A Proposal to Add 2D Graphics Rendering and Display to C++

Note: this is an early draft. It’s known to be incomplet and incorrekt, and it has lots of bad formatting.

0 Introduction

0.1 Background and rational

0.1.1 Interactive I/O background

1 When C++ was first created, the dominant interactive I/O technology was a console. From its inception, C++ included the ability to interact with users via a console as part of its standard library. Programs that needed to interact with the user would send output information in the form of text to the user and receive input information in the form of text from the user.

2 The implementation details necessary to provide this functionality varied from platform to platform, of course. The same was, and still is, true for other functionality that relies on interacting with the environment provided by the platform that the program runs on, e.g. file I/O. Compilers provided such functionality in ways that were unspecified. The only specification was of the API that a programmer used to access these features.

3 Today, 2D computer graphics displays have replaced console I/O as the dominant interactive I/O technology. For example, writing a simple `cout << "Hello, world!";` statement doesn’t do anything useful on most tablets and smartphones. Even on PCs, console I/O is generally a legacy technology rather than the primary form of user interaction.

4 Thus the absence of 2D computer graphics I/O in the standard library leaves standard C++ less useful and relevant than it was when it was created. In other areas, standard C++ has modernized, evolved, and continues to develop and improve as new features are added. As a result, standard C++ is a vibrant and highly relevant programming language. Except when it comes to providing programmers access to the current dominant interactive I/O technology.

5 Standard C++ has lost the capability of providing access to the dominant interactive I/O technology, which it had provided when the language was created. The purpose of this Technical Specification is to rectify this. This is a complex subject matter. The design has undergone numerous reviews and revisions since the initial proposal, N3888, in January 2014. Work on output is now substantially complete. Since the design of an input API is inherently reliant on the design of the output API, from the outset the authors decided to only pursue the input API after the output API design was complete. This is why there is no proposed input API at this time.

0.1.2 Brief comparison of I/O technologies

1 For purposes of clarity, we will briefly touch on the differences between console I/O and 2D computer graphics I/O.

2 Console I/O allows for the input and output of strings, whether as single characters or as multi-line constructs.

3 For output purposes, a console is defined in terms of the number of characters it can display per horizontal line, e.g. 80, and the number of horizontal lines of characters, e.g. 24, that it can display. Its finest granularity is at the character level; in other words a programmer can, at most, control the output at the character level. The actual size of those characters on the console in terms of specific pixels is an implementation detail that is inaccessible to the programmer. Individual pixels are not addressable.

4 For output purposes, a 2D computer graphics display is defined in terms of the number of pixels it can display per horizontal line, e.g. 1920, and the number of horizontal lines of pixels, e.g. 1080, that it can display, called its resolution. It is also defined by the number of bits per pixel, representing the amount of color information each pixel is capable of carrying and thus the amount of variation in color that can be displayed to the user.

5 The display of characters on 2D computer graphics displays is usually accomplished using technologies that process those characters, transform them into pixels in a manner specified by fonts, and modify the appropriate pixels.

6 Fonts describe characters in ideal representations and the process of transforming them into pixels is called rendering. Rendering converts the ideal representation into a representation composed of pixels. They are then rasterized, i.e. transformed from their rendered composition of pixels into pixels on the 2D graphics display such that they are sized appropriately based on the program’s specification.
Characters, by way of fonts, are not the only things that can be rendered. Any specification of an ideal representation of graphical data can be rendered into a composition of pixels and the result can then be rasterized. Because different displays have different resolutions, there doesn’t need to be a one-to-one ratio of pixels between the rendered result and the rasterization of it. Non-exact rasterization can be, and often is, done, and the method for doing it is defined by any one of a number of algorithms, each of which produce outputs that depend on the values supplied for parameters that they use.

From an input perspective, the lowest resolution for console input is a character. While lower resolutions are not inherently prohibited, because the lowest resolution of console output is a character, in practice this is also the lowest resolution of input to a console.

For a 2D computer graphics display, the lowest resolution is a pixel on the display itself. This does not prohibit higher input resolutions, including characters and strings. It is in no way uncommon for a 2D computer graphics display to receive character or string input. It is simply a fact that such displays are virtually always designed to be capable of receiving input at a lower resolution than the character level if that is what the program requires.

### 0.1.3 Computer graphics history

Computer graphics first appeared in the 1950s. The first displays were oscilloscopes which could be used to plot points and lines. Spacewar!, which was first released in 1962 for the DEC PDP-1, is widely recognized as the first computer game that was distributed to and played at multiple computer facilities.

As computers became less exotic and computer time became less expensive, games and puzzles became a typical way for students to learn programming. The first commercial video game, Pong, was a TTL device which rendered a small number of lines and points to a CRT device.

In 1974 the Evans and Sutherland frame buffer debuted which allowed the display of 512x512 pixel images. Although enormously expensive at $15,000 (not adjusted for inflation), prices were driven down over time. This new technology allowed raster display to be incorporated into the nascent home-brew computers of the late 1970s.

With the invention of VRAM in the mid-1980s frame buffers became significantly cheaper and as a result available pixel resolutions increased and color displays steadily replaced monochrome displays. Computer displays now frequently deliver resolutions exceeding 2 million pixels with 24 bits or more of color information.

In the late 1980s, software programs started to rely on 2D graphics for intuitive feedback of information using spatial contexts on screens. The widespread introduction of home computers to the market made 2D graphics a familiar experience. Many of today’s programmers had their first experience of programming on these machines, learning to code by writing graphics demonstrations and simple games.

During the 1990s graphics co-processors started to appear; these were add-in cards which provided additional computing power for performing vector calculations. They often contained their own separate RAM used for their own frame buffer to preserve locality in hardware. Over the past twenty years available resolutions have come to greatly exceed the typical resolution of a domestic television set.

Rendering images has spawned a large field of academic study, advanced by Bresenham’s line drawing algorithm in 1965, and also by K. Vesprille’s dissertation on the B-Spline approximation form in 1975. As colour depths and available grey scales have increased, font rendering and anti-aliasing have become rich areas of investigation. There are entire conferences devoted to rendering, for example SIGGRAPH.

### 0.1.4 C++ and computer graphics

Many C++ 2D graphics libraries have been released in the years since computer graphics have become common. Some are very feature-rich, requiring many hundreds of hours of study and use to master. Some support hardware acceleration using the graphics co-processors that have become ubiquitous in many devices. Some support only one OS or only one type of GPU.

What these libraries do not provide is a standardized C++ API. The C++ Standard Library and the C++ Technical Specifications all provide standard C++ APIs. Some features, such as atomics, rely on the host environment and quality of implementation to determine their ability to work and their performance. The same will be true for 2D graphics. Unlike many other features being added to C++, 2D graphics has a core set of functionality that has existed and has been in wide use for decades.

Beginning with the PostScript language and continuing through to modern C and C++ libraries such as Skia, is the functionality of plotting points, drawing lines and curves, displaying bitmaps, and rendering text. This functionality has been the stable core of 2D graphics for nearly 40 years (since the advent of PostScript,
if not before then). While the best methods of implementing it has changed over the years as computer hardware has evolved, the functionality itself has remained the stable core of 2D graphics; any other 2D graphics operations can be performed using it. As such there is no reason to be concerned about the future utility of a standard C++ API that embodies this functionality. 2D graphics is, in effect, a solved problem. Indeed, even the rendering of text is performed either by displaying bitmaps (using bitmap fonts) or by rendering points, lines, and curves (using text rendering descriptions such as OpenType fonts), such that text rendering, while sometimes considered a core part of 2D graphics functionality, is in fact a superset of the true core of 2D graphics.

0.1.5 Goals for the proposed TS [io2d.goals]

1. Get feedback from implementers regarding changes that could be made to allow them to provide better performance. This design decouples the front end user API and the back end implementation by using templates, thus mimicking a standard ABI as close as possible. Back end implementations will still need to provide builds that are compatible with each linker that they want to allow users to make use of. But the front end is able to be provided as non-compiled header files. In fact the reference implementation already provides a front end implementation that is licensed under terms that allow all its use by commercial and non-commercial implementations, such that there is no need for implementers to implement the front end unless they are restricted from doing so by policies they are required to follow.

2. Get feedback from users regarding improvements in usability and requests for additional features. While the design has undergone numerous design reviews and revisions, feedback from the C++ community is crucial to ensuring that this API meets the needs of the community at large. As with any library functionality, there will be users who have needs that cannot be met except by an extremely targeted design meant for one or more specific environments. The goal here is to identify areas where a design change would broaden the C++ programming community’s ability to use this API in real world products and to make it more usable for C++ programmers who would already be able to use it to meet their needs.

0.2 Revision history [io2d.revisionhistory]

0.2.1 Revision 9 [io2d.revisionhistory.r9]

1. Text rendering has been added to the surface classes.

2. A command list interface for drawing has been added. This allows advanced users to batch drawing commands and submit them to a surface. It can be used in addition to or in lieu of the existing draw callback mechanism.

3. The SVG 1.1 Standard format is now included as an image_file_format enumerator.

4. This Clause is now an Introduction clause as defined by ISO/IEC directives. It now includes informative information and commentary about the technical content of this Technical Specification and the reasons prompting its preparation. Much of it is drawn from information previously published in P0669R0, with revisions and expansions. This is a result of feedback from the San Diego 2018 conference where it was noted that it is advisable to include this sort of information directly in this Technical Specification rather than in separate papers.

5. There is now an informative clause that describes the design of the library so that implementers can more easily understand how the pieces of this Technical Specification work and how they interact with each other.

6. Formatting and typo fixes.

7. rgba_color is no longer premultiplied. Users can apply premultiplication themselves if they wish. This change allowed the setters to directly set a value rather than be modified by the alpha value, or in the case of the alpha setter modifying all other values.

8. The solid color basic_brush ctor now takes its rgba_color argument by value rather than reference.

0.2.2 Revision 8 [io2d.revisionhistory.r8]

1. Modified the revision 7 notes (0.2.3) to denote trademarks where applicable, and to use the correct capitalization for the cairo graphics library. The contents of those notes is otherwise unchanged.

2. Changed the Revision history Clause to be Clause 0.

3. Added a new Clause, Graphics math (Clause 8), which defines the requirements of a type that conforms to the GraphicsMath template parameter used by various classes.

4. Updated the relevant class member functions in this proposal to define their effects to include calls to the appropriate GraphicsMath functions. This completes the work, begun in P0267R7, of abstracting the
implementation of the linear algebra and geometry classes, thereby allowing users to specify a preferred implementation of the mathematical functionality used in this proposal.

5 Added a new Clause, Graphics surfaces (Clause 9), which defines the requirements of a type that conforms to the GraphicsSurfaces template parameter used by various classes.

6 Updated the relevant class member functions in this proposal to define their effects to include calls to the appropriate GraphicsSurfaces functions. This completes the work, begun in P0267R7, of abstracting the implementation of the brush, paths, surface state, and surface classes, thereby allowing users to specify a preferred implementation of the functionality specified in this proposal.

7 Added a new Clause, Surface state props (Clause 15) and moved the relevant enum class types and the basic_render_props, basic_brush_props, basic_clip_props, basic_stroke_props, and basic_mask_-props class templates to it.

8 Added Michael Kazakov as a co-author. He has written an implementation of this proposal using the Core Graphics framework of Cocoa®, thus providing a native implementation for iOS® and OS X®. It is available as part of the reference implementation (See 0.2.3).

9 He has also written a series of tests for compliance. This has drawn attention to several issues that have require some revision.

10 Eliminated format::rgb16_565 and format::rgb30.

11 Eliminated compositing_op::dest since it is a no-op.

12 Significant cleanup of terms and definitions.

13 Added overload of copy_surface for basic_output_surface.

14 Removed format_stride_for_width: it has had no use since mapping functionality was removed.

15 Added functions degrees_to_radians and radians_to_degrees.

16 Added equality comparison operators for a number of classes.

17 Removed the copyright notice that stated that the proposal was copyrighted by ISO/IEC. Neither organization, jointly or severally, made any contribution to this document and no assignment of interests by the authors to either organization, jointly or severally, has ever been executed. The notice was there unintentionally and its presence in all revisions of P0267 was a mistake.

18 Added basic_dashes which was added in R7 but had its description omitted accidentally.

19 Removed the mandate of underlying layout of pixel formats in enum class format and made it and, the interpretation of the data (i.e. what each bit value in each channel means), and whether data is in a premultiplied format implementation defined.

20 Added GraphicsSurfaces::additional_formats This allows implementations to support additional visual data formats.

21 Eliminated all flush and mark_dirty member functions. These only existed to allow users to modify surfaces externally. Implementations that wish to allow users to modify surfaces externally should provide and document their own functionality for how to do that. The errors, etc., are all implementation dependent anyway so a uniform calling interface provides no benefit at all in the current templated-design.

22 Renamed enum class refresh_rate to refresh_style to more accurately reflect its meaning. This was already done in parts of the R7; it is now complete.

23 Changed the order of items in the basic_figure_items::figure_item type alias from alphabetical to grouping by function (e.g. abs_new_figure, rel_new_figure, and close_figure are grouped together and abs_line and rel_line are grouped together). While it’s not expected that any new figure item types will be added, there is no chance that the existing ones will be augmented with additional types. So if new figure items are added, grouping by type will simply add them to the end, thus preserving the validity of the existing index values without having the existing entries be alphabetized and new entries not being alphabetized.

24 Moved the class template definitions for the nested classes within basic_figure_items<GraphicsSurfaces> to the descriptions of each of those types from the synopsis of basic_figure_items<GraphicsSurfaces> itself.

25 Added format::xrgb16. The number of bits per channel is left to the implementation since, e.g., Windows® is 565 whereas OS X® and iOS® are 555 with an unused bit. This is useful for platforms with limited memory where supported so having it as an official enumerator will help.

§ 0.2.2
Users can now request a different output device format when calling the overloads of the `basic_output_surface` ctor and the `basic_unmanaged_output_surface` ctor that take separate output device width and height preferences.

Eliminated `redraw_required` from `basic_unmanaged_output_surface`. Users can and should track the need to redraw in their own code when they manage the output device.

Eliminated `user_scaling_callback` functionality from `basic_output_surface` and `basic_unmanaged_output_surface` since the output device is intentionally not fully specified (same as stdout, etc.).

`begin_show` now returns void instead of int and has an `error_code` overload in case the user tries to show more output surfaces than the system permits.

`render_props` now has a `filter` instead of an `antialias`.

`stroke_props` now has an `antialias` instead of a `filter`.

New type `basic_fill_props` for parameters specific to the fill operation.

Removed the `fill_rule` from `basic_brush_props` as it was only being used for fill operations.

### 0.2.3 Revision 7 [io2d.revisionhistory.r7]

The significant difference between R7 and R6 is the abstraction of the implementation into separate classes. These classes provide math and rendering support. The linear algebra and geometry classes are templated over any appropriate math support class, while the path, brush and surface classes are templated over any appropriate rendering support class.

The reference implementation of this paper provides a software implementation of the math and rendering support classes. This is based on cairo; indeed, so far the reference implementation has been based on cairo. However, it is now possible to provide an implementation more appropriate to the target platform.

For example, a Windows® implementation could provide support classes based on DirectX®, while a Linux® implementation could provide support classes based on OpenGL®. In fact, any hardware vendor could provide a support library, targeting a specific implementation and their particular silicon if they wanted to exploit particular features of their hardware.

Additionally, the surface classes have been modified: now there are simply managed and unmanaged output surfaces, the latter of which offers developers the opportunity to take finer control of the drawing surface.

The modified classes are as follows

<table>
<thead>
<tr>
<th>R6 Identifier</th>
<th>R7 Identifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>vector_2d</td>
<td>basic_point_2d</td>
</tr>
<tr>
<td>matrix_2d</td>
<td>basic_matrix_2d</td>
</tr>
<tr>
<td>rectangle</td>
<td>basic_bounding_box</td>
</tr>
<tr>
<td>circle</td>
<td>basic_circle</td>
</tr>
<tr>
<td>path_group</td>
<td>basic_interpreted_path</td>
</tr>
<tr>
<td>path_builder</td>
<td>basic_path_builder</td>
</tr>
<tr>
<td>color_stop</td>
<td>gradient_stop</td>
</tr>
<tr>
<td>brush</td>
<td>basic_brush</td>
</tr>
<tr>
<td>render_props</td>
<td>basic_render_props</td>
</tr>
<tr>
<td>brush_props</td>
<td>basic_brush_props</td>
</tr>
<tr>
<td>clip_props</td>
<td>basic_clip_props</td>
</tr>
<tr>
<td>stroke_props</td>
<td>basic_stroke_props</td>
</tr>

<td>basic_mask_props</td>
</tr>
<tr>
<td>image_surface</td>
<td>basic_image_surface</td>
</tr>
<tr>
<td>display_surface</td>
<td>basic_output_surface</td>
</tr>
</tbody>
</table>

The `surface` class and the `mapped_surface` class have been withdrawn, while the `basic_unmanaged_output_surface` class has been introduced.

The reference implementation, including a software-only implementation of math and rendering support classes, is available at https://github.com/mikebmcl/P0267_RefImpl
0.2.4 Revision 6

1 Presented to LEWG in Toronto, July 2017
1 Scope

1 This Technical Specification specifies requirements for implementations of an interface that computer programs written in the C++ programming language may use to render and display 2D computer graphics.
2 Normative references

The following documents are referred to in the text in such a way that some or all of their content constitutes requirements of this document. For dated references, only the edition cited applies. For undated references, the latest edition of the referenced document (including any amendments) applies.

1. ISO/IEC 14882, *Programming languages — C++*
2. ISO/IEC 2382 (all parts), *Information technology — Vocabulary*
5. ISO 12639, *Graphic technology — Prepress digital data exchange — Tag image file format for image technology (TIFF/IT)*
6. ISO/IEC 14496-22, *Information technology — Coding of audio-visual objects — Open Font Format*
8. ISO/IEC TR 19769:2004, *Information technology — Programming languages, their environments and system software interfaces — Extensions for the programming language C to support new character data types*
10. IEC 61966-2-1, *Colour Measurement and Management in Multimedia Systems and Equipment - Part 2-1: Default RGB Colour Space - sRGB*
12. ISO 80000-2:2009, *Quantities and units — Part 2: Mathematical signs and symbols to be used in the natural sciences and technology*

The compressed image data format described in ISO/IEC 10918-1 is hereinafter called the *JPEG format*.

The tag image file format described in ISO 12639 is hereinafter called the *TIFF format*. The datastream and associated file format described in ISO/IEC 15948 is hereinafter called the *PNG format*.

The library described in ISO/IEC TR 19769:2004 is hereinafter called the *C Unicode TR*.

The document CSS Color Module Level 3 — W3C Recommendation 19 June 2018 is hereinafter called the *CSS Colors Specification*.

The UTF-8 encoding scheme described in ISO/IEC 10646 is hereinafter called *UTF-8*.

The open font format described in ISO/IEC 14496-22 is hereinafter called the *OFF Font Format*.

The document CSS Fonts Module Level 3 — W3C Recommendation 20 September 2018 is hereinafter called the *CSS Fonts Specification*.

The document Scalable Vector Graphics (SVG) 1.1 (Second Edition) — W3C Recommendation 16 August 2011 is hereinafter called the *SVG 1.1 Standard*.

Normative references 8
3 Terms and definitions

For the purposes of this document, the following terms and definitions apply. ISO and IEC maintain terminological databases for use in standardization at the following addresses:

- ISO Online browsing platform: available at [http://www.iso.org/obp](http://www.iso.org/obp)

Terms that are used only in a small portion of this document are defined where they are used and italicized where they are defined.

3.1 point
coordinate designated by a floating-point $x$ axis value and a floating-point $y$ axis value

3.2 origin
point with an $x$ axis value of 0 and a $y$ axis value of 0

3.3 standard coordinate space
Euclidean plane described by a Cartesian coordinate system where the $x$ axis is a horizontal axis oriented from left to right, the $y$ axis is a vertical axis oriented from top to bottom, and rotation of a point, excluding the origin, around the origin by a positive value in radians is counterclockwise

3.4 integral point
point where the $x$ axis value and the $y$ axis value are integers

3.5 normalize
map a closed set of evenly spaced values in the range $[0, x]$ to an evenly spaced sequence of floating-point values in the range $[0, 1]$ [Note: The definition of normalize given is the definition for normalizing unsigned input. Signed normalization, i.e. the mapping of a closed set of evenly spaced values in the range $[-x, x)$ to an evenly spaced sequence of floating-point values in the range $[-1, 1]$ is not used in this Technical Specification. —end note]

3.6 aspect ratio
ratio of the width to the height of a rectangular area

3.7 visual data
data in a possibly bounded Euclidean plane consisting of one or more components representing color, transparency, or some other quality where the component values are not necessarily uniform throughout the plane

3.8 visual data element
unit of visual data at a specific point

3.9 channel
component of visual data

3.10 color channel
channel that only represents the intensity of a specific color
3.11 alpha channel
channel that only represents transparency

3.12 visual data format
specification of information necessary to transform a set of one or more channels into colors in a color model

3.13 premultiplied format
visual data format with one or more color channels and an alpha channel where each color channel is normalized and then multiplied by the normalized alpha channel value. Example: Given the 32-bit non-premultiplied RGBA pixel with 8 bits per channel \{255, 0, 0, 127\} (half-transparent red), when normalized it would become \{1.0f, 0.0f, 0.0f, 0.5f\}. When premultiplied it would become \{0.5f, 0.0f, 0.0f, 0.5f\} as a result of multiplying each of the three color channels by the alpha channel value. — end example

3.14 raster graphics data
data comprised of a rectangular array of visual data elements together with their visual data format where the top-left visual data element is located at the origin in the standard coordinate space and additional visual data elements are located at integral points of consecutive values

3.15 pixel
discrete element of raster graphics data

3.16 vector graphics data
data comprised of zero or more paths together with a sequence of rendering and composing operations and graphics state data that produces continuous visual data when processed

3.17 color model
ideal, mathematical representation of color

3.18 additive color
color defined by the emissive intensity of its color channels

3.19 RGB color model
color model using additive color comprised of red, green, and blue color channels

3.20 RGBA color model
RGB color model with an alpha channel

3.21 color space
systematic mapping of values to colorimetric colors

3.22 sRGB color space
color space defined in IEC 61966-2-1 that is based on the RGB color model

3.23 start point
point that begins a segment

§ 3.23
3.24
end point
point that ends a segment

3.25
control point
point, other than the start point and the end point, that is used in defining a curve

3.26
Bézier curve
(quadratic) curve defined by the equation \( f(t) = (1 - t)^2 \times P_0 + 2 \times t \times (1 - t) \times P_1 + t^2 \times t \times P_2 \) where \( t \) is in the range \([0, 1]\), \( P_0 \) is the start point, \( P_1 \) is the control point, and \( P_2 \) is end point

3.27
Bézier curve
(cubic) curve defined by the equation \( f(t) = (1 - t)^3 \times P_0 + 3 \times t \times (1 - t)^2 \times P_1 + 3 \times t^2 \times (1 - t) \times P_2 + t^3 \times t \times P_3 \) where \( t \) is in the range \([0, 1]\), \( P_0 \) is the start point, \( P_1 \) is the first control point, \( P_2 \) is the second control point, and \( P_3 \) is the end point

3.28
segment
line, Bézier curve, or arc

3.29
initial segment
segment in a figure whose start point is not defined as being the end point of another segment in the figure [Note: It is possible for the initial segment and final segment to be the same segment. — end note]

3.30
new figure point
point that is the start point of the initial segment

3.31
final segment
segment in a figure whose end point does not define the start point of any other segment [Note: It is possible for the initial segment and final segment to be the same segment. — end note]

3.32
current point
point used as the start point of a segment

3.33
open figure
figure with one or more segments where the new figure point is not used to define the end point of the figure’s final segment [Note: Even if the start point of the initial segment and the end point of the final segment are assigned the same coordinates, the figure is still an open figure. This is because the final segment’s end point is not defined as being the new figure point but instead merely happens to have the same value as that point. — end note]

3.34
closed figure
figure with one or more segments where the new figure point is used to define the end point of the figure’s final segment

3.35
degenerate segment
segment that has the same values for its start point, end point, and, if any, control points
3.36 command [io2d.defns.command.closefig]
(close figure command) instruction that creates a line segment with a start point of current point and an end point of new figure point

3.37 command [io2d.defns.command.newfig]
(new figure command) an instruction that creates a new path

3.38 figure item [io2d.defns.figitem]
segment, new figure command, close figure command, or path command

3.39 figure [io2d.defns.figure]
collection of figure items where the end point of each segment in the collection, except the final segment, defines the start point of exactly one other segment in the collection

3.40 path [io2d.defns.path]
collection of figures

3.41 path transformation matrix [io2d.defns.pathtransform]
affine transformation matrix used to apply affine transformations to the points in a path

3.42 path command [io2d.defns.pathcommand]
instruction that modifies the path transformation matrix

3.43 degenerate figure [io2d.defns.degenfigure]
figure containing a new figure command, zero or more degenerate segments, zero or more path commands, and, optionally, a close figure command

3.44 graphics state data [io2d.defns.graphicsstatedata]
data which specify how some part of the process of rendering or composing is performed in part or in whole

3.45 render [io2d.defns.render]
transform a path into visual data

3.46 composition algorithm [io2d.defns.compositionalgorithm]
algorithm that combines source visual data and destination visual data producing visual data that has the same visual data format as the destination visual data

3.47 compose [io2d.defns.compose]
apply a composition algorithm

3.48 rendering and composing operation [io2d.defns.renderingandcomposingop]
operation that is either a composing operation or a rendering operation followed by a composing operation that uses the data produced by the rendering operation

3.49 filter [io2d.defns.filter]
algorithm that determines a color value from a raster graphics data source for a non-integral point

§ 3.49
3.50  sample
    apply a filter

3.51  aliasing
    errors in the appearance of the results of rendering where the resulting visual data is raster graphics data because of inaccuracies in transforming continuous data into discrete data

3.52  anti-aliasing
    application of an algorithm while rendering to reduce aliasing
4 Error reporting

1 2D graphics library functions that can produce errors occasionally provide two overloads: one that throws an exception to report errors and another that reports errors using an error_code object. This provides for situations where errors are not truly exceptional.

2 report errors as follows, unless otherwise specified:

3 When an error prevents the function from meeting its specifications:

(3.1) — Functions that do not take argument of type error_code& throw an exception of type system_error or of an implementation-defined type that derives from system_error. The exception object shall include the enumerator specified by the function as part of its observable state.

(3.2) — Functions that take an argument of type error_code& assigns the specified enumerator to the provided error_code object and then returns.

4 Failure to allocate storage is reported by throwing an exception as described in [res.on.exception.handling] in C++ 2017.

5 Destructor operations defined in this Technical Specification shall not throw exceptions. Every destructor in this Technical Specification shall behave as-if it had a non-throwing exception specification.

6 If no error occurs in a function that takes an argument of type error_code&, error_code::clear shall be called on the error_code object immediately before the function returns.

7 Where the specification of a function template, including member functions of class templates, declares that there may be implementation-defined errors, the implementer is the provider of the type used as the template argument, referred to at times as the 'back end' (see: Clause 5, Clause 8, and Clause 9). The implementer is not the provider of the class template or function template.
5 Library design overview (Informative)
[io2d.desgn]

1 In order to provide an effective, efficient, standardized 2D graphics library, the library design makes use of templates. The main class templates described provide a standard API "front end" and the template arguments to them provide the implementation "back end".

2 The front end is described in terms of calling specific functions that back ends are required to provide in order to meet the requirements necessary to be a valid back end. As a result, the front end code can be and likely will be identical for all standard library implementations. As a time saving measure, standard library implementers can likely simply incorporate the source code for the front end that is provided by the reference implementation. The license of the reference implementation is intended to allow this and its authors are happy to work with standard library implementers to try to ensure that this can be done (e.g. by providing the option to license the front end code under a different license if necessary). Regardless, the specification of the front end in this Technical Specification is sufficient for standard library implementers to write their own implementation without any need to refer to the reference implementation.

3 The back end, which consists of classes meeting the requirements specified herein, is where the platform-specific operations that make this library work are performed.

4 Back ends can be provided by standard library implementations and by others. It is expected that standard library implementations will provide back ends for all relevant platforms they support, but they aren’t required to do so. This significantly reduces the burden on standard library implementations. Others, in turn, need only provide the back end, not a full standard library implementation.

5 Users of the library can choose which back end they are using by changing the template arguments provided to the front end and making any other changes required by the compiler and build system they are using.

6 Only back ends provided by standard library implementers are allowed to be in the std namespace. This requirement exists simply to prevent naming collisions that otherwise could occur.

7 The back end specifies requirements for two classes, one for mathematics functionality required for 2D graphics, GraphicsMath, and the other for 2D graphics operations, GraphicsSurfaces. The design is such that while GraphicsSurfaces uses functionality provided by GraphicsMath, the two are independent of each other. This allows users to choose the best ones for their needs.

8 It is expected that the template arguments provided to the front end will be user defined type aliases. If so, to change back ends, users would change the type aliases, include any back end-specific header files for the desired back end, and use implementation dependent mechanisms, such as arguments to the compiler, to ensure that the back end is available when the program runs.

9 With conditional type aliases, conditional includes, and conditional arguments to the compiler, the user can easily change back ends without ever needing to change the code that performs the graphics operations, since all of that code exclusively uses the front end. The back end is not meant to be directly invoked by the users, and the description of the library functionality does not provide users with the ability to access the back end via the front end APIs.

10 Two goals are met by adopting this design.

11 First, standard library implementers do not need to provide full back ends for every single platform on which their standard library implementation might used. Standard library implementers are required to provide a back end that, at a minimum, supports all operations on image surfaces. The reason for this is that it is possible to write platform independent code that supports image surfaces and all operations on them (subject to host environment limitations, of course).

12 The reference implementation relies on outside libraries for back end image surface operations such that standard library implementers might not be able to use the reference implementation to meet this requirement. They will need to evaluate how best to meet this requirement, which could require a non-trivial, albeit one-time, expenditure of time to write the necessary code to meet this obligation (not including future maintenance and possible modifications as a result of changes made as a byproduct of the TS process). This is considered a reasonable trade off since it ensures that there is always support for image surfaces (subject
to host limitations) without requiring standard library implementers to take on any new platform-specific dependencies.

Second, users are not forced to use the back ends that standard library implementations do provide. Users can choose their own back ends (whether written in-house or by third parties) for purposes of gaining access to back ends that support other platforms and back ends that provide more performant implementations for specific platforms than what might be provided by standard library implementations.

Third parties such as graphics acceleration hardware vendors, operating system vendors, graphics environment vendors, and others can write back ends and make them available to users directly or perhaps even by contributing them to standard library implementations. As hardware and software evolves, new and updated back ends can be provided. Since a back end only needs to conform to the specified requirements, these individuals and organizations are not committed to implementing any part of the C++ standard library. Nor are they required to produce updates quickly (or even at all) should the API change due to the use of inline namespaces to provide versioning for large APIs such as this.

In summation, the API of the 2D graphics library is split into two parts: a front end composed of classes, class templates, and scoped enums that is expected to be fairly static in its design and will be what users use for standardized 2D graphics programming in C++; and a back end that is a specification of requirements for classes that are used by the front end to perform the graphics operations specified by the front end. Standard library implementers are required to provide the front end and a back end that provides only the platform-independent functionality required by the requirements for a back end. Back ends are provided as template arguments to the class templates of the front end such that users can choose back ends provided by standard library implementations, by third parties, or by the user’s own back end implementation that meet the user’s needs.

7 Colors

7.1 Introduction to color

Color involves many disciplines and has been the subject of many papers, treatises, experiments, studies, and research work in general.

While color is an important part of computer graphics, it is only necessary to understand a few concepts from the study of color for computer graphics.

A color model defines color mathematically without regard to how humans actually perceive color. These color models are composed of some combination of channels which each channel representing alpha or an ideal color. Color models are useful for working with color computationally, such as in composing operations, because their channel values are homogeneously spaced.

A color space, for purposes of computer graphics, is the result of mapping the ideal color channels from a color model, after making any necessary adjustment for alpha, to color channels that are calibrated to align with human perception of colors. Since the perception of color varies from person to person, color spaces use the science of colorimetry to define those perceived colors in order to obtain uniformity to the extent possible. As such, the uniform display of the colors in a color space on different output devices is possible. The values of color channels in a color space are not necessarily homogeneously spaced because of human perception of color.

Color models are often termed linear while color spaces are often termed gamma corrected. The mapping of a color model, such as the RGB color model, to a color space, such as the sRGB color space, is often the application of gamma correction.

Gamma correction is the process of transforming homogeneously spaced visual data to visual data that, when displayed, matches the intent of the untransformed visual data.

For example a color that is 50% of the maximum intensity of red when encoded as homogeneously spaced visual data, will likely have a different intensity value when it has been gamma corrected so that a human looking at on a computer display will see it as being 50% of the maximum intensity of red that the computer display is capable of producing. Without gamma correction, it would likely have appeared as though it was closer to the maximum intensity than the untransformed data intended it to be.

In addition to color channels, colors in computer graphics often have an alpha channel. The value of the alpha channel represents transparency of the color channels when they are combined with other visual data using certain composing algorithms. When using alpha, it should be used in a premultiplied format in order to obtain the desired results when applying multiple composing algorithms that utilize alpha.

7.2 Color usage requirements

During rendering and composing operations, color data is linear and, when it has an alpha channel associated with it, in premultiplied format. Implementations shall make any necessary conversions to ensure this.

7.3 Class rgba_color

The class rgba_color describes a four channel color using the RGBA color model.

There are three color channels, red, green, and blue, each of which is a float value.

Legal values for each channel are in the range [0.0f, 1.0f].

7.3.2 rgba_color synopsis

template <class U>
constexpr rgba_color operator*(U lhs, const rgba_color& rhs) noexcept;

7.3.3  rgba_color constructors and assignment operators  [io2d.rgbacolor.cons]

constexpr rgba_color() noexcept;

Effects: Equivalent to: rgba_color{ 0.0f, 0.0f, 0.0f, 0.0f }.

template <class T>
constexpr rgba_color(T r, T g, T b, T a = static_cast<T>(255)) noexcept;

Requires: r >= 0 and r <= 255 and g >= 0 and g <= 255 and b >= 0 and b <= 255 and a >= 0 and a <= 255.
Effects: Constructs an object of type rgba_color. The red channel is r / 255.0f. The green channel is g / 255.0f. The blue channel is b / 255.0f. The alpha channel is a / 255.0f.
Remarks: This constructor shall not participate in overload resolution unless is_integral_v<T> is true.

template <class U>
constexpr rgba_color(U r, U g, U b, U a = static_cast<U>(1.0f)) noexcept;

Requires: r >= 0.0f and r <= 1.0f and g >= 0.0f and g <= 1.0f and b >= 0.0f and b <= 1.0f and a >= 0.0f and a <= 1.0f.
Effects: Constructs an object of type rgba_color. The red channel is static_cast<float>(r). The green channel is static_cast<float>(g). The blue channel is static_cast<float>(b). The alpha channel is static_cast<float>(a).
Remarks: This constructor shall not participate in overload resolution unless is_floating_point_v<U> is true.

7.3.4  rgba_color modifiers  [io2d.rgbacolor.modifiers]

template <class T>
constexpr void r(T val) noexcept;

Requires: val >= 0 and val <= 255.
Effects: The red channel is val / 255.0f.
Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.

template <class U>
constexpr void r(U val) noexcept;

Requires: val >= 0.0f and val <= 1.0f.
Effects: The red channel is static_cast<float>(val).
Remarks: This function shall not participate in overload resolution unless is_floating_point_v<U> is true.

template <class T>
constexpr void g(T val) noexcept;

Requires: val >= 0 and val <= 255.
Effects: The green channel is val / 255.0f.
Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.
template <class U>
constexpr void g(U val) noexcept;

10 Requires: val >= 0.0f and val <= 1.0f.
11 Effects: The green channel is static_cast<float>(val).
12 Remarks: This function shall not participate in overload resolution unless is_floating_point_v<U> is
true.

template <class T>
constexpr void b(T val) noexcept;

13 Requires: val >= 0 and val <= 255.
14 Effects: The blue channel is val / 255.0f.
15 Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.

template <class U>
constexpr void b(U val) noexcept;

16 Requires: val >= 0.0f and val <= 1.0f.
17 Effects: The blue channel is static_cast<float>(val).
18 Remarks: This function shall not participate in overload resolution unless is_floating_point_v<U> is
true.

template <class T>
constexpr void a(T val) noexcept;

19 Requires: val >= 0 and val <= 255.
20 Effects: The alpha channel is val / 255.0f.
21 Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.

template <class U>
constexpr void a(U val) noexcept;

22 Requires: val >= 0.0f and val <= 1.0f.
23 Effects: The alpha channel is static_cast<float>(val).
24 Remarks: This function shall not participate in overload resolution unless is_floating_point_v<U> is
true.

7.3.5 rgba_color observers

constexpr float r() const noexcept;

1 Returns: The red channel.

customexpr float g() const noexcept;

2 Returns: The green channel.

customexpr float b() const noexcept;

3 Returns: The blue channel.

customexpr float a() const noexcept;

4 Returns: The alpha channel.

7.3.6 rgba_color static members

1 The alpha value of all of the predefined rgba_color static member object in Table 2 is 1.0f except for
transparent_black, which has an alpha value of 0.0f.

7.3.7 rgba_color operators

```cpp
template <class T>
constexpr rgba_color& operator*=(T rhs) noexcept;
```

1. Requires: rhs >= 0 and rhs <= 255.

2. Effects: r(min(r() * rhs / 255.0f, 1.0f)).

3. g(min(g() * rhs / 255.0f, 1.0f)).

4. b(min(b() * rhs / 255.0f, 1.0f)).

5. a(min(a() * rhs / 255.0f, 1.0f)).

6. Returns: *this.

7. Remarks: This function shall not participate in overload resolution unless is_integral_v<T> is true.

```cpp
template <class U>
constexpr rgba_color& operator*=(U rhs) noexcept;
```

1. Requires: rhs >= 0.0f and rhs <= 1.0f.
Effects:  
\[
r(\min(r() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))
\]

\[
g(\min(g() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))
\]

\[
b(\min(b() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))
\]

\[
a(\min(a() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f)).
\]

Returns: \*this.

Remarks: This function shall not participate in overload resolution unless \text{is\_floating\_point\_v<T> is true.}

```cpp
constexpr bool operator==(const rgba\_color& lhs, const rgba\_color& rhs) noexcept;
```

Returns:  
\[
\text{lhs.r() == rhs.r()} \&\& \text{lhs.g() == rhs.g()} \&\& \text{lhs.b() == rhs.b()} \&\& \text{lhs.a() == rhs.a()).}
\]

Remarks: This function shall not participate in overload resolution unless \text{is\_integral\_v<T> is true.}

```cpp
template <class T>
constexpr rgba\_color operator\*(const rgba\_color& lhs, const rgba\_color& rhs) noexcept;
```

Returns:  
\[
\text{rgba\_color(min(lhs.r() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs.g() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs.b() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs.a() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))}
\]

Remarks: This function shall not participate in overload resolution unless \text{is\_floating\_point\_v<T> is true.}

```cpp
template <class U>
constexpr rgba\_color operator\*(const rgba\_color& lhs, const rgba\_color& rhs) noexcept;
```

Returns:  
\[
\text{rgba\_color(min(lhs.r() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs.g() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs.b() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs.a() \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))}
\]

Remarks: This function shall not participate in overload resolution unless \text{is\_integral\_v<T> is true.}

```cpp
template <class T>
constexpr rgba\_color operator\*(T lhs, const rgba\_color& rhs) noexcept;
```

Returns:  
\[
\text{rgba\_color(min(lhs \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(lhs \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))}
\]

Remarks: This function shall not participate in overload resolution unless \text{is\_floating\_point\_v<T> is true.}

```cpp
template <class U>
constexpr rgba\_color operator\*(U lhs, const rgba\_color& rhs) noexcept;
```

Returns:  
\[
\text{rgba\_color(min(static\_cast<float>\(\text{lhs}\) \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(static\_cast<float>\(\text{lhs}\) \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(static\_cast<float>\(\text{lhs}\) \ast \text{static\_cast<float>}(\text{rhs}), 1.0f),}
\]

\[
\text{min(static\_cast<float>\(\text{lhs}\) \ast \text{static\_cast<float>}(\text{rhs}), 1.0f))}
\]

Remarks: This function shall not participate in overload resolution unless \text{is\_floating\_point\_v<T> is true.}

§ 7.3.7
8 Graphics math

8.1 General

This Clause describes components that are used to describe certain geometric types and to perform certain linear algebra operations. [Note: These types are intended for use in 2D graphics input/output operations. They are not meant to provide a full set of linear algebra types and operations. — end note]

The following subclauses describe graphics math requirements and components for linear algebra classes and geometry classes, as summarized in Table 3.

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>8.2 GraphicsMath traits</td>
<td>&lt;experimental/io2d&gt;</td>
</tr>
<tr>
<td>Clause 10</td>
<td>Linear algebra classes</td>
</tr>
<tr>
<td>Clause 11</td>
<td>Geometry classes</td>
</tr>
</tbody>
</table>

8.2 Requirements

This subsection defines requirements on GraphicsMath types.

Most classes specified in Clause 10 through Clause 16 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedef-names and static member functions in the template parameter GraphicsMath used by each such template. This subclause defines the semantics of these members.

Let X be a GraphicsMath type.

Table 8 defines required typedef-names in X, which are identifiers for class types capable of storing all data required to support the corresponding class template.

<table>
<thead>
<tr>
<th>typedef-name</th>
<th>Class data</th>
</tr>
</thead>
<tbody>
<tr>
<td>bounding_box_data_type</td>
<td>basic_bounding_box&lt;X&gt;</td>
</tr>
<tr>
<td>circle_data_type</td>
<td>basic_circle&lt;X&gt;</td>
</tr>
<tr>
<td>display_point_data_type</td>
<td>basic_display_point&lt;X&gt;</td>
</tr>
<tr>
<td>matrix_2d_data_type</td>
<td>basic_matrix_2d&lt;X&gt;</td>
</tr>
<tr>
<td>point_2d_data_type</td>
<td>basic_point_2d&lt;X&gt;</td>
</tr>
</tbody>
</table>

In order to describe the observable effects of functions contained in Table 6, Table 5 describes the types contained in X as if they possessed certain member data.

