class charT>
    class numwidth;
```

§ 27.2
The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.\(^1\)

### 27.3 Locales

#### 27.3.1 Class locale

```cpp
namespace std {
    class locale {
        public:
            // types
            class facet;
            class id;
            using category = int;
            static const category  // values assigned here are for exposition only
                none = 0,
                collate = 0x010, ctype = 0x020,
                monetary = 0x040, numeric = 0x080,
                time = 0x100, messages = 0x200,
                all = collate | ctype | monetary | numeric | time | messages;

            // construct/copy/destroy
            locale() noexcept;
            locale(const locale& other) noexcept;
            explicit locale(const char* std_name);
            explicit locale(const string& std_name);
            locale(const locale& other, const char* std_name, category);
            locale(const locale& other, const string& std_name, category);
            template<class Facet> locale(const locale& other, Facet* f);
```
locale(const locale& other, const locale& one, category);
~locale();  // not virtual
const locale& operator=(const locale& other) noexcept;
template<class Facet> locale combine(const locale& other) const;

// locale operations
basic_string<char> name() const;

bool operator==(const locale& other) const;
bool operator!=(const locale& other) const;

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
     const basic_string<charT, traits, Allocator>& s2) const;

// global locale objects
static locale global(const locale&);
static const locale& classic();

1 Class locale implements a type-safe polymorphic set of facets, indexed by facet type. In other words, a facet has a dual role: in one sense, it’s just a class interface; at the same time, it’s an index into a locale’s set of facets.

2 Access to the facets of a locale is via two function templates, use_facet<> and has_facet<>.

[Example: An iostream operator<< might be implemented as:]

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>&& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        ios_base::iostate err = ios_base::iostate::goodbit;
        tm tmbuf; d.extract(tmbuf);
        use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(
            s.getloc()).put(s, s, s.fill(), err, &tmbuf, 'x');
        s.setstate(err);  // might throw
    }
    return s;
}
```

— end example

3 In the call to use_facet<Facet>(loc), the type argument chooses a facet, making available all members of the named type. If Facet is not present in a locale, it throws the standard exception bad_cast. A C++ program can check if a locale implements a particular facet with the function template has_facet<Facet>(). User-defined facets may be installed in a locale, and used identically as may standard facets.

4 [Note: All locale semantics are accessed via use_facet<> and has_facet<>], except that:

(5.1) — A member operator template operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&) is provided so that a locale may be used as a predicate argument to the standard collections, to collate strings.

(5.2) — Convenient global interfaces are provided for traditional ctype functions such as isdigit() and isspace(), so that given a locale object loc a C++ program can call isspace(c, loc). (This eases upgrading existing extractors (28.7.4.2).)

— end note

5 Once a facet reference is obtained from a locale object by calling use_facet<>; that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

60) Note that in the call to put the stream is implicitly converted to an ostreambuf_iterator<charT, traits>.

§ 27.3.1
In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

A locale constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "*".

Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (15.5.5.9).

### 27.3.1.1 Types

#### [locale.types]

#### 27.3.1.1.1 Type `locale::category`

```cpp
using category = int;
```

Valid category values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is true, and represents the union of all categories. Further, the expression `(X | Y)`, where X and Y each represent a single category, represents the union of the two categories.

`locale` member functions expecting a category argument require one of the category values defined above, or the union of two or more such values. Such a category value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 90.

<table>

<td><code>time_put&lt;char&gt;, time_put&lt;wchar_t&gt;</code></td>
</tr>
<tr>
<td>messages</td>
<td><code>messages&lt;char&gt;, messages&lt;wchar_t&gt;</code></td>
</tr>
</tbody>
</table>

For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 90, `has_facet<Facet>(loc)` is `true`. Each locale member function which takes a `locale::category` argument operates on the corresponding set of facets.

An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 91.

The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<Facet>(1)` only for facet F of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that satisfy the `Cpp17InputIterator` requirements or...

</tbody>
</table>

`Cpp17OutputIterator` requirements, respectively (22.3). A template parameter with name `C` represents the set of types containing `char, wchar_t`, and any other implementation-defined character types that satisfy the requirements for a character on which any of the istream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

### 27.3.1.1.2 Class `locale::facet`

```cpp
namespace std {
  class locale::facet {
    protected:
      explicit facet(size_t refs = 0);
      virtual ~facet();
      facet(const facet&) = delete;
      void operator=(const facet&) = delete;
  }
}
```

1. Class `facet` is the base class for locale feature sets. A class is a `facet` if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:

   ```cpp
   static ::std::locale::id id;
   ```

2. Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is not a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

3. The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4. Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are `explicit`, preventing their participation in automatic conversions.

---

261) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.

§ 27.3.1.1.2
For some standard facets a standard "..._byname" class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no "..._byname" version of a facet, the base class implements named locale semantics itself by reference to other facets.

27.3.1.1.3 Class `locale::id`

```cpp
namespace std {
  class locale::id {
    public:
      id();
      void operator=(const id&) = delete;
      id(const id&) = delete;
    }
  }
```

The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

[Note: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet’s `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.8.3.2). — end note]

27.3.1.2 Constructors and destructor

`locale() noexcept;`

Default constructor: a snapshot of the current global locale.

Effects: Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

[Note: This constructor is commonly used as the default value for arguments of functions that take a `const locale&` argument. — end note]

`locale(const locale& other) noexcept;`

Effects: Constructs a locale which is a copy of `other`.

`explicit locale(const char* std_name);`

Effects: Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

Throws: `runtime_error` if the argument is not valid, or is null.

Remarks: The set of valid string argument values is "C", ",", and any implementation-defined values.

`explicit locale(const string& std_name);`

Effects: The same as `locale(std_name.c_str())`.

`locale(const locale& other, const char* std_name, category);`

Effects: Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

Throws: `runtime_error` if the argument is not valid, or is null.

Remarks: The locale has a name if and only if `other` has a name.

`locale(const locale& other, const string& std_name, category cat);`

Effects: The same as `locale(other, std_name.c_str(), cat)`.
template<class Facet> locale(const locale& other, Facet* f);

**Effects:** Constructs a locale incorporating all facets from the first argument except that of type Facet, and installs the second argument as the remaining facet. If f is null, the resulting object is a copy of other.

**Remarks:** The resulting locale has no name.

locale(const locale& other, const locale& one, category cats);

**Effects:** Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.

**Remarks:** The resulting locale has a name if and only if the first two arguments have names.

const locale& operator=(const locale& other) noexcept;

**Effects:** Creates a copy of other, replacing the current value.

**Returns:** *this.

~locale();

A non-virtual destructor that throws no exceptions.

### 27.3.1.3 Members

```cpp
template<class Facet> locale combine(const locale& other) const;
```

**Effects:** Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.

**Returns:** The newly created locale.

**Throws:** runtime_error if has_facet<Facet>(other) is false.

**Remarks:** The resulting locale has no name.

```cpp
basic_string<char> name() const;
```

**Returns:** The name of *this, if it has one; otherwise, the string "*".

### 27.3.1.4 Operators

```cpp
bool operator==(const locale& other) const;
```

**Returns:** true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

```cpp
bool operator!=(const locale& other) const;
```

**Returns:** !(*this == other).

```cpp
template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
    const basic_string<charT, traits, Allocator>& s2) const;
```

**Effects:** Compares two strings according to the collate<charT> facet.

**Remarks:** This member operator template (and therefore locale itself) satisfies requirements for a comparator predicate template argument (Clause 24) applied to strings.

**Returns:**

```cpp
use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
    s2.data(), s2.data() + s2.size()) < 0
```

[Example: A vector of strings v can be collated according to collation rules in locale loc simply by (24.7.1, 21.3.11):

```cpp
std::sort(v.begin(), v.end(), loc);
```

— end example]
27.3.1.5 Static members

static locale global(const locale& loc);

Sets the global locale to its argument.

Effects: Causes future calls to the constructor locale() to return a copy of the argument. If the argument has a name, does

```
setlocale(LC_ALL, loc.name().c_str());
```
otherwise, the effect on the C locale, if any, is implementation-defined. No library function other than locale::global() shall affect the value returned by locale(). [Note: See 27.5 for data race considerations when setlocale is invoked. — end note]

Returns: The previous value of locale().

static const locale& classic();

The "C" locale.

Returns: A locale that implements the classic "C" locale semantics, equivalent to the value locale("C").

Remarks: This locale, its facets, and their member functions, do not change with time.

27.3.2 locale globals

```
template<class Facet> const Facet& use_facet(const locale& loc);
```

Requires: Facet is a facet class whose definition contains the public static member id as defined in 27.3.1.1.2.

Returns: A reference to the corresponding facet of loc, if present.

Throws: bad_cast if has_facet<Facet>(loc) is false.

Remarks: The reference returned remains valid at least as long as any copy of loc exists.

```
template<class Facet> bool has_facet(const locale& loc) noexcept;
```

Returns: true if the facet requested is present in loc; otherwise false.

27.3.3 Convenience interfaces

27.3.3.1 Character classification

```
template<class charT> bool isspace (charT c, const locale& loc);
```

```
template<class charT> bool isprint (charT c, const locale& loc);
```

```
template<class charT> bool iscntrl (charT c, const locale& loc);
```

```
template<class charT> bool isupper (charT c, const locale& loc);
```

```
template<class charT> bool islower (charT c, const locale& loc);
```

```
template<class charT> bool isalpha (charT c, const locale& loc);
```

```
template<class charT> bool isdigit (charT c, const locale& loc);
```

```
template<class charT> bool ispunct (charT c, const locale& loc);
```

```
template<class charT> bool isxdigit(charT c, const locale& loc);
```

```
template<class charT> bool isgraph (charT c, const locale& loc);
```

```
template<class charT> bool isblank (charT c, const locale& loc);
```

Each of these functions isF returns the result of the expression:

```
use_facet<ctype<charT>>(loc).is(ctype_base::F, c)
```

where F is the ctype_base::mask value corresponding to that function (27.4.1).262

27.3.3.2 Conversions

27.3.3.2.1 Character conversions

```
template<class charT> charT toupper(charT c, const locale& loc);
```

Returns: use_facet<ctype<charT>>(loc).toupper(c).

262) When used in a loop, it is faster to cache the ctype<> facet and use it directly, or use the vector form of ctype<>::is.
template<class charT> charT tolower(charT c, const locale& loc);

Returns: use_facet<ctype<charT>>(loc).tolower(c).

27.4 Standard locale categories

Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users’ iostream operators << and >>, as members put() and get(), respectively. Each such member function takes an ios_base& argument whose members flags(), precision(), and width(), specify the format of the corresponding datum (28.5.3). Those functions which need to use other facets call its member getloc() to retrieve the locale imbued there. Formatting facets use the character argument fill to fill out the specified width where necessary.

The put() members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The get() members take an ios_base::iostate& argument whose value they ignore, but set to ios_base::failbit in case of a parse error.

Within this clause it is unspecified whether one virtual function calls another virtual function.

27.4.1 The ctype category

namespace std {
    class ctype_base {
    public:
        using mask = see below;

        // numeric values are for exposition only.
        static const mask space = 1 << 0;
        static const mask print = 1 << 1;
        static const mask cntrl = 1 << 2;
        static const mask upper = 1 << 3;
        static const mask lower = 1 << 4;
        static const mask alpha = 1 << 5;
        static const mask digit = 1 << 6;
        static const mask punct = 1 << 7;
        static const mask xdigit = 1 << 8;
        static const mask blank = 1 << 9;
        static const mask alnum = alpha | digit;
        static const mask graph = alnum | punct;
    };
}

The type mask is a bitmask type (15.4.2.1.4).

27.4.1.1 Class template ctype

namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
    public:
        using char_type = charT;
        using char_type = charT;

        explicit ctype(size_t refs = 0);

        bool is(mask m, charT c) const;
        const charT* is(const charT* low, const charT* high, mask* vec) const;
        const charT* scan_is(mask m, const charT* low, const charT* high) const;
        const charT* scan_not(mask m, const charT* low, const charT* high) const;
        charT toupper(charT c) const;
        const charT* toupper(charT* low, const charT* high) const;
        charT tolower(charT c) const;
        const charT* tolower(charT* low, const charT* high) const;
        charT widen(char c) const;
        const char* widen(const char* low, const char* high, charT* to) const;
        char narrow(charT c, char dfault) const;
        const charT* narrow(const charT* low, const charT* high, charT* to) const;

    };
}
static locale::id id;

protected:
~ctype();
virtual bool do_is(mask m, charT c) const;
virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
virtual charT do_toupper(charT) const;
virtual const charT* do_toupper(charT* low, const charT* high) const;
virtual charT do_tolower(charT) const;
virtual const charT* do_tolower(charT* low, const charT* high) const;
virtual charT do_widen(char) const;
virtual const charT* do_widen(const charT* low, const charT* high, charT* dest) const;
virtual char do_narrow(charT, char dfault) const;
virtual const charT* do_narrow(const charT* low, const charT* high, charT* dest, char dfault, char* dest) const;
};

1 Class ctype encapsulates the C library <cctype> features. istream members are required to use ctype<> for character classing during input parsing.

2 The specializations required in Table 90 (27.3.1.1.1), namely ctype<char> and ctype<wchar_t>, implement character classing appropriate to the implementation's native character set.

### 27.4.1.1.1 ctype members

**bool is(mask m, charT c) const;**

- **Returns:** do_is(m, c) or do_is(low, high, vec).

**const charT* scan_is(mask m, const charT* low, const charT* high) const;**

- **Returns:** do_scan_is(m, low, high).

**const charT* scan_not(mask m, const charT* low, const charT* high) const;**

- **Returns:** do_scan_not(m, low, high).

**charT toupper(charT) const;**

- **Returns:** do_toupper(c) or do_toupper(low, high).

**charT tolower(charT c) const;**

- **Returns:** do_tolower(c) or do_tolower(low, high).

**charT widen(char c) const;**

- **Returns:** do_widen(c) or do_widen(low, high, to).

**char narrow(charT c, char dfault) const;**

- **Returns:** do_narrow(c, dfault) or do_narrow(low, high, dfault, to).

### 27.4.1.1.2 ctype virtual functions

**bool do_is(mask m, charT c) const;**

- **Returns:** do_is(m, c) or do_is(low, high, vec).

**const charT* do_is(const charT* low, const charT* high, mask* vec) const;**

- **Effects:** Classifies a character or sequence of characters. For each argument character, identifies a value $M$ of type ctype_base::mask. The second form identifies a value $M$ of type ctype_base::mask for each *p where (low <= p && p < high), and places it into vec[p - low].
Returns: The first form returns the result of the expression \((M \& m) \neq 0\); i.e., \texttt{true} if the character has the characteristics specified. The second form returns \texttt{high}.

\begin{verbatim}
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
\end{verbatim}

Effects: Locates a character in a buffer that conforms to a classification \(m\).

Returns: The smallest pointer \(p\) in the range \([\texttt{low}, \texttt{high})\) such that \texttt{is}(\(m, \*p\)) would return \texttt{true}; otherwise, returns \texttt{high}.

\begin{verbatim}
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
\end{verbatim}

Effects: Locates a character in a buffer that fails to conform to a classification \(m\).

Returns: The smallest pointer \(p\), if any, in the range \([\texttt{low}, \texttt{high})\) such that \texttt{is}(\(m, \*p\)) would return \texttt{false}; otherwise, returns \texttt{high}.

\begin{verbatim}
charT do_toupper(charT c) const;
\end{verbatim}

\begin{verbatim}
const charT* do_toupper(charT* low, const charT* high) const;
\end{verbatim}

Effects: Converts a character or characters to upper case. The second form replaces each character \(*p\) in the range \([\texttt{low}, \texttt{high})\) for which a corresponding upper-case character exists, with that character.

Returns: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns \texttt{high}.

\begin{verbatim}
charT do_tolower(charT c) const;
\end{verbatim}

\begin{verbatim}
const charT* do_tolower(charT* low, const charT* high) const;
\end{verbatim}

Effects: Converts a character or characters to lower case. The second form replaces each character \(*p\) in the range \([\texttt{low}, \texttt{high})\) and for which a corresponding lower-case character exists, with that character.

Returns: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns \texttt{high}.

\begin{verbatim}
charT do_widen(char c) const;
\end{verbatim}

\begin{verbatim}
const charT* do_widen(const charT* low, const charT* high, charT* dest) const;
\end{verbatim}

Effects: Applies the simplest reasonable transformation from a \texttt{char} value or sequence of \texttt{char} values to the corresponding \texttt{charT} value or values.\(^{263}\) The only characters for which unique transformations are required are those in the basic source character set (5.3).

For any named \texttt{ctype} category with a \texttt{ctype <charT>} facet \(ctc\) and valid \texttt{ctype_base::mask} value \(M\),

\[ (ctc.is(M, c) \| \!is(M, \texttt{do_widen}(c)) ) \text{ is true} \] \(^{264}\)

The second form transforms each character \(*p\) in the range \([\texttt{low}, \texttt{high})\), placing the result in \(\texttt{dest}[p - \texttt{low}]\).

Returns: The first form returns the transformed value. The second form returns \texttt{high}.

\begin{verbatim}
char do_narrow(charT c, char dfault) const;
\end{verbatim}

\begin{verbatim}
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;
\end{verbatim}

Effects: Applies the simplest reasonable transformation from a \texttt{charT} value or sequence of \texttt{charT} values to the corresponding \texttt{char} value or values.

For any character \(c\) in the basic source character set (5.3) the transformation is such that

\[ \texttt{do_widen}(\texttt{do_narrow}(c, 0)) == c \] \(^{263}\)

For any named \texttt{ctype} category with a \texttt{ctype <char>} facet \(ctc\) however, and \texttt{ctype_base::mask} value \(M\),

\[ (\texttt{is}(M, c) \| \!ctc.is(M, \texttt{do_narrow}(c, \texttt{dfault})) ) \text{ is true} \] (unless \texttt{do_narrow} returns \texttt{dfault}). In addition, for any digit character \(c\), the expression \((\texttt{do_narrow}(c, \texttt{dfault}) - '0')\) evaluates to the digit value of the character. The second form transforms each character \(*p\) in the range \([\texttt{low}, \texttt{high})\), placing the result (or \texttt{dfault} if no simple transformation is readily available) in \(\texttt{dest}[p - \texttt{low}]\).

---

\(^{263}\) The \texttt{char} argument of \texttt{do_widen} is intended to accept values derived from character literals for conversion to the locale’s encoding.

\(^{264}\) In other words, the transformed character is not a member of any character classification that \(c\) is not also a member of.
Returns: The first form returns the transformed value; or default if no mapping is readily available. The second form returns high.

27.4.1.2 Class template ctype_byname

namespace std {
  template<class charT>
  class ctype_byname : public ctype<charT> {
    public:
      using mask = typename ctype<charT>::mask;
      explicit ctype_byname(const char*, size_t refs = 0);
      explicit ctype_byname(const string&, size_t refs = 0);

    protected:
      ~ctype_byname();
  };
}

27.4.1.3 ctype<char> specialization

namespace std {
  template<>
  class ctype<char> : public locale::facet, public ctype_base {
    public:
      using char_type = char;
      explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

    protected:
      ~ctype();
  };
}
A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.\(^{265}\) The implementation-defined value of member `table_size` is at least 256.

### 27.4.1.3.1 Destructor  

`~ctype();`

**Effects:** If the constructor’s first argument was nonzero, and its second argument was `true`, does `delete [] table()`.

### 27.4.1.3.2 Members

In the following member descriptions, for `unsigned char` values `v` where `v >= table_size`, `table()[v]` is assumed to have an implementation-specific value (possibly different for each such value `v`) without performing the array lookup.

```cpp
effects explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);

requires tbl either 0 or an array of at least table_size elements.

effects Passes its refs argument to its base class constructor.

bool is(mask m, char c) const;

const char* is(const char* low, const char* high, mask* vec) const;

returns The second form, for all `*p` in the range `[low, high)`, assigns into `vec[p - low]` the value `table()[((unsigned char)*p)]`.

returns The first form returns `table()[(unsigned char)c] & m`; the second form returns `high`.

const char* scan_is(mask m, const char* low, const char* high) const;

returns The smallest `p` in the range `[low, high)` such that `table()[((unsigned char) *p) & m]` is `true`.

const char* scan_not(mask m, const char* low, const char* high) const;

returns The smallest `p` in the range `[low, high)` such that `table()[((unsigned char) *p) & m]` is `false`.

char toupper(char c) const;

const char* toupper(char* low, const char* high) const;

returns `do_toupper(c)` or `do_toupper(low, high)`, respectively.

char tolower(char c) const;

const char* tolower(char* low, const char* high) const;

returns `do_tolower(c)` or `do_tolower(low, high)`, respectively.

char widen(char c) const;

const char* widen(const char* low, const char* high, char* to) const;

returns `do_widen(c)` or `do_widen(low, high, to)`, respectively.

char narrow(char c, char dfault) const;

const char* narrow(const char* low, const char* high, char dfault, char* to) const;

returns `do_narrow(c, dfault)` or `do_narrow(low, high, dfault, to)`, respectively.

const mask* table() const noexcept;

returns The first constructor argument, if it was nonzero, otherwise `classic_table()`.
```

\(^{265}\) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`. 

---

\(\S 27.4.1.3.2\)
27.4.1.3.3 Static members

static const mask* classic_table() noexcept;

Returns: A pointer to the initial element of an array of size table_size which represents the classifications of characters in the "C" locale.

27.4.1.3.4 Virtual functions

char do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;

virtual char do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high, char dfault, char* to) const;

These functions are described identically as those members of the same name in the ctype class template (27.4.1.1.1).

27.4.1.4 Class template codecvt

namespace std {
    class codecvt_base {
        public:
            enum result { ok, partial, error, noconv };
    };

    template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
        public:
            using intern_type = internT;
            using extern_type = externT;
            using state_type = stateT;

            explicit codecvt(size_t refs = 0);

            result out(
                stateT& state,
                const internT* from, const internT* from_end, const internT*& from_next,
                externT* to, externT* to_end, externT*& to_next) const;

            result unshift(
                stateT& state,
                externT* to, externT* to_end, externT*& to_next) const;

            result in(
                stateT& state,
                const externT* from, const externT* from_end, const externT*& from_next,
                internT* to, internT* to_end, internT*& to_next) const;

            int encoding() const noexcept;
            bool always_noconv() const noexcept;
            int length(stateT&, const externT* from, const externT* end, size_t max) const;
            int max_length() const noexcept;

            static locale::id id;
        protected:
            ~codecvt();
            virtual result do_out(
                stateT& state,
                const internT* from, const internT* from_end, const internT*& from_next,
                externT* to, externT* to_end, externT*& to_next) const;

§ 27.4.1.4
virtual result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
virtual result do_unshift(
    stateT& state,
    externT* to, externT* to_end, externT*& to_next) const;
virtual int do_encoding() const noexcept;
virtual bool do_always_noconv() const noexcept;
virtual int do_length(stateT& state, const externT* from, const externT* end, size_t max) const;
virtual int do_max_length() const noexcept;
};

The class codecvt<internT, externT, stateT> is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as Unicode and EUC.

The stateT argument selects the pair of character encodings being mapped between.

The specializations required in Table 90 (27.3.1.1.1) convert the implementation-defined native character set. codecvt<char, char, mbstate_t> implements a degenerate conversion; it does not convert at all. The specialization codecvt<char16_t, char8_t, mbstate_t> converts between the UTF-16 and UTF-8 encoding forms, and the specialization codecvt<char32_t, char8_t, mbstate_t> converts between the UTF-32 and UTF-8 encoding forms. codecvt<wchar_t, char, mbstate_t> converts between the native character sets for ordinary and wide characters. Specializations on mbstate_t perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined stateT type. Objects of type stateT can contain any state that is useful to communicate to or from the specialized do_in or do_out members.

27.4.1.4.1 Members

result out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;
1
Returns: do_out(state, from, from_end, from_next, to, to_end, to_next).

result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
2
Returns: do_unshift(state, to, to_end, to_next).

result in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
3
Returns: do_in(state, from, from_end, from_next, to, to_end, to_next).

int encoding() const noexcept;
4
Returns: do_encoding().

bool always_noconv() const noexcept;
5
Returns: do_always_noconv().

int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
6
Returns: do_length(state, from, from_end, max).

int max_length() const noexcept;
7
Returns: do_max_length().

§ 27.4.1.4.1 1256
27.4.1.4.2 Virtual functions

[locale.codecvt.virtuals]

result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;

result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;

1 Requires: (from <= from_end && to <= to_end) well-defined and true: state initialized, if at the
beginning of a sequence, or else equal to the result of converting the preceding characters in the
sequence.

2 Effects: Translates characters in the source range [from, from_end), placing the results in sequential
positions starting at destination to. Converts no more than (from_end - from) source elements, and
stores no more than (to_end - to) destination elements.

   Stops if it encounters a character it cannot convert. It always leaves the from_next and to_next pointers
   pointing one beyond the last element successfully converted. If returns noconv, internT and externT
   are the same type and the converted sequence is identical to the input sequence [from, from_next).
   to_next is set equal to to, the value of state is unchanged, and there are no changes to the values in
   [to, to_end).

3 A codecvt facet that is used by basic_filebuf (28.9) shall have the property that if
   do_out(state, from, from_end, from_next, to, to_end, to_next)
   would return ok, where from != from_end, then
   do_out(state, from, from + 1, from_next, to, to_end, to_next)
   shall also return ok, and that if
   do_in(state, from, from_end, from_next, to, to_end, to_next)
   would return ok, where to != to_end, then
   do_in(state, from, from_end, from_next, to, to + 1, to_next)
   shall also return ok.266 [Note: As a result of operations on state, it can return ok or partial and set
   from_next == from and to_next != to. —end note]

4 Remarks: Its operations on state are unspecified. [Note: This argument can be used, for example, to
   maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek
   offsets. —end note]

5 Returns: An enumeration value, as summarized in Table 92.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the conversion</td>
</tr>
<tr>
<td>partial</td>
<td>not all source characters converted</td>
</tr>
<tr>
<td>error</td>
<td>encountered a character in [from, from_end) that it could not convert</td>
</tr>
<tr>
<td>noconv</td>
<td>internT and externT are the same type, and input sequence is identical to converted sequence</td>
</tr>
</tbody>
</table>

A return value of partial, if (from_next == from_end), indicates that either the destination sequence
has not absorbed all the available destination elements, or that additional source elements are needed
before another destination element can be produced.

266 Informally, this means that basic_filebuf assumes that the mappings from internal to external characters is 1 to N: a
codecvt facet that is used by basic_filebuf must be able to translate characters one internal character at a time.
result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

Requires: (to <= to_end) well-defined and true; state initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.

Effects: Places characters starting at to that should be appended to terminate a sequence when the current stateT is given by state. Stores no more than (to_end - to) destination elements, and leaves the to_next pointer pointing one beyond the last element successfully stored.

Returns: An enumeration value, as summarized in Table 93.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the sequence</td>
</tr>
<tr>
<td>partial</td>
<td>space for more than to_end - to destination elements was needed to terminate a sequence given the value of state</td>
</tr>
<tr>
<td>error</td>
<td>an unspecified error has occurred</td>
</tr>
<tr>
<td>noconv</td>
<td>no termination is needed for this state_type</td>
</tr>
</tbody>
</table>

int do_encoding() const noexcept;

Returns: -1 if the encoding of the externT sequence is state-dependent; else the constant number of externT characters needed to produce an internal character; or 0 if this number is not a constant.

bool do_always_noconv() const noexcept;

Returns: true if do_in() and do_out() return noconv for all valid argument values. codecvt<char, char, mbstate_t> returns true.

int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

Requires: (from <= from_end) well-defined and true; state initialized, if at the beginning of a sequence, or else equal to the result of converting the preceding characters in the sequence.

Effects: The effect on the state argument is “as if” it called do_in(state, from, from_end, from, to, to+max, to) for to pointing to a buffer of at least max elements.

Returns: (from_next-from) where from_next is the largest value in the range [from, from_end) such that the sequence of values in the range [from, from_next) represents max or fewer valid complete characters of type internT. The specialization codecvt<char, char, mbstate_t::do_max_length() returns 1.

int do_max_length() const noexcept;

Returns: The maximum value that do_length(state, from, from_end, 1) can return for any valid range [from, from_end] and stateT value state. The specialization codecvt<char, char, mbstate_t::do_max_length() returns 1.

27.4.1.5 Class template codecvt_byname

namespace std {
  template<class internT, class externT, class stateT>
  class codecvt_byname : public codecvt<internT, externT, stateT> {
    public:
      explicit codecvt_byname(const char*, size_t refs = 0);
      explicit codecvt_byname(const string&, size_t refs = 0);

    protected:
      ~codecvt_byname();
  }
}

Typically these will be characters to return the state to stateT().

If encoding() yields -1, then more than max_length() externT elements may be consumed when producing a single internT character, and additional externT elements may appear at the end of a sequence after those that yield the final internT character.

§ 27.4.1.5
27.4.2 The numeric category

1 The classes num_get<> and num_put<> handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.\footnote{ Parsing "-1" correctly into, e.g., an unsigned short requires that the corresponding member get() at least extract the sign before delegating.}

2 All specifications of member functions for num_put and num_get in the subclasses of 27.4.2 only apply to the specializations required in Tables 90 and 91 (27.3.1.1.1), namely num_get<char>, num_get<wchar_t>, num_get<C, InputIterator>, num_put<char>, num_put<wchar_t>, and num_put<C, OutputIterator>. These specializations refer to the ios_base argument for formatting specifications (27.4), and to its imbued locale for the numpunct<> facet to identify all numeric punctuation preferences, and also for the ctype<> facet to perform character classification.

3 Extractor and inserter members of the standard iostreams use num_get<> and num_put<> member functions for formatting and parsing numeric values (28.7.4.2.1, 28.7.5.2.1).

27.4.2.1 Class template num_get

namespace std {

    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, void*& v) const;

            static locale::id id;

        protected:
            num_get();
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, bool& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, long long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, unsigned short& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, unsigned int& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, unsigned long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, unsigned long long& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, float& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, double& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, long double& v) const;
            virtual iter_type do_get(iter_type, iter_type, ios_base&,
                                      ios_base::iostate& err, void*& v) const;

        };
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, unsigned int& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, unsigned long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, unsigned long long& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, float& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, long double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate&, void*& v) const;

The facet num_get is used to parse numeric values from an input sequence such as an istream.

27.4.2.1.1 Members

iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, void*& val) const;

Returns: do_get(in, end, str, err, val).

27.4.2.1.2 Virtual functions

iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, bool& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, long& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, long long& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned short& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned int& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned long& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, unsigned long long& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, float& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, double& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, long double& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base&, ios_base::iostate&, void*& v) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str,  
    ios_base::iostate& err, void*& val) const;

1 Effects: Reads characters from in, interpreting them according to str.flags(), use_facet<ctype<charT>>(loc), and use_facet<numpunct<charT>>(loc), where loc is str.getloc().

2 The details of this operation occur in three stages

(2.1) — Stage 1: Determine a conversion specifier

(2.2) — Stage 2: Extract characters from in and determine a corresponding char value for the format expected by the conversion specification determined in stage 1.

(2.3) — Stage 3: Store results

3 The details of the stages are presented below.

Stage 1: The function initializes local variables via

\[
\begin{align*}
\text{fmtflags} & \quad \text{flags} = \text{str.flags();} \\
\text{fmtflags} & \quad \text{basefield} = (\text{flags} \land \text{ios_base::basefield}); \\
\text{fmtflags} & \quad \text{uppercase} = (\text{flags} \land \text{ios_base::uppercase}); \\
\text{fmtflags} & \quad \text{boolalpha} = (\text{flags} \land \text{ios_base::boolalpha});
\end{align*}
\]

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 94. The table is ordered. That is, the first line whose condition is true applies.

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == oct</td>
<td>%o</td>
</tr>
<tr>
<td>basefield == hex</td>
<td>%x</td>
</tr>
<tr>
<td>basefield == 0</td>
<td>%d</td>
</tr>
<tr>
<td>signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversions to a floating-point type the specifier is %g.

For conversions to void* the specifier is %p.

A length modifier is added to the conversion specification, if needed, as indicated in Table 95.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>h</td>
</tr>
<tr>
<td>unsigned short</td>
<td>h</td>
</tr>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>double</td>
<td>l</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
</tbody>
</table>

Stage 2: If in == end then stage 2 terminates. Otherwise a charT is taken from in and local variables are initialized as if by

\[
\begin{align*}
\text{char_type} & \quad \text{ct} = *\text{in}; \\
\text{char} & \quad \text{c} = \text{src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms]}; \\
\text{if} & \quad (\text{ct} == \text{use_facet<numpunct<charT>>(loc).decimal_point()} \\
\text{c} & \quad = \cdot); \\
\text{bool} & \quad \text{discard} = \\
\text{ct} & \quad == \text{use_facet<numpunct<charT>>(loc).thousands_sep()} \\
& \quad \text{&& use_facet<numpunct<charT>>(loc).grouping().length()} \neq 0;
\end{align*}
\]

where the values src and atoms are defined as if by:

\[
\begin{align*}
\text{static const char src[] = } & \text{"0123456789abcdefABCDEF+-";} \\
\text{char_type atoms[} & \text{sizeof(src)];} \\
\text{use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms)};
\end{align*}
\]
for this value of loc.

If discard is true, then if '.' has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if '.' has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a check is made to determine if c is allowed as the next character of an input field of the conversion specifier returned by Stage 1. It so, it is accumulated.

If the character is either discarded or accumulated then in is advanced by ++in and processing returns to the beginning of stage 2.

**Stage 3:** The sequence of chars accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header <cstdlib>:

(3.1) For a signed integer value, the function strtol.
(3.2) For an unsigned integer value, the function strtoull.
(3.3) For a float value, the function strtof.
(3.4) For a double value, the function strtod.
(3.5) For a long double value, the function strtold.

The numeric value to be stored can be one of:

(3.6) zero, if the conversion function does not convert the entire field.
(3.7) the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in val.
(3.8) the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in val.
(3.9) the converted value, otherwise.

The resultant numeric value is stored in val. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, io_base::failbit is assigned to err.

Digit grouping is checked. That is, the positions of discarded separators is examined for consistency with use_facet<numpunct<charT>>(loc).grouping(). If they are not consistent then io_base::failbit is assigned to err.

In any case, if stage 2 processing was terminated by the test for in == end then err |= io_base::eofbit is performed.

```cpp
iter_type do_get(iter_type in, iter_type end, io_base& str, 
    io_base::iostate& err, bool& val) const;
```

*Effects:* If (str.flags()&io_base::boolalpha) == 0 then input proceeds as it would for a long except that if a value is being stored into val, the value is determined according to the following: If the value to be stored is 0 then false is stored. If the value is 1 then true is stored. Otherwise true is stored and io_base::failbit is assigned to err.

Otherwise target sequences are determined “as if” by calling the members false_name() and true_name() of the facet obtained by use_facet<numpunct<charT>>(str.getloc()). Successive characters in the range [in, end) (see 21.2.3) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator in is compared to end only when necessary to obtain a character. If a target sequence is uniquely matched, val is set to the corresponding value. Otherwise false is stored and io_base::failbit is assigned to err.

The in iterator is always left pointing one position beyond the last character successfully matched. If val is set, then err is set to str.goodbit; or to str.eofbit if, when seeking another character to match, it is found that (in == end). If val is not set, then err is set to str.failbit; or to (str.failbit|str.eofbit) if the reason for the failure was that (in == end). [Example: For targets true: "a" and false: "abb", the input sequence "a" yields val == true and err == str.eofbit; the input sequence "abc" yields err == str.failbit, with in ending at the 'c' element. For targets true: "1" and false: "0", the input sequence "1" yields val == true and err == str.goodbit. For empty targets (""), any input sequence yields err == str.failbit. — end example]

*Returns:* in.
27.4.2.2 Class template num_put

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit num_put(size_t refs = 0);

            iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

            static locale::id id;

        protected:
            ~num_put();
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
    }
}

The facet num_put is used to format numeric values to a character sequence such as an ostream.

27.4.2.2.1 Members

iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

Returns: do_put(out, str, fill, val).

27.4.2.2.2 Virtual functions

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

Effects: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as

    locale loc = str.getloc();

The details of this operation occur in several stages:

— Stage 1: Determine a printf conversion specifier spec and determine the characters that would be printed by printf (28.12) given this conversion specifier for
printf(spec, val)
assuming that the current locale is the "C" locale.

(2.2) — Stage 2: Adjust the representation by converting each char determined by stage 1 to a charT
using a conversion and values returned by members of use_facet<numpunct<charT>>(loc)

(2.3) — Stage 3: Determine where padding is required.

(2.4) — Stage 4: Insert the sequence into the out.

Detailed descriptions of each stage follow.

Returns: out.

Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe
this determination use the following local variables

fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true
applies. A line without a condition is the default behavior when none of the earlier lines apply.
For conversion from an integral type other than a character type, the function determines the
integral conversion specifier as indicated in Table 96.

Table 96 — Integer conversions

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == ios_base::oct</td>
<td>%o</td>
</tr>
<tr>
<td>(basefield == ios_base::hex) &amp;&amp; !uppercase</td>
<td>%x</td>
</tr>
<tr>
<td>(basefield == ios_base::hex)</td>
<td>%X</td>
</tr>
<tr>
<td>for a signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>for an unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, the function determines the floating-point conversion
specifier as indicated in Table 97.

Table 97 — Floating-point conversions

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>floatfield == ios_base::fixed</td>
<td>%f</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific &amp;&amp; !uppercase</td>
<td>%e</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific</td>
<td>%E</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific) &amp;&amp; !uppercase</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific)</td>
</tr>
<tr>
<td>!showpos</td>
<td>%g</td>
</tr>
<tr>
<td>otherwise</td>
<td>%G</td>
</tr>
</tbody>
</table>

For conversions from an integral or floating-point type a length modifier is added to the conversion
specifier as indicated in Table 98.

The conversion specifier has the following optional additional qualifiers prepended as indicated in
Table 99.

For conversion from a floating-point type, if floatfield != (ios_base::fixed | ios_base::
scientific), str.precision() is specified as precision in the conversion specification. Otherwise,
no precision is specified.

For conversion from void* the specifier is %p.
Table 98 — Length modifier

<td>#</td>
</tr>
</tbody>
</table>

The representations at the end of stage 1 consists of the char’s that would be printed by a call of \( \text{printf}(s, \text{val}) \) where \( s \) is the conversion specifier determined above.

**Stage 2:** Any character \( c \) other than a decimal point(.) is converted to a charT via \( \text{use\_facet}<\text{ctype}\<\text{charT}>>\langle\text{loc}.\text{widen}(c) \rangle \)

A local variable punct is initialized via

\[
\text{const numpunct<charT>& punct = use\_facet<numpunct<charT>>\langle\text{loc}\rangle;}
\]

For arithmetic types, \( \text{punct.thousands\_sep()} \) characters are inserted into the sequence as determined by the value returned by \( \text{punct.do\_grouping()} \) using the method described in 27.4.3.1.2

Decimal point characters(.) are replaced by \( \text{punct.decimal\_point()} \)

**Stage 3:** A local variable is initialized as

\[
\text{fmtflags adjustfield = (flags & (ios\_base::adjustfield));}
\]

The location of any padding\(^{270}\) is determined according to Table 100.

Table 100 — Fill padding

<table>
<thead>
<tr>
<th>State</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield == ios_base::left</td>
<td>pad after</td>
</tr>
<tr>
<td>adjustfield == ios_base::right</td>
<td>pad before</td>
</tr>
<tr>
<td>adjustfield == internal and a sign occurs in the representation</td>
<td>pad after the sign</td>
</tr>
<tr>
<td>adjustfield == internal and representation after stage 1 began with 0x or 0X</td>
<td>pad after x or X</td>
</tr>
<tr>
<td>otherwise</td>
<td>pad before</td>
</tr>
</tbody>
</table>

If \( \text{str\_width()} \) is nonzero and the number of charT’s in the sequence after stage 2 is less than \( \text{str\_width()} \), then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to \( \text{str\_width()} \).

\( \text{str\_width(0)} \) is called.

**Stage 4:** The sequence of charT's at the end of stage 3 are output via

\[
*\text{out}++ = c
\]

\[
\text{iter\_type do\_put(iter\_type out, ios\_base& str, char\_type fill, bool val) const;}
\]

\( \text{Returns: If } (\text{str\_flags()} & \text{ios\_base::boolalpha}) == 0 \text{ returns do\_put(out, str, fill, (int)val)}, \text{otherwise obtains a string } s \text{ as if by}

\( ^{270} \) The conversion specification \#o generates a leading 0 which is not a padding character.
string_type s =
val ? use_facet<numpunct<charT>>(loc).truename()
: use_facet<numpunct<charT>>(loc).falsename();

and then inserts each character c of s into out via *out++ = c and returns out.

27.4.3 The numeric punctuation facet

27.4.3.1 Class template numpunct

namespace std {

  template<class charT>
  class numpunct : public locale::facet {
  public:
    using char_type = charT;
    using string_type = basic_string<charT>;

    explicit numpunct(size_t refs = 0);

    char_type decimal_point() const;
    char_type thousands_sep() const;
    string grouping() const;
    string_type truename() const;
    string_type falsename() const;
    static locale::id id;
  protected:
    ~numpunct();  // virtual
    virtual char_type do_decimal_point() const;
    virtual char_type do_thousands_sep() const;
    virtual string do_grouping() const;  // for bool
    virtual string_type do_truename() const;  // for bool
    virtual string_type do_falsename() const;  // for bool
  }
}

numpunct<> specifies numeric punctuation. The specializations required in Table 90 (27.3.1.1.1), namely
numpunct<wchar_t> and numpunct<char>, provide classic "C" numeric formats, i.e., they contain information

equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to

widen.

The syntax for number formats is as follows, where digit represents the radix set specified by the fmtflags
argument value, and thousands-sep and decimal-point are the results of corresponding numpunct<charT>

members. Integer values have the format:

  integer ::= [sign] units
  sign ::= plusminus
  plusminus ::= '+' | '-'
  units ::= digits [thousands-sep units]
  digits ::= digit [digits]

and floating-point values have:

  floatval ::= [sign] units [decimal-point [digits]] [e [sign] digits] |
             [sign] decimal-point digits [e [sign] digits]
  e ::= 'e' | 'E'

where the number of digits between thousands-sep is as specified by do_grouping(). For parsing, if the
digits portion contains no thousands-separators, no grouping constraint is applied.

27.4.3.1.1 Members

  char_type decimal_point() const;
  Returns: do_decimal_point().

  char_type thousands_sep() const;
  Returns: do_thousands_sep().

Returns: do_grouping().

string_type truename() const;
string_type falsename() const;

Returns: do_truename() or do_falsename(), respectively.

27.4.3.1.2 Virtual functions

char_type do_decimal_point() const;

Returns: A character for use as the decimal radix separator. The required specializations return '.\n' or \L'.

char_type do_thousands_sep() const;

Returns: A character for use as the digit group separator. The required specializations return '',' or \L','.

string do_grouping() const;

Returns: A basic_string<char> vec used as a vector of integer values, in which each element vec[i]
represents the number of digits\n in the group at position i, starting with position 0 as the rightmost
group. If vec.size() <= i, the number is the same as group (i - 1); if (i < 0 || vec[i] <= 0
|| vec[i] == CHAR_MAX), the size of the digit group is unlimited.

The required specializations return the empty string, indicating no grouping.

string_type do_truename() const;
string_type do_falsename() const;

Returns: A string representing the name of the boolean value true or false, respectively.

In the base class implementation these names are "true" and "false", or \L"true" and \L"false".

27.4.3.2 Class template numpunct_byname

namespace std {
    template<class charT>
    class numpunct_byname : public numpunct<charT> {
        // this class is specialized for char and wchar_t.
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;

            explicit numpunct_byname(const char*, size_t refs = 0);
            explicit numpunct_byname(const string&, size_t refs = 0);

            protected:
                ~numpunct_byname();
            };
}

27.4.4 The collate category

27.4.4.1 Class template collate

namespace std {
    template<class charT>
    class collate : public locale::facet {
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;

            explicit collate(size_t refs = 0);

\[\text{271) Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".}\]
The class `collate<charT>` provides features for use in the collation (comparison) and hashing of strings. A locale member function template, `operator()`, uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 24) and containers operating on strings. The specializations required in Table 90 (27.3.1.1.1), namely `collate<char>` and `collate<wchar_t>`, apply lexicographic ordering (24.7.10).

Each function compares a string of characters `*p` in the range `[low, high)`.

### 27.4.4.1.1 Members

```cpp
template<class charT>
namespace std {
    class collate_byname {
    public:
        using string_type = basic_string<charT>;
        static locale::id id;
    private:
        ~collate();
        virtual int do_compare(const charT* low1, const charT* high1,
                               const charT* low2, const charT* high2) const;
        virtual string_type do_transform(const charT* low, const charT* high) const;
        virtual long do_hash (const charT* low, const charT* high) const;
    }
}
```

This function is useful when one string is being compared to many other strings.

272) This function is useful when one string is being compared to many other strings.
explicit collate_byname(const char*, size_t refs = 0);
explicit collate_byname(const string&, size_t refs = 0);

protected:
- collate_byname();
};

27.4.5 The time category

Templates `time_get<charT, InputIterator>` and `time_put<charT, OutputIterator>` provide date and time formatting and parsing. All specifications of member functions for `time_put` and `time_get` in the subclauses of 27.4.5 only apply to the specializations required in Tables 90 and 91 (27.3.1.1.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 27.4, and the `ctype<>` facet, to determine formatting details.

27.4.5.1 Class template `time_get`

namespace std {
    class time_base {
    public:
        enum dateorder { no_order, dmy, mdy, ymd, ydm };
    }

    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
    public:
        using char_type = charT;
        using iter_type = InputIterator;

        explicit time_get(size_t refs = 0);

        dateorder date_order() const { return do_date_order(); }
        iter_type get_time(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
        iter_type get_date(iter_type s, iter_type end, ios_base& f,
                           ios_base::iostate& err, tm* t) const;
        iter_type get_weekday(iter_type s, iter_type end, ios_base& f,
                              ios_base::iostate& err, tm* t) const;
        iter_type get_monthname(iter_type s, iter_type end, ios_base& f,
                                ios_base::iostate& err, tm* t) const;
        iter_type get_year(iter_type s, iter_type end, ios_base& f,
                            ios_base::iostate& err, tm* t) const;
        iter_type get(iter_type s, iter_type end, ios_base& f,
                      const char_type* fmt, const char_type* fmtend) const;

        static locale::id id;
    protected:
        ~time_get();
        virtual iter_type do_get_time(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_date(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base& f,
                                          ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base& f,
                                             ios_base::iostate& err, tm* t) const;
        virtual iter_type do_get_year(iter_type s, iter_type end, ios_base& f,
                                       ios_base::iostate& err, tm* t) const;
};
virtual iter_type do_get(iter_type s, iter_type end, ios_base& f, 
   ios_base::iostate& err, tm* t, char format, char modifier) const;
};

1 time_get is used to parse a character sequence, extracting components of a time or date into a struct tm object. Each get member parses a format as produced by a corresponding format specifier to time_put<>::put. If the sequence being parsed matches the correct format, the corresponding members of the struct tm argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.273

2 If the end iterator is reached during parsing by any of the get() member functions, the member sets ios_base::eofbit in err.

27.4.5.1.1 Members

[locale.time.get.members]

dateorder date_order() const;
1
   Returns: do_date_order().

iter_type get_time(iter_type s, iter_type end, ios_base& str, 
   ios_base::iostate& err, tm* t) const;
2
   Returns: do_get_time(s, end, str, err, t).

iter_type get_date(iter_type s, iter_type end, ios_base& str, 
   ios_base::iostate& err, tm* t) const;
3
   Returns: do_get_date(s, end, str, err, t).

iter_type get_weekday(iter_type s, iter_type end, ios_base& str, 
   ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str, 
   ios_base::iostate& err, tm* t) const;
4
   Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t).

iter_type get_year(iter_type s, iter_type end, ios_base& str, 
   ios_base::iostate& err, tm* t) const;
5
   Returns: do_get_year(s, end, str, err, t).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, 
   tm* t, char format, char modifier = 0) const;
6
   Returns: do_get(s, end, f, err, t, format, modifier).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, 
   tm* t, const char_type* fmt, const char_type* fmtend) const;
7
   Requires: [fmt, fmtend) shall be a valid range.

   Effects: The function starts by evaluating err = ios_base::goodbit. It then enters a loop, reading zero or more characters from s at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

(8.1) The expression fmt == fmtend evaluates to true.
(8.2) The expression err == ios_base::goodbit evaluates to false.
(8.3) The expression s == end evaluates to true, in which case the function evaluates err = ios_base::eofbit | ios_base::failbit.
(8.4) The next element of fmt is equal to ‘%’, optionally followed by a modifier character, followed by a conversion specifier character, format, together forming a conversion specification valid for the ISO/IEC 9945 function strptime. If the number of elements in the range [fmt, fmtend) is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates err = ios_base::failbit. Otherwise, the function evaluates s = do_get(s, end, f, err, t, format, modifier), where the value of modifier is ‘\0’ when

273) In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.
the optional modifier is absent from the conversion specification. If \( \text{err} == \text{ios\_base::goodbit} \) holds after the evaluation of the expression, the function increments \( \text{fmt} \) to point just past the end of the conversion specification and continues looping.

\( \text{(8.5)} \)

— The expression `isspace(*fmt, f.getloc())` evaluates to `true`, in which case the function first increments \( \text{fmt} \) until `fmt == \text{fmtend} || !isspace(*fmt, f.getloc())` evaluates to `true`, then advances \( \text{s} \) until `s == \text{end} || !isspace(*s, f.getloc())` is `true`, and finally resumes looping.

\( \text{(8.6)} \)

— The next character read from \( \text{s} \) matches the element pointed to by \( \text{fmt} \) in a case-insensitive comparison, in which case the function evaluates `++fmt, ++s` and continues looping. Otherwise, the function evaluates `\text{err} = \text{ios\_base::failbit}`.

\[ \text{Note: The function uses the ctype<charT> facet installed in f's locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — end note} \]

27.4.5.1.2 Virtual functions

\[ \text{locale\_time\_get\_virtuals} \]

\textbf{dateorder do\_date\_order() const;}

\textit{Returns:} An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year.\textsuperscript{274} Returns \textit{no\_order} if the date format specified by ‘x’ contains other variable components (e.g., Julian day, week number, week day).

\textbf{iter\_type do\_get\_time(iter\_type s, iter\_type end, ios\_base& \textit{str}, ios\_base::iostate& \textit{err}, tm* \textit{t}) const;}

\textit{Effects:} Reads characters starting at \( s \) until it has extracted those \textit{struct tm} members, and remaining format characters, used by \textit{time\_put<>::put} to produce the format specified by "%H:%M:%S", or until it encounters an error or end of sequence.

\textit{Returns:} An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

\textbf{iter\_type do\_get\_date(iter\_type s, iter\_type end, ios\_base& \textit{str}, ios\_base::iostate& \textit{err}, tm* \textit{t}) const;}

\textit{Effects:} Reads characters starting at \( s \) until it has extracted those \textit{struct tm} members and remaining format characters used by \textit{time\_put<>::put} to produce one of the following formats, or until it encounters an error. The format depends on the value returned by \textit{date\_order()} as shown in Table 101.

<table>
<thead>
<tr>
<th>\textbf{date_order()}</th>
<th>\textbf{Format}</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_order</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>dmy</td>
<td>&quot;%d%m%y&quot;</td>
</tr>
<tr>
<td>mdy</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>ymd</td>
<td>&quot;%y%m%d&quot;</td>
</tr>
<tr>
<td>ydm</td>
<td>&quot;%y%d%m&quot;</td>
</tr>
</tbody>
</table>

Table 101 — \textit{do\_get\_date} effects

\[ \text{274) This function is intended as a convenience only, for common formats, and may return no\_order in valid locales.} \]

\textbf{iter\_type do\_get\_weekday(iter\_type s, iter\_type end, ios\_base& \textit{str}, ios\_base::iostate& \textit{err}, tm* \textit{t}) const;}

\textbf{iter\_type do\_get\_monthname(iter\_type s, iter\_type end, ios\_base& \textit{str}, ios\_base::iostate& \textit{err}, tm* \textit{t}) const;}

\textit{Effects:} Reads characters starting at \( s \) until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that could match a full
name, it continues reading until it matches the full name or fails. It sets the appropriate `struct tm` member accordingly.

**Returns:** An iterator pointing immediately beyond the last character recognized as part of a valid name.

```cpp
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;
```

**Effects:** Reads characters starting at `s` until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the `t->tm_year` member accordingly.

**Returns:** An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

```cpp
iter_type do_get(iter_type s, iter_type end, ios_base& f,
                 ios_base::iostate& err, tm* t, char format, char modifier) const;
```

**Requires:** `t` shall point to an object.

**Effects:** The function starts by evaluating `err = ios_base::goodbit`. It then reads characters starting at `s` until it encounters an error, or until it has extracted and assigned those `struct tm` members, and any remaining format characters, corresponding to a conversion directive appropriate for the ISO/IEC 9945 function `strptime`, formed by concatenating `'%'`, the `modifier` character, when non-NUL, and the `format` character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by `t` unchanged and evaluates `err |= ios_base::failbit`. When `s == end` evaluates to `true` after reading a character the function evaluates `err |= ios_base::eofbit`. For complex conversion directives such as `%c`, `%x`, or `%X`, or directives that involve the optional modifiers `E` or `O`, when the function is unable to unambiguously determine some or all `struct tm` members from the input sequence `[s, end)`, it evaluates `err |= ios_base::eofbit`. In such cases the values of those `struct tm` members are unspecified and may be outside their valid range.

**Remarks:** It is unspecified whether multiple calls to `do_get()` with the address of the same `struct tm` object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

**Returns:** An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given `format` and `modifier`.

### 27.4.5.2 Class template `time_get_byname` [locale.time.get.byname]

```cpp
namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
  class time_get_byname : public time_get<charT, InputIterator> {
    public:
      using dateorder = time_base::dateorder;
      using iter_type = InputIterator;

      explicit time_get_byname(const char*, size_t refs = 0);
      explicit time_get_byname(const string&, size_t refs = 0);

    protected:
      ~time_get_byname();
    }
  }
}
```

### 27.4.5.3 Class template `time_put` [locale.time.put]

```cpp
namespace std {
  template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
  class time_put : public locale::facet {
    public:
      using char_type = charT;
      using iter_type = OutputIterator;

      explicit time_put(size_t refs = 0);
    }
  }
}
```
// the following is implemented in terms of other member functions.
iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
    const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& f, char_type fill,
    const tm* tmb, char format, char modifier = 0) const;

static locale::id id;

protected:
    ~time_put();
    virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
        char format, char modifier) const;
};

27.4.5.3.1 Members
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
    const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
    char format, char modifier = 0) const;

Effects: The first form steps through the sequence from pattern to pat_end, identifying characters
that are part of a format sequence. Each character that is not part of a format sequence is written to
s immediately, and each format sequence, as it is identified, results in a call to do_put; thus, format
elements and other characters are interleaved in the output in the order in which they appear in
the pattern. Format sequences are identified by converting each character c to a char value as if by
c.t.narrow(c, 0), where ct is a reference to ctype<charT> obtained from str.getloc(). The first
character of each sequence is equal to '%', followed by an optional modifier character mod275 and a
format specifier character spec as defined for the function strftime. If no modifier character is present,
mod is zero. For each valid format sequence identified, calls do_put(s, str, fill, t, spec, mod).

The second form calls do_put(s, str, fill, t, format, modifier).

[Note: The fill argument may be used in the implementation-defined formats or by derivations. A
space character is a reasonable default for this argument. —end note]

Returns: An iterator pointing immediately after the last character produced.

27.4.5.3.2 Virtual functions
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
    char format, char modifier) const;

Effects: Formats the contents of the parameter t into characters placed on the output sequence s.
Formatting is controlled by the parameters format and modifier, interpreted identically as the format
specifiers in the string argument to the standard library function strftime()276, except that the
sequence of characters produced for those specifiers that are described as depending on the C locale are
instead implementation-defined.277

Returns: An iterator pointing immediately after the last character produced. [Note: The fill argument
may be used in the implementation-defined formats or by derivations. A space character is a reasonable
default for this argument. —end note]

27.4.5.4 Class template time_put_byname
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
    public:
        using char_type = charT;
        using iter_type = OutputIterator;

    275) Although the C programming language defines no modifiers, most vendors do.
    276) Interpretation of the modifier argument is implementation-defined, but should follow POSIX conventions.
    277) Implementations should refer to other standards such as POSIX for these definitions.

  ~time_putbyname();
};

27.4.6 The monetary category [category.monetary]

These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

All specifications of member functions for money_put and money_get in the subclauses of 27.4.6 only apply to the specializations required in Tables 90 and 91 (27.3.1.1.1). Their members use their ios_base&, ios_base::iostate&, and fill arguments as described in 27.4, and the moneypunct<> and ctype<> facets, to determine formatting details.

27.4.6.1 Class template money_get [locale.money.get]

namespace std {
  template<class charT, class InputIterator = istreambuf_iterator<charT>>
  class money_get : public locale::facet {
  public:
    using char_type = charT;
    using iter_type = InputIterator;
    using string_type = basic_string<charT>;
    explicit money_get(size_t refs = 0);
    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  long double& units) const;
    iter_type get(iter_type s, iter_type end, bool intl,
                  ios_base& f, ios_base::iostate& err,
                  string_type& digits) const;

    static locale::id id;
  protected:
    ~money_get();
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                              ios_base::iostate& err, long double& units) const;
    virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
                              ios_base::iostate& err, string_type& digits) const;
  }
};

27.4.6.1.1 Members [locale.money.get.members]

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
              ios_base::iostate& err, string_type& quant) const;

Returns: do_get(s, end, intl, f, err, quant).

27.4.6.1.2 Virtual functions [locale.money.get.virtuals]

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
                 ios_base::iostate& err, string_type& digits) const;

Effects: Reads characters from s to parse and construct a monetary value according to the format specified by a moneypunct<charT, Intl> facet reference mp and the character mapping specified by a ctype<charT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags().
If a valid sequence is recognized, does not change `err`; otherwise, sets `err` to `(err|str.failbit)`, or `(err|str.failbit|str.eofbit)` if no more characters are available, and does not change `units` or `digits`. Uses the pattern returned by `mp.neg_format()` to parse all values. The result is returned as an integral value stored in `units` or as a sequence of digits possibly preceded by a minus sign (as produced by `ct.widen(c)` where `c` is `-' or in the range from '0' through '9', inclusive) stored in `digits`. [Example: The sequence $1,056.23$ in a common United States locale would yield, for `units`, 105623, or, for `digits`, "105623". — end example] If `mp.grouping()` indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

Where `money_base::space` or `money_base::none` appears as the last element in the format pattern, no white space is consumed. Otherwise, where `money_base::space` appears in any of the initial elements of the format pattern, at least one white space character is required. Where `money_base::none` appears in any of the initial elements of the format pattern, white space is allowed but not required.

If `(str.flags() & str.showbase)` is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

If the first character (if any) in the string `pos` returned by `mp.positive_sign()` or the string `neg` returned by `mp.negative_sign()` is recognized in the position indicated by `sign` in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components. [Example: If `showbase` is off, then for a `neg` value of "()" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if `neg` is "-", the "L" in "-100 L" is not consumed. — end example] If `pos` or `neg` is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of `pos` or `neg`, and the result is given the corresponding sign. If the first character of `pos` is equal to the first character of `neg`, or if both strings are empty, the result is given a positive sign.

Digits in the numeric monetary component are extracted and placed in `digits`, or into a character buffer `buf1` for conversion to produce a value for `units`, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value `units` is produced as if by

```cpp
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where `n` is the number of characters placed in `buf1`, `buf2` is a character buffer, and the values `src` and `atoms` are defined as if by

```cpp
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

### 27.4.6.2 Class template money_put

```cpp
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
    public:
        using char_type = charT;
        using iter_type = OutputIterator;
        using string_type = basic_string<charT>;

        explicit money_put(size_t refs = 0);

        iter_type put(iter_type s, bool intl, ios_base& f,
                      char_type fill, long double units) const;
        iter_type put(iter_type s, bool intl, ios_base& f,
                      char_type fill, const string_type& digits) const;
    }
}
```

278) The semantics here are different from `ct.narrow`. 

§ 27.4.6.2  1275
static locale::id id;

protected:
- money_put();
virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
    long double units) const;
virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill,
    const string_type& digits) const;
};

27.4.6.2.1 Members

iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;

Returns: do_put(s, intl, f, loc, quant).

27.4.6.2.2 Virtual functions

iter_type do_put(iter_type s, bool intl, ios_base& str,
    char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
    char_type fill, const string_type& digits) const;

Effects: Writes characters to s according to the format specified by a moneypunct<charT, Intl> facet reference mp and the character mapping specified by a ctype<charT> facet reference ct obtained from the locale returned by str.getloc() and str.flags(). The argument units is transformed into a sequence of wide characters as if by

c.t.widen(buf1, buf1 + sprintf(buf1, "%0Lf", units), buf2)

for character buffers buf1 and buf2. If the first character in digits or buf2 is equal to ct.widen('-'), then the pattern used for formatting is the result of mp.neg_format(); otherwise the pattern is the result of mp.pos_format(). Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in digits or buf2. In digits, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to ct) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls str.width(0).

Remarks: The currency symbol is generated if and only if (str.flags() & str.showbase) is nonzero. If the number of characters generated for the specified format is less than the value returned by str.width() on entry to the function, then copies of fill are inserted as necessary to pad to the specified width. For the value af equal to (str.flags() & str.adjustfield), if (af == str.internal) is true, the fill characters are placed where none or space appears in the formatting pattern; otherwise if (af == str.left) is true, they are placed after the other characters; otherwise they are placed before the other characters. [Note: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using num_get<>::get. — end note]

Returns: An iterator pointing immediately after the last character produced.

27.4.6.3 Class template moneypunct

namespace std {
    class money_base {
    public:
        enum part { none, space, symbol, sign, value };
        struct pattern { char field[4]; };
    };

    template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;

        explicit moneypunct(size_t refs = 0);
The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `i`th component of the format. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

Where `none` or `space` appears, white space is permitted in the format, except where `none` appears at the end, in which case no white space is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

The format of the numeric monetary value is a decimal number:

```
value ::= units [ decimal-point [ digits ]] |
        decimal-point digits
```

if `frac_digits()` returns a positive value, or

```
value ::= units
```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```
units ::= digits [ thousands-sep units ]
digits ::= adigit [ digits ]
```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range '0' through '9', inclusive, and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. White space characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `moneypunct<>::do_grouping()`.

---

279) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.
27.4.6.3.1 Members

charT decimal_point() const;
charT thousands_sep() const;
string grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int frac_digits() const;
pattern pos_format() const;
pattern neg_format() const;

1 Each of these functions \( F \) returns the result of calling the corresponding virtual member function \( \text{do}_F() \).

27.4.6.3.2 Virtual functions

charT do_decimal_point() const;

1 Returns: The radix separator to use in case \( \text{do_frac_digits()} \) is greater than zero.\(^{280}\)

charT do_thousands_sep() const;

2 Returns: The digit group separator to use in case \( \text{do_grouping()} \) specifies a digit grouping pattern.\(^{281}\)

string do_grouping() const;

3 Returns: A pattern defined identically as, but not necessarily equal to, the result of \( \text{numpunct<charT>::do_grouping()} \).\(^{282}\)

string_type do_curr_symbol() const;

4 Returns: A string to use as the currency identifier symbol. [Note: For specializations where the second template parameter is true, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. — end note]

string_type do_positive_sign() const;

string_type do_negative_sign() const;

5 Returns: \( \text{do_positive_sign()} \) returns the string to use to indicate a positive monetary value;\(^{283}\)

\( \text{do_negative_sign()} \) returns the string to use to indicate a negative value.

int do_frac_digits() const;

6 Returns: The number of digits after the decimal radix separator, if any.\(^{284}\)

pattern do_pos_format() const;
pattern do_neg_format() const;

7 Returns: The specializations required in Table 91 (27.3.1.1.1), namely \( \text{numpunct<char>, numpunct<wchar_t>, numpunct<char, true>, and numpunct<wchar_t, true>,} \) return an object of type \( \text{pattern} \) initialized to \{ symbol, sign, none, value \}.\(^{285}\)

27.4.6.4 Class template moneypunct_byname

namespace std {
    template<class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
        public:
            using pattern = money_base::pattern;
            using string_type = basic_string<charT>;

            explicit moneypunct_byname(const char*, size_t refs = 0);
            explicit moneypunct_byname(const string&, size_t refs = 0);

            280) In common U.S. locales this is ".".
            281) In common U.S. locales this is ",".
            282) To specify grouping by 3s, the value is "\003" not "3".
            283) This is usually the empty string.
            284) In common U.S. locales, this is 2.
            285) Note that the international symbol returned by \( \text{do_curr_symbol()} \) usually contains a space, itself; for example, "USD ".

§ 27.4.6.4
27.4.7 The message retrieval category

Class messages<charT> implements retrieval of strings from message catalogs.

27.4.7.1 Class template messages

namespace std {
    class messages_base {
    public:
        using catalog = unspecified signed integer type;
    }

template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;
        explicit messages(size_t refs = 0);
        catalog open(const basic_string<char>& fn, const locale& loc) const;
        string_type get(catalog c, int set, int msgid, const string_type& dfault) const;
        void close(catalog c) const;
        static locale::id id;
    protected:
        ~messages();
        virtual catalog do_open(const basic_string<char>& name, const locale& loc) const;
        virtual string_type do_get(catalog c, int set, int msgid, const string_type& dfault) const;
        virtual void do_close(catalog c) const;
    }
}

Values of type messages_base::catalog usable as arguments to members get and close can be obtained only by calling member open.

27.4.7.1.1 Members

catalog open(const basic_string<char>& name, const locale& loc) const;

Returns: do_open(name, loc).

string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;

Returns: do_get(cat, set, msgid, dfault).

void close(catalog cat) const;

Effects: Calls do_close(cat).

27.4.7.1.2 Virtual functions

catalog do_open(const basic_string<char>& name, const locale& loc) const;

Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().

Returns a value less than 0 if no such catalog can be opened.

Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

§ 27.4.7.1.2
string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;

4 Requires: cat shall be a catalog obtained from open() and not yet closed.

5 Returns: A message identified by arguments set,msgid, and dfault, according to an implementation-defined mapping. If no such message can be found, returns dfault.

void do_close(catalog cat) const;

6 Requires: cat shall be a catalog obtained from open() and not yet closed.

7 Effects: Releases unspecified resources associated with cat.

8 Remarks: The limit on such resources, if any, is implementation-defined.

27.4.7.2 Class template messages_byname [locale.messagesbyname]
namespace std {
    template<class charT>
    class messages_byname : public messages<charT> {
        public:
            using catalog = messages_base::catalog;
            using string_type = basic_string<charT>;

            explicit messages_byname(const char*, size_t refs = 0);
            explicit messages_byname(const string&, size_t refs = 0);

            protected:
                ~messages_byname();
        }
    }

27.5 C library locales [clocales]
27.5.1 Header <clocale> synopsis [clocale.syn]
namespace std {
    struct lconv {
        char* setlocale(int category, const char* locale);
        lconv* localeconv();
    }

#define NULL see 16.2.3
#define LC_ALL see below
#define LC_COLLATE see below
#define LC_CTYPE see below
#define LC_MONETARY see below
#define LC_NUMERIC see below
#define LC_TIME see below

1 The contents and meaning of the header <clocale> are the same as the C standard library header <locale.h>.

2 Calls to the function setlocale may introduce a data race (15.5.5.9) with other calls to setlocale or with calls to the functions listed in Table 102.

28 Input/output library

28.1 General

1 This Clause describes components that C++ programs may use to perform input/output operations.

2 The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 103.

Table 103 — Input/output library summary

3 Figure 7 illustrates relationships among various types described in this clause. A line from A to B indicates that A is an alias (e.g., a typedef) for B or that A is defined in terms of B.

![Figure 7 — Stream position, offset, and size types [non-normative]](image)

28.2 Iostreams requirements

28.2.1 Imbue limitations

1 No function described in Clause 28 except for ios_base::imbue and basic_filebuf::pubimbue causes any instance of basic_ios::imbue or basic_streambuf::imbue to be called. If any user function called from a function declared in Clause 28 or as an overriding virtual function of any class declared in Clause 28 calls imbue, the behavior is undefined.
28.2.2 Positioning type limitations [iostreams.limits.pos]

The classes of Clause 28 with template arguments \texttt{charT} and \texttt{traits} behave as described if \texttt{traits::pos_type} and \texttt{traits::off_type} are \texttt{streampos} and \texttt{streamoff} respectively. Except as noted explicitly below, their behavior when \texttt{traits::pos_type} and \texttt{traits::off_type} are other types is implementation-defined.

In the classes of Clause 28, a template parameter with name \texttt{charT} represents a member of the set of types containing \texttt{char}, \texttt{wchar_t}, and any other implementation-defined character types that satisfy the requirements for a character on which any of the iostream components can be instantiated.

28.2.3 Thread safety [iostreams.threadsafety]

Concurrent access to a stream object (28.8, 28.9), stream buffer object (28.6), or C Library stream (28.12) by multiple threads may result in a data race (6.8.2) unless otherwise specified (28.4). [Note: Data races result in undefined behavior (6.8.2). —end note]

If one thread makes a library call \texttt{a} that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call \texttt{b} such that this does not result in a data race, then \texttt{a}'s write synchronizes with \texttt{b}'s read.

28.3 Forward declarations [iostream.forward]

28.3.1 Header \texttt{<iosfwd>} synopsis [iosfwd.syn]

1 Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.

---

286 It is the implementation’s responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.
28.3.2 Overview

The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iosstream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.

The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_stringbuf`, `basic_filebuf`, and `basic_syncbuf`.

The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istringstream` and `basic_ifstream`.

The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_ostringstream`, `basic_ofstream`, and `basic_osyncstream`.

The class template specialization `basic_iostream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.

[Note: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (20.2). — end note]

Other typedef-names define instances of class templates specialized for `char` or `wchar_t` types.

Specializations of the class template `fpos` are used for specifying file position information. [Example: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — end example]

[Note: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — end note]

28.4 Standard iostream objects

28.4.1 Header `<iostream>` synopsis

```cpp
#include <ios>     // see 28.5.1
#include <streambuf> // see 28.6.1
#include <iostream>  // see 28.7.1
#include <ostream>   // see 28.7.2

namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;

    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
}
```

28.4.2 Overview

In this Clause, the type name `FILE` refers to the type `FILE` declared in `<cstdio>` (28.12.1).

The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>` (28.12), and includes all the headers necessary to use these objects.

The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.8.3.1) begins execution. The objects are not destroyed during program execution. The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration.

Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on `FILE`s, as specified in the C standard library.

---

287) If it is possible for them to do so, implementations should initialize the objects earlier than required.

288) Constructors and destructors for static objects can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.

§ 28.4.2
Concurrent access to a synchronized standard iostream object’s formatted and unformatted input and output functions or a standard C stream by multiple threads shall not result in a data race. [Note: Users must still synchronize concurrent use of these objects and streams by multiple threads if they wish to avoid interleaved characters. — end note]

See also: ISO C 7.21.2

**28.4.3 Narrow stream objects**

```cpp
istream cin;
```

The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (28.12.1).

After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (28.5.5.2).

