Constraints: `is_constructible_v<T, initializer_list<U>&, Args...>` is true, and `T` occurs exactly once in `Types`.

Effects: Equivalent to:

```c++
return emplace<I>(il, std::forward<Args>(args)...);
```

where `I` is the zero-based index of `T` in `Types`.

```c++
template<size_t I, class... Args>
constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&... args);
```

Mandates: `I < sizeof...(Types)`.

Constraints: `is_constructible_v<T_I, Args...>` is true.

Effects: Destroys the currently contained value if `valueless_by_exception()` is false. Then direct-
non-list-initializes the contained value of type `T_I` with the arguments `std::forward<Args>(args)`....

Postconditions: `index()` is `I`.

Returns: A reference to the new contained value.

Remarks: If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

```c++
template<size_t I, class U, class... Args>
constexpr variant_alternative_t<I, variant<Types...>>&
emplace(initializer_list<U> il, Args&&... args);
```

Mandates: `I < sizeof...(Types)`.

Constraints: `is_constructible_v<T_I, initializer_list<U>&, Args...>` is true.

Effects: Destroys the currently contained value if `valueless_by_exception()` is false. Then direct-
non-list-initializes the contained value of type `T_I` with `il`, `std::forward<Args>(args)`....

Postconditions: `index()` is `I`.

Returns: A reference to the new contained value.
22.6.3.6 Value status

```cpp
constexpr bool valueless_by_exception() const noexcept;
```

**Effects:** Returns false if and only if the variant holds a value.

**Note 1:** It is possible for a variant to hold no value if an exception is thrown during a type-changing assignment or emplacement. The latter means that even a `variant<float, int>` can become `valueless_by_exception()`, for instance by:

```cpp
struct S { operator int() { throw 42; };
    variant<float, int> v{12.f};
    v.emplace<1>(S());
```

**Note 2:**

22.6.3.7 Swap

```cpp
constexpr void swap(variant& rhs) noexcept;
```

**Mandates:** is_move_constructible_v<T_i> is true for all i.

**Preconditions:** Lvalues of type T_i are swappable (16.4.4.3).

**Effects:**

1. If `valueless_by_exception() && rhs.valueless_by_exception()` no effect.
2. Otherwise, if `index() == rhs.index()`, calls swap(get<i>(*this), get<i>(rhs)) where i is index().
3. Otherwise, exchanges values of rhs and *this.

**Throws:** If `index() == rhs.index()`, any exception thrown by swap(get<i>(*this), get<i>(rhs)) with i being index(). Otherwise, any exception thrown by the move constructor of T_i or T_j with i being index() and j being rhs.index().

**Remarks:** If an exception is thrown during the call to function swap(get<i>(*this), get<i>(rhs)), the states of the contained values of *this and of rhs are determined by the exception safety guarantee of swap for lvalues of T_i with i being index(). If an exception is thrown during the exchange of the values of *this and rhs, the states of the values of *this and of rhs are determined by the exception safety guarantee of variant’s move constructor. The exception specification is equivalent to the logical AND of is_nothrow_move_constructible_v<T_i> && is_nothrow_swapable_v<T_i> for all i.

22.6.4 variant helper classes

```cpp
template<class T> struct variant_size;
```

All specializations of variant_size meet the Cpp17UnaryTypeTrait requirements (21.3.2) with a base characteristic of integral_constant<size_t, N> for some N.

```cpp
template<class T> struct variant_size<const T>;
```

Let VS denote variant_size<T> of the cv-unqualified type T. Then each specialization of the template meets the Cpp17UnaryTypeTrait requirements (21.3.2) with a base characteristic of integral_constant<size_t, VS::value>.

```cpp
template<class... Types>
struct variant_size<variant<Types...>> : integral_constant<size_t, sizeof...(Types)> { };
```
Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T. Then each specialization of the template meets the `Cpp17TransformationTrait` requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<VA::type>`.

**Mandates**: I < sizeof...(Types).

**Type**: The type `T_I`.

### 22.6.5 Value access

**Mandates**: The type `T` occurs exactly once in `Types`.

**Returns**: If `v.index()` is equal to the zero-based index of `T` in `Types`.

**Effects**: If `v` holds a value of type `T`, returns a reference to that value. Otherwise, throws an exception of type `bad_variant_access`.

**Mandates**: The type `T` occurs exactly once in `Types`.

**Returns**: A pointer to the value stored in the `variant`, if `v` != `nullptr` and `v->index()` == `I`. Otherwise, returns `nullptr`.

**Effects**: Equivalent to: `return get_if<i>(v)`; with `i` being the zero-based index of `T` in `Types`.

### 22.6.6 Relational operators

**Mandates**: The type `T` occurs exactly once in `Types`.

**Effects**: Equivalent to: `return get_if<i>(v)`; with `i` being the zero-based index of `T` in `Types`.

**Mandates**: The type `T` occurs exactly once in `Types`.

**Effects**: Equivalent to: `return get_if<i>(v)`; with `i` being the zero-based index of `T` in `Types`.
constexpr bool operator==(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) == get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.index() != w.index(), false; otherwise if v.valueless_by_exception(), true; otherwise get<i>(v) == get<i>(w) with i being v.index().

template<class... Types>
constexpr bool operator!=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) != get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.index() != w.index(), true; otherwise if v.valueless_by_exception(), false; otherwise get<i>(v) != get<i>(w) with i being v.index().

template<class... Types>
constexpr bool operator<(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) < get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If w.valueless_by_exception(), false; otherwise if v.valueless_by_exception(), true; otherwise if v.index() < w.index(), true; otherwise if v.index() > w.index(), false; otherwise get<i>(v) < get<i>(w) with i being v.index().

template<class... Types>
constexpr bool operator<=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) <= get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.valueless_by_exception(), true; otherwise if w.valueless_by_exception(), false; otherwise if v.index() < w.index(), true; otherwise if v.index() > w.index(), false; otherwise get<i>(v) <= get<i>(w) with i being v.index().

template<class... Types>
constexpr bool operator>(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) > get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.valueless_by_exception(), false; otherwise if w.valueless_by_exception(), true; otherwise if v.index() > w.index(), true; otherwise if v.index() < w.index(), false; otherwise get<i>(v) > get<i>(w) with i being v.index().

template<class... Types>
constexpr bool operator>=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) >= get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If w.valueless_by_exception(), true; otherwise if v.valueless_by_exception(), false; otherwise if v.index() > w.index(), false; otherwise if v.index() < w.index(), false; otherwise get<i>(v) >= get<i>(w) with i being v.index().

template<class... Types> requires (three_way_comparable<Types> && ...)
constexpr common_comparison_category_t<compare_three_way_result_t<Types>...>
operator<=>(const variant<Types...>& v, const variant<Types...>& w);

Effects: Equivalent to:
if (v.valueless_by_exception() && w.valueless_by_exception())
  return strong_ordering::equal;
if (v.valueless_by_exception()) return strong_ordering::less;
if (w.valueless_by_exception()) return strong_ordering::greater;
if (auto c = v.index() <=> w.index(); c != 0) return c;
return get<i>(v) <=> get<i>(w);
with i being v.index().

22.6.7 Visitation

template<class Visitor, class... Variants>
constexpr see below visit(Visitor&& vis, Variants&&... vars);
template<class R, class Visitor, class... Variants>
constexpr R visit(Visitor&& vis, Variants&&... vars);

Let \texttt{as-variant} denote the following exposition-only function templates:

\begin{verbatim}
template<class... Ts>
auto&& as-variant(variant<Ts...>&& var) { return var; }
template<class... Ts>
auto&& as-variant(variant<Ts...>& var) { return var; }
template<class... Ts>
auto&& as-variant(const variant<Ts...>&& var) { return std::move(var); }
template<class... Ts>
auto&& as-variant(const variant<Ts...>& var) { return std::move(var); }
\end{verbatim}

Let \( n \) be \( \text{sizeof...}(\text{Variants}) \). For each \( 0 \leq i < n \), let \( V_i \) denote the type \( \text{decltype(as-variant(std::forward<Variants_i>(vars_i)))} \).

Constraints: \( V_i \) is a valid type for all \( 0 \leq i < n \).

Let \( V \) denote the pack of types \( V_i \).

Let \( m \) be a pack of \( n \) values of type \( \text{size_t} \). Such a pack is valid if \( 0 \leq m_i < \text{variant_size_v<remove_reference_t<V_i>>} \) for all \( 0 \leq i < n \). For each valid pack \( m \), let \( e(m) \) denote the expression:

\[ \text{INVOKExx:} (std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) \] // see 22.10.4

for the first form and

\[ \text{INVOKExx:<R>(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...)} \] // see 22.10.4

for the second form.

Mandates: For each valid pack \( m \), \( e(m) \) is a valid expression. All such expressions are of the same type and value category.

Returns: \( e(m) \), where \( m \) is the pack for which \( m_i \) is \( \text{as-variant(vars_i).index()} \) for all \( 0 \leq i < n \). The return type is \( \text{decltype(e(m))} \) for the first form.

Throws: \texttt{bad_variant_access} if \( \text{as-variant(vars).valueless_by_exception()} || \ldots \) is true.

Complexity: For \( n \leq 1 \), the invocation of the callable object is implemented in constant time, i.e., for \( n = 1 \), it does not depend on the number of alternative types of \( V_0 \). For \( n > 1 \), the invocation of the callable object has no complexity requirements.

### 22.6.8 Class monostate

\begin{verbatim}
struct monostate{};
\end{verbatim}

The class \texttt{monostate} can serve as a first alternative type for a \texttt{variant} to make the \texttt{variant} type default constructible.

### 22.6.9 monostate relational operators

\begin{verbatim}
constexpr bool operator==(monostate, monostate) noexcept { return true; }
constexpr strong_ordering operator<=>(monostate, monostate) noexcept { return strong_ordering::equal; }
\end{verbatim}

[Note 1: \texttt{monostate} objects have only a single state; they thus always compare equal. — end note]

### 22.6.10 Specialized algorithms

\begin{verbatim}
template<class... Types>
constexpr void swap(variant<Types...>& v, variant<Types...>& w) noexcept(see below);
\end{verbatim}

Constraints: \texttt{is_move_constructible_v<T,_>} \&\& \texttt{is_swappable_v<T,_>} is true for all \( i \).

Effects: Equivalent to \( v\text{.swap}(w) \).

Remarks: The exception specification is equivalent to \texttt{noexcept(v.swap(w))}.
22.6.11 Class bad_variant_access
[variant.bad.access]
namespace std {
    class bad_variant_access : public exception {
        public:
            // see 17.9.3 for the specification of the special member functions
            const char* what() const noexcept override;
    };
}

1 Objects of type bad_variant_access are thrown to report invalid accesses to the value of a variant object.

const char* what() const noexcept override;

2 Returns: An implementation-defined ntbs.

22.6.12 Hash support
[variant.hash]
template<class... Types> struct hash<variant<Types...>>;

1 The specialization hash<variant<Types...>> is enabled (22.10.19) if and only if every specialization in hash<remove_const_t<Types>>... is enabled. The member functions are not guaranteed to be noexcept.

template<> struct hash<monostate>;

2 The specialization is enabled (22.10.19).

22.7 Storage for any type
[any]
22.7.1 General
[any.general]
1 Subclause 22.7 describes components that C++ programs may use to perform operations on objects of a discriminated type.

2 [Note 1: The discriminated type can contain values of different types but does not attempt conversion between them, i.e., 5 is held strictly as an int and is not implicitly convertible either to "5" or to 5.0. This indifference to interpretation but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions. — end note]

22.7.2 Header <any> synopsis
[any.synop]
namespace std {
    // 22.7.3, class bad_any_cast
class bad_any_cast;

    // 22.7.4, class any
class any;

    // 22.7.5, non-member functions
    void swap(any& x, any& y) noexcept;

    template<class T, class... Args>
    any make_any(Args&&... args);
    template<class T, class U, class... Args>
    any make_any(initializer_list<U> il, Args&&... args);

    template<class T>
    T any_cast(const any& operand);
    template<class T>
    T any_cast(any& operand);
    template<class T>
    T any_cast(any&& operand);

    template<class T>
    const T* any_cast(const any* operand) noexcept;
    template<class T>
    T* any_cast(any* operand) noexcept;
}

§ 22.7.2 711
22.7.3 Class bad_any_cast

namespace std {
    class bad_any_cast : public bad_cast {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    }
}

1 Objects of type bad_any_cast are thrown by a failed any_cast (22.7.5).

const char* what() const noexcept override;

2 Returns: An implementation-defined ntbs.

22.7.4 Class any

22.7.4.1 General

namespace std {
    class any {
    public:
        // 22.7.4.2, construction and destruction
        constexpr any() noexcept;
        any(const any& other);
        any(any&& other) noexcept;
        template<class T>
        any(T&& value);
        template<class T, class... Args>
        explicit any(in_place_type_t<T>, Args&&...);
        template<class T, class U, class... Args>
        explicit any(in_place_type_t<T>, initializer_list<U>, Args&&...);
        ~any();
        // 22.7.4.3, assignments
        any& operator=(const any& rhs);
        any& operator=(any&& rhs) noexcept;
        template<class T>
        any& operator=(T&& rhs);
        // 22.7.4.4, modifiers
        template<class T, class... Args>
        decay_t<T>& emplace(Args&&...);
        template<class T, class U, class... Args>
        decay_t<T>& emplace(initializer_list<U>, Args&&...);
        void reset() noexcept;
        void swap(any& rhs) noexcept;
        // 22.7.4.5, observers
        bool has_value() const noexcept;
        const type_info& type() const noexcept;
    };
}

1 An object of class any stores an instance of any type that meets the constructor requirements or it has no value, and this is referred to as the state of the class any object. The stored instance is called the contained value. Two states are equivalent if either they both have no value, or they both have a value and the contained values are equivalent.

2 The non-member any_cast functions provide type-safe access to the contained value.
Implementations should avoid the use of dynamically allocated memory for a small contained value. However, any such small-object optimization shall only be applied to types \( T \) for which \code{is_nothrow_move_constructible_v\langle T\rangle} is true.

[Example 1: A contained value of type \code{int} could be stored in an internal buffer, not in separately-allocated memory.
—end example]

### § 22.7.4.2 Construction and destruction

**constexpr** \code{any()} noexcept;

**Postconditions:** \code{has_value()} is false.

\code{any(const any& other)};

**Effects:** If \code{other.has_value()} is false, constructs an object that has no value. Otherwise, equivalent to \code{any(in_place_type\langle T\rangle, any_cast\langle const T&\rangle(other))} where \( T \) is the type of the contained value.

**Throws:** Any exceptions arising from calling the selected constructor for the contained value.

\code{any(any&& other) noexcept};

**Effects:** If \code{other.has_value()} is false, constructs an object that has no value. Otherwise, constructs an object of type \code{any} that contains either the contained value of \code{other}, or contains an object of the same type constructed from the contained value of \code{other} considering that contained value as an rvalue.

**Constraints:** \( VT \) is not the same type as \code{any}, \( VT \) is not a specialization of \code{in_place_type_t}, and \code{is_copy_constructible_v\langle VT\rangle} is true.

**Preconditions:** \( VT \) meets the \code{Cpp17CopyConstructible} requirements.

**Effects:** Constructs an object of type \code{any} that contains an object of type \( VT \) direct-initialized with \code{std::forward\langle T\rangle(value)}.

**Throws:** Any exception thrown by the selected constructor of \( VT \).

**template<class T>**

\code{any(T&& value)};

**Let \( VT \) be \code{decay\_t\langle T\rangle}.**

**Constraints:** \( VT \) is not the same type as \code{any}, \( VT \) is not a specialization of \code{in_place_type_t}, and \code{is_copy_constructible_v\langle VT\rangle} is true.

**Preconditions:** \( VT \) meets the \code{Cpp17CopyConstructible} requirements.

**Effects:** Direct-non-list-initializes the contained value of type \( VT \) with \code{std::forward\langle Args\rangle(args)\ldots}.

**Postconditions:** \code{*this} contains a value of type \( VT \).

**Throws:** Any exception thrown by the selected constructor of \( VT \).

**template<class T, class... Args>**

\code{explicit any(in_place_type\langle T\rangle, Args&&... args)};

**Let \( VT \) be \code{decay\_t\langle T\rangle}.**

**Constraints:** \code{is_copy_constructible_v\langle VT\rangle} is true and \code{is_constructible_v\langle VT, Args\ldots\rangle} is true.

**Preconditions:** \( VT \) meets the \code{Cpp17CopyConstructible} requirements.

**Effects:** Direct-non-list-initializes the contained value of type \( VT \) with \code{std::forward\langle Args\rangle(args)\ldots}.

**Postconditions:** \code{*this} contains a value of type \( VT \).

**Throws:** Any exception thrown by the selected constructor of \( VT \).

**template<class T, class U, class... Args>**

\code{explicit any(in_place_type\langle T\rangle, initializer_list\langle U\rangle il, Args&&... args)};

**Let \( VT \) be \code{decay\_t\langle T\rangle}.**

**Constraints:** \code{is_copy_constructible_v\langle VT\rangle} is true and \code{is_constructible_v\langle VT, initializer\_list\langle U\&\rangle, Args\ldots\rangle} is true.

**Preconditions:** \( VT \) meets the \code{Cpp17CopyConstructible} requirements.

**Effects:** Direct-non-list-initializes the contained value of type \( VT \) with \code{il, std::forward\langle Args\rangle(args)\ldots}.

**Postconditions:** \code{*this} contains a value.

**Throws:** Any exception thrown by the selected constructor of \( VT \).

\code{~any();}

**Effects:** As if by \code{reset()}.
22.7.4.3 Assignment

any& operator=(const any& rhs);

Effects: As if by any(rhs).swap(*this). No effects if an exception is thrown.
Returns: *this.
Throws: Any exceptions arising from the copy constructor for the contained value.

any& operator=(any&& rhs) noexcept;

Effects: As if by any(std::move(rhs)).swap(*this).
Postconditions: The state of *this is equivalent to the original state of rhs.
Returns: *this.

template<class T>
any& operator=(T&& rhs);

Let VT be decay_t<T>.
Constraints: VT is not the same type as any and is_copy_constructible_v<VT> is true.
Preconditions: VT meets the Cpp17CopyConstructible requirements.
Effects: Constructs an object tmp of type any that contains an object of type VT direct-initialized with std::forward<T>(rhs), and tmp.swap(*this). No effects if an exception is thrown.
Returns: *this.
Throws: Any exception thrown by the selected constructor of VT.

22.7.4.4 Modifiers

template<class T, class... Args>
declay_t<T>& emplace(Args&&... args);

Let VT be decay_t<T>.
Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.
Preconditions: VT meets the Cpp17CopyConstructible requirements.
Effects: Calls reset(). Then direct-non-list-initializes the contained value of type VT with std::forward<Args>(args)....
Postconditions: *this contains a value.
Returns: A reference to the new contained value.
Throws: Any exception thrown by the selected constructor of VT.
Remarks: If an exception is thrown during the call to VT's constructor, *this does not contain a value, and any previously contained value has been destroyed.

template<class T, class U, class... Args>
declay_t<T>& emplace(initializer_list<U> il, Args&&... args);

Let VT be decay_t<T>.
Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, initializer_list<U>, Args...> is true.
Preconditions: VT meets the Cpp17CopyConstructible requirements.
Effects: Calls reset(). Then direct-non-list-initializes the contained value of type VT with il, std::forward<Args>(args)....
Postconditions: *this contains a value.
Returns: A reference to the new contained value.
Throws: Any exception thrown by the selected constructor of VT.
Remarks: If an exception is thrown during the call to VT's constructor, *this does not contain a value, and any previously contained value has been destroyed.
void reset() noexcept;

Effects: If has_value() is true, destroys the contained value.

Postconditions: has_value() is false.

void swap(any& rhs) noexcept;

Effects: Exchanges the states of *this and rhs.

22.7.4.5 Observers

bool has_value() const noexcept;

Returns: true if *this contains an object, otherwise false.

cast type_info& type() const noexcept;

Returns: typeid(T) if *this has a contained value of type T, otherwise typeid(void).

