1 Introduction

In the Rapperswil '18 meeting, after protracted discussion, it was decided that the span type’s .size() method should be changed to return an unsigned integer type. The primary motivation for the change was consistency with the rest of the Standard Library, which uses unsigned integers for size types exclusively.

Although not discussed then, the new View types in the Ranges clause also need to be changed to have unsigned size types in order to keep the Standard Library consistent.

This proposed resolution in this paper assumes the adoption of its companion paper [P1775R0], “Iterator Difference Type and Integer Overflow”. Should that paper not be adopted, the resolution proposed in this paper can be trivially adapted to apply directly to the working draft.

2 Design Considerations

Should the subrange(I i, S s, iter_difference_t<I> n) constructor be changed to take an unsigned type, like span?

3 Proposed Resolution

[ Editor’s note: Change [range.prim.size] as follows (edits relative to [P1775R0]): ]

[ Editor’s note: If the user has defined a size function (either a member function or a free function) that returns a signed integer, this does not force it to be unsigned. Presumably, the user knows what they are doing. Rather, only force the size to be unsigned if they have not specified a size function, and we are using distance on SizedSentinel<S, I> to compute the size, which yields a signed integer always. ]

24.3.9 ranges::size

The name size denotes a customization point object (16.4.2.6). The expression ranges::size(E) for some subexpression E with type T is expression-equivalent to:

1.1 — decay-copy(extent_v<T>) if T is an array type (6.7.2).
1.2 — Otherwise, if disable_sized_range<remove_cv_t<T>>(24.4.3) is false:

1.2.1 — decay-copy(E.size()) if it is a valid expression and its type I is integer-like.
1.2.2 — Otherwise, decay-copy(size(E)) if it is a valid expression and its type I is integer-like with overload resolution performed in a context that includes the declaration:
template<class T> void size(T&&) = delete;

and does not include a declaration of \texttt{ranges::size}.

1.3 — Otherwise, \texttt{make-unsigned(ranges::end(E) - ranges::begin(E))} if it is a valid expression and the types \texttt{I} and \texttt{S} of \texttt{ranges::begin(E)} and \texttt{ranges::end(E)} model \texttt{SizedSentinel<S, I>} (23.3.4.8) and \texttt{ForwardIterator<I>}. However, \texttt{E} is evaluated only once.

1.4 — Otherwise, \texttt{ranges::size(E)} is ill-formed. [\textit{Note}: This case can result in substitution failure when \texttt{ranges::size(E)} appears in the immediate context of a template instantiation. — end note]

2 [\textit{Note}: Whenever \texttt{ranges::size(E)} is a valid expression, its type is integer-like. — end note]

[Editor's note: Change the class declaration of \texttt{subrange} ([range subrange]/p1) as follows:]

```cpp
template<Iterator I, Sentinel<I> S = I, subrange_kind K = SizedSentinel<S, I> ? subrange_kind::sized : subrange_kind::unsized>
 requires (K == subrange_kind::sized || !SizedSentinel<S, I>)
 class subrange : public view_interface<subrange<I, S, K>> {
 private:
 static constexpr bool StoreSize = // exposition only
  K == subrange_kind::sized && !SizedSentinel<S, I>;
  I begin_ = I(); // exposition only
  S end_ = S(); // exposition only
  iter_difference_t<I> size_ = 0; // exposition only; present only
   // when StoreSize is true

  [...] constexpr bool empty() const;
 -constexpr iter_difference_t<I> size() const
 +constexpr auto size() const
  requires (K == subrange_kind::sized);

 [...]};
 [...]

[Editor's note: Change [range subrange access]/p4 as follows:]

```cpp
-constexpr iter_difference_t<I> size() const
 +constexpr auto size() const
  requires (K == subrange_kind::sized);
```

4 \textit{Effects:}

4.1 — If \texttt{StoreSize} is \texttt{true}, equivalent to: return \texttt{make-unsigned(size_)};

4.2 — Otherwise, equivalent to: return \texttt{make-unsigned(end_ - begin_)};

[Editor's note: Change the class declaration of \texttt{range::empty_view} in [range empty view] as follows:]

```cpp
namespace std::ranges {
 template<class T>
  requires is_object_v<T>
```
class empty_view : public view_interface<empty_view<T>> {
public:
    static constexpr T* begin() noexcept { return nullptr; }
    static constexpr T* end() noexcept { return nullptr; }
    static constexpr T* data() noexcept { return nullptr; }
-    static constexpr ptrdiff_t size() noexcept { return 0; }
+    static constexpr size_t size() noexcept { return 0; }
    static constexpr bool empty() noexcept { return true; }

friend constexpr T* begin(empty_view) noexcept { return nullptr; }
friend constexpr T* end(empty_view) noexcept { return nullptr; }
};

[ Editor’s note: Change the class declaration of range::single_view in [range.single.view] as follows: ]

namespace std::ranges {
    template<CopyConstructible T>
    requires is_object_v<T>
    class single_view : public view_interface<single_view<T>> {
private:
        semiregular<T> value_; // exposition only
public:
    single_view() = default;
    constexpr explicit single_view(const T& t);
    constexpr explicit single_view(T&& t);
    template<class... Args>
        requires Constructible<T, Args...>
    constexpr single_view(in_place_t, Args&&... args);
    constexpr T* begin() noexcept;
    constexpr const T* begin() const noexcept;
    constexpr T* end() noexcept;
    constexpr const T* end() const noexcept;
-    static constexpr ptrdiff_t size() noexcept;
+    static constexpr size_t size() noexcept;
    constexpr T* data() noexcept;
    constexpr const T* data() const noexcept;
};
}

[ Editor’s note: Change [range.single.view]/p6 as follows: ]

- static constexpr ptrdiff_t size() noexcept;
+ static constexpr size_t size() noexcept;

6     Effects: Equivalent to: return 1;
