1 Motivation

Streams have been the oldest part of the C++ standard library and their specification doesn’t take into account many things introduced since C++11. One of the oversights is that there is no non-copying access to the internal buffer of a basic_stringbuf which makes at least the obtaining of the output results from an ostringstream inefficient, because a copy is always made. I personally speculate that this was also the reason why basic_strbuf took so long to get deprecated with its char * access.

With move semantics and basic_string_view there is no longer a reason to keep this pessimisation alive on basic_stringbuf.

I also believe we should remove basic_strbuf from the standard’s appendix [depr.str.strstreams]. This is proposed in p0448, that completes the replacement of that deprecated feature.

2 Introduction

This paper proposes to adjust the API of basic_stringbuf and the corresponding stream class templates to allow accessing the underlying string more efficiently.

C++17 and library TS have basic_string_view allowing an efficient read-only access to a contiguous sequence of characters which I believe basic_stringbuf has to guarantee about its internal buffer, even if it is not implemented using basic_string obtaining a basic_string_view on the internal buffer should work sidestepping the copy overhead of calling str().

On the other hand, there is no means to construct a basic_string and move from it into a basic_stringbuf via a constructor or a move-enabled overload of str(basic_string &&).
2.1 History

2.1.1 Changes from r3

To make the job of reviewing and integrating my stringstream adjustments easier, I incorporate the changes proposed in p0407r2 (allocator-aware basic_stringbuf), since both papers have been forwarded by LEWG to LWG.

— Added full set of reasonable overloads to the constructors with and without allocator (basic_string&& does not get an allocator constructor template argument to allow efficient construction from charT* literals).

2.1.2 Changes from r2

Discussed in Albuquerque, where LEWG was in favor to forward it to LWG for IS with the following change.

— reestablish rvalue-ref qualified str() instead of the previously suggested pilfer().
— address LWG only in document header.

2.1.3 Changes from r1

Discussed in LEWG Issaquah. Answering some questions and raising more. Reflected in this paper.

— reflected new section numbers from the std. now relative to the current working draft.
— implementation is now working with gcc 7. (not relevant for this paper)

2.1.4 Changes from r0

— Added more context to synopsis sections to see all overloads (Thanks Alisdair).
— rename str_view() to just view(). There was discussion on including an explicit conversion operator as well, but I didn’t add it yet (my implementation has it).
— renamed r-value-ref qualified str() to pilfer() and removed the reference qualification from it and remaining str() member.
— Added allocator parameter for the basic_string parameter/result to member functions (see p0407 for allocator support for stringstreams in general)

3 Acknowledgements

— Daniel Krügler encouraged me to pursue this track.
— Alisdair Meredith for telling me to include context in the synopsis showing all overloads. That is the only change in this version, no semantic changes!
— Jonathan Wakely to show me the #undef _GLIBCXX_EXTERN_TEMPLATE
4 Impact on the Standard

This is an extension to the API of basic_stringbuf, basic_stringstream, basic istreamstream, and basic ostream stream class templates. This paper addresses both Library Fundamentals TS 3 and C++ Next (2020?). When added to the standard draft with p0448 (spanstream), section [depr.str.strstreams] should be removed.

5 Design Decisions

After experimentation I decided that substituting the (basic_string<charT,traits,Allocator const &)
constructors in favor of passing a basic_string_view would lead to ambiguities with the new move-from-string constructors.

5.1 Open Issues to be discussed by LWG

Note: this list includes the discussion of p0407 features.

— Does it make sense to add noexcept specifications for move() and swap() members, since the base classes and other streams do not. At least it does not make sense so for stream objects, since the base classes do not specify that.

— The basic_string constructors that move from the string get a default template argument for SAlloc in the hope that allows initialization from a character string literal. Need confirmation that this trick works and selects the better constructor for temporary conversion without ambiguity, because for the copying (const-ref) overload the allocator of the string needs to be deduced. This should lead to the effect of optimizing existing usages.