[Note 1: Useful for querying against types known either at compile time or only at runtime. — end note]

22.7.5 Non-member functions

void swap(any& x, any& y) noexcept;

Effects: Equivalent to x.swap(y).

template<class T, class... Args>
any make_any(Args&&... args);

Effects: Equivalent to: return any(in_place_type<T>, std::forward<Args>(args)...);

template<class T, class U, class... Args>
any make_any(initializer_list<U> il, Args&&... args);

Effects: Equivalent to: return any(in_place_type<T>, il, std::forward<Args>(args)...);

template<class T>
T any_cast(const any& operand);
template<class T>
T any_cast(any& operand);
template<class T>
T any_cast(any&& operand);

Let U be the type remove_cvref_t<T>.

Mandates: For the first overload, is_constructible_v<T, const U&> is true. For the second overload, is_constructible_v<T, U&> is true. For the third overload, is_constructible_v<T, U> is true.

Returns: For the first and second overload, static_cast<T>(any_cast<U>(&operand)). For the third overload, static_cast<T>(std::move(any_cast<U>(&operand))).

Throws: bad_any_cast if operand.type() != typeid(remove_reference_t<T>.

[Example 1:

any x(5); // x holds int
assert(any_cast<int>(x) == 5); // cast to value
any_cast<int&>(x) = 10; // cast to reference
assert(any_cast<int>(x) == 10);

x = "Meow"; // x holds const char*
assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
any_cast<const char*>(x) = "Harry";
assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

x = string("Meow"); // x holds string
string s, s2("Jane");
s = move(any_cast<string&>(x)); // move from any
assert(s == "Meow");
any_cast<string&>(x) = move(s2); // move to any
assert(any_cast<const string&>(x) == "Jane");

§ 22.7.5
```cpp
string cat("Meow");
const any y(cat);    // const y holds string
assert(any_cast<const string&>(y) == cat);

any_cast<string&>(y);     // error: cannot any_cast away const
```

```cpp
Returns: If operand != nullptr && operand->type() == typeid(T), a pointer to the object contained by operand; otherwise, nullptr.
```

```cpp
[Example 2]:
bool is_string(const any& operand) {
    return any_cast<string&>(operand) != nullptr;
}
```

### 22.8 Expected objects

#### 22.8.1 In general

Subclause 22.8 describes the class template `expected` that represents expected objects. An `expected<T, E>` object holds an object of type `T` or an object of type `unexpected<E>` and manages the lifetime of the contained objects.

#### 22.8.2 Header `<expected>` synopsis

```cpp
namespace std {
    // 22.8.3.2, class template unexpected
    template<class E> class unexpected;
    // 22.8.4, class template bad_expected_access
    template<class E> class bad_expected_access;
    // 22.8.5, specialization for void
    template<> class bad_expected_access<void>;
    // in-place construction of unexpected values
    struct unexpect_t { explicit unexpect_t() = default; };
    inline constexpr unexpect_t unexpect{};
    // 22.8.6, class template expected
    template<class T, class E> class expected;
    // 22.8.7, partial specialization of expected for void types
    template<class T, class E> requires is_void_v<T> class expected<T, E>;
}
```

#### 22.8.3 Unexpected objects

##### 22.8.3.1 General

Subclause 22.8.3 describes the class template `unexpected` that represents unexpected objects stored in `expected` objects.

##### 22.8.3.2 Class template unexpected

#### 22.8.3.2.1 General

```cpp
namespace std {
    template<class E> class unexpected {
    }
}
```
public:
constexpr unexpected(const unexpected&) = default;
customexpr unexpected(unexpected&&) = default;
template<class... Args>
  constexpr explicit unexpected(in_place_t, Args&&...);
template<class U, class... Args>
  constexpr explicit unexpected(in_place_t, initializer_list<U>, Args&&...);
template<class Err = E>
  constexpr explicit unexpected(Err&&);
constexpr unexpected& operator=(const unexpected&) = default;
customexpr unexpected& operator=(unexpected&&) = default;
customexpr const E& value() const & noexcept;
customexpr E& value() & noexcept;
customexpr const E&& value() const && noexcept;
customexpr E&& value() && noexcept;
customexpr void swap(unexpected& other) noexcept;
template<class E2>
  friend constexpr bool operator==(const unexpected&, const unexpected<E2>&);
  friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
private:
    E val;                     // exposition only
};
template<class E> unexpected(E) -> unexpected<E>;

1 A program that instantiates the definition of unexpected for a non-object type, an array type, a specialization of unexpected, or a cv-qualified type is ill-formed.

22.8.3.2.2 Constructors

template<class Err = E>
  constexpr explicit unexpected(Err&& e);

1 Constraints:
(1.1) — is_same_v<remove_cvref_t<Err>, unexpected> is false; and
(1.2) — is_same_v<remove_cvref_t<Err>, in_place_t> is false; and
(1.3) — is_constructible_v<E, Err> is true.
2 Effects: Direct-non-list-initializes val with std::forward<Err>(e).
3 Throws: Any exception thrown by the initialization of val.

template<class... Args>
  constexpr explicit unexpected(in_place_t, Args&&... args);
4 Constraints: is_constructible_v<E, Args...> is true.
5 Effects: Direct-non-list-initializes val with std::forward<Args>(args)....
6 Throws: Any exception thrown by the initialization of val.

template<class U, class... Args>
  constexpr explicit unexpected(in_place_t, initializer_list<U> il, Args&&... args);
7 Constraints: is_constructible_v<E, initializer_list<U>&, Args...> is true.
8 Effects: Direct-non-list-initializes val with il, std::forward<Args>(args)....
9 Throws: Any exception thrown by the initialization of val.
22.8.3.2.3 Observers

```cpp
constexpr const E& value() const & noexcept;
constexpr E& value() & noexcept;
```

1 Returns: val.

```cpp
constexpr E&& value() && noexcept;
constexpr const E&& value() const && noexcept;
```

2 Returns: std::move(val).

22.8.3.2.4 Swap

```cpp
constexpr void swap(unexpected& other) noexcept(is_nothrow_swappable_v<E>);
```

1 Mandates: is_swappable_v<E> is true.

2 Effects: Equivalent to: using std::swap; swap(val, other.val);

```cpp
friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
```

3 Constraints: is_swappable_v<E> is true.

4 Effects: Equivalent to x.swap(y).

22.8.3.2.5 Equality operator

```cpp
template<class E2>
template<

friend constexpr bool operator==(const unexpected& x, const unexpected<E2>& y);
```

1 Mandates: The expression x.value() == y.value() is well-formed and its result is convertible to bool.

2 Returns: x.value() == y.value().

22.8.4 Class template bad_expected_access

```cpp
namespace std {
    template<class E>
    class bad_expected_access : public bad_expected_access<void> {
        public:
            explicit bad_expected_access(E);
            const char* what() const noexcept override;
            E& error() & noexcept;
            const E& error() const & noexcept;
            E&& error() && noexcept;
            const E&& error() const && noexcept;
        private:
            E val; // exposition only
    };
}
```

1 The class template bad_expected_access defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an expected<T, E> object for which has_value() is false.

```cpp
explicit bad_expected_access(E e);
```

2 Effects: Initializes val with std::move(e).

```cpp
const E& error() const & noexcept;
E& error() & noexcept;
```

3 Returns: val.

```cpp
E&& error() && noexcept;
const E&& error() const && noexcept;
```

4 Returns: std::move(val).

```cpp
const char* what() const noexcept override;
```

5 Returns: An implementation-defined NTBS.
22.8.5 Class template specialization bad_expected_access<void>  

namespace std {
    template<>  
    class bad_expected_access<void> : public exception {
        protected:  
            bad_expected_access() noexcept;  
            bad_expected_access(const bad_expected_access&);  
            bad_expected_access(bad_expected_access&);  
            bad_expected_access(bad_expected_access&&);  
            bad_expected_access& operator=(const bad_expected_access&);  
            bad_expected_access& operator=(bad_expected_access&&);  
            ~bad_expected_access();  
        public:  
            const char* what() const noexcept override;
    };
}

const char* what() const noexcept override;

1 Returns: An implementation-defined NTBS.

22.8.6 Class template expected  

22.8.6.1 General

namespace std {
    template<class T, class E>
    class expected {
        public:
            using value_type = T;
            using error_type = E;
            using unexpected_type = unexpected<E>;

            template<class U>
            using rebind = expected<U, error_type>;

            constexpr expected();
            constexpr explicit(const expected&);
            constexpr explicit(expected&&) noexcept;
            template<class U, class G>
            constexpr explicit(expected<U, G>&&);
            template<class U, class G>
            constexpr explicit(expected<U, G>&);
            template<class U = T>
            constexpr explicit(U&& v);
            template<class G>
            constexpr expected(const unexpected<G>&);
            template<class G>
            constexpr expected(unexpected<G>&&);

            template<class... Args>
            constexpr explicit(in_place_t, Args&&...);
            template<class U, class... Args>
            constexpr explicit(in_place_t, initializer_list<U>, Args&&...);
            template<class... Args>
            constexpr explicit(unexpect_t, Args&&...);
            template<class U, class... Args>
            constexpr explicit(unexpect_t, initializer_list<U>, Args&&...);

            // 22.8.6.2, constructors
            constexpr expected();
            constexpr explicit(see below) expected(const expected&);
            constexpr explicit(see below) expected(expected&&) noexcept(see below);
            template<class U, class G>
            constexpr explicit(see below) expected(const expected<U, G&>&);
            template<class U, class G>
            constexpr explicit(see below) expected(expected<U, G&>&);

            template<class U = T>
            constexpr explicit(see below) expected(U&& v);

            template<class G>
            constexpr expected(const unexpected<G>&);
            template<class G>
            constexpr expected(unexpected<G>&&);

            template<class... Args>
            constexpr explicit(expected(in_place_t, Args&&...);
            template<class U, class... Args>
            constexpr explicit(expected(in_place_t, initializer_list<U>, Args&&...);
            template<class... Args>
            constexpr explicit(expected(unexpect_t, Args&&...);
            template<class U, class... Args>
            constexpr explicit(expected(unexpect_t, initializer_list<U>, Args&&...);

            // 22.8.6.3, destructor
            constexpr ~expected();
        }
    };
}
// 22.8.6.4, assignment
constexpr expected& operator=(const expected&);
constexpr expected& operator=(expected& noexcept(see below));
template<class U = T> constexpr expected& operator=(U&);
template<class G>
constexpr expected& operator=(const unexpected<G>&);
template<class G>
constexpr expected& operator=(unexpected<G>&&);

template<class... Args>
constexpr T& emplace(Args&&...) noexcept;
template<class U, class... Args>
constexpr T& emplace(initializer_list<U>, Args&&...) noexcept;

// 22.8.6.5, swap
constexpr void swap(expected&) noexcept(see below);
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

// 22.8.6.6, observers
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
constexpr const T&& operator*() const && noexcept;
constexpr T&& operator*() && noexcept;
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr const T& value() const &;
constexpr T& value() &;
constexpr const T&& value() const &&;
constexpr T&& value() &&;
constexpr const E& error() const &;
constexpr E& error() &;
constexpr const E&& error() const &&;
constexpr E&& error() &&;
template<class U> constexpr T value_or(U&&) const &;
template<class U> constexpr T value_or(U&&) &&;

// 22.8.6.7, equality operators
template<class T2, class E2> requires (!is_void_v<T2>)
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
template<class T2>
friend constexpr bool operator==(const expected&, const T2&);
template<class E2>
friend constexpr bool operator==(const expected&, const unexpected<E2>&);

private:
bool has_val;    // exposition only
union {
    T val;    // exposition only
    E unex;   // exposition only
};

1 Any object of type expected<T, E> either contains a value of type T or a value of type E within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type T or the object of type E. These objects are allocated in a region of the expected<T, E> storage suitably aligned for the types T and E. Members has_val, val, and unex are provided for exposition only. has_val indicates whether the expected<T, E> object contains an object of type T.

2 A program that instantiates the definition of template expected<T, E> for a reference type, a function type, or for possibly cv-qualified types in_place_t, unexpected_t, or a specialization of unexpected for the T
parameter is ill-formed. A program that instantiates the definition of the template `expected<T, E>` with a type for the E parameter that is not a valid template argument for `unexpected` is ill-formed.

When T is not cv void, it shall meet the `Cpp17Destructible` requirements (Table 34). E shall meet the `Cpp17Destructible` requirements.

### 22.8.6.2 Constructors

```cpp
constexpr expected();

Constraints: is_default_constructible_v<T> is true.

Effects: Value-initializes val.

Postconditions: has_value() is true.

Throws: Any exception thrown by the initialization of val.
```

```cpp
constexpr expected(const expected& rhs);

Effects: If rhs.has_value() is true, direct-non-list-initializes val with *rhs. Otherwise, direct-non-list-initializes unex with rhs.error().

Postconditions: rhs.has_value() == this->has_value().

Throws: Any exception thrown by the initialization of val or unex.

Remarks: This constructor is defined as deleted unless

(8.1) — is_copy_constructible_v<T> is true and
(8.2) — is_copy_constructible_v<E> is true.

This constructor is trivial if

(9.1) — is_trivially_copy_constructible_v<T> is true and
(9.2) — is_trivially_copy_constructible_v<E> is true.
```

```cpp
constexpr expected(expected&& rhs) noexcept(see below);

Constraints:

(10.1) — is_move_constructible_v<T> is true and
(10.2) — is_move_constructible_v<E> is true.

Effects: If rhs.has_value() is true, direct-non-list-initializes val with std::move(*rhs). Otherwise, direct-non-list-initializes unex with std::move(rhs.error()).

Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.

Throws: Any exception thrown by the initialization of val or unex.

Remarks: The exception specification is equivalent to is_nothrow_move_constructible_v<T> && is_nothrow_move_constructible_v<E>.

This constructor is trivial if

(15.1) — is_trivially_move_constructible_v<T> is true and
(15.2) — is_trivially_move_constructible_v<E> is true.
```

```cpp
template<class U, class G>
constexpr explicit(see below) expected(const expected<U, G>& rhs);

class U;

class G;
```

Let:

(16.1) — UF be const Uk for the first overload and U for the second overload.
(16.2) — GF be const Gk for the first overload and G for the second overload.

### Constraints:

(17.1) — is_constructible_v<T, UF> is true; and
(17.2) — is_constructible_v<E, GF> is true; and
is_constructible_v<T, expected<U, G>&> is false; and
— is_constructible_v<T, expected<U, G>>& is false; and
— is_constructible_v<T, const expected<U, G>&> is false; and
— is_convertible_v<expected<U, G>&, T> is false; and
— is_convertible_v<expected<U, G>&&, T> is false; and
— is_convertible_v<const expected<U, G>&, T> is false; and
— is_convertible_v<const expected<U, G>&&, T> is false; and
— is_constructible_v<unexpected<E>, expected<U, G>&> is false; and
— is_constructible_v<unexpected<E>, expected<U, G>> is false; and
— is_constructible_v<unexpected<E>, const expected<U, G>&> is false; and
— is_constructible_v<unexpected<E>, const expected<U, G>> is false.

Effects: If rhs.has_value(), direct-non-list-initializes val with std::forward<UF>(*rhs). Otherwise, direct-non-list-initializes unex with std::forward<GF>(rhs.error()).

Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.

Throws: Any exception thrown by the initialization of val or unex.

Remarks: The expression inside explicit is equivalent to !is_convertible_v<UF, T> || !is_convertible_v<GF, E>.

template<class U = T>
constexpr explicit(!is_convertible_v<U, T>) expected(U&& v);

Constraints:
— is_same_v<remove_cvref_t<U>, in_place_t> is false; and
— is_same_v<expected<T, E>, remove_cvref_t<U>>& is false; and
— remove_cvref_t<U> is not a specialization of unexpected; and
— is_constructible_v<T, U> is true.

Effects: Direct-non-list-initializes val with std::forward<U>(v).

Postconditions: has_value() is true.

Throws: Any exception thrown by the initialization of val.

template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>&& e);

template<class G>
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);

Let GF be const G& for the first overload and G for the second overload.

Constraints: is_constructible_v<E, GF> is true.

Effects: Direct-non-list-initializes unex with std::forward<GF>(e.value()).

Postconditions: has_value() is false.

Throws: Any exception thrown by the initialization of unex.

template<class... Args>
constexpr explicit(expected(in_place_t, Args&&... args);

Constraints: is_constructible_v<T, Args&&... args> is true.

Effects: Direct-non-list-initializes val with std::forward<Args>(args). . .

Postconditions: has_value() is true.

Throws: Any exception thrown by the initialization of val.

§ 22.8.6.2
template<class U, class... Args>
constexpr explicit expected(in_place_t, initializer_list<U> il, Args&&... args);

Constraints: `is_constructible_v<T, initializer_list<U>&, Args...>` is true.
Effects: Direct-non-list-initializes `val` with `il, std::forward<Args>(args)`.
Postconditions: `has_value()` is true.
Throws: Any exception thrown by the initialization of `val`.

22.8.6.3 Destructor

constexpr ~expected();

Effects: If `has_value()` is true, destroys `val`, otherwise destroys `unex`.
Remarks: If `is_trivially_destructible_v<T>` is true, and `is_trivially_destructible_v<E>` is true, then this destructor is a trivial destructor.

22.8.6.4 Assignment

This subclause makes use of the following exposition-only function:

```cpp
template<class T, class U, class... Args>
constexpr void reinit-expected(T& newval, U& oldval, Args&&... args) { // exposition only
  if constexpr (is_nothrow_constructible_v<T, Args...>) {
    destroy_at(addressof(oldval));
    construct_at(addressof(newval), std::forward<Args>(args)...);
  } else if constexpr (is_nothrow_move_constructible_v<T>) {
    T tmp(std::forward<Args>(args)...);
    destroy_at(addressof(oldval));
    construct_at(addressof(newval), std::move(tmp));
  } else {
    U tmp(std::move(oldval));
    destroy_at(addressof(oldval));
    try {
      construct_at(addressof(newval), std::forward<Args>(args)...);
    } catch (...) {
      construct_at(addressof(oldval), std::move(tmp));
      throw;
    }
  }
}
```

constexpr expected& operator=(const expected& rhs);

Effects:
(2.1) If `this->has_value() && rhs.has_value()` is true, equivalent to `val = *rhs`.
(2.2) Otherwise, if `this->has_value()` is true, equivalent to:
```cpp
reinit-expected(unex, val, rhs.error())
```
Otherwise, if \( \text{rhs}.\text{has\_value()} \) is \text{true}, equivalent to:
\[ \text{reinit-expected}(\text{val}, \text{unex}, *\text{rhs}) \]

Otherwise, equivalent to \( \text{unex} = \text{rhs}.\text{error()} \).

Then, if no exception was thrown, equivalent to: \( \text{has\_val} = \text{rhs}.\text{has\_value()}; \) \text{return } \ast\text{this};

\textbf{Remarks:} This operator is defined as deleted unless:

- \( \text{is\_copy\_assignable\_v<T> is true} \)
- \( \text{is\_copy\_constructible\_v<T> is true} \)
- \( \text{is\_copy\_assignable\_v<E> is true} \)
- \( \text{is\_copy\_constructible\_v<E> is true} \)
- \( \text{is\_nothrow\_move\_constructible\_v<T> } || \text{is\_nothrow\_move\_constructible\_v<E> is true} \)

\begin{verbatim}
closeexpr \text{expected}& \text{operator=} (\text{expected}& \text{rhs}) \text{noexcept (see below)};
\end{verbatim}

\textbf{Constraints:}

- \( \text{is\_move\_constructible\_v<T> is true} \)
- \( \text{is\_move\_assignable\_v<T> is true} \)
- \( \text{is\_move\_constructible\_v<E> is true} \)
- \( \text{is\_move\_assignable\_v<E> is true} \)
- \( \text{is\_nothrow\_move\_constructible\_v<T> } || \text{is\_nothrow\_move\_constructible\_v<E> is true} \)

\textbf{Effects:}

- If \( \text{this->has\_value()} && \text{rhs}.\text{has\_value()} \) is \text{true}, equivalent to \( \text{val} = \text{std::move(*rhs)} \).
- Otherwise, if \( \text{this->has\_value()} \) is \text{true}, equivalent to:
  \[ \text{reinit-expected}(\text{unex}, \text{val}, \text{std::move(rhs.error())}) \]
- Otherwise, if \( \text{rhs}.\text{has\_value()} \) is \text{true}, equivalent to:
  \[ \text{reinit-expected}(\text{val}, \text{unex}, \text{std::move(*rhs)}) \]
- Otherwise, equivalent to \( \text{unex} = \text{std::move(rhs.error())} \).

