A Proposal to Add 2D Graphics Rendering and Display to C++

Note: this is an early draft. It's known to be incomple and incorrekt, and it has lots of bad formatting.

1 Revision history

1.1 Revision 7

The significant difference between R7 and R6 is the abstraction of the implementation into separate classes. These classes provide math and rendering support. The linear algebra and geometry classes are templated over any appropriate math support class, while the path, brush and surface classes are templated over any appropriate rendering support class.

The reference implementation of this paper provides a software implementation of the math and rendering support classes. This is based on the Cairo library; indeed, so far the reference implementation has been based on Cairo. However, it is now possible to provide an implementation more appropriate to the target platform.

For example, a Windows implementation could provide support classes based on DirectX, while a Linux implementation could provide support classes based on OpenGL. In fact, any hardware vendor could provide a support library, targeting a specific implementation and their particular silicon if they wanted to exploit particular features of their hardware.

Additionally, the surface classes have been modified: now there are simply managed and unmanaged output surfaces, the latter of which offers developers the opportunity to take finer control of the drawing surface

The surface class and the mapped_surface class have been withdrawn, while the basic_unmanaged_output_surface class has been introduced.

The reference implementation, including a software-only implementation of math and rendering support classes, is available at https://github.com/mikebmcl/P0267_RefImpl

1.2 Revision 6

Presented to LEWG in Toronto, July 2017
2 Scope

This Technical Specification specifies requirements for implementations of an interface that computer programs written in the C++ programming language may use to render and display 2D computer graphics.
3 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

1. ISO/IEC 14882, Programming languages — C++
2. ISO/IEC 2382 (all parts), Information technology — Vocabulary
4. ISO/IEC 10918-1, Information technology — Digital compression and coding of continuous-tone still images: Requirements and guidelines
5. ISO 12639, Graphic technology — Prepress digital data exchange — Tag image file format for image technology (TIFF/IT)
7. ISO/IEC TR 19769:2004, Information technology — Programming languages, their environments and system software interfaces — Extensions for the programming language C to support new character data types
9. IEC 61966-2-1, Colour Measurement and Management in Multimedia Systems and Equipment - Part 2-1: Default RGB Colour Space - sRGB
11. ISO 80000-2:2009, Quantities and units — Part 2: Mathematical signs and symbols to be used in the natural sciences and technology
12. Tantek Çelik et al., CSS Color Module Level 3 — W3C Recommendation 07 June 2011, Copyright © 2011 W3C® (MIT, ERCIM, Keio)

The compressed image data format described in ISO/IEC 10918-1 is hereinafter called the JPEG format.

The tag image file format described in ISO 12639 is hereinafter called the TIFF format. The datastream and associated file format described in ISO/IEC 15948 is hereinafter called the PNG format.

The library described in ISO/IEC TR 19769:2004 is hereinafter called the C Unicode TR.

The document CSS Color Module Level 3 — W3C Recommendation 07 June 2011 is hereinafter called the CSS Colors Specification.
4 Terms and definitions

For the purposes of this document, the following terms and definitions apply. ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at http://www.iso.org/obp

Terms that are used only in a small portion of this document are defined where they are used and italicized where they are defined.

4.1 standard coordinate space
Euclidean plane described by a Cartesian coordinate system where the first coordinate is measured along a horizontal axis, called the $x$ axis, oriented from left to right, the second coordinate is measured along a vertical axis, called the $y$ axis, oriented from top to bottom, and rotation of a point around the origin by a positive value expressed in radians is counterclockwise.

4.2 point
(\textit{point}) coordinate designated by a floating point $x$ axis value and a floating point $y$ axis value within the standard coordinate space (4.1).

4.3 point
(\textit{integral point}) coordinate designated by an integral $x$ axis value and an integral $y$ axis value within the standard coordinate space (4.1).

4.4 normalize
map a closed set of evenly spaced values in the range $[0, x]$ to an evenly spaced sequence of floating point values in the range $[0, 1]$ [Note: The definition of normalize given is the definition for normalizing unsigned input. Signed normalization, i.e. the mapping of a closed set of evenly spaced values in the range $[-x, x)$ to an evenly spaced sequence of floating point values in the range $[-1, 1]$ is not used in this Technical Specification. —end note]

4.5 aspect ratio
ratio of the width to the height of a rectangular area

4.6 color space
unambiguous mapping of values to colorimetric colors

4.7 gradient stop
point at which a color gradient changes from one color to the next
4.8 visual data [io2d.defns.visdata]
data representing color, transparency, or some combination thereof

4.9 graphics data [io2d.defns.graphicsdata]
graphics data (visual data (4.8)) stored in an unspecified form

4.10 channel [io2d.defns.channel]
component of visual data (4.8) with a defined bit size

4.11 color channel [io2d.defns.colorchannel]
component of visual data (4.8) representing color

4.12 alpha channel [io2d.defns.alphachannel]
component of visual data (4.8) representing transparency

4.13 visual data format [io2d.defns.visdatafmt]
specification that defines a total bit size, a set of one or more channels (4.10), and each channel’s role, bit size, and location relative to the upper (high-order) bit

4.14 premultiplied format [io2d.defns.premultipliedformat]
format with color channels (4.11) and an alpha channel (4.12) where each color channel is normalized (4.4) and then multiplied by the normalized alpha channel value [Example: Given the 32-bit non-premultiplied RGBA pixel with 8 bits per channel {255, 0, 0, 127} (half-transparent red), when normalized it would become {1.0f, 0.0f, 0.0f, 0.5f}. As such, in premultiplied, normalized format it would become {0.5f, 0.0f, 0.0f, 0.5f} as a result of multiplying each of the three color channels by the alpha channel value. — end example]

4.15 visual data element [io2d.defns.visdataelem]
item of visual data (4.8) with a defined visual data format (4.13)

4.16 pixel [io2d.defns.pixel]
discrete, rectangular visual data element (4.15)

4.17 graphics data [io2d.defns.graphics.raster]
graphics data (raster graphics data) visual data (4.8) stored as pixels (4.16) that is accessible as-if it was an array of rows of pixels beginning with the pixel at the integral point (0, 0) (4.3)

4.18 additive color [io2d.defns.additivcolor]
color defined by the emissive intensity of its color channels (4.11)

4.19 color model [io2d.defns.colormodel]
ideal, mathematical representation of colors which often uses color channels (4.11)
4.20 RGB color model
(RGB) additive (4.18) color model (4.19) using red, green, and blue color channels (4.11)

4.21 RGBA color model
(RGBA) RGB color model (4.20) with an alpha channel (4.12)

4.22 sRGB color space
(sRGB) additive (4.18) color space (4.6) defined in IEC 61966-2-1 that is based on an RGB color model (4.20)

4.23 start point
point that begins a segment (4.28)

4.24 end point
point that ends a segment (4.28)

4.25 control point
point, other than the start point and the end point, that is used in defining a curve

4.26 Bézier curve
(quadratic) curve defined by the equation $f(t) = (1 - t)^2 \times P_0 + 2 \times t \times (1 - t) \times P_1 + t^2 \times t \times P_2$ where $t$ is in the range $[0, 1]$, $P_0$ is the start point (4.23), $P_1$ is the control point (4.25), and $P_2$ is end point (4.24)

4.27 Bézier curve
(cubic) curve defined by the equation $f(t) = (1 - t)^3 \times P_0 + 3 \times t \times (1 - t)^2 \times P_1 + 3 \times t^2 \times (1 - t) \times P_2 + t^3 \times t \times P_3$ where $t$ is in the range $[0, 1]$. $P_0$ is the start point (4.23), $P_1$ is the first control point (4.25), $P_2$ is the second control point, and $P_3$ is the end point (4.24)

4.28 segment
line, Bézier curve (4.26, 4.27), or arc

4.29 initial segment
segment (4.28) in a figure (4.39) whose start point (4.23) is not defined as being the end point (4.24) of another segment in the figure. [Note: It is possible for the initial segment and final segment to be the same segment. — end note]

4.30 new figure point
point that is the start point (4.23) of the initial segment (4.29)

4.31 final segment
segment (4.28) in a figure (4.39) whose end point (4.24) does not define the start point (4.23) of any other segment [Note: It is possible for the initial segment and final segment to be the same segment. — end note]
4.32 \([\text{io2d.defns.currentpt}]\)  
**current point**  
point used as the *start point* \((4.23)\) of a *segment* \((4.28)\)

4.33 \([\text{io2d.defns.openfigure}]\)  
**open figure**  
figure \((4.39)\) with one or more *segments* \((4.28)\) where the *new figure point* \((4.30)\) is not used to define the *end point* \((4.24)\) of the figure’s *final segment* \((4.31)\) \([\text{Note: Even if the start point of the initial segment and the end point of the final segment are assigned the same coordinates, the figure is still an open figure. This is because the final segment’s end point is not defined as being the new figure point but instead merely happens to have the same value as that point. — end note}]\)

4.34 \([\text{io2d.defns.closedfigure}]\)  
**closed figure**  
figure \((4.39)\) with one or more *segments* \((4.28)\) where the *new figure point* \((4.30)\) is used to define the *end point* \((4.24)\) of the figure’s *final segment* \((4.31)\)

4.35 \([\text{io2d.defns.degenerateseg}]\)  
**degenerate segment**  
*segment* \((4.28)\) that has the same values for its *start point* \((4.23)\), *end point* \((4.24)\), and, if any, *control points* \((4.25)\)

4.36 \([\text{io2d.defns.command.closefig}]\)  
**command**  
\(<\text{close figure command}>\) instruction that creates a line *segment* \((4.28)\) with a *start point* \((4.23)\) of *current point* \((4.32)\) and an *end point* \((4.24)\) of *new figure point* \((4.30)\)

4.37 \([\text{io2d.defns.command.newfig}]\)  
**command**  
\(<\text{new figure command}>\) an instruction that creates a new *path* \((4.40)\)

4.38 \([\text{io2d.defns.figitem}]\)  
**figure item**  
*segment* \((4.28)\), *new figure command* \((4.37)\), *close figure command* \((4.36)\), or *path command* \((4.42)\)

4.39 \([\text{io2d.defns.figure}]\)  
**figure**  
collection of *figure items* \((4.38)\) where the *end point* \((4.24)\) of each *segment* \((4.28)\) in the collection, except the *final segment* \((4.31)\), defines the *start point* \((4.23)\) of exactly one other segment in the collection

4.40 \([\text{io2d.defns.path}]\)  
**path**  
collection of *figures* \((4.39)\)

4.41 \([\text{io2d.defns.pathtransform}]\)  
**path transformation matrix**  
affine transformation matrix used to apply affine transformations to the points in a *path* \((4.40)\)

4.42 \([\text{io2d.defns.pathcommand}]\)  
**path command**  
instruction that modifies the *path transformation matrix* \((4.41)\)
4.43 degenerate figure
figure (4.39) containing a new figure command (4.37), zero or more degenerate segments (4.35), zero or more path commands (4.42), and, optionally, a close figure command (4.36)

4.44 graphics subsystem
collection of unspecified operating system and library functionality used to render and display 2D computer graphics

4.45 graphics resource
(graphics resource) object of unspecified type used by an implementation [Note: By its definition a graphics resource is an implementation detail. Often it will be a graphics subsystem object (e.g. a graphics device or a render target) or an aggregate composed of multiple graphics subsystem objects. However the only requirement placed upon a graphics resource is that the implementation is able to use it to provide the functionality required of the graphics resource. — end note]

4.46 graphics resource
(graphics data graphics resource) object of unspecified type used by an implementation to provide access to, and allow manipulation of, visual data (4.8)

4.47 pixmap
raster graphics data graphics resource (4.46)

4.48 filter
mathematical function that determines the visual data (4.8) value of a point for a graphics data graphics resource (4.46)

4.49 composition algorithm
algorithm that combines a source visual data element (4.15) and a destination visual data element producing a visual data element that has the same visual data format (4.13) as the destination visual data element

4.50 compose
combine part or all of a source graphics data graphics resource (4.46) with a destination graphics data graphics resource in the manner specified by a composition algorithm (4.49)

4.51 composing operation
operation that performs composing (4.50)

4.52 artifact
error in the results of the application of a composing operation (4.51)
4.53 sample

use a filter (4.48) to obtain the visual data (4.8) for a given point from a graphics data graphics resource (4.46)

4.54 aliasing

presence of visual artifacts (4.52) in the results of rendering due to sampling (4.53) imperfections

4.55 anti-aliasing

application of a function or algorithm while composing (4.50) to reduce aliasing (4.54) [Note: Certain algorithms can produce “better” results, i.e. results with fewer artifacts or with less pronounced artifacts, when rendering text with anti-aliasing due to the nature of text rendering. As such, it often makes sense to provide the ability to choose one type of anti-aliasing for text rendering and another for all other rendering and to provide different sets of anti-aliasing types to choose from for each of the two operations. — end note]

4.56 graphics state data

data which specify how some part of the process of rendering, or of a composing operation (4.51), shall be performed in part or in whole

4.57 render

transform a path (4.40) into graphics data in the manner specified by a set of graphics state data (4.56)

4.58 rendering operation

operation that performs rendering (4.57)

4.59 rendering and composing operation

operation that is either a composing operation (4.51), or a rendering operation (4.58) followed by a composing operation
5 Error reporting

2D graphics library functions that can produce errors occasionally provide two overloads: one that throws an exception to report errors and another that reports errors using an `error_code` object. This provides for situations where errors are not truly exceptional.

report errors as follows, unless otherwise specified:

When an error prevents the function from meeting its specifications:

1. Functions that do not take argument of type `error_code&` throw an exception of type `system_error` or of a `system_error`-derived type. The exception object shall include the enumerator specified by the function as part of its observable state.

2. Functions that take an argument of type `error_code&` assigns the specified enumerator to the provided `error_code` object and then returns.

Failure to allocate storage is reported by throwing an exception as described in [res.on.exception.handling] in N4618.

Destructor operations defined in this Technical Specification shall not throw exceptions. Every destructor in this Technical Specification shall behave as if it had a non-throwing exception specification.

If no error occurs in a function that takes an argument of type `error_code&`, `error_code::clear` shall be called on the `error_code` object immediately before the function returns.

7 Colors

7.1 Introduction to color

Color involves many disciplines and has been the subject of many papers, treatises, experiments, studies, and research work in general.

While color is an important part of computer graphics, it is only necessary to understand a few concepts from the study of color for computer graphics.

A color model defines color mathematically without regard to how humans actually perceive color. These color models are composed of some combination of channels which each channel representing alpha or an ideal color. Color models are useful for working with color computationally, such as in composing operations, because their channel values are homogeneously spaced.

A color space, for purposes of computer graphics, is the result of mapping the ideal color channels from a color model, after making any necessary adjustment for alpha, to color channels that are calibrated to align with human perception of colors. Since the perception of color varies from person to person, color spaces use the science of colorimetry to define those perceived colors in order to obtain uniformity to the extent possible. As such, the uniform display of the colors in a color space on different output devices is possible. The values of color channels in a color space are not necessarily homogeneously spaced because of human perception of color.

Color models are often termed linear while color spaces are often termed gamma corrected. The mapping of a color model, such as the RGB color model, to a color space, such as the sRGB color space, is often the application of gamma correction.

Gamma correction is the process of transforming homogeneously spaced visual data to visual data that, when displayed, matches the intent of the untransformed visual data.

For example a color that is 50% of the maximum intensity of red when encoded as homogeneously spaced visual data, will likely have a different intensity value when it has been gamma corrected so that a human looking at on a computer display will see it as being 50% of the maximum intensity of red that the computer display is capable of producing. Without gamma correction, it would likely have appeared as though it was closer to the maximum intensity than the untransformed data intended it to be.

In addition to color channels, colors in computer graphics often have an alpha channel. The value of the alpha channel represents transparency of the color channels when they are combined with other visual data using certain composing algorithms. When using alpha, it should be used in a premultiplied format in order to obtain the desired results when applying multiple composing algorithms that utilize alpha.

7.2 Color usage requirements

During rendering and composing operations, color data is linear and, when it has an alpha channel associated with it, in premultiplied format. Implementations shall make any necessary conversions to ensure this.

7.3 Class rgba_color

The class rgba_color describes a four channel color in premultiplied format.

There are three color channels, red, green, and blue, each of which is a float.

There is also an alpha channel, which is a float.

Legal values for each channel are in the range [0.0f, 1.0f].
7.3.2  rgba_color synopsis

namespace std::experimental::io2d::v1 {
    class rgba_color {
public:
    // 7.3.3, construct/copy/move/destroy:
    constexpr rgba_color() noexcept;

// 7.3.7, operators
template <class T>
constexpr rgba_color& operator*=(T rhs) noexcept;

// 7.3.7, operators:
constexpr bool operator==(const rgba_color& lhs, const rgba_color& rhs) noexcept;
constexpr bool operator!=(const rgba_color& lhs, const rgba_color& rhs) noexcept;

template <class T>
constexpr rgba_color operator*(const rgba_color& lhs, T rhs) noexcept;

section § 7.3.3
7.3.3 rgba_color constructors and assignment operators

constexpr rgba_color() noexcept;

1 Effects: Equivalent to: rgba_color{ 0.0f, 0.0f, 0.0f, 0.0f }.

template <class T>
constexpr rgba_color(T r, T g, T b, T a = static_cast<T>(255)) noexcept;

2 Requires: r >= 0 and r <= 255 and g >= 0 and g <= 255 and b >= 0 and b <= 255 and a >= 0 and a <= 255.

3 Effects: Constructs an object of type rgba_color. The alpha channel is a / 255.0F. The red channel is r / 255.0F * a / 255.0F. The green channel is g / 255.0F * a / 255.0F. The blue channel is b / 255.0F * a / 255.0F.
Remarks: This constructor shall not participate in overload resolution unless `is_integral_v<T>` is true.

```cpp
template <class U>
constexpr rgba_color(U r, U g, U b, U a = static_cast<U>(1.0f)) noexcept;
```

Requires: `r >= 0.0f` and `r <= 1.0f` and `g >= 0.0f` and `g <= 1.0f` and `b >= 0.0f` and `b <= 1.0f` and `a >= 0.0f` and `a <= 1.0f`.

Effects: Constructs an object of type `rgba_color`. The alpha channel is `a`. The red channel is `r * a`. The green channel is `g * a`. The blue channel is `b * a`.

Remarks: This constructor shall not participate in overload resolution unless `is_floating_point_v<U>` is true.

### 7.3.4 rgba_color modifiers

[io2d.rgbacolor.modifiers]

```cpp
template <class T>
constexpr void r(T val) noexcept;
```

Requires: `val >= 0` and `val <= 255`.

Effects: The red channel is `val / 255.0F * a()`.

Remarks: This function shall not participate in overload resolution unless `is_integral_v<T>` is true.

```cpp
template <class U>
constexpr void r(U val) noexcept;
```

Requires: `val >= 0.0f` and `val <= 1.0f`.

Effects: The red channel is `val * a()`.

Remarks: This function shall not participate in overload resolution unless `is_floating_point_v<U>` is true.

```cpp
template <class T>
constexpr void g(T val) noexcept;
```

Requires: `val >= 0` and `val <= 255`.

Effects: The green channel is `val / 255.0F * a()`.

Remarks: This function shall not participate in overload resolution unless `is_integral_v<T>` is true.

```cpp
template <class U>
constexpr void g(U val) noexcept;
```

Requires: `val >= 0.0f` and `val <= 1.0f`.

Effects: The green channel is `val * a()`.

Remarks: This function shall not participate in overload resolution unless `is_floating_point_v<U>` is true.

```cpp
template <class T>
constexpr void b(T val) noexcept;
```

Requires: `val >= 0` and `val <= 255`.

Effects: The blue channel is `val / 255.0F * a()`.

Remarks: This function shall not participate in overload resolution unless `is_integral_v<T>` is true.

```cpp
template <class U>
```
constexpr void b(U val) noexcept;

Requires: \( val \geq 0.0f \) and \( val \leq 1.0f \).

Effects: The blue channel is \( val \times a() \).

Remarks: This function shall not participate in overload resolution unless \( \text{is\_floating\_point\_v<U> is true} \).

template <class T>
constexpr void a(T val) noexcept;

Requires: \( val \geq 0 \) and \( val \leq 255 \).

Effects: If \( a() == 0.0f \) the alpha channel is \( \frac{val}{255.0F} \), otherwise:
1. The red channel is set to \( \frac{r()}{a()} \times \frac{val}{255.0F} \);
2. The green channel is set to \( \frac{g()}{a()} \times \frac{val}{255.0F} \);
3. The blue channel is set to \( \frac{b()}{a()} \times \frac{val}{255.0F} \);
4. The alpha channel is set to \( \frac{val}{255.0F} \).

Remarks: This function shall not participate in overload resolution unless \( \text{is\_integral\_v<T> is true} \).

template <class U>
constexpr void a(U val) noexcept;

Requires: \( val \geq 0.0f \) and \( val \leq 1.0f \).

Effects: If \( a() == 0.0f \) the alpha channel is \( val \), otherwise:
1. The red channel is set to \( \frac{r()}{a()} \times \frac{val}{1.0} \);
2. The green channel is set to \( \frac{g()}{a()} \times \frac{val}{1.0} \);
3. The blue channel is set to \( \frac{b()}{a()} \times \frac{val}{1.0} \);
4. The alpha channel is \( val \).

Remarks: This function shall not participate in overload resolution unless \( \text{is\_floating\_point\_v<U> is true} \).

7.3.5 rgba_color observers

constexpr float r() const noexcept;

Returns: The red channel.

constexpr float g() const noexcept;

Returns: The green channel.

constexpr float b() const noexcept;

Returns: The blue channel.

constexpr float a() const noexcept;

Returns: The alpha channel.

7.3.6 rgba_color static members

The alpha value of all of the predefined rgba_color static member object in Table 2 is 1.0F except for transparent_black, which has an alpha value of 0.0F.

7.3.7  rgba_color operators

```
template <class T>
constexpr rgba_color& operator*=(T rhs) noexcept;
```

1. Requires: rhs >= 0 and rhs <= 255.
2. Effects: r(min(r() * rhs / 255.0F, 1.0F)).
3. g(min(g() * rhs / 255.0F, 1.0F)).
4. b(min(b() * rhs / 255.0F, 1.0F)).
5. a(min(a() * rhs / 255.0F, 1.0F)).
6. Returns: *this.
7. Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.

```
template <class U>
constexpr rgba_color& operator*=(U rhs) noexcept;
```

8. Requires: rhs >= 0.0F and rhs <= 1.0F.
9. Effects: r(min(r() * rhs, 1.0F)).
10. g(min(g() * rhs, 1.0F)).
11. b(min(b() * rhs, 1.0F)).
12. a(min(a() * rhs, 1.0F)).
13. Returns: *this.
14. Remarks: This function shall not participate in overload resolution unless is_floating_point_v<T> is true.

```
constexpr bool operator==(const rgba_color& lhs, const rgba_color& rhs) noexcept;
```

15. Returns: lhs.r() == rhs.r() && lhs.g() == rhs.g() && lhs.b() == rhs.b() && lhs.a() == rhs.a().

```
template <class T>
constexpr rgba_color operator*(const rgba_color& lhs, T rhs) noexcept;
```

16. Requires: rhs >= 0 and rhs <= 255.
17. Returns:
   rgba_color(min(lhs.r() * rhs / 255.0F, 1.0F), min(lhs.g() * rhs / 255.0F, 1.0F),
   min(lhs.b() * rhs / 255.0F, 1.0F), min(lhs.a() * rhs / 255.0F, 1.0F))
18. Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.
template <class U>
  constexpr rgba_color& operator*(const rgba_color& lhs, U rhs) noexcept;

  Requires: rhs >= 0.0F and rhs <= 1.0F.

  Returns:
  rgba_color(min(lhs.r() * rhs, 1.0F), min(lhs.g() * rhs, 1.0F),
  min(lhs.b() * rhs, 1.0F), min(lhs.a() * rhs, 1.0F))

  Remarks: This function shall not participate in overload resolution unless is_floating_point_v<U> is true.

template <class T>
  constexpr rgba_color operator*(T lhs, const rgba_color& rhs) noexcept;

  Requires: lhs >= 0 and lhs <= 255.

  Returns:
  rgba_color(min(lhs * rhs.r() / 255.0F, 1.0F), min(lhs * rhs.g() / 255.0F, 1.0F),
  min(lhs * rhs.b() / 255.0F, 1.0F), min(lhs * rhs.a() / 255.0F, 1.0F))

  Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.

template <class U>
  constexpr rgba_color& operator*(U lhs, const rgba_color& rhs) noexcept;

  Requires: lhs >= 0.0F and lhs <= 1.0F.