<table>
<thead>
<tr>
<th>Type</th>
<th>Member data</th>
<th>Member data type</th>
</tr>
</thead>
<tbody>
<tr>
<td>bounding_box_data_type</td>
<td>x</td>
<td>float</td>
</tr>
<tr>
<td>bounding_box_data_type</td>
<td>y</td>
<td>float</td>
</tr>
<tr>
<td>bounding_box_data_type</td>
<td>w</td>
<td>float</td>
</tr>
<tr>
<td>bounding_box_data_type</td>
<td>h</td>
<td>float</td>
</tr>
<tr>
<td>circle_data_type</td>
<td>x</td>
<td>float</td>
</tr>
<tr>
<td>circle_data_type</td>
<td>y</td>
<td>float</td>
</tr>
<tr>
<td>circle_data_type</td>
<td>r</td>
<td>float</td>
</tr>
<tr>
<td>display_point_data_type</td>
<td>x</td>
<td>int</td>
</tr>
<tr>
<td>display_point_data_type</td>
<td>y</td>
<td>int</td>
</tr>
</tbody>
</table>
In Table 6, `B` denotes the type `X::bounding_box_data_type`, `C` denotes the type `X::circle_data_type`, `D` denotes the type `X::display_point_data_type`, `M` denotes the type `X::matrix_2d_data_type`, and `P` denotes the type `X::point_2d_data_type`.

All expressions in Table 6 are `noexcept`. For purposes of brevity, `noexcept` is omitted in the table.

---

9 Graphics surfaces

9.1 General

This Clause defines requirements on GraphicsSurfaces types.

Most classes specified in Clause 13, Clause 14, and Clause 16 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of typedef-names and nested classes containing typedef-names and static member functions in the template argument GraphicsSurfaces used by each such template. This Clause defines the names of the classes and the semantics of their members.

[Note: It is important to remember that in C++, the requirements are not to execute each expression at the time and place that it occurs in the program but instead is to emulate the observable behavior of the abstract machine described by the C++ standard, i.e. to follow the as-if rule.]

There are only a few 2D graphics operations that produce observable behavior, those being the operations that are visible to the user either by displaying the results of graphics operations to the output surface or by saving the results to a file. Thus, most operations can be implemented in whatever manner best suits the environment that the GraphicsSurfaces types are designed to target so long as the end result complies with the as-if rule.

For example, hardware accelerated implementations could record the rendering and composing operations, creating vertex buffers, index buffers, and state objects at appropriate times and adding them to a command list, and then submit that list to the hardware when observable behavior occurs in order to achieve optimal performance. This is a highly simplified description that is meant to provide some indication as to how such implementations could work since the details of hardware accelerated optimization of graphics operations are quite complex and are beyond the scope of this Technical Specification. —end note]

9.2 Requirements

9.2.1 Classes

A GraphicsSurfaces type is a class template with one type parameter. The template type argument of an instantiation of a GraphicsSurfaces specialization shall meet the requirements of a GraphicsMath type (See: Clause 8).

A GraphicsSurfaces type contains a typedef-name graphics_math_type, which is an identifier for the template argument. It also contains a typedef-name graphics_surfaces_type, which is an identifier for the GraphicsSurfaces type.

[Example:
template <class GraphMath>
struct GraphSurf {
    using graphics_math_type = GraphMath;
    using graphics_surfaces_type = GraphSurf;
    // ...
};
—end example]

A GraphicsSurfaces is required to have the following public nested classes:

1. additional_image_file_formats
2. additional_formats
3. brushes
4. paths
5. surface_states
6. surfaces
9.2.2 additional_image_file_formats requirements [io2d.graphsurf.reqs.addimgform]

Let \( X \) be a GraphicsSurfaces type.

2 The \( X::\text{additional\_image\_file\_formats} \) class contains zero or more \textit{image\_file\_format} enumerators that represent implementation-defined additional data formats that the implementation can both construct an \textit{image\_surface} object from using the appropriate constructor and save an \textit{image\_surface} object to using \textit{image\_surface::save}. These are called \textit{read/write image format enumerators}.

3 The values of read/write image format enumerators shall be in the range \([10000, 19999]\).

4 The \( X::\text{additional\_image\_file\_formats} \) class also contains the following nested classes:

1. \textit{read\_only}
2. \textit{write\_only}

5 The \( \text{additional\_image\_file\_formats} \) class contains zero or more \textit{image\_file\_format} enumerators that represent implementation-defined additional data formats that the implementation can construct an \textit{image\_surface} object from using the appropriate constructor but cannot save an \textit{image\_surface} object to using \textit{image\_surface::save}. These are called \textit{read only image format enumerators}.

6 The values of read only image format enumerators shall be in the range \([20000, 29999]\).

7 The \( \text{additional\_image\_file\_formats::write\_only} \) class contains zero or more \textit{image\_file\_format} enumerators that represent implementation-defined additional data formats that the implementation can construct an \textit{image\_surface} object from using the appropriate constructor and save an \textit{image\_surface} object to using \textit{image\_surface::save} but cannot construct an \textit{image\_surface} object from using any constructor. These are called \textit{write only image format enumerators}.

8 The values of write only image format enumerators shall be in the range \([30000, 39999]\).

9.2.3 additional_formats requirements [io2d.graphsurf.reqs.addform]

Let \( X \) be a GraphicsSurfaces type.

2 The \( X::\text{additional\_formats} \) class contains zero or more \textit{format} enumerators that represent implementation-defined additional visual data formats that the implementation supports.

3 The size in bytes, byte order, and interpretation of values within each channel of each additional visual data format is \textit{implementation-defined}.

4 The values of the additional visual data format enumerators shall be in the range \([10000, 39999]\).

9.2.4 brushes requirements [io2d.graphsurf.reqs.brushes]

Brushes are described in Clause 14.

2 Let \( X \) be a GraphicsSurfaces type.

3 Let \( M \) be \( X::\text{graphics\_math\_type} \).

4 Table 7 describes the observable effects of a member functions of \( X::\text{brushes} \).

5 \( X::\text{brushes} \) contains a \textit{typedef-name}, \textit{brush\_data\_type}, which is an identifier for a class type capable of storing all data required to support a brush of any type described in Clause 14. [Note: The information in 14.7.3 is particularly important. — end note]

9.2.5 paths requirements

1 Paths are described in Clause 13.
2 Let X be a GraphicsSurfaces type.
3 Let G be X::graphics_math_type.
4 Table 10 describes the observable effects of the member functions of X::paths.
5 Table 8 defines the required typedef-names in X::paths, which are identifiers for class types capable of storing all data required to support the corresponding class template.

Table 8 — X::paths typedef-names

<table>
<thead>
<tr>
<th>typedef-name</th>
<th>Class data</th>
</tr>
</thead>
<tbody>
<tr>
<td>abs_cubic_curve_data_type</td>
<td>basic_figure_items&lt;X&gt;::abs_cubic_curve</td>
</tr>
<tr>
<td>abs_line_data_type</td>
<td>basic_figure_items&lt;X&gt;::abs_line</td>
</tr>
<tr>
<td>abs_matrix_data_type</td>
<td>basic_figure_items&lt;X&gt;::abs_matrix</td>
</tr>
<tr>
<td>abs_new_figure_data_type</td>
<td>basic_figure_items&lt;X&gt;::abs_new_figure</td>
</tr>
<tr>
<td>abs_quadratic_curve_data_type</td>
<td>basic_figure_items&lt;X&gt;::abs_quadratic_curve</td>
</tr>
<tr>
<td>arc_data_type</td>
<td>basic_figure_items&lt;X&gt;::arc</td>
</tr>
<tr>
<td>close_figure_data_type</td>
<td>basic_figure_items&lt;X&gt;::close_data</td>
</tr>
</tbody>
</table>
Table 8 — X::paths typedef-names (continued)

<table>
<thead>
<tr>
<th>typedef-name</th>
<th>Class template</th>
</tr>
</thead>
<tbody>
<tr>
<td>interpreted_path_data_type</td>
<td>basic_interpreted_path&lt;X&gt;</td>
</tr>
<tr>
<td>rel_cubic_curve_data_type</td>
<td>basic_figure_items&lt;X&gt;::rel_cubic_curve</td>
</tr>
<tr>
<td>rel_line_data_type</td>
<td>basic_figure_items&lt;X&gt;::rel_line</td>
</tr>
<tr>
<td>rel_matrix_data_type</td>
<td>basic_figure_items&lt;X&gt;::rel_matrix</td>
</tr>
<tr>
<td>rel_new_figure_data_type</td>
<td>basic_figure_items&lt;X&gt;::rel_new_figure</td>
</tr>
<tr>
<td>rel_quadratic_curve_data_type</td>
<td>basic_figure_items&lt;X&gt;::rel_quadratic_curve</td>
</tr>
<tr>
<td>revert_matrix_data_type</td>
<td>basic_figure_items&lt;X&gt;::revert_matrix</td>
</tr>
</tbody>
</table>

6 [Note: An object of type basic_interpreted_path<X> is an immutable object. As such, the contents of the class type for which X::paths::interpreted_path_data_type is an identifier are able to be highly tailored to the platform and environment targeted by X. — end note]

7 In Table 10, AC denotes the type X::paths::abs_cubic_curve_data_type, AL denotes the type X::paths::abs_line_data_type, AM denotes the type X::paths::abs_matrix_data_type, AN denotes the type X::paths::abs_new_figure_data_type, AQ denotes the type X::paths::abs_quadratic_curve_data_type, ARC denotes the type X::paths::arc_data_type, BB denotes the type basic_bounding_box<G>, FI denotes the type basic_figure_items<X>::figure_item, IP denotes the type X::paths::interpreted_path_data_type, RC denotes the type X::paths::rel_cubic_curve_data_type, RL denotes the type X::paths::rel_line_data_type, RM denotes the type X::paths::rel_matrix_data_type, RN denotes the type X::paths::rel_new_figure_data_type, RQ denotes the type X::paths::rel_quadratic_curve_data_type, M denotes the type basic_matrix_2d<G, and P denotes the type basic_point_2d<G>.

8 In order to describe the observable effects of functions contained in Table 10, Table 9 describes the types contained in X as–if they possessed certain member data.

9 [Note: Certain types do not require any member data to describe the observable effects of the functions they are used by and thus do not appear in Table (9). — end note]

</table>

### 9.2.6 `surface_state_props` requirements

1 Surface state data are described in Clause 15.
2 Let `X` be a `GraphicsSurfaces` type.
3 Let `G` be `X::graphics_math_type`.

§ 9.2.6
Table 13 describes the observable effects of the member functions of \texttt{X::surface_state_props}.

Table 11 defines the required \textit{typedef-names} in \texttt{X::surface_state_props}, which are identifiers for class types capable of storing all data required to support the corresponding class template.

Table 11 — \texttt{X::surface_state_props} typedef-names

<table>
<thead>
<tr>
<th>typedef-name</th>
<th>Class data</th>
</tr>
</thead>
<tbody>
<tr>
<td>render_props_data_type</td>
<td>basic_render_props</td>
</tr>
<tr>
<td>brush_props_data_type</td>
<td>basic_brush_props</td>
</tr>
<tr>
<td>clip_props_data_type</td>
<td>basic_clip_props</td>
</tr>
<tr>
<td>stroke_props_data_type</td>
<td>basic_stroke_props</td>
</tr>
<tr>
<td>mask_props_data_type</td>
<td>basic_mask_props</td>
</tr>
<tr>
<td>dashes_data_type</td>
<td>basic_dashes</td>
</tr>
</tbody>
</table>

In Table 13, \texttt{RE} denotes the type \texttt{X::surface_state_props::render_props_data_type}, \texttt{BR} denotes the type \texttt{X::surface_state_props::brush_props_data_type}, \texttt{CL} denotes the type \texttt{X::surface_state_props::clip_props_data_type}, \texttt{ST} denotes the type \texttt{X::surface_state_props::stroke_props_data_type}, \texttt{FP} denotes the type \texttt{X::surface_state_props::fill_props_data_type}, \texttt{MA} denotes the type \texttt{X::surface_state_props::mask_props_data_type}, \texttt{DA} denotes the type \texttt{X::surface_state_props::dashes_data_type}, \texttt{BB} denotes the type \texttt{basic_bounding_box<G>}, \texttt{IP} denotes the type \texttt{basic_interpreted_path<X>}, \texttt{FI} denotes the type \texttt{basic_figure_items<X>::figure_item}, \texttt{M} denotes the type \texttt{basic_matrix_2d<G>}, and \texttt{P} denotes the type \texttt{basic_point_2d<G>}.

In order to describe the observable effects of functions contained in Table 13, Table 12 describes the types contained in \texttt{X} as if they possessed certain member data.

9.2.7 surfaces requirements

Let X be a GraphicsSurfaces type.

Let G be a GraphicsMath type.

Let IM be an object of unspecified type that contains visual data.

Let OU be an object of unspecified type that provides all functionality needed to display visual data on an output device and to process all operations required to create, maintain, and destroy the mechanism used to display visual data. [Example: In a windowing environment the mechanism would typically be a window. — end example]

Let UN be an object of unspecified type that provides all functionality needed to display visual data on an output device which does not process the operations required to create, maintain, and destroy the mechanism used to display visual data. [Note: This type lets the user draw on an existing output mechanism which the user manages. — end note]

The types OU and UN may be the same type.

The definition of an output device is provided in 16.3.9.

Table 16 describes the observable effects of the member functions of X::surfaces.

Table 14 defines the required typedef-names in X::surfaces, which are identifiers for class types capable of storing all data required to support the corresponding class template.

<table>
<thead>
<tr>
<th>typedef-name</th>
<th>Class data</th>
</tr>
</thead>
<tbody>
<tr>
<td>image_surface_data_type</td>
<td>basic_image_surface</td>
</tr>
<tr>
<td>output_surface_data_type</td>
<td>basic_output_surface</td>
</tr>
<tr>
<td>unmanaged_output_surface_data_type</td>
<td>basic_unmanaged_output_surface</td>
</tr>
</tbody>
</table>

In Table 15 and Table 16, I denotes the type image_surface_data_type, 0 denotes the type output_surface_data_type, U denotes the type unmanaged_output_surface_data_type, BB denotes the type basic_bounding_box<G>, BP denotes the type basic_brush_props<X>, BR denotes the type basic_brush<X>, CP denotes the type basic_clip_props<X>, D denotes the type basic_dashes<X>, DP denotes the type basic_display_point<G>, FI denotes the type basic_figure_items<X>::figure_item, IMS denotes the type basic_image_surface<X>, IP denotes the type basic_interpreted_path<X>, MP denotes the type basic_mask_properties<X>, OUS denotes the type basic_output_surface<X>, P denotes the type basic_point_2d<G>, RP denotes the type basic_render_props<X>, SP denotes the type basic_stroke_props<X>, and UOS denotes the type basic_unmanaged_output_surface<X>.

In order to describe the observable effects of functions contained in Table 16, Table 15 describes the types contained in X as-if they possessed certain member data.

</tbody>
</table>

12 [Note: In the same way that stdin, stdout, and stderr do not specify how they meet certain requirements, the requirements set forth in Table 16 also do not specify how they meet certain requirements, most or all of which relate to the output device. — end note]

13 [Note: Operations on objects of types IM, OU, and UO follow the C++ requirements regarding observable behavior (See: C++ 2017[intro.execution]). Successive operations on such objects are not observable unless and until the visual data of such objects can be observed, such as when the visual data is displayed on an output device or is written out to a file. As such, implementations that use graphics acceleration hardware can use batching and other deferred processing techniques to improve performance. — end note]

10  Linear algebra

10.1  Class basic_point_2d

10.1.1  basic_point_2d description

1  The class template `basic_point_2d` is used as both a point and as a two-dimensional Euclidean vector.
2  It has an `x coordinate` of type `float` and a `y coordinate` of type `float`.
3  The data are stored in an object of type `typename GraphicsMath::point_2d_data_type`. It is accessible using the data member functions.

10.1.2  basic_point_2d synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsMath>
    class basic_point_2d {
        public:
            using data_type = typename GraphicsMath::point_2d_data_type;
            // 10.1.3, constructors:
            basic_point_2d() noexcept;
            basic_point_2d(float x, float y) noexcept;
            basic_point_2d(const typename GraphicsMath::point_2d_data_type& data) noexcept;
            // 10.1.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;
            // 10.1.5, modifiers:
            void x(float val) noexcept;
            void y(float val) noexcept;
            // 10.1.6, observers:
            float x() const noexcept;
            float y() const noexcept;
            float dot(const basic_point_2d& other) const noexcept;
            float magnitude() const noexcept;
            float magnitude_squared() const noexcept;
            float angular_direction() const noexcept;
            basic_point_2d to_unit() const noexcept;
            // 10.1.7, member operators:
            basic_point_2d& operator+=(const basic_point_2d& rhs) noexcept;
            basic_point_2d& operator+=(float rhs) noexcept;
            basic_point_2d& operator-=(const basic_point_2d& rhs) noexcept;
            basic_point_2d& operator-=(float rhs) noexcept;
            basic_point_2d& operator*=(const basic_point_2d& rhs) noexcept;
            basic_point_2d& operator*=(float rhs) noexcept;
            basic_point_2d& operator/=(const basic_point_2d& rhs) noexcept;
            basic_point_2d& operator/=(float rhs) noexcept;
    };
    // 10.1.8, non-member operators:
    template <class GraphicsMath>
    bool operator==(const basic_point_2d/GraphicsMath& lhs,
                    const basic_point_2d/GraphicsMath& rhs) noexcept;
    template <class GraphicsMath>
    bool operator!=(const basic_point_2d/GraphicsMath& lhs,
                    const basic_point_2d/GraphicsMath& rhs) noexcept;
}
```

§ 10.1.2
template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator+ (const basic_point_2d<GraphicsMath>& val) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator+ (const basic_point_2d<GraphicsMath>& lhs, const basic_point_2d<GraphicsMath>& rhs) noexcept;

basic_point_2d<GraphicsMath>& operator- (const basic_point_2d<GraphicsMath>& val) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator- (const basic_point_2d<GraphicsMath>& lhs, const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator* (const basic_point_2d<GraphicsMath>& lhs, float rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator* (const basic_point_2d<GraphicsMath>& lhs, const basic_point_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator/ (const basic_point_2d<GraphicsMath>& lhs, float rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath>& operator/ (const basic_point_2d<GraphicsMath>& lhs, const basic_point_2d<GraphicsMath>& rhs) noexcept;

}  // namespace io2d

10.1.3 basic_point_2d constructors [io2d.point2d.cons]

basic_point_2d() noexcept;
1  Effects: Constructs an object of type basic_point_2d.
2  Postconditions: data() == GraphicsMath::create_point_2d().

basic_point_2d(float x, float y) noexcept;
3  Effects: Constructs an object of type basic_point_2d.
4  Postconditions: data() == GraphicsMath::create_point_2d(x, y).

basic_point_2d(const data_type& d) noexcept;
5  Effects: Constructs an object of type basic_point_2d.
6  Postconditions: data() == d.

10.1.4 basic_point_2d accessors [io2d.point2d.accessors]

const data_type& data() const noexcept;

data_type& data() noexcept;
1  Returns: A reference to the basic_point_2d object’s data object (See: 10.1.1).
10.1.5 basic_point_2d modifiers

```cpp
void x(float val) noexcept;

Effects: Equivalent to GraphicsMath::x(data(), val);

void y(float val) noexcept;

Effects: Equivalent to GraphicsMath::y(data(), val);
```

10.1.6 basic_point_2d observers

```cpp
float x() const noexcept;

Returns: GraphicsMath::x(data()).

float y() const noexcept;

Returns: GraphicsMath::y(data()).

float dot(const basic_point_2d& other) const noexcept;

Returns: GraphicsMath::dot(data(), other).

float magnitude() const noexcept;

Returns: GraphicsMath::magnitude(data()).

float magnitude_squared() const noexcept;

Returns: GraphicsMath::magnitude_squared(data()).

float angular_direction() const noexcept;

Returns: GraphicsMath::angular_direction(data()).

basic_point_2d to_unit() const noexcept;

Returns: basic_point_2d(GraphicsMath::to_unit(data())).
```

10.1.7 basic_point_2d member operators

```cpp
basic_point_2d& operator+=(const basic_point_2d& rhs) noexcept;

Effects: Equivalent to data() = GraphicsMath::add(data(), rhs.data());

Returns: *this.

basic_point_2d& operator-=(const basic_point_2d& rhs) noexcept;

Effects: Equivalent to data() = GraphicsMath::subtract(data(), rhs.data());

Returns: *this.

basic_point_2d& operator*=(float rhs) noexcept;

Effects: Equivalent to data() = GraphicsMath::multiply(data(), rhs);

Returns: *this.

basic_point_2d& operator*=(const basic_point_2d& rhs) noexcept;

Effects: Equivalent to data() = GraphicsMath::multiply(data(), rhs.data());

Returns: *this.

basic_point_2d& operator/=(float rhs) noexcept;

Effects: Equivalent to data() = GraphicsMath::divide(data(), rhs);

Returns: *this.

basic_point_2d& operator/=(const basic_point_2d& rhs) noexcept;

Effects: Equivalent to data() = GraphicsMath::divide(data(), rhs.data());

Returns: *this.
```
10.1.8 basic_point_2d non-member operators

bool operator==(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: GraphicsMath::equal(lhs.data(), rhs.data()).

bool operator!=(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: GraphicsMath::not_equal(lhs.data(), rhs.data()).

basic_point_2d operator+(const basic_point_2d& val) noexcept;

Returns: val.

basic_point_2d operator+(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d(GraphicsMath::add(lhs.data(), rhs.data())).

basic_point_2d operator-(const basic_point_2d& val) noexcept;

Returns: basic_point_2d(GraphicsMath::negate(val.data())).

basic_point_2d operator-(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d(GraphicsMath::subtract(lhs.data(), rhs.data())).

basic_point_2d operator*(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d(GraphicsMath::multiply(lhs.data(), rhs.data())).

basic_point_2d operator*(const basic_point_2d& lhs, float rhs) noexcept;

Returns: basic_point_2d(GraphicsMath::multiply(lhs.data(), rhs)).

basic_point_2d operator*(float lhs, const basic_point_2d& rhs) noexcept;

Returns: basic_point_2d(GraphicsMath::multiply(lhs, rhs.data())).

basic_point_2d operator/(const basic_point_2d& lhs, const basic_point_2d& rhs) noexcept;

Requires: rhs.x() != 0.0f and rhs.y() != 0.0f.

Returns: basic_point_2d(GraphicsMath::divide(lhs.data(), rhs.data())).

basic_point_2d operator/(const basic_point_2d& lhs, float rhs) noexcept;

Requires: rhs != 0.0f.

Returns: basic_point_2d(GraphicsMath::divide(lhs.data(), rhs)).

basic_point_2d operator/(float lhs, const basic_point_2d& rhs) noexcept;

Requires: rhs.x() != 0.0f and rhs.y() != 0.0f.

Returns: basic_point_2d(GraphicsMath::divide(lhs, rhs.data())).

10.2 Class basic_matrix_2d

10.2.1 basic_matrix_2d description

The class template basic_matrix_2d represents a three row by three column matrix. Its purpose is to perform affine transformations.

The matrix is composed of nine float values: m00, m01, m02, m10, m11, m12, m20, m21, and m22. The ordering of these float values in the basic_matrix_2d class is unspecified.

The specification of the basic_matrix_2d class, as described in this subclause, uses the following ordering:

\[
\begin{bmatrix}
m00 & m01 & m02 \\
m10 & m11 & m12 \\
m20 & m21 & m22 \\
\end{bmatrix}
\]

Note: The naming convention and the layout shown above are consistent with a row-major layout. Though the naming convention is fixed, the unspecified layout allows for a column-major layout (or any other layout, though row-major and column-major are the only layouts typically used). —end note

The performance of any mathematical operation upon a basic_matrix_2d shall be carried out as if the omitted third column data members were present with the values prescribed in the previous paragraph.
The data are stored in an object of type `typename GraphicsMath::matrix_2d_data_type`. It is accessible using the `data` member functions.

### 10.2.2 basic_matrix_2d synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsMath>
    class basic_matrix_2d {
        using data_type = typename GraphicsMath::matrix_2d_data_type;

        // 10.2.3, constructors:
        basic_matrix_2d() noexcept;
        basic_matrix_2d(float v00, float v01, float v10, float v11, float v20, float v21) noexcept;
        basic_matrix_2d(const typename GraphicsMath::matrix_2d_data_type& v) noexcept;

        // 10.2.4, accessors:
        const data_type& data() const noexcept;
        data_type& data() noexcept;

        // 10.2.5, static factory functions:
        static basic_matrix_2d init_translate(const basic_point_2d<GraphicsMath>& v) noexcept;
        static basic_matrix_2d init_scale(const basic_point_2d<GraphicsMath>& v) noexcept;
        static basic_matrix_2d init_rotate(float radians) noexcept;
        static basic_matrix_2d init_rotate(float radians, const basic_point_2d<GraphicsMath>& origin) noexcept;
        static basic_matrix_2d init_reflect(float radians) noexcept;
        static basic_matrix_2d init_shear_x(float factor) noexcept;
        static basic_matrix_2d init_shear_y(float factor) noexcept;

        // 10.2.6, modifiers:
        void m00(float v) noexcept;
        void m01(float v) noexcept;
        void m10(float v) noexcept;
        void m11(float v) noexcept;
        void m20(float v) noexcept;
        void m21(float v) noexcept;
        basic_matrix_2d& translate(const basic_point_2d<GraphicsMath>& v) noexcept;
        basic_matrix_2d& scale(const basic_point_2d<GraphicsMath>& v) noexcept;
        basic_matrix_2d& rotate(float radians) noexcept;
        basic_matrix_2d& rotate(float radians, const basic_point_2d<GraphicsMath>& origin) noexcept;
        basic_matrix_2d& reflect(float radians) noexcept;

        float m01() const noexcept;
        float m10() const noexcept;
        float m11() const noexcept;
        float m20() const noexcept;
        float m21() const noexcept;
        bool is_finite() const noexcept;
        bool is_invertible() const noexcept;
        float determinant() const noexcept;
        basic_point_2d<GraphicsMath> transform_pt(const basic_point_2d<GraphicsMath>& pt) const noexcept;

        // 10.2.8, member operators:
        basic_matrix_2d& operator*=(const basic_matrix_2d& other) noexcept;
    }
}
```

§ 10.2.2
// 10.2.9  member operators:

```cpp
template <class GraphicsMath>
basic_matrix_2d<GraphicsMath> operator*(
    const basic_matrix_2d<GraphicsMath>& lhs,
    const basic_matrix_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
basic_point_2d<GraphicsMath> operator*(
    const basic_point_2d<GraphicsMath>& lhs,
    const basic_matrix_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
bool operator==(const basic_matrix_2d<GraphicsMath>& lhs,
    const basic_matrix_2d<GraphicsMath>& rhs) noexcept;

template <class GraphicsMath>
bool operator!=(const basic_matrix_2d<GraphicsMath>& lhs,
    const basic_matrix_2d<GraphicsMath>& rhs) noexcept;
```

10.2.3  basic_matrix_2d constructors  

```cpp
basic_matrix_2d() noexcept;
```

Effects: Constructs an object of type basic_matrix_2d.

[ Note: The resulting matrix is the identity matrix. — end note ]

Postconditions: data() == GraphicsMath::create_matrix_2d().

```cpp
basic_matrix_2d(float m00, float m01, float m10, float m11,
    float m20, float m21) noexcept;
```

Effects: Constructs an object of type basic_matrix_2d.

Postconditions: data() == GraphicsMath::create_matrix_2d(m00, m01, m10, m11, m20, m21).

```cpp
basic_matrix_2d(const data_type& v) noexcept;
```

Effects: Constructs an object of type basic_matrix_2d.

Postconditions: data() == v.

10.2.4  basic_matrix_2d accessors

```cpp
const data_type& data() const noexcept;
```

Returns: A reference to the basic_matrix_2d object’s data object (See: 10.2.1).

```cpp
data_type& data() noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_matrix_2d().)

10.2.5  basic_matrix_2d static factory functions

```cpp
static basic_matrix_2d init_translate(basic_point_2d<GraphicsMath> v) noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_translate(v.data())).

```cpp
static basic_matrix_2d init_scale(basic_point_2d<GraphicsMath> v) noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_scale(v.data()).

```cpp
static basic_matrix_2d init_rotate(float radians) noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_rotate(radians)).

```cpp
static basic_matrix_2d init_rotate(float radians, basic_point_2d<GraphicsMath> origin) noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_rotate(radians, origin.data()).

```cpp
static basic_matrix_2d init_reflect(float radians) noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_reflect(radians)).

```cpp
static basic_matrix_2d init_shear_x(float factor) noexcept;
```

Returns: basic_matrix_2d(GraphicsMath::create_shear_x(factor)).
static basic_matrix_2d init_shear_y(float factor) noexcept;

Returns: basic_matrix_2d(GraphicsMath::create_shear_y(factor)).

10.2.6 basic_matrix_2d modifiers

void m00(float v) noexcept;

Effects: Equivalent to GraphicsMath::m00(data(), v);

void m01(float v) noexcept;

Effects: Equivalent to GraphicsMath::m01(data(), v);

void m10(float v) noexcept;

Effects: Equivalent to GraphicsMath::m10(data(), v);

void m11(float v) noexcept;

Effects: Equivalent to GraphicsMath::m11(data(), v);

void m20(float v) noexcept;

Effects: Equivalent to GraphicsMath::m20(data(), v);

void m21(float v) noexcept;

Effects: Equivalent to GraphicsMath::m21(data(), v);

basic_matrix_2d& translate(basic_point_2d<GraphicsMath> v) noexcept;

Effects: Equivalent to data() = GraphicsMath::translate(data(), v.data());

Returns: *this.

basic_matrix_2d& scale(basic_point_2d<GraphicsMath> v) noexcept;

Effects: Equivalent to data() = GraphicsMath::scale(data(), v.data());

Returns: *this.

basic_matrix_2d& rotate(float radians) noexcept;

Effects: Equivalent to data() = GraphicsMath::rotate(data(), radians);

Returns: *this.

basic_matrix_2d& rotate(float radians, basic_point_2d<GraphicsMath> origin) noexcept;

Effects: Equivalent to data() = GraphicsMath::rotate(data(), radians, origin.data());

Returns: *this.

basic_matrix_2d& reflect(float radians) noexcept;

Effects: Equivalent to data() = GraphicsMath::reflect(data(), radians);

Returns: *this.

basic_matrix_2d& shear_x(float factor) noexcept;

Effects: Equivalent to data() = GraphicsMath::shear_x(data(), factor);

Returns: *this.

basic_matrix_2d& shear_y(float factor) noexcept;

Effects: Equivalent to data() = GraphicsMath::shear_y(factor);

Returns: *this.

10.2.7 basic_matrix_2d observers

float m00() const noexcept;

Returns: GraphicsMath::m00(data()).
float m01() const noexcept;
    Returns: GraphicsMath::m01(data()).
float m10() const noexcept;
    Returns: GraphicsMath::m10(data()).
float m11() const noexcept;
    Returns: GraphicsMath::m11(data()).
float m20() const noexcept;
    Returns: GraphicsMath::m20(data()).
float m21() const noexcept;
    Returns: GraphicsMath::m21(data()).
bool is_finite() const noexcept;
    Returns: GraphicsMath::is_finite(data()).
bool is_invertible() const noexcept;
    Requires: is_finite() == true.
    Returns: GraphicsMath::is_invertible(data()).
basic_matrix_2d inverse() const noexcept;
    Requires: is_invertible() == true.
    Returns: basic_matrix_2d(GraphicsMath::inverse(data())).
float determinant() const noexcept;
    Requires: is_finite() == true.
    Returns: GraphicsMath::determinant(data()).
basic_point_2d<GraphicsMath> transform_pt(basic_point_2d<GraphicsMath> pt) const noexcept;
    Returns: basic_point_2d<GraphicsMath>(GraphicsMath::transform_pt(data(), pt.data())).

10.2.8 basic_matrix_2d member operators
[io2d.matrix2d.member.ops]
basic_matrix_2d& operator*=(const basic_matrix_2d& rhs) noexcept;
    Effects: Equivalent to data() = GraphicsMath::multiply(data(), rhs.data());
    Returns: *this.

10.2.9 basic_matrix_2d non-member operators
[io2d.matrix2d.ops]
basic_matrix_2d operator*(const basic_matrix_2d& lhs, const basic_matrix_2d& rhs)
    noexcept;
    Returns: basic_matrix_2d(GraphicsMath::multiply(lhs.data(), rhs.data())).
basic_point_2d<GraphicsMath> operator*(basic_point_2d<GraphicsMath> v, const basic_matrix_2d& m) noexcept;
    Returns: Equivalent to m.transform_pt(v).
bool operator==(const basic_matrix_2d& lhs, const basic_matrix_2d& rhs) noexcept;
    Returns: GraphicsMath::equal(lhs.data(), rhs.data()).
bool operator!=(const basic_matrix_2d& lhs, const basic_matrix_2d& rhs) noexcept;
    Returns: Equivalent to GraphicsMath::not_equal(lhs.data(), rhs.data()).
11 Geometry

11.1 Class template basic_display_point

11.1.1 basic_display_point description

1 The class template basic_display_point describes an integral point used to describe certain properties of surfaces.

2 It has an \textit{x coordinate} of type \texttt{int} and a \textit{y coordinate} of type \texttt{int}.

3 The data are stored in an object of type \texttt{typename GraphicsMath::display_point_data_type}. It is accessible using the \texttt{data} member functions.

11.1.2 basic_display_point synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsMath>
    class basic_display_point {
        public:
            using data_type = typename GraphicsMath::display_point_data_type;

            // 11.1.3, constructors:
            basic_display_point() noexcept;
            basic_display_point(int x, int y) noexcept;
            basic_display_point(const data_type& val) noexcept;

            // 11.1.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 11.1.5, modifiers:
            void x(int val) noexcept;
            void y(int val) noexcept;

            // 11.1.6, observers:
            int x() const noexcept;
            int y() const noexcept;
    };

    // 11.1.7, operators:
    template <class GraphicsMath>
    bool operator==(const basic_display_point<GraphicsMath>& lhs,
                    const basic_display_point<GraphicsMath>& rhs) noexcept;
    template <class GraphicsMath>
    bool operator!=(const basic_display_point<GraphicsMath>& lhs,
                    const basic_display_point<GraphicsMath>& rhs) noexcept;
}
basic_display_point(const data_type& val) noexcept;

    Effects: Constructs an object of type basic_display_point.
    Postconditions: data() == val.
    Remarks: The x coordinate is GraphicsMath::x(val) and the y coordinate is GraphicsMath::y(val).

11.1.4 basic_display_point accessors

    Returns: A reference to the basic_display_point object’s data object (See: 11.1).

11.1.5 basic_display_point modifiers

    Effects: Equivalent to GraphicsMath::x(data(), v);
    Effects: Equivalent to GraphicsMath::y(data(), v);

11.1.6 basic_display_point observers

    Returns: GraphicsMath::x(data()).
    Returns: GraphicsMath::y(data()).

11.1.7 basic_display_point operators

    Returns: GraphicsMath::equal(lhs.data(), rhs.data()).
    Returns: GraphicsMath::not_equal(lhs.data(), rhs.data()).

11.2 Class basic_bounding_box

11.2.1 basic_bounding_box description

    The class template basic_bounding_box describes a bounding_box.
    It has an x coordinate of type float, a y coordinate of type float, a width of type float, and a height of type float.
    The data are stored in an object of type typename GraphicsMath::bounding_box_data_type. It is accessible using the data member functions.

11.2.2 basic_bounding_box synopsis

    namespace std::experimental::io2d::v1 {
        template <class GraphicsMath>
        class basic_bounding_box {
            public:
                using data_type = typename GraphicsMath::bounding_box_data_type;

                // 11.2.3, constructors:
                basic_bounding_box() noexcept;
                basic_bounding_box(float x, float y, float width, float height) noexcept;
                basic_bounding_box(const basic_point_2d<GraphicsMath>& t1, const basic_point_2d<GraphicsMath>& br) noexcept;
                basic_bounding_box(const data_type& val) noexcept;
    } // std::experimental::io2d::v1
11.2.3 basic_bounding_box constructors

### Constructors

```cpp
basic_bounding_box() noexcept;
```

**Effects:** Constructs an object of type `basic_bounding_box`.

**Postconditions:** `data() == GraphicsMath::create_bounding_box()`.

```cpp
basic_bounding_box(float x, float y, float w, float h) noexcept;
```

**Requires:** `w` is not less than `0.0f` and `h` is not less than `0.0f`.

**Effects:** Constructs an object of type `basic_bounding_box`.

**Postconditions:** `data() == GraphicsMath::create_bounding_box(x, y, w, h)`.

```cpp
basic_bounding_box(const basic_point_2d<GraphicsMath>& tl,
                   const basic_point_2d<GraphicsMath>& br) noexcept;
```

**Effects:** Constructs an object of type `basic_bounding_box`.

**Postconditions:** `data() == GraphicsMath::create_bounding_box(tl.data(), br.data())`.

```cpp
basic_bounding_box(const data_type& val) noexcept;
```

**Effects:** Constructs an object of type `basic_bounding_box`.

**Postconditions:** `data() == val`.

11.2.4 basic_bounding_box accessors

```cpp
const data_type& data() const noexcept;
```

**Returns:** A reference to the `basic_bounding_box` object’s data object (See: 11.2.1).

```cpp
data_type& data() noexcept;
```

11.2.5 basic_bounding_box modifiers

```cpp
void x(float v) noexcept;
```

**Effects:** Equivalent to `GraphicsMath::x(data(), v);`
void y(float v) noexcept;

Effects: Equivalent to GraphicsMath::y(data(), v);

void width(float v) noexcept;

Effects: Equivalent to GraphicsMath::width(data(), v);

void height(float v) noexcept;

Effects: Equivalent to GraphicsMath::height(data(), v);

void top_left(const basic_point_2d<GraphicsMath>& v) noexcept;

Effects: Equivalent to GraphicsMath::top_left(data(), v.data());

void bottom_right(const basic_point_2d<GraphicsMath>& v) noexcept;

Effects: Equivalent to GraphicsMath::bottom_right(data(), v.data());

11.2.6 basic_bounding_box observers

float x() const noexcept;

Returns: GraphicsMath::x(data()).

float y() const noexcept;

Returns: GraphicsMath::y(data()).

float width() const noexcept;

Returns: GraphicsMath::width(data()).

float height() const noexcept;

Returns: GraphicsMath::height(data()).

basic_point_2d<GraphicsMath> top_left() const noexcept;

Returns: basic_point_2d<GraphicsMath>(GraphicsMath::top_left(data())).

basic_point_2d<GraphicsMath> bottom_right() const noexcept;

Returns: basic_point_2d<GraphicsMath>(GraphicsMath::bottom_right(data())).

11.2.7 basic_bounding_box operators

bool operator==(const basic_bounding_box<GraphicsMath>& lhs,
const basic_bounding_box<GraphicsMath>& rhs) noexcept;

Returns: GraphicsMath::equal(lhs.data(), rhs.data()).

bool operator!=(const basic_bounding_box<GraphicsMath>& lhs,
const basic_bounding_box<GraphicsMath>& rhs) noexcept;

Returns: GraphicsMath::not_equal(lhs.data(), rhs.data()).

11.3 Class basic_circle

11.3.1 basic_circle description

The class template basic_circle describes a circle.

It has a center of type basic_point_2d<GraphicsMath> and a radius of type float.

The data are stored in an object of type typename GraphicsMath::circle_data_type. It is accessible using the data member functions.

11.3.2 basic_circle synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsMath>
    class basic_circle {
    public:
        using data_type = typename GraphicsMath::circle_data_type;
// 11.3.3, constructors:
basic_circle() noexcept;
basic_circle(const basic_point_2d<GraphicsMath>& ctr, float rad) noexcept;
basic_circle(const typename GraphicsMath::circle_data_type& val) noexcept;

// 11.3.4, accessors:
const data_type& data() const noexcept;
data_type& data() noexcept;

// 11.3.5, modifiers:
void center(const basic_point_2d<GraphicsMath>& ctr) noexcept;
void radius(float r) noexcept;

// 11.3.6, observers:
basic_point_2d<GraphicsMath> center() const noexcept;
float radius() const noexcept;

};

11.3.3 basic_circle constructors

basic_circle() noexcept;

1 Effects: Constructs an object of type basic_circle.
2 Postconditions: data() == GraphicsMath::create_circle().

basic_circle(const basic_point_2d<GraphicsMath>& ctr, float rad) noexcept;

1 Requires: r >= 0.0f.
3 Effects: Constructs an object of type basic_circle.
4 Postconditions: data() == GraphicsMath::create_circle(ctr, r).

11.3.4 basic_circle accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

1 Returns: A reference to the basic_circle object’s data object (See: 11.3.1).

11.3.5 basic_circle modifiers

void center(const basic_point_2d<GraphicsMath>& ctr) noexcept;

1 Effects: Equivalent to GraphicsMath::center(data(), ctr.data());

void radius(float r) noexcept;

1 Effects: Equivalent to GraphicsMath::radius(data(), r);

11.3.6 basic_circle observers

basic_point_2d<GraphicsMath> center() const noexcept;

1 Returns: (basic_point_2d<GraphicsMath>(GraphicsMath::center(data()))).

float radius() const noexcept;

1 Returns: GraphicsMath::radius(data()).
11.3.7 basic_circle operators

bool operator==(const basic_circle<GraphicsMath>& lhs, const basic_circle<GraphicsMath>& rhs) noexcept;

Returns: GraphicsMath::equal(lhs.data(), rhs.data()).

bool operator!=(const basic_circle<GraphicsMath>& lhs, const basic_circle<GraphicsMath>& rhs) noexcept;

Returns: GraphicsMath::not_equal(lhs.data(), rhs.data()).
12  Text rendering and display  [io2d.text]

12.1  Intro  [io2d.text.intro]

[Note: Measuring text and creating preformatted layouts will be coming in a future revision. — end note]

For an overview of how text rendering works, see 16.3.8.