Then, if no exception was thrown, equivalent to: \( \text{has\_val} = \text{rhs}.\text{has\_value()}; \) \text{return } \ast\text{this};

\textbf{Remarks:} The exception specification is equivalent to:

\[ \text{is\_nothrow\_move\_assignable\_v<T> } && \text{is\_nothrow\_move\_constructible\_v<T> } && \text{is\_nothrow\_move\_assignable\_v<E> } && \text{is\_nothrow\_move\_constructible\_v<E> } \]

\textbf{template<class } \text{U } = \text{T>}
\text{constexpr expected& } \text{operator=} (\text{U}& \text{v});

\textbf{Constraints:}

- \( \text{is\_same\_v<expected, remove\_cvref\_t<U>> is false} ; \text{and} \)
- \( \text{remove\_cvref\_t<U>} \) is not a specialization of \text{unexpected} ; \text{and} \)
- \( \text{is\_constructible\_v<T, U> is true} ; \text{and} \)
- \( \text{is\_assignable\_v<T\&, U> is true} ; \text{and} \)
- \( \text{is\_nothrow\_constructible\_v<T, U> } || \text{is\_nothrow\_move\_constructible\_v<T> } || \text{is\_nothrow\_move\_constructible\_v<E> } \)

\textbf{Effects:}

- If \text{has\_value()} is \text{true}, equivalent to: \( \text{val} = \text{std::forward<U>(v)} \);
- Otherwise, equivalent to:
  \[ \text{reinit-expected}(\text{val}, \text{unex}, \text{std::forward<U>(v)}) \]
  \( \text{has\_val} = \text{true} \);

\textbf{Returns: } \ast\text{this}.
Let GF be const G& for the first overload and G for the second overload.

Constraints:
(11.1) — is_constructible_v<E, GF> is true; and
(11.2) — is_assignable_v<E&, GF> is true; and
(11.3) — is_nothrow_constructible_v<E, GF> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

Effects:
(12.1) — If has_value() is true, equivalent to:
  reinit-expected(unex, val, std::forward<GF>(e.value()));
  has_val = false;
(12.2) — Otherwise, equivalent to: unex = std::forward<GF>(e.value());

Returns: *this.

template<class... Args>
constexpr T& emplace(Args&&... args) noexcept;

Constraints: is_nothrow_constructible_v<T, Args...> is true.

Effects: Equivalent to:
if (has_value()) {
  destroy_at(addressof(val));
} else {
  destroy_at(addressof(unex));
  has_val = true;
}
return *construct_at(addressof(val), std::forward<Args>(args)...);

Effects: Equivalent to:
if (has_value()) {
  destroy_at(addressof(val));
} else {
  destroy_at(addressof(unex));
  has_val = true;
}
return *construct_at(addressof(val), il, std::forward<Args>(args)...);

22.8.6.5 Swap

constexpr void swap(expected& rhs) noexcept((see below);

Constraints:
(1.1) — is_swappable_v<T> is true and
(1.2) — is_swappable_v<E> is true and
(1.3) — is_move_constructible_v<T> && is_move_constructible_v<E> is true, and
(1.4) — is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

Effects: See Table 62.

For the case where rhs.value() is false and this->has_value() is true, equivalent to:
if constexpr (is_nothrow_move_constructible_v<E>) {
  E tmp(std::move(rhs.unex));
Table 62: swap(expected&) effects

<table>

<tbody>
<tr>
<td>rhs.has_value()</td>
<td>equivalent to: using std::swap; calls rhs.swap(*this)</td>
</tr>
<tr>
<td>!rhs.has_value()</td>
<td>see below</td>
</tr>
</tbody>
</table>

```
destroy_at(addressof(rhs.uex));
try {
    construct_at(addressof(rhs.val), std::move(val));
    destroy_at(addressof(val));
    construct_at(addressof(uex), std::move(tmp));
} catch(...) {
    construct_at(addressof(rhs.uex), std::move(tmp));
    throw;
}
else {
    T tmp(std::move(val));
    destroy_at(addressof(val));
    try {
        construct_at(addressof(uex), std::move(rhs.uex));
        destroy_at(addressof(rhs.uex));
        construct_at(addressof(rhs.val), std::move(tmp));
    } catch (...) {
        construct_at(addressof(val), std::move(tmp));
        throw;
    }
}
has_val = false;
rhs.has_val = true;
```

3 Throws: Any exception thrown by the expressions in the Effects.

4 Remarks: The exception specification is equivalent to:

```
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

5 Effects: Equivalent to x.swap(y).

### 22.8.6.6 Observers

```
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

1 Preconditions: has_value() is true.

2 Returns: addressof(val).

```
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

3 Preconditions: has_value() is true.

4 Returns: val.

```
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

5 Preconditions: has_value() is true.

6 Returns: std::move(val).

```
constexpr explicit operator bool() const noexcept;
```
constexpr bool has_value() const noexcept;

Returns: has_val.

constexpr const T& value() const &;
constexpr T& value() &;

Returns: val, if has_value() is true.

Throws: bad_expected_access(error()) if has_value() is false.

constexpr T&& value() &&;
constexpr const T&& value() const &&;

Returns: std::move(val), if has_value() is true.

Throws: bad_expected_access(std::move(error())) if has_value() is false.

constexpr E& error() & noexcept;
constexpr const E& error() const & noexcept;

Preconditions: has_value() is false.

constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;

Preconditions: has_value() is false.

Mandates: The expressions *x == *y and x.error() == y.error() are well-formed and their results are convertible to bool.

Returns: If x.has_value() does not equal y.has_value(), false; otherwise if x.has_value() is true, *x == *y; otherwise x.error() == y.error().

Mandates: The expression x.error() == e.value() is well-formed and its result is convertible to bool.

Returns: !x.has_value() && static_cast<bool>(x.error() == e.value()).

22.8.7 Partial specialization of expected for void types

22.8.7.1 General

Mandates: The expression x.error() == e.value() is well-formed and its result is convertible to bool.

Returns: !x.has_value() && static_cast<brool>(x.error() == e.value()).
using error_type = E;
using unexpected_type = unexpected<E>;

template<class U>
using rebind = expected<U, error_type>;

// 22.8.7.7, equality operators
template<class T2, class E2> requires is_void_v<T2>
  friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
template<class E2>
  friend constexpr bool operator==(const expected&, const unexpected<E2>&);

private:
  bool has_val;       // exposition only
  union {
    E unex;           // exposition only
  }
E shall meet the requirements of Cpp17Destructible (Table 34).

### 22.8.7.2 Constructors

```cpp
constexpr expected() noexcept;
1
Postconditions: has_value() is true.

constexpr expected(const expected& rhs);
2
Effects: If rhs.has_value() is false, direct-non-list-initializes unez with rhs.error().
3
Postconditions: rhs.has_value() == this->has_value().
4
Throws: Any exception thrown by the initialization of unez.
5
Remarks: This constructor is defined as deleted unless is_copy_constructible_v<E> is true.
6
This constructor is trivial if is_trivially_copy_constructible_v<E> is true.

constexpr expected(expected&& rhs) noexcept(is_nothrow_move_constructible_v<E>);
7
Constraints: is_move_constructible_v<E> is true.
8
Effects: If rhs.has_value() is false, direct-non-list-initializes unez with std::move(rhs.error()).
9
Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.
10
Throws: Any exception thrown by the initialization of unez.
11
Remarks: This constructor is trivial if is_trivially_move_constructible_v<E> is true.

template<class U, class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const expected<U, G>& rhs);
12
Let GF be const G& for the first overload and G for the second overload.
13
Constraints:
(13.1) is_void_v<U> is true; and
(13.2) is_constructible_v<E, GF> is true; and
(13.3) is_constructible_v<unexpected<E>, expected<U, G>&> is false; and
(13.4) is_constructible_v<unexpected<E>, expected<U, G>>& is false; and
(13.5) is_constructible_v<unexpected<E>, const expected<U, G>&> is false; and
(13.6) is_constructible_v<unexpected<E>, const expected<U, G>> is false.
14
Effects: If rhs.has_value() is false, direct-non-list-initializes unez with std::forward<GF>(rhs.error()).
15
Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.
16
Throws: Any exception thrown by the initialization of unez.

template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
17
Let GF be const G& for the first overload and G for the second overload.
18
Constraints: is_constructible_v<E, GF> is true.
19
Effects: Direct-non-list-initializes unez with std::forward<GF>(e.value()).
20
Postconditions: has_value() is false.
21
Throws: Any exception thrown by the initialization of unez.
```
constexpr explicit expected(in_place_t) noexcept;

Postconditions: has_value() is true.

template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);

Constraints: is_constructible_v<E, Args...> is true.
Effects: Direct-non-list-initializes unez with std::forward<Args>(args)....
Postconditions: has_value() is false.
Throws: Any exception thrown by the initialization of unez.

template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);

Constraints: is_constructible_v<E, initializer_list<U>&, Args...> is true.
Effects: Direct-non-list-initializes unez with il, std::forward<Args>(args)....
Postconditions: has_value() is false.
Throws: Any exception thrown by the initialization of unez.

22.8.7.3 Destructor

constexpr ~expected();

Effects: If has_value() is false, destroys unez.
Remarks: If is_trivially_destructible_v<E> is true, then this destructor is a trivial destructor.

22.8.7.4 Assignment

constexpr expected& operator=(const expected& rhs);

Effects:
1. If this->has_value() && rhs.has_value() is true, no effects.
2. Otherwise, if this->has_value() is true, equivalent to: construct_at(addressof(unex), rhs.unex); has_val = false;
3. Otherwise, if rhs.has_value() is true, destroys unez and sets has_val to true.
4. Otherwise, equivalent to unex = rhs.error().
Returns: *this.
Remarks: This operator is defined as deleted unless is_copyAssignable_v<E> is true and is_copyConstructible_v<E> is true.

constexpr expected& operator=(expected&& rhs) noexcept(see below);

Effects:
1. If this->has_value() && rhs.has_value() is true, no effects.
2. Otherwise, if this->has_value() is true, equivalent to:
   construct_at(addressof(unex), std::move(rhs.unex));
   has_val = false;
3. Otherwise, if rhs.has_value() is true, destroys unez and sets has_val to true.
4. Otherwise, equivalent to unex = rhs.error().
Returns: *this.
Remarks: The exception specification is equivalent to is_nothrowMoveConstructible_v<E> && is_nothrowMoveAssignable_v<E>.
This operator is defined as deleted unless is_moveConstructible_v<E> is true and is_moveAssignable_v<E> is true.
template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);

Let GF be const G& for the first overload and G for the second overload.

Constraints: is_constructible_v<G, GF> is true and is_assignable_v<G, GF> is true.

Effects:

(10.1) — If has_value() is true, equivalent to:
construct_at(addressof(unex), std::forward<G>(e.value()));
has_val = false;

(10.2) — Otherwise, equivalent to: unex = std::forward<G>(e.value());

Returns: *this.

constexpr void emplace() noexcept;

Effects: If has_value() is false, destroys unex and sets has_val to true.

22.8.7.5 Swap

constexpr void swap(expected& rhs) noexcept;

Constraints: is_swappable_v<G> is true and is_move_constructible_v<G> is true.

Effects: See Table 63.

Table 63: swap(expected&) effects

<table>
<thead>
<tr>
<th>this-&gt;has_value()</th>
<th>!this-&gt;has_value()</th>
</tr>
</thead>
<tbody>
<tr>
<td>rhs.has_value()</td>
<td>calls rhs.swap(*this)</td>
</tr>
</tbody>
</table>
| !rhs.has_value() | see below            | equivalent to: using std::swap;
|                  |                      | swap(unex, rhs.unex); |

For the case where rhs.value() is false and this->has_value() is true, equivalent to:
construct_at(addressof(unex), std::move(rhs.unex));
destroy_at(addressof(rhs.unex));
has_val = false;
rhs.has_val = true;

Throws: Any exception thrown by the expressions in the Effects.

Remarks: The exception specification is equivalent to is_nothrow_move_constructible_v<G> &&
is_nothrow_swappable_v<G>.

friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

Effects: Equivalent to x.swap(y).

22.8.7.6 Observers

constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;

Returns: has_val.

constexpr void operator*() const noexcept;

Preconditions: has_value() is true.

constexpr void value() const &;

Throws: bad_expected_access(error()) if has_value() is false.

constexpr void value() &&;

Throws: bad_expected_access(std::move(error())) if has_value() is false.
constexpr const E& error() const &;  
constexpr E& error() &;  

Preconditions: has_value() is false.  

Returns: unex.

constexpr E&& error() &&;  
constexpr const E&& error() const &&;  

Preconditions: has_value() is false.  

Returns: std::move(unex).

22.8.7.7 Equality operators

template<class T2, class E2> requires is_void_v<T2>  
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);  

Mandates: The expression x.error() == y.error() is well-formed and its result is convertible to bool.  

Returns: If x.has_value() does not equal y.has_value(), false; otherwise x.has_value() || static_cast<bool>(x.error() == y.error()).

template<class E2>  
friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);  

Mandates: The expression x.error() == e.value() is well-formed and its result is convertible to bool.

Returns: !x.has_value() && static_cast<bool>(x.error() == e.value()).

22.9 Bitsets

22.9.1 Header <bitset> synopsis

The header <bitset> defines a class template and several related functions for representing and manipulating fixed-size sequences of bits.

#include <string>  
#include <iosfwd>  // for istream (31.7.1), ostream (31.7.2), see 31.3.1

namespace std {  
    template<size_t N> class bitset;
    // 22.9.4, bitset operators
    template<size_t N>  
    bitset<N> operator&(const bitset<N>&, const bitset<N>&) noexcept;
    template<size_t N>  
    bitset<N> operator|(const bitset<N>&, const bitset<N>&) noexcept;
    template<size_t N>  
    bitset<N> operator^(const bitset<N>&, const bitset<N>&) noexcept;
    template<class charT, class traits, size_t N>  
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&& is, bitset<N>& x);  
    template<class charT, class traits, size_t N>  
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
}

22.9.2 Class template bitset

22.9.2.1 General

namespace std {  
    template<size_t N> class bitset {  
        public:  
            // bit reference
            friend class bitset;  
            reference() noexcept;

§ 22.9.2.1 732
public:
    reference(const reference&) = default;
    ~reference()
    reference operator=(bool x) noexcept;  // for b[i] = x;
    reference operator=(const reference&) noexcept; // for b[i] = b[j];
    bool operator~() const noexcept;  // flips the bit
    operator bool() const noexcept;  // for x = b[i];

bool none() const noexcept;
bitset operator<<(size_t pos) const noexcept;
bitset operator>>(size_t pos) const noexcept;

§ 22.9.2.1
The class template `bitset<N>` describes an object that can store a sequence consisting of a fixed number of bits, N.

Each bit represents either the value zero (reset) or one (set). To toggle a bit is to change the value zero to one, or the value one to zero. Each bit has a non-negative position `pos`. When converting between an object of class `bitset<N>` and a value of some integral type, bit position `pos` corresponds to the bit value `1 << pos`. The integral value corresponding to two or more bits is the sum of their bit values.

The functions described in 22.9.2 can report three kinds of errors, each associated with a distinct exception:

- (3.1) — an invalid-argument error is associated with exceptions of type `invalid_argument` (19.2.5);
- (3.2) — an out-of-range error is associated with exceptions of type `out_of_range` (19.2.7);
- (3.3) — an overflow error is associated with exceptions of type `overflow_error` (19.2.10).

### 22.9.2.2 Constructors

**constexpr bitset() noexcept;**

*Effects:* Initializes all bits in `*this` to zero.

**constexpr bitset(unsigned long long val) noexcept;**

*Effects:* Initializes the first M bit positions to the corresponding bit values in `val`. M is the smaller of N and the number of bits in the value representation (6.8.1) of `unsigned long long`. If M < N, the remaining bit positions are initialized to zero.

**template<class charT, class traits, class Allocator>
explicit bitset(const basic_string<charT, traits, Allocator>& str, typename basic_string<charT, traits, Allocator>::size_type pos = 0, typename basic_string<charT, traits, Allocator>::size_type n = basic_string<charT, traits, Allocator>::npos, charT zero = charT('0'), charT one = charT('1'));**

*Effects:* Determines the effective length `rlen` of the initializing string as the smaller of `n` and `str.size()` - `pos`. Initializes the first M bit positions to values determined from the corresponding characters in the string `str`. M is the smaller of N and `rlen`.

An element of the constructed object has value zero if the corresponding character in `str`, beginning at position `pos`, is zero. Otherwise, the element has the value one. Character position `pos + M - 1` corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions.

If M < N, remaining bit positions are initialized to zero.

The function uses `traits::eq` to compare the character values.

**Throws:** `out_of_range` if `pos > str.size()` or `invalid_argument` if any of the `rlen` characters in `str` beginning at position `pos` is other than zero or one.

**template<class charT>
explicit bitset(const charT* str, typename basic_string<charT>::size_type n = basic_string<charT>::npos, charT zero = charT('0'), charT one = charT('1'));**

*Effects:* As if by:

```cpp
bitset(n == basic_string<charT>::npos
    ? basic_string<charT>(str)
    : basic_string<charT>(str, n),
    0, n, zero, one)
```
22.9.2.3 Members

bitset& operator&=(const bitset& rhs) noexcept;
1  Effects: Clears each bit in *this for which the corresponding bit in rhs is clear, and leaves all other
2    bits unchanged.
3  Returns: *this.

bitset& operator|=(const bitset& rhs) noexcept;
3  Effects: Sets each bit in *this for which the corresponding bit in rhs is set, and leaves all other bits
4    unchanged.
5  Returns: *this.

bitset& operator^=(const bitset& rhs) noexcept;
5  Effects: Toggles each bit in *this for which the corresponding bit in rhs is set, and leaves all other
6    bits unchanged.
7  Returns: *this.

bitset& operator<<=(size_t pos) noexcept;
7  Effects: Replaces each bit at position I in *this with a value determined as follows:
8                   — If I < pos, the new value is zero;
9                   — If I >= pos, the new value is the previous value of the bit at position I - pos.
10 Returns: *this.

bitset& operator>>=(size_t pos) noexcept;
9  Effects: Replaces each bit at position I in *this with a value determined as follows:
10                  — If pos >= N - I, the new value is zero;
11                  — If pos < N - I, the new value is the previous value of the bit at position I + pos.
12 Returns: *this.

bitset& set() noexcept;
11  Effects: Sets all bits in *this.
12  Returns: *this.

bitset& set(size_t pos, bool val = true);
13  Effects: Stores a new value in the bit at position pos in *this. If val is true, the stored value is one,
14    otherwise it is zero.
15  Returns: *this.
16  Throws: out_of_range if pos does not correspond to a valid bit position.

bitset& reset() noexcept;
16  Effects: Resets all bits in *this.
17  Returns: *this.

bitset& reset(size_t pos);
18  Effects: Resets the bit at position pos in *this.
19  Returns: *this.
20  Throws: out_of_range if pos does not correspond to a valid bit position.

bitset operator~() const noexcept;
21  Effects: Constructs an object x of class bitset and initializes it with *this.
22  Returns: x.flip().
bitset & flip() noexcept;
   Effects: Toggles all bits in *this.
   Returns: *this.

bitset & flip(size_t pos);
   Effects: Toggles the bit at position pos in *this.
   Returns: *this.
   Throws: out_of_range if pos does not correspond to a valid bit position.

unsigned long to_ulong() const;
   Returns: x.
   Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long.

unsigned long long to_ullong() const;
   Returns: x.
   Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long long.

template<class charT = char,
         class traits = char_traits<charT>,
         class Allocator = allocator<charT>>
   basic_string<charT, traits, Allocator>
   to_string(charT zero = charT('0'), charT one = charT('1')) const;
   Effects: Constructs a string object of the appropriate type and initializes it to a string of length N characters. Each character is determined by the value of its corresponding bit position in *this. Character position N - 1 corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions. Bit value zero becomes the character zero, bit value one becomes the character one.
   Returns: The created object.

size_t count() const noexcept;
   Returns: A count of the number of bits set in *this.

constexpr size_t size() const noexcept;
   Returns: N.

bool operator==(const bitset& rhs) const noexcept;
   Returns: true if the value of each bit in *this equals the value of the corresponding bit in rhs.

bool test(size_t pos) const;
   Returns: true if the bit at position pos in *this has the value one.
   Throws: out_of_range if pos does not correspond to a valid bit position.

bool all() const noexcept;
   Returns: count() == size().

bool any() const noexcept;
   Returns: count() != 0.

bool none() const noexcept;
   Returns: count() == 0.

bitset operator<<(size_t pos) const noexcept;
   Returns: bitset(*this) <<= pos.
bitset operator>>(size_t pos) const noexcept;

Returns: \( \text{bitset}(*\text{this}) >>= \text{pos} \).

constexpr bool operator[](size_t pos) const;

Preconditions: pos is valid.