```cpp
ostream cout;
```

The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (28.12.1).

```cpp
ostream cerr;
```

The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).

After the object `cerr` is initialized, `cerr.flags()` & `unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (28.5.5.2).

```cpp
ostream clog;
```

The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).

**28.4.4 Wide stream objects**

```cpp
wistream wcin;
```

The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (28.12.1).

After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (28.5.5.2).

```cpp
wostream wcout;
```

The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (28.12.1).

```cpp
wostream wcerr;
```

The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).

After the object `wcerr` is initialized, `wcerr.flags()` & `unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (28.5.5.2).

```cpp
wostream wclog;
```

The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (28.12.1).

**28.5 Iostreams base classes**

**28.5.1 Header `<ios>` synopsis**

```cpp
#include <iosfwd>  // see 28.3.1

namespace std {
    using streamoff = implementation-defined;
    using streamsize = implementation-defined;
}  // namespace std
```
template<class stateT> class fpos;

class ios_base;

// 28.5.6, manipulators
ios_base& boolalpha (ios_base& str);
ios_base& noboolalpha(ios_base& str);

ios_base& showbase (ios_base& str);
ios_base& noshowbase (ios_base& str);

ios_base& showpoint (ios_base& str);
ios_base& noshowpoint(ios_base& str);

ios_base& showpos (ios_base& str);
ios_base& noshowpos (ios_base& str);

ios_base& skipws (ios_base& str);
ios_base& noskipws (ios_base& str);

ios_base& uppercase (ios_base& str);
ios_base& nouppercase(ios_base& str);

ios_base& unitbuf (ios_base& str);
ios_base& nounitbuf (ios_base& str);

// 28.5.6.2, adjustfield
ios_base& internal (ios_base& str);
ios_base& left (ios_base& str);
ios_base& right (ios_base& str);

// 28.5.6.3, basefield
ios_base& dec (ios_base& str);
ios_base& hex (ios_base& str);
ios_base& oct (ios_base& str);

// 28.5.6.4, floatfield
ios_base& fixed (ios_base& str);
ios_base& scientific (ios_base& str);
ios_base& hexfloat (ios_base& str);
ios_base& defaultfloat(ios_base& str);

// 28.5.7, error reporting
enum class io_errc {
    stream = 1
};

template<> struct is_error_code_enum<io_errc> : public true_type { };
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;

28.5.2 Types

using streamoff = implementation-defined;

1 The type streamoff is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.289

289) Typically long long.
using streamsize = implementation-defined;

The type streamsize is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.\textsuperscript{290}

28.5.3 Class \texttt{ios\_base}

namespace std {
  class \texttt{ios\_base} {
    public:
      \texttt{failure}; // see below

      \texttt{fmtflags flags() const;}
      \texttt{fmtflags flags(fmtflags fmtfl);}
      \texttt{fmtflags setf(fmtflags fmtfl);}
      \texttt{fmtflags setf(fmtflags fmtfl, fmtflags mask);}
      \texttt{void unsetf(fmtflags mask);}

      \texttt{streamsize} is used in most places where ISO C would use \texttt{size\_t}.

\textsuperscript{290} streamsize is used in most places where ISO C would use \texttt{size\_t}.

\textsuperscript{290}
streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 28.5.3.3, locales
locale imbue(const locale& loc);
locale getloc() const;

// 28.5.3.5, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 28.5.3.6, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;

static bool sync_with_stdio(bool sync = true);

protected:
ios_base();

private:
static int index; // exposition only
long* iarray; // exposition only
void** parray; // exposition only
};

1 i os_base defines several member types:

(1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;

(1.2) — a class Init;

(1.3) — three bitmask types, fmtflags, iostate, and openmode;

(1.4) — an enumerated type, seekdir.

2 It maintains several kinds of data:

(2.1) — state information that reflects the integrity of the stream buffer;

(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;

(2.3) — additional information that is stored by the program for its private use.

3 [Note: For the sake of exposition, the maintained data is presented here as:

(3.1) — static int index, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

(3.2) — long* iarray, points to the first element of an arbitrary-length long array maintained for the private use of the program;

(3.3) — void** parray, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

— end note]
28.5.3.1 Types

28.5.3.1.1 Class ios_base::failure

namespace std {
    class ios_base::failure : public system_error {
        public:
            explicit failure(const string& msg, const error_code& ec = io_errc::stream);
            explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    };
}

An implementation is permitted to define ios_base::failure as a synonym for a class with equivalent functionality to class ios_base::failure shown in this subclause. [Note: When ios_base::failure is a synonym for another type it shall provide a nested type failure, to emulate the injected class name. — end note] The class failure defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.

2 When throwing ios_base::failure exceptions, implementations should provide values of ec that identify the specific reason for the failure. [Note: Errors arising from the operating system would typically be reported as system_category() errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as error_code(io_errc::stream, iostream_category()). — end note]

explicit failure(const string& msg, const error_code& ec = io_errc::stream);

Effects: Constructs an object of class failure by constructing the base class with msg and ec.

explicit failure(const char* msg, const error_code& ec = io_errc::stream);

Effects: Constructs an object of class failure by constructing the base class with msg and ec.

28.5.3.1.2 Type ios_base::fmtflags

using fmtflags = T1;

The type fmtflags is a bitmask type (15.4.2.1.4). Setting its elements has the effects indicated in Table 104.

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolalpha</td>
<td>insert and extract bool type in alphabetic format</td>

28.5.3.1.3 Type ios_base::iostate

using iostate = T2;

1 The type iostate is a bitmask type (15.4.2.1.4) that contains the elements indicated in Table 106.

Table 106 — iostate effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>badbit</td>
<td>indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);</td>
</tr>
<tr>
<td>eofbit</td>
<td>indicates that an input operation reached the end of an input sequence;</td>
</tr>
<tr>
<td>failbit</td>
<td>indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.</td>
</tr>
</tbody>
</table>

2 Type iostate also defines the constant:

(2.1) — goodbit, the value zero.

28.5.3.1.4 Type ios_base::openmode

using openmode = T3;

1 The type openmode is a bitmask type (15.4.2.1.4). It contains the elements indicated in Table 107.

Table 107 — openmode effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>

</tr>
<tr>
<td>trunc</td>
<td>truncate an existing stream when opening</td>
</tr>
</tbody>
</table>

28.5.3.1.5 Type ios_base::seekdir

using seekdir = T4;

1 The type seekdir is an enumerated type (15.4.2.1.3) that contains the elements indicated in Table 108.

Table 108 — seekdir effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>beg</td>
<td>request a seek (for subsequent input or output) relative to the beginning of the stream</td>
</tr>
<tr>
<td>cur</td>
<td>request a seek relative to the current position within the sequence</td>
</tr>
<tr>
<td>end</td>
<td>request a seek relative to the current end of the sequence</td>
</tr>
</tbody>
</table>
28.5.3.1.6 Class `ios_base::Init`  

```cpp
namespace std {
    class ios_base::Init {
    public:
        Init();
        Init(const Init&) = default;
        ~Init();
        Init& operator=(const Init&) = default;
    private:
        static int init_cnt; // exposition only
    }
}
```

The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (28.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (28.12.1).

For the sake of exposition, the maintained data is presented here as:

```cpp
static int init_cnt, counts the number of constructor and destructor calls for class `Init`, initialized to zero.
```

1. `Init();`  
   **Effects:** Constructs an object of class `Init`. Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

2. `~Init();`  
   **Effects:** Destroys an object of class `Init`. If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, `wclog.flush()`.

28.5.3.2 State functions

```cpp
fmtflags flags() const;
```

1. **Returns:** The format control information for both input and output.

```cpp
fmtflags flags(fmtflags fmtfl);
```

2. **Ensures:** `fmtfl == flags()`.

3. **Returns:** The previous value of `flags()`.

```cpp
fmtflags setf(fmtflags fmtfl);
```

4. **Effects:** Sets `fmtfl` in `flags()`.

5. **Returns:** The previous value of `flags()`.

```cpp
fmtflags setf(fmtflags fmtfl, fmtflags mask);
```

6. **Effects:** Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

7. **Returns:** The previous value of `flags()`.

```cpp
void unsetf(fmtflags mask);
```

8. **Effects:** Clears `mask` in `flags()`.

```cpp
streamsize precision() const;
```

9. **Returns:** The precision to generate on certain output conversions.

```cpp
streamsize precision(streamsize prec);
```

10. **Ensures:** `prec == precision()`.

11. **Returns:** The previous value of `precision()`.

```cpp
streamsize width() const;
```

12. **Returns:** The minimum field width (number of characters) to generate on certain output conversions.
streamsize width(streamsize wide);

Ensures: wide == width().
Returns: The previous value of width().

28.5.3.3 Functions

locale imbue(const locale& loc);

Effects: Calls each registered callback pair \( (fn, idx) \) (28.5.3.6) as \( (*fn)(imbue\_event, *this, idx) \) at such a time that a call to `ios\_base::getloc()` from within `fn` returns the new locale value `loc`.
Returns: The previous value of `getloc()`.
Ensures: `loc == getloc()`.

locale getloc() const;

Returns: If no locale has been imbued, a copy of the global C++ locale, `locale()`, in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

28.5.3.4 Static members

bool sync_with_stdio(bool sync = true);

Returns: `true` if the previous state of the standard iostream objects (28.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.
Effects: If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.
When a standard iostream object `str` is synchronized with a standard stdio stream `f`, the effect of inserting a character `c` by

\[
\text{fputc}(f, c);
\]

is the same as the effect of

\[
\text{str.rdbuf()->sputc}(c);
\]

for any sequences of characters; the effect of extracting a character `c` by

\[
c = \text{fgetc}(f);
\]

is the same as the effect of

\[
c = \text{str.rdbuf()->sbumpc}();
\]

for any sequences of characters; and the effect of pushing back a character `c` by

\[
\text{ungetc}(c, f);
\]

is the same as the effect of

\[
\text{str.rdbuf()->sputbackc}(c);
\]

for any sequence of characters.\(^{291}\)

28.5.3.5 Storage functions

static int xalloc();

Returns: `index ++`.
Remarks: Concurrent access to this function by multiple threads shall not result in a data race (6.8.2).

long& iword(int idx);

Requires: `idx` is a value obtained by a call to `xalloc`.
Effects: If `iarray` is a null pointer, allocates an array of `long` of unspecified size and stores a pointer to its first element in `iarray`. The function then extends the array pointed at by `iarray` as necessary

\(^{291}\) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.
to include the element \texttt{iarray[idx]}. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operations on the object.\footnote{An implementation is free to implement both the integer array pointed at by \texttt{iarray} and the pointer array pointed at by \texttt{parray} as sparse data structures, possibly with a one-element cache for each.} However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{ivord} with the same index yields another reference to the same value. If the function fails\footnote{For example, because it cannot allocate space.} and \*\texttt{this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\begin{verbatim}
Returns: On success \texttt{iarray[idx]}. On failure, a valid \texttt{long&} initialized to 0.
\end{verbatim}

\begin{verbatim}
void*& pword(int idx);
\end{verbatim}

\begin{verbatim}
Requires: \texttt{idx} is a value obtained by a call to \texttt{xalloc}.
\end{verbatim}

\begin{verbatim}
Effects: If \texttt{parray} is a null pointer, allocates an array of pointers to \texttt{void} of unspecified size and stores a pointer to its first element in \texttt{parray}. The function then extends the array pointed at by \texttt{parray} as necessary to include the element \texttt{parray[idx]}. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{pword} with the same index yields another reference to the same value. If the function fails\footnote{For example, because it cannot allocate space.} and \*\texttt{this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\begin{verbatim}
Returns: On success \texttt{parray[idx]}. On failure a valid \texttt{void*&} initialized to 0.
\end{verbatim}

\begin{verbatim}
Remarks: After a subsequent call to \texttt{pword(int)} for the same object, the earlier return value may no longer be valid.
\end{verbatim}

\subsection{Callbacks}[ios.base.callback]

\begin{verbatim}
void register_callback(event_callback fn, int idx);
\end{verbatim}

\begin{verbatim}
Effects: Registers the pair \texttt{(fn, idx)} such that during calls to \texttt{imbue()} (28.5.3.3), \texttt{copyfmt()}, or \texttt{~ios_base()} (28.5.3.7), the function \texttt{fn} is called with argument \texttt{idx}. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

\begin{verbatim}
Requires: The function \texttt{fn} shall not throw exceptions.
\end{verbatim}

\begin{verbatim}
Remarks: Identical pairs are not merged. A function registered twice will be called twice.
\end{verbatim}

\subsection{Constructors and Destructor}[ios.base.cons]

\begin{verbatim}
ios_base();
\end{verbatim}

\begin{verbatim}
Effects: Each \texttt{ios_base} member has an indeterminate value after construction. The object’s members shall be initialized by calling \texttt{basic_ios::init} before the object’s first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

\begin{verbatim}
~ios_base();
\end{verbatim}

\begin{verbatim}
Effects: Destroys an object of class \texttt{ios_base}. Calls each registered callback pair \texttt{(fn, idx)} (28.5.3.6) as \texttt{(*fn)(erase_event, \*this, idx)} at such time that any \texttt{ios_base} member function called from within \texttt{fn} has well-defined results.
\end{verbatim}

\subsection{Class template fpos}[fpos]

\begin{verbatim}
namespace std {
  template<class stateT> class fpos {
    public:
      // 28.5.4.1, members
      stateT state() const;
      void state(stateT);
    private:
      stateT st; // exposition only
  }
}
\end{verbatim}
28.5.4.1 Members

```cpp
void state(stateT s);
```

1. **Effects**: Assigns `s` to `st`.

```cpp
stateT state() const;
```

2. **Returns**: Current value of `st`.

28.5.4.2 Requirements

1. An `fpos` type specifies file position information. It holds a state object whose type is equal to the template parameter `stateT`. Type `stateT` shall meet the `Cpp17DefaultConstructible` (Table 25), `Cpp17CopyConstructible` (Table 27), `Cpp17CopyAssignable` (Table 29), and `Cpp17Destructible` (Table 30) requirements. If `is_trivially_copy_constructible_v<stateT>` is `true`, then `fpos<stateT>` has a trivial copy constructor. If `is_trivially_copy_assignable<stateT>` is `true`, then `fpos<stateT>` has a trivial copy assignment operator. If `is_trivially_destructible_v<stateT>` is `true`, then `fpos<stateT>` has a trivial destructor. All specializations of `fpos` satisfy the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, `Cpp17CopyAssignable`, `Cpp17Destructible`, and `Cpp17EqualityComparable` (Table 23) requirements. In addition, the expressions shown in Table 109 are valid and have the indicated semantics. In that table,

1.1. — `P` refers to an instance of `fpos`,
1.2. — `p` and `q` refer to values of type `P` or `const P`,
1.3. — `pl` and `ql` refer to modifiable lvalues of type `P`,
1.4. — `o` refers to type `streamoff`, and
1.5. — `o` refers to a value of type `streamoff` or `const streamoff`.

### Table 109 — Position type requirements

<td><code>p == q + (p - q)</code></td>
</tr>
</tbody>
</table>

2. Stream operations that return a value of type `traits::pos_type` return `P(0(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

§ 28.5.4.2
28.5.5 Class template basic_ios

28.5.5.1 Overview

namespace std {

    template<class charT, class traits = char_traits<charT>>
    class basic_ios : public ios_base {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 28.5.5.4, flags functions
        explicit operator bool() const;
        bool operator!() const;
        iostate rdstate() const;
        void clear(iostate state = goodbit);
        void setstate(iostate state);
        bool good() const;
        bool eof() const;
        bool fail() const;
        bool bad() const;

        iostate exceptions() const;
        void exceptions(iostate except);

        // 28.5.5.2, constructor/destructor
        explicit basic_ios(basic_streambuf<charT, traits>* sb);
        virtual ~basic_ios();

        // 28.5.5.3, members
        basic_ostream<charT, traits>* tie() const;
        basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

        basic_streambuf<charT, traits>* rdbuf() const;
        basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

        basic_ios& copyfmt(const basic_ios& rhs);

        char_type fill() const;
        char_type fill(char_type ch);

        locale imbue(const locale& loc);

        char narrow(char_type c, char dfault) const;
        char_type widen(char c) const;

        basic_ios(const basic_ios&) = delete;
        basic_ios& operator=(const basic_ios&) = delete;

    protected:
        basic_ios();
        void init(basic_streambuf<charT, traits>* sb);
        void move(basic_ios& rhs);
        void move(basic_ios&& rhs);
        void swap(basic_ios& rhs) noexcept;
        void set_rdbuf(basic_streambuf<charT, traits>* sb);
    }
};
28.5.5.2 Constructors

`explicit basic_ios(basic_streambuf<charT, traits>* sb);`

*Effects:* Constructs an object of class `basic_ios`, assigning initial values to its member objects by calling `init(sb)`.

`basic_ios();`

*Effects:* Constructs an object of class `basic_ios` (28.5.3.7) leaving its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

`~basic_ios();`

*Remarks:* The destructor does not destroy `rdbuf()`.

`void init(basic_streambuf<charT, traits>* sb);`

*Ensures:* The postconditions of this function are indicated in Table 110.

<table>

</table>

28.5.5.3 Member functions

`basic_ostream<charT, traits>** tie() const;`

*Returns:* An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

`basic_ostream<charT, traits>** tie(basic_ostream<charT, traits>** tiestr);`

*Requires:* If `tiestr` is not null, `tiestr` shall not be reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

*Ensures:* `tiestr == tie()`.

*Returns:* The previous value of `tie()`.

`basic_streambuf<charT, traits>** rdbuf() const;`

*Returns:* A pointer to the `streambuf` associated with the stream.

`basic_streambuf<charT, traits>** rdbuf(basic_streambuf<charT, traits>** sb);`

*Ensures:* `sb == rdbuf()`.

*Effects:* Calls `clear()`.

*Returns:* The previous value of `rdbuf()`.

`locale imbue(const locale& loc);`

*Effects:* Calls `ios_base::imbue(loc)` (28.5.3.3) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` (28.6.3.2.1).
Returns: The prior value of `ios_base::imbue()`.

char narrow(char_type c, char dfault) const;

Returns: `use_facet<ctype<char_type>>()(getloc()).narrow(c, dfault)

char_type widen(char c) const;

Returns: `use_facet<ctype<char_type>>()(getloc()).widen(c)

char_type fill() const;

Returns: The character used to pad (fill) an output conversion to the specified field width.

char_type fill(char_type fillch);

Ensures: `traits::eq(fillch, fill())`.

Returns: The previous value of `fill()`.

basic_ios& copyfmt(const basic_ios& rhs);

Effects: If `this == addressof(rhs)` does nothing. Otherwise assigns to the member objects of `*this` the corresponding member objects of `rhs` as follows:

(16.1) — calls each registered callback pair `fn, idx` as `(*fn)(erase_event, *this, idx)`;
(16.2) — then, assigns to the member objects of `*this` the corresponding member objects of `rhs`, except that
(16.2.1) — `rdstate()`, `rdbuf()`, and `exceptions()` are left unchanged;
(16.2.2) — the contents of arrays pointed at by `pword` and `iword` are copied, not the pointers themselves;
(16.2.3) — if any newly stored pointer values in `*this` point at objects stored outside the object `rhs` and those objects are destroyed when `rhs` is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
(16.3) — then, calls each callback pair that was copied from `rhs` as `(*fn)(copyfmt_event, *this, idx)`;
(16.4) — then, calls `exceptions(rhs.exceptions())`.

[Note: The second pass through the callback pairs permits a copied `pword` value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — end note]

Ensures: The postconditions of this function are indicated in Table 111.

Table 111 — `basic_ios::copyfmt()` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>rdbuf()</td>
<td>unchanged</td>
</tr>
<tr>
<td>tie()</td>
<td>rhs.tie()</td>
</tr>
<tr>
<td>rdstate()</td>
<td>unchanged</td>
</tr>
<tr>
<td>exceptions()</td>
<td>rhs.exceptions()</td>
</tr>
<tr>
<td>flags()</td>
<td>rhs.flags()</td>
</tr>
<tr>
<td>width()</td>
<td>rhs.width()</td>
</tr>
<tr>
<td>precision()</td>
<td>rhs.precision()</td>
</tr>
<tr>
<td>fill()</td>
<td>rhs.fill()</td>
</tr>
<tr>
<td>getloc()</td>
<td>rhs.getloc()</td>
</tr>
</tbody>
</table>

Returns: `*this`.

void move(basic_ios& rhs);

This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.
void move(basic_ios&& rhs);

Ensures: *this shall have the state that rhs had before the function call, except that rdbuf() shall return 0. rhs shall be in a valid but unspecified state, except that rhs.rdbuf() shall return the same value as it returned before the function call, and rhs.tie() shall return 0.

void swap(basic_ios& rhs) noexcept;

Effects: The states of *this and rhs shall be exchanged, except that rdbuf() shall return the same value as it returned before the function call, and rhs.rdbuf() shall return the same value as it returned before the function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);

Requires: sb != nullptr.

Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling clear().

Ensures: rdbuf() == sb.

Throws: Nothing.

28.5.5.4 Flags functions

explicit operator bool() const;

Returns: !fail().

bool operator!() const;

Returns: fail().

iostate rdstate() const;

Returns: The error state of the stream buffer.

void clear(iostate state = goodbit);

Ensures: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | ios_base::badbit).

Effects: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Otherwise, the function throws an object of class basic_ios::failure (28.5.3.1.1), constructed with implementation-defined argument values.

void setstate(iostate state);

Effects: Calls clear(rdbuf() | state) (which may throw basic_ios::failure (28.5.3.1.1)).

bool good() const;

Returns: rdstate() == 0

bool eof() const;

Returns: true if eofbit is set in rdstate().

bool fail() const;

Returns: true if failbit or badbit is set in rdstate().

bool bad() const;

Returns: true if badbit is set in rdstate().

iostate exceptions() const;

Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

void exceptions(iostate except);

Ensures: except == exceptions().

[28.5.5.4]

296) Checking badbit also for fail() is historical practice.
Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

```cpp
ios_base& boolalpha(ios_base& str);

Effects: Calls str.setf(ios_base::boolalpha).
Returns: str.

ios_base& noboolalpha(ios_base& str);

Effects: Calls str.unsetf(ios_base::boolalpha).
Returns: str.

ios_base& showbase(ios_base& str);

Effects: Calls str.setf(ios_base::showbase).
Returns: str.

ios_base& noshowbase(ios_base& str);

Effects: Calls str.unsetf(ios_base::showbase).
Returns: str.

ios_base& showpoint(ios_base& str);

Effects: Calls str.setf(ios_base::showpoint).
Returns: str.

ios_base& noshowpoint(ios_base& str);

Effects: Calls str.unsetf(ios_base::showpoint).
Returns: str.

ios_base& showpos(ios_base& str);

Effects: Calls str.setf(ios_base::showpos).
Returns: str.

ios_base& noshowpos(ios_base& str);

Effects: Calls str.unsetf(ios_base::showpos).
Returns: str.

ios_base& skipws(ios_base& str);

Effects: Calls str.setf(ios_base::skipws).
Returns: str.

ios_base& noskipws(ios_base& str);

Effects: Calls str.unsetf(ios_base::skipws).
Returns: str.

ios_base& uppercase(ios_base& str);

Effects: Calls str.setf(ios_base::uppercase).
Returns: str.

ios_base& nouppercase(ios_base& str);

Effects: Calls str.unsetf(ios_base::uppercase).
Returns: str.
```
28.5.6.2 adjustfield manipulators

Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

ios_base& internal(ios_base& str);

Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).

Returns: str.

ios_base& left(ios_base& str);

Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).

Returns: str.

ios_base& right(ios_base& str);

Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).

Returns: str.

28.5.6.3 basefield manipulators

Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

ios_base& dec(ios_base& str);

Effects: Calls str.setf(ios_base::dec, ios_base::basefield).

Returns: str\(^{297}\).

ios_base& hex(ios_base& str);

Effects: Calls str.setf(ios_base::hex, ios_base::basefield).

Returns: str.

ios_base& oct(ios_base& str);

Effects: Calls str.setf(ios_base::oct, ios_base::basefield).

Returns: str.

28.5.6.4 floatfield manipulators

Each function specified in this subclause is a designated addressable function (15.5.4.2.1).

ios_base& fixed(ios_base& str);

Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).

Returns: str.

ios_base& scientific(ios_base& str);

Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).

Returns: str.

ios_base& hexfloat(ios_base& str);

Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).

Returns: str.

\(^{297}\) The function signature dec(ios_base&) can be called by the function signature basic_ostream& stream::operator<<(ios_base& (*)(ios_base&)) to permit expressions of the form cout << dec to change the format flags stored in cout.
8 [Note: The more obvious use of `ios_base::hex` to specify hexadecimal floating-point format would change the meaning of existing well-defined programs. C++ 2003 gives no meaning to the combination of `fixed` and `scientific`. — end note]

ios_base& defaultfloat(ios_base& str);

Effects: Calls `str.unsetf(ios_base::floatfield)`.

Returns: `str`.

28.5.7 Error reporting

error_code make_error_code(io_errc e) noexcept;

Returns: `error_code(static_cast<int>(e), iostream_category())`.

error_condition make_error_condition(io_errc e) noexcept;

Returns: `error_condition(static_cast<int>(e), iostream_category())`.

const error_category& iostream_category() noexcept;

Returns: A reference to an object of a type derived from class `error_category`.

The object’s `default_error_condition` and `equivalent` virtual functions shall behave as specified for the class `error_category`. The object’s `name` virtual function shall return a pointer to the string "iostream".

28.6 Stream buffers

28.6.1 Header `<streambuf>` synopsis

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;
    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}

The header `<streambuf>` defines types that control input from and output to `character` sequences.

28.6.2 Stream buffer requirements

Stream buffers can impose various constraints on the sequences they control. Some constraints are:

1. The controlled input sequence can be not readable.
2. The controlled output sequence can be not writable.
3. The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.
4. The controlled sequences can support operations directly to or from associated sequences.
5. The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

Each sequence is characterized by three pointers which, if non-null, all point into the same `charT` array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

1. The `beginning pointer`, or lowest element address in the array (called `xbeg` here);
2. The `next pointer`, or next element address that is a current candidate for reading or writing (called `xnext` here);
3. The `end pointer`, or first element address beyond the end of the array (called `xend` here).

The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:
If \( x_{\text{next}} \) is not a null pointer, then \( x_{\text{beg}} \) and \( x_{\text{end}} \) shall also be non-null pointers into the same \( \text{charT} \) array, as described above; otherwise, \( x_{\text{beg}} \) and \( x_{\text{end}} \) shall also be null.

If \( x_{\text{next}} \) is not a null pointer and \( x_{\text{next}} < x_{\text{end}} \) for an output sequence, then a \textit{write position} is available. In this case, \( \ast x_{\text{next}} \) shall be assignable as the next element to write (to put, or to store a character value, into the sequence).

If \( x_{\text{next}} \) is not a null pointer and \( x_{\text{beg}} < x_{\text{next}} \) for an input sequence, then a \textit{putback position} is available. In this case, \( x_{\text{next}}[-1] \) shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.

If \( x_{\text{next}} \) is not a null pointer and \( x_{\text{next}} < x_{\text{end}} \) for an input sequence, then a \textit{read position} is available. In this case, \( \ast x_{\text{next}} \) shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 28.6.3 Class template basic_streambuf

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf {
public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        virtual ~basic_streambuf();

        // 28.6.3.2.1, locales
        locale pubimbue(const locale& loc);
        locale getloc() const;

        // 28.6.3.2.2, buffer and positioning
        basic_streambuf* pubsetbuf(char_type* s, streamsize n);
        pos_type pubseekoff(off_type off, ios_base::seekdir way,
            ios_base::openmode which
            = ios_base::in | ios_base::out);
        pos_type pubseekpos(pos_type sp,
            ios_base::openmode which
            = ios_base::in | ios_base::out);
        int pubsync();

        // get and put areas
        // 28.6.3.2.3, get area
        streamsize in_avail();
        int_type snextc();
        int_type sbumpc();
        int_type sgetc();
        streamsize sgetn(char_type* s, streamsize n);

        // 28.6.3.2.4, putback
        int_type sputbackc(char_type c);
        int_type sungetc();

        // 28.6.3.2.5, put area
        int_type sputc(char_type c);
        streamsize sputn(const char_type* s, streamsize n);

    protected:
        basic_streambuf();
        basic_streambuf(const basic_streambuf& rhs);
        basic_streambuf& operator=(const basic_streambuf& rhs);

        void swap(basic_streambuf& rhs);
    };
}
```

§ 28.6.3
The class template `basic_streambuf` serves as an abstract base class for deriving various stream buffers whose objects each control two character sequences:

- a character input sequence;
- a character output sequence.

### 28.6.3.1 Constructors [streambuf.cons]

`basic_streambuf()`;

**Effects:** Constructs an object of class `basic_streambuf<charT, traits>` and initializes:

1. all its pointer member objects to null pointers,
2. the `getloc()` member to a copy the global locale, `locale()`, at the time of construction.

**Remarks:** Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

---

298) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class may be constructed.
basic_streambuf(const basic_streambuf& rhs);

Effects: Constructs a copy of rhs.

Ensures:
(4.1)  eback() == rhs.eback()
(4.2)  gptr() == rhs.gptr()
(4.3)  egptr() == rhs.egptr()
(4.4)  pbase() == rhs.pbase()
(4.5)  pptr() == rhs.pptr()
(4.6)  epptr() == rhs.epptr()
(4.7)  getloc() == rhs.getloc()

~basic_streambuf();

Effects: None.

28.6.3.2 Public member functions

28.6.3.2.1 Locales
locale pubimbue(const locale& loc);

Ensures: loc == getloc().
Effects: Calls imbue(loc).
Returns: Previous value of getloc().

locale getloc() const;

Returns: If pubimbue() has ever been called, then the last value of loc supplied, otherwise the current global locale, locale(), in effect at the time of construction. If called after pubimbue() has been called but before pubimbue has returned (i.e., within the call of imbue()) then it returns the previous value.

28.6.3.2.2 Buffer management and positioning

basic_streambuf* pubsetbuf(char_type* s, streamsize n);

Returns: setbuf(s, n).

pos_type pubseekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out);

Returns: seekoff(off, way, which).

pos_type pubseekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out);

Returns: seekpos(sp, which).

int pubsync();

Returns: sync().

28.6.3.2.3 Get area

streamsize in_avail();

Returns: If a read position is available, returns egptr() - gptr(). Otherwise returns showmanyc() (28.6.3.4.3).

int_type snextc();

Effects: Calls sbumpc().

Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().

§ 28.6.3.2.3
int_type sbumpc();

Returns: If the input sequence read position is not available, returns uflow(). Otherwise, returns traits::to_int_type(*gptr()) and increments the next pointer for the input sequence.

int_type sgetc();

Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns traits::to_int_type(*gptr()).

streamsize sgetn(char_type* s, streamsize n);

Returns: xsgetn(s, n).

28.6.3.2.4 Putback [streambuf.pub.pback]

int_type sputbackc(char_type c);

Returns: If the input sequence putback position is not available, or if traits::eq(c, gptr())[-1] is false, returns pbackfail(traits::to_int_type(c)). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

int_type sungetc();

Returns: If the input sequence putback position is not available, returns pbackfail(). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

28.6.3.2.5 Put area [streambuf.pub.put]

int_type sputc(char_type c);

Returns: If the output sequence write position is not available, returns overflow(traits::to_int_type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and returns traits::to_int_type(c).

streamsize sputn(const char_type* s, streamsize n);

Returns: xsputn(s, n).

28.6.3.3 Protected member functions [streambuf.protected]

28.6.3.3.1 Assignment [streambuf.assign]

basic_streambuf& operator=(const basic_streambuf& rhs);

Effects: Assigns the data members of rhs to *this.

Ensures:

(2.1) eback() == rhs.eback()
(2.2) gptr() == rhs.gptr()
(2.3) egptr() == rhs.egptr()
(2.4) pbase() == rhs.pbase()
(2.5) pptr() == rhs.pptr()
(2.6) epptr() == rhs.epptr()
(2.7) getloc() == rhs.getloc()

Returns: *this.

void swap(basic_streambuf& rhs);

Effects: Swaps the data members of rhs and *this.

28.6.3.3.2 Get area access [streambuf.get.area]

char_type* eback() const;

Returns: The beginning pointer for the input sequence.
char_type* gptr() const;
Returns: The next pointer for the input sequence.

char_type* egptr() const;
Returns: The end pointer for the input sequence.

void gbump(int n);
Effects: Adds n to the next pointer for the input sequence.

void setg(char_type* gbeg, char_type* gnext, char_type* gend);
Ensures: gbeg == eback(), gnext == gptr(), and gend == egptr().

28.6.3.3 Put area access [streambuf.put.area]
char_type* pbase() const;
Returns: The beginning pointer for the output sequence.

char_type* pptr() const;
Returns: The next pointer for the output sequence.

char_type* epptr() const;
Returns: The end pointer for the output sequence.

void pbump(int n);
Effects: Adds n to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);
Ensures: pbeg == pbase(), pbeg == pptr(), and pend == epptr().

28.6.3.4 Virtual functions [streambuf.virtuals]
28.6.3.4.1 Locales [streambuf.virt.locales]

void imbue(const locale&);
Effects: Change any translations based on locale.
Remarks: Allows the derived class to be informed of changes in locale at the time they occur. Between
invocations of this function a class derived from streambuf can safely cache results of calls to locale
functions and to members of facets so obtained.
Default behavior: Does nothing.

28.6.3.4.2 Buffer management and positioning [streambuf.virt.buffer]
basic_streambuf* setbuf(char_type* s, streamsize n);
Effects: Influences stream buffering in a way that is defined separately for each class derived from
basic_streambuf in this Clause (28.8.2.4, 28.9.2.4).
Default behavior: Does nothing. Returns this.

pos_type seekoff(off_type off, ios_base::seekdir way,
ios_base::openmode which
= ios_base::in | ios_base::out);
Effects: Alters the stream positions within one or more of the controlled sequences in a way that is
defined separately for each class derived from basic_streambuf in this Clause (28.8.2.4, 28.9.2.4).
Default behavior: Returns pos_type(off_type(-1)).

pos_type seekpos(pos_type sp,
ios_base::openmode which
= ios_base::in | ios_base::out);
Effects: Alters the stream positions within one or more of the controlled sequences in a way that is
defined separately for each class derived from basic_streambuf in this Clause (28.8.2, 28.9.2).
Default behavior: Returns `pos_type(off_type(-1))`.

```c
int sync();
```

**Effects:** Synchronizes the controlled sequences with the arrays. That is, if `pbase()` is non-null the characters between `pbase()` and `pptr()` are written to the controlled sequence. The pointers may then be reset as appropriate.

**Returns:** -1 on failure. What constitutes failure is determined by each derived class (28.9.2.4).

Default behavior: Returns zero.

### 28.6.3.4.3 Get area

```c
streamsize showmanyc();
```

**Returns:** An estimate of the number of characters available in the sequence, or -1. If it returns a positive value, then successive calls to `underflow()` will not return `traits::eof()` until at least that number of characters have been extracted from the stream. If `showmanyc()` returns -1, then calls to `underflow()` or `uflow()` will fail.

Default behavior: Returns zero.

**Remarks:** Uses `traits::eof()`.

```c
streamsize xsgetn(char_type* s, streamsize n);
```

**Effects:** Assigns up to `n` characters to successive elements of the array whose first element is designated by `s`. The characters assigned are read from the input sequence as if by repeated calls to `sbumpc()`. Assigning stops when either `n` characters have been assigned or a call to `sbumpc()` would return `traits::eof()`.

**Returns:** The number of characters assigned.

**Remarks:** Uses `traits::eof()`.

```c
int_type underflow();
```

**Remarks:** The public members of `basic_streambuf` call this virtual function only if `gptr()` is null or `gptr() >= egptr()`.

**Returns:** `traits::to_int_type(c)`, where `c` is the first character of the pending sequence, without moving the input sequence position past it. If the pending sequence is null then the function returns `traits::eof()` to indicate failure.

The **pending sequence** of characters is defined as the concatenation of

1. the empty sequence if `gptr()` is null, otherwise the characters in `[gptr(), egptr())`, followed by
2. some (possibly empty) sequence of characters read from the input sequence.

The **result character** is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

The **backup sequence** is the empty sequence if `eback()` is null, otherwise the characters in `[eback(), gptr())`.

**Effects:** The function sets up the `gptr()` and `egptr()` such that if the pending sequence is non-empty, then `egptr()` is non-null and the characters in `[gptr(), egptr())` are the characters in the pending sequence, otherwise either `gptr()` is null or `gptr() == egptr()`.

If `eback()` and `gptr()` are non-null then the function is not constrained as to their contents, but the "usual backup condition" is that either

1. the backup sequence contains at least `gptr() - eback()` characters, in which case the characters in `[eback(), gptr())` agree with the last `gptr() - eback()` characters of the backup sequence, or

---

299) The morphemes of `showmanyc` are “es-how-many-see”, not “show-manic”.

300) `underflow` or `uflow` might fail by throwing an exception prematurely. The intention is not only that the calls will not return `eof()` but that they will return “immediately”.

301) Classes derived from `basic_streambuf` can provide more efficient ways to implement `xsgetn()` and `xsputn()` by overriding these definitions from the base class.
the characters in \([\text{gptr()} - n, \text{gptr()}]\) agree with the backup sequence (where \(n\) is the length of the backup sequence).

**Default behavior:** Returns \(\text{traits::eof()}\).

```cpp
int_type uflow();
```

**Requires:** The constraints are the same as for \(\text{underflow()}\), except that the result character shall be transferred from the pending sequence to the backup sequence, and the pending sequence shall not be empty before the transfer.

**Default behavior:** Calls \(\text{underflow()}\). If \(\text{underflow()}\) returns \(\text{traits::eof()}\), returns \(\text{traits::eof()}\). Otherwise, returns the value of \(\text{traits::to_int_type(*gptr())}\) and increment the value of the next pointer for the input sequence.

**Returns:** \(\text{traits::eof()}\) to indicate failure.

### 28.6.3.4.4 Putback

```cpp
int_type pbackfail(int_type c = traits::eof());
```

**Remarks:** The public functions of \(\text{basic\_streambuf}\) call this virtual function only when \(\text{gptr()}\) is null, \(\text{gptr()} == \text{eback()}\), or \(\text{traits::eq(traits::to_char_type(c), gptr()[-1])}\) returns \(\text{false}\). Other calls shall also satisfy that constraint.

The **pending sequence** is defined as for \(\text{underflow()}\), with the modifications that

1. If \(\text{traits::eq_int_type(c, traits::eof())}\) returns \(\text{true}\), then the input sequence is backed up one character before the pending sequence is determined.
2. If \(\text{traits::eq_int_type(c, traits::eof())}\) returns \(\text{false}\), then \(c\) is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

**Ensures:** On return, the constraints of \(\text{gptr()}, \text{eback()}, \) and \(\text{pptr()}\) are the same as for \(\text{underflow()}\).

**Returns:** \(\text{traits::eof()}\) to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers could not be set consistent with the constraints. \(\text{pbackfail()}\) is called only when put back has really failed.

Returns some value other than \(\text{traits::eof()}\) to indicate success.

**Default behavior:** Returns \(\text{traits::eof()}\).

### 28.6.3.4.5 Put area

```cpp
streamsize xsputn(const char_type* s, streamsize n);
```

**Effects:** Writes up to \(n\) characters to the output sequence as if by repeated calls to \(\text{sputc(c)}\). The characters written are obtained from successive elements of the array whose first element is designated by \(s\). Writing stops when either \(n\) characters have been written or a call to \(\text{sputc(c)}\) would return \(\text{traits::eof()}\). It is unspecified whether the function calls \(\text{overflow()}\) when \(\text{pptr()} == \text{epptr()}\) becomes \(\text{true}\) or whether it achieves the same effects by other means.

**Returns:** The number of characters written.

```cpp
int_type overflow(int_type c = traits::eof());
```

**Effects:** Consumes some initial subsequence of the characters of the **pending sequence**. The pending sequence is defined as the concatenation of

1. The empty sequence if \(\text{pbase()}\) is null, otherwise the \(\text{pptr()} - \text{pbase()}\) characters beginning at \(\text{pbase()}\), followed by
2. The empty sequence if \(\text{traits::eq_int_type(c, traits::eof())}\) returns \(\text{true}\), otherwise the sequence consisting of \(c\).

**Remarks:** The member functions \(\text{sputc()}\) and \(\text{sputn()}\) call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

**Requires:** Every overriding definition of this virtual function shall obey the following constraints:
— The effect of consuming a character on the associated output sequence is specified. 302

— Let \( r \) be the number of characters in the pending sequence not consumed. If \( r \) is nonzero then \( \text{pbase()} \) and \( \text{pptr()} \) shall be set so that: \( \text{pptr()} - \text{pbase()} = r \) and the \( r \) characters starting at \( \text{pbase()} \) are the associated output stream. In case \( r \) is zero (all characters of the pending sequence have been consumed) then either \( \text{pbase()} \) is set to \text{nullptr}, or \( \text{pbase()} \) and \( \text{pptr()} \) are both set to the same non-null value.

— The function may fail if either appending some character to the associated output stream fails or if it is unable to establish \( \text{pbase()} \) and \( \text{pptr()} \) according to the above rules.

Returns: \text{traits::eof()} or throws an exception if the function fails.

Otherwise, returns some value other than \text{traits::eof()} to indicate success. 303

Default behavior: Returns \text{traits::eof()}.

### 28.7 Formatting and manipulators [iostream.format]

#### 28.7.1 Header <istream> synopsis [istream.syn]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_istream;
    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;
    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);
    template<class charT, class traits, class T>
        basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&& is, T&& x);
}
```

#### 28.7.2 Header <ostream> synopsis [ostream.syn]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_ostream;
    using ostream = basic_ostream<char>;
    using wostream = basic_ostream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
        basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
    template<class charT, class traits = char_traits<charT>>
        basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
    template<class charT, class traits = char_traits<charT>>
        basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
    template<class charT, class traits = char_traits<charT>>
        basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
    template<class charT, class traits = char_traits<charT>>
        basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
    template<class charT, class traits = char_traits<charT>>
        basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
}
```

---

302) That is, for each class derived from an instance of \text{basic_streambuf} in this Clause (28.8.2, 28.9.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.

303) Typically, \text{overflow} returns \( c \) to indicate success, except when \text{traits::eq_int_type}(c, \text{traits::eof()}) returns \text{true}, in which case it returns \text{traits::not_eof}(c).
template<class charT, class traits, class T>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&& os, const T& x);

28.7.3 Header <iomanip> synopsis

namespace std {

    // types T1, T2, ... are unspecified implementation types
    T1 resetiosflags(ios_base::fmtflags mask);
    T2 setiosflags (ios_base::fmtflags mask);
    T3 setbase(int base);
    template<class charT> T4 setfill(charT c);
    T5 setprecision(int n);
    T6 setw(int n);
    template<class moneyT> T7 get_money(moneyT& mon, bool intl = false);
    template<class moneyT> T8 put_money(const moneyT& mon, bool intl = false);
    template<class charT> T9 get_time(struct tm* tmb, const charT* fmt);
    template<class charT> T10 put_time(const struct tm* tmb, const charT* fmt);

    template<class charT> T11 quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\\'));
    template<class charT, class traits, class Allocator> T12 quoted(const basic_string<charT, traits, Allocator>& s, charT delim = charT('"'), charT escape = charT('\\'));
    template<class charT, class traits, class Allocator> T13 quoted(basic_string<charT, traits, Allocator>& s, charT delim = charT('"'), charT escape = charT('\\'));
    template<class charT, class traits> T14 quoted(basic_string_view<charT, traits> s, charT delim = charT('"'), charT escape = charT('\\'));
}

28.7.4 Input streams

1 The header <istream> defines two types and a function signature that control input from a stream buffer along with a function template that extracts from stream rvalues.

28.7.4.1 Class template basic_istream

namespace std {

    template<class charT, class traits = char_traits<charT>>
    class basic_istream : virtual public basic_ios<charT, traits> {
        public:
            // types (inherited from basic_ios (28.5.5))
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 28.7.4.1.1, constructor/destructor
            explicit basic_istream(basic_streambuf<charT, traits>* sb);
            virtual ~basic_istream();

            // 28.7.4.1.3, prefix/suffix
            class sentry;

            // 28.7.4.2, formatted input
            basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>&* (pf)(basic_istream<charT, traits>&&));
            basic_istream<charT, traits>&
                operator>>(basic_ios<charT, traits>&* (pf)(basic_ios<charT, traits>&&));

§ 28.7.4.1 1311
basic_istream<
operator>>(ios_base& (*pf)(ios_base&));

basic_istream<
operator>>(bool& n);
basic_istream<
operator>>(short& n);
basic_istream<
operator>>(unsigned short& n);
basic_istream<
operator>>(int& n);
basic_istream<
operator>>(unsigned int& n);
basic_istream<

basic_istream<charT, traits>& read (char_type* s, streamsize n);
streamsize readsome(char_type* s, streamsize n);

basic_istream<charT, traits>& putback(char_type c);
basic_istream<charT, traits>& unget();
int sync();

pos_type tellg();
basic_istream<charT, traits>& seekg(pos_type);
basic_istream<charT, traits>& seekg(off_type, ios_base::seekdir);

protected:
// 28.7.4.1.1, copy/move constructor
basic_istream(const basic_istream& rhs) = delete;
basic_istream(basic_istream&& rhs);

// 28.7.4.1.2, assign and swap
basic_istream& operator=(const basic_istream& rhs) = delete;
basic_istream& operator=(basic_istream&& rhs);
void swap(basic_istream& rhs);

// 28.7.4.2.3, character extraction templates
template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&, charT&);
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, unsigned char&);
template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>&, signed char&);
The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the formatted input functions (or extractors) and the unformatted input functions. Both groups of input functions are described as if they obtain (or extract) input characters by calling `rdbuf()->sbumpc()` or `rdbuf()->sgetc()`. They may use other public members of `istream`.

If `rdbuf()->sbumpc()` or `rdbuf()->sgetc()` returns `traits::eof()`, then the input function, except as explicitly noted otherwise, completes its actions and does `setstate(eofbit)`, which may throw `ios_base::failure` (28.5.5.4), before returning.

If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

### 28.7.4.1.1 Constructors

```cpp
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

**Effects:** Constructs an object of class `basic_istream`, initializing the base class subobject with `basic_ios::init(sb)` (28.5.5.2).

**Ensures:** `gcount()` == 0.

```cpp
basic_istream(basic_istream&& rhs);
```

**Effects:** Move constructs from the rvalue `rhs`. This is accomplished by default constructing the base class, copying the `gcount()` from `rhs`, calling `basic_ios<charT, traits>::move(rhs)` to initialize the base class, and setting the `gcount()` for `rhs` to 0.

**Remarks:** Does not perform any operations of `rdbuf()`.

### 28.7.4.1.2 Assignment and swap

```cpp
basic_istream& operator=(basic_istream&& rhs);
```

**Effects:** As if by `swap(rhs)`.

**Returns:** `*this`.

```cpp
void swap(basic_istream& rhs);
```

**Effects:** Calls `basic_ios<charT, traits>::swap(rhs)`. Exchanges the values returned by `gcount()` and `rhs.gcount()`.

### 28.7.4.1.3 Class basic_istream::sentry

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream<charT, traits>::sentry {
        using traits_type = traits;
        bool ok_; // exposition only
    public:
        explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
        ~sentry();
        explicit operator bool() const { return ok_; }
        sentry(const sentry&) = delete;
    }
}
```
sentry& operator=(const sentry&) = delete;
};

The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```cpp
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false);
```

**Effects:** If `is.good()` is false, calls `is.setstate(failbit)`. Otherwise, prepares for formatted or unformatted input. First, if `is.tie()` is not a null pointer, the function calls `is.tie()->flush()` to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of `is.tie()` is empty. Further an implementation is allowed to defer the call to `flush` until a call of `is.rdbuf()->underflow()` occurs. If no such call occurs before the `sentry` object is destroyed, the call to `flush` may be eliminated entirely. If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

**Remarks:** The constructor

```cpp
explicit sentry(basic_istream<charT, traits>& is, bool noskipws = false)
```

uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```cpp
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
  // c is a whitespace character.
```

If, after any preparation is completed, `is.good()` is true, `ok_ != false` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure`).

```cpp
~sentry();
```

**Effects:** None.

```cpp
explicit operator bool() const;
```

**Effects:** Returns `ok_`.

### 28.7.4.2 Formatted input functions

#### 28.7.4.2.1 Common requirements

Each formatted input function begins execution by constructing an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. If an exception is thrown during input then `ios::badbit` is turned on in `*this`’s error state. If `(exceptions()&badbit) != 0` then the exception is rethrown. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

#### 28.7.4.2.2 Arithmetic extractors

```cpp
operator>>(unsigned short& val);
operator>>(unsigned int& val);
operator>>(long& val);
operator>>(long long& val);
operator>>(float& val);
operator>>(double& val);
```

304) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

305) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

306) This is done without causing an `ios::failure` to be thrown.
operator>>(long double& val);
operator>>(bool& val);
operator>>(void*& val);

As in the case of the inserters, these extractors depend on the locale’s num_get<> (27.4.2.1) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 28.7.4.2.1). After a sentry object is constructed, the conversion occurs as if performed by the following code fragment:

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = iostate::goodbit;
use_facet<numget>(loc).get(*this, 0, *this, err, val);
setstate(err);

In the above fragment, loc stands for the private member of the basic_ios class. [Note: The first argument provides an object of the istreambuf_iterator class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. —end note] Class locale relies on this type as its interface to istream, so that it does not need to depend directly on istream.

operator>>(short& val);

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
  err |= ios_base::failbit;
  val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
  err |= ios_base::failbit;
  val = numeric_limits<short>::max();
} else
  val = static_cast<short>(lval);
setstate(err);

operator>>(int& val);

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
  err |= ios_base::failbit;
  val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
  err |= ios_base::failbit;
  val = numeric_limits<int>::max();
} else
  val = static_cast<int>(lval);
setstate(err);

28.7.4.2.3 basic_istream::operator>>

basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits> & (*pf)(basic_istream<charT, traits>&));

Effects: None. This extractor does not behave as a formatted input function (as described in 28.7.4.2.1).

Returns: pf(*this).

See, for example, the function signature ws(basic_istream&) (28.7.4.4).
basic_istream<charT, traits>&
    operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&&));

    Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described in 28.7.4.2.1).
    Returns: *this.

basic_istream<charT, traits>& operator>>(ios_base& (*pf)(ios_base&));

    Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described in 28.7.4.2.1).
    Returns: *this.

template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);

    template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);

    template<class traits, size_t N>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);

    Effects: Behaves like a formatted input member (as described in 28.7.4.2.1) of in. After a sentry object is constructed, operator>> extracts characters and stores them into s. If width() is greater than zero, n is min(size_t(width())), N). Otherwise n is N. n is the maximum number of characters stored.

    Characters are extracted and stored until any of the following occurs:
    (8.1) n-1 characters are stored;
    (8.2) end of file occurs on the input sequence;
    (8.3) letting ct be use_facet<ctype<charT>>(in.getloc()), ct.is(ct.space, c) is true.

    operator>> then stores a null byte (charT()) in the next position, which may be the first position if no characters were extracted. operator>> then calls width(0).

    If the function extracted no characters, it calls setstate(failbit), which may throw ios_base::failure (28.5.5.4).
    Returns: in.

template<class charT, class traits>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);

    template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);

    template<class traits>
    basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);

    Effects: Behaves like a formatted input member (as described in 28.7.4.2.1) of in. After a sentry object is constructed a character is extracted from in, if one is available, and stored in c. Otherwise, the function calls in.setstate(failbit).
    Returns: in.

basic_istream<charT, traits>& operator>>(basic_streambuf<charT, traits>* sb);

    Effects: Behaves as an unformatted input function (28.7.4.3). If sb is null, calls setstate(failbit), which may throw ios_base::failure (28.5.5.4). After a sentry object is constructed, extracts characters from *this and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:
    (14.1) end-of-file occurs on the input sequence;
    (14.2) inserting in the output sequence fails (in which case the character to be inserted is not extracted);
    (14.3) an exception occurs (in which case the exception is caught).

    If the function inserts no characters, it calls setstate(failbit), which may throw ios_base::failure (28.5.5.4). If it inserted no characters because it caught an exception thrown while extracting

308) See, for example, the function signature dec(ios_base&) (28.5.6.3).
characters from \*this and failbit is on in exceptions() (28.5.5.4), then the caught exception is rethrown.

Returns: \*this.

28.7.4.3 Unformatted input functions

Each unformatted input function begins execution by constructing an object of class sentry with the default argument noskipws (second) argument true. If the sentry object returns true, when converted to a value of type bool, the function endeavors to obtain the requested input. Otherwise, if the sentry constructor exits by throwing an exception or if the sentry object returns false, when converted to a value of type bool, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using charT()) in the first location of the array. If an exception is thrown during input then ios::badbit is turned on in \*this’s error state. (Exceptions thrown from basic_ios<>::clear() are not caught or rethrown.) If (exceptions()&badbit) != 0 then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the sentry object is destroyed before leaving the unformatted input function.

streamsize gcount() const;

Effects: None. This member function does not behave as an unformatted input function (as described above).

Returns: The number of characters extracted by the last unformatted input member function called for the object.

int_type get();

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts a character c, if one is available. Otherwise, the function calls setstate(failbit), which may throw ios_base::failure (28.5.5.4),

Returns: c if available, otherwise traits::eof().

basic_istream<charT, traits>& get(char_type& c);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts a character, if one is available, and assigns it to c.\(^{310}\) Otherwise, the function calls setstate(failbit) (which may throw ios_base::failure (28.5.5.4)).

Returns: \*this.

basic_istream<charT, traits>& get(char_type* s, streamsize n, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by s.\(^{311}\) Characters are extracted and stored until any of the following occurs:

- n is less than one or n - 1 characters are stored;
- end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit));
- traits::eq(c, delim) for the next available input character c (in which case c is not extracted).

If the function stores no characters, it calls setstate(failbit) (which may throw ios_base::failure (28.5.5.4)). In any case, if n is greater than zero it then stores a null character into the next successive location of the array.

Returns: \*this.

basic_istream<charT, traits>& get(char_type* s, streamsize n);

Effects: Calls get(s, n, widen(‘\n’)).

Returns: Value returned by the call.

\(^{309}\) This is done without causing an ios::failure to be thrown.

\(^{310}\) Note that this function is not overloaded on types signed char and unsigned char.

\(^{311}\) Note that this function is not overloaded on types signed char and unsigned char.
basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:

(13.1) end-of-file occurs on the input sequence;
(13.2) inserting in the output sequence fails (in which case the character to be inserted is not extracted);
(13.3) traits::eq(c, delim) for the next available input character c (in which case c is not extracted);
(13.4) an exception occurs (in which case, the exception is caught but not rethrown).

If the function inserts no characters, it calls setstate(failbit), which may throw ios_base::failure (28.5.5.4).

Returns: *this.

basic_istream<charT, traits>& get(basic_streambuf<char_type, traits>& sb);

Effects: Calls get(sb, widen('
')).

Returns: Value returned by the call.

basic_istream<charT, traits>& getline(char_type* s, streamsize n, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by s.312 Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit));
2. traits::eq(c, delim) for the next available input character c (in which case the input character is extracted but not stored);313
3. n is less than one or n - 1 characters are stored (in which case the function calls setstate(failbit)).

These conditions are tested in the order shown.314

If the function extracts no characters, it calls setstate(failbit) (which may throw ios_base::failure (28.5.5.4)).315

In any case, if n is greater than zero, it then stores a null character (using charT()) into the next successive location of the array.

Returns: *this.

[Example:

```c
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;
    char buffer[line_buffer_size];
    int line_number = 0;
    while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line"; // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            // Don't include newline in count
        }
    }
}
```

312) Note that this function is not overloaded on types signed char and unsigned char.
313) Since the final input character is “extracted”, it is counted in the gcount(), even though it is not stored.
314) This allows an input line which exactly fills the buffer, without setting failbit. This is different behavior than the historical AT&T implementation.
315) This implies an empty input line will not cause failbit to be set.
```cpp
#include <iostream>

int main()
{
    int line_number = 1;
    std::string buffer;
    int count = 0;

    std::cout << "Line " << ++line_number;
    std::cout << " (" << count << " chars): " << buffer << std::endl;
    // — end example

    basic_istream<char, std::char_traits<char>>& getline(char_type* s, streamsize n);
    Returns: getline(s, n, widen(\'\n\')

    basic_istream<char, std::char_traits<char>>& ignore(streamsize n = 1, int_type delim = traits::eof());
    Effects: Behaves as an unformatted input function (as described above). After constructing a sentry
            object, extracts characters and discards them. Characters are extracted until any of the following
            occurs:
                — n != numeric_limits<streamsize>::max() (16.3.4) and n characters have been extracted so
                  far
                — end-of-file occurs on the input sequence (in which case the function calls
                  setstate(eofbit), which may throw ios_base::failure (28.5.5.4));
                — traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character
                  c (in which case c is extracted).
    Remarks: The last condition will never occur if traits::eq_int_type(delim, traits::eof()).
    Returns: *this.

    int_type peek();
    Effects: Behaves as an unformatted input function (as described above). After constructing a sentry
             object, reads but does not extract the current input character.
    Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

    basic_istream<char, std::char_traits<char>>& read(char_type* s, streamsize n);
    Effects: Behaves as an unformatted input function (as described above). After constructing a sentry
             object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise
             extracts characters and stores them into successive locations of an array whose first element is designated
             by s. Characters are extracted and stored until either of the following occurs:
                 — n characters are stored;
                 — end-of-file occurs on the input sequence (in which case the function calls setstate(failbit |
                   eofbit), which may throw ios_base::failure (28.5.5.4)).
    Returns: *this.

    streamsize readsome(char_type* s, streamsize n);
    Effects: Behaves as an unformatted input function (as described above). After constructing a sentry
             object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise
             extracts characters and stores them into successive locations of an array whose first element is designated
             by s. If rdbuf()->in_avail() == 0, calls setstate(eofbit) (which may throw ios_base::failure (28.5.5.4)),
             and extracts no characters;
                 — If rdbuf()->in_avail() == 0, extracts no characters
                 — If rdbuf()->in_avail() > 0, extracts min(rdbuf()->in_avail(), n)).
    Returns: The number of characters extracted.

    basic_istream<char, std::char_traits<char>>& putback(char_type c);
    Effects: Behaves as an unformatted input function (as described above), except that the function first
             clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may
             throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputbackc(c). If rdbuf()
```

316) Note that this function is not overloaded on types signed char and unsigned char.
is null, or if sputbackc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (28.5.5.4)). [Note: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]

Returns: *this.

basic_istream<charT, traits>&& unget();

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf() -> sungetc(). If rdbuf() is null, or if sungetc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (28.5.5.4)). [Note: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]

Returns: *this.

int sync();

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if rdbuf() is a null pointer, returns -1. Otherwise, calls rdbuf() -> pubsync() and, if that function returns -1 calls setstate(badbit) (which may throw ios_base::failure (28.5.5.4)), and returns -1. Otherwise, returns zero.

pos_type tellg();

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to gcount().

Returns: After constructing a sentry object, if fail() != false, returns pos_type(-1) to indicate failure. Otherwise, returns rdbuf() -> pubseekoff(0, cur, in).

basic_istream<charT, traits>& seekg(pos_type pos);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if fail() != true, executes rdbuf() -> pubseekpos(pos, ios_base::in). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

basic_istream<charT, traits>& seekg(off_type off, ios_base::seekdir dir);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if fail() != true, executes rdbuf() -> pubseekoff(off, dir, ios_base::in). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

28.7.4.4 Standard basic_istream manipulators [istream.manip]

Each instantiation of the function template specified in this subclause is a designated addressable function (15.5.4.2.1).

template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

Effects: Behaves as an unformatted input function (28.7.4.3), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to is.gcount(). After constructing a sentry object extracts characters as long as the next available character c is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by sentry::sentry (28.7.4.1.3). If ws stops extracting characters because there are no more available it sets eofbit, but not failbit.

Returns: is.
28.7.4.5 Rvalue stream extraction

template<class charT, class traits, class T>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&& is, T&& x);

1 Effects: Equivalent to:
   is >> std::forward<T>(x);
   return is;

2 Remarks: This function shall not participate in overload resolution unless the expression is >>
   std::forward<T>(x) is well-formed.

28.7.4.6 Class template basic_iostream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
        public basic_ostream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 28.7.4.6.1, constructor
        explicit basic_iostream(basic_streambuf<charT, traits>* sb);

        // 28.7.4.6.2, destructor
        virtual ~basic_iostream();

    protected:
        // 28.7.4.6.1, constructor
        basic_iostream(const basic_iostream& rhs) = delete;
        basic_iostream(basic_iostream&& rhs);

        // 28.7.4.6.3, assign and swap
        basic_iostream& operator=(const basic_iostream& rhs) = delete;
        basic_iostream& operator=(basic_iostream&& rhs);
        void swap(basic_iostream& rhs);
    }
}

The class template basic_iostream inherits a number of functions that allow reading input and writing
output to sequences controlled by a stream buffer.

28.7.4.6.1 Constructors

explicit basic_iostream(basic_streambuf<charT, traits>* sb);

1 Effects: Constructs an object of class basic_iostream, initializing the base class subobjects with
   basic_istream<charT, traits>(sb) (28.7.4.1) and basic_ostream<charT, traits>(sb) (28.7.5.1).

2 Ensures: rdbuf() == sb and gcount() == 0.

basic_iostream(basic_iostream&& rhs);

1 Effects: Move constructs from the rvalue rhs by constructing the basic_istream base class with
   move(rhs).

28.7.4.6.2 Destructor

virtual ~basic_iostream();

1 Effects: Destroys an object of class basic_iostream.

2 Remarks: Does not perform any operations on rdbuf().
28.7.4.6.3 Assignment and swap

basic_istream& operator=(basic_istream&& rhs);

1 Effects: As if by swap(rhs).

void swap(basic_istream& rhs);

2 Effects: Calls basic_istream<charT, traits>::swap(rhs).

28.7.5 Output streams

The header `<ostream>` defines a type and several function signatures that control output to a stream buffer along with a function template that inserts into stream values.

28.7.5.1 Class template basic_ostream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
        public:
            // types (inherited from basic_ios (28.5.5))
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 28.7.5.1.1, constructor/destructor
            explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
            virtual ~basic_ostream();

            // 28.7.5.1.3, prefix/suffix
            class sentry;

            // 28.7.5.2, formatted output
            basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& (*pf)(basic_ostream<charT, traits>&&));
            basic_ostream<charT, traits>&
                operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&&));
            basic_ostream<charT, traits>&
                operator<<(ios_base& (*pf)(ios_base&));
            basic_ostream<charT, traits>&
                operator<<(bool n);
            basic_ostream<charT, traits>&
                operator<<(short n);
            basic_ostream<charT, traits>&
                operator<<(unsigned short n);
            basic_ostream<charT, traits>&
                operator<<(int n);
            basic_ostream<charT, traits>&
                operator<<(unsigned int n);
            basic_ostream<charT, traits>&
                operator<<(long n);
            basic_ostream<charT, traits>&
                operator<<(unsigned long n);
            basic_ostream<charT, traits>&
                operator<<(long long n);
            basic_ostream<charT, traits>&
                operator<<(unsigned long long n);
            basic_ostream<charT, traits>&
                operator<<(float f);
            basic_ostream<charT, traits>&
                operator<<(double f);
            basic_ostream<charT, traits>&
                operator<<(long double f);
            basic_ostream<charT, traits>&
                operator<<(const void* p);
            basic_ostream<charT, traits>&
                operator<<(nullptr_t);
            basic_ostream<charT, traits>&
                operator<<(basic_streambuf<char_type, traits>* sb);

            // 28.7.5.3, unformatted output
            basic_ostream<charT, traits>&
                put(char_type c);
            basic_ostream<charT, traits>&
                write(const char_type* s, streamsize n);
            basic_ostream<charT, traits>&
                flush();
The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the formatted output functions (or inserters) and the unformatted output functions. Both groups of output functions generate (or insert) output characters by actions equivalent to calling `rdbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xsputn()`, and `sync()`.