  Returns:
  rgba_color(min(lhs * rhs.r(), 1.0F), min(lhs * rhs.g(), 1.0F),
  min(lhs * rhs.b(), 1.0F), min(lhs * rhs.a(), 1.0F))

  Remarks: This function shall not participate in overload resolution unless is_floating_point_v<U> is true.

§ 7.3.7
8 Linear algebra

8.1 Class basic_point_2d

8.1.1 basic_point_2d description

1 The class template basic_point_2d is used as both a point and as a two-dimensional Euclidean vector.
2 It has an x coordinate of type float and a y coordinate of type float.

8.1.2 basic_point_2d synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsMath>
    class basic_point_2d {
        public:
        // 8.1.3, constructors:
        basic_point_2d() noexcept;
        basic_point_2d(float x, float y) noexcept;
        basic_point_2d(const typename GraphicsMath::point_2d_data_type& data) noexcept;

        // 8.1.4, modifiers:
        void x(float val) noexcept;
        void y(float val) noexcept;

        // 8.1.5, observers:
        float x() const noexcept;
        float y() const noexcept;
        float dot(const basic_point_2d& other) const noexcept;
        float magnitude() const noexcept;
        float magnitude_squared() const noexcept;
        float angular_direction() const noexcept;
        basic_point_2d to_unit() const noexcept;

        // 8.1.6, member operators:
        basic_point_2d& operator+=(const basic_point_2d& rhs) noexcept;
        basic_point_2d& operator+=(float rhs) noexcept;
        basic_point_2d& operator-=(const basic_point_2d& rhs) noexcept;
        basic_point_2d& operator-=(float rhs) noexcept;
        basic_point_2d& operator*=(const basic_point_2d& rhs) noexcept;
        basic_point_2d& operator*=(float rhs) noexcept;
        basic_point_2d& operator/=(const basic_point_2d& rhs) noexcept;
        basic_point_2d& operator/=(float rhs) noexcept;
    };

    // 8.1.7, non-member operators:
    template <class GraphicsMath>
    bool operator==(const basic_point_2d<GraphicsMath>& lhs, const basic_point_2d<GraphicsMath>& rhs) noexcept;
    template <class GraphicsMath>
    bool operator!=(const basic_point_2d<GraphicsMath>& lhs, const basic_point_2d<GraphicsMath>& rhs) noexcept;
};
basic_point_2d<GraphicsMath> operator+(const basic_point_2d<GraphicsMath>& val) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator+(const basic_point_2d<GraphicsMath>& lhs,
    const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator-(const basic_point_2d<GraphicsMath>& val) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator-(const basic_point_2d<GraphicsMath>& lhs,
    const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator*(const basic_point_2d<GraphicsMath>& lhs,
    float rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator*(float lhs,
    const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator*(const basic_point_2d<GraphicsMath>& lhs,
    const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator/(const basic_point_2d<GraphicsMath>& lhs,
    float rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator/(float lhs,
    const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator/(const basic_point_2d<GraphicsMath>& lhs,
    const basic_point_2d<GraphicsMath>& rhs) noexcept;

}  

8.1.3 basic_point_2d constructors

basic_point_2d() noexcept;

Effects: Equivalent to basic_point_2d{ 0.0f, 0.0f }.

basic_point_2d(float x, float y) noexcept;

Effects: Constructs an object of type basic_point_2d.

The x coordinate is x.

The y coordinate is y.

basic_point_2d(const typename GraphicsMath::point_2d_data_type& data) noexcept;

Effects: Constructs an object of type basic_point_2d.

The coordinates are data.

8.1.4 basic_point_2d modifiers

void x(float val) noexcept;

Effects: <TODO>

void y(float val) noexcept;

Effects: <TODO>

8.1.5 basic_point_2d observers

§ 8.1.5 25
float x() const noexcept;
   Returns: <TODO>

float y() const noexcept;
   Returns: <TODO>

float dot(const basic_point_2d& other) const noexcept;
   Returns: <TODO>x * other.x + y * other.y.

float magnitude() const noexcept;
   Returns: Equivalent to: sqrt(dot(*this));

float magnitude_squared() const noexcept;
   Returns: Equivalent to: dot(*this);

float angular_direction() const noexcept
   Returns: <TODO>atan2(y, x) if it is greater than or equal to 0.0f.
   <TODO>Otherwise, atan2(y, x) + two_pi<float>.
   [Note: The purpose of adding two_pi<float> if the result is negative is to produce values in the range [0.0f, two_pi<float>). — end note]

basic_point_2d to_unit() const noexcept;
   Returns: <TODO>basic_point_2d{ x / magnitude(), y / magnitude()}. 

8.1.6 basic_point_2d member operators [io2d.point2d.member.ops]

basic_point_2d& operator+=(const basic_point_2d& rhs) noexcept;
   Effects: *this = *this + rhs.
   Returns: *this.

basic_point_2d& operator-=(const basic_point_2d& rhs) noexcept;
   Effects: Equivalent to: *this = *this - rhs;.
   Returns: *this.

basic_point_2d& operator*=(float rhs) noexcept;
   Returns: *this.

8.1.7 basic_point_2d non-member operators [io2d.point2d.ops]

bool operator==(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;
   Returns: <TODO>lhs.x == rhs.x && lhs.y == rhs.y.
bool operator!=(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: !(lhs == rhs).

basic_point_2d operator+(const basic_point_2d& val) noexcept;

Returns: val.

basic_point_2d operator+(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d{ lhs.x + rhs.x, lhs.y + rhs.y }.

basic_point_2d operator-(const basic_point_2d& val) noexcept;

Returns: basic_point_2d{ -val.x, -val.y }.

basic_point_2d operator-(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d{ lhs.x - rhs.x, lhs.y - rhs.y }.

basic_point_2d operator*(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d{ lhs.x * rhs.x, lhs.y * rhs.y }.

basic_point_2d operator*(const basic_point_2d& lhs, float rhs) noexcept;

Returns: basic_point_2d{ lhs.x * rhs, lhs.y * rhs }.

basic_point_2d operator*(float lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d{ lhs * rhs.x, lhs * rhs.y }.

basic_point_2d operator/((const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d{ lhs.x / rhs.x, lhs.y / rhs.y }.

8.2 Class basic_matrix_2d  

8.2.1 basic_matrix_2d description

The class template basic_matrix_2d represents a three row by three column matrix. Its purpose is to perform affine transformations.

The matrix is composed of nine float values: m00, m01, m02, m10, m11, m12, m20, m21, and m22. The ordering of these float values in the basic_matrix_2d class is unspecified.

The specification of the basic_matrix_2d class, as described in this subclause, uses the following ordering:

\[
\begin{bmatrix}
  m_{00} & m_{01} & m_{02} \\
  m_{10} & m_{11} & m_{12} \\
  m_{20} & m_{21} & m_{22}
\end{bmatrix}
\]

Note: The naming convention and the layout shown above are consistent with a row-major layout. Though the naming convention is fixed, the unspecified layout allows for a column-major layout (or any other layout,
though row-major and column-major are the only layouts typically used). —end note]\end{note}

The performance of any mathematical operation upon a basic_matrix_2d shall be carried out as if the omitted third column data members were present with the values prescribed in the previous paragraph.

8.2.2 basic_matrix_2d synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsMath>
    class basic_matrix_2d {
        public:
            // 8.2.3, constructors:
            basic_matrix_2d() noexcept;
            basic_matrix_2d(float v00, float v01, float v10, float v11, float v20, float v21) noexcept;
            basic_matrix_2d(const typename GraphicsMath::matrix_2d_data_type& val) noexcept;

            // 8.2.4, static factory functions:
            static basic_matrix_2d init_translate(const basic_point_2d<GraphicsMath>& val) noexcept;

            static basic_matrix_2d init_rotate(float radians) noexcept;
            static basic_matrix_2d init_rotate(float radians, const basic_point_2d<GraphicsMath>& origin) noexcept;
            static basic_matrix_2d init_reflect(float radians) noexcept;
            static basic_matrix_2d init_shear_x(float factor) noexcept;
            static basic_matrix_2d init_shear_y(float factor) noexcept;

            // 8.2.5, modifiers:
            void m00(float val) noexcept;
            void m01(float val) noexcept;
            void m10(float val) noexcept;
            void m11(float val) noexcept;
            void m20(float val) noexcept;
            void m21(float val) noexcept;
            basic_matrix_2d& translate(const basic_point_2d<GraphicsMath>& v) noexcept;
            basic_matrix_2d& scale(const basic_point_2d<GraphicsMath>& v) noexcept;
            basic_matrix_2d& rotate(float radians) noexcept;
            basic_matrix_2d& rotate(float radians, const basic_point_2d<GraphicsMath>& origin) noexcept;
            basic_matrix_2d& reflect(float radians) noexcept;
            basic_matrix_2d& shear_x(float factor) noexcept;
            basic_matrix_2d& shear_y(float factor) noexcept;

            // 8.2.6, observers:
            float m00() const noexcept;
            float m01() const noexcept;
            float m10() const noexcept;
            float m11() const noexcept;
            float m20() const noexcept;
            float m21() const noexcept;
            bool is_finite() const noexcept;
            bool is_invertible() const noexcept;
            float determinant() const noexcept;
            basic_matrix_2d inverse() const noexcept;
            basic_point_2d<GraphicsMath> transform_pt(const basic_point_2d<GraphicsMath>& pt) const noexcept;

            // 8.2.7, member operators:

§ 8.2.2
8.2.3 basic_matrix_2d constructors

basic_matrix_2d() noexcept;

Effects: Equivalent to: basic_matrix_2d{ 1.0f, 0.0f, 0.0f, 1.0f, 0.0f, 0.0f }.

Note: The resulting matrix is the identity matrix. —end note

basic_matrix_2d(float v00, float v01, float v10, float v11,
float v20, float v21) noexcept;

Effects: Constructs an object of type basic_matrix_2d.

<TODO>
m00 == v00, m01 == v01, m02 == 0.0f, m10 == v10, m11 == v11, m12 == 0.0f, m20 ==
v20, m21 == v21, m22 == 1.0f.

basic_matrix_2d(const typename GraphicsMath::matrix_2d_data_type& val) noexcept;

Effects: Constructs an object of type basic_matrix_2d.

8.2.4 basic_matrix_2d static factory functions

static basic_matrix_2d init_translate(basic_point_2d<GraphicsMath> value) noexcept;

Returns: <TODO>basic_matrix_2d(1.0f, 0.0f, 0.0f, 1.0f, value.x, value.y).

static basic_matrix_2d init_scale(basic_point_2d<GraphicsMath> value) noexcept;

Returns: <TODO>basic_matrix_2d(value.x, 0.0f, 0.0f, value.y, 0.0f, 0.0f).

static basic_matrix_2d init_rotate(float radians) noexcept;

Returns: basic_matrix_2d(cos(radians), -sin(radians), sin(radians), cos(radians), 0.0f,
0.0f).

static basic_matrix_2d init_rotate(float radians, basic_point_2d<GraphicsMath> origin) noexcept;

Effects: Equivalent to:

return basic_matrix_2d(
    basic_matrix_2d::init_translate(origin).rotate(radians).translate(-origin));

static basic_matrix_2d init_reflect(float radians) noexcept;

§ 8.2.4
5  Returns: basic_matrix_2d(cos(radians * 2.0f), sin(radians * 2.0f), sin(radians * 2.0f),
           -cos(radians * 2.0f), 0.0f, 0.0f)

static basic_matrix_2d init_shear_x(float factor) noexcept;
6  Returns: basic_matrix_2d(1.0f, 0.0f, factor, 1.0f, 0.0f, 0.0f).

static basic_matrix_2d init_shear_y(float factor) noexcept;
7  Returns: basic_matrix_2d(1.0f, factor, 0.0f, 1.0f, 0.0f, 0.0f)

8.2.5 basic_matrix_2d modifiers

basic_matrix_2d& translate(basic_point_2d<GraphicsMath> val) noexcept;
1  Effects: Equivalent to: *this = *this * init_translate(val);
2  Returns: *this.

basic_matrix_2d& scale(basic_point_2d<GraphicsMath> val) noexcept;
3  Effects: Equivalent to: *this = *this * init_scale(val);
4  Returns: *this.

basic_matrix_2d& rotate(float radians) noexcept;
5  Effects: Equivalent to: *this = *this * init_rotate(radians);
6  Returns: *this.

basic_matrix_2d& rotate(float radians, basic_point_2d<GraphicsMath> origin) noexcept;
7  Effects: Equivalent to: *this = *this * init_rotate(radians, origin);
8  Returns: *this.

basic_matrix_2d& reflect(float radians) noexcept;
9  Effects: Equivalent to: *this = *this * init_reflect(radians);
10 Returns: *this.

basic_matrix_2d& shear_x(float factor) noexcept;
11 Effects: Equivalent to: *this = *this * init_shear_x(factor);
12 Returns: *this.

basic_matrix_2d& shear_y(float factor) noexcept;
13 Effects: Equivalent to: *this = *this * init_shear_y(factor);
14 Returns: *this.

8.2.6 basic_matrix_2d observers

bool is_finite() const noexcept;
1  Returns: true if the observable behavior of all of the following expressions evaluates to true:

(1.1) — isfinite(m00);
(1.2) — isfinite(m01);
(1.3) — isfinite(m10);
(1.4) — isfinite(m11);
— isfinite(m20);
— isfinite(m21);

Otherwise returns false.

[Note: The specification of isfinite in N4618 does not include the constexpr specifier. Regardless, the requirements stated in [library.c] and [c.math.fpclass] in N4618 make it possible to implement a constexpr function that produces the observable behavior of isfinite. As a result, this function can be implemented as a constexpr function. — end note]

bool is_invertible() const noexcept;

Requires: is_finite() is true.

Returns: determinant() != 0.0f.

basic_matrix_2d inverse() const noexcept;

Requires: is_invertible() is true.

Returns: Let inverseDeterminant be 1.0f / determinant().

<TODO>

return basic_matrix_2d{
    (m11 * 1.0f - 0.0f * m21) * inverseDeterminant,
    -(m01 * 1.0f - 0.0f * m21) * inverseDeterminant,
    -(m10 * 1.0f - 0.0f * m20) * inverseDeterminant,
    (m00 * 1.0f - 0.0f * m20) * inverseDeterminant,
    (m10 * m21 - m11 * m20) * inverseDeterminant,
    -(m00 * m21 - m01 * m20) * inverseDeterminant
};

float determinant() const noexcept;

Requires: is_finite() is true.

Returns: <TODO>m00 * m11 - m01 * m10.

basic_point_2d<GraphicsMath> transform_pt(basic_point_2d<GraphicsMath> pt) const noexcept;

Returns: <TODO>basic_point_2d<GraphicsMath>((m00 * pt.x + m10 * pt.y) + m20, (m01 * pt.x + m11 * pt.y) + m21).

8.2.7 basic_matrix_2d member operators [io2d.matrix2d.member.ops]

basic_matrix_2d& operator*=(const basic_matrix_2d& rhs) noexcept;

Effects: Equivalent to: *this = *this * rhs;

Returns: *this.

8.2.8 basic_matrix_2d non-member operators [io2d.matrix2d.ops]

basic_matrix_2d operator*(const basic_matrix_2d& lhs, const basic_matrix_2d& rhs) noexcept;

Returns: <TODO>
\[
\begin{align*}
\text{lhs.m20} \times \text{rhs.m00} + \text{lhs.m21} \times \text{rhs.m10} + \text{lhs.m20}, \\
\text{lhs.m20} \times \text{rhs.m01} + \text{lhs.m21} \times \text{rhs.m11} + \text{lhs.m21}
\end{align*}
\]

basic_point_2d<GraphicsMath> operator*(basic_point_2d<GraphicsMath> v, const basic_matrix_2d& m) noexcept;

Returns: Equivalent to: m.transform_pt(v).

bool operator==(const basic_matrix_2d& lhs, const basic_matrix_2d& rhs) noexcept;

Returns: <TODO>

- lhs.m00 == rhs.m00 && lhs.m01 == rhs.m01 &&
- lhs.m10 == rhs.m10 && lhs.m11 == rhs.m11 &&
- lhs.m20 == rhs.m20 && lhs.m21 == rhs.m21

bool operator!=(const basic_matrix_2d& lhs, const basic_matrix_2d& rhs) noexcept;

Returns: Equivalent to: !(lhs == rhs).
9 Geometry

9.1 Class basic_bounding_box

9.1.1 basic_bounding_box description

The class template basic_bounding_box describes a bounding_box. It has an \( x \) coordinate of type float, a \( y \) coordinate of type float, a width of type float, and a height of type float.

9.1.2 basic_bounding_box synopsis

```cpp
namespace std::experimental::io2d::v1 {
  template <class GraphicsMath>
  class basic_bounding_box {
  public:
    // 9.1.3, constructors:
    basic_bounding_box() noexcept;
    basic_bounding_box(float x, float y, float width, float height) noexcept;
    basic_bounding_box(const basic_point_2d<GraphicsMath>& tl,
                        const basic_point_2d<GraphicsMath>& br) noexcept;
    basic_bounding_box(const typename GraphicsMath::bounding_box_data_type& val) noexcept;
    // 9.1.4, modifiers:
    void x(float val) noexcept;
    void y(float val) noexcept;
    void width(float val) noexcept;
    void height(float val) noexcept;
    void top_left(const basic_point_2d<GraphicsMath>& val) noexcept;
    void bottom_right(const basic_point_2d<GraphicsMath>& val) noexcept;
    // 9.1.5, observers:
    float x() const noexcept;
    float y() const noexcept;
    float width() const noexcept;
    float height() const noexcept;
    basic_point_2d<GraphicsMath> top_left() const noexcept;
    basic_point_2d<GraphicsMath> bottom_right() const noexcept;
  };

  // 9.1.6, operators:
  template <class GraphicsMath>
  bool operator==(const basic_bounding_box<GraphicsMath>& lhs,
                  const basic_bounding_box<GraphicsMath>& rhs) noexcept;
  template <class GraphicsMath>
  bool operator!=(const basic_bounding_box<GraphicsMath>& lhs,
                  const basic_bounding_box<GraphicsMath>& rhs) noexcept;
}
```

9.1.3 basic_bounding_box constructors

```cpp
basic_bounding_box() noexcept;
```

1 Effects: Equivalent to `basic_bounding_box{ 0.0f, 0.0f, 0.0f, 0.0f }`. 

§ 9.1.3
basic_bounding_box(float x, float y, float w, float h) noexcept;

  Requires: w is not less than 0.0f and h is not less than 0.0f.
  Effects: Constructs an object of type basic_bounding_box.
  The x coordinate is x. The y coordinate is y. The width is w. The height is h.

basic_bounding_box(const basic_point_2d<GraphicsMath>& tl, const basic_point_2d<GraphicsMath>& br) noexcept;

  Effects: Constructs an object of type basic_bounding_box.
  <TODO>The x coordinate is tl.x. The y coordinate is tl.y. The width is max(0.0f, br.x - tl.x).
  The height is max(0.0f, br.y - tl.y).

9.1.4 basic_bounding_box modifiers

void x(float val) noexcept;

  Effects: The x coordinate is val.

void y(float val) noexcept;

  Effects: The y coordinate is val.

void width(float val) noexcept;

  Effects: The width is val.

void height(float val) noexcept;

  Effects: The height is val.

void top_left(const basic_point_2d<GraphicsMath>& val) noexcept;

  Effects: <TODO>The x coordinate is val.x.
  <TODO>The y coordinate is val.y.

void bottom_right(const basic_point_2d<GraphicsMath>& val) noexcept;

  Effects: <TODO>The width is max(0.0f, val.x - x()).
  <TODO>The height is max(0.0f, value.y - y()).

9.1.5 basic_bounding_box observers

float x() const noexcept;

  Returns: The x coordinate.

float y() const noexcept;

  Returns: The y coordinate.

float width() const noexcept;

  Returns: The width.

float height() const noexcept;

  Returns: The height.

basic_point_2d<GraphicsMath> top_left() const noexcept;

§ 9.1.5
Returns: A \texttt{basic\_point\_2d\langle GraphicsMath\rangle} object constructed with the x coordinate as its first argument and the y coordinate as its second argument.

\texttt{basic\_point\_2d\langle GraphicsMath\rangle} \texttt{bottom\_right()} const noexcept;

Returns: A \texttt{basic\_point\_2d\langle GraphicsMath\rangle} object constructed with the width added to the x coordinate as its first argument and the height added to the y coordinate as its second argument.

9.1.6 \texttt{basic\_bounding\_box} operators

\texttt{bool operator\==(const basic\_bounding\_box\langle GraphicsMath\rangle& lhs,}
\texttt{\hspace{2em}const basic\_bounding\_box\langle GraphicsMath\rangle& rhs) noexcept;}

Returns: <TODO>

\texttt{lhs.x() == rhs.x() \&\& lhs.y() == rhs.y() \&\&}
\texttt{lhs.width() == rhs.width() \&\& lhs.height() == rhs.height()}

9.2 Class \texttt{basic\_circle}

9.2.1 \texttt{basic\_circle} description

The class template \texttt{basic\_circle} describes a circle.

It has a \texttt{center} of type \texttt{basic\_point\_2d\langle GraphicsMath\rangle} and a \texttt{radius} of type \texttt{float}.

9.2.2 \texttt{basic\_circle} synopsis

\texttt{namespace std::experimental::io2d::v1 {}
\texttt{\hspace{2em}template <class GraphicsMath>}
\texttt{\hspace{2em}class basic\_circle {}
\texttt{\hspace{4em}public:}
\texttt{\hspace{6em}// 9.2.3, constructors:}
\texttt{\hspace{6em}basic\_circle() noexcept;}
\texttt{\hspace{6em}basic\_circle(const basic\_point\_2d\langle GraphicsMath\rangle& ctr, float rad) noexcept;}
\texttt{\hspace{6em}basic\_circle(const typename GraphicsMath::circle\_data\_type& val) noexcept;}
\texttt{\hspace{4em}// 9.2.4, modifiers:}
\texttt{\hspace{6em}void center(const basic\_point\_2d\langle GraphicsMath\rangle& ctr) noexcept;}
\texttt{\hspace{6em}void radius(float r) noexcept;}
\texttt{\hspace{4em}// 9.2.5, observers:}
\texttt{\hspace{6em}basic\_point\_2d\langle GraphicsMath\rangle center() const noexcept;}
\texttt{\hspace{6em}float radius() const noexcept;}
\texttt{};}
\texttt{\hspace{4em}// 9.2.6, operators:}
\texttt{\hspace{6em}template <class GraphicsMath>}
\texttt{\hspace{6em}bool operator\==(const basic\_circle\langle GraphicsMath\rangle& lhs,}
\texttt{\hspace{8em}\hspace{8em}const basic\_circle\langle GraphicsMath\rangle& rhs) noexcept;}
\texttt{\hspace{6em}template <class GraphicsMath>}
\texttt{\hspace{6em}bool operator\!=(const basic\_circle\langle GraphicsMath\rangle& lhs,}
\texttt{\hspace{8em}\hspace{8em}const basic\_circle\langle GraphicsMath\rangle& rhs) noexcept;}
\texttt{}}

9.2.3 \texttt{basic\_circle} constructors

\texttt{basic\_circle() noexcept;}

Effects: Equivalent to: \texttt{basic\_circle\{ 0.0f, 0.0f \}, 0.0f}.
basic_circle(const basic_point_2d<GraphicsMath>& ctr, float r) noexcept;

Requires: \( r \geq 0.0f \).

Effects: Constructs an object of type basic_circle.

The center is \( \text{ctr} \). The radius is \( r \).

9.2.4 basic_circle modifiers

void center(const basic_point_2d<GraphicsMath>& ctr) noexcept;

Effects: The center is \( \text{ctr} \).

void radius(float r) noexcept;

Requires: \( r \geq 0.0f \).

Effects: The radius is \( r \).

9.2.5 basic_circle observers

basic_point_2d<GraphicsMath> center() const noexcept;

Returns: The center.

float radius() const noexcept;

Returns: The radius.

9.2.6 basic_circle operators

bool operator==(const basic_circle<GraphicsMath>& lhs, const basic_circle<GraphicsMath>& rhs) noexcept;

Returns: \( \text{lhs.center()} == \text{rhs.center()} \) && \( \text{lhs.radius()} == \text{rhs.radius()} \);
10  Text rendering and display  [io2d.text]

1  [Note: Text rendering and matters related to it, such as font support, will be added at a later date. This section is a placeholder. The integration of text rendering is expected to result in the addition of member functions to the surface class and changes to other parts of the text. — end note]
11 Paths

11.1 Overview of paths

Paths define geometric objects which can be stroked (Table 19), filled, masked, and used to define a clip area (See: 13.12.1).