Returns: true if the bit at position pos in *this has the value one, otherwise false.

Throws: Nothing.

bitset::reference operator[](size_t pos);

Preconditions: pos is valid.

Returns: An object of type bitset::reference such that (*this)[pos] == this->test(pos), and such that (*this)[pos] = val is equivalent to this->set(pos, val).

Throws: Nothing.

Remarks: For the purpose of determining the presence of a data race (6.9.2), any access or update through the resulting reference potentially accesses or modifies, respectively, the entire underlying bitset.

22.9.3 bitset hash support

```cpp
template<size_t N> struct hash<bitset<N>>;
```

The specialization is enabled (22.10.19).

22.9.4 bitset operators

```cpp
template<size_t N>
bitset<N> operator&(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;

Returns: \( \text{bitset}<\text{N}>(\text{lhs}) &\text{ rhs} \).
```

```cpp
template<size_t N>
bitset<N> operator|(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;

Returns: \( \text{bitset}<\text{N}>(\text{lhs}) |\text{ rhs} \).
```

```cpp
template<size_t N>
bitset<N> operator^(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;

Returns: \( \text{bitset}<\text{N}>(\text{lhs}) ^\text{ rhs} \).
```

```cpp
template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, bitset<N>& x);

A formatted input function (31.7.4.3).

Effects: Extracts up to \( \text{N} \) characters from is. Stores these characters in a temporary object str of type basic_string<charT, traits>, then evaluates the expression \( \text{x} = \text{bitset}<\text{N}>(\text{str}) \). Characters are extracted and stored until any of the following occurs:

(5.1) \( \text{N} \) characters have been extracted and stored;
(5.2) end-of-file occurs on the input sequence;
(5.3) the next input character is neither is.widen('0') nor is.widen('1') (in which case the input character is not extracted).

If \( \text{N} > 0 \) and no characters are stored in str, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)).

Returns: is.
```

```cpp
template<class charT, class traits, size_t N>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);

Returns:
```
os << x.template to_string<charT, traits, allocator<charT>>(
    use_facet<ctype<charT>>(os.getloc()).widen('0'),
    use_facet<ctype<charT>>(os.getloc()).widen('1'))

(see 31.7.5.3).

22.10 Function objects

22.10.1 General

A function object type is an object type (6.8.1) that can be the type of the postfix-expression in a function call (7.6.1.3, 12.2.2.2). A function object is an object of a function object type. In the places where one would expect to pass a pointer to a function to an algorithmic template (Clause 27), the interface is specified to accept a function object. This not only makes algorithmic templates work with pointers to functions, but also enables them to work with arbitrary function objects.

22.10.2 Header `<functional>` synopsis

namespace std {

  // 22.10.5, invoke
  template<class F, class... Args>
  constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
      noexcept(is_nothrow_invocable_v<F, Args...>);
  template<class R, class F, class... Args>
  constexpr R invoke_r(F&& f, Args&&... args)
      noexcept(is_nothrow_invocable_r_v<R, F, Args...>);

  // 22.10.6, reference_wrapper
  template<class T> class reference_wrapper;
  template<class T> constexpr reference_wrapper<T> ref(T&) noexcept;
  template<class T> constexpr reference_wrapper<const T> cref(const T&) noexcept;
  template<class T> void ref(const T&&) = delete;
  template<class T> void cref(const T&&) = delete;
  template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T>) noexcept;
  template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T>) noexcept;

  // 22.10.7, arithmetic operations
  template<class T = void> struct plus;

template<class T> struct is_bind_expression;
template<class T> inline constexpr bool is_bind_expression_v = is_bind_expression<T>::value;
template<class T> struct is_placeholder;
template<class T> inline constexpr int is_placeholder_v = is_placeholder<T>::value;
template<class F, class... BoundArgs>
  constexpr unspecified bind(F&&, BoundArgs&&...);
template<class R, class F, class... BoundArgs>
  constexpr unspecified bind(R, F, class... BoundArgs);

namespace placeholders {
  // M is the implementation-defined number of placeholders
  see below _1;
  see below _2;
  .
  .
  see below _M;
}

// 22.10.16, member function adaptors
template<class R, class T>
  constexpr unspecified mem_fn(R T::* noexcept;

// 22.10.17, polymorphic function wrappers
class bad_function_call;
template<class> class function;  // not defined
template<class R, class... ArgTypes> class function<R(ArgTypes...)>;

// 22.10.17.3.8, specialized algorithms
template<class R, class... ArgTypes>
    void swap(function<R(ArgTypes...)>&, function<R(ArgTypes...)>&) noexcept;

// 22.10.17.3.7, null pointer comparison operator functions
template<class R, class... ArgTypes>
    bool operator==(const function<R(ArgTypes...)>&, nullptr_t) noexcept;

// 22.10.17.4, move only wrapper
template<class... S> class move_only_function;  // not defined
template<class R, class... ArgTypes>
    class move_only_function<R(ArgTypes...)>
        cv ref noexcept(noex);
        // see below

// 22.10.18, searchers
template<class ForwardIterator, class BinaryPredicate = equal_to<>>
    class default_searcher;

template<class RandomAccessIterator, class Hash = hash<typename iterator_traits<RandomAccessIterator>::value_type>,
            class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher;

// 22.10.19, class template hash
template<class T>
    struct hash;

namespace ranges {
    // 22.10.9, concept-constrained comparisons
    struct equal_to;
    struct not_equal_to;
    struct greater;
    struct less;
    struct greater_equal;
    struct less_equal;
}

1 [Example 1: If a C++ program wants to have a by-element addition of two vectors \texttt{a} and \texttt{b} containing \texttt{double} and put the result into \texttt{a}, it can do:
    
    \begin{verbatim}
    transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
    \end{verbatim}
    —end example]

2 [Example 2: To negate every element of \texttt{a}:
    
    \begin{verbatim}
    transform(a.begin(), a.end(), a.begin(), negate<double>());
    \end{verbatim}
    —end example]

22.10.3 Definitions

The following definitions apply to this Clause:

A \textit{call signature} is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.

A \textit{callable type} is a function object type (22.10) or a pointer to member.

A \textit{callable object} is an object of a callable type.
A call wrapper type is a type that holds a callable object and supports a call operation that forwards to that object.

A call wrapper is an object of a call wrapper type.

A target object is the callable object held by a call wrapper.

A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as bound argument entities.

The target object and bound argument entities of the call wrapper are collectively referred to as state entities.

### 22.10.4 Requirements

1. Define `INVOKE(f, t_1, t_2, ..., t_N)` as follows:
   
   - \((t_1.f)(t_2, \ldots, t_N)\) when \(f\) is a pointer to a member function of a class \(T\) and \(\text{is\_base\_of\_v<T, remove\_reference\_t<\text{decltype}(t_1)>>}\) is true;
   
   - \((t_1.get().f)(t_2, \ldots, t_N)\) when \(f\) is a pointer to a member function of a class \(T\) and \(\text{remove\_cvt\_t<\text{decltype}(t_1)>}\) is a specialization of `reference\_wrapper`;
   
   - \(((*t_1).f)(t_2, \ldots, t_N)\) when \(f\) is a pointer to a member function of a class \(T\) and \(t_1\) does not satisfy the previous two items;
   
   - \(t_1.f\) when \(N = 1\) and \(f\) is a pointer to data member of a class \(T\) and \(\text{is\_base\_of\_v<T, remove\_reference\_t<\text{decltype}(t_1)>}\) is true;
   
   - \(t_1.get().f\) when \(N = 1\) and \(f\) is a pointer to data member of a class \(T\) and \(\text{remove\_cvt\_t<\text{decltype}(t_1)>}\) is a specialization of `reference\_wrapper`;
   
   - \(((*t_1).f)\) when \(N = 1\) and \(f\) is a pointer to data member of a class \(T\) and \(t_1\) does not satisfy the previous two items;
   
   - \(f(t_1, t_2, \ldots, t_N)\) in all other cases.

2. Define `INVOKE<R>(f, t_1, t_2, ..., t_N)` as `static\_cast<void>(INVOKE(f, t_1, t_2, ..., t_N))` if \(R\) is `cv\_void` otherwise `INVOKE(f, t_1, t_2, ..., t_N)` implicitly converted to \(R\). If `reference\_converts\_from\_temporary\_v<R, declaring<INVOKE(f, t_1, t_2, ..., t_N)>>` is true, `INVOKE<R>(f, t_1, t_2, ..., t_N)` is ill-formed.

3. Every call wrapper (22.10.3) meets the Cpp17MoveConstructible and Cpp17Destructible requirements. An argument forwarding call wrapper is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the target object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.

4. In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form

   ```cpp
   template<class... UnBoundArgs>
   constexpr R operator()(UnBoundArgs&&... unbound_args) cv-guaranteed;
   ```

5. A perfect forwarding call wrapper is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type \(T\) as `cv T&` when the call is performed on an lvalue of the call wrapper type and as `cv T&&` otherwise, where `cv` represents the cv-qualifiers of the call wrapper and where `cv` shall be neither `volatile` nor `const volatile`.

6. A call pattern defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.21) to an expression \(e\) determined from its call pattern `cp` by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.

7. A simple call wrapper is a perfect forwarding call wrapper that meets the Cpp17CopyConstructible and Cpp17CopyAssignable requirements and whose copy constructor, move constructor, and assignment operators are `constexpr` functions that do not throw exceptions.

8. The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).

9. This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as `constexpr` if the corresponding implicit definition would be considered to be `constexpr`. — end note]
Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

22.10.5 invoke functions

```cpp
template<class F, class... Args>
constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
noexcept(is_nothrow_invocable_v<F, Args...>);
```

Constraints: is_invocable_v<F, Args...> is true.

Returns: INVOKE(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4).

```cpp
template<class R, class F, class... Args>
constexpr R invoke_r(F&& f, Args&&... args)
noexcept(is_nothrow_invocable_r_v<R, F, Args...>);
```

Constraints: is_invocable_r_v<R, F, Args...> is true.

Returns: INVOKE<R>(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4).

22.10.6 Class template reference_wrapper

22.10.6.1 General

```cpp
namespace std {
    template<class T> class reference_wrapper {
        public:
            using type = T;

            template<class U>
            constexpr reference_wrapper(U&&) noexcept;
            constexpr reference_wrapper(const reference_wrapper& x) noexcept;
            constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

            constexpr operator T& () const noexcept;
            constexpr T& get() const noexcept;

            template<class... ArgTypes>
            constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const;
    };
```

1 reference_wrapper<T> is a Cpp17CopyConstructible and Cpp17CopyAssignable wrapper around a reference to an object or function of type T.

2 reference_wrapper<T> is a trivially copyable type (6.8.1).

3 The template parameter T of reference_wrapper may be an incomplete type.

22.10.6.2 Constructors

```cpp
template<class U>
constexpr reference_wrapper(U&& u) noexcept;
```

1 Let FUN denote the exposition-only functions

   void FUN(T&) noexcept;
   void FUN(T&&) = delete;

Constraints: The expression FUN(declval<U>() is well-formed and is_same_v<remove_cvref_t<U>, reference_wrapper> is false.
Effects: Creates a variable r as if by T& r = std::forward<U>(u), then constructs a reference_wrapper object that stores a reference to r.

Remarks: The exception specification is equivalent to noexcept(FUN(declval<U>())).

```cpp
constexpr reference_wrapper(const reference_wrapper& x) noexcept;
```

Effects: Constructs a reference_wrapper object that stores a reference to x.get().

22.10.6.3 Assignment

```cpp
constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;
```

Postconditions: *this stores a reference to x.get().

22.10.6.4 Access

```cpp
constexpr T& get() const noexcept;
```

Returns: The stored reference.

22.10.6.5 Invocation

```cpp
template<class... ArgTypes>
constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&... args) const;
```

Mandates: T is a complete type.

Returns: INVOKE(get(), std::forward<ArgTypes>(args)...). (22.10.4)

22.10.6.6 Helper functions

```cpp
template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;
```

Returns: reference_wrapper<T>(t).

```cpp
template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;
```

Returns: t.

```cpp
template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;
```

Returns: reference_wrapper<const T>(t).

```cpp
template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;
```

Returns: t.

22.10.7 Arithmetic operations

22.10.7.2 Class template plus

```cpp
template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

Returns: x + y.

§ 22.10.7.2
template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));

Returns: std::forward<T>(t) + std::forward<U>(u).

22.10.7.3 Class template minus

template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x - y.

template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));

2 Returns: std::forward<T>(t) - std::forward<U>(u).

22.10.7.4 Class template multiplies

template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x * y.

template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));

2 Returns: std::forward<T>(t) * std::forward<U>(u).

22.10.7.5 Class template divides

template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x / y.

template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));
using is_transparent = unspecified;
};
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) / std::forward<U>(u));
2
Returns: std::forward<T>(t) / std::forward<U>(u).

22.10.7.6 Class template modulus

template<class T = void> struct modulus {
  constexpr T operator()(const T& x, const T& y) const;
};
constexpr T operator()(const T& x, const T& y) const;
1
Returns: x % y.

template<> struct modulus<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) % std::forward<U>(u));
  using is_transparent = unspecified;
};
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) % std::forward<U>(u));
2
Returns: std::forward<T>(t) % std::forward<U>(u).

22.10.7.7 Class template negate

template<class T = void> struct negate {
  constexpr T operator()(const T& x) const;
};
constexpr T operator()(const T& x) const;
1
Returns: -x.

template<> struct negate<void> {
  template<class T> constexpr auto operator()(T&& t) const
-> decltype(-std::forward<T>(t));
  using is_transparent = unspecified;
};
template<class T> constexpr auto operator()(T&& t) const
-> decltype(-std::forward<T>(t));
2
Returns: -std::forward<T>(t).

22.10.8 Comparisons

22.10.8.1 General

The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).

For templates less, greater, less_equal, and greater_equal, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.27).

[Note 1: If a < b is well-defined for pointers a and b of type P, then (a < b) == less<P>()(a, b), (a > b) == greater<P>()(a, b), and so forth. — end note]

For template specializations less<void>, greater<void>, less_equal<void>, and greater_equal<void>, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.
22.10.8.2 Class template `equal_to`  

```cpp
template<class T = void> struct equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

returns: `x == y`.

```cpp
template<> struct equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) == std::forward<U>(u));
    using is_transparent = unspecified;
};
```

returns: `std::forward<T>(t) == std::forward<U>(u)`.

22.10.8.3 Class template `not_equal_to`  

```cpp
template<class T = void> struct not_equal_to {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

returns: `x != y`.

```cpp
template<> struct not_equal_to<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) != std::forward<U>(u));
    using is_transparent = unspecified;
};
```

returns: `std::forward<T>(t) != std::forward<U>(u)`.

22.10.8.4 Class template `greater`  

```cpp
template<class T = void> struct greater {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

returns: `x > y`.

```cpp
template<> struct greater<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) > std::forward<U>(u));
    using is_transparent = unspecified;
};
```

returns: `std::forward<T>(t) > std::forward<U>(u)`.

22.10.8.5 Class template `less`  

```cpp
template<class T = void> struct less {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

returns: `x < y`.
constexpr bool operator()(const T& x, const T& y) const;

Returns: x < y.

template struct less<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) < std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) < std::forward<U>(u));

Returns: std::forward<T>(t) < std::forward<U>(u).

22.10.8.6 Class template greater_equal

template<class T = void> struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};

castexpr bool operator()(const T& x, const T& y) const;

Returns: x >= y.

template struct greater_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) >= std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) >= std::forward<U>(u));

Returns: std::forward<T>(t) >= std::forward<U>(u).

22.10.8.7 Class template less_equal

template<class T = void> struct less_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};

castexpr bool operator()(const T& x, const T& y) const;

Returns: x <= y.

template struct less_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) <= std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) <= std::forward<U>(u));

Returns: std::forward<T>(t) <= std::forward<U>(u).

22.10.8.8 Class compare_three_way

namespace std {
  struct compare_three_way {
    template<class T, class U>
      constexpr auto operator()(T&& t, U&& u) const;
  };

§ 22.10.8.8 747
template<class T, class U>
constexpr auto operator()(T&& t, U&& u) const;

Constraints: T and U satisfy three_way_comparable_with.

Preconditions: If the expression \( \text{std::forward<T>(t) <=> std::forward<U>(u) } \) results in a call to a built-in operator \( <=> \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2); otherwise, \( T \) and \( U \) model three_way_comparable_with.

Effects:

1. If the expression \( \text{std::forward<T>(t) <=> std::forward<U>(u) } \) results in a call to a built-in operator \( <=> \) comparing pointers of type \( P \), returns strong_ordering::less if (the converted value of) \( t \) precedes \( u \) in the implementation-defined strict total order over pointers (3.27), strong_ordering::greater if \( u \) precedes \( t \), and otherwise strong_ordering::equal.

2. Otherwise, equivalent to: return std::forward<T>(t) <=> std::forward<U>(u);

22.10.9 Concept-constrained comparisons [range cmp]

struct ranges::equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy equality_comparable_with.

Preconditions: If the expression \( \text{std::forward<T>(t) == std::forward<U>(u) } \) results in a call to a built-in operator \( == \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2); otherwise, \( T \) and \( U \) model equality_comparable_with.

Effects:

1. If the expression \( \text{std::forward<T>(t) == std::forward<U>(u) } \) results in a call to a built-in operator \( == \) comparing pointers: returns false if either (the converted value of) \( t \) precedes \( u \) or \( u \) precedes \( t \) in the implementation-defined strict total order over pointers (3.27) and otherwise true.

2. Otherwise, equivalent to: return std::forward<T>(t) == std::forward<U>(u);

struct ranges::not_equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy equality_comparable_with.

Effects: Equivalent to:

return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::greater {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.

Effects: Equivalent to:
    return ranges::less{}(std::forward<U>(u), std::forward<T>(t));

struct ranges::less {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.

Preconditions: If the expression std::forward<T>(t) < std::forward<U>(u) results in a call to a built-in operator < comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model totally_ordered_with. For any expressions ET and EU such that decltype((ET)) is T and decltype((EU)) is U, exactly one of ranges::less{}(ET, EU), ranges::less{}(EU, ET), or ranges::equal_to{}(ET, EU) is true.

Effects:
    — If the expression std::forward<T>(t) < std::forward<U>(u) results in a call to a built-in operator < comparing pointers: returns true if (the converted value of) t precedes u in the implementation-defined strict total order over pointers (3.27) and otherwise false.
    — Otherwise, equivalent to: return std::forward<T>(t) < std::forward<U>(u);

struct ranges::greater_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.

Effects: Equivalent to:
    return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::less_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.

Effects: Equivalent to:
    return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));

22.10.10 Logical operations [logical.operations]

22.10.10.1 General [logical.operations.general]

The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).
22.10.10.2 Class template logical_and

```cpp
template<class T = void> struct logical_and {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

Returns: \( x \&\& y \).

```cpp
template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) \&\& std::forward<U>(u));
    using is_transparent = unspecified;
};
```

Returns: \( \text{std::forward<T>(t)} \&\& \text{std::forward<U>(u)} \).