5.2 Open Issues discussed by LEWG in Albuquerque

— Should pilfer() be rvalue-ref qualified to denote the "destruction" of the underlying buffer? LEWG in Issaquah didn’t think so, but I’d like to ask again. LEWG small group in Albuquerque in favor of rvalue-ref qualification. Re-establish str()&&, drop pilfer

5.3 Open Issues discussed by LEWG in Issaquah and Albuquerque

— Is the name of the str_view() member function ok? No. Renamed to view()

— Should the str()&& overload be provided for move-out? No, give it another name (pilfer) and remove rvalue-ref qualification (Issaquah). Re-establish str()&&, drop pilfer

— Should str()&& empty the character sequence or leave it in an unspecified but valid state? Empty it, and specify.

— Provide guidance on validity lifetime of of the obtained string_view object.

6 Technical Specifications

The following is relative to n4604.
Remove section on char* streams [depr.str.strstreams] and all its subsections from appendix D.

6.1 30.8.2 Adjust synopsis of basic_stringbuf [stringbuf]

Add a new constructor overload.

*Note that p0407 provides allocator support for basic_stringbuf, since now both papers have been forwarded to LWG, the changes proposed in p0407 are integrated here for ease of review and integration. The explanations of those changes are added in italics here.*

*Change each of the non-moving, non-deleted constructors to add a const-ref Allocator parameter as last parameter with a default constructed Allocator as default argument. Add an overload for the move constructor adding an Allocator parameter. Add an exposition-only member variable buf to allow referring to it for specifying allocator behaviour. May be: Add noexcept specification, depending on allocator behavior, like with basic_string?*

```cpp
// ??, constructors:
explicit basic_stringbuf(
    ios_base::openmode which = ios_base::in | ios_base::out,
    const Allocator& a = Allocator());

template<class SAlloc>
explicit basic_stringbuf(
    const basic_stringbuf<charT, traits, SAlloc>& sb,
    const Allocator& a = Allocator());

explicit basic_stringbuf(
    basic_string<charT, traits, Allocator>&& sb,
    const Allocator& a = Allocator());

explicit basic_stringbuf(const Allocator& a)
    : basic_stringbuf(ios_base::openmode(ios_base::in | ios_base::out), a) {}

template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<traits, Allocator>& sb,
    const Allocator& a)
    : basic_stringbuf(sb, ios_base::openmode(ios_base::in | ios_base::out), a) {}

explicit basic_stringbuf(
    basic_string<traits, Allocator>&& sb,
    const Allocator& a)
    : basic_stringbuf(std::move(sb), ios_base::openmode(ios_base::in | ios_base::out), a) {}

basic_stringbuf(const basic_stringbuf& rhs) = delete;
basic_stringbuf(basic_stringbuf&& rhs);

basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

Change the getting `str()` overload to take an Allocator for the returned string and add a reference qualification. Add an rvalue-ref overload of `str()`. Change the `str()` overload copying into the string buffer to take an allocator template parameter that could differ from the buffer’s own Allocator.
Add a `str()` overload that moves from its string rvalue-reference argument into the internal buffer. Add the `view()` member function obtaining a `string_view` to the underlying internal buffer.

```cpp
// ??, get and set:
template<class SAlloc = Allocator>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa = SAlloc()) const &;
template<class SAlloc = Allocator>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const;
```

Add the following declaration to the public section of synopsis of the class template `basic_stringbuf`:

```cpp
allocator_type get_allocator() const noexcept;
```

Add the following exposition only member to the private section of synopsis of the class template `basic_stringbuf`. This allows to delegate all details of allocator-related behaviour on what `basic_string` is doing, simplifying this specification a lot.

```cpp
private:
    ios_base::openmode mode; // exposition only
    basic_string<charT, traits, Allocator> buf; // exposition only
```

**May be:** Add a conditional noexcept specification to swap based on Allocator’s behaviour?:

```cpp
template <class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
          basic_stringbuf<charT, traits, Allocator>& y);
```

### 6.1.1 30.8.2.1 basic_stringbuf constructors [stringbuf.cons]

Adjust the constructor specifications taking the additional Allocator parameter and an overload for the move-constructor taking an Allocator:

```cpp
explicit basic_stringbuf(
    ios_base::openmode which = ios_base::in | ios_base::out,
    const Allocator &a = Allocator());

Effects: Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` [streambuf.cons], and initializing mode with `which` and `buf` with `a`.