Text rendering and display makes use of the OFF Font Format. No other font formats are supported at this time.

References made to a font’s tables refer to the tables contained in the font’s OFF Font Format.

Text rendering and display uses UTF-8 encoded text contained in a string object. Attempting to use text in a different encoding results in undefined behavior.

Several enum classes and class template are used in the process of text rendering. These are defined here.

12.2  Enum class font_size_units  [io2d.text.sizeunits]

12.2.1  font_size_units summary  [io2d.text.sizeunits.summary]

The font_size_units enum class specifies the measurement units used to interpret a font size value.

Glyph data in a font is specified in font size units. The area in which the glyph data is defined is known as an em box, which is a two-dimensional square. The number of font size units that make up the length of a side of the em box, an em, is defined by the unitsPerEm value contained in the font’s head table. Acceptable values for one em are between \[16, 16384\].

When a glyph is rendered, the font size unit coordinates are converted to ems by dividing 1 by em and multiplying the result by the coordinate value. This is then multiplied by the interpreted font size value to get the coordinates in surface space. The method for turning a font size value into an interpreted font size value is specified by the font_size_units enumerators.

The font_size_units enumerators

12.2.2  font_size_units synopsis  [io2d.text.sizeunits.synopsis]

namespace std::experimental::io2d::v1 {
    enum class font_size_units {
        points,
        pixels
    };
}

12.2.3  font_size_units enumerators  [io2d.text.sizeunits.enumerators]

Table 17 — font_size_units enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>points</td>
<td>The interpreted font size value (\frac{1}{\text{PPI}}) of an inch. This relies on the PPI of the surface. The default value for a basic_image_surface is 96. This can be changed by calling the ppi member function of the basic_image_surface object. The default PPI values for other surface types is environment-specific and as such is unspecified. Users must query those surfaces to determine their PPI value.</td>
</tr>
<tr>
<td>pixels</td>
<td>The interpreted font size value is the same as the font size value.</td>
</tr>
</tbody>
</table>

[Note: The PPI of output surfaces varies greatly depending on the device on which the program is running. Common values currently range anywhere from 96 to 300+. The value can even change when an output
surface is moved from one output device to another or when settings are changed on the existing output device. This is a difficult issue to deal with even when writing programs using environment-specific APIs. Using a basic_image_surface and setting its PPI to the current value of the output surface can help alleviate these problems, but if the PPI of the output surface changes, or if no adjustment from the default value is made, the resulting scaling will likely produce text that appears fuzzy or heavily pixelated depending on the parameters used when text rendering occurs. — end note

12.3 Enum class font_weight

12.3.1 font_weight summary

The font_weight enum class indicates the visual weight (degree of blackness or thickness of strokes) of the characters in a font. The names of the enumerators correspond to the names of the usWeightClass values in the OS/2 table described in the OFF Font Format and represent the same meaning as their counterparts in the OFF Font Format.

The names of the enumerators substitute _ for - in order to conform to C++ syntax.

12.3.2 font_weight synopsis

namespace std::experimental::io2d::v1 {
    enum class font_weight {
        thin,
        extra_light,
        light,
        normal,
        medium,
        semi_bold,
        bold,
        extra_bold,
        black
    };
}

12.4 Enum class font_capitalization

12.4.1 font_capitalization summary

The font_capitalization enum class specifies that text should be rendered in a particular capitalization style. This value is ignored for text that is not in a bicameral script (i.e. those without case differences).

Where the font that is being used provides small capital glyphs, glyph substitution shall be performed to replace lower case character glyphs with their small capital glyph counterparts as specified by the font.

Where the font that is being used does not provide separate small capital glyphs, small capitals shall be emulated by using uppercase character glyphs to replace their lowercase character glyph counterparts and then modifying the rendering of those replacement glyphs such that they are shorter than ordinary capital glyphs. The rendering method for shortening such glyphs is unspecified. In the case of emulation, it is recommended that the scaled height of the small capitals be the ratio of the sxHeight to the sCapHeight as specified in the OS/2 table of the font.

[Note: To achieve a better look with emulation, in addition to scaling down the uppercase glyphs, using an increased weight (boldness) is often beneficial. — end note]

12.4.2 font_capitalization synopsis

namespace std::experimental::io2d::v1 {
    enum class font_capitalization {
        normal,
        small_caps
    };
}

12.4.3 font_capitalization enumerators
Table 18 — font_capitalization enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>No change in rendering results from this enumerator value.</td>
</tr>
<tr>
<td>small_caps</td>
<td>The text is rendered with small capitals replacing lowercase characters.</td>
</tr>
</tbody>
</table>

12.5 Enum class font_stretching

12.5.1 font_stretching summary

The font_stretching enum class indicates a relative change from the normal aspect ratio (width to height ratio) as specified by a font designer for the glyphs in a font. The names of the enumerators correspond to the names of the usWidthClass values in the OS/2 table described in the OFF Font Format and represent the same meaning as their counterparts in the OFF Font Format.

2 The names of the enumerators substitute _ for - in order to conform to C++ syntax.

12.5.2 font_stretching synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class font_stretching {
        ultra_condensed = 1,
        extra_condensed,
        condensed,
        semi_condensed,
        medium,
        normal = medium,
        semi_expanded,
        expanded,
        extra_expanded,
        ultra_expanded
    }
}
```

12.6 Enum class font_style

12.6.1 font_style summary

The font_style enum class specifies that a specific font pattern shall be used. If this font pattern is not available in the requested font family, a similar font family that contains a font face with this font pattern shall be used when creating the basic_font object.

12.6.2 font_style synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class font_style {
        normal,
        italic,
        oblique
    }
}
```

12.6.3 font_style enumerators

All enumerators are defined in terms of bit flags set in the fsSelection value of the OS/2 table of the font.

Table 19 — font_style enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>normal</td>
<td>A font face with bit 6 (REGULAR) set to 1.</td>
</tr>
<tr>
<td>italic</td>
<td>A font face with bit 0 (ITALIC) set to 1.</td>
</tr>
<tr>
<td>oblique</td>
<td>A font face with bit 9 (OBLIQUE) set to 1 or bit 1 (ITALIC) set to 1, with font rendering preference given to the font face that has bit 9 set to 1 if both font faces are present.</td>
</tr>
</tbody>
</table>
12.7 Enum class font_line

12.7.1 font_line summary

The font_line enum class specifies whether or not text should be underlined when rendered.

12.7.2 font_line synopsis

namespace std::experimental::io2d::v1 {
enum class font_line {
    none,
    underline
};
}

12.7.3 font_line enumerators

Table 20 — font_line enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>No underlining is performed when rendering text.</td>
</tr>
<tr>
<td>underline</td>
<td>Underlining is performed when rendering text.</td>
</tr>
</tbody>
</table>

12.8 Enum class font_antialias

12.8.1 font_antialias summary

The font_antialias enum class specifies whether or not text should be anti-aliased when rendered. Excluding the font_antialias::none enumerator, all enumerators specify preferences.

Subpixel antialiasing takes advantage of the fact that most modern displays use pixels that have a red, a green, and a blue subcomponent. By manipulating which of these subcomponents are turned on for each pixel, the resulting text will appear to have less aliasing while retaining the intended color of the text as rendered when viewed by the user of the program.

Gray anti-aliasing uses varying shades of the color that the text is to be rendered with for pixels that are rendered and certain pixels that surround pixels that would be rendered if no anti-aliasing were performed in order to reduce aliasing. If a non-solid color brush is used, implementations may ignore this type of anti-aliasing even if they are otherwise capable of performing it.

[Note: With gray anti-aliasing, as examples, when the text is rendered as white, shades of gray would be used. When the text is rendered as green, shades of green would be used. — end note]

[Note: Anti-aliasing may not be available in certain environments, for certain font families, or in other circumstances, but it is always possible to not perform anti-aliasing. — end note]

12.8.2 font_antialias synopsis

namespace std::experimental::io2d::v1 {
enum class font_antialias {
    none,
    antialias,
    gray,
    subpixel,
    prefer_gray,
    prefer_subpixel
};
}

12.8.3 font_antialias enumerators

Table 21 — font_antialias enumerator meanings

<table>

<tr>
<td>prefer_subpixel</td>
<td>Prefer subpixel anti-aliasing if available, otherwise use gray if available.</td>
</tr>
</tbody>
</table>

12.9 Enum class generic_font_names

12.9.1 antialias summary

The generic_font_names enum class specifies font names that correspond to generic font families found in the CSS Fonts Specification. A basic_font object created using a generic_font_names enumerator without specifying a font family through a string argument shall meet the requirements for a generic font family of the same name as specified in the CSS Fonts Specification.

1 A basic_font object constructed using a generic_font_names enumerator shall return the name of the enumerator as a string object when its family member function is called.

2 [Note: As per the specification, multiple font families might be required to be used when using a basic_font object that is constructed using a generic_font_names enumerator in order to meet the specifications. Because of this, the basic_font object returns the enumerator name when its family member function is called rather than a more specific font family name. — end note]

12.9.2 antialias synopsis

namespace std::experimental::io2d::v1 {
    enum class generic_font_names {
        serif, sans_serif, cursive, fantasy, monospace
    };
}

12.10 Class template basic_text_props

12.10.1 basic_text_props summary

The basic_text_props class provides general state information that is applicable to the text rendering rendering and composing operations (16.3.2).

1 It has a scale of type float, a font size of type float, a size units type of type font_size_unit, a kerning value of type bool, an anti-aliasing value of type font_antialias, a stretch value of type font_stretching, a strike through value of type bool, and a font line value of type font_line.

2 The data are stored in an object of type typename GraphicsSurfaces::text::text_props_data_type. It is accessible using the data member function.

12.10.2 basic_text_props synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_text_props {
    public:
        using data_type = typename GraphicsSurfaces::text::text_props_data_type;
    };
}
// 12.10.3, construct:
basic_text_props(float scl = 1.0f,
    font_size_units fsu = font_size_units::points,
    float sz = -1.0f,
    bool kern = true,
    font_antialias aa = font_antialias::antialias,
    font_stretching stretch = font_stretching::normal,
    bool strike = false,
    font_line fl = font_line::none) noexcept;

// 12.10.4, accessors:
const data_type& data() const noexcept;
data_type& data() noexcept;

// 12.10.5, modifiers:
void scale(float s) noexcept;
void font_size(font_size_units fsu, float sz) noexcept;
void kerning(bool k) noexcept;
void antialiasing(font_antialias aa) noexcept;
void stretching(font_stretching fs) noexcept;
void strike_through(bool st) noexcept;
void line(font_line fl) noexcept;

// 12.10.6, observers:
float scale() const noexcept;
float font_size() const noexcept;
font_size_units size_units() const noexcept;
bool kerning() const noexcept;
font_antialias antialiasing() const noexcept;
font_stretching stretching() const noexcept;
bool strike_through() const noexcept;
font_line line() const noexcept;

};

12.10.3 basic_text_props constructor

basic_text_props(float scl = 1.0f,
    font_size_units fsu = font_size_units::points,
    float sz = -1.0f,
    bool kern = true,
    font_antialias aa = font_antialias::antialias,
    font_stretching stretch = font_stretching::normal,
    bool strike = false,
    font_line fl = font_line::none) noexcept;

<table>
<thead>
<tr>
<th>Effects: Constructs an object of type basic_text_props.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Postconditions: data() == GraphicsSurfaces::text::create_text_props(scl, fsu, sz, kern, aa, stretch, strike, fl).</td>
</tr>
<tr>
<td>The scale is scl. The size units type is fsu. The font size is sz. The kerning value is kern. The anti-aliasing value is aa. The stretch value is stretch. The strike through value is strike. The font line value is fl.</td>
</tr>
</tbody>
</table>

12.10.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

| Returns: A reference to the basic_text_props object’s data object (See: 17.2.5.1). |
| Remarks: The behavior of a program is undefined if the user modifies the data contained in the data_type object returned by this function. |
12.10.5 basic_text_props modifiers

void scale(float scl) noexcept;

Effects: Calls GraphicsSurfaces::text::scale(data(), scl).
Remarks: The scale is scl.
If the scale is \( \leq 0 \), the scale is disregarded during text rendering occurs.

void font_size(font_size_units fsu, float sz) noexcept;

Effects: Calls GraphicsSurfaces::text::font_size(data(), fsu, sz).
Remarks: The size units type is fsu. The font size is sz.
If the font size is \( \leq 0 \), the basic_font object’s font size is used during text rendering.

void kerning(bool k) noexcept;

Effects: Calls GraphicsSurfaces::text::kerning(data(), k).
Remarks: The kerning value is k.
When the kerning value is true, kerning should be used.
[ Note: If kerning is not available with the font being used, kerning does not occur. — end note ]

void antialiasing(font_antialias aa) noexcept;

Effects: Calls GraphicsSurfaces::text::antialiasing(data(), aa).
Remarks: The anti-aliasing value is aa.

void stretching(font_stretching fs) noexcept;

Effects: Calls GraphicsSurfaces::text::stretching(data(), fs).
Remarks: The stretch value is fs.

void strike_through(bool st) noexcept;

Effects: Calls GraphicsSurfaces::text::strike_through(data(), st).
Remarks: The strike through value is st.

void line(font_line fl) noexcept;

Effects: Calls GraphicsSurfaces::text::line(data(), fl).
Remarks: The font line value is fl.

12.10.6 basic_text_props observers

float scale() const noexcept;

Returns: GraphicsSurfaces::text::scale(data()).
Remarks: The returned value is the scale.

float font_size() const noexcept;

Returns: GraphicsSurfaces::text::font_size(data()).
Remarks: The returned value is the font size.

font_size_units size_units() const noexcept;

Returns: GraphicsSurfaces::text::size_units(data()).
Remarks: The returned value is the size units type.

bool kerning() const noexcept;

Returns: GraphicsSurfaces::text::kerning(data()).
Remarks: The returned value is the kerning value.

font_antialias antialiasing() const noexcept;

Returns: GraphicsSurfaces::text::antialiasing(data()).

§ 12.10.6
Remarks: The returned value is the anti-aliasing value.

font_stretching stretching() const noexcept;

Returns: GraphicsSurfaces::text::stretching(data()).
Remarks: The returned value is the stretch value.

bool strike_through() const noexcept;

Returns: GraphicsSurfaces::text::strike_through(data()).
Remarks: The returned value is the strike through value.

font_line line() const noexcept;

Returns: GraphicsSurfaces::text::line(data()).
Remarks: The returned value is the font line value.

12.11 Class template basic_font

12.11.1 basic_font summary

The basic_font class provides an OFF Font Format font for use by the text rendering rendering and
composing operation (16.3.8).

It has a font family of type string, a font size of type float, a size units type of type font_size_unit, a
font weight of type font_weight, a font style of type font_style, and a merging value of bool.

The data are stored in an object of type typename GraphicsSurfaces::text::font_data_type. It is
accessible using the data member function.

12.11.2 basic_font matching

Sometimes when creating a basic_font object, the font family that is requested is not present in the
environment the program is running in. When this occurs, the implementation uses the other parameters,
together with its knowledge, if any, of the requested family to select a similar font family to the one requested.
The selection algorithm is unspecified. When this occurs, the family member function shall return the name
of the font the implementation selected.

12.11.3 basic_font synopsis

namespace std::experimental::io2d::v1 {  
  template <class GraphicsSurfaces>
  class basic_font {
    public:
      using data_type = typename GraphicsSurfaces::text::font_data_type;

      // 12.11.4, construct:
      basic_font(string family, font_size_units fsu, float sz,
                 generic_font_names gfn, font_weight fw = font_weight::normal,
                 font_style fs = font_style::normal, bool merging = true);
      basic_font(filesystem::path file, font_size_units fsu, float sz,
                 font_weight fw = font_weight::normal, font_style fs = font_style::normal,
                 bool merging = true);
      basic_font(generic_font_names gfn, font_size_units fsu, float sz,
                 font_weight fw = font_weight::normal, font_style fs = font_style::normal);

      // 12.11.5, accessors:
      const data_type& data() const noexcept;
      data_type& data() noexcept;

      // 12.11.6, modifiers:
      void font_size(font_size_units fsu, float sz) noexcept;
      void merging(bool m) noexcept;

      // 12.11.7, observers:
      float font_size() const noexcept;
      string family() const noexcept;
font_size_units size_units() const noexcept;
font_weight weight() const noexcept;
font_style style() const noexcept;
bool merging() const noexcept;
}

12.11.4 basic_font constructor

basic_font(string family, font_size_units fsu, float sz,
generic_font_names gfn, font_weight fw = font_weight::normal,
font_style fs = font_style::normal, bool merging = true);

Requires: sz > 0.
Effects: Constructs an object of type basic_font.
Postconditions: data() == GraphicsSurfaces::text::create_font(family, fsu, sz, gfn, fw, fs, merging).
Remarks: The value of gfn is only used if an exact match is not available (see: 12.11.2).
If an exact match is available, the font family is family. The size units type is fsu. The font size is sz. The font weight is fw. The font style is fs. The stretch value is stretch. The strike through value is strike. The font line value is fl. The merging value is merging.
When an exact match is not available, the implementation uses the value of gfn to help select a similar font. In this case, the font family is the name of the font chosen by the implementation. The size units type is fsu. The font size is sz. The font weight is the font weight of the font chosen by the implementation. The font style is the font style of the font chosen by the implementation. The stretch value is stretch. The strike through value is strike. The font line value is fl. The merging value is merging.

basic_font(filesystem::path file, font_size_units fsu, float sz,
font_weight fw = font_weight::normal, font_style fs = font_style::normal,
bool merging = true);

Requires: sz > 0.
Effects: Constructs an object of type basic_font.
Postconditions: data() == GraphicsSurfaces::text::create_font(family, fsu, sz, fw, fs, merging).
Remarks: The font family is specified in the name table of the OFF Font Format font contained in file. The size units type is fsu. The font size is sz. The font weight is the font weight of the font in the OFF Font Format font contain in file, or is the nearest font weight to value if the file is an OFF Font Format Font Collection. The font style is the font style of the font in the OFF Font Format font contain in file, or is the nearest font style to value if the file is an OFF Font Format Font Collection. The stretch value is stretch. The strike through value is strike. The font line value is fl. The merging value is merging.

basic_font(generic_font_names gfn, font_size_units fsu, float sz,
font_weight fw = font_weight::normal, font_style fs = font_style::normal);

Requires: sz > 0.
Effects: Constructs an object of type basic_font.
Postconditions: data() == GraphicsSurfaces::text::create_font(family, fsu, sz, fw, fs).
Remarks: The font is chosen by the implementation using gfn together with the other arguments to perform matching (see 12.11.2).
The font family is the name of the font chosen by the implementation. The size units type is fsu. The font size is sz. The font weight is the font weight of the font chosen by the implementation. The font style is the font style of the font chosen by the implementation. The stretch value is stretch. The strike through value is strike. The font line value is fl. The merging value is true.
[Note: The merging value is true because the intention of this constructor is to support as many characters as possible, in the manner specified by the CSS Fonts Specification. The user is mostly
surrendering control of the choice of a font family in exchange for this expansive character support. It can be changed using the merging member function, but this is strongly discouraged. — end note

12.11.5 Accessors  

const data_type& data() const noexcept;
data_type& data() noexcept;

1 Returns: A reference to the basic_font object’s data object (See: 17.2.5.1).
2 Remarks: The behavior of a program is undefined if the user modifies the data contained in the data_type object returned by this function.

12.11.6 basic_font modifiers  

void font_size(font_size_units fsu, float sz) noexcept;

1 Requires: sz > 0.
2 Effects: Calls GraphicsSurfaces::text::font_size(data(), fsu, sz).
3 Remarks: The size units type is fsu. The font size is sz.

void merging(bool m) noexcept;
4 Effects: Calls GraphicsSurfaces::text::merging(data(), m).
5 Remarks: The merging value is m.

12.11.7 basic_font observers  

float font_size() const noexcept;
1 Returns: GraphicsSurfaces::text::font_size(data()).
2 Remarks: The returned value is the font size.

font_size_units size_units() const noexcept;
3 Returns: GraphicsSurfaces::text::size_units(data()).
4 Remarks: The returned value is the size units type.

string family() const noexcept;
5 Returns: GraphicsSurfaces::text::family(data()).
6 Remarks: The returned value is the font family. If matching occurred (see: 12.11.2), the value is the name of the family that the implementation chose.

font_weight weight() const noexcept;
7 Returns: GraphicsSurfaces::text::weight(data()).
8 Remarks: The returned value is the font weight.

font_style style() const noexcept;
9 Returns: GraphicsSurfaces::text::style(data()).
10 Remarks: The returned value is the font style.

bool merging() const noexcept;
11 Returns: GraphicsSurfaces::text::merging(data()).
12 Remarks: The returned value is the merging value.

12.12 Class template basic_font_database  

12.12.1 basic_font_database summary  

The basic_font_database class provides a way to get a list of all font families available in the environment the program is running in.

1 It has no public data.

§ 12.12.1
The data are stored in an object of type typename GraphicsSurfaces::text::font_database_data_type. It is accessible using the data member function.

12.12.2 basic_font_database matching

12.12.3 basic_font_database synopsis

namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_font_database {
    public:
      using data_type = typename GraphicsSurfaces::text::font_database_data_type;

      // 12.12.4, construct:
      basic_font_database();

      // 12.12.5, accessors:
      const data_type& data() const noexcept;
      data_type& data() noexcept;

      // 12.12.6, observers:
      vector<string> get_families() const noexcept;
  };
}

12.12.4 basic_font_database constructor

basic_font_database();

Effects: Constructs an object of type basic_font_database.

Postconditions: data() == GraphicsSurfaces::text::create_font_database().

12.12.5 Accessors

const data_type& data() const noexcept;

data_type& data() noexcept;

Returns: A reference to the basic_font_database object’s data object (See: 17.2.5.1).

Remarks: The behavior of a program is undefined if the user modifies the data contained in the data_type object returned by this function.

12.12.6 basic_font_database observers

vector<string> get_families() const noexcept;

Returns: GraphicsSurfaces::text::get_families(data()).

Remarks: The returned value is a collection containing the names of all font families available in the environment the program is running in.

§ 12.12.6
13 Paths

13.1 Overview of paths

Paths define geometric objects which can be stroked (Table 38), filled, and used to define a clip area (See: 15.11.1).

A path contains zero or more figures.

A figure is composed of at least one segment.

A figure may contain degenerate segments. When a path is interpreted (13.3.16), degenerate segments are removed from figures. \[ Note: \] If a path command exists or is inserted between segments, it’s possible that points which might have compared equal will no longer compare equal as a result of interpretation (13.3.16). —end note

Paths provide vector graphics functionality. As such they are particularly useful in situations where an application is intended to run on a variety of platforms whose output devices (16.3.9) span a large gamut of sizes, both in terms of measurement units and in terms of a horizontal and vertical pixel count, in that order.

A basic_interpreted_path object is an immutable resource wrapper containing a path (13.4). A basic_interpreted_path object is created by interpreting the path contained in a basic_path_builder object. It can also be default constructed, in which case the basic_interpreted_path object contains no figures. \[ Note: \] basic_interpreted_path objects provide significant optimization opportunities for implementations. Because they are immutable and opaque, they are intended to be used to store a path in the most efficient representation available. —end note

13.2 Path examples (Informative)

13.2.1 Overview

Paths are composed of zero or more figures. The following examples show the basics of how paths work in practice.

Every example is placed within the following code at the indicated spot. This code is shown here once to avoid repetition:

```cpp
#include <experimental/io2d>
using namespace std;
using namespace std::experimental::io2d;

int main() {
    auto imgSfc = make_image_surface(format::argb32, 300, 200);
    brush backBrush{ rgba_color::black };
    brush foreBrush{ rgba_color::white };
    render_props aliased{ antialias::none };
    path_builder pb{);
    imgSfc.paint(backBrush);
    // Example code goes here.
    // Example code ends.
    imgSfc.save(filesystem::path("example.png"), image_file_format::png);
    return 0;
}
```

13.2.2 Example 1

Example 1 consists of a single figure, forming a trapezoid:

```cpp
pb.new_figure({ 80.0f, 20.0f }); // Begins the figure.
pb.line({ 220.0f, 20.0f }); // Creates a line from the [80, 20] to [220, 20].
pb.rel_line({ 60.0f, 160.0f }); // Line from [220, 20] to
```

§ 13.2.2
13.2.3 Example 2

Example 2 consists of two figures. The first is a rectangular open figure (on the left) and the second is a rectangular closed figure (on the right):

pb.new_figure({ 20.0f, 20.0f }); // Begin the first figure.
pb.rel_line({ 100.0f, 0.0f });
pb.rel_line({ 0.0f, 160.0f });
pb.rel_line({ -100.0f, 0.0f });
pb.rel_line({ 0.0f, -160.0f });

pb.new_figure({ 180.0f, 20.0f }); // End the first figure and begin the second figure.
pb.rel_line({ 100.0f, 0.0f });
pb.rel_line({ 0.0f, 160.0f });
pb.rel_line({ -100.0f, 0.0f });
pb.close_figure(); // End the second figure.
imgSfc.stroke(foreBrush, pb, nullopt, stroke_props{ 10.0f }, nullopt, aliased);
The resulting image from example 2 shows the difference between an open figure and a closed figure. Each figure begins and ends at the same point. The difference is that with the closed figure, that the rendering of the point where the initial segment and final segment meet is controlled by the line_join value in the stroke_props class, which in this case is the default value of line_join::miter. In the open figure, the rendering of that point receives no special treatment such that each segment at that point is rendered using the line_cap value in the stroke_props class, which in this case is the default value of line_cap::none.

That difference between rendering as a line_join versus rendering as two line_caps is what causes the notch to appear in the open segment. Segments are rendered such that half of the stroke width is rendered on each side of the point being evaluated. With no line cap, each segment begins and ends exactly at the point specified.

So for the open figure, the first line begins at point_2d{ 20.0f, 20.0f } and the last line ends there. Given the stroke width of 10.0f, the visible result for the first line is a rectangle with an upper left corner of point_2d{ 20.0f, 15.0f } and a lower right corner of point_2d{ 120.0f, 25.0f }. The last line appears as a rectangle with an upper left corner of point_2d{ 15.0f, 20.0f } and a lower right corner of point_2d{ 25.0f, 180.0f }. This produces the appearance of a square gap between point_2d{ 15.0f, 15.0f } and point_2d{20.0f, 20.0f }.

For the closed figure, adjusting for the coordinate differences, the rendering facts are the same as for the open figure except for one key difference: the point where the first line and last line meet is rendered as a line join rather than two line caps, which, given the default value of line_join::miter, produces a miter, adding that square area to the rendering result.

13.2.4  Example 3

Example 3 demonstrates open and closed figures each containing either a quadratic curve or a cubic curve.

```plaintext
pb.new_figure({ 20.0f, 20.0f });
pb.rel_quadratic_curve({ 60.0f, 120.0f }, { 60.0f, -120.0f });
pb.rel_new_figure({ 20.0f, 0.0f });
pb.rel_quadratic_curve({ 60.0f, 120.0f }, { 60.0f, -120.0f });
pb.close_figure();
pb.new_figure({ 20.0f, 150.0f });
pb.rel_cubic_curve({ 40.0f, -120.0f }, { 40.0f, 120.0f * 2.0f },
    { 40.0f, -120.0f });
pb.rel_new_figure({ 20.0f, 0.0f });
pb.rel_cubic_curve({ 40.0f, -120.0f }, { 40.0f, 120.0f * 2.0f },
    { 40.0f, -120.0f });
pb.close_figure();
imgSfc.stroke(foreBrush, pb, nullopt, nullopt, nullopt, aliased);
```
13.2.5 Example 4

Example 4 shows how to draw 'C++' using figures.

For the 'C', it is created using an arc. A scaling matrix is used to make it slightly elliptical. It is also desirable that the arc has a fixed center point, point_2d\{ 85.0f, 100.0f \}. The inverse of the scaling matrix is used in combination with the point_for_angle function to determine the point at which the arc should begin in order to get achieve this fixed center point. The 'C' is then stroked.

Unlike the 'C', which is created using an open figure that is stroked, each '+' is created using a closed figure that is filled. To avoid filling the 'C', pb.clear(); is called to empty the container. The first '+' is created using a series of lines and is then filled.

Taking advantage of the fact that path_builder is a container, rather than create a brand new figure for the second '+', a translation matrix is applied by inserting a figure_items::change_matrix figure item before the figure_items::new_figure object in the existing plus, reverting back to the old matrix immediately after the and then filling it again.

```cpp
// Create the 'C'.
const matrix_2d scl = matrix_2d::init_scale({ 0.9f, 1.1f });
auto pt = scl.inverse().transform_pt({ 85.0f, 100.0f }) +
    point_for_angle(half_pi<float> / 2.0f, 50.0f);
pb.matrix(scl);
pb.new_figure(pt);
pb.arc({ 50.0f, 50.0f }, three_pi_over_two<float>, half_pi<float> / 2.0f);
imgSfc.stroke(foreBrush, pb, nullopt, stroke_props{ 10.0f });
// Create the first '+'.
pb.clear();
pb.new_figure({ 130.0f, 105.0f });
pb.rel_line({ 0.0f, -10.0f });
pb.rel_line({ 25.0f, 0.0f });
pb.rel_line({ 0.0f, -25.0f });
pb.rel_line({ 10.0f, 0.0f });
pb.rel_line({ 0.0f, 25.0f });
pb.rel_line({ 25.0f, 0.0f });
pb.rel_line({ 0.0f, 10.0f });
pb.rel_line({ -25.0f, 0.0f });
pb.rel_line({ -10.0f, 0.0f });
pb.rel_line({ 0.0f, -25.0f });
```
pb.close_figure();
imgSfc.fill(foreBrush, pb);
// Create the second '+'.
pb.insert(pb.begin(), figure_items::change_matrix(
    matrix_2d::init_translate({ 80.0f, 0.0f })));
imgSfc.fill(foreBrush, pb);

Figure 4 — Path example 4

13.3 Class template basic_figure_items

13.3.1 Introduction

The nested classes within the class template basic_figure_items describe figure items.

A figure begins with an abs_new_figure or rel_new_figure object. A figure ends when:

1. A close_figure object is encountered;
2. An abs_new_figure or rel_new_figure object is encountered; or
3. There are no more figure items in the path.

The basic_path_builder class is a sequential container that contains a path. It provides a simple interface for building a path. A path can also be created using any container that stores basic_figure_items<GraphicsSurfaces>::figure_item objects.

13.3.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items {
        public:
            class abs_new_figure;
            class rel_new_figure;
            class close_figure;
            class abs_matrix;
            class rel_matrix;
            class revert_matrix;
            class abs_cubic_curve;
            class rel_cubic_curve;
            class abs_line;
            class rel_line;
            class abs_quadratic_curve;
            class rel_quadratic_curve;
            class arc;
    }
using figure_item = variant<abs_new_figure, rel_new_figure,
close_figure, abs_matrix, rel_matrix, revert_matrix, abs_cubic_curve,
rel_cubic_curve, abs_line, rel_line, abs_quadratic_curve,
rel_quadratic_curve, arc>;

13.3.3 Class template basic_figure_items<GraphicsSurfaces>::abs_new_figure

13.3.3.1 Overview
The class template basic_figure_items<GraphicsSurfaces>::abs_new_figure describes a figure item that is a new figure command.

It has an at point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>.

The data are stored in an object of type typename GraphicsSurfaces::paths::abs_new_figure_data_type. It is accessible using the data member functions.

13.3.3.2 Synopsis
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::abs_new_figure {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::paths::abs_new_figure_data_type;

            // 13.3.3.3, construct:
            abs_new_figure();
            explicit abs_new_figure(const basic_point_2d<graphics_math_type>& pt);
            abs_new_figure(const abs_new_figure& other) = default;
            abs_new_figure(abs_new_figure&& other) noexcept = default;

            // assign:
            abs_new_figure& operator=(const abs_new_figure& other) = default;
            abs_new_figure& operator=(abs_new_figure&& other) noexcept = default;

            // 13.3.3.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 13.3.3.5, modifiers:
            void at(const basic_point_2d<graphics_math_type>& pt) noexcept;

            // 13.3.3.6, observers:
            basic_point_2d<graphics_math_type> at() const noexcept;
    }

    // 13.3.3.7, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& lhs,
                    const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& rhs)
        noexcept;

    template <class GraphicsSurfaces>
    bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& lhs,
                    const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& rhs)
        noexcept;
}

13.3.3.3 Constructors
abs_new_figure();

Effects: Constructs an object of type abs_new_figure.
Postconditions: \( \text{data}() == \text{GraphicsSurfaces::paths::create_abs_new_figure()} \).

Remarks: The at point is \text{basic_point_2d<graphics_math_type>}().

\begin{verbatim}
explicit abs_new_figure(const basic_point_2d<graphics_math_type>& pt);
\end{verbatim}

Effects: Constructs an object of type abs_new_figure.

Postconditions: \( \text{data}() == \text{GraphicsSurfaces::paths::create_abs_new_figure(pt)} \).

Remarks: The at point is pt.

13.3.3.4 Accessors

\begin{verbatim}
const data_type& data() const noexcept;
data_type& data() noexcept;
\end{verbatim}

Returns: A reference to the abs_new_figure object’s data object (See: 13.3.3.1).

13.3.3.5 Modifiers

\begin{verbatim}
void at(const basic_point_2d<graphics_math_type>& pt) noexcept;
\end{verbatim}

Effects: Calls GraphicsSurfaces::paths::at(data(), pt).

Remarks: The at point is pt.

13.3.3.6 Observers

\begin{verbatim}
basic_point_2d<graphics_math_type> at() const noexcept;
\end{verbatim}

Returns: GraphicsSurfaces::paths::at(data()).

Remarks: The returned value is the at point.

13.3.3.7 Equality operators

\begin{verbatim}
template <class GraphicsSurfaces>
bool operator==(
    const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& rhs);

bool operator!=(
    const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::abs_new_figure& rhs);
\end{verbatim}

Returns: GraphicsSurfaces::paths::equal(lhs, rhs).

Returns: GraphicsSurfaces::paths::not_equal(lhs, rhs).

13.3.4 Class template basic_figure_items<GraphicsSurfaces>::rel_new_figure

13.3.4.1 Overview

The class template basic_figure_items<GraphicsSurfaces>::rel_new_figure describes a figure item that is a new figure command.

It has an at point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>.

The data are stored in an object of type typename GraphicsSurfaces::paths::rel_new_figure_data_type. It is accessible using the data member functions.

13.3.4.2 Synopsis

\begin{verbatim}
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::rel_new_figure {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::paths::rel_new_figure_data_type;
    }
\end{verbatim}
Constructors

rel_new_figure() noexcept;

Effects: Constructs an object of type rel_new_figure.

Postconditions: data() == GraphicsSurfaces::paths::create_rel_new_figure().

Remarks: The at point is basic_point_2d<graphics_math_type>().

explicit rel_new_figure(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;

Effects: Constructs an object of type rel_new_figure.

Postconditions: data() == GraphicsSurfaces::paths::create_rel_new_figure(pt).

Remarks: The at point is pt.

Accessors

const data_type& data() const noexcept;

data_type& data() noexcept;

Returns: A reference to the rel_new_figure object’s data object (See: 13.3.4.1).

Modifiers

void at(const basic_point_2d<graphics_math_type>& pt) noexcept;

Effects: Calls GraphicsSurfaces::paths::at(data(), pt).

Remarks: The at point is pt.
13.3.4.6 Observers

basic_point_2d<graphics_math_type> at() const noexcept;

1

Returns: GraphicsSurfaces::paths::at(data()).

2

Remarks: The returned value is the at point.

13.3.4.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_new_figure& lhs, const typename basic_figure_items<GraphicsSurfaces>::rel_new_figure& rhs) noexcept;

1

Returns: GraphicsSurfaces::paths::equal(lhs, rhs).

2

template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::rel_new_figure& lhs, const typename basic_figure_items<GraphicsSurfaces>::rel_new_figure& rhs) noexcept;

13.3.5 Class template basic_figure_items<GraphicsSurfaces>::close_figure

13.3.5.1 Overview

The class template basic_figure_items<GraphicsSurfaces>::close_figure describes a figure item that is a close figure command.

13.3.5.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::close_figure {
    public:
        // construct:
        close_figure() = default;
        close_figure(const close_figure& other) = default;
        close_figure(close_figure&& other) noexcept = default;

        // assign:
        close_figure& operator=(const close_figure& other) = default;
        close_figure& operator=(close_figure&& other) noexcept = default;
    };

    // 13.3.5.3, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(const typename basic_figure_items<GraphicsSurfaces>::close_figure& lhs, const typename basic_figure_items<GraphicsSurfaces>::close_figure& rhs) noexcept;
    template <class GraphicsSurfaces>
    bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::close_figure& lhs, const typename basic_figure_items<GraphicsSurfaces>::close_figure& rhs) noexcept;
}

13.3.5.3 Equality operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::close_figure& lhs, const typename basic_figure_items<GraphicsSurfaces>::close_figure& rhs)

§ 13.3.5.3 112
template <class GraphicsSurfaces>
bool operator!=(
    const typename basic_figure_items<GraphicsSurfaces>::close_figure& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::close_figure& rhs)
noexcept;

Returns: false.

13.3.6 Class template basic_figure_items<GraphicsSurfaces>::abs_matrix
[io2d.absmatrix]

13.3.6.1 Overview
[io2d.absmatrix.intro]
The class template basic_figure_items<GraphicsSurfaces>::abs_matrix describes a figure item that is
a path command.

It has a transform matrix of type basic_matrix_2d<GraphicsSurfaces::graphics_math_type>.
The data are stored in an object of type typename GraphicsSurfaces::paths::abs_matrix_data_type.
It is accessible using the data member functions.

13.3.6.2 Synopsis
[io2d.absmatrix.synopsis]

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::abs_matrix {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::paths::abs_matrix_data_type;

            // 13.3.6.3, construct:
            abs_matrix();
            explicit abs_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;
            abs_matrix(const abs_matrix& other) = default;
            abs_matrix(abs_matrix&& other) noexcept = default;

            // assign:
            abs_matrix& operator=(const abs_matrix& other) = default;
            abs_matrix& operator=(abs_matrix&& other) noexcept = default;

            // 13.3.6.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 13.3.6.5, modifiers:
            void matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

            // 13.3.6.6, observers:
            basic_matrix_2d<graphics_math_type> matrix() const noexcept;
    };

    // 13.3.6.7, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& lhs,
                    const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& rhs)
    noexcept;
    template <class GraphicsSurfaces>
    bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& lhs,
                    const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& rhs)
    noexcept;
}
13.3.6.3 Constructors

```cpp
abs_matrix() noexcept;
```

1 Effects: Constructs an abs_matrix object.
2 Postconditions: data() == GraphicsSurfaces::paths::create_abs_matrix().
3 Remarks: The transform matrix is basic_matrix_2d<graphics_math_type>().

```cpp
explicit abs_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;
```

4 Requires: m.is_invertible() is true.
5 Effects: Constructs an abs_matrix object.
6 Postconditions: data() == GraphicsSurfaces::paths::create_abs_matrix(m).
7 Remarks: The transform matrix is m.

13.3.6.4 Accessors

```cpp
const data_type& data() const noexcept;
data_type& data() noexcept;
```

1 Returns: A reference to the abs_matrix object’s data object (See: 13.3.6.1).

13.3.6.5 Modifiers

```cpp
void matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;
```

1 Requires: m.is_invertible() is true.
2 Effects: The transform matrix is m.

13.3.6.6 Observers

```cpp
basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type> matrix() const noexcept;
```

1 Returns: The transform matrix.

13.3.6.7 Equality operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& rhs) noexcept;
```

1 Returns: lhs.matrix() == rhs.matrix().

```cpp
template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::abs_matrix& rhs) noexcept;
```

2 Returns: lhs.matrix() != rhs.matrix().

13.3.7 Class template basic_figure_items<GraphicsSurfaces>::rel_matrix

1 Overview

The class template basic_figure_items<GraphicsSurfaces>::rel_matrix describes a figure item that is a path command.

2 It has a transform matrix of type basic_matrix_2d<GraphicsSurfaces::graphics_math_type>.
3 The data are stored in an object of type typename GraphicsSurfaces::paths::rel_matrix_data_type. It is accessible using the data member functions.
### 13.3.7.2 Synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::rel_matrix {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::paths::rel_matrix_data_type;

            // 13.3.7.3, construct:
            rel_matrix();
            explicit rel_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;
            rel_matrix(const rel_matrix& other) = default;
            rel_matrix(rel_matrix&& other) noexcept = default;

            // assign:
            rel_matrix& operator=(const rel_matrix& other) = default;
            rel_matrix& operator=(rel_matrix&& other) noexcept = default;

            // 13.3.7.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 13.3.7.5, modifiers:
            void matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

            // 13.3.7.6, observers:
            basic_matrix_2d<graphics_math_type> matrix() const noexcept;
    }

    // 13.3.7.7, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& lhs,
                    const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& rhs) noexcept;
    template <class GraphicsSurfaces>
    bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& lhs,
                    const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& rhs) noexcept;
}
```

### 13.3.7.3 Constructors

- **rel_matrix() noexcept**

  **Effects:** Equivalent to: `rel_matrix{ basic_matrix_2d() };`

  **Postconditions:** `data() == GraphicsSurfaces::paths::create_rel_matrix()`.

- **explicit rel_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept**

  **Requires:** `m.is_invertible()` is true.

  **Effects:** Constructs an object of type `rel_matrix`.

  **Remarks:** The transform matrix is `m`.

### 13.3.7.4 Accessors

- **const data_type& data() const noexcept;**

  **Returns:** A reference to the `rel_matrix` object’s data object (See: 13.3.7.1).

- **data_type& data() noexcept;**

---

§ 13.3.7.4
13.3.7.5 Modifiers

```cpp
void matrix(const basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>& m) noexcept;
```

1 Requires: `m.is_invertible()` is true.
2 Effects: The transform matrix is `m`.

13.3.7.6 Observers

```cpp
basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type> matrix() const noexcept;
```

1 Returns: The transform matrix.

13.3.7.7 Equality operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& lhs,
const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& rhs) noexcept;
```

1 Returns: `lhs.matrix() == rhs.matrix()`.