If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and treat as an error.

### 28.7.5.1.1 Constructors

```plaintext
explicit basic_ostream(basic_streambuf<charT, traits>* sb);
```

1. **Effects:** Constructs an object of class `basic_ostream`, initializing the base class subobject with `basic_ios<charT, traits>::init(sb)` (28.5.5.2).
2. **Ensures:** `rdbuf() == sb`.

---

1. The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.
2. Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or insert) output characters by actions equivalent to calling `rdbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xsputn()`, and `sync()`.
3. If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and treat as an error.

2. Two groups of member function signatures share common properties: the *formatted output functions* (or *inserters*) and the *unformatted output functions*. Both groups of output functions generate (or insert) output characters by actions equivalent to calling `rdbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xsputn()`, and `sync()`.
3. If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in error state. If `badbit` is on in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and treat as an error.
basic_ostream(basic_ostream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by default constructing the base
class and calling basic_ios<charT, traits>::move(rhs) to initialize the base class.

virtual ~basic_ostream();

Effects: Destroys an object of class basic_ostream.

Remarks: Does not perform any operations on rdbuf().

28.7.5.1.2 Assignment and swap [ostream.assign]

basic_ostream& operator=(basic_ostream&& rhs);

Effects: As if by swap(rhs).

Returns: *this.

void swap(basic_ostream& rhs);

Effects: Calls basic_ios<charT, traits>::swap(rhs).

28.7.5.1.3 Class basic_ostream::sentry [ostream.sentry]

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream<charT, traits>::sentry {
        bool ok_; // exposition only
        public:
            explicit sentry(basic_ostream<charT, traits>&& os);
            ~sentry();
            explicit operator bool() const { return ok_; }
            sentry(const sentry&) = delete;
            sentry& operator=(const sentry&) = delete;
        }
    }

1 The class sentry defines a class that is responsible for doing exception safe prefix and suffix operations.

explicit sentry(basic_ostream<charT, traits>& os);

2 If os.good() is nonzero, prepares for formatted or unformatted output. If os.tie() is not a null
pointer, calls os.tie()->flush().

3 If, after any preparation is completed, os.good() is true, ok_ == true otherwise, ok_ == false.
During preparation, the constructor may call setstate(failbit) (which may throw ios_base::
failure (28.5.5.4)).

~sentry();

4 If (os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good() is true, calls
os.rdbuf()->pubsync(). If that function returns -1, sets badbit in os.rdstate() without propagating
an exception.

explicit operator bool() const;

Effects: Returns ok_.

28.7.5.1.4 Seek members [ostream.seeks]

Each seek member function begins execution by constructing an object of class sentry. It returns by
destroying the sentry object.

pos_type tellp();

Returns: If fail() != false, returns pos_type(-1) to indicate failure. Otherwise, returns rdbuf()->
pubseekoff(0, cur, out).

---

317) The call os.tie()->flush() does not necessarily occur if the function can determine that no synchronization is necessary.
318) The sentry constructor and destructor can also perform additional implementation-dependent operations.
basic_ostream<charT, traits>& seekp(pos_type pos);

Effects: If fail() != true, executes rdbuf()->pubseekpos(pos, ios_base::out). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

basic_ostream<charT, traits>& seekp(off_type off, ios_base::seekdir dir);

Effects: If fail() != true, executes rdbuf()->pubseekoff(off, dir, ios_base::out). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

28.7.5.2 Formatted output functions [ostream.formatted]

28.7.5.2.1 Common requirements [ostream.formatted.reqmts]

Each formatted output function begins execution by constructing an object of class sentry. If this object returns true when converted to a value of type bool, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does setstate(ios_base::failbit), which might throw an exception. If an exception is thrown during output, then ios::badbit is turned on in *this’s error state. If (exceptions()&badbit) != 0 then the exception is rethrown. Whether or not an exception is thrown, the sentry object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is *this.

The descriptions of the individual formatted output functions describe how they perform output and do not mention the sentry object.

If a formatted output function of a stream os determines padding, it does so as follows. Given a charT character sequence seq where charT is the character type of the stream, if the length of seq is less than os.width(), then enough copies of os.fill() are added to this sequence as necessary to pad to a width of os.width() characters. If (os.flags() & ios_base::adjustfield) == ios_base::left is true, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

28.7.5.2.2 Arithmetic inserters [ostream.inserters.arithmetic]

operator<<(bool val);
operator<<(short val);
operator<<(unsigned short val);
operator<<(int val);
operator<<(long val);
operator<<(unsigned long val);
operator<<(long long val);
operator<<(unsigned long long val);
operator<<(float val);
operator<<(double val);
operator<<(long double val);
operator<<(const void* val);

Effects: The classes num_get<> and num_put<> handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued locale value to perform numeric formatting. When val is of type bool, long unsigned long, long, unsigned long, double, long double, or const void*, the formatting conversion occurs as if it performed the following code fragment:

bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
>(getloc()).put(*this, *this, fill(), val).failed();

When val is of type short the formatting conversion occurs as if it performed the following code fragment:

ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;

§ 28.7.5.2.2
bool failed = use_facet<
  num_put<charT, ostreambuf_iterator<charT, traits>>
  >(*getloc()).put(*this, *this, fill(),
  baseflags == ios_base::oct || baseflags == ios_base::hex
  ? static_cast<long>(static_cast<unsigned short>(val))
  : static_cast<long>(val)).failed();

When val is of type int the formatting conversion occurs as if it performed the following code fragment:

ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
  num_put<charT, ostreambuf_iterator<charT, traits>>
  >(*getloc()).put(*this, *this, fill(),
  baseflags == ios_base::oct || baseflags == ios_base::hex
  ? static_cast<long>(static_cast<unsigned int>(val))
  : static_cast<long>(val)).failed();

When val is of type unsigned short or unsigned int the formatting conversion occurs as if it performed the following code fragment:

bool failed = use_facet<
  num_put<charT, ostreambuf_iterator<charT, traits>>
  >(*getloc()).put(*this, *this, fill(),
  static_cast<unsigned long>(val)).failed();

When val is of type float the formatting conversion occurs as if it performed the following code fragment:

bool failed = use_facet<
  num_put<charT, ostreambuf_iterator<charT, traits>>
  >(*getloc()).put(*this, *this, fill(),
  static_cast<double>(val)).failed();

The first argument provides an object of the ostreambuf_iterator<> class which is an iterator for class basic_ostream<>. It bypasses ostream and uses streambufs directly. Class locale relies on these types as its interface to iostreams, since for flexibility it has been abstracted away from direct dependence on ostream. The second parameter is a reference to the base class subobject of type ios_base. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If failed is true then does setstate(badbit), which may throw an exception, and returns.

Returns: *this.

28.7.5.2.3 basic_ostream::operator<<

basic_ostream<
  charT, traits>&
operator<((basic_ostream<
  charT, traits>& (*pf)(basic_ostream<
  charT, traits>&)));

Effects: None. Does not behave as a formatted output function (as described in 28.7.5.2.1).

Returns: pf(*this).320

basic_ostream<
  charT, traits>&
operator<((basic_ios<
  charT, traits>& (*pf)(basic_ios<
  charT, traits>&)));

Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described in 28.7.5.2.1).

Returns: *this.321

basic_ostream<
  charT, traits>&
operator<((ios_base& (*pf)(ios_base&)));

Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described in 28.7.5.2.1).

Returns: *this.

320) See, for example, the function signature endl(basic_ostream&) (28.7.5.4).
321) See, for example, the function signature dec(ios_base&) (28.5.6.3).
basic_ostream<charT, traits>& operator<<(basic_streambuf<charT, traits>* sb);

Effects: Behaves as an unformatted output function (28.7.5.3). After the sentry object is constructed, if sb is null calls setstate(badbit) (which may throw ios_base::failure).

Gets characters from sb and inserts them in *this. Characters are read from sb and inserted until any of the following occurs:

1. end-of-file occurs on the input sequence;
2. inserting in the output sequence fails (in which case the character to be inserted is not extracted);
3. an exception occurs while getting a character from sb.

If the function inserts no characters, it calls setstate(failbit) (which may throw ios_base::failure (28.5.5.4)). If an exception was thrown while extracting a character, the function sets failbit in error state, and if failbit is on in exceptions() the caught exception is rethrown.

Returns: *this.

basic_ostream<charT, traits>& operator<<(nullptr_t);

Effects: Equivalent to:

return *this << s;

where s is an implementation-defined NTCTS (15.3.17).

28.7.5.2.4 Character inserter function templates

```
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(const charT* s);
```

Requires: s shall not be a null pointer.

Effects: Behaves like a formatted inserter (as described in 28.7.5.2.1) of out. Creates a character sequence seq of n characters starting at s, each widened using out.widen() (28.5.5.3), where n is the number that would be computed as if by:

1. traits::length(s) for the overload where the first argument is of type basic_ostream<charT, traits>& and the second is of type const charT*; and also for the overload where the first argument is of type basic_ostream<char, traits>& and the second is of type const char*,
(4.2) char_traits<char>::length(s) for the overload where the first argument is of type basic_ostream<charT, traits>& and the second is of type const char*,
(4.3) traits::length(reinterpret_cast<const char*>(s)) for the other two overloads.

Determine s as described in 28.7.2.1. Inserts s into out. Calls width(0).

Returns: out.

28.7.5.3 Unformatted output functions

Each unformatted output function begins execution by constructing an object of class sentry. If this object returns true, while converting to a value of type bool, the function endeavors to generate the requested output. If an exception is thrown during output, then ios::badbit is turned on in *this's error state. If (exceptions() & badbit) != 0 then the exception is rethrown. In any case, the unformatted output function ends by destroying the sentry object, then, if no exception was thrown, returning the value specified for the unformatted output function.

basic_ostream<charT, traits>& put(char_type c);
Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, inserts the character c, if possible.
Otherwise, calls setstate(badbit) (which may throw ios_base::failure (28.5.5.4)).
Returns: *this.

basic_ostream& write(const char_type* s, streamsize n);
Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, obtains characters to insert from successive locations of an array whose first element is designated by s. Characters are inserted until either of the following occurs:
— n characters are inserted;
— inserting in the output sequence fails (in which case the function calls setstate(badbit), which may throw ios_base::failure (28.5.5.4)).
Returns: *this.

basic_ostream& flush();
Effects: Behaves as an unformatted output function (as described above). If rdbuf() is not a null pointer, constructs a sentry object. If this object returns true when converted to a value of type bool the function calls rdbuf()->pubsync(). If that function returns -1 calls setstate(badbit) (which may throw ios_base::failure (28.5.5.4)). Otherwise, if the sentry object returns false, does nothing.
Returns: *this.

28.7.5.4 Standard manipulators

Each instantiation of any of the function templates specified in this subclause is a designated addressable function (15.5.4.2.1).

template<class charT, class traits>
basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
Effects: Calls os.put(os.widen(\'\n\')), then os.flush().
Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
Effects: Inserts a null character into the output sequence: calls os.put(charT()).
Returns: os.
template<class charT, class traits>
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

Effects: Calls os.flush().
Returns: os.

template<class charT, class traits>
    basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);

Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose
of exposition, calls buf->set_emit_on_sync(true). Otherwise this manipulator has no effect. [Note:
To work around the issue that the Allocator template argument cannot be deduced, implementations
can introduce an intermediate base class to basic_syncbuf that manages its emit_on_sync flag. — end
note]
Returns: os.

template<class charT, class traits>
    basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);

Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose
of exposition, calls buf->set_emit_on_sync(false). Otherwise this manipulator has no effect.
Returns: os.

template<class charT, class traits>
    basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

Effects: Calls os.flush(). Then, if os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*,
called buf for the purpose of exposition, calls buf->emit().
Returns: os.

28.7.5.5 Rvalue stream insertion
[ostream.rvalue]

template<class charT, class traits, class T>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&& os, const T& x);

Effects: As if by: os << x;
Returns: os.
Remarks: This function shall not participate in overload resolution unless the expression os << x is
well-formed.

28.7.6 Standard manipulators
[std.manip]
The header <iomanip> defines several functions that support extractors and inserters that alter information
maintained by class ios_base and its derived classes.

unspecified resetiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT,
traits> then the expression out << resetiosflags(mask) behaves as if it called f(out, mask), or if in
is an object of type basic_istream<charT, traits> then the expression in >> resetiosflags(
mask) behaves as if it called f(in, mask), where the function f is defined as:325

void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}

The expression out << resetiosflags(mask) shall have type basic_ostream<charT, traits>& and
value out. The expression in >> resetiosflags(mask) shall have type basic_istream<charT,
traits>& and value in.

325) The expression cin >> resetiosflags(ios_base::skipws) clears ios_base::skipws in the format flags stored in the
basic_istream<charT, traits> object cin (the same as cin >> noskipws), and the expression cout << resetiosflags(ios_-
base::showbase) clears ios_base::showbase in the format flags stored in the basic_ostream<charT, traits> object cout (the
same as cout << noshownotbase).

§ 28.7.6
unspecified setiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setiosflags(mask) behaves as if it called f(out, mask), or if in is an object of type basic_istream<charT, traits> then the expression in >> setiosflags(mask) behaves as if it called f(in, mask), where the function f is defined as:

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression out << setiosflags(mask) shall have type basic_ostream<charT, traits>& and value out. The expression in >> setiosflags(mask) shall have type basic_istream<charT, traits>& and value in.

unspecified setbase(int base);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setbase(base) behaves as if it called f(out, base), or if in is an object of type basic_istream<charT, traits> then the expression in >> setbase(base) behaves as if it called f(in, base), where the function f is defined as:

```cpp
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
              base == 10 ? ios_base::dec :
              base == 16 ? ios_base::hex :
              ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression out << setbase(base) shall have type basic_ostream<charT, traits>& and value out. The expression in >> setbase(base) shall have type basic_istream<charT, traits>& and value in.

unspecified setfill(char_type c);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> and c has type charT then the expression out << setfill(c) behaves as if it called f(out, c), where the function f is defined as:

```cpp
template<class charT, class traits>
void f(basic_ostream<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}
```

The expression out << setfill(c) shall have type basic_ostream<charT, traits>& and value out.

unspecified setprecision(int n);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setprecision(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setprecision(n) behaves as if it called f(in, n), where the function f is defined as:

```cpp
void f(ios_base& str, int n) {
    // set precision
    str.precision(n);
}
```

The expression out << setprecision(n) shall have type basic_ostream<charT, traits>& and value out. The expression in >> setprecision(n) shall have type basic_istream<charT, traits>& and value in.

unspecified setw(int n);

Returns: An object of unspecified type such that if out is an instance of basic_ostream<charT, traits> then the expression out << setw(n) behaves as if it called f(out, n), or if in is an object
of type basic_istream<charT, traits> then the expression \texttt{in >> setw(n)} behaves as if it called \texttt{f(in, n)}, where the function \texttt{f} is defined as:

\begin{verbatim}
void f(ios_base& str, int n) {
    // set width
    str.width(n);
}
\end{verbatim}

The expression \texttt{out << setw(n)} shall have type basic_ostream<charT, traits>& and value \texttt{out}. The expression \texttt{in >> setw(n)} shall have type basic_istream<charT, traits>& and value \texttt{in}.

\section*{28.7.7 Extended manipulators}[ext.manip]

The header \texttt{<iomanip>} defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

\begin{verbatim}
template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);
\end{verbatim}

\textbf{Requires:} The type \texttt{moneyT} shall be either \texttt{long double} or a specialization of the basic_string template (Clause 20).

\textbf{Effects:} The expression \texttt{in >> get_money(mon, intl)} described below behaves as a formatted input function (28.7.4.2.1).

\textbf{Returns:} An object of unspecified type such that if \texttt{in} is an object of type basic_istream<charT, traits> then the expression \texttt{in >> get_money(mon, intl)} behaves as if it called \texttt{f(in, mon, intl)}, where the function \texttt{f} is defined as:

\begin{verbatim}
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    using Iter = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>;
    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());
    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);
    if (ios_base::goodbit != err)
        str.setstate(err);
}
\end{verbatim}

The expression \texttt{in >> get_money(mon, intl)} shall have type basic_istream<charT, traits>& and value \texttt{in}.

\begin{verbatim}
template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);
\end{verbatim}

\textbf{Requires:} The type \texttt{moneyT} shall be either \texttt{long double} or a specialization of the basic_string template (Clause 20).

\textbf{Returns:} An object of unspecified type such that if \texttt{out} is an object of type basic_ostream<charT, traits> then the expression \texttt{out << put_money(mon, intl)} behaves as a formatted output function (28.7.5.2.1) that calls \texttt{f(out, mon, intl)}, where the function \texttt{f} is defined as:

\begin{verbatim}
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool intl) {
    using Iter = ostreambuf_iterator<charT, traits>;
    using MoneyPut = money_put<charT, Iter>;
    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);
    if (end.failed())
        str.setstate(ios::badbit);
}
\end{verbatim}

The expression \texttt{out << put_money(mon, intl)} shall have type basic_ostream<charT, traits>& and value \texttt{out}. 

\§ 28.7.7
template<class charT> unspecified get_time(struct tm* tmb, const charT* fmt);

Requires: The argument tmb shall be a valid pointer to an object of type struct tm. The argument fmt shall be a valid pointer to an array of objects of type charT with char_traits<charT>::length(fmt) elements.

Returns: An object of unspecified type such that if in is an object of type basic_istream<charT, traits> then the expression in >> get_time(tmb, fmt) behaves as if it called f(in, tmb, fmt), where the function f is defined as:

```cpp
template<class charT, class traits>
void f(basic_istream<charT, traits>& str, struct tm* tmb, const charT* fmt) {
    using Iter = istreambuf_iterator<charT, traits>;
    using TimeGet = time_get<charT, Iter>;
    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());
    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb,
           fmt, fmt + char_traits<charT>::length(fmt));
    if (err != ios_base::goodbit)
        str.setstate(err);
}
```

The expression in >> get_time(tmb, fmt) shall have type basic_istream<charT, traits>& and value in.

template<class charT> unspecified put_time(const struct tm* tmb, const charT* fmt);

Requires: The argument tmb shall be a valid pointer to an object of type struct tm, and the argument fmt shall be a valid pointer to an array of objects of type charT with char_traits<charT>::length(fmt) elements.

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << put_time(tmb, fmt) behaves as if it called f(out, tmb, fmt), where the function f is defined as:

```cpp
template<class charT, class traits>
void f(basic_ostream<charT, traits>& str, const struct tm* tmb, const charT* fmt) {
    using Iter = ostreambuf_iterator<charT, traits>;
    using TimePut = time_put<charT, Iter>;
    const Iter end = TimePut::put(Iter(str.rdbuf()), str, str.fill(), tmb,
                                  fmt, fmt + traits::length(fmt));
    if (end.failed())
        str.setstate(ios_base::badbit);
}
```

The expression out << put_time(tmb, fmt) shall have type basic_ostream<charT, traits>& and value out.

### 28.7.8 Quoted manipulators

[Note: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — end note]

```cpp
template<class charT>
    unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT(\\\'));

template<class charT, class traits, class Allocator>
    unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                       charT delim = charT('"'), charT escape = charT(\\\'));
```
template<class charT, class traits>
  unspecified quoted(basic_stringview<charT, traits> s,
        charT delim = charT(""'), charT escape = charT('\\'));

2 Returns: An object of unspecified type such that if `out` is an instance of basic_ostream with member type char_type the same as charT and with member type traits_type, which in the second and third forms is the same as traits, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (28.7.5.2.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

(2.1) — delim.
(2.2) — Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by traits_type::eq, first output escape.
(2.3) — delim.

Let x be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 28.7.5.2.1, `seq` is inserted as if by calling `out.rdbuf()->sputn(seq, n)`, where n is the larger of `out.width()` and x, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` shall have type basic_ostream<charT, traits>& and value `out`.

template<class charT, class traits, class Allocator>
  unspecified quoted(basic_string<charT, traits, Allocator>& s,
        charT delim = charT(""'), charT escape = charT('\\'));

3 Returns: An object of unspecified type such that:

(3.1) — If `in` is an instance of basic_istream with member types char_type and traits_type the same as charT and traits, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using operator>>(basic_istream<charT, traits>&, charT&) (28.7.4.2.3) which may throw ios_base::failure (28.5.3.1.1):

(3.1.1) — If the first character extracted is equal to `delim`, as determined by traits_type::eq, then:
  (3.1.1.1) — Turn off the skipws flag.
  (3.1.1.2) — s.clear()
  (3.1.1.3) — Until an unescaped `delim` character is reached or !in, extract characters from `in` and append them to `s`, except that if an escape is reached, ignore it and append the next character to `s`.
  (3.1.1.4) — Discard the final `delim` character.
  (3.1.1.5) — Restore the skipws flag to its original value.
  (3.1.2) — Otherwise, `in >> s`.

(3.2) — If `out` is an instance of basic_ostream with member types char_type and traits_type the same as charT and traits, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the const basic_string<charT, traits, Allocator>& overload of the quoted function.

The expression `in >> quoted(s, delim, escape)` shall have type basic_istream<charT, traits>& and value `in`. The expression `out << quoted(s, delim, escape)` shall have type basic_ostream<charT, traits>& and value `out`.

28.8 String-based streams

28.8.1 Header <sstream> synopsis

namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
    class basic_stringbuf;

  using stringbuf = basic_stringbuf<char>;
  using wstringbuf = basic_stringbuf<wchar_t>;
}
The header `<sstream>` defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 20.3.

28.8.2 Class template `basic_stringbuf`  

```cpp
namespace std {
  template<class charT, class traits = char_traits<charT>,
           class Allocator = allocator<charT>>
  class basic_stringbuf : public basic_streambuf<charT, traits> {
    public:
      using char_type = charT;
      using int_type = typename traits::int_type;
      using pos_type = typename traits::pos_type;
      using off_type = typename traits::off_type;
      using traits_type = traits;
      using allocator_type = Allocator;

      // 28.8.2.1, constructors
      basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {};
      explicit basic_stringbuf(ios_base::openmode which);
      explicit basic_stringbuf(
          const basic_string<charT, traits, Allocator>& str, 
          ios_base::openmode which = ios_base::in | ios_base::out);
      basic_stringbuf(const basic_stringbuf&amp rhs) = delete;
      basic_stringbuf(basic_stringbuf&amp rhs);

      // 28.8.2.2, assign and swap
      basic_stringbuf&amp operator=(const basic_stringbuf&amp rhs) = delete;
      basic_stringbuf&amp operator=(basic_stringbuf&amp rhs);
      void swap(basic_stringbuf&amp rhs);

      // 28.8.2.3, get and set
      basic_string<charT, traits, Allocator> str() const;
      void str(const basic_string<charT, traits, Allocator>& s);

    protected:
      // 28.8.2.4, overridden virtual functions
      int_type underflow() override;
      int_type pbackfail(int_type c = traits::eof()) override;
      int_type overflow (int_type c = traits::eof()) override;
      basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
      pos_type seekoff(off_type off, ios_base::seekdir way, 
                       ios_base::openmode which 
                       = ios_base::in | ios_base::out) override;
  }
```

} // namespace std
The class `basic_stringbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence can be initialized from, or made available as, an object of class `basic_string`.

For the sake of exposition, the maintained data is presented here as:

1. `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.

28.8.2.1 Constructors

```cpp
declares

The code snippet provides the constructors for the `basic_stringbuf` class, which is derived from `basic_streambuf`. The constructors include:

1. `explicit basic_stringbuf(ios_base::openmode which);` - This constructor initializes `mode` with `which`. It ensures that `str()` returns an empty string.

2. `explicit basic_stringbuf(const basic_string<charT, traits, Allocator>& s, ios_base::openmode which = ios_base::in | ios_base::out);` - This constructor initializes `mode` with `which` and calls `str(s)`.

3. `basic_stringbuf(basic_stringbuf&& rhs);` - This constructor moves from the rvalue `rhs`. It ensures that the state of `rhs` is copied.

The code snippet also includes the implementation details for the `seekpos` function, which sets the position pointer to a specified position within the input or output sequence.
28.8.2.2 Assignment and swap [stringbuf.assign]

basic_stringbuf& operator=(basic_stringbuf&& rhs);

Effects: After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 28.8.2.1).

Returns: *this.

void swap(basic_stringbuf& rhs);

Effects: Exchanges the state of *this and rhs.

template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y);

Effects: As if by x.swap(y).

28.8.2.3 Member functions [stringbuf.members]

basic_string<charT, traits, Allocator> str() const;

Returns: A basic_string object whose content is equal to the basic_stringbuf underlying character sequence. If the basic_stringbuf was created only in input mode, the resultant basic_string contains the character sequence in the range [eback(), egptr()). If the basic_stringbuf was created with which & ios_base::out being nonzero then the resultant basic_string contains the character sequence in the range [pbase(), high_mark), where high_mark represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the basic_stringbuf with a basic_string, or by calling the str(basic_string) member function. In the case of calling the str(basic_string) member function, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new basic_string). Otherwise the basic_stringbuf has been created in neither input nor output mode and a zero length basic_string is returned.

void str(const basic_string<charT, traits, Allocator>& s);

Effects: Copies the content of s into the basic_stringbuf underlying character sequence and initializes the input and output sequences according to mode.

Ensures: If mode & ios_base::out is nonzero, pbase() points to the first underlying character and epptr() >= pbase() + s.size() holds; in addition, if mode & ios_base::ate is nonzero, pptr() == pbase() + s.size() holds, otherwise pptr() == pbase() is true. If mode & ios_base::in is nonzero, eback() points to the first underlying character, and both gptr() == eback() and egptr() == eback() + s.size() hold.

28.8.2.4 Overridden virtual functions [stringbuf.virtualse]

int_type underflow() override;

Returns: If the input sequence has a read position available, returns traits::to_int_type(*gptr()). Otherwise, returns traits::eof(). Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

int_type pbackfail(int_type c = traits::eof()) override;

Effects: Puts back the character designated by c to the input sequence, if possible, in one of three ways:

(2.1) If traits::eq_int_type(c, traits::eof()) returns false and if the input sequence has a putback position available, and if traits::eq(to_char_type(c), gptr()[-1]) returns true, assigns gptr() - 1 to gptr().

Returns: c.

(2.2) If traits::eq_int_type(c, traits::eof()) returns false and if the input sequence has a putback position available, and if mode & ios_base::out is nonzero, assigns c to *--gptr().

Returns: c.

(2.3) If traits::eq_int_type(c, traits::eof()) returns true and if the input sequence has a putback position available, assigns gptr() - 1 to gptr().
Returns: \texttt{traits::not_eof(c)}.

Returns: As specified above, or \texttt{traits::eof()} to indicate failure.

Remarks: If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

```cpp
int_type overflow(int_type c = traits::eof()) override;
```

Effects: Appends the character designated by \( c \) to the output sequence, if possible, in one of two ways:

- If \texttt{traits::eq_int_type(c, traits::eof())} returns \texttt{false} and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls \texttt{sputc(c)}.
  Signals success by returning \( c \).

- If \texttt{traits::eq_int_type(c, traits::eof())} returns \texttt{true}, there is no character to append.
  Signals success by returning a value other than \texttt{traits::eof()}.

Remarks: The function can alter the number of write positions available as a result of any call.

Returns: As specified above, or \texttt{traits::eof()} to indicate failure.

The function can make a write position available only if \((\text{mode} \& \text{ios\_base::out}) \neq 0\). To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If \((\text{mode} \& \text{ios\_base::in}) \neq 0\), the function alters the read end pointer \texttt{egptr()} to point just past the new write position.

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way,
                 ios_base::openmode which = ios_base::in | ios_base::out) override;
```

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 112.

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>((\text{which} &amp; \text{ios_base::in}) == \text{ios_base::in}))</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>((\text{which} &amp; \text{ios_base::out}) == \text{ios_base::out}))</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>((\text{which} &amp; (\text{ios_base::in} | \text{ios_base::out})) == \text{ios_base::in} | \text{ios_base::out})) and \text{way} = \text{either} \text{ios_base::beg} or \text{ios_base::end}</td>
<td>positions both the input and the output sequences</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, the function determines \texttt{newoff} as indicated in Table 113. If the sequence’s next pointer (either \texttt{gptr()} or \texttt{pptr()}) is a null pointer and \texttt{newoff} is nonzero, the positioning operation fails.

If \((\text{newoff} + \text{off}) < 0\), or if \texttt{newoff} + \texttt{off} refers to an uninitialized character (28.8.2.3), the positioning operation fails. Otherwise, the function assigns \( \texttt{xbeg + newoff + off} \) to the next pointer \texttt{xnext}.

Returns: \texttt{pos\_type(newoff)}, constructed from the resultant offset \texttt{newoff} (of type \texttt{off\_type}), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \texttt{pos\_type(off\_type(-1))}. 

§ 28.8.2.4
Table 113 — newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios_base::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios_base::cur</td>
<td>the next pointer minus the beginning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td>the high mark pointer minus the beginning pointer (high_mark - xbeg).</td>
</tr>
</tbody>
</table>

pos_type seekpos(pos_type sp,  
ios_base::openmode which  
= ios_base::in | ios_base::out) override;

13  
Effects: Equivalent to seekoff(off_type(sp), ios_base::beg, which).

Returns: sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

basic_streambuf<charT, traits>** setbuf(charT* s, streamsize n);

15  
Effects: implementation-defined, except that setbuf(0, 0) has no effect.

Returns: this.

28.8.3 Class template basic_istringstream

namespace std {

    template<class charT, class traits = char_traits<charT>,  
            class Allocator = allocator<charT>>
    class basic_istringstream : public basic_istream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
        using allocator_type = Allocator;

    // 28.8.3.1, constructors
    basic_istringstream() : basic_istringstream(ios_base::in) {}  
    explicit basic_istringstream(ios_base::openmode which);  
    explicit basic_istringstream(  
        const basic_string<charT, traits, Allocator>& str,  
        ios_base::openmode which = ios_base::in);  
    basic_istringstream(const basic_istringstream& rhs) = delete;  
    basic_istringstream(basic_istringstream&& rhs);
    
    // 28.8.3.2, assign and swap
    basic_istringstream& operator=(const basic_istringstream& rhs) = delete;  
    basic_istringstream& operator=(basic_istringstream&& rhs);
    void swap(basic_istringstream& rhs);
    
    // 28.8.3.3, members
    basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
    
    basic_string<charT, traits, Allocator> str() const;
    void str(const basic_string<charT, traits, Allocator>& s);
    private:
        basic_stringbuf<charT, traits, Allocator> sb;  // exposition only
    };

    template<class charT, class traits, class Allocator>
    void swap(basic_istringstream<charT, traits, Allocator>& x,  
              basic_istringstream<charT, traits, Allocator>& y);
}
The class `basic_istringstream<charT, traits, Allocator>` supports reading objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

— sb, the stringbuf object.

### 28.8.3.1 Constructors

```cpp
explicit basic_istringstream(ios_base::openmode which);
```

**Effects:** Constructs an object of class `basic_istringstream<charT, traits>`, initializing the base class with `basic_istream<charT, traits>(addressof(sb))` (28.7.4.1) and initializing sb with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in)` (28.8.2.1).

```cpp
explicit basic_istringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::in);
```

**Effects:** Constructs an object of class `basic_istringstream<charT, traits>`, initializing the base class with `basic_istream<charT, traits>(addressof(sb))` (28.7.4.1) and initializing sb with `basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::in)` (28.8.2.1).

```cpp
basic_istringstream(basic_istringstream&& rhs);
```

**Effects:** Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Next `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_stringbuf`.

### 28.8.3.2 Assignment and swap

```cpp
basic_istringstream& operator=(basic_istringstream&& rhs);
```

**Effects:** Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

**Returns:** `*this`.

```cpp
void swap(basic_istringstream& rhs);
```

**Effects:** Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
    basic_istringstream<charT, traits, Allocator>& y);
```

**Effects:** As if by `x.swap(y)`.

### 28.8.3.3 Member functions

```cpp
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

**Returns:** `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```cpp
basic_string<charT, traits, Allocator> str() const;
```

**Returns:** `rbdbuf()->str()`.

```cpp
void str(const basic_string<charT, traits, Allocator>& s);
```

**Effects:** Calls `rbdbuf()->str(s)`.

### 28.8.4 Class template basic_ostringstream

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
    class basic_ostringstream : public basic_ostream<charT, traits> { public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
    }
}
```

§ 28.8.4
using off_type = typename traits::off_type;
using traits_type = traits;
using allocator_type = Allocator;

// 28.8.4.1, constructors
basic_ostringstream() : basic_ostringstream(ios_base::out) {}
explicit basic_ostringstream(ios_base::openmode which);
explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out);
basic_ostringstream(const basic_ostringstream& rhs) = delete;
basic_ostringstream(basic_ostringstream&& rhs);

// 28.8.4.2, assign and swap
basic_ostringstream& operator=(const basic_ostringstream& rhs) = delete;
basic_ostringstream& operator=(basic_ostringstream&& rhs);
void swap(basic_ostringstream& rhs);

// 28.8.4.3, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const;
void str(const basic_string<charT, traits, Allocator>& s);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
    basic_ostringstream<charT, traits, Allocator>& y);

1 The class basic_ostringstream<charT, traits, Allocator> supports writing objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

— sb, the stringbuf object.

28.8.4.1 Constructors

explicit basic_ostringstream(ios_base::openmode which);

1 Effects: Constructs an object of class basic_ostringstream<charT, traits>, initializing the base class with basic_ostream<charT, traits>(addressof(sb)) (28.7.5.1) and initializing sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out) (28.8.2.1).

explicit basic_ostringstream(
    const basic_string<charT, traits, Allocator>& str,
    ios_base::openmode which = ios_base::out);

2 Effects: Constructs an object of class basic_ostringstream<charT, traits>, initializing the base class with basic_ostream<charT, traits>(addressof(sb)) (28.7.5.1) and initializing sb with basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::out) (28.8.2.1).

basic_ostringstream(basic_ostringstream&& rhs);

3 Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Next basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_stringbuf.

28.8.4.2 Assignment and swap

basic_ostringstream& operator=(basic_ostringstream&& rhs);

1 Effects: Move assigns the base and members of *this from the base and corresponding members of rhs.

2 Returns: *this.
3

```cpp
void swap(basic_ostringstream& rhs);
```

**Effects:** Exchanges the state of `*this` and `rhs` by calling `basic_ostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
          basic_ostringstream<charT, traits, Allocator>& y);
```

**Effects:** As if by `x.swap(y)`.

28.8.4.3 Member functions

```cpp
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

**Returns:** `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

```cpp
basic_string<charT, traits, Allocator> str() const;
```

**Returns:** `rdbuf()->str()`.

```cpp
void str(const basic_string<charT, traits, Allocator>& s);
```

**Effects:** Calls `rdbuf()->str(s)`.

28.8.5 Class template `basic_stringstream`

```cpp
namespace std {

```

```cpp
class basic_stringstream : public basic_iostream<charT, traits> {
public:
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;
    using allocator_type = Allocator;

    // 28.8.5.1, constructors
    basic_stringstream() : basic_stringstream(ios_base::out | ios_base::in) {}  // exposition only
    explicit basic_stringstream(ios_base::openmode which);
    explicit basic_stringstream(
        const basic_string<charT, traits, Allocator>& str,
        ios_base::openmode which = ios_base::out | ios_base::in);
    basic_stringstream(const basic_stringstream& rhs) = delete;
    basic_stringstream(basic_stringstream&& rhs);

    // 28.8.5.2, assign and swap
    basic_stringstream& operator=(const basic_stringstream& rhs) = delete;
    basic_stringstream& operator=(basic_stringstream&& rhs);
    void swap(basic_stringstream& rhs);

    // 28.8.5.3, members
    basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
    basic_string<charT, traits, Allocator> str() const;
    void str(const basic_string<charT, traits, Allocator>& str);

private:
    basic_stringbuf<charT, traits> sb;  // exposition only
};
```

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
          basic_stringstream<charT, traits, Allocator>& y);
```
The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

[(1.1)] — `sb`, the `stringbuf` object.

### 28.8.5.1 Constructors

**explicit basic_stringstream(ios_base::openmode which);**

1. **Effects:** Constructs an object of class `basic_stringstream<charT, traits>`, initializing the base class with `basic_iostream<charT, traits>(addressof(sb))` (28.7.4.6.1) and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

**explicit basic_stringstream(const basic_string<charT, traits, Allocator>& str, ios_base::openmode which = ios_base::out | ios_base::in);**

2. **Effects:** Constructs an object of class `basic_stringstream<charT, traits>`, initializing the base class with `basic_iostream<charT, traits>(addressof(sb))` (28.7.4.6.1) and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which)`.

**basic_stringstream(basic_stringstream&& rhs);**

3. **Effects:** Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Next `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_stringbuf`.

### 28.8.5.2 Assignment and swap

**basic_stringstream& operator=(basic_stringstream&& rhs);**

1. **Effects:** Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

2. **Returns:** `*this`.

**void swap(basic_stringstream& rhs);**

3. **Effects:** Exchanges the state of `*this` and `rhs` by calling `basic_istream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

**template<class charT, class traits, class Allocator>**

void swap(basic_stringstream<charT, traits, Allocator>& x, basic_stringstream<charT, traits, Allocator>& y);

4. **Effects:** As if by `x.swap(y)`.

### 28.8.5.3 Member functions

**basic_stringbuf<charT, traits, Allocator>* rdbuf() const;**

1. **Returns:** `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.

**basic_string<charT, traits, Allocator> str() const;**

2. **Returns:** `rdbuf()->str()`.

**void str(const basic_string<charT, traits, Allocator>& str);**

3. **Effects:** Calls `rdbuf()->str(str)`.

### 28.9 File-based streams

#### 28.9.1 Header `<fstream>` synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf;
    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;
}
```

§ 28.9.1 1342
The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

[Note: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. — end note]

In this subclause, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type` (28.11.7) is not `char`. [Note: These functions enable class `path` support for systems with a wide native path character type, such as `wchar_t`. — end note]
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;
basic_streambuf<charT, traits>* setbuf(char_type* s,
    streamsize n) override;
pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;
int sync() override;
void imbue(const locale& loc) override;
};

template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x,
    basic_filebuf<charT, traits>& y);
}

1 The class basic_filebuf<charT, traits> associates both the input sequence and the output sequence with a file.
2 The restrictions on reading and writing a sequence controlled by an object of class basic_filebuf<charT, traits> are the same as for reading and writing with the C standard library FILEs.
3 In particular:
   (3.1) — If the file is not open for reading the input sequence cannot be read.
   (3.2) — If the file is not open for writing the output sequence cannot be written.
   (3.3) — A joint file position is maintained for both the input sequence and the output sequence.
4 An instance of basic_filebuf behaves as described in 28.9.2 provided traits::pos_type is fpos<traits::state_type>. Otherwise the behavior is undefined.
5 In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as a_codecvt in following subclauses, obtained as if by
   const codecvt<charT, char, typename traits::state_type>& a_codecvt =
    use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());

28.9.2.1 Constructors

[filebuf.cons]

basic_filebuf();

Effects: Constructs an object of class basic_filebuf<charT, traits>, initializing the base class with basic_streambuf<charT, traits>() (28.6.3.1).

Ensures: is_open() == false.

basic_filebuf(basic_filebuf&& rhs);

Effects: Move constructs from the rvalue rhs. It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had. Whether they do or not, *this and rhs reference separate buffers (if any at all) after the construction. Additionally *this references the file which rhs did before the construction, and rhs references no file after the construction. The openmode, locale and any other state of rhs is also copied.

Ensures: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

(4.1) — is_open() == rhs_p.is_open()
(4.2) — rhs_a.is_open() == false
(4.3) — gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
(4.4) — egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
(4.5) — pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
--- eptr() - pbase() == rhs_p.eptr() - rhs_p.pbase()

if (eback()) eback() != rhs_a.eback()

if (gptr()) gptr() != rhs_a.gptr()

if (egptr()) egptr() != rhs_a.egptr()

if (pbase()) pbase() != rhs_a.pbase()

if (pptr()) pptr() != rhs_a.pptr()

if (epptr()) epptr() != rhs_a.epptr()

virtual ~basic_filebuf();

Effects: Destroys an object of class basic_filebuf<charT, traits>. Calls close(). If an exception occurs during the destruction of the object, including the call to close(), the exception is caught but not rethrown (see 15.5.5.12).

28.9.2.2 Assignment and swap

basic_filebuf& operator=(basic_filebuf&& rhs);  

Effects: Calls close() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 28.9.2.1).

Returns: *this.

void swap(basic_filebuf& rhs);

Effects: Exchanges the state of *this and rhs.

template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x,  
          basic_filebuf<charT, traits>& y);

Effects: As if by x.swap(y).

28.9.2.3 Member functions

bool is_open() const;

Returns: true if a previous call to open succeeded (returned a non-null value) and there has been no intervening call to close.

basic_filebuf* open(const char* s, ios_base::openmode mode);

basic_filebuf* open(const filesystem::path::value_type* s,  
                    ios_base::openmode mode);  // wide systems only; see 28.9.1

Expect: s shall point to a NTCTS (15.3.17).

Effects: If is_open() != false, returns a null pointer. Otherwise, initializes the filebuf as required. It then opens the file to which s resolves, if possible, as if by a call to fopen with the second argument determined from mode & ~ios_base::ate as indicated in Table 114. If mode is not some combination of flags shown in the table then the open fails.

If the open operation succeeds and (mode & ios_base::ate) != 0, positions the file to the end (as if by calling fseek(file, 0, SEEK_END), where file is the pointer returned by calling fopen).326

If the repositioning operation fails, calls close() and returns a null pointer to indicate failure.

Returns: this if successful, a null pointer otherwise.

basic_filebuf* open(const string& s, ios_base::openmode mode);

basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);

Returns: open(s.c_str(), mode);

326) The macro SEEK_END is defined, and the function signatures fopen(const char*, const char*) and fseek(FILE*, long, int) are declared, in <cstdio> (28.12.1).
basic_filebuf* close();

Effects: If is_open() == false, returns a null pointer. If a put area exists, calls overflow(traits::
eof()) to flush characters. If the last virtual member function called on *this (between underflow,
overflow, seekoff, and seekpos) was overflow then calls a_codecvt.unshift (possibly several
times) to determine a termination sequence, inserts those characters and calls overflow(traits::
eof()) again. Finally, regardless of whether any of the preceding calls fails or throws an exception,
the function closes the file (as if by calling fclose(file)). If any of the calls made by the function,
including fclose, fails, close fails by returning a null pointer. If one of these calls throws an exception,
the exception is caught and rethrown after closing the file.

Returns: *this on success, a null pointer otherwise.

Ensures: is_open() == false.

28.9.2.4 Overridden virtual functions

streamsize showmanyc() override;

Effects: Behaves the same as basic_streambuf::showmanyc() (28.6.3.4).

Remarks: An implementation might well provide an overriding definition for this function signature if
it can determine that more characters can be read from the input sequence.

int_type underflow() override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::underflow(),
with the specialization that a sequence of characters is read from the input sequence as if by reading
from the associated file into an internal buffer (extern_buf) and then as if by doing:

```c
char extern_buf[XSIZE];
char* extern_end;
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r =
a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
           intern_buf, intern_buf+ISIZE, intern_end);
```

28.9.2.4.1346
This shall be done in such a way that the class can recover the position (fpos_t) corresponding to each character between `intern_buf` and `intern_end`. If the value of `r` indicates that `a_codecvt.in()` ran out of space in `intern_buf`, retry with a larger `intern_buf`.

```c
int_type uflow() override;
```

**Effects:** Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

```c
int_type pbackfail(int_type c = traits::eof()) override;
```

**Effects:** Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

1. If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.
   
   Returns: `c`.

2. If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.
   
   Returns: `c`.

3. If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.
   
   Returns: `traits::not_eof(c)`.

**Returns:** As specified above, or `traits::eof()` to indicate failure.

**Remarks:** If `is_open() == false`, the function always fails.

The function does not put back a character directly to the input sequence.

If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```c
int_type overflow(int_type c = traits::eof()) override;
```

**Effects:** Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```c
charT* b = pbase();
charT* p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
  a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then:

1. If `r == codecvt_base::error` then fail.

2. If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.

3. If `r == codecvt_base::partial` then output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).

4. Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != end(xbuf)` and `b != end(xbuf)` isn’t large enough) then increase `XSIZE` and repeat from the beginning.

**Returns:** `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

```c
basic_streambuf* setbuf(char_type* s, streamsize n) override;
```

**Effects:** Behaves according to the description of `basic_streambuf<charT, traits>::setbuf()`, except that the behavior of “unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.
pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;

Effects: Let width denote a_codecvt.encoding(). If is_open() == false, or off != 0 && width <= 0, then the positioning operation fails. Otherwise, if way != basic_ios::cur or off != 0, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if width > 0, call fseek(file, width * off, whence), otherwise call fseek(file, 0, whence).

Remarks: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if width if less than zero then call a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end) and output the resulting unshift sequence. The function determines one of three values for the argument whence, of type int, as indicated in Table 115.

<table>
<thead>
<tr>
<th>way Value</th>
<th>stdio Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basic_ios::beg</td>
<td>SEEK_SET</td>
</tr>
<tr>
<td>basic_ios::cur</td>
<td>SEEK_CUR</td>
</tr>
<tr>
<td>basic_ios::end</td>
<td>SEEK_END</td>
</tr>
</tbody>
</table>

Returns: A newly constructed pos_type object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns pos_type(off_type(-1)).

pos_type seekpos(pos_type sp,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;

Alters the file position, if possible, to correspond to the position stored in sp (as described below). Altering the file position performs as follows:
1. if (om & ios_base::out) != 0, then update the output sequence and write any unshift sequence;
2. set the file position to sp as if by a call to fsetpos;
3. if (om & ios_base::in) != 0, then update the input sequence;
where om is the open mode passed to the last call to open(). The operation fails if is_open() returns false.

If sp is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If sp has not been obtained by a previous successful call to one of the positioning functions (seekoff or seekpos) on the same file the effects are undefined.

Returns: sp on success. Otherwise returns pos_type(off_type(-1)).

int sync() override;

Effects: If a put area exists, calls filebuf::overflow to write the characters to the file, then flushes the file as if by calling fflush(file). If a get area exists, the effect is implementation-defined.

void imbue(const locale& loc) override;

Requires: If the file is not positioned at its beginning and the encoding of the current locale as determined by a_codecvt.encoding() is state-dependent (27.4.1.4.2) then that facet is the same as the corresponding facet of loc.

Effects: Causes characters inserted or extracted after this call to be converted according to loc until another call of imbue.

Remarks: This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.
28.9.3 Class template basic_ifstream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream : public basic_istream<charT, traits> {
public:
    using char_type = charT);
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;

    // 28.9.3.1, constructors
    basic_ifstream();
    explicit basic_ifstream(const char* s,
                           ios_base::openmode mode = ios_base::in);
    explicit basic_ifstream(const filesystem::path::value_type* s,
                           ios_base::openmode mode = ios_base::in);
    // wide systems only; see 28.9.1
    explicit basic_ifstream(const string& s,
                           ios_base::openmode mode = ios_base::in);
    explicit basic_ifstream(const filesystem::path& s,
                           ios_base::openmode mode = ios_base::in);
    basic_ifstream(const basic_ifstream& rhs) = delete;
    basic_ifstream(basic_ifstream&& rhs);

    // 28.9.3.2, assign and swap
    basic_ifstream& operator=(const basic_ifstream& rhs) = delete;
    basic_ifstream& operator=(basic_ifstream&& rhs);
    void swap(basic_ifstream& rhs);

    // 28.9.3.3, members
    basic_filebuf<charT, traits>* rdbuf() const;
    bool is_open() const;
    void open(const char* s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path::value_type* s,
              ios_base::openmode mode = ios_base::in);
    // wide systems only; see 28.9.1
    void open(const string& s, ios_base::openmode mode = ios_base::in);
    void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
    void close();

private:
    basic_filebuf<charT, traits> sb; // exposition only
    };

    template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x,
              basic_ifstream<charT, traits>& y);
};

1 The class basic_ifstream<charT, traits> supports reading from named files. It uses a basic_filebuf<
charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data
is presented here as:

— sb, the filebuf object.

(1.1)

28.9.3.1 Constructors

basic_ifstream();

1 Effects: Constructs an object of class basic_ifstream<charT, traits>, initializing the base class
with basic_istream<charT, traits>(addressof(sb)) (28.7.4.1.1) and initializing sb with basic_filebuf<charT, traits>()); (28.9.2.1).

explicit basic_ifstream(const char* s,
                        ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in); // wide systems only; see 28.9.1

Effects: Constructs an object of class basic_ifstream<charT, traits>, initializing the base class with basic_istream<charT, traits>(addressof(sb)) (28.7.4.1.1) and initializing sb with basic_filebuf<charT, traits>() (28.9.2.1), then calls rdbuf()->open(s, mode | ios_base::in). If that function returns a null pointer, calls setstate(failbit).

explicit basic_ifstream(const string& s,
    ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path& s,
    ios_base::openmode mode = ios_base::in);

Effects: The same as basic_ifstream(s.c_str(), mode).

basic_ifstream(basic_ifstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_filebuf. Next basic_istream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_filebuf.

28.9.3.2 Assignment and swap

basic_ifstream& operator=(basic_ifstream&& rhs);

Effects: Move assigns the base and members of *this from the base and corresponding members of rhs.

Returns: *this.

void swap(basic_ifstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x,
    basic_ifstream<charT, traits>& y);

Effects: As if by x.swap(y).

28.9.3.3 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in); // wide systems only; see 28.9.1

Effects: Calls rdbuf()->open(s, mode | ios_base::in). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (28.5.5.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);

Effects: Calls open(s.c_str(), mode).

void close();

Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (28.5.5.4).
28.9.4 Class template basic_ofstream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 28.9.4.1, constructors
            basic_ofstream();
            explicit basic_ofstream(const char* s,
                                      ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const filesystem::path::value_type* s,
                                      ios_base::openmode mode = ios_base::out); // wide systems only; see 28.9.1
            explicit basic_ofstream(const string& s,
                                      ios_base::openmode mode = ios_base::out);
            explicit basic_ofstream(const filesystem::path& s,
                                      ios_base::openmode mode = ios_base::out);
            basic_ofstream(const basic_ofstream& rhs) = delete;
            basic_ofstream(basic_ofstream&& rhs);

            // 28.9.4.2, assign and swap
            basic_ofstream& operator=(const basic_ofstream& rhs) = delete;
            basic_ofstream& operator=(basic_ofstream&& rhs);
            void swap(basic_ofstream& rhs);

            // 28.9.4.3, members
            basic_filebuf<charT, traits>* rdbuf() const;
            bool is_open() const;
            void open(const char* s, ios_base::openmode mode = ios_base::out);
            void open(const filesystem::path::value_type* s,
                      ios_base::openmode mode = ios_base::out); // wide systems only; see 28.9.1
            void open(const string& s, ios_base::openmode mode = ios_base::out);
            void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
            void close();

        private:
            basic_filebuf<charT, traits> sb; // exposition only
        }

    template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x,
              basic_ofstream<charT, traits>& y);
}

The class basic_ofstream<charT, traits> supports writing to named files. It uses a basic_filebuf<
charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data
is presented here as:

— sb, the filebuf object.

28.9.4.1 Constructors

basic_ofstream();

1 Effects: Constructs an object of class basic_ofstream<charT, traits>, initializing the base class
with basic_ostream<charT, traits>(addressof(sb)) (28.7.5.1.1) and initializing sb with basic_filebuf<charT, traits>{} (28.9.2.1).

explicit basic_ofstream(const char* s,
                        ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::out); // wide systems only; see 28.9.1

Effects: Constructs an object of class basic_ofstream<
charT, traits>, initializing the base class with basic_ostream<
charT, traits>(addressof(sb)) (28.7.5.1.1) and initializing sb with basic_filebuf<
charT, traits>() (28.9.2.1), then calls rdbuf()->open(s, mode | ios_base::out). If
that function returns a null pointer, calls setstate(failbit).

explicit basic_ofstream(const string& s,
    ios_base::openmode mode = ios_base::out);
explicit basic_ofstream(const filesystem::path& s,
    ios_base::openmode mode = ios_base::out);

Effects: The same as basic_ofstream(s.c_str(), mode).

basic_ofstream(basic_ofstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
base class, and the contained basic_filebuf. Next basic_ostream<
charT, traits>::set_rdbuf(
    addressof(sb)) is called to install the contained basic_filebuf.

28.9.4.2 Assignment and swap

basic_ofstream& operator=(basic_ofstream&& rhs);

Effects: Move assigns the base and members of *this from the base and corresponding members of
rhs.

Returns: *this.

void swap(basic_ofstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_ostream<
charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ofstream<
charT, traits>& x,
    basic_ofstream<
charT, traits>& y);

Effects: As if by x.swap(y).

28.9.4.3 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::out); // wide systems only; see 28.9.1

Effects: Calls rdbuf()->open(s, mode | ios_base::out). If that function does not return a null
pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure)
(28.5.5.4).

void close();

Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(
failbit) (which may throw ios_base::failure) (28.5.5.4).

void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

Effects: Calls open(s.c_str(), mode).
28.9.5 Class template basic_fstream

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_fstream : public basic_iostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 28.9.5.1, constructors
            basic_fstream();
            explicit basic_fstream(
                const char* s,
                ios_base::openmode mode = ios_base::in | ios_base::out);
            explicit basic_fstream(
                const filesystem::path::value_type* s,
                ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 28.9.1
            explicit basic_fstream(
                const string& s,
                ios_base::openmode mode = ios_base::in | ios_base::out);
            explicit basic_fstream(
                const filesystem::path& s,
                ios_base::openmode mode = ios_base::in | ios_base::out);
            basic_fstream(const basic_fstream& rhs) = delete;
            basic_fstream(basic_fstream&& rhs);

            // 28.9.5.2, assign and swap
            basic_fstream& operator=(const basic_fstream& rhs) = delete;
            basic_fstream& operator=(basic_fstream&& rhs);
            void swap(basic_fstream& rhs);

            // 28.9.5.3, members
            basic_filebuf<charT, traits>* rdbuf() const;
            bool is_open() const;
            void open(
                const char* s,
                ios_base::openmode mode = ios_base::in | ios_base::out);
            void open(
                const filesystem::path::value_type* s,
                ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 28.9.1
            void open(
                const string& s,
                ios_base::openmode mode = ios_base::in | ios_base::out);
            void open(
                const filesystem::path& s,
                ios_base::openmode mode = ios_base::in | ios_base::out);
            void close();

            private:
                basic_filebuf<charT, traits> sb; // exposition only
            };

    template<class charT, class traits>
    void swap(basic_fstream<charT, traits>& x,
              basic_fstream<charT, traits>& y);
    }

\footnote{The class template basic_fstream<charT, traits> supports reading and writing from named files. It uses a basic_filebuf<charT, traits> object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

— sb, the basic_filebuf object.}
28.9.5.1 Constructors

`basic_fstream();`

Effects: Constructs an object of class `basic_fstream<charT, traits>`, initializing the base class with `basic_iosstream<charT, traits>(addressof(sb))` (28.7.4.6.1) and initializing `sb` with `basic_filebuf<charT, traits>()`.

`explicit basic_fstream(const char* s, ios_base::openmode mode = ios_base::in | ios_base::out);`

`explicit basic_fstream(const filesystem::path::value_type* s, ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 28.9.1`

Effects: Constructs an object of class `basic_fstream<charT, traits>`, initializing the base class with `basic_iosstream<charT, traits>(addressof(sb))` (28.7.4.6.1) and initializing `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf() -> open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

`explicit basic_fstream(const string& s, ios_base::openmode mode = ios_base::in | ios_base::out);`

`explicit basic_fstream(const filesystem::path& s, ios_base::openmode mode = ios_base::in | ios_base::out);`

Effects: The same as `basic_fstream(s.c_str(), mode)`.

`basic_fstream(basic_fstream&& rhs);`

Effects: Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_filebuf`. Next `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_filebuf`.

28.9.5.2 Assignment and swap

`basic_fstream& operator=(basic_fstream&& rhs);`

Effects: Move assigns the base and members of `*this` from the base and corresponding members of `rhs`.

Returns: `*this`.

`void swap(basic_fstream& rhs);`

Effects: Exchanges the state of `*this` and `rhs` by calling `basic_iosstream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

`template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);`

Effects: As if by `x.swap(y)`.

28.9.5.3 Member functions

`basic_filebuf<charT, traits>* rdbuf() const;`

Returns: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

`bool is_open() const;`

Returns: `rdbuf() -> is_open()`.

`void open(const char* s, ios_base::openmode mode = ios_base::in | ios_base::out);`
void open(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out); // wide systems only; see 28.9.1

    Effects: Calls rdbuf()->open(s, mode). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (28.5.5.4).

void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

void open(
    const filesystem::path& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);

    Effects: Calls open(s.c_str(), mode).

void close();

    Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (28.5.5.4).

28.10 Synchronized output streams [syncstream]

28.10.1 Header <syncstream> synopsis [syncstream.syn]

#include <ostream> // see 28.7.2

namespace std {
    template<class charT, class traits, class Allocator>
        class basic_syncbuf;

    using syncbuf = basic_syncbuf<char>;
    using wsyncbuf = basic_syncbuf<wchar_t>;

    template<class charT, class traits, class Allocator>
        class basic_osyncstream;

    using osyncstream = basic_osyncstream<char>;
    using wosyncstream = basic_osyncstream<wchar_t>;
} 1

The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

28.10.2 Class template basic_syncbuf [syncstream.syncbuf]

28.10.2.1 Overview [syncstream.syncbuf.overview]

namespace std {
    template<class charT, class traits, class Allocator>
        class basic_syncbuf : public basic_streambuf<charT, traits> {

    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
        using allocator_type = Allocator;

        using streambuf_type = basic_streambuf<charT, traits>;

    // 28.10.2.2, construction and destruction
    explicit basic_syncbuf(streambuf_type* obuf = nullptr) :
        basic_syncbuf(obuf, Allocator()) {}
    basic_syncbuf(streambuf_type*, const Allocator&);
    basic_syncbuf(basic_syncbuf&&);
    ~basic_syncbuf();
}
class template `basic_syncbuf` stores character data written to it, known as the associated output, into internal buffers allocated using the object’s allocator. The associated output is transferred to the wrapped stream buffer object `*wrapped` when `emit()` is called or when the `basic_syncbuf` object is destroyed. Such transfers are atomic with respect to transfers by other `basic_syncbuf` objects with the same wrapped stream buffer object.

### 28.10.2.2 Construction and destruction

`basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);`

**Effects:**
Constructs the `basic_syncbuf` object and sets `wrapped` to `obuf`.

**Remarks:** A copy of `allocator` is used to allocate memory for internal buffers holding the associated output.

**Throws:** Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

**Ensures:** `get_wrapped() == obuf` and `get_allocator() == allocator` are true.

`basic_syncbuf(basic_syncbuf&& other);`

**Effects:** Move constructs from `other` (Table 26).

**Ensures:** The value returned by `this->get_wrapped()` is the value returned by `other.get_wrapped()` prior to calling this constructor. Output stored in `other` prior to calling this constructor will be stored in `*this` afterwards. `other.rdbuf()->pbase() == other.rdbuf()->pptr()` and `other.get_wrapped() == nullptr` are true.

**Remarks:** This constructor disassociates `other` from its wrapped stream buffer, ensuring destruction of `other` produces no output.

`~basic_syncbuf();`

**Effects:** Calls `emit()`.

**Throws:** Nothing. If an exception is thrown from `emit()`, the destructor catches and ignores that exception.

### 28.10.2.3 Assignment and swap

`basic_syncbuf& operator=(basic_syncbuf&& rhs) noexcept;`

**Effects:** Calls `emit()` then move assigns from `rhs`. After the move assignment `*this` has the observable state it would have had if it had been move constructed from `rhs` (28.10.2.2).
Returns: *this.

Ensures:

(3.1) rhs.get_wrapped() == nullptr is true.
(3.2) this->get_allocator() == rhs.get_allocator() is true when
      allocator_traits<Allocator>::propagate_on_container_move_assignment::value
      is true; otherwise, the allocator is unchanged.

Remarks: This assignment operator disassociates rhs from its wrapped stream buffer, ensuring
destruction of rhs produces no output.

```cpp
void swap(basic_syncbuf& other) noexcept;
```

Requires: Either allocator_traits<Allocator>::propagate_on_container_swap::value is true
or this->get_allocator() == other.get_allocator() is true.

Effects: Exchanges the state of *this and other.

### 28.10.2.4 Member functions

```cpp
bool emit();
```

Effects: Atomically transfers the associated output of *this to the stream buffer *wrapped, so that it
appears in the output stream as a contiguous sequence of characters. wrapped->pubsync() is called if
and only if a call was made to sync() since the most recent call to emit(), if any.

Returns: true if all of the following conditions hold; otherwise false:

(2.1) wrapped == nullptr is false.
(2.2) All of the characters in the associated output were successfully transferred.
(2.3) The call to wrapped->pubsync() (if any) succeeded.

Ensures: On success, the associated output is empty.

Synchronization: All emit() calls transferring characters to the same stream buffer object appear to
execute in a total order consistent with the “happens before” relation (6.8.2.1), where each emit() call
synchronizes with subsequent emit() calls in that total order.

Remarks: May call member functions of wrapped while holding a lock uniquely associated with wrapped.

```cpp
streambuf_type* get_wrapped() const noexcept;
```

Returns: wrapped.

```cpp
allocator_type get_allocator() const noexcept;
```

Returns: A copy of the allocator that was set in the constructor or assignment operator.

```cpp
void set_emit_on_sync(bool b) noexcept;
```

Effects: emit_on_sync = b.

### 28.10.2.5 Overridden virtual functions

```cpp
int sync() override;
```

Effects: Records that the wrapped stream buffer is to be flushed. Then, if emit_on_sync is true, calls
emit(). [Note: If emit_on_sync is false, the actual flush is delayed until a call to emit(). — end note]

Returns: If emit() was called and returned false, returns -1; otherwise 0.

### 28.10.2.6 Specialized algorithms

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
          basic_syncbuf<charT, traits, Allocator>& b) noexcept;
```

Effects: Equivalent to a.swap(b).
28.10.3 Class template basic_osyncstream

28.10.3.1 Overview

namespace std {
    template<class charT, class traits, class Allocator>
    class basic_osyncstream : public basic_ostream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
        using allocator_type = Allocator;
        using streambuf_type = basic_streambuf<charT, traits>;
        using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

        // 28.10.3.2, construction and destruction
        basic_osyncstream(streambuf_type* buf, const Allocator& allocator);
        explicit basic_osyncstream(streambuf_type* obuf);
        explicit basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator);
        basic_osyncstream(basic_osyncstream&&) noexcept;
        ~basic_osyncstream();

        // 28.10.3.3, assignment
        basic_osyncstream& operator=(basic_osyncstream&&) noexcept;

        // 28.10.3.4, member functions
        void emit();
        streambuf_type* get_wrapped() const noexcept;
        syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); }

    private:
        syncbuf_type sb;  // exposition only
    };
}

1 Allocator shall satisfy the Cpp17::Allocator requirements (Table 34).

[Example: A named variable can be used within a block statement for streaming.

```c++
    osyncstream bout(cout);
    bout << "Hello, ";
    bout << "World!";
    bout << endl;  // flush is noted
    bout << "and more!\n";
    // characters are transferred and cout is flushed
```
— end example]

2 [Example: A temporary object can be used for streaming within a single statement.

```c++
    osyncstream(cout) << "Hello, " << "World!" << \n;
```
In this example, cout is not flushed. — end example]

28.10.3.2 Construction and destruction

basic_osyncstream(streambuf_type* buf, const Allocator& allocator);

1 Effects: Initializes sb from buf and allocator. Initializes the base class with basic_ostream<charT, traits>(addressof(sb)).
[Note: The member functions of the provided stream buffer might be called from emit() while a lock is held. Care should be taken to ensure that this does not result in deadlock. — end note]

Ensures: get_wrapped() == buf is true.

basic_osyncstream(basic_osyncstream&& other) noexcept;

Effects: Move constructs the base class and sb from the corresponding subobjects of other, and calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)).

Ensures: The value returned by get_wrapped() is the value returned by os.get_wrapped() prior to calling this constructor. nullptr == other.get_wrapped() is true.

~basic_osyncstream();

Effects: Calls emit(). If an exception is thrown from emit(), that exception is caught and ignored.

28.10.3.3 Assignment

basic_osyncstream& operator=(basic_osyncstream&& rhs) noexcept;

Effects: First, calls emit(). If an exception is thrown from emit(), that exception is caught and ignored. Move assigns sb from rhs.sb. [Note: This disassociates rhs from its wrapped stream buffer ensuring destruction of rhs produces no output. — end note]

Ensures: nullptr == rhs.get_wrapped() is true. get_wrapped() returns the value previously returned by rhs.get_wrapped().

28.10.3.4 Member functions

void emit();

Effects: Calls sb.emit(). If that call returns false, calls setstate(ios::badbit).

[Example: A flush on a basic_osyncstream does not flush immediately:

```cpp
{ 
  osyncstream bout(cout);
  bout << "Hello," << 'n'; // no flush
  bout.emit();          // characters transferred; cout not flushed
  bout << "World!" << endl; // flush noted; cout not flushed
  bout.emit();          // characters transferred; cout flushed
  bout << "Greetings." << 'n'; // no flush
} // characters transferred; cout not flushed
```

— end example]

[Example: The function emit() can be used to handle exceptions from operations on the underlying stream.