Postconditions: `str()` == "".
```

Modify the following constructor specification:

```cpp
template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& str,
    ios_base::openmode which = ios_base::in | ios_base::out,
    const Allocator &a = Allocator());

Effects: Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` [streambuf.cons], and initializing mode with `which`, and initializing `buf` with `{s, a}`. Then calls `str(s)`.
Add the following constructor specifications:

```cpp
explicit basic_stringbuf(
    basic_string<CharT, Traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in | ios_base::out,
    const Allocator& a = Allocator());
```

**Effects:** Constructs an object of class `basic_stringbuf`, initializing the base class with `basic_streambuf()` (30.6.3.1), and initializing mode with `which`. Then calls `str(std::move(s))`, and initializing `buf` with `{std::move(s), a}`.

Note to reviewers: For p0407, different allocators for `s` and the `basic_stringbuf` will result in a copy instead of a move.

Add the additional move constructor taking an allocator and adjust the description accordingly:

```cpp
basic_stringbuf(basic_stringbuf&& rhs);
```

```cpp
basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);
```

**Effects:** Move constructs from the rvalue `rhs`. In the first form `buf` is initialized from `{std::move(rhs.buf)}`. In the second form `buf` is initialized from `{std::move(rhs.buf), a}`. It is implementation-defined whether the sequence pointers in `*this (eback(), gptr(), egptr(), pbase(), pptr(), epptr())` obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. The openmode, locale and any other state of `rhs` is also copied.

**Postconditions:** Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

```cpp
(6.1)  str() == rhs_p.str()
(6.2)  gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
(6.3)  egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
(6.4)  pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
(6.5)  epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
(6.6)  if (eback()) eback() != rhs_a.eback()
(6.7)  if (gptr()) gptr() != rhs_a.gptr()
(6.8)  if (egptr()) egptr() != rhs_a.egptr()
(6.9)  if (pbase()) pbase() != rhs_a.pbase()
(6.10) if (pptr()) pptr() != rhs_a.pptr()
(6.11) if (epptr()) epptr() != rhs_a.epptr()
```

### 6.2 30.8.2.2 Assign and swap [stringbuf.assign]

*Most of this section is included to allow for simpler adding of conditional noexcept.*

```cpp
basic_stringbuf& operator=(basic_stringbuf&& rhs);
```

**Effects:** Move assigns `buf` from `{std::move(rhs.buf)}`. After the move assignment `*this` has
the observable state it would have had if it had been move constructed from \texttt{rhs} (see ??).

2  \textbf{Returns:} \texttt{*this}.

void swap(basic\_stringbuf& \texttt{rhs});

3  \textbf{Effects:} Exchanges the state of \texttt{*this} and \texttt{rhs}.

\textbf{template \textless \texttt{charT, traits, Allocator}\textgreater
void swap(basic\_stringbuf<\texttt{charT}, traits, Allocator>& \texttt{x},
basic\_stringbuf<\texttt{charT}, traits, Allocator>& \texttt{y});

4  \textbf{Effects:} As if by \texttt{x.swap(y)}.

\subsection{30.8.2.3 Member functions [stringbuf.members]}

\textbf{Add the definition of the \texttt{get\_allocator} function:}

\begin{verbatim}
allocator\_type get\_allocator() const noexcept;
\end{verbatim}

1  \textbf{Returns:} \texttt{buf.get\_allocator()}.

Add an allocator parameter for the copied from string to allow having a different allocator than the underlying stream and a ref-qualifier to avoid ambiguities with the rvalue-ref qualified overload.

\begin{verbatim}
\textbf{template<\texttt{class SAlloc = Allocator>}
\textbf{basic\_string<\texttt{charT, traits, SAlloc>} \texttt{str(const SAlloc& \texttt{sa} = SAlloc()) const \&;}
\end{verbatim}

Change p1 to use plural for "\texttt{str(basic\_string)} member functions" and refer to the allocator:

2  \textbf{Returns:} A \texttt{basic\_string} object with \texttt{allocator sa} whose content is equal to the \texttt{basic\_stringbuf} underlying character sequence. If the \texttt{basic\_stringbuf} was created only in input mode, the resultant \texttt{basic\_string} contains the character sequence in the range \texttt{[eback(), egptr()]).} If the \texttt{basic\_stringbuf} was created with \texttt{which \& ios\_base::out} being true then the resultant \texttt{basic\_string} contains the character sequence in the range \texttt{[pbase(), high\_mark)},} where \texttt{high\_mark} represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the \texttt{basic\_stringbuf} with a \texttt{basic\_string}, or by calling \texttt{one of} the \texttt{str(basic\_string)} member functions. In the case of calling \texttt{one of} the \texttt{str(basic\_string)} member functions, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new \texttt{basic\_string}). Otherwise the \texttt{basic\_stringbuf} has been created in neither input nor output mode and a zero length \texttt{basic\_string} is returned.