```cpp
template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& lhs,
const typename basic_figure_items<GraphicsSurfaces>::rel_matrix& rhs) noexcept;
```

2 Returns: `lhs.matrix() != rhs.matrix()`.

13.3.8 Class template basic_figure_items<GraphicsSurfaces>::revert_matrix

13.3.8.1 Overview

The class template `basic_figure_items<GraphicsSurfaces>::revert_matrix` describes a figure item that is a path command.

13.3.8.2 Synopsis

```cpp
namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_figure_items<GraphicsSurfaces>::revert_matrix {
    public:
      // construct:
      revert_matrix() = default;
      revert_matrix(const revert_matrix& other) = default;
      revert_matrix(revert_matrix&& other) noexcept = default;

      // assign:
      revert_matrix& operator=(const revert_matrix& other) = default;
      revert_matrix& operator=(revert_matrix&& other) noexcept = default;
    }

    // 13.3.8.3, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& lhs,
                   const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& rhs) noexcept;

    template <class GraphicsSurfaces>
    bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& lhs,
                   const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& rhs) noexcept;
  };
}
```

§ 13.3.8.2 116
13.3.8.3 Equality operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& lhs,
               const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& rhs) noexcept;

Returns: true.
```

```cpp
template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& lhs,
               const typename basic_figure_items<GraphicsSurfaces>::revert_matrix& rhs) noexcept;

Returns: false.
```

13.3.9 Class template basic_figure_items<GraphicsSurfaces>::abs_cubic_curve

13.3.9.1 Overview

The class basic_figure_items<GraphicsSurfaces>::abs_cubic_curve describes a figure item that is a segment.

It has a first control point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>, a second control point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>, and an end point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>.

The data are stored in an object of type typename GraphicsSurfaces::paths::abs_cubic_curve_data_type. It is accessible using the data member functions.

13.3.9.2 Synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::abs_cubic_curve {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::paths::abs_cubic_curve_data_type;

            // 13.3.9.3, construct:
            abs_cubic_curve();
            abs_cubic_curve(const basic_point_2d<graphics_math_type>& cpt1,
                            const basic_point_2d<graphics_math_type>& cpt2,
                            const basic_point_2d<graphics_math_type>& ept) noexcept;
            abs_cubic_curve(const abs_cubic_curve& other) = default;
            abs_cubic_curve(abs_cubic_curve&& other) noexcept = default;

            // assign:
            abs_cubic_curve& operator=(const abs_cubic_curve& other) = default;
            abs_cubic_curve& operator=(abs_cubic_curve&& other) noexcept = default;

            // 13.3.9.4, accessor:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 13.3.9.5, modifier:
            void control_pt1(const basic_point_2d<graphics_math_type>& cpt) noexcept;
            void control_pt2(const basic_point_2d<graphics_math_type>& cpt) noexcept;
            void end_pt(const basic_point_2d<graphics_math_type>& ept) noexcept;

            // 13.3.9.6, observer:
            basic_point_2d<graphics_math_type> control_pt1() const noexcept;
            basic_point_2d<graphics_math_type> control_pt2() const noexcept;
            basic_point_2d<graphics_math_type> end_pt() const noexcept;
    }
}
```
13.3.9.7, equality operators:

```cpp
// 13.3.9.7, equality operators:
template <class GraphicsSurfaces>
bool operator==(
    const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& rhs)
noexcept;
template <class GraphicsSurfaces>
bool operator!=(
    const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& lhs,
    const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& rhs)
noexcept;
```

13.3.9.3 Constructors

```cpp
abs_cubic_curve() noexcept;
```

**Effects:** Equivalent to `abs_cubic_curve{ basic_point_2d(), basic_point_2d(), basic_point_2d() }`.

```cpp
abs_cubic_curve(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt1,
    const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt2,
    const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
```

**Effects:** Constructs an object of type `abs_cubic_curve`.

**Remarks:** The first control point is `cpt1`.

**Remarks:** The second control point is `cpt2`.

**Remarks:** The end point is `ept`.

13.3.9.4 Accessors

```cpp
const data_type& data() const noexcept;
data_type& data() noexcept;
```

**Returns:** A reference to the `rel_matrix` object’s data object (See: 13.3.9.1).

13.3.9.5 Modifiers

```cpp
void control_pt1(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
```

**Effects:** The first control point is `cpt`.

```cpp
void control_pt2(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
```

**Effects:** The second control point is `cpt`.

```cpp
void end_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
```

**Effects:** The end point is `ept`.

13.3.9.6 Observers

```cpp
basic_point_2d<graphics_math_type> control_pt1() const noexcept;
```

**Returns:** The first control point.

```cpp
basic_point_2d<graphics_math_type> control_pt2() const noexcept;
```

**Returns:** The second control point.

```cpp
basic_point_2d<graphics_math_type> end_pt() const noexcept;
```

**Returns:** The end point.
13.3.9.7 Equality operators
[io2d.abscubiccurve.eq]

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& lhs,
const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& rhs)
noexcept;

1 Returns: lhs.control_pt1() == rhs.control_pt1() && lhs.control_pt2() == rhs.control_pt2() &&
lhs.end_pt() == rhs.end_pt().

template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& lhs,
const typename basic_figure_items<GraphicsSurfaces>::abs_cubic_curve& rhs)
noexcept;

2 Returns: lhs.control_pt1() != rhs.control_pt1() || lhs.control_pt2() != rhs.control_pt2() ||
lhs.end_pt() != rhs.end_pt().

13.3.10 Class template basic_figure_items<GraphicsSurfaces>::rel_cubic_curve
[io2d.relcubiccurve]

13.3.10.1 Overview
[io2d.relcubiccurve.intro]
1 The class basic_figure_items<GraphicsSurfaces>::rel_cubic_curve describes a figure item that is a
segment.
2 It has a first control point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>, a second
control point of type basic_point_2d<GraphicsSurfaces::graphics_math_type>, and an end point of
type basic_point_2d<GraphicsSurfaces::graphics_math_type>.
3 The data are stored in an object of type typename GraphicsSurfaces::paths::rel_cubic_curve_data_type.
It is accessible using the data member functions.

13.3.10.2 Synopsis
[io2d.relcubiccurve.synopsis]

namespace std::experimental::io2d::v1 {
template <class GraphicsSurfaces>
class basic_figure_items<GraphicsSurfaces>::rel_cubic_curve {
public:
using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
using data_type = typename GraphicsSurfaces::paths::rel_cubic_curve_data_type;

// 13.3.10.3, construct:
rel_cubic_curve();
rel_cubic_curve(const basic_point_2d<graphics_math_type>& cpt1,
const basic_point_2d<graphics_math_type>& cpt2,
const basic_point_2d<graphics_math_type>& ept) noexcept;
rel_cubic_curve(const rel_cubic_curve& other) = default;
rel_cubic_curve(rel_cubic_curve&& other) noexcept = default;

// assign:
rel_cubic_curve& operator=(const rel_cubic_curve& other) = default;
rel_cubic_curve& operator=(rel_cubic_curve&& other) noexcept = default;

// 13.3.10.4, accessors:
const data_type& data() const noexcept;
data_type& data() noexcept;

// 13.3.10.5, modifiers:
void control_pt1(const basic_point_2d<graphics_math_type>& cpt) noexcept;
void control_pt2(const basic_point_2d<graphics_math_type>& cpt) noexcept;
void end_pt(const basic_point_2d<graphics_math_type>& ept) noexcept;

§ 13.3.10.2 119
13.3.10.6, observers:

```cpp
basic_point_2d<graphics_math_type> control_pt1() const noexcept;
basic_point_2d<graphics_math_type> control_pt2() const noexcept;
basic_point_2d<graphics_math_type> end_pt() const noexcept;
};
```

13.3.10.7, equality operators:

```cpp
template <class GraphicsSurfaces>
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& lhs,
const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& rhs) noexcept;

bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& lhs,
const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& rhs) noexcept;
```

13.3.10.3 Constructors [io2d.relcubiccurve.ctor]

```cpp
rel_cubic_curve() noexcept;
rel_cubic_curve(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt1,
const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt2,
const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
```

13.3.10.4 Accessors [io2d.relcubiccurve.acc]

```cpp
const data_type& data() const noexcept;
data_type& data() noexcept;
```

13.3.10.5 Modifiers [io2d.relcubiccurve.mod]

```cpp
void control_pt1(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
void control_pt2(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;
void end_pt(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;
```

13.3.10.6 Observers [io2d.relcubiccurve.obs]

```cpp
basic_point_2d<graphics_math_type> control_pt1() const noexcept;
basic_point_2d<graphics_math_type> control_pt2() const noexcept;
```
basic_point_2d<graphics_math_type> end_pt() const noexcept;

Returns: The end point.

13.3.10.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& lhs,
               const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& rhs)
               noexcept;

Returns: lhs.control_pt1() == rhs.control_pt1() && lhs.control_pt2() == rhs.control_pt2() &&
               lhs.end_pt() == rhs.end_pt() n

template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& lhs,
               const typename basic_figure_items<GraphicsSurfaces>::rel_cubic_curve& rhs)
               noexcept;

Returns: lhs.control_pt1() != rhs.control_pt1() || lhs.control_pt2() != rhs.control_pt2()
          || lhs.end_pt() != rhs.end_pt() n

13.3.11 Class template basic_figure_items<GraphicsSurfaces>::abs_line

13.3.11.1 Overview

The class basic_figure_items<GraphicsSurfaces>::abs_line describes a figure item that is a segment.

It has an end point of type basic_point_2d<GraphicsSurfaces>::graphics_math_type.

The data are stored in an object of type typename GraphicsSurfaces::paths::abs_line_data_type. It

is accessible using the data member functions.

13.3.11.2 Synopsis

namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_figure_items<GraphicsSurfaces>::abs_line {
    public:
      using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
      using data_type =
                     typename GraphicsSurfaces::paths::abs_line_data_type;

    // 13.3.11.3, construct:
    abs_line();
    explicit abs_line(const basic_point_2d<graphics_math_type>& pt);
    abs_line(const abs_line& other) = default;
    abs_line(abs_line&& other) noexcept = default;

    // assign:
    abs_line& operator=(const abs_line& other) = default;
    abs_line& operator=(abs_line&& other) noexcept = default;

    // 13.3.11.4, accessors:
    const data_type& data() const noexcept;
    data_type& data() noexcept;

    // 13.3.11.5, modifiers:
    void at(const basic_point_2d<graphics_math_type>& pt) noexcept;

    // 13.3.11.6, observers:
    basic_point_2d<graphics_math_type> at() const noexcept;
  };
13.3.11.7 Equality operators

```cpp
// 13.3.11.7, equality operators:
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_line& lhs,
                const typename basic_figure_items<GraphicsSurfaces>::abs_line& rhs)
    noexcept;

template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::abs_line& lhs,
                const typename basic_figure_items<GraphicsSurfaces>::abs_line& rhs)
    noexcept;
```

13.3.11.3 Constructors

```cpp
abs_line() noexcept;
```

Effects: Equivalent to: `abs_line{ basic_point_2d() }`.

```cpp
explicit abs_line(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& pt) noexcept;
```

Effects: Constructs an object of type `abs_line`.

Remarks: The end point is `pt`.

13.3.11.4 Accessors

```cpp
const data_type& data() const noexcept;
data_type& data() noexcept;
```

Returns: A reference to the `abs_line` object’s data object (See: 13.3.11.1).

13.3.11.5 Modifiers

```cpp
void to(const basic_point_2d<graphics_math_type>& pt) noexcept;
```

Effects: The end point is `pt`.

13.3.11.6 Observers

```cpp
basic_point_2d<graphics_math_type> to() const noexcept;
```

Returns: The end point.

13.3.11.7 Equality operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::abs_line& lhs,
                const typename basic_figure_items<GraphicsSurfaces>::abs_line& rhs)
    noexcept;
```

Returns: `lhs.to() == rhs.to()`.

```cpp
template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::abs_line& lhs,
                const typename basic_figure_items<GraphicsSurfaces>::abs_line& rhs)
    noexcept;
```

Returns: `lhs.to() != rhs.to()`.

13.3.12 Class rel_line

13.3.12.1 Overview

The class `basic_figure_items<GraphicsSurfaces>::rel_line` describes a figure item that is a segment.

It has an end point of type `basic_point_2d<GraphicsSurfaces::graphics_math_type>`.

The data are stored in an object of type `typename GraphicsSurfaces::paths::rel_line_data_type`. It is accessible using the `data` member functions.
13.3.12.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::rel_line {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type =
                typename GraphicsSurfaces::paths::rel_line_data_type;

            // 13.3.12.3, construct:
            rel_line();
            explicit rel_line(const basic_point_2d<graphics_math_type>& pt);
            rel_line(const rel_line& other) = default;
            rel_line(rel_line&& other) noexcept = default;

            // assign:
            rel_line& operator=(const rel_line& other) = default;
            rel_line& operator=(rel_line&& other) noexcept = default;

            // 13.3.12.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 13.3.12.5, modifiers:
            void at(const basic_point_2d<graphics_math_type>& pt) noexcept;

            // 13.3.12.6, observers:
            basic_point_2d<graphics_math_type> at() const noexcept;
        }
    }

    // 13.3.12.7, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(
        const typename basic_figure_items<GraphicsSurfaces>::rel_line& lhs,
        const typename basic_figure_items<GraphicsSurfaces>::rel_line& rhs)
        noexcept;
    template <class GraphicsSurfaces>
    bool operator!=(
        const typename basic_figure_items<GraphicsSurfaces>::rel_line& lhs,
        const typename basic_figure_items<GraphicsSurfaces>::rel_line& rhs)
        noexcept;
}

13.3.12.3 Constructors

rel_line() noexcept;
1
   Effects: Equivalent to: rel_line( basic_point_2d() );

explicit rel_line(const basic_point_2d<typename
    GraphicsSurfaces::graphics_math_type>& pt) noexcept;
2
   Effects: Constructs an object of type rel_line.
   Remarks: The end point is pt.

13.3.12.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;
1
   Returns: A reference to the rel_line object’s data object (See: 13.3.12.1).

13.3.12.5 Modifiers

void at(const basic_point_2d<graphics_math_type>& pt) noexcept;
1
   Effects: The end point is pt.
13.3.12.6 Observers

\texttt{basic\_point\_2d<graphics\_math\_type> to() const noexcept;}

\textit{Returns:} The end point.

13.3.12.7 Equality operators

\texttt{template <class GraphicsSurfaces> bool operator== (}
\texttt{const typename basic\_figure\_items<GraphicsSurfaces>::rel\_line& lhs,}
\texttt{const typename basic\_figure\_items<GraphicsSurfaces>::rel\_line& rhs)}
\texttt{noexcept;}

\textit{Returns:} \texttt{lhs.to()} == \texttt{rhs.to()}.

\texttt{template <class GraphicsSurfaces> bool operator!= (}
\texttt{const typename basic\_figure\_items<GraphicsSurfaces>::rel\_line& lhs,}
\texttt{const typename basic\_figure\_items<GraphicsSurfaces>::rel\_line& rhs)}
\texttt{noexcept;}

\textit{Returns:} \texttt{lhs.to()} != \texttt{rhs.to()}.

13.3.13 Class template \texttt{basic\_figure\_items<GraphicsSurfaces>::abs\_quadratic\_curve}

13.3.13.1 Overview

The class \texttt{basic\_figure\_items<GraphicsSurfaces>::abs\_quadratic\_curve} describes a figure item that is a segment.

It has a \textit{control point} of type \texttt{basic\_point\_2d<graphics\_math\_type>} and an \textit{end point} of type \texttt{basic\_point\_2d<graphics\_math\_type>}.

The data are stored in an object of type \texttt{typename GraphicsSurfaces::paths::abs\_quadratic\_curve\_data\_type}. It is accessible using the \texttt{data} member functions.

13.3.13.2 Synopsis

\texttt{namespace std::experimental::io2d::v1 {}
\texttt{template <class GraphicsSurfaces> class basic\_figure\_items<GraphicsSurfaces>::abs\_quadratic\_curve {}
\texttt{public:}
\texttt{using graphics\_math\_type = typename GraphicsSurfaces::graphics\_math\_type;}

const data_type& data() const noexcept;

1
Returns: A reference to the rel_quadratic_curve object’s data object (See: 13.3.14.1).

data_type& data() noexcept;

13.3.14.5 Modifiers

void control_pt(const basic_point_2d<
 typename GraphicsSurfaces::graphics_math_type>& cpt) noexcept;

1
Effects: The control point is cpt.

void end_pt(const basic_point_2d<
 typename GraphicsSurfaces::graphics_math_type>& ept) noexcept;

2
Effects: The end point is ept.

13.3.14.6 Observers

basic_point_2d<
 typename GraphicsSurfaces::graphics_math_type> control_pt() const noexcept;

1
Returns: The control point.

basic_point_2d<
 typename GraphicsSurfaces::graphics_math_type> end_pt() const noexcept;

2
Returns: The end point.

13.3.14.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_figure_items<GraphicsSurfaces>::rel_quadratic_curve& lhs,
 const typename basic_figure_items<GraphicsSurfaces>::rel_quadratic_curve& rhs) noexcept;

1
Returns: lhs.control_pt() == rhs.control_pt() && lhs.end_pt() == rhs.end_pt().

template <class GraphicsSurfaces>
bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::rel_quadratic_curve& lhs,
 const typename basic_figure_items<GraphicsSurfaces>::rel_quadratic_curve& rhs) noexcept;

2
Returns: lhs.control_pt() != rhs.control_pt() || lhs.end_pt() != rhs.end_pt().

13.3.15 Class template basic_figure_items<GraphicsSurfaces>::arc

13.3.15.1 Overview

The class basic_figure_items<GraphicsSurfaces>::arc describes a figure item that is a segment.

It has a radius of type basic_point_2d<GraphicsSurfaces::graphics_math_type>, a rotation of type float, and a start angle of type float.

It forms a portion of the circumference of a circle. The centre of the circle is implied by the start point, the radius and the start angle of the arc.
The data are stored in an object of type typename GraphicsSurfaces::paths::arc_data_type. It is accessible using the data member functions.

13.3.15.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_figure_items<GraphicsSurfaces>::arc {
    public:
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
        using data_type = typename GraphicsSurfaces::paths::arc_data_type;

        // 13.3.15.3, construct:
        arc();
        arc(const basic_point_2d<graphics_math_type>& rad, float rot, float sang) noexcept;
        arc(const arc& other) = default;
        arc(arc&& other) noexcept = default;

        // assign:
        arc& operator=(const arc& other) = default;
        arc& operator=(arc&& other) noexcept = default;

        // 13.3.15.4, accessors:
        const data_type& data() const noexcept;
        data_type& data() noexcept;

        // 13.3.15.5, modifiers:
        void radius(const basic_point_2d<graphics_math_type>& rad) noexcept;
        void rotation(float rot) noexcept;
        void start_angle(float radians) noexcept;

        // 13.3.15.6, observers:
        basic_point_2d<typename GraphicsSurfaces::graphics_math_type> radius() const noexcept;
        float rotation() const noexcept;
        float start_angle() const noexcept;
        basic_point_2d<graphics_math_type> center(const basic_point_2d<graphics_math_type>& cpt, const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{}) const noexcept;
        basic_point_2d<graphics_math_type> end_pt(const basic_point_2d<graphics_math_type>& cpt, const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{}) const noexcept;
    };

    // 13.3.15.7, equality operators:
    template <class GraphicsSurfaces>
    bool operator==(const typename basic_figure_items<GraphicsSurfaces>::arc& lhs, const typename basic_figure_items<GraphicsSurfaces>::arc& rhs) noexcept;
    template <class GraphicsSurfaces>
    bool operator!=(const typename basic_figure_items<GraphicsSurfaces>::arc& lhs, const typename basic_figure_items<GraphicsSurfaces>::arc& rhs) noexcept;
};

13.3.15.3 Constructors

arc() noexcept;

Effects: Equivalent to: arc{ basic_point_2d(10.0f, 10.0f), pi<float>, pi<float> };.
arc(const basic_point_2d<graphics_math_type>& rad,
    float rot, float sang) noexcept;

  Effects: Constructs an object of type arc.

  The radius is rad.

  The rotation is rot.

  The start angle is sang.

13.3.15.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

  Returns: A reference to the arc object’s data object (See: 13.3.15.1).

13.3.15.5 Modifiers

void radius(const basic_point_2d<typename GraphicsSurfaces::graphics_math_type>& rad) noexcept;

  Effects: The radius is rad.

constexpr void rotation(float rot) noexcept;

  Effects: The rotation is rot.

void start_angle(float sang) noexcept;

  Effects: The start angle is sang.

13.3.15.6 Observers

basic_point_2d<typename GraphicsSurfaces::graphics_math_type> radius() const noexcept;

  Returns: The radius.

float rotation() const noexcept;

  Returns: The rotation.

float start_angle() const noexcept;

  Returns: The start angle.

basic_point_2d<graphics_math_type> center(
    const basic_point_2d<graphics_math_type>& cpt,
    const basic_matrix_2d<graphics_math_type>& m =
    basic_matrix_2d<graphics_math_type>{} ) const noexcept;

  Returns: As-if:
    auto lmtx = m;
    lmtx.m20 = 0.0f;
    lmtx.m21 = 0.0f;
    auto centerOffset = point_for_angle(two_pi<float> - start_angle(), radius());
    centerOffset.y = -centerOffset.y;
    return cpt - centerOffset * lmtx;

basic_point_2d<graphics_math_type> end_pt(
    const basic_point_2d<graphics_math_type>& cpt,
    const basic_matrix_2d<graphics_math_type>& m =
    basic_matrix_2d<graphics_math_type>{} ) const noexcept;

  Returns: As-if:
    auto lmtx = m;
    auto tfrm = matrix_2d::init_rotate(start_angle() + rotation());
    lmtx.m20 = 0.0f;
    lmtx.m21 = 0.0f;
    auto pt = (radius() * tfrm);
    pt.y = -pt.y;
    return cpt + pt * lmtx;
13.3.15.7 Equality operators

```
template <class GraphicsSurfaces>
bool operator==(  
    const typename basic_figure_items<GraphicsSurfaces>::arc& lhs,  
    const typename basic_figure_items<GraphicsSurfaces>::arc& rhs)  
noexcept;
```

Returns:

```
lhs.radius() == rhs.radius() && lhs.rotation() == rhs.rotation() &&  
lhs.start_angle() && rhs.start_angle()
```

```
template <class GraphicsSurfaces>
bool operator!=(  
    const typename basic_figure_items<GraphicsSurfaces>::arc& lhs,  
    const typename basic_figure_items<GraphicsSurfaces>::arc& rhs)  
noexcept;
```

Returns:

```
lhs.radius() != rhs.radius() || lhs.rotation() != rhs.rotation() ||  
lhs.start_angle() != rhs.start_angle()
```

13.3.16 Path interpretation

This subclause describes how to interpret a path for use in a rendering and composing operation.

Interpreting a path consists of sequentially evaluating the figure items contained in the figures in the path and transforming them into zero or more figures as-if in the manner specified in this subclause.

The interpretation of a path requires the state data specified in Table 22.

### Table 22 — Path interpretation state data

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
<th>Type</th>
<th>Initial value</th>
</tr>
</thead>
<tbody>
<tr>
<td>mtx</td>
<td>Path transformation matrix</td>
<td>matrix_2d</td>
<td>matrix_2d{ }</td>
</tr>
<tr>
<td>currPt</td>
<td>Current point</td>
<td>point_2d</td>
<td>unspecified</td>
</tr>
<tr>
<td>lnfPt</td>
<td>Last new figure point</td>
<td>point_2d</td>
<td>unspecified</td>
</tr>
<tr>
<td>mtxStk</td>
<td>Matrix stack</td>
<td>stack&lt;matrix_2d&gt;</td>
<td>stack&lt;matrix_2d&gt;{ }</td>
</tr>
</tbody>
</table>

When interpreting a path, until a `figure_items::abs_new_figure` figure item is reached, a path shall only contain path command figure items; no diagnostic is required. If a figure is a degenerate figure, none of its figure items have any effects, with two exceptions:

- the path’s `figure_items::abs_new_figure` or `figure_items::rel_new_figure` figure item sets the value of `currPt` as-if the figure item was interpreted; and,
- any path command figure items are evaluated with full effect.

The effects of a figure item contained in a `figure_items::figure_item` object when that object is being evaluated during path interpretation are described in Table 23.

If evaluation of a figure item contained in a `figure_items::figure_item` during path interpretation results in the figure item becoming a degenerate segment, its effects are ignored and interpretation continues as-if that figure item did not exist.

### Table 23 — Figure item interpretation effects

<table>
<thead>
<tr>
<th>Figure item</th>
<th>Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>figure_items::abs_new_figure</code> p</td>
<td>Creates a new figure. Sets currPt to p.at() * mtx. Sets lnfPt to currPt.</td>
</tr>
<tr>
<td><code>figure_items::rel_new_figure</code> p</td>
<td>Let mm equal mtx. Let mm.m20 equal 0.0f. Let mm.m21 equal 0.0f. Creates a new figure. Sets currPt to currPt + p.at() * mm. Sets lnfPt to currPt.</td>
</tr>
</tbody>
</table>
Table 23 — Figure item interpretation effects (continued)

<table>
<thead>
<tr>
<th>Figure item</th>
<th>Effects</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>figure_items::close_figure p</code></td>
<td>Creates a line from <code>currPt</code> to <code>lnfPt</code>. Makes the current figure a closed figure. Creates a new figure. Sets <code>currPt</code> to <code>lnfPt</code>.</td>
</tr>
<tr>
<td><code>figure_items::abs_matrix p</code></td>
<td>Calls <code>mtxStk.push(mtx)</code>. Sets <code>mtx</code> to <code>p.matrix()</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_matrix p</code></td>
<td>Calls <code>mtxStk.push(mtx)</code>. Sets <code>mtx</code> to <code>p.matrix() * mtx</code>.</td>
</tr>
<tr>
<td><code>figure_items::revert_matrix p</code></td>
<td>If <code>mtxStk.empty()</code> is <code>false</code>, sets <code>mtx</code> to <code>mtxStk.top()</code> then calls <code>mtxStk.pop()</code>. Otherwise sets <code>mtx</code> to its initial value as specified in Table 22.</td>
</tr>
<tr>
<td><code>figure_items::abs_line p</code></td>
<td>Let <code>pt</code> equal <code>p.to() * mtx</code>. Creates a line from <code>currPt</code> to <code>pt</code>. Sets <code>currPt</code> to <code>pt</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_line p</code></td>
<td>Let <code>mm</code> equal <code>mtx</code>. Let <code>mm.m20</code> equal 0.0f. Let <code>mm.m21</code> equal 0.0f. Let <code>pt</code> equal <code>currPt + p.to() * mm</code>. Creates a line from <code>currPt</code> to <code>pt</code>. Sets <code>currPt</code> to <code>pt</code>.</td>
</tr>
<tr>
<td><code>figure_items::abs_quadratic_curve p</code></td>
<td>Let <code>cpt</code> equal <code>p.control_pt() * mtx</code>. Let <code>ept</code> equal <code>p.end_pt() * mtx</code>. Creates a quadratic Bézier curve from <code>currPt</code> to <code>ept</code> using <code>cpt</code> as the curve's control point. Sets <code>currPt</code> to <code>ept</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_quadratic_curve p</code></td>
<td>Let <code>mm</code> equal <code>mtx</code>. Let <code>mm.m20</code> equal 0.0f. Let <code>mm.m21</code> equal 0.0f. Let <code>cpt</code> equal <code>currPt + p.control_pt() * mm</code>. Let <code>ept</code> equal <code>currPt + p.control_pt() + p.end_pt() * mm</code>. Creates a quadratic Bézier curve from <code>currPt</code> to <code>ept</code> using <code>cpt</code> as the curve's control point. Sets <code>currPt</code> to <code>ept</code>.</td>
</tr>
<tr>
<td><code>figure_items::abs_cubic_curve p</code></td>
<td>Let <code>cpt1</code> equal <code>p.control_pt1() * mtx</code>. Let <code>cpt2</code> equal <code>p.control_pt2() * mtx</code>. Let <code>ept</code> equal <code>p.end_pt() * mtx</code>. Creates a cubic Bézier curve from <code>currPt</code> to <code>ept</code> using <code>cpt1</code> as the curve's first control point and <code>cpt2</code> as the curve's second control point. Sets <code>currPt</code> to <code>ept</code>.</td>
</tr>
<tr>
<td><code>figure_items::rel_cubic_curve p</code></td>
<td>Let <code>mm</code> equal <code>mtx</code>. Let <code>mm.m20</code> equal 0.0f. Let <code>mm.m21</code> equal 0.0f. Let <code>cpt1</code> equal <code>currPt + p.control_pt1() * mm</code>. Let <code>cpt2</code> equal <code>currPt + p.control_pt1() + p.control_pt2() * mm</code>. Let <code>ept</code> equal <code>currPt + p.control_pt1() + p.control_pt2() + p.end_pt() * mm</code>. Creates a cubic Bézier curve from <code>currPt</code> to <code>ept</code> using <code>cpt1</code> as the curve's first control point and <code>cpt2</code> as the curve's second control point. Sets <code>currPt</code> to <code>ept</code>.</td>
</tr>
<tr>
<td><code>figure_items::arc p</code></td>
<td>Let <code>mm</code> equal <code>mtx</code>. Let <code>mm.m20</code> equal 0.0f. Let <code>mm.m21</code> equal 0.0f. Creates an arc. It begins at <code>currPt</code>, which is at <code>p.start_angle()</code> radians on the arc and rotates <code>p.rotation()</code> radians. If <code>p.rotation()</code> is positive, rotation is counterclockwise, otherwise it is clockwise. The center of the arc is located at <code>p.center(currPt, mm)</code>. The arc ends at <code>p.end_pt(currPt, mm)</code>. Sets <code>currPt</code> to <code>p.end_pt(currPt, mm)</code>. [Note: <code>p.radius()</code>, which specifies the radius of the arc, is implicitly included in the above statement of effects by the specifications of the center of the arc and the end of the arcs. The use of the current point as the origin for the application of the path transformation matrix is also implicitly included by the same specifications. — end note]</td>
</tr>
</tbody>
</table>

13.4 Class template `basic_interpreted_path`  

13.4.1 Overview  

1 The class template `basic_interpreted_path` contains the data that result from interpreting (13.3.16) a sequence of `basic_figure_items<GraphicsSurfaces>::figure_item` objects.  

2 The data are stored in an object of type `typename GraphicsSurfaces::paths::interpreted_path_data_type`. It is accessible using the `data` member function.  

3 A `basic_interpreted_path` object is used by most rendering and composing operations.
13.4.2 basic_interpreted_path synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_interpreted_path {
        public:
            using data_type = typename
                GraphicsSurfaces::paths::interpreted_path_data_type;

            // 13.4.3, construct:
            basic_interpreted_path() noexcept;
            explicit basic_interpreted_path(
                const basic_bounding_box<GraphicsMath>& bb);
            template <class Allocator>
            explicit basic_interpreted_path(
                const basic_path_builder<GraphicsSurfaces, Allocator>& pb);
            template <class InputIterator>
            basic_interpreted_path(InputIterator first, InputIterator last);
            explicit basic_interpreted_path(initializer_list<typename
                basic_figure_items<GraphicsSurfaces>::figure_item>> il);

            // 13.4.4, accessors:
            const data_type& data() const noexcept;
    }
}
```

13.4.3 basic_interpreted_path constructors

```
basic_interpreted_path() noexcept;
    Effects: Constructs a basic_interpreted_path that contains an empty path.

explicit basic_interpreted_path(const basic_bounding_box<GraphicsMath>& bb);
    Effects: Constructs an object of type basic_interpreted_path.
    Postconditions: data() == GraphicsSurfaces::paths::create_interpreted_path(bb).

template <class Allocator>
explicit basic_interpreted_path(const basic_path_builder<GraphicsSurfaces, Allocator>& pb);
    Effects: Equivalent to: basic_interpreted_path{ begin(pb), end(pb) }.

template <class InputIterator>
basic_interpreted_path(InputIterator first, InputIterator last);
    Effects: Constructs an object of type basic_interpreted_path.
    Postconditions: data() == GraphicsSurfaces::paths::create_interpreted_path(first, last).
    [ Note: The contained path is as-if it was the result of interpreting a path containing the values of the
      elements from first to the last element before last. — end note ]

explicit basic_interpreted_path(initializer_list<typename
    basic_figure_items<GraphicsSurfaces>::figure_item>> il);
    Effects: Equivalent to basic_interpreted_path{ il.begin(), il.end() }.
```

13.4.4 Accessors

```
const data_type& data() const noexcept;
    Returns: A reference to the basic_interpreted_path object’s data object (See: 13.4.1).
```

13.5 Class basic_path_builder

```
The class basic_path_builder is a container that stores and manipulates objects of type figure_items::figure_item from which interpreted_path objects are created.
```

A basic_path_builder is a contiguous container. (See [container.requirements.general] in C++ 2017.)

The collection of figure_items::figure_item objects in a path builder is referred to as its path.
namespace std::experimental::io2d::v1 {

13.5.2 basic_path_builder container requirements

This class is a sequence container, as defined in [containers] in C++ 2017, and all sequence container
requirements that apply specifically to vector shall also apply to this class.

13.5.3 basic_path_builder constructors, copy, and assignment

basf_path_builder() noexcept(noexcept(Allocator()));

Effects: Constructs an empty basic_path_builder.

explicit basic_path_builder(const Allocator&);

Effects: Constructs an empty basic_path_builder, using the specified allocator.

Complexity: Constant.

explicit basic_path_builder(size_type n, const Allocator& = Allocator());

Effects: Constructs a basic_path_builder with n default-inserted elements using the specified allocator.

Complexity: Linear in n.

basic_path_builder(size_type n, const value_type& value,
                      const Allocator& = Allocator());

Requires: value_type shall be CopyInsertable into *this.

Effects: Constructs a basic_path_builder with n copies of value, using the specified allocator.

Complexity: Linear in n.

template <class InputIterator>
basic_path_builder(InputIterator first, InputIterator last,
                       const Allocator& = Allocator());

Effects: Constructs a basic_path_builder equal to the range [first, last), using the specified allocator.

Complexity: Makes only N calls to the copy constructor of value_type (where N is the distance
between first and last) and no reallocations if iterators first and last are of forward, bidirectional,
or random access categories. It makes order N calls to the copy constructor of value_type and order
log(N) reallocations if they are just input iterators.

13.5.4 basic_path_builder capacity

size_type capacity() const noexcept;

Returns: The total number of elements that the path builder can hold without requiring reallocation.

void reserve(size_type n);

Requires: value_type shall be MoveInsertable into *this.

Effects: A directive that informs a path builder of a planned change in size, so that it can manage the
storage allocation accordingly. After reserve(), capacity() is greater or equal to the argument of
reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation
happens at this point if and only if the current capacity is less than the argument of reserve(). If an
exception is thrown other than by the move constructor of a non-
\texttt{CopyInsertable} type, there are no effects.

\textit{Complexity:} It does not change the size of the sequence and takes at most linear time in the size of the sequence.

\textit{Throws:} \texttt{length\_error} if \( n > \max\_\text{size}() \).

\textit{Remarks:} Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. No reallocation shall take place during insertions that happen after a call to \texttt{reserve()} until the time when an insertion would make the size of the vector greater than the value of \texttt{capacity()}.

\begin{verbatim}
void shrink_to_fit();
\end{verbatim}

\textit{Requires:} \texttt{value\_type} shall be \texttt{MoveInsertable} into \*this.

\textit{Effects:} \texttt{shrink\_to\_fit} is a non-binding request to reduce \texttt{capacity()} to \texttt{size()}. \footnote{\textit{Note:} The request is non-binding to allow latitude for implementation-specific optimizations. — end note} It does not increase \texttt{capacity()}, but may reduce \texttt{capacity()} by causing reallocation. If an exception is thrown other than by the move constructor of a non-\texttt{CopyInsertable} \texttt{value\_type} there are no effects.

\textit{Complexity:} Linear in the size of the sequence.

\textit{Remarks:} Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. If no reallocation happens, they remain valid.

\begin{verbatim}
void swap(basic_path_builder&)
noexcept(algorithm_traits<Allocator>::propagate_on_container_swap::value ||
algorithm_traits<Allocator>::is_always_equal::value);
\end{verbatim}

\textit{Effects:} Exchanges the contents and \texttt{capacity()} of \*this with that of \texttt{x}.

\textit{Complexity:} Constant time.

\begin{verbatim}
void resize(size_type sz);
\end{verbatim}

\textit{Effects:} If \( sz < \text{size}() \), erases the last \texttt{size()} - \texttt{sz} elements from the sequence. Otherwise, appends \texttt{sz} - \texttt{size()} default-inserted elements to the sequence.

\textit{Requires:} \texttt{value\_type} shall be \texttt{MoveInsertable} and \texttt{DefaultInsertable} into \*this.

\textit{Remarks:} If an exception is thrown other than by the move constructor of a non-\texttt{CopyInsertable} \texttt{value\_type} there are no effects.

\begin{verbatim}
void resize(size_type sz, const value_type& c);
\end{verbatim}

\textit{Effects:} If \( sz < \text{size}() \), erases the last \texttt{size()} - \texttt{sz} elements from the sequence. Otherwise, appends \texttt{sz} - \texttt{size()} copies of \texttt{c} to the sequence.

\textit{Requires:} \texttt{value\_type} shall be \texttt{CopyInsertable} into \*this.

\textit{Remarks:} If an exception is thrown there are no effects.

\subsection*{13.5.5 \texttt{basic\_path\_builder} modifiers} \footnote{1) \texttt{reserve()} uses \texttt{Allocators::allocates()} which may throw an appropriate exception.}

\begin{verbatim}
void new_figure(point_2d pt) noexcept;
\end{verbatim}

\textit{Effects:} Adds a \texttt{figure\_items::figure\_item} object constructed from \texttt{figure\_items::abs\_new\_figure(pt)} to the end of the path.

\begin{verbatim}
void rel_new_figure(point_2d pt) noexcept;
\end{verbatim}

\textit{Effects:} Adds a \texttt{figure\_items::figure\_item} object constructed from \texttt{figure\_items::rel\_new\_figure(pt)} to the end of the path.

\begin{verbatim}
void close_figure() noexcept;
\end{verbatim}

\textit{Requires:} The current point contains a value.
**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::close_figure()` to the end of the path.

```cpp
void matrix(const matrix_2d& m) noexcept;

*Requires:* The matrix m shall be invertible.

**Effects:** Adds a `figure_items::figure_item` object constructed from `(figure_items::abs_matrix(m)` to the end of the path.

```cpp
void rel_matrix(const matrix_2d& m) noexcept;

*Requires:* The matrix m shall be invertible.

**Effects:** Adds a `figure_items::figure_item` object constructed from `(figure_items::rel_matrix(m)` to the end of the path.

```cpp
void revert_matrix() noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `(figure_items::revert_matrix()` to the end of the path.

```cpp
void line(point_2d pt) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::abs_line(pt)` to the end of the path.

```cpp
void rel_line(point_2d dpt) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::rel_line(dpt)` to the end of the path.

```cpp
void quadratic_curve(point_2d pt0, point_2d pt1) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::abs_quadratic_curve(pt0, pt1)` to the end of the path.

```cpp
void rel_quadratic_curve(point_2d dpt0, point_2d dpt1) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::rel_quadratic_curve(dpt0, dpt1)` to the end of the path.

```cpp
void cubic_curve(point_2d pt0, point_2d pt1, point_2d pt2) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::abs_cubic_curve(pt0, pt1, pt2)` to the end of the path.

```cpp
void rel_cubic_curve(point_2d dpt0, point_2d dpt1, point_2d dpt2) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::rel_cubic_curve(dpt0, dpt1, dpt2)` to the end of the path.

```cpp
void arc(point_2d rad, float rot, float sang) noexcept;

**Effects:** Adds a `figure_items::figure_item` object constructed from `figure_items::arc(rad, rot, sang)` to the end of the path.

```cpp
iterator insert(const_iterator position, const value_type& x);
iterator insert(const_iterator position, value_type&& x);
iterator insert(const_iterator position, size_type n, const value_type& x);
template <class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
iterator insert(const_iterator position, initializer_list<value_type>);
template <class... Args>
reference emplace_back(Args&&... args);
template <class... Args>
iterator emplace(const_iterator position, Args&&... args);

§ 13.5.5
void push_back(const value_type& x);
void push_back(value_type&& x);

Remarks: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence. If no reallocation happens, all the iterators and references before the insertion point remain valid. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of value_type or by any InputIterator operation there are no effects. If an exception is thrown while inserting a single element at the end and value_type is CopyInsertable or is_nothrow_-move_constructible_v<value_type> is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-CopyInsertable value_type, the effects are unspecified.

Complexity: The complexity is linear in the number of elements inserted plus the distance to the end of the path builder.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_back();

Effects: Invalidates iterators and references at or after the point of the erase.

Complexity: The destructor of value_type is called the number of times equal to the number of the elements erased, but the assignment operator of value_type is called the number of times equal to the number of elements in the path builder after the erased elements.

Throws: Nothing unless an exception is thrown by the copy constructor, move constructor, assignment operator, or move assignment operator of value_type.

§ 13.5.6 basic_path_builder iterators

iterator begin() noexcept;
const_iterator begin() const noexcept;
const_iterator cbegin() const noexcept;

Returns: An iterator referring to the first figure_items::figure_item item in the path.

Remarks: Changing a figure_items::figure_item object or otherwise modifying the path in a way that violates the preconditions of that figure_items::figure_item object or of any subsequent figure_items::figure_item object in the path produces undefined behavior when the path is interpreted as described in 13.3.16 unless all of the violations are fixed prior to such interpretation.

iterator end() noexcept;
const_iterator end() const noexcept;
const_iterator cend() const noexcept;

Returns: An iterator which is the past-the-end value.