1 A path contains zero or more figures.

2 A figure is composed of at least one segment.

3 A figure may contain degenerate segments. When a path is interpreted (11.3.16), degenerate segments are removed from figures. [Note: If a path command exists or is inserted between segments, it’s possible that points which might have compared equal will no longer compare equal as a result of interpretation (11.3.16). —end note]

4 Paths provide vector graphics functionality. As such they are particularly useful in situations where an application is intended to run on a variety of platforms whose output devices span a large gamut of sizes, both in terms of measurement units and in terms of a horizontal and vertical pixel count, in that order.

5 A basic_interpreted_path object is an immutable resource wrapper containing a path (11.4). A basic_interpreted_path object is created by interpreting the path contained in a basic_path_builder object. It can also be default constructed, in which case the basic_interpreted_path object contains no figures. [Note: basic_interpreted_path objects provide significant optimization opportunities for implementations. Because they are immutable and opaque, they are intended to be used to store a path in the most efficient representation available. —end note]

11.2 Path examples (Informative)

11.2.1 Overview

Paths are composed of zero or more figures. The following examples show the basics of how paths work in practice.

2 Every example is placed within the following code at the indicated spot. This code is shown here once to avoid repetition:

```cpp
#include <experimental/io2d>

using namespace std;
using namespace std::experimental::io2d;

int main() {
    auto imgSfc = make_image_surface(format::argb32, 300, 200);
    brush backBrush{ rgba_color::black };
    brush foreBrush{ rgba_color::white };
    render_props aliased{ antialias::none };
    path_builder pb{};
    imgSfc.paint(backBrush);
    // Example code goes here.
    // Example code ends.
    imgSfc.save(filesystem::path("example.png"), image_file_format::png);
}
```

§ 11.2.1
return 0;
}

11.2.2 Example 1 [io2d.paths.examples.one]

Example 1 consists of a single figure, forming a trapezoid:

pb.new_figure({ 80.0f, 20.0f }); // Begins the figure.
pb.line({ 220.0f, 20.0f }); // Creates a line from [80, 20] to [220, 20].
pb.rel_line({ 60.0f, 160.0f }); // Line from [220, 20] to [220 + 60, 160 + 20]. The 'to' point is relative to the starting point.
pb.rel_line({ -260.0f, 0.0f }); // Line from [280, 180] to [280 - 260, 180 + 0].
pb.close_figure(); // Creates a line from [20, 180] to [80, 20] (the new figure point), which makes this a closed figure.

Figure 1 — Example 1 result

11.2.3 Example 2 [io2d.paths.examples.two]

Example 2 consists of two figures. The first is a rectangular open figure (on the left) and the second is a rectangular closed figure (on the right):

pb.new_figure({ 20.0f, 20.0f }); // Begin the first figure.
pb.rel_line({ 100.0f, 0.0f });
pb.rel_line({ 0.0f, 160.0f });
pb.rel_line({ -100.0f, 0.0f });
pb.rel_line({ 0.0f, -160.0f });
pb.new_figure({ 180.0f, 20.0f }); // End the first figure and begin the second figure.
pb.rel_line({ 100.0f, 0.0f });
pb.rel_line({ 0.0f, 160.0f });
pb.rel_line({ -100.0f, 0.0f });
pb.close_figure(); // End the second figure.

imgSfc.stroke(foreBrush, pb, nullopt, stroke_props{ 10.0f }, nullopt, aliased);
The resulting image from example 2 shows the difference between an open figure and a closed figure. Each figure begins and ends at the same point. The difference is that with the closed figure, that the rendering of the point where the initial segment and final segment meet is controlled by the `line_join` value in the `stroke_props` class, which in this case is the default value of `line_join::miter`. In the open figure, the rendering of that point receives no special treatment such that each segment at that point is rendered using the `line_cap` value in the `stroke_props` class, which in this case is the default value of `line_cap::none`.

That difference between rendering as a `line_join` versus rendering as two `line_caps` is what causes the notch to appear in the open segment. Segments are rendered such that half of the stroke width is rendered on each side of the point being evaluated. With no line cap, each segment begins and ends exactly at the point specified.

So for the open figure, the first line begins at `point_2d{ 20.0f, 20.0f }` and the last line ends there. Given the stroke width of `10.0f`, the visible result for the first line is a rectangle with an upper left corner of `point_2d{ 20.0f, 15.0f }` and a lower right corner of `point_2d{ 120.0f, 25.0f }`. The last line appears as a rectangle with an upper left corner of `point_2d{ 15.0f, 20.0f }` and a lower right corner of `point_2d{ 25.0f, 180.0f }`. This produces the appearance of a square gap between `point_2d{ 15.0f, 15.0f }` and `point_2d{ 20.0f, 20.0f }`.

For the closed figure, adjusting for the coordinate differences, the rendering facts are the same as for the open figure except for one key difference: the point where the first line and last line meet is rendered as a line join rather than two line caps, which, given the default value of `line_join::miter`, produces a miter, adding that square area to the rendering result.

### 11.2.4 Example 3

Example 3 demonstrates open and closed figures each containing either a quadratic curve or a cubic curve.

```cpp
    pb.new_figure({ 20.0f, 20.0f });
    pb.rel_quadratic_curve({ 60.0f, 120.0f }, { 60.0f, -120.0f });
    pb.rel_new_figure({ 20.0f, 0.0f });
    pb.rel_quadratic_curve({ 60.0f, 120.0f }, { 60.0f, -120.0f });
    pb.close_figure();
    pb.new_figure({ 20.0f, 150.0f });
```
Example 4 shows how to draw 'C++' using figures.

For the 'C', it is created using an arc. A scaling matrix is used to make it slightly elliptical. It is also desirable that the arc has a fixed center point, \( \text{point}_2\text{d}\{ 85.0f, 100.0f \} \). The inverse of the scaling matrix is used in combination with the \text{point_for_angle} function to determine the point at which the arc should begin in order to achieve this fixed center point. The 'C' is then stroked.

Unlike the 'C', which is created using an open figure that is stroked, each '+' is created using a closed figure that is filled. To avoid filling the 'C', \text{pb.clear}(); is called to empty the container. The first '+' is created using a series of lines and is then filled.

Taking advantage of the fact that \text{path_builder} is a container, rather than create a brand new figure for the second '+', a translation matrix is applied by inserting a \text{figure_items::change_matrix} figure item before the \text{figure_items::new_figure} object in the existing plus, reverting back to the old matrix immediately after the and then filling it again.

// Create the 'C'.
const matrix_2d scl = matrix_2d::init_scale({ 0.9f, 1.1f });
auto pt = scl.inverse().transform_pt({ 85.0f, 100.0f }) +
    \text{point_for_angle(half_pi<float> / 2.0f, 50.0f)};
\text{pb.matrix(scl)};
\text{pb.new_figure(pt)};
11.3 Figure items

11.3.1 Introduction

1 The member classes of the class template basic_figure_items describe figure items.

2 A figure begins with an abs_new_figure or rel_new_figure object. A figure ends when:

- a close_figure object is encountered;
- a abs_new_figure or rel_new_figure object is encountered; or
- there are no more figure items in the path.

Figure 4 — Path example 4
The basic_path_builder class is a sequential container that contains a path. It provides a simple interface for building a path but a path can be created using any container that stores basic_figure_items::figure_item objects.

11.3.2 basic_figure_items synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items {
    public:

11.3.3 Class abs_new_figure

The class abs_new_figure describes a figure item that is a new figure command.

11.3.3.1 abs_new_figure constructors

abs_new_figure();
Effects: Equivalent to: abs_new_figure{basic_point_2d<typename GraphicsSurfaces::graphics_math_type>());

explicit abs_new_figure(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt);
Effects: Constructs an object of type abs_new_figure.
The at point is pt.

abs_new_figure(const abs_new_figure& other);
abs_new_figure(abs_new_figure&& other) noexcept;
Effects: Constructs an object of type abs_new_figure. In the second form, other is left in a valid state with an unspecified value.
The at point is other.at().

11.3.3.2 abs_new_figure assignment operators

abs_new_figure& operator=(const abs_new_figure& other);
Effects: If *this and other are not the same object, modifies *this such that *this.at() is other.at().
If *this and other are the same object, the member has no effect.
Returns: *this

abs_new_figure& operator=(abs_new_figure&& other) noexcept;
Effects: <TODO>
Returns: *this

11.3.3.3 abs_new_figure modifiers

§ 11.3.3.3
```cpp
void at(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;
1
   Effects: The at point is pt.

11.3.3.4 abs_new_figure observers
[io2d.absnewfigure.observers]
basic_point_2d<typename GraphicsSurfaces::graphics_math_type> at() const noexcept;
1
   Returns: The at point.

11.3.3.5 abs_new_figure operators
[io2d.absnewfigure.ops]
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& lhs,
   const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& rhs) noexcept;
1
   Returns: lhs.at() == rhs.at().

11.3.4 Class rel_new_figure
[io2d.relnewfigure]
The class rel_new_figure describes a figure item that is a new figure command.
2 It has an at point of type point_2d.

11.3.4.1 rel_new_figure constructors
[io2d.relnewfigure.cons]
rel_new_figure() noexcept;
1
   Effects: Equivalent to: rel_new_figure(basic_point_2d<typename GraphicsSurfaces::graphics_math_type>());

explicit rel_new_figure(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;
2
   Effects: Constructs an object of type rel_new_figure.
3
   The at point is pt.

rel_new_figure(const rel_new_figure& other);
rel_new_figure(rel_new_figure&& other) noexcept;
4
   Effects: Constructs an object of type rel_new_figure. In the second form, other is left in a valid state
   with an unspecified value.
5
   The at point is other.at().

11.3.4.2 rel_new_figure assignment operators
[io2d.relnewfigure.assign]
rel_new_figure& operator=(const rel_new_figure& other);
1
   Effects: If *this and other are not the same object, modifies *this such that *this.at() is
   other.at()
2
   If *this and other are the same object, the member has no effect.
3
   Returns: *this

rel_new_figure& operator=(rel_new_figure&& other) noexcept;
4
   Effects: <TODO>
5
   Returns: *this

11.3.4.3 rel_new_figure modifiers
[io2d.relnewfigure.modifiers]
void at(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;

§ 11.3.4.3
```

Effects: The at point is pt.

11.3.4.4 rel_new_figure observers

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> at() const noexcept;

Returns: The at point.

11.3.4.5 rel_new_figure operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_new_figure& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::rel_new_figure& rhs) noexcept;

Returns: lhs.at() == rhs.at().

11.3.5 Class close_figure

The class close_figure describes a figure item that is a close figure command.

11.3.5.1 close_figure constructors

close_figure();

Effects: Constructs an object of type close_figure.

11.3.5.2 close_figure operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::close_figure& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::close_figure& rhs) noexcept;

Returns: true.

11.3.6 Class abs_matrix

The class abs_matrix describes a figure item that is a path command.

2 It has a transform matrix of type basic_matrix_2d.

11.3.6.1 abs_matrix constructors

abs_matrix() noexcept;

Effects: Equivalent to: abs_matrix{ basic_matrix_2d() };

explicit abs_matrix(const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m) noexcept;

Requires: m.is_invertible() is true.

Effects: Constructs an object of type abs_matrix.

The transform matrix is m.

abs_matrix(const abs_matrix& other);
abs_matrix(abs_matrix&& other) noexcept;

Effects: Constructs an object of type abs_matrix. In the second form, other is left in a valid state with an unspecified value.

11.3.6.2 abs_matrix assignment operators

abs_matrix& operator=(const abs_matrix& other);
Effects: If this and other are not the same object, modifies this such that this.matrix() is other.matrix().
If this and other are the same object, the member has no effect.

Returns: *this

abs_matrix& operator=(abs_matrix&& other) noexcept;
Effects: <TODO>
Returns: *this

11.3.6.3 abs_matrix modifiers

void matrix(const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m) noexcept;
Requires: m.is_invertible() is true.
Effects: The transform matrix is m.

11.3.6.4 abs_matrix observers

basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type> matrix() const noexcept;
Returns: The transform matrix.

11.3.6.5 abs_matrix operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& lhs,
const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& rhs) noexcept;
Returns: lhs.matrix() == rhs.matrix().

11.3.7 Class rel_matrix

The class rel_matrix describes a figure item that is a path command.
It has a transform matrix of type basic_matrix_2d.

11.3.7.1 rel_matrix constructors

rel_matrix() noexcept;
Effects: Equivalent to: rel_matrix{ basic_matrix_2d() };

explicit rel_matrix(const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m) noexcept;
Requires: m.is_invertible() is true.
Effects: Constructs an object of type rel_matrix.

The transform matrix is m.

rel_matrix(const rel_matrix& other);
rel_matrix(rel_matrix&& other) noexcept;
Effects: Constructs an object of type rel_matrix. In the second form, other is left in a valid state with an unspecified value.

11.3.7.2 rel_matrix assignment operators

rel_matrix& operator=(const rel_matrix& other);
Effects: If \*this and other are not the same object, modifies \*this such that \*this.matrix() is other.matrix().

If \*this and other are the same object, the member has no effect.

Returns: \*this

rel_matrix& operator=(rel_matrix&& other) noexcept;

Effects: <TODO>

Returns: \*this

11.3.7.3 rel_matrix modifiers

void matrix(const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m) noexcept;

Requires: m.is_invertible() is true.

Effects: The transform matrix is m.

11.3.7.4 rel_matrix observers

basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type> matrix() const noexcept;

Returns: The transform matrix.

11.3.7.5 rel_matrix operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& lhs,
                const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& rhs) noexcept;

Returns: lhs.matrix() == rhs.matrix().

11.3.8 Class revert_matrix

The class revert_matrix describes a figure item that is a path command.

11.3.8.1 revert_matrix constructors

revert_matrix() noexcept;

Effects: Constructs an object of type revert_matrix.

11.3.8.2 revert_matrix operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& lhs,
                const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& rhs) noexcept;

Returns: true.

11.3.9 Class abs_line

The class abs_line describes a figure item that is a segment.

2 It has an end point of type basic_point_2d.

11.3.9.1 abs_line constructors

abs_line() noexcept;

Effects: Equivalent to: abs_line{ basic_point_2d() };
explicit abs_line(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;

Effects: Constructs an object of type abs_line.

The end point is pt.

abs_line(const abs_line& other);
abs_line(abs_line&& other) noexcept;

Effects: Constructs an object of type abs_line. In the second form, other is left in a valid state with an unspecified value.

The end point is other.to().

11.3.9.2 abs_line assignment operators

abs_line& operator=(const abs_line& other);

Effects: If *this and other are not the same object, modifies *this such that *this.to() is other.to()

If *this and other are the same object, the member has no effect.

Returns: *this

abs_line& operator=(abs_line&& other) noexcept;

Effects: <TODO>

Returns: *this

11.3.9.3 abs_line modifiers

void to(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;

Effects: The end point is pt.

11.3.9.4 abs_line observers

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> to() const noexcept;

Returns: The end point.

11.3.9.5 abs_line operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_line& lhs, const typename basic_figure_items<GraphicsSurfaces>::abs_line& rhs) noexcept;

Returns: lhs.to() == rhs.to().

11.3.10 Class rel_line

The class rel_line describes a figure item that is a segment.

It has an end point of type basic_point_2d.

11.3.10.1 rel_line constructors

rel_line() noexcept;

Effects: Equivalent to: rel_line{ basic_point_2d() };

explicit rel_line(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;
"Effects: Constructs an object of type rel_line.
The end point is pt.
rel_line(const rel_line& other);
rel_line(rel_line&& other) noexcept;
"Effects: Constructs an object of type rel_line. In the second form, other is left in a valid state with an unspecified value.
The end point is other.to().

11.3.10.2 rel_line assignment operators

rel_line& operator=(const rel_line& other);
1 "Effects: If *this and other are not the same object, modifies *this such that *this.to() is other.to()
2 If *this and other are the same object, the member has no effect.
3 Returns: *this
rel_line& operator=(rel_line&& other) noexcept;
4 "Effects: <TODO>
5 Returns: *this

11.3.10.3 rel_line modifiers

void to(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;
1 "Effects: The end point is pt.

11.3.10.4 rel_line observers

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> to() const noexcept;
1 "Returns: The end point.

11.3.10.5 rel_line operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_line& lhs,
const typename basic_figure_items<GraphicsSurfaces>::rel_line& rhs) noexcept;
1 "Returns: lhs.to() == rhs.to().

11.3.11 Class abs_quadratic_curve

The class abs_quadratic_curve describes a figure item that is a segment.
It has a control point of type basic_point_2d and an end point of type basic_point_2d.

11.3.11.1 abs_quadratic_curve constructors

abs_quad_c() noexcept;
1 "Effects: Equivalent to: abs_quad_c{ basic_point_2d(), basic_point_2d() };
abs_quad_c(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt,
const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
2 "Effects: Constructs an object of type abs_quad_c.
The control point is \textit{cpt}.
The end point is \textit{ept}.

\begin{verbatim}
abs_quadratic_curve(const abs_quadratic_curve& other);
abs_quadratic_curve(abs_quadratic_curve& other) noexcept;
\end{verbatim}

\textbf{Effects:} Constructs an object of type \textit{abs_quadratic_curve}. In the second form, other is left in a valid state with an unspecified value.

The control point is \textit{other.control_pt()}.
The end point is \textit{other.end_pt()}.

11.3.11.2 \textit{abs_quadratic_curve} assignment operators

\begin{verbatim}
abs_quadratic_curve& operator=(const abs_quadratic_curve& other);
abs_quadratic_curve& operator=(abs_quadratic_curve&& other) noexcept;
\end{verbatim}

\textbf{Effects:} If \textit{*this} and \textit{other} are not the same object, modifies \textit{*this} such that \textit{*this.control_pt()} is \textit{other.control_pt()} and \textit{*this.end_pt()} is \textit{other.end_pt()}

If \textit{*this} and \textit{other} are the same object, the member has no effect.

\textbf{Returns:} \textit{*this}

\begin{verbatim}
abs_quadratic_curve& operator=(abs_quadratic_curve&& other) noexcept;
\end{verbatim}

\textbf{Effects:} <TODO>

\textbf{Returns:} \textit{*this}

11.3.11.3 \textit{abs_quadratic_curve} modifiers

\begin{verbatim}
void control_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
void end_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
\end{verbatim}

\textbf{Effects:} The control point is \textit{cpt}.
The end point is \textit{ept}.

11.3.11.4 \textit{abs_quadratic_curve} observers

\begin{verbatim}
basic_point_2d<typename GraphicsSurfaces::graphics_math_type> control_pt() const noexcept;
basic_point_2d<typename GraphicsSurfaces::graphics_math_type> end_pt() const noexcept;
\end{verbatim}

\textbf{Returns:} The control point.
The end point.

11.3.11.5 \textit{abs_quadratic_curve} operators

\begin{verbatim}
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_quadratic_curve& lhs,
               const typename basic_figure_items<GraphicsSurfaces>::abs_quadratic_curve& rhs) noexcept;
\end{verbatim}

\textbf{Returns:} \textit{lhs.control_pt()} == \textit{rhs.control_pt()} \&\& \textit{lhs.end_pt()} == \textit{rhs.end_pt()}.

11.3.12 Class \textit{rel_quadratic_curve}

The class \textit{rel_quadratic_curve} describes a figure item that is a segment.

It has a \textit{control point} of type basic_point_2d and an \textit{end point} of type basic_point_2d.
11.3.12.1 rel_quadratic_curve constructors

rel_quadratic_curve() noexcept;

    Effects: Equivalent to: rel_quadratic_curve( basic_point_2d(), basic_point_2d() );

rel_quadratic_curve(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt, const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;

    Effects: Constructs an object of type rel_quadratic_curve.

The control point is cpt.

The end point is ept.

rel_quadratic_curve(const rel_quadratic_curve& other);
rel_quadratic_curve(rel_quadratic_curve&& other) noexcept;

    Effects: Constructs an object of type rel_quadratic_curve. In the second form, other is left in a
valid state with an unspecified value.

The control point is other.control_pt().

The end point is other.end_pt().

11.3.12.2 rel_quadratic_curve assignment operators

rel_quadratic_curve& operator=(const rel_quadratic_curve& other);

    Effects: If *this and other are not the same object, modifies *this such that *this.control_pt() is
other.control_pt() and *this.end_pt() is other.end_pt()

If *this and other are the same object, the member has no effect.

Returns: *this

rel_quadratic_curve& operator=(rel_quadratic_curve&& other) noexcept;

    Effects: <TODO>

Returns: *this

11.3.12.3 rel_quadratic_curve modifiers

void control_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;

    Effects: The control point is cpt.

void end_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;

    Effects: The end point is ept.

11.3.12.4 rel_quadratic_curve observers

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> control_pt() const noexcept;

    Returns: The control point.

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> end_pt() const noexcept;

    Returns: The end point.

11.3.12.5 rel_quadratic_curve operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_quadratic_curve& lhs, const typename basic_figure_items<GraphicsSurfaces>::rel_quadratic_curve& rhs) noexcept;
Returns: \( \text{lhs.control\_pt()} == \text{rhs.control\_pt()} && \text{lhs.end\_pt()} == \text{rhs.end\_pt()} \).

11.3.13 Class \textit{abs\_cubic\_curve} \[io2d.abs cubic\_curve\]

The class \textit{abs\_cubic\_curve} describes a figure item that is a segment.

It has a first control point of type \textit{basic\_point\_2d}, a second control point of type \textit{basic\_point\_2d}, and an end point of type \textit{basic\_point\_2d}.

11.3.13.1 \textit{abs\_cubic\_curve} constructors \[io2d.abs cubic\_curve\.cons\]

\begin{verbatim}
abs\_cubic\_curve() noexcept;
\end{verbatim}

\textit{Effects:} Equivalent to \texttt{abs\_cubic\_curve(basic\_point\_2d(), basic\_point\_2d(), basic\_point\_2d())}.

\begin{verbatim}
abs\_cubic\_curve(const basic\_point\_2d<typename GraphicsSurfaces::graphics\_math\_type>& cpt1,
    const basic\_point\_2d<typename GraphicsSurfaces::graphics\_math\_type>& cpt2,
    const basic\_point\_2d<typename GraphicsSurfaces::graphics\_math\_type>& ept) noexcept;
\end{verbatim}

\textit{Effects:} Constructs an object of type \textit{abs\_cubic\_curve}.

The first control point is \texttt{cpt1}.

The second control point is \texttt{cpt2}.

The end point is \texttt{ept}.

\begin{verbatim}
abs\_cubic\_curve(const abs\_cubic\_curve& other);
abs\_cubic\_curve(abs\_cubic\_curve&& other) noexcept;
\end{verbatim}

\textit{Effects:} Constructs an object of type \textit{abs\_cubic\_curve}. In the second form, \texttt{other} is left in a valid state with an unspecified value.

The first control point is \texttt{other.control\_pt1()}.

The second control point is \texttt{other.control\_pt2()}.

The end point is \texttt{other.end\_pt()}.

11.3.13.2 \textit{abs\_cubic\_curve} assignment operators \[io2d.abs cubic\_curve\.assign\]

\begin{verbatim}
abs\_cubic\_curve& operator=(const abs\_cubic\_curve& other);
\end{verbatim}

\textit{Effects:} If *\texttt{this} and \texttt{other} are not the same object, modifies *\texttt{this} such that *\texttt{this.control\_pt1()} is \texttt{other.control\_pt1()}, *\texttt{this.control\_pt2()} is \texttt{other.control\_pt2()} and *\texttt{this.end\_pt()} is \texttt{other.end\_pt()}.

If *\texttt{this} and \texttt{other} are the same object, the member has no effect.

\begin{verbatim}
abs\_cubic\_curve& operator=(abs\_cubic\_curve&& other) noexcept;
\end{verbatim}

\textit{Effects:} <\texttt{TODO}>.

\textit{Returns:} *\texttt{this}.

11.3.13.3 \textit{abs\_cubic\_curve} modifiers \[io2d.abs cubic\_curve\.modifiers\]

\begin{verbatim}
void control\_pt1(const basic\_point\_2d<typename
    GraphicsSurfaces::graphics\_math\_type>& cpt) noexcept;
\end{verbatim}

\textit{Effects:} The first control point is \texttt{cpt}.

\begin{verbatim}
void control\_pt2(const basic\_point\_2d<typename
\end{verbatim}
Effects: The second control point is \( \text{cpt} \).