22.10.10.3 Class template logical_or

```cpp
template<class T = void> struct logical_or {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

Returns: \( x \|\| y \).

```cpp
template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) \|\| std::forward<U>(u));
    using is_transparent = unspecified;
};
```

Returns: \( \text{std::forward<T>(t)} \|\| \text{std::forward<U>(u)} \).

22.10.10.4 Class template logical_not

```cpp
template<class T = void> struct logical_not {
    constexpr bool operator()(const T& x) const;
};
```

Returns: \( \neg x \).

```cpp
template<> struct logical_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));
    using is_transparent = unspecified;
};
```

Returns: \( \neg \text{std::forward<T>(t)} \).
22.10.11 Bitwise operations

22.10.11.1 General

The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

22.10.11.2 Class template bit_and

```cpp
template<class T = void> struct bit_and {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

1 Returns: \( x \& y \).

```cpp
template<> struct bit_and<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));
  using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) & std::forward<U>(u));
```

2 Returns: \( \text{std::forward}(t) \& \text{std::forward}(u) \).

22.10.11.3 Class template bit_or

```cpp
template<class T = void> struct bit_or {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

1 Returns: \( x | y \).

```cpp
template<> struct bit_or<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) | std::forward<U>(u));
  using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) | std::forward<U>(u));
```

2 Returns: \( \text{std::forward}(t) | \text{std::forward}(u) \).

22.10.11.4 Class template bit_xor

```cpp
template<class T = void> struct bit_xor {
  constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

1 Returns: \( x ^ y \).

```cpp
template<> struct bit_xor<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
  using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
```

2 Returns: \( \text{std::forward}(t) ^ \text{std::forward}(u) \).
22.10.11.5 Class template bit_not

template<class T = void> struct bit_not {
    constexpr T operator()(const T& x) const;
};

constexpr T operator()(const T& x) const;

1 Returns: -x.

template<> struct bit_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));

    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&&) const
    -> decltype(~std::forward<T>(t));

2 Returns: ~std::forward<T>(t).

22.10.12 Class identity

struct identity {
    template<class T>
    constexpr T&& operator()(T&& t) const noexcept;

    using is_transparent = unspecified;
};

template<class T>
constexpr T&& operator()(T&& t) const noexcept;

1 Effects: Equivalent to: return std::forward<T>(t);

22.10.13 Function template not_fn

template<class F> constexpr unspecified not_fn(F&& f);

1 In the text that follows:
(1.1) g is a value of the result of a not_fn invocation,
(1.2) FD is the type decay_t<F>,
(1.3) fd is the target object of g (22.10.3) of type FD, direct-non-list-initialized with std::forward<F>(f),
(1.4) call_args is an argument pack used in a function call expression (7.6.1.3) of g.

2 Mandates: is_constructible_v<FD, F> && is_move_constructible_v<FD> is true.
3 Preconditions: FD meets the Cpp17MoveConstructible requirements.
4 Returns: A perfect forwarding call wrapper (22.10.4) g with call pattern !invoke(fd, call_args...).
5 Throws: Any exception thrown by the initialization of fd.

22.10.14 Function templates bind_front and bind_back

template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);

template<class F, class... Args>
constexpr unspecified bind_back(F&& f, Args&&... args);

1 Within this subclause:
(1.1) g is a value of the result of a bind_front or bind_back invocation,
(1.2) FD is the type decay_t<F>,
(1.3) fd is the target object of g (22.10.3) of type FD, direct-non-list-initialized with std::forward<F>(f),
BoundArgs is a pack that denotes decay_t<Args>..., bound_args is a pack of bound argument entities of g (22.10.3) of types BoundArgs..., direct-non-list-initialized with std::forward<Args>(args)..., respectively, and call_args is an argument pack used in a function call expression (7.6.1.3) of g.

Mandates:

\[
\text{is_constructible_v<FD, F>} \&\& \\
\text{is_move_constructible_v<FD>} \&\& \\
\text{(is_constructible_v<BoundArgs, Args>} \&\& \ldots) \&\& \\
\text{(is_move_constructible_v<BoundArgs} \&\& \ldots)
\]

is true.

Preconditions: FD meets the Cpp17MoveConstructible requirements. For each Ti in BoundArgs, if Ti is an object type, Ti meets the Cpp17MoveConstructible requirements.

Returns: A perfect forwarding call wrapper (22.10.4) g with call pattern:

1. `invoke(fd, bound_args..., call_args...)` for a bind_front invocation, or
2. `invoke(fd, call_args..., bound_args...)` for a bind_back invocation.

Throws: Any exception thrown by the initialization of the state entities of g (22.10.3).

22.10.15 Function object binders

22.10.15.1 General

Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

22.10.15.2 Class template is_bind_expression

```
namespace std {
    template<class T> struct is_bind_expression; // see below
}
```

The class template is_bind_expression can be used to detect function objects generated by bind. The function template bind uses is_bind_expression to detect subexpressions.

Specializations of the is_bind_expression template shall meet the Cpp17UnaryTypeTrait requirements (21.3.2). The implementation provides a definition that has a base characteristic of true_type if T is a type returned from bind, otherwise it has a base characteristic of false_type. A program may specialize this template for a program-defined type T to have a base characteristic of true_type to indicate that T should be treated as a subexpression in a bind call.

22.10.15.3 Class template is_placeholder

```
namespace std {
    template<class T> struct is_placeholder; // see below
}
```

The class template is_placeholder can be used to detect the standard placeholders _1, _2, and so on. The function template bind uses is_placeholder to detect placeholders.

Specializations of the is_placeholder template shall meet the Cpp17UnaryTypeTrait requirements (21.3.2). The implementation provides a definition that has the base characteristic of integral_constant<int, J> if T is the type of std::placeholders::J, otherwise it has a base characteristic of integral_constant<int, 0>. A program may specialize this template for a program-defined type T to have a base characteristic of integral_constant<int, N> with N > 0 to indicate that T should be treated as a placeholder type.

22.10.15.4 Function template bind

In the text that follows:

1. g is a value of the result of a bind invocation,
2. FD is the type decay_t<F>,
3. fd is an lvalue that is a target object of g (22.10.3) of type FD direct-non-list-initialized with std::forward<F>(f),
4. Ti is the i-th type in the template parameter pack BoundArgs,
TD is the type decay_t<T>,

- t is the i-th argument in the function parameter pack bound_args,
- td is a bound argument entity of g (22.10.3) of type TD direct-non-list-initialized with std::forward<T, t>,
- Uj is the j-th deduced type of the UnBoundArgs... parameter of the argument forwarding call wrapper, and
- ui is the j-th argument associated with Uj.

```cpp
template<class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

- Mandates: is_constructible_v<FD, F> is true. For each Ti in BoundArgs, is_constructible_v<TD, Ti> is true.
- Preconditions: FD and each TD meet the Cpp17MoveConstructible and Cpp17Destructible requirements.
- INVOKED(fd, w1, w2, ..., wN) (22.10.4) is a valid expression for some values w1, w2, ..., wN, where N has the value sizeof...(bound_args).
- Returns: An argument forwarding call wrapper g (22.10.4). A program that attempts to invoke a volatile-qualified g is ill-formed. When g is not volatile-qualified, invocation of g(u1, u2, ..., uM) is expression-equivalent (3.21) to

```
INVOKED(static_cast<Inv<In>(vf1),
    static_cast<Inv<In>(vf1), static_cast<Inv<In>(vf2), ..., static_cast<Inv<In>(vfN))
```

for the first overload, and

```
INVOKED<Inv>(static_cast<Inv<In>(vf1),
    static_cast<Inv<In>(vf1), static_cast<Inv<In>(vf2), ..., static_cast<Inv<In>(vfN))
```

for the second overload, where the values and types of the target argument vf1 and of the bound arguments v1, v2, ..., vN are determined as specified below.

- Throws: Any exception thrown by the initialization of the state entities of g.

[Note 1: If all of FD and TD meet the requirements of Cpp17CopyConstructible, then the return type meets the requirements of Cpp17CopyConstructible. — end note]

The values of the bound arguments v1, v2, ..., vN and their corresponding types V1, V2, ..., VN depend on the types TD derived from the call to bind and the cv-qualifiers cv of the call wrapper g as follows:

- if TD is reference_wrapper<T>, the argument is td.get() and its type Vi is T;
- if the value of is_bind_expression_v<TD> is true, the argument is

```
    static_cast<Inv<In>>(td)(std::forward<U>(u) ...)
```

and its type Vi is invoke_result_t<Inv TD, Uj, Uj,...&&;
- if the value j of is_placeholder_v<TD> is not zero, the argument is std::forward<Uj>(uj) and its type Vi is Uj&&;
- otherwise, the value is td, and its type Vi is cv TD.

The value of the target argument vf1 is fd and its corresponding type V is cv FD.

### 22.10.15.5 Placeholders

```cpp
namespace std::placeholders {
    // M is the implementation-defined number of placeholders
    see below _1;
    see below _2;
    ...
    ...
    see below _M;
}
```

1 All placeholder types meet the Cpp17DefaultConstructible and Cpp17CopyConstructible requirements, and their default constructors and copy/move constructors are constexpr functions that do not throw exceptions.
It is implementation-defined whether placeholder types meet the \texttt{Cpp17CopyAssignable} requirements, but if so, their copy assignment operators are \texttt{constexpr} functions that do not throw exceptions.

2 Placeholders should be defined as:

\begin{verbatim}
inline constexpr unspecified _1{};
\end{verbatim}

If they are not, they are declared as:

\begin{verbatim}
extern unspecified _1;
\end{verbatim}

22.10.16 Function template \texttt{mem\_fn} \hfill [\texttt{func.memfn}]

\begin{verbatim}
template<class R, class T> constexpr unspecified mem\_fn(R T::* pm) noexcept;
\end{verbatim}

\begin{enumerate}
\item \texttt{Returns:} A simple call wrapper (22.10.4) \texttt{fn} with call pattern \texttt{invoke(pmd, call\_args...)}, where \texttt{pmd} is the target object of \texttt{fn} of type \texttt{R T::*} direct-non-list-initialized with \texttt{pm}, and \texttt{call\_args} is an argument pack used in a function call expression (7.6.1.3) of \texttt{fn}.
\end{enumerate}

22.10.17 Polymorphic function wrappers \hfill [\texttt{func.wrap}]

22.10.17.1 General \hfill [\texttt{func.wrap.general}]

1 Subclause 22.10.17 describes polymorphic wrapper classes that encapsulate arbitrary callable objects.

22.10.17.2 Class \texttt{bad\_function\_call} \hfill [\texttt{func.wrap.badcall}]

1 An exception of type \texttt{bad\_function\_call} is thrown by \texttt{function::operator()} (22.10.17.3.5) when the function wrapper object has no target.

\begin{verbatim}
namespace std {
    class bad_function_call : public exception {
        public:
            // see 17.9.3 for the specification of the special member functions
            const char* what() const noexcept override;
    }
}
\end{verbatim}

\begin{enumerate}
\item \texttt{Returns:} An implementation-defined \texttt{ntbs}.
\end{enumerate}

22.10.17.3 Class template \texttt{function} \hfill [\texttt{func.wrap.func}]

22.10.17.3.1 General \hfill [\texttt{func.wrap.func.general}]

\begin{verbatim}
namespace std {
    template<class> class function; // not defined

    template<class R, class... ArgTypes>
    class function<R(ArgTypes...)>
    { 
        public:
            using result_type = R;
            // 22.10.17.3.2, construct/copy/destroy
            function() noexcept;
            function(nullptr_t) noexcept;
            function(const function&);
            function(function&&) noexcept;
            template<class F> function(F&&);
            function& operator=(const function&);
            function& operator=(function&&);
            function& operator=(nullptr_t) noexcept;
            template<class F> function& operator=(F&&);
            template<class F> function& operator=(reference_wrapper<F>()) noexcept;

            ~function();
            // 22.10.17.3.3, function modifiers
            void swap(function&) noexcept;
    }

    // 22.10.17.3.4, special member functions
\end{verbatim}
The `function` class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (22.10.3), given a call signature (22.10.3).

A callable type (22.10.3) `F` is *Lvalue-Callable* for argument types `ArgTypes` and return type `R` if the expression 

```
INVOKER<R>(declval<F&>(), declval<ArgTypes>())...
```

considered as an unevaluated operand (7.2.3), is well-formed (22.10.4).

The `function` class template is a call wrapper (22.10.3) whose call signature (22.10.3) is `R(ArgTypes...)`.

**Note 1:** The types deduced by the deduction guides for `function` might change in future revisions of C++.  — end note

### 22.10.17.3.2 Constructors and destructor

**[func.wrap.func.con]**

```
function() noexcept;
```

Postconditions: `!*this`.

```
function(nullptr_t) noexcept;
```

Postconditions: `!*this`.

```
function(const function& f);
```

Postconditions: `!*this` if `!f`; otherwise, the target object of `*this` is a copy of `f.target()`. Throes: Nothing if `f`‘s target is a specialization of `reference_wrapper` or a function pointer. Otherwise, may throw `bad_alloc` or any exception thrown by the copy constructor of the stored callable object.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f`‘s target is an object holding only a pointer or reference to an object and a member function pointer.

```
function(function&& f) noexcept;
```

Postconditions: If `!f`, `*this` has no target; otherwise, the target of `*this` is equivalent to the target of `f` before the construction, and `f` is in a valid state with an unspecified value.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where `f`‘s target is an object holding only a pointer or reference to an object and a member function pointer.

```
template<class F> function(F&& f);
```

Let `FD` be `decay_t<F>`,

Constraints:

- is_same_v<`remove_cvref_t<F>`, function> is false, and
- `FD` is Lvalue-Callable (22.10.17.3) for argument types `ArgTypes...` and return type `R`.

Mandates:
- is_copy_constructible_v<`FD`> is true, and
Preconditions: FD meets the Cpp17CopyConstructible requirements.

Postconditions: !*this is true if any of the following hold:

- f is a null function pointer value.
- f is a null member pointer value.
- remove_cvref_t<F> is a specialization of the function class template, and !f is true.

Otherwise, *this has a target object of type FD direct-non-list-initialized with std::forward<F>(f).

Throws: Nothing if FD is a specialization of reference_wrapper or a function pointer type. Otherwise, may throw bad_alloc or any exception thrown by the initialization of the target object.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f refers to an object holding only a pointer or reference to an object and a member function pointer.

### function

```cpp
template<class F> function(F) -> function<see below>;
```

Constraints: &F::operator() is well-formed when treated as an unevaluated operand and decltype( &F::operator() ) is of the form R(G::*)(A...) cv &opt noexcept opt for a class type G.

Remarks: The deduced type is function<R(A...)>

[Example 1:

```cpp
void f() {
    int i{5};
    function g = [&](double) { return i; }; // deduces function<int(double)>
}
```

—end example]

```cpp
function& operator=(const function& f);
```

Effects: As if by function(f).swap(*this);

Returns: *this.

```cpp
function& operator=(function&& f);
```

Effects: Replaces the target of *this with the target of f.

Returns: *this.

```cpp
function& operator=(nullptr_t) noexcept;
```

Effects: If *this != nullptr, destroys the target of this.

Returns: *this.

```cpp
template<class F> function& operator=(F&& f);
```

Constraints: decay_t<F> is Lvalue-Callable (22.10.17.3) for argument types ArgTypes... and return type R.

Effects: As if by: function(std::forward<F>(f)).swap(*this);

Returns: *this.

```cpp
template<class F> function& operator=(reference_wrapper<F> f) noexcept;
```

Effects: As if by: function(f).swap(*this);

Returns: *this.

~function();

Effects: If *this != nullptr, destroys the target of this.
22.10.17.3.3 Modifiers

```cpp
void swap(function& other) noexcept;
```

*Effects:* Interchanges the target objects of *this and other.*

22.10.17.3.4 Capacity

```cpp
explicit operator bool() const noexcept;
```

*Returns:* true if *this has a target, otherwise false.*

22.10.17.3.5 Invocation

```cpp
R operator()(ArgTypes... args) const;
```

*Returns:* \( \text{INVOKE}<R>(f, \text{std::forward<ArgTypes>(args)...) (22.10.4), where f is the target object (22.10.3) of *this.}

*Throws:* bad_function_call if !*this; otherwise, any exception thrown by the target object.

22.10.17.3.6 Target access

```cpp
const type_info& target_type() const noexcept;
```

*Returns:* If *this has a target of type T, typeid(T); otherwise, typeid(void).

```cpp
template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;
```

*Returns:* If target_type() == typeid(T) a pointer to the stored function target; otherwise a null pointer.

22.10.17.3.7 Null pointer comparison operator functions

```cpp
template<class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
```

*Returns:* !f.

22.10.17.3.8 Specialized algorithms

```cpp
template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
```

*Effects:* As if by: f1.swap(f2);

22.10.17.4 Move only wrapper

22.10.17.4.1 General

The header provides partial specializations of move_only_function for each combination of the possible replacements of the placeholders `cv, ref, and noex` where

1. `cv` is either const or empty,
2. `ref` is either `&`, `&&`, or empty, and
3. `noex` is either `true` or `false`.

For each of the possible combinations of the placeholders mentioned above, there is a placeholder `inv-quals` defined as follows:

1. If `ref` is empty, let `inv-quals` be `cv&`,
2. otherwise, let `inv-quals` be `cv ref`.

22.10.17.4.2 Class template move_only_function