Remarks: Changing a figure_items::figure_item object or otherwise modifying the path in a way that violates the preconditions of that figure_items::figure_item object or of any subsequent figure_items::figure_item object in the path produces undefined behavior when the path is interpreted as described in 13.3.16 unless all of the violations are fixed prior to such interpretation.

reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
const_reverse_iterator crbegin() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(end).

Remarks: Changing a figure_items::figure_item object or otherwise modifying the path in a way that violates the preconditions of that figure_items::figure_item object or of any subsequent figure_items::figure_item object in the path produces undefined behavior when the path is interpreted as described in 13.3.16 all of the violations are fixed prior to such interpretation.

reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_reverse_iterator crend() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(begin).
Remarks: Changing a `figure_items::figure_item` object or otherwise modifying the path in a way that violates the preconditions of that `figure_items::figure_item` object or of any subsequent `figure_items::figure_item` object in the path produces undefined behavior when the path is interpreted as described in 13.3.16 unless all of the violations are fixed prior to such interpretation.

13.5.7 `basic_path_builder` specialized algorithms

```cpp
template <class Allocator>
void swap(basic_path_builder<Allocator>& lhs, basic_path_builder<Allocator>& rhs)
    noexcept(noexcept(lhs.swap(rhs)));
```

Effects: As if by `lhs.swap(rhs)`. 

§ 13.5.7
14 Brushes

14.1 Overview of brushes

Brushes contain visual data and serve as sources of visual data for rendering and composing operations.

There are four types of brushes:

(2.1) — solid color;
(2.2) — linear gradient;
(2.3) — radial gradient; and,
(2.4) — surface.

Once a brush is created, its visual data is immutable.

[Note: While copy and move operations along with a swap operation can change the visual data that a brush contains, the visual data itself is not modified. — end note] A brush is used either as a source brush or a mask brush (16.3.2.2).

When a brush is used in a rendering and composing operation, if it is used as a source brush, it has a brush_props object that describes how the brush is interpreted for purposes of sampling. If it is used as a mask brush, it has a mask_props object that describes how the brush is interpreted for purposes of sampling.

The basic_brush_props (15.10.1) and basic_mask_props (15.14.1) classes each have a wrap mode and a filter. The basic_brush_props class also has a brush matrix and a fill rule. The basic_mask_props class also has a mask matrix. Where possible, the terms that are common between the two classes are referenced without regard to whether the brush is being used as a source brush or a mask brush.

Solid color brushes are unbounded and as such always produce the same visual data when sampled from, regardless of the requested point.

Linear gradient and radial gradient brushes share similarities with each other that are not shared by the other types of brushes. This is discussed in more detail elsewhere (14.2).

Surface brushes are constructed from a basic_image_surface object. Their visual data is raster graphics data, which has implications on sampling from the brush that are not present in the other brush types.

14.2 Gradient brushes

14.2.1 Common properties of gradients

Gradients are formed, in part, from a collection of gradient_stop objects.

The collection of gradient_stop objects contribute to defining a brush which, when sampled from, returns a value that is interpolated based on those gradient stops.

14.2.2 Linear gradients

A linear gradient is a type of gradient.

A linear gradient has a begin point and an end point, each of which are objects of type basic_point_-2d<GraphicsMath>.

A linear gradient for which the distance between its begin point and its end point is 0 is a degenerate linear gradient.

All attempts to sample from a a degenerate linear gradient return the color rgba_color::transparent_-black. The remainder of 14.2 is inapplicable to degenerate linear gradients. [Note: Because a point has no width and this case is only met when the distance is between the begin point and the end point is zero (such that it collapses to a single point), the existence of one or more gradient stops is irrelevant. A linear gradient requires a line segment to define its color(s). Without a line segment, it is not a linear gradient. — end note]

The begin point and end point of a linear gradient define a line segment, with a gradient stop offset value of 0.0f corresponding to the begin point and a gradient stop offset value of 1.0f corresponding to the end point.

Gradient stop offset values in the range [0.0f, 1.0f] linearly correspond to points on the line segment.
Example: Given a linear gradient with a begin point of `basic_point_2d<GraphicsMath>(0.0f, 0.0f)` and an end point of `basic_point_2d<GraphicsMath>(10.0f, 5.0f)`, a gradient stop offset value of 0.6f would correspond to the point `basic_point_2d<GraphicsMath>(6.0f, 3.0f)`. — end example

To determine the offset value of a point \( p \) for a linear gradient, perform the following steps:

a) Create a line at the begin point of the linear gradient, the `begin line`, and another line at the end point of the linear gradient, the `end line`, with each line being perpendicular to the `gradient line segment`, which is the line segment delineated by the begin point and the end point.

b) Using the `begin line`, \( p \), and the `end line`, create a line, the `\( p \) line`, which is parallel to the `gradient line segment`.

c) Defining \( dp \) as the distance between \( p \) and the point where the `\( p \) line` intersects the `begin line` and \( dt \) as the distance between the point where the `\( p \) line` intersects the `begin line` and the point where the `\( p \) line` intersects the `end line`, the offset value of \( p \) is \( dp \div dt \).

d) The offset value shall be negative if

\( (8.1) \) — \( p \) is not on the line segment delineated by the point where the `\( p \) line` intersects the `begin line` and the point where the `\( p \) line` intersects the `end line`; and,

\( (8.2) \) — the distance between \( p \) and the point where the `\( p \) line` intersects the `begin line` is less than the distance between \( p \) and the point where the `\( p \) line` intersects the `end line`.

14.2.3 Radial gradients

A radial gradient is a type of gradient.

A radial gradient has a `start circle` and an `end circle`, each of which is defined by a `basic_circle<GraphicsMath>` object.

A radial gradient is a `degenerate radial gradient` if:

\( (3.1) \) — its `start circle` has a negative radius; or,

\( (3.2) \) — its `end circle` has a negative radius; or,

\( (3.3) \) — the distance between the center point of its `start circle` and the center point of its `end circle` is 0; or,

\( (3.4) \) — its `start circle` has a radius of \( 0.0f \) and its `end circle` has a radius of \( 0.0f \).

All attempts to sample from a `brush` object created using a degenerate radial gradient return the color `rgba_color::transparent_black`. The remainder of 14.2 is inapplicable to degenerate radial gradients.

A gradient stop offset of 0.0f corresponds to all points along the diameter of the `start circle` or to its center point if it has a radius value of 0.0f.

A gradient stop offset of 1.0f corresponds to all points along the diameter of the `end circle` or to its center point if it has a radius value of 0.0f.

A radial gradient shall be rendered as a continuous series of interpolated circles defined by the following equations:

\( a) x(o) = x_{start} + o \times (x_{end} - x_{start}) \)

\( b) y(o) = y_{start} + o \times (y_{end} - y_{start}) \)

\( c) radius(o) = radius_{start} + o \times (radius_{end} - radius_{start}) \)

where \( o \) is a gradient stop offset value.

The range of potential values for \( o \) shall be determined by the `wrap mode` (14.1):

\( (8.1) \) — For `wrap mode::none`, the range of potential values for \( o \) is \([0, 1]\).

\( (8.2) \) — For all other `wrap mode` values, the range of potential values for \( o \) is

\[ \text{numeric\_limits<float>::lowest()}, \text{numeric\_limits<float>::max()} \].

The interpolated circles shall be rendered starting from the smallest potential value of \( o \).

An interpolated circle shall not be rendered if its value for \( o \) results in `radius(o)` evaluating to a negative value.

14.2.4 Sampling from gradients

For any offset value \( o \), its color value shall be determined according to the following rules:
a) If there are less than two gradient stops or if all gradient stops have the same offset value, then the color value of every offset value shall be **rgba_color::transparent_black** and the remainder of these rules are inapplicable.

b) If exactly one gradient stop has an offset value equal to \( a \), \( a \)'s color value shall be the color value of that gradient stop and the remainder of these rules are inapplicable.

c) If two or more gradient stops have an offset value equal to \( a \), \( o \)'s color value shall be the color value of the gradient stop which has the lowest index value among the set of gradient stops that have an offset value equal to \( a \) and the remainder of 14.2.4 is inapplicable.

d) When no gradient stop has the offset value of \( 0.0f \), then, defining \( n \) to be the offset value that is nearest to \( 0.0f \) among the offset values in the set of all gradient stops, if \( o \) is in the offset range \([0, n)\), \( o \)'s color value shall be **rgba_color::transparent_black** and the remainder of these rules are inapplicable. [Note: Since the range described does not include \( n \), it does not matter how many gradient stops have \( n \) as their offset value for purposes of this rule. — end note]

e) When no gradient stop has the offset value of \( 1.0f \), then, defining \( n \) to be the offset value that is nearest to \( 1.0f \) among the offset values in the set of all gradient stops, if \( o \) is in the offset range \((n, 1]\), \( o \)'s color value shall be **rgba_color::transparent_black** and the remainder of these rules are inapplicable. [Note: Since the range described does not include \( n \), it does not matter how many gradient stops have \( n \) as their offset value for purposes of this rule. — end note]

f) Each gradient stop has, at most, two adjacent gradient stops: one to its left and one to its right.

g) Adjacency of gradient stops is initially determined by offset values. If two or more gradient stops have the same offset value then index values are used to determine adjacency as described below.

h) For each gradient stop \( a \), the set of gradient stops to its left are those gradient stops which have an offset value which is closer to \( 0.0f \) than \( a \)'s offset value. [Note: This includes any gradient stops with an offset value of \( 0.0f \) provided that \( a \)'s offset value is not \( 0.0f \). — end note]

i) For each gradient stop \( b \), the set of gradient stops to its right are those gradient stops which have an offset value which is closer to \( 1.0f \) than \( b \)'s offset value. [Note: This includes any gradient stops with an offset value of \( 1.0f \) provided that \( b \)'s offset value is not \( 1.0f \). — end note]

j) A gradient stop which has an offset value of \( 0.0f \) does not have an adjacent gradient stop to its left.

k) A gradient stop which has an offset value of \( 1.0f \) does not have an adjacent gradient stop to its right.

l) If a gradient stop \( a \)'s set of gradient stops to its left consists of exactly one gradient stop, that gradient stop is the gradient stop that is adjacent to \( a \) on its left.

m) If a gradient stop \( b \)'s set of gradient stops to its right consists of exactly one gradient stop, that gradient stop is the gradient stop that is adjacent to \( b \) on its right.

n) If two or more gradient stops have the same offset value then the gradient stop with the lowest index value is the only gradient stop from that set of gradient stops which can have a gradient stop that is adjacent to it on its left and the gradient stop with the highest index value is the only gradient stop from that set of gradient stops which can have a gradient stop that is adjacent to it on its right. This rule takes precedence over all of the remaining rules.

o) If a gradient stop can have an adjacent gradient stop to its left, then the gradient stop which is adjacent to it to its left is the gradient stop from the set of gradient stops to its left which has an offset value which is closest to its offset value. If two or more gradient stops meet that criteria, then the gradient stop which is adjacent to it to its left is the gradient stop which has the highest index value from the set of gradient stops to its left which are tied for being closest to its offset value.

p) If a gradient stop can have an adjacent gradient stop to its right, then the gradient stop which is adjacent to it to its right is the gradient stop from the set of gradient stops to its right which has an offset value which is closest to its offset value. If two or more gradient stops meet that criteria, then the gradient stop which is adjacent to it to its right is the gradient stop which has the lowest index value from the set of gradient stops to its right which are tied for being closest to its offset value.

q) Where the value of \( o \) is in the range \([0, 1]\), its color value shall be determined by interpolating between the gradient stop, \( r \), which is the gradient stop whose offset value is closest to \( o \) without being less than \( o \) and which can have an adjacent gradient stop to its left, and the gradient stop that is adjacent to \( r \) on \( r \)'s left. The acceptable forms of interpolating between color values is set forth later in this section.
r) Where the value of $o$ is outside the range $[0, 1]$, its color value depends on the value of wrap mode:

- If wrap mode is \texttt{wrap_mode::none}, the color value of $o$ shall be \texttt{rgba_color::transparent_black}.
- If wrap mode is \texttt{wrap_mode::pad}, if $o$ is negative then the color value of $o$ shall be the same as-if the value of $o$ was $0.0f$, otherwise the color value of $o$ shall be the same as-if the value of $o$ was $1.0f$.
- If wrap mode is \texttt{wrap_mode::repeat}, then $1.0f$ shall be added to or subtracted from $o$ until $o$ is in the range $[0, 1]$, at which point its color value is the color value for the modified value of $o$ as determined by these rules. \[ Example: \] Given $o == 2.1$, after application of this rule $o == 0.1$ and the color value of $o$ shall be the same value as-if the initial value of $o$ was $0.1$.

Given $o == -0.3$, after application of this rule $o == 0.7$ and the color value of $o$ shall be the same as-if the initial value of $o$ was $0.7$. \[ end example \]

- If wrap mode is \texttt{wrap_mode::reflect}, $o$ shall be set to the absolute value of $o$, then $2.0f$ shall be subtracted from $o$ until $o$ is in the range $[0, 2]$, then if $o$ is in the range $[1, 2]$ then $o$ shall be set to $1.0f - (o - 1.0f)$, at which point its color value is the color value for the modified value of $o$ as determined by these rules. \[ Example: \] Given $o == 2.8$, after application of this rule $o == 0.8$ and the color value of $o$ shall be the same value as-if the initial value of $o$ was $0.8$.

Given $o == 3.6$, after application of this rule $o == 0.4$ and the color value of $o$ shall be the same value as-if the initial value of $o$ was $0.4$.

Given $o == -0.3$, after application of this rule $o == 0.3$ and the color value of $o$ shall be the same as-if the initial value of $o$ was $0.3$.

Given $o == -5.8$, after application of this rule $o == 0.2$ and the color value of $o$ shall be the same as-if the initial value of $o$ was $0.2$. \[ end example \]

Interpolation between the color values of two adjacent gradient stops is performed linearly on each color channel.

14.3 Enum class \texttt{wrap_mode} \[io2d.wrapmode\]

14.3.1 \texttt{wrap_mode} summary \[io2d.wrapmode.summary\]

The \texttt{wrap_mode} enum class describes how a point’s visual data is determined if it is outside the bounds of the source brush (16.3.2.2) when sampling.

Depending on the source brush’s \texttt{filter} value, the visual data of several points may be required to determine the appropriate visual data value for the point that is being sampled. In this case, each point is sampled according to the source brush’s \texttt{wrap_mode} value with two exceptions:

1. If the point to be sampled is within the bounds of the source brush and the source brush’s \texttt{wrap_mode} value is \texttt{wrap_mode::none}, then if the source brush’s \texttt{filter} value requires that one or more points which are outside of the bounds of the source brush be sampled, each of those points is sampled as-if the source brush’s \texttt{wrap_mode} value is \texttt{wrap_mode::pad} rather than \texttt{wrap_mode::none}.

2. If the point to be sampled is within the bounds of the source brush and the source brush’s \texttt{wrap_mode} value is \texttt{wrap_mode::none}, then if the source brush’s \texttt{filter} value requires that one or more points which are inside of the bounds of the source brush be sampled, each of those points is sampled such that the visual data that is returned is the equivalent of \texttt{rgba_color::transparent_black}.

If a point to be sampled does not have a defined visual data element and the search for the nearest point with defined visual data produces two or more points with defined visual data that are equidistant from the point to be sampled, the returned visual data shall be an unspecified value which is the visual data of one of those equidistant points. Where possible, implementations should choose the among the equidistant points that have an $x$ axisvalue and a $y$ axisvalue that is nearest to $0.0f$.

See Table 24 for the meaning of each \texttt{wrap_mode} enumerator.

14.3.2 \texttt{wrap_mode} synopsis \[io2d.wrapmode.synopsis\]

```
namespace std::experimental::io2d::v1 {
    enum class wrap_mode {
        none,
        repeat,
        reflect,
    }
}
```
14.3.3 wrap_mode enumerators

Table 24 — wrap_mode enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>If the point to be sampled is outside of the bounds of the source brush, the visual data that is returned is the equivalent of rgba_color::transparent_black.</td>
</tr>
<tr>
<td>repeat</td>
<td>If the point to be sampled is outside of the bounds of the source brush, the visual data that is returned is the visual data that would have been returned if the source brush was infinitely large and repeated itself in a left-to-right-left-to-right and top-to-bottom-top-to-bottom fashion.</td>

14.4 Enum class filter

14.4.1 filter summary

The filter enum class specifies the type of filter to use when sampling from raster graphics data.

Three of the filter enumerators, filter::fast, filter::good, and filter::best, specify desired characteristics of the filter, leaving the choice of a specific filter to the implementation.

The other two, filter::nearest and filter::bilinear, each specify a particular filter that shall be used.

[Note: The only type of brush that has raster graphics data as its visual data is a brush with a brush type of brush_type::surface. — end note]

See Table 25 for the meaning of each filter enumerator.

14.4.2 filter synopsis

namespace std::experimental::io2d::v1 {
  enum class filter {
    fast,
    good,
    best,
    nearest,
    bilinear
  };
}

14.6 Class \texttt{gradient\_stop}  

14.6.1 Overview  

1 The class \texttt{gradient\_stop} describes a gradient stop that is used by gradient brushes.  

2 It has an \textit{offset} of type \texttt{float} and an \textit{offset color} of type \texttt{rgba\_color}.
14.6.2 gradient_stop synopsis

namespace std::experimental::io2d::v1 {
    class gradient_stop {
    public:
        // 14.6.3, construct:
        constexpr gradient_stop() noexcept;
        constexpr gradient_stop(float o, rgba_color c) noexcept;

        // 14.6.4, modifiers:
        constexpr void offset(float o) noexcept;
        constexpr void color(rgba_color c) noexcept;

        // 14.6.5, observers:
        constexpr float offset() const noexcept;
        constexpr rgba_color color() const noexcept;
    }
    // 14.6.6, operators:
    constexpr bool operator==(const gradient_stop& lhs, const gradient_stop& rhs) noexcept;
    constexpr bool operator!=(const gradient_stop& lhs, const gradient_stop& rhs) noexcept;
};

14.6.3 gradient_stop constructors

call the gradient_stop constructor() noexcept;
1  Effects: Equivalent to: gradient_stop(0.0f, rgba_color::transparent_black).

call the gradient_stop constructor(float o, rgba_color c) noexcept;
2  Requires: o >= 0.0f and o <= 1.0f.
3  Effects: Constructs a gradient_stop object.
4  The offset is o rounded to the nearest multiple of 0.00001f. The offset color is c.

14.6.4 gradient_stop modifiers

call the gradient_stop void offset(float o) noexcept;
1  Requires: o >= 0.0f and o <= 1.0f.
2  Effects: The offset is o rounded to the nearest multiple of 0.00001f.

call the gradient_stop void color(rgba_color c) noexcept;
3  Effects: The offset color is c.

14.6.5 gradient_stop observers

call the gradient_stop float offset() const noexcept;
1  Returns: The offset.

call the gradient_stop rgba_color color() const noexcept;
2  Returns: The offset color.

14.6.6 gradient_stop operators

call the gradient_stop bool operator==(const gradient_stop& lhs, const gradient_stop& rhs) noexcept;
1  Returns: lhs.offset() == rhs.offset() && lhs.color() == rhs.color();

14.7 Class template basic_brush

14.7.1 Summary

The class template basic_brush describes an opaque wrapper for visual data. It takes one type parameter, which is a GraphicsSurfaces.
A basic_brush object is usable with any basic_image_surface basic_output_surface, and basic_unmanaged_output_surface object provided that they have the same GraphicsSurfaces as the basic_brush object.

A basic_brush object’s visual data is immutable. It is observable only by the effect that it produces when the brush is used as a source brush or as a mask brush (16.3.2.2).

A basic_brush object has a brush type of brush_type, which indicates which type of brush it is (Table 26).

As a result of technological limitations, a basic_brush object’s visual data may have less precision than the data from which it was created.

The data are stored in an object of type typename GraphicsMath::brushes::brush_data_type.

14.7.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_brush {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::brushes::brush_data_type;

            // 14.7.4, constructors:
            explicit basic_brush(rgba_color c);
            template <class InputIterator>
            basic_brush(const basic_point_2d<graphics_math_type>& begin,
                        const basic_point_2d<graphics_math_type>& end,
                        InputIterator first, InputIterator last);
            basic_brush(const basic_point_2d<graphics_math_type>& begin,
                        const basic_point_2d<graphics_math_type>& end,
                        initializer_list<gradient_stop> il);
            template <class InputIterator>
            basic_brush(const basic_circle<graphics_math_type>& start,
                        const basic_circle<graphics_math_type>& end,
                        InputIterator first, InputIterator last);
            basic_brush(const basic_circle<graphics_math_type>& start,
                        const basic_circle<graphics_math_type>& end,
                        initializer_list<gradient_stop> il);
            basic_brush(basic_image_surface<GraphicsSurfaces>&& img);

            // 14.7.5, accessors:
            const data_type& data() const noexcept;
            brush_type type() const noexcept;
    }
}

14.7.3 Sampling from a basic_brush object

A basic_brush object is sampled from either as a source brush (16.3.2.2) or a mask brush (16.3.2.2).

If it is being sampled from as a source brush, its wrap mode, filter, and brush matrix are defined by a basic_brush_props object (16.3.2.4 and 16.3.2.6).

If it is being sampled from as a mask brush, its wrap mode, filter, and mask matrix are defined by a basic_mask_props object (16.3.2.5 and 16.3.2.6).

When sampling from a basic_brush object b, the brush_type returned by calling b.type() determines how the results of sampling are determined:

1. If the result of b.type() is brush_type::solid_color then b is a solid color brush.
2. If the result of b.type() is brush_type::surface then b is a surface brush.
3. If the result of b.type() is brush_type::linear then b is a linear gradient brush.
4. If the result of b.type() is brush_type::radial then b is a radial gradient brush.
14.7.3.1 Sampling from a solid color brush

When \( b \) is a solid color brush, then when sampling from \( b \), the visual data returned is always the visual data used to construct \( b \), regardless of the point which is to be sampled and regardless of the return values of wrap mode, filter, and brush matrix or mask matrix.

14.7.3.2 Sampling from a linear gradient brush

When \( b \) is a linear gradient brush, when sampling point \( p_t \), where \( p_t \) is the return value of calling the \( \text{transform}_p \) member function of brush matrix or mask matrix using the requested point, from \( b \), the visual data returned are as specified by 14.2.2 and 14.2.4.

14.7.3.3 Sampling from a radial gradient brush

When \( b \) is a radial gradient brush, when sampling point \( p_t \), where \( p_t \) is the return value of calling the \( \text{transform}_p \) member function of brush matrix or mask matrix using the requested point, from \( b \), the visual data are as specified by 14.2.3 and 14.2.4.

14.7.3.4 Sampling from a surface brush

When \( b \) is a surface brush, when sampling point \( p_t \) from \( b \), where \( p_t \) is the return value of calling the \( \text{transform}_p \) member function of the brush matrix or mask matrix using the requested point, the visual data returned are from the point \( p_t \) in the raster graphics data of the brush, as modified by the values of wrap mode (14.3) and filter (14.4).

14.7.4 Constructors

```cpp
explicit basic_brush(rgba_color c);

Effects: Constructs an object of type basic_brush.
Postconditions: data() == GraphicsSurfaces::brushes::create_brush(c).
Remarks: The visual data format of the visual data are as-if it is that specified by format::argb32.
```

```cpp
template <class InputIterator>
basic_brush(const basic_point_2d<graphics_math_type>& begin,
            const basic_point_2d<graphics_math_type>& end,
            InputIterator first, InputIterator last);
```

Effects: Constructs an object of type basic_brush.
Postconditions: data() == GraphicsSurfaces::brushes::create_brush(begin, end, first, last).
Remarks: Sampling from this brush produces the results specified in 14.7.3.2.

```cpp
basic_brush(const basic_point_2d<graphics_math_type>& begin,
            const basic_point_2d<graphics_math_type>& end,
            initializer_list<gradient_stop> il);
```

Effects: Constructs an object of type basic_brush.
Postconditions: data() == GraphicsSurfaces::brushes::create_brush(begin, end, il).
Remarks: Sampling from this brush produces the results specified in 14.7.3.2.

```cpp
template <class InputIterator>
basic_brush(const basic_circle<graphics_math_type>& start,
            const basic_circle<graphics_math_type>& end,
            InputIterator first, InputIterator last);
```

Effects: Constructs an object of type basic_brush.
Postconditions: data() == GraphicsSurfaces::brushes::create_brush(start, end, first, last).
Remarks: Sampling from this brush produces the results specified in 14.7.3.3.

```cpp
basic_brush(const basic_circle<graphics_math_type>& start,
            const basic_circle<graphics_math_type>& end,
            initializer_list<gradient_stop> il);
```

Effects: Constructs an object of type basic_brush.
Postconditions: \texttt{data()} == \texttt{GraphicsSurfaces::brushes::create\_brush(start, end, il)}.

Remarks: Sampling from this brush produces the results specified in 14.7.3.3.

\begin{verbatim}
basic\_brush(basic\_image\_surface<GraphicsSurfaces>&& img);
\end{verbatim}

\textit{Effects}: Constructs an object of type \texttt{basic\_brush}.

Postconditions: \texttt{data()} == \texttt{GraphicsSurfaces::brushes::create\_brush(move(img))}.

Sampling from this brush produces the results specified in 14.7.3.4.

### 14.7.5 Accessors

\begin{verbatim}
const data\_type& data() const noexcept;
\end{verbatim}

\textit{Returns}: A reference to the \texttt{basic\_brush} object’s data object (See 14.7.1).

\begin{verbatim}
brush\_type type() const noexcept;
\end{verbatim}

\textit{Returns}: \texttt{GraphicsSurfaces::brushes::get\_brush\_type(data())}.
15 Surface state props [io2d.surfacestate]

15.1 Overview [io2d.surfacestate.general]

1 In order to produce effects beyond simply drawing raster graphics data or a path to a surface, graphics state

data is supplied when performing rendering and composing operations (16.3.2) on surfaces.

2 Surface state types group together related graphics state data. Objects of those types are then supplied as

arguments to the functions that carry out rendering and composing operations on surfaces. [Note: This

allows surfaces to be stateless, which typically provides significant performance gains on modern graphics

acceleration hardware. — end note]

3 The enum class types and surface state class templates that define and provide the graphics state data are

described below.

15.2 Enum class antialias [io2d.antialias]

15.2.1 antialias summary [io2d.antialias.summary]

1 The antialias enum class specifies the type of anti-aliasing that the rendering system uses for rendering paths.

See Table 27 for the meaning of each antialias enumerator.

15.2.2 antialias synopsis [io2d.antialias.synopsis]

namespace std::experimental::io2d::v1 {
    enum class antialias {
        none,
        fast,
        good,
        best
    };
}

15.2.3 antialias enumerators [io2d.antialias.enumerators]

Table 27 — antialias enumerator meanings

<table>
<thead>
<tr>

<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>No anti-aliasing is performed when performing a rendering operation.</td>
</tr>
<tr>
<td>fast</td>
<td>Some form of anti-aliasing should be used when performing a rendering operation but performance is more important than the quality of the results. The technique used is implementation-defined.</td>
</tr>
<tr>
<td>good</td>
<td>Some form of anti-aliasing should be used when performing a rendering operation and the sacrificing some performance to obtain better anti-aliasing results than would likely be obtained from antialias::fast is acceptable. The technique used is implementation-defined.</td>
</tr>
<tr>
<td>best</td>
<td>Some form of anti-aliasing should be used when performing a rendering operation and better anti-aliasing results than would likely be obtained from antialias::fast and antialias::good are desired even if performance degrades significantly. The technique used is implementation-defined. [Note: This might commonly be chosen when a user is going to render something once and cache the results for repeated use or when a user is rendering something that does not necessarily need performance suitable for real-time computer graphics applications. — end note]</td>
</tr>
</tbody>
</table>
15.3 Enum class fill_rule

15.3.1 fill_rule summary

1 The fill_rule enum class determines how the filling operation (16.3.5) is performed on a path.

2 For each point, draw a ray from that point to infinity which does not pass through the start point or end point of any non-degenerate segment in the path, is not tangent to any non-degenerate segment in the path, and is not coincident with any non-degenerate segment in the path.

3 See Table 28 for the meaning of each fill_rule enumerator.

15.3.2 fill_rule synopsis

namestd::experimental::io2d::v1 {
    enum class fill_rule {
        winding,
        even_odd
    };
}

15.3.3 fill_rule enumerators

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>winding</td>
<td>If the fill rule (15.10.1) is fill_rule::winding, then using the ray described above and beginning with a count of zero, add one to the count each time a non-degenerate segment crosses the ray going left-to-right from its begin point to its end point, and subtract one each time a non-degenerate segment crosses the ray going from right-to-left from its begin point to its end point. If the resulting count is zero after all non-degenerate segments that cross the ray have been evaluated, the point shall not be filled; otherwise the point shall be filled.</td>
</tr>
<tr>
<td>even_odd</td>
<td>If the fill rule is fill_rule::even_odd, then using the ray described above and beginning with a count of zero, add one to the count each time a non-degenerate segment crosses the ray. If the resulting count is an odd number after all non-degenerate segments that cross the ray have been evaluated, the point shall be filled; otherwise the point shall not be filled. [Note: Mathematically, zero is an even number, not an odd number. — end note]</td>
</tr>
</tbody>
</table>

15.4 Enum class line_cap

15.4.1 line_cap summary

1 The line_cap enum class specifies how the ends of lines should be rendered when a interpreted_path object is stroked. See Table 29 for the meaning of each line_cap enumerator.

15.4.2 line_cap synopsis

namestd::experimental::io2d::v1 {
    enum class line_cap {
        none,
        round,
        square
    };
}

15.4.3 line_cap enumerators
Table 29 — line_cap enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The line has no cap. It terminates exactly at the end point.</td>
</tr>
<tr>
<td>round</td>
<td>The line has a circular cap, with the end point serving as the center of the circle and the line width serving as its diameter.</td>
</tr>
<tr>
<td>square</td>
<td>The line has a square cap, with the end point serving as the center of the square and the line width serving as the length of each side.</td>
</tr>
</tbody>
</table>

15.5 Enum class line_join

15.5.1 line_join summary

The line_join enum class specifies how the junction of two line segments should be rendered when a interpreted_path is stroked. See Table 30 for the meaning of each enumerator.

15.5.2 line_join synopsis

namespace std::experimental::io2d::v1 {
    enum class line_join {
        miter,
        round,
        bevel
    };
}

</tbody>
</table>

15.6 Enum class compositing_op

15.6.1 compositing_op Summary

The compositing_op enum class specifies composition algorithms. See Table 31, Table 32 and Table 33 for the meaning of each compositing_op enumerator.

15.6.2 compositing_op Synopsis

namespace std::experimental::io2d::v1 {
    enum class compositing_op {
        // basic
        over,
        clear,
        source,
        in,
        out,
        atop,
        dest_over,
        dest_in,
        dest_out,
    };
}
dest_atop,
xor_op,
add,
saturate,
// blend
multiply,
screen,
overlay,
darken,
lighten,
color_dodge,
color_burn,
hard_light,
soft_light,
difference,
exclusion,
// hsl
hsl_hue,
hsl_saturation,
hsl_color,
hsl_luminosity

};

15.6.3 compositing_op Enumerators

The tables below specifies the mathematical formula for each enumerator’s composition algorithm. The formulas differentiate between three color channels (red, green, and blue) and an alpha channel (transparency). For all channels, valid channel values are in the range \([0, 1.0]\).

Where a visual data format for a visual data element has no alpha channel, the visual data format shall be treated as though it had an alpha channel with a value of 1.0 for purposes of evaluating the formulas.

Where a visual data format for a visual data element has no color channels, the visual data format shall be treated as though it had a value of 0.0 for all color channels for purposes of evaluating the formulas.

The following symbols and specifiers are used:

- The \(R\) symbol means the result color value
- The \(S\) symbol means the source color value
- The \(D\) symbol means the destination color value
- The \(c\) specifier means the color channels of the value it follows
- The \(a\) specifier means the alpha channel of the value it follows

The color symbols \(R\), \(S\), and \(D\) may appear with or without any specifiers.

If a color symbol appears alone, it designates the entire color as a tuple in the unsigned normalized form (red, green, blue, alpha).

The specifiers \(c\) and \(a\) may appear alone or together after any of the three color symbols.

The presence of the \(c\) specifier alone means the three color channels of the color as a tuple in the unsigned normalized form (red, green, blue).

The presence of the \(a\) specifier alone means the alpha channel of the color in unsigned normalized form.

The presence of the specifiers together in the form \(ca\) means the value of the color as a tuple in the unsigned normalized form (red, green, blue, alpha), where the value of each color channel is the product of each color channel and the alpha channel and the value of the alpha channel is the original value of the alpha channel. \([\text{Example: When it appears in a formula, } Sca \text{ means } ((Sc \times Sa), Sa)\text{, such that, given a source color } Sc = (1.0, 0.5, 0.0) \text{ and an source alpha } Sa = (0.5)\text{, the value of } Sca \text{ when specified in one of the formulas would be } Sca = (1.0 \times 0.5, 0.5 \times 0.5, 0.0 \times 0.5, 0.5) = (0.5, 0.25, 0.0, 0.5). \text{ The same is true for } Dca \text{ and } Rca. \text{ — end example}]\)

No space is left between a value and its channel specifiers. Channel specifiers will be preceded by exactly one value symbol.

When performing an operation that involves evaluating the color channels, each color channel should be evaluated individually to produce its own value.
The basic enumerators specify a value for `bound`. This value may be 'Yes', 'No', or 'N/A'.

If the bound value is 'Yes', then the source is treated as though it is also a mask. As such, only areas of the surface where the source would affect the surface are altered. The remaining areas of the surface have the same color value as before the compositing operation.

If the bound value is 'No', then every area of the surface that is not affected by the source will become transparent black. In effect, it is as though the source was treated as being the same size as the destination surface with every part of the source that does not already have a color value assigned to it being treated as though it were transparent black. Application of the formula with this precondition results in those areas evaluating to transparent black such that evaluation can be bypassed due to the predetermined outcome.

If the bound value is 'N/A', the operation would have the same effect regardless of whether it was treated as 'Yes' or 'No' such that those bound values are not applicable to the operation. A 'N/A' formula when applied to an area where the source does not provide a value will evaluate to the original value of the destination even if the source is treated as having a value thereof of transparent black. As such the result is the same as if the source were treated as being a mask, i.e. 'Yes' and 'No' treatment each produce the same result in areas where the source does not have a value.

If a clip is set and the bound value is 'Yes' or 'N/A', then only those areas of the surface that are within the clip will be affected by the compositing operation.

If a clip is set and the bound value is 'No', then only those areas of the surface that are within the clip will be affected by the compositing operation. Even if no part of the source is within the clip, the operation will still set every area within the clip to transparent black. Areas outside the clip are not modified.

</tr>
</tbody>
</table>

The blend enumerators and hsl enumerators share a common formula for the result color’s color channel, with only one part of it changing depending on the enumerator. The result color’s color channel value formula is as follows: \( R_c = \frac{1}{R_a} \times ((1 - D_a) \times Sca + (1 - S_a) \times Dca + S_a \times D_a \times f(Sc, Dc)) \). The function \( f(Sc, Dc) \) is the component of the formula that is enumerator dependent.

For the blend enumerators, the color channels shall be treated as separable, meaning that the color formula shall be evaluated separately for each color channel: red, green, and blue.
The color formula divides 1 by the result color’s alpha channel value. As a result, if the result color’s alpha channel is zero then a division by zero would normally occur. Implementations shall not throw an exception nor otherwise produce any observable error condition if the result color’s alpha channel is zero. Instead, implementations shall bypass the division by zero and produce the result color (0, 0, 0, 0), i.e. transparent black, if the result color alpha channel formula evaluates to zero. [Note: The simplest way to comply with this requirement is to bypass evaluation of the color channel formula in the event that the result alpha is zero. However, in order to allow implementations the greatest latitude possible, only the result is specified. —end note]

For the enumerators in Table 32 and Table 33 the result color’s alpha channel value formula is as follows: \( Ra = Sa + Da \times (1 - Sa) \). [Note: Since it is the same formula for all enumerators in those tables, the formula is not included in those tables. —end note]

All of the blend enumerators and hsl enumerators have a bound value of ’N/A’.

\( \text{difference} \)

24 For the hsl enumerators, the color channels shall be treated as nonseparable, meaning that the color formula shall be evaluated once, with the colors being passed in as tuples in the form \( \text{(red, green, blue)} \).

25 The following additional functions are used to define the hsl enumerator formulas:

\( \text{min}(x, y, z) = \text{min}(x, \text{min}(y, z)) \)

\( \text{max}(x, y, z) = \text{max}(x, \text{max}(y, z)) \)

\( \text{sat}(C) = \text{max}(Cr, Cg, Cb) - \text{min}(Cr, Cg, Cb) \)

\( \text{lum}(C) = Cr \times 0.3 + Cg \times 0.59 + Cb \times 0.11 \)

\( \text{clip} \_\text{color}(C) = \) \{

\( L = \text{lum}(C) \)

\( N = \text{min}(Cr, Cg, Cb) \)

\( X = \text{max}(Cr, Cg, Cb) \)

\( \text{if} (N < 0.0) \) \{ \( Cr = L + (\frac{(Cr - L) \times L}{L - N}) \) \}

\( Cg = L + (\frac{(Cg - L) \times L}{L - N}) \)

\( Cb = L + (\frac{(Cb - L) \times L}{L - N}) \)

\( \text{if} (X > 1.0) \) \{ \( Cr = L + (\frac{(Cr - L) \times (1 - L)}{X - L}) \) \}

\( Cg = L + (\frac{(Cg - L) \times (1 - L)}{X - L}) \)

\( Cb = L + (\frac{(Cb - L) \times (1 - L)}{X - L}) \) \}

\( \text{§ 15.6.3} \)
\[ \text{return } C \]

31 \( \text{set\_lum}(C, L) = \{ \)
\[ D = L - \text{lum}(C) \]
\[ Cr = Cr + D \]
\[ Cg = Cg + D \]
\[ Cb = Cb + D \]
\( \text{return } \text{clip\_color}(C) \}

32 \( \text{set\_sat}(C, S) = \{ \)
\[ R = C \]
\( \text{auto}\& \text{ max} = (Rr > Rg) ? ((Rr > Rb) ? Rr : Rb) : ((Rg > Rb) ? Rg : Rb) \]
\( \text{auto}\& \text{ mid} = (Rr > Rg) ? ((Rr > Rb) ? (Rg > Rb) ? Rr : Rb) : Rr \)
\( \text{auto}\& \text{ min} = (Rr > Rg) ? ((Rg > Rb) ? Rb : Rg) : ((Rr > Rb) ? Rb : Rr) \)
\( \text{if} \ (\text{max} > \text{min}) \{ \)
\[ \text{mid} = (\text{mid} - \text{min}) \times S \]
\[ \text{max} = \text{max} - \text{min} \]
\} \text{ else } \{ \]
\[ \text{mid} = 0.0 \]
\[ \text{max} = 0.0 \]
\} \[ \text{min} = 0.0 \]
\( \text{return } R \} \] [Note: In the formula, \( \text{max} \), \( \text{mid} \), and \( \text{min} \) are reference variables which are bound to the highest value, second highest value, and lowest value color channels of the (red, blue, green) tuple \( R \) such that the subsequent operations modify the values of \( R \) directly. — end note]

15.7 Enum class \text{format} [io2d.format]

15.7.1 \text{Summary} [io2d.format.summary]

The \text{format} enum class indicates a visual data format. See Table 34 for the meaning of each \text{format} enumerator.

15.7.2 \text{Synopsis} [io2d.format.synopsis]

\begin{verbatim}
namespace std::experimental::io2d::v1 {
    enum class format {
        invalid,
        argb32,
        xrgb32,
        xrgb16,
        a8
    };
}
\end{verbatim}

15.7.3 Enumerators [io2d.format.enumerators]
Table 34 — format enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>invalid</td>
<td>A previously requested format is unsupported by the implementation.</td>
</tr>
<tr>
<td>argb32</td>
<td>A 32-bit RGB color model pixel format. There is an 8 bit alpha channel, an 8-bit red color channel, an 8-bit green color channel, and an 8-bit blue color channel. </tbody>
</table>

1 Implementations may support additional visual data formats (Sec: 9.2.3).

15.8 Enum class scaling [io2d.scaling]

15.8.1 scaling summary [io2d.scaling.summary]

1 The scaling enum class specifies the type of scaling an output surface will use when the size of its display buffer (16.3.9) differs from the size of its back buffer (16.3.9).

2 See Table 35 for the meaning of each scaling enumerator.

15.8.2 scaling synopsis [io2d.scaling.synopsis]

namespace std::experimental::io2d::v1 {
  enum class scaling {
    letterbox,
    uniform,
    fill_uniform,
    fill_exact,
    none
  };
}

15.8.3 scaling enumerators [io2d.scaling.enumerators]

[Note: In the following table, examples will be given to help explain the meaning of each enumerator. The examples will all use a basic_output_surface object called ds.]

The back buffer (16.3.9) of ds is 640x480 (i.e. it has a width of 640 pixels and a height of 480 pixels), giving it an aspect ratio of 1.3.

The display buffer (16.3.9) of ds is 1280x720, giving it an aspect ratio of 1.7.