Effects: The end point is \( \text{ept} \).

11.3.13.4 abs_cubic_curve observers

- \( \text{control_pt1()} \) const noexcept;
  Returns: The first control point.
- \( \text{control_pt2()} \) const noexcept;
  Returns: The second control point.
- \( \text{end_pt()} \) const noexcept;
  Returns: The end point.

11.3.13.5 abs_cubic_curve operators

\[
\text{template<\quad \text{class } \text{GraphicsSurfaces}>}
\text{bool operator==(const typename \text{basic_figure_items<GraphicsSurfaces>::abs_cubic_curve}& \text{lhs},}
\text{const typename \text{basic_figure_items<GraphicsSurfaces>::abs_cubic_curve}& \text{rhs}) noexcept;}
\]
Returns:
\[
\text{lhs.control_pt1()} == \text{rhs.control_pt1()} \\&\&
\text{lhs.control_pt2()} == \text{rhs.control_pt2()} \\&\&
\text{lhs.end_pt()} \\&\& \text{rhs.end_pt()}
\]

11.3.14 Class rel_cubic_curve

The class \text{rel_cubic_curve} describes a figure item that is a segment.

It has a first control point of type \text{basic_point_2d}, a second control point of type \text{basic_point_2d}, and an end point of type \text{basic_point_2d}.

11.3.14.1 rel_cubic_curve constructors

- \( \text{rel_cubic_curve()} \) noexcept;
  Effects: Equivalent to \text{rel_cubic_curve}{}(\text{basic_point_2d()}, \text{basic_point_2d()}, \text{basic_point_2d}()
  \).
- \( \text{rel_cubic_curve(const basic_point_2d<\text{typename } \text{GraphicsSurfaces::graphics_math_type}>& \text{cpt1},}
\text{const basic_point_2d<\text{typename } \text{GraphicsSurfaces::graphics_math_type}>& \text{cpt2,}
\text{const basic_point_2d<\text{typename } \text{GraphicsSurfaces::graphics_math_type}>& \text{ept}) noexcept;}
\)
  Effects: Constructs an object of type \text{rel_cubic_curve}.
  The first control point is \( \text{cpt1} \).
  The second control point is \( \text{cpt2} \).
  The end point is \( \text{ept} \).
- \( \text{rel_cubic_curve(const rel_cubic_curve& other);}
\)
- \( \text{rel_cubic_curve(rel_cubic_curve& other) noexcept;}
\)
  Effects: Constructs an object of type \text{rel_cubic_curve}. In the second form, \text{other} is left in a valid state with an unspecified value.
The first control point is `other.control_pt1()`.
The second control point is `other.control_pt2()`.
The end point is `other.end_pt()`.

### 11.3.14.2 rel_cubic_curve assignment operators

```cpp
rel_cubic_curve& operator=(const rel_cubic_curve& other);
```

**Effects:**
- If `*this` and `other` are not the same object, modifies `*this` such that `*this.control_pt1()` is `other.control_pt1()`, `*this.control_pt2()` is `other.control_pt2()` and `*this.end_pt()` is `other.end_pt()`.
- If `*this` and `other` are the same object, the member has no effect.

**Returns:** `*this`

```cpp
rel_cubic_curve& operator=(rel_cubic_curve&& other) noexcept;
```

**Effects:** `<TODO>`

**Returns:** `*this`

### 11.3.14.3 rel_cubic_curve modifiers

```cpp
void control_pt1(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
```

**Effects:** The first control point is `cpt`.

```cpp
void control_pt2(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
```

**Effects:** The second control point is `cpt`.

```cpp
void end_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
```

**Effects:** The end point is `ept`.

### 11.3.14.4 rel_cubic_curve observers

```cpp
basic_point_2d<typename GraphicsSurfaces::graphics_math_type> control_pt1() const noexcept;
```

**Returns:** The first control point.

```cpp
basic_point_2d<typename GraphicsSurfaces::graphics_math_type> control_pt2() const noexcept;
```

**Returns:** The second control point.

```cpp
basic_point_2d<typename GraphicsSurfaces::graphics_math_type> end_pt() const noexcept;
```

**Returns:** The end point.

### 11.3.14.5 rel_cubic_curve operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& lhs,
const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& rhs) noexcept;
```

**Returns:**
- `lhs.control_pt1() == rhs.control_pt1() &&
- `lhs.control_pt2() == rhs.control_pt2() &&
- `lhs.end_pt() == rhs.end_pt() &&
11.3.15 Class arc

11.3.15.1 In general

The class `arc` describes a figure item that is a segment.

It has a `radius` of type `basic_point_2d`, a `rotation` of type `float`, and a `start angle` of type `float`.

It forms a portion of the circumference of a circle. The centre of the circle is implied by the start point, the radius and the start angle of the arc.

11.3.15.2 arc constructors

```cpp
class arc

arc() noexcept;
    Effects: Equivalent to: arc{ basic_point_2d(10.0f, 10.0f), pi<float>, pi<float> };

arc(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& rad,
     float rot, float sang) noexcept;
    Effects: Constructs an object of type `arc`.
             The radius is `rad`.
             The rotation is `rot`.
             The start angle is `sang`.

arc(const arc& other);
arc(arc&& other) noexcept;
    Effects: Constructs an object of type `arc`. In the second form, other is left in a valid state with an unspecified value.
             The radius is `other.radius()`.
             The rotation is `other.rotation()`.
             The start angle is `other.start_angle()`.
```

11.3.15.3 arc assignment operators

```cpp
arc& operator=(const arc& other);
    Effects: If `*this` and `other` are not the same object, modifies `*this` such that `*this.radius()` is `other.radius()`, `*this.rotation()` is `other.rotation()` and `*this.start_angle()` is `other.start_angle()`.
             If `*this` and `other` are the same object, the member has no effect.

arc& operator=(arc&& other) noexcept;
    Effects: <TODO>
```

11.3.15.4 arc modifiers

```cpp
void radius(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& rad) noexcept;
    Effects: The radius is `rad`.

constexpr void rotation(float rot) noexcept;
    Effects: The rotation is `rot`.
```
void start_angle(float sang) noexcept;

Effects: The start angle is \( \text{sang} \).

11.3.15.5 arc observers [io2d.arc.observers]

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> radius() const noexcept;

Returns: The radius.

float rotation() const noexcept;

Returns: The rotation.

float start_angle() const noexcept;

Returns: The start angle.

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> center(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt, const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m = basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>{}) const noexcept;

Returns: As-if:

    auto lmtx = m;
    lmtx.m20 = 0.0f;
    lmtx.m21 = 0.0f;
    auto centerOffset = point_for_angle(two_pi<float> - start_angle(), radius());
    centerOffset.y = -centerOffset.y;
    return cpt - centerOffset * lmtx;

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> end_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt, const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m = basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>{}) const noexcept;

Returns: As-if:

    auto lmtx = m;
    auto tfrm = matrix_2d::init_rotate(start_angle() + rotation());
    lmtx.m20 = 0.0f;
    lmtx.m21 = 0.0f;
    auto pt = (radius() * tfrm);
    pt.y = -pt.y;
    return cpt + pt * lmtx;

11.3.15.6 arc operators [io2d.arc.ops]

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::arc& lhs, const typename basic_figure_items<GraphicsSurfaces>::arc& rhs) noexcept;

Returns:

    lhs.radius() == rhs.radius() &&
    lhs.rotation() == rhs.rotation() &&
    lhs.start_angle() == rhs.start_angle()

11.3.16 Path interpretation [io2d.paths.interpretation]

This subclause describes how to interpret a path for use in a rendering and composing operation.

§ 11.3.16
2 Interpreting a path consists of sequentially evaluating the figure items contained in the figures in the path and transforming them into zero or more figures as-if in the manner specified in this subclause.

3 The interpretation of a path requires the state data specified in Table 3.

### Table 3 — Path interpretation state data

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
<th>Initial value</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtx</td>
<td>Path transformation matrix</td>
<td>matrix_2d</td>
<td>matrix_2d( )</td>
</tr>
<tr>
<td>currPt</td>
<td>Current point</td>
<td>point_2d</td>
<td>unspecified</td>
</tr>
<tr>
<td>lnfPt</td>
<td>Last new figure point</td>
<td>point_2d</td>
<td>unspecified</td>
</tr>
<tr>
<td>mtxStk</td>
<td>Matrix stack</td>
<td>stack&lt;matrix_2d&gt;</td>
<td>stack&lt;matrix_2d&gt;{ }</td>
</tr>
</tbody>
</table>

4 When interpreting a path, until a `figure_items::abs_new_figure` figure item is reached, a path shall only contain path command figure items; no diagnostic is required. If a figure is a degenerate figure, none of its figure items have any effects, with two exceptions:

- (4.1) — the path’s `figure_items::abs_new_figure` or `figure_items::rel_new_figure` figure item sets the value of `currPt` as-if the figure item was interpreted; and,
- (4.2) — any path command figure items are evaluated with full effect.

5 The effects of a figure item contained in a `figure_items::figure_item` object when that object is being evaluated during path interpretation are described in Table 4.

6 If evaluation of a figure item contained in a `figure_items::figure_item` during path interpretation results in the figure item becoming a degenerate segment, its effects are ignored and interpretation continues as-if that figure item did not exist.

### Table 4 — Figure item interpretation effects

<table>
<thead>
<tr>
<th>Figure item</th>
<th>Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>figure_items::abs_new_figure</code></td>
<td>Creates a new figure. Sets <code>currPt</code> to <code>mtx.transform_pt({ 0.0f, 0.0f }) + p.at()</code>. Sets <code>lnfPt</code> to <code>currPt</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_new_figure</code></td>
<td>Let <code>mm</code> equal <code>mtx</code>. Let <code>mm.m20</code> equal 0.0f. Let <code>mm.m21</code> equal 0.0f. Creates a new figure. Sets <code>currPt</code> to <code>currPt + p.at() * mm</code>. Sets <code>lnfPt</code> to <code>currPt</code>.</td>
</tr>
<tr>
<td><code>figure_items::close_figure</code></td>
<td>Creates a line from <code>currPt</code> to <code>lnfPt</code>. Makes the current figure a closed figure. Creates a new figure. Sets <code>currPt</code> to <code>lnfPt</code>.</td>
</tr>
<tr>
<td><code>figure_items::abs_matrix</code></td>
<td>Calls <code>mtxStk.push(mtx)</code>. Sets <code>mtx</code> to <code>p.matrix()</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_matrix</code></td>
<td>Calls <code>mtxStk.push(mtx)</code>. Sets <code>mtx</code> to <code>mtx * p.matrix()</code>.</td>
</tr>
<tr>
<td><code>figure_items::revert_matrix</code></td>
<td>If <code>mtxStk.empty()</code> is false, sets <code>mtx</code> to <code>mtxStk.top()</code> then calls <code>mtxStk.pop()</code>. Otherwise sets <code>mtx</code> to its initial value as specified in Table 3.</td>
</tr>
<tr>
<td><code>figure_items::abs_line</code></td>
<td>Let <code>pt</code> equal <code>mtx.transform_pt(p.to() - currPt) + currPt</code>. Creates a line from <code>currPt</code> to <code>pt</code>. Sets <code>currPt</code> to <code>pt</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_line</code></td>
<td>Let <code>mm</code> equal <code>mtx</code>. Let <code>mm.m20</code> equal 0.0f. Let <code>mm.m21</code> equal 0.0f. Let <code>pt</code> equal <code>currPt + p.to() * mm</code>. Creates a line from <code>currPt</code> to <code>pt</code>. Sets <code>currPt</code> to <code>pt</code>.</td>
</tr>
</tbody>
</table>
Table 4 — Figure item interpretation effects (continued)

<table>
<thead>
<tr>
<th>Figure item</th>
<th>Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td>figure_items::abs_quadratic_curve p</td>
<td>Let ( \text{cpt} ) equal ( \text{mtx}.\text{transform_pt}(\text{p}\cdot\text{control_pt}() - \text{currPt}) ) + ( \text{currPt} ). Let ( \text{ept} ) equal ( \text{mtx}.\text{transform_pt}(\text{p}\cdot\text{end_pt}() - \text{currPt}) ) + ( \text{currPt} ). Creates a quadratic Bézier curve from ( \text{currPt} ) to ( \text{ept} ) using ( \text{cpt} ) as the curve’s control point. Sets ( \text{currPt} ) to ( \text{ept} ).</td>
</tr>
<tr>
<td>figure_items::rel_quadratic_curve p</td>
<td>Let ( \text{mm} ) equal ( \text{mtx} ). Let ( \text{mm}.\text{m20} ) equal 0.0f. Let ( \text{mm}.\text{m21} ) equal 0.0f. Let ( \text{cpt} ) equal ( \text{currPt} + \text{p}\cdot\text{control_pt}() \cdot \text{mm} ). Let ( \text{ept} ) equal ( \text{currPt} + \text{p}\cdot\text{control_pt}() \cdot \text{mm} + \text{p}\cdot\text{end_pt}() \cdot \text{mm} ). Creates a quadratic Bézier curve from ( \text{currPt} ) to ( \text{ept} ) using ( \text{cpt} ) as the curve’s control point. Sets ( \text{currPt} ) to ( \text{ept} ).</td>
</tr>
<tr>
<td>figure_items::abs_cubic_curve p</td>
<td>Let ( \text{cpt1} ) equal ( \text{mtx}.\text{transform_pt}(\text{p}\cdot\text{control_pt1}() - \text{currPt}) ) + ( \text{currPt} ). Let ( \text{cpt2} ) equal ( \text{mtx}.\text{transform_pt}(\text{p}\cdot\text{control_pt2}() - \text{currPt}) ) + ( \text{currPt} ). Let ( \text{ept} ) equal ( \text{mtx}.\text{transform_pt}(\text{p}\cdot\text{end_pt}() - \text{currPt}) ) + ( \text{currPt} ). Creates a cubic Bézier curve from ( \text{currPt} ) to ( \text{ept} ) using ( \text{cpt1} ) as the curve’s first control point and ( \text{cpt2} ) as the curve’s second control point. Sets ( \text{currPt} ) to ( \text{ept} ).</td>
</tr>
<tr>
<td>figure_items::rel_cubic_curve p</td>
<td>Let ( \text{mm} ) equal ( \text{mtx} ). Let ( \text{mm}.\text{m20} ) equal 0.0f. Let ( \text{mm}.\text{m21} ) equal 0.0f. Let ( \text{cpt1} ) equal ( \text{currPt} + \text{p}\cdot\text{control_pt1}() \cdot \text{mm} ). Let ( \text{cpt2} ) equal ( \text{currPt} + \text{p}\cdot\text{control_pt1}() \cdot \text{mm} + \text{p}\cdot\text{control_pt2}() \cdot \text{mm} ). Let ( \text{ept} ) equal ( \text{currPt} + \text{p}\cdot\text{control_pt1}() \cdot \text{mm} + \text{p}\cdot\text{control_pt2}() \cdot \text{mm} + \text{p}\cdot\text{end_pt}() \cdot \text{mm} ). Creates a cubic Bézier curve from ( \text{currPt} ) to ( \text{ept} ) using ( \text{cpt1} ) as the curve’s first control point and ( \text{cpt2} ) as the curve’s second control point. Sets ( \text{currPt} ) to ( \text{ept} ).</td>
</tr>
<tr>
<td>figure_items::arc p</td>
<td>Let ( \text{mm} ) equal ( \text{mtx} ). Let ( \text{mm}.\text{m20} ) equal 0.0f. Let ( \text{mm}.\text{m21} ) equal 0.0f. Creates an arc. It begins at ( \text{currPt} ), which is at ( \text{p}\cdot\text{start_angle}() ) radians on the arc and rotates ( \text{p}\cdot\text{rotation}() ) radians. If ( \text{p}\cdot\text{rotation}() ) is positive, rotation is counterclockwise, otherwise it is clockwise. The center of the arc is located at ( \text{p}\cdot\text{center}(\text{currPt}, \text{mm}) ). The arc ends at ( \text{p}\cdot\text{end_pt}(\text{currPt}, \text{mm}) ). Sets ( \text{currPt} ) to ( \text{p}\cdot\text{end_pt}(\text{currPt}, \text{mm}) ).</td>
</tr>
</tbody>
</table>

11.4 Class basic_interpreted_path

The class basic_interpreted_path contains the data that result from interpreting (11.3.16) a sequence of figure_items::figure_item objects.

A basic_interpreted_path object is used by most rendering and composing operations.

11.4.1 basic_interpreted_path synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_interpreted_path {
        public:
            // 11.4.2, construct:
            basic_interpreted_path() noexcept;
            template <class Allocator>
```
11.4.2 basic_interpreted_path constructors

basic_interpreted_path() noexcept;

Effects: Constructs a basic_interpreted_path that contains an empty path.

template <class Allocator>
explicit basic_interpreted_path(const basic_path_builder<GraphicsSurfaces, Allocator>& pb);

Effects: Equivalent to: basic_interpreted_path{ begin(pb), end(pb) };

template <class ForwardIterator>
basic_interpreted_path(ForwardIterator first, ForwardIterator last);

Effects: Constructs an object of type interpreted_path.

The contained path is as-if it was the result of interpreting a path containing the values of the elements from first to the last element before last.

explicit basic_interpreted_path(initializer_list<typename basic_figure_items<GraphicsSurfaces>::figure_item> il);

Effects: <TODO>

11.5 Class basic_path_builder

The class basic_path_builder is a container that stores and manipulates objects of type figure_items::figure_item from which interpreted_path objects are created.

A basic_path_builder is a contiguous container. (See [container.requirements.general] in N4618.)

The collection of figure_items::figure_item objects in a path builder is referred to as its path.

11.5.1 basic_path_builder synopsis

namespace std::experimental::io2d::v1 {

template <class GraphicsSurfaces,
    class Allocator = std::allocator<typename basic_figure_items<GraphicsSurfaces>::figure_item>>

class basic_path_builder {

public:

    using value_type = typename basic_figure_items<GraphicsSurfaces>::figure_item;
    using allocator_type = Allocator;
    using reference = value_type&;
    using const_reference = const value_type&;
    using size_type = implementation_defined. // See [container.requirements] in N4618.
    using difference_type = implementation_defined. // See [container.requirements] in N4618.
    using iterator = implementation_defined. // See [container.requirements] in N4618.
    using const_iterator = implementation_defined. // See [container.requirements] in N4618.
    using reverse_iterator = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // 11.5.3, construct, copy, move, destroy:
basic_path_builder() noexcept(noexcept(Allocator()));
explicit basic_path_builder(const Allocator&) noexcept;
explicit basic_path_builder(size_type n, const Allocator& = Allocator());
basic_path_builder(size_type n, const value_type& value, const Allocator& = Allocator());

11.5.2 basic_path_builder container requirements

This class is a sequence container, as defined in [containers] in N4618, and all sequence container requirements
that apply specifically to vector shall also apply to this class.

11.5.3 basic_path_builder constructors, copy, and assignment

basic_path_builder() noexcept(noexcept(Allocator()));

Effects: Constructs an empty basic_path_builder.

explicit basic_path_builder(const Allocator&);

Effects: Constructs an empty basic_path_builder, using the specified allocator.

Complexity: Constant.

explicit basic_path_builder(size_type n, const Allocator& = Allocator());

Effects: Constructs a basic_path_builder with n default-inserted elements using the specified allocator.

Complexity: Linear in n.

basic_path_builder(size_type n, const value_type& value,
    const Allocator& = Allocator());

Requires: value_type shall be CopyInsertable into *this.

Effects: Constructs a basic_path_builder with n copies of value, using the specified allocator.

Complexity: Linear in n.

template <class InputIterator>
basic_path_builder(InputIterator first, InputIterator last,
    const Allocator& = Allocator());

Effects: Constructs a basic_path_builder equal to the range [first, last), using the specified
allocator.

Complexity: Makes only N calls to the copy constructor of value_type (where N is the distance
between first and last) and no reallocations if iterators first and last are of forward, bidirectional,
or random access categories. It makes order N calls to the copy constructor of value_type and order
log(N) reallocations if they are just input iterators.

11.5.4 basic_path_builder capacity

size_type capacity() const noexcept;

Returns: The total number of elements that the path builder can hold without requiring reallocation.

void reserve(size_type n);
Requires: value_type shall be MoveInsertable into *this.

Effects: A directive that informs a path builder of a planned change in size, so that it can manage the storage allocation accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve(). If an exception is thrown other than by the move constructor of a non-CopyInsertable type, there are no effects.

Complexity: It does not change the size of the sequence and takes at most linear time in the size of the sequence.

Throws: length_error if n > max_size().¹

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. No reallocation shall take place during insertions that happen after a call to reserve() until the time when an insertion would make the size of the vector greater than the value of capacity().

void shrink_to_fit();

Requires: value_type shall be MoveInsertable into *this.

Effects: shrink_to_fit is a non-binding request to reduce capacity() to size(). [Note: The request is non-binding to allow latitude for implementation-specific optimizations. — end note] It does not increase capacity(), but may reduce capacity() by causing reallocation. If an exception is thrown other than by the move constructor of a non-CopyInsertable value_type there are no effects.

Complexity: Linear in the size of the sequence.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. If no reallocation happens, they remain valid.

void swap(basic_path_builder&)

noexcept(algorithm_traits<Allocator>::propagate_on_container_swap::value ||
algorithm_traits<Allocator>::is_always_equal::value);

Effects: Exchanges the contents and capacity() of *this with that of x.

Complexity: Constant time.

resize

void resize(size_type sz);

Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

Requires: value_type shall be MoveInsertable and DefaultInsertable into *this.

Remarks: If an exception is thrown other than by the move constructor of a non-CopyInsertable value_type there are no effects.

resize

void resize(size_type sz, const value_type& c);

Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

Requires: value_type shall be CopyInsertable into *this.

Remarks: If an exception is thrown there are no effects.

¹) reserve() uses Allocator::allocate() which may throw an appropriate exception.
11.5.5 basic_path_builder

void new_figure(point_2d pt) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::abs_new_figure(pt) to the end of the path.

void rel_new_figure(point_2d pt) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::rel_new_figure(pt) to the end of the path.

void close_figure() noexcept;

Requires: The current point contains a value.

Effects: Adds a figure_items::figure_item object constructed from figure_items::close_figure() to the end of the path.

void matrix(const matrix_2d& m) noexcept;

Requires: The matrix m shall be invertible.

Effects: Adds a figure_items::figure_item object constructed from figure_items::abs_matrix(m) to the end of the path.

void rel_matrix(const matrix_2d& m) noexcept;

Requires: The matrix m shall be invertible.

Effects: Adds a figure_items::figure_item object constructed from figure_items::rel_matrix(m) to the end of the path.

void revert_matrix() noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::revert_matrix() to the end of the path.

void line(point_2d pt) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::abs_line(pt) to the end of the path.

void rel_line(point_2d dpt) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::rel_line(dpt) to the end of the path.

void quadratic_curve(point_2d pt0, point_2d pt1) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::abs_quadratic_curve(pt0, pt1) to the end of the path.

void rel_quadratic_curve(point_2d dpt0, point_2d dpt1) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::rel_quadratic_curve(dpt0, dpt1) to the end of the path.

void cubic_curve(point_2d pt0, point_2d pt1, point_2d pt2) noexcept;

Effects: Adds a figure_items::figure_item object constructed from figure_items::abs_cubic_curve(pt0, pt1, pt2) to the end of the path.
void rel_cubic_curve(point_2d dpt0, point_2d dpt1, point_2d dpt2) noexcept;

   Effects: Adds a figure_items::figure_item object constructed from figure_items::rel_cubic_curve(dpt0, dpt1, dpt2) to the end of the path.

void arc(point_2d rad, float rot, float sang) noexcept;

   Effects: Adds a figure_items::figure_item object constructed from figure_items::arc(rad, rot, sang) to the end of the path.

iterator insert(const_iterator position, const value_type& x);
iterator insert(const_iterator position, value_type&& x);
iterator insert(const_iterator position, size_type n, const value_type& x);
template <class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<value_type>);
template <class... Args>
reference emplace_back(Args&&... args);
template <class... Args>
iterator emplace(const_iterator position, Args&&... args);
void push_back(const value_type& x);
void push_back(value_type&& x);

   Remarks: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. If no reallocation happens, all the iterators and references before the insertion point remain valid. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of value_type or by any InputIterator operation there are no effects. If an exception is thrown while inserting a single element at the end and value_type is CopyInsertable or is_nothrow_move_constructible_v<value_type> is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-CopyInsertable value_type, the effects are unspecified.