```cpp
namespace std {
    template<class... S> class move_only_function; // not defined

    template<class R, class... ArgTypes>
    class move_only_function<R(ArgTypes...) cv ref noexcept(noex)> {
        public:
            using result_type = R;
    }
}
```

§ 22.10.17.4.2
move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;
move_only_function(move_only_function&&) noexcept;

// 22.10.17.4.4, invocation
explicit operator bool() const noexcept;
R operator()(ArgTypes...) cv ref noexcept(noex);

// 22.10.17.4.5, utility
void swap(move_only_function&) noexcept;
friend void swap(move_only_function&, move_only_function&) noexcept;
friend bool operator==(const move_only_function&, nullptr_t) noexcept;

private:
  template<class VT>
    static constexpr bool is-callable-from = see below;  // exposition only
};

1 The move_only_function class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for a small contained value.

[Note 1: Such small-object optimization can only be applied to a type T for which is_nothrow_move_constructible_v<T> is true. — end note]

22.10.17.4.3 Constructors, assignment, and destructor

move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;
move_only_function(move_only_function&&) noexcept;

// 22.10.17.4.4, invocation
explicit operator bool() const noexcept;
R operator()(ArgTypes...) cv ref noexcept(noex);

// 22.10.17.4.5, utility
void swap(move_only_function&) noexcept;
friend void swap(move_only_function&, move_only_function&) noexcept;
friend bool operator==(const move_only_function&, nullptr_t) noexcept;

private:
  template<class VT>
    static constexpr bool is-callable-from = see below;  // exposition only
};

1 The move_only_function class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for a small contained value.

[Note 1: Such small-object optimization can only be applied to a type T for which is_nothrow_move_constructible_v<T> is true. — end note]
Constraints:

(5.1) \(\text{remove_cvref}_t<F>\) is not the same type as \(\text{move_only_function}\), and

(5.2) \(\text{remove_cvref}_t<F>\) is not a specialization of \(\text{in_place_type}_t\), and

(5.3) is-callable-from<VT> is true.

Mandates: \(\text{is_constructible}_v<\text{VT}, F>\) is true.

Preconditions: VT meets the Cpp17Destructible requirements, and if \(\text{is_move_constructible}_v<\text{VT}>\) is true, VT meets the Cpp17MoveConstructible requirements.

Postconditions: *this has no target object if any of the following hold:

(8.1) \(f\) is a null function pointer value, or

(8.2) \(f\) is a null member pointer value, or

(8.3) \(\text{remove_cvref}_t<F>\) is a specialization of the \(\text{move_only_function}\) class template, and \(f\) has no target object.

Otherwise, *this has a target object of type VT direct-non-list-initialized with \(\text{std::forward}<F>(f)\).

Throws: Any exception thrown by the initialization of the target object. May throw \text{bad_alloc} unless VT is a function pointer or a specialization of \text{reference_wrapper}.

\[
\text{template}<\text{class } T, \ldots \text{ Args}>
\]

\[
\text{explicit move_only_function}(\text{in_place_type}_t<T>, \text{Args}&& \ldots \text{ args});
\]

Let VT be \(\text{decay}_t<T>\).

Constraints:

(11.1) \(\text{is_constructible}_v<\text{VT}, \text{Args}&&>\) is true, and

(11.2) is-callable-from<VT> is true.

Mandates: VT is the same type as T.

Preconditions: VT meets the Cpp17Destructible requirements, and if \(\text{is_move_constructible}_v<\text{VT}>\) is true, VT meets the Cpp17MoveConstructible requirements.

Postconditions: *this has a target object of type VT direct-non-list-initialized with \(\text{std::forward}<\text{Args}>(\text{args})\).

Throws: Any exception thrown by the initialization of the target object. May throw \text{bad_alloc} unless VT is a function pointer or a specialization of \text{reference_wrapper}.

\[
\text{template}<\text{class } T, \text{class } U, \ldots \text{ Args}>
\]

\[
\text{explicit move_only_function}(\text{in_place_type}_t<T>, \text{initializer_list}<U> ilist, \text{Args}&& \ldots \text{ args});
\]

Let VT be \(\text{decay}_t<T>\).

Constraints:

(17.1) \(\text{is_constructible}_v<\text{VT}, \text{initializer_list}<U>&, \text{ArgTypes}&&>\) is true, and

(17.2) is-callable-from<VT> is true.

Mandates: VT is the same type as T.

Preconditions: VT meets the Cpp17Destructible requirements, and if \(\text{is_move_constructible}_v<\text{VT}>\) is true, VT meets the Cpp17MoveConstructible requirements.

Postconditions: *this has a target object of type VT direct-non-list-initialized with ilist, \(\text{std::forward}<\text{ArgTypes}>(\text{args})\).

Throws: Any exception thrown by the initialization of the target object. May throw \text{bad_alloc} unless VT is a function pointer or a specialization of \text{reference_wrapper}.

move_only_function& operator=(move_only_function&& f);

Effects: Equivalent to: move_only_function(std::move(f)).swap(*this);

Returns: *this.
move_only_function& operator=(nullptr_t) noexcept;

Effects: Destroys the target object of *this, if any.

Returns: *this.

template<class F> move_only_function& operator=(F&& f);

Effects: Equivalent to: move_only_function(std::forward<F>(f)).swap(*this);

Returns: *this.

~move_only_function();

Effects: Destroys the target object of *this, if any.

22.10.17.4.4 Invocation

explicit operator bool() const noexcept;

Returns: true if *this has a target object, otherwise false.

R operator()(ArgTypes... args) cv ref noexcept(noex);

Preconditions: *this has a target object.

Effects: Equivalent to:

return INVOKE<R>(static_cast<F inv-quals>(f), std::forward<ArgTypes>(args)...);

where f is an lvalue designating the target object of *this and F is the type of f.

22.10.17.4.5 Utility

void swap(move_only_function& other) noexcept;

Effects: Exchanges the target objects of *this and other.

friend void swap(move_only_function& f1, move_only_function& f2) noexcept;

Effects: Equivalent to f1.swap(f2).

friend bool operator==(const move_only_function& f, nullptr_t) noexcept;

Returns: true if f has no target object, otherwise false.

22.10.18 Searchers

22.10.18.1 General

Subclause 22.10.18 provides function object types (22.10) for operations that search for a sequence [pat_first,
pat_last) in another sequence [first, last) that is provided to the object’s function call operator. The first sequence (the pattern to be searched for) is provided to the object’s constructor, and the second (the sequence to be searched) is provided to the function call operator.

Each specialization of a class template specified in 22.10.18 shall meet the Cpp17CopyConstructible and Cpp17CopyAssignable requirements. Template parameters named

(2.1) — ForwardIterator,
(2.2) — ForwardIterator1,
(2.3) — ForwardIterator2,
(2.4) — RandomAccessIterator,
(2.5) — RandomAccessIterator1,
(2.6) — RandomAccessIterator2, and
(2.7) — BinaryPredicate

of templates specified in 22.10.18 shall meet the same requirements and semantics as specified in 27.1. Template parameters named Hash shall meet the Cpp17Hash requirements (Table 36).

The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.
22.10.18.2 Class template default_searcher

```cpp
namespace std {
    template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
    class default_searcher {
    public:
        constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                                   BinaryPredicate pred = BinaryPredicate());

        template<class ForwardIterator2>
        constexpr pair<ForwardIterator2, ForwardIterator2>
        operator()(ForwardIterator2 first, ForwardIterator2 last) const;
    private:
        ForwardIterator1 pat_first_; // exposition only
        ForwardIterator1 pat_last_;  // exposition only
        BinaryPredicate pred_;      // exposition only
    };
}
```

1. **Effects:** Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.
2. **Throws:** Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

22.10.18.3 Class template boyer_moore_searcher

```cpp
namespace std {
    template<class RandomAccessIterator1,
             class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
             class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher {
    public:
        boyer_moore_searcher(RandomAccessIterator1 pat_first,
                              RandomAccessIterator1 pat_last,
                              Hash hf = Hash(),
                              BinaryPredicate pred = BinaryPredicate());

        template<class RandomAccessIterator2>
        pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
    private:
        RandomAccessIterator1 pat_first_; // exposition only
        RandomAccessIterator1 pat_last_;  // exposition only
        Hash hash_;                       // exposition only
        BinaryPredicate pred_;           // exposition only
    };
}
```

1. **Effects:** Returns a pair of iterators `i` and `j` such that
   - `i == search(first, last, pat_first_, pat_last_, pred_)`, and
   - if `i == last`, then `j == last`, otherwise `j == next(i, distance(pat_first_, pat_last_))`.

§ 22.10.18.3 762
BinaryPredicate pred = BinaryPredicate();

1 Preconditions: The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible, the Cpp17CopyConstructible, and the Cpp17CopyAssignable requirements.

Let V be iterator_traits<RandomAccessIterator1>::value_type. For any two values A and B of type V, if pred(A, B) == true, then hf(A) == hf(B) is true.

2 Effects: Initializes pat_first_ with pat_first, pat_last_ with pat_last, hash_ with hf, and pred_ with pred.

3 Throws: Any exception thrown by the copy constructor of RandomAccessIterator1, or by the default constructor, copy constructor, or the copy assignment operator of the value type of RandomAccessIterator1, or the copy constructor or operator() of BinaryPredicate or Hash. May throw bad_alloc if additional memory needed for internal data structures cannot be allocated.

4 template<class RandomAccessIterator2>
   pair<RandomAccessIterator2, RandomAccessIterator2> operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

5 Mandates: RandomAccessIterator1 and RandomAccessIterator2 have the same value type.

6 Effects: Finds a subsequence of equal values in a sequence.

7 Returns: A pair of iterators i and j such that

   (7.1) — i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds: pred(*(i + n), *(pat_first_ + n)) != false, and

   (7.2) — j == next(i, distance(pat_first_, pat_last_)).

Returns make_pair(first, first) if [pat_first_, pat_last_) is empty, otherwise returns make_pair(last, last) if no such iterator is found.

8 Complexity: At most \((last - first) * (pat_last_ - pat_first_)) applications of the predicate.

§ 22.10.18.4 Class template boyer_moore_horspool_searcher

namespace std {
  template<class RandomAccessIterator1,
   class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
   class BinaryPredicate = equal_to<>>
  class boyer_moore_horspool_searcher {
    public:
      boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first, 
                                  RandomAccessIterator1 pat_last, 
                                  Hash hf = Hash(), 
                                  BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
    pair<RandomAccessIterator2, RandomAccessIterator2> operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
  }

  private:
    RandomAccessIterator1 pat_first_; // exposition only
    RandomAccessIterator1 pat_last_; // exposition only
    Hash hash_; // exposition only
    BinaryPredicate pred_; // exposition only
  }

boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first, 
                              RandomAccessIterator1 pat_last, 
                              Hash hf = Hash(), 
                              BinaryPredicate pred = BinaryPredicate());

1 Preconditions: The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible, Cpp17CopyConstructible, and Cpp17CopyAssignable requirements.
Let $V$ be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values $A$ and $B$ of type $V$, if $\text{pred}(A, B) == \text{true}$, then $hf(A) == hf(B)$ is true.

**Effects:** Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

**Throws:** Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```cpp
template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2> operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

**Mandates:** `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

**Effects:** Finds a subsequence of equal values in a sequence.

**Returns:** A pair of iterators $i$ and $j$ such that

1. $i$ is the first iterator in the range $[\text{first}, \text{last} - (\text{pat_last} - \text{pat_first})]$ such that for every non-negative integer $n$ less than $\text{pat_last} - \text{pat_first}$ the following condition holds: $\text{pred}(*(i + n), *(\text{pat_first} + n)) != \text{false}$, and
2. $j == \text{next}(i, \text{distance}(\text{pat_first}, \text{pat_last}))$.

Returns `make_pair(first, first)` if $[\text{pat_first, pat_last})$ is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

**Complexity:** At most $(\text{last} - \text{first}) \times (\text{pat_last} - \text{pat_first})$ applications of the predicate.

### 22.10.19 Class template `hash` [unord.hash]

The unordered associative containers defined in 24.5 use specializations of the class template `hash` (22.10.2) as the default hash function.

Each specialization of `hash` is either enabled or disabled, as described below.

**Note 1:** Enabled specializations meet the `Cpp17Hash` requirements, and disabled specializations do not. — end note

Each header that declares the template `hash` provides enabled specializations of `hash` for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template `hash`, `hash<Key>` is disabled.

If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are `noexcept` except as noted otherwise.

If `H` is a disabled specialization of `hash`, these values are `false`: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copy_assignable_v<H>`, and `is_moveAssignable_v<H>`. Disabled specializations of `hash` are not function object types (22.10).

**Note 2:** This means that the specialization of `hash` exists, but any attempts to use it as a `Cpp17Hash` will be ill-formed. — end note

An enabled specialization `hash<Key>` will:

1. meet the `Cpp17Hash` requirements (Table 36), with `Key` as the function call argument type, the `Cpp17DefaultConstructible` requirements (Table 29), the `Cpp17CopyAssignable` requirements (Table 33),
2. be swappable (16.4.4.3) for lvalues,
3. meet the requirement that if $k1 == k2$ is true, $h(k1) == h(k2)$ is also true, where `h` is an object of type `hash<Key>` and $k1$ and $k2$ are objects of type `Key`;
4. meet the requirement that the expression $h(k)$, where `h` is an object of type `hash<Key>` and `k` is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization.

### 22.11 Class `type_index` [type.index]

#### 22.11.1 Header `<typeindex>` synopsis [type.index.synopsis]

```cpp
#include <compare>  // see 17.11.1
```
namespace std {
  class type_index;
  template<class T> struct hash;
  template<> struct hash<type_index>;
}

22.11.2 type_index overview

namespace std {
  class type_index {
  public:
    type_index(const type_info& rhs) noexcept;
    bool operator==(const type_index& rhs) const noexcept;
    bool operator<(const type_index& rhs) const noexcept;
    bool operator>(const type_index& rhs) const noexcept;
    bool operator<=(const type_index& rhs) const noexcept;
    bool operator>=(const type_index& rhs) const noexcept;
    strong_ordering operator<=>(const type_index& rhs) const noexcept;
    size_t hash_code() const noexcept;
    const char* name() const noexcept;
  private:
    const type_info* target;  // exposition only
    // Note that the use of a pointer here, rather than a reference,
    // means that the default copy/move constructor and assignment
    // operators will be provided and work as expected.
  };
}

1 The class type_index provides a simple wrapper for type_info which can be used as an index type in associative containers (24.4) and in unordered associative containers (24.5).

22.11.3 type_index members

    type_index(const type_info& rhs) noexcept;
    bool operator==(const type_index& rhs) const noexcept;
    bool operator<(const type_index& rhs) const noexcept;
    bool operator>(const type_index& rhs) const noexcept;
    bool operator<=(const type_index& rhs) const noexcept;
    bool operator>=(const type_index& rhs) const noexcept;
    strong_ordering operator<=>(const type_index& rhs) const noexcept;
    size_t hash_code() const noexcept;

1 Effects: Constructs a type_index object, the equivalent of target = &rhs.

2 Returns: *target == *rhs.target.

3 Returns: target->before(*rhs.target).

4 Returns: rhs.target->before(*target).

5 Returns: !rhs.target->before(*target).

7 Effects: Equivalent to:

    if (*target == *rhs.target) return strong_ordering::equal;
    if (target->before(*rhs.target)) return strong_ordering::less;
    return strong_ordering::greater;

8 Returns: target->hash_code().
const char* name() const noexcept;

Returns: target->name().

22.11.4 Hash support

template<> struct hash<type_index>;

For an object index of type type_index, hash<type_index>()(index) shall evaluate to the same result as index.hash_code().

22.12 Execution policies

22.12.1 In general

Subclause 22.12 describes classes that are execution policy types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions.

[Example 1:

```c++
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());

// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());
```
—end example]

[Note 1: Implementations can provide additional execution policies to those described in this standard as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution. — end note]

22.12.2 Header <execution> synopsis

```c++
namespace std {
    // 22.12.3, execution policy type trait
    template<class T> struct is_execution_policy;
    template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

namespace std::execution {
    // 22.12.4, sequenced execution policy
    class sequenced_policy;

    // 22.12.5, parallel execution policy
    class parallel_policy;

    // 22.12.6, parallel and unsequenced execution policy
    class parallel_unsequenced_policy;

    // 22.12.7, unsequenced execution policy
    class unsequenced_policy;

    // 22.12.8, execution policy objects
    inline constexpr sequenced_policy seq{ unspecified };  
    inline constexpr parallel_policy par{ unspecified }; 
    inline constexpr parallel_unsequenced_policy par_unseq{ unspecified }; 
    inline constexpr unsequenced_policy unseq{ unspecified }; 
}
```
22.12.3 Execution policy type trait

`template<class T> struct is_execution_policy { see below };`

`is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

`is_execution_policy<T>` is a `Cpp17UnaryTypeTrait` with a base characteristic of `true_type` if `T` is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[Note 1: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — end note]

The behavior of a program that adds specializations for `is_execution_policy` is undefined.

22.12.4 Sequenced execution policy

`class execution::sequenced_policy { unspecified };`

The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.

During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.5 Parallel execution policy

`class execution::parallel_policy { unspecified };`

The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.

During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.6 Parallel and unsequenced execution policy

`class execution::parallel_unsequenced_policy { unspecified };`

The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.7 Unsequenced execution policy

`class execution::unsequenced_policy { unspecified };`

The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.

During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.8 Execution policy objects

`inline constexpr execution::sequenced_policy execution::seq{ unspecified };`

`inline constexpr execution::parallel_policy execution::par{ unspecified };`

`inline constexpr execution::parallel_unsequenced_policy execution::par_unseq{ unspecified };`

`inline constexpr execution::unsequenced_policy execution::unseq{ unspecified };`

The header `<execution>` declares global objects associated with each type of execution policy.
22.13 Primitive numeric conversions [charconv]

22.13.1 Header <charconv> synopsis [charconv.syn]
namespace std {
    // floating-point format for primitive numerical conversion
    enum class chars_format {
        scientific = unspecified,
        fixed = unspecified,
        hex = unspecified,
        general = fixed | scientific
    };

    // 22.13.2, primitive numerical output conversion
    struct to_chars_result {
        char* ptr;
        errc ec;
        friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
    };

    to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
    to_chars_result to_chars(char* first, char* last, bool value, int base = 10) = delete;
    to_chars_result to_chars(char* first, char* last, float value);
    to_chars_result to_chars(char* first, char* last, double value);
    to_chars_result to_chars(char* first, char* last, long double value);
    to_chars_result to_chars(char* first, char* last, float value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, double value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, float value, chars_format fmt, int precision);
    to_chars_result to_chars(char* first, char* last, double value, chars_format fmt, int precision);
    to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt, int precision);

    // 22.13.3, primitive numerical input conversion
    struct from_chars_result {
        const char* ptr;
        errc ec;
        friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
    };

    from_chars_result from_chars(const char* first, const char* last, see below & value, int base = 10);
    from_chars_result from_chars(const char* first, const char* last, float& value,
        chars_format fmt = chars_format::general);
    from_chars_result from_chars(const char* first, const char* last, double& value,
        chars_format fmt = chars_format::general);
    from_chars_result from_chars(const char* first, const char* last, long double& value,
        chars_format fmt = chars_format::general);
}

1 The type chars_format is a bitmask type (16.3.3.3.4) with elements scientific, fixed, and hex.
2 The types to_chars_result and from_chars_result have the data members and special members specified above. They have no base classes or members other than those specified.

22.13.2 Primitive numeric output conversion [charconv.to.chars]
1 All functions named to_chars convert value into a character string by successively filling the range [first, last), where [first, last) is required to be a valid range. If the member ec of the return value is such that the value is equal to the value of a value-initialized errc, the conversion was successful and
the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec` has
the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range `[first, last)` are unspecified.

2 The functions that take a floating-point value but not a precision parameter ensure that the string representation consists of the smallest number of characters such that there is at least one digit before the radix point (if present) and parsing the representation using the corresponding `from_chars` function recovers value exactly.

[Note 1: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — end note]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4.1).

3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows:
The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading "0x" in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```c++
to_chars_result to_chars(char* first, char* last, see below value, int base = 10);
```

4 **Preconditions:** `base` has a value between 2 and 36 (inclusive).

5 **Effects:** The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a`..`z`. If `value` is less than zero, the representation starts with `-`.

6 **Throws:** Nothing.

7 **Remarks:** The implementation shall provide overloads for all signed and unsigned integer types and `char` as the type of the parameter `value`.

```c++
to_chars_result to_chars(char* first, char* last, float value);
```

8 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

9 **Throws:** Nothing.

```c++
to_chars_result to_chars(char* first, char* last, double value);
```

10 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale.

11 **Throws:** Nothing.

```c++
to_chars_result to_chars(char* first, char* last, long double value, chars_format fmt);
```

12 **Preconditions:** `fmt` has the value of one of the enumerators of `chars_format`.

13 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale.

14 **Throws:** Nothing.

```c++
to_chars_result to_chars(char* first, char* last, float value, chars_format fmt, int precision);
```

15 **Preconditions:** `fmt` has the value of one of the enumerators of `chars_format`.

16 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale with the given precision.

17 **Throws:** Nothing.

See also: ISO C 7.21.6.1

22.13.3 Primitive numeric input conversion [charconv.from.chars]

All functions named `from_chars` analyze the string `[first, last)` for a pattern, where `[first, last)` is required to be a valid range. If no characters match the pattern, `value` is unmodified, the member `ptr` of the return value is `first` and the member `ec` is equal to `errc::invalid_argument`. 

§ 22.13.3 769
from_chars_result from_chars(const char* first, const char* last, 
   see below& value, int base = 10);

Preconditions: base has a value between 2 and 36 (inclusive).
Effects: The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for strtol, except that no "0x" or "0X" prefix shall appear if the value of base is 16, and except that '+' is the only sign that may appear, and only if value has a signed type.