When a rectangle is defined in an example, the coordinate \((x_1, y_1)\) denotes the top left corner of the rectangle, inclusive, and the coordinate \((x_2, y_2)\) denotes the bottom right corner of the rectangle, exclusive. As such, a rectangle with \((x_1, y_1) = (10, 10), (x_2, y_2) = (20, 20)\) is 10 pixels wide and 10 pixels tall and includes the pixel \((x, y) = (19, 19)\) but does not include the pixels \((x, y) = (20, 19)\) or \((x, y) = (19, 20)\). — end note]
Table 35 — **scaling** enumerator meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>letterbox</strong></td>
<td>Fill the display buffer with the letterbox brush (16.3.9) of the <code>basic_output_surface</code>. Uniformly scale the back buffer so that one dimension of it is the same length as the same dimension of the display buffer and the second dimension of it is not longer than the second dimension of the display buffer and transfer the scaled back buffer to the display buffer using sampling such that it is centered in the display buffer.</td>
</tr>
</tbody>
</table>

*Example:* The display buffer of `ds` will be filled with the `brush` object returned by `ds.letterbox_brush()`. The back buffer of `ds` will be scaled so that it is 960x720, thereby retaining its original aspect ratio. The scaled back buffer will be transferred to the display buffer using sampling such that it is in the rectangle

\[(x_1, y_1) = \left( \frac{1280}{2} - \frac{960}{2}, 0 \right) = (160, 0),\]

\[(x_2, y_2) = (960 + \left( \frac{1280}{2} - \frac{960}{2} \right), 720) = (1120, 720).\]

This fulfills all of the conditions. At least one dimension of the scaled back buffer is the same length as the same dimension of the display buffer (both have a height of 720 pixels). The second dimension of the scaled back buffer is not longer than the second dimension of the display buffer (the back buffer’s scaled width is 960 pixels, which is not longer than the display buffer’s width of 1280 pixels). Lastly, the scaled back buffer is centered in the display buffer (on the \(x\) axis there are 160 pixels between each vertical side of the scaled back buffer and the nearest vertical edge of the display buffer and on the \(y\) axis there are 0 pixels between each horizontal side of the scaled back buffer and the nearest horizontal edge of the display buffer). — end example]
Table 35 — scaling enumerator meanings (continued)

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| uniform          | Uniformly scale the back buffer so that one dimension of it is the same length as the same dimension of the display buffer and the second dimension of it is not longer than the second dimension of the display buffer and transfer the scaled back buffer to the display buffer using sampling such that it is centered in the display buffer.  
  *Example:* The back buffer of $ds$ will be scaled so that it is 960x720, thereby retaining its original aspect ratio. The scaled back buffer will be transferred to the display buffer using sampling such that it is in the rectangle $(x_1, y_1) = \left(\frac{1280}{2} - \frac{960}{2}, 0\right) = (160, 0)$, $(x_2, y_2) = \left(960 + \left(\frac{1280}{2} - \frac{960}{2}\right), 720\right) = (1120, 720)$. This fulfills all of the conditions. At least one dimension of the scaled back buffer is the same length as the same dimension of the display buffer (both have a height of 720 pixels). The second dimension of the scaled back buffer is not longer than the second dimension of the display buffer (the back buffer’s scaled width is 960 pixels, which is not longer than the display buffer’s width of 1280 pixels). Lastly, the scaled back buffer is centered in the display buffer (on the $x$ axis there are 160 pixels between each vertical side of the scaled back buffer and the nearest vertical edge of the display buffer and on the $y$ axis there are 0 pixels between each horizontal side of the scaled back buffer and the nearest horizontal edge of the display buffer).  — *end example* ]  
  [ *Note:* The difference between uniform and letterbox is that uniform does not modify the contents of the display buffer that fall outside of the rectangle into which the scaled back buffer is drawn while letterbox fills those areas with the basic_output_surface object’s letterbox brush (sec: 16.3.9).  — *end note* ]
| fill_uniform     | Uniformly scale the back buffer so that one dimension of it is the same length as the same dimension of the display buffer and the second dimension of it is not shorter than the second dimension of the display buffer and transfer the scaled back buffer to the display buffer using sampling such that it is centered in the display buffer.  
  *Example:* The back buffer of $ds$ will be drawn in the rectangle $(x_1, y_1) = (0, -120)$, $(x_2, y_2) = (1280, 840)$. This fulfills all of the conditions. At least one dimension of the scaled back buffer is the same length as the same dimension of the display buffer (both have a width of 1280 pixels). The second dimension of the scaled back buffer is not shorter than the second dimension of the display buffer (the back buffer’s scaled height is 840 pixels, which is not shorter than the display buffer’s height of 720 pixels). Lastly, the scaled back buffer is centered in the display buffer (on the $x$ axis there are 0 pixels between each vertical side of the rectangle and the nearest vertical edge of the display buffer and on the $y$ axis there are 120 pixels between each horizontal side of the rectangle and the nearest horizontal edge of the display buffer).  — *end example* ]
<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| fill_exact | Scale the back buffer so that each dimension of it is the same length as the same dimension of the display buffer and transfer the scaled back buffer to the display buffer using sampling such that its origin is at the origin of the display buffer.  
[Example: The back buffer will be drawn in the rectangle \((x_1, y_1) = (0, 0), (x_2, y_2) = (1280, 720)\). This fulfills all of the conditions. Each dimension of the scaled back buffer is the same length as the same dimension of the display buffer (both have a width of 1280 pixels and a height of 720 pixels) and the origin of the scaled back buffer is at the origin of the display buffer. — end example]  |
| none       | Do not perform any scaling. Transfer the back buffer to the display buffer using sampling such that its origin is at the origin of the display buffer.  
[Example: The back buffer of \(ds\) will be drawn in the rectangle \((x_1, y_1) = (0, 0), (x_2, y_2) = (640, 480)\) such that no scaling occurs and the origin of the back buffer is at the origin of the display buffer. — end example]  |

15.9 Class template `basic_render_props` [io2d.renderprops]

15.9.1 Overview [io2d.renderprops.intro]

The `basic_render_props` class template provides general state information that is applicable to all rendering and composing operations (16.3.2).

2 It has a filter algorithm of type `filter`, a surface matrix of type `basic_matrix_2d`, and a compositing operator of type `compositing_op`.

3 The data are stored in an object of type `typename GraphicsSurfaces::surface_state_props::render_props_data_type`. It is accessible using the `data` member functions.

15.9.2 Synopsis [io2d.renderprops.synopsis]

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_render_props {
    public:
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
        using data_type =
            typename GraphicsSurfaces::surface_state_props::render_props_data_type;

        // 15.9.3, constructors:
        basic_render_props() noexcept;
        explicit basic_render_props(filter f,
            const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{},
            compositing_op co = compositing_op::over) noexcept;

        // 15.9.4, accessors:
        const data_type& data() const noexcept;
        data_type& data() noexcept;

        // 15.9.5, modifiers:
        void filtering(filter f) noexcept;
        void compositing(compositing_op co) noexcept;
        void surface_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

        // 15.9.6, observers:
        filter filtering() const noexcept;
        compositing_op compositing() const noexcept;
    };
};
```
basic_matrix_2d<graphics_math_type> surface_matrix() const noexcept;
);

15.9.3 Constructors

basic_render_props() noexcept;

Effects: Constructs an object of type basic_render_props.

Postconditions: data() == X::surface_state_props::create_render_props().

explicit basic_render_props(filter f,
const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{},
compositing_op co = compositing_op::over) noexcept;

Requires: m.is_invertible() == true.

Effects: Constructs an object of type basic_render_props.

Postconditions: data() == GraphicsSurfaces::surface_state_props::create_render_props(f, m, co).

15.9.4 Accessors

const data_type& data() const noexcept;

data_type& data() noexcept;

Returns: A reference to the basic_render_props object’s data object (See: 15.9.1).

15.9.5 Modifiers

void filtering(filter f) noexcept;

Effects: Calls GraphicsSurfaces::surface_state_props::filtering(data(), f)).

Remarks: The filtering algorithm is f.

void compositing(compositing_op co) noexcept;

Effects: Calls GraphicsSurfaces::surface_state_props::compositing(data(), co).

Remarks: The compositing operator is co.

void surface_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

Requires: m.is_invertible() == true.

Effects: Calls GraphicsSurfaces::surface_state_props::surface_matrix(data(), m).

Remarks: The surface matrix is m.

15.9.6 Observers

filter filtering() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::filtering(data()).

Remarks: The returned value is the filter algorithm.

compositing_op compositing() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::compositing(data()).

Remarks: The returned value is the compositing operator.

basic_matrix_2d<graphics_math_type> surface_matrix() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::surface_matrix(data()).

Remarks: The returned value is the surface matrix.
15.10 Class template basic_brush_props

15.10.1 basic_brush_props summary

The basic_brush_props class template provides general state information that is applicable to all rendering and composing operations (16.3.2).

It has a wrap mode of type wrap_mode, a filter of type filter, a fill rule of type fill_rule, and a brush matrix of type basic_matrix_2d.

15.10.2 basic_brush_props synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_brush_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

            // 15.10.3, constructor:
            basic_brush_props(io2d::wrap_mode w = io2d::wrap_mode::none,
                              io2d::filter fi = io2d::filter::good,
                              io2d::fill_rule fr = io2d::fill_rule::winding,
                              const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{})
                noexcept;

            // 15.10.4, modifiers:
            void wrap_mode(io2d::wrap_mode w) noexcept;
            void filter(io2d::filter fi) noexcept;
            void fill_rule(io2d::fill_rule fr) noexcept;
            void brush_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

            // 15.10.5, observers:
            io2d::wrap_mode wrap_mode() const noexcept;
            io2d::filter filter() const noexcept;
            io2d::fill_rule fill_rule() const noexcept;
            basic_matrix_2d<graphics_math_type> brush_matrix() const noexcept;
    };
}

15.10.3 basic_brush_props constructor

basic_brush_props(io2d::wrap_mode w = io2d::wrap_mode::none,
                   io2d::filter fi = io2d::filter::good,
                   io2d::fill_rule fr = io2d::fill_rule::winding,
                   const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{})
    noexcept;

    Requires: m.is_invertible() == true.
    Effects: Constructs an object of type basic_brush_props.

The wrap mode is w. The filter is fi. The fill rule is fr. The brush matrix is m.

15.10.4 basic_brush_props modifiers

void wrap_mode(io2d::wrap_mode w) noexcept;

    Effects: The wrap mode is w.

void filter(io2d::filter fi) noexcept;

    Effects: The filter is fi.

void fill_rule(io2d::fill_rule fr) noexcept;

    Effects: The fill rule is fr.

void brush_matrix(const basic_matrix_2d<graphics_math_type>& m) noexcept;

    Requires: m.is_invertible() == true.
    Effects: The brush matrix is m.
15.10.5 basic_brush_props observers

- `io2d::wrap_mode wrap_mode() const noexcept;` Returns: The wrap mode.
- `io2d::filter filter() const noexcept;` Returns: The filter.
- `io2d::fill_rule fill_rule() const noexcept;` Returns: The fill rule.
- `basic_matrix_2d<graphics_math_type> brush_matrix() const noexcept;` Returns: The brush matrix.

15.11 Class template basic_clip_props

15.11.1 Overview

The `basic_clip_props` class template provides general state information that is applicable to all rendering and composing operations (16.3.2).

It has a clip area of type `optional<interpreted_path>` and a fill rule of type `fill_rule`. If the clip area has no value, the clip area is boundless.

The data are stored in an object of type `typename GraphicsSurfaces::surface_state_props::clip_props_data_type`. It is accessible using the data member functions.

15.11.2 basic_clip_props synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_clip_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::surface_state_props::clip_props_data_type;

            // 15.11.3, constructors:
            basic_clip_props() noexcept;
            template <class Allocator>
            explicit basic_clip_props(
                const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
                io2d::fill_rule fr = io2d::fill_rule::winding);
            explicit basic_clip_props(
                const basic_interpreted_path<GraphicsSurfaces>& ip,
                io2d::fill_rule fr = io2d::fill_rule::winding) noexcept;
            explicit basic_clip_props(const basic_bounding_box<graphics_math_type>& r,
                io2d::fill_rule fr = io2d::fill_rule::winding);

            // 15.11.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 15.11.5, modifiers:
            void clip();
            template <class Allocator>
            void clip(const basic_path_builder<GraphicsSurfaces, Allocator>& pb);
            void clip(const basic_interpreted_path<GraphicsSurfaces>& ip) noexcept;
            void fill_rule(io2d::fill_rule fr) noexcept;

            // 15.11.6, observers:
            optional<basic_interpreted_path<GraphicsSurfaces>> clip() const noexcept;
            io2d::fill_rule fill_rule() const noexcept;
    };
}
```
15.11.3 basic_clip_props constructors

```cpp
basic_clip_props() noexcept;

Effects: Constructs an object of type basic_clip_props.
Postconditions: data() == GraphicsSurfaces::surface_state_props::create_clip_props().
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(). The fill rule
is io2d::fill_rule::winding.
```

```cpp
template <class Allocator>
explicit basic_clip_props(const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
io2d::fill_rule fr = io2d::fill_rule::winding);

Effects: Constructs an object of type basic_clip_props.
Postconditions: data() == GraphicsSurfaces::surface_state_props::create_clip_props(pb, fr).
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(pb)).
The fill rule is fr.
```

```cpp
template <class InputIterator>
basic_clip_props(InputIterator first, InputIterator last,
io2d::fill_rule fr = io2d::fill_rule::winding);

Effects: Constructs an object of type basic_clip_props.
Postconditions: data() == GraphicsSurfaces::surface_state_props::create_clip_props(first, last, fr).
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(first, last)).
The fill rule is fr.
```

```cpp
template <class Allocator>
explicit basic_clip_props(
    initializer_list<basic_figure_items<GraphicsSurfaces>::figure_item> il,
io2d::fill_rule fr = io2d::fill_rule::winding);

Effects: Constructs an object of type basic_clip_props.
Postconditions: data() == GraphicsSurfaces::surface_state_props::create_clip_props(il, fr).
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(il)).
The fill rule is fr.
```

```cpp
explicit basic_clip_props(const basic_interpreted_path<GraphicsSurfaces>& ip,
io2d::fill_rule fr = io2d::fill_rule::winding) noexcept;

Effects: Constructs an object of type basic_clip_props.
Postconditions: data() == GraphicsSurfaces::surface_state_props::create_clip_props(ip, fr).
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(ip).
The fill rule is fr.
```

```cpp
explicit basic_clip_props(const basic_bounding_box<graphics_math_type>& r,
io2d::fill_rule fr = io2d::fill_rule::winding);

Effects: Constructs an object of type basic_clip_props.
Postconditions: data() == GraphicsSurfaces::surface_state_props::create_clip_props(r, fr).
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(r).
The fill rule is fr.
```
15.11.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

Returns: A reference to the basic_clip_props object’s data object (See: 15.11.1).

15.11.5 basic_clip_props modifiers

template <class Allocator>
void clip();

Effects: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>().

void clip(const basic_bounding_box<GraphicsSurfaces>& bb);

Effects: Calls GraphicsSurfaces::surface_state_props::clip(data(), bb);
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(bb))

template <class Allocator>
void clip(const basic_path_builder<GraphicsSurfaces, Allocator>& pb);

Effects: Calls GraphicsSurfaces::surface_state_props::clip(data(), pb);
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(pb))

template <class InputIterator>
void clip(InputIterator first, InputIterator last);

Effects: Calls GraphicsSurfaces::surface_state_props::clip(data(), first, last);
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(first, last))

void clip(const initializer_list<typename basic_figure_items<GraphicsSurfaces>::figure_item> il);

Effects: Calls GraphicsSurfaces::surface_state_props::clip(data(), il);
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(basic_interpreted_path<GraphicsSurfaces>(il))

void clip(const basic_bounding_box<GraphicsSurfaces>& bb);

Effects: Calls GraphicsSurfaces::surface_state_props::clip(data(), ip);
Remarks: The clip area is optional<basic_interpreted_path<GraphicsSurfaces>>(ip).

void fill_rule(experimental::io2d::fill_rule fr) noexcept;

Effects: Calls GraphicsSurfaces::surface_state_props::clip_fill_rule(fr).
Remarks: The fill rule is fr.

15.11.6 basic_clip_props observers

optional<basic_interpreted_path<GraphicsSurfaces>> clip() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::clip(data()).
Remarks: The return value is the clip area.

io2d::fill_rule fill_rule() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::clip_fill_rule(data()).
Remarks: The return value is the fill rule.
15.12 Class template basic_stroke_props

15.12.1 basic_stroke_props summary

The basic_stroke_props class template provides state information that is applicable to the stroking operation (see: 16.3.2 and 16.3.6).

It has a line width of type float, a line cap of type line_cap, a line join of type line_join, and a miter limit of type float.

15.12.2 basic_stroke_props synopsis

namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_stroke_props {
    public:
    using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

    // 15.12.3, constructors:
    basic_stroke_props() noexcept;
    explicit basic_stroke_props(float w, io2d::line_cap lc = io2d::line_cap::none,
                               io2d::line_join lj = io2d::line_join::miter, float ml = 10.0f) noexcept;

    // 15.12.4, modifiers:
    void line_width(float w) noexcept;
    void line_cap(io2d::line_cap lc) noexcept;
    void line_join(io2d::line_join lj) noexcept;
    void miter_limit(float ml) noexcept;

    // 15.12.5, observers:
    float line_width() const noexcept;
    io2d::line_cap line_cap() const noexcept;
    io2d::line_join line_join() const noexcept;
    float miter_limit() const noexcept;
    float max_miter_limit() const noexcept;
  };
}

15.12.3 basic_stroke_props constructors

basic_stroke_props() noexcept;

1 Effects: Equivalent to: basic_stroke_props(2.0f).

explicit basic_stroke_props(float w, io2d::line_cap lc = io2d::line_cap::none,
                            io2d::line_join lj = io2d::line_join::miter,
                            float ml = 10.0f) noexcept;

2 Requires: w > 0.0f. ml >= 10.0f. ml <= max_miter_limit().

3 Effects: The line width is w. The line cap is lc. The line join is lj. The miter limit is ml.

15.12.4 basic_stroke_props modifiers

void line_width(float w) noexcept;

1 Requires: w >= 0.0f.

2 Effects: The line width is w.

void line_cap(io2d::line_cap lc) noexcept;

3 Effects: The line cap is lc.

void line_join(io2d::line_join lj) noexcept;

4 Effects: The line join is lj.
void miter_limit(float ml) noexcept;

Requires: ml >= 1.0f and ml <= max_miter_limit.

Effects: The miter limit is ml.

15.12.5 basic_stroke_props observers

float line_width() const noexcept;

Returns: The line width.

io2d::line_cap line_cap() const noexcept;

Returns: The line cap.

io2d::line_join line_join() const noexcept;

Returns: The line join.

float miter_limit() const noexcept;

Returns: The miter limit.

float max_miter_limit() const noexcept;

Requires: This value shall be finite and greater than 10.0f.

Returns: The implementation-defined maximum value of miter limit.

15.13 Class template basic_fill_props

15.13.1 Overview

The basic_fill_props class template provides state information that is applicable to the filling rendering and composing operation (16.3.2).

It has a fill rule of type fill_rule and an antialiasing algorithm of type antialias.

The data are stored in an object of type typename GraphicsSurfaces::surface_state_props::fill_props_data_type. It is accessible using the data member functions.

15.13.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_fill_props {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::surface_state_props::fill_props_data_type;

            // 15.13.3, constructors:
            basic_fill_props() noexcept;
            explicit basic_fill_props(io2d::fill_rule fr,
                                        antialias aa = antialias::good) noexcept;

            // 15.13.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

            // 15.13.5, modifiers:
            void fill_rule(io2d::fill_rule fr) noexcept;
            void antialiasing(antialias aa) noexcept;

            // 15.13.6, observers:
            io2d::fill_rule fill_rule() const noexcept;
            antialias antialiasing() const noexcept;
    };
}
15.13.3 Constructors

basic_fill_props() noexcept;

Effects: Constructs an object of type basic_fill_props.

Postconditions: data() == X::surface_state_props::create_fill_props().

explicit basic_fill_props(io2d::fill_rule fr, antialias aa = antialias::good) noexcept;

Effects: Constructs an object of type basic_fill_props.

Postconditions: data() == GraphicsSurfaces::surface_state_props::create_fill_props(fr, aa).

15.13.4 Accessors

const data_type& data() const noexcept;

data_type& data() noexcept;

Returns: A reference to the basic_fill_props object’s data object (See: 15.13.1).

15.13.5 Modifiers

void fill_rule(io2d::fill_rule fr) noexcept;

Effects: Calls GraphicsSurfaces::surface_state_props::fill_fill_rule(data(), fr)).

Remarks: The fill rule is fr.

void compositing(compositing_op co) noexcept;

Effects: Calls GraphicsSurfaces::surface_state_props::antialiasing(data(), aa).

Remarks: The antialiasing algorithm is aa.

15.13.6 Observers

io2d::fill_rule fill_rule() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::fill_fill_rule(data()).

Remarks: The returned value is the fill rule.

antialias antialiasing() const noexcept;

Returns: GraphicsSurfaces::surface_state_props::antialiasing(data()).

Remarks: The returned value is the antialiasing algorithm.

15.14 Class template basic_mask_props

15.14.1 basic_mask_props summary

The basic_mask_props class template provides state information that is applicable to the mask rendering and composing operation (16.3.2).

It has a wrap mode of type wrap_mode, a filter of type filter, and a mask matrix of type matrix_2d.

15.14.2 basic_mask_props synopsis

namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_mask_props {
    public:
      using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

      // 15.14.3, constructor:
      basic_mask_props(io2d::wrap_mode w = io2d::wrap_mode::repeat,
                       io2d::filter fi = io2d::filter::good,
                       const basic_matrix_2d<graphics_math_type>& m = basic_matrix_2d<graphics_math_type>{});
  }
}
15.14.3 \texttt{basic\_mask\_props} constructor \index{io2d\#maskprops\#constructor}[io2d.maskprops.cons]

\begin{verbatim}
\texttt{basic\_mask\_props(io2d::wrap\_mode w = io2d::wrap\_mode::repeat,}
\texttt{ io2d::filter fi = io2d::filter::good,}
\texttt{ const basic\_matrix\_2d<graphics\_math\_type>& m = basic\_matrix\_2d<graphics\_math\_type>{})) noexcept;}
\end{verbatim}

\textbf{Requires:} \texttt{m.is\_invertible() == true}.

\textbf{Effects:} The wrap mode is \texttt{w}. The filter is \texttt{fi}. The mask matrix is \texttt{m}.

15.14.4 \texttt{basic\_mask\_props} modifiers \index{io2d\#maskprops\#modifiers}[io2d.maskprops.modifiers]

\end{verbatim}

\textbf{Effects:} The filter is \texttt{fi}.

\begin{verbatim}
\void \texttt{mask\_matrix(const basic\_matrix\_2d<graphics\_math\_type>& m) noexcept;}
\end{verbatim}

\textbf{Requires:} \texttt{m.is\_invertible() == true}.

\textbf{Effects:} The mask matrix is \texttt{m}.

15.14.5 \texttt{basic\_mask\_props} observers \index{io2d\#maskprops\#observers}[io2d.maskprops.observers]

\begin{verbatim}
\texttt{io2d::wrap\_mode wrap\_mode() const noexcept;}
\end{verbatim}

\textbf{Returns:} The wrap mode.

\begin{verbatim}
\texttt{io2d::filter filter() const noexcept;}
\end{verbatim}

\textbf{Returns:} The filter.

\begin{verbatim}
\texttt{basic\_matrix\_2d<graphics\_math\_type> mask\_matrix() const noexcept;}
\end{verbatim}

\textbf{Returns:} The mask matrix.

15.15 Class template \texttt{basic\_dashes} \index{io2d\#dashes}[io2d.dashes]

15.15.1 \texttt{basic\_dashes} class template \index{io2d\#dashes\#intro}[io2d.dashes.intro]

\begin{verbatim}
\texttt{The class template \texttt{basic\_dashes} describes a pattern for determining, in conjunction with other properties,}
\texttt{what points on a path are included when a stroking operation is performed.}
\end{verbatim}

\begin{verbatim}
\texttt{It has an \texttt{offset} of type \texttt{float} and a \texttt{pattern} of an \texttt{unspecified} type capable of sequentially storing floating-point values.}
\end{verbatim}

\begin{verbatim}
\texttt{The data are stored in an object of type \texttt{typename GraphicsSurfaces::surface\_props\_data::dashes\_props\_data\_type}. It is accessible using the \texttt{data} member function.}
\end{verbatim}

15.15.2 Synopsis \index{io2d\#dashes\#synopsis}[io2d.dashes.synopsis]

\begin{verbatim}
namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic\_dashes {
    public:
      using data\_type =
        typename GraphicsSurfaces::surface\_state\_props::dashes\_data\_type;
  }
\end{verbatim}

\begin{verbatim}
\} // 15.14.4, modifiers:
\void \texttt{wrap\_mode(io2d::wrap\_mode w) noexcept;}
\void \texttt{filter(io2d::filter fi) noexcept;}
\void \texttt{mask\_matrix(const basic\_matrix\_2d<graphics\_math\_type>& m) noexcept;}
\} // 15.14.5, observers:
\texttt{io2d::wrap\_mode wrap\_mode()} const noexcept;
\texttt{io2d::filter filter()} const noexcept;
\texttt{basic\_matrix\_2d<graphics\_math\_type> mask\_matrix()} const noexcept;
\}
public:
    // 15.15.3, constructors:
    basic_dashes() noexcept;
    template <class InputIterator>
    basic_dashes(float o, InputIterator first, InputIterator last);
    basic_dashes(float o, initializer_list<float> il);

    // 15.15.4, observers:
    const data_type& data() const noexcept;

    // 15.15.5, operators:
    template <class GraphicsSurfaces>
    bool operator==(const basic_dashes<GraphicsSurfaces>& lhs,
                    const basic_dashes<GraphicsSurfaces>& rhs) noexcept;
    template <class GraphicsSurfaces>
    bool operator!=(const basic_dashes<GraphicsSurfaces>& lhs,
                    const basic_dashes<GraphicsSurfaces>& rhs) noexcept;

15.15.3 Constructors

basic_dashes() noexcept;
1    Effects: Constructs an object of type basic_dashes.
2    Postconditions: data() == GraphicsSurfaces::surface_state_props::create_dashes().
3    Remarks: The offset is 0.0f and the pattern contains no values.

template <class InputIterator>
basic_dashes(float o, InputIterator first, InputIterator last);
4    Requires: The value type of InputIterator is float.
5    Each value from first through last - 1 is greater than or equal to 0.0f.
6    Effects: Constructs an object of type basic_dashes.
7    Postconditions: data() == GraphicsSurfaces::surface_state_props::create_dashes(o, first, last).
8    Remarks: The offset is o and the pattern is the sequential list of value beginning at first and ending at last - 1.

basic_dashes(float o, initializer_list<float> il);
9    Requires: Each value in il is greater than or equal to 0.0f.
10   Effects: Constructs an object of type basic_dashes.
11   Postconditions: data() == GraphicsSurfaces::surface_state_props::create_dashes(o, il).

15.15.4 Observers

const data_type& data() const noexcept;
1    Returns: A reference to the basic_dashes object’s data object (See 15.15.1).

15.15.5 Operators

template <class GraphicsSurfaces>
bool operator==(const basic_dashes<GraphicsSurfaces>& lhs,
                const basic_dashes<GraphicsSurfaces>& rhs) noexcept;
2    Returns: GraphicsSurfaces::surface_state_props::equal(lhs.data(), rhs.data()).
template <class GraphicsSurfaces>
bool operator!=(const basic_dashes<GraphicsSurfaces>& lhs,
               const basic_dashes<GraphicsSurfaces>& rhs) noexcept;

Returns: GraphicsSurfaces::surface_state_props::not_equal(lhs.data(), rhs.data()).
16  Surfaces

16.1  Enum class refresh_style

16.1.1  refresh_style summary

The refresh_style enum class describes when the draw callback (Table 42) of a basic_output_surface or basic_unmanaged_output_surface object shall be called. See Table 36 for the meaning of each refresh_style enumerator.

16.1.2  refresh_style synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class refresh_style {
        as_needed,
        as_fast_as_possible,
        fixed
    };
}
```

16.1.3  refresh_style enumerators

Table 36 — refresh_style value meanings

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>as_needed</td>
<td>The draw callback shall be called when the implementation needs to do so. [Note: The intention of this enumerator is that implementations will call the draw callback as little as possible in order to minimize power usage. Users can call the redraw_required member function of one of the display surface types to make the implementation run the draw callback whenever the user requires. — end note]</td>
</tr>
<tr>
<td>as_fast_as_possible</td>
<td>The draw callback shall be called as frequently as possible, subject to any limits of the execution environment.</td>
</tr>
</tbody>
</table>
Table 36 — refresh_style value meanings (continued)

<table>
<thead>
<tr>
<th>Enumerator</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>fixed</td>
<td>The draw callback shall be called as frequently as needed to maintain the desired frame rate (Table 42) as closely as possible. If more time has passed between two successive calls to the draw callback than is required, it shall be called excess time and it shall count towards the required time, which is the time that is required to pass after a call to the draw callback before the next successive call to the draw callback shall be made. If the excess time is greater than the required time, implementations shall call the draw callback and then repeatedly subtract the required time from the excess time until the excess time is less than the required time. If the implementation needs to call the draw callback for some other reason, it shall use that call as the new starting point for maintaining the desired frame rate. [Example: Given a desired frame rate of 20.0f, then as per the above, the implementation would call the draw callback at 50 millisecond intervals or as close thereto as possible. If for some reason the excess time is 51 milliseconds, the implementation would call the draw callback, subtract 50 milliseconds from the excess time, and then would wait 49 milliseconds before calling the draw callback again. If only 15 milliseconds have passed since the draw callback was last called and the implementation needs to call the draw callback again, then the implementation shall call the draw callback immediately and proceed to wait 50 milliseconds before calling the draw callback again. — end example]</td>
</tr>
</tbody>
</table>

16.2 Enum class image_file_format

16.2.1 image_file_format summary

The image_file_format enum class specifies the data format that an image_surface object is constructed from or saved to. This allows data in a format that is required to be supported to be read or written regardless of its extension.

16.2.2 image_file_format synopsis