Complexity: The complexity is linear in the number of elements inserted plus the distance to the end of the path builder.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_back();

   Effects: Invalidates iterators and references at or after the point of the erase.

Complexity: The destructor of value_type is called the number of times equal to the number of the elements erased, but the assignment operator of value_type is called the number of times equal to the number of elements in the path builder after the erased elements.

Throws: Nothing unless an exception is thrown by the copy constructor, move constructor, assignment operator, or move assignment operator of value_type.

11.5.6  basic_path_builder iterators

iterator begin() noexcept;
const_iterator begin() const noexcept;
const_iterator cbegin() const noexcept;

   Returns: An iterator referring to the first figure_items::figure_item item in the path.

   Remarks: Changing a figure_items::figure_item object or otherwise modifying the path in a
way that violates the preconditions of that `figure_items::figure_item` object or of any subsequent `figure_items::figure_item` object in the path produces undefined behavior when the path is interpreted as described in 11.3.16 unless all of the violations are fixed prior to such interpretation.

```
iterator end() noexcept;
const_iterator end() const noexcept;
const_iterator cend() const noexcept;
```

1. **Returns:** An iterator which is the past-the-end value.
2. **Remarks:** Changing a `figure_items::figure_item` object or otherwise modifying the path in a way that violates the preconditions of that `figure_items::figure_item` object or of any subsequent `figure_items::figure_item` object in the path produces undefined behavior when the path is interpreted as described in 11.3.16 unless all of the violations are fixed prior to such interpretation.

```
reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator crbegin() const noexcept;
```

3. **Returns:** An iterator which is semantically equivalent to `reverse_iterator(end)`.
4. **Remarks:** Changing a `figure_items::figure_item` object or otherwise modifying the path in a way that violates the preconditions of that `figure_items::figure_item` object or of any subsequent `figure_items::figure_item` object in the path produces undefined behavior when the path is interpreted as described in 11.3.16 unless all of the violations are fixed prior to such interpretation.

```
reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crend() const noexcept;
```

5. **Returns:** An iterator which is semantically equivalent to `reverse_iterator(begin)`.
6. **Remarks:** Changing a `figure_items::figure_item` object or otherwise modifying the path in a way that violates the preconditions of that `figure_items::figure_item` object or of any subsequent `figure_items::figure_item` object in the path produces undefined behavior when the path is interpreted as described in 11.3.16 unless all of the violations are fixed prior to such interpretation.

11.5.7 basic_path_builder specialized algorithms

```
template <class Allocator>
void swap(basic_path_builder<Allocator>& lhs, basic_path_builder<Allocator>& rhs)
    noexcept(noexcept(lhs.swap(rhs)));
```

1. **Effects:** As if by `lhs.swap(rhs)`.

§ 11.5.7                                                                                         73
12 Brushes

12.1 Overview of brushes

Brushes contain visual data and serve as sources of visual data for rendering and composing operations.

There are four types of brushes:

- solid color;
- linear gradient;
- radial gradient; and,
- surface.

Once a brush is created, its visual data is immutable.

A brush is used either as a source brush or a mask brush (13.15.2.2).

When a brush is used in a rendering and composing operation, if it is used as a source brush, it has a brush_props object that describes how the brush is interpreted for purposes of sampling. If it is used as a mask brush, it has a mask_props object that describes how the brush is interpreted for purposes of sampling.

The basic_brush_props (13.11.1) and basic_mask_props (13.14.1) classes each have a wrap mode and a filter. The basic_brush_props class also has a brush matrix and a fill rule. The basic_mask_props class also has a mask matrix. Where possible, the terms that are common between the two classes are referenced without regard to whether the brush is being used as a source brush or a mask brush.

Solid color brushes are unbounded and as such always produce the same visual data when sampled from, regardless of the requested point.

Linear gradient and radial gradient brushes share similarities with each other that are not shared by the other types of brushes. This is discussed in more detail elsewhere (12.2).

Surface brushes are constructed from a basic_image_surface object. Their visual data is a pixmap, which has implications on sampling from the brush that are not present in the other brush types.

12.2 Gradient brushes

12.2.1 Common properties of gradients

Gradients are formed, in part, from a collection of gradient_stop objects.

The collection of gradient_stop objects contribute to defining a brush which, when sampled from, returns a value that is interpolated based on those gradient stops.

12.2.2 Linear gradients

A linear gradient is a type of gradient.

A linear gradient has a begin point and an end point, each of which are objects of type basic_point_2d.

A linear gradient for which the distance between its begin point and its end point is \(<\text{TODO}>\text{basic}_{-}\text{point}_{-}2d::\text{zero}()\) is a degenerate linear gradient.

All attempts to sample from a a degenerate linear gradient return the color \(\text{rgba}_{-}\text{color}::\text{transparent}_{-}\text{black}\). The remainder of 12.2 is inapplicable to degenerate linear gradients. [Note: Because a point has no
width and this case is only met when the distance is between the begin point and the end point is zero (such that it collapses to a single point), the existence of one or more gradient stops is irrelevant. A linear gradient requires a line segment to define its color(s). Without a line segment, it is not a linear gradient. — end note]  

5 The begin point and end point of a linear gradient define a line segment, with a gradient stop offset value of 0.0f corresponding to the begin point and a gradient stop offset value of 1.0f corresponding to the end point. Gradient stop offset values in the range \([0.0f, 1.0f]\) linearly correspond to points on the line segment. 

[Example: Given a linear gradient with a begin point of <TODO>basic_point_2d(0.0f, 0.0f) and an end point of <TODO>basic_point_2d(10.0f, 5.0f), a gradient stop offset value of 0.6f would correspond to the point <TODO>basic_point_2d(6.0f, 3.0f). — end example]  

8 To determine the offset value of a point \(p\) for a linear gradient, perform the following steps:  

a) Create a line at the begin point of the linear gradient, the \textit{begin line}, and another line at the end point of the linear gradient, the \textit{end line}, with each line being perpendicular to the \textit{gradient line segment}, which is the line segment delineated by the begin point and the end point.  

b) Using the begin line, \(p\), and the end line, create a line, the \textit{p line}, which is parallel to the gradient line segment.  

c) Defining \(dp\) as the distance between \(p\) and the point where the \(p\) line intersects the begin line and \(dt\) as the distance between the point where the \(p\) line intersects the begin line and the point where the \(p\) line intersects the end line, the offset value of \(p\) is \(dp \div dt\).  

d) The offset value shall be negative if 

\( (8.1) \)  
— \(p\) is not on the line segment delineated by the point where the \(p\) line intersects the begin line and the point where the \(p\) line intersects the end line; and,  

\( (8.2) \)  
— the distance between \(p\) and the point where the \(p\) line intersects the begin line is less than the distance between \(p\) and the point where the \(p\) line intersects the end line.  

12.2.3 Radial gradients [io2d.gradients.radial]  

1 A radial gradient is a type of gradient.  

2 A radial gradient has a \textit{start circle} and an \textit{end circle}, each of which is defined by a \texttt{basic_circle} object.  

3 A radial gradient is a \textit{degenerate radial gradient} if:  

\( (3.1) \)  
— its start circle has a negative radius; or,  

\( (3.2) \)  
— its end circle has a negative radius; or,  

\( (3.3) \)  
— the distance between the center point of its start circle and the center point of its end circle is \(<TODO>basic_point_2d::zero()\); or,  

\( (3.4) \)  
— its start circle has a radius of 0.0f and its end circle has a radius of 0.0f.  

4 All attempts to sample from a \texttt{brush} object created using a degenerate radial gradient return the color \texttt{rgba_color::transparent_black}. The remainder of 12.2 is inapplicable to degenerate radial gradients.  

5 A gradient stop offset of 0.0f corresponds to all points along the diameter of the start circle or to its center point if it has a radius value of 0.0f.  

6 A gradient stop offset of 1.0f corresponds to all points along the diameter of the end circle or to its center point if it has a radius value of 0.0f.  

7 A radial gradient shall be rendered as a continuous series of interpolated circles defined by the following equations:  

\[ x(o) = x_{\text{start}} + o \times (x_{\text{end}} - x_{\text{start}}) \]  

\[ y(o) = y_{\text{start}} + o \times (y_{\text{end}} - y_{\text{start}}) \]
c) \( \text{radius}(o) = \text{radius}_{\text{start}} + o \times (\text{radius}_{\text{end}} - \text{radius}_{\text{start}}) \)

where \( o \) is a gradient stop offset value.

The range of potential values for \( o \) shall be determined by the \textit{wrap mode} (12.1):

\( (8.1) \) For \texttt{wrap_mode::none}, the range of potential values for \( o \) is \([0, 1]\).

\( (8.2) \) For all other \texttt{wrap_mode} values, the range of potential values for \( o \) is \([\text{numeric_limits<float>::lowest()},\text{numeric_limits<float>::max()}]\).

The interpolated circles shall be rendered starting from the smallest potential value of \( o \).

An interpolated circle shall not be rendered if its value for \( o \) results in \( \text{radius}(o) \) evaluating to a negative value.

\subsection*{12.2.4 Sampling from gradients} [io2d.gradients.sampling]

For any offset value \( o \), its color value shall be determined according to the following rules:

a) If there are less than two gradient stops or if all gradient stops have the same offset value, then the color value of every offset value shall be \texttt{rgba_color::transparent_black} and the remainder of these rules are inapplicable.

b) If exactly one gradient stop has an offset value equal to \( o \), \( o \)'s color value shall be the color value of that gradient stop and the remainder of these rules are inapplicable.

c) If two or more gradient stops have an offset value equal to \( o \), \( o \)'s color value shall be the color value of the gradient stop which has the lowest index value among the set of gradient stops that have an offset value equal to \( o \) and the remainder of 12.2.4 is inapplicable.

d) When no gradient stop has the offset value of 0.0f, then, defining \( n \) to be the offset value that is nearest to 0.0f among the offset values in the set of all gradient stops, if \( o \) is in the offset range \([0,n)\), \( o \)'s color value shall be \texttt{rgba_color::transparent_black} and the remainder of these rules are inapplicable.  
\[ \text{Note: Since the range described does not include } n, \text{ it does not matter how many gradient stops have } n \text{ as their offset value for purposes of this rule. —end note} \]

e) When no gradient stop has the offset value of 1.0f, then, defining \( n \) to be the offset value that is nearest to 1.0f among the offset values in the set of all gradient stops, if \( o \) is in the offset range \((n,1]\), \( o \)'s color value shall be \texttt{rgba_color::transparent_black} and the remainder of these rules are inapplicable.  
\[ \text{Note: Since the range described does not include } n, \text{ it does not matter how many gradient stops have } n \text{ as their offset value for purposes of this rule. —end note} \]

f) Each gradient stop has, at most, two adjacent gradient stops: one to its left and one to its right.

g) Adjacency of gradient stops is initially determined by offset values. If two or more gradient stops have the same offset value then index values are used to determine adjacency as described below.

h) For each gradient stop \( a \), the \textit{set of gradient stops to its left} are those gradient stops which have an offset value which is closer to 0.0f than \( a \)'s offset value.  
\[ \text{Note: This includes any gradient stops with an offset value of 0.0f provided that } a \text{'s offset value is not 0.0f. —end note} \]

i) For each gradient stop \( b \), the \textit{set of gradient stops to its right} are those gradient stops which have an offset value which is closer to 1.0f than \( b \)'s offset value.  
\[ \text{Note: This includes any gradient stops with an offset value of 1.0f provided that } b \text{'s offset value is not 1.0f. —end note} \]

j) A gradient stop which has an offset value of 0.0f does not have an adjacent gradient stop to its left.

k) A gradient stop which has an offset value of 1.0f does not have an adjacent gradient stop to its right.

l) If a gradient stop \( a \)'s set of gradient stops to its left consists of exactly one gradient stop, that gradient stop is the gradient stop that is adjacent to \( a \) on its left.

m) If a gradient stop \( b \)'s set of gradient stops to its right consists of exactly one gradient stop, that gradient
stop is the gradient stop that is adjacent to \( b \) on its right.

n) If two or more gradient stops have the same offset value then the gradient stop with the lowest index value is the only gradient stop from that set of gradient stops which can have a gradient stop that is adjacent to it on its left and the gradient stop with the highest index value is the only gradient stop from that set of gradient stops which can have a gradient stop that is adjacent to it on its right. This rule takes precedence over all of the remaining rules.

o) If a gradient stop can have an adjacent gradient stop to its left, then the gradient stop which is adjacent to it to its left is the gradient stop from the set of gradient stops to its left which has an offset value which is closest to its offset value. If two or more gradient stops meet that criteria, then the gradient stop which is adjacent to it to its left is the gradient stop which has the highest index value from the set of gradient stops to its left which are tied for being closest to its offset value.

p) If a gradient stop can have an adjacent gradient stop to its right, then the gradient stop which is adjacent to it to its right is the gradient stop from the set of gradient stops to its right which has an offset value which is closest to its offset value. If two or more gradient stops meet that criteria, then the gradient stop which is adjacent to it to its right is the gradient stop which has the lowest index value from the set of gradient stops to its right which are tied for being closest to its offset value.

q) Where the value of \( o \) is in the range \([0, 1]\), its color value shall be determined by interpolating between the gradient stop, \( r \), which is the gradient stop whose offset value is closest to \( o \) without being less than \( o \) and which can have an adjacent gradient stop to its left, and the gradient stop that is adjacent to \( r \) on \( r \)'s left. The acceptable forms of interpolating between color values is set forth later in this section.

r) Where the value of \( o \) is outside the range \([0, 1]\), its color value depends on the value of wrap mode:

(1.1) If wrap mode is `wrap_mode::none`, the color value of \( o \) shall be `rgba_color::transparent_black`.

(1.2) If wrap mode is `wrap_mode::pad`, if \( o \) is negative then the color value of \( o \) shall be the same as-if the value of \( o \) was \( 0.0f \), otherwise the color value of \( o \) shall be the same as-if the value of \( o \) was \( 1.0f \).

(1.3) If wrap mode is `wrap_mode::repeat`, then \( 1.0f \) shall be added to or subtracted from \( o \) until \( o \) is in the range \([0, 1]\), at which point its color value is the color value for the modified value of \( o \) as determined by these rules. [Example: Given \( o == 2.1 \), after application of this rule \( o == 0.1 \) and the color value of \( o \) shall be the same value as-if the initial value of \( o \) was \( 0.1 \). Given \( o == -0.3 \), after application of this rule \( o == 0.7 \) and the color value of \( o \) shall be the same as-if the initial value of \( o \) was \( 0.7 \). — end example]

(1.4) If wrap mode is `wrap_mode::reflect`, \( o \) shall be set to the absolute value of \( o \), then \( 2.0f \) shall be subtracted from \( o \) until \( o \) is in the range \([0, 2]\), then if \( o \) is in the range \([1, 2]\) then \( o \) shall be set to \( 1.0f - (o - 1.0f) \), at which point its color value is the color value for the modified value of \( o \) as determined by these rules. [Example: Given \( o == 2.8 \), after application of this rule \( o == 0.8 \) and the color value of \( o \) shall be the same value as-if the initial value of \( o \) was \( 0.8 \). Given \( o == 3.6 \), after application of this rule \( o == 0.4 \) and the color value of \( o \) shall be the same value as-if the initial value of \( o \) was \( 0.4 \). Given \( o == -0.3 \), after application of this rule \( o == 0.3 \) and the color value of \( o \) shall be the same as-if the initial value of \( o \) was \( 0.3 \). Given \( o == -5.8 \), after application of this rule \( o == 0.2 \) and the color value of \( o \) shall be the same as-if the initial value of \( o \) was \( 0.2 \). — end example]"
12.3  Enum class `wrap_mode`

12.3.1  `wrap_mode` summary

The `wrap_mode` enum class describes how a point’s visual data is determined if it is outside the bounds of the source brush (13.15.2.2) when sampling.

Depending on the source brush’s `filter` value, the visual data of several points may be required to determine the appropriate visual data value for the point that is being sampled. In this case, each point is sampled according to the source brush’s `wrap_mode` value with two exceptions:

1. If the point to be sampled is within the bounds of the source brush and the source brush’s `wrap_mode` value is `wrap_mode::none`, then if the source brush’s `filter` value requires that one or more points which are outside of the bounds of the source brush be sampled, each of those points is sampled as if the source brush’s `wrap_mode` value is `wrap_mode::pad` rather than `wrap_mode::none`.

2. If the point to be sampled is within the bounds of the source brush and the source brush’s `wrap_mode` value is `wrap_mode::none`, then if the source brush’s `filter` value requires that one or more points which are inside of the bounds of the source brush be sampled, each of those points is sampled such that the visual data that is returned is the equivalent of `rgba_color::transparent_black`.

If a point to be sampled does not have a defined visual data element and the search for the nearest point with defined visual data produces two or more points with defined visual data that are equidistant from the point to be sampled, the returned visual data shall be an unspecified value which is the visual data of one of those equidistant points. Where possible, implementations should choose the among the equidistant points that have an `x` axis value and a `y` axis value that is nearest to `0.0f`.

See Table 5 for the meaning of each `wrap_mode` enumerator.

12.3.2  `wrap_mode` synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class wrap_mode {
        none,
        repeat,
        reflect,
        pad
    };
}
```

12.3.3  `wrap_mode` enumerators

<tr>
<td>reflect</td>
<td>If the point to be sampled is outside of the bounds of the source brush, the visual data that is returned is the visual data that would have been returned if the source brush was infinitely large and repeated itself in a left-to-right-to-left-to-right and top-to-bottom-to-top-to-bottom fashion.</td>
</tr>
<tr>
<td>pad</td>
<td>If the point to be sampled is outside of the bounds of the source brush, the visual data that is returned is the visual data that would have been returned for the nearest defined point that is in inside the bounds of the source brush.</td>
</tr>
</tbody>
</table>

12.4 Enum class filter

12.4.1 filter summary

The filter enum class specifies the type of filter to use when sampling from a pixmap.

Three of the filter enumerators, filter::fast, filter::good, and filter::best, specify desired characteristics of the filter, leaving the choice of a specific filter to the implementation.

The other two, filter::nearest and filter::bilinear, each specify a particular filter that shall be used.

[Note: The only type of brush that has a pixmap as its underlying graphics data graphics resource is a brush with a brush type of brush_type::surface. — end note]

See Table 6 for the meaning of each filter enumerator.

12.4.2 filter synopsis

namespace std::experimental::io2d::v1 {
    enum class filter {
        fast,
        good,
        best,
        nearest,
        bilinear
    };
}

12.5 Enum class brush_type

12.5.1 brush_type summary

The brush_type enum class denotes the type of a brush object.

See Table 7 for the meaning of each brush_type enumerator.

12.5.2 brush_type synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class brush_type {
        solid_color,
        surface,
        linear,
        radial
    };
}
```

12.5.3 brush_type enumerators

<td>The brush object is a radial gradient brush.</td>
</tr>
</tbody>
</table>

12.6 Class gradient_stop

12.6.1 Overview

The class gradient_stop describes a gradient stop that is used by gradient brushes.

It has an offset of type float and an offset color of type rgba_color.

12.6.2 gradient_stop synopsis

§ 12.6.2
namespace std::experimental::io2d::v1 {
  class gradient_stop {

    // 12.6.3, construct:
    constexpr gradient_stop() noexcept;
    constexpr gradient_stop(float o, rgba_color c) noexcept;<TODO><Implementation mismatch>

    // 12.6.4, modifiers:
    constexpr void offset(float o) noexcept;
    constexpr void color(rgba_color c) noexcept;

    // 12.6.5, observers:
    constexpr float offset() const noexcept;
    constexpr rgba_color color() const noexcept;
  }

  // 12.6.6, operators:
  constexpr bool operator==(const gradient_stop& lhs, const gradient_stop& rhs) noexcept;
  constexpr bool operator!=(const gradient_stop& lhs, const gradient_stop& rhs) noexcept;
};

12.6.3 gradient_stop constructors

constexpr gradient_stop() noexcept;
  Effects: Equivalent to: gradient_stop(0.0f, rgba_color::transparent_black).

constexpr gradient_stop(float o, rgba_color c) noexcept;
  Requires: o >= 0.0f and o <= 1.0f.
  Effects: Constructs a gradient_stop object.
  The offset is o rounded to the nearest multiple of 0.00001f. The offset color is c.

12.6.4 gradient_stop modifiers

constexpr void offset(float o) noexcept;
  Requires: o >= 0.0f and o <= 1.0f.
  Effects: The offset is o rounded to the nearest multiple of 0.00001f.

constexpr void color(rgba_color c) noexcept;
  Effects: The offset color is c.

12.6.5 gradient_stop observers

constexpr float offset() const noexcept;
  Returns: The offset.

constexpr rgba_color color() const noexcept;
  Returns: The offset color.

12.6.6 gradient_stop operators

constexpr bool operator==(const gradient_stop& lhs, const gradient_stop& rhs) noexcept;

§ 12.6.6
1 Returns: \( \text{lhs.offset()} == \text{rhs.offset()} \) && \( \text{lhs.color()} == \text{rhs.color()} \);

12.7 Class basic_brush

12.7.1 basic_brush summary

The class basic_brush describes an opaque wrapper for graphics data.

A basic_brush object is usable with any surface or surface-derived object.<TODO>

A basic_brush object’s graphics data is immutable. It is observable only by the effect that it produces when the brush is used as a source brush or as a mask brush (13.15.2.2).

A basic_brush object has a brush type of brush_type, which indicates which type of brush it is (Table 7).

As a result of technological limitations and considerations, a basic_brush object’s graphics data may have less precision than the data from which it was created.

12.7.2 basic_brush synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_brush {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            explicit basic_brush(const rgba_color& c);

            template <class InputIterator>
            basic_brush(const basic_point_2d<graphics_math_type>& begin,
                         const basic_point_2d<graphics_math_type>& end,
                         InputIterator first, InputIterator last);

            basic_brush(const basic_point_2d<graphics_math_type>& begin,
                         const basic_point_2d<graphics_math_type>& end,
                         ::std::initializer_list<gradient_stop> il);

            template <class InputIterator>
            basic_brush(const basic_circle<graphics_math_type>& start,
                         const basic_circle<graphics_math_type>& end,
                         InputIterator first, InputIterator last);

            basic_brush(const basic_circle<graphics_math_type>& start,
                         const basic_circle<graphics_math_type>& end,
                         ::std::initializer_list<gradient_stop> il);

            basic_brush(basic_image_surface<GraphicsSurfaces>&& img);
        basic_type type() const noexcept;
    };
}
```

12.7.3 Sampling from a basic_brush object

A basic_brush object is sampled from either as a source brush (13.15.2.2) or a mask brush (13.15.2.2).

If it is being sampled from as a source brush, its wrap mode, filter, and brush matrix are defined by a basic_brush_props object (13.15.2.4 and 13.15.2.6).

If it is being sampled from as a mask brush, its wrap mode, filter, and mask matrix are defined by a basic_mask_props object (13.15.2.5 and 13.15.2.6).
When sampling from a basic_brush object \(b\), the brush_type returned by calling \(b\).type()\) determines how the results of sampling are determined:

1. If the result of \(b\).type()\) is brush_type::solid_color then \(b\) is a solid color brush.
2. If the result of \(b\).type()\) is brush_type::surface then \(b\) is a surface brush.
3. If the result of \(b\).type()\) is brush_type::linear then \(b\) is a linear gradient brush.
4. If the result of \(b\).type()\) is brush_type::radial then \(b\) is a radial gradient brush.

12.7.3.1 Sampling from a solid color brush

When \(b\) is a solid color brush, then when sampling from \(b\), the visual data returned is always the visual data used to construct \(b\), regardless of the point which is to be sampled and regardless of the return values of wrap mode, filter, and brush matrix or mask matrix.

12.7.3.2 Sampling from a linear gradient brush

When \(b\) is a linear gradient brush, when sampling point \(pt\), where \(pt\) is the return value of calling the transform_pt member function of brush matrix or mask matrix using the requested point, from \(b\), the visual data returned are as specified by 12.2.2 and 12.2.4.

12.7.3.3 Sampling from a radial gradient brush

When \(b\) is a radial gradient brush, when sampling point \(pt\), where \(pt\) is the return value of calling the transform_pt member function of brush matrix or mask matrix using the requested point, from \(b\), the visual data are as specified by 12.2.3 and 12.2.4.

12.7.3.4 Sampling from a surface brush

When \(b\) is a surface brush, when sampling point \(pt\) from \(b\), where \(pt\) is the return value of calling the transform_pt member function of the brush matrix or mask matrix using the requested point, the visual data returned are from the point \(pt\) in the graphics data of the brush, as modified by the values of wrap mode (12.3) and filter (12.4).

12.7.4 basic_brush constructors and assignment operators

```
explicit basic_brush(const rgba_color& c);<TODO><Implementation mismatch>
```

1. Effects: Constructs an object of type basic_brush.
2. The brush’s brush type shall be set to the value brush_type::solid_color.
3. The graphics data of the brush are created from the value of \(c\). The visual data format of the graphics data are as-if it is that specified by format::argb32.
4. Remarks: Sampling from this produces the results specified in 12.7.3.1.