Remarks: The implementation shall provide overloads for all signed and unsigned integer types and char as the referenced type of the parameter value.

from_chars_result from_chars(const char* first, const char* last, float& value, 
   chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, double& value, 
   chars_format fmt = chars_format::general);
from_chars_result from_chars(const char* first, const char* last, long double& value, 
   chars_format fmt = chars_format::general);

Preconditions: fmt has the value of one of the enumerators of chars_format.
Effects: The pattern is the expected form of the subject sequence in the "C" locale, as described for strtod, except that
(7.1) the sign '+' may only appear in the exponent part;
(7.2) if fmt has chars_format::scientific set but not chars_format::fixed, the otherwise optional exponent part shall appear;
(7.3) if fmt has chars_format::fixed set but not chars_format::scientific, the optional exponent part shall not appear; and
(7.4) if fmt is chars_format::hex, the prefix "0x" or "0X" is assumed.
[Example 1: The string 0x123 is parsed to have the value 0 with remaining characters x123. — end example]
In any case, the resulting value is one of at most two floating-point values closest to the value of the string matching the pattern.

Throws: Nothing.

The class template `formatter` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

### 22.14.2 Format string

#### 22.14.2.1 In general

A format string for arguments `args` is a (possibly empty) sequence of replacement fields, escape sequences, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{` or `}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

- **replacement-field**
  - `{ arg-id [opt], format-specifier [opt] }
  - **arg-id**
    - 0
    - positive-integer
  - positive-integer:
    - nonzero-digit
    - positive-integer digit
  - nonnegative-integer:
    - digit
    - nonnegative-integer digit
  - nonzero-digit:
    - one of 1 2 3 4 5 6 7 8 9
digit: one of
   0 1 2 3 4 5 6 7 8 9

format-specifier:
   : format-spec

format-spec:
   as specified by the formatter specialization for the argument type

2 The arg-id field specifies the index of the argument in args whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index arg-id in args, the string is not a format string for args. The optional format-specifier field explicitly specifies a format for the replacement value.

3 [Example 1:
   string s = format("{0}-{" , 8); // value of s is "8-"
   — end example]

4 If all arg-ids in a format string are omitted (including those in the format-spec, as interpreted by the corresponding formatter specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some arg-ids are omitted and some are present, the string is not a format string.
   
   [Note 1: A format string cannot contain a mixture of automatic and manual indexing. — end note]

   [Example 2:
   string s0 = format("{} to {}", "a", "b"); // OK, automatic indexing
   string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
   string s2 = format("{0} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing), // ill-formed
   string s3 = format("{} to {1}", "a", "b"); // not a format string (mixing automatic and manual indexing), // ill-formed
   — end example]

5 The format-spec field contains format specifications that define how the value should be presented. Each type can define its own interpretation of the format-spec field. If format-spec does not conform to the format specifications for the argument type referred to by arg-id, the string is not a format string for args.

   [Example 3:
   (5.1) — For arithmetic, pointer, and string types the format-spec is interpreted as a std-format-spec as described in (22.14.2.2).
   (5.2) — For chrono types the format-spec is interpreted as a chrono-format-spec as described in (29.12).
   (5.3) — For user-defined formatter specializations, the behavior of the parse member function determines how the format-spec is interpreted.
   — end example]

22.14.2.2 Standard format specifiers

Each formatter specializations described in 22.14.6.2 for fundamental and string types interprets format-spec as a std-format-spec.

[Note 1: The format specification can be used to specify such details as field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — end note]

The syntax of format specifications is as follows:

\[
\text{std-format-spec:} \\
\text{fill-and-align_{opt} sign_{opt} \#_{opt} 0_{opt} width_{opt} precision_{opt} L_{opt} type_{opt}}
\]

fill-and-align:

fill:
   any character other than \{ or \}

align: one of
   < > ^

sign: one of
   + - space
width:
  positive-integer
  \{ arg-id_opt \}

precision:
  nonnegative-integer
  \{ arg-id_opt \}

type: one of
  a A b B c d e E f F g G o p s x X

2 [Note 2: The fill character can be any character other than \{ or \}. The presence of a fill character is signaled by the character following it, which must be one of the alignment options. If the second character of std-format-spec is not a valid alignment option, then it is assumed that both the fill character and the alignment option are absent. —end note]

3 The align specifier applies to all argument types. The meaning of the various alignment options is as specified in Table 64.

[Example 1:]

```c
char c = 120;
string s0 = format("{:6}", 42); // value of s0 is " 42"
string s1 = format("{:6}"\', 'x\'); // value of s1 is "x  
string s2 = format("{:<6}"\', 'x\'); // value of s2 is "x*****
string s3 = format("{:^6}"\', 'x\'); // value of s3 is "*****x"
string s4 = format("{:^6}"\', 'x\'); // value of s4 is "*x***
string s5 = format("{:>6}"\', c); // value of s5 is "120"
string s6 = format("{:6}"\', true); // value of s6 is "true  
```

—end example

[Note 3: Unless a minimum field width is defined, the field width is determined by the size of the content and the alignment option has no effect. —end note]

Table 64: Meaning of align options [tab:format.align]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>Forces the field to be aligned to the start of the available space. This is the default for non-arithmetic non-pointer types, charT, and bool, unless an integer presentation type is specified.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Forces the field to be aligned to the end of the available space. This is the default for arithmetic types other than charT and bool, pointer types, or when an integer presentation type is specified.</td>
</tr>
<tr>
<td>^</td>
<td>Forces the field to be centered within the available space by inserting ( \lfloor n/2 \rfloor ) characters before and ( \lceil n/2 \rceil ) characters after the value, where ( n ) is the total number of fill characters to insert.</td>
</tr>
</tbody>
</table>

4 The sign option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. The meaning of the various options is as specified in Table 65.

Table 65: Meaning of sign options [tab:format.sign]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Indicates that a sign should be used for both non-negative and negative numbers. The + sign is inserted before the output of to_chars for non-negative numbers other than negative zero. [Note 4: For negative numbers and negative zero the output of to_chars will already contain the sign so no additional transformation is performed. —end note]</td>
</tr>
<tr>
<td>-</td>
<td>Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).</td>
</tr>
<tr>
<td>space</td>
<td>Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.</td>
</tr>
</tbody>
</table>

5 The sign option applies to floating-point infinity and NaN.
Example 2:

```cpp
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1);  // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1);  // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf);  // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan);  // value of s3 is "nan,+nan,nan, nan"
```

—end example

6 The `#` option causes the alternate form to be used for the conversion. This option is valid for arithmetic types other than `charT` and `bool` or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 67 into the output after the sign character (possibly space) if there is one, or before the output of `to_chars` otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these conversions only if a digit follows it. In addition, for `g` and `G` conversions, trailing zeros are not removed from the result.

7 If `{arg-id,opt}` is used in a `width` or `precision`, the value of the corresponding formatting argument is used in its place. If the corresponding formatting argument is not of integral type, or its value is negative for `precision` or non-positive for `width`, an exception of type `format_error` is thrown.

8 The `positive-integer` in `width` is a decimal integer defining the minimum field width. If `width` is not specified, there is no minimum field width, and the field width is determined based on the content of the field.

9 The `width` of a string is defined as the estimated number of column positions appropriate for displaying it in a terminal.

[Note 5: This is similar to the semantics of the POSIX `wcswidth` function. —end note]

10 For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use a Unicode encoding on platforms capable of displaying Unicode text in a terminal.

[Note 6: This is the case for Windows®-based and many POSIX-based operating systems. —end note]

11 For a string in a Unicode encoding, implementations should estimate the width of a string as the sum of estimated widths of the first code points in its extended grapheme clusters. The extended grapheme clusters of a string are defined by UAX #29. The estimated width of the following code points is 2:

(11.1) — U+1100 – U+115F
(11.2) — U+2329 – U+232A
(11.3) — U+2E80 – U+303E
(11.4) — U+3040 – U+A4CF
(11.5) — U+AC00 – U+D7A3
(11.6) — U+F900 – U+FAFF
(11.7) — U+FE10 – U+FE19
(11.8) — U+FE30 – U+FE6F
(11.9) — U+FF00 – U+FF60
(11.10) — U+FFE0 – U+FFE6
(11.11) — U+1F300 – U+1F64F
(11.12) — U+1F900 – U+1F9FF
(11.13) — U+20000 – U+2FFFD
(11.14) — U+30000 – U+3FFFD

The estimated width of other code points is 1.

12 For a string in a non-Unicode encoding, the width of a string is unspecified.

210) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.
A zero (0) character preceding the width field pads the field with leading zeros (following any indication of sign or base) to the field width, except when applied to an infinity or NaN. This option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. If the 0 character and an align option both appear, the 0 character is ignored.

[Example 3:]

```cpp
cchar c = 120;
string s1 = format("{:+06d}", c); // value of s1 is +00120
string s2 = format("{:06x}", 0xa); // value of s2 is 0x000a
string s3 = format("{:06}", -42);  // value of s3 is -42   " (0 is ignored because of < alignment)
```

The nonnegative-integer in precision is a decimal integer defining the precision or maximum field size. It can only be used with floating-point and string types. For floating-point types this field specifies the formatting precision. For string types, this field provides an upper bound for the estimated width of the prefix of the input string that is copied into the output. For a string in a Unicode encoding, the formatter copies to the output the longest prefix of whole extended grapheme clusters whose estimated width is no greater than the precision.

When the L option is used, the form used for the conversion is called the locale-specific form. The L option is only valid for arithmetic types, and its effect depends upon the type.

(15.1) — For integral types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group separator characters.

(15.2) — For floating-point types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group and radix separator characters.

(15.3) — For the textual representation of bool, the locale-specific form causes the context’s locale to be used to insert the appropriate string as if obtained with numpunct::truename or numpunct::falsename.

The type determines how the data should be presented.

The available string presentation types are specified in Table 66.

Table 66: Meaning of type options for strings

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none, s</td>
<td>Copies the string to the output.</td>
</tr>
</tbody>
</table>

The meaning of some non-string presentation types is defined in terms of a call to to_chars. In such cases, let [first, last) be a range large enough to hold the to_chars output and value be the formatting argument value. Formatting is done as if by calling to_chars as specified and copying the output through the output iterator of the format context.

[Note 7: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. — end note]

The available integer presentation types for integral types other than bool and charT are specified in Table 67.

[Example 4:]

```cpp
string s0 = format("{}", 42); // value of s0 is "42"
string s1 = format("{:0b} {0:d} {0:o} {0:x}", 42); // value of s1 is "101010 42 52 2a"
string s2 = format("{:x} {0:x}", 42);  // value of s2 is "0x2a 0x2A"
string s3 = format("{:l}", 1234); // value of s3 can be "1,234" // (depending on the locale)
```

The available charT presentation types are specified in Table 68.

The available bool presentation types are specified in Table 69.

The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in Table 70. For lower-case presentation types, infinity and NaN are formatted as inf and nan, respectively. For upper-case presentation types, infinity and NaN are formatted as INF and NAN, respectively.

[Note 9: In either case, a sign is included if indicated by the sign option. — end note]

</table>

22.14.3 Error reporting [format.err.report]

Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

22.14.4 Class template basic-format-string [format.fmt.string]

```
template<class charT, class... Args>
struct basic-format-string {
  // exposition only
  basic_string_view<charT> str;  // exposition only

  public:
    template<class T> consteval basic-format-string(const T& s);
    
  template<class T> consteval basic-format-string(const T& s);

  Constraints: `const T&` models convertible_to<basic_string_view<charT>>.
  Effects: Direct-non-list-initializes `str` with `s`.
  Remarks: A call to this function is not a core constant expression (7.7) unless there exist `args` of types `Args` such that `str` is a format string for `args`.
```

22.14.5 Formatting functions [format.functions]

```
In the description of the functions, operator + is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of a + n are the same as in 27.2.

```

```
template<class... Args>
string format(format-string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
  return vformat(fmt.str, make_format_args(args...));

```

```
template<class... Args>
wstring format(wformat-string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
  return vformat(fmt.str, make_wformat_args(args...));

```

```
template<class... Args>
string format(const locale& loc, format-string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
  return vformat(loc, fmt.str, make_format_args(args...));

```

```
template<class... Args>
wstring format(const locale& loc, wformat-string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
  return vformat(loc, fmt.str, make_wformat_args(args...));

```

§ 22.14.5
string vformat(string_view fmt, format_args args);
wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);

Returns: A string object holding the character representation of formatting arguments provided by args formatted according to specifications given in fmt. If present, loc is used for locale-specific formatting.

Throws: As specified in 22.14.3.

template<class Out, class... Args>
Out format_to(Out out, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), fmt.str, make_format_args(args...));

template<class Out, class... Args>
Out format_to(Out out, uformat_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), fmt.str, make_uformat_args(args...));

template<class Out, class... Args>
Out format_to(Out out, const locale& loc, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));

template<class Out, class... Args>
Out format_to(Out out, const locale& loc, uformat_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), loc, fmt.str, make_uformat_args(args...));

template<class Out, class... Args>
Out format_to_n_result<Out>(Out out, iter_difference_t<Out> n, format_string<Args...> fmt, Args&&... args);

template<class Out, class... Args>
Out format_to_n_result<Out>(Out out, iter_difference_t<Out> n, uformat_string<Args...> fmt, Args&&... args);

template<class Out, class... Args>
Out format_to_n_result<Out>(Out out, iter_difference_t<Out> n, const locale& loc, format_string<Args...> fmt, Args&&... args);

Let charT be decltype(fmt)::value_type.

Constraints: Out satisfies output_iterator<const charT&>.

Preconditions: Out models output_iterator<const charT&>.

Effects: Places the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + N), where N is the number of characters in that character representation. If present, loc is used for locale-specific formatting.

Returns: out + N.

Throws: As specified in 22.14.3.

§ 22.14.5
Let

\[ \text{charT be decltype(fmt.str)::value_type,} \]
\[ \text{N be formatted_size(fmt, args...)} \]
\[ \text{for the functions without a loc parameter and formatted_size(loc, fmt, args...)} \]
\[ \text{for the functions with a loc parameter, and} \]
\[ \text{M be clamp(n, 0, N).} \]

Constraints: Out satisfies \text{output_iterator<const charT&}.

Preconditions: Out models \text{output_iterator<const charT&}, and \text{formatter<remove_cvref_t<T_i>, charT>} meets the BasicFormatter requirements \text{(22.14.6.1)} for each \( T_i \) in Args.

Effects: Places the first \( M \) characters of the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range \([\text{out}, \text{out} + M)\). If present, \text{loc} is used for locale-specific formatting.

Returns: \{\text{out} + M, N\}.

Throws: As specified in \text{22.14.3}.

A type \( F \) meets the BasicFormatter requirements if:

1. it meets the

   \[ \text{Cpp17DefaultConstructible (Table 29)}, \]
   \[ \text{Cpp17CopyConstructible (Table 31)}, \]
   \[ \text{Cpp17CopyAssignable (Table 33)}, \]
   \[ \text{Cpp17Destructible (Table 34)} \]

   requirements,

2. it is swappable (16.4.4.3) for lvalues, and

3. the expressions shown in Table 72 are valid and have the indicated semantics.

A type \( F \) meets the Formatter requirements if it meets the BasicFormatter requirements and the expressions shown in Table 73 are valid and have the indicated semantics.

Given character type \text{charT}, output iterator type \text{Out}, and formatting argument type \( T \), in Table 72 and Table 73:

1. \( f \) is a value of type \( F \),
2. \( u \) is an lvalue of type \( T \),

\[ \text{22.14.6.1 \hspace{1em} Formatter requirements} \]
(3.3) t is a value of a type convertible to (possibly const) T,
(3.4) PC is basic_format_parse_context<charT>,
(3.5) FC is basic_format_context<Out, charT>,
(3.6) pc is an lvalue of type PC, and
(3.7) fc is an lvalue of type FC.

pc.begin() points to the beginning of the format-spec (22.14.2) of the replacement field being formatted in the format string. If format-spec is empty then either pc.begin() == pc.end() or *pc.begin() == '}'

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>f.parse(pc)</td>
<td>PC::iterator</td>
<td>Parses format-spec (22.14.2) for type T in the range [pc.begin(), pc.end()) until the first un-matched character. Throws format_error unless the whole range is parsed or the unmatched character is '}. [Note 1: This allows formatters to emit meaningful error messages. — end note] Stores the parsed format specifiers in *this and returns an iterator past the end of the parsed range.</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>Formats u according to the specifiers stored in *this, writes the output to fc.out(), and returns an iterator past the end of the output range. The output shall only depend on u, fc.locale(), fc.arg(n) for any value n of type size_t, and the range [pc.begin(), pc.end()) from the last call to f.parse(pc).</td>
</tr>
</tbody>
</table>

22.14.6.2 Formatter specializations

1 The functions defined in 22.14.5 use specializations of the class template formatter to format individual arguments.

2 Let charT be either char or wchar_t. Each specialization of formatter is either enabled or disabled, as described below. Each header that declares the template formatter provides the following enabled specializations:

(2.1) The specializations
    template<> struct formatter<char, char>;
    template<> struct formatter<char, wchar_t>;
    template<> struct formatter<wchar_t, wchar_t>;

(2.2) For each charT, the string type specializations
    template<> struct formatter<charT*, charT>;

Table 73: Formatter requirements [tab:formatter]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>f.format(t, fc)</td>
<td>FC::iterator</td>
<td>Formats t according to the specifiers stored in *this, writes the output to fc.out(), and returns an iterator past the end of the output range. The output shall only depend on t, fc.locale(), fc.arg(n) for any value n of type size_t, and the range [pc.begin(), pc.end()) from the last call to f.parse(pc).</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>As above, but does not modify u.</td>
</tr>
</tbody>
</table>

§ 22.14.6.2
template<> struct formatter<const charT*, charT>;
template<size_t N> struct formatter<const charT[N], charT>;
template<class traits, class Allocator>
    struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
    struct formatter<basic_string_view<charT, traits>, charT>;

(2.3) — For each charT, for each cv-unqualified arithmetic type ArithmeticT other than char, wchar_t, char8_t, char16_t, or char32_t, a specialization
    template<> struct formatter<ArithmeticT, charT>;

(2.4) — For each charT, the pointer type specializations
    template<> struct formatter<nullptr_t, charT>;
    template<> struct formatter<void*, charT>;
    template<> struct formatter<const void*, charT>;

The parse member functions of these formatters interpret the format specification as a std-format-spec as described in 22.14.2.2.

[Note 1: Specializations such as formatter<wchar_t, char> and formatter<const char*, wchar_t> that would require implicit multibyte / wide string or character conversion are disabled. — end note]

3 For any types T and charT for which neither the library nor the user provides an explicit or partial specialization of the class template formatter<T, charT>, that specialization is disabled.

4 If the library provides an explicit or partial specialization of formatter<T, charT>, that specialization is enabled and meets the Formatter requirements except as noted otherwise.

5 If F is a disabled specialization of formatter, these values are false:

(5.1) — is_default_constructible_v<F>,
(5.2) — is_copy_constructible_v<F>,
(5.3) — is_move_constructible_v<F>,
(5.4) — is_copy_assignable_v<F>, and
(5.5) — is_move_assignable_v<F>.

