Expanding the Rights in SD-8

Introduction
The rights enumerated in the 2018-08-02 version of SD-8 (Standard Library Compatibility) are a great start, but are not sufficient. This proposal expands upon those rights.

Motivation and Scope
The rights enumerated in “Rights the Standard Library Reserves for Itself” is a great start, but is not sufficient to cover what we already assume. Here is an attempt to expand on those rights.

Add new names to namespace std

We own more than one namespace, and we should reserve the right to add names to any of those namespaces and to any entity within those namespaces.
Impact on the Standard
No direct impact.

Design Decisions
Entities within reserved namespaces are things that are in the domain of the standard library.

Technical Specifications
Replace the first three bullet items with:

• Add new names to namespace std and any namespace reserved for future standardization as per [namespace.future].
• Add new names to any entity within any reserved namespace, including but not limited to
  o Functions (this includes new member functions and overloads to existing functions)
  o Enumerations
  o Namespaces
  o Aliases (using, typedef, etc.)
  o Classes (struct/class/union)
  o Concepts

Acknowledgements
Thanks to Titus Winters for encouraging me to write this.

This was supported by the Exascale Computing Project (17-SC-20-SC), a collaborative effort of two U.S. Department of Energy organizations (Office of Science and the National Nuclear Security Administration) responsible for the planning and preparation of a capable exascale ecosystem, including software, applications, hardware, advanced system engineering, and early testbed platforms, in support of the nation’s exascale computing imperative. Additionally, this research used resources of the Argonne Leadership Computing Facility, which is a DOE Office of Science User Facility supported under Contract DE-AC02-06CH11357.