```template <class InputIterator>
basic_brush(const basic_point_2d<graphics_math_type>& begin,
            const basic_point_2d<graphics_math_type>& end,
            InputIterator first, InputIterator last);
```

5. Effects: Constructs a linear gradient basic_brush object with a begin point of \(begin\), an end point of \(end\), and a sequential series of gradient_stop values beginning at \(first\) and ending at \(last - 1\).
6. The brush’s brush type is brush_type::linear.
7. Remarks: Sampling from this brush produces the results specified in 12.7.3.2.
Effects: Constructs a linear gradient basic_brush object with a begin point of begin, an end point of end, and the sequential series of gradient_stop values in il. The brush’s brush type is brush_type:linear.

Remarks: Sampling from this brush produces the results specified in 12.7.3.2.

template <class InputIterator>
basic_brush(const basic_circle<graphics_math_type>& start,
const basic_circle<graphics_math_type>& end,
InputIterator first, InputIterator last);

Effects: Constructs a radial gradient basic_brush object with a start circle of start, an end circle of end, and a sequential series of gradient_stop values beginning at first and ending at last - 1. The brush’s brush type is brush_type:radial.

Remarks: Sampling from this brush produces the results specified in 12.7.3.3.

basic_brush(const basic_circle<graphics_math_type>& start,
const basic_circle<graphics_math_type>& end,
::std::initializer_list<gradient_stop> il);

Effects: Constructs a radial gradient basic_brush object with a start circle of start, an end circle of end, and the sequential series of gradient_stop values in il. The brush’s brush type is brush_type:radial.

Remarks: Sampling from this brush produces the results specified in 12.7.3.3.

basic_brush(basic_image_surface<GraphicsSurfaces>&& img);

Effects: Constructs an object of type basic_brush. The brush’s brush type is brush_type:surface. The graphics data of the brush is as-if it is the raster graphics data of img. Remarks: Sampling from this brush produces the results specified in 12.7.3.4.

12.7.5 basic_brush observers

brush_type type() const noexcept;

Returns: The brush’s brush type.
13 Surfaces

Surfaces are composed of visual data, stored in a graphics data graphics resource. [Note: <TODO>All well-defined surface-derived types are currently raster graphics data graphics resources with defined bounds. To allow for easier additions of future surface-derived types which are not composed of raster graphics data or do not have fixed bounds, such as a vector graphics-based surface, the less constrained term graphics data graphics resource is used. —end note]

The surface’s visual data is manipulated by rendering and composing operations (13.15.2).

<TODO>The various surface-derived classes each provide specific, unique functionality that enables a broad variety of 2D graphics operations to be accomplished efficiently.

13.1 Enum class antialias

13.1.1 antialias summary

The antialias enum class specifies the type of anti-aliasing that the rendering system uses for rendering and composing paths. See Table 8 for the meaning of each antialias enumerator.

13.1.2 antialias synopsis

namespace std::experimental::io2d::v1 {
    enum class antialias {
        none,
        fast,
        good,
        best
    };
}

13.1.3 antialias enumerators

Table 8 — antialias enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>fast</td>
<td>No anti-aliasing is performed. Some form of anti-aliasing shall be used when this option is selected, but the form used is implementation-defined. [Note: By specifying this value, the user is hinting that faster anti-aliasing is preferable to better anti-aliasing. —end note]</td>
</tr>
<tr>
<td>good</td>
<td>Some form of anti-aliasing shall be used when this option is selected, but the form used is implementation-defined. [Note: By specifying this value, the user is hinting that sacrificing some performance to obtain better anti-aliasing is acceptable but that performance is still a concern. —end note]</td>
</tr>
</tbody>
</table>

---

### 13.2 Enum class fill_rule

#### 13.2.1 fill_rule summary

1. The `fill_rule` enum class determines how the filling operation (13.15.5) is performed on a path.
2. For each point, draw a ray from that point to infinity which does not pass through the start point or end point of any non-degenerate segment in the path, is not tangent to any non-degenerate segment in the path, and is not coincident with any non-degenerate segment in the path.
3. See Table 9 for the meaning of each `fill_rule` enumerator.

#### 13.2.2 fill_rule synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class fill_rule {
        winding,
        even_odd
    };
}
```

#### 13.2.3 fill_rule enumerators

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>winding</td>
<td>If the <code>fill_rule</code> (13.11.1) is <code>fill_rule::winding</code>, then using the ray described above and beginning with a count of zero, add one to the count each time a non-degenerate segment crosses the ray going left-to-right from its begin point to its end point, and subtract one each time a non-degenerate segment crosses the ray going from right-to-left from its begin point to its end point. If the resulting count is zero after all non-degenerate segments that cross the ray have been evaluated, the point shall not be filled; otherwise the point shall be filled.</td>
</tr>
<tr>
<td>even_odd</td>
<td>If the fill rule is <code>fill_rule::even_odd</code>, then using the ray described above and beginning with a count of zero, add one to the count each time a non-degenerate segment crosses the ray. If the resulting count is an odd number after all non-degenerate segments that cross the ray have been evaluated, the point shall be filled; otherwise the point shall not be filled. [Note: Mathematically, zero is an even number, not an odd number. — end note]</td>
</tr>
</tbody>
</table>
13.3 Enum class line_cap

13.3.1 line_cap summary

The line_cap enum class specifies how the ends of lines should be rendered when a interpreted_path object is stroked. See Table 10 for the meaning of each line_cap enumerator.

13.3.2 line_cap synopsis

namespace std::experimental::io2d::v1 {
    enum class line_cap {
        none,
        round,
        square
    };
}

13.3.3 line_cap enumerators

Table 10 — line_cap enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The line has no cap. It terminates exactly at the end point.</td>
</tr>
<tr>
<td>round</td>
<td>The line has a circular cap, with the end point serving as the center of the circle and the line width serving as its diameter.</td>
</tr>
<tr>
<td>square</td>
<td>The line has a square cap, with the end point serving as the center of the square and the line width serving as the length of each side.</td>
</tr>
</tbody>
</table>

13.4 Enum class line_join

13.4.1 line_join summary

The line_join enum class specifies how the junction of two line segments should be rendered when a interpreted_path is stroked. See Table 11 for the meaning of each enumerator.

13.4.2 line_join synopsis

namespace std::experimental::io2d::v1 {
    enum class line_join {
        miter,
        round,
        bevel
    };
}

<td>Joins will be beveled, with the join cut off at half the line width from the join point. Implementations may vary the cut off distance by an amount that is less than one pixel at each join for aesthetic or technical reasons.</td>
</tr>
</tbody>
</table>

13.5 Enum class compositing_op

13.5.1 compositing_op Summary

The compositing_op enum class specifies composition algorithms. See Table 12, Table 13 and Table 14 for the meaning of each compositing_op enumerator.

13.5.2 compositing_op Synopsis

namespace std::experimental::io2d::v1 {
    enum class compositing_op {
        // basic
        over,
        clear,
        source,
        in,
        out,
        atop,
        dest,
        dest_over,
        dest_in,
        dest_out,
        dest_atop,
        xor_op,
        add,
        saturate,
        // blend
        multiply,
        screen,
        overlay,
        darken,
        lighten,
        color_dodge,
        color_burn,
        hard_light,
        soft_light,
        difference,
        exclusion,
        // hsl
        hsl_hue,
        hsl_saturation,
        hsl_color,
        hsl_luminosity
    };
}

§ 13.5.2
13.5.3 compositing_op Enumerators

1 The tables below specifies the mathematical formula for each enumerator’s composition algorithm. The formulas differentiate between three color channels (red, green, and blue) and an alpha channel (transparency). For all channels, valid channel values are in the range $[0.0, 1.0]$.

2 Where a visual data format for a visual data element has no alpha channel, the visual data format shall be treated as though it had an alpha channel with a value of 1.0 for purposes of evaluating the formulas.

3 Where a visual data format for a visual data element has no color channels, the visual data format shall be treated as though it had a value of 0.0 for all color channels for purposes of evaluating the formulas.

4 The following symbols and specifiers are used:
   - The $R$ symbol means the result color value
   - The $S$ symbol means the source color value
   - The $D$ symbol means the destination color value
   - The $c$ specifier means the color channels of the value it follows
   - The $a$ specifier means the alpha channel of the value it follows

5 The color symbols $R$, $S$, and $D$ may appear with or without any specifiers.

6 If a color symbol appears alone, it designates the entire color as a tuple in the unsigned normalized form (red, green, blue, alpha).

7 The specifiers $c$ and $a$ may appear alone or together after any of the three color symbols.

8 The presence of the $c$ specifier alone means the three color channels of the color as a tuple in the unsigned normalized form (red, green, blue).

9 The presence of the $a$ specifier alone means the alpha channel of the color in unsigned normalized form.

10 The presence of the specifiers together in the form $ca$ means the value of the color as a tuple in the unsigned normalized form (red, green, blue, alpha), where the value of each color channel is the product of each color channel and the alpha channel and the value of the alpha channel is the original value of the alpha channel. [Example: When it appears in a formula, $Sca$ means ($(Sc \times Sa)$, $Sa$), such that, given a source color $Sc = (1.0, 0.5, 0.0)$ and an source alpha $Sa = (0.5)$, the value of $Sca$ when specified in one of the formulas would be $Sca = (1.0 \times 0.5, 0.5 \times 0.5, 0.0 \times 0.5, 0.5) = (0.5, 0.25, 0.0, 0.5)$. The same is true for $Dca$ and $Rca$. —end example]

11 No space is left between a value and its channel specifiers. Channel specifiers will be preceded by exactly one value symbol.

12 When performing an operation that involves evaluating the color channels, each color channel should be evaluated individually to produce its own value.

13 The basic enumerators specify a value for bound. This value may be 'Yes', 'No', or 'N/A'.

14 If the bound value is 'Yes', then the source is treated as though it is also a mask. As such, only areas of the surface where the source would affect the surface are altered. The remaining areas of the surface have the same color value as before the compositing operation.

15 If the bound value is 'No', then every area of the surface that is not affected by the source will become transparent black. In effect, it is as though the source was treated as being the same size as the destination surface with every part of the source that does not already have a color value assigned to it being treated as though it were transparent black. Application of the formula with this precondition results in those areas evaluating to transparent black such that evaluation can be bypassed due to the predetermined outcome.

16 If the bound value is 'N/A', the operation would have the same effect regardless of whether it was treated as 'Yes' or 'No' such that those bound values are not applicable to the operation. A 'N/A' formula when applied to an area where the source does not provide a value will evaluate to the original value of the destination even if the source is treated as having a value there of transparent black. As such the result is the same as-if

§ 13.5.3

89
the source were treated as being a mask, i.e. 'Yes' and 'No' treatment each produce the same result in areas where the source does not have a value.

17 If a clip is set and the bound value is 'Yes' or 'N/A', then only those areas of the surface that are within the clip will be affected by the compositing operation.

18 If a clip is set and the bound value is 'No', then only those areas of the surface that are within the clip will be affected by the compositing operation. Even if no part of the source is within the clip, the operation will still set every area within the clip to transparent black. Areas outside the clip are not modified.

</tr>
</tbody>
</table>

19 The blend enumerators and hsl enumerators share a common formula for the result color’s color channel, with only one part of it changing depending on the enumerator. The result color’s color channel value formula is as follows: $Rc = \frac{1}{Ra} \times ((1 - Da) \times Sc + (1 - Sa) \times Dca + Sa \times Da \times f(Sc, Dc))$. The function $f(Sc, Dc)$ is the component of the formula that is enumerator dependent.

20 For the blend enumerators, the color channels shall be treated as separable, meaning that the color formula shall be evaluated separately for each color channel: red, green, and blue.

21 The color formula divides 1 by the result color’s alpha channel value. As a result, if the result color’s alpha channel is zero then a division by zero would normally occur. Implementations shall not throw an exception nor otherwise produce any observable error condition if the result color’s alpha channel is zero. Instead, implementations shall bypass the division by zero and produce the result color (0, 0, 0, 0), i.e. transparent
black, if the result color alpha channel formula evaluates to zero. [Note: The simplest way to comply with this requirement is to bypass evaluation of the color channel formula in the event that the result alpha is zero. However, in order to allow implementations the greatest latitude possible, only the result is specified. — end note]

For the enumerators in Table 13 and Table 14 the result color’s alpha channel value formula is as follows: $Ra = Sa + Da \times (1 - Sa)$. [Note: Since it is the same formula for all enumerators in those tables, the formula is not included in those tables. — end note]

All of the blend enumerators and hsl enumerators have a bound value of ‘N/A’.

13.6 Enum class format

13.6.1 format summary

1 The format enum class indicates a visual data format. See Table 15 for the meaning of each format enumerator.

2 Unless otherwise specified, a visual data format shall be an unsigned integral value of the specified bit size in native-endian format.

3 A channel value of 0x0 means that there is no contribution from that channel. As the channel value increases towards the maximum unsigned integral value representable by the number of bits of the channel, the contribution from that channel also increases, with the maximum value representing the maximum contribution from that channel. [Example: Given a 5-bit channel representing the color, a value of 0x0 means that the red channel does not contribute any value towards the final color of the pixel. A value of 0x1F means that the red channel makes its maximum contribution to the final color of the pixel. —end example]

13.6.2 format synopsis

namespace std::experimental::io2d::v1 {
    enum class format {
        invalid,
        argb32,
        rgb24,
        a8,
        rgb16_565,
        rgb30
    };
}

</tr>
</tbody>
</table>

13.7 Enum class scaling

13.7.1 scaling summary

The scaling enum class specifies the type of scaling a display_surface will use when the size of its display buffer (??) differs from the size of its back buffer (??).

1 See Table 16 for the meaning of each scaling enumerator.

13.7.2 scaling synopsis

namespace std::experimental::io2d::v1 {
    enum class scaling {
        letterbox,
        uniform,
        fill_uniform,
        fill_exact,
        none
    };
}

13.7.3 scaling enumerators

[Note: In the following table, examples will be given to help explain the meaning of each enumerator. The examples will all use a display_surface called ds.]

The back buffer (??) of ds is 640x480 (i.e. it has a width of 640 pixels and a height of 480 pixels), giving it an aspect ratio of 1.3.

The display buffer (??) of ds is 1280x720, giving it an aspect ratio of 1.7.

When a rectangle is defined in an example, the coordinate (x1, y1) denotes the top left corner of the rectangle, inclusive, and the coordinate (x2, y2) denotes the bottom right corner of the rectangle, exclusive. As such, a rectangle with (x1, y1) = (10, 10), (x2, y2) = (20, 20) is 10 pixels wide and 10 pixels tall and includes the pixel (x, y) = (19, 19) but does not include the pixels (x, y) = (20, 19) or (x, y) = (19, 20). — end note]
Table 16 — scaling enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| letterbox  | Fill the display buffer with the letterbox brush (??) of the display_surface. Uniformly scale the back buffer so that one dimension of it is the same length as the same dimension of the display buffer and the second dimension of it is not longer than the second dimension of the display buffer and transfer the scaled back buffer to the display buffer using sampling such that it is centered in the display buffer. Example: The display buffer of ds will be filled with the brush object returned by ds.letterbox_brush(). The back buffer of ds will be scaled so that it is 960x720, thereby retaining its original aspect ratio. The scaled back buffer will be transferred to the display buffer using sampling such that it is in the rectangle:

\[
(x_1, y_1) = \left( \frac{1280}{2} - \frac{960}{2}, 0 \right) = (160, 0),
\]

\[
(x_2, y_2) = \left( 960 + (\frac{1280}{2} - \frac{960}{2}), 720 \right) = (1120, 720).
\]

This fulfills all of the conditions. At least one dimension of the scaled back buffer is the same length as the same dimension of the display buffer (both have a height of 720 pixels). The second dimension of the scaled back buffer is not longer than the second dimension of the display buffer (the back buffer’s scaled width is 960 pixels, which is not longer than the display buffer’s width of 1280 pixels. Lastly, the scaled back buffer is centered in the display buffer (on the x axis there are 160 pixels between each vertical side of the scaled back buffer and the nearest vertical edge of the display buffer and on the y axis there are 0 pixels between each horizontal side of the scaled back buffer and the nearest horizontal edge of the display buffer). — end example |

§ 13.7.3
Table 16 — **scaling** enumerator meanings (continued)

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>uniform</td>
<td>Uniformly scale the back buffer so that one dimension of it is the same length as the same dimension of the display buffer and the second dimension of it is not longer than the second dimension of the display buffer and transfer the scaled back buffer to the display buffer using sampling such that it is centered in the display buffer. [Example: The back buffer of ( \text{ds} ) will be scaled so that it is 960x720, thereby retaining its original aspect ratio. The scaled back buffer will be transferred to the display buffer using sampling such that it is in the rectangle ((x_1, y_1) = (\frac{1280}{2} - \frac{960}{2}, 0) = (160, 0),) ((x_2, y_2) = (960 + (\frac{1280}{2} - \frac{960}{2}), 720) = (1120, 720).) This fulfills all of the conditions. At least one dimension of the scaled back buffer is the same length as the same dimension of the display buffer (both have a height of 720 pixels). The second dimension of the scaled back buffer is not longer than the second dimension of the display buffer (the back buffer’s scaled width is 960 pixels, which is not longer than the display buffer’s width of 1280 pixels. </tr>
<tr>
<td>none</td>
<td>Do not perform any scaling. Transfer the back buffer to the display buffer using sampling such that its origin is at the origin of the display buffer.</td>
</tr>
<tr>
<td></td>
<td>[Example: The back buffer of ds will be drawn in the rectangle ((x_1, y_1) = (0, 0), (x_2, y_2) = (640, 480)) such that no scaling occurs and the origin of the back buffer is at the origin of the display buffer. — end example]</td>
</tr>
</tbody>
</table>

13.8 Enum class refresh_rate

13.8.1 refresh_rate summary

The refresh_rate enum class describes when the draw callback (Table ??) of a display_surface object shall be called. See Table 17 for the meaning of each enumerator.
namespace std::experimental::io2d::v1 {
 enum class refresh_rate {
   as_needed,
   as_fast_as_possible,
   fixed
 };}

13.8.3 refresh_rate enumerators

Table 17 — refresh_rate value meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_needed</td>
<td>The draw callback shall be called when the implementation needs to do so. [Note: The intention of this enumerator is that implementations will call the draw callback as little as possible in order to minimize power usage. Users can call display_surface::redraw_required to make the implementation run the draw callback whenever the user requires. — end note]</td>
</tr>
<tr>
<td>as_fast_as_possible</td>
<td>The draw callback shall be called as frequently as possible, subject to any limits of the execution environment and the underlying rendering and presentation technologies.</td>
</tr>
<tr>
<td>fixed</td>
<td>The draw callback shall be called as frequently as needed to maintain the desired frame rate (Table ??) as closely as possible. If more time has passed between two successive calls to the draw callback than is required, it shall be called excess time and it shall count towards the required time, which is the time that is required to pass after a call to the draw callback before the next successive call to the draw callback shall be made. If the excess time is greater than the required time, implementations shall call the draw callback and then repeatedly subtract the required time from the excess time until the excess time is less than the required time. If the implementation needs to call the draw callback for some other reason, it shall use that call as the new starting point for maintaining the desired frame rate. [Example: Given a desired frame rate of 20.0f, then as per the above, the implementation would call the draw callback at 50 millisecond intervals or as close thereto as possible. If for some reason the excess time is 51 milliseconds, the implementation would call the draw callback, subtract 50 milliseconds from the excess time, and then would wait 49 milliseconds before calling the draw callback again. If only 15 milliseconds have passed since the draw callback was last called and the implementation needs to call the draw callback again, then the implementation shall call the draw callback immediately and proceed to wait 50 milliseconds before calling the draw callback again. — end example]</td>
</tr>
</tbody>
</table>
13.9 Enum class **image_file_format**

13.9.1 **image_file_format** summary

The **image_file_format** enum class specifies the data format that an **image_surface** object is constructed from or saved to. This allows data in a format that is required to be supported to be read or written regardless of its extension.

1 It also has a value that allows implementations to support additional file formats if it recognizes them.

13.9.2 **image_file_format** synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class image_file_format {
        unknown,
        png,
        jpeg,
        tiff
    };
}
```

13.9.3 **image_file_format** enumerators

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>unknown</td>
<td>The format is unknown because it is not an image file format that is required to be supported. It may be known and supported by the implementation.</td>
</tr>
<tr>
<td>png</td>
<td>The PNG format.</td>
</tr>
<tr>
<td>jpeg</td>
<td>The JPEG format.</td>
</tr>
<tr>
<td>tiff</td>
<td>The TIFF format.</td>
</tr>
</tbody>
</table>

13.10 Class **basic_render_props**

13.10.1 **basic_render_props** summary

The **basic_render_props** class provides general state information that is applicable to all rendering and composing operations (13.15.2).

2 It has an **antialias** of type **antialias** with a default value of **antialias::good**, a **surface matrix** of type **basic_matrix_2d** with a default constructed value, and a **compositing operator** of type **compositing_op** with a default value of **compositing_op::over**.

13.10.2 **basic_render_props** synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_render_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

            // 13.10.3, constructors:
            basic_render_props() noexcept;
            explicit basic_render_props(antialias a,
                const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{},
                compositing_op co = compositing_op::over) noexcept;
    }
}
```
```cpp
// 13.10.4, modifiers:
void antialiasing(antialias a) noexcept;
void compositing(compositing_op co) noexcept;
void surface_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

// 13.10.5, observers:
antialias antialiasing() const noexcept;
compositing_op compositing() const noexcept;
basic_matrix_2d<graphics_math_type> surface_matrix() const noexcept;
};
```
It has a wrap mode of type `wrap_mode`, a filter of type `filter`, a fill rule of type `fill_rule`, and a brush matrix of type `basic_matrix_2d`.

### 13.11.2 basic_brush_props synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_brush_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

            // 13.11.3, constructor:
            basic_brush_props(io2d::wrap_mode w = io2d::wrap_mode::none,
                               io2d::filter fi = io2d::filter::good,
                               io2d::fill_rule fr = io2d::fill_rule::winding,
                               const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{})
                                  noexcept;

            // 13.11.4, modifiers:
            void wrap_mode(io2d::wrap_mode w) noexcept;
            void filter(io2d::filter fi) noexcept;
            void fill_rule(io2d::fill_rule fr) noexcept;
            void brush_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

            // 13.11.5, observers:
            io2d::wrap_mode wrap_mode() const noexcept;
            io2d::filter filter() const noexcept;
            io2d::fill_rule fill_rule() const noexcept;
            basic_matrix_2d<graphics_math_type> brush_matrix() const noexcept;
    };
}
```

### 13.11.3 basic_brush_props constructor

```cpp
basic_brush_props(io2d::wrap_mode w = io2d::wrap_mode::none,
                   io2d::filter fi = io2d::filter::good,
                   io2d::fill_rule fr = io2d::fill_rule::winding,
                   const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{})
                         noexcept;
```

1. Requires: `m.is_invertible() == true`.
2. Effects: Constructs an object of type `basic_brush_props`.
3. The wrap mode is `w`. The filter is `fi`. The fill rule is `fr`. The brush matrix is `m`.

### 13.11.4 basic_brush_props modifiers

```cpp
void wrap_mode(io2d::wrap_mode w) noexcept;
```

1. Effects: The wrap mode is `w`.

```cpp
void filter(io2d::filter fi) noexcept;
```

2. Effects: The filter is `fi`.

```cpp
void fill_rule(io2d::fill_rule fr) noexcept;
```

3. Effects: The fill rule is `fr`.