Add the following specifications and adjust the wording of \texttt{str()} \texttt{const} according to the wording given for \texttt{view()} \texttt{const} member function.:

\begin{verbatim}
\textbf{template<\texttt{class SAlloc = Allocator>}
\textbf{void str(basic\_string<\texttt{charT, traits, SAlloc}>\& \texttt{s});}
\end{verbatim}

3  \textbf{Effects:} Move-assigns \texttt{buf} from \texttt{s} and initializes the input and output sequences according to \texttt{mode}.

4  \textbf{Postconditions:} Let \texttt{size} denote the original value of \texttt{s.size()} before the move. If \texttt{mode \& \& ios\_base::out} is true, \texttt{pbase()} points to the first underlying character and \texttt{epptr()} \textgeq \texttt{pbase()} + \texttt{size} holds; in addition, if \texttt{mode \& \& ios\_base::ate} is true, \texttt{pptr()} = \texttt{pbase()} +
size holds, otherwise \texttt{pptr() == pbase()} is true. If \texttt{mode \& ios\_base::in} is true, \texttt{eback()} points to the first underlying character, and both \texttt{gptr() == eback()} and \texttt{egptr() == eback() + size} hold.

\texttt{basic\_string\_view<charT, traits, Allocator> view() const;}

Returns: A \texttt{basic\_string\_view} object referring to the \texttt{basic\_stringbuf} underlying character sequence in \texttt{buf}. If the \texttt{basic\_stringbuf} was created only in input mode, \texttt{basic\_string\_view(eback(), egptr()-eback())}. If the \texttt{basic\_stringbuf} was created with \texttt{which \& ios\_base::out} being true then \texttt{basic\_string\_view(pbase(), high\_mark-pbase())}, where \texttt{high\_mark} represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the \texttt{basic\_stringbuf} with a \texttt{basic\_string}, or by calling one of the \texttt{str(basic\_string)} member functions. In the case of calling one of the \texttt{str(basic\_string)} member functions, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new \texttt{basic\_string}). Otherwise the \texttt{basic\_stringbuf} has been created in neither input nor output mode and an empty \texttt{basic\_string} is returned.

Postconditions: The underlying character sequence is empty.

[Note: Using the returned \texttt{basic\_string\_view} object after destruction or any modification of the character sequence underlying \texttt{*this}, such as output on the holding stream, will cause undefined behavior, because the internal string referred by the return value might have changed or re-allocated. — end note]

6.3 30.8.3 Adjust synopsis of basic\_istringstream [istringstream]

Change each of the non-move, non-deleted constructors to add a const-ref \texttt{Allocator} parameter as last parameter with a default constructed \texttt{Allocator} as default argument. Allow a string with a different allocator type here as well.

Add a new constructor overload and change the one taking the string by copy to allow a different allocator for the copied from string:
explicit basic_istringstream(
    ios_base::openmode which = ios_base::in,
    const Allocator& a = Allocator());

template <class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& str,
    ios_base::openmode which = ios_base::in,
    const Allocator& a = Allocator());

explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& str,
    ios_base::openmode which = ios_base::in,
    const Allocator& a = Allocator());

explicit basic_istringstream(const Allocator& a)
    : basic_istringstream(ios_base::in, a) {}

template <class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& str,
    const Allocator& a)
    : basic_istringstream(str, ios_base::in, a) {}

explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& str,
    const Allocator& a)
    : basic_istringstream(std::move(str), ios_base::in, a) {}

basic_istringstream(const basic_istringstream& rhs) = delete;
basic_istringstream(basic_istringstream&& rhs);