```cpp
namespace std::experimental::io2d::v1 {
    enum class image_file_format {
        unknown,
        png,
        jpeg,
        tiff,
        svg
    };
}
```

16.3 Overview of surface classes

16.3.1 Surface class templates description

There are three surface class templates:

1. basic_image_surface
2. basic_output_surface
3. basic_unmanaged_output_surface

For ease of description, an instantiation of a surface class template will be called a surface.

A surface contains visual data and provides an interface for managing and manipulating that visual data.

Surface class templates are MoveConstructible and MoveAssignable. They are neither CopyConstructible nor CopyAssignable. [Note: On many platforms, especially those that use specialized hardware to accelerate various graphics operations, copying a surface is highly detrimental to performance and is rarely desired. The copy_surface function (19.2) exists for those situations where a copy is desired. — end note]

The surface class templates manipulate visual data through rendering and composing operations.

The rendering and composing operations 16.3.2 are described in terms of operating on each integral point of the visual data of a surface. The reason for that is to support the discrete nature of raster graphics data. Operating on each integral point of the surface is the coarsest granularity allowed. Implementations may perform rendering and composing operations at a finer granularity than that of each integral point. [Note: Vector graphics data, being continuous, has the finest granularity possible since it resolves at the limits imposed by the precision of the floating-point types used to determine its visual data at any particular point. — end note]

16.3.2 Rendering and composing

16.3.2.1 Operations

The surface classes provide five fundamental rendering and composing operations:

<table>
<thead>
<tr>
<th>Operation</th>
<th>Function(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Painting</td>
<td>paint</td>
</tr>
<tr>
<td>Filling</td>
<td>fill</td>
</tr>
<tr>
<td>Stroking</td>
<td>stroke</td>
</tr>
<tr>
<td>Masking</td>
<td>mask</td>
</tr>
<tr>
<td>Text Rendering</td>
<td>draw_text</td>
</tr>
</tbody>
</table>

All composing operations shall happen as-if in a linear color space, regardless of the color space of the visual data that is involved.

[Note: While a color space such as sRGB helps produce expected, consistent results when visual data are viewed by people, composing operations only produce expected results when the valid values for the color channel and alpha channel data in the visual data involved are uniformly (i.e. linearly) spaced. — end note]

16.3.2.2 Rendering and composing brushes

All rendering and composing operations use a source brush of type basic_brush.

The masking operation uses a mask brush of type basic_brush.
16.3.2.3 Rendering and composing source path

In addition to brushes (16.3.2.2), the Stroke and Fill rendering and composing operations use a source path. The source path is either a basic_path_builder<Allocator> object or a basic_interpreted_path object. If it is a basic_path_builder<Allocator> object, it is interpreted (13.3.16) before it is used as the source path.

In addition to brushes, the Text Rendering rendering and composing operation uses a source text and a font. The source text is a string object containing text in the UTF-8 text format. The font is a basic_font object.

16.3.2.4 Common state data

All rendering and composing operations use the following state data:

Table 39 — surface rendering and composing common state data

<table>
<thead>
<tr>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Brush properties</td>
<td>brush_props</td>
</tr>
<tr>
<td>Surface properties</td>
<td>render_props</td>
</tr>
<tr>
<td>Clip properties</td>
<td>clip_props</td>
</tr>
</tbody>
</table>

16.3.2.5 Specific state data

In addition to the common state data (16.3.2.4), certain rendering and composing operations use state data that is specific to each of them:

Table 40 — surface rendering and composing specific state data

<table>
<thead>
<tr>
<th>Operation</th>
<th>Name</th>
<th>Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stroking</td>
<td>Stroke properties</td>
<td>stroke_props</td>
</tr>
<tr>
<td>Stroking Dashes</td>
<td>Dashes</td>
<td>dashes</td>
</tr>
<tr>
<td>Masking</td>
<td>Mask properties</td>
<td>mask_props</td>
</tr>
<tr>
<td>Text Rendering</td>
<td>Text properties</td>
<td>text_props</td>
</tr>
</tbody>
</table>

16.3.2.6 State data default values

For all rendering and composing operations, the state data objects named above are provided using optional<T> class template arguments.

If there is no contained value for a state data object, it is interpreted as if the optional<T> argument contained a default constructed object of the relevant state data object.

16.3.3 Standard coordinate spaces

There are four standard coordinate spaces relevant to the rendering and composing operations (16.3.2):

(1.1) — the brush coordinate space;
(1.2) — the mask coordinate space;
(1.3) — the user coordinate space; and
(1.4) — the surface coordinate space.

The brush coordinate space is the standard coordinate space of the source brush (16.3.2.2). Its transformation matrix is the brush properties’ brush matrix (15.10.1).

The mask coordinate space is the standard coordinate space of the mask brush (16.3.2.2). Its transformation matrix is the mask properties’ mask matrix (15.14.1).

The user coordinate space is the standard coordinate space of basic_interpreted_path objects. Its transformation matrix is a default-constructed basic_matrix_2d.

The surface coordinate space is the standard coordinate space of the surface object’s visual data. Its transformation matrix is the surface properties’ surface matrix (15.9.1).

Given a point pt, a brush coordinate space transformation matrix bcsm, a mask coordinate space transformation matrix mcsm, a user coordinate space transformation matrix ucsm, and a surface coordinate space
transformation matrix \texttt{scsm}, the following table describes how to transform it from each of these standard coordinate spaces to the other standard coordinate spaces:

<table>
<thead>
<tr>
<th>From</th>
<th>To</th>
<th>Transform</th>
</tr>
</thead>
<tbody>
<tr>
<td>brush coordinate space</td>
<td>mask coordinate space</td>
<td>\texttt{mcsm.transform_{-}pt(bcsm.invert().transform_{-}pt(pt)).}</td>
</tr>
<tr>
<td>brush coordinate space</td>
<td>user coordinate space</td>
<td>\texttt{bcsm.invert().transform_{-}pt(pt)}.</td>
</tr>
<tr>
<td>brush coordinate space</td>
<td>surface coordinate space</td>
<td>\texttt{scsm.transform_{-}pt(bcsm.invert().transform_{-}pt(pt)).}</td>
</tr>
<tr>
<td>user coordinate space</td>
<td>brush coordinate space</td>
<td>\texttt{bcsm.transform_{-}pt(pt)}.</td>
</tr>
<tr>
<td>user coordinate space</td>
<td>mask coordinate space</td>
<td>\texttt{mcsm.transform_{-}pt(pt)}.</td>
</tr>
<tr>
<td>user coordinate space</td>
<td>surface coordinate space</td>
<td>\texttt{scsm.transform_{-}pt(pt)}.</td>
</tr>
<tr>
<td>surface coordinate space</td>
<td>brush coordinate space</td>
<td>\texttt{bcsm.transform_{-}pt(scsm.invert().transform_{-}pt(pt)).}</td>
</tr>
<tr>
<td>surface coordinate space</td>
<td>mask coordinate space</td>
<td>\texttt{mcsm.transform_{-}pt(scsm.invert().transform_{-}pt(pt)).}</td>
</tr>
<tr>
<td>surface coordinate space</td>
<td>user coordinate space</td>
<td>\texttt{scsm.invert().transform_{-}pt(pt)}.</td>
</tr>
</tbody>
</table>

16.3.4 surface painting

When a painting operation is initiated on a surface, the implementation shall produce results as-if the following steps were performed:

1. For each integral point \(sp\) of the surface’s visual data, determine if \(sp\) is within the clip area (15.11.1); if so, proceed with the remaining steps.
2. Transform \(sp\) from the surface coordinate space (16.3.3) to the brush coordinate space (Table 41), resulting in point \(bp\).
3. Sample from point \(bp\) of the source brush (16.3.2.2), combine the resulting visual data with the visual data at point \(sp\) in the surface’s visual data in the manner specified by the surface’s current compositing operator (15.9.1), and modify the visual data of the surface at point \(sp\) to reflect the result produced by application of the compositing operator.

16.3.5 surface filling

When a filling operation is initiated on a surface, the implementation shall produce results as-if the following steps were performed:

1. For each integral point \(sp\) of the surface’s visual data, determine if \(sp\) is within the clip area (15.11.1); if so, proceed with the remaining steps.
2. Transform \(sp\) from the surface coordinate space (16.3.3) to the user coordinate space (Table 41), resulting in point \(up\).
3. Using the source path (16.3.2.3) and the fill rule (15.10.1), determine whether \(up\) shall be filled; if so, proceed with the remaining steps.
4. Transform \(up\) from the user coordinate space to the brush coordinate space (16.3.3 and Table 41), resulting in point \(bp\).
5. Sample from point \(bp\) of the source brush (16.3.2.2), combine the resulting visual data with the visual data at point \(sp\) in the surface’s visual data in the manner specified by the surface’s current compositing operator (15.9.1), and modify the surface’s visual data at point \(sp\) to reflect the result produced by application of the compositing operator.

16.3.6 surface stroking

When a stroking operation is initiated on a surface, it is carried out for each figure in the source path (16.3.2).

The following rules shall apply when a stroking operation is carried out on a figure:
1. No part of the surface’s visual data that is outside of the clip area shall be modified.

2. If the figure is a closed figure, then the point where the end point of its final segment meets the start point of the initial segment shall be rendered as specified by the line join value (see: 15.12.1 and 16.3.2.5); otherwise the start point of the initial segment and end point of the final segment shall each be rendered as specified by the line cap value. The remaining meetings between successive end points and start points shall be rendered as specified by the line join value.

3. If the dash pattern (Table 40) has its default value or if its vector<float> member is empty, the segments shall be rendered as a continuous path.

4. If the dash pattern’s vector<float> member contains only one value, that value shall be used to define a repeating pattern in which the path is shown then hidden. The ends of each shown portion of the path shall be rendered as specified by the line cap value.

5. If the dash pattern’s vector<float> member contains two or more values, the values shall be used to define a pattern in which the figure is alternatively rendered then not rendered for the length specified by the value. The ends of each rendered portion of the figure shall be rendered as specified by the line cap value. If the dash pattern’s float member, which specifies an offset value, is not 0.0f, the meaning of its value is implementation-defined. If a rendered portion of the figure overlaps a not rendered portion of the figure, the rendered portion shall be rendered.

3 When a stroking operation is carried out on a figure, the width of each rendered portion shall be the line width (see: 15.12.1 and 16.3.2.5). Ideally this means that the diameter of the stroke at each rendered point should be equal to the line width. However, because there are an infinite number of points along each rendered portion, implementations may choose an unspecified method of determining minimum distances between points along each rendered portion and the diameter of the stroke between those points shall be the same.

[Note: This concept is sometimes referred to as a tolerance. It allows for a balance between precision and performance, especially in situations where the end result is in a non-exact format such as raster graphics data. —end note]

4 After all figures in the path have been rendered but before the rendered result is composed to the surface’s visual data, the rendered result shall be transformed from the user coordinate space (16.3.3) to the surface coordinate space (16.3.3).

16.3.7 surface masking [io2d.surface.masking]

1 When a masking operation is initiated on a surface, the implementation shall produce results as-if the following steps were performed:

1. For each integral point sp of the surface’s visual data, determine if sp is within the clip area (15.11.1); if so, proceed with the remaining steps.

2. Transform sp from the surface coordinate space (16.3.3) to the mask coordinate space (Table 41), resulting in point mp.

3. Sample the alpha channel from point mp of the mask brush and store the result in mac; if the visual data format of the mask brush does not have an alpha channel, the value of mac shall always be 1.0.

4. Transform sp from the surface coordinate space to the brush coordinate space, resulting in point bp.

5. Sample from point bp of the source brush (16.3.2.2), combine the resulting visual data with the surface’s visual data at point sp in the manner specified by the surface’s current compositing operator (15.9.1), multiply each channel of the result produced by application of the compositing operator by map if the visual data format of the surface’s visual data is a premultiplied format and if not then just multiply the alpha channel of the result by map, and modify the surface’s visual data at point sp to reflect the multiplied result.

16.3.8 surface text rendering [io2d.surface.textrendering]

1 [Note: The following uses terminology and other information contained in ISO/IEC 10646 and ISO/IEC 14496-22, both of which are listed in the normative references of this Technical Specification. —end note]

2 Text rendering is a complex subject. The specifics of how it is performed are described in ISO/IEC 10646 and ISO/IEC 14496-22. The following is an informative overview of the process. The normative process is described in those two standards, except where otherwise noted.

1. This item is normative. The source text is transformed from UTF-8 to UCS characters.
2. Those characters are transformed into glyphs using the cmap table of the font.

3. That set of glyphs is then modified using transformations specified in various tables in the font, some of which are optional and thus may not be present, e.g. the GSUB table. Depending on the glyphs that are present in the set and the presence or absence of certain tables, it is possible that no modification will occur.

4. The layout of the glyphs for purposes of rasterization is calculated using metrics and adjustments specified in various tables in the font, some of which are optional, e.g. the BASE and GPOS tables.

5. This item is normative. When the text properties’ location is a basic_point_2d object, the glyphs are rendered in a single line without regard to justification. When the location is a basic_bounding_box object, the glyphs are rendered in one or more lines, which are contained within the confines of the basic_bounding_box object.

6. If applicable, potential line break locations are determined.

7. This item is normative. The layout is modified as specified by the property values contained within the text properties.

8. If multiple lines are possible, the layout is modified to ensure that the rendered glyphs will fit within the specified bounds, adding line breaks where necessary and applying justification to each line.

9. This item is normative. Where the glyph data are contours or otherwise are composed of commands that resemble the figure items described in this Technical Specification, the glyphs shall be rendered and composed as-if this was a stroking operation, using the glyph data as the source path after applying any mathematical transformations necessary to convert the glyph data as defined in ISO/IEC 14496-22 into figure items as defined in this Technical Specification. Where the glyph data are raster graphics data, the glyphs shall be rendered and composed as-if this was a masking operation, with the glyph data serving as the mask brush and a basic_mask_properties object default constructed with its wrap mode changed to wrap_mode::none serving as the mask properties. Regardless of how the glyph data are rendered and composed, the glyph data shall be transformed from its design space to surface coordinate space as specified in ISO/IEC 14496-22 suitably adjusted to conform to the layout. [Note: The property values contained in the text properties have already been applied to the layout such that things like its font size and size units will be taken into account when transformation of glyph data from its design space to surface coordinate space occurs. —end note]

16.3.9 output surface miscellaneous behavior [io2d.outputsurface.misc]

1 What constitutes an output device is implementation-defined, with the sole constraint being that an output device must allow the user to see the dynamically-updated contents of the display buffer. [Example: An output device might be a window in a windowing system environment or the usable screen area of a smart phone or tablet. —end example]

2 Implementations may allow more than one basic_output_surface object, basic_unmanaged_output_surface object, or a combination thereof to exist and be displayed co-synchronously. [Note: In windowing environments, implementations would likely support multiple objects of these types. In contrast, on a smart phone it is unlikely that an implementation would support multiple objects of these types due to environmental and platform constraints. —end note]

3 It is not required that implementations support the existence of any basic_unmanaged_output_surface objects. See Table 16.

4 All functions that perform rendering and composing operations operate on the back buffer. The data is subsequently transferred to the display buffer as specified by the output surfaces.

16.3.10 output surface state [io2d.outputsurface.state]

Table 42 specifies the name, type, function, and default value for each item of a display surface’s observable state.
Table 42 — Output surface observable state

<table>

16.4 Class basic_image_surface
16.4.1 basic_image_surface summary

The class basic_image_surface provides an interface to raster graphics data.

It has a pixel format of type format, a width of type int, and a height of type int.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::image_surface_data_type. It is accessible using the data member functions.

[Note: Because of the functionality it provides and what it can be used for, it is expected that developers familiar with other graphics technologies will think of the basic_image_surface class as being a form of render target. This is intentional, though this Technical Specification does not formally define or use that term to avoid any minor ambiguities and differences in its meaning between the various graphics technologies that do use the term render target. —end note]

16.4.2 basic_image_surface synopsis

const basic_brush<GraphicsSurfaces>& b,
const basic_font<GraphicsSurfaces>& font, const string& text,
const optional<basic_text_props<GraphicsSurfaces>>& tp = nullopt,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt,
const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

future<void> command_list(const basic_command_list<GraphicsSurfaces>& cl);

};

16.4.3 basic_image_surface constructors and assignment operators

basic_image_surface(io2d::format fmt, int w, int h);

Requirements: w is greater than 0 and not greater than basic_image_surface::max_width().
2 h is greater than 0 and not greater than basic_image_surface::max_height().
3 fmt is not io2d::format::invalid.
4 Effects: Constructs an object of type basic_image_surface.
5 The pixel format is fmt, the width is w, and the height is h.
6 Postconditions: data() == GraphicsSurfaces::surfaces::create_image_surface(fmt, w, h).

basic_image_surface(filesystem::path f, io2d::image_file_format i, io2d::format fmt);
basic_image_surface(filesystem::path f, io2d::image_file_format i, io2d::format fmt,
error_code& ec) noexcept;

Requirements: f is a file and its contents are data in a supported format (see: 16.2).
8 fmt is not io2d::format::invalid.
9 Effects: Constructs an object of type basic_image_surface.
Postconditions: If called without an error_code& argument, \( \text{data()} == \text{GraphicsSurfaces::surfaces::create_image_surface}(f, i, fmt) \), otherwise \( \text{data()} == \text{GraphicsSurfaces::surfaces::create_image_surface}(f, i, fmt, ec) \).

Remarks: The raster graphics data is the result of processing \( f \) into uncompressed raster graphics in the manner specified by the standard that describes how to transform the contents of data contained in \( f \) into raster graphics data and then transforming that transformed raster graphics data into the format specified by \( fmt \).

The data of \( f \) is processed into uncompressed raster graphics data as specified by the value of \( i \).

If \( i \) is \text{image_file_format::unknown}, implementations may attempt to process the data of \( f \) into uncompressed raster graphics data. The manner in which it does so is unspecified. If no uncompressed raster graphics data is produced, the error specified below occurs.

\[ \text{Note: The intent of image_file_format::unknown is to allow implementations to support image file formats that are not required to be supported.} \]

If the width of the uncompressed raster graphics data would be less than 1 or greater than \text{basic_image_surface::max_width()}, or if the height of the uncompressed raster graphics data would be less than 1 or greater than \text{basic_image_surface::max_height()}, the error specified below occurs.

The resulting uncompressed raster graphics data is then transformed into the data format specified by \( fmt \). If the format specified by \( fmt \) only contains an alpha channel, the values of the color channels, if any, of the surface’s visual data are unspecified. If the format specified by \( fmt \) only contains color channels and the resulting uncompressed raster graphics data is in a premultiplied format, then the value of each color channel for each pixel is be divided by the value of the alpha channel for that pixel. The visual data is then set as the visual data of the surface.

The width is the width of the uncompressed raster graphics data. The height is the height of the uncompressed raster graphics data.

Throws: As specified in Error reporting (Clause 4).

Error conditions: Any error that could result from trying to access \( f \), open \( f \) for reading, or reading data from \( f \).

errc::not_supported if \text{image_file_format::unknown} is passed as an argument and the implementation is unable to determine the file format or does not support saving in the image file format it determined.

errc::invalid_argument if \( fmt \) is \text{io2d::format::invalid}.

errc::argument_out_of_domain if the width would be less than 1, the width would be greater than \text{basic_image_surface::max_width()}, the height would be less than 1, or the height would be greater than \text{basic_image_surface::max_height()}.

16.4.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

Returns: A reference to the \text{basic_image_surface} object’s data object (See: 16.4.1).

Remarks: The behavior of a program is undefined if the user modifies the data contained in the data_type object returned by this function.

16.4.5 \text{basic_image_surface} members

void save(filesystem::path p, image_file_format i);
void save(filesystem::path p, image_file_format i, error_code& ec) noexcept;

Requires: \( p \) shall be a valid path to a file. The file need not exist provided that the other components of the path are valid.

If the file exists, it shall be writable. If the file does not exist, it shall be possible to create the file at the specified path and then the created file shall be writable.

Effects: If called without an error_code& argument, \( \text{GraphicsSurfaces::surfaces::save}(p, i) \), otherwise \( \text{GraphicsSurfaces::surfaces::save}(p, i, ec) \).
Remarks: Any pending rendering and composing operations (16.3.2) are performed before the surface’s visual data is written to p.

The surface’s visual data is written to p in the data format specified by i.

If i is image_file_format::unknown, it is implementation-defined whether the surface is saved in the image file format, if any, that the implementation associates with p.extension() provided that p.has_extension() == true. If p.has_extension() == false, the implementation does not associate an image file format with p.extension(), or the implementation does not support saving in that image file format, the error specified below occurs.

Throws: As specified in Error reporting (Clause 4).

Error conditions: Any error that could result from trying to create f, access f, or write data to f.
errc::not_supported if image_file_format::unknown is passed as an argument and the implementation is unable to determine the file format or does not support saving in the image file format it determined.

16.4.6 basic_image_surface static members

static basic_display_point<graphics_math_type> max_dimensions() noexcept;

Returns: GraphicsSurfaces::surfaces::max_dimensions().
Remarks: The maximum height and width for a basic_image_surface object.

16.4.7 basic_image_surface observers

io2d::format format() const noexcept;

Returns: GraphicsSurfaces::surfaces::format(data()).
Remarks: The pixel format.

basic_display_point<graphics_math_type> dimensions() const noexcept;

Returns: GraphicsSurfaces::surfaces::dimensions(data()).
Remarks: The pixel dimensions.

16.4.8 basic_image_surface modifiers

void clear();

Effects: Equivalent to paint(basic_brush<GraphicsSurfaces>(rgba_color::white), nullopt, basic_render_props<GraphicsSurfaces>(nearest, basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>{}, compositing_op::clear));

void paint(const basic_brush<GraphicsSurfaces>& b,
const basic_brush_props<GraphicsSurfaces>& bp = nullopt,
const basic_render_props<GraphicsSurfaces>& rp = nullopt,
const basic_clip_props<GraphicsSurfaces>& cl = nullopt);

Remarks: Performs the painting rendering and composing operation as specified by 16.3.4.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

Error conditions: The errors, if any, produced by this function are implementation-defined.

template <class Allocator>
void stroke(const basic_brush<GraphicsSurfaces>& b,
const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
const basic_brush_props<GraphicsSurfaces>& bp = nullopt,
const basic_stroke_props<GraphicsSurfaces>& sp = nullopt,
const basic_dashes<GraphicsSurfaces>& d = nullopt,
const basic_render_props<GraphicsSurfaces>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Calls GraphicsSurfaces::surfaces::stroke(data(), b, basic_interpreted_path<GraphicsSurfaces>(bp),
(bp == nullopt ? basic_brush_props<GraphicsSurfaces>() : bp.value()), (sp == nullopt ?
basic_stroke_props<GraphicsSurfaces>() : sp.value()), (d == nullopt ? basic_dashes<GraphicsSurfaces>()
: d.value()), (rp == nullopt ? basic_render_props<GraphicsSurfaces>() : rp.value()),
(cl == nullopt ? basic_clip_props<GraphicsSurfaces>() : cl.value())).

Remarks: Performs the stroking rendering and composing operation as specified by 16.3.6.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

Error conditions: The errors, if any, produced by this function are implementation-defined.

void stroke(const basic_brush<GraphicsSurfaces>& b,
const basic_interpreted_path<GraphicsSurfaces>& ip,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_stroke Props<GraphicsSurfaces>>& sp = nullopt,
const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Calls GraphicsSurfaces::surfaces::stroke(data(), b, ip,
(bp == nullopt ? basic_brush_props<GraphicsSurfaces>() : bp.value()), (sp == nullopt ? basic_stroke_props<GraphicsSurfaces>()
: sp.value()), (d == nullopt ? basic_dashes<GraphicsSurfaces>() : d.value()), (rp == nullopt ? basic_render_props<GraphicsSurfaces>()
: rp.value()), (cl == nullopt ? basic_clip_props<GraphicsSurfaces>() : cl.value())).

Remarks: Performs the stroking rendering and composing operation as specified by 16.3.6.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

Error conditions: The errors, if any, produced by this function are implementation-defined.

template <class Allocator>
void fill(const basic_brush<GraphicsSurfaces>& b,
const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Calls GraphicsSurfaces::surfaces::fill(data(), b, basic_interpreted_path<GraphicsSurfaces>(pb),
(bp == nullopt ? basic_brush_props<GraphicsSurfaces>() : bp.value()), (rp == nullopt ? basic_render_props<GraphicsSurfaces>()
: rp.value()), (cl == nullopt ? basic_clip_props<GraphicsSurfaces>() : cl.value())).

Remarks: Performs the filling rendering and composing operation as specified by 16.3.5.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

Error conditions: The errors, if any, produced by this function are implementation-defined.

void fill(const basic_brush<GraphicsSurfaces>& b,
const basic_interpreted_path<GraphicsSurfaces>& ip,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

Effects: Calls GraphicsSurfaces::surfaces::fill(data(), b, ip,
(bp == nullopt ? basic_brush_props<GraphicsSurfaces>() : bp.value()), (rp == nullopt ? basic_render_props<GraphicsSurfaces>()
: rp.value()), (cl == nullopt ? basic_clip_props<GraphicsSurfaces>() : cl.value())).

Remarks: Performs the filling rendering and composing operation as specified by 16.3.5.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).
Error conditions: The errors, if any, produced by this function are implementation-defined.

```cpp
void mask(const basic_brush<GraphicsSurfaces>& b,
          const basic_brush<GraphicsSurfaces>& mb,
          const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
          const optional<basic_mask_props<GraphicsSurfaces>>& mp = nullopt,
          const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
          const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

Remarks: Performs the masking rendering and composing operation as specified by 16.3.7.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

Error conditions: The errors, if any, produced by this function are implementation-defined.

```cpp
future<void> command_list(const basic_command_list<GraphicsSurfaces>& cl);
```

Effects: Calls GraphicsSurfaces::surfaces::command_list(data(), cl);

Returns: A future<void> object to inform the user when the command list has completed.
Remarks: Submits a command list to be processed by the surface. The command list may run on a separate thread. Users shall be responsible for preventing data races.

Note: The ability of the implementation to run command lists on separate threads provides a number of optimization opportunities. As a byproduct, it introduces the potential for data races.

Submitting a command list to a basic_image_surface object and then calling one of its other functions, especially one of the rendering and composing operation functions, before the command list has finished execution is highly likely to introduce data races. Attempting to use that object before the command list has finished execution will, at best, produce erroneous results.

Some intended uses for command lists are to allow advanced graphics users who need high performance for their applications to run graphics operations in parallel, to allow users to pre-record various sets of operations and run them on an as-needed basis, and to provide a mechanism where users can be sure that the graphics operations they perform will be batched such that the function is guaranteed to return instantly and allow other work that would not introduce data races to proceed in parallel.

As such, it is recommended that users choose to use either command lists or the 'direct' API (where surface member functions that perform rendering and composing operations, copying image surfaces, saving image data, etc.).

This is not to suggest that the direct API is simplistic and only meant for beginners. For light graphics loads it is easier to use since it does not introduce potentials for race conditions, etc. Further, the direct API can be implemented such that its graphics operations are batched and only run when it is efficient to run them or when when observable behavior requirements force their execution, which will allow them to have reasonably good performance. — end note]

16.5 Class basic_output_surface

16.5.1 basic_output_surface summary

A basic_output_surface object represents a simple way to display 2D graphics to a user. The mechanisms required to ensure that all environment-specific requirements, such as providing an event loop handler, are provided by the object.

The user just needs to set a draw callback or a command list (or both) and then call the begin_show member function.

When the user wishes to end the display of 2D graphics, the user calls the end_show member function either from the draw callback or from a run_function object contained within the command list.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::output_surface_data_type. It is accessible using the data member functions.

16.5.2 basic_output_surface synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_output_surface {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;

            // 16.5.3, constructors:
            basic_output_surface(int preferredWidth, int preferredHeight, 
                io2d::format preferredFormat,

16.5.3 basic_output_surface constructors
[io2d.outputsurface.cons]
basic_output_surface(int preferredWidth, int preferredHeight,
io2d::scaling scl = io2d::scaling::letterbox,
io2d::refresh_style rr = io2d::refresh_style::as_fast_as_possible,
float fps = 30.0f);

Effects: Constructs an object of type basic_output_surface.

Postconditions: data() == GraphicsSurfaces::surfaces::create_output_surface(preferredWidth,
preferredHeight, preferredFormat, scl, rr, fps).

Throws: As specified in Error reporting (Clause 4).

Error conditions: Errors, if any, are implementation-defined

basic_output_surface(int preferredWidth, int preferredHeight,
io2d::format preferredFormat,
io2d::scaling scl = io2d::scaling::letterbox,
io2d::refresh_style rr = io2d::refresh_style::as_fast_as_possible,
float fps = 30.0f) noexcept;

Effects: Constructs an object of type basic_output_surface.

Postconditions: data() == GraphicsSurfaces::surfaces::create_output_surface(preferredWidth,
preferredHeight, preferredFormat, scl, rr, fps).

Throws: As specified in Error reporting (Clause 4).

Error conditions: Errors, if any, are implementation-defined

§ 16.5.3
Effects: Constructs an object of type basic_output_surface.

Postconditions: data() == GraphicsSurfaces::surfaces::create_output_surface(preferredWidth,
preferredHeight, preferredFormat, preferredDisplayWidth, preferredDisplayHeight, preferredDisplayFormat,
scl, rr, fps).

Throws: As specified in Error reporting (Clause 4).

Error conditions: Errors, if any, are implementation-defined.

16.5.4 basic_output_surface modifiers

int begin_show();

Effects: Performs the following actions in a continuous loop:

1. Handle any implementation and host environment matters. If there are no pending implementation
   or host environment matters to handle, proceed immediately to the next action.
2. Run the size change callback if doing so is required by its specification and it does not have a
   value equivalent to its default value.
3. If the refresh style requires that the draw callback be called then:
   a) Evaluate auto clear and perform the actions required by its specification, if any.
   b) Run the draw callback.
   c) Ensure that all operations from the draw callback that can effect the back buffer have
      completed.
   d) Transfer the contents of the back buffer to the display buffer using sampling with an unspecified
      filter. If the user scaling callback does not have a value equivalent to its default value, use it
      to determine the position where the contents of the back buffer shall be transferred to and
      whether or not the letterbox brush should be used. Otherwise use the value of scaling type to
      determine the position and whether the letterbox brush should be used.

If basic_output_surface::end_show is called from the draw callback, the implementation shall finish
executing the draw callback and shall immediately cease to perform any actions in the continuous
loop other than handling any implementation and host environment matters needed to exit the loop
properly.

No later than when this function returns, the output device shall cease to display the contents of the
display buffer.

What the output device shall display when it is not displaying the contents of the display buffer is
unspecified.

Returns: The possible values and meanings of the possible values returned are implementation-defined.

Throws: As specified in Error reporting (Clause 4).
Remarks: Since this function calls the draw callback and can call the size change callback and the user scaling callback, in addition to the errors documented below, any errors that the callback functions produce can also occur.

Error conditions: errc::operation_would_block if the value of draw callback is equivalent to its default value or if it becomes equivalent to its default value before this function returns.

Other errors, if any, produced by this function are implementation-defined.

```cpp
void end_show();
```

Effects: If this function is called outside of the draw callback while it is being executed in the basic_output_surface::begin_show function’s continuous loop, it does nothing.

Otherwise, the implementation initiates the process of exiting the basic_output_surface::begin_show function’s continuous loop.

If possible, any procedures that the host environment requires in order to cause the basic_output_surface::show function’s continuous loop to stop executing without error should be followed.

The basic_output_surface::begin_show function’s loop continues execution until it returns.

```cpp
void clear();
```

Effects: Equivalent to paint(basic_brush<GraphicsSurfaces>(rgba_color::white), nullopt, basic_render_props<GraphicsSurfaces>(nearest, basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>{}, compositing_op::clear));

```cpp
void paint(const basic_brush<GraphicsSurfaces>& b,
           const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
           const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
           const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

Effects: Performs the painting rendering and composing operation as specified by 16.3.4.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

```cpp
Error conditions: The errors, if any, produced by this function are implementation-defined.
```

```cpp
template <class Allocator>
void stroke(const basic_brush<GraphicsSurfaces>& b,
            const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
            const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
            const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt,
            const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
            const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
            const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```

Effects: Performs the stroking rendering and composing operation as specified by 16.3.6.

The meanings of the parameters are specified by 16.3.2.

Throws: As specified in Error reporting (Clause 4).

```cpp
Error conditions: The errors, if any, produced by this function are implementation-defined.
```

```cpp
template <class Allocator>
void fill(const basic_brush<GraphicsSurfaces>& b,
           const basic_path_builder<GraphicsSurfaces, Allocator>& pb,
           const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
           const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
           const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);
```
void fill(const basic_brush<GraphicsSurfaces>& b,
           const basic_interpreted_path<GraphicsSurfaces>& ip,
           const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
           const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
           const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

   Effects: Performs the filling rendering and composing operation as specified by 16.3.5.
   The meanings of the parameters are specified by 16.3.2.
   Throws: As specified in Error reporting (Clause 4).
   Error conditions: The errors, if any, produced by this function are implementation-defined.

void mask(const basic_brush<GraphicsSurfaces>& b,
           const basic_brush<GraphicsSurfaces>& mb,
           const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
           const optional<basic_mask_props<GraphicsSurfaces>>& mp = nullopt,
           const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
           const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

   Effects: Performs the masking rendering and composing operation as specified by 16.3.7.
   The meanings of the parameters are specified by 16.3.2.
   Throws: As specified in Error reporting (Clause 4).
   Error conditions: The errors, if any, produced by this function are implementation-defined.

void draw_text(const basic_point_2d<graphics_math_type>& pt,
               const basic_brush<GraphicsSurfaces>& b,
               const basic_font<GraphicsSurfaces>& font, const string& text,
               const optional<basic_text_props<GraphicsSurfaces>>& tp = nullopt,
               const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
               const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt,
               const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt,
               const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
               const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

   Effects: Performs the text rendering rendering and composing operation as specified by 16.3.8.
   The meanings of the parameters are specified by 16.3.2.
   Throws: As specified in Error reporting (Clause 4).
   Error conditions: The errors, if any, produced by this function are implementation-defined.

void command_list(const basic_command_list<GraphicsSurfaces>& cl);

   Effects: Calls GraphicsSurfaces::surfaces::command_list(data(), cl).
   Remarks: Stores a basic_command_list object for execution whenever the output needs to be redrawn.
   If a draw callback exists, it is executed before the command list.
   Either a draw callback or a command list must be set before begin_show is called. Both may be set if desired.
   The command list may use a run_function command object to replace itself, but it is not permitted
   to replace the existing command list with a new command list more than once within the existing
   command list.
void draw_callback(const function<void(basic_output_surface& sfc)>& fn);

   Effects: Calls GraphicsSurfaces::surfaces::draw_callback(data(), fn).
   Remarks: Either a draw callback or a command list must be set before begin_show is called. Both may be set if desired.

void size_change_callback(const function<void(basic_output_surface& sfc)>& fn);

   Effects: Calls GraphicsSurfaces::surfaces::size_change_callback(data(), fn).
   Remarks: Sets a function that will be called whenever the output surface size changes.

void dimensions(basic_display_point<graphics_math_type> dp);
void dimensions(basic_display_point<graphics_math_type> dp, error_code& ec) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::dimensions(data(), dp) or GraphicsSurfaces::surfaces::dimensions(data(), dp, ec).
   Remarks: Changes the dimensions of the output surface's back buffer.
   Error conditions: Errors, if any, are implementation-defined.

void display_dimensions(basic_display_point<graphics_math_type> dp);
void display_dimensions(basic_display_point<graphics_math_type> dp, error_code& ec) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::display_dimensions(data(), dp) or GraphicsSurfaces::surfaces::display_dimensions(data(), dp, ec).
   Remarks: Changes the dimensions of the output surface's display.
   Error conditions: Errors, if any, are implementation-defined.

void scaling(io2d::scaling scl) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::scaling(data(), scl).
   Remarks: Sets the type of scaling that should be performed, if required, when transferring the graphics data from the back buffer to the display buffer.

void user_scaling_callback(const function<basic_bounding_box<graphics_math_type>(const basic_output_surface&, bool&)>& fn);

   Effects: Calls GraphicsSurfaces::surfaces::user_scaling_callback(data(), fn).
   Remarks: Sets an optional user function that allows the user to provide a basic_bounding_box object that specifies the area in the display buffer that the back buffer shall be transferred to.

void letterbox_brush(const optional<basic_brush<GraphicsSurfaces>>& b, const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::letterbox_brush(data(), b, bp).

void letterbox_brush_props(const optional<basic_brush_props<GraphicsSurfaces>>& bp) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::letterbox_brush_props(data(), bp).

void auto_clear(bool val) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::auto_clear(data(), val).

void redraw_required(bool val = true) noexcept;

   Effects: Calls GraphicsSurfaces::surfaces::redraw_required(data(), val).

16.5.5  basic_output_surface observers

io2d::format format() const noexcept;

   Returns: GraphicsSurfaces::surfaces::format(data()).
   Remarks: The pixel format of the back buffer.

basic_display_point<graphics_math_type> dimensions() const noexcept;

   Returns: GraphicsSurfaces::surfaces::dimensions(data()).
Remarks: The pixel dimensions of the back buffer.

```
basic_display_point<graphics_math_type> max_dimensions() const noexcept;
```

Returns: GraphicsSurfaces::surfaces::max_dimensions(data()).

Remarks: The maximum possible pixel dimensions of the back buffer.

```
basic_display_point<graphics_math_type> display_dimensions() const noexcept;
```

Returns: GraphicsSurfaces::surfaces::display_dimensions(data()).

Remarks: The pixel dimensions of the output buffer.

```
basic_display_point<graphics_math_type> max_output_dimensions() const noexcept;
```

Returns: GraphicsSurfaces::surfaces::max_output_dimensions(data()).

Remarks: The maximum possible pixel dimensions of the output buffer.

```
io2d::scaling scaling() const noexcept;
```

Returns: GraphicsSurfaces::surfaces::scaling(data()).

Remarks: The scaling type.

```
optional<basic_brush<GraphicsSurfaces>> letterbox_brush() const noexcept;
```

Returns: GraphicsSurfaces::surfaces::letterbox_brush(data()).

Remarks: An optional<basic_brush<GraphicsSurfaces>> object constructed using the user-provided letterbox brush or, if the letterbox brush is set to its default value, an empty optional<basic_brush<GraphicsSurfaces>> object.

```
optional<basic_brush_props<GraphicsSurfaces>> letterbox_brush_props() const noexcept;
```

Returns: An optional<basic_brush_props<GraphicsSurfaces>> object constructed using the user-provided letterbox brush props or, if the letterbox brush props is set to its default value, an empty optional<basic_brush_props<GraphicsSurfaces>> object.

```
bool auto_clear() const noexcept;
```

Returns: GraphicsSurfaces::surfaces::auto_clear(data()).

Remarks: The value of auto clear.

### 16.6 Class template basic_unmanaged_output_surface [io2d.unmanagedoutputsurface]

#### 16.6.1 basic_unmanaged_output_surface summary [io2d.unmanagedoutputsurface.summary]

The basic_unmanaged_output_surface provides users the ability to use this library to draw on an existing surface, one that is not owned or managed by the library.

Specifics of its implementation depend to a certain degree on the environment, especially when it comes to constructing one. Back ends are not required to support them but should do so where possible. Once a basic_unmanaged_output_surface object is created, the user is able to rely on a standard API such that the only non-standard (i.e. platform and implementation-dependent) aspect is instantiation of the object.

Its data are unspecified.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::unmanaged_output_surface_data_type. It is accessible using the data member functions.

#### 16.6.2 basic_unmanaged_output_surface synopsis [io2d.unmanagedoutputsurface.synopsis]

```
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_unmanaged_output_surface {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type =
                typename GraphicsSurfaces::surfaces::unmanaged_output_surface_data_type;
```
// 16.6.3, constructor:
basic_unmanaged_output_surface(data_type&& data) noexcept;

16.6.3 basic_unmanaged_output_surface constructor
[io2d.unmanagedoutputsurface.cons]

basic_unmanaged_output_surface(data_type&& data) noexcept;

Effects: Constructs an object of type basic_unmanaged_output_surface.

Remarks: The method of constructing an object of type data_type, including its arguments, is
        implementation-defined.

Implementations are not required to provide this class and may explicitly do so by not providing any
public constructors for data_type.

16.6.4 Accessors
[io2d.unmanagedoutputsurface.acc]

const data_type& data() const noexcept;
data_type& data() noexcept;

Returns: A reference to the basic_unmanaged_output_surface object’s data object (See: 16.6.1).

16.6.5 basic_unmanaged_output_surface observers
[io2d.unmanagedoutputsurface.observers]

bool has_draw_callback() const noexcept;

Returns: GraphicsSurfaces::surfaces::has_draw_callback(data())

bool has_size_change_callback() const noexcept;

Returns: <TODO>

io2d::format format() const noexcept;

Returns: <TODO>

basic_display_point<graphics_math_type> dimensions() const noexcept;

Returns: <TODO>

basic_display_point<graphics_math_type> max_dimensions() const noexcept;

Returns: <TODO>

basic_display_point<graphics_math_type> display_dimensions() const noexcept;

Returns: <TODO>

basic_display_point<graphics_math_type> max_display_dimensions() const noexcept;

Returns: <TODO>
io2d::scaling scaling() const noexcept;

Returns: <TODO>

optional<basic_brush<GraphicsSurfaces>> letterbox_brush() const noexcept;

Returns: <TODO>

optional<basic_brush_props<GraphicsSurfaces>> letterbox_brush_props() const noexcept;

Returns: <TODO>

bool auto_clear() const noexcept;

Returns: <TODO>

### 16.6.6 basic_unmanaged_output_surface modifiers

[io2d.unmanagedoutputsurface.modifiers]

#### void clear();

**Effects:** Equivalent to paint(basic_brush<GraphicsSurfaces>(rgba_color::white), nullopt, basic_render_props<GraphicsSurfaces>({nearest, basic_matrix_2d<typename GraphicsSurfaces::graphics_math_type>(), compositing_op::clear}));

#### void paint(const basic_brush<GraphicsSurfaces>& b, const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt, const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt, const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

**Effects:** Performs the painting rendering and composing operation as specified by 16.3.4.

The meanings of the parameters are specified by 16.3.2.

**Throws:** As specified in Error reporting (Clause 4).

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

#### template <class Allocator>

void stroke(const basic_brush<GraphicsSurfaces>& b, const basic_path_builder<GraphicsSurfaces, Allocator>& pb, const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt, const optional<basic_stroke_props<GraphicsSurfaces>>& sp = nullopt, const optional<basic_dashes<GraphicsSurfaces>>& d = nullopt, const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt, const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

**Effects:** Performs the stroking rendering and composing operation as specified by 16.3.6.

The meanings of the parameters are specified by 16.3.2.

**Throws:** As specified in Error reporting (Clause 4).

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

#### template <class Allocator>

void fill(const basic_brush<GraphicsSurfaces>& b, const basic_path_builder<GraphicsSurfaces, Allocator>& pb, const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt, const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt, const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

§ 16.6.6 200
void fill(const basic_brush<GraphicsSurfaces>& b,
const basic_interpreted_path<GraphicsSurfaces>& ip,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

**Effects:** Performs the filling rendering and composing operation as specified by 16.3.5.

The meanings of the parameters are specified by 16.3.2.

**Throws:** As specified in Error reporting (Clause 4).

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

void mask(const basic_brush<GraphicsSurfaces>& b,
const basic_brush<GraphicsSurfaces>& mb,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt,
const optional<basic_mask_props<GraphicsSurfaces>>& mp = nullopt,
const optional<basic_render_props<GraphicsSurfaces>>& rp = nullopt,
const optional<basic_clip_props<GraphicsSurfaces>>& cl = nullopt);

**Effects:** Performs the masking rendering and composing operation as specified by 16.3.7.

The meanings of the parameters are specified by 16.3.2.

**Throws:** As specified in Error reporting (Clause 4).

**Error conditions:** The errors, if any, produced by this function are implementation-defined.

void draw_callback(const function<void(basic_unmanaged_output_surface& sfc)>& fn);

**Effects:** <TODO>

void size_change_callback(const function<void(basic_unmanaged_output_surface& sfc)>& fn);

**Effects:** <TODO>

void dimensions(basic_display_point<graphics_math_type> dp);
void dimensions(basic_display_point<graphics_math_type> dp, error_code& ec) noexcept;

**Effects:** <TODO>

void display_dimensions(basic_display_point<graphics_math_type> dp);
void display_dimensions(basic_display_point<graphics_math_type> dp, error_code& ec) noexcept;

**Effects:** <TODO>

void scaling(io2d::scaling scl) noexcept;

**Effects:** <TODO>

void letterbox_brush(const optional<basic_brush<GraphicsSurfaces>>& b,
const optional<basic_brush_props<GraphicsSurfaces>>& bp = nullopt) noexcept;
void letterbox_brush_props(const optional<basic_brush_props<GraphicsSurfaces>>& bp) noexcept;

**Effects:** <TODO>

void auto_clear(bool val) noexcept;

**Effects:** <TODO>
17 Command lists

17.1 Overview of command lists

Command lists define operations on surfaces, commands, that can be submitted to a surface.

Commands consist of the rendering and composing operations, other operations on surfaces, and a type that allows a user-provided function to run.

Command lists provide a mechanism for efficiently processing graphics operations, allowing them to be executed on multiple threads. Additionally, the basic_interpreted_command_list class template allows command lists to be pre-compiled by the back end, which provides optimization possibilities for back ends that use graphics acceleration hardware.

17.2 Class template basic_commands

17.2.1 Class template basic_commands<GraphicsSurfaces>::clear

17.2.1.1 Overview

The class template basic_commands<GraphicsSurfaces>::clear describes a command that invokes the clear member function of a surface.

It has an optional surface of type optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>.

If optional surface has a value, the clear operation is performed on the optional surface instead of the surface that the command is submitted to.

If optional surface has a value and the referenced basic_image_surface<GraphicsSurfaces> object has been destroyed or otherwise rendered invalid when a basic_command_list<GraphicsSurfaces> object built using this paint object is used by the program, the effects are undefined.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::clear_data_type. It is accessible using the data member functions.

17.2.1.2 Synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_commands<GraphicsSurfaces>::clear {
    public:
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
        using data_type = typename GraphicsSurfaces::surfaces::clear_data_type;

        // 17.2.1.3, construct:
        clear() noexcept;
        clear(reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc) noexcept;

        // 17.2.1.4, accessors:
        const data_type& data() const noexcept;
        data_type& data() noexcept;

        // 17.2.1.5, modifiers:
        void surface(
            optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
            noexcept;

        // 17.2.1.6, observers:
        optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;
    };
```

§ 17.2.1.2
17.2.1.7 Equality operators:

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_commands<GraphicsSurfaces::clear&> lhs,
                const typename basic_commands<GraphicsSurfaces::clear&> rhs) noexcept;

template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces::clear&> lhs,
                const typename basic_commands<GraphicsSurfaces::clear&> rhs) noexcept;
```
17.2.2 Class template `basic_commands<GraphicsSurfaces>::paint`

[io2d.cmdlists.commands.paint]

17.2.2.1 Overview

The class template `basic_commands<GraphicsSurfaces>::paint` describes a command that invokes the `paint` member function of a surface.

1. It has an optional surface of type `optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>`. If optional surface has a value, the paint operation is performed on the optional surface instead of the surface that the command list is submitted to.

2. If optional surface has a value and the referenced `basic_image_surface<GraphicsSurfaces>` object has been destroyed or otherwise rendered invalid when a `basic_command_list<GraphicsSurfaces>` object built using this `paint` object is used by the program, the effects are undefined.

3. It has a brush of type `basic_brush<GraphicsSurfaces>`, a brush props of type `basic_brush_props<GraphicsSurfaces>`, a render props of type `basic_render_props<GraphicsSurfaces>`, a clip props of type `basic_clip_props`, and the data are stored in an object of type `typename GraphicsSurfaces::surfaces::paint_data_type`. It is accessible using the `data` member functions.

4. The data are used as arguments for the invocation of the `paint` member function of the appropriate surface when a `basic_command_list<GraphicsSurfaces>` object built using this `paint` object is used by the program.

17.2.2.2 Synopsis

namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_commands<GraphicsSurfaces>::paint {
    public:
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
        using data_type = typename GraphicsSurfaces::surfaces::paint_data_type;

        // 17.2.2.3, construct:
        paint(const basic_brush<GraphicsSurfaces>& b,
              const basic_brush_props<GraphicsSurfaces>& bp =
              basic_brush_props<GraphicsSurfaces>({}),
              const basic_render_props<GraphicsSurfaces>& rp =
              basic_render_props<GraphicsSurfaces>({}),
              const basic_clip_props<GraphicsSurfaces>& cl =
              basic_clip_props<GraphicsSurfaces>({})) noexcept;
        paint(reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc,
              const basic_brush<GraphicsSurfaces>& b,
              const basic_brush_props<GraphicsSurfaces>& bp =
              basic_brush_props<GraphicsSurfaces>({}),
              const basic_render_props<GraphicsSurfaces>& rp =
              basic_render_props<GraphicsSurfaces>({}),
              const basic_clip_props<GraphicsSurfaces>& cl =
              basic_clip_props<GraphicsSurfaces>({})) noexcept;

        // 17.2.2.4, accessors:
        const data_type& data() const noexcept;
        data_type& data() noexcept;

        // 17.2.2.5, modifiers:
        void surface(
            optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
            noexcept;
        void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;
        void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;
        void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;
        void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;
    }
17.2.2.6 Observers:

```cpp
// optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>
surface() const noexcept;
basic_brush<GraphicsSurfaces> brush() const noexcept;
basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;
basic_render_props<GraphicsSurfaces> render_props() const noexcept;
basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;
```

17.2.2.7 Equality Operators:

```cpp
// template <class GraphicsSurfaces>
bool operator==(
    const typename basic_commands<GraphicsSurfaces::paint& lhs,
    const typename basic_commands<GraphicsSurfaces::paint& rhs)
noexcept;
```

17.2.2.3 Constructors

```cpp
// 17.2.2.3 Constructors [io2d.cmdlists.paint.ctor]
paint(const basic_brush<GraphicsSurfaces>& b,
    const basic_brush_props<GraphicsSurfaces>& bp =
    basic_brush_props<GraphicsSurfaces>{},
    const basic_render_props<GraphicsSurfaces>& rp =
    basic_render_props<GraphicsSurfaces>{},
    const basic_clip_props<GraphicsSurfaces>& cl =
    basic_clip_props<GraphicsSurfaces>{}) noexcept;
```

1. **Effects:** Constructs an object of type `paint`.
2. **Postconditions:** `data() == GraphicsSurfaces::surfaces::create_paint(b, bp, rp, cl).`

```cpp
// 17.2.2.4 Accessors [io2d.cmdlists.paint.acc]
const data_type& data() const noexcept;
```

1. **Returns:** A reference to the `paint` object’s data object (See: 17.2.2.1).
2. **Remarks:** The behavior of a program is undefined if the user modifies the data contained in the `data_type` object returned by this function.

17.2.2.5 Modifiers

```cpp
// void modifiers
void surface(
    optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc)
noexcept;
```

1. **Effects:** Calls `GraphicsSurfaces::surfaces::surface(data(), sfc).`
2. **Remarks:** The optional surface is `sfc`. 

§ 17.2.2.5 205
void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::brush(data(), b).
Remarks: The brush is b.

void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::brush_props(data(), bp).
Remarks: The brush props is bp.

void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::render_props(data(), rp).
Remarks: The render props is rp.

void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::clip_props(data(), cl).
Remarks: The clip props is cl.

17.2.2.6 Observers

optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;

Returns: GraphicsSurfaces::surfaces::surface(data()).
Remarks: The returned value is the optional surface.

basic_brush<GraphicsSurfaces> brush() const noexcept;

Returns: GraphicsSurfaces::surfaces::brush(data()).
Remarks: The returned value is the brush.

basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::brush_props(data()).
Remarks: The returned value is the brush props.

basic_render_props<GraphicsSurfaces> render_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::render_props(data()).
Remarks: The returned value is the render props.

basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::clip_props(data()).
Remarks: The returned value is the clip props.

17.2.2.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_commands<GraphicsSurfaces::paint& lhs,
               const typename basic_commands<GraphicsSurfaces::paint& rhs)
               noexcept;

Returns: GraphicsSurfaces::surfaces::equal(lhs.data(), rhs.data()).

template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces::paint& lhs,
               const typename basic_commands<GraphicsSurfaces::paint& rhs)
               noexcept;

Returns: GraphicsSurfaces::surfaces::not_equal(lhs.data(), rhs.data()).

§ 17.2.2.7 206
17.2.3 Class template basic_commands<GraphicsSurfaces>::stroke

17.2.3.1 Overview

The class template basic_commands<GraphicsSurfaces>::stroke describes a command that invokes the `stroke` member function of a surface.

The optional surface of type optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> is used if it has a value. The stroke operation is performed on the optional surface instead of the surface that the command is submitted to.

If optional surface has a value and the referenced basic_image_surface<GraphicsSurfaces> object has been destroyed or otherwise rendered invalid when a basic_command_list<GraphicsSurfaces> object built using this paint object is used by the program, the effects are undefined.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::stroke_data_type. It is accessible using the data member functions.

The data are used as arguments for the invocation of the `stroke` member function of the appropriate surface when a basic_command_list<GraphicsSurfaces> object built using this stroke object is used by the program.

17.2.3.2 Synopsis

namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_commands<GraphicsSurfaces>::stroke {
    public:
      using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
      using data_type = typename GraphicsSurfaces::surfaces::stroke_data_type;

      // 17.2.3.3, construct:
      stroke(const basic_brush<GraphicsSurfaces>& b,
              const basic_interpreted_path<GraphicsSurfaces>& ip,
              const basic_brush_props<GraphicsSurfaces>& bp =
              basic_brush_props<GraphicsSurfaces>{},
              const basic_stroke_props<GraphicsSurfaces>& sp =
              basic_stroke_props<GraphicsSurfaces>{},

template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces>::stroke& lhs,
    const typename basic_commands<GraphicsSurfaces>::stroke& rhs) noexcept;

§ 17.2.3.3  Constructors

stroke(const basic_brush<GraphicsSurfaces>& b,
    const basic_interpreted_path<GraphicsSurfaces>& ip,
    const basic_brush_props<GraphicsSurfaces>& bp =
        basic_brush_props<GraphicsSurfaces>{},
    const basic_stroke_props<GraphicsSurfaces>& sp =
        basic_stroke_props<GraphicsSurfaces>{},
    const basic_dashes<GraphicsSurfaces>& d =
        basic_dashes<GraphicsSurfaces>{},
    const basic_render_props<GraphicsSurfaces>& rp =
        basic_render_props<GraphicsSurfaces>{},
    const basic_clip_props<GraphicsSurfaces>& cl =
        basic_clip_props<GraphicsSurfaces>{}) noexcept;

  Effects: Constructs an object of type stroke.