```cpp
{ 
  osyncstream bout(cout);
  bout << "Hello, " << "World!" << 'n';
  try {
    bout.emit();
  } catch (...) {
    // handle exception
  }
} 
```

— end example]

streambuf_type* get_wrapped() const noexcept;

Returns: sb.get_wrapped().

[Example: Obtaining the wrapped stream buffer with get_wrapped() allows wrapping it again with an osyncstream. For example,

```cpp
{ 
  osyncstream bout1(cout);
  bout1 << "Hello, ";
} 
```
This subclause describes operations on file systems and their components, such as paths, regular files, and directories.

A file system is a collection of files and their attributes.

A file is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.

A directory is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The parent directory of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (28.11.7.1) in the given directory. The parent directory of other types of files is a directory containing a directory entry for the file under discussion.

A link is an object that associates a filename with a file. Several links can associate names with the same file. A hard link is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed. [Note: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note] A symbolic link is a type of file with the property that when the file is encountered during pathname resolution (28.11.7), a string stored by the file is used to modify the pathname resolution. [Note: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

Some behavior is specified by reference to POSIX (28.11.3). How such behavior is actually implemented is unspecified. [Note: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — end note]

Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 28.11.6. [Note: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. — end note]

Implementations are not required to provide behavior that is not supported by a particular file system. [Example: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — end example]
28.11.2.2 Operating system dependent behavior conformance

Behavior that is specified as being operating system dependent is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.

It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

28.11.2.3 File system race behavior

A file system race is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by this subclause introduce a file system race.

If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, Requires: is not specified for the function. [Note: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — end note]

28.11.3 Normative references

This subclause mentions commercially available operating systems for purposes of exposition.

28.11.4 Requirements

Throughout this subclause, char, wchar_t, char8_t, char16_t, and char32_t are collectively called encoded character types.

Functions with template parameters named EcharT shall not participate in overload resolution unless EcharT is one of the encoded character types.

Template parameters named InputIterator shall satisfy the Cpp17InputIterator requirements (22.3.5.2) and shall have a value type that is one of the encoded character types.

[Note: Use of an encoded character type implies an associated character set and encoding. Since signed char and unsigned char have no implied character set and encoding, they are not included as permitted types. — end note]

Template parameters named Allocator shall satisfy the Cpp17Allocator requirements (Table 34).

28.11.4.1 Namespaces and headers

Unless otherwise specified, references to entities described in this subclause are assumed to be qualified with ::std::filesystem::.

28.11.5 Header <filesystem> synopsis

```cpp
namespace std::filesystem {
    // 28.11.7, paths
    class path;

    // 28.11.7.7, path non-member functions
    void swap(path& lhs, path& rhs) noexcept;
    size_t hash_value(const path& p) noexcept;

    // 28.11.8, filesystem errors
    class filesystem_error;

    // 28.11.11, directory entries
    class directory_entry;

    // 28.11.12, directory iterators
    class directory_iterator;
}
```

1 Implementations should ensure that the resolution and range of file_time_type reflect the operating system dependent resolution and range of file time values.

28.11.6 Error reporting

Files system library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an error_code. [Note: This supports two common use cases:

(1.1) Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.

(1.2) Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

§ 28.11.6 1364
Functions not having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

1. When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type `filesystem_error` shall be thrown. For functions with a single path argument, that argument shall be passed to the `filesystem_error` constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the `filesystem_error` constructor as the `path1` argument, and the second shall be passed as the `path2` argument. The `filesystem_error` constructor’s `error_code` argument is set as appropriate for the specific operating system dependent error.

2. Failure to allocate storage is reported by throwing an exception as described in 15.5.5.12.

3. Destructors throw nothing.

Functions having an argument of type `error_code&` handle errors as follows, unless otherwise specified:

1. If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the `error_code&` argument is set as appropriate for the specific operating system dependent error. Otherwise, `clear()` is called on the `error_code&` argument.

### 28.11.7 Class `path`

An object of class `path` represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

Class `path` is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]

A `path` is a sequence of elements that identify the location of a file within a filesystem. The elements are the `root-name_opt`, `root-directory_opt`, and an optional sequence of filenames (28.11.7.1). The maximum number of elements in the sequence is operating system dependent (28.11.2.2).

An `absolute path` is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A `relative path` is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent. [Note: Pathnames "." and "." are relative paths. — end note]

A `pathname` is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (28.11.7.1) or according to an operating system dependent `native pathname format` accepted by the host operating system.

`Pathname resolution` is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file. [Example: POSIX specifies the mechanism in section 4.11, Pathname resolution. — end example]

```cpp
namespace std::filesystem {
    class path {
        public:
            using value_type = see below;
            using string_type = basic_string<value_type>;
            static constexpr value_type preferred_separator = see below;

            // 28.11.9.1, enumeration format
            enum format;

            // 28.11.7.4.1, constructors and destructor
            path() noexcept;
            path(const path& p);
            path(path&& p) noexcept;
            path(string_type&& source, format fmt = auto_format);
```

    operator>>(basic_istream<charT, traits>& is, path& p);
};

7 value_type is a typedef for the operating system dependent encoded character type used to represent
pathnames.

8 The value of the preferred_separator member is the operating system dependent preferred-separator
character (28.11.7.1).

9 [Example: For POSIX-based operating systems, value_type is char and preferred_separator is the slash
character (‘/’). For Windows-based operating systems, value_type is wchar_t and preferred_separator
is the backslash character (L’\’). —end example]

28.11.7.1  Generic pathname format

pathname:
    root-name_opt root-directory_opt relative-path

root-name:
    operating system dependent sequences of characters
    implementation-defined sequences of characters

root-directory:
    directory-separator

relative-path:
    filename
    filename directory-separator relative-path
    an empty path

filename:
    non-empty sequence of characters other than directory-separator characters

directory-separator:
    preferred-separator directory-separator_opt
    fallback-separator directory-separator_opt

preferred-separator:
    operating system dependent directory separator character

fallback-separator:
    /, if preferred-separator is not /

1 A filename is the name of a file. The dot and dot-dot filenames, consisting solely of one and two period
characters respectively, have special meaning. The following characteristics of filenames are operating system
dependent:

(1.1) — The permitted characters. [Example: Some operating systems prohibit the ASCII control characters
(0x00 – 0x1F) in filenames. —end example] [Note: For wide portability, users may wish to limit
filename characters to the POSIX Portable Filename Character Set:
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
a b c d e f g h i j k l m n o p q r s t u v w x y z
0 1 2 3 4 5 6 7 8 9 . _ -] — end note]

(1.2) — The maximum permitted length.

(1.3) — Filenames that are not permitted.

(1.4) — Filenames that have special meaning.

(1.5) — Case awareness and sensitivity during path resolution.

(1.6) — Special rules that may apply to file types other than regular files, such as directories.
Except in a root-name, multiple successive directory-separator characters are considered to be the same as one directory-separator character.

The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to root-directory is implementation-defined. Specific filenames may have special meanings for a particular operating system.

A root-name identifies the starting location for pathname resolution (28.11.7). If there are no operating system dependent root-names, at least one implementation-defined root-name is required. [Note: Many operating systems define a name beginning with two directory-separator characters as a root-name that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier – a root-name identifying a specific device such as a disk drive. — end note]

If a root-name is otherwise ambiguous, the possibility with the longest sequence of characters is chosen. [Note: On a POSIX-like operating system, it is impossible to have a root-name and a relative-path without an intervening root-directory element. — end note]

Normalization of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the root-name with a preferred-separator.
3. Replace each directory-separator with a preferred-separator. [Note: The generic pathname grammar (28.11.7.1) defines directory-separator as one or more slashes and preferred-separators. — end note]
4. Remove each dot filename and any immediately following directory-separator.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a directory-separator and a dot-dot filename, along with any immediately following directory-separator.
6. If there is a root-directory, remove all dot-dot filenames and any directory-separators immediately following them. [Note: These dot-dot filenames attempt to refer to nonexistent parent directories. — end note]
7. If the last filename is dot-dot, remove any trailing directory-separator.
8. If the path is empty, add a dot.

The result of normalization is a path in normal form, which is said to be normalized.

28.11.7.2 Conversions

28.11.7.2.1 Argument format conversions [fs.path.fmt.cvt]

[Note: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

(1.1) — The generic format is acceptable as a native path.
(1.2) — There is no need to distinguish between native format and generic format in function arguments.
(1.3) — Paths for regular files and paths for directories share the same syntax.

— end note]

Several functions are defined to accept detected-format arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (28.11.7.1) or a pathname in the native format (28.11.7). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

[Note: Some operating systems may have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — end note]

Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let $G(n)$ and $N(g)$ in a mathematical sense be the implementation’s functions that convert native-to-generic and generic-to-native formats respectively. If $g=G(n)$ for some $n$, then $G(N(g))=g$; if $n=N(g)$ for some $g$, then $N(G(n))=n$. [Note: Neither $G$ nor $N$ need be invertible. — end note]

If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a directory-separator, otherwise it shall be treated as a path to a regular file.
6 [Note: A path stores a native format pathname (28.11.7.4.6) and acts as if it also stores a generic format pathname, related as given below. The implementation may generate the generic format pathname based on the native format pathname (and possibly other information) when requested. —end note]

7 When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function (G or N).

8 When the (new) value $p$ of one representation of a path is derived from the representation of that or another path, a value $q$ is chosen for the other representation. The value $q$ converts to $p$ (by $G$ or $N$ as appropriate) if any such value does so; $q$ is otherwise unspecified. [Note: If $q$ is the result of converting any path at all, it is the result of converting $p$. —end note]

28.11.7.2.2 Type and encoding conversions

The native encoding of an ordinary character string is the operating system dependent current encoding for pathnames (28.11.7). The native encoding for wide character strings is the implementation-defined execution-wide-character set encoding (5.3).

For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from path::value_type. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

1. **char**: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent. [Note: For POSIX-based operating systems path::value_type is char so no conversion from char value type arguments or to char value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. —end note] [Note: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error prone. —end note]

2. **wchar_t**: The encoding is the native wide encoding. The method of conversion is unspecified. [Note: For Windows-based operating systems path::value_type is wchar_t so no conversion from wchar_t value type arguments or to wchar_t value type return values is performed. —end note]

3. **char8_t**: The encoding is UTF-8. The method of conversion is unspecified.

4. **char16_t**: The encoding is UTF-16. The method of conversion is unspecified.

5. **char32_t**: The encoding is UTF-32. The method of conversion is unspecified.

If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type path::value_type.

28.11.7.3 Requirements

In addition to the requirements (28.11.4), function template parameters named Source shall be one of:

1. basic_string<CharT, traits, Allocator>. A function argument const Source& source shall have an effective range [source.begin(), source.end()).

2. basic_string_view<CharT, traits>. A function argument const Source& source shall have an effective range [source.begin(), source.end()).

3. A type meeting the Cpp17InputIterator requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument const Source& source shall have an effective range [source, end) where end is the first iterator value with an element value equal to iterator_traits<Source>::value_type().

4. A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument const Source& source shall have an effective range [source, end) where end is the first iterator value with an element value equal to iterator_traits<decay_t<Source>>::value_type().

Functions taking template parameters named Source shall not participate in overload resolution unless either

1. Source is a specialization of basic_string or basic_string_view, or

2. the qualified-id iterator_traits<decay_t<Source>>::value_type is valid and denotes a possibly const encoded character type (12.9.2).
Arguments of type `Source` shall not be null pointers.

### 28.11.7.4 Members

#### 28.11.7.4.1 Constructors

- `path()` noexcept;
  - **Effects:** Constructs an object of class `path`.
  - **Ensures:** `empty() == true`.

- `path(const path& p);`
- `path(path&& p) noexcept;`
  - **Effects:** Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.

- `path(string_type&& source, format fmt = auto_format);`
  - **Effects:** Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (28.11.7.2.1), converting format if required (28.11.7.2.1). `source` is left in a valid but unspecified state.

- `template<class Source> path(const Source& source, format fmt = auto_format);`
- `template<class InputIterator> path(InputIterator first, InputIterator last, format fmt = auto_format);`
  - **Effects:** Let `s` be the effective range of `source` (28.11.7.3) or the range `[first, last)`, after converting the encoding as follows:
    - If `value_type` is `wchar_t`, converts to the native wide encoding (28.11.7.2.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
    - Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

- `template<class Source> path(const Source& source, const locale& loc, format fmt = auto_format);`
- `template<class InputIterator> path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);`
  - **Requires:** The value type of `Source` and `InputIterator` is `char`.
  - **Effects:** Let `s` be the effective range of `source` or the range `[first, last)`, after converting the encoding as follows:
    1. If `value_type` is `wchar_t`, converts to the native wide encoding (28.11.7.2.2) using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`.
    2. Otherwise a conversion is performed using the `codecvt<wchar_t, char, mbstate_t>` facet of `loc`, and then a second conversion to the current ordinary encoding.

- `namespace fs = std::filesystem;`
- `std::string latin1_string = read_latin1_data();`
- `codecvt_8859_1<wchar_t> latin1_facet;`
- `std::locale latin1_locale(std::locale(), latin1_facet);`
- `fs::create_directory(fs::path(latin1_string, latin1_locale));`

For POSIX-based operating systems, the path is constructed by first using `latin1_facet` to convert ISO/IEC 8859-1 encoded `latin1_string` to a wide character string in the native wide encoding (28.11.7.2.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.
For Windows-based operating systems, the path is constructed by using \texttt{latin1\_facet} to convert ISO/IEC 8859-1 encoded \texttt{latin1\_string} to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation.

\textit{—end example}

\subsection*{28.11.7.4.2 Assignments} \hspace*{1em} [fs.path.assign]

\begin{verbatim}
path& operator=(const path& p);

Effects: If \texttt{*this} and \texttt{p} are the same object, has no effect. Otherwise, sets both respective pathnames of \texttt{*this} to the respective pathnames of \texttt{p}.

Returns: \texttt{*this}.

path& operator=(path& p) noexcept;

Effects: If \texttt{*this} and \texttt{p} are the same object, has no effect. Otherwise, sets both respective pathnames of \texttt{*this} to the respective pathnames of \texttt{p}. \texttt{p} is left in a valid but unspecified state. \hspace*{1em} \textit{[Note: A valid implementation is swap(p). — end note]}

Returns: \texttt{*this}.

path& operator=(string_type&& source);
path& assign(string_type&& source);

Effects: Sets the pathname in the detected-format of \texttt{source} to the original value of \texttt{source}. \texttt{source} is left in a valid but unspecified state.

Returns: \texttt{*this}.

template<class Source>
path& operator=(const Source& source);
template<class Source>
path& assign(const Source& source);

Effects: Let \texttt{s} be the effective range of \texttt{source} (28.11.7.3) or the range [\texttt{first, last}), with the encoding converted if required (28.11.7.2). Finds the detected-format of \texttt{s} (28.11.7.2.1) and sets the pathname in that format to \texttt{s}.

Returns: \texttt{*this}.
\end{verbatim}

\subsection*{28.11.7.4.3 Appends} \hspace*{1em} [fs.path.append]

The append operations use \texttt{operator/=} to denote their semantic effect of appending \texttt{preferred-separator} when needed.

\begin{verbatim}
path& operator/=(const path& p);

Effects: If \texttt{p.is_absolute()} \texttt{|| (p.has_root_name() \&\& p.root_name() != root_name())}, then \texttt{operator=(p)}.

Otherwise, modifies \texttt{*this} as if by these steps:

\begin{enumerate}
\item If \texttt{p.has_root_directory()}, then removes any root directory and relative path from the generic format pathname. Otherwise, if \texttt{!has_root_directory() \&\& is_absolute()} is \texttt{true} or if \texttt{has_filename()} is \texttt{true}, then appends \texttt{path::preferred_separator} to the generic format pathname.

\item Then appends the native format pathname of \texttt{p}, omitting any \texttt{root-name} from its generic format pathname, to the native format pathname.
\end{enumerate}

\textit{[Example: Even if //host is interpreted as a root-name, both of the paths path("//host")/"foo" and path("//host")/"foo" equal "/host/foo".}

Expression examples:

// On POSIX,
path("foo") / ""; \hspace*{1em} // yields "foo/"
path("foo") / "/bar"; \hspace*{1em} // yields "/bar"

// On Windows, backslashes replace slashes in the above yields

\end{verbatim}
// On Windows,
path("foo") / "c:/bar";  // yields "c:/bar"
path("foo") / "c:";  // yields "c:"
path("c:" / "";  // yields "c:"
path("c:foo") / "/bar";  // yields "c:/bar"
path("c:foo") / "c:bar";  // yields "c:foo/bar"

— end example

Returns: *this.

template<class Source>
path& operator/(const Source& source);
template<class Source>
path& append(const Source& source);

Effects: Equivalent to: return operator/=(path(source));

template<class InputIterator>
path& append(InputIterator first, InputIterator last);

Effects: Equivalent to: return operator/=(path(first, last));

28.11.7.4.4 Concatenation

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
path& operator+=(value_type x);
template<class Source>
path& operator+=(const Source& x);
template<class EcharT>
path& operator+=(EcharT x);
template<class Source>
path& concat(const Source& x);

Effects: Appends path(x).native() to the pathname in the native format. [Note: This directly manipulates the value of native() and may not be portable between operating systems. — end note]

Returns: *this.

template<class InputIterator>
path& concat(InputIterator first, InputIterator last);

Effects: Equivalent to: return *this += path(first, last);

28.11.7.4.5 Modifiers

void clear() noexcept;

Ensures: empty() == true.

path& make_preferred();

Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.

Returns: *this.

[Example:
path p("foo/bar");
std::cout << p << \\
\n; p.make_preferred();
std::cout << p << \\
\n;
]

On an operating system where preferred-separator is a slash, the output is:

"foo/bar"
"foo/bar"

On an operating system where preferred-separator is a backslash, the output is:
© ISO/IEC  N4791

```
"foo/bar"
"foo\bar"
— end example]

path& remove_filename();

Ensures: !has_filename().

Effects: Remove the generic format pathname of filename() from the generic format pathname.

Returns: *this.

[Example:
  path("foo/bar").remove_filename();  // yields "foo/"
  path("foo/").remove_filename();    // yields "foo/"
  path("/foo").remove_filename();   // yields "/"
  path("").remove_filename();       // yields "/"
— end example]

path& replace_filename(const path& replacement);

Effects: Equivalent to:
  remove_filename();
  operator/=(replacement);

Returns: *this.

[Example:
  path("/foo").replace_filename("bar");  // yields "/bar" on POSIX
  path("/").replace_filename("bar");   // yields "/bar" on POSIX
— end example]

path& replace_extension(const path& replacement = path());

Effects:

(12.1) — Any existing extension() (28.11.7.4.9) is removed from the pathname in the generic format, then
(12.2) — If replacement is not empty and does not begin with a dot character, a dot character is appended
to the pathname in the generic format, then
(12.3) — operator+=(replacement);

Returns: *this.

void swap(path& rhs) noexcept;

Effects: Swaps the contents (in all formats) of the two paths.

Complexity: Constant time.

28.11.7.4.6 Native format observers [fs.path.native.obs]

The string returned by all native format observers is in the native pathname format (28.11.7).

const string_type& native() const noexcept;

Returns: The pathname in the native format.

const value_type* c_str() const noexcept;

Effects: Equivalent to: return native().c_str();

operator string_type() const;

Returns: native().

[Note: Conversion to string_type is provided so that an object of class path can be given as an
argument to existing standard library file stream constructors and open functions. — end note]
template<class EcharT, class traits = char_traits<EcharT>,
    class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
    string(const Allocator& a = Allocator()) const;

Returns: native().
Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 28.11.7.2.

std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;

Returns: native().
Remarks: Conversion, if any, is performed as specified by 28.11.7.2.

28.11.7.4.7 Generic format observers

Generic format observer functions return strings formatted according to the generic pathname format (28.11.7.1). A single slash (‘/’) character is used as the directory-separator.

[Example: On an operating system that uses backslash as its preferred-separator,
path("foo\bar").generic_string() returns "foo/bar". — end example]

template<class EcharT, class traits = char_traits<EcharT>,
    class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
    generic_string(const Allocator& a = Allocator()) const;

Returns: The pathname in the generic format.
Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 28.11.7.2.

std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;

Returns: The pathname in the generic format.
Remarks: Conversion, if any, is specified by 28.11.7.2.

28.11.7.4.8 Compare

int compare(const path& p) const noexcept;

Returns:
(1.1) — Let rootNameComparison be the result of this->root_name().native().compare(p.root_name().native()). If rootNameComparison is not 0, rootNameComparison.
(1.2) — Otherwise, if this->has_root_directory() and p.has_root_directory(), a value less than 0.
(1.3) — Otherwise, if this->has_root_directory() and !p.has_root_directory(), a value greater than 0.
(1.4) — Otherwise, if native() for the elements of this->relative_path() are lexicographically less than native() for the elements of p.relative_path(), a value less than 0.
(1.5) — Otherwise, if native() for the elements of this->relative_path() are lexicographically greater than native() for the elements of p.relative_path(), a value greater than 0.
(1.6) — Otherwise, 0.
int compare(const string_type& s) const
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const

Effects: Equivalent to: return compare(path(s));

28.11.7.4.9 Decomposition [fs.path.decompose]

path root_name() const;
1 Returns: root-name, if the pathname in the generic format includes root-name, otherwise path().

path root_directory() const;
2 Returns: root-directory, if the pathname in the generic format includes root-directory, otherwise path().

path root_path() const;
3 Returns: root_name() / root_directory().

path relative_path() const;
4 Returns: A path composed from the pathname in the generic format, if empty() is false, beginning with the first filename after root_path(). Otherwise, path().

path parent_path() const;
5 Returns: *this if has_relative_path() is false, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of *this that produces one fewer element in its iteration.

path filename() const;
6 Returns: relative_path().empty() ? path() : *--end().
7
[Example:
    path("/foo/bar.txt").filename(); // yields "bar.txt"
    path("/foo/bar" ).filename(); // yields "bar"
    path("/foo/bar/" ).filename(); // yields 
    path("/" ).filename(); // yields 
    path("//host").filename(); // yields 
    path("." ).filename(); // yields 
    path(".." ).filename(); // yields ..
    — end example]

path stem() const;
8 Returns: Let f be the generic format pathname of filename(). Returns a path whose pathname in the generic format is

(8.1) — f, if it contains no periods other than a leading period or consists solely of one or two periods;
(8.2) — otherwise, the prefix of f ending before its last period.

[Example:
    std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
    path p = "foo.barbaz.tar";
    for (; !p.extension().empty(); p = p.stem())
        std::cout << p.extension() << '\n';
        // outputs: .tar
        // .baz
        // .bar
    — end example]

path extension() const;
10 Returns: A path whose pathname in the generic format is the suffix of filename() not included in stem().

[Example:
path("/foo/bar.txt").extension(); // yields ".txt" and stem() is "bar"
path("/foo/bar").extension(); // yields "" and stem() is "bar"
path("/foo/.profile").extension(); // yields "" and stem() is ".profile"
path(".bar").extension(); // yields "" and stem() is ".bar"
path("..bar").extension(); // yields ".bar" and stem() is "."

— end example

[Note: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — end note]

[Note: On non-POSIX operating systems, for a path p, it may not be the case that p.stem() + p.extension() == p.filename(), even though the generic format pathnames are the same. — end note]

28.11.7.4.10 Query [fs.path.query]

[[nodiscard]] bool empty() const noexcept;
Returns: true if the pathname in the generic format is empty, else false.

bool has_root_path() const;
Returns: !root_path().empty().

bool has_root_name() const;
Returns: !root_name().empty().

bool has_root_directory() const;
Returns: !root_directory().empty().

bool has_relative_path() const;
Returns: !relative_path().empty().

bool has_parent_path() const;
Returns: !parent_path().empty().

bool has_filename() const;
Returns: !filename().empty().

bool has_stem() const;
Returns: !stem().empty().

bool has_extension() const;
Returns: !extension().empty().

bool is_absolute() const;
Returns: true if the pathname in the native format contains an absolute path (28.11.7), else false.

[Example: path("/").is_absolute() is true for POSIX-based operating systems, and false for Windows-based operating systems. — end example]

bool is_relative() const;
Returns: !is_absolute().

28.11.7.4.11 Generation [fs.path.gen]

path lexically_normal() const;
Returns: A path whose pathname in the generic format is the normal form (28.11.7.1) of the pathname in the generic format of *this.

[Example: assert(path("foo/.bar/../.").lexically_normal() == "foo/");
assert(path("foo/./bar/../.").lexically_normal() == "foo/");

§ 28.11.7.4.11 1377
The above assertions will succeed. On Windows, the returned path’s directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. —end example

path lexically_relative(const path& base) const;

Returns: *this made relative to base. Does not resolve (28.11.7) symlinks. Does not first normalize (28.11.7.1) *this or base.

Effects: If root_name() ! = base.root_name() is true or is_absolute() != base.is_absolute() is true or !has_root_directory() && base.has_root_directory() is true, returns path(). Determines the first mismatched element of *this and base as if by:

auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());

Then,

(4.1) — if a == end() and b == base.end(), returns path("."); otherwise

(4.2) — let n be the number of filename elements in [b, base.end()) that are not dot or dot-dot or empty, minus the number that are dot-dot. If n<0, returns path(); otherwise

(4.3) — if n == 0 and (a == end() || a->empty()), returns path("."); otherwise

(4.4) — returns an object of class path that is default-constructed, followed by

(4.4.1) — application of operator/=(path(".")) n times, and then

(4.4.2) — application of operator/= for each element in [a, end()).

[Example:

assert(path("/a/d").lexically_relative("/a/b/c") == "../../d");
assert(path("/a/b/c").lexically_relative("/a/d") == "../b/c");
assert(path("/a/b/c").lexically_relative("a") == "b/c");
assert(path("/a/b/c").lexically_relative("a/b/c/x/y") == "../...");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b/c").lexically_relative("c/d") == "/a/b")

The above assertions will succeed. On Windows, the returned path’s directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. —end example]

[Note: If symlink following semantics are desired, use the operational function relative(). —end note]

path lexically_proximate(const path& base) const;

Returns: If the value of lexically_relative(base) is not an empty path, return it. Otherwise return *this.

[Note: If symlink following semantics are desired, use the operational function proximate(). —end note]

[Note: If normalization (28.11.7.1) is needed to ensure consistent matching of elements, apply lexically_normal() to *this, base, or both. —end note]

28.11.7.5 Iterators [fs.path.itr]

1 Path iterators iterate over the elements of the pathname in the generic format (28.11.7.1).

2 A path::iterator is a constant iterator satisfying all the requirements of a bidirectional iterator (22.3.5.5) except that, for dereferenceable iterators a and b of type path::iterator with a == b, there is no requirement that *a and *b are bound to the same object. Its value_type is path.

3 Calling any non-const member function of a path object invalidates all iterators referring to elements of that object.

4 For the elements of the pathname in the generic format, the forward traversal order is as follows:

(4.1) — The root-name element, if present.

(4.2) — The root-directory element, if present. [Note: The generic format is required to ensure lexicographical comparison works correctly. —end note]
Each successive file name element, if present.

An empty element, if a trailing non-root directory-separator is present.

The backward traversal order is the reverse of forward traversal.

```cpp
iterator begin() const;

Returns: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.
```

```cpp
iterator end() const;

Returns: The end iterator.
```

### 28.11.7.6 Inserter and extractor

```cpp
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);
```

Effects: Equivalent to

```
  os << quoted(p.string<charT, traits>())
```

[Note: The quoted function is described in 28.7.8. — end note]

Returns: os.

```cpp
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);
```

Effects: Equivalent to:

```
  basic_string<charT, traits> tmp;
  is >> quoted(tmp);
  p = tmp;
```

Returns: is.

### 28.11.7.7 Non-member functions

```cpp
void swap(path& lhs, path& rhs) noexcept;

Effects: Equivalent to lhs.swap(rhs).
```

```cpp
size_t hash_value (const path& p) noexcept;

Returns: A hash value for the path p. If for two paths, p1 == p2 then hash_value(p1) == hash_value(p2).
```

```cpp
friend bool operator==(const path& lhs, const path& rhs) noexcept;

Returns: !(lhs < rhs) && !(rhs < lhs).
```

[Note: Path equality and path equivalence have different semantics.]

Equality is determined by the path non-member operator==, which considers the two paths’ lexical representations only. [Example: path("foo") == "bar" is never true. — end example]

Equivalence is determined by the equivalent() non-member function, which determines if two paths resolve (28.11.7) to the same file system entity. [Example: equivalent("foo", "bar") will be true when both paths resolve to the same file. — end example]

Programmers wishing to determine if two paths are “the same” must decide if “the same” means “the same representation” or “resolve to the same actual file”, and choose the appropriate function accordingly. — end note]

```cpp
friend bool operator!=(const path& lhs, const path& rhs) noexcept;

Returns: !(lhs == rhs).
```

```cpp
friend bool operator< (const path& lhs, const path& rhs) noexcept;

Returns: lhs.compare(rhs) < 0.
```
friend bool operator<=(const path& lhs, const path& rhs) noexcept;

    Returns: !(rhs < lhs).

friend bool operator> (const path& lhs, const path& rhs) noexcept;

    Returns: rhs < lhs.

friend bool operator>=(const path& lhs, const path& rhs) noexcept;

    Returns: !(lhs < rhs).

friend path operator/ (const path& lhs, const path& rhs);

    Effects: Equivalent to: return path(lhs) /= rhs;

28.11.8 Class filesystem_error

namespace std::filesystem {
    class filesystem_error : public system_error {
    public:
        filesystem_error(const string& what_arg, error_code ec);
        filesystem_error(const string& what_arg,
            const path& p1, error_code ec);
        filesystem_error(const string& what_arg,
            const path& p1, const path& p2, error_code ec);

        const path& path1() const noexcept;
        const path& path2() const noexcept;
        const char* what() const noexcept override;
    };
}

1 The class filesystem_error defines the type of objects thrown as exceptions to report file system errors from functions described in this subclause.

28.11.8.1 Members

filesystem_error(const string& what_arg, error_code ec);

    Ensures:

(2.1) — code() == ec,
(2.2) — path1().empty() == true,
(2.3) — path2().empty() == true, and
(2.4) — string_view(what()).find(what_arg) != string_view::npos.

filesystem_error(const string& what_arg, const path& p1, error_code ec);

    Ensures:

(3.1) — code() == ec,
(3.2) — path1() returns a reference to the stored copy of p1,
(3.3) — path2().empty() == true, and
(3.4) — string_view(what()).find(what_arg) != string_view::npos.

filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);

    Ensures:

(4.1) — code() == ec,
(4.2) — path1() returns a reference to the stored copy of p1,
(4.3) — path2() returns a reference to the stored copy of p2, and
(4.4) — string_view(what()).find(what_arg) != string_view::npos.
const path& path1() const noexcept;

Returns: A reference to the copy of \texttt{p1} stored by the constructor, or, if none, an empty path.

const path& path2() const noexcept;

Returns: A reference to the copy of \texttt{p2} stored by the constructor, or, if none, an empty path.

const char* what() const noexcept override;

Returns: An \texttt{ntbs} that incorporates the \texttt{what\_arg} argument supplied to the constructor. The exact format is unspecified. Implementations should include the \texttt{system\_error::what()} string and the pathnames of \texttt{path1} and \texttt{path2} in the native format in the returned string.

28.11.9 Enumerations \[fs.enum\]

28.11.9.1 Enum \texttt{path::format} \[fs.enum.path.format\]

This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 116.

<tr>
<td>auto_format</td>
<td>The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format. [Note: For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way. — end note]</td>
</tr>
</tbody>
</table>

28.11.9.2 Enum class \texttt{file\_type} \[fs.enum.file\_type\]

This enum class specifies constants used to identify file types, with the meanings listed in Table 117. The values of the constants are distinct.

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The type of the file has not been determined or an error occurred while trying to determine the type.</td>
</tr>
<tr>
<td>not_found</td>
<td>Pseudo-type indicating the file was not found. [Note: The file not being found is not considered an error while determining the type of a file. — end note]</td>
</tr>
<tr>
<td>regular</td>
<td>Regular file</td>
</tr>
<tr>
<td>directory</td>

<tr>
<td>character</td>
<td>Character special file</td>
</tr>
<tr>
<td>fifo</td>
<td>FIFO or pipe file</td>
</tr>
<tr>
<td>socket</td>
<td>Socket file</td>
</tr>
<tr>
<td>implementation_defined</td>
<td>Implementations that support file systems having file types in addition to the above \texttt{file_type} types shall supply implementation-defined \texttt{file_type} constants to separately identify each of those additional file types</td>
</tr>
<tr>
<td>unknown</td>
<td>The file exists but the type could not be determined</td>
</tr>
</tbody>
</table>
28.11.3 Enum class copy_options

The enum class type copy_options is a bitmask type (15.4.2.1.4) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 118. The constant none represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

</table>

28.11.4 Enum class perms

The enum class type perms is a bitmask type (15.4.2.1.4) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 119.

28.11.5 Enum class perm_options

The enum class type perm_options is a bitmask type (15.4.2.1.4) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 120. The bitmask constants are bitmask elements. In Table 120 perm denotes a value of type perms passed to permissions.

28.11.6 Enum class directory_options

The enum class type directory_options is a bitmask type (15.4.2.1.4) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 121. The constant none represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

28.11.10 Class file_status

namespace std::filesystem {
    class file_status {
        public:
            // 28.11.10.1, constructors and destructor
            file_status() noexcept : file_status(file_type::none) {};
            explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;

An object of type `file_status` stores information about the type and permissions of a file.

### 28.11.10.1 Constructors

```cpp
explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;
```

**Ensures:** `type() == ft` and `permissions() == prms`.

### 28.11.10.2 Observers

```cpp
file_type type() const noexcept;
perms permissions() const noexcept;
```

**Returns:**
- `type()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `type(file_type)` function.
- `permissions()` specified by the postconditions of the most recent call to a constructor, `operator=`, or `permissions(perms)` function.

### 28.11.10.3 Modifiers

```cpp
void type(file_type ft) noexcept;
void permissions(perms prms) noexcept;
```

**Ensures:**
- `type() == ft`
- `permissions() == prms`.

### 28.11.11 Class `directory_entry`

```cpp
namespace std::filesystem {

class directory_entry {

public:

  // 28.11.11.1, constructors and destructor
  directory_entry() noexcept = default;
  directory_entry(const directory_entry&) = default;
  directory_entry(directory_entry&&) noexcept = default;
  explicit directory_entry(const filesystem::path& p);
  directory_entry(const filesystem::path& p, error_code& ec);
  ~directory_entry();

  // assignments
directory_entry& operator=(const directory_entry&) = default;
directory_entry& operator=(directory_entry&&) noexcept = default;

  // 28.11.11.2, modifiers
  void assign(const filesystem::path& p);
  void assign(const filesystem::path& p, error_code& ec);
  void replace_filename(const filesystem::path& p);

};
```

### 28.11.11

An object of type `file_status` stores information about the type and permissions of a file.
void replace_filename(const filesystem::path& p, error_code& ec);
void refresh();
void refresh(error_code ec) noexcept;

// 28.11.11.3, observers
const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;
bool exists() const;
bool exists(error_code& ec) const noexcept;
bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;
bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;
bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;
bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;
bool is_other() const;
bool is_other(error_code& ec) const noexcept;
bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
bool operator==(const directory_entry& rhs) const noexcept;
bool operator!=(const directory_entry& rhs) const noexcept;
bool operator< (const directory_entry& rhs) const noexcept;
bool operator> (const directory_entry& rhs) const noexcept;
bool operator<=(const directory_entry& rhs) const noexcept;
bool operator>=(const directory_entry& rhs) const noexcept;

private:
 filesystem::path pathobject;   // exposition only
 friend class directory_iterator; // exposition only

1 A directory_entry object stores a path object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.

2 Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by directory_entry observer functions (28.11.14). Such stored file attribute values are said to be cached.

3 [Note: For purposes of exposition, class directory_iterator (28.11.12) is shown above as a friend of class directory_entry. Friendship allows the directory_iterator implementation to cache already available attribute values directly into a directory_entry object without the cost of an unneeded call to refresh(). — end note]

4 [Example:
   using namespace std::filesystem;

§ 28.11.11 1385
// use possibly cached last write time to minimize disk accesses
for (auto& x : directory_iterator("."))
{
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto& x : directory_iterator("."))
{
    lengthy_function(x.path()); // cache becomes stale
    x.refresh();
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the std::filesystem::last_write_time function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the std::filesystem::last_write_time function. The code is portable to any implementation, regardless of whether or not it employs caching. — end example]

28.11.11.1 Constructors

explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);

1 Effects: Constructs an object of type directory_entry, then refresh() or refresh(ec), respectively.
2 Ensures: path() == p if no error occurs, otherwise path() == filesystem::path().
3 Throws: As specified in 28.11.6.

28.11.11.2 Modifiers

void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);

1 Effects: Equivalent to pathobject = p, then refresh() or refresh(ec), respectively. If an error occurs, the values of any cached attributes are unspecified.
2 Throws: As specified in 28.11.6.

void replace_filename(const filesystem::path& p);
void replace_filename(const filesystem::path& p, error_code& ec);

3 Effects: Equivalent to pathobject.replace_filename(p), then refresh() or refresh(ec), respectively. If an error occurs, the values of any cached attributes are unspecified.
4 Throws: As specified in 28.11.6.

void refresh();
void refresh(error_code& ec) noexcept;

4 Effects: Stores the current values of any cached attributes of the file p resolves to. If an error occurs, an error is reported (28.11.6) and the values of any cached attributes are unspecified.
5 Throws: As specified in 28.11.6.
6 [Note: Implementations of directory_iterator (28.11.12) are prohibited from directly or indirectly calling the refresh function since it must access the external file system, and the objective of caching is to avoid unnecessary file system accesses. — end note]

28.11.11.3 Observers

Unqualified function names in the Returns: elements of the directory_entry observers described below refer to members of the std::filesystem namespace.

const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;

2 Returns: pathobject.
bool exists() const;
bool exists(error_code& ec) const noexcept;

Returns: exists(this->status()) or exists(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;

Returns: is_block_file(this->status()) or is_block_file(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;

Returns: is_character_file(this->status()) or is_character_file(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;

Returns: is_directory(this->status()) or is_directory(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;

Returns: is_fifo(this->status()) or is_fifo(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_other() const;
bool is_other(error_code& ec) const noexcept;

Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;

Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;

Returns: is_socket(this->status()) or is_socket(this->status(ec)), respectively.
Thros: As specified in 28.11.6.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;

Returns: is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.
Thros: As specified in 28.11.6.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;

Returns: If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.
Thros: As specified in 28.11.6.

uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;

23
Returns: If cached, the hard link count attribute value. Otherwise, hard_link_count(path()) or hard_link_count(path(), ec), respectively.

24
Throws: As specified in 28.11.6.

file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;

25
Returns: If cached, the last write time attribute value. Otherwise, last_write_time(path()) or last_write_time(path(), ec), respectively.

26
Throws: As specified in 28.11.6.

file_status status() const;
file_status status(error_code& ec) const noexcept;

27
Returns: If cached, the status attribute value. Otherwise, status(path()) or status(path(), ec), respectively.

28
Throws: As specified in 28.11.6.

file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;

29
Returns: If cached, the symlink status attribute value. Otherwise, symlink_status(path()) or symlink_status(path(), ec), respectively.

30
Throws: As specified in 28.11.6.

bool operator==(const directory_entry& rhs) const noexcept;

31
Returns: pathobject == rhs.pathobject.

bool operator!=(const directory_entry& rhs) const noexcept;

32
Returns: pathobject != rhs.pathobject.

bool operator< (const directory_entry& rhs) const noexcept;

33
Returns: pathobject < rhs.pathobject.

bool operator> (const directory_entry& rhs) const noexcept;

34
Returns: pathobject > rhs.pathobject.

bool operator<=(const directory_entry& rhs) const noexcept;

35
Returns: pathobject <= rhs.pathobject.

bool operator>=(const directory_entry& rhs) const noexcept;

36
Returns: pathobject >= rhs.pathobject.

28.11.12 Class directory_iterator

[fs.class.directory_iterator]

1
An object of type directory_iterator provides an iterator for a sequence of directory_entry elements representing the path and any cached attribute values (28.11.11) for each file in a directory or in an implementation-defined directory-like file type. [Note: For iteration into sub-directories, see class recursive_directory_iterator (28.11.13). — end note]

namespace std::filesystem {
class directory_iterator {
public:
    using iterator_category = input_iterator_tag;
    using value_type = directory_entry;
    using difference_type = ptrdiff_t;
    using pointer = const directory_entry*;
    using reference = const directory_entry&;

    // 28.11.12.1, member functions
directory_iterator() noexcept;
    explicit directory_iterator(const path& p);

§ 28.11.12 1388
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);
directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;
~directory_iterator();
directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;
const directory_entry& operator*() const;
const directory_entry* operator->() const;
directory_iterator& operator++();
directory_iterator& increment(error_code& ec);

// other members as required by 22.3.5.2, input iterators

2 directory_iterator satisfies the Cpp17InputIterator requirements (22.3.5.2).

3 If an iterator of type directory_iterator reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The directory_iterator default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

4 The end iterator is not dereferenceable.

5 Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

6 The result of calling the path() member of the directory_entry object obtained by dereferencing a directory_iterator is a reference to a path object composed of the directory argument from which the iterator was constructed with filename of the directory entry appended as if by operator/=

7 Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.

8 The order of directory entries obtained by dereferencing successive increments of a directory_iterator is unspecified.

9 Constructors and non-const directory_iterator member functions store the values of any cached attributes (28.11.11) in the directory_entry element returned by operator*(). directory_iterator member functions shall not directly or indirectly call any directory_entry refresh function. [Note: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class directory_iterator is shown in 28.11.11 as a friend of class directory_entry. —end note]

10 [Note: Programs performing directory iteration may wish to test if the path obtained by dereferencing a directory iterator actually exists. It could be a symbolic link to a non-existent file. Programs recursively walking directory trees for purposes of removing and renaming entries may wish to avoid following symbolic links. —end note]

11 [Note: If a file is removed from or added to a directory after the construction of a directory_iterator for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX readdir_r. —end note]

28.11.12.1 Members [fs.dir.itr.members]

directory_iterator() noexcept;

1 Effects: Constructs the end iterator.

explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);

2 Effects: For the directory that p resolves to, constructs an iterator for the first element in a sequence of directory_entry elements representing the files in the directory, if any; otherwise the end iterator. However, if
and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

Throws: As specified in 28.11.6.

[Note: To iterate over the current directory, use directory_iterator("."), rather than directory_iterator("*"). — end note]

directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;

Effects: Constructs an object of class directory_iterator.

Ensures: *this has the original value of rhs.

directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;

Effects: If *this and rhs are the same object, the member has no effect.

Ensures: *this has the original value of rhs.

Returns: *this.

directory_iterator& operator++();
directory_iterator& increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (22.3.5.2).

Returns: *this.

Throws: As specified in 28.11.6.

28.11.12.2 Non-member functions

These functions enable range access for directory_iterator.

directory_iterator begin(directory_iterator iter) noexcept;

Returns: iter.

directory_iterator end(const directory_iterator&) noexcept;

Returns: directory_iterator().
// 28.11.13.1, observers

directory_options  options() const;
int                depth() const;
bool               recursion_pending() const;

const directory_entry& operator*() const;
const directory_entry* operator->() const;

// 28.11.13.1, modifiers
recursive_directory_iterator&
  operator=(const recursive_directory_iterator& rhs);
recursive_directory_iterator&
  operator=(recursive_directory_iterator&& rhs) noexcept;

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);
void pop();
void pop(error_code& ec);
void disable_recursion_pending();

// other members as required by 22.3.5.2, input iterators

2 Calling options, depth, recursion_pending, pop or disable_recursion_pending on an iterator that is
not dereferenceable results in undefined behavior.

3 The behavior of a recursive_directory_iterator is the same as a directory_iterator unless otherwise
specified.

4 [Note: If the directory structure being iterated over contains cycles then the end iterator may be unreachable.
— end note]

28.11.13.1 Members

recursive_directory_iterator() noexcept;

1 Effects: Constructs the end iterator.

explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);

2 Effects: Constructs an iterator representing the first entry in the directory to which p resolves, if any;
otherwise, the end iterator. However, if

(options & directory_options::skip_permission_denied) != directory_options::none

and construction encounters an error indicating that permission to access p is denied, constructs the
end iterator and does not report an error.

3 Ensures: options() == options for the signatures with a directory_options argument, otherwise
options() == directory_options::none.

4 Throws: As specified in 28.11.6.

5 [Note: To iterate over the current directory, use recursive_directory_iterator(".") rather than
recursive_directory_iterator(""). — end note]

6 [Note: By default, recursive_directory_iterator does not follow directory symlinks. To follow di-
rectory symlinks, specify options as directory_options::follow_directory_symlink — end note]

recursive_directory_iterator(const recursive_directory_iterator& rhs);

7 Effects: Constructs an object of class recursive_directory_iterator.

8 Ensures:

(8.1) — options() == rhs.options()
(8.2) \hspace{1em} \text{depth() == rhs.depth()}
(8.3) \hspace{1em} \text{recursion_pending() == rhs.recursion_pending()}

\texttt{recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;}

\textit{Effects:} Constructs an object of class \texttt{recursive_directory_iterator}.

\textit{Ensures:} \texttt{options()}, \texttt{depth()}, and \texttt{recursion_pending()} have the values that \texttt{rhs.options()}, \texttt{rhs.depth()}, and \texttt{rhs.recursion_pending()}, respectively, had before the function call.

\texttt{recursive_directory_iterator\& operator=(const recursive_directory_iterator\& rhs);}  

\textit{Effects:} If \texttt{*this} and \texttt{rhs} are the same object, the member has no effect.

\textit{Ensures:}
\begin{itemize}
  \item \texttt{options()} == \texttt{rhs.options()}
  \item \texttt{depth()} == \texttt{rhs.depth()}
  \item \texttt{recursion_pending()} == \texttt{rhs.recursion_pending()}
\end{itemize}

\textit{Returns:} \texttt{*this}.

\texttt{recursive_directory_iterator\& operator=(recursive_directory_iterator&& rhs) noexcept;}

\textit{Effects:} If \texttt{*this} and \texttt{rhs} are the same object, the member has no effect.

\textit{Ensures:} \texttt{options()}, \texttt{depth()}, and \texttt{recursion_pending()} have the values that \texttt{rhs.options()}, \texttt{rhs.depth()}, and \texttt{rhs.recursion_pending()}, respectively, had before the function call.

\textit{Returns:} \texttt{*this}.

\texttt{directory_options options() const;}

\textit{Returns:} The value of the argument passed to the constructor for the \texttt{options} parameter, if present, otherwise \texttt{directory_options::none}.

\textit{Throws:} Nothing.

\texttt{int depth() const;}

\textit{Returns:} The current depth of the directory tree being traversed. [\textit{Note:} The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. \textit{— end note}]

\textit{Throws:} Nothing.

\texttt{bool recursion_pending() const;}

\textit{Returns:} \texttt{true} if \texttt{disable_recursion_pending()} has not been called subsequent to the prior construction or increment operation, otherwise \texttt{false}.

\textit{Throws:} Nothing.

\texttt{recursive_directory_iterator\& operator++();}
\texttt{recursive_directory_iterator\& increment(error_code\& ec);}  

\textit{Effects:} As specified for the prefix increment operation of Input iterators (22.3.5.2), except that:
\begin{itemize}
  \item \texttt{if there are no more entries at the current depth, then if depth() != 0 iteration over the parent directory resumes; otherwise *this = recursive_directory_iterator();}
  \item \texttt{Otherwise if}
      \begin{itemize}
          \item \texttt{recursion_pending() && is_directory((**this)->status()) && (!is_symlink((**this)->symlink_status()) || (options() & directory_options::follow_directory_symlink) != directory_options::none)}
      \end{itemize}
      \texttt{then either directory (**this)->path() is recursively iterated into or, if}
      \begin{itemize}
          \item \texttt{(options() & directory_options::skip_permission_denied) != directory_options::none}
      \end{itemize}
      \texttt{and an error occurs indicating that permission to access directory (**this)->path() is denied, then directory (**this)->path() is treated as an empty directory and no error is reported.}
\end{itemize}

\textit{Returns:} \texttt{*this}.

\textit{Throws:} As specified in 28.11.6.
© ISO/IEC N4791

void pop();
void pop(error_code& ec);

Effects: If depth() == 0, set *this to recursive_directory_iterator(). Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

Ensures: Any copies of the previous value of *this are no longer required to be dereferenceable nor to be in the domain of ==.

Throws: As specified in 28.11.6.

void disable_recursion_pending();

Ensures: recursion_pending() == false.

[Note: disable_recursion_pending() is used to prevent unwanted recursion into a directory. — end note]

28.11.13.2 Non-member functions [fs.rec.dir.itr.nonmembers]

These functions enable use of recursive_directory_iterator with range-based for statements.

recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;

Returns: iter.

recursive_directory_iterator end(const recursive_directory_iterator&) noexcept;

Returns: recursive_directory_iterator().

28.11.14 Filesystem operation functions [fs.op.funcs]

Filesystem operation functions query or modify files, including directories, in external storage.

[Note: Because hardware failures, network failures, file system races (28.11.2.3), and many other kinds of errors occur frequently in file system operations, users should be aware that any filesystem operation function, no matter how apparently innocuous, may encounter an error; see 28.11.6. — end note]

28.11.14.1 Absolute [fs.op.absolute]

path absolute(const path& p);
path absolute(const path& p, error_code& ec);

Effects: Composes an absolute path referencing the same file system location as p according to the operating system (28.11.2.2).

Returns: The composed path. The signature with argument ec returns path() if an error occurs.

[Note: For the returned path, rp, rp.is_absolute() is true unless an error occurs. — end note]

Throws: As specified in 28.11.6.

[Note: To resolve symlinks, or perform other sanitization which might require queries to secondary storage, such as hard disks, consider canonical (28.11.14.2). — end note]

[Example: For POSIX-based operating systems, absolute(p) is simply current_path() / p. For Windows-based operating systems, absolute might have the same semantics as GetFullPathNameW. — end example]

28.11.14.2 Canonical [fs.op.canonical]

path canonical(const path& p);
path canonical(const path& p, error_code& ec);

Effects: Converts p to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

Returns: A path that refers to the same file system object as absolute(p). The signature with argument ec returns path() if an error occurs.

Throws: As specified in 28.11.6.

Remarks: !exists(p) is an error.
28.11.14.3 Copy

void copy(const path& from, const path& to);

Effects: Equivalent to copy(from, to, copy_options::none).

void copy(const path& from, const path& to, error_code& ec);

Effects: Equivalent to copy(from, to, copy_options::none, ec).

void copy(const path& from, const path& to, copy_options options);
void copy(const path& from, const path& to, copy_options options,
error_code& ec);

Requires: At most one element from each option group (28.11.9.3) is set in options.

Effects: Before the first use of f and t:

1. If
   (options & copy_options::create_symlinks) != copy_options::none ||
   (options & copy_options::skip_symlinks) != copy_options::none
then auto f = symlink_status(from) and if needed auto t = symlink_status(to).

2. Otherwise, if
   (options & copy_options::copy_symlinks) != copy_options::none
then auto f = symlink_status(from) and if needed auto t = status(to).

3. Otherwise, auto f = status(from) and if needed auto t = status(to).

Effects are then as follows:

1. If f.type() or t.type() is an implementation-defined file type (28.11.9.2), then the effects are implementation-defined.

2. Otherwise, an error is reported as specified in 28.11.6 if:

   2.1. exists(f) is false, or
   2.2. equivalent(from, to) is true, or
   2.3. is_other(f) || is_other(t) is true, or
   2.4. is_directory(f) && is_regular_file(t) is true.

3. Otherwise, if is_symlink(f), then:

   3.1. If (options & copy_options::skip_symlinks) != copy_options::none then return.
   3.2. Otherwise if
       !exists(t) && (options & copy_options::copy_symlinks) != copy_options::none
       then copy_symlink(from, to).

4. Otherwise report an error as specified in 28.11.6.

5. Otherwise, if is_regular_file(f), then:

   5.1. If (options & copy_options::directories_only) != copy_options::none, then return.
   5.2. Otherwise, if (options & copy_options::create_symlinks) != copy_options::none,
then create a symbolic link to the source file.
   5.3. Otherwise, if (options & copy_options::create_hard_links) != copy_options::none,
then create a hard link to the source file.

6. Otherwise, if is_directory(t), then copy_file(from, to/from.filename(), options).

7. Otherwise, copy_file(from, to, options).

8. Otherwise, if
   is_directory(f) &&
   (options & copy_options::create_symlinks) != copy_options::none
then report an error with an error_code argument equal to make_error_code(errc::is_a_directory).
Otherwise, if
\[
\text{is_directory}(f) \&\&
\]
\[
(\text{options} \& \text{copy_options::recursive}) \neq \text{copy_options::none} \mid \mid \text{options} == \text{copy_options::none}
\]
then:

— If \(\text{exists}(t)\) is false, then \(\text{create_directory}(\text{to}, \text{from})\).

— Then, iterate over the files in \(\text{from}\), as if by

\[
\text{for} \ (\text{const directory_entry} & x : \text{directory_iterator}(\text{from}))
\]
\[
\text{copy}(x.\text{path}(), \text{to} / x.\text{path}().\text{filename}(),
\]
\[
\text{options} \mid \text{copy_options::in-recursive-copy}
\]

where \(\text{in-recursive-copy}\) is a bitmask element of \(\text{copy_options}\) that is not one of the elements in 28.11.9.3.

— Otherwise, for the signature with argument \(\text{ec}, \text{ec}.\text{clear}()\).

— Otherwise, no effects.

**Throws:** As specified in 28.11.6.

**Remarks:** For the signature with argument \(\text{ec}\), any library functions called by the implementation shall have an \(\text{error_code}\) argument if applicable.

**Example:** Given this directory structure:

```
/dir1
  file1
  file2
  dir2
    file3
```

Calling \(\text{copy}("/dir1", "/dir3")\) would result in:

```
/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
```

Alternatively, calling \(\text{copy}("/dir1", "/dir3", \text{copy_options::recursive})\) would result in:

```
/dir1
  file1
  file2
  dir2
    file3
/dir3
  file1
  file2
  dir2
    file3
```

— end example

### 28.11.14.4 Copy file

```cpp
bool \text{copy}_\text{file}(\text{const path} & \text{from}, \text{const path} & \text{to});
bool \text{copy}_\text{file}(\text{const path} & \text{from}, \text{const path} & \text{to}, \text{error_code} & \text{ec});
```

**Returns:** \(\text{copy}_\text{file}(\text{from}, \text{to}, \text{copy_options::none})\) or \(\text{copy}_\text{file}(\text{from}, \text{to}, \text{copy_options::none}, \text{ec})\), respectively.

**Throws:** As specified in 28.11.6.
bool copy_file(const path& from, const path& to, copy_options options, error_code& ec);

Requires: At most one element from each option group (28.11.9.3) is set in options.

Effects: As follows:

(4.1) — Report an error as specified in 28.11.6 if:
(4.1.1) — is_regular_file(from) is false, or
(4.1.2) — exists(to) is true and is_regular_file(to) is false, or
(4.1.3) — exists(to) is true and equivalent(from, to) is true, or
(4.1.4) — exists(to) is true and
   (options & (copy_options::skip_existing |
   copy_options::overwrite_existing |
   copy_options::update_existing)) == copy_options::none

(4.2) — Otherwise, copy the contents and attributes of the file from resolves to, to the file to resolves to, if:
(4.2.1) — exists(to) is false, or
(4.2.2) — (options & copy_options::overwrite_existing) != copy_options::none, or
(4.2.3) — (options & copy_options::update_existing) != copy_options::none and from is more recent than to, determined as if by use of the last_write_time function (28.11.14.25).

(4.3) — Otherwise, no effects.

Returns: true if the from file was copied, otherwise false. The signature with argument ec returns false if an error occurs.

Throws: As specified in 28.11.6.

Complexity: At most one direct or indirect invocation of status(to).

28.11.14.5 Copy symlink

void copy_symlink(const path& existing_symlink, const path& new_symlink);
void copy_symlink(const path& existing_symlink, const path& new_symlink, error_code& ec) noexcept;

Effects: Equivalent to function(read_symlink(existing_symlink), new_symlink) or function(read_symlink(existing_symlink, ec), new_symlink, ec), respectively, where in each case function is create_symlink or create_directory_symlink as appropriate.

Throws: As specified in 28.11.6.

28.11.14.6 Create directories

bool create_directories(const path& p);
bool create_directories(const path& p, error_code& ec);

Effects: Calls create_directory() for each element of p that does not exist.

Returns: true if a new directory was created for the directory p resolves to, otherwise false. The signature with argument ec returns false if an error occurs.

Throws: As specified in 28.11.6.

Complexity: $O(n)$ where n is the number of elements of p.

28.11.14.7 Create directory

bool create_directory(const path& p);
bool create_directory(const path& p, error_code& ec) noexcept;

Effects: Creates the directory p resolves to, as if by POSIX mkdir() with a second argument of static_cast<int>(perms::all). Creation failure because p already exists is not an error.

Returns: true if a new directory was created, otherwise false. The signature with argument ec returns false if an error occurs.

Throws: As specified in 28.11.6.
bool create_directory(const path& p, const path& existing_p);
bool create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;

**Effects:** Creates the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. Creation failure because `p` already exists is not an error. [Note: For POSIX-based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)` for Windows-based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`. — end note]

**Returns:** `true` if a new directory was created, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

** Throws:** As specified in 28.11.6.

### 28.11.14.8 Create directory symlink

void create_directory_symlink(const path& to, const path& new_symlink);
void create_directory_symlink(const path& to, const path& new_symlink, error_code& ec) noexcept;

**Effects:** Establishes the postcondition, as if by POSIX `symlink()`.

**Ensures:** `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

**Throws:** As specified in 28.11.6.

[Note: Some operating systems require symlink creation to identify that the link is to a directory. Portable code should use `create_directory_symlink()` to create directory symlinks rather than `create_symlink()` — end note]

[Note: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]

### 28.11.14.9 Create hard link

void create_hard_link(const path& to, const path& new_hard_link);
void create_hard_link(const path& to, const path& new_hard_link, error_code& ec) noexcept;

**Effects:** Establishes the postcondition, as if by POSIX `link()`.

**Ensures:**

(2.1) `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`

(2.2) The contents of the file or directory `to` resolves to are unchanged.

**Throws:** As specified in 28.11.6.

[Note: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — end note]

### 28.11.14.10 Create symlink

void create_symlink(const path& to, const path& new_symlink);
void create_symlink(const path& to, const path& new_symlink, error_code& ec) noexcept;

**Effects:** Establishes the postcondition, as if by POSIX `symlink()`.

**Ensures:** `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

**Throws:** As specified in 28.11.6.

[Note: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]
28.11.14.11 Current path

path current_path();
path current_path(error_code& ec);

1 Returns: The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd()`. The signature with argument `ec` returns `path()` if an error occurs.
2 Throws: As specified in 28.11.6.
3 Remarks: The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

[Note: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name. — end note]

[Note: The current path as returned by many operating systems is a dangerous global variable. It may be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

void current_path(const path& p);
void current_path(const path& p, error_code& ec) noexcept;

6 Effects: Establishes the postcondition, as if by POSIX `chdir()`.
7 Ensures: `equivalent(p, current_path())`.
8 Throws: As specified in 28.11.6.

[Note: The current path for many operating systems is a dangerous global state. It may be changed unexpectedly by a third-party or system library functions, or by another thread. — end note]

28.11.14.12 Equivalent

bool equivalent(const path& p1, const path& p2);
bool equivalent(const path& p1, const path& p2, error_code& ec) noexcept;

1 Returns: `true`, if `p1` and `p2` resolve to the same file system entity, else `false`. The signature with argument `ec` returns `false` if an error occurs.
2 Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location. [Note: On POSIX platforms, this is determined as if by the values of the POSIX `stat` class, obtained as if by `stat()` for the two paths, having equal `st_dev` values and equal `st_ino` values. — end note]
3 Remarks: `!exists(p1) || !exists(p2)` is an error.
4 Throws: As specified in 28.11.6.

28.11.14.13 Exists

bool exists(file_status s) noexcept;

1 Returns: `status_known(s) && s.type() != file_type::not_found`.

bool exists(const path& p);
bool exists(const path& p, error_code& ec) noexcept;

2 Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.
3 Effects: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.
4 Returns: `exists(s)`.
5 Throws: As specified in 28.11.6.

28.11.14.14 File size

uintmax_t file_size(const path& p);
uintmax_t file_size(const path& p, error_code& ec) noexcept;

1 Effects: If `exists(p)` is `false`, an error is reported (28.11.6).
2 Returns:
If \( \text{is\_regular\_file}(p) \), the size in bytes of the file \( p \) resolves to, determined as if by the value of the POSIX \texttt{stat} class member \texttt{st\_size} obtained as if by POSIX \texttt{stat(\)}. Otherwise, the result is implementation-defined.

The signature with argument \( ec \) returns \texttt{static\_cast<uintmax\_t>(-1)} if an error occurs.

**28.11.14.15 Hard link count**  
\[ \text{uintmax\_t hard\_link\_count(const path\& p);} \]  
\[ \text{uintmax\_t hard\_link\_count(const path\& p, error\_code\& ec) noexcept;} \]  

Returns: The number of hard links for \( p \). The signature with argument \( ec \) returns \texttt{static\_cast<uintmax\_t>(-1)} if an error occurs.

**28.11.14.16 Is block file**  
\[ \text{bool is\_block\_file(file\_status s) noexcept;} \]  
\[ \text{bool is\_block\_file(const path\& p);} \]  
\[ \text{bool is\_block\_file(const path\& p, error\_code\& ec) noexcept;} \]  

Returns: \( \text{s.type()} == \text{file\_type::block} \).

The signature with argument \( ec \) returns \texttt{false} if an error occurs.

**28.11.14.17 Is character file**  
\[ \text{bool is\_character\_file(file\_status s) noexcept;} \]  
\[ \text{bool is\_character\_file(const path\& p);} \]  
\[ \text{bool is\_character\_file(const path\& p, error\_code\& ec) noexcept;} \]  

Returns: \( \text{s.type()} == \text{file\_type::character} \).

The signature with argument \( ec \) returns \texttt{false} if an error occurs.

**28.11.14.18 Is directory**  
\[ \text{bool is\_directory(file\_status s) noexcept;} \]  
\[ \text{bool is\_directory(const path\& p);} \]  
\[ \text{bool is\_directory(const path\& p, error\_code\& ec) noexcept;} \]  

Returns: \( \text{s.type()} == \text{file\_type::directory} \).

The signature with argument \( ec \) returns \texttt{false} if an error occurs.

**28.11.14.19 Is empty**  
\[ \text{bool is\_empty(const path\& p);} \]  
\[ \text{bool is\_empty(const path\& p, error\_code\& ec);} \]  

Effects:

(1.1) — Determine \( \text{file\_status s} \), as if by \texttt{status(p) or status(p, ec)}, respectively.
(1.2) — For the signature with argument \( ec \), return \texttt{false} if an error occurred.
(1.3) — Otherwise, if \( \text{is\_directory(s)} \):
(1.3.1) — Create a variable \( \text{itr} \), as if by \texttt{directory\_iterator itr(p) or directory\_iterator itr(p, ec)}, respectively.
— For the signature with argument `ec`, return `false` if an error occurred.

— Otherwise, return `itr == directory_iterator()`.

— Otherwise:

— Determine `uintmax_t sz`, as if by `file_size(p)` or `file_size(p, ec)`, respectively.

— For the signature with argument `ec`, return `false` if an error occurred.

— Otherwise, return `sz == 0`.

Throws: As specified in 28.11.6.

### 28.11.14.20 Is fifo

```cpp
bool is_fifo(file_status s) noexcept;
```
1

*Returns:* `s.type() == file_type::fifo.`

```cpp
bool is_fifo(const path& p);
```

```cpp
bool is_fifo(const path& p, error_code& ec) noexcept;
```
2

*Returns:* `is_fifo(status(p))` or `is_fifo(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

Throws: As specified in 28.11.6.

### 28.11.14.21 Is other

```cpp
bool is_other(file_status s) noexcept;
```
1

*Returns:* `exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s).`

```cpp
bool is_other(const path& p);
```

```cpp
bool is_other(const path& p, error_code& ec) noexcept;
```
2

*Returns:* `is_other(status(p))` or `is_other(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

Throws: As specified in 28.11.6.

### 28.11.14.22 Is regular file

```cpp
bool is_regular_file(file_status s) noexcept;
```
1

*Returns:* `s.type() == file_type::regular.`

```cpp
bool is_regular_file(const path& p);
```

*Returns:* `is_regular_file(status(p)).`

Throws: `filesystem_error` if `status(p)` would throw `filesystem_error`.

```cpp
bool is_regular_file(const path& p, error_code& ec) noexcept;
```
4

*Effects:* Sets `ec` as if by `status(p, ec)`. [Note: `file_type::none`, `file_type::not_found` and `file_type::unknown` cases set `ec` to error values. To distinguish between cases, call the `status` function directly. — end note]

*Returns:* `is_regular_file(status(p, ec))`. Returns `false` if an error occurs.

### 28.11.14.23 Is socket

```cpp
bool is_socket(file_status s) noexcept;
```
1

*Returns:* `s.type() == file_type::socket.`

```cpp
bool is_socket(const path& p);
```

*Returns:* `is_socket(status(p))` or `is_socket(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.

Throws: As specified in 28.11.6.
28.11.14.24 Is symlink

bool is_symlink(file_status s) noexcept;

Returns: s.type() == file_type::symlink.

bool is_symlink(const path& p);
bool is_symlink(const path& p, error_code& ec) noexcept;

Returns: is_symlink(symlink_status(p)) or is_symlink(symlink_status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 28.11.6.

28.11.14.25 Last write time

file_time_type last_write_time(const path& p);
file_time_type last_write_time(const path& p, error_code& ec) noexcept;

Returns: The time of last data modification of p, determined as if by the value of the POSIX stat class member st_mtime obtained as if by POSIX stat(). The signature with argument ec returns file_time_type::min() if an error occurs.

Throws: As specified in 28.11.6.

void last_write_time(const path& p, file_time_type new_time);
void last_write_time(const path& p, file_time_type new_time, error_code& ec) noexcept;

Effects: Sets the time of last data modification of the file resolved to by p to new_time, as if by POSIX futimens().

Throws: As specified in 28.11.6.

[Note: A postcondition of last_write_time(p) == new_time is not specified since it might not hold for file systems with coarse time granularity. —end note]

28.11.14.26 Permissions

void permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void permissions(const path& p, perms prms, error_code& ec) noexcept;
void permissions(const path& p, perms prms, perm_options opts, error_code& ec);

Requires: Exactly one of the perm_options constants replace, add, or remove is present in opts.

Remarks: The second signature behaves as if it had an additional parameter perm_options opts with an argument of perm_options::replace.

Effects: Applies the action specified by opts to the file p resolves to, or to file p itself if p is a symbolic link and perm_options::nofollow is set in opts. The action is applied as if by POSIX fchmodat().

[Note: Conceptually permissions are viewed as bits, but the actual implementation may use some other mechanism. —end note]

Throws: As specified in 28.11.6.

28.11.14.27 Proximate

path proximate(const path& p, error_code& ec);

Returns: proximate(p, current_path(), ec).

Throws: As specified in 28.11.6.

path proximate(const path& p, const path& base = current_path());
path proximate(const path& p, const path& base, error_code& ec);

Returns: For the first form:
weakly_canonical(p).lexically_proximate(weakly_canonical(base));
For the second form:
weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
or `path()` at the first error occurrence, if any.

**Throws:** As specified in 28.11.6.

28.11.14.28 Read symlink

```c++
path read_symlink(const path& p);
path read_symlink(const path& p, error_code& ec);
```

**Returns:** If `p` resolves to a symbolic link, a `path` object containing the contents of that symbolic link. The signature with argument `ec` returns `path()` if an error occurs.

**Throws:** As specified in 28.11.6. [Note: It is an error if `p` does not resolve to a symbolic link. — end note]

28.11.14.29 Relative

```c++
path relative(const path& p, error_code& ec);
```

**Returns:** `relative(p, current_path(), ec)`.

**Throws:** As specified in 28.11.6.

```c++
path relative(const path& p, const path& base = current_path());
path relative(const path& p, const path& base, error_code& ec);
```

**Returns:** For the first form:

\[
\text{weakly\_canonical}(p).\text{lexically\_relative}(\text{weakly\_canonical}(base));
\]

For the second form:

\[
\text{weakly\_canonical}(p, ec).\text{lexically\_relative}(\text{weakly\_canonical}(base, ec));
\]

or `path()` at the first error occurrence, if any.

**Throws:** As specified in 28.11.6.

28.11.14.30 Remove

```c++
bool remove(const path& p);
bool remove(const path& p, error_code& ec) noexcept;
```

**Effects:** If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove()`. [Note: A symbolic link is itself removed, rather than the file it resolves to. — end note]

**Ensures:** `exists(symlink_status(p))` is false.

**Returns:** `false` if `p` did not exist, otherwise `true`. The signature with argument `ec` returns `false` if an error occurs.

**Throws:** As specified in 28.11.6.

28.11.14.31 Remove all

```c++
uintmax_t remove_all(const path& p);
uintmax_t remove_all(const path& p, error_code& ec);
```

**Effects:** Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove()`. [Note: A symbolic link is itself removed, rather than the file it resolves to. — end note]

**Ensures:** `exists(symlink_status(p))` is false.

**Returns:** The number of files removed. The signature with argument `ec` returns `static_cast<
uintmax_t>(-1)` if an error occurs.