Change the getting \texttt{str()} overload to take an Allocator for the returned string and add a reference qualification. Add an rvalue-ref overload of \texttt{str()}. Change the \texttt{str(s)} overload to take an allocator template parameter that could differ from the buffer's own \texttt{Allocator}. Add a \texttt{str(s)} overload that moves from its string and a \texttt{view()} member function:

\begin{verbatim}
// ??, members:
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

template<class SAlloc = Allocator>
basic_string<charT, traits, Allocator> str(const SAlloc& sa=SAlloc()) const &;
template<class SAlloc = Allocator>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

basic_string<charT, traits, Allocator> str() &&;

basic_string_view<charT, traits> view() const;
\end{verbatim}

6.3.1 30.8.3.1 basic_istringstream constructors [istringstream.cons]

Adjust the constructor specifications taking the additional Allocator parameter and adjust the delegation
to basic_stringbuf constructors in the Effects clauses in p1 and p2 to pass on the given allocator object.

```cpp
explicit basic_istringstream(
    ios_base::openmode which = ios_base::in,
    const Allocator& a = Allocator());
```

**Effects:** Constructs an object of class `basic_istringstream<charT, traits, Allocator>`, initializing the base class with `basic_istream(&sb)` and initializing sb with `basic_stringbuf<charT, traits, Allocator>(which | ios_base::in, a)` ([stringbuf.cons]).

Change the constructor specification to allow a string copy with a different allocator.

```cpp
template<class SAlloc>
explicit basic_istringstream(
    const basic_string<charT, traits, SAlloc>& str,
    ios_base::openmode which = ios_base::in,
    const Allocator& a = Allocator());
```

**Effects:** Constructs an object of class `basic_istringstream<charT, traits, Allocator>`, initializing the base class with `basic_istream(&sb)` and initializing sb with `basic_stringbuf<charT, traits, Allocator>(str, which | ios_base::in, a)` ([stringbuf.cons]).

Add the following constructor specification:

```cpp
explicit basic_istringstream(
    basic_string<charT, traits, Allocator>&& str,
    ios_base::openmode which = ios_base::in,
    const Allocator& a = Allocator());
```

**Effects:** Constructs an object of class `basic_istringstream<charT, traits, Allocator>`, initializing the base class with `basic_istream(&sb)` and initializing sb with `basic_stringbuf<charT, traits, Allocator>(std::move(str), which | ios_base::in, a)` ([stringbuf.cons]).

### 6.3.2 30.8.3.3 Member functions [istringstream.members]

Add the allocator parameter to the following `str()` overloads:

```cpp
template<class SAlloc = Allocator>
basic_string<charT, traits, SAlloc>& str(const SAlloc& sa = SAlloc()) const &;
```

**Returns:** `rdbuf()->str(sa)`.

```cpp
template<class SAlloc = Allocator>
void str(const basic_string<charT, traits, SAlloc>& s);
```

**Effects:** Calls `rdbuf()->str(s)`.

Add the following specifications:

```cpp
void str(basic_string<charT, traits, Allocator>&& s);
```

**Effects:** `rdbuf()->str(std::move(s))`.

```cpp
basic_string<charT, traits, Allocator> str() &&;
```
Returns: `std::move(*rdbuf()).str()`.

[Note: Calling this member function leaves the stream object in a usable state with an emptied underlying `basic_stringbuf`. — end note]

`basic_string_view<charT, traits> view() const;`  
Returns: `rdbuf()->view()`.

6.4 30.8.4 Adjust synopsis of `basic_ostringstream [ostringstream]`

Change each of the non-move, non-deleted constructors to add a `const-ref Allocator` parameter as last parameter with a default constructed `Allocator` as default argument.

Add a new constructor overload and change the one taking the string by copy to allow a different allocator for the copied from string:

```cpp
// [ostringstream.cons], constructors:
explicit basic_ostringstream(
    ios_base::openmode which = ios_base::out,
    const Allocator& a = Allocator());

template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& str,
    ios_base::openmode which = ios_base::out,
    const Allocator& a = Allocator());

explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& str,
    ios_base::openmode which = ios_base::out,
    const Allocator& a = Allocator());

explicit basic_ostringstream(const Allocator& a)
    : basic_ostringstream(ios_base::out, a) {}

template <class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& str,
    const Allocator& a)
    : basic_ostringstream(std, ios_base::out, a) {}

explicit basic_ostringstream(
    basic_string<charT, traits, Allocator>&& str,
    const Allocator& a)
    : basic_ostringstream(std::move(str), ios_base::out, a) {}

basic_ostringstream(const basic_ostringstream& rhs) = delete;
basic_ostringstream(basic_ostringstream&& rhs);
```