  Postconditions: data() == GraphicsSurfaces::surfaces::create_stroke(b, ip, bp, sp, d, rp, cl).
stroke(reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc,
const basic_brush<GraphicsSurfaces>& b,
const basic_interpreted_path<GraphicsSurfaces>& ip,
const basic_brush_props<GraphicsSurfaces>& bp =
basic_brush_props<GraphicsSurfaces>{},
const basic_stroke_props<GraphicsSurfaces>& sp =
basic_stroke_props<GraphicsSurfaces>{},
const basic_dashes<GraphicsSurfaces>& d =
basic_dashes<GraphicsSurfaces>{},
const basic_render_props<GraphicsSurfaces>& rp =
basic_render_props<GraphicsSurfaces>{},
const basic_clip_props<GraphicsSurfaces>& cl =
basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type stroke.

Postconditions: data() == GraphicsSurfaces::surfaces::create_stroke(sfc, b, ip, bp, sp,
d, rp, cl).

17.2.3.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

Returns: A reference to the stroke object’s data object (See: 17.2.3.1).
Remarks: The behavior of a program is undefined if the user modifies the data contained in the
data_type object returned by this function.

17.2.3.5 Modifiers

void surface(
optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
noexcept;

Effects: Calls GraphicsSurfaces::surfaces::surface(data(), sfc).
Remarks: The optional surface is sfc.

void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::brush(data(), b).
Remarks: The brush is b.

void path(const basic_interpreted_path<GraphicsSurfaces>& p) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::path(data(), p).
Remarks: The path is p.

void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::brush_props(data(), bp).
Remarks: The brush props is bp.

void brush_props(const basic_stroke_props<GraphicsSurfaces>& sp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::stroke_props(data(), sp).
Remarks: The stroke props is sp.

void dashes(const basic_dashes<GraphicsSurfaces>& d) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::dashes(data(), d).
Remarks: The dashes is d.

void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::render_props(data(), rp).
Remarks: The render props is rp.
void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::clip_props(data(), cl).
Remarks: The clip props is cl.

17.2.3.6 Observers

optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;
Returns: GraphicsSurfaces::surfaces::surface(data()).
Remarks: The returned value is the optional surface.

basic_brush<GraphicsSurfaces> brush() const noexcept;
Returns: GraphicsSurfaces::surfaces::brush(data()).
Remarks: The returned value is the brush.

basic_interpreted_path<GraphicsSurfaces> path() const noexcept;
Returns: GraphicsSurfaces::surfaces::path(data()).
Remarks: The returned value is the path.

basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;
Returns: GraphicsSurfaces::surfaces::brush_props(data()).
Remarks: The returned value is the brush props.

basic_stroke_props<GraphicsSurfaces> stroke_props() const noexcept;
Returns: GraphicsSurfaces::surfaces::stroke_props(data()).
Remarks: The returned value is the stroke props.

basic_dashes<GraphicsSurfaces> dashes() const noexcept;
Returns: GraphicsSurfaces::surfaces::dashes(data()).
Remarks: The returned value is the dashes.

basic_render_props<GraphicsSurfaces> render_props() const noexcept;
Returns: GraphicsSurfaces::surfaces::render_props(data()).
Remarks: The returned value is the render props.

basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;
Returns: GraphicsSurfaces::surfaces::clip_props(data()).
Remarks: The returned value is the clip props.

17.2.3.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(const typename basic_commands<GraphicsSurfaces::stroke>& lhs,
const typename basic_commands<GraphicsSurfaces::stroke>& rhs) noexcept;
Returns: GraphicsSurfaces::surfaces::equal(lhs.data(), rhs.data()).

template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces::stroke>& lhs,
const typename basic_commands<GraphicsSurfaces::stroke>& rhs) noexcept;
Returns: GraphicsSurfaces::surfaces::not_equal(lhs.data(), rhs.data()).
17.2.4 Class template `basic_commands<GraphicsSurfaces>::fill`

[io2d.cmdlists.commands.fill]

17.2.4.1 Overview

The class template `basic_commands<GraphicsSurfaces>::fill` describes a command that invokes the `fill` member function of a surface.

It has an optional surface of type `optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>`. If optional surface has a value, the fill operation is performed on the optional surface instead of the surface that the command is submitted to.

If optional surface has a value and the referenced `basic_image_surface<GraphicsSurfaces>` object has been destroyed or otherwise rendered invalid when a `basic_command_list<GraphicsSurfaces>` object built using this paint object is used by the program, the effects are undefined.

It has a brush of type `basic_brush<GraphicsSurfaces>`.

It has a path of type `basic_interpreted_path<GraphicsSurfaces>`.

It has a brush props of type `basic_brush_props<GraphicsSurfaces>`.

It has a render props of type `basic_render_props<GraphicsSurfaces>`.

It has a clip props of type `basic_clip_props`.

The data are stored in an object of type `typename GraphicsSurfaces::surfaces::fill_data_type`. It is accessible using the data member functions.

The data are used as arguments for the invocation of the fill member function of the appropriate surface when a `basic_command_list<GraphicsSurfaces>` object built using this fill object is used by the program.

17.2.4.2 Synopsis

[io2d.cmdlists.fill.synopsis]

```cpp
namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  class basic_commands<GraphicsSurfaces>::fill {
    public:
      using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
      using data_type = typename GraphicsSurfaces::surfaces::fill_data_type;

    // 17.2.4.3, construct:
    fill(const basic_brush<GraphicsSurfaces>& b,
         const basic_interpreted_path<GraphicsSurfaces>& ip,
         const basic_brush_props<GraphicsSurfaces>& bp =
         basic_brush_props<GraphicsSurfaces>{},
         const basic_render_props<GraphicsSurfaces>& rp =
         basic_render_props<GraphicsSurfaces>{},

bool operator!=(const typename basic_commands<GraphicsSurfaces>::fill& lhs,
const typename basic_commands<GraphicsSurfaces>::fill& rhs) noexcept;

17.2.4.3 Constructors

fill(const basic_brush<GraphicsSurfaces>& b,
const basic_interpreted_path<GraphicsSurfaces>& ip,
const basic_brush_props<GraphicsSurfaces>& bp =
basic_brush_props<GraphicsSurfaces>{},
const basic_render_props<GraphicsSurfaces>& rp =
basic_render_props<GraphicsSurfaces>{},
const basic_clip_props<GraphicsSurfaces>& cl =
basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type fill.

Postconditions: data() == GraphicsSurfaces::surfaces::create_fill(b, ip, bp, rp, cl).

fill(const basic_brush<GraphicsSurfaces>& b,
const basic_interpreted_path<GraphicsSurfaces>& ip,
const basic_brush_props<GraphicsSurfaces>& bp =
basic_brush_props<GraphicsSurfaces>{},
const basic_render_props<GraphicsSurfaces>& rp =
basic_render_props<GraphicsSurfaces>{},
const basic_clip_props<GraphicsSurfaces>& cl =
basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type fill.

Postconditions: data() == GraphicsSurfaces::surfaces::create_fill(b, ip, bp, rp, cl).

17.2.4.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

Returns: A reference to the fill object’s data object (See: 17.2.4.1).

Remarks: The behavior of a program is undefined if the user modifies the data contained in the
data_type object returned by this function.
17.2.4.5 Modifiers

void surface(
    optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
noexcept;
1
    Effects: Calls GraphicsSurfaces::surfaces::surface(data(), sfc).
2
    Remarks: The optional surface is sfc.

void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;
3
    Effects: Calls GraphicsSurfaces::surfaces::brush(data(), b).
4
    Remarks: The brush is b.

void path(const basic_interpreted_path<GraphicsSurfaces>& p) noexcept;
5
    Effects: Calls GraphicsSurfaces::surfaces::path(data(), p).
6
    Remarks: The path is p.

void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;
7
    Effects: Calls GraphicsSurfaces::surfaces::brush_props(data(), bp).
8
    Remarks: The brush props is bp.

void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;
9
    Effects: Calls GraphicsSurfaces::surfaces::render_props(data(), rp).
10
    Remarks: The render props is rp.

void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;
11
    Effects: Calls GraphicsSurfaces::surfaces::clip_props(data(), cl).
12
    Remarks: The clip props is cl.

17.2.4.6 Observers

optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;
1
    Returns: GraphicsSurfaces::surfaces::surface(data()).
2
    Remarks: The returned value is the optional surface.

basic_brush<GraphicsSurfaces> brush() const noexcept;
3
    Returns: GraphicsSurfaces::surfaces::brush(data()).
4
    Remarks: The returned value is the brush.

basic_interpreted_path<GraphicsSurfaces> path() const noexcept;
5
    Returns: GraphicsSurfaces::surfaces::path(data()).
6
    Remarks: The returned value is the path.

basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;
7
    Returns: GraphicsSurfaces::surfaces::brush_props(data()).
8
    Remarks: The returned value is the brush props.

basic_render_props<GraphicsSurfaces> render_props() const noexcept;
9
    Returns: GraphicsSurfaces::surfaces::render_props(data()).
10
    Remarks: The returned value is the render props.

basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;
11
    Returns: GraphicsSurfaces::surfaces::clip_props(data()).
12
    Remarks: The returned value is the clip props.
17.2.4.7 Equality operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_commands<GraphicsSurfaces::fill>& lhs,
                const typename basic_commands<GraphicsSurfaces::fill>& rhs)
    noexcept;

    Returns: GraphicsSurfaces::surfaces::equal(lhs.data(), rhs.data()).
```

```cpp
template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces::fill>& lhs,
                const typename basic_commands<GraphicsSurfaces::fill>& rhs)
    noexcept;

    Returns: GraphicsSurfaces::surfaces::not_equal(lhs.data(), rhs.data()).
```

17.2.5 Class template basic_commands<GraphicsSurfaces>::mask

17.2.5.1 Overview

The class template basic_commands<GraphicsSurfaces>::mask describes a command that invokes the mask member function of a surface.

It has an optional surface of type optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>. If optional surface has a value, the mask operation is performed on the optional surface instead of the surface that the command is submitted to.

If optional surface has a value and the referenced basic_image_surface<GraphicsSurfaces> object has been destroyed or otherwise rendered invalid when a basic_command_list<GraphicsSurfaces> object built using this paint object is used by the program, the effects are undefined.

It has a brush of type basic_brush<GraphicsSurfaces>.

It has a mask brush of type basic_brush<GraphicsSurfaces>.

It has a mask props of type basic_brush_props<GraphicsSurfaces>.

It has a render props of type basic_render_props<GraphicsSurfaces>.

It has a clip props of type basic_clip_props.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::mask_data_type. It is accessible using the data member functions.

The data are used as arguments for the invocation of the mask member function of the appropriate surface when a basic_command_list<GraphicsSurfaces> object built using this mask object is used by the program.

17.2.5.2 Synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_commands<GraphicsSurfaces>::mask {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::surfaces::mask_data_type;

            // 17.2.5.3, construct:
            mask(const basic_brush<GraphicsSurfaces>& b,
                 const basic_brush<GraphicsSurfaces>& mb,
                 const basic_brush_props<GraphicsSurfaces>& bp = basic_brush_props<GraphicsSurfaces>(),
                 const basic_mask_props<GraphicsSurfaces>& mp = basic_mask_props<GraphicsSurfaces>(),
                 const basic_render_props<GraphicsSurfaces>& rp = basic_mask_props<GraphicsSurfaces>(),
                 const basic_clip_props<GraphicsSurfaces>& cl = basic_clip_props<GraphicsSurfaces>()) noexcept;
```
mask(const basic_brush<GraphicsSurfaces>& b,
    const basic_brush<GraphicsSurfaces>& mb,
    const basic_brush_props<GraphicsSurfaces>& bp =
    basic_brush_props<GraphicsSurfaces>{},
    const basic_mask_props<GraphicsSurfaces>& mp =
    basic_mask_props<GraphicsSurfaces>{},
    const basic_render_props<GraphicsSurfaces>& rp =
    basic_mask_props<GraphicsSurfaces>{},
    const basic_clip_props<GraphicsSurfaces>& cl =
    basic_clip_props<GraphicsSurfaces>{}) noexcept;

// 17.2.5.4, accessors:
const data_type& data() const noexcept;
data_type& data() noexcept;

// 17.2.5.5, modifiers:
void surface(
    optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
    noexcept;
void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;
void mask_brush(const basic_brush<GraphicsSurfaces>& mb) noexcept;
void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;
void mask_props(const basic_mask_props<GraphicsSurfaces>& mp) noexcept;
void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;
void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;

// 17.2.5.6, observers:
optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;
basic_brush<GraphicsSurfaces> brush() const noexcept;
basic_brush<GraphicsSurfaces> mask_brush() const noexcept;
basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;
basic_mask_props<GraphicsSurfaces> mask_props() const noexcept;
basic_render_props<GraphicsSurfaces> render_props() const noexcept;
basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;
}

// 17.2.5.7, equality operators:
template <class GraphicsSurfaces>

    const typename basic_commands<GraphicsSurfaces>::mask& rhs) noexcept;
template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces>::mask& lhs,
    const typename basic_commands<GraphicsSurfaces>::mask& rhs) noexcept;

17.2.5.3 Constructors

Effects: Constructs an object of type mask.
Postconditions: \( \text{data()} == \text{GraphicsSurfaces::surfaces::create_mask}(b, \text{mb}, \text{bp}, \text{mp}, \text{rp}, \text{cl}) \).

\[
\text{mask}(\text{reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc,}
\text{const basic_brush<GraphicsSurfaces>& b,}
\text{const basic_brush<GraphicsSurfaces>& mb,}
\text{const basic_brush_props<GraphicsSurfaces>& bp =}
\text{basic_brush_props<GraphicsSurfaces>{},}
\text{const basic_mask_props<GraphicsSurfaces>& mp =}
\text{basic_mask_props<GraphicsSurfaces>{},}
\text{const basic_render_props<GraphicsSurfaces>& rp =}
\text{basic_mask_props<GraphicsSurfaces>{},}
\text{const basic_clip_props<GraphicsSurfaces>& cl =}
\text{basic_clip_props<GraphicsSurfaces>{} } \text{noexcept;}
\]

Effects: Constructs an object of type \text{mask}.

Postconditions: \( \text{data()} == \text{GraphicsSurfaces::surfaces::create_mask}(\text{sfc, b, mb, bp, mp, rp, cl}) \).

17.2.5.4 Accessors

\[\text{const data_type& data()}\text{ const noexcept;}
\text{data_type& data()}\text{ noexcept;}
\]

Returns: A reference to the \text{mask} object’s data object (See: 17.2.5.1).

Remarks: The behavior of a program is undefined if the user modifies the data contained in the \text{data_type} object returned by this function.

17.2.5.5 Modifiers

\[\text{void surface(}
\text{optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)}\text{ noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::surface(data(), sfc).

Remarks: The optional surface is sfc.

\[\text{void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::brush(data(), b).

Remarks: The brush is b.

\[\text{void path(const basic_brush<GraphicsSurfaces>& mb) noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::mask_brush(data(), mb).

Remarks: The mask brush is mb.

\[\text{void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::brush_props(data(), bp).

Remarks: The brush props is bp.

\[\text{void mask_props(const basic_mask_props<GraphicsSurfaces>& bp) noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::mask_props(data(), bp).

Remarks: The mask props is bp.

\[\text{void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::render_props(data(), rp).

Remarks: The render props is rp.

\[\text{void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;}\]

Effects: Calls GraphicsSurfaces::surfaces::clip_props(data(), cl).

Remarks: The clip props is cl.
17.2.5.6 Observers

optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>
surface() const noexcept;

Returns: GraphicsSurfaces::surfaces::surface(data()).
Remarks: The returned value is the optional surface.

basic_brush<GraphicsSurfaces> brush() const noexcept;

Returns: GraphicsSurfaces::surfaces::brush(data()).
Remarks: The returned value is the brush.

basic_brush<GraphicsSurfaces> mask_brush() const noexcept;

Returns: GraphicsSurfaces::surfaces::mask_brush(data()).
Remarks: The returned value is the mask brush.

basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::brush_props(data()).
Remarks: The returned value is the brush props.

basic_mask_props<GraphicsSurfaces> mask_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::mask_props(data()).
Remarks: The returned value is the mask props.

basic_render_props<GraphicsSurfaces> render_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::render_props(data()).
Remarks: The returned value is the render props.

basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::clip_props(data()).
Remarks: The returned value is the clip props.

17.2.5.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(
    const typename basic_commands<GraphicsSurfaces::mask&> lhs,
    const typename basic_commands<GraphicsSurfaces::mask&> rhs) noexcept;

Returns: GraphicsSurfaces::surfaces::equal(lhs.data(), rhs.data()).

template <class GraphicsSurfaces>
bool operator!=(
    const typename basic_commands<GraphicsSurfaces::mask&> lhs,
    const typename basic_commands<GraphicsSurfaces::mask&> rhs) noexcept;

Returns: GraphicsSurfaces::surfaces::not_equal(lhs.data(), rhs.data()).

17.2.6 Class template basic_commands<GraphicsSurfaces>::draw_text

17.2.6.1 Overview

The class template basic_commands<GraphicsSurfaces>::draw_text describes a command that invokes
the draw_text member function of a surface.

It has an optional surface of type optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>. 
If optional surface has a value, the draw_text operation is performed on the optional surface instead of the 
surface that the command is submitted to.

§ 17.2.6.1
If optional surface has a value and the referenced basic_image_surface<GraphicsSurfaces> object has been destroyed or otherwise rendered invalid when a basic_command_list<GraphicsSurfaces> object built using this paint object is used by the program, the effects are undefined.

It has a text location of type variant<basic_point_2d<typename GraphicsSurfaces::graphics_math_type>, basic_bounding_box<typename GraphicsSurfaces::graphics_math_type>>.

It has a brush of type basic_brush<GraphicsSurfaces>.

It has a font of type basic_font<GraphicsSurfaces>.

It has text of type string comprised of UTF-8 encoded character data.

It has a text props of type basic_text_props<GraphicsSurfaces>.

It has a brush props of type basic_brush_props<GraphicsSurfaces>.

It has a stroke props of type basic_stroke_props<GraphicsSurfaces>.

It has a dashes of type basic_dashes<GraphicsSurfaces>.

It has a render props of type basic_render_props<GraphicsSurfaces>.

It has a clip props of type basic_clip_props.

The data are stored in an object of type typename GraphicsSurfaces::surfaces::stroke_data_type. It is accessible using the data member functions.

The data are used as arguments for the invocation of the draw_text member function of the appropriate surface when a basic_command_list<GraphicsSurfaces> object built using this draw_text object is used by the program.

### 17.2.6.2 Synopsis [io2d.cmdlists.drawtext.synopsis]

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basiccommands<GraphicsSurfaces>::draw_text {
    public:
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
        using data_type = typename GraphicsSurfaces::surfaces::draw_text_data_type;

        // 17.2.6.3, construct:
        draw_text(const basic_point_2d<graphics_math_type>& pt,
                  const basic_brush<GraphicsSurfaces>& b,
                  const basic_font<GraphicsSurfaces>& font,
                  const basic_text_props<GraphicsSurfaces>& tp = basic_text_props<GraphicsSurfaces>{},
                  const basic_brush_props<GraphicsSurfaces>& bp = basic_brush_props<GraphicsSurfaces>{},
                  const basic_stroke_props<GraphicsSurfaces>& sp = basic_stroke_props<GraphicsSurfaces>{},
                  const basic_dashes<GraphicsSurfaces>& d = basic_dashes<GraphicsSurfaces>{},
                  const basic_render_props<GraphicsSurfaces>& rp = basic_render_props<GraphicsSurfaces>{},
                  const basic_clip_props<GraphicsSurfaces>& cl = basic_clip_props<GraphicsSurfaces>{}) noexcept;

        draw_text(reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc,
                  const basic_point_2d<graphics_math_type>& pt,
                  const basic_brush<GraphicsSurfaces>& b,
                  const basic_font<GraphicsSurfaces>& font,
                  const basic_text_props<GraphicsSurfaces>& tp = basic_text_props<GraphicsSurfaces>{},

17.2.6.3 Constructors  [io2d.cmdlists.drawtext.ctor]
draw_text(const basic_point_2d<graphics_math_type>& pt,
const basic_brush<GraphicsSurfaces>& b,
const basic_font<GraphicsSurfaces>& font, string t,
const basic_text_props<GraphicsSurfaces>& tp =
basic_text_props<GraphicsSurfaces>{},
const basic_brush_props<GraphicsSurfaces>& bp =
basic_brush_props<GraphicsSurfaces>{},
const basic_stroke_props<GraphicsSurfaces>& sp =
basic_stroke_props<GraphicsSurfaces>{},
const basic_dashes<GraphicsSurfaces>& d =
basic_dashes<GraphicsSurfaces>{},
const basic_render_props<GraphicsSurfaces>& rp =
basic_render_props<GraphicsSurfaces>{},
const basic_clip_props<GraphicsSurfaces>& cl =
basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type draw_text.
Postconditions: data() == GraphicsSurfaces::surfaces::create_draw_text(pt, b, font, t, tp, bp, sp, d, rp, cl).

draw_text(reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc,
const basic_point_2d<graphics_math_type>& pt,
const basic_brush<GraphicsSurfaces>& b,
const basic_font<GraphicsSurfaces>& font, string t,
const basic_text_props<GraphicsSurfaces>& tp =
basic_text_props<GraphicsSurfaces>{},
const basic_brush_props<GraphicsSurfaces>& bp =
basic_brush_props<GraphicsSurfaces>{},
const basic_stroke_props<GraphicsSurfaces>& sp =
basic_stroke_props<GraphicsSurfaces>{},
const basic_dashes<GraphicsSurfaces>& d =
basic_dashes<GraphicsSurfaces>{},
const basic_render_props<GraphicsSurfaces>& rp =
basic_render_props<GraphicsSurfaces>{},
const basic_clip_props<GraphicsSurfaces>& cl =
basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type draw_text.
Postconditions: data() == GraphicsSurfaces::surfaces::create_draw_text(sfc, pt, b, font, t, tp, bp, sp, d, rp, cl).
draw_text(const basic_bounding_box<graphics_math_type>& bb,
    const basic_brush<GraphicsSurfaces>& b,
    const basic_font<GraphicsSurfaces>& font, string t,
    const basic_text_props<GraphicsSurfaces>& tp =
    basic_text_props<GraphicsSurfaces>{},
    const basic_brush_props<GraphicsSurfaces>& bp =
    basic_brush_props<GraphicsSurfaces>{},
    const basic_stroke_props<GraphicsSurfaces>& sp =
    basic_stroke_props<GraphicsSurfaces>{},
    const basic_dashes<GraphicsSurfaces>& d =
    basic_dashes<GraphicsSurfaces>{},
    const basic_render_props<GraphicsSurfaces>& rp =
    basic_render_props<GraphicsSurfaces>{},
    const basic_clip_props<GraphicsSurfaces>& cl =
    basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type draw_text.

Postconditions: data() == GraphicsSurfaces::surfaces::create_draw_text(bb, b, font, t, tp, bp, sp, d, rp, cl).

draw_text(reference_wrapper<basic_image_surface<GraphicsSurfaces>> sfc,
    const basic_bounding_box<graphics_math_type>& bb,
    const basic_brush<GraphicsSurfaces>& b,
    const basic_font<GraphicsSurfaces>& font, string t,
    const basic_text_props<GraphicsSurfaces>& tp =
    basic_text_props<GraphicsSurfaces>{},
    const basic_brush_props<GraphicsSurfaces>& bp =
    basic_brush_props<GraphicsSurfaces>{},
    const basic_stroke_props<GraphicsSurfaces>& sp =
    basic_stroke_props<GraphicsSurfaces>{},
    const basic_dashes<GraphicsSurfaces>& d =
    basic_dashes<GraphicsSurfaces>{},
    const basic_render_props<GraphicsSurfaces>& rp =
    basic_render_props<GraphicsSurfaces>{},
    const basic_clip_props<GraphicsSurfaces>& cl =
    basic_clip_props<GraphicsSurfaces>{}) noexcept;

Effects: Constructs an object of type draw_text.

Postconditions: data() == GraphicsSurfaces::surfaces::create_draw_text(sfc, bb, b, font, t, tp, bp, sp, d, rp, cl).

17.2.6.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

Returns: A reference to the draw_text object’s data object (See: 17.2.6.1).

Remarks: The behavior of a program is undefined if the user modifies the data contained in the data_type object returned by this function.

17.2.6.5 Modifiers

void surface(
    optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
noexcept;

Effects: Calls GraphicsSurfaces::surfaces::surface(data(), sfc).

Remarks: The optional surface is sfc.

void location(const basic_point_2d<graphics_math_type>& pt) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::location(data(), pt).

Remarks: The text location holds pt as its value.
void location(const basic_bounding_box<graphics_math_type>& bb) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::location(data(), bb).
Remarks: The text location holds bb as its value.

void brush(const basic_brush<GraphicsSurfaces>& b) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::brush(data(), b).
Remarks: The brush is b.

void font(const basic_font<GraphicsSurfaces>& f) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::font(data(), f).
Remarks: The font is f.

void text_props(const basic_text_props<GraphicsSurfaces>& tp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::text_props(data(), tp).
Remarks: The text props is tp.

void brush_props(const basic_brush_props<GraphicsSurfaces>& bp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::brush_props(data(), bp).
Remarks: The brush props is bp.

void render_props(const basic_render_props<GraphicsSurfaces>& rp) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::render_props(data(), rp).
Remarks: The render props is rp.

void clip_props(const basic_clip_props<GraphicsSurfaces>& cl) noexcept;

Effects: Calls GraphicsSurfaces::surfaces::clip_props(data(), cl).
Remarks: The clip props is cl.

17.2.6.6 Observers

optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;

Returns: GraphicsSurfaces::surfaces::surface(data()).
Remarks: The returned value is the optional surface.

variant<basic_point_2d<graphics_math_type>, basic_bounding_box<graphics_math_type>> brush() const noexcept;

Returns: GraphicsSurfaces::surfaces::location(data()).
Remarks: The returned value is the text location.

basic_brush<GraphicsSurfaces> brush() const noexcept;

Returns: GraphicsSurfaces::surfaces::brush(data()).
Remarks: The returned value is the brush.
basic_font<GraphicsSurfaces> font() const noexcept;

Returns: GraphicsSurfaces::surfaces::font(data()).
Remarks: The returned value is the font.

basic_text_props<GraphicsSurfaces> text_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::text_props(data()).
Remarks: The returned value is the text props.

basic_brush_props<GraphicsSurfaces> brush_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::brush_props(data()).
Remarks: The returned value is the brush props.

basic_stroke_props<GraphicsSurfaces> stroke_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::stroke_props(data()).
Remarks: The returned value is the stroke props.

basic_dashes<GraphicsSurfaces> dashes() const noexcept;

Returns: GraphicsSurfaces::surfaces::dashes(data()).
Remarks: The returned value is the dashes.

basic_render_props<GraphicsSurfaces> render_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::render_props(data()).
Remarks: The returned value is the render props.

basic_clip_props<GraphicsSurfaces> clip_props() const noexcept;

Returns: GraphicsSurfaces::surfaces::clip_props(data()).
Remarks: The returned value is the clip props.

17.2.6.7 Equality operators

template <class GraphicsSurfaces>
bool operator==(
    const typename basic_commands<GraphicsSurfaces::draw_text& lhs,
    const typename basic_commands<GraphicsSurfaces::draw_text& rhs)
noexcept;

Returns: GraphicsSurfaces::surfaces::equal(lhs.data(), rhs.data()).

template <class GraphicsSurfaces>
bool operator!=(
    const typename basic_commands<GraphicsSurfaces::draw_text& lhs,
    const typename basic_commands<GraphicsSurfaces::draw_text& rhs)
noexcept;

Returns: GraphicsSurfaces::surfaces::not_equal(lhs.data(), rhs.data()).

17.2.7 Class template basic_commands<GraphicsSurfaces>::run_function

17.2.7.1 Overview

The class template basic_commands<GraphicsSurfaces>::run_function describes a command that invokes the user-provided function, passing it a reference to the surface the command list was submitted to, an optional surface, and user data. It allows the user to perform arbitrary operations that are not otherwise possible using the other command types.

It has a user-provided function of type variant<function<void(basic_image_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)>, function<void(basic_output_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)>, function<void(basic_unmanaged_output_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)>>.
3 [Note: The user-defined function is stored in a variant to avoid having three separate classes that essentially provide the same functionality. —end note]

4 It has an optional surface of type \texttt{optional<reference\_wrapper<basic\_image\_surface<GraphicsSurfaces>>>}.

5 It has user data of type \texttt{void*}.

6 The data are stored in an object of type \texttt{typename GraphicsSurfaces::surfaces::run\_function\_data\_type}. It is accessible using the data member functions.

### 17.2.7.2 Synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_commands<GraphicsSurfaces::run_function {
        public:
            using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
            using data_type = typename GraphicsSurfaces::surfaces::run_function_data_type;

            // 17.2.7.3, construct:
            run_function(const function<void(basic_image_surface<GraphicsSurfaces>&,
                optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>,
                void*)& fn, void* ud,
                optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
                noexcept;
            run_function(const function<void(basic_output_surface<GraphicsSurfaces>&,
                optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>,
                void*)& fn, void* ud,
                optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
                noexcept;
            run_function(  
                const function<void(basic_unmanaged_output_surface<GraphicsSurfaces>&,
                optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>,
                void*)& fn, void* ud,
                optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc)
                noexcept;

            // 17.2.7.4, accessors:
            const data_type& data() const noexcept;
            data_type& data() noexcept;

run_function(const function<void(basic_output_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)& fn, void* ud, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc) noexcept;
run_function(const function<void(basic_unmanaged_output_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)& fn, void* ud, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc) noexcept;

1 Effects: Constructs an object of type run_function.
2 Postconditions: data() == GraphicsSurfaces::surfaces::create_run_function(fn, ud, sfc).

17.2.7.4 Accessors

const data_type& data() const noexcept;
data_type& data() noexcept;

1 Returns: A reference to the run_function object’s data object (See: 17.2.7.1).

17.2.7.5 Modifiers

void surface(optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> sfc) noexcept;

1 Effects: Calls GraphicsSurfaces::surfaces::surface(data(), sfc).
2 Remarks: The optional surface is sfc.

void func(const function<void(basic_image_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)& fn) noexcept;
void func(const function<void(basic_output_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)& fn) noexcept;
void func(const function<void(basic_unmanaged_output_surface<GraphicsSurfaces>&, optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>, void*)& fn) noexcept;
void func(
    const function<void(basic_unmanaged_output_surface<GraphicsSurfaces>>&,
        optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>&,
        void*)& fn) noexcept;

  Effects: Calls GraphicsSurfaces::surfaces::func(data(), fn).
  Remarks: The user-defined function holds fn as its value.

void user_data(void* ud) noexcept;

  Effects: Calls GraphicsSurfaces::surfaces::user_data(data(), ud).
  Remarks: The user data is ud.

### 17.2.7.6 Observers

```cpp
optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>> surface() const noexcept;
```

  Returns: GraphicsSurfaces::surfaces::surface(data()).
  Remarks: The returned value is the optional surface.

```cpp
const variant<function<void(basic_image_surface<GraphicsSurfaces>&,
        optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>&,
        void*)>,
        function<void(basic_output_surface<GraphicsSurfaces>&,
                    optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>&,
                    void*)>,
        function<void(basic_unmanaged_output_surface<GraphicsSurfaces>&,
                     optional<reference_wrapper<basic_image_surface<GraphicsSurfaces>>>&,
                     void*)>& func() const noexcept;
```

  Returns: GraphicsSurfaces::surfaces::func(data()).
  Remarks: The returned value is the user-defined function.

```cpp
void* user_data() const noexcept;
```

  Returns: GraphicsSurfaces::surfaces::user_data(data()).
  Remarks: The returned value is the user data.

### 17.2.7.7 Equality operators

```cpp
template <class GraphicsSurfaces>
bool operator==(const typename basic_commands<GraphicsSurfaces>::run_function& lhs,
                const typename basic_commands<GraphicsSurfaces>::run_function& rhs) noexcept;
```

  Returns: GraphicsSurfaces::surfaces::equal(lhs.data(), rhs.data()).

```cpp
template <class GraphicsSurfaces>
bool operator!=(const typename basic_commands<GraphicsSurfaces>::run_function& lhs,
                const typename basic_commands<GraphicsSurfaces>::run_function& rhs) noexcept;
```

  Returns: GraphicsSurfaces::surfaces::not_equal(lhs.data(), rhs.data()).

### 17.3 Class template basic_command_list

#### 17.3.1 Overview

The class template `basic_command_list<GraphicsSurfaces>` contains the data that results from a back end pre-compiling (interpreting) a sequence of `basic_commands<GraphicsSurfaces>::command_item` objects.

This command list may later be executed by one of the surface types. For `basic_image_surface`, it may be executed on separate thread.

The data are stored in an object of type `typename GraphicsSurfaces::surfaces::command_list_data_type`. It is accessible using the `data` member function.

§ 17.3.1
### 17.3.2 basic_command_list synopsis

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    class basic_command_list {
public:
    using data_type = typename GraphicsSurfaces::surfaces::command_list_data_type;
    // 17.3.3, construct:
    basic_command_list() noexcept;
    template <class InputIterator>
    basic_command_list(InputIterator first, InputIterator last);
    explicit basic_command_list(initializer_list<typename basic_commands<GraphicsSurfaces>::command_item>> il);
    // 17.3.4, accessors:
    const data_type& data() const noexcept;
};
```

### 17.3.3 basic_command_list constructors

1. basic_command_list() noexcept;
   ```cpp```
   Effects: Constructs an object of type basic_command_list.

   Postconditions: data() == GraphicsSurfaces::surfaces::create_command_list().

2. explicit basic_command_list(const basic_bounding_box<GraphicsMath>& bb);
   Effects: Constructs an object of type basic_command_list.

   Postconditions: data() == GraphicsSurfaces::surfaces::create_command_list().

3. template <class InputIterator>
   basic_command_list(InputIterator first, InputIterator last);
   Effects: Constructs an object of type basic_command_list.

   Postconditions: data() == GraphicsSurfaces::surfaces::create_command_list(first, last).

   [Note: The contained data is the result of the back end pre-compiling the series of objects of type basic_commands<GraphicsSurfaces>::command_item from first to the last element before last. —end note]

4. explicit basic_command_list(initializer_list<typename basic_commands<GraphicsSurfaces>::command_item> il);
   Effects: Equivalent to: basic_command_list{ il.begin(), il.end() }

### 17.3.4 Accessors

```cpp```
const data_type& data() const noexcept;
```

Returns: A reference to the basic_command_list object’s data object (See: 17.3.1).

```cpp
namespace std::experimental::io2d::v1 {
    template <class GraphicsSurfaces>
    struct basic_commands {
        using graphics_math_type = typename GraphicsSurfaces::graphics_math_type;
        class clear;
        class paint;
        class stroke;
        class fill;
        class mask;
        class draw_text;
        class run_function;
    }
```
using command_item = variant<clear, paint, stroke, fill, mask, draw_text, run_function>;
};
18  Input

[io2d.input]

1 Note: Input, such as keyboard, mouse, and touch, to user-visible surfaces will be added at a later date. This section is a placeholder. It is expected that input will be added via deriving from a user-visible surface. One example is a basic_io_surface class template deriving from basic_output_surface. This would allow developers to choose not to incur any additional costs of input support where the surface does not require user input. —end note]
19 Standalone functions [io2d.standalone]

19.1 Standalone functions synopsis [io2d.standalone.synopsis]

namespace std::experimental::io2d::v1 {
  template <class GraphicsSurfaces>
  basic_image_surface<GraphicsSurfaces> copy_surface(
    basic_image_surface<GraphicsSurfaces>& sfc) noexcept;
  template <class GraphicsSurfaces>
  basic_output_surface<GraphicsSurfaces> copy_surface(
    basic_output_surface<GraphicsSurfaces>& sfc) noexcept;
  template <class T>
  constexpr T degrees_to_radians(T d) noexcept;
  template <class T>
  constexpr T radians_to_degrees(T r) noexcept;
  float angle_for_point(point_2d ctr, point_2d pt) noexcept;
  point_2d point_for_angle(float ang, float rad = 1.0f) noexcept;
  point_2d point_for_angle(float ang, point_2d rad) noexcept;
  point_2d arc_start(point_2d ctr, float sang, point_2d rad,
    const matrix_2d& m = matrix_2d{}) noexcept;
  point_2d arc_center(point_2d cpt, float sang, point_2d rad,
    const matrix_2d& m = matrix_2d{}) noexcept;
  point_2d arc_end(point_2d cpt, float eang, point_2d rad,
    const matrix_2d& m = matrix_2d{}) noexcept;
}

19.2 copy_surface [io2d.standalone.copysurface]

template <class GraphicsSurfaces>
basic_image_surface<GraphicsSurfaces> copy_surface(
  basic_image_surface<GraphicsSurfaces>& sfc) noexcept;

template <class GraphicsSurfaces>
basic_output_surface<GraphicsSurfaces> copy_surface(
  basic_output_surface<GraphicsSurfaces>& sfc) noexcept;

Returns: GraphicsSurfaces::surfaces::copy_surface(sfc).

19.3 degrees_to_radians [io2d.standalone.degtorad]

template <class T>
constexpr T degrees_to_radians(T d) noexcept;

Returns: If d is positive and is less than one thousandth of a degree, then static_cast<T>(0). If d is negative and is less than one thousandth of a degree, then -static_cast<T>(0). Otherwise, the value obtained from converting the degrees value d to radians.

Remarks: This function shall not participate in overload resolution unless T is a floating-point type.

19.4 radians_to_degrees [io2d.standalone.radtodeg]

template <class T>
constexpr T radians_to_degrees(T r) noexcept;

Returns: If r is positive and is less than one thousandth of a degree in radians, then static_cast<T>(0). If r is negative and is less than one thousandth of a degree in radians, then -static_cast<T>(0). Otherwise, the value obtained from converting the radians value r to degrees.

Remarks: This function shall not participate in overload resolution unless T is a floating-point type.

19.5 angle_for_point [io2d.standalone.angleforpoint]

float angle_for_point(point_2d ctr, point_2d pt) noexcept;

Returns: The angle, in radians, of pt as a point on a circle with a center at ctr. If the angle is less that pi<float> / 180000.0f, returns 0.0f.
19.6 \texttt{point\_for\_angle} \hfill [\texttt{io2d.standalone.pointforangle}]

\begin{verbatim}
1 point_2d point_for_angle(float ang, float rad = 1.0f) noexcept;
point_2d point_for_angle(float ang, point_2d rad) noexcept;

1 \textit{Requires}: If it is a \texttt{float}, \texttt{rad} is greater than 0.0f. If it is a \texttt{point\_2d}, \texttt{rad.x} or \texttt{rad.y} is greater than 0.0f and neither is less than 0.0f.

2 \textit{Returns}: The result of rotating the point \texttt{point\_2d\{ 1.0f, 0.0f \}}, around an origin of \texttt{point\_2d\{ 0.0f, 0.0f \}} by \texttt{ang} radians, with a positive value of \texttt{ang} meaning counterclockwise rotation and a negative value meaning clockwise rotation, with the result being multiplied by \texttt{rad}.
\end{verbatim}

19.7 \texttt{arc\_start} \hfill [\texttt{io2d.standalone.arcstart}]

\begin{verbatim}
point_2d arc_start(point_2d ctr, float sang, point_2d rad,
const matrix_2d& m = matrix_2d{}) noexcept;

1 \textit{Requires}: \texttt{rad.x} and \texttt{rad.y} are both greater than 0.0f.

2 \textit{Returns}: As-if:
\begin{verbatim}
auto lmtx = m;
lmtx.m20 = 0.0f; lmtx.m21 = 0.0f;
auto pt = point_for_angle(sang, rad);
return ctr + pt * lmtx;
\end{verbatim}

3 \textit{Note}: Among other things, this function is useful for determining the point at which a new figure should begin if the first item in the figure is an arc and the user wishes to clearly define its center.
\end{verbatim}

19.8 \texttt{arc\_center} \hfill [\texttt{io2d.standalone.arccenter}]

\begin{verbatim}
point_2d arc_center(point_2d cpt, float sang, point_2d rad,
const matrix_2d& m = matrix_2d{}) noexcept;

1 \textit{Requires}: \texttt{rad.x} and \texttt{rad.y} are both greater than 0.0f.

2 \textit{Returns}: As-if:
\begin{verbatim}
auto lmtx = m;
lmtx.m20 = 0.0f; lmtx.m21 = 0.0f;
auto centerOffset = point_for_angle(two_pi<float> - sang, rad);
centerOffset.y = -centerOffset.y;
return cpt - centerOffset * lmtx;
\end{verbatim}
\end{verbatim}

19.9 \texttt{arc\_end} \hfill [\texttt{io2d.standalone.arcend}]

\begin{verbatim}
point_2d arc_end(point_2d cpt, float eang, point_2d rad,
const matrix_2d& m = matrix_2d{}) noexcept;

1 \textit{Requires}: \texttt{rad.x} and \texttt{rad.y} are both greater than 0.0f.

2 \textit{Returns}: As-if:
\begin{verbatim}
auto lmtx = m;
auto tfrm = matrix_2d::init_rotate(eang);
lmtx.m20 = 0.0f; lmtx.m21 = 0.0f;
auto pt = (rad * tfrm);
pt.y = -pt.y;
return cpt + pt * lmtx;
\end{verbatim}
\end{verbatim}
Annex A  (informative)