**Throws:** As specified in 28.11.6.

28.11.14.32 Rename

```c++
void rename(const path& old_p, const path& new_p);
void rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

**Effects:** Renames `old_p` to `new_p`, as if by POSIX `rename()`.

[Note:
— If old_p and new_p resolve to the same existing file, no action is taken.

— Otherwise, the rename may include the following effects:

— if new_p resolves to an existing non-directory file, new_p is removed; otherwise,

— if new_p resolves to an existing directory, new_p is removed if empty on POSIX compliant operating systems but may be an error on other operating systems.

A symbolic link is itself renamed, rather than the file it resolves to. — end note]

Throws: As specified in 28.11.6.

28.11.14.33  Resize file  [fs.op.resize_file]

void resize_file(const path& p, uintmax_t new_size);
void resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;

Effects: Causes the size that would be returned by file_size(p) to be equal to new_size, as if by POSIX truncate().

Throws: As specified in 28.11.6.

28.11.14.34  Space  [fs.op.space]

space_info space(const path& p);
space_info space(const path& p, error_code& ec) noexcept;

Returns: An object of type space_info. The value of the space_info object is determined as if by using POSIX statvfs to obtain a POSIX struct statvfs, and then multiplying its f_blocks, f_bfree, and f_bavail members by its f_frsize member, and assigning the results to the capacity, free, and available members respectively. Any members for which the value cannot be determined shall be set to static_cast<uintmax_t>(-1). For the signature with argument ec, all members are set to static_cast<uintmax_t>(-1) if an error occurs.

Throws: As specified in 28.11.6.

Remarks: The value of member space_info::available is operating system dependent. [Note: available may be less than free. — end note]

28.11.14.35  Status  [fs.op.status]

file_status status(const path& p);
file_status status(const path& p, error_code& ec) noexcept;

Effects: As if:

    error_code ec;
    file_status result = status(p, ec);
    if (result.type() == file_type::none)
        throw filesystem_error(implementation-supplied-message, p, ec);
    return result;

Returns: See above.

 Throws: filesystem_error. [Note: result values of file_status(file_type::not_found) and file_status(file_type::unknown) are not considered failures and do not cause an exception to be thrown. — end note]

Effects: If possible, determines the attributes of the file p resolves to, as if by using POSIX stat() to obtain a POSIX struct stat. If, during attribute determination, the underlying file system API reports an error, sets ec to indicate the specific error reported. Otherwise, ec.clear(). [Note: This allows users to inspect the specifics of underlying API errors even when the value returned by status() is not file_status(file_type::none). — end note]

Let prms denote the result of (m & perms::mask), where m is determined as if by converting the st_mode member of the obtained struct stat to the type perms.

Returns:

(6.1) — If ec != error_code():

§ 28.11.14.35
If the specific error indicates that \( p \) cannot be resolved because some element of the path does not exist, returns \( \text{file_status(file_type::not_found)} \).

Otherwise, if the specific error indicates that \( p \) can be resolved but the attributes cannot be determined, returns \( \text{file_status(file_type::unknown)} \).

Otherwise, returns \( \text{file_status(file_type::none)} \).

[Note: These semantics distinguish between \( p \) being known not to exist, \( p \) existing but not being able to determine its attributes, and there being an error that prevents even knowing if \( p \) exists. These distinctions are important to some use cases. — end note]

— Otherwise,

— If the attributes indicate a regular file, as if by POSIX \( S\_ISREG \), returns \( \text{file_status(file_type::regular, prms)} \). [Note: file_type::regular implies appropriate <fstream> operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of file_type::regular does not necessarily imply <fstream> operations would fail on a directory. — end note]

— Otherwise, if the attributes indicate a directory, as if by POSIX \( S\_ISDIR \), returns \( \text{file_status(file_type::directory, prms)} \). [Note: file_type::directory implies that calling directory_iterator(\( p \)) would succeed. — end note]

— Otherwise, if the attributes indicate a block special file, as if by POSIX \( S\_ISBLK \), returns \( \text{file_status(file_type::block, prms)} \).

— Otherwise, if the attributes indicate a character special file, as if by POSIX \( S\_ISCHR \), returns \( \text{file_status(file_type::character, prms)} \).

— Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX \( S\_ISFIFO \), returns \( \text{file_status(file_type::fifo, prms)} \).

— Otherwise, if the attributes indicate a socket, as if by POSIX \( S\_ISSOCK \), returns \( \text{file_status(file_type::socket, prms)} \).

— Otherwise, if the attributes indicate an implementation-defined file type (28.11.9.2), returns \( \text{file_status(file_type::A, prms)} \), where \( A \) is the constant for the implementation-defined file type.

— Otherwise, returns \( \text{file_status(file_type::unknown, prms)} \).

Remarks: If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

28.11.14.36 Status known

bool status_known(file_status s) noexcept;

Returns: \( s.\text{type()} != \text{file_type::none} \).

28.11.14.37 Symlink status

file_status symlink_status(const path& p);

file_status symlink_status(const path& p, error_code& ec) noexcept;

Effects: Same as status(), above, except that the attributes of \( p \) are determined as if by using POSIX lstat() to obtain a POSIX struct stat.

Let \( prms \) denote the result of \( (m & \text{perms::mask}) \), where \( m \) is determined as if by converting the st_mode member of the obtained struct stat to the type \( \text{perms} \).

Returns: Same as status(), above, except that if the attributes indicate a symbolic link, as if by POSIX \( S\_ISLINK \), returns \( \text{file_status(file_type::symlink, prms)} \). The signature with argument \( \text{ec} \) returns \( \text{file_status(file_type::none)} \) if an error occurs.

Remarks: Pathname resolution terminates if \( p \) names a symbolic link.

Throws: As specified in 28.11.6.

28.11.14.38 Temporary directory path

path temp_directory_path();
path temp_directory_path(error_code& ec);

1. Let \( p \) be an unspecified directory path suitable for temporary files.

2. **Effects:** If `exists(p)` is false or `is_directory(p)` is false, an error is reported (28.11.6).

3. **Returns:** The path \( p \). The signature with argument `ec` returns `path()` if an error occurs.

4. **Throws:** As specified in 28.11.6.

5. **Example:** For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list `TMPDIR`, `TMP`, `TEMP`, `TEMPDIR`, or if none of these are found, "/tmp".

   For Windows-based operating systems, an implementation might return the path reported by the Windows `GetTempPath` API function. — end example

### 28.11.14.39 Weakly canonical

```cpp
path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);
```

1. **Returns:** \( p \) with symlinks resolved and the result normalized (28.11.7.1).

2. **Effects:** Using `status(p)` or `status(p, ec)`, respectively, to determine existence, return a path composed by `operator/=` from the result of calling `canonical()` with a path argument composed of the leading elements of \( p \) that exist, if any, followed by the elements of \( p \) that do not exist, if any. For the first form, `canonical()` is called without an `error_code` argument. For the second form, `canonical()` is called with `ec` as an `error_code` argument, and `path()` is returned at the first error occurrence, if any.

3. **Ensures:** The returned path is in normal form (28.11.7.1).

4. **Remarks:** Implementations should avoid unnecessary normalization such as when `canonical` has already been called on the entirety of \( p \).

5. **Throws:** As specified in 28.11.6.

### 28.12 C library files

#### 28.12.1 Header <cstdio>

```c
namespace std {
    using size_t = see 16.2.4;
    using FILE = see below;
    using fpos_t = see below;
}
```

```c
#define NULL see 16.2.3
#define _IOFBF see below
#define _IOLBF see below
#define _IONBF see below
#define BUFSIZ see below
#define EOF see below
#define FOPEN_MAX see below
#define FILENAME_MAX see below
#define L_tmpnam see below
#define SEEK_CUR see below
#define SEEK_END see below
#define SEEK_SET see below
#define TMP_MAX see below
#define stderr see below
#define stdin see below
#define stdout see below
```

```c
namespace std {
    int remove(const char* filename);
    int rename(const char* old, const char* new);
    FILE* tmpfile();
    char* tmpnam(char* s);
}
```
int fclose(FILE* stream);
int fflush(FILE* stream);
FILE* fopen(const char* filename, const char* mode);
void setbuf(FILE* stream, char* buf);
int setvbuf(FILE* stream, char* buf, int mode, size_t size);
int fprintf(FILE* stream, const char* format, ...);
itonlush(FILE* stream, const char* format, ...);
int printf(const char* format, ...);
int scanf(const char* format, ...);
int snprintf(char* s, size_t n, const char* format, ...);
int sprintf(char* s, const char* format, ...);
int sscanf(const char* s, const char* format, ...);
int vfprintf(FILE* stream, const char* format, va_list arg);
int vfscanf(FILE* stream, const char* format, va_list arg);
int vprintf(const char* format, va_list arg);
int vscanf(const char* format, va_list arg);
int vsnprintf(char* s, size_t n, const char* format, va_list arg);
int vsprintf(char* s, const char* format, va_list arg);
int vsscanf(const char* s, const char* format, va_list arg);

The contents and meaning of the header `<cstdio>` are the same as the C standard library header `<stdio.h>`. Calls to the function `tmpnam` with an argument that is a null pointer value may introduce a data race (15.5.5.9) with other calls to `tmpnam` with an argument that is a null pointer value.

#define SCNuPTR see below
#define SCNxPTR see below

1 The contents and meaning of the header `<cinttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

(1.1) — The header `<cinttypes>` includes the header `<stdint>` instead of `<stdint.h>`, and
if and only if the type intmax_t designates an extended integer type (6.7.1), the following function signatures are added:

```
intmax_t abs(intmax_t);
imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures intmax_t imaxabs(intmax_t) and imaxdiv_t imaxdiv(intmax_t, intmax_t), respectively.

29 Regular expressions library [re]

29.1 General [re.general]

This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.

The following subclauses describe a basic regular expression class template and its traits that can handle char-like (20.1) template arguments, two specializations of this class template that handle sequences of char and wchar_t, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 122.

Table 122 — Regular expressions library summary

</tbody>
</table>

29.2 Definitions [re.def]

The following definitions shall apply to this Clause:

29.2.1 [defns.regex.collating.element]
collating element
a sequence of one or more characters within the current locale that collate as if they were a single character.

29.2.2 [defns.regex.finite.state.machine]
finite state machine
an unspecified data structure that is used to represent a regular expression, and which permits efficient matches against the regular expression to be obtained.

29.2.3 [defns.regex.format.specifier]
format specifier
a sequence of one or more characters that is to be replaced with some part of a regular expression match.

29.2.4 [defns.regex.matched]
matched
a sequence of zero or more characters is matched by a regular expression when the characters in the sequence correspond to a sequence of characters defined by the pattern.

29.2.5 [defns.regex.primary.equivalence.class]
primary equivalence class
a set of one or more characters which share the same primary sort key: that is the sort key weighting that depends only upon character shape, and not accents, case, or locale specific tailorings.
29.2.6 regular expression

[defns.regex.regular.expression]

a pattern that selects specific strings from a set of character strings.

29.2.7 sub-expression

[defns.regex.subexpression]

a subset of a regular expression that has been marked by parenthesis.

29.3 Requirements

[re.req]

1 This subclause defines requirements on classes representing regular expression traits. [Note: The class template `regex_traits`, defined in 29.7, satisfies these requirements. — end note]

2 The class template `basic_regex`, defined in 29.8, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter `traits` used by the `basic_regex` class template. This subclause defines the semantics of these members.

3 To specialize class template `basic_regex` for a character container `CharT` and its related regular expression traits class `Traits`, use `basic_regex<CharT, Traits>`.

4 In Table 123 `X` denotes a traits class defining types and functions for the character container type `charT`; `u` is an object of type `X`; `v` is an object of type `const X`; `p` is a value of type `const charT*`; `I1` and `I2` are input iterators (22.3.5.2); `F1` and `F2` are forward iterators (22.3.5.4); `c` is a value of type `const charT`; `s` is an object of type `X::string_type`; `cs` is an object of type `const X::string_type`; `b` is a value of type `bool`; `I` is a value of type `int`; `cl` is an object of type `X::char_class_type`, and `loc` is an object of type `X::locale_type`.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>X::char_type</code></td>
<td><code>charT</code></td>
<td>The character container type used in the implementation of class template <code>basic_regex</code>.</td>
</tr>
<tr>
<td><code>X::string_type</code></td>
<td><code>basic_string&lt;charT&gt;</code></td>
<td>A type that represents the locale used by the traits class.</td>
</tr>
<tr>
<td><code>X::locale_type</code></td>
<td></td>
<td>A type representing the locale used by the traits class.</td>
</tr>
<tr>
<td><code>X::char_class_type</code></td>
<td>A bitmask type representing a particular character classification.</td>
<td></td>
</tr>
<tr>
<td><code>X::length(p)</code></td>
<td><code>size_t</code></td>
<td>Yields the smallest <code>i</code> such that <code>p[i] == 0</code>. Complexity is linear in <code>i</code>.</td>
</tr>
<tr>
<td><code>v.translate(c)</code></td>
<td><code>X::char_type</code></td>
<td>Returns a character such that for any character <code>d</code> that is to be considered equivalent to <code>c</code> then <code>v.translate(c) == v.translate(d)</code>.</td>
</tr>
<tr>
<td><code>v.translate_nocase(c)</code></td>
<td><code>X::char_type</code></td>
<td>For all characters <code>C</code> that are to be considered equivalent to <code>c</code> when comparisons are to be performed without regard to case, then <code>v.translate_nocase(c) == v.translate_nocase(C)</code>.</td>
</tr>
<tr>
<td><code>v.transform(F1, F2)</code></td>
<td><code>X::string_type</code></td>
<td>Returns a sort key for the character sequence designated by the iterator range <code>[F1, F2)</code> such that if the character sequence <code>[G1, G2)</code> sorts before the character sequence <code>[H1, H2)</code> then <code>v.transform(G1, G2) &lt; v.transform(H1, H2)</code>.</td>
</tr>
</tbody>
</table>
### Table 123 — Regular expression traits class requirements (continued)

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>v.transform_primary(F1, F2)</code></td>
<td><code>X::string_type</code></td>
<td>Returns a sort key for the character sequence designated by the iterator range ([F1, F2)) such that if the character sequence ([G1, G2)) sorts before the character sequence ([H1, H2)) when character case is not considered then (v.transform_primary(G1, G2) &lt; v.transform_primary(H1, H2)).</td>
</tr>
<tr>
<td><code>v.lookup_collatename(F1, F2)</code></td>
<td><code>X::string_type</code></td>
<td>Returns a sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range ([F1, F2)). Returns an empty string if the character sequence is not a valid collating element.</td>
</tr>
<tr>
<td><code>v.lookup_classname(F1, F2, b)</code></td>
<td><code>X::char_class_type</code></td>
<td>Converts the character sequence designated by the iterator range ([F1, F2)) into a value of a bitmask type that can subsequently be passed to <code>isctype</code>. Values returned from <code>lookup_classname</code> can be bitwise OR’ed together; the resulting value represents membership in either of the corresponding character classes. If (b) is <code>true</code>, the returned bitmask is suitable for matching characters without regard to their case. Returns 0 if the character sequence is not the name of a character class recognized by (X). The value returned shall be independent of the case of the characters in the sequence.</td>
</tr>
<tr>
<td><code>v.isctype(c, cl)</code></td>
<td><code>bool</code></td>
<td>Returns <code>true</code> if character (c) is a member of one of the character classes designated by (cl), <code>false</code> otherwise.</td>
</tr>
<tr>
<td><code>v.value(c, I)</code></td>
<td><code>int</code></td>
<td>Returns the value represented by the digit (c) in base (I) if the character (c) is a valid digit in base (I); otherwise returns -1. [Note: The value of (I) will only be 8, 10, or 16. — end note]</td>
</tr>
<tr>
<td><code>u.imbue(loc)</code></td>
<td><code>X::locale_type</code></td>
<td>Imbues (u) with the locale (loc) and returns the previous locale used by (u) if any.</td>
</tr>
<tr>
<td><code>v.getloc()</code></td>
<td><code>X::locale_type</code></td>
<td>Returns the current locale used by (v), if any.</td>
</tr>
</tbody>
</table>

5 \[Note: Class template `regex_traits` satisfies the requirements for a regular expression traits class when it is specialized for `char` or `wchar_t`. This class template is described in the header `<regex>`, and is described in 29.7. — end note\]

### 29.4 Header `<regex>` synopsis

```cpp
#include <initializer_list>
namespace std {
    // 29.5, regex constants
    namespace regex_constants {
        using syntax_option_type = T1;
        using match_flag_type = T2;
        using error_type = T3;
    }
    // 29.6, class regex_error
    class regex_error;
```
// 29.7, class template regex_traits
template<class charT> struct regex_traits;

// 29.8, class template basic_regex
template<class charT, class traits = regex_traits<charT>> class basic_regex;

using regex = basic_regex<char>;
using wregex = basic_regex<wchar_t>;

}

29.5 Namespace std::regex_constants

The namespace std::regex_constants holds symbolic constants used by the regular expression library. This namespace provides three types, syntax_option_type, match_flag_type, and error_type, along with several constants of these types.

29.5.1 Bitmask type syntax_option_type

namespace std::regex_constants {
    using syntax_option_type = T1;
    inline constexpr syntax_option_type icase = unspecified;
    inline constexpr syntax_option_type nosubs = unspecified;
    inline constexpr syntax_option_type optimize = unspecified;
    inline constexpr syntax_option_type collate = unspecified;
    inline constexpr syntax_option_type ECMAScript = unspecified;
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
}

The type syntax_option_type is an implementation-defined bitmask type (15.4.2.1.4). Setting its elements has the effects listed in Table 124. A valid value of type syntax_option_type shall have at most one of the grammar elements ECMAScript, basic, extended, awk, grep, egrep, set. If no grammar element is set, the default grammar is ECMAScript.

29.5.2 Bitmask type match_flag_type

namespace std::regex_constants {
    using match_flag_type = T2;
    inline constexpr match_flag_type match_default = {};
    inline constexpr match_flag_type match_not_bol = unspecified;
    inline constexpr match_flag_type match_not_eol = unspecified;
    inline constexpr match_flag_type match_not_bow = unspecified;
    inline constexpr match_flag_type match_not_eow = unspecified;
    inline constexpr match_flag_type match_any = unspecified;
    inline constexpr match_flag_type match_not_null = unspecified;
    inline constexpr match_flag_type match_prev_avail = unspecified;
    inline constexpr match_flag_type match_continuous = unspecified;
    inline constexpr match_flag_type format_default = {};
    inline constexpr match_flag_type format_sed = unspecified;
    inline constexpr match_flag_type format_no_copy = unspecified;
    inline constexpr match_flag_type format_first_only = unspecified;
}
<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>icase</td>
<td>Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.</td>
</tr>
<tr>
<td>nosubs</td>
<td>Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied match_results object.</td>
</tr>
<tr>
<td>optimize</td>
<td>Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.</td>
</tr>
<tr>
<td>collate</td>
<td>Specifies that character ranges of the form &quot;[a-b]&quot; shall be locale sensitive.</td>
</tr>
<tr>
<td>ECMAScript</td>
<td>Specifies that the grammar recognized by the regular expression engine shall be that used by ECMAScript in ECMA-262, as modified in 29.13. SEE ALSO: ECMA-262 15.10</td>
</tr>
<tr>
<td>basic</td>
<td>Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX. SEE ALSO: POSIX, Base Definitions and Headers, Section 9.3</td>
</tr>
<tr>
<td>extended</td>
<td>Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX. SEE ALSO: POSIX, Base Definitions and Headers, Section 9.4</td>
</tr>
<tr>
<td>awk</td>
<td>Specifies that the grammar recognized by the regular expression engine shall be that used by the utility awk in POSIX.</td>
</tr>
<tr>
<td>grep</td>
<td>Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep in POSIX.</td>
</tr>
<tr>
<td>egrep</td>
<td>Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep when given the -E option in POSIX.</td>
</tr>
<tr>
<td>multiline</td>
<td>Specifies that ^ shall match the beginning of a line and $ shall match the end of a line, if the ECMAScript engine is selected.</td>
</tr>
</tbody>
</table>

1 The type match_flag_type is an implementation-defined bitmask type (15.4.2.1.4). The constants of that type, except for match_default and format_default, are bitmask elements. The match_default and format_default constants are empty bitmasks. Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 125 for any bitmask elements set.

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_not_bol</td>
<td>The first character in the sequence [first, last) shall be treated as though it is not at the beginning of a line, so the character ^ in the regular expression shall not match [first, first).</td>
</tr>
<tr>
<td>match_not_eol</td>
<td>The last character in the sequence [first, last) shall be treated as though it is not at the end of a line, so the character $ in the regular expression shall not match [last, last).</td>
</tr>
<tr>
<td>match_not_bow</td>
<td>The expression ^\b$ shall not match the sub-sequence [first, first).</td>
</tr>
<tr>
<td>match_not_eow</td>
<td>The expression ^\b$ shall not match the sub-sequence [last, last).</td>
</tr>
<tr>
<td>match_any</td>
<td>If more than one match is possible then any match is an acceptable result.</td>
</tr>
<tr>
<td>match_not_null</td>
<td>The expression shall not match an empty sequence.</td>
</tr>
<tr>
<td>match_continuous</td>
<td>The expression shall only match a sub-sequence that begins at first.</td>
</tr>
</tbody>
</table>
Table 125 — regex_constants::match_flag_type effects when obtaining a match against a character container sequence [first, last). (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_prev_avail</td>
<td>--first is a valid iterator position. When this flag is set the flags match_not_bol and match_not_bow shall be ignored by the regular expression algorithms (29.11) and iterators (29.12).</td>
</tr>
<tr>
<td>format_default</td>
<td>When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the ECMAScript replace function in ECMA-262, part 15.5.4.11 String.prototype.replace. In addition, during search and replace operations all non-overlapping occurrences of the regular expression shall be located and replaced, and sections of the input that did not match the expression shall be copied unchanged to the output string.</td>
</tr>
<tr>
<td>format_sed</td>
<td>When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.</td>
</tr>
<tr>
<td>format_no_copy</td>
<td>During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.</td>
</tr>
<tr>
<td>format_first_only</td>
<td>When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.</td>
</tr>
</tbody>
</table>

29.5.3 Implementation-defined error_type

namespace std::regex_constants {
    using error_type = T3;
    inline constexpr error_type error_collate = unspecified;
    inline constexpr error_type error_cctype = unspecified;
    inline constexpr error_type error_escape = unspecified;
    inline constexpr error_type error_backref = unspecified;
    inline constexpr error_type error_brack = unspecified;
    inline constexpr error_type error_bparen = unspecified;
    inline constexpr error_type error_bbrace = unspecified;
    inline constexpr error_type error_badbrace = unspecified;
    inline constexpr error_type error_range = unspecified;
    inline constexpr error_type error_space = unspecified;
    inline constexpr error_type error_badrepeat = unspecified;
    inline constexpr error_type error_complexity = unspecified;
    inline constexpr error_type error_stack = unspecified;
}

1 The type error_type is an implementation-defined enumerated type (15.4.2.1.3). Values of type error_type represent the error conditions described in Table 126:

Table 126 — error_type values in the C locale

<table>
<thead>
<tr>
<th>Value</th>
<th>Error condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_collate</td>
<td>The expression contained an invalid collating element name.</td>
</tr>
<tr>
<td>error_cctype</td>
<td>The expression contained an invalid character class name.</td>
</tr>
<tr>
<td>error_escape</td>
<td>The expression contained an invalid escaped character, or a trailing escape.</td>
</tr>
<tr>
<td>error_backref</td>
<td>The expression contained an invalid back reference.</td>
</tr>
<tr>
<td>error_brack</td>
<td>The expression contained mismatched [ and ].</td>
</tr>
<tr>
<td>error_bparen</td>
<td>The expression contained mismatched ( and ).</td>
</tr>
<tr>
<td>error_bbrace</td>
<td>The expression contained mismatched { and }</td>
</tr>
<tr>
<td>error_badbrace</td>
<td>The expression contained an invalid range in a {} expression.</td>
</tr>
<tr>
<td>error_range</td>
<td>The expression contained an invalid character range, such as [b-a] in most encodings.</td>
</tr>
<tr>
<td>error_space</td>
<td>There was insufficient memory to convert the expression into a finite state machine.</td>
</tr>
<tr>
<td>Value</td>
<td>Error condition</td>
</tr>
<tr>
<td>-------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>error_badrepeat</td>
<td>One of *?+{ was not preceded by a valid regular expression.</td>
</tr>
<tr>
<td>error_complexity</td>
<td>The complexity of an attempted match against a regular expression exceeded a pre-set level.</td>
</tr>
<tr>
<td>error_stack</td>
<td>There was insufficient memory to determine whether the regular expression could match the specified character sequence.</td>
</tr>
</tbody>
</table>

### 29.6 Class regex_error

```cpp
class regex_error : public runtime_error {
public:
    explicit regex_error(regex_constants::error_type ecode);
    regex_constants::error_type code() const;
};
```

1. The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```cpp
regex_error(regex_constants::error_type ecode);
```

2. **Effects:** Constructs an object of class `regex_error`.

3. **Ensures:** `ecode == code()`.

```cpp
regex_constants::error_type code() const;
```

4. **Returns:** The error code that was passed to the constructor.

### 29.7 Class template regex_traits

```cpp
namespace std {
    template<class charT>
    struct regex_traits {
        using char_type = charT;
        using string_type = basic_string<char_type>;
        using locale_type = locale;
        using char_class_type = bitmask_type;

        regex_traits();
        static size_t length(const char_type* p);
        charT translate(charT c) const;
        charT translate_nocase(charT c) const;
        template<class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        char_class_type lookup_classname(ForwardIterator first, ForwardIterator last, bool icase = false) const;
        bool isctype(charT c, char_class_type f) const;
        int value(charT ch, int radix) const;
        locale_type imbue(locale_type l);
        locale_type getloc() const;
    };
}
```

1. The specializations `regex_traits<char>` and `regex_traits<wchar_t>` shall be valid and shall satisfy the requirements for a regular expression traits class (29.3).
using char_class_type = bitmask_type;

The type char_class_type is used to represent a character classification and is capable of holding an implementation specific set returned by lookup_classname.

static size_t length(const char_type* p);

Returns: char_traits<charT>::length(p).

carbT translate(carbT c) const;

Returns: c.

carbT translate_nocase(carbT c) const;

Returns: use_facet<ctype<carbT>>(getloc()).tolower(c).

template<class ForwardIterator>
string_type transform(ForwardIterator first, ForwardIterator last) const;

Effects: As if by:

string_type str(first, last);
return use_facet<collate<carbT>>(getloc()).transform(str.data(), str.data() + str.length());

template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;

Effects: If

typeid(use_facet<collate<carbT>>(getloc())) == typeid(collate_byname<carbT>)
and the form of the sort key returned by collate_byname<carbT>::transform(first, last) is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

template<class ForwardIterator>
string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;

Returns: A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range [first, last). Returns an empty string if the character sequence is not a valid collating element.

template<class ForwardIterator>
char_class_type lookup_classname(ForwardIterator first, ForwardIterator last, bool icase = false) const;

Returns: An unspecified value that represents the character classification named by the character sequence designated by the iterator range [first, last). If the parameter icase is true then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched. The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns char_class_type().

Remarks: For regex_traits<char>, at least the narrow character names in Table 127 shall be recognized. For regex_traits<wchar_t>, at least the wide character names in Table 127 shall be recognized.

bool isctype(carbT c, char_class_type f) const;

Effects: Determines if the character c is a member of the character classification represented by f.

Returns: Given the following function declaration:

// for exposition only
template<class C>
typebase::mask convert(typename regex_traits<C>::char_class_type f);

that returns a value in which each typebase::mask value corresponding to a value in f named in Table 127 is set, then the result is determined as if by:

§ 29.7
ctype_base::mask m = convert<charT>(f);
const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
if (ct.is(m, c)) {
    return true;
} else if (c == ct.widen('_')) {
    charT w[1] = { ct.widen('w') };
    char_class_type x = lookup_classname(w, w+1);
    return (f&x) == x;
} else {
    return false;
}

Example:
regex_traits<char> t;
string d("d");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
— end example]  [Example:
regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f); // returns true
t.isctype('_', f); // returns true
t.isctype(' ', f); // returns false
— end example]

int value(charT ch, int radix) const;

Requires: The value of radix shall be 8, 10, or 16.

Returns: The value represented by the digit ch in base radix if the character ch is a valid digit in base radix; otherwise returns -1.

locale_type imbue(locale_type loc);

Effects: Imbues this with a copy of the locale loc. [Note: Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this. — end note]

Returns: If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of *this, otherwise a copy of the last argument passed to imbue.

Ensures: getloc() == loc.

locale_type getloc() const;

Returns: If no locale has been imbued then a copy of the global locale in effect at the time of construction of *this, otherwise a copy of the last argument passed to imbue.

29.8 Class template basic_regex

For a char-like type charT, specializations of class template basic_regex represent regular expressions constructed from character sequences of charT characters. In the rest of 29.8, charT denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class basic_regex.

Objects of type specialization of basic_regex are responsible for converting the sequence of charT objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions. [Note: Implementations will typically declare some function templates as friends of basic_regex to achieve this — end note]

The functions described in this Clause report errors by throwing exceptions of type regex_error.

        basic_regex(initializer_list<charT>, flag_type = regex_constants::ECMAScript);

        ~basic_regex();
    }
basic_regex& operator=(const basic_regex&);
basic_regex& operator=(basic_regex&&) noexcept;
basic_regex& operator=(const charT* ptr);
basic_regex& operator=(initializer_list<charT> il);
template<class ST, class SA>
  basic_regex& operator=(const basic_string<charT, ST, SA>& p);

  // 29.8.2, assign
  basic_regex& assign(const basic_regex& that);
basic_regex& assign(basic_regex&& that) noexcept;
basic_regex& assign(const charT* ptr, flag_type f = regex_constants::ECMAScript);
basic_regex& assign(const charT* p, size_t len, flag_type f);
template<class string_traits, class A>
  basic_regex& assign(const basic_string<charT, string_traits, A>& s, 
  flag_type f = regex_constants::ECMAScript);
Ensures: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

basic_regex(const basic_regex& e);

Effects: Constructs an object of class basic_regex as a copy of the object \( e \).

Ensures: flags() and mark_count() return \( e \).flags() and \( e \).mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;

Effects: Move constructs an object of class basic_regex from \( e \).

Ensures: flags() and mark_count() return the values that \( e \).flags() and \( e \).mark_count(), respectively, had before construction. \( e \) is in a valid state with unspecified value.

template<class ST, class SA>
explicit basic_regex(const basic_string<charT, ST, SA>& s,
flag_type f = regex_constants::ECMAScript);

Throws: regex_error if \( s \) is not a valid regular expression.

Effects: Constructs an object of class basic_regex; the object’s internal finite state machine is constructed from the regular expression contained in the string \( s \), and interpreted according to the flags specified in \( f \).

Ensures: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

template<class ForwardIterator>
basic_regex(ForwardIterator first, ForwardIterator last,
flag_type f = regex_constants::ECMAScript);

Throws: regex_error if the sequence \([first, last)\) is not a valid regular expression.

Effects: Constructs an object of class basic_regex; the object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters \([first, last)\), and interpreted according to the flags specified in \( f \).

Ensures: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);

Effects: Same as basic_regex(il.begin(), il.end(), \( f \)).

29.8.2 Assignment

basic_regex& operator=(const basic_regex& e);

Effects: Copies \( e \) into \*this and returns \*this.

Ensures: flags() and mark_count() return \( e \).flags() and \( e \).mark_count(), respectively.

basic_regex& operator=(basic_regex&& e) noexcept;

Effects: Move assigns from \( e \) into \*this and returns \*this.

Ensures: flags() and mark_count() return the values that \( e \).flags() and \( e \).mark_count(), respectively, had before assignment. \( e \) is in a valid state with unspecified value.

basic_regex& operator=(const charT* ptr);

Requires: \( ptr \) shall not be a null pointer.

Effects: Returns assign(ptr).

basic_regex& operator=(initializer_list<charT> il);

Effects: Returns assign(il.begin(), il.end()).

template<class ST, class SA>
basic_regex& operator=(const basic_string<charT, ST, SA>& p);

Effects: Returns assign(p).
basic_regex& assign(const basic_regex& that);

Effects: Equivalent to: return *this = that;

basic_regex& assign(basic_regex&& that) noexcept;

Effects: Equivalent to: return *this = std::move(that);

basic_regex& assign(const charT* ptr, flag_type f = regex_constants::ECMAScript);

Returns: assign(string_type(ptr), f).

basic_regex& assign(const charT* ptr, size_t len, flag_type f = regex_constants::ECMAScript);

Returns: assign(string_type(ptr, len), f).

template<class string_traits, class A>
basic_regex& assign(const basic_string<charT, string_traits, A>& s,
flag_type f = regex_constants::ECMAScript);

Throws: regex_error if s is not a valid regular expression.

Returns: *this.

Effects: Assigns the regular expression contained in the string s, interpreted according the flags specified in f. If an exception is thrown, *this is unchanged.

Ensures: If no exception is thrown, flags() returns f and mark_count() returns the number of marked sub-expressions within the expression.

template<class InputIterator>
basic_regex& assign(InputIterator first, InputIterator last,
flag_type f = regex_constants::ECMAScript);

Requires: InputIterator shall satisfy the Cpp17InputIterator requirements (22.3.5.2).

Returns: assign(string_type(first, last), f).

basic_regex& assign(initializer_list<charT> il,
flag_type f = regex_constants::ECMAScript);

Effects: Same as assign(il.begin(), il.end(), f).

Returns: *this.

29.8.3 Constant operations

unsigned mark_count() const;

Effects: Returns the number of marked sub-expressions within the regular expression.

flag_type flags() const;

Effects: Returns a copy of the regular expression syntax flags that were passed to the object’s constructor or to the last call to assign.

29.8.4 Locale

locale_type imbue(locale_type loc);

Effects: Returns the result of traits_inst.imbue(loc) where traits_inst is a (default-initialized) instance of the template type argument traits stored within the object. After a call to imbue the basic_regex object does not match any character sequence.

locale_type getloc() const;

Effects: Returns the result of traits_inst.getloc() where traits_inst is a (default-initialized) instance of the template parameter traits stored within the object.

29.8.5 Swap

void swap(basic_regex& e);

Effects: Swaps the contents of the two regular expressions.
2 Ensures: *this contains the regular expression that was in e, e contains the regular expression that was in *this.

3 Complexity: Constant time.

29.8.6 Non-member functions

```cpp
template<class charT, class traits>
void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);
```

1 Effects: Calls lhs.swap(rhs).

29.9 Class template sub_match

1 Class template sub_match denotes the sequence of characters matched by a particular marked sub-expression.

```cpp
namespace std {
    template<class BidirectionalIterator>
    class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
    public:
        using value_type = typename iterator_traits<BidirectionalIterator>::value_type;
        using difference_type = typename iterator_traits<BidirectionalIterator>::difference_type;
        using iterator = BidirectionalIterator;
        using string_type = basic_string<value_type>;

        bool matched;

        constexpr sub_match();

        difference_type length() const;
        operator string_type() const;
        string_type str() const;

        int compare(const sub_match& s) const;
        int compare(const string_type& s) const;
        int compare(const value_type* s) const;
    }
}
```

29.9.1 Members

```cpp
constexpr sub_match();

1 Effects: Value-initializes the pair base class subobject and the member matched.

difference_type length() const;

2 Returns: matched ? distance(first, second) : 0.

operator string_type() const;

3 Returns: matched ? string_type(first, second) : string_type().

string_type str() const;

4 Returns: matched ? string_type(first, second) : string_type().

int compare(const sub_match& s) const;

5 Returns: str().compare(s.str()).

int compare(const string_type& s) const;

6 Returns: str().compare(s).

int compare(const value_type* s) const;

7 Returns: str().compare(s).

§ 29.9.1
29.9.2 Non-member operators

```cpp
template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{lhs.compare(rhs)} == 0 \).
```

```cpp
template<class BiIter>
bool operator!=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{lhs.compare(rhs)} != 0 \).
```

```cpp
template<class BiIter>
bool operator<(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{lhs.compare(rhs)} < 0 \).
```

```cpp
template<class BiIter>
bool operator>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{lhs.compare(rhs)} > 0 \).
```

```cpp
template<class BiIter>
bool operator<=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{lhs.compare(rhs)} <= 0 \).
```

```cpp
template<class BiIter>
bool operator>=(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{lhs.compare(rhs)} >= 0 \).
```

```cpp
template<class BiIter, class ST, class SA>
bool operator==(const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{rhs.compare(typename sub_match<BiIter>::string_type(lhs.data(), lhs.size())) == 0} \).
```

```cpp
template<class BiIter, class ST, class SA>
bool operator!=(const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& lhs, const sub_match<BiIter>& rhs);

Returns: \( !\text{(lhs == rhs)} \).
```

```cpp
template<class BiIter, class ST, class SA>
bool operator<(const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{rhs.compare(typename sub_match<BiIter>::string_type(lhs.data(), lhs.size())) > 0} \).
```

```cpp
template<class BiIter, class ST, class SA>
bool operator>(const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& lhs, const sub_match<BiIter>& rhs);

Returns: \( \text{rhs < lhs} \).
```

```cpp
template<class BiIter, class ST, class SA>
bool operator<=(const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& lhs, const sub_match<BiIter>& rhs);

Returns: \( !\text{(rhs < lhs)} \).
```
template<class BiIter, class ST, class SA>
bool operator>=(
    const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& lhs,
    const sub_match<BiIter>& rhs);

12
Returns: !(lhs < rhs).

template<class BiIter, class ST, class SA>
bool operator>=(
    const sub_match<BiIter>& lhs,
    const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

13
Returns:
lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
bool operator!=(
    const sub_match<BiIter>& lhs,
    const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

14
Returns: !(lhs == rhs).

template<class BiIter, class ST, class SA>
bool operator<(const typename iterator_traits<BiIter>::value_type* lhs,
    const sub_match<BiIter>& rhs);

15
Returns: rhs.compare(lhs) == 0

template<class BiIter, class ST, class SA>
bool operator!=(const typename iterator_traits<BiIter>::value_type* lhs,
    const sub_match<BiIter>& rhs);

16
Returns: !(lhs == rhs).

template<class BiIter, class ST, class SA>
bool operator<(const typename iterator_traits<BiIter>::value_type* lhs,
    const sub_match<BiIter>& rhs);

17
Returns: rhs.compare(lhs) > 0

§ 29.9.2 1429

template<class BiIter, class ST, class SA>
bool operator==(const typename iterator_traits<BiIter>::value_type* lhs,
    const sub_match<BiIter>& rhs);

18
Returns: rhs.compare(lhs) == 0.
template<class BiIter>
bool operator>(const typename iterator_traits<BiIter>::value_type* lhs, const sub_match<BiIter>& rhs);
22

Returns: rhs < lhs.

template<class BiIter>
bool operator<=(const typename iterator_traits<BiIter>::value_type* lhs, const sub_match<BiIter>& rhs);
23

Returns: !(rhs < lhs).

template<class BiIter>
bool operator>=(const typename iterator_traits<BiIter>::value_type* lhs, const sub_match<BiIter>& rhs);
24

Returns: !(lhs < rhs).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);
25

Returns: lhs.compare(rhs) == 0.

template<class BiIter>
bool operator!=(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);
26

Returns: !(lhs == rhs).

template<class BiIter>
bool operator<(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);
27

Returns: lhs.compare(rhs) < 0.

template<class BiIter>
bool operator>(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);
28

Returns: rhs < lhs.

template<class BiIter>
bool operator<=(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);
29

Returns: !(rhs < lhs).

template<class BiIter>
bool operator>=(const sub_match<BiIter>& lhs, const typename iterator_traits<BiIter>::value_type* rhs);
30

Returns: !(lhs < rhs).

template<class BiIter>
bool operator==(const typename iterator_traits<BiIter>::value_type& lhs, const sub_match<BiIter>& rhs);
31

Returns: rhs.compare(typename sub_match<BiIter>::string_type(1, lhs)) == 0.

template<class BiIter>
bool operator!=(const typename iterator_traits<BiIter>::value_type& lhs, const sub_match<BiIter>& rhs);
32

Returns: !(lhs == rhs).

template<class BiIter>
bool operator<(const typename iterator_traits<BiIter>::value_type& lhs, const sub_match<BiIter>& rhs);
33

Returns: rhs.compare(typename sub_match<BiIter>::string_type(1, lhs)) > 0.
template<class BiIter>
 bool operator>(const typename iterator_traits<BiIter>::value_type& lhs,  
 const sub_match<BiIter>& rhs);

Returns: rhs < lhs.

template<class BiIter>
 bool operator<=(const typename iterator_traits<BiIter>::value_type& lhs,  
 const sub_match<BiIter>& rhs);

Returns: !(rhs < lhs).

template<class BiIter>
 bool operator>=(const typename iterator_traits<BiIter>::value_type& lhs,  
 const sub_match<BiIter>& rhs);

Returns: !(lhs < rhs).

template<class BiIter>
 bool operator==(const sub_match<BiIter>& lhs,  
 const typename iterator_traits<BiIter>::value_type& rhs);

Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
 bool operator!=(const sub_match<BiIter>& lhs,  
 const typename iterator_traits<BiIter>::value_type& rhs);

Returns: !(lhs == rhs).

template<class BiIter>
 bool operator<(const sub_match<BiIter>& lhs,  
 const typename iterator_traits<BiIter>::value_type& rhs);

Returns: rhs < lhs.

template<class BiIter>
 bool operator<=(const sub_match<BiIter>& lhs,  
 const typename iterator_traits<BiIter>::value_type& rhs);

Returns: !(rhs < lhs).

template<class BiIter>
 bool operator>=(const sub_match<BiIter>& lhs,  
 const typename iterator_traits<BiIter>::value_type& rhs);

Returns: !(lhs < rhs).

template<class charT, class ST, class BiIter>
 basic_ostream<charT, ST>&  
 operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);

Returns: os << m.str().

29.10 Class template match_results

Class template match_results denotes a collection of character sequences representing the result of a regular  
expression match. Storage for the collection is allocated and freed as necessary by the member functions of  
class template match_results.

The class template match_results satisfies the requirements of an allocator-aware container and of a sequence  
container (21.2.1, 21.2.3) except that only copy assignment, move assignment, and operations defined for  
const-qualified sequence containers are supported and that the semantics of comparison functions are different  
from those required for a container.
A default-constructed `match_results` object has no fully established result state. A match result is `ready` when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a `match_results` object that is not ready are undefined.

The `sub_match` object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the `sub_match` member `matched` is always `true`. The `sub_match` object stored at index `n` denotes what matched the marked sub-expression `n` within the matched expression. If the sub-expression `n` participated in a regular expression match then the `sub_match` member `matched` evaluates to `true`, and members `first` and `second` denote the range of characters `[first, second)` which formed that match. Otherwise `matched` is `false`, and members `first` and `second` point to the end of the sequence that was searched. [Note: The `sub_match` objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — end note]

 namespace std {
    template<class BidirectionalIterator,
             class Allocator = allocator<sub_match<BidirectionalIterator>>>
    class match_results {

// 29.10.7, swap
void swap(match_results& that);
};

29.10.1 Constructors

explicit match_results(const Allocator& a);
1. Effects: Constructs an object of class match_results.
2. Ensures: ready() returns false, size() returns 0.

match_results(const match_results& m);
3. Effects: Constructs an object of class match_results, as a copy of m.

match_results(match_results&& m) noexcept;
4. Effects: Move constructs an object of class match_results from m satisfying the same postconditions as Table 128. Additionally, the stored Allocator value is move constructed from m.get_allocator().
5. Throws: Nothing.

match_results& operator=(const match_results& m);
6. Effects: Assigns m to *this. The postconditions of this function are indicated in Table 128.

match_results& operator=(match_results&& m);
7. Effects: Move-assigns m to *this. The postconditions of this function are indicated in Table 128.

</tbody>
</table>
29.10.2 State

bool ready() const;  
Returns: true if *this has a fully established result state, otherwise false.

29.10.3 Size

size_type size() const;  
Returns: One plus the number of marked sub-expressions in the regular expression that was matched if *this represents the result of a successful match. Otherwise returns 0. [Note: The state of a match_results object can be modified only by passing that object to regex_match or regex_search. Subclauses 29.11.2 and 29.11.3 specify the effects of those algorithms on their match_results arguments. —end note]

size_type max_size() const;  
Returns: The maximum number of sub_match elements that can be stored in *this.

[[nodiscard]] bool empty() const;  
Returns: size() == 0.

29.10.4 Element access

difference_type length(size_type sub = 0) const;  
Requires: ready() == true.  
Returns: (*this)[sub].length().

difference_type position(size_type sub = 0) const;  
Requires: ready() == true.  
Returns: The distance from the start of the target sequence to (*this)[sub].first.

string_type str(size_type sub = 0) const;  
Requires: ready() == true.  
Returns: string_type((*this)[sub]).

const_reference operator[](size_type n) const;  
Requires: ready() == true.  
Returns: A reference to the sub_match object representing the character sequence that matched marked sub-expression n. If n == 0 then returns a reference to a sub_match object representing the character sequence that matched the whole regular expression. If n >= size() then returns a sub_match object representing an unmatched sub-expression.

const_reference prefix() const;  
Requires: ready() == true.  
Returns: A reference to the sub_match object representing the character sequence from the start of the string being matched/searched to the start of the match found.

const_reference suffix() const;  
Requires: ready() == true.  
Returns: A reference to the sub_match object representing the character sequence from the end of the match found to the end of the string being matched/searched.

const_iterator begin() const;  
const_iterator cbegin() const;  
Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;

Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

### 29.10.5 Formatting

```
template<class OutputIter>
OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Requires: ready() == true and OutputIter shall satisfy the requirements for a Cpp17OutputIterator (22.3.5.3).

Effects: Copies the character sequence [fmt_first, fmt_last) to OutputIter out. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within *this to which it refers. The bitmasks specified in flags determine which format specifiers and escape sequences are recognized.

Returns: out.

```
template<class OutputIter, class ST, class SA>
OutputIter format(
    OutputIter out,
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Effects: Equivalent to:

```
return format(out, fmt.data(), fmt.data() + fmt.size(), flags);
```

```
template<class ST, class SA>
basic_string<char_type, ST, SA> format(
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Requires: ready() == true.

Effects: Constructs an empty string result of type basic_string<char_type, ST, SA> and calls:

```
format(back_inserter(result), fmt, flags);
```

Returns: result.

```
string_type format(
    const char_type* fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Requires: ready() == true.

Effects: Constructs an empty string result of type string_type and calls:

```
format(back_inserter(result), fmt, fmt + char_traits<char_type>::length(fmt), flags);
```

Returns: result.

### 29.10.6 Allocator

```
allocator_type get_allocator() const;
```

Returns: A copy of the Allocator that was passed to the object’s constructor or, if that allocator has been replaced, a copy of the most recent replacement.

### 29.10.7 Swap

```
void swap(match_results& that);
```

Effects: Swaps the contents of the two sequences.

Ensures: *this contains the sequence of matched sub-expressions that were in that, that contains the sequence of matched sub-expressions that were in *this.

Complexity: Constant time.
template<class BidirectionalIterator, class Allocator>
void swap(match_results<BidirectionalIterator, Allocator>& m1,
          match_results<BidirectionalIterator, Allocator>& m2);

4 Effects: As if by m1.swap(m2).

29.10.8 Non-member functions [re.results.nonmember]

template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
                const match_results<BidirectionalIterator, Allocator>& m2);

1 Returns: true if neither match result is ready, false if one match result is ready and the other is not.
If both match results are ready, returns true only if:

(1.1) — m1.empty() && m2.empty(), or
(1.2) — !m1.empty() && !m2.empty(), and the following conditions are satisfied:
      (1.2.1) — m1.prefix() == m2.prefix(),
      (1.2.2) — m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin()), and
      (1.2.3) — m1.suffix() == m2.suffix().

[Note: The algorithm equal is defined in Clause 24. — end note]

template<class BidirectionalIterator, class Allocator>
bool operator!=(const match_results<BidirectionalIterator, Allocator>& m1,
                const match_results<BidirectionalIterator, Allocator>& m2);

2 Returns: !(m1 == m2).

29.11 Regular expression algorithms [re.alg]

29.11.1 Exceptions [re.except]

1 The algorithms described in this subclause may throw an exception of type regex_error. If such an exception e is thrown, e.code() shall return either regex_constants::error_complexity or regex_constants::error_stack.

29.11.2 regex_match [re.alg.match]

template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                 match_results<BidirectionalIterator, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

1 Requires: The type BidirectionalIterator shall satisfy the Cpp17BidirectionalIterator requirements (22.3.5.5).

2 Effects: Determines whether there is a match between the regular expression e, and all of the character sequence [first, last). The parameter flags is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns true if such a match exists, false otherwise. [Example:

```cpp
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); // returns true, and m[0] contains "Get"
regex_match("GetValue", m, re);  // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re); // returns true, and m[0] contains "Get"
regex_match("GetValues", m, re);  // returns false

— end example]
```

3 Ensures: m.ready() == true in all cases. If the function returns false, then the effect on parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise the effects on parameter m are given in Table 129.
Table 129 — Effects of regex_match algorithm

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>m.size()</td>
<td>1 + e.mark_count()</td>
</tr>
<tr>
<td>m.empty()</td>
<td>false</td>
</tr>
<tr>
<td>m.prefix().first</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().second</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().matched</td>
<td>false</td>
</tr>
<tr>
<td>m.suffix().first</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().second</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().matched</td>
<td>false</td>
</tr>
<tr>
<td>m[0].first</td>
<td>first</td>
</tr>
<tr>
<td>m[0].second</td>
<td>last</td>
</tr>
<tr>
<td>m[0].matched</td>
<td>true</td>
</tr>
<tr>
<td>m[n].first</td>
<td>For all integers 0 &lt; n &lt; m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].second</td>
<td>For all integers 0 &lt; n &lt; m.size(), the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].matched</td>
<td>For all integers 0 &lt; n &lt; m.size(), true if sub-expression n participated in the match, false otherwise.</td>
</tr>
</tbody>
</table>

4 Effects: Behaves “as if” by constructing an instance of match_results<BidirectionalIterator> what, and then returning the result of regex_match(first, last, what, e, flags).

5 Returns: regex_match(str, str + char_traits<charT>::length(str), m, e, flags).

6 Returns: regex_match(s.begin(), s.end(), m, e, flags).

7 Returns: regex_match(str, str + char_traits<charT>::length(str), e, flags).

8 Returns: regex_match(s.begin(), s.end(), e, flags).
29.11.3  \texttt{regex\_search} \hfill \[re.alg.search\]

\begin{verbatim}
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last, 
    match_results<BidirectionalIterator, Allocator>& m, 
    const basic_regex<charT, traits>& e, 
    regex_constants::match_flag_type flags = regex_constants::match_default);
\end{verbatim}

\textit{Requires:} Type \texttt{BidirectionalIterator} shall satisfy the \texttt{Cpp17BidirectionalIterator} requirements (22.3.5.5).

\textit{Effects:} Determines whether there is some sub-sequence within \([\texttt{first}, \texttt{last})\) that matches the regular expression \texttt{e}. The parameter \texttt{flags} is used to control how the expression is matched against the character sequence. Returns \texttt{true} if such a sequence exists, \texttt{false} otherwise.

\textit{Ensures:} \texttt{m.ready() == true} in all cases. If the function returns \texttt{false}, then the effect on parameter \texttt{m} is unspecified except that \texttt{m.size()} returns 0 and \texttt{m.empty()} returns \texttt{true}. Otherwise the effects on parameter \texttt{m} are given in Table 130.

\begin{table}[h]
\centering
\begin{tabular}{|l|l|}
\hline
Element     & Value                                                                 \\
\hline
\texttt{m.size()}    & \(1 + \texttt{e.mark\_count()}\)                                                \\
\texttt{m.empty()}    & \texttt{false}                                                                  \\
\texttt{m.prefix().first} & \texttt{first}                                                                \\
\texttt{m.prefix().second} & \texttt{m[0].first}                                                            \\
\texttt{m.prefix().matched} & \texttt{m.prefix().first != m.prefix().second}                                     \\
\texttt{m.suffix().first} & \texttt{m[0].second}                                                            \\
\texttt{m.suffix().second} & \texttt{last}                                                                   \\
\texttt{m.suffix().matched} & \texttt{m.suffix().first != m.suffix().second}                                     \\
\texttt{m[0].first}    & The start of the sequence of characters that matched the regular expression    \\
\texttt{m[0].second}    & The end of the sequence of characters that matched the regular expression       \\
\texttt{m[0].matched} & \texttt{true}                                                                   \\
\texttt{m[n].first}    & For all integers \(0 < n < \texttt{m.size()}\), the start of the sequence that matched sub-expression \(n\). Alternatively, if sub-expression \(n\) did not participate in the match, then \texttt{last}.  \\
\texttt{m[n].second}    & For all integers \(0 < n < \texttt{m.size()}\), the end of the sequence that matched sub-expression \(n\). Alternatively, if sub-expression \(n\) did not participate in the match, then \texttt{last}.  \\
\texttt{m[n].matched} & For all integers \(0 < n < \texttt{m.size()}\), \texttt{true} if sub-expression \(n\) participated in the match, \texttt{false} otherwise.  \\
\hline
\end{tabular}
\caption{Effects of \texttt{regex\_search} algorithm}
\end{table}

\begin{verbatim}
template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m, 
    const basic_regex<charT, traits>& e, 
    regex_constants::match_flag_type flags = regex_constants::match_default);
\end{verbatim}

\textit{Returns:} \texttt{regex\_search(str, str + char_traits<charT>::length(str), m, e, flags)}.

\begin{verbatim}
template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s, 
    match_results<
    typename basic_string<charT, ST, SA>::const_iterator, 
    Allocator>& m, 
    const basic_regex<charT, traits>& e, 
    regex_constants::match_flag_type flags = regex_constants::match_default);
\end{verbatim}

\textit{Returns:} \texttt{regex\_search(s.begin()), s.end(), m, e, flags)}.
template<class BidirectionalIterator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Behaves “as if” by constructing an object what of type match_results<BidirectionalIterator> and returning regex_search(first, last, what, e, flags).

template<class charT, class traits>
bool regex_search(const charT* str,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: regex_search(str, str + char_traits<charT>::length(str), e, flags).

template<class ST, class SA, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: regex_search(s.begin(), s.end(), e, flags).

29.11.4 regex_replace

template<class OutputIterator, class BidirectionalIterator, 
class traits, class charT, class ST, class SA>
OutputIterator
regex_replace(OutputIterator out,
BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
const basic_string<charT, ST, SA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

template<class OutputIterator, class BidirectionalIterator, class traits, class charT>
OutputIterator
regex_replace(OutputIterator out,
BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
const charT* fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Constructs a regex_iterator object i as if by

regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)

and uses i to enumerate through all of the matches m of type match_results<BidirectionalIterator> that occur within the sequence [first, last). If no such matches are found and !(flags & regex_constants::format_no_copy), then calls

out = copy(first, last, out)

If any matches are found then, for each such match:

(1.1) If !(flags & regex_constants::format_no_copy), calls

out = copy(m.prefix().first, m.prefix().second, out)

(1.2) Then calls

out = m.format(out, fmt, flags)

for the first form of the function and

out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)

for the second.

Finally, if such a match is found and !(flags & regex_constants::format_first_only) is nonzero, then only the first match found is replaced.

Returns: out.
template<class traits, class charT, class ST, class SA, class FST, class FSA>
  basic_string<charT, ST, SA>
  regex_replace(const basic_string<charT, ST, SA>& s,
                 const basic_regex<charT, traits>& e,
                 const basic_string<charT, FST, FSA>& fmt,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

template<class traits, class charT, class ST, class SA>
  basic_string<charT, ST, SA>
  regex_replace(const basic_string<charT, ST, SA>& s,
                 const basic_regex<charT, traits>& e,
                 const charT* fmt,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Constructs an empty string result of type basic_string<charT, ST, SA> and calls:
  regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags);

Returns: result.

template<class traits, class charT, class ST, class SA>
  basic_string<charT>
  regex_replace(const charT* s,
                 const basic_regex<charT, traits>& e,
                 const basic_string<charT, ST, SA>& fmt,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

template<class traits, class charT>
  basic_string<charT>
  regex_replace(const charT* s,
                 const basic_regex<charT, traits>& e,
                 const charT* fmt,
                 regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Constructs an empty string result of type basic_string<charT> and calls:
  regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);

Returns: result.

§ 29.12 Regular expression iterators

29.12.1 Class template regex_iterator

The class template regex_iterator is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A regex_iterator uses regex_search to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time operator++ is used, the iterator finds and stores a value of match_results<BidirectionalIterator>. If the end of the sequence is reached (regex_search returns false), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-sequence iterator is not defined. For any other iterator value a const match_results<BidirectionalIterator>& is returned. The result of operator-> on an end-of-sequence iterator is not defined. For any other iterator value a const match_results<BidirectionalIterator>* is returned. It is impossible to store things into regex_iterators. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

namespace std {
  template<class BidirectionalIterator,
           class charT = typename iterator_traits<BidirectionalIterator>::value_type,
           class traits = regex_traits<charT>>
  class regex_iterator {
    public:
      using regex_type = basic_regex<charT, traits>;
      using iterator_category = forward_iterator_tag;
      using value_type = match_results<BidirectionalIterator>;
      using difference_type = ptrdiff_t;
      using pointer = const value_type*;
      using reference = const value_type&;

§ 29.12.1
regex_iterator();
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
  regex_constants::match_flag_type m = regex_constants::match_default);
regex_iterator(BidirectionalIterator, BidirectionalIterator,
const regex_type&,
  regex_constants::match_flag_type = regex_constants::match_default) = delete;
regex_iterator(const regex_iterator&);
regex_iterator& operator=(const regex_iterator&);
bool operator==(const regex_iterator&) const;
bool operator!=(const regex_iterator&) const;
const value_type& operator*() const;
const value_type* operator->() const;
regex_iterator& operator++();
regex_iterator operator++(int);

private:
  BidirectionalIterator begin; // exposition only
  BidirectionalIterator end; // exposition only
  const regex_type* pregex; // exposition only
  regex_constants::match_flag_type flags; // exposition only
  match_results<BidirectionalIterator> match; // exposition only
};

An object of type regex_iterator that is not an end-of-sequence iterator holds a zero-length match if
match[0].matched == true and match[0].first == match[0].second. [Note: For example, this can
occur when the part of the regular expression that matched consists only of an assertion (such as ‘^’, ‘$’,
‘\b’, ‘\B’). — end note]

29.12.1.1 Constructors

regex_iterator();
1 Effects: Constructs an end-of-sequence iterator.

regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
  regex_constants::match_flag_type m = regex_constants::match_default);
2 Effects: Initializes begin and end to a and b, respectively, sets pregex to addressof(re), sets flags
to m, then calls regex_search(begin, end, match, *pregex, flags). If this call returns false the
constructor sets *this to the end-of-sequence iterator.

29.12.1.2 Comparisons

bool operator==(const regex_iterator& right) const;
1 Returns: true if *this and right are both end-of-sequence iterators or if the following conditions all
hold:
(1.1)  — begin == right.begin,
(1.2)  — end == right.end,
(1.3)  — pregex == right.pregex,
(1.4)  — flags == right.flags, and
(1.5)  — match[0] == right.match[0];
otherwise false.

bool operator!=(const regex_iterator& right) const;
2 Returns: !(this == right).
29.12.1.3 Indirection

const value_type& operator*() const;
Returns: match.

const value_type* operator->() const;
Returns: &match.

29.12.1.4 Increment

regex_iterator& operator++();
Effects: Constructs a local variable start of type BidirectionalIterator and initializes it with the value of match[0].second.
If the iterator holds a zero-length match and start == end the operator sets *this to the end-of-sequence iterator and returns *this.
Otherwise, if the iterator holds a zero-length match, the operator calls:

regex_search(start, end, match, *pregex,
flags | regex_constants::match_not_null | regex_constants::match_continuous)
If the call returns true the operator returns *this. Otherwise the operator increments start and continues as if the most recent match was not a zero-length match.
If the most recent match was not a zero-length match, the operator sets flags to flags | regex_constants::match_prev_avail and calls regex_search(start, end, match, *pregex, flags).
If the call returns false the iterator sets *this to the end-of-sequence iterator. The iterator then returns *this.
In all cases in which the call to regex_search returns true, match.prefix().first shall be equal to the previous value of match[0].second, and for each index i in the half-open range [0, match.size()) for which match[i].matched is true, match.position(i) shall return distance(begin, match[i].first).

[Note: This means that match.position(i) gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to regex_search. — end note]

It is unspecified how the implementation makes these adjustments.
[Note: This means that a compiler may call an implementation-specific search function, in which case a program-defined specialization of regex_search will not be called. — end note]

regex_iterator operator++(int);  
Effects: As if by:

regex_iterator tmp = *this;
++(*this);
return tmp;

29.12.2 Class template regex_token_iterator

The class template regex_token_iterator is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a sub_match class template instance that represents what matched a particular sub-expression within the regular expression.

When class regex_token_iterator is used to enumerate a single sub-expression with index -1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.

After it is constructed, the iterator finds and stores a value regex_iterator<BidirectionalIterator> position and sets the internal count N to zero. It also maintains a sequence subs which contains a list of the sub-expressions which will be enumerated. Every time operator++ is used the count N is incremented; if N exceeds or equals subs.size(), then the iterator increments member position and sets count N to zero.
4 If the end of sequence is reached (position is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index -1, in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.

5 The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-sequence iterator is not defined. For any other iterator value a const sub_match<BidirectionalIterator>& is returned. The result of operator-> on an end-of-sequence iterator is not defined. For any other iterator value a const sub_match<BidirectionalIterator>* is returned.

6 It is impossible to store things into regex_token_iterators. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

namespace std {
    template<class BidirectionalIterator, class charT = typename iterator_traits<BidirectionalIterator>::value_type, class traits = regex_traits<charT>>
    class regex_token_iterator {
public:
    using regex_type = basic_regex<charT, traits>;
    using iterator_category = forward_iterator_tag;
    using value_type = sub_match<BidirectionalIterator>;
    using difference_type = ptrdiff_t;
    using pointer = const value_type*;
    using reference = const value_type&;
    regex_token_iterator();
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re, int submatch = 0,
        regex_constants::match_flag_type m =
            regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        const vector<int>& submatches,
        regex_constants::match_flag_type m =
            regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        initializer_list<int> submatches,
        regex_constants::match_flag_type m =
            regex_constants::match_default);
    template<size_t N>
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        const int (&submatches)[N],
        regex_constants::match_flag_type m =
            regex_constants::match_default);
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        int submatch = 0,
        regex_constants::match_flag_type m =
            regex_constants::match_default) = delete;
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        const vector<int>& submatches,
        regex_constants::match_flag_type m =
            regex_constants::match_default) = delete;
    regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
        const regex_type& re,
        initializer_list<int> submatches,
        regex_constants::match_flag_type m =
7 A suffix iterator is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is true, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.

8 [Note: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence — end note]

9 The current match is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N].`

### 29.12.2.1 Constructors

**`regex_token_iterator()`**

*Effects:* Constructs the end-of-sequence iterator.

**`regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, const int (&submatches)[N], regex_constants::match_flag_type m = regex_constants::match_default)`**

**Requires:** Each of the initialization values of `submatches` shall be >= -1.
Effects: The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[begin(submatches), end(submatches))].

Each constructor then sets $N$ to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to -1 the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

**29.12.2.2 Comparisons**

```cpp
bool operator==(const regex_token_iterator& right) const;
```

Returns: true if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns false if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if `position == right.position`, $N == right.N$, and `subs == right.subs`. Otherwise returns false.

```cpp
bool operator!=(const regex_token_iterator& right) const;
```

Returns: `!(*this == right)`.

**29.12.2.3 Indirection**

```cpp
const value_type& operator*() const;
```

Returns: `*result`.

```cpp
const value_type* operator->() const;
```

Returns: `result`.

**29.12.2.4 Increment**

```cpp
regex_token_iterator& operator++();
```

Effects: Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.

If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.

Otherwise, if $N + 1 < subs.size()$, increments $N$ and sets `result` to the address of the current match.

Otherwise, sets $N$ to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.

Otherwise, if any of the values stored in `subs` is equal to -1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range `[prev->suffix().first, prev->suffix().second)`. Otherwise, sets `*this` to an end-of-sequence iterator.

Returns: `*this`

```cpp
regex_token_iterator& operator++(int);
```

Effects: Constructs a copy `tmp` of `*this`, then calls `++(*this)`.

Returns: `tmp`.

**29.13 Modified ECMAScript regular expression grammar**

The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

The following productions within the ECMAScript grammar are modified as follows:
ClassAtom ::
-  ClassAtomNoDash
-  ClassAtomExClass
-  ClassAtomCollatingElement
-  ClassAtomEquivalence

IdentityEscape ::
  SourceCharacter but not c

The following new productions are then added:

ClassAtomExClass ::
  [: ClassName :]

ClassAtomCollatingElement ::
  [. ClassName .]

ClassAtomEquivalence ::
  [= ClassName =]

ClassName ::
  ClassNameCharacter
  ClassNameCharacter ClassName

ClassNameCharacter ::
  SourceCharacter but not one of "." ":" ";"

The productions ClassAtomExClass, ClassAtomCollatingElement and ClassAtomEquivalence provide functionality equivalent to that of the same features in regular expressions in POSIX.

The regular expression grammar may be modified by any regex_constants::syntax_option_type flags specified when constructing an object of type specialization of basic_regex according to the rules in Table 124.

A ClassName production, when used in ClassAtomExClass, is not valid if traits_inst.lookup_classname returns zero for that name. The names recognized as valid ClassNames are determined by the type of the traits class, but at least the following names shall be recognized: alnum, alpha, blank, cntrl, digit, graph, lower, print, punct, space, upper, xdigit, d, s, w. In addition the following expressions shall be equivalent:
\d and \[:digit:]
\D and \[^[:digit:]]
\s and \[:space:]
\S and \[^[:space:]]
\w and \:[alnum:]
\W and \[^alnum:]

A ClassName production when used in a ClassAtomCollatingElement production is not valid if the value returned by traits_inst.lookup_collatename for that name is an empty string.

The results from multiple calls to traits_inst.lookup_classname can be bitwise OR’ed together and subsequently passed to traits_inst.isctype.

A ClassName production when used in a ClassAtomEquivalence production is not valid if the value returned by traits_inst.lookup_collatename for that name is an empty string or if the value returned by traits_inst.transform_primary for the result of the call to traits_inst.lookup_collatename is an empty string.

When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type regex_error.
If the CV of a UnicodeEscapeSequence is greater than the largest value that can be held in an object of type charT the translator shall throw an exception object of type regex_error. [Note: This means that values of the form "uxxxx" that do not fit in a character are invalid. — end note]

Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling traits_inst.value.

The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any match_flag_type flags (29.5.2) specified when using the regular expression object in one of the regular expression algorithms (29.11). The behavior is also localized by interaction with the traits class template parameter as follows:

12. During matching of a regular expression finite state machine against a sequence of characters, two characters c and d are compared using the following rules:

12.1. If (flags() & regex_constants::icase) the two characters are equal if traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d);
12.1.2. Otherwise, if flags() & regex_constants::collate the two characters are equal if traits_inst.translate(c) == traits_inst.translate(d);
12.1.3. Otherwise, the two characters are equal if c == d.

12.2. During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range c1-c2 against a character c is conducted as follows: if flags() & regex_constants::collate is false then the character c is matched if c1 <= c && c <= c2, otherwise c is matched in accordance with the following algorithm:

```c++
string_type str1 = string_type(1, flags() & icase ? traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1, flags() & icase ? traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1, flags() & icase ? traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end()) <= traits_inst.transform(str.begin(), str.end())
&& traits_inst.transform(str.begin(), str.end()) <= traits_inst.transform(str2.begin(), str2.end());
```

12.3. During matching of a regular expression finite state machine against a sequence of characters, testing whether a collating element is a member of a primary equivalence class is conducted by first converting the collating element and the equivalence class to sort keys using traits::transform_primary, and then comparing the sort keys for equality.