```cpp
void brush_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;
```

§ 13.11.4
13.12 Class basic_clip_props

13.12.1 basic_clip_props summary

The basic_clip_props class provides general state information that is applicable to all rendering and composing operations (13.15.2).

13.12.2 basic_clip_props synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_clip_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

            // 13.12.3, constructors:
            basic_clip_props() noexcept;
            template <class Allocator>
            explicit basic_clip_props(const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
                                      io2d::fill_rule fr = io2d::fill_rule::winding);
            explicit basic_clip_props(const basic_interpreted_path<GraphicsSurfaces>& ip,
                                      io2d::fill_rule fr = io2d::fill_rule::winding) noexcept;
            explicit basic_clip_props(const basic_bounding_box<graphics_math_type>& r,
                                      io2d::fill_rule fr = io2d::fill_rule::winding);

            // 13.12.4, modifiers:
            template <class Allocator>
            void clip(const basic_path_builder<GraphicsSurfaces, Allocator>& pb);
            void clip(const basic_interpreted_path<GraphicsSurfaces>& ip) noexcept;
            void fill_rule(io2d::fill_rule fr) noexcept;

            // 13.12.5, observers:
            basic_interpreted_path<GraphicsSurfaces> clip() const noexcept;
            io2d::fill_rule fill_rule() const noexcept;
    };
}
### 13.12.3 basic_clip_props constructors

basic_clip_props() noexcept;

*Effects:* Equivalent to: `basic_clip_props(basic_path_builder<>()).`

```cpp
template <class Allocator>
explicit basic_clip_props(const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
                         io2d::fill_rule fr = io2d::fill_rule::winding);
explicit basic_clip_props(const basic_interpreted_path<GraphicsSurfaces>& ip,
                         io2d::fill_rule fr = io2d::fill_rule::winding) noexcept;
explicit basic_clip_props(const basic_bounding_box<graphics_math_type>& r,
                         io2d::fill_rule fr = io2d::fill_rule::winding)
```

*Effects:* Constructs an object of type `basic_clip_props`.

The clip area is:

- (3.1) `interpreted_path(pb);` or
- (3.2) `ip;` or
- (3.3) `interpreted_path(r);`<TODO>

The fill rule is `fr`.

### 13.12.4 basic_clip_props modifiers

```cpp
template <class Allocator>
void clip(const basic_path_builder<GraphicsSurfaces, Allocator>& pb);
void clip(const basic_interpreted_path<GraphicsSurfaces>& ip) noexcept;
```

*Effects:* The clip area is:

- (1.1) `interpreted_path(pb);` or
- (1.2) `ip.`

```cpp
void fill_rule(experimental::io2d::fill_rule fr) noexcept;
```

*Effects:* The fill rule is `fr`.

### 13.12.5 basic_clip_props observers

```cpp
basic_interpreted_path<GraphicsSurfaces> clip() const noexcept;
```

*Returns:* The clip area.

```cpp
io2d::fill_rule fill_rule() const noexcept;
```

*Returns:* The fill rule.

### 13.13 Class basic_stroke_props

#### 13.13.1 basic_stroke_props summary

The `basic_stroke_props` class provides state information that is applicable to the stroking operation (see: 13.15.2 and 13.15.6).

It has a line width of type `float`, a line cap of type `line_cap`, a line join of type `line_join`, and a miter limit of type `float`.

#### 13.13.2 basic_stroke_props synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
```

§ 13.13.2 104
class basic_stroke_props {
public:
    using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

    // 13.13.3, constructors:
    basic_stroke_props() noexcept;
    explicit basic_stroke_props(float w, io2d::line_cap lc = io2d::line_cap::none,
                                 io2d::line_join lj = io2d::line_join::miter, float ml = 10.0f) noexcept;

    // 13.13.4, modifiers:
    void line_width(float w) noexcept;
    void line_cap(io2d::line_cap lc) noexcept;
    void line_join(io2d::line_join lj) noexcept;
    void miter_limit(float ml) noexcept;

    // 13.13.5, observers:
    float line_width() const noexcept;
    io2d::line_cap line_cap() const noexcept;
    io2d::line_join line_join() const noexcept;
    float miter_limit() const noexcept;
    float max_miter_limit() const noexcept;
};

13.13.3 basic_stroke_props constructors

basic_stroke_props() noexcept;
1
    Effects: Equivalent to: basic_stroke_props(2.0f).

explicit basic_stroke_props(float w, io2d::line_cap lc = io2d::line_cap::none,
                             io2d::line_join lj = io2d::line_join::miter,
                             float ml = 10.0f) noexcept;
2
    Requires: w > 0.0f. ml >= 10.0f. ml <= max_miter_limit().
3
    Effects: The line width is w. The line cap is lc. The line join is lj. The miter limit is ml.

13.13.4 basic_stroke_props modifiers

void line_width(float w) noexcept;
1
    Requires: w >= 0.0f.
2
    Effects: The line width is w.

void line_cap(io2d::line_cap lc) noexcept;
3
    Effects: The line cap is lc.

void line_join(io2d::line_join lj) noexcept;
4
    Effects: The line join is lj.

void miter_limit(float ml) noexcept;
5
    Requires: ml >= 1.0f and ml <= max_miter_limit.
6
    Effects: The miter limit is ml.

13.13.5 basic_stroke_props observers
float line_width() const noexcept;

    Returns: The line width.

io2d::line_cap line_cap() const noexcept;

    Returns: The line cap.

io2d::line_join line_join() const noexcept;

    Returns: The line join.

float miter_limit() const noexcept;

    Returns: The miter limit.

float max_miter_limit() const noexcept;

    Requires: This value shall be finite and greater than 10.0f.

    Returns: The implementation-defined maximum value of miter limit.

13.14 Class basic_mask_props [io2d.maskprops]

13.14.1 basic_mask_props summary [io2d.maskprops.summary]

The basic_mask_props class provides state information that is applicable to the mask rendering and composing operation (13.15.2).

It has a wrap mode of type wrap_mode, a filter of type filter, and a mask matrix of type matrix_2d.

13.14.2 basic_mask_props synopsis [io2d.maskprops.synopsis]

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_mask_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

            // 13.14.3, constructor:
            basic_mask_props(io2d::wrap_mode w = io2d::wrap_mode::repeat,
                             io2d::filter fi = io2d::filter::good,
                             const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{}) noexcept;

            // 13.14.4, modifiers:
            void wrap_mode(io2d::wrap_mode w) noexcept;
            void filter(io2d::filter fi) noexcept;
            void mask_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

            // 13.14.5, observers:
            io2d::wrap_mode wrap_mode() const noexcept;
            io2d::filter filter() const noexcept;
            basic_matrix_2d<graphics_math_type> mask_matrix() const noexcept;
        };
    }

13.14.3 basic_mask_props constructor [io2d.maskprops.cons]

basic_mask_props(io2d::wrap_mode w = io2d::wrap_mode::repeat,
                 io2d::filter fi = io2d::filter::good,
                 const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{}) noexcept;

Requires: \( \text{m.is_invertible()} == \text{true} \).

Effects: The wrap mode is \( w \). The filter is \( f_i \). The mask matrix is \( m \).

13.14.4 basic_mask_props modifiers

\[
\begin{align*}
\text{void wrap_mode}(\text{io2d::wrap_mode} w) & \quad \text{noexcept;}
\text{Effects: The wrap mode is } w. \\
\text{void filter}(\text{io2d::filter} f_i) & \quad \text{noexcept;}
\text{Effects: The filter is } f_i. \\
\text{void mask_matrix}(\text{const basic_matrix_2d<graphics_math_type>&} m) & \quad \text{noexcept;}
\text{Requires: } \text{m.is_invertible()} == \text{true.}
\text{Effects: The mask matrix is } m.
\end{align*}
\]

13.14.5 basic_mask_props observers

\[
\begin{align*}
\text{io2d::wrap_mode wrap_mode() const noexcept;}
\text{Returns: The wrap mode.} \\
\text{io2d::filter filter() const noexcept;}
\text{Returns: The filter.} \\
\text{basic_matrix_2d<graphics_math_type> mask_matrix() const noexcept;}
\text{Returns: The mask matrix.}
\end{align*}
\]

13.15 Overview of surface classes

13.15.1 Surface class templates description

There are three surface class templates:

1. basic_image_surface
2. basic_output_surface
3. basic_unmanaged_output_surface

The surface classes provides an interface for managing a graphics data graphics resource.

A surface object is a move-only object.

The surface classes modify their graphics resource through rendering and composing operations. They shall provide well-defined semantics for the graphics data graphics resource.

The definitions of the rendering and composing operations in 13.15.2 shall only be applicable when the graphics data graphics resource on which the surface class members operate is a raster graphics data graphics resource. In all other cases, any attempt to invoke the rendering and composing operations shall result in undefined behavior.

13.15.2 Rendering and composing

13.15.2.1 Operations

The surface classes provide four fundamental rendering and composing operations:
Table 19 — surface rendering and composing operations

<table>
<thead>
<tr>
<th>Operation</th>
<th>Function(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Painting</td>
<td>paint</td>
</tr>
<tr>
<td>Filling</td>
<td>fill</td>
</tr>
<tr>
<td>Stroking</td>
<td>stroke</td>
</tr>
<tr>
<td>Masking</td>
<td>mask</td>
</tr>
</tbody>
</table>

2 All composing operations shall happen in a linear color space, regardless of the color space of the graphics data that is involved.

3 [Note: While a color space such as sRGB helps produce expected, consistent results when graphics data are viewed by people, composing operations only produce expected results when the channel data in the graphics data involved are uniformly (i.e. linearly) spaced. — end note]

13.15.2.2 Rendering and composing brushes [io2d.surface.rendering.brushes]

1 All rendering and composing operations use a source brush of type basic_brush.

2 The masking operation uses a mask brush of type basic_brush.

13.15.2.3 Rendering and composing source path [io2d.surface.rendering.sourcepath]

1 In addition to brushes (13.15.2.2), all rendering and composing operation except for painting and masking use a source path. The source path is either a basic_path_builder<Allocator> object or a basic_interpreted_path object. If it is a basic_path_builder<Allocator> object, it is interpreted (11.3.16) before it is used as the source path.

13.15.2.4 Common state data [io2d.surface.rendering.commonstate]

1 All rendering and composing operations use the following state data:

Table 20 — surface rendering and composing common state data

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brush properties</td>
<td>brush_props</td>
</tr>
<tr>
<td>Surface properties</td>
<td>render_props</td>
</tr>
<tr>
<td>Clip properties</td>
<td>clip_props</td>
</tr>
</tbody>
</table>

13.15.2.5 Specific state data [io2d.surface.rendering.specificstate]

1 In addition to the common state data (13.15.2.4), certain rendering and composing operations use state data that is specific to each of them:

Table 21 — surface rendering and composing specific state data

<table>
<thead>
<tr>
<th>Operation</th>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stroking</td>
<td>Stroke properties</td>
<td>stroke_props</td>
</tr>
<tr>
<td>Stroking</td>
<td>Dashes</td>
<td>dashes</td>
</tr>
<tr>
<td>Masking</td>
<td>Mask properties</td>
<td>mask_props</td>
</tr>
</tbody>
</table>

13.15.2.6 State data default values [io2d.surface.rendering.statedefaults]

1 For all rendering and composing operations, the state data objects named above are provided using optional<T> class template arguments.
If there is no contained value for a state data object, it is interpreted as if the `optional<T>` argument contained a default constructed object of the relevant state data object.

### 13.15.3 Standard coordinate spaces

There are four standard coordinate spaces relevant to the rendering and composing operations (13.15.2):

1. The **brush coordinate space** is the standard coordinate space of the source brush (13.15.2.2). Its transformation matrix is the brush properties' brush matrix (13.11.1).
2. The **mask coordinate space** is the standard coordinate space of the mask brush (13.15.2.2). Its transformation matrix is the mask properties' mask matrix (13.14.1).
3. The **user coordinate space** is the standard coordinate space of basic_interpreted_path objects. Its transformation matrix is a default-constructed `basic_matrix_2d`.
4. The **surface coordinate space** is the standard coordinate space of the surface object’s underlying graphics data graphics resource. Its transformation matrix is the surface properties’ surface matrix (13.10.1).

Given a point \( \mathbf{pt} \), a brush coordinate space transformation matrix \( \mathbf{bcsm} \), a mask coordinate space transformation matrix \( \mathbf{mcsm} \), a user coordinate space transformation matrix \( \mathbf{ucsm} \), and a surface coordinate space transformation matrix \( \mathbf{scsm} \), the following table describes how to transform it from each of these standard coordinate spaces to the other standard coordinate spaces:

<table>
<thead>
<tr>
<th>From (Coordinate Space)</th>
<th>To (Coordinate Space)</th>
<th>Transform</th>
</tr>
</thead>
<tbody>
<tr>
<td>brush coordinate space</td>
<td>mask coordinate space</td>
<td>( \mathbf{mcsm}.\text{transform_-pt}(\mathbf{bcsm}\text{-invert().transform_-pt}(\mathbf{pt})) ).</td>
</tr>
<tr>
<td>brush coordinate space</td>
<td>user coordinate space</td>
<td>( \mathbf{bcsm}\text{-invert().transform_-pt}(\mathbf{pt}) ).</td>
</tr>
<tr>
<td>brush coordinate space</td>
<td>surface coordinate space</td>
<td>( \mathbf{scsm}\text{-invert().transform_-pt}(\mathbf{bcsm}\text{-invert().transform_-pt}(\mathbf{pt})) ).</td>
</tr>
<tr>
<td>user coordinate space</td>
<td>brush coordinate space</td>
<td>( \mathbf{bcsm}.\text{transform_-pt}(\mathbf{pt}) ).</td>
</tr>
<tr>
<td>user coordinate space</td>
<td>mask coordinate space</td>
<td>( \mathbf{mcsm}.\text{transform_-pt}(\mathbf{pt}) ).</td>
</tr>
<tr>
<td>user coordinate space</td>
<td>surface coordinate space</td>
<td>( \mathbf{scsm}.\text{transform_-pt}(\mathbf{pt}) ).</td>
</tr>
<tr>
<td>surface coordinate space</td>
<td>brush coordinate space</td>
<td>( \mathbf{bcsm}\text{-invert().transform_-pt}(\mathbf{scsm}\text{-invert().transform_-pt}(\mathbf{pt})) ).</td>
</tr>
<tr>
<td>surface coordinate space</td>
<td>mask coordinate space</td>
<td>( \mathbf{mcsm}\text{-invert().transform_-pt}(\mathbf{scsm}\text{-invert().transform_-pt}(\mathbf{pt})) ).</td>
</tr>
<tr>
<td>surface coordinate space</td>
<td>user coordinate space</td>
<td>( \mathbf{scsm}\text{-invert().transform_-pt}(\mathbf{pt}) ).</td>
</tr>
</tbody>
</table>

### 13.15.4 Surface painting

When a painting operation is initiated on a surface, the implementation shall produce results as if the following steps were performed:

1. For each integral point \( \mathbf{sp} \) of the underlying graphics data graphics resource, determine if \( \mathbf{sp} \) is within...
the clip area (io2d.clipprops.summary); if so, proceed with the remaining steps.

2. Transform \( sp \) from the surface coordinate space (13.15.3) to the brush coordinate space (Table 22), resulting in point \( bp \).

3. Sample from point \( bp \) of the source brush (13.15.2.2), combine the resulting visual data with the visual data at point \( sp \) in the underlying graphics data graphics resource in the manner specified by the surface’s current compositing operator (13.10.1), and modify the visual data of the underlying graphics data graphics resource at point \( sp \) to reflect the result produced by application of the compositing operator.

### 13.15.5 surface filling

When a filling operation is initiated on a surface, the implementation shall produce results as-if the following steps were performed:

1. For each integral point \( sp \) of the underlying graphics data graphics resource, determine if \( sp \) is within the clip area (13.12.1); if so, proceed with the remaining steps.

2. Transform \( sp \) from the surface coordinate space (13.15.3) to the user coordinate space (Table 22), resulting in point \( up \).

3. Using the source path (13.15.2.3) and the fill rule (13.11.1), determine whether \( up \) shall be filled; if so, proceed with the remaining steps.

4. Transform \( up \) from the user coordinate space to the brush coordinate space (13.15.3 and Table 22), resulting in point \( bp \).

5. Sample from point \( bp \) of the source brush (13.15.2.2), combine the resulting visual data with the visual data at point \( sp \) in the underlying graphics data graphics resource in the manner specified by the surface’s current compositing operator (13.10.1), and modify the visual data of the underlying graphics data graphics resource at point \( sp \) to reflect the result produced by application of the compositing operator.

### 13.15.6 surface stroking

When a stroking operation is initiated on a surface, it is carried out for each figure in the source path (13.15.2).

The following rules shall apply when a stroking operation is carried out on a figure:

1. No part of the underlying graphics data graphics resource that is outside of the clip area shall be modified.

2. If the figure is a closed figure, then the point where the end point of its final segment meets the start point of the initial segment shall be rendered as specified by the line join value (see: 13.13.1 and 13.15.2.5); otherwise the start point of the initial segment and end point of the final segment shall each be rendered as specified by the line cap value. The remaining meetings between successive end points and start points shall be rendered as specified by the line join value.

3. If the dash pattern (Table 21) has its default value or if its \texttt{vector<float>} member is empty, the segments shall be rendered as a continuous path.

4. If the dash pattern’s \texttt{vector<float>} member contains only one value, that value shall be used to define a repeating pattern in which the path is shown then hidden. The ends of each shown portion of the path shall be rendered as specified by the line cap value.

5. If the dash pattern’s \texttt{vector<float>} member contains two or more values, the values shall be used to define a pattern in which the figure is alternatively rendered then not rendered for the length specified by the value. The ends of each rendered portion of the figure shall be rendered as specified by the line cap value. If the dash pattern’s \texttt{float} member, which specifies an offset value, is not 0.0f, the meaning
of its value is implementation-defined. If a rendered portion of the figure overlaps a not rendered portion of the figure, the rendered portion shall be rendered.

3 When a stroking operation is carried out on a figure, the width of each rendered portion shall be the line width (see: 13.13.1 and 13.15.2.5). Ideally this means that the diameter of the stroke at each rendered point should be equal to the line width. However, because there are an infinite number of points along each rendered portion, implementations may choose an unspecified method of determining minimum distances between points along each rendered portion and the diameter of the stroke between those points shall be the same. [Note: This concept is sometimes referred to as a tolerance. It allows for a balance between precision and performance, especially in situations where the end result is in a non-exact format such as raster graphics data. — end note]

4 After all figures in the path have been rendered but before the rendered result is composed to the underlying graphics data graphics resource, the rendered result shall be transformed from the user coordinate space (13.15.3) to the surface coordinate space (13.15.3).

13.15.7 surface masking [io2d.surface.masking]

1 A mask brush is composed of a graphics data graphics resource, a wrap_mode value, a filter value, and a basic_matrix_2d object.

2 When a masking operation is initiated on a surface, the implementation shall produce results as-if the following steps were performed:

1. For each integral point $sp$ of the underlying graphics data graphics resource, determine if $sp$ is within the clip area (13.12.1); if so, proceed with the remaining steps.

2. Transform $sp$ from the surface coordinate space (13.15.3) to the mask coordinate space (Table 22), resulting in point $mp$.

3. Sample the alpha channel from point $mp$ of the mask brush and store the result in $mac$; if the visual data format of the mask brush does not have an alpha channel, the value of $mac$ shall always be 1.0.

4. Transform $sp$ from the surface coordinate space to the brush coordinate space, resulting in point $bp$.

5. Sample from point $bp$ of the source brush (13.15.2.2), combine the resulting visual data with the visual data at point $sp$ in the underlying graphics data graphics resource in the manner specified by the surface’s current compositing operator (13.10.1), multiply each channel of the result produced by application of the compositing operator by $map$ if the visual data format of the underlying graphics data graphics resource is a premultiplied format and if not then just multiply the alpha channel of the result by $map$, and modify the visual data of the underlying graphics data graphics resource at point $sp$ to reflect the multiplied result.

13.15.8 output surface miscellaneous behavior [io2d.outputsurface.misc]

1 What constitutes an output device is implementation-defined, with the sole constraint being that an output device must allow the user to see the dynamically-updated contents of the display buffer. [Example: An output device might be a window in a windowing system environment or the usable screen area of a smart phone or tablet. — end example]

2 Implementations do not need to support the simultaneous existence of multiple display_surface objects.

3 All functions inherited from surface that affect its underlying graphics data graphics resource shall operate on the back buffer.

13.15.9 output surface state [io2d.outputsurface.state]

1 Table 23 specifies the name, type, function, and default value for each item of a display surface’s observable state.
<table>
<thead>
<tr>

13.16 Class basic_image_surface [io2d.imagesurface]

13.16.1 basic_image_surface summary [io2d.imagesurface.summary]

1 The class basic_image_surface provides an interface to a raster graphics data graphics resource.

2 It has a pixel format of type format, a width of type int, and a height of type int.

3 [Note: Because of the functionality it provides and what it can be used for, it is expected that developers familiar with other graphics technologies will think of the basic_image_surface class as being a form of render target. This is intentional, though this Technical Specification does not formally define or use that term to avoid any minor ambiguities and differences in its meaning between the various graphics technologies that do use the term render target. — end note]

13.16.2 basic_image_surface synopsis [io2d.imagesurface.synopsis]

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_image_surface {
    public:
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

        // 13.16.3, construct/copy/move/destroy:
        basic_image_surface(io2d::format fmt, int width, int height);
        basic_image_surface(filesystem::path f, io2d::image_file_format iff, io2d::format fmt);
        basic_image_surface(filesystem::path f, io2d::image_file_format iff, io2d::format fmt,
            error_code& ec) noexcept;
        basic_image_surface(basic_image_surface&&) noexcept;
        basic_image_surface& operator=(basic_image_surface&&) noexcept;

        // 13.16.4, members:
        void save(filesystem::path p, image_file_format i);
        void save(filesystem::path p, image_file_format i, error_code& ec) noexcept;

        // 13.16.5, static members:
        static basic_display_point<graphics_math_type> max_dimensions() noexcept;

        // 13.16.6, observers:
        io2d::format format() const noexcept;
        basic_display_point<graphics_math_type> dimensions() const noexcept;
    }
}
```

}

13.16.3 basic_image_surface constructors and assignment operators

[io2d.imagesurface.cons]
basic_image_surface(io2d::format fmt, int w, int h);
Requires: \( w \) is greater than 0 and not greater than \( \text{basic_image_surface} \cdot \text{max_width}() \).

\( h \) is greater than 0 and not greater than \( \text{basic_image_surface} \cdot \text{max_height}() \).

\( \text{fmt} \) is not \( \text{io2d:format:invalid} \).

Effects: Constructs an object of type \( \text{basic_image_surface} \).

The pixel format is \( \text{fmt} \), the width is \( w \), and the height is \( h \).

\[
\text{basic_image_surface}((\text{filesystem:} \text{path} \ f, \ \text{io2d:format:file_format} \ i, \ \text{io2d:format:format} \ \text{fmt});
\]

\[
\text{basic_image_surface}((\text{filesystem:} \text{path} \ f, \ \text{io2d:format:file_format} \ i, \ \text{io2d:format:format} \ \text{fmt},
\text{error_code} \ \text{ec}) \text{ noexcept};
\]

Requires: \( f \) is a file and its contents are data in either JPEG format, TIFF format or PNG format.

\( \text{fmt} \) is not \( \text{io2d:format:invalid} \).

Effects: Constructs an object of type \( \text{basic_image_surface} \).

The data of the underlying raster graphics data graphics resource is the raster graphics data that results from processing \( f \) into uncompressed raster graphics in the manner specified by the standard that specifies how to transform the contents of data contained in \( f \) into raster graphics data and then transforming that raster graphics data into the format specified by \( \text{fmt} \).

The data of \( f \) is processed into uncompressed raster graphics data as specified by the value of \( i \).

If \( i \) is \( \text{image_file_format::unknown} \), implementations may attempt to process the data of \( f \) into uncompressed raster graphics data. The manner in which it does so is unspecified. If no uncompressed raster graphics data is produced, the error specified below occurs.

[Note: The intent of \( \text{image_file_format::unknown} \) is to allow implementations to support image file formats that are not required to be supported. — end note]

If the width of the uncompressed raster graphics data would be less than 1 or greater than \( \text{basic_image_surface} \cdot \text{max_width}() \) or if the height of the uncompressed raster graphics data would be less than 1 or greater than \( \text{basic_image_surface} \cdot \text{max_height}() \), the error specified below occurs.

The resulting uncompressed raster graphics data is then transformed into the data format specified by \( \text{fmt} \). If the format specified by \( \text{fmt} \) only contains an alpha channel, the values of the color channels, if any, of the underlying raster graphics data graphics resource are unspecified. If the format specified by \( \text{fmt} \) only contains color channels and the resulting uncompressed raster graphics data is in a premultiplied format, then the value of each color channel for each pixel is be divided by the value of the alpha channel for that pixel. The visual data is then set as the visual data of the underlying raster graphics data graphics resource.

The width is the width of the uncompressed raster graphics data. The height is the height of the uncompressed raster graphics data.

Throws: As specified in Error reporting (5).

Error conditions: Any error that could result from trying to access \( f \), open \( f \) for reading, or reading data from \( f \).

\( \text{errc::not_supported} \) if \( \text{image_file_format::unknown} \) is passed as an argument and the implementation is unable to determine the file format or does not support saving in the image file format it determined.

\( \text{errc::invalid_argument} \) if \( \text{fmt} \) is \( \text{io2d:format:invalid} \).

\( \text{errc::argument_out_of_domain} \) if the width would be less than 1, the width would be greater than \( \text{basic_image_surface} \cdot \text{max_width}() \), the height would be less than 1, or the height would be greater than \( \text{basic_image_surface} \cdot \text{max_height}() \).
13.16.4 basic_image_surface members

```cpp
void save(filesystem::path p, image_file_format i);
void save(filesystem::path p, image_file_format i, error_code& ec) noexcept;
```

1. Requires: `p` shall be a valid path to a file. The file need not exist provided that the other components of the path are valid.
2. If the file exists, it shall be writable. If the file does not exist, it shall be possible to create the file at the specified path and then the created file shall be writable.
3. Effects: Any pending rendering and composing operations (13.15.2) are performed.
4. The visual data of the underlying raster graphics data graphics resource is written to `p` in the data format specified by `i`.
5. If `i` is `image_file_format::unknown`, it is implementation-defined whether the surface is saved in the image file format, if any, that the implementation associates with `p.extension()` provided that `p.has_extension() == true`. If `p.has_extension() == false`, the implementation does not associate an image file format with `p.extension()`, or the implementation does not support saving in that image file format, the error specified below occurs.
6. Throws: As specified in Error reporting (5).
7. Error conditions: Any error that could result from trying to create `f`, access `f`, or write data to `f`.
8. `errc::not_supported` if `image_file_format::unknown` is passed as an argument and the implementation is unable to determine the file format or does not support saving in the image file format it determined.

13.16.5 basic_image_surface static members

```cpp
static basic_display_point<graphics_math_type> max_dimensions() noexcept;
```

1. Returns: The maximum height and width for a `basic_image_surface` object.

13.16.6 basic_image_surface observers

```cpp
io2d::format format() const noexcept;
```

1. Returns: The pixel format.