Change the getting `str()` overload to take an Allocator for the returned string and add a reference qualification. Add an rvalue-ref overload of `str()`. Change the `str(s)` overload to take an allocator template parameter that could differ from the buffer’s own `Allocator`. Add a `str(s)` overload that moves from its string and a `view()` member function:
// ??, members:
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

template<class SAlloc = Allocator>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa = SAlloc()) const &;
template<class SAlloc = Allocator>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const;

6.4.1 30.8.4.1 basic_ostringstream constructors [ostringstream.cons]

Adjust the constructor specifications taking the additional Allocator parameter and adjust the delegation
to basic_stringbuf constructors in the Effects clauses in p1 and p2 to pass on the given allocator object.

explicit basic_stringstream(
        ios_base::openmode which = ios_base::out | ios_base::in,
        const Allocator& a = Allocator());

1 Effects: Constructs an object of class basic_stringstream<charT, traits, Allocator>, initializing
the base class with basic_iostream(&sb) and initializing sb with basic_stringbuf<charT, traits, Allocator>
(which, a) ([stringbuf.cons]).

Change the constructor specification to allow a string copy with a different allocator.

template<class SAlloc>
explicit basic_ostringstream(
        const basic_string<charT, traits, SAlloc>& str,
        ios_base::openmode which = ios_base::out,
        const Allocator& a = Allocator());

2 Effects: Constructs an object of class basic_ostringstream<charT, traits, Allocator>, initializing
the base class with basic_ostream(&sb) and initializing sb with basic_stringbuf<charT, traits, Allocator>
(str, which | ios_base::out, a) ([stringbuf.cons]).

Add the following constructor specification:

explicit basic_ostringstream(
        const basic_string<charT, traits, Allocator>&& str,
        ios_base::openmode which = ios_base::out,
        const Allocator& a = Allocator());

3 Effects: Constructs an object of class basic_ostringstream<charT, traits, Allocator>, initializing
the base class with basic_ostream(&sb) and initializing sb with basic_stringbuf<charT, traits, Allocator>
(std::move(str), which | ios_base::out, a) ([stringbuf.cons]).

6.4.2 30.8.4.3 Member functions [ostringstream.members]

Add the allocator parameter to the following str() overloads:

template<class SAlloc = Allocator>
basic_string<
charT, traits, SAlloc>&
str(const SAlloc& sa = SAlloc()) const &;

Returns: rdbuf()->str(sa).

template<class SAlloc = Allocator>
void str(const basic_string<
charT, traits, SAlloc>& s);

Effects: Calls rdbuf()->str(s).

Add the following specifications:

void str(basic_string<
charT, traits, Allocator>&& s);

Effects: rdbuf()->str(std::move(s)).

basic_string<
charT, traits, Allocator> str() &&;

Returns: std::move(*rdbuf()).str().

[Note: Calling this member function leaves the stream object in a usable state with an emptied
underlying basic_stringbuf. —end note]

basic_string_view<charT, traits> view() const;

Returns: rdbuf()->view().

6.5 30.8.5 Adjust synopsis of basic_stringstream [stringstream]

Change each of the non-move, non-deleted constructors to add a const-ref Allocator parameter as
last parameter with a default constructed Allocator as default argument.

Add a new constructor overload and change the one taking the string by copy to allow a different
allocator for the copied from string:

// ??, constructors:
explicit basic_stringstream(
    ios_base::openmode which = ios_base::out | ios_base::in,
    const Allocator& a = Allocator());

template<class SAlloc>
explicit basic_stringstream(
    const basic_string<
charT, traits, SAlloc>& str,
    ios_base::openmode which = ios_base::out | ios_base::in,
    const Allocator& a = Allocator());

explicit basic_stringstream(
    basic_string<
charT, traits, Allocator>&& str,
    ios_base::openmode which = ios_base::in | ios_base::out,
    const Allocator& a = Allocator());

explicit basic_stringstream(const Allocator& a)
    : basic_stringstring(ios_base::openmode(ios_base::in | ios_base::out), a) {}

template <class SAlloc>
explicit basic_stringstream(
    const basic_string<
charT, traits, SAlloc>& str,
const Allocator& a)
  : basic_stringstream(std, ios_base::openmode(ios_base::in | ios_base::out), a) {}

explicit basic_stringstream(
  basic_string<charT, traits, Allocator>&& str,
  const Allocator& a)
  : basic_stringstream(std::move(str), ios_base::openmode(ios_base::in | ios_base::out), a) {}

basic_stringstream(const basic_stringstream& rhs) = delete;
basic_stringstream(basic_stringstream&& rhs);

Change the getting `str()` overload to take an Allocator for the returned string and add a reference qualification. Add an rvalue-ref overload of `str()`. Change the `str(s)` overload to take an allocator template parameter that could differ from the buffer’s own `Alloc`. Add a `str(s)` overload that moves from its string and a `view()` member function:

```
// ??, members:
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

template<class SAlloc=Allocator>
basic_string<charT, traits, Allocator>SAlloc str(const SAlloc& sa = SAlloc()) const &;
template<class SAlloc = Allocator>
void str(const basic_string<charT, traits, SAlloc>& s);

void str(basic_string<charT, traits, Allocator>&& s);
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const;
```

### 6.5.1 30.8.4.1 basic_stringstream constructors [stringstream.cons]

Adjust the constructor specifications taking the additional `Alloc` parameter and adjust the delegation to basic_stringbuf constructors in the `Effects` clauses in p1 and p2 to pass on the given allocator object.

```
explicit basic_stringstream(
  ios_base::openmode which = ios_base::out | ios_base::in,
  const Allocator& a = Allocator());
```

*Effects:* Constructs an object of class `basic_stringstream<charT, traits, Allocator>`, initializing the base class with `basic_iostream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)`.

Change the constructor specification to allow a string copy with a different allocator.

```
template<class SAlloc = Allocator>
explicit basic_stringstream(
  const basic_string<charT, traits, SAlloc>& str,
  ios_base::openmode which = ios_base::out | ios_base::in,
  const Allocator& a = Allocator());
```

*Effects:* Constructs an object of class `basic_stringstream<charT, traits, Allocator>`, initializing the base class with `basic_iostream(&sb)` and initializing `sb` with `basic_stringbuf<charT, traits, Allocator>(str, which, a)` ([stringbuf.cons]).
Add the following constructor specification:

```cpp
explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>&& str,
    ios_base::openmode which = ios_base::in | ios_base::out,
    const Allocator& a = Allocator());
```

**Effects:** Constructs an object of class `basic_stringstream<charT, traits, Allocator>`, initializing the base class with `basic_stream<sbb>` and initializing `sbb` with `basic_stringbuf<charT, traits, Allocator>(std::move(str), which, a)` ([stringbuf.cons]).

### 6.5.2 30.8.4.3 Member functions [stringstream.members]

Add the allocator parameter to the following `str()` overloads:

```cpp
//template<class SAlloc = Allocator>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa = SAlloc()) const &;
```

1. **Returns:** `rdbuf()->str(sa)`.

```cpp
//template<class SAlloc = Allocator>
void str(const basic_string<charT, traits, SAlloc>& s);
```

2. **Effects:** Calls `rdbuf()->str(s)`.

Add the following specifications:

```cpp
void str(basic_string<charT, traits, Allocator>&& s);
```

3. **Effects:** `rdbuf()->str(std::move(s))`.

```cpp
basic_string<charT,traits,Allocator> str() &&;
```

4. **Returns:** `std::move(*rdbuf()).str()`.

   [Note: Calling this member function leaves the stream object in a usable state with an emptied underlying `basic_stringbuf`. — end note]

```cpp
basic_string_view<charT, traits> view() const;
```

5. **Returns:** `rdbuf()->view()`.

### 7 Appendix: Example Implementations

The given specification has been implemented within a recent version of the sstream header of gcc6. Modified version of the headers and some tests are available at https://github.com/PeterSommerlad/SC22WG21_Papers/tree/master/workspace/Test_basic_stringbuf_efficient/src.