12.4. During matching of a regular expression finite state machine against a sequence of characters, a character c is a member of a character class designated by an iterator range [first, last) if traits_inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase)) is true.

30 Atomic operations library [atomics]

30.1 General [atomics.general]

This Clause describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

The following subclauses describe atomics requirements and components for types and operations, as summarized below.

}
30.3 Type aliases

The type aliases `atomic_int_N_t, atomic_uint_N_t, atomic_intptr_t, and atomicuintptr_t` are defined if and only if `int_N_t, uint_N_t, intptr_t, and uintptr_t` are defined, respectively.

30.4 Order and consistency

```cpp
namespace std {
    enum class memory_order : unspecified {
        relaxed, consume, acquire, release, acq_rel, seq_cst
    };
    inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;
    inline constexpr memory_order memory_order_consume = memory_order::consume;
    inline constexpr memory_order memory_order_acquire = memory_order::acquire;
    inline constexpr memory_order memory_order_release = memory_order::release;
    inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;
    inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;
}
```

1 The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.8.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

(1.1) — `memory_order::relaxed`: no operation orders memory.
(1.2) — `memory_order::release, memory_order::acq_rel, and memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
(1.3) — `memory_order::consume`: a load operation performs a consume operation on the affected memory location. [Note: Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration. — end note]
(1.4) — `memory_order::acquire, memory_order::acq_rel, and memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[Note: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — end note]

2 An atomic operation `A` that performs a release operation on an atomic object `M` synchronizes with an atomic operation `B` that performs an acquire operation on `M` and takes its value from any side effect in the release sequence headed by `A`.

3 An atomic operation `A` on some atomic object `M` is coherence-ordered before another atomic operation `B` on `M` if

(3.1) — `A` is a modification, and `B` reads the value stored by `A`, or
(3.2) — `A` precedes `B` in the modification order of `M`, or
(3.3) — `A` and `B` are not the same atomic read-modify-write operation, and there exists an atomic modification `X` of `M` such that `A` reads the value stored by `X` and `X` precedes `B` in the modification order of `M`, or
(3.4) — there exists an atomic modification `X` of `M` such that `A` is coherence-ordered before `X` and `X` is coherence-ordered before `B`.

4 There is a single total order `S` on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if `A` and `B` are `memory_order::seq_cst` operations and `A` strongly happens before `B`, then `A` precedes `B` in `S`. Second, for every pair of atomic operations `A` and `B` on an object `M`, where `A` is coherence-ordered before `B`, the following four conditions are required to be satisfied by `S`:

(4.1) — if `A` and `B` are both `memory_order::seq_cst` operations, then `A` precedes `B` in `S`; and
(4.2) — if `A` is a `memory_order::seq_cst` operation and `B` happens before a `memory_order::seq_cst` fence `Y`, then `A` precedes `Y` in `S`; and
(4.3) — if a `memory_order::seq_cst` fence `X` happens before `A` and `B` is a `memory_order::seq_cst` operation, then `X` precedes `B` in `S`; and
(4.4) — if a `memory_order::seq_cst` fence `X` happens before `A` and `B` happens before a `memory_order::seq_cst` fence `Y`, then `X` precedes `Y` in `S`. 

§ 30.4
[Note: This definition ensures that \( S \) is consistent with the modification order of any atomic object \( M \). It also ensures that a `memory_order::seq_cst` load \( A \) of \( M \) gets its value either from the last modification of \( M \) that precedes \( A \) in \( S \) or from some non-`memory_order::seq_cst` modification of \( M \) that does not happen before any modification of \( M \) that precedes \( A \) in \( S \). — end note]

[Note: We do not require that \( S \) be consistent with “happens before” (6.8.2.1). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — end note]

[Note: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — end note]

Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[Note: For example, with \( x \) and \( y \) initially zero,

```c
// Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);
// Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);
```

should not produce \( r1 == r2 == 42 \), since the store of 42 to \( y \) is only possible if the store to \( x \) stores 42, which circularly depends on the store to \( y \) storing 42. Note that without this restriction, such an execution is possible. — end note]

[Note: The recommendation similarly disallows \( r1 == r2 == 42 \) in the following example, with \( x \) and \( y \) again initially zero:

```c
// Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);
// Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
— end note]
```

Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```c
template<class T>
T kill_dependency(T y) noexcept;
```

**Effects:** The argument does not carry a dependency to the return value (6.8.2).

**Returns:** \( y \).

### 30.5 Lock-free property

```c
#define ATOMIC_BOOL_LOCK_FREE unspecified
#define ATOMIC_CHAR_LOCK_FREE unspecified
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified
#define ATOMIC_SHORT_LOCK_FREE unspecified
#define ATOMIC_INT_LOCK_FREE unspecified
#define ATOMIC_LONG_LOCK_FREE unspecified
#define ATOMIC_LLONG_LOCK_FREE unspecified
#define ATOMIC_POINTER_LOCK_FREE unspecified
```

The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial)
specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

The function `atomic_is_lock_free` (30.7.1) indicates whether the object is lock-free. In any given program execution, the result of the lock-free query shall be consistent for all pointers of the same type.

Atomic operations that are not lock-free are considered to potentially block (6.8.2.2).

[Note: Operations that are lock-free should also be address-free. That is, atomic operations on the same memory location via two different addresses will communicate atomically. The implementation should not depend on any per-process state. This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — end note]

### 30.6 Class template `atomic_ref`

```cpp
namespace std {
    template<class T> struct atomic_ref {
        private:
            T* ptr; // exposition only
        public:
            using value_type = T;
            static constexpr bool is_always_lock_free = implementation-defined;
            static constexpr size_t required_alignment = implementation-defined;

            atomic_ref& operator=(const atomic_ref&) = delete;
            explicit atomic_ref(T&); // exposition only
            atomic_ref(const atomic_ref&) noexcept;
            T operator=(T) const noexcept;
            operator T() const noexcept;
            bool is_lock_free() const noexcept;
            void store(T, memory_order = memory_order_seq_cst) const noexcept;
            T load(memory_order = memory_order_seq_cst) const noexcept;
            T exchange(T, memory_order = memory_order_seq_cst) const noexcept;
            bool compare_exchange_weak(T&, T, memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T&, T, memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T&, T, memory_order = memory_order_seq_cst) const noexcept;
            bool compare_exchange_strong(T&, T, memory_order = memory_order_seq_cst) const noexcept;
    }
}
```

An `atomic_ref` object applies atomic operations (30.1) to the object referenced by `*ptr` such that, for the lifetime (6.6.3) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.8.2.1).

The template argument for `T` shall be trivially copyable (6.7).

The lifetime (6.6.3) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_ref`s that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.

Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object. [Note: Atomic operations or the `atomic_ref` constructor could acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — end note]

### 30.6.1 Operations

```cpp
static constexpr bool is_always_lock_free;
```

The static data member `is_always_lock_free` is `true` if the `atomic_ref` type’s operations are always lock-free, and `false` otherwise.
static constexpr size_t required_alignment;

The alignment required for an object to be referenced by an atomic reference, which is at least `alignof(T)`.

[Note: Hardware could require an object referenced by an `atomic_ref` to have stricter alignment (6.6.5) than other objects of type T. Further, whether operations on an `atomic_ref` are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on `std::complex<double>` could be supported only if aligned to `2*alignof(double)`. — end note]

`atomic_ref(T& obj);`

Requires: The referenced object shall be aligned to `required_alignment`.
Effects: Constructs an atomic reference that references the object.
Throws: Nothing.

`atomic_ref(const atomic_ref& ref) noexcept;`

Effects: Constructs an atomic reference that references the object referenced by `ref`.

`T operator=(T desired) const noexcept;`

Effects: Equivalent to:
```
store(desired);
return desired;
```

`operator T() const noexcept;`

Effects: Equivalent to: `return load();`

`bool is_lock_free() const noexcept;`

Returns: `true` if the object’s operations are lock-free, `false` otherwise.

`void store(T desired, memory_order order = memory_order_seq_cst) const noexcept;`

Requires: The `order` argument shall not be `memory_order_consume`, `memory_order_acquire`, nor `memory_order_acq_rel`.
Effects: Atomically replaces the value referenced by `*ptr` with the value of `desired`. Memory is affected according to the value of `order`.

`T load(memory_order order = memory_order_seq_cst) const noexcept;`

Requires: The `order` argument shall not be `memory_order_release` nor `memory_order_acq_rel`.
Effects: Memory is affected according to the value of `order`.
Returns: Atomically returns the value referenced by `*ptr`.

`T exchange(T desired, memory_order order = memory_order_seq_cst) const noexcept;`

Effects: Atomically replaces the value referenced by `*ptr` with `desired`. Memory is affected according to the value of `order`. This operation is an atomic read-modify-write operation (6.8.2).
Returns: Atomically returns the value referenced by `*ptr` immediately before the effects.

`bool compare_exchange_weak(T& expected, T desired, memory_order success, memory_order failure) const noexcept;`

`bool compare_exchange_strong(T& expected, T desired, memory_order success, memory_order failure) const noexcept;`

`bool compare_exchange_weak(T& expected, T desired, memory_order order = memory_order_seq_cst) const noexcept;`

`bool compare_exchange_strong(T& expected, T desired, memory_order order = memory_order_seq_cst) const noexcept;`

Requires: The `failure` argument shall not be `memory_order_release` nor `memory_order_acq_rel`. 

§ 30.6.1 1455
**Effects:** Retrieves the value in `expected`. It then atomically compares the value representation of the value referenced by `*ptr` for equality with that previously retrieved from `expected`, and if `true`, replaces the value referenced by `*ptr` with that in `desired`. If and only if the comparison is `true`, memory is affected according to the value of `success`, and if the comparison is `false`, memory is affected according to the value of `failure`. When only one `memory_order` argument is supplied, the value of `success` is `order`, and the value of `failure` is `order` except that a value of `memory_order_acq_rel` shall be replaced by the value `memory_order_acquire` and a value of `memory_order_release` shall be replaced by the value `memory_order_relaxed`. If and only if the comparison is `false` then, after the atomic operation, the value in `expected` is replaced by the value read from the value referenced by `*ptr` during the atomic comparison. If the operation returns `true`, these operations are atomic read-modify-write operations (6.8.2.1) on the value referenced by `*ptr`. Otherwise, these operations are atomic load operations on that memory.

**Returns:** The result of the comparison.

**Remarks:** A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by `expected` and `ptr` are equal, it may return `false` and store back to `expected` the same memory contents that were originally there. [Note: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. —end note]

### 30.6.2 Specializations for integral types [atomics.ref.int]

There are specializations of the `atomic_ref` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `signed int`, `long`, `unsigned long`, `long long`, `unsigned long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>`. For each such type `integral`, the specialization `atomic_ref<integral>` provides additional atomic operations appropriate to integral types. [Note: For the specialization `atomic_ref<bool>`, see 30.6. —end note]

```cpp
namespace std {
    template<> struct atomic_ref<integral> {
        private:
            integral* ptr;  // exposition only

        public:
            using value_type = integral;
            using difference_type = value_type;
            static constexpr bool is_always_lock_free = implementation-defined;
            static constexpr size_t required_alignment = implementation-defined;

            atomic_ref& operator=(const atomic_ref&) = delete;
            explicit atomic_ref(integral&);  
            atomic_ref(const atomic_ref&) noexcept;
            integral operator=(integral) const noexcept;
            operator integral() const noexcept;

            bool is_lock_free() const noexcept;  
            void store(integral, memory_order = memory_order_seq_cst) const noexcept;
            integral load(memory_order = memory_order_seq_cst) const noexcept;
            integral exchange(integral,
                memory_order = memory_order_seq_cst) const noexcept;

            bool compare_exchange_weak(integral&, integral,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(integral&, integral,
                memory_order, memory_order) const noexcept;

            bool compare_exchange_weak(integral&, integral,
                memory_order = memory_order_seq_cst) const noexcept;
            bool compare_exchange_strong(integral&, integral,
                memory_order = memory_order_seq_cst) const noexcept;
    }
}
```

§ 30.6.2 1456
The following operations perform arithmetic computations. The key, operator, and computation correspondence is identified in Table 132.

integral fetch_key(inTEGRAL operand, memory_order order = memory_order_seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.8.2.1).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type. [Note: There are no undefined results arising from the computation. —end note]

integral operator op=(integral operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

30.6.3 Specializations for floating-point types [atomics.ref.float]

There are specializations of the atomic_ref class template for the floating-point types float, double, and long double. For each such type floating-point, the specialization atomic_ref<floating-point> provides additional atomic operations appropriate to floating-point types.

namespace std {
    template<> struct atomic_ref<floating-point> {  
        private:
            floating-point* ptr; // exposition only
        public:
            using value_type = floating-point;
            using difference_type = value_type;
            static constexpr bool is_always_lock_free = implementation-defined;
            static constexpr size_t required_alignment = implementation-defined;

            atomic_ref& operator=(const atomic_ref&) = delete;
        
            explicit atomic_ref(floating-point);
            atomic_ref(const atomic_ref&) noexcept;

            floating-point operator=(floating-point) noexcept;
            operator floating-point() const noexcept;
    };
}
bool is_lock_free() const noexcept;
void store(floating-point, memory_order = memory_order_seq_cst) const noexcept;
floating-point load(memory_order = memory_order_seq_cst) const noexcept;
floating-point exchange(floating-point,
    memory_order = memory_order_seq_cst) const noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order, memory_order) const noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order, memory_order) const noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order, memory_order) const noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order = memory_order_seq_cst) const noexcept;

floating-point fetch_add(floating-point,
    memory_order = memory_order_seq_cst) const noexcept;
floating-point fetch_sub(floating-point,
    memory_order = memory_order_seq_cst) const noexcept;

floating-point operator+=(floating-point) const noexcept;
floating-point operator-=(floating-point) const noexcept;
};

2 Descriptions are provided below only for members that differ from the primary template.
3 The following operations perform arithmetic computations. The key, operator, and computation correspondence are identified in Table 132.

floating-point fetch_key(floating-point operand,
    memory_order order = memory_order_seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.8.2.1).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric_limits<floating-point> traits associated with the floating-point type (16.3.2). The floating-point environment (25.3) for atomic arithmetic operations on floating-point may be different than the calling thread's floating-point environment.

floating-point operator op=(floating-point operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

30.6.4 Partial specialization for pointers [atomics.ref.pointer]

namespace std {

    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr;          // exposition only
        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr bool is_always_lock_free = implementation-defined;
            static constexpr size_t required_alignment = implementation-defined;

            atomic_ref& operator=(const atomic_ref&) = delete;

            explicit atomic_ref(T*);         // exposition only
            atomic_ref(T*&) noexcept;

            T* operator=(T*) const noexcept;
            operator T*() const noexcept;
    };

§ 30.6.4
bool is_lock_free() const noexcept;
void store(T*, memory_order = memory_order_seq_cst) const noexcept;
T* load(memory_order = memory_order_seq_cst) const noexcept;
T* exchange(T*, memory_order = memory_order_seq_cst) const noexcept;
bool compare_exchange_weak(T*& T, memory_order, memory_order) const noexcept;
bool compare_exchange_strong(T*& T, memory_order, memory_order) const noexcept;
bool compare_exchange_weak(T*& T, memory_order = memory_order_seq_cst) const noexcept;
bool compare_exchange_strong(T*& T, memory_order = memory_order_seq_cst) const noexcept;
T* fetch_add(difference_type, memory_order = memory_order_seq_cst) const noexcept;
T* fetch_sub(difference_type, memory_order = memory_order_seq_cst) const noexcept;
T* operator++(int) const noexcept;
T* operator--(int) const noexcept;
T* operator++() const noexcept;
T* operator--() const noexcept;
T* operator+=(difference_type) const noexcept;
T* operator-=(difference_type) const noexcept;
};

1 Descriptions are provided below only for members that differ from the primary template.
2 The following operations perform arithmetic computations. The key, operator, and computation correspondence is identified in Table 133.

T* fetch_key(difference_type operand, memory_order order = memory_order_seq_cst) const noexcept;

3 Requires: T shall be an object type, otherwise the program is ill-formed.
4 Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.8.2.1).
5 Returns: Atomically, the value referenced by *ptr immediately before the effects.
6 Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(difference_type operand) const noexcept;
7 Effects: Equivalent to: return fetch_key(operand) op operand;

30.6.5 Member operators common to integers and pointers to objects
[atomics.ref.memop]

T* operator++(int) const noexcept;
1 Effects: Equivalent to: return fetch_add(1);

T* operator--(int) const noexcept;
2 Effects: Equivalent to: return fetch_sub(1);

T* operator++() const noexcept;
3 Effects: Equivalent to: return fetch_add(1) + 1;

T* operator--(int) const noexcept;
4 Effects: Equivalent to: return fetch_sub(1) - 1;

30.7 Class template atomic
[atomics.types.generic]

namespace std {
    template<class T> struct atomic {
        using value_type = T;
static constexpr bool is_always_lock_free = implementation-defined;
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;
void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
void store(T, memory_order = memory_order::seq_cst) noexcept;
T load(memory_order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order = memory_order::seq_cst) const noexcept;
operator T() const volatile noexcept;
operator T() const noexcept;
T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
T exchange(T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

atomic() noexcept = default;
constexpr atomic(T) noexcept;
atomic(const atomic&) = delete;
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;
T operator=(T) volatile noexcept;
T operator=(T) noexcept;

1 The template argument for T shall be trivially copyable (6.7). [Note: Type arguments that are not also statically initializable may be difficult to use. — end note]

2 The specialization atomic<bool> is a standard-layout struct.

3 [Note: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]

30.7.1 Operations on atomic types [atomics.types.operations]

1 [Note: Many operations are volatile-qualified. The “volatile as device register” semantics have not changed in the standard. This qualification means that volatility is preserved when applying these operations to volatile objects. It does not mean that operations on non-volatile objects become volatile. — end note]

atomic() noexcept = default;

2 Effects: Leaves the atomic object in an uninitialized state. [Note: These semantics ensure compatibility with C. — end note]

constexpr atomic(T desired) noexcept;

3 Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.8.2). [Note: It is possible to have an access to an atomic object A race with its construction, for example by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

#define ATOMIC_VAR_INIT(value) see below

4 The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with value. [Note: This operation may need to initialize locks. — end note] Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race. [Example:
   atomic<int> v = ATOMIC_VAR_INIT(5);
   — end example]
static constexpr bool is_always_lock_free = implementation-defined;

The static data member is_always_lock_free is true if the atomic type’s operations are always
lock-free, and false otherwise. [Note: The value of is_always_lock_free is consistent with the value
of the corresponding ATOMIC_..._LOCK_FREE macro, if defined. — end note]

bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;

Returns: true if the object’s operations are lock-free, false otherwise. [Note: The return value of the
is_lock_free member function is consistent with the value of is_always_lock_free for the same
type. — end note]

void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcept;

Requires: The order argument shall not be memory_order::consume, memory_order::acquire, nor
memory_order::acq_rel.

Effects: Atomically replaces the value pointed to by this with the value of desired. Memory is
affected according to the value of order.

T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;

Effects: Equivalent to store(desired).

Returns: desired.

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;

Requires: The order argument shall not be memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns the value pointed to by this.

operator T() const volatile noexcept;
operator T() const noexcept;

Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces the value pointed to by this with desired. Memory is affected according
to the value of order. These operations are atomic read-modify-write operations (6.8.2).

Returns: Atomically returns the value pointed to by this immediately before the effects.

bool compare_exchange_weak(T& expected, T desired,
memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order order = memory_order::seq_cst) noexcept;

Requires: The failure argument shall not be memory_order::release nor memory_order::acq_rel.

Effects: Retrieves the value in expected. It then atomically compares the value representation of
the value pointed to by this for equality with that previously retrieved from expected, and if true,
replaces the value pointed to by this with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value pointed to by this during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.8.2) on the memory pointed to by this. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

[Note: For example, the effect of compare_exchange_strong on objects without padding bits (6.7) is]

```c
if (memcmp(this, &expected, sizeof(*this)) == 0)
   memcpy(this, &desired, sizeof(*this));
else
   memcpy(expected, this, sizeof(*this));
```

—end note] [Example: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update expected when another iteration of the loop is needed.

```c
expected = current.load();
do {
   desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
```

—end example] [Example: Because the expected value is updated only on failure, code releasing the memory containing the expected value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:

```c
do {
   p->next = head; // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert
```

—end example]

Implementations should ensure that weak compare-and-exchange operations do not consistently return false unless either the atomic object has value different from expected or there are concurrent modifications to the atomic object.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and this are equal, it may return false and store back to expected the same memory contents that were originally there. [Note: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

[Note: Under cases where the memcpy and memcmp semantics of the compare-and-exchange operations apply, the outcome might be failed comparisons for values that compare equal with operator== if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point -0.0 and +0.0 will not compare equal with memcmp but will compare equal with operator==, and NaNs with the same payload will compare equal with memcmp but will not compare equal with operator==. — end note] [Note: Because compare-and-exchange acts on an object’s value representation, padding bits that never participate in the object’s value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:

```c
struct padded {
   char clank = 0x42; // Padding here.
   unsigned biff = 0xC0DEFEFE;
};
atomic<padded> pad = ATOMIC_VAR_INIT({});
```
bool zap() {
    padded expected, desired{0, 0};
    return pad.compare_exchange_strong(expected, desired);
}
— end note] [Note: For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

union pony {
    double celestia = 0.;
    short luna; // padded
};
atomic<pony> princesses = ATOMIC_VAR_INIT({});

bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
}
— end note]

30.7.2 Specializations for integers [atomics.types.int]

There are specializations of the atomic class template for the integral types char, signed char, short, unsigned short, int, unsigned int, long, unsigned long, long long, unsigned long long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header <cstdint>. For each such type integral, the specialization atomic<integral> provides additional atomic operations appropriate to integral types. [Note: For the specialization atomic<bool>, see 30.7. — end note]

namespace std {
    template<> struct atomic<integral> {
        using value_type = integral;
        using difference_type = value_type;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
        void store(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(integral, memory_order = memory_order::seq_cst) noexcept;
        integral load(memory_order = memory_order::seq_cst) const volatile noexcept;
        integral load(memory_order = memory_order::seq_cst) const noexcept;
        operator integral() const volatile noexcept;
        operator integral() const noexcept;
        integral exchange(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral exchange(integral, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(integral&, integral,
                                    memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(integral&, integral,
                                    memory_order, memory_order) noexcept;
        bool compare_exchange_strong(integral&, integral,
                                       memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(integral&, integral,
                                       memory_order, memory_order) noexcept;
        bool compare_exchange_weak(integral&, integral,
                                    memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(integral&, integral,
                                    memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(integral&, integral,
                                       memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(integral&, integral,
                                       memory_order = memory_order::seq_cst) noexcept;
        integral fetch_add(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_add(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_sub(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_sub(integral, memory_order = memory_order::seq_cst) noexcept;
    }

§ 30.7.2 1463
integral fetch_and(integral, memory_order = memory_order::seq_cst) volatile noexcept;
integral fetch_and(integral, memory_order = memory_order::seq_cst) noexcept;
integral fetch_or(integral, memory_order = memory_order::seq_cst) volatile noexcept;
integral fetch_or(integral, memory_order = memory_order::seq_cst) noexcept;
integral fetch_xor(integral, memory_order = memory_order::seq_cst) volatile noexcept;
integral fetch_xor(integral, memory_order = memory_order::seq_cst) noexcept;

atomic() noexcept = default;
constexpr atomic(integral) noexcept;
atomic(const atomic&) = delete;
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;

integral operator=(int) volatile noexcept;
integral operator=(int) noexcept;
integral operator++(int) volatile noexcept;
integral operator++(int) noexcept;
integral operator--(int) volatile noexcept;
integral operator--(int) noexcept;
integral operator++() volatile noexcept;
integral operator++() noexcept;
integral operator--() volatile noexcept;
integral operator--() noexcept;

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces the value pointed to by \texttt{this} with the result of the computation applied to the value pointed to by \texttt{this} and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.8.2).

Returns: Atomically, the value pointed to by \texttt{this} immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type. \cite{Note: There are no undefined results arising from the computation.}
T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

30.7.3 Specializations for floating-point types
[atomics.types.float]

There are specializations of the atomic class template for the floating-point types float, double, and long double. For each such type floating-point, the specialization atomic<floating-point> provides additional atomic operations appropriate to floating-point types.

namespace std {
    template<> struct atomic<floating-point> {
        using value_type = floating-point;
        using difference_type = value_type;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
        void store(floating-point, memory_order = memory_order_seq_cst) volatile noexcept;
        void store(floating-point, memory_order = memory_order_seq_cst) noexcept;
        floating-point load(memory_order = memory_order_seq_cst) volatile noexcept;
        floating-point load(memory_order = memory_order_seq_cst) noexcept;
        operator floating-point() volatile noexcept;
        operator floating-point() noexcept;
        floating-point exchange(floating-point, 
            memory_order = memory_order_seq_cst) volatile noexcept;
        floating-point exchange(floating-point, 
            memory_order = memory_order_seq_cst) noexcept;
        bool compare_exchange_weak(floating-point&, floating-point, 
            memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(floating-point&, floating-point, 
            memory_order, memory_order) noexcept;
        bool compare_exchange_strong(floating-point&, floating-point, 
            memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(floating-point&, floating-point, 
            memory_order, memory_order) noexcept;
        bool compare_exchange_weak(floating-point&, floating-point, 
            memory_order = memory_order_seq_cst) volatile noexcept;
        bool compare_exchange_weak(floating-point&, floating-point, 
            memory_order = memory_order_seq_cst) noexcept;
        bool compare_exchange_strong(floating-point&, floating-point, 
            memory_order = memory_order_seq_cst) volatile noexcept;
        bool compare_exchange_strong(floating-point&, floating-point, 
            memory_order = memory_order_seq_cst) noexcept;
        floating-point fetch_add(floating-point, 
            memory_order = memory_order_seq_cst) volatile noexcept;
        floating-point fetch_add(floating-point, 
            memory_order = memory_order_seq_cst) noexcept;
        floating-point fetch_sub(floating-point, 
            memory_order = memory_order_seq_cst) volatile noexcept;
        floating-point fetch_sub(floating-point, 
            memory_order = memory_order_seq_cst) noexcept;
        atomic() noexcept = default;
        constexpr atomic(floating-point) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
        floating-point operator=(floating-point) volatile noexcept;
        floating-point operator=(floating-point) noexcept;
    }
}

§ 30.7.3
The atomic floating-point specializations are standard-layout structs. They each have a trivial default constructor and a trivial destructor.

Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic addition and subtraction computations. The key, operator, and computation correspondence are identified in Table 132.

T A::fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;

**Effects:** Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.8.2).

**Returns:** Atomically, the value pointed to by this immediately before the effects.

**Remarks:** If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric_limits-floating-point traits associated with the floating-point type (16.3.2). The floating-point environment (25.3) for atomic arithmetic operations on floating-point may be different than the calling thread’s floating-point environment.

T operator op=(T operand) volatile noexcept;

**Effects:** Equivalent to: return fetch_key(operand) op operand;

**Remarks:** If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric_limits-floating-point traits associated with the floating-point type (16.3.2). The floating-point environment (25.3) for atomic arithmetic operations on floating-point may be different than the calling thread’s floating-point environment.

### 30.7.4 Partial specialization for pointers

namespace std {
    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
        void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(T*, memory_order = memory_order::seq_cst) noexcept;
        T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T* load(memory_order = memory_order::seq_cst) const noexcept;
        operator T*() const volatile noexcept;
        operator T*() const noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(T*& T*, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(T*& T*, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(T*& T*, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(T*& T*, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_weak(T*& T*, T*, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(T*& T*, T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(T*& T*, T*, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(T*& T*, T*, memory_order = memory_order::seq_cst) noexcept;
        T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
    };
}
T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;

atomic() noexcept = default;
constexpr atomic(T*) noexcept;
atomic(const atomic&) = delete;
atomic& operator=(const atomic&) = delete;
atomic& operator=(const atomic&) volatile = delete;
T* operator=(T*) volatile noexcept;
T* operator=(T*) noexcept;
T* operator++(int) volatile noexcept;
T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
T* operator++() volatile noexcept;
T* operator++() noexcept;
T* operator--() volatile noexcept;
T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
T* operator-=(ptrdiff_t) noexcept;

1 There is a partial specialization of the atomic class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial default constructor and a trivial destructor.
2 Descriptions are provided below only for members that differ from the primary template.
3 The following operations perform pointer arithmetic. The key, operator, and computation correspondence is:

T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;

4 Requires: T shall be an object type, otherwise the program is ill-formed. [Note: Pointer arithmetic on void* or function pointers is ill-formed. —end note]
5 Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.8.2).
6 Returns: Atomically, the value pointed to by this immediately before the effects.
7 Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;
8 Effects: Equivalent to: return fetch_key(operand) op operand;

30.7.5 Member operators common to integers and pointers to objects
[atomics.types.memop]
T operator++(int) volatile noexcept;
T operator++(int) noexcept;
1 Effects: Equivalent to: return fetch_add(1);
T operator--(int) volatile noexcept;
T operator--(int) noexcept;

Effects: Equivalent to: return fetch_sub(1);

T operator++() volatile noexcept;
T operator++() noexcept;

Effects: Equivalent to: return fetch_add(1) + 1;

T operator--() volatile noexcept;
T operator--() noexcept;

Effects: Equivalent to: return fetch_sub(1) - 1;

30.8 Non-member functions

A non-member function template whose name matches the pattern `atomic_f` or the pattern `atomic_f_-
explicit` invokes the member function `f`, with the value of the first parameter as the object expression and
the values of the remaining parameters (if any) as the arguments of the member function call, in order. An
argument for a parameter of type `atomic<T>::value_type*` is dereferenced when passed to the member
function call. If no such member function exists, the program is ill-formed.

```
template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;

void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

Effects: Non-atomically initializes *object with value desired. This function shall only be applied
to objects that have been default constructed, and then only once. [Note: These semantics ensure
compatibility with C. — end note] [Note: Concurrent access from another thread, even via an atomic
operation, constitutes a data race. — end note]

[Note: The non-member functions enable programmers to write code that can be compiled as either C or
C++, for example in a shared header file. — end note]

30.9 Flag type and operations

```
namespace std {

struct atomic_flag {
    bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
    bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
    void clear(memory_order = memory_order::seq_cst) volatile noexcept;
    void clear(memory_order = memory_order::seq_cst) noexcept;

    atomic_flag() noexcept = default;
    atomic_flag(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) volatile = delete;
};

bool atomic_flag::test_and_set(volatile atomic_flag*) noexcept;
bool atomic_flag::test_and_set(atomic_flag*) noexcept;
bool atomic_flag::test_and_set_explicit(volatile atomic_flag*, memory_order) noexcept;
bool atomic_flag::test_and_set_explicit(atomic_flag*, memory_order) noexcept;
void atomic_flag::clear(volatile atomic_flag*) noexcept;
void atomic_flag::clear(atomic_flag*) noexcept;
void atomic_flag::clear_explicit(volatile atomic_flag*, memory_order) noexcept;
void atomic_flag::clear_explicit(atomic_flag*, memory_order) noexcept;

#define ATOMIC_FLAG_INIT see below

};
```

1 The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear.

2 Operations on an object of type `atomic_flag` shall be lock-free. [Note: Hence the operations should also be
address-free. — end note]

3 The `atomic_flag` type is a standard-layout struct. It has a trivial default constructor and a trivial destructor.
The macro \texttt{ATOMIC\_FLAG\_INIT} shall be defined in such a way that it can be used to initialize an object of type \texttt{atomic\_flag} to the clear state. The macro can be used in the form:

\begin{verbatim}
atomic_flag guard = ATOMIC_FLAG_INIT;
\end{verbatim}

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static. Unless initialized with \texttt{ATOMIC\_FLAG\_INIT}, it is unspecified whether an \texttt{atomic\_flag} object has an initial state of set or clear.

\begin{verbatim}
bool atomic_flag\_test_and_set(volatile atomic\_flag* object) noexcept;
bool atomic_flag\_test_and_set(atomic\_flag* object) noexcept;
bool atomic_flag\_test_and_set\_explicit(volatile atomic\_flag* object, memory\_order order) noexcept;
bool atomic_flag\_test_and_set\_explicit(atomic\_flag* object, memory\_order order) noexcept;
bool atomic\_flag::test\_and\_set(memory\_order order = memory\_order::seq\_cst) volatile noexcept;
bool atomic\_flag::test\_and\_set(memory\_order order = memory\_order::seq\_cst) noexcept;
\end{verbatim}

\textbf{Effects:} Atomically sets the value pointed to by \texttt{object} or by \texttt{this} to \texttt{true}. Memory is affected according to the value of \texttt{order}. These operations are atomic read-modify-write operations (6.8.2).

\begin{verbatim}
void atomic_flag\_clear(volatile atomic\_flag* object) noexcept;
void atomic_flag\_clear(atomic\_flag* object) noexcept;
void atomic_flag\_clear\_explicit(volatile atomic\_flag* object, memory\_order order) noexcept;
void atomic_flag\_clear\_explicit(atomic\_flag* object, memory\_order order) noexcept;
void atomic\_flag::clear(memory\_order order = memory\_order::seq\_cst) volatile noexcept;
void atomic\_flag::clear(memory\_order order = memory\_order::seq\_cst) noexcept;
\end{verbatim}

\textbf{Requires:} The \texttt{order} argument shall not be \texttt{memory\_order::consume}, \texttt{memory\_order::acquire}, nor \texttt{memory\_order::acq\_rel}.

\textbf{Effects:} Atomically sets the value pointed to by \texttt{object} or by \texttt{this} to \texttt{false}. Memory is affected according to the value of \texttt{order}.

\section*{30.10 Fences [atomics.fences]}

This subclause introduces synchronization primitives called \textit{fences}. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an \textit{acquire fence}. A fence with release semantics is called a \textit{release fence}.

A release fence \texttt{A} synchronizes with an acquire fence \texttt{B} if there exist atomic operations \texttt{X} and \texttt{Y}, both operating on some atomic object \texttt{M}, such that \texttt{A} is sequenced before \texttt{X}, \texttt{X} modifies \texttt{M}, \texttt{Y} is sequenced before \texttt{B}, and \texttt{Y} reads the value written by \texttt{X} or a value written by any side effect in the hypothetical release sequence \texttt{X} would head if it were a release operation.

A release fence \texttt{A} synchronizes with an atomic operation \texttt{B} that performs an acquire operation on an atomic object \texttt{M} if there exists an atomic operation \texttt{X} on \texttt{M} such that \texttt{A} is sequenced before \texttt{X}, \texttt{X} modifies \texttt{M}, and \texttt{B} reads the value written by \texttt{X} or a value written by any side effect in the hypothetical release sequence \texttt{X} would head if it were a release operation.

An atomic operation \texttt{A} that is a release operation on an atomic object \texttt{M} synchronizes with an acquire fence \texttt{B} if there exists some atomic operation \texttt{X} on \texttt{M} such that \texttt{X} is sequenced before \texttt{B} and reads the value written by \texttt{A} or a value written by any side effect in the release sequence headed by \texttt{A}.

\begin{verbatim}
extern "C" void atomic\_thread\_fence(memory\_order order) noexcept;
\end{verbatim}

\textbf{Effects:} Depending on the value of \texttt{order}, this operation:

\begin{itemize}
  \item has no effects, if \texttt{order == memory\_order::relaxed};
  \item is an acquire fence, if \texttt{order == memory\_order::acquire} or \texttt{order == memory\_order::consume};
  \item is a release fence, if \texttt{order == memory\_order::release};
  \item is both an acquire fence and a release fence, if \texttt{order == memory\_order::acq\_rel};
  \item is a sequentially consistent acquire and release fence, if \texttt{order == memory\_order::seq\_cst}.
\end{itemize}

\begin{verbatim}
extern "C" void atomic\_signal\_fence(memory\_order order) noexcept;
\end{verbatim}

\textbf{Effects:} Equivalent to \texttt{atomic\_thread\_fence(order)}, except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.
[Note: `atomic_signal_fence` can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with `atomic_thread_fence`, but the hardware fence instructions that `atomic_thread_fence` would have inserted are not emitted. — end note]
31 Thread support library

31.1 General

The following subclauses describe components to create and manage threads (6.8.2), perform mutual exclusion, and communicate conditions and values between threads, as summarized in Table 134.

Table 134 — Thread support library summary

31.2 Requirements

31.2.1 Template parameter names

Throughout this Clause, the names of template parameters are used to express type requirements. If a template parameter is named `Predicate`, `operator()` applied to the template argument shall return a value that is convertible to `bool`. If a template parameter is named `Clock`, the corresponding template argument shall be a type `C` for which `is_clock_v<C>` is `true`; otherwise the program is ill-formed.

31.2.2 Exceptions

Some functions described in this Clause are specified to throw exceptions of type `system_error` (18.5.7). Such exceptions shall be thrown if any of the function’s error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage shall be reported as described in 15.5.5.12.

[Example: Consider a function in this clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (18.5) and an exception of type `system_error` is thrown. —end example]

The `error_code` reported by such an exception’s `code()` member function shall compare equal to one of the conditions specified in the function’s error condition element.

31.2.3 Native handles

Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined. [Note: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — end note]

31.2.4 Timing specifications

Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in Clause 26.

Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration $D_i$. Ideally, this delay would be zero. Further, any contention for processor and memory resources induces a “quality of
management” delay, expressed as duration $D_m$. The delay durations may vary from timeout to timeout, but in all cases shorter is better.

3 The functions whose names end in _for take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a clock to measure time for these functions given a duration argument $D_l$, the real-time duration of the timeout is $D_l + D_l + D_m$. The functions whose names end in _until take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument $C_t$, the clock time point of the return from timeout should be $C_t + D_l + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time $C_a$ during the timeout, the behavior should be as follows:

(4.1) — if $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_l + D_m$, since the timeout is already satisfied. [Note: This specification may result in the total duration of the wait decreasing when measured against a steady clock. — end note]

(4.2) — if $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_l + D_m$. [Note: When the clock is adjusted backwards, this specification may result in the timeout-related exceptions when measured against a steady clock. When the clock is adjusted forwards, this specification may result in the total duration of the wait decreasing when measured against a steady clock. — end note]

An implementation shall return from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between $C_t$ and the time point of the call to the _until function. [Note: Implementations should decrease the duration of the wait when the clock is adjusted forwards. — end note]

5 [Note: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts might not provide useful functionality. — end note]

6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the native resolution.

7 Implementation-provided clocks that are used for these functions shall satisfy the Cpp17TrivialClock requirements (26.3).

8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as timeout-related exceptions. [Note: Instantiations of clock, time point and duration types supplied by the implementation as specified in 26.7 do not throw exceptions. — end note]

31.2.5 Requirements for Cpp17Lockable types

31.2.5.1 In general

An execution agent is an entity such as a thread that may perform work in parallel with other execution agents. [Note: Implementations or users may introduce other kinds of agents such as processes or thread-pool tasks. — end note] The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

[Note: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — end note]

3 The standard library templates unique_lock (31.4.4.3), shared_lock (31.4.4.4), scoped_lock (31.4.4.2), lock_guard (31.4.4.1), lock, try_lock (31.4.5), and condition_variable_any (31.5.4) all operate on user-supplied lockable objects. The Cpp17BasicLockable requirements, the Cpp17Lockable requirements, and the Cpp17TimedLockable requirements list the requirements imposed by these library types in order to acquire or release ownership of a lock by a given execution agent. [Note: The nature of any lock ownership and any synchronization it may entail are not part of these requirements. — end note]

31.2.5.2 Cpp17BasicLockable requirements

A type L meets the Cpp17BasicLockable requirements if the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

329 All implementations for which standard time units are meaningful must necessarily have a steady clock within their hardware implementation.
31.2.5.3 `Cpp17Lockable` requirements

A type `L` meets the `Cpp17Lockable` requirements if it meets the `Cpp17BasicLockable` requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`).

### m.lock()

- **Effects:** Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

### m.unlock()

- **Requires:** The current execution agent shall hold a lock on `m`.
- **Effects:** Releases a lock on `m` held by the current execution agent.
- **Throws:** Nothing.

31.2.5.4 `Cpp17TimedLockable` requirements

A type `L` meets the `Cpp17TimedLockable` requirements if it meets the `Cpp17Lockable` requirements and the following expressions are well-formed and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of an instantiation of `duration` (26.5), and `abs_time` denotes a value of an instantiation of `time_point` (26.6)).

### m.try_lock_for(rel_time)

- **Effects:** Attempts to acquire a lock for the current execution agent within the relative timeout (31.2.4) specified by `rel_time`. The function shall not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
- **Return type:** `bool`.
- **Returns:** `true` if the lock was acquired, `false` otherwise.

### m.try_lock_until(abs_time)

- **Effects:** Attempts to acquire a lock for the current execution agent before the absolute timeout (31.2.4) specified by `abs_time`. The function shall not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.
- **Return type:** `bool`.
- **Returns:** `true` if the lock was acquired, `false` otherwise.

31.2.6 decay_copy

In several places in this Clause the operation `DECAY_COPY(x)` is used. All such uses mean call the function `decay_copy(x)` and use the result, where `decay_copy` is defined as follows:

```cpp
template<class T> constexpr decay_t<T> decay_copy(T&& v) noexcept(is_nothrow_convertible_v<T, decay_t<T>>)
{ return std::forward<T>(v); }
```

31.3 Threads

31.3 describes components that can be used to create and manage threads. [Note: These threads are intended to map one-to-one with operating system threads. — end note]

31.3.1 Header `<thread>` synopsis

```cpp
namespace std {
    class thread;
}
```
void swap(thread& x, thread& y) noexcept;

namespace std {
  class thread {
    public:
      // types
      class id;
      using native_handle_type = implementation-defined;  // see 31.2.3

      // construct/copy/destroy
      thread() noexcept;
      template<class F, class... Args> explicit thread(F&& f, Args&&... args);
      ~thread();
      thread(const thread&) = delete;
      thread(thread&&) noexcept;
      thread& operator=(const thread&) = delete;
      thread& operator=(thread&&) noexcept;

      // members
      void swap(thread&) noexcept;
      bool joinable() const noexcept;
      void join();
      void detach();
      id get_id() const noexcept;
      native_handle_type native_handle();  // see 31.2.3

      // static members
      static unsigned int hardware_concurrency() noexcept;
  };
}

31.3.2 Class thread

1 The class thread provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A thread object uniquely represents a particular thread of execution. That representation may be transferred to other thread objects in such a way that no two thread objects simultaneously represent the same thread of execution. A thread of execution is detached when no thread object represents that thread. Objects of class thread can be in a state that does not represent a thread of execution. [Note: A thread object does not represent a thread of execution after default construction, after being moved from, or after a successful call to detach or join. —end note]

namespace std {
  class thread::id {
    public:
      id() noexcept;

      bool operator==(thread::id x, thread::id y) noexcept;
      bool operator!=(thread::id x, thread::id y) noexcept;
      bool operator<=(thread::id x, thread::id y) noexcept;
      bool operator>=(thread::id x, thread::id y) noexcept;
  };
}
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& out, thread::id id);

    // hash support
    template<class T> struct hash;
    template<> struct hash<thread::id>;

1 An object of type thread::id provides a unique identifier for each thread of execution and a single distinct value for all thread objects that do not represent a thread of execution (31.3.2). Each thread of execution has an associated thread::id object that is not equal to the thread::id object of any other thread of execution and that is not equal to the thread::id object of any thread object that does not represent threads of execution.

2 thread::id is a trivially copyable class (10.1). The library may reuse the value of a thread::id of a terminated thread that can no longer be joined.

3 [Note: Relational operators allow thread::id objects to be used as keys in associative containers. — end note]

    id() noexcept;
    Effects: Constructs an object of type id.
    Ensures: The constructed object does not represent a thread of execution.

7 bool operator!=(thread::id x, thread::id y) noexcept;
    Returns: !(x == y)

9 bool operator<(thread::id x, thread::id y) noexcept;
    Returns: y < x.

10 bool operator<=(thread::id x, thread::id y) noexcept;
    Returns: !(y < x).

11 bool operator>=(thread::id x, thread::id y) noexcept;
    Returns: !x < y.

12 template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& out, thread::id id);
    Effects: Inserts an unspecified text representation of id into out. For two objects of type thread::id x and y, if x == y the thread::id objects have the same text representation and if x !== y the thread::id objects have distinct text representations.
    Returns: out.

14 The specialization is enabled (19.14.18).
31.3.2.2 Constructors

```cpp
thread() noexcept;
```

1. **Effects:** Constructs a `thread` object that does not represent a thread of execution.
2. **Ensures:** `get_id() == id()`.

```cpp
template<class F, class... Args> explicit thread(F&& f, Args&&... args);
```

3. **Requires:** `F` and each `T_i` in `Args` shall satisfy the `Cpp17MoveConstructible` requirements. `INVOKE(DECRYPT_COPY(std::forward<F>(f)), DECRYPT_COPY(std::forward<Args>(args))...)` (19.14.3) shall be a valid expression.
4. **Remarks:** This constructor shall not participate in overload resolution if `remove_cvref_t<F>` is the same type as `std::thread`.
5. **Effects:** Constructs an object of type `thread`. The new thread of execution executes `INVOKE(DECRYPT_COPY(std::forward<F>(f)), DECRYPT_COPY(std::forward<Args>(args))...)` with the calls to `DECRYPT_COPY` being evaluated in the constructing thread. Any return value from this invocation is ignored. [Note: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — end note] If the invocation of `INVOKE(DECRYPT_COPY(std::forward<F>(f)), DECRYPT_COPY(std::forward<Args>(args))...)` terminates with an uncaught exception, `terminate` shall be called.
6. **Synchronization:** The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.
7. **Ensures:** `get_id() != id()`. `*this` represents the newly started thread.
8. **Throws:** `system_error` if unable to start the new thread.
9. **Error conditions:**
   - `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

thread(thread&& x) noexcept;

10. **Effects:** Constructs an object of type `thread` from `x`, and sets `x` to a default constructed state.
11. **Ensures:** `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

31.3.2.3 Destructor

```cpp
~thread();
```

1. If `joinable()`, calls `terminate()`. Otherwise, has no effects. [Note: Either implicitly detaching or joining a `joinable()` thread in its destructor could result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. Thus the programmer must ensure that the destructor is never executed while the thread is still joinable. — end note]

31.3.2.4 Assignment

```cpp
thread& operator=(thread&& x) noexcept;
```

1. **Effects:** If `joinable()`, calls `terminate()`. Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.
2. **Ensures:** `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.
3. **Returns:** `*this`.

31.3.2.5 Members

```cpp
void swap(thread& x) noexcept;
```

1. **Effects:** Swaps the state of `*this` and `x`.

```cpp
bool joinable() const noexcept;
```

1. **Returns:** `get_id() != id()`.
void join();

Effects: Blocks until the thread represented by \*this has completed.

Synchronization: The completion of the thread represented by \*this synchronizes with (6.8.2) the corresponding successful join() return. [Note: Operations on \*this are not synchronized. — end note]

Ensures: The thread represented by \*this has completed. get_id() == id().

Throws: system_error when an exception is required (31.2.2).

Error conditions:

- resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::get_id().

- no_such_process — if the thread is not valid.

- invalid_argument — if the thread is not joinable.

void detach();

Effects: The thread represented by \*this continues execution without the calling thread blocking. When detach() returns, \*this no longer represents the possibly continuing thread of execution. When the thread previously represented by \*this ends execution, the implementation shall release any owned resources.

Ensures: get_id() == id().

Throws: system_error when an exception is required (31.2.2).

Error conditions:

- no_such_process — if the thread is not valid.

- invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if \*this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by \*this.

31.3.2.6 Static members

unsigned hardware_concurrency() noexcept;

Returns: The number of hardware thread contexts. [Note: This value should only be considered to be a hint. — end note] If this value is not computable or well-defined, an implementation should return 0.

31.3.2.7 Specialized algorithms

void swap(thread& x, thread& y) noexcept;

Effects: As if by x.swap(y).

31.3.3 Namespace this_thread

namespace std::this_thread {

    thread::id get_id() noexcept;

    void yield() noexcept;

template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);

template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);

}
void this_thread::yield() noexcept;

- **Effects:** Offers the implementation the opportunity to reschedule.
- **Synchronization:** None.

```cpp
template<class Clock, class Duration>
void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
```

- **Effects:** Blocks the calling thread for the absolute timeout (31.2.4) specified by `abs_time`.
- **Synchronization:** None.
- **Throws:** Timeout-related exceptions (31.2.4).

```cpp
template<class Rep, class Period>
void sleep_for(const chrono::duration<Rep, Period>& rel_time);
```

- **Effects:** Blocks the calling thread for the relative timeout (31.2.4) specified by `rel_time`.
- **Synchronization:** None.
- **Throws:** Timeout-related exceptions (31.2.4).

### 31.4 Mutual Exclusion

This subclause provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.8.2).

#### 31.4.1 Header `<mutex>` synopsis

```cpp
namespace std {
    class mutex;
    class recursive_mutex;
    class timed_mutex;
    class recursive_timed_mutex;

    struct defer_lock_t { explicit defer_lock_t() = default; };
    struct try_to_lock_t { explicit try_to_lock_t() = default; };
    struct adopt_lock_t { explicit adopt_lock_t() = default; };

    inline constexpr defer_lock_t defer_lock { };  
    inline constexpr try_to_lock_t try_to_lock { };  
    inline constexpr adopt_lock_t adopt_lock { };  

    template<class Mutex> class lock_guard;
    template<class... MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

    template<class Mutex>
    void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

    template<class L1, class L2, class... L3>
    int try_lock(L1&, L2&, L3&...);

    template<class L1, class L2, class... L3>
    void lock(L1&, L2&, L3&...);

    struct once_flag;

    template<class Callable, class... Args>
    void call_once(once_flag& flag, Callable& func, Args&&... args);
}
```

#### 31.4.2 Header `<shared_mutex>` synopsis

```cpp
namespace std {
    class shared_mutex;
    class shared_timed_mutex;
    template<class Mutex> class shared_lock;

    template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}
```
31.4.3 Mutex requirements

31.4.3.1 In general

A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (31.2.5). An execution agent owns a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

31.4.3.2 Mutex types

The mutex types are the standard library types mutex, recursive_mutex, timed_mutex, recursive_timed_mutex, shared_mutex, and shared_timed_mutex. They shall satisfy the requirements set out in this subclause. In this description, m denotes an object of a mutex type.

The mutex types shall satisfy the Cpp17Lockable requirements (31.2.5.3).

The mutex types shall be Cpp17DefaultConstructible and Cpp17Destructible. If initialization of an object of a mutex type fails, an exception of type system_error shall be thrown. The mutex types shall not be copyable or movable.

The error conditions for error codes, if any, reported by member functions of the mutex types shall be:

- resource_unavailable_try_again — if any native handle type manipulated is not available.
- operation_not_permitted — if the thread does not have the privilege to perform the operation.
- invalid_argument — if any native handle type manipulated as part of mutex construction is incorrect.

The implementation shall provide lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.8.2). The lock and unlock operations on a single mutex shall appear to occur in a single total order. [Note: This can be viewed as the modification order (6.8.2) of the mutex. —end note] [Note: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization should be used to ensure that mutex objects are initialized and visible to other threads. —end note]

The expression m.lock() shall be well-formed and have the following semantics:

Requires: If m is of type mutex, timed_mutex, shared_mutex, or shared_timed_mutex, the calling thread does not own the mutex.

Effects: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

Ensures: The calling thread owns the mutex.

Return type: void.

Synchronization: Prior unlock() operations on the same object shall synchronize with (6.8.2) this operation.

Throws: system_error when an exception is required (31.2.2).

Error conditions:

- operation_not_permitted — if the thread does not have the privilege to perform the operation.
- resource_deadlock_would_occur — if the implementation detects that a deadlock would occur.

The expression m.try_lock() shall be well-formed and have the following semantics:

Requires: If m is of type mutex, timed_mutex, shared_mutex, or shared_timed_mutex, the calling thread does not own the mutex.

Effects: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and try_lock() immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread. [Note: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (Clause 30). —end note] An implementation should ensure that try_lock() does not consistently return false in the absence of contending mutex acquisitions.

Return type: bool.

Returns: true if ownership of the mutex was obtained for the calling thread, otherwise false.

Synchronization: If try_lock() returns true, prior unlock() operations on the same object synchronize with (6.8.2) this operation. [Note: Since lock() does not synchronize with a failed subsequent try_
lock(), the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — end note]

20 Throws: Nothing.

21 The expression m.unlock() shall be well-formed and have the following semantics:

22 Requires: The calling thread shall own the mutex.

23 Effects: Releases the calling thread's ownership of the mutex.

24 Return type: void.

25 Synchronization: This operation synchronizes with (6.8.2) subsequent lock operations that obtain ownership on the same object.

26 Throws: Nothing.

31.4.3.2.1 Class mutex

namespace std {
    class mutex {
        public:
            constexpr mutex() noexcept;
            ~mutex();
            mutex(const mutex&) = delete;
            mutex& operator=(const mutex&) = delete;
            void lock();
            bool try_lock();
            void unlock();

            using native_handle_type = implementation-defined; // see 31.2.3
            native_handle_type native_handle(); // see 31.2.3
    }
}

1 The class mutex provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for try_lock()) or block (for lock()) until the owning thread has released ownership with a call to unlock().

2 [Note: After a thread A has called unlock(), releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn’t access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note]

3 The class mutex shall satisfy all of the mutex requirements (31.4.3). It shall be a standard-layout class (10.1).

4 [Note: A program may deadlock if the thread that owns a mutex object calls lock() on that object. If the implementation can detect the deadlock, a resource_deadlock_would_occur error condition may be observed. — end note]

5 The behavior of a program is undefined if it destroys a mutex object owned by any thread or a thread terminates while owning a mutex object.

31.4.3.2.2 Class recursive_mutex

namespace std {
    class recursive_mutex {
        public:
            recursive_mutex();
            ~recursive_mutex();
            recursive_mutex(const recursive_mutex&) = delete;
            recursive_mutex& operator=(const recursive_mutex&) = delete;

            void lock();
            bool try_lock() noexcept;
            void unlock();

§ 31.4.3.2.2
The class `recursive_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`) until the first thread has completely released ownership.

The class `recursive_mutex` shall satisfy all of the mutex requirements (31.4.3). It shall be a standard-layout class (10.1).

A thread that owns a `recursive_mutex` object may acquire additional levels of ownership by calling `lock()` or `try_lock()` on that object. If a thread has already acquired the maximum level of ownership for a `recursive_mutex` object, additional calls to `try_lock()` shall fail, and additional calls to `lock()` shall throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()` and `try_lock()`. Only when all levels of ownership have been released may ownership be acquired by another thread.

The behavior of a program is undefined if:

1. it destroys a `recursive_mutex` object owned by any thread or
2. a thread terminates while owning a `recursive_mutex` object.

### 31.4.3.3 Timed mutex types

The timed mutex types are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They shall meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (26.5), and `abs_time` denotes an object of an instantiation of `time_point` (26.6).

The timed mutex types shall satisfy the `Cpp17TimedLockable` requirements (31.2.5.4).

The expression `m.try_lock_for(rel_time)` shall be well-formed and have the following semantics:

1. **Requires:** If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.
2. **Effects:** The function attempts to obtain ownership of the mutex within the relative timeout (31.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function shall return within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object. [Note: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]
3. **Return type:** `bool`.
4. **Returns:** `true` if ownership was obtained, otherwise `false`.
5. **Synchronization:** If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.8.2) this operation.
6. **Throws:** Timeout-related exceptions (31.2.4).

The expression `m.try_lock_until(abs_time)` shall be well-formed and have the following semantics:

1. **Requires:** If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.
2. **Effects:** The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function shall return before the absolute timeout (31.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object. [Note: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]
3. **Return type:** `bool`.
4. **Returns:** `true` if ownership was obtained, otherwise `false`.
5. **Synchronization:** If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.8.2) this operation.
§ 31.4.3.3.1 Class timed_mutex [thread.timedmutex.class]

namespace std {
    class timed_mutex {
    public:
        // Constructor
        timed_mutex();
        ~timed_mutex();
        timed_mutex(const timed_mutex&) = delete;
        timed_mutex& operator=(const timed_mutex&) = delete;

        // Locking Methods
        void lock(); // blocking
        bool try_lock();
        template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        using native_handle_type = implementation-defined; // see 31.2.3
        native_handle_type native_handle(); // see 31.2.3
    };
}

1 The class timed_mutex provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a timed_mutex object, attempts by another thread to acquire ownership of that object will fail (for try_lock()) or block (for lock(), try_lock_for(), and try_lock_until()) until the owning thread has released ownership with a call to unlock() or the call to try_lock_for() or try_lock_until() times out (having failed to obtain ownership).

2 The class timed_mutex shall satisfy all of the timed mutex requirements (31.4.3.3). It shall be a standard-layout class (10.1).

3 The behavior of a program is undefined if:

(3.1) — it destroys a timed_mutex object owned by any thread,

(3.2) — a thread that owns a timed_mutex object calls lock(), try_lock(), try_lock_for(), or try_lock_until() on that object, or

(3.3) — a thread terminates while owning a timed_mutex object.

31.4.3.3.2 Class recursive_timed_mutex [thread.timedmutex.recursive]

namespace std {
    class recursive_timed_mutex {
    public:
        recursive_timed_mutex();
        ~recursive_timed_mutex();
        recursive_timed_mutex(const recursive_timed_mutex&) = delete;
        recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

        void lock(); // blocking
        bool try_lock() noexcept;
        template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        using native_handle_type = implementation-defined; // see 31.2.3
        native_handle_type native_handle(); // see 31.2.3
    };
}

§ 31.4.3.3.2 1482
The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

The class `recursive_timed_mutex` shall satisfy all of the timed mutex requirements (31.4.3.3). It shall be a standard-layout class (10.1).

A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` shall fail, and additional calls to `lock()` shall throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

The behavior of a program is undefined if:

1. it destroys a `recursive_timed_mutex` object owned by any thread, or
2. a thread terminates while owning a `recursive_timed_mutex` object.

### 31.4.3.4 Shared mutex types

The standard library types `shared_mutex` and `shared_timed_mutex` are shared mutex types. Shared mutex types shall satisfy the requirements of mutex types (31.4.3.2), and additionally shall satisfy the requirements set out below. In this description, `m` denotes an object of a shared mutex type.

In addition to the exclusive lock ownership mode specified in 31.4.3.2, shared mutex types provide a shared lock ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent shall hold a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but shall be at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents shall block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

The expression `m.lock_shared()` shall be well-formed and have the following semantics:

- **Requires:** The calling thread has no ownership of the mutex.
- **Effects:** Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock shall not have been acquired for the current thread.
- **Ensures:** The calling thread has a shared lock on the mutex.
- **Return type:** void.
- **Synchronization:** Prior `unlock()` operations on the same object shall synchronize with (6.8.2) this operation.
- **Throws:** `system_error` when an exception is required (31.2.2).

**Error conditions:**

1. `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
2. `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

The expression `m.unlock_shared()` shall be well-formed and have the following semantics:

- **Requires:** The calling thread shall hold a shared lock on the mutex.
- **Effects:** Releases a shared lock on the mutex held by the calling thread.
- **Return type:** void.
- **Synchronization:** This operation synchronizes with (6.8.2) subsequent `lock()` operations that obtain ownership on the same object.
- **Throws:** Nothing.
The expression `m.try_lock_shared()` shall be well-formed and have the following semantics:

**Requires:** The calling thread has no ownership of the mutex.

**Effects:** Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try_lock_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

**Return type:** `bool`.

**Returns:** true if the shared ownership lock was acquired, false otherwise.

**Synchronization:** If `try_lock_shared()` returns true, prior `unlock()` operations on the same object synchronize with (6.8.2) this operation.

**Throws:** Nothing.

### 31.4.3.4.1 Class shared_mutex

```cpp
namespace std {
    class shared_mutex {
        public:
            shared_mutex();
            ~shared_mutex();
            shared_mutex(const shared_mutex&) = delete;
            shared_mutex& operator=(const shared_mutex&) = delete;

            // exclusive ownership
            void lock(); // blocking
            bool try_lock();
            void unlock();

            // shared ownership
            void lock_shared(); // blocking
            bool try_lock_shared();
            void unlock_shared();

            using native_handle_type = implementation-defined; // see 31.2.3
            native_handle_type native_handle(); // see 31.2.3
    }
}
```

1. The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.
2. The class `shared_mutex` shall satisfy all of the shared mutex requirements (31.4.3.4). It shall be a standard-layout class (10.1).
3. The behavior of a program is undefined if:
   - (3.1) it destroys a `shared_mutex` object owned by any thread,
   - (3.2) a thread attempts to recursively gain any ownership of a `shared_mutex`, or
   - (3.3) a thread terminates while possessing any ownership of a `shared_mutex`.

`shared_mutex` may be a synonym for `shared_timed_mutex`.

### 31.4.3.5 Shared timed mutex types

The standard library type `shared_timed_mutex` is a shared timed mutex type. Shared timed mutex types shall satisfy the requirements of timed mutex types (31.4.3.3), shared mutex types (31.4.3.4), and additionally shall satisfy the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_type` denotes an object of an instantiation of `duration` (26.5), and `abs_time` denotes an object of an instantiation of `time_point` (26.6).

The expression `m.try_lock_shared_for(rel_time)` shall be well-formed and have the following semantics:

**Requires:** The calling thread has no ownership of the mutex.

**Effects:** Attempts to obtain shared lock ownership for the calling thread within the relative timeout (31.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_-
shared()). The function shall return within the timeout specified by rel_time only if it has obtained shared ownership of the mutex object. [Note: As with try_lock(), there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note] If an exception is thrown then a shared lock shall not have been acquired for the current thread.

Return type: bool.

Returns: true if the shared lock was acquired, false otherwise.

Synchronization: If try_lock_shared_for() returns true, prior unlock() operations on the same object synchronize with (6.8.2) this operation.

Throws: Timeout-related exceptions (31.2.4).

The expression m.try_lock_shared_until(abs_time) shall be well-formed and have the following semantics:

Requires: The calling thread has no ownership of the mutex.

Effects: The function attempts to obtain shared ownership of the mutex. If abs_time has already passed, the function attempts to obtain shared ownership without blocking (as if by calling try_lock_shared()). The function shall return before the absolute timeout (31.2.4) specified by abs_time only if it has obtained shared ownership of the mutex object. [Note: As with try_lock(), there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note] If an exception is thrown then a shared lock shall not have been acquired for the current thread.

Return type: bool.

Returns: true if the shared lock was acquired, false otherwise.

Synchronization: If try_lock_shared_until() returns true, prior unlock() operations on the same object synchronize with (6.8.2) this operation.

Throws: Timeout-related exceptions (31.2.4).

### 31.4.3.5.1 Class shared_timed_mutex

```cpp
namespace std {
    class shared_timed_mutex {
    public:
        shared_timed_mutex();
        ~shared_timed_mutex();
        shared_timed_mutex(const shared_timed_mutex&) = delete;
        shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

        // exclusive ownership
        void lock();                // blocking
        bool try_lock();
        template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        // shared ownership
        void lock_shared();         // blocking
        bool try_lock_shared();
        template<class Rep, class Period>
        bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
        bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock_shared();
    }
}
```

The class shared_timed_mutex provides a non-recursive mutex with shared ownership semantics.
The class `shared_timed_mutex` shall satisfy all of the shared timed mutex requirements (31.4.3.5). It shall be a standard-layout class (10.1).

The behavior of a program is undefined if:

1. it destroys a `shared_timed_mutex` object owned by any thread,
2. a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
3. a thread terminates while possessing any ownership of a `shared_timed_mutex`.

31.4.4 Locks

A `lock` is an object that holds a reference to a lockable object and may unlock the lockable object during the lock’s destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to own a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references. [Note: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — end note]

Some lock constructors take tag types which describe what should be done with the lockable object during the lock’s construction.

```cpp
namespace std {
    struct defer_lock_t { }; // do not acquire ownership of the mutex
    struct try_to_lock_t { }; // try to acquire ownership of the mutex
    struct adopt_lock_t { }; // assume the calling thread has already obtained mutex ownership and manage it

    inline constexpr defer_lock_t defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t adopt_lock { };
}
```

31.4.4.1 Class template lock_guard

```cpp
namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;

    private:
        mutex_type& pm; // exposition only
    };
}
```

An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object’s lifetime (6.6.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall satisfy the `Cpp17BasicLockable` requirements (31.2.5.2).

```cpp
explicit lock_guard(mutex_type& m);
```

**Requires:** If `mutex_type` is not a recursive mutex, the calling thread does not own the mutex `m`.

**Effects:** Initializes `pm` with `m`. Calls `m.lock()`.

```cpp
lock_guard(mutex_type& m, adopt_lock_t);
```

**Requires:** The calling thread owns the mutex `m`.

**Effects:** Initializes `pm` with `m`.

6      **Throws:** Nothing.

    ~lock_guard();

7      **Effects:** As if by pm.unlock().

31.4.4.2  Class template `scoped_lock`  

namespace std {

    template<class... MutexTypes>
    class scoped_lock {

        public:

            using mutex_type = Mutex;  // If MutexTypes... consists of the single type Mutex

            explicit scoped_lock(MutexTypes&... m);
            explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
            scoped_lock();

            scoped_lock(const scoped_lock&) = delete;
            scoped_lock& operator=(const scoped_lock&) = delete;

        private:

            tuple<MutexTypes&...> pm;  // exposition only
    };

1  An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object’s lifetime (6.6.3). The behavior of a program is undefined if the lockable objects referenced by pm do not exist for the entire lifetime of the `scoped_lock` object. When sizeof...(MutexTypes) is 1, the supplied Mutex type shall satisfy the `Cpp17BasicLockable` requirements (31.2.5.2). Otherwise, each of the mutex types shall satisfy the `Cpp17Lockable` requirements (31.2.5.3).

    explicit scoped_lock(MutexTypes&... m);

2  **Requires:** If a MutexTypes type is not a recursive mutex, the calling thread does not own the corresponding mutex element of m.

3  **Effects:** Initializes pm with tie(m...). Then if sizeof...(MutexTypes) is 0, no effects. Otherwise if sizeof...(MutexTypes) is 1, then m.lock(). Otherwise, lock(m...).

    explicit scoped_lock(adopt_lock_t, MutexTypes&... m);

4  **Requires:** The calling thread owns all the mutexes in m.

5  **Effects:** Initializes pm with tie(m...).

6  **Throws:** Nothing.

    ~scoped_lock();

7  **Effects:** For all i in [0, sizeof...(MutexTypes)), get<i>(pm).unlock().

31.4.4.3  Class template `unique_lock`

namespace std {

    template<class Mutex>
    class unique_lock {

        public:

            using mutex_type = Mutex;

            // 31.4.4.3.1, construct/copy/destroy
            unique_lock() noexcept;
            explicit unique_lock(mutex_type& m);
            unique_lock(mutex_type& m, defer_lock_t) noexcept;
            unique_lock(mutex_type& m, try_to_lock_t);
            unique_lock(mutex_type& m, adopt_lock_t);
            template<class Clock, class Duration>
            unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);

§ 31.4.4.3  1487
template<class Rep, class Period>
    unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
    ~unique_lock();
    unique_lock(const unique_lock&) = delete;
    unique_lock& operator=(const unique_lock&) = delete;
    unique_lock(unique_lock&& u) noexcept;
    unique_lock& operator=(unique_lock&& u);

    // 31.4.4.3.2, locking
    void lock();
    bool try_lock();

    template<class Rep, class Period>
    bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
    template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
    void unlock();

    // 31.4.4.3.3, modifiers
    void swap(unique_lock& u) noexcept;
    mutex_type* release() noexcept;

    // 31.4.4.3.4, observers
    bool owns_lock() const noexcept;
    explicit operator bool () const noexcept;
    mutex_type* mutex() const noexcept;

private:
    mutex_type* pm; // exposition only
    bool owns; // exposition only
};

template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

An object of type unique_lock controls the ownership of a lockable object within a scope. Ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another unique_lock object. Objects of type unique_lock are not copyable but are movable. The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed to by pm does not exist for the entire remaining lifetime (6.6.3) of the unique_lock object. The supplied Mutex type shall satisfy the Cpp17BasicLockable requirements (31.2.5.2).