```cpp
basic_display_point<graphics_math_type> dimensions() const noexcept;
```

2. Returns: The height and width.

13.16.7 basic_image_surface modifiers

```cpp
void clear();
```

1. Effects: <TODO>

```cpp
void flush();
void flush(error_code& ec) noexcept;
```

2. Effects: If the implementation does not provide a native handle to the surface's underlying graphics data graphics resource, this function does nothing.
3. If the implementation does provide a native handle to the surface’s underlying graphics data graphics resource, then the implementation performs every action necessary to ensure that all operations on the surface that produce observable effects occur.
4. The implementation performs any other actions necessary to ensure that the surface will be usable again after a call to `basic_image_surface::mark_dirty`. 
Once a call to `basic_image_surface::flush` is made, `basic_image_surface::mark_dirty` shall be called before any other member function of the surface is called or the surface is used as an argument to any other function.

**Throws:** As specified in Error reporting (5).

**Remarks:** This function exists to allow the user to take control of the underlying surface using an implementation-provided native handle without introducing a race condition. The implementation’s responsibility is to ensure that the user can safely use the underlying surface.

**Error conditions:** The potential errors are implementation-defined.

Implementations should avoid producing errors here.

If the implementation does not provide a native handle to the `basic_image_surface` object’s underlying graphics data graphics resource, this function shall not produce any errors.

[Note: There are several purposes for `basic_image_surface::flush` and `basic_image_surface::mark_dirty`.

One is to allow implementation wide latitude in how they implement the rendering and composing operations (13.15.2), such as batching calls and then sending them to the underlying rendering and presentation technologies at appropriate times.

Another is to give implementations the chance during the call to `basic_image_surface::flush` to save any internal state that might be modified by the user and then restore it during the call to `basic_image_surface::mark_dirty`.

Other uses of this pair of calls are also possible. —end note]

```cpp
void mark_dirty();
void mark_dirty(error_code& ec) noexcept;
void mark_dirty(const basic_bounding_box<graphics_math_type>& extents);
void mark_dirty(const basic_bounding_box<graphics_math_type>& extents, error_code& ec) noexcept;
```

**Effects:** If the implementation does not provide a native handle to the `basic_image_surface` object’s underlying graphics data graphics resource, this function shall do nothing.

If the implementation does provide a native handle to the `basic_image_surface` object’s underlying graphics data graphics resource, then:

- If called without a `basic_bounding_box` argument, informs the implementation that external changes using a native handle were potentially made to the entire underlying graphics data graphics resource.

- If called with a `basic_bounding_box` argument, informs the implementation that external changes using a native handle were potentially made to the underlying graphics data graphics resource within the bounds specified by the bounding rectangle `basic_bounding_box{ round(extents.x()), round (extents.y()), round(extents.width()), round(extents.height())}`. No part of the bounding rectangle shall be outside of the bounds of the underlying graphics data graphics resource; no diagnostic is required.

**Throws:** As specified in Error reporting (5).

**Remarks:** After external changes are made to this `basic_image_surface` object’s underlying graphics data graphics resource using a native pointer, this function shall be called before using this `basic_image_surface` object; no diagnostic is required.

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

If the implementation does not provide a native handle to the `basic_image_surface` object’s underlying graphics data graphics resource, this function shall not produce any errors.
void paint(const basic_brush<GraphicsSurfaces>& b,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Performs the painting rendering and composing operation as specified by 13.15.4.

The meanings of the parameters are specified by 13.15.2.

Throws: As specified in Error reporting (5).

Error conditions: The errors, if any, produced by this function are implementation-defined.

template <class Allocator>
void stroke(const basic_brush<GraphicsSurfaces>& b,
const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt,
const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Performs the stroking rendering and composing operation as specified by 13.15.6.

The meanings of the parameters are specified by 13.15.2.

Throws: As specified in Error reporting (5).

Error conditions: The errors, if any, produced by this function are implementation-defined.

template <class Allocator>
void fill(const basic_brush<GraphicsSurfaces>& b,
const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Performs the filling rendering and composing operation as specified by 13.15.5.

The meanings of the parameters are specified by 13.15.2.

Throws: As specified in Error reporting (5).

Error conditions: The errors, if any, produced by this function are implementation-defined.

void mask(const basic_brush<GraphicsSurfaces>& b,
const basic_brush<GraphicsSurfaces>& mb,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_mask_props<GraphicsSurfaces>>& mp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Performs the masking rendering and composing operation as specified by 13.15.7.

The meanings of the parameters are specified by 13.15.2.

Throws: As specified in Error reporting (5).

Error conditions:
The errors, if any, produced by this function are implementation-defined.

13.17 Class basic_output_surface

13.17.1 basic_output_surface summary

13.17.2 basic_output_surface synopsis
void flush(error_code& ec) noexcept;

void auto_clear(bool val) noexcept;
void redraw_required(bool val = true) noexcept;
};

13.17.3 basic_output_surface constructors

basic_output_surface(int preferredWidth, int preferredHeight, io2d::format preferredFormat,
io2d::scaling scl = io2d::scaling::letterbox,
io2d::refresh_style rr = io2d::refresh_style::as_fast_as_possible, float fps = 30.0f);

13.17.4 basic_output_surface observers

io2d::format format() const noexcept;

Returns: The pixel format.

basic_display_point<graphics_math_type> dimensions() const noexcept;

Returns: <TODO>The height and width.

basic_display_point<graphics_math_type> max_dimensions() const noexcept;

Returns: <TODO>The maximum available height and width of a basic_output_surface for the device.

basic_display_point<graphics_math_type> display_dimensions() const noexcept;

Returns: <TODO>

basic_display_point<graphics_math_type> max_display_dimensions() const noexcept;

Returns: <TODO>

io2d::scaling scaling() const noexcept;

Returns: The scaling type.

optional<basic_brush<GraphicsSurfaces>> letterbox_brush() const noexcept;

Returns: An optional<basic_brush<GraphicsSurfaces>> object constructed using the user-provided letterbox brush or, if the letterbox brush is set to its default value, an empty optional<basic_brush<GraphicsSurfaces>> object.

optional<basic_brush_props<GraphicsSurfaces>> letterbox_brush_props() const noexcept;
Returns: An optional<basic_brush_props<GraphicsSurfaces>> object constructed using the user-provided letterbox brush props or, if the letterbox brush props is set to its default value, an empty optional<basic_brush_props<GraphicsSurfaces>> object.

bool auto_clear() const noexcept;

Returns: The value of auto clear.

13.17.5 basic_output_surface modifiers

int begin_show();

Effects: Performs the following actions in a continuous loop:

1. Handle any implementation and host environment matters. If there are no pending implementation or host environment matters to handle, proceed immediately to the next action.
2. Run the size change callback if doing so is required by its specification and it does not have a value equivalent to its default value.
3. If the refresh rate requires that the draw callback be called then:
   a) Evaluate auto clear and perform the actions required by its specification, if any.
   b) Run the draw callback.
   c) Ensure that all operations from the draw callback that can effect the back buffer have completed.
   d) Transfer the contents of the back buffer to the display buffer using sampling with an unspecified filter. If the user scaling callback does not have a value equivalent to its default value, use it to determine the position where the contents of the back buffer shall be transferred to and whether or not the letterbox brush should be used. Otherwise use the value of scaling type to determine the position and whether the letterbox brush should be used.

If basic_output_surface::end_show is called from the draw callback, the implementation shall finish executing the draw callback and shall immediately cease to perform any actions in the continuous loop other than handling any implementation and host environment matters needed to exit the loop properly.

No later than when this function returns, the output device shall cease to display the contents of the display buffer.

What the output device shall display when it is not displaying the contents of the display buffer is unspecified.

Returns: The possible values and meanings of the possible values returned are implementation-defined.

Throws: As specified in Error reporting (5).

Remarks: Since this function calls the draw callback and can call the size change callback and the user scaling callback, in addition to the errors documented below, any errors that the callback functions produce can also occur.

Error conditions: errc::operation_would_block if the value of draw callback is equivalent to its default value or if it becomes equivalent to its default value before this function returns.

Other errors, if any, produced by this function are implementation-defined.

void end_show();

Effects: If this function is called outside of the draw callback while it is being executed in the basic_output_surface::begin_show function’s continuous loop, it does nothing.
Otherwise, the implementation initiates the process of exiting the basic_output_surface::begin_show function’s continuous loop.

If possible, any procedures that the host environment requires in order to cause the basic_output_surface::show function’s continuous loop to stop executing without error should be followed.

The basic_output_surface::begin_show function’s loop continues execution until it returns.

```cpp
void clear();
```

**Effects:** <TODO>

```cpp
void flush();
void flush(error_code& ec) noexcept;
```

**Effects:** If the implementation does not provide a native handle to the surface’s underlying graphics data graphics resource, this function does nothing.

If the implementation does provide a native handle to the surface’s underlying graphics data graphics resource, then the implementation performs every action necessary to ensure that all operations on the surface that produce observable effects occur.

The implementation performs any other actions necessary to ensure that the surface will be usable again after a call to basic_output_surface::mark_dirty.

Once a call to basic_output_surface::flush is made, basic_output_surface::mark_dirty shall be called before any other member function of the surface is called or the surface is used as an argument to any other function.

**Throws:** As specified in Error reporting (5).

**Remarks:** This function exists to allow the user to take control of the underlying surface using an implementation-provided native handle without introducing a race condition. The implementation’s responsibility is to ensure that the user can safely use the underlying surface.

**Error conditions:** The potential errors are implementation-defined.

Implementations should avoid producing errors here.

If the implementation does not provide a native handle to the basic_output_surface object’s underlying graphics data graphics resource, this function shall not produce any errors.

[Note: There are several purposes for basic_output_surface::flush and basic_output_surface::mark_dirty.

One is to allow implementation wide latitude in how they implement the rendering and composing operations (13.15.2), such as batching calls and then sending them to the underlying rendering and presentation technologies at appropriate times.

Another is to give implementations the chance during the call to basic_output_surface::flush to save any internal state that might be modified by the user and then restore it during the call to basic_output_surface::mark_dirty.

Other uses of this pair of calls are also possible. —end note]

```cpp
void mark_dirty();
void mark_dirty(error_code& ec) noexcept;
void mark_dirty(const basic_bounding_box<graphics_math_type>& extents);
void mark_dirty(const basic_bounding_box<graphics_math_type>& extents, error_code& ec) noexcept;
```

**Effects:** If the implementation does not provide a native handle to the basic_output_surface object’s underlying graphics data graphics resource, this function shall do nothing.
If the implementation does provide a native handle to the basic_output_surface object’s underlying graphics data graphics resource, then:

- If called without a basic_bounding_box argument, informs the implementation that external changes using a native handle were potentially made to the entire underlying graphics data graphics resource.

- If called with a basic_bounding_box argument, informs the implementation that external changes using a native handle were potentially made to the underlying graphics data graphics resource within the bounds specified by the bounding rectangle basic_bounding_box( round(extents.x()), round(extents.y()), round(extents.width()), round(extents.height())). No part of the bounding rectangle shall be outside of the bounds of the underlying graphics data graphics resource; no diagnostic is required.

**Throws:** As specified in Error reporting (5).

**Remarks:** After external changes are made to this basic_output_surface object’s underlying graphics data graphics resource using a native pointer, this function shall be called before using this basic_output_surface object; no diagnostic is required.

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

If the implementation does not provide a native handle to the basic_output_surface object’s underlying graphics data graphics resource, this function shall not produce any errors.

```cpp
void paint(const basic_brush<GraphicsSurfaces>& b,
           const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
           const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
           const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

**Effects:** Performs the painting rendering and composing operation as specified by 13.15.4.

The meanings of the parameters are specified by 13.15.2.

**Throws:** As specified in Error reporting (5).

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

```cpp
template <class Allocator>
void stroke(const basic_brush<GraphicsSurfaces>& b,
            const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
            const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
            const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt,
            const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
            const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
            const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

**Effects:** Performs the stroking rendering and composing operation as specified by 13.15.6.

The meanings of the parameters are specified by 13.15.2.

**Throws:** As specified in Error reporting (5).

**Error conditions:** The errors, if any, produced by this function are implementation-defined.
template <class Allocator>
void fill(const basic_brush<GraphicsSurfaces>& b,
         const basic_path_builder<GraphicsSurfaces, Allocator>& pb,

13.18.5 basic_unmanaged_output_surface modifiers

void clear();
   Effects: <TODO>
void flush();
void flush(error_code& ec) noexcept;

Effects: If the implementation does not provide a native handle to the surface's underlying graphics data graphics resource, this function does nothing.

If the implementation does provide a native handle to the surface's underlying graphics data graphics resource, then the implementation performs every action necessary to ensure that all operations on the surface that produce observable effects occur.

The implementation performs any other actions necessary to ensure that the surface will be usable again after a call to basic_unmanaged_output_surface::mark_dirty.

Once a call to basic_unmanaged_output_surface::flush is made, basic_unmanaged_output_surface::mark_dirty shall be called before any other member function of the surface is called or the surface is used as an argument to any other function.

Throws: As specified in Error reporting (5).

Remarks: This function exists to allow the user to take control of the underlying surface using an implementation-provided native handle without introducing a race condition. The implementation's responsibility is to ensure that the user can safely use the underlying surface.

Error conditions: The potential errors are implementation-defined.

Implementations should avoid producing errors here.

If the implementation does not provide a native handle to the basic_unmanaged_output_surface object's underlying graphics data graphics resource, this function shall not produce any errors.

[Note: There are several purposes for basic_unmanaged_output_surface::flush and basic_unmanaged_output_surface::mark_dirty.

One is to allow implementation wide latitude in how they implement the rendering and composing operations (13.15.2), such as batching calls and then sending them to the underlying rendering and presentation technologies at appropriate times.

Another is to give implementations the chance during the call to basic_unmanaged_output_surface::flush to save any internal state that might be modified by the user and then restore it during the call to basic_unmanaged_output_surface::mark_dirty.

Other uses of this pair of calls are also possible. — end note]

void mark_dirty();
void mark_dirty(error_code& ec) noexcept;
void mark_dirty(const basic_bounding_box<graphics_math_type>& extents);
void mark_dirty(const basic_bounding_box<graphics_math_type>& extents, error_code& ec) noexcept;

Effects: If the implementation does not provide a native handle to the basic_unmanaged_output_surface object's underlying graphics data graphics resource, this function shall do nothing.

If the implementation does provide a native handle to the basic_unmanaged_output_surface object's underlying graphics data graphics resource, then:

16.1 If called without a basic_bounding_box argument, informs the implementation that external changes using a native handle were potentially made to the entire underlying graphics data graphics resource.

16.2 If called with a basic_bounding_box argument, informs the implementation that external changes using a native handle were potentially made to the underlying graphics data graphics resource within the bounds specified by the bounding rectangle basic_bounding_box{ round(extents.x()), round (extents.y()), round(extents.width()), round(extents.height())}. No part of

§ 13.18.5
the bounding rectangle shall be outside of the bounds of the underlying graphics data graphics resource; no diagnostic is required.

Throws: As specified in Error reporting (5).

Remarks: After external changes are made to this basic_unmanaged_output_surface object’s underlying graphics data resource using a native pointer, this function shall be called before using this basic_unmanaged_output_surface object; no diagnostic is required.

Error conditions: The errors, if any, produced by this function are implementation-defined.

If the implementation does not provide a native handle to the basic_unmanaged_output_surface object’s underlying graphics data graphics resource, this function shall not produce any errors.

```cpp
void paint(const basic_brush<GraphicsSurfaces>& b,
            const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
            const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
            const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

Effects: Performs the painting rendering and composing operation as specified by 13.15.4.

The meanings of the parameters are specified by 13.15.2.

Throws: As specified in Error reporting (5).

Error conditions: The errors, if any, produced by this function are implementation-defined.

template <class Allocator>
void stroke(const basic_brush<GraphicsSurfaces>& b,
            const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
            const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
            const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt,
            const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
            const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
            const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

Effects: Performs the stroking rendering and composing operation as specified by 13.15.6.

The meanings of the parameters are specified by 13.15.2.

Throws: As specified in Error reporting (5).

Error conditions: The errors, if any, produced by this function are implementation-defined.

template <class Allocator>

          const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
          const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
          const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
          const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

§ 13.18.5
Effects: Performs the filling rendering and composing operation as specified by 13.15.5.
The meanings of the parameters are specified by 13.15.2.
Throws: As specified in Error reporting (5).
Error conditions: The errors, if any, produced by this function are implementation-defined.

```c
void mask(const basic_brush<GraphicsSurfaces>& b,
    const basic_brush<GraphicsSurfaces>& mb,
    const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
    const optional<basic_mask_props<GraphicsSurfaces>>& mp = nullopt,
    const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
    const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

Effects: Performs the masking rendering and composing operation as specified by 13.15.7.
The meanings of the parameters are specified by 13.15.2.
Throws: As specified in Error reporting (5).
Error conditions: The errors, if any, produced by this function are implementation-defined.

```c
void draw_callback(const function<void(basic_unmanaged_output_surface& sfc)>& fn);
```

Effects: <TODO>

```c
void size_change_callback(const function<void(basic_unmanaged_output_surface& sfc)>& fn);
```

Effects: <TODO>

```c
void dimensions(basic_display_point<graphics_math_type> dp);
void dimensions(basic_display_point<graphics_math_type> dp, error_code& ec) noexcept;
```

Effects: <TODO>

```c
void display_dimensions(basic_display_point<graphics_math_type> dp);
void display_dimensions(basic_display_point<graphics_math_type> dp, error_code& ec) noexcept;
```

Effects: <TODO>

```c
void scaling(io2d::scaling scl) noexcept;
```

Effects: <TODO>

```c
void user_scaling_callback(const function<basic_bounding_box<graphics_math_type>(const basic_unmanaged_output_surface&, bool&)>& fn);
```

Effects: <TODO>

```c
voidletterbox_brush(const optional<basic_brush<GraphicsSurfaces>>& b,
    const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt) noexcept;
void letterbox_brush_props(const optional<basic_brush_props<GraphicsSurfaces>>& bp) noexcept;
```

Effects: <TODO>

```c
void auto_clear(bool val) noexcept;
```

Effects: <TODO>

```c
void redraw_required(bool val = true) noexcept;
```

Effects: <TODO>

§ 13.18.5
14 Input

[io2d.input]

1 [Note: Input, such as keyboard, mouse, and touch, to user-visible surfaces will be added at a later date. This section is a placeholder. It is expected that input will be added via deriving from a user-visible surface. One possibility is that an io_surface class deriving from display_surface. This would allow developers to choose not to incur any additional costs of input support where the surface does not require user input.

—end note]
15 Standalone functions

15.1 Standalone functions synopsis

namespace std::experimental::io2d::v1 {
    int format_stride_for_width(format format, int width) noexcept;
    float angle_for_point(point_2d ctr, point_2d pt) noexcept;
    point_2d point_for_angle(float ang, float rad = 1.0f) noexcept;
    point_2d point_for_angle(float ang, point_2d rad) noexcept;
    point_2d arc_start(point_2d ctr, float sang, point_2d rad,
        const matrix_2d& m = matrix_2d{}) noexcept;
    point_2d arc_center(point_2d cpt, float sang, point_2d rad,
        const matrix_2d& m = matrix_2d{}) noexcept;
    point_2d arc_end(point_2d cpt, float eang, point_2d rad,
        const matrix_2d& m = matrix_2d{}) noexcept;
}

15.2 format_stride_for_width

int format_stride_for_width(format fmt, int width) noexcept;

1 Returns: The size in bytes of a row of pixels with a visual data format of fmt that is width pixels wide. This value may be larger than the value obtained by multiplying the number of bytes specified by the format enumerator specified by fmt by the number of pixels specified by width.

2 If fmt == format::invalid, this function shall return 0.

15.3 angle_for_point

float angle_for_point(point_2d ctr, point_2d pt) noexcept;

1 Returns: The angle, in radians, of pt as a point on a circle with a center at ctr. If the angle is less than \( \pi/180000.0 \), returns 0.0f.

15.4 point_for_angle

point_2d point_for_angle(float ang, float rad = 1.0f) noexcept;
point_2d point_for_angle(float ang, point_2d rad) noexcept;

1 Requires: If it is a float, rad is greater than 0.0f. If it is a point_2d, rad.x or rad.y is greater than 0.0f and neither is less than 0.0f.

2 Returns: The result of rotating the point point_2d{ 1.0f, 0.0f }, around an origin of point_2d{ 0.0f, 0.0f } by ang radians, with a positive value of ang meaning counterclockwise rotation and a negative value meaning clockwise rotation, with the result being multiplied by rad.

15.5 arc_start

point_2d arc_start(point_2d ctr, float sang, point_2d rad,
    const matrix_2d& m = matrix_2d{}) noexcept;

1 Requires: rad.x and rad.y are both greater than 0.0f.

2 Returns: As-if:

- auto lmtx = m;
- lmtx.m20 = 0.0f; lmtx.m21 = 0.0f;
auto pt = point_for_angle(sang, rad);
return ctr + pt * lmtx;

[Note: Among other things, this function is useful for determining the point at which a new figure should begin if the first item in the figure is an arc and the user wishes to clearly define its center. — end note]

15.6 arc_center

point_2d arc_center(point_2d cpt, float sang, point_2d rad,
const matrix_2d& m = matrix_2d{}) noexcept;

1 Requires: rad.x and rad.y are both greater than 0.0f.

2 Returns: As-if:

auto lmtx = m;
lmtx.m20 = 0.0f; lmtx.m21 = 0.0f;
auto centerOffset = point_for_angle(two_pi<float> - sang, rad);
centerOffset.y = -centerOffset.y;
return cpt - centerOffset * lmtx;

15.7 arc_end

point_2d arc_end(point_2d cpt, float eang, point_2d rad,
const matrix_2d& m = matrix_2d{}) noexcept;

1 Requires: rad.x and rad.y are both greater than 0.0f.

2 Returns: As-if:

auto lmtx = m;
auto tfrm = matrix_2d::init_rotate(eang);
lmtx.m20 = 0.0f; lmtx.m21 = 0.0f;
auto pt = (rad * tfrm);
pt.y = -pt.y;
return cpt + pt * lmtx;