[Note: unique_lock<Mutex> meets the Cpp17BasicLockable requirements. If Mutex meets the Cpp17Lockable requirements (31.2.5.3), unique_lock<Mutex> also meets the Cpp17Lockable requirements; if Mutex meets the Cpp17TimedLockable requirements (31.2.5.4), unique_lock<Mutex> also meets the Cpp17TimedLockable requirements. —end note]

31.4.4.3.1 Constructors, destructor, and assignment

unique_lock() noexcept;

Effects: Constructs an object of type unique_lock.

Ensures: pm == 0 and owns == false.

explicit unique_lock(mutex_type& m);

Requires: If mutex_type is not a recursive mutex the calling thread does not own the mutex.

Effects: Constructs an object of type unique_lock and calls m.lock().

Ensures: pm == addressof(m) and owns == true.
unique_lock(mutex_type& m, defer_lock_t) noexcept;
   Effects: Constructs an object of type unique_lock.
   Ensures: pm == addressof(m) and owns == false.

unique_lock(mutex_type& m, try_to_lock_t);
   Requires: The supplied Mutex type shall satisfy the Cpp17Lockable requirements (31.2.5.3). If mutex_type is not a recursive mutex the calling thread does not own the mutex.
   Effects: Constructs an object of type unique_lock and calls m.try_lock().
   Ensures: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock().

unique_lock(mutex_type& m, adopt_lock_t);
   Requires: The calling thread owns the mutex.
   Effects: Constructs an object of type unique_lock.
   Ensures: pm == addressof(m) and owns == true.
   Throws: Nothing.

template<class Clock, class Duration>
   unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
   Requires: If mutex_type is not a recursive mutex the calling thread does not own the mutex. The supplied Mutex type shall satisfy the Cpp17TimedLockable requirements (31.2.5.4).
   Effects: Constructs an object of type unique_lock and calls m.try_lock_until(abs_time). 
   Ensures: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_until(abs_time).

template<class Rep, class Period>
   unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
   Requires: If mutex_type is not a recursive mutex the calling thread does not own the mutex. The supplied Mutex type shall satisfy the Cpp17TimedLockable requirements (31.2.5.4).
   Effects: Constructs an object of type unique_lock and calls m.try_lock_for(rel_time).
   Ensures: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_for(rel_time).

unique_lock(unique_lock&& u) noexcept;
   Ensures: pm == u_p.pm and owns == u_p.owns (where u_p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.

unique_lock& operator=(unique_lock&& u);
   Effects: If owns calls pm->unlock().
   Ensures: pm == u_p.pm and owns == u_p.owns (where u_p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.
   [Note: With a recursive mutex it is possible for both *this and u to own the same mutex before the assignment. In this case, *this will own the mutex after the assignment and u will not. — end note]
   Throws: Nothing.

~unique_lock();
   Effects: If owns calls pm->unlock().

31.4.4.3.2 Locking [thread.lock.unique.locking]

void lock();
   Effects: As if by pm->lock().
   Ensures: owns == true.
Throws: Any exception thrown by \texttt{pm->lock(). system_error} when an exception is required (31.2.2).

Error conditions:

- \texttt{operation_not_permitted} — if \texttt{pm} is \texttt{nullptr}.

- \texttt{resource_deadlock_would_occuur} — if on entry \texttt{owns} is true.

\textbf{bool try_lock();}

Requires: The supplied \texttt{Mutex} shall satisfy the \texttt{Cpp17Lockable} requirements (31.2.5.3).

Effects: As if by \texttt{pm->try_lock().

Returns: The value returned by the call to \texttt{try_lock().

Ensures: \texttt{owns == res}, where \texttt{res} is the value returned by the call to \texttt{try_lock().

Throws: Any exception thrown by \texttt{pm->try_lock(). system_error} when an exception is required (31.2.2).

Error conditions:

- \texttt{operation_not_permitted} — if \texttt{pm} is \texttt{nullptr}.

- \texttt{resource_deadlock_would_occuur} — if on entry \texttt{owns} is true.

\textbf{template<class Clock, class Duration> bool try_lock_until(const \texttt{chrono::time_point<Clock, Duration>\& abs_time);}

Requires: The supplied \texttt{Mutex} type shall satisfy the \texttt{Cpp17TimedLockable} requirements (31.2.5.4).

Effects: As if by \texttt{pm->try_lock_until(abs_time).

Returns: The value returned by the call to \texttt{try_lock_until(abs_time).

Ensures: \texttt{owns == res}, where \texttt{res} is the value returned by the call to \texttt{try_lock_until(abs_time).

Throws: Any exception thrown by \texttt{pm->try_lock_until(). system_error} when an exception is required (31.2.2).

Error conditions:

- \texttt{operation_not_permitted} — if \texttt{pm} is \texttt{nullptr}.

- \texttt{resource_deadlock_would_occuur} — if on entry \texttt{owns} is true.

\textbf{template<class Rep, class Period> bool try_lock_for(const \texttt{chrono::duration<Rep, Period>\& rel_time);}

Requires: The supplied \texttt{Mutex} type shall satisfy the \texttt{Cpp17TimedLockable} requirements (31.2.5.4).

Effects: As if by \texttt{pm->try_lock_for(rel_time).

Returns: The value returned by the call to \texttt{try_lock_until(rel_time).

Ensures: \texttt{owns == res}, where \texttt{res} is the value returned by the call to \texttt{try_lock_for(rel_time).

Throws: Any exception thrown by \texttt{pm->try_lock_for(). system_error} when an exception is required (31.2.2).

Error conditions:

- \texttt{operation_not_permitted} — if \texttt{pm} is \texttt{nullptr}.

- \texttt{resource_deadlock_would_occuur} — if on entry \texttt{owns} is true.

\textbf{void unlock();}

Effects: As if by \texttt{pm->unlock().

Ensures: \texttt{owns == false.

Throws: \texttt{system_error} when an exception is required (31.2.2).

Error conditions:

- \texttt{operation_not_permitted} — if on entry \texttt{owns} is false.
31.4.4.3 Modifiers

```cpp
void swap(unique_lock& u) noexcept;
```

**Effects:** Swaps the data members of `*this` and `u`.

```cpp
mutex_type* release() noexcept;
```

**Returns:** The previous value of `pm`.

**Ensures:** `pm == 0` and `owns == false`.

```cpp
template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;
```

**Effects:** As if by `x.swap(y)`.

31.4.4.3.4 Observers

```cpp
bool owns_lock() const noexcept;
```

**Returns:** `owns`.

```cpp
explicit operator bool() const noexcept;
```

**Returns:** `owns`.

```cpp
mutex_type* mutex() const noexcept;
```

**Returns:** `pm`.

31.4.4.4 Class template shared_lock

```cpp
namespace std {
    template<class Mutex>
    class shared_lock {
        using mutex_type = Mutex;

        // 31.4.4.4.1, construct/copy/destroy
        shared_lock() noexcept;
        explicit shared_lock(mutex_type& m);  // blocking
        shared_lock(mutex_type& m, defer_lock_t) noexcept;
        shared_lock(mutex_type& m, try_to_lock_t);
        shared_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
        shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
        shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~shared_lock();

        shared_lock(const shared_lock&) = delete;
        shared_lock& operator=(const shared_lock&) = delete;

        shared_lock(shared_lock&& u) noexcept;
        shared_lock& operator=(shared_lock&& u) noexcept;

        // 31.4.4.4.2, locking
        void lock();  // blocking
        bool try_lock();
        template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
        bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        // 31.4.4.4.3, modifiers
        void swap(shared_lock& u) noexcept;
        mutex_type* release() noexcept;
    }  // end of class template shared_lock
```
// 31.4.4.4, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

private:
mutex_type* pm;
bool owns;
// exposition only
};

template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;

An object of type shared_lock controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another shared_lock object. Objects of type shared_lock are not copyable but are movable. The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed to by pm does not exist for the entire remaining lifetime (6.6.3) of the shared_lock object. The supplied Mutex type shall satisfy the shared mutex requirements (31.4.3.5).

[Note: shared_lock<Mutex> meets the Cpp17TimedLockable requirements (31.2.5.4). — end note]

31.4.4.4.1 Constructors, destructor, and assignment

shared_lock() noexcept;
Effects: Constructs an object of type shared_lock.
Ensures: pm == nullptr and owns == false.

explicit shared_lock(mutex_type& m);
Requires: The calling thread does not own the mutex for any ownership mode.
Effects: Constructs an object of type shared_lock and calls m.lock_shared().
Ensures: pm == addressof(m) and owns == true.

shared_lock(mutex_type& m, defer_lock_t) noexcept;
Effects: Constructs an object of type shared_lock.
Ensures: pm == addressof(m) and owns == false.

shared_lock(mutex_type& m, try_to_lock_t);
Requires: The calling thread does not own the mutex for any ownership mode.
Effects: Constructs an object of type shared_lock and calls m.try_lock_shared().
Ensures: pm == addressof(m) and owns == res where res is the value returned by the call to m.try_lock_shared().

shared_lock(mutex_type& m, adopt_lock_t);
Requires: The calling thread has shared ownership of the mutex.
Effects: Constructs an object of type shared_lock.
Ensures: pm == addressof(m) and owns == true.

template<class Clock, class Duration>
shared_lock(mutex_type& m,
const chrono::time_point<Clock, Duration>& abs_time);
Requires: The calling thread does not own the mutex for any ownership mode.
Effects: Constructs an object of type shared_lock and calls m.try_lock_shared_until(abs_time).
Ensures: pm == addressof(m) and owns == res where res is the value returned by the call to m.try_lock_shared_until(abs_time).
template<class Rep, class Period>
    shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);

    Requires: The calling thread does not own the mutex for any ownership mode.
    Effects: Constructs an object of type shared_lock and calls m.try_lock_shared_for(rel_time).
    Ensures: pm == addressof(m) and owns == res where res is the value returned by the call to m.try_lock_shared_for(rel_time).

~shared_lock();

    Effects: If owns calls pm->unlock_shared().

shared_lock(shared_lock&& sl) noexcept;

    Ensures: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to this construction), sl.pm == nullptr and sl.owns == false.

shared_lock& operator=(shared_lock&& sl) noexcept;

    Effects: If owns calls pm->unlock_shared().

    Ensures: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to this assignment), sl.pm == nullptr and sl.owns == false.

31.4.4.4.2 Locking [thread.lock.shared.locking]

void lock();

    Effects: As if by pm->lock_shared().
    Ensures: owns == true.
    Throws: Any exception thrown by pm->lock_shared(). system_error when an exception is required (31.2.2).
    Error conditions:
(4.1)  — operation_not_permitted — if pm is nullptr.
(4.2)  — resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();

    Effects: As if by pm->try_lock_shared().
    Returns: The value returned by the call to pm->try_lock_shared().
    Ensures: owns == res, where res is the value returned by the call to pm->try_lock_shared().
    Throws: Any exception thrown by pm->try_lock_shared(). system_error when an exception is required (31.2.2).
    Error conditions:
(9.1)  — operation_not_permitted — if pm is nullptr.
(9.2)  — resource_deadlock_would_occur — if on entry owns is true.

template<class Clock, class Duration>
    bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

    Effects: As if by pm->try_lock_shared_until(abs_time).
    Returns: The value returned by the call to pm->try_lock_shared_until(abs_time).
    Ensures: owns == res, where res is the value returned by the call to pm->try_lock_shared_until(abs_time).
    Throws: Any exception thrown by pm->try_lock_shared_until(abs_time). system_error when an exception is required (31.2.2).
    Error conditions:
(14.1)  — operation_not_permitted — if pm is nullptr.
(14.2)  — resource_deadlock_would_occur — if on entry owns is true.
template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

Effects: As if by pm->try_lock_shared_for(rel_time).

Returns: The value returned by the call to pm->try_lock_shared_for(rel_time).

Ensures: owns == res, where res is the value returned by the call to pm->try_lock_shared_for(rel_time).

Throws: Any exception thrown by pm->try_lock_shared_for(rel_time), system_error when an exception is required (31.2.2).

Error conditions:
- operation_not_permitted — if pm is nullptr.
- resource_deadlock_would_occur — if on entry owns is true.

void unlock();

Effects: As if by pm->unlock_shared().

Ensures: owns == false.

Throws: system_error when an exception is required (31.2.2).

Error conditions:
- operation_not_permitted — if on entry owns is false.

31.4.4.4.3 Modifiers

void swap(shared_lock& sl) noexcept;
Effects: Swaps the data members of *this and sl.

mutex_type* release() noexcept;
Returns: The previous value of pm.

Ensures: pm == nullptr and owns == false.

31.4.4.4.4 Observers

bool owns_lock() const noexcept;
Returns: owns.

explicit operator bool() const noexcept;
Returns: owns.

mutex_type* mutex() const noexcept;
Returns: pm.

31.4.5 Generic locking algorithms

template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);

Requires: Each template parameter type shall satisfy the Cpp17Lockable requirements. [Note: The unique_lock class template meets these requirements when suitably instantiated. —end note]

Effects: Calls try_lock() for each argument in order beginning with the first until all arguments have been processed or a call to try_lock() fails, either by returning false or by throwing an exception. If a call to try_lock() fails, unlock() is called for all prior arguments with no further calls to try_lock().

Returns: -1 if all calls to try_lock() returned true, otherwise a zero-based index value that indicates the argument for which try_lock() returned false.
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

Requires: Each template parameter type shall satisfy the \texttt{Cpp17Lockable} requirements, [Note: The unique\_lock class template meets these requirements when suitably instantiated. — end note]

Effects: All arguments are locked via a sequence of calls to lock(), try\_lock(), or unlock() on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified. [Note: A deadlock avoidance algorithm such as try-and-back-off must be used, but the specific algorithm is not specified to avoid over-constraining implementations. — end note] If a call to lock() or try\_lock() throws an exception, unlock() is called for any argument that had been locked by a call to lock() or try\_lock().

31.4.6 Call once

31.4.6.1 Struct once\_flag

namespace std {

struct once\_flag {
    constexpr once\_flag() noexcept;

    once\_flag(const once\_flag&) = delete;
    once\_flag& operator=(const once\_flag&) = delete;
};

} // namespace std

The class once\_flag is an opaque data structure that call\_once uses to initialize data without causing a data race or deadlock.

constexpr once\_flag() noexcept;

Effects: Constructs an object of type once\_flag.

Synchronization: The construction of a once\_flag object is not synchronized.

Ensures: The object’s internal state is set to indicate to an invocation of call\_once with the object as its initial argument that no function has been called.

31.4.6.2 Function call\_once

template<class Callable, class... Args>
void call\_once(once\_flag& flag, Callable&& func, Args&&... args);

Requires:

\texttt{INVOLVE}(std::forward<Callable>(func), std::forward<Args>(args)...)

(see 19.14.3) shall be a valid expression.

Effects: An execution of call\_once that does not call its func is a passive execution. An execution of call\_once that calls its func is an active execution. An active execution shall call call\_once( std::forward<Callable>(func), std::forward<Args>(args)...). If such a call to func throws an exception the execution is exceptional, otherwise it is returning. An exceptional execution shall propagate the exception to the caller of call\_once. Among all executions of call\_once for any given once\_flag, at most one shall be a returning execution; if there is a returning execution, it shall be the last active execution; and there are passive executions only if there is a returning execution. [Note: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — end note]

Synchronization: For any given once\_flag: all active executions occur in a total order; completion of an active execution synchronizes with (6.8.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

Throws: system\_error when an exception is required (31.2.2), or any exception thrown by func.

[Example:

// global flag, regular function
void init();
std::once\_flag flag;]
void f() {
    std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
    void operator()();
};

void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
}

// object flag, member function
class information {
    std::once_flag verified;
    void verifier();
    public:
        void verify() { std::call_once(verified, &information::verifier, *this); }
};
— end example]

31.5 Condition variables

1 Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class condition_variable provides a condition variable that can only wait on an object of type unique_lock<mutex>, allowing maximum efficiency on some platforms. Class condition_variable_any provides a general condition variable that can wait on objects of user-supplied lock types.

2 Condition variables permit concurrent invocation of the wait, wait_for, wait_until, notify_one and notify_all member functions.

3 The execution of notify_one and notify_all shall be atomic. The execution of wait, wait_for, and wait_until shall be performed in three atomic parts:
   1. the release of the mutex and entry into the waiting state;
   2. the unblocking of the wait; and
   3. the reacquisition of the lock.

4 The implementation shall behave as if all executions of notify_one, notify_all, and each part of the wait, wait_for, and wait_until executions are executed in a single unspecified total order consistent with the 'happens before' order.

5 Condition variable construction and destruction need not be synchronized.

31.5.1 Header <condition_variable> synopsis

namespace std {
    class condition_variable;
    class condition_variable_any;

    void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

    enum class cv_status { no_timeout, timeout };
}

31.5.2 Non-member functions

void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

1 Requires: lk is locked by the calling thread and either
(1.1) no other thread is waiting on cond, or
lk.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

Effects: Transfers ownership of the lock associated with lk into internal storage and schedules cond to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification shall be as if:

lk.unlock();
cond.notify_all();

Synchronization: The implied lk.unlock() call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.

[Note: The supplied lock will be held until the thread exits, and care should be taken to ensure that this does not cause deadlock due to lock ordering issues. After calling notify_all_at_thread_exit it is recommended that the thread should be exited as soon as possible, and that no blocking or time-consuming tasks are run on that thread. — end note]

[Note: It is the user’s responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on lk, and that this lock is not released and reacquired prior to calling notify_all_at_thread_exit. — end note]

31.5.3 Class condition_variable

namespace std {
  class condition_variable {
    public:
      condition_variable();
      ~condition_variable();
      condition_variable(const condition_variable&) = delete;
      condition_variable& operator=(const condition_variable&) = delete;
      void notify_one() noexcept;
      void notify_all() noexcept;
      void wait(unique_lock<mutex>& lock);
      template<class Predicate>
        void wait(unique_lock<mutex>& lock, Predicate pred);
      template<class Clock, class Duration>
        cv_status wait_until(unique_lock<mutex>& lock,
                              const chrono::time_point<Clock, Duration>& abs_time);
      template<class Clock, class Duration, class Predicate>
        bool wait_until(unique_lock<mutex>& lock,
                        const chrono::time_point<Clock, Duration>& abs_time,
                        Predicate pred);
      template<class Rep, class Period>
        cv_status wait_for(unique_lock<mutex>& lock,
                             const chrono::duration<Rep, Period>& rel_time);
      template<class Rep, class Period, class Predicate>
        bool wait_for(unique_lock<mutex>& lock,
                      const chrono::duration<Rep, Period>& rel_time,
                      Predicate pred);
  using native_handle_type = implementation-defined; // see 31.2.3
  native_handle_type native_handle(); // see 31.2.3
  }
};

1 The class condition_variable shall be a standard-layout class (10.1).

condition_variable();

Effects: Constructs an object of type condition_variable.

Throws: system_error when an exception is required (31.2.2).

Error conditions:
(4.1) 

— resource_unavailable_try_again — if some non-memory resource limitation prevents initialization.

~condition_variable();

5

Requires: There shall be no thread blocked on *this. [Note: That is, all threads shall have been notified; they may subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. — end note]

Effects: Destroys the object.

void notify_one() noexcept;

Effects: If any threads are blocked waiting for *this, unblocks one of those threads.

void notify_all() noexcept;

Effects: Unblocks all threads that are blocked waiting for *this.

void wait(unique_lock<mutex>& lock);

Requires: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either

(9.1) — no other thread is waiting on this condition_variable object or

(9.2) — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

Effects:

(10.1) — Atomically calls lock.unlock() and blocks on *this.

(10.2) — When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.

(10.3) — The function will unblock when signaled by a call to notify_one() or a call to notify_all(), or spuriously.

Remarks: If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

Ensures: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Throws: Nothing.

template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);

Requires: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either

(14.1) — no other thread is waiting on this condition_variable object or

(14.2) — lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:

while (!pred())
    wait(lock);

Remarks: If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

Ensures: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Throws: Any exception thrown by pred.

template<class Clock, class Duration>

cv_status wait_until(unique_lock<mutex>& lock,
        const chrono::time_point<Clock, Duration>& abs_time);

Requires: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either

(19.1) — no other thread is waiting on this condition_variable object or
lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

**Effects:**
- Atomically calls lock.unlock() and blocks on *this.
- When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.
- The function will unblock when signaled by a call to notify_one(), a call to notify_all(), expiration of the absolute timeout (31.2.4) specified by abs_time, or spuriously.
- If the function exits via an exception, lock.lock() shall be called prior to exiting the function.

**Remarks:** If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

**Ensures:** lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

**Returns:** cv_status::timeout if the absolute timeout (31.2.4) specified by abs_time expired, otherwise cv_status::no_timeout.

**Throws:** Timeout-related exceptions (31.2.4).

```cpp
template<class Rep, class Period>
void cv_status wait_for(unique_lock<mutex>& lock,
const chrono::duration<Rep, Period>& rel_time);
```

**Requires:** lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
- no other thread is waiting on this condition_variable object or
- lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

**Effects:** Equivalent to:
```
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

**Returns:** cv_status::timeout if the relative timeout (31.2.4) specified by rel_time expired, otherwise cv_status::no_timeout.

**Remarks:** If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

**Ensures:** lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

**Throws:** Timeout-related exceptions (31.2.4).

```cpp
template<class Clock, class Duration, class Predicate>
bool wait_until(unique_lock<mutex>& lock,
const chrono::time_point<Clock, Duration>& abs_time,
Predicate pred);
```

**Requires:** lock.owns_lock() is true and lockmutex() is locked by the calling thread, and either
- no other thread is waiting on this condition_variable object or
- lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

**Effects:** Equivalent to:
```
while (!pred())
  if (wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
return true;
```

**Remarks:** If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

**Ensures:** lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

[Note: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered. — end note]

**Throws:** Timeout-related exceptions (31.2.4) or any exception thrown by pred.
template<class Rep, class Period, class Predicate>
bool wait_for(unique_lock<mutex>& lock,
    const chrono::duration<Rep, Period>& rel_time,
    Predicate pred);

**Requires:** lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(37.1) no other thread is waiting on this condition_variable object or
(37.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently waiting (via wait, wait_for, or wait_until) threads.

**Effects:** Equivalent to:
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

[Note: There is no blocking if pred() is initially true, even if the timeout has already expired. — end note]

**Remarks:** If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

**Ensures:** lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

[Note: The returned value indicates whether the predicate evaluates to true regardless of whether the timeout was triggered. — end note]

**Throws:** Timeout-related exceptions (31.2.4) or any exception thrown by pred.

### 31.5.4 Class condition_variable_any

A Lock type shall satisfy the Cpp17BasicLockable requirements (31.2.5.2). [Note: All of the standard mutex types meet this requirement. If a Lock type other than one of the standard mutex types or a unique_lock wrapper for a standard mutex type is used with condition_variable_any, the user should ensure that any necessary synchronization is in place with respect to the predicate associated with the condition_variable_any instance. — end note]

namespace std {
    class condition_variable_any {
    public:
        condition_variable_any();
        ~condition_variable_any();

        condition_variable_any(const condition_variable_any&) = delete;
        condition_variable_any& operator=(const condition_variable_any&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;

        template<class Lock>
        void wait(Lock& lock);
        template<class Lock, class Predicate>
        void wait(Lock& lock, Predicate pred);

        template<class Lock, class Clock, class Duration>
        cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Lock, class Clock, class Duration, class Predicate>
        bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                        Predicate pred);
        template<class Lock, class Rep, class Period>
        cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
        template<class Lock, class Rep, class Period, class Predicate>
        bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
    }
}

condition_variable_any();

**Effects:** Constructs an object of type condition_variable_any.

**Throws:** bad_alloc or system_error when an exception is required (31.2.2).
Error conditions:

(4.1) resource_unavailable_try_again — if some non-memory resource limitation prevents initialization.

(4.2) operation_not_permitted — if the thread does not have the privilege to perform the operation.

Requires: There shall be no thread blocked on *this. [Note: That is, all threads shall have been notified; they may subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. The user should take care to ensure that no threads wait on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. —end note]

Effects: Destroys the object.

void notify_one() noexcept;

Effects: If any threads are blocked waiting for *this, unblocks one of those threads.

void notify_all() noexcept;

Effects: Unblocks all threads that are blocked waiting for *this.

template<class Lock>
void wait(Lock& lock);

Effects:

(9.1) Atomically calls lock.unlock() and blocks on *this.

(9.2) When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.

(9.3) The function will unblock when signaled by a call to notify_one(), a call to notify_all(), or spuriously.

Remarks: If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. —end note]

Ensures: lock is locked by the calling thread.

Throws: Nothing.

template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);

Effects: Equivalent to:

while (!pred())
   wait(lock);

template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);

Effects:

(14.1) Atomically calls lock.unlock() and blocks on *this.

(14.2) When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.

(14.3) The function will unblock when signaled by a call to notify_one(), a call to notify_all(), expiration of the absolute timeout (31.2.4) specified by abs_time, or spuriously.

(14.4) If the function exits via an exception, lock.lock() shall be called prior to exiting the function.

Remarks: If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. —end note]

Ensures: lock is locked by the calling thread.

Returns: cv_status::timeout if the absolute timeout (31.2.4) specified by abs_time expired, otherwise cv_status::no_timeout.

Throws: Timeout-related exceptions (31.2.4).
```cpp
template<class Lock, class Rep, class Period>
    cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);

Effects: Equivalent to:
    return wait_until(lock, chrono::steady_clock::now() + rel_time);

Returns: cv_status::timeout if the relative timeout (31.2.4) specified by rel_time expired, otherwise
    cv_status::no_timeout.

Remarks: If the function fails to meet the postcondition, terminate() shall be called (13.5.1). [Note: This can happen if the re-locking of the mutex throws an exception. — end note]

Ensures: lock is locked by the calling thread.

Throws: Timeout-related exceptions (31.2.4).
```

```cpp
template<class Lock, class Clock, class Duration, class Predicate>
    bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

Effects: Equivalent to:
    while (!pred())
        if (wait_until(lock, abs_time) == cv_status::timeout)
            return pred();
    return true;

[Note: There is no blocking if pred() is initially true, or if the timeout has already expired. — end note]

[Note: The returned value indicates whether the predicate evaluates to true regardless of whether the
    timeout was triggered. — end note]

template<class Lock, class Rep, class Period, class Predicate>
    bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

Effects: Equivalent to:
    return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

### 31.6 Futures [futures]

#### 31.6.1 Overview [futures.overview]

31.6 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread. [Note: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

#### 31.6.2 Header <future> synopsis [future.syn]

```cpp
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
    implementation-defined
    };

    enum class future_status {
        ready,
        timeout,
        deferred
    };
```
template<> struct is_error_code_enum<future_errc> : public true_type { }

error_code make_error_code(future_errc e) noexcept;

error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

class future_error;

template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

template<class> class packaged_task;
// not defined

template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);

1 The enum type launch is a bitmask type (15.4.2.1.4) with elements launch::async and launch::deferred.
[Note: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched
by async() applicable to a corresponding subset of available launch policies. Implementations can extend
the behavior of the first overload of async() by adding their extensions to the launch policy under the “as if”
rule. — end note]

2 The enum values of future_errc are distinct and not zero.

31.6.3 Error handling

const error_category& future_category() noexcept;

1 Returns: A reference to an object of a type derived from class error_category.

2 The object’s default_error_condition and equivalent virtual functions shall behave as specified for
the class error_category. The object’s name virtual function shall return a pointer to the string
“future”.

error_code make_error_code(future_errc e) noexcept;

3 Returns: error_code(static_cast<int>(e), future_category()).

error_condition make_error_condition(future_errc e) noexcept;

4 Returns: error_condition(static_cast<int>(e), future_category()).
31.6.4 Class future_error

namespace std {
    class future_error : public logic_error {
    public:
        explicit future_error(future_errc e);

        const error_code& code() const noexcept;
        const char* what() const noexcept;

    private:
        error_code ec_; // exposition only
    }
};

explicit future_error(future_errc e);

Effects: Constructs an object of class future_error and initializes ec_ with make_error_code(e).

const error_code& code() const noexcept;

Returns: ec_.

const char* what() const noexcept;

Returns: An NTBS incorporating code().message().

31.6.5 Shared state

Many of the classes introduced in this subclause use some state to communicate results. This shared state consists of some state information and some (possibly not yet evaluated) result, which can be a (possibly void) value or an exception. [Note: Futures, promises, and tasks defined in this clause reference such shared state. — end note]

[Note: The result can be any kind of object including a function to compute that result, as used by async when policy is launch::deferred. — end note]

An asynchronous return object is an object that reads results from a shared state. A waiting function of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (31.2.5), then it is a timed waiting function, otherwise it is a non-timed waiting function.

An asynchronous provider is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider. [Note: Such as promises or tasks. — end note] The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

(5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and

(5.2) — the return object or provider gives up its reference to its shared state; and

(5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to std::async, the shared state is not yet ready, and this was the last reference to the shared state.

When an asynchronous provider is said to make its shared state ready, it means:

(6.1) — first, the provider marks its shared state as ready; and

(6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

When an asynchronous provider is said to abandon its shared state, it means:

(7.1) — first, if that state is not ready, the provider

(7.1.1) — stores an exception object of type future_error with an error condition of broken.promise within its shared state; and then

(7.1.2) — makes its shared state ready;

(7.2) — second, the provider releases its shared state.
A shared state is ready only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

Calls to functions that successfully set the stored result of a shared state synchronize with (6.8.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.8.2) the successful return from a call to a waiting function on the shared state.

Some functions (e.g., promise::set_value_at_thread_exit) delay making the shared state ready until the calling thread exits. The destruction of each of that thread’s objects with thread storage duration (6.6.4.2) is sequenced before making that shared state ready.

Access to the result of the same shared state may conflict (6.8.2). [Note: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (15.5.5.9). For example, concurrent accesses through references returned by shared_future::get() (31.6.8) must either use read-only operations or provide additional synchronization. — end note]

31.6.6 Class template promise

```cpp
namespace std {
    template<class R>
    class promise {
        public:
            promise();
            template<class Allocator>
            promise(allocator_arg_t, const Allocator& a);
            promise(promise&& rhs) noexcept;
            promise(const promise& rhs) = delete;
            ~promise();

            // assignment
            promise& operator=(promise&& rhs) noexcept;
            promise& operator=(const promise& rhs) = delete;
            void swap(promise& other) noexcept;

            // retrieving the result
            future<R> get_future();

            // setting the result
            void set_value(see below);
            void set_exception(exception_ptr p);

            // setting the result with deferred notification
            void set_value_at_thread_exit(see below);
            void set_exception_at_thread_exit(exception_ptr p);
        }

        template<class R>
        void swap(promise<R>& x, promise<R>& y) noexcept;

        template<class R, class Alloc>
        struct uses_allocator<promise<R>, Alloc> {
        }
    }
}
```

1 The implementation shall provide the template promise and two specializations, promise<R&> and promise<void>. These differ only in the argument type of the member functions set_value and set_value_at_thread_exit, as set out in their descriptions, below.

2 The set_value, set_exception, set_value_at_thread_exit, and set_exception_at_thread_exit member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.
§ 31.6.6 1506

---

: true_type { };

Requires: Alloc shall satisfy the Cpp17Allocator requirements (Table 34).

promise();

template<class Allocator>
    promise(allocation_arg_t, const Allocator& a);

Effects: Constructs a promise object and a shared state. The second constructor uses the allocator a to allocate memory for the shared state.

promise(promise&& rhs) noexcept;

Effects: Constructs a new promise object and transfers ownership of the shared state of rhs (if any) to the newly-constructed object.

Ensures: rhs has no shared state.

~promise();

Effects: Abandons any shared state (31.6.5).

promise& operator=(promise&& rhs) noexcept;

Effects: Abandons any shared state (31.6.5) and then as if promise(std::move(rhs)).swap(*this).

Returns: *this.

void swap(promise& other) noexcept;

Effects: Exchanges the shared state of *this and other.

Ensures: *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

future<R> get_future();

Returns: A future<R> object with the same shared state as *this.

Synchronization: Calls to this function do not introduce data races (6.8.2) with calls to set_value, set_exception, set_value_at_thread_exit, or set_exception_at_thread_exit. [Note: Such calls need not synchronize with each other. — end note]

Throws: future_error if *this has no shared state or if get_future has already been called on a promise with the same shared state as *this.

Error conditions:

(15.1) future_already_retrieved if get_future has already been called on a promise with the same shared state as *this.

(15.2) no_state if *this has no shared state.

void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();

Effects: Atomically stores the value r in the shared state and makes that state ready (31.6.5).

Throws:

(17.1) future_error if its shared state already has a stored value or exception, or

(17.2) for the first version, any exception thrown by the constructor selected to copy an object of R, or

(17.3) for the second version, any exception thrown by the constructor selected to move an object of R.

Error conditions:

(18.1) promise_already_satisfied if its shared state already has a stored value or exception.

(18.2) no_state if *this has no shared state.

void set_exception(exception_ptr p);

Requires: p is not null.
Effects: Atomically stores the exception pointer \( p \) in the shared state and makes that state ready (31.6.5).

**Throws:** future_error if its shared state already has a stored value or exception.

**Error conditions:**
- promise_already_satisfied if its shared state already has a stored value or exception.
- no_state if \( *\text{this} \) has no shared state.

```cpp
void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();
```

Effects: Stores the value \( r \) in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

**Throws:**
- future_error if its shared state already has a stored value or exception, or
- for the first version, any exception thrown by the constructor selected to copy an object of \( R \), or
- for the second version, any exception thrown by the constructor selected to move an object of \( R \).

**Error conditions:**
- promise_already_satisfied if its shared state already has a stored value or exception.
- no_state if \( *\text{this} \) has no shared state.

```cpp
void set_exception_at_thread_exit(exception_ptr p);
```

*Requires:* \( p \) is not null.

Effects: Stores the exception pointer \( p \) in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

**Throws:** future_error if an error condition occurs.

**Error conditions:**
- promise_already_satisfied if its shared state already has a stored value or exception.
- no_state if \( *\text{this} \) has no shared state.

```cpp
template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;
```

Effects: As if by \( x.\text{swap}(y) \).

### 31.6.7 Class template future [futures.unique_future]

The class template **future** defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed future object has no shared state. A future object with shared state can be created by functions on asynchronous providers (31.6.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a future object can be set by calling a respective function on an object that shares the same shared state.

**Note:** Member functions of future do not synchronize with themselves or with member functions of shared_future. — end note

The effect of calling any member function other than the destructor, the move-assignment operator, share, or valid on a future object for which valid() == false is undefined. **Note:** It is valid to move from a future object for which valid() == false. — end note

**Note:** Implementations should detect this case and throw an object of type future_error with an error condition of future_errc::no_state. — end note

```cpp
namespace std {
    template<class R>
    class future {
```
public:
    future() noexcept;
    future(future&&) noexcept;
    future(const future& rhs) = delete;
    ~future();
    future& operator=(const future& rhs) = delete;
    future& operator=(future&&) noexcept;
    shared_future<R> share() noexcept;

    // retrieving the value
    see below get();

    // functions to check state
    bool valid() const noexcept;

    void wait() const;
    template<class Rep, class Period>
        future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
    template<class Clock, class Duration>
        future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
};

4 The implementation shall provide the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

future() noexcept;
5 Effects: Constructs an empty `future` object that does not refer to a shared state.
6 Ensures: valid() == false.

future(future&& rhs) noexcept;
7 Effects: Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).
8 Ensures:
   (8.1) valid() returns the same value as rhs.valid() prior to the constructor invocation.
   (8.2) rhs.valid() == false.

~future();
9 Effects:
   (9.1) Releases any shared state (31.6.5);
   (9.2) destroys *this.

future& operator=(future&& rhs) noexcept;
10 Effects:
   (10.1) Releases any shared state (31.6.5).
   (10.2) move assigns the contents of `rhs` to *this.
11 Ensures:
   (11.1) valid() returns the same value as rhs.valid() prior to the assignment.
   (11.2) rhs.valid() == false.

shared_future<R> share() noexcept;
12 Returns: shared_future<R>(std::move(*this)).
13 Ensures: valid() == false.

R future::get();
R& future<R&>::get();
void future<void>::get();

[Note: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

Effects:
(15.1) — wait()s until the shared state is ready, then retrieves the value stored in the shared state;
(15.2) — releases any shared state (31.6.5).

Returns:
(16.1) — future::get() returns the value stored in the object’s shared state as std::move(v).
(16.2) — future<R&>::get() returns the reference stored as value in the object’s shared state.
(16.3) — future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

Ensure: valid() == false.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (31.6.9), otherwise blocks until the shared state is ready or until the relative timeout (31.2.4) specified by rel_time has expired.

Returns:
(22.1) — future_status::deferred if the shared state contains a deferred function.
(22.2) — future_status::ready if the shared state is ready.
(22.3) — future_status::timeout if the function is returning because the relative timeout (31.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (31.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;

Effects: None if the shared state contains a deferred function (31.6.9), otherwise blocks until the shared state is ready or until the absolute timeout (31.2.4) specified by abs_time has expired.

Returns:
(25.1) — future_status::deferred if the shared state contains a deferred function.
(25.2) — future_status::ready if the shared state is ready.
(25.3) — future_status::timeout if the function is returning because the absolute timeout (31.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (31.2.4).

31.6.8 Class template shared_future

The class template shared_future defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed shared_future object has no shared state. A shared_future object with shared state can be created by conversion from a future object and shares its shared state with the original asynchronous provider (31.6.5) of the shared state. The result (value or exception) of a shared_future object can be set by calling a respective function on an object that shares the same shared state.

[Note: Member functions of shared_future do not synchronize with themselves, but they synchronize with the shared state. — end note]
The effect of calling any member function other than the destructor, the move-assignment operator, the

The implementation shall provide the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

`shared_future()` noexcept;

Effects: Constructs an empty `shared_future` object that does not refer to a shared state.

Ensures: `valid()` == false.

`shared_future(const shared_future& rhs)` noexcept;

Effects: Constructs a `shared_future` object that refers to the same shared state as `rhs` (if any).

Ensures: `valid()` returns the same value as `rhs.valid()`.

`shared_future(future<R>&& rhs)` noexcept;

`shared_future(shared_future&& rhs)` noexcept;

Effects: Move constructs a `shared_future` object that refers to the shared state that was originally referred to by `rhs` (if any).

Ensures:

(10.1) — `valid()` returns the same value as `rhs.valid()` returned prior to the constructor invocation.

(10.2) — `rhs.valid()` == false.

`~shared_future();`

Effects:

(11.1) — Releases any shared state (31.6.5);

(11.2) — destroys `*this`.

`shared_future& operator=(shared_future&& rhs)` noexcept;

Effects:
— Releases any shared state (31.6.5);

move assigns the contents of \( \text{rhs} \) to \(*\text{this}.*

**Ensures:**
— \( \text{valid()} \) returns the same value as \( \text{rhs.valid()} \) returned prior to the assignment.
— \( \text{rhs.valid()} == \text{false} \).

\[ \text{shared_future} \& \text{operator=}(\text{const shared_future} \& \text{rhs}) \text{ noexcept}; \]

**Effects:**
— Releases any shared state (31.6.5);
— assigns the contents of \( \text{rhs} \) to \(*\text{this}.* [\text{Note}: \text{As a result, } \*\text{this} \text{ refers to the same shared state as } \text{rhs} \text{ (if any).} \text{ — end note}]\n
**Ensures:** \( \text{valid()} == \text{rhs.valid()} \).

\[ \text{const R} \& \text{shared_future}::\text{get()} \text{ const}; \]
\[ \text{R} \& \text{shared_future}<\text{R} \&>::\text{get()} \text{ const}; \]
\[ \text{void shared_future<}\text{void}>::\text{get()} \text{ const}; \]

[\text{Note}: \text{As described above, the template and its two required specializations differ only in the return type and return value of the member function get.} \text{ — end note}]\n
[\text{Note}: \text{Access to a value object stored in the shared state is unsynchronized, so programmers should apply only those operations on R that do not introduce a data race (6.8.2).} \text{ — end note}]\n
**Effects:** \( \text{wait()} \) until the shared state is ready, then retrieves the value stored in the shared state.

**Returns:**
— \( \text{shared_future}::\text{get()} \) returns a const reference to the value stored in the object’s shared state. [\text{Note}: \text{Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the shared_future object that returned the reference.} \text{ — end note}]\n— \( \text{shared_future}<\text{R} \&>::\text{get()} \) returns the reference stored as value in the object’s shared state.
— \( \text{shared_future<}\text{void}>::\text{get()} \) returns nothing.

**Throws:** The stored exception, if an exception was stored in the shared state.

\[ \text{bool valid()} \text{ const noexcept}; \]

**Returns:** \( \text{true} \) only if \( \*\text{this} \) refers to a shared state.

\[ \text{void wait()} \text{ const}; \]

**Effects:** Blocks until the shared state is ready.

\[ \text{template<}\text{class Rep, class Period}> \]
\[ \text{future_status wait_for(const chrono::duration<Rep, Period>& rel_time)} \text{ const}; \]

**Effects:** None if the shared state contains a deferred function (31.6.9), otherwise blocks until the shared state is ready or until the relative timeout (31.2.4) specified by \( \text{rel_time} \) has expired.

**Returns:**
— \( \text{future_status::deferred} \) if the shared state contains a deferred function.
— \( \text{future_status::ready} \) if the shared state is ready.
— \( \text{future_status::timeout} \) if the function is returning because the relative timeout (31.2.4) specified by \( \text{rel_time} \) has expired.

**Throws:** timeout-related exceptions (31.2.4).

\[ \text{template<}\text{class Clock, class Duration}> \]
\[ \text{future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time)} \text{ const}; \]

**Effects:** None if the shared state contains a deferred function (31.6.9), otherwise blocks until the shared state is ready or until the absolute timeout (31.2.4) specified by \( \text{abs_time} \) has expired.

**Returns:**
— future_status::deferred if the shared state contains a deferred function.
— future_status::ready if the shared state is ready.
— future_status::timeout if the function is returning because the absolute timeout (31.2.4) specified by abs_time has expired.

28 Throes: timeout-related exceptions (31.2.4).

31.6.9 Function template async

1 The function template async provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a future object with which it shares a shared state.

```cpp
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
```

2 Requires: F and each T\textsubscript{i} in Args shall satisfy the Cpp17MoveConstructible requirements, and

\[
\text{INVOKE}(\text{DECAY\_COPY}(\text{std::forward\<F\>(f)}), \text{DECAY\_COPY}(\text{std::forward\<Args\>(args)})...)
\]

shall be a valid expression.

3 Effects: The first function behaves the same as a call to the second function with a policy argument of launch::async | launch::deferred and the same arguments for F and Args. The second function creates a shared state that is associated with the returned future object. The further behavior of the second function depends on the policy argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

1. If launch::async is set in policy, calls \text{INVOKE}(\text{DECAY\_COPY}(\text{std::forward\<F\>(f)}), \text{DECAY\_COPY}(\text{std::forward\<Args\>(args)})...)
   (19.14.3, 31.3.2.2) as if in a new thread of execution represented by a thread object with the calls to \text{DECAY\_COPY} being evaluated in the thread that called async. Any return value is stored as the result in the shared state. Any exception propagated from the execution of \text{INVOKE}(\text{DECAY\_COPY}(\text{std::forward\<F\>(f)}), \text{DECAY\_COPY}(\text{std::forward\<Args\>(args)})...)
   is stored as the exceptional result in the shared state. The thread object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

2. If launch::deferred is set in policy, stores \text{DECAY\_COPY}(\text{std::forward\<F\>(f)}) and \text{DECAY\_COPY}(\text{std::forward\<Args\>(args)})... in the shared state. These copies of f and args constitute a deferred function. Invocation of the deferred function evaluates \text{INVOKE}(\text{std::move\(g\)}, \text{std::move\(xyz\)}) where g is the stored value of \text{DECAY\_COPY}(\text{std::forward\<F\>(f)}) and xyz is the stored copy of \text{DECAY\_COPY}(\text{std::forward\<Args\>(args)})... Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (31.6.5) on an asynchronous return object referring to this shared state shall invoke the deferred function in the thread that called the waiting function. Once evaluation of \text{INVOKE}(\text{std::move\(g\)}, \text{std::move\(xyz\)}) begins, the function is no longer considered deferred. [Note: If this policy is specified together with other policies, such as when using a policy value of launch::async | launch::deferred, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited. — end note]

3. If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

4 Returns: An object of type future<invoke_result_t<decay_t<F>, decay_t<Args>...>> that refers to the shared state created by this call to async. [Note: If a future obtained from async is moved outside the local scope, other code that uses the future should be aware that the future’s destructor may block for the shared state to become ready. — end note]

5 Synchronization: Regardless of the provided policy argument,
the invocation of async synchronizes with (6.8.2) the invocation of \( f \). [Note: This statement applies even when the corresponding future object is moved to another thread. — end note] and

the completion of the function \( f \) is sequenced before (6.8.2) the shared state is made ready. [Note: \( f \) might not be called at all, so its completion might never happen. — end note]

If the implementation chooses the launch::async policy,

— a call to a waiting function on an asynchronous return object that shares the shared state created by this async call shall block until the associated thread has completed, as if joined, or else time out (31.3.2.5);

— the associated thread completion synchronizes with (6.8.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

Throws: system_error if policy == launch::async and the implementation is unable to start a new thread, or std::bad_alloc if memory for the internal data structures could not be allocated.

Error conditions:

— resource_unavailable_try_again — if policy == launch::async and the system is unable to start a new thread.

[Example:

```cpp
template<class R, class... ArgTypes>
class packaged_task
{
public:

  packaged_task() noexcept;
  template<class F>
  explicit packaged_task(F&& f);
  ~packaged_task();

  // no copy
  packaged_task(const packaged_task&) = delete;
  packaged_task& operator=(const packaged_task&) = delete;

  // move support
  packaged_task(packaged_task&& rhs) noexcept;
  packaged_task& operator=(packaged_task&& rhs) noexcept;
  void swap(packaged_task& other) noexcept;

  bool valid() const noexcept;

  void swap(packaged_task& other) noexcept;
};
```

[Note: Line #1 might not result in concurrency because the async call uses the default policy, which may use launch::deferred, in which case the lambda might not be invoked until the get() call; in that case, work1 and work2 are called on the same thread and there is no concurrency. — end note] — end example]
// result retrieval
future<R> get_future();

// execution
void operator()(ArgTypes...);
void make_ready_at_thread_exit(ArgTypes...);

void reset();

};

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;

31.6.10.1 Member functions [futures.task.members]

packaged_task() noexcept;

Effects: Constructs a packaged_task object with no shared state and no stored task.

template<class F>
packaged_task(F&& f);

Requires: INVOKE<R>(f, t_1, t_2, ..., t_N) (19.14.3), where t_1, t_2, ..., t_N are values of the corresponding types in ArgTypes..., shall be a valid expression. Invoking a copy of f shall behave the same as invoking f.

Remarks: This constructor shall not participate in overload resolution if remove_cvref_t<F> is the same type as packaged_task<R(ArgTypes...)>

Effects: Constructs a new packaged_task object with a shared state and initializes the object’s stored task with std::forward<F>(f).

Throws: Any exceptions thrown by the copy or move constructor of f, or bad_alloc if memory for the internal data structures could not be allocated.

packaged_task(packaged_task&& rhs) noexcept;

Effects: Constructs a new packaged_task object and transfers ownership of rhs’s shared state to *this, leaving rhs with no shared state. Moves the stored task from rhs to *this.

Ensures: rhs has no shared state.

packaged_task& operator=(packaged_task&& rhs) noexcept;

Effects:— Releasing any shared state (31.6.5);
— calls packaged_task(std::move(rhs)).swap(*this).

~packaged_task();

Effects: Abandons any shared state (31.6.5).

void swap(packaged_task& other) noexcept;

Effects: Exchanges the shared states and stored tasks of *this and other.

Ensures: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

bool valid() const noexcept;

Returns: true only if *this has a shared state.

future<R> get_future();

Returns: A future object that shares the same shared state as *this.

Synchronization: Calls to this function do not introduce data races (6.8.2) with calls to operator() or make_ready_at_thread_exit. [Note: Such calls need not synchronize with each other. — end note]

Throws: A future_error object if an error occurs.
Error conditions:

— future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.

— no_state if *this has no shared state.

void operator()(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t₁, t₂, ..., tₙ) (19.14.3), where f is the stored task of *this and t₁, t₂, ..., tₙ are the values in args... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.

Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.

Error conditions:

— promise_already_satisfied if the stored task has already been invoked.

— no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t₁, t₂, ..., tₙ) (19.14.3), where f is the stored task and t₁, t₂, ..., tₙ are the values in args... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this shall be done without making that state ready (31.6.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

Throws: future_error if an error condition occurs.

Error conditions:

— promise_already_satisfied if the stored task has already been invoked.

— no_state if *this has no shared state.

void reset();

Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this. [Note: This constructs a new shared state for *this. The old state is abandoned (31.6.5). — end note]

Throws:

— bad_alloc if memory for the new shared state could not be allocated.

— any exception thrown by the move constructor of the task stored in the shared state.

— future_error with an error condition of no_state if *this has no shared state.

31.6.10.2 Globals  [futures.task.nonmembers]

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)> & x, packaged_task<R(ArgTypes...)> & y) noexcept;

Effects: As if by x.swap(y).
Annex A  (informative)
Grammar summary

1 This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.8, 9.1, 10.7) must be applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules must be used to weed out syntactically valid but meaningless constructs.

A.1 Keywords

1 New context-dependent keywords are introduced into a program by typedef (9.1.3), namespace (9.7.1), class (Clause 10), enumeration (9.6), and template (Clause 12) declarations.

Annex B  (informative)
Implementation quantities  [implimits]

1 Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.

2 The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.

(2.1)  — Nesting levels of compound statements (8.3), iteration control structures (8.5), and selection control structures (8.4) [256].

(2.2)  — Nesting levels of conditional inclusion (14.1) [256].

(2.3)  — Pointer (9.2.3.1), array (9.2.3.4), and function (9.2.3.5) declarators (in any combination) modifying a class, arithmetic, or incomplete type in a declaration [256].

(2.4)  — Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].

(2.5)  — Number of characters in an internal identifier (5.10) or macro name (14.3) [1024].

(2.6)  — Number of characters in an external identifier (5.10, 6.5) [1024].

(2.7)  — External identifiers (6.5) in one translation unit [65536].

(2.8)  — Identifiers with block scope declared in one block (6.3.3) [1024].

(2.9)  — Structured bindings (9.5) introduced in one declaration [256].

(2.10) — Macro identifiers (14.3) simultaneously defined in one translation unit [65536].

(2.11) — Parameters in one function definition (9.4.1) [256].

(2.12) — Arguments in one function call (7.6.1.2) [256].

(2.13) — Parameters in one macro definition (14.3) [256].

(2.14) — Arguments in one macro invocation (14.3) [256].

(2.15) — Characters in one logical source line (5.2) [65536].

(2.16) — Characters in a string literal (5.13.5) (after concatenation (5.2)) [65536].

(2.17) — Size of an object (6.6.2) [262144].

(2.18) — Nesting levels for #include files (14.2) [256].

(2.19) — Case labels for a switch statement (8.4.2) (excluding those for any nested switch statements) [16384].

(2.20) — Non-static data members (including inherited ones) in a single class (10.3) [16384].

(2.21) — Lambda-captures in one lambda-expression (7.5.5.2) [256].

(2.22) — Enumeration constants in a single enumeration (9.6) [4096].

(2.23) — Levels of nested class definitions (10.3.10) in a single member-specification [256].

(2.24) — Functions registered by atexit() (16.5) [32].

(2.25) — Functions registered by at_quick_exit() (16.5) [32].

(2.26) — Direct and indirect base classes (10.6) [16384].

(2.27) — Direct base classes for a single class (10.6) [1024].

(2.28) — Class members declared in a single member-specification (including member functions) (10.3) [4096].

(2.29) — Final overriding virtual functions in a class, accessible or not (10.6.2) [16384].

(2.30) — Direct and indirect virtual bases of a class (10.6.1) [1024].
© ISO/IEC

N4791

(2.31) — Static data members of a class (10.3.8.2) [1024].
(2.32) — Friend declarations in a class (10.8.3) [4096].
(2.33) — Access control declarations in a class (10.8.1) [4096].
(2.34) — Member initializers in a constructor definition (10.9.2) [6144].
(2.35) — initializer-clauses in one braced-init-list (9.3) [16384].
(2.36) — Scope qualifications of one identifier (7.5.4.2) [256].
(2.37) — Nested linkage-specifications (9.10) [1024].
(2.38) — Recursive constexpr function invocations (9.1.5) [512].
(2.39) — Full-expressions evaluated within a core constant expression (7.7) [1048576].
(2.40) — Template parameters in a template declaration (12.1) [1024].
(2.41) — Recursively nested template instantiations (12.8.1), including substitution during template argument deduction (12.9.2) [1024].
(2.42) — Handlers per try block (13.3) [256].
(2.43) — Number of placeholders (19.14.14.4) [10].
Annex C  (informative)

Compatibility

C.1  C++ and ISO C

This subclause lists the differences between C++ and ISO C, by the chapters of this document.

C.1.1  Clause 5: lexical conventions

1  Affected subclause: 5.11
Change: New Keywords
New keywords are added to C++; see 5.11.
Rationale: These keywords were added in order to implement the new semantics of C++.
Effect on original feature: Change to semantics of well-defined feature. Any ISO C programs that used
any of these keywords as identifiers are not valid C++ programs.
Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a
large collection of related programs takes more work.
How widely used: Common.

2  Affected subclause: 5.13.3
Change: Type of character literal is changed from int to char.
Rationale: This is needed for improved overloaded function argument type matching. For example:

```c
int function( int i );
int function( char c );

function( 'x' );
```

It is preferable that this call match the second version of function rather than the first.
Effect on original feature: Change to semantics of well-defined feature. ISO C programs which depend on

```
sizeof('x') == sizeof(int)
```

will not work the same as C++ programs.
Difficulty of converting: Simple.
How widely used: Programs which depend upon `sizeof('x')` are probably rare.

3  Affected subclause: 5.13.5
Change: String literals made const.
The type of a string literal is changed from “array of char” to “array of const char”. The type of a UTF-8
string literal is changed from “array of char” to “array of const char8_t”. The type of a char16_t string
literal is changed from “array of some-integer-type” to “array of const char16_t”. The type of a char32_t
string literal is changed from “array of some-integer-type” to “array of const char32_t”. The type of a wide
string literal is changed from “array of wchar_t” to “array of const wchar_t”.
Rationale: This avoids calling an inappropriate overloaded function, which might expect to be able to
modify its argument.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Syntactic transformation. The fix is to add a cast:

```c
char* p = "abc";
void f(char*) {
    char* p = (char*)"abc"; // OK: cast added
    f(p);
    f((char*)"def"); // OK: cast added
}
```

How widely used: Programs that have a legitimate reason to treat string literals as pointers to potentially
modifiable memory are probably rare.
C.1.2 Clause 6: basics

1 Affected subclause: 6.1
Change: C++ does not have “tentative definitions” as in C.
E.g., at file scope,

```c
int i;
int i;
```
is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local static objects, if initializers are restricted to the syntactic forms of C. For example,

```c
struct X { int i; struct X* next; };
static struct X a;
static struct X b = { 0, &a };
static struct X a = { 1, &b };
```

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local static objects must invoke a function call to achieve the initialization.

How widely used: Seldom.

2 Affected subclause: 6.3
Change: A `struct` is a scope in C++, not in C.
Rationale: Class scope is crucial to C++, and a struct is a class.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

3 Affected subclause: 6.5 [also 9.1.7]
Change: A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

Rationale: Because const objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each const object. This feature allows the user to put const objects in source files that are included in more than one translation unit.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

4 Affected subclause: 6.8.3.1
Change: The `main` function cannot be called recursively and cannot have its address taken.
Rationale: The `main` function may require special actions.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Trivial: create an intermediary function such as `mymain(argc, argv)`.

How widely used: Seldom.

5 Affected subclause: 6.7
Change: C allows “compatible types” in several places, C++ does not.

For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.

How widely used: Common.

C.1.3 Clause 7: expressions

1 Affected subclause: 7.3.11
Change: Converting `void*` to a pointer-to-object type requires casting.

```c
char a[10];
```
ISO C will accept this usage of pointer to void being assigned to a pointer to object type. C++ will not.

**Rationale:** C++ tries harder than C to enforce compile-time type safety.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Could be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```c
char* c = (char*) b;
```

**How widely used:** This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

---

**Affected subclause:** 7.6.1.2

**Change:** Implicit declaration of functions is not allowed.

**Rationale:** The type-safe nature of C++.

**Effect on original feature:** Deletion of semantically well-defined feature. Note: the original feature was labeled as “obsolescent” in ISO C.

**Difficulty of converting:** Syntactic transformation. Facilities for producing explicit function declarations are fairly widespread commercially.

**How widely used:** Common.

---

**Affected subclauses:** 7.6.1.5, 7.6.2.2

**Change:** Decrement operator is not allowed with bool operand.

**Rationale:** Feature with surprising semantics.

**Effect on original feature:** A valid ISO C expression utilizing the decrement operator on a bool lvalue (for instance, via the C typedef in `<stdbool.h>`) is ill-formed in this International Standard.

---

**Affected subclauses:** 7.6.2.3, 7.6.3

**Change:** Types must be defined in declarations, not in expressions.

In C, a sizeof expression or cast expression may define a new type. For example,

```c
p = (void*)((struct x {int i;}) *)0;
```

defines a new type, struct x.

**Rationale:** This prohibition helps to clarify the location of definitions in the source code.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

---

**Affected subclauses:** 7.6.16, 7.6.18, 7.6.19

**Change:** The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

**Rationale:** C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

**Effect on original feature:** Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```c
char arr[100];
sizeof(0, arr)
```
yields 100 in C++ and `sizeof(char*)` in C.

**Difficulty of converting:** Programs must add explicit casts to the appropriate rvalue.

**How widely used:** Rare.

---

**C.1.4 Clause 8: statements**

**Affected subclauses:** 8.4.2, 8.6.4

**Change:** It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

**Rationale:** Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of
allocation. Furthermore, any use of the uninitialized object could be a disaster. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation.

**How widely used:** Seldom.

---

**Affected subclause:** 8.6.3

**Change:** It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

**Rationale:** The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between void functions and int functions.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Semantic transformation. Add an appropriate return value to the source code, such as zero.

**How widely used:** Seldom. For several years, many existing C implementations have produced warnings in this case.

---

**C.1.5 Clause 9: declarations**

**Affected subclause:** 9.1.1

**Change:** In C++, the static or extern specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

**Example:**

```c
static struct S {
    int i;
};
```

**Rationale:** Storage class specifiers don’t have any meaning when associated with a type. In C++, class members can be declared with the static storage class specifier. Allowing storage class specifiers on type declarations could render the code confusing for users.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Seldom.

---

**Affected subclause:** 9.1.1

**Change:** In C++, register is not a storage class specifier.

**Rationale:** The storage class specifier had no effect in C++.

**Effect on original feature:** Deletion of semantically well-defined feature.

**Difficulty of converting:** Syntactic transformation.

**How widely used:** Common.

---

**Affected subclause:** 9.1.3

**Change:** A C++ typedef name must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a typedef name and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

**Example:**

```c
typedef struct name1 { /* ... */ } name1; // valid C and C++
struct name { /* ... */ }; // valid C, invalid C++
typedef int name; // valid C, invalid C++
```

**Rationale:** For ease of use, C++ doesn’t require that a type name be prefixed with the keywords class, struct or union when used in object declarations or type casts.

**Example:**

```c
class name { /* ... */ ;
name i; // i has type class name
```
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.
How widely used: Seldom.

4 Affected subclause: 9.1.7 [see also 6.5]
Change: const objects must be initialized in C++ but can be left uninitialized in C.
Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

5 Affected subclause: 9.1.7
Change: Banning implicit int.
In C++ a decl-specifier-seq must contain a type-specifier, unless it is followed by a declarator for a constructor, a destructor, or a conversion function. In the following example, the left-hand column presents valid C; the right-hand column presents equivalent C++:

```c
void f(const parm);  void f(const int parm);
const n = 3;       const int n = 3;
main()             int main()
    /* ... */   /* ... */
```

Rationale: In C++, implicit int creates several opportunities for ambiguity between expressions involving function-like casts and declarations. Explicit declaration is increasingly considered to be proper style. Liaison with WG14 (C) indicated support for (at least) deprecating implicit int in the next revision of C.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. Could be automated.
How widely used: Common.

6 Affected subclause: 9.1.7.5
Change: The keyword auto cannot be used as a storage class specifier.
```c
void f() {
    auto int x;      // valid C, invalid C++
}
```

Rationale: Allowing the use of auto to deduce the type of a variable from its initializer results in undesired interpretations of auto as a storage class specifier in certain contexts.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Rare.

7 Affected subclause: 9.2.3.5
Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.
Example:
```c
int f();          // means int f(void) in C++
// int f( unknown ) in C
```

Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).
Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolescent” in C.
Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.
How widely used: Common.
Affected subclause: 9.2.3.5 [see 7.6.2.3]
Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:

```c
void f(struct S { int a; } arg) {} // valid C, invalid C++
enum E { A, B, C } f() {}        // valid C, invalid C++
```

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.

How widely used: Seldom. This style of type definition is seen as poor coding style.

Affected subclause: 9.4
Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

Rationale: Prototypes are essential to type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common in old programs, but already known to be obsolescent.

Affected subclause: 9.3.1
Change: In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:

```c
struct A { int x, y; };          // valid C, invalid C++
struct B { struct A a; };       // valid C, invalid C++
struct A a = {.y = 1, .x = 2};  // valid C, invalid C++
struct B b = {.a.x = 0};        // valid C, invalid C++
struct A c = {.x = 1, 2};      // valid C, invalid C++
```

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with lambda-expression syntax. Nested designators are seldom used.

Effect on original feature: Deletion of feature that is incompatible with C++.

Difficulty of converting: Syntactic transformation.

How widely used: Out-of-order initializers are common. The other features are seldom used.

Affected subclause: 9.3.2
Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating ‘\0’) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating ‘\0’.

Example:

```c
char array[4] = "abcd";        // valid C, invalid C++
```

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string-terminating ‘\0’.

How widely used: Seldom. This style of array initialization is seen as poor coding style.
Affected subclause: 9.6
Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:
```c
enum color { red, blue, green };
enum color c = 1; // valid C, invalid C++
```

Rationale: The type-safe nature of C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)
How widely used: Common.

Affected subclause: 9.6
Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is int.

Example:
```c
enum e { A };
sizeof(A) == sizeof(int) // in C
sizeof(A) == sizeof(e) // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

Rationale: In C++, an enumeration is a distinct type.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

C.1.6 Clause 10: classes

Affected subclause: 10.2 [see also 9.1.3]
Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

Example:
```c
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}
```

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords class, struct, union or enum be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at global scope, the :: C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.
How widely used: Seldom.

Affected subclause: 10.3.4.2
Change: Copying volatile objects.
The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:
struct X { int i; };  
volatile struct X x1 = {0};  
struct X x2 = x1;  // invalid C++  
struct X x3;  
x3 = x1;  // also invalid C++

Rationale: Several alternatives were debated at length. Changing the parameter to volatile const X& would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit const_cast can be used.

How widely used: Seldom.

3 Affected subclause: 10.3.9
Change: Bit-fields of type plain int are signed.
Rationale: Leaving the choice of signedness to implementations could lead to inconsistent definitions of template specializations. For consistency, the implementation freedom was eliminated for non-dependent types, too.

Effect on original feature: The choice is implementation-defined in C, but not so in C++.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

4 Affected subclause: 10.3.10
Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class belongs to the same scope as the name of the outermost enclosing class.

Example:
```c
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy;  // valid C, invalid C++
```

Rationale: C++ classes have member functions which require that classes establish scopes. The C rule would leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving nested or local functions.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. To make the struct type name visible in the scope of the enclosing struct, the struct tag could be declared in the scope of the enclosing struct, before the enclosing struct is defined. Example:
```c
struct Y;
struct X {
    struct Y { /* ... */ } y;
};
```

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of the enclosing struct could be exported to the scope of the enclosing struct. Note: this is a consequence of the difference in scope rules, which is documented in 6.3.

How widely used: Seldom.

5 Affected subclause: 10.3.11
Change: In C++, a typedef name may not be redeclared in a class definition after being used in that definition.

Example:
```c
typedef int I;
```
struct S {
  I i;
  int I;  // valid C, invalid C++
};

Rationale: When classes become complicated, allowing such a redefinition after the type has been used can create confusion for C++ programmers as to what the meaning of I really is.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Either the type or the struct member has to be renamed.

How widely used: Seldom.

C.1.7 Clause 14: preprocessing directives

1 Affected subclause: 14.8
Change: Whether __STDC__ is defined and if so, what its value is, are implementation-defined.
Rationale: C++ is not identical to ISO C. Mandating that __STDC__ be defined would require that translators make an incorrect claim. Each implementation must choose the behavior that will be most useful to its marketplace.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Programs and headers that reference __STDC__ are quite common.

C.2 C++ and ISO C++ 2003

1 This subclause lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, Programming Languages — C++), by the chapters of this document.

C.2.1 Clause 5: lexical conventions

1 Affected subclause: 5.4
Change: New kinds of string literals.
Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this International Standard. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a string literal but will be interpreted as part of the string literal. For example:

```c
#define u8 "abc"
const char* s = u8"def";  // Previously "abcdef", now "def"
```

2 Affected subclause: 5.4
Change: User-defined literal string support.
Rationale: Required for new features.

Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this International Standard. For example:

```c
#define _x "there"
"hello"_x  // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro _x would have been expanded. In this International Standard, #1 consists of a single preprocessing token, so the macro is not expanded.

3 Affected subclause: 5.11
Change: New keywords.
Rationale: Required for new features.

Effect on original feature: Added to Table 5, the following identifiers are new keywords: alignas, alignof, char16_t, char32_t, constexpr, decltype, noexcept, nullptr, static_assert, and thread_local. Valid C++ 2003 code using these identifiers is invalid in this International Standard.

4 Affected subclause: 5.13.2
Change: Type of integer literals.
Rationale: C99 compatibility.

Effect on original feature: Certain integer literals larger than can be represented by long could change from an unsigned integer type to signed long long.

§ C.2.1
C.2.2 Clause 7: expressions

1 Affected subclause: 7.3.11
   Change: Only literals are integer null pointer constants.
   Rationale: Removing surprising interactions with templates and constant expressions.
   Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this International Standard. For example:

   ```cpp
   void f(void *); // #1
   void f(...); // #2
   template<int N> void g() {
     f(0*N); // calls #2; used to call #1
   }
   ```

2 Affected subclause: 7.6.5
   Change: Specify rounding for results of integer / and %.
   Rationale: Increase portability, C99 compatibility.
   Effect on original feature: Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this International Standard always rounds the result toward 0.

3 Affected subclause: 7.6.14
   Change: && is valid in a type-name.
   Rationale: Required for new features.
   Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this International Standard. For example:

   ```cpp
   bool b1 = new int && false; // previously false, now ill-formed
   struct S { operator int(); }; 
   bool b2 = &S::operator int && false; // previously false, now ill-formed
   ```

C.2.3 Clause 9: declarations

1 Affected subclause: 9.1
   Change: Remove auto as a storage class specifier.
   Rationale: New feature.
   Effect on original feature: Valid C++ 2003 code that uses the keyword auto as a storage class specifier may be invalid in this International Standard. In this International Standard, auto indicates that the type of a variable is to be deduced from its initializer expression.

2 Affected subclause: 9.3.4
   Change: Narrowing restrictions in aggregate initializers.
   Rationale: Catches bugs.
   Effect on original feature: Valid C++ 2003 code may fail to compile in this International Standard. For example, the following code is valid in C++ 2003 but invalid in this International Standard because double to int is a narrowing conversion:

   ```cpp
   int x[] = { 2.0 }; 
   ```

C.2.4 Clause 10: classes

1 Affected subclauses: 10.3.4.1, 10.3.6, 10.3.4.2, 10.3.5
   Change: Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.
   Rationale: Improves template argument deduction failure.
   Effect on original feature: A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

2 Affected subclause: 10.3.6
   Change: User-declared destructors have an implicit exception specification.
   Rationale: Clarification of destructor requirements.
   Effect on original feature: Valid C++ 2003 code may execute differently in this International Standard. In particular, destructors that throw exceptions will call std::terminate (without calling std::unexpected) if their exception specification is non-throwing.
C.2.5 Clause 12: templates

1 Affected subclause: 12.1
   Change: Remove export.
   Rationale: No implementation consensus.
   Effect on original feature: A valid C++ 2003 declaration containing export is ill-formed in this International Standard.

2 Affected subclause: 12.3
   Change: Remove whitespace requirement for nested closing template right angle brackets.
   Rationale: Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.
   Effect on original feature: Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (">") followed immediately by another right angle bracket may now be treated as closing two templates. For example, the following code is valid in C++ 2003 because ">>" is a right-shift operator, but invalid in this International Standard because ">>" closes two templates.

   template <class T> struct X { };
   template <int N> struct Y { };
   X<Y<1>>2>x;

3 Affected subclause: 12.7.4.2
   Change: Allow dependent calls of functions with internal linkage.
   Rationale: Overly constrained, simplify overload resolution rules.
   Effect on original feature: A valid C++ 2003 program could get a different result than this International Standard.

C.2.6 Clause 15: library introduction

1 Affected: Clause 15 – Clause 31
   Change: New reserved identifiers.
   Rationale: Required by new features.
   Effect on original feature: Valid C++ 2003 code that uses any identifiers added to the C++ standard library by this International Standard may fail to compile or produce different results in this International Standard. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this International Standard.

2 Affected subclause: 15.5.1.2
   Change: New headers.
   Rationale: New functionality.
   Effect on original feature: The following C++ headers are new: <array>, <atomic>, <chrono>, <codecvt>, <condition_variable>, <forward_list>, <future>, <initializer_list>, <mutex>, <random>, <ratio>, <regex>, <scoped_allocator>, <system_error>, <thread>, <tuple>, <typeindex>, <type_traits>, <unordered_map>, and <unordered_set>. In addition the following C compatibility headers are new: <cfenv>, <cinttypes>, <cstdint>, and <cuchar>. Valid C++ 2003 code that #includes headers with these names may be invalid in this International Standard.

3 Affected subclause: 15.5.3.2
   Effect on original feature: Function swap moved to a different header
   Rationale: Remove dependency on <algorithm> for swap.
   Effect on original feature: Valid C++ 2003 code that has been compiled expecting swap to be in <algorithm> may have to instead include <utility>.

4 Affected subclause: 15.5.4.2.2
   Change: New reserved namespace.
   Rationale: New functionality.
   Effect on original feature: The global namespace posix is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace posix may be invalid in this International Standard.

5 Affected subclause: 15.5.5.3
   Change: Additional restrictions on macro names.
   Rationale: Avoid hard to diagnose or non-portable constructs.
   Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines override, final, carries_dependency, or noreturn as macros is invalid in this International Standard.
C.2.7 Clause 16: language support library  [diff.cpp03.language.support]

Affected subclause: 16.6.2.1
Change: `operator new` may throw exceptions other than `std::bad_alloc`.
Rationale: Consistent application of `noexcept`.
Effect on original feature: Valid C++ 2003 code that assumes that global `operator new` only throws `std::bad_alloc` may execute differently in this International Standard. Valid C++ 2003 code that replaces the global replaceable `operator new` is ill-formed in this International Standard, because the exception specification of `throw(std::bad_alloc)` was removed.

C.2.8 Clause 18: diagnostics library  [diff.cpp03.diagnostics]

Affected subclause: 18.4
Change: Thread-local error numbers.
Rationale: Support for new thread facilities.
Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this International Standard.

C.2.9 Clause 19: general utilities library  [diff.cpp03.utilities]

Affected subclause: 19.10.5
Change: Minimal support for garbage-collected regions.
Rationale: Required by new feature.
Effect on original feature: Valid C++ 2003 code, compiled without traceable pointer support, that interacts with newer C++ code using regions declared reachable may have different runtime behavior.

C.2.10 Clause 20: strings library  [diff.cpp03.strings]

Affected subclauses: 20.3, 20.3.2.1
Change: `basic_string` requirements no longer allow reference-counted strings.
Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior for this International Standard.
Effect on original feature: Valid C++ 2003 code may execute differently in this International Standard.

C.2.11 Clause 21: containers library  [diff.cpp03.containers]

Affected subclause: 21.2
Change: Complexity of `size()` member functions now constant.
Rationale: Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.
Effect on original feature: Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this International Standard. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

(2.1) — not all containers provide `size();` use `empty()` instead of `size() == 0;`
— not all containers are empty after construction (array);
— not all containers have constant complexity for swap() (array).

3

Affected subclause: 21.2

Change: Requirements change: default constructible.
Rationale: Clarification of container requirements.
Effect on original feature: Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

4

Affected subclauses: 21.2.3, 21.2.6

Change: Signature changes: from void return types.
Rationale: Old signature threw away useful information that may be expensive to recalculate.
Effect on original feature: The following member functions have changed:

(4.1) — erase(iter) for set, multiset, map, multimap
(4.2) — erase(begin, end) for set, multiset, map, multimap
(4.3) — insert(pos, num, val) for vector, deque, list, forward_list
(4.4) — insert(pos, beg, end) for vector, deque, list, forward_list

Valid C++ 2003 code that relies on these functions returning void (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this International Standard.

5

Affected subclauses: 21.2.3, 21.2.6

Change: Signature changes: from iterator to const_iterator parameters.
Rationale: Overspecification.
Effect on original feature: The signatures of the following member functions changed from taking an iterator to taking a const_iterator:

(5.1) — insert(iter, val) for vector, deque, list, set, multiset, map, multimap
(5.2) — insert(pos, beg, end) for vector, deque, list, set, multiset, map, multimap
(5.3) — erase(begin, end) for set, multiset, map, multimap
(5.4) — all forms of list::splice
(5.5) — all forms of list::merge

Valid C++ 2003 code that uses these functions may fail to compile with this International Standard.

6

Affected subclauses: 21.2.3, 21.2.6

Change: Signature changes: resize.
Rationale: Performance, compatibility with move semantics.
Effect on original feature: For vector, deque, and list the fill value passed to resize is now passed by reference instead of by value, and an additional overload of resize has been added. Valid C++ 2003 code that uses this function may fail to compile with this International Standard.

C.2.12 Clause 24: algorithms library

Affected subclause: 24.1

Change: Result state of inputs after application of some algorithms.
Rationale: Required by new feature.
Effect on original feature: A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this International Standard. For example, std::remove and std::remove_if may leave the tail of the input sequence with a different set of values than previously.

C.2.13 Clause 25: numerics library

Affected subclause: 25.4

Change: Specified representation of complex numbers.
Rationale: Compatibility with C99.
Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of std::complex may not be compatible with this International Standard.
C.2.14 **Clause 28: input/output library** [diff.cpp03.input.output]

1 **Affected subclauses:** 28.7.4.1.3, 28.7.5.1.3, 28.5.5.4

**Change:** Specify use of `explicit` in existing boolean conversion functions.

**Rationale:** Clarify intentions, avoid workarounds.

**Effect on original feature:** Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this International Standard. Such conversions occur in the following conditions:

- (1.1) passing a value to a function that takes an argument of type `bool`;
- (1.2) using `operator==` to compare to `false` or `true`;
- (1.3) returning a value from a function with a return type of `bool`;
- (1.4) initializing members of type `bool` via aggregate initialization;
- (1.5) initializing a `const bool&` which would bind to a temporary object.

2 **Affected subclause:** 28.5.3.1.1

**Change:** Change base class of `std::ios_base::failure`.

**Rationale:** More detailed error messages.

**Effect on original feature:** `std::ios_base::failure` is no longer derived directly from `std::exception`, but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this International Standard.

3 **Affected subclause:** 28.5.3

**Change:** Flag types in `std::ios_base` are now bitmasks with values defined as constexpr static members.

**Rationale:** Required for new features.

**Effect on original feature:** Valid C++ 2003 code that relies on `std::ios_base` flag types being represented as `std::bitset` or as an integer type may fail to compile with this International Standard. For example:

```cpp
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag); // error: setf does not take argument of type int
}
```

C.3 **C++ and ISO C++ 2011** [diff.cpp11]

1 This subclause lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, *Programming Languages — C++*), by the chapters of this document.

C.3.1 **Clause 5: lexical conventions** [diff.cpp11.lex]

1 **Affected subclause:** 5.9

**Change:** `pp-number` can contain one or more single quotes.

**Rationale:** Necessary to enable single quotes as digit separators.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this International Standard. For example, the following code is valid both in C++ 2011 and in this International Standard, but the macro invocation produces different outcomes because the single quotes delimit a character literal in C++ 2011, whereas they are digit separators in this International Standard:

```cpp
#define M(x, ...) __VA_ARGS__
int x[2] = { M(1'2,3'4, 5) };
// int x[2] = { 3'4, 5 }; — this International Standard
```

C.3.2 **Clause 6: basics** [diff.cpp11.basic]

1 **Affected subclause:** 6.6.4.4.2

**Change:** New usual (non-placement) deallocator.

**Rationale:** Required for sized deallocation.

**Effect on original feature:** Valid C++ 2011 code could declare a global placement allocation function and deallocation function as follows:

```cpp
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```
N4791

© ISO/IEC

In this International Standard, however, the declaration of operator delete might match a predefined usual
(non-placement) operator delete (6.6.4.4). If so, the program is ill-formed, as it was for class member
allocation functions and deallocation functions (7.6.2.4).

C.3.3
1

Clause 7: expressions

[diff.cpp11.expr]

Affected subclause: 7.6.16
Change: A conditional expression with a throw expression as its second or third operand keeps the type
and value category of the other operand.
Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.1), array-to-pointer (7.3.2), and functionto-pointer (7.3.3) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue
conversion, were considered gratuitous and surprising.
Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in
this International Standard:
struct S {
int x = 1;
void mf() { x = 2; }
};
int f(bool cond) {
S s;
(cond ? s : throw 0).mf();
return s.x;
}

In C++ 2011, f(true) returns 1. In this International Standard, it returns 2.
sizeof(true ? "" : throw 0)

In C++ 2011, the expression yields sizeof(const char*).
sizeof(const char[1]).

C.3.4
1

In this International Standard, it yields

Clause 9: declarations

[diff.cpp11.dcl.dcl]

Affected subclause: 9.1.5
Change: constexpr non-static member functions are not implicitly const member functions.
Rationale: Necessary to allow constexpr member functions to mutate the object.
Effect on original feature: Valid C++ 2011 code may fail to compile in this International Standard. For
example, the following code is valid in C++ 2011 but invalid in this International Standard because it declares
the same member function twice with different return types:
struct S {
constexpr const int &f();
int &f();
};

2

Affected subclause: 9.3.1
Change: Classes with default member initializers can be aggregates.
Rationale: Necessary to allow default member initializers to be used by aggregate initialization.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this
International Standard. For example:
struct S { // Aggregate in C++ 2014 onwards.
int m = 1;
};
struct X {
operator int();
operator S();
};
X a{};
S b{a}; // uses copy constructor in C++ 2011,
// performs aggregate initialization in this International Standard

C.3.5
1

Clause 15: library introduction

[diff.cpp11.library]

Affected subclause: 15.5.1.2
Change: New header.
Rationale: New functionality.
§ C.3.5

1553


**Effect on original feature:** The C++ header `<shared_mutex>` is new. Valid C++ 2011 code that `#includes` a header with that name may be invalid in this International Standard.

**C.3.6 Clause 28: input/output library**  
[diff.cpp11.input.output]

1 Affected subclause: 28.12  
Change: `gets` is not defined.  
Rationale: Use of `gets` is considered dangerous.  
**Effect on original feature:** Valid C++ 2011 code that uses the `gets` function may fail to compile in this International Standard.

**C.4 C++ and ISO C++ 2014**  
[diff.cpp14]

1 This subclause lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, *Programming Languages — C++*), by the chapters of this document.

**C.4.1 Clause 5: lexical conventions**  
[diff.cpp14.lex]

1 Affected subclause: 5.2  
Change: Removal of trigraph support as a required feature.  
Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.  
**Effect on original feature:** Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this International Standard. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from physical source file characters to the basic source character set.

2 Affected subclause: 5.9  
Change: `pp-number` can contain `p` sign and `P` sign.  
Rationale: Necessary to enable hexadecimal floating literals.  
**Effect on original feature:** Valid C++ 2014 code may fail to compile or produce different results in this International Standard. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this International Standard. For example:

```cpp
#define F(a) b ## a  
int b0p = F(0p+0);  // ill-formed; equivalent to “int b0p = b0p + 0;” in C++ 2014
```

**C.4.2 Clause 7: expressions**  
[diff.cpp14.expr]

1 Affected subclauses: 7.6.1.5, 7.6.2.2  
Change: Remove increment operator with `bool` operand.  
Rationale: Obsolete feature with occasionally surprising semantics.  
**Effect on original feature:** A valid C++ 2014 expression utilizing the increment operator on a `bool` lvalue is ill-formed in this International Standard. Note that this might occur when the lvalue has a type given by a template parameter.

2 Affected subclauses: 7.6.2.4, 7.6.2.5  
Change: Dynamic allocation mechanism for over-aligned types.  
Rationale: Simplify use of over-aligned types.  
**Effect on original feature:** In C++ 2014 code that uses a `new-expression` to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, `::operator new(std::size_t)` is used to allocate the memory. In this International Standard, `::operator new(std::size_t, std::align_val_t)` is used instead.

**C.4.3 Clause 9: declarations**  
[diff.cpp14.dcl.dcl]

1 Affected subclause: 9.1.1  
Change: Removal of `register storage-class-specifier`.  
Rationale: Enable repurposing of deprecated keyword in future revisions of this International Standard.  
**Effect on original feature:** A valid C++ 2014 declaration utilizing the `register storage-class-specifier` is ill-formed in this International Standard. The specifier can simply be removed to retain the original meaning.

2 Affected subclause: 9.1.7.5  
Change: `auto` deduction from `braced-init-list`.  
Rationale: More intuitive deduction behavior.  
**Effect on original feature:** Valid C++ 2014 code may fail to compile or may change meaning in this International Standard. For example:
auto x1{};  // was std::initializer_list<int>, now int
auto x2(1, 2);  // was std::initializer_list<int>, now ill-formed

3 Affected subclause: 9.2.3.5
Change: Make exception specifications be part of the type system.
Rationale: Improve type-safety.
Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this International Standard. For example:

```cpp
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2);  // ill-formed; previously well-formed
```

4 Affected subclause: 9.3.1
Change: Definition of an aggregate is extended to apply to user-defined types with base classes.
Rationale: To increase convenience of aggregate initialization.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this International Standard; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```cpp
struct derived;
struct base {
friend struct derived;
private:
  base();
};
struct derived : base {};

derived d1{};  // error; the code was well-formed in C++ 2014
derived d2;   // still OK
```

C.4.4 Clause 10: classes

1 Affected subclause: 10.9.3
Change: Inheriting a constructor no longer injects a constructor into the derived class.
Rationale: Better interaction with other language features.
Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A using-declaration that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

```cpp
struct A {
  template<typename T> A(T, typename T::type = 0);
  A(int);
};
struct B : A {
  using A::A;
  B(int);
};
B b(42L);  // now calls B(int), used to call B<long>(long),
           // which called A(int) due to substitution failure
           // in A<long>(long).
```

C.4.5 Clause 12: templates

1 Affected subclause: 12.9.2.5
Change: Allowance to deduce from the type of a non-type template argument.
Rationale: In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this International Standard. For example:

```cpp
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
```
C.4.6 Clause 13: exception handling

void bar(A<0> *p) {
    foo(p); // ill-formed; previously well-formed
}

C.4.7 Clause 15: library introduction

C.4.8 Clause 19: general utilities library

C.4.9 Clause 20: strings library

§ C.4.9
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed

C.4.10 Clause 21: containers library

Affected subclause: 21.2.6
Change: Requirements change:
Rationale: Increase portability, clarification of associative container requirements.
Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a
comparison object with non-const function call operator may fail to compile in this International Standard:

```cpp
#include <set>
struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};
int main()
{
    const std::set<int, compare> s;
    s.find(0);
}
```

C.4.11 Annex D: compatibility features

Change: The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`,
`bind1st`, and `bind2nd` are not defined.
Rationale: Superseded by new features.
Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates
may fail to compile in this International Standard.

Change: Remove old iostreams members [depr.ios.members].
Rationale: Redundant feature for compatibility with pre-standard code has served its time.
Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this
International Standard.

C.5 C++ and ISO C++ 2017

This subclause lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, Programming
Languages — C++), by the chapters of this document.

C.5.1 Clause 5: lexical conventions

Affected subclause: 5.11
Change: New keywords.
Rationale: Required for new features.

| (1.1) | The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5). |
| (1.2) | The `concept` keyword is added to enable the definition of concepts (12.6.8). |
| (1.3) | The `constexpr` keyword is added to declare immediate functions (9.1.5). |
| (1.4) | The `requires` keyword is added to introduce constraints through a `requires-clause` or a `requires-expression`. |

Effect on original feature: Valid ISO C++ 2017 code using `char8_t`, `concept`, `constexpr`, or `requires`
as an identifier is not valid in this International Standard.

Affected subclause: 5.12
Change: New operator `<=`.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code that contains a `<=` token immediately followed by a `>`
token may be ill-formed or have different semantics in this International Standard:
namespace N {
    struct X {
        bool operator<=(X, X);
        template<bool(X, X)> struct Y {}
        Y operator<= y; // ill-formed; previously well-formed
    }
}

C.5.2 Clause 6: basics

1

Affected subclause: 6.8.2.1

Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.

Rationale: Removal of rarely used and confusing feature.

Effect on original feature: If a memory_order_release atomic store is followed by a memory_order_-relaxed store to the same variable by the same thread, then reading the latter value with a memory_order_-_acquire load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.5.3 Clause 7: expressions

1

Affected subclause: 7.5.5.2

Change: Implicit lambda capture may capture additional entities.

Rationale: Rule simplification, necessary to resolve interactions with constexpr if.

Effect on original feature: Lambdas with a capture-default may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

C.5.4 Clause 9: declarations

1

Affected subclause: 9.3.1

Change: A class that has user-declared constructors is never an aggregate.

Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.

Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this International Standard.
C.5.5 Clause 10: classes

Affected subclauses: 10.3.4, 10.3.7.2

Change: The class name can no longer be used parenthesized immediately after an explicit decl-specifier in a constructor declaration. The conversion-function-id can no longer be used parenthesized immediately after an explicit decl-specifier in a conversion function declaration.

Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code may fail to compile in this International Standard. For example:

```cpp
struct S {
    explicit (S)(const S&);  // ill-formed; previously well-formed
    explicit (operator int)(); // ill-formed; previously well-formed
    explicit(true) (S)(int);  // OK
};
```

C.5.6 Clause 12: templates

Affected subclause: 12.2

Change: An unqualified-id that is followed by a < and for which name lookup finds nothing or finds a function will be treated as a template-name in order to potentially cause argument dependent lookup to be performed.

Rationale: It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.
Effect on original feature: Previously valid code that uses a function name as the left operand of a `<` operator would become ill-formed.

```cpp
struct A {}
bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
    f < a;  // ill-formed; previously well-formed
    (f) < a;  // still well formed
}
```

C.5.7 Clause 13: exception handling

Affected subclause: 13.4
Change: Remove `throw()` exception specification.
Rationale: Removal of obsolete feature that has been replaced by `noexcept`.
Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses `throw()` for its exception specification will be rejected as ill-formed in this International Standard. It should simply be replaced with `noexcept` for no change of meaning since C++ 2017. [Note: There is no way to write a function declaration that is non-throwing in this International Standard and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. —end note]

C.5.8 Clause 15: library introduction

Affected subclause: 15.5.1.2
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<bit>`, `<compare>`, `<concepts>`, `<contract>`, `<span>`, `<syncstream>`, and `<version>`. Valid C++ 2017 code that `#include`s headers with these names may be invalid in this International Standard.

(2.1) a `#include` of `<ccomplex>` can be replaced by a `#include` of `<complex>` (25.4.1),
(2.2) a `#include` of `<ctgmath>` can be replaced by a `#include` of `<cmath>` (25.8.1) and a `#include` of `<complex>`, and
(2.3) a `#include` of `<ciso646>`, `<cstdalign>`, or `<cstdbool>` can simply be removed.

C.5.9 Clause 21: containers library

Affected subclauses: 21.3.9, 21.3.10
Change: Return types of `remove`, `remove_if`, and `unique` changed from `void` to `container::size_type`.
Rationale: Improve efficiency and convenience of finding number of removed elements.
Effect on original feature: Code that depends on the return types might have different semantics in this International Standard. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

C.5.10 Clause 24: algorithms library

Affected subclause: 24.2
Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.
Rationale: Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.
Effect on original feature: A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.
C.5.11 Clause 28: input/output library

1 Affected subclause: 28.7.4.2.3
Change: Character array extraction only takes array types.
Rationale: Increase safety via preventing buffer overflow at compile time.
Effect on original feature: Valid C++ 2017 code may fail to compile in this International Standard:

```cpp
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;  // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;  // OK
```

2 Affected subclause: 28.7.5.2.4
Change: Overload resolution for ostream inserters used with UTF-8 literals.
Rationale: Required for new features.
Effect on original feature: Valid ISO C++ 2017 code that passes UTF-8 literals to `basic_ostream::operator<<` no longer calls character-related overloads.

```cpp
std::cout << u8"text";  // previously called operator<<(const char*) and printed a string;
                       // now calls operator<<(const void*) and prints a pointer value
std::cout << u8'X';    // previously called operator<<(char) and printed a character;
                       // now calls operator<<(int) and prints an integer value
```

3 Affected subclause: 28.11.7
Change: Return type of filesystem path format observer member functions.
Rationale: Required for new features.
Effect on original feature: Valid ISO C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this International Standard.

```cpp
std::filesystem::path p;
std::string s1 = p.u8string();   // ill-formed; previously well-formed
std::string s2 = p.generic_u8string();  // ill-formed; previously well-formed
```

C.5.12 Annex D: compatibility features

1 Change: Remove `uncaught_exception`.
Rationale: The function did not have a clear specification when multiple exceptions were active, and has been superseded by `uncaught_exceptions`.
Effect on original feature: A valid C++ 2017 program that calls `std::uncaught_exception` may fail to compile. It might be revised to use `std::uncaught_exceptions` instead, for clear and portable semantics.

2 Change: Remove support for adaptable function API.
Rationale: The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with `decltype`, and by the `std::bind` and `std::not_fn` function templates.
Effect on original feature: A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

3 Change: Remove redundant members from `std::allocator`.
Rationale: `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.
Effect on original feature: A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

4 Change: Remove `raw_storage_iterator`.
Rationale: The iterator encouraged use of algorithms that might throw exceptions, but did not return the number of elements successfully constructed that might need to be destroyed in order to avoid leaks.
Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

5 Change: Remove temporary buffers API.
Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.
Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

6 Change: Remove `shared_ptr::unique`.
Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well defined use in single-threaded cases.

Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

7 Affected subclause: D.9
Change: Remove deprecated type traits.
Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that could not report the result of a regular function type. It has been superseded by the `invoke_result` trait.

Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.6 C standard library

This subclause summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.6.1 Modifications to headers

For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in D.6, but their use is deprecated in C++.

There are no C++ headers for the C standard library's headers `<stdatomic.h>`, `<stdnoreturn.h>`, and `<threads.h>`, nor are these headers from the C standard library headers themselves part of C++.

The C headers `<complex.h>` and `<tgmath.h>` do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.6.2 Modifications to definitions

C.6.2.1 Types `char16_t` and `char32_t`

The types `char16_t` and `char32_t` are distinct types rather than typedefs to existing integral types. The tokens `char16_t` and `char32_t` are keywords in this International Standard (5.11). They do not appear as macro names defined in `<cuchar>` (20.5.5).

C.6.2.2 Type `wchar_t`

The type `wchar_t` is a distinct type rather than a typedef to an existing integral type. The token `wchar_t` is a keyword in this International Standard (5.11). It does not appear as a type name defined in any of `<cstdint>` (16.2.1), `<cstdlib>` (16.2.2), or `<cwchar>` (20.5.4).

C.6.2.3 Header `<assert.h>`

The token `static_assert` is a keyword in this International Standard (5.11). It does not appear as a macro name defined in `<assert>` (18.3.1).

C.6.2.4 Header `<iso646.h>`

The tokens `and`, `and_eq`, `bitand`, `bitor`, `compl`, `not_eq`, `not`, `or`, `or_eq`, `xor`, and `xor_eq` are keywords in this International Standard (5.11), and are not introduced as macros by `<iso646.h>` (D.6.2).

C.6.2.5 Header `<stdalign.h>`

The token `alignas` is a keyword in this International Standard (5.11), and is not introduced as a macro by `<stdalign.h>` (D.6.3).

C.6.2.6 Header `<stdbool.h>`

The tokens `bool`, `true`, and `false` are keywords in this International Standard (5.11), and are not introduced as macros by `<stdbool.h>` (D.6.4).

§ C.6.2.6 1562
C.6.2.7 Macro NULL

The macro `NULL`, defined in any of `<clocale>` (27.5), `<cstddef>` (16.2.1), `<cstdio>` (28.12.1), `<cstdlib>` (16.2.2), `<cstring>` (20.5.3), `<ctime>` (26.13), or `<cwchar>` (20.5.4), is an implementation-defined C++ null pointer constant in this International Standard (16.2).

C.6.3 Modifications to declarations

1. Header `<cstring>` (20.5.3): The following functions have different declarations:
   (1.1) — `strchr`
   (1.2) — `strpbrk`
   (1.3) — `strrchr`
   (1.4) — `strstr`
   (1.5) — `memchr`

   Subclause 20.5.3 describes the changes.

2. Header `<cwchar>` (20.5.4): The following functions have different declarations:
   (2.1) — `wcschr`
   (2.2) — `wcspbrk`
   (2.3) — `wcsrchr`
   (2.4) — `wcsstr`
   (2.5) — `wmemchr`

   Subclause 20.5.4 describes the changes.

3. Header `<cstddef>` (16.2.1) declares the name `nullptr_t` in addition to the names declared in `<stddef.h>` in the C standard library.

C.6.4 Modifications to behavior

1. Header `<cstdlib>` (16.2.2): The following functions have different behavior:
   (1.1) — `atexit`
   (1.2) — `exit`
   (1.3) — `abort`

   Subclause 16.5 describes the changes.

2. Header `<csetjmp>` (16.12.2): The following functions have different behavior:
   (2.1) — `longjmp`

   Subclause 16.12.2 describes the changes.

C.6.4.1 Macro `offsetof(type, member-designator)`

The macro `offsetof`, defined in `<cstddef>` (16.2.1), accepts a restricted set of `type` arguments in this International Standard. Subclause 16.2.4 describes the change.

C.6.4.2 Memory allocation functions

The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in this International Standard. Subclause 19.10.12 describes the changes.
Annex D (normative)
Compatibility features [depr]

This Clause describes features of the C++ Standard that are specified for compatibility with existing implementations.

These are deprecated features, where deprecated is defined as: Normative for the current edition of this International Standard, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the deprecated attribute (9.11.5).

D.1 Arithmetic conversion on enumerations [depr.arith.conv.enum]
The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated. [Note: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note] [Example:

```cpp
enum E1 { e }
enum E2 { f }
bool b = e <= 3.7; // deprecated
int k = f - e; // deprecated
auto cmp = e <=> f; // ill-formed
```
—end example]

D.2 Implicit capture of *this by reference [depr.capture.this]
For compatibility with prior C++ International Standards, a lambda-expression with capture-default = (7.5.5.2) may implicitly capture *this by reference. [Example:

```cpp
struct X {
    int x;
    void foo(int n) {
        auto f = [=]() { x = n; }; // deprecated: x means this->x, not a copy thereof
        auto g = [=, this]() { x = n; }; // recommended replacement
    }
};
```
—end example]

D.3 Array comparisons [depr.array.comp]
Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated. [Note: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note] [Example:

```cpp
int arr1[5];
int arr2[5];
bool same = arr1 == arr2; // deprecated, same as &arr[0] == &arr[1],
auto cmp = arr1 <=> arr2; // ill-formed
```
—end example]

D.4 Redeclaration of static constexpr data members [depr.static constexpr]
For compatibility with prior C++ International Standards, a constexpr static data member may be redundantly redeclared outside the class with no initializer. This usage is deprecated. [Example:

```cpp
struct A {
    static constexpr int n = 5; // definition (declaration in C++ 2014)
};
constexpr int A::n; // redundant declaration (definition in C++ 2014)
```
—end example]
D.5 Implicit declaration of copy functions

1 The implicit definition of a copy constructor (10.3.4.2) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (10.3.6). The implicit definition of a copy assignment operator (10.3.5) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. In a future revision of this International Standard, these implicit definitions could become deleted (9.4).

D.6 C standard library headers

1 For compatibility with the C standard library, the C++ standard library provides the C headers shown in Table 135.

Table 135 — C headers

| <assert.h> | <inttypes.h> | <signal.h> | <stdio.h> | <wchar.h> |
| <complex.h> | <iso646.h> | <stdlib.h> | <stdlib.h> | <wctype.h> |
| <ctypes.h> | <limits.h> | <string.h> | <string.h> | <uchar.h> |
| <errno.h> | <locale.h> | <stdbool.h> | <stdio.h> | <uchar.h> |
| <fenv.h> | <math.h> | <stdbool.h> | <stdio.h> | <uchar.h> |
| <float.h> | <setjmp.h> | <stddef.h> | <stdio.h> | <uchar.h> |

D.6.1 Header <complex.h> synopsis

1 The header <complex.h> behaves as if it simply includes the header <complex> (25.4.1).

2 [Note: Names introduced by <complex> in namespace std are not placed into the global namespace scope by <complex.h>. — end note]

D.6.2 Header <iso646.h> synopsis

1 The C++ header <iso646.h> is empty. [Note: and, and_eq, bitand, bitor, compl, not_eq, not, or, or_eq, xor, and xor_eq are keywords in this International Standard (5.11). — end note]

D.6.3 Header <stdalign.h> synopsis

1 The contents of the C++ header <stdalign.h> are the same as the C standard library header <stdalign.h>, with the following changes: The header <stdalign.h> does not define a macro named alignas.

See also: ISO C 7.15

D.6.4 Header <stdbool.h> synopsis

1 The contents of the C++ header <stdbool.h> are the same as the C standard library header <stdbool.h>, with the following changes: The header <stdbool.h> does not define macros named bool, true, or false.

See also: ISO C 7.18

D.6.5 Header <tgmath.h> synopsis

1 The header <tgmath.h> behaves as if it simply includes the headers <cmath> (25.8.1) and <complex> (25.4.1).

2 [Note: The overloads provided in C by type-generic macros are already provided in <complex> and <cmath> by “sufficient” additional overloads. — end note]

3 [Note: Names introduced by <cmath> or <complex> in namespace std are not placed into the global namespace scope by <tgmath.h>. — end note]
D.6.6 Other C headers

Every C header other than `<complex.h>`, `<iso646.h>`, `<stdalign.h>`, `<stdbool.h>`, and `<tgmath.h>`, each of which has a name of the form `<name>.h>`, behaves as if each name placed in the standard library namespace by the corresponding `<name>` header is placed within the global namespace scope, except for the functions described in 25.8.5, the declaration of `std::byte (16.2.1)`, and the functions and function templates described in 16.2.5. It is unspecified whether these names are first declared or defined within namespace scope (6.3.6) of the namespace `std` and are then injected into the global namespace scope by explicit using-declarations (9.8).

Example: The header `<cstdlib>` assuredly provides its declarations and definitions within the namespace `std`. It may also provide these names within the global namespace. The header `<stdlib.h>` assuredly provides the same declarations and definitions within the global namespace, much as in the C Standard. It may also provide these names within the namespace `std`. — end example]

D.7 Relational operators

The header `<utility>` has the following additions:

```cpp
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<= (const T&, const T&);
    template<class T> bool operator>= (const T&, const T&);
}
```

To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<`, and `>=` out of `operator<`, the library provides the following:

```cpp
template<class T> bool operator!=(const T& x, const T& y);
```

Requires: Type `T` is `Cpp17EqualityComparable (Table 23).`

Returns: `!(x == y).`

```cpp
template<class T> bool operator>(const T& x, const T& y);
```

Requires: Type `T` is `Cpp17LessThanComparable (Table 24).`

Returns: `y < x`.

```cpp
template<class T> bool operator<=(const T& x, const T& y);
```

Requires: Type `T` is `Cpp17LessThanComparable (Table 24).`

Returns: `!(y < x)`.

```cpp
template<class T> bool operator>=(const T& x, const T& y);
```

Requires: Type `T` is `Cpp17LessThanComparable (Table 24).`

Returns: `!(x < y)`.

D.8 char* streams

D.8.1 Header `<strstream>` synopsis

The header `<strstream>` defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```cpp
namespace std {
    class strstreambuf;
    class istrstream;
    class ostrstream;
    class strstream;
}
```

D.8.2 Class strstreambuf

```cpp
namespace std {
    class strstreambuf : public basic_streambuf<char> {
        public:
            strstreambuf() : strstreambuf(0) {}}
```
explicit strstreambuf(streamsize alsize_arg);
strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
strstreambuf(const char* gnext_arg, streamsize n);

strstreambuf(signed char* gnext_arg, streamsize n,
    signed char* pbeg_arg = nullptr);
strstreambuf(const signed char* gnext_arg, streamsize n);
strstreambuf(unsigned char* gnext_arg, streamsize n,
    unsigned char* pbeg_arg = nullptr);
strstreambuf(const unsigned char* gnext_arg, streamsize n);

virtual ~strstreambuf();

void freeze(bool freeze1 = true);
char* str();
int pcount();

protected:
    int_type overflow (int_type c = EOF) override;
    int_type pbackfail(int_type c = EOF) override;
    int_type underflow() override;
    pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which
        = ios_base::in | ios_base::out) override;
    pos_type seekpos(pos_type sp, 
    ios_base::openmode which
        = ios_base::in | ios_base::out) override;
    streambuf* setbuf(char* s, streamsize n) override;

private:
    using strstate = T1;   // exposition only
    static const strstate allocated; // exposition only
    static const strstate constant; // exposition only
    static const strstate dynamic; // exposition only
    static const strstate frozen; // exposition only
    static const strstate strmode; // exposition only
    streamsize alsize; // exposition only
    void* (*palloc)(size_t); // exposition only
    void (*pfree)(void*); // exposition only

};

1 The class strstreambuf associates the input sequence, and possibly the output sequence, with an object of some character array type, whose elements store arbitrary values. The array object has several attributes.

2 [Note: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called strstate. The elements are:

(2.1) — allocated, set when a dynamic array object has been allocated, and hence should be freed by the destructor for the strstreambuf object;

(2.2) — constant, set when the array object has const elements, so the output sequence cannot be written;

(2.3) — dynamic, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;

(2.4) — frozen, set when the program has requested that the array object not be altered, reallocated, or freed.

— end note]

3 [Note: For the sake of exposition, the maintained data is presented here as:

(3.1) — strstate strmode, the attributes of the array object associated with the strstreambuf object;

(3.2) — int alsize, the suggested minimum size for a dynamic array object;

(3.3) — void* (*palloc)(size_t), points to the function to call to allocate a dynamic array object;

(3.4) — void (*pfree)(void*), points to the function to call to free a dynamic array object.
Each object of class `strstreambuf` has a seekable area, delimited by the pointers `seeklow` and `seekhigh`. If `gnext` is a null pointer, the seekable area is undefined. Otherwise, `seeklow` equals `gbeg` and `seekhigh` is either `pend`, if `pend` is not a null pointer, or `gend`.

**D.8.2.1 strstreambuf constructors**

1. `explicit strstreambuf(streamsize alsize_arg);`
   - **Effects:** Constructs an object of class `strstreambuf`, initializing the base class with `streambuf()`. The postconditions of this function are indicated in Table 136.

   Table 136 — `strstreambuf(streamsize)` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsize</td>
<td>alsize_arg</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

2. `strstreambuf(void* (*)(size_t), void (*)(void*))(void*);`
   - **Effects:** Constructs an object of class `strstreambuf`, initializing the base class with `streambuf()`. The postconditions of this function are indicated in Table 137.

   Table 137 — `strstreambuf(void* (*)(size_t), void (*)(void*))` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsize</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>palloc_arg</td>
</tr>
<tr>
<td>pfree</td>
<td>pfree_arg</td>
</tr>
</tbody>
</table>

3. `strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);`
   - **Effects:** Constructs an object of class `strstreambuf`, initializing the base class with `streambuf()`. The postconditions of this function are indicated in Table 138.

   Table 138 — `strstreambuf(charT*, streamsize, charT*)` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>0</td>
</tr>
<tr>
<td>alsize</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

4. `gnext_arg` shall point to the first element of an array object whose number of elements \( N \) is determined as follows:

   - If \( n > 0 \), \( N = n \).
   - If \( n == 0 \), \( N = \text{std::strlen(gnext_arg)} \).
   - If \( n < 0 \), \( N = \text{INT_MAX} \).\(^{330}\)

\(^{330}\) The function signature `strlen(const char*)` is declared in `<cstring>` (20.5.3). The macro `INT_MAX` is defined in `<climits>` (16.3.5).
If `pbeg_arg` is a null pointer, the function executes:

```c
setg(gnext_arg, gnext_arg, gnext_arg + N);
```

Otherwise, the function executes:

```c
setg(gnext_arg, gnext_arg, pbeg_arg);
setp(pbeg_arg, pbeg_arg + N);
```

```
strstreambuf(const char* gnext_arg, streamsize n);
strstreambuf(const signed char* gnext_arg, streamsize n);
strstreambuf(const unsigned char* gnext_arg, streamsize n);
```

**Effects:** Behaves the same as `strstreambuf((char*)gnext_arg,n)`, except that the constructor also sets `constant` in `strmode`.

```c
virtual ~strstreambuf();
```

**Effects:** Destroys an object of class `strstreambuf`. The function frees the dynamically allocated array object only if `(strmode & allocated) != 0` and `(strmode & frozen) == 0`. (D.8.2.3 describes how a dynamically allocated array object is freed.)

### D.8.2.2 Member functions [depr.strstreambuf.members]

#### void freeze(bool freezeIf = true);

**Effects:** If `strmode & dynamic` is nonzero, alters the freeze status of the dynamic array object as follows:

1. If `freezeIf` is `true`, the function sets `frozen` in `strmode`.
2. Otherwise, it clears `frozen` in `strmode`.

```c
char* str();
```

**Effects:** Calls `freeze()`, then returns the beginning pointer for the input sequence, `gbeg`.

**Remarks:** The return value can be a null pointer.

```c
int pcount() const;
```

**Effects:** If the next pointer for the output sequence, `pnext`, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, `pnext - pbeg`.

### D.8.2.3 strstreambuf overridden virtual functions [depr.strstreambuf.virtualls]

#### int_type overflow(int_type c = EOF) override;

**Effects:** Appends the character designated by `c` to the output sequence, if possible, in one of two ways:

1. If `c != EOF` and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns `c` to `*pnext++`.

   Returns `(unsigned char)c`.

2. If `c == EOF`, there is no character to append.

   Returns a value other than `EOF`.

**Remarks:** The function can alter the number of write positions available as a result of any call.

To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements `n` to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If `palloc` is not a null pointer, the function calls `(*palloc)(n)` to allocate the new dynamic array object. Otherwise, it evaluates the expression `new charT[n]`. In either case, if the allocation fails, the function returns `EOF`. Otherwise, it sets `allocated` in `strmode`.

To free a previously existing dynamic array object whose first element address is `p`: If `pfree` is not a null pointer, the function calls `(*pfree)(p)`. Otherwise, it evaluates the expression `delete[]p`.

An implementation should consider `alsize` in making this decision.
If (strmode & dynamic) == 0, or if (strmode & frozen) != 0, the function cannot extend the array (reallocate it with greater length) to make a write position available.

```cpp
int_type pbackfail(int_type c = EOF) override;
```

Puts back the character designated by c to the input sequence, if possible, in one of three ways:

1. If c != EOF, if the input sequence has a putback position available, and if (char)c == gnext[-1], assigns gnext - 1 to gnext.
   - Returns c.
2. If c != EOF, if the input sequence has a putback position available, and if strmode & constant is zero, assigns c to *--gnext.
   - Returns c.
3. If c == EOF and if the input sequence has a putback position available, assigns gnext - 1 to gnext.
   - Returns a value other than EOF.

Returns EOF to indicate failure.

Remarks: If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```cpp
int_type underflow() override;
```

Effects: Reads a character from the input sequence, if possible, without moving the stream position past it, as follows:

1. If the input sequence has a read position available, the function signals success by returning (unsigned char)*gnext.
2. Otherwise, if the current write next pointer pnext is not a null pointer and is greater than the current read end pointer gend, makes a read position available by assigning to gend a value greater than gnext and no greater than pnext.
   - Returns (unsigned char)*gnext.

Returns EOF to indicate failure.

Remarks: The function can alter the number of read positions available as a result of any call.

```cpp
pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;
```

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 139.

Table 139 — seekoff positioning

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>(which &amp; ios::in) != 0</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>(which &amp; ios::out) != 0</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>(which &amp; (ios::in</td>
<td>ios::out)) == (ios::in</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines newoff as indicated in Table 140.

If (newoff + off) < (seeklow - xbeg) or (seekhigh - xbeg) < (newoff + off), the positioning operation fails. Otherwise, the function assigns xbeg + newoff + off to the next pointer xnext.
Table 140 — newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios::cur</td>
<td>the next pointer minus the beginning pointer ((xnext - xbeg)).</td>
</tr>
<tr>
<td>way == ios::end</td>
<td>seekhigh minus the beginning pointer ((seekhigh - xbeg)).</td>
</tr>
</tbody>
</table>

**Returns:** pos_type(newoff), constructed from the resultant offset newoff (of type off_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is pos_type(off_type(-1)).

```cpp
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects:** Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in sp (as described below).

- If \((\text{which} & \text{ios::in}) \neq 0\), positions the input sequence.
- If \((\text{which} & \text{ios::out}) \neq 0\), positions the output sequence.
- If the function positions neither sequence, the positioning operation fails.

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines newoff from sp.offset():

- If newoff is an invalid stream position, has a negative value, or has a value greater than \((\text{seekhigh} - \text{seeklow})\), the positioning operation fails
- Otherwise, the function adds newoff to the beginning pointer xbeg and stores the result in the next pointer xnext.

**Returns:** pos_type(newoff), constructed from the resultant offset newoff (of type off_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is pos_type(off_type(-1)).

```cpp
streambuf<char>* setbuf(char* s, streamsize n) override;
```

**Effects:** Implementation defined, except that setbuf(0, 0) has no effect.

### D.8.3 Class istrstream

```cpp
namespace std {
    class istrstream : public basic_istream<char> {
        public:
            explicit istrstream(const char* s);
            explicit istrstream(char* s);
            istrstream(const char* s, streamsize n);
            istrstream(char* s, streamsize n);
            virtual ~istrstream();
            strstreambuf* rdbuf() const;
            char* str();
        private:
            strstreambuf sb; // exposition only
        }
    }
```

The class istrstream supports the reading of objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

- \(sb\), the strstreambuf object.
D.8.3.1 istream constructors

explicit istream(const char* s);
explicit istream(char* s);

Effects: Constructs an object of class istream, initializing the base class with istream(&sb) and initializing sb with strstreambuf(s,0). s shall designate the first element of an ntbs.

istream(const char* s, streamsize n);
istream(char* s, streamsize n);

Effects: Constructs an object of class istream, initializing the base class with istream(&sb) and initializing sb with strstreambuf(s,n). s shall designate the first element of an array whose length is n elements, and n shall be greater than zero.

D.8.3.2 Member functions

strstreambuf* rdbuf() const;

Returns: const_cast<strstreambuf*>(&sb).

cchar* str();

Returns: rdbuf()->str().

D.8.4 Class ostrstream

namespace std {
class ostrstream : public basic_ostream<char> {
public:
ostrstream();
ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
virtual ~ostrstream();

strstreambuf* rdbuf() const;
void freeze(bool freezefl = true);
cchar* str();
int pcount() const;
private:
strstreambuf sb; // exposition only
};
}

The class ostrstream supports the writing of objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the strstreambuf object.

D.8.4.1 ostrstream constructors

ostrstream();

Effects: Constructs an object of class ostrstream, initializing the base class with ostrstream(&sb) and initializing sb with strstreambuf().

ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);

Effects: Constructs an object of class ostrstream, initializing the base class with ostrstream(&sb), and initializing sb with one of two constructors:

(2.1) — If (mode & app) == 0, then s shall designate the first element of an array of n elements.

The constructor is strstreambuf(s, n, s).

(2.2) — If (mode & app) != 0, then s shall designate the first element of an array of n elements that contains an NTBS whose first element is designated by s. The constructor is strstreambuf(s, n, s + std::strlen(s)).

332) The function signature strlen(const char*) is declared in <cstring> (20.5.3).
D.8.4.2 Member functions

strstreambuf* rdbuf() const;

1  Returns: (strstreambuf*)&sb.

void freeze(bool freezefl = true);

2  Effects: Calls rdbuf()->freeze(freezefl).

char* str();

3  Returns: rdbuf()->str().

int pcount() const;

4  Returns: rdbuf()->pcount().

D.8.5 Class strstream

namespace std {
    class strstream
        : public basic_iostream<char> {
        public:
            // types
            using char_type = char;
            using int_type = char_traits<char>::int_type;
            using pos_type = char_traits<char>::pos_type;
            using off_type = char_traits<char>::off_type;

            // constructors/destructor
            strstream();
            strstream(char* s, int n,
                ios_base::openmode mode = ios_base::in|ios_base::out);
            virtual ~strstream();

            // members
            strstreambuf* rdbuf() const;
            void freeze(bool freezefl = true);
            int pcount() const;
            char* str();

        private:
            strstreambuf sb;  // exposition only
        }
    }

1 The class strstream supports reading and writing from objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the strstreambuf object.

D.8.5.1 strstream constructors

strstream();

1  Effects: Constructs an object of class strstream, initializing the base class with iostream(&sb).

strstream(char* s, int n,
            ios_base::openmode mode = ios_base::in|ios_base::out);

2  Effects: Constructs an object of class strstream, initializing the base class with iostream(&sb) and initializing sb with one of the two constructors:

(2.1) — If (mode & app) == 0, then s shall designate the first element of an array of n elements. The constructor is strstreambuf(s,n,s).

(2.2) — If (mode & app) != 0, then s shall designate the first element of an array of n elements that contains an NTBS whose first element is designated by s. The constructor is strstreambuf(s,n,s + std::strlen(s)).
D.8.5.2 `strstream` destructor

virtual ~strstream();

Effects: Destroys an object of class `strstream`.

D.8.5.3 `strstream` operations

`strstreambuf*dbuf() const;`  

Returns: `const_cast<strstreambuf*>(&sb)`.

`void freeze(bool freezefl = true);`  

Effects: Calls rdbuf()->freeze(freezefl).

`char* str();`  

Returns: rdbuf()->str().

`int pcount() const;`  

Returns: rdbuf()->pcount().

D.9 Deprecated type traits

The header `<type_traits>` has the following addition:

```cpp
namespace std {
    template<class T> struct is_pod;
    template<class T> inline constexpr bool is_pod_v = is_pod<T>::value;
}
```

The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

```cpp
template<class T> struct is_pod;
```

Requires: `remove_all_extents_t<T>` shall be a complete type or `cv void`.

`is_pod<T>` is a `Cpp17UnaryTypeTrait` with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise. A POD class is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A POD type is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

Note: It is unspecified whether a closure type (7.5.5.1) is a POD type. — end note

D.10 Deprecated iterator primitives

D.10.1 Basic iterator

The header `<iterator>` has the following addition:

```cpp
namespace std {
    template<class Category, class T, class Distance = ptrdiff_t, class Pointer = T*, class Reference = T&>
    struct iterator {
        using iterator_category = Category;
        using value_type = T;
        using difference_type = Distance;
        using pointer = Pointer;
        using reference = Reference;
    };
}
```

The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

Note: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note

Example: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:
class MyIterator :
    \public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
        // code implementing ++, etc.
    }

—end example]

D.11 Deprecated shared_ptr atomic access

The header `<memory>` has the following additions:

```cpp
namespace std {
    \template<class T>
    \bool atomic_is_lock_free(const shared_ptr<T>* p);

    \template<class T>
    \shared_ptr<T> atomic_load(const shared_ptr<T>* p);

    \template<class T>
    \shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

    \template<class T>
    \void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);

    \template<class T>
    \void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    \template<class T>
    \shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);

    \template<class T>
    \shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

    \template<class T>
    \bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

    \template<class T>
    \bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

    \template<class T>
    \bool atomic_compare_exchange_weak_explicit(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w, memory_order success, memory_order failure);

    \template<class T>
    \bool atomic_compare_exchange_strong_explicit(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w, memory_order success, memory_order failure);
}
```

Concurrent access to a shared_ptr object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

The meaning of the arguments of type memory_order is explained in 30.4.

```cpp
\template<class T> \bool atomic_is_lock_free(const shared_ptr<T>* p);

Requires: p shall not be null.

Returns: true if atomic access to *p is lock-free, false otherwise.

Throws: Nothing.

\template<class T> \shared_ptr<T> atomic_load(const shared_ptr<T>* p);

Requires: p shall not be null.

Returns: atomic_load_explicit(p, memory_order_seq_cst).

Throws: Nothing.

\template<class T> \shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

Requires: p shall not be null.

Requires: mo shall not be memory_order_release or memory_order_acq_rel.

Returns: *p.
```
template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.
Effects: As if by atomic_store_explicit(p, r, memory_order_seq_cst).
Throws: Nothing.

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.
Requires: mo shall not be memory_order_acquire or memory_order_acq_rel.
Effects: As if by p->swap(r).
Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.
Returns: atomic_exchange_explicit(p, r, memory_order_seq_cst).
Throws: Nothing.

template<class T>
shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.
Effects: As if by p->swap(r).
Returns: The previous value of *p.
Throws: Nothing.

template<class T>
bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Requires: p shall not be null and v shall not be null.
Returns:
atomic_compare_exchange_weak_explicit(p, v, w, memory_order_seq_cst, memory_order_seq_cst)
Throws: Nothing.

template<class T>
bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Returns:
atomic_compare_exchange_strong_explicit(p, v, w, memory_order_seq_cst, memory_order_seq_cst)

template<class T>
bool atomic_compare_exchange_weak_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

template<class T>
bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

Requires: p shall not be null and v shall not be null. The failure argument shall not be
memory_order_release or memory_order_acq_rel.
Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to
the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to
the value of failure.
Returns: true if *p was equivalent to *v, false otherwise.
Throws: Nothing.
Remarks: Two `shared_ptr` objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 30.7.1.

D.12 Deprecated `basic_string` capacity

The following member is declared in addition to those members specified in 20.3.2.4:

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
    public:
        void reserve();
    }
}
```

`void reserve();`

Effects: After this call, `capacity()` has an unspecified value greater than or equal to `size()`. [Note: This is a non-binding shrink to fit request. —end note]

D.13 Deprecated standard code conversion facets

The header `<codecvt>` provides code conversion facets for various character encodings.

D.13.1 Header `<codecvt>` synopsis

```cpp
namespace std {
    enum codecvt_mode {
        consume_header = 4,
        generate_header = 2,
        little_endian = 1
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8(size_t refs = 0);
        ~codecvt_utf8();
    }

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf16 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf16(size_t refs = 0);
        ~codecvt_utf16();
    }

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8_utf16 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8_utf16(size_t refs = 0);
        ~codecvt_utf8_utf16();
    }
}
```

D.13.2 Requirements

For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

(1.1) `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.

(1.2) `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.

(1.3) If `(Mode & consume_header)`, the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
— If \((\text{Mode} \& \text{generate\_header})\), the facet shall generate an initial header sequence when writing a
multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.

— If \((\text{Mode} \& \text{little\_endian})\), the facet shall generate a multibyte sequence in little-endian order, as
opposed to the default big-endian order.

For the facet \texttt{codecvt\_utf8}:

— The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the
size of \texttt{Elem}) within the program.

— Endianness shall not affect how multibyte sequences are read or written.

— The multibyte sequences may be written as either a text or a binary file.

For the facet \texttt{codecvt\_utf16}:

— The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the
size of \texttt{Elem}) within the program.

— Multibyte sequences shall be read or written according to the \texttt{Mode} flag, as set out above.

— The multibyte sequences may be written only as a binary file. Attempting to write to a text file
produces undefined behavior.

For the facet \texttt{codecvt\_utf8\_utf16}:

— The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes)
within the program.

— Endianness shall not affect how multibyte sequences are read or written.

— The multibyte sequences may be written as either a text or a binary file.

The encoding forms UTF-8, UTF-16, and UTF-32 are specified in ISO/IEC 10646. The encoding form UCS-2
is specified in ISO/IEC 10646-1:1993.

### D.14 Deprecated convenience conversion interfaces

The header \texttt{<locale>} has the following additions:

```c++
namespace std {
    template<class Codecvt, class Elem = wchar_t,
             class Wide_alloc = allocator<Elem>,
             class Byte_alloc = allocator<char>>
    class wstring_convert;

    template<class Codecvt, class Elem = wchar_t,
             class Tr = char_traits<Elem>>
    class wbuffer_convert;
}
```

#### D.14.1 Class template \texttt{wstring\_convert}

Class template \texttt{wstring\_convert} performs conversions between a wide string and a byte string. It lets you
specify a code conversion facet (like class template \texttt{codecvt}) to perform the conversions, without affecting
any streams or locales. [Example: If you want to use the code conversion facet \texttt{codecvt\_utf8} to output to
\texttt{cout} a UTF-8 multibyte sequence corresponding to a wide string, but you don’t want to alter the locale for
\texttt{cout}, you can write something like:

```c++
wstring_convert<\texttt{std::codecvt\_utf8<\texttt{wchar\_t)>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
```
using state_type = typename Codecvt::state_type;
using int_type = typename wide_string::traits_type::int_type;

wstring_convert() : wstring_convert(new Codecvt) {}
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
const wide_string& wide_err = wide_string());
~wstring_convert();

wstring_convert(const wstring_convert&) = delete;
wstring_convert& operator=(const wstring_convert&) = delete;

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);

size_t converted() const noexcept;
state_type state() const;

private:
byte_string byte_err_string;     // exposition only
wide_string wide_err_string;    // exposition only
Codecvt* cvtptr;                // exposition only
state_type cvtstate;            // exposition only
size_t cvtcount;                // exposition only
};

The class template describes an object that controls conversions between wide string objects of class `basic_string<Elem, char_traits<Elem>, Wide_alloc>` and byte string objects of class `basic_string<char, char_traits<char>, Byte_alloc>`. The class template defines the types `wide_string` and `byte_string` as synonyms for these two types. Conversion between a sequence of `Elem` values (stored in a `wide_string` object) and multibyte sequences (stored in a `byte_string` object) is performed by an object of class `Codecvt`, which meets the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`. An object of this class template stores:

1. `byte_err_string` — a byte string to display on errors
2. `wide_err_string` — a wide string to display on errors
3. `cvtptr` — a pointer to the allocated conversion object (which is freed when the `wstring_convert` object is destroyed)
4. `cvtstate` — a conversion state object
5. `cvtcount` — a conversion count

using byte_string = basic_string<char, char_traits<char>, Byte_alloc>;

The type shall be a synonym for `basic_string<char, char_traits<char>, Byte_alloc>`.

size_t converted() const noexcept;

Returns: cvtcount.

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

Effects: The first member function shall convert the single-element sequence byte to a wide string. The second member function shall convert the null-terminated sequence beginning at ptr to a wide string. The third member function shall convert the sequence stored in str to a wide string. The fourth member function shall convert the sequence defined by the range [first, last) to a wide string.

In all cases:

(7.1) If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.

(7.2) The number of input elements successfully converted shall be stored in cvtcount.

Returns: If no conversion error occurs, the member function shall return the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function shall return the wide-error string. Otherwise, the member function throws an object of class range_error.

using int_type = typename wide_string::traits_type::int_type;

The type shall be a synonym for wide_string::traits_type::int_type.

state_type state() const;

returns cvtstate.

using state_type = typename Codecvt::state_type;

The type shall be a synonym for Codecvt::state_type.

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);

Effects: The first member function shall convert the single-element sequence wchar to a byte string. The second member function shall convert the null-terminated sequence beginning at wptr to a byte string. The third member function shall convert the sequence stored in wstr to a byte string. The fourth member function shall convert the sequence defined by the range [first, last) to a byte string.

In all cases:

(13.1) If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.

(13.2) The number of input elements successfully converted shall be stored in cvtcount.

Returns: If no conversion error occurs, the member function shall return the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function shall return the byte-error string. Otherwise, the member function shall throw an object of class range_error.

using wide_string = basic_string<Elem, char_traits<Elem>, Wide_alloc>;

The type shall be a synonym for basic_string<Elem, char_traits<Elem>, Wide_alloc>.

explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
const wide_string& wide_err = wide_string());

Requires: For the first and second constructors, pcvt != nullptr.

Effects: The first constructor shall store pcvt in cvtptr and default values in cvtstate, byte_err_string, and wide_err_string. The second constructor shall store pcvt in cvtptr, state in cvtstate, and default values in byte_err_string and wide_err_string; moreover the stored state shall be retained between calls to from_bytes and to_bytes. The third constructor shall store new Codecvt in cvtptr, state_type() in cvtstate, byte_err in byte_err_string, and wide_err in wide_err_string.
D.14.2 Class template \texttt{wbuffer\_convert} \textup{[depr\textunderscore conversions\textunderscore buffer]}

Class template \texttt{wbuffer\_convert} looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template \texttt{wstring\_convert}, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

 namespace std {
    template<class Codecvt, class Elem = wchar\_t, class Tr = char\_traits<Elem>>
    class wbuffer_convert : public basic\_streambuf<Elem, Tr> {
        public:
            using state\_type = typename Codecvt::state\_type;
        
            wbuffer\_convert() : wbuffer\_convert(nullptr) {}  // exposition only
            explicit wbuffer\_convert(streambuf* bytebuf,
                                      Codecvt* pcvt = new Codecvt,
                                      state\_type state = state\_type());  // exposition only

            ~wbuffer\_convert();

            wbuffer\_convert(const wbuffer\_convert&) = delete;
            wbuffer\_convert& operator=(const wbuffer\_convert&) = delete;

            streambuf* rdbuf() const;  // exposition only
            streambuf* rdbuf(streambuf* bytebuf);

            state\_type state() const;  // exposition only

        private:
            streambuf* bufptr;      // exposition only
            Codecvt* cvtptr;        // exposition only
            state\_type cvtstate;    // exposition only
        }
    }

2 The class template describes a stream buffer that controls the transmission of elements of type \texttt{Elem}, whose character traits are described by the class \texttt{Tr}, to and from a byte stream buffer of type \texttt{streambuf}. Conversion between a sequence of \texttt{Elem} values and multibyte sequences is performed by an object of class \texttt{Codecvt}, which shall satisfy the requirements of the standard code-conversion facet \texttt{codecvt<Elem, char, mbstate\_t>}.

3 An object of this class template stores:

\begin{itemize}
\item[(3.1)] \texttt{bufptr} — a pointer to its underlying byte stream buffer
\item[(3.2)] \texttt{cvtptr} — a pointer to the allocated conversion object (which is freed when the \texttt{wbuffer\_convert} object is destroyed)
\item[(3.3)] \texttt{cvtstate} — a conversion state object
\end{itemize}

4 Returns: \texttt{cvtstate}.

5 Returns: \texttt{bufptr}.

6 Effects: Stores \texttt{bytebuf} in \texttt{bufptr}.

7 Returns: The previous value of \texttt{bufptr}.

8 The type shall be a synonym for \texttt{Codecvt::state\_type}. 

§ D.14.2 1581
explicit wbuffer_convert(
    streambuf* bytebuf,
    Codecvt* pcvt = new Codecvt,
    state_type state = state_type());

_requires:_ pcvt != nullptr.

_effects:_ The constructor constructs a stream buffer object, initializes bufptr to bytebuf, initializes cvtptr to pcvt, and initializes cvtstate to state.

~wbuffer_convert();

_effects:_ The destructor shall delete cvtptr.

D.15 Deprecated locale category facets [depr.locale.category]

1 The _ctype_ locale category includes the following facets as if they were specified in table Table 90 of 27.3.1.1.1.
   - codecvt<char16_t, char, mbstate_t>
   - codecvt<char32_t, char, mbstate_t>

2 The _ctype_ locale category includes the following facets as if they were specified in table Table 91 of 27.3.1.1.1.
   - codecvt_byname<char16_t, char, mbstate_t>
   - codecvt_byname<char32_t, char, mbstate_t>

3 The following class template specializations are required in addition to those specified in 27.4.1.4. The specialization codecvt<char16_t, char, mbstate_t> converts between the UTF-16 and UTF-8 encoding forms, and the specialization codecvt<char32_t, char, mbstate_t> converts between the UTF-32 and UTF-8 encoding forms.

D.16 Deprecated filesystem path factory functions [depr.fs.path.factory]

template<class Source>
    path u8path(const Source& source);

template<class InputIterator>
    path u8path(InputIterator first, InputIterator last);

_requires:_ The source and [first, last) sequences are UTF-8 encoded. The value type of Source and InputIterator is char. Source meets the requirements specified in 28.11.7.3.

_returns:_

(2.1) — If value_type is char and the current native narrow encoding (28.11.7.2.2) is UTF-8, return path(source) or path(first, last); otherwise,

(2.2) — if value_type is wchar_t and the native wide encoding is UTF-16, or if value_type is char16_t or char32_t, convert source or [first, last) to a temporary, tmp, of type string_type and return path(tmp); otherwise,

(2.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).

_remarks:_ Argument format conversion (28.11.7.2.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

_example:_ A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:

namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));

For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs. — _end example_

behavior of iostream classes when traits::pos_type is not streampos or when traits::off_type is not streamoff, 1283
behavior of non-standard attributes, 212
bits in a byte, 48
choice of larger or smaller value of floating literal, 19
concatenation of some types of string literals, 20
consistency of build level and violation continuation mode, 29
conversions between pointers and integers, 110
converting characters from source character set to execution character set, 9
converting function pointer to object pointer and vice versa, 111
default configuration of a pool, 625
default next_buffer_size for a monotonic_buffer_resource, 627
default number of buckets in unordered_map, 820
default number of buckets in unordered_multimap, 826
default number of buckets in unordered_multiset, 835
default number of buckets in unordered_set, 830, 831
defining main in freestanding environment, 74
error_category for errors originating outside the operating system, 447
establishing of and argument for violation handler, 217
exception type when random_device constructor fails, 1095
exception type when random_device::operator() fails, 1095
exceptions thrown by standard library functions that have a potentially-throwing exception specification, 447
execution character set and execution wide-character set, 10
exit status, 465
extended signed integer types, 62
file type of the file argument of filesystem::status, 1404
formatted character sequence generated by time_put::do_put in C locale, 1273
forward progress guarantees for implicit threads of parallel algorithms (if not defined for thread), 961
growth factor for monotonic_buffer_resource, 627
headers for freestanding implementation, 431
how random_device::operator() generates values, 1095
interactive device, 7
interpretation of the path character sequence with format path::auto_format, 1381
largest supported value to configure the largest allocation satisfied directly by a pool, 625
largest supported value to configure the maximum number of blocks to replenish a pool, 625
linkage of main, 74
linkage of names from C standard library, 431
linkage of objects between C++ and other languages, 211
locale names, 1247
lvalue-to-rvalue conversion of an invalid pointer value, 83
manner of search for included source file, 409
mapping from name to catalog when calling messages::do_open, 1279
mapping from physical source file characters to basic source character set, 10, 1554
mapping header name to header or external source file, 13
mapping of pointer to integer, 110
mapping physical source file characters to basic source character set, 9
mapping to message when calling messages::do_get, 1280
maximum depth of recursive template instantiations, 369
maximum size of an allocated object, 115, 471
meaning of ‘’, ‘\’, ‘/’, or ‘/’ in a q-char-sequence or an h-char-sequence, 13
meaning of asm declaration, 209
meaning of attribute declaration, 145
meaning of dot-dot in root-directory, 1369
mechanism for selecting the build level, 217
negative value of character literal in preprocessor, 408
nesting limit for #include directives, 409
NTCTS in basic_ostream<charT, traits>& operator<<(nullptr_t), 1327
number of placeholders for bind expressions, 632, 648
number of threads in a program under a freestanding implementation, 69
numeric values of character literals in #if directives, 408
operating system on which implementation depends, 1361
parameters to main, 74
passing argument of class type through ellipsis, 105
physical source file characters, 9
presence and meaning of native_handle_type and native_handle, 1471
range defined for character literals, 18
range exponent of integral type, 63

value of wide-character literal containing multiple characters, 18
value of wide-character literal with single c-char that is not in execution wide-character set, 18
value representation of floating-point types, 64
value representation of pointer types, 65
values of a trivially copyable type, 61
values of various \texttt{ATOMIC\_...\_LOCK\_FREE} macros, 1453

whether \texttt{<cfenv>} functions can be used to manage floating-point status, 1067
whether a given \texttt{atomic} type’s operations are always lock free, 616, 617, 1460, 1461, 1463, 1465, 1466
whether a given \texttt{atomic\_ref} type’s operations are always lock free, 1454, 1456–1458
whether an implementation has relaxed or strict pointer safety, 57
whether functions from Annex K of the C standard library are declared when C++ headers are included, 430
whether \texttt{get\_pointer\_safety} returns \texttt{pointer\_safety::relaxed} or \texttt{pointer\_safety::preferred} if the implementation has relaxed pointer safety, 580
whether locale object is global or per-thread, 1245
whether pragma \texttt{FENV\_ACCESS} is supported, 1067
whether \texttt{rand} may introduce a data race, 1114
whether sequence pointers are copied by \texttt{basic\_filebuf} move constructor, 1344
whether sequence pointers are copied by \texttt{basic\_stringbuf} move constructor, 1335
whether sequence pointers are initialized to null pointers, 1335
whether source of translation units must be available to locate template definitions, 10
whether stack is unwound before calling the function \texttt{std::terminate} when a \texttt{noexcept} specification is violated, 403
whether the lifetime of a parameter ends when the callee returns or at the end of the enclosing full-expression, 104
whether the thread that executes \texttt{main} and the threads created by \texttt{std::thread} provide concurrent forward progress guarantees, 73
whether \texttt{time\_get::do\_get\_year} accepts two-digit year numbers, 1272

whether values are rounded or truncated to the required precision when converting between \texttt{time\_t} values and \texttt{time\_point} objects, 1176
which functions in the C++ standard library may be recursively reentered, 446
which non-standard-layout objects containing no data are considered empty, 50
which scalar types have unique object representations, 670