6 An enabled specialization formatter<T, charT> meets the BasicFormatter requirements (22.14.6.1).

[Example 1:
   #include <format>

   enum color { red, green, blue };
   const char* color_names[] = { "red", "green", "blue" };

   template<> struct std::formatter<color> : std::formatter<const char*> {
       auto format(color c, format_context& ctx) {
           return formatter<const char*>::format(color_names[c], ctx);
       }
   };

   struct err {};

   std::string s0 = std::format("{}", 42);         // OK, library-provided formatter
   std::string s1 = std::format("{}", L"foo");    // error: disabled formatter
   std::string s2 = std::format("{}", red);       // OK, user-provided formatter
   std::string s3 = std::format("{}", err);       // error: disabled formatter
   —end example]

22.14.6.3 Class template basic_format_parse_context [format.parse.ctx]

namespace std {
    template<class charT>
    class basic_format_parse_context {
        public:
            using char_type = charT;
            using const_iterator = typename basic_string_view<charT>::const_iterator;

    };

§ 22.14.6.3
using iterator = const_iterator;

private:
    iterator begin_;         // exposition only
    iterator end_;           // exposition only
    enum indexing { unknown, manual, automatic };  // exposition only
    indexing indexing_;      // exposition only
    size_t next_arg_id_;     // exposition only
    size_t num_args_;        // exposition only

public:
    constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                                                size_t num_args = 0) noexcept;
    basic_format_parse_context(const basic_format_parse_context&) = delete;
    basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;
    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr void advance_to(const_iterator it);
    constexpr size_t next_arg_id();
    constexpr void check_arg_id(size_t id);

An instance of basic_format_parse_context holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                                            size_t num_args = 0) noexcept;

Effects: Initializes begin_ with fmt.begin(), end_ with fmt.end(), indexing_ with unknown, next_arg_id_ with 0, and num_args_ with num_args.

constexpr const_iterator begin() const noexcept;
Returns: begin_.

constexpr const_iterator end() const noexcept;
Returns: end_.

constexpr void advance_to(const_iterator it);
Preconditions: end() is reachable from it.
Effects: Equivalent to: begin_ = it;

constexpr size_t next_arg_id();
Effects: If indexing_ != manual, equivalent to:
    if (indexing_ == unknown)
        indexing_ = automatic;
    return next_arg_id_++;
Throws: format_error if indexing_ == manual which indicates mixing of automatic and manual argument indexing.

constexpr void check_arg_id(size_t id);
Effects: If indexing_ != automatic, equivalent to:
    if (indexing_ == unknown)
        indexing_ = manual;
Throws: format_error if indexing_ == automatic which indicates mixing of automatic and manual argument indexing.
Remarks: Call expressions where id >= num_args_ are not core constant expressions (7.7).
22.14.6.4 Class template basic_format_context

namespace std {
    template<class Out, class charT>
    class basic_format_context {
        basic_format_args<basic_format_context> args_; // exposition only
        Out out_; // exposition only

        public:
            using iterator = Out;
            using char_type = charT;
            template<class T> using formatter_type = formatter<T, charT>;

            basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
            std::locale locale();
            iterator out();
            void advance_to(iterator it);
    }
}

An instance of basic_format_context holds formatting state consisting of the formatting arguments and the output iterator.

Out shall model output_iterator<const charT&>.

format_context is an alias for a specialization of basic_format_context with an output iterator that appends to string, such as back_insert_iterator<string>. Similarly, wformat_context is an alias for a specialization of basic_format_context with an output iterator that appends to wstring.

Recommended practice: For a given type charT, implementations should provide a single instantiation of basic_format_context for appending to basic_string<charT>, vector<charT>, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a span<charT>) and polymorphic reallocation.

basic_format_arg<basic_format_context> arg(size_t id) const noexcept;

Returns: args_.get(id).

std::locale locale();

Returns: The locale passed to the formatting function if the latter takes one, and std::locale() otherwise.

iterator out();

Effects: Equivalent to: return std::move(out_);

void advance_to(iterator it);

Effects: Equivalent to: out_ = std::move(it);

[Example 1]:
struct S {
    int value;
};

template<>
struct std::formatter<S> {
    size_t width_arg_id = 0;

    // Parses a width argument id in the format { digit }.
    constexpr auto parse(format_parse_context& ctx) {
        auto iter = ctx.begin();
        auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; }; // exposition only
        if (get_char() != '{')
            throw format_error("invalid format");
        ++iter;
        char c = get_char();
        if (!isdigit(c) || (++iter, get_char()) != '}
            throw format_error("invalid format");
        width_arg_id = c - '0';
    }
};
ctx.check_arg_id(width_arg_id);
  return ++iter;
}

// Formats an S with width given by the argument width_arg_id.
auto format(S s, format_context& ctx) {
  int width = visit_format_arg([](auto value) -> int {
    if constexpr (!is_integral_v<decltype(value)>)
      throw format_error("width is not integral");
    else if (value < 0 || value > numeric_limits<int>::max())
      throw format_error("invalid width");
    else
      return value;
  }, ctx.arg(width_arg_id));
  return format_to(ctx.out(), "{0:x<{1}}", s.value, width);
};

std::string s = std::format("{0:{1}}", S{42}, 10);  // value of s is "xxxxxxxx42"

22.14.7 Arguments

22.14.7.1 Class template basic_format_arg

namespace std {
  template<class Context>
  class basic_format_arg {
  public:
    class handle;

  private:
    using char_type = typename Context::char_type;  // exposition only
    variant<monostate, bool, char_type,
      int, unsigned int, long long int, unsigned long long int,
      float, double, long double,
      const char_type*, basic_string_view<char_type>,
      const void*, handle> value;  // exposition only

    template<class T> explicit basic_format_arg(T& v) noexcept;  // exposition only
    explicit basic_format_arg(float n) noexcept;  // exposition only
    explicit basic_format_arg(double n) noexcept;  // exposition only
    explicit basic_format_arg(long double n) noexcept;  // exposition only
    explicit basic_format_arg(const char_type* s);  // exposition only

    template<class traits>
    explicit basic_format_arg(
      basic_string_view<char_type, traits> s) noexcept;  // exposition only

    template<class traits, class Allocator>
    explicit basic_format_arg(
      const basic_string<char_type, traits, Allocator>& s) noexcept;  // exposition only

    explicit basic_format_arg(nullptr_t) noexcept;  // exposition only

    template<class T>
    explicit basic_format_arg(T* p) noexcept;  // exposition only

  public:
    basic_format_arg() noexcept;

    explicit operator bool() const noexcept;
  }
};
An instance of basic_format_arg provides access to a formatting argument for user-defined formatters.

The behavior of a program that adds specializations of basic_format_arg is undefined.

basic_format_arg() noexcept;

Postconditions: !(this).

template<class T> explicit basic_format_arg(T& v) noexcept;

Constraints: The template specialization
typename Context::template formatter_type<remove_cvref_t<T>>
meets the BasicFormatter requirements (22.14.6.1). The extent to which an implementation determines that the specialization meets the BasicFormatter requirements is unspecified, except that as a minimum the expression
typename Context::template formatter_type<remove_cvref_t<T>>::format(declval<T&>(), declval<Context&>())
shall be well-formed when treated as an unevaluated operand (7.2.3).

Effects:

(5.1) if T is bool or char_type, initializes value with v;
(5.2) otherwise, if T is char and char_type is wchar_t, initializes value with static_cast<wchar_t>(v);
(5.3) otherwise, if T is a signed integer type (6.8.2) and sizeof(T) <= sizeof(int), initializes value with static_cast<int>(v);
(5.4) otherwise, if T is an unsigned integer type and sizeof(T) <= sizeof(unsigned int), initializes value with static_cast<unsigned int>(v);
(5.5) otherwise, if T is a signed integer type and sizeof(T) <= sizeof(long long int), initializes value with static_cast<long long int>(v);
(5.6) otherwise, if T is an unsigned integer type and sizeof(T) <= sizeof(unsigned long long int), initializes value with static_cast<unsigned long long int>(v);
(5.7) otherwise, initializes value with handle(v).

explicit basic_format_arg(float n) noexcept;
explicit basic_format_arg(double n) noexcept;
explicit basic_format_arg(long double n) noexcept;

Effects: Initializes value with n.

explicit basic_format_arg(const char_type* s);

Preconditions: s points to a NTCTS (3.37).

Effects: Initializes value with s.

template<class traits>
explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;

Effects: Initializes value with basic_string_view<char_type>(s.data(), s.size()).

template<class traits, class Allocator>
explicit basic_format_arg(
    const basic_string<char_type, traits, Allocator>& s) noexcept;

Effects: Initializes value with basic_string_view<char_type>(s.data(), s.size()).

explicit basic_format_arg(nullptr_t) noexcept;

Effects: Initializes value with static_cast<const void*>(nullptr).

template<class T> explicit basic_format_arg(T* p) noexcept;

Constraints: is_void_v<T* p> is true.

Effects: Initializes value with p.

§ 22.14.7.1
[Note 1: Constructing basic_format_arg from a pointer to a member is ill-formed unless the user provides an enabled specialization of formatter for that pointer to member type. — end note]

```cpp
explicit operator bool() const noexcept;
```

Returns: !holds_alternative<monostate>(value).

The class handle allows formatting an object of a user-defined type.

```cpp
namespace std {
  template<class Context>
  class basic_format_arg<Context>::handle {
    const void* ptr_; // exposition only
    void (*format_)(basic_format_parse_context<char_type>&, Context&, const void*); // exposition only
    template<class T> explicit handle(T& val) noexcept; // exposition only
  public:
    friend class basic_format_arg<Context>; // exposition only
    void format(basic_format_parse_context<char_type>&, Context& ctx) const;
  }
}
```

```cpp
template<class T> explicit handle(T& val) noexcept;
```

Let

(17.1) — TD be remove_cvref_t<T>,

(17.2) — const-formattable be true if typename Context::template formatter_type<TD>()

   .format(declval<const TD&>(), declval<Context&>()) is well-formed, otherwise false,

(17.3) — TQ be const TD if const-formattable is true and TD otherwise.

Mandates: const-formattable || !is_const_v<remove_reference_t<T>> is true.

Effects: Initializes ptr_ with addressof(val) and format_ with

```cpp
[](basic_format_parse_context<char_type>& parse_ctx,
  Context& ctx, const void* ptr) {
  typename Context::template formatter_type<TD> f;
  parse_ctx.advance_to(f.parse(parse_ctx));
  format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr)),
                                  format_ctx));
}
```

void format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;

Effects: Equivalent to: format_(parse_ctx, format_ctx, ptr_);

```cpp
template<class Visitor, class Context>
decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);
```

Effects: Equivalent to: return visit(forward<Visitor>(vis), arg.value);

### 22.14.7.2 Class template format-arg-store

[format.arg.store]

```cpp
namespace std {
  template<class Context, class... Args>
  class format-arg-store {
    array<basic_format_arg<Context>, sizeof...(Args)> args; // exposition only
  };
}
```

An instance of format-arg-store stores formatting arguments.

```cpp
template<class Context = format_context, class... Args>
format-arg-store<Context, Args...> make_format_args(Args&&... fmt_args);
```

Preconditions: The type typename Context::template formatter_type<Ti> meets the BasicFormatter requirements (22.14.6.1) for each Ti in Args.
Returns: An object of type `format-arg-store<Context, Args...>` whose `args` data member is initialized with `{basic_format_arg<Context>((fmt_args)...)}.  

```cpp
template<class... Args>
  format-arg-store<wformat_context, Args...> make_wformat_args(Args&&... args);
```

Effects: Equivalent to: `return make_format_args<wformat_context>(args...)`;

#### 22.14.7.3 Class template `basic_format_args`  

```cpp
namespace std {
  template<class Context>
  class basic_format_args {
    size_t size_{}; // exposition only
    const basic_format_arg<Context>* data_{}; // exposition only
  public:
    basic_format_args() noexcept;
    template<class... Args>
      basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
    basic_format_arg<Context> get(size_t i) const noexcept;
  }
}
```

An instance of `basic_format_args` provides access to formatting arguments. Implementations should optimize the representation of `basic_format_args` for a small number of formatting arguments.

[Note 1: For example, by storing indices of type alternatives separately from values and packing the former. — end note]

```cpp
basic_format_args() noexcept;
```

Effects: Initializes `size_` with 0.

```cpp
template<class... Args>
  basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
```

Effects: Initializes `size_` with `sizeof...(Args)` and `data_` with `store.args.data()`.

```cpp
basic_format_arg<Context> get(size_t i) const noexcept;
```

#### 22.14.8 Class `format_error`  

```cpp
namespace std {
  class format_error : public runtime_error {
    public:
      explicit format_error(const string& what_arg);
      explicit format_error(const char* what_arg);
  }
}
```

The class `format_error` defines the type of objects thrown as exceptions to report errors from the formatting library.

```cpp
format_error(const string& what_arg);
```

Postconditions: `strcmp(what(), what_arg.c_str()) == 0`.

```cpp
format_error(const char* what_arg);
```

Postconditions: `strcmp(what(), what_arg) == 0`.

#### 22.15 Bit manipulation  

#### 22.15.1 General  

The header `<bit>` provides components to access, manipulate and process both individual bits and bit sequences.
22.15.2 Header <bit> synopsis

namespace std
{
    // 22.15.3, bit_cast
    template<class To, class From>
    constexpr To bit_cast(const From& from) noexcept;

    // 22.15.4, byteswap
    template<class T>
    constexpr T byteswap(T value) noexcept;

    // 22.15.5, integral powers of 2
    template<class T>
    constexpr bool has_single_bit(T x) noexcept;
    template<class T>
    constexpr T bit_ceil(T x);
    template<class T>
    constexpr T bit_floor(T x) noexcept;
    template<class T>
    constexpr T bit_width(T x) noexcept;

    // 22.15.6, rotating
    template<class T>
    [[nodiscard]] constexpr T rotl(T x, int s) noexcept;
    template<class T>
    [[nodiscard]] constexpr T rotr(T x, int s) noexcept;

    // 22.15.7, counting
    template<class T>
    constexpr int countl_zero(T x) noexcept;
    template<class T>
    constexpr int countl_one(T x) noexcept;
    template<class T>
    constexpr int countr_zero(T x) noexcept;
    template<class T>
    constexpr int countr_one(T x) noexcept;
    template<class T>
    constexpr int popcount(T x) noexcept;

    // 22.15.8, endian
    enum class endian {
        little = see below,
        big = see below,
        native = see below
    };
}

22.15.3 Function template bit_cast

template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;

Constraints:

1

- sizeof(To) == sizeof(From) is true;
- is_trivially_copyable_v<To> is true; and
- is_trivially_copyable_v<From> is true.

2

Returns: An object of type To. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of from. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object’s type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified. A bit in the value representation of the result is indeterminate if it does not correspond to a bit in the value representation of from or corresponds to a bit of an object that is not within its lifetime or has an
indeterminate value (6.7.4). For each bit in the value representation of the result that is indeterminate, the smallest object containing that bit has an indeterminate value; the behavior is undefined unless that object is of unsigned ordinary character type or std::byte type. The result does not otherwise contain any indeterminate values.

Remarks: This function is constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:

- is_union_v<T> is false;
- is_pointer_v<T> is false;
- is_member_pointer_v<T> is false;
- is_volatile_v<T> is false; and
- T has no non-static data members of reference type.

### 22.15.4 byteswap

```cpp
template<class T>
constexpr T byteswap(T value) noexcept;
```

Remarks: This function is constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:

1. is_union_v<T> is false;
2. is_pointer_v<T> is false;
3. is_member_pointer_v<T> is false;
4. is_volatile_v<T> is false; and
5. T has no non-static data members of reference type.

### 22.15.5 Integral powers of 2

```cpp
template<class T>
constexpr bool has_single_bit(T x) noexcept;
```

Remarks: A function call expression that violates the precondition in the Preconditions: element is not a core constant expression (7.7).

### 22.15.6 Rotating

In the following descriptions, let N denote numeric_limits<T>::digits.
template<class T>
[nodiscard] constexpr T rotl(T x, int s) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Let r be s % N.
Returns: If r is 0, x; if r is positive, (x << r) | (x >> (N - r)); if r is negative, rotr(x, -r).

template<class T>
[nodiscard] constexpr T rotr(T x, int s) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Let r be s % N.
Returns: If r is 0, x; if r is positive, (x >> r) | (x << (N - r)); if r is negative, rotl(x, -r).

22.15.7 Counting

In the following descriptions, let N denote numeric_limits<T>::digits.

template<class T>
constexpr int countl_zero(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Returns: The number of consecutive 0 bits in the value of x, starting from the most significant bit.
Note 1: Returns N if x == 0. — end note]

template<class T>
constexpr int countl_one(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Returns: The number of consecutive 1 bits in the value of x, starting from the most significant bit.
Note 2: Returns N if x == numeric_limits<T>::max(). — end note]

template<class T>
constexpr int countr_zero(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Returns: The number of consecutive 0 bits in the value of x, starting from the least significant bit.
Note 3: Returns N if x == 0. — end note]

template<class T>
constexpr int countr_one(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Returns: The number of consecutive 1 bits in the value of x, starting from the least significant bit.
Note 4: Returns N if x == numeric_limits<T>::max(). — end note]

template<class T>
constexpr int popcount(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Returns: The number of 1 bits in the value of x.

22.15.8 Endian

Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

enum class endian {
  little = see below,
  big = see below,
  native = see below
}
If all scalar types have size 1 byte, then all of `Endian::little`, `Endian::big`, and `Endian::native` have the same value. Otherwise, `Endian::little` is not equal to `Endian::big`. If all scalar types are big-endian, `Endian::native` is equal to `Endian::big`. If all scalar types are little-endian, `Endian::native` is equal to `Endian::little`. Otherwise, `Endian::native` is not equal to either `Endian::big` or `Endian::little`. 
23 Strings library

23.1 General

1 This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8.1) type. Such types are called char-like types, and objects of char-like types are called char-like objects or simply characters.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 74.

![Table 74: Strings library summary](tab:strings.summary)

<table>

</tbody>
</table>

23.2 Character traits

23.2.1 General

1 Subclause 23.2 defines requirements on classes representing character traits, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.

2 Most classes specified in 23.4, 23.3, and Clause 31 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by each such template. Subclause 23.2 defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) C, that and its related character traits class X are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If X::char_type is not the same type as C, the program is ill-formed.

23.2.2 Character traits requirements

1 In Table 75, X denotes a traits class defining types and functions for the character container type C; c and d denote values of type C; p and q denote values of type `const C*`; s denotes a value of type `C*`; n, i and j denote values of type `size_t`; e and f denote values of type `X::int_type`; pos denotes a value of type `X::pos_type`; and r denotes an lvalue of type C. No expression which is part of the character traits requirements specified in this subclause 23.2.2 shall exit via an exception.

2 The class template

\begin{verbatim}
    template<class charT> struct char_traits;
\end{verbatim}

is provided in the header <string> as a basis for explicit specializations.

23.2.3 Traits typedefs

using \texttt{int\_type} = see below;

1 \textbf{Preconditions:} \texttt{int\_type} shall be able to represent all of the valid characters converted from the corresponding \texttt{char\_type} values, as well as an end-of-file value, \texttt{eof()}.\footnote{If \texttt{eof()} can be held in \texttt{char\_type} then some iostreams operations can give surprising results.}

using \texttt{state\_type} = see below;

2 \textbf{Preconditions:} \texttt{state\_type} meets the Cpp17Destructible (Table 34), Cpp17CopyAssignable (Table 33), Cpp17CopyConstructible (Table 31), and Cpp17DefaultConstructible (Table 29) requirements.

23.2.4 \texttt{char\_traits} specializations

23.2.4.1 General

\begin{verbatim}
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
\end{verbatim}

1 The header <string> defines five specializations of the class template \texttt{char\_traits}: \texttt{char\_traits<char>}, \texttt{char\_traits<char8\_t>}, \texttt{char\_traits<char16\_t>}, \texttt{char\_traits<char32\_t>}, and \texttt{char\_traits<wchar\_t>}.
The type `mbstate_t` is defined in `<cwchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.

The member `eof()` returns EOF.

```
23.2.4.3 struct char_traits<char8_t> [char.traits.specializations.char8.t]
namespace std {
  template<> struct char_traits<char8_t> {
    using char_type = char8_t;
    using int_type = unsigned int;
    using off_type = streamoff;
    using pos_type = u8streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```

The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.

The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

```
23.2.4.4 struct char_traits<char16_t> [char.traits.specializations.char16.t]
namespace std {
  template<> struct char_traits<char16_t> {
    using char_type = char16_t;
    using int_type = uint_least16_t;
    using off_type = streamoff;
    using pos_type = u16streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  };
}
```
The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

### 23.2.4.5 `struct char_traits<char32_t>`

```cpp
class char_traits<char32_t> { }
```

### 23.2.4.6 `struct char_traits<wchar_t>`

```cpp
class char_traits<wchar_t> { }
```
The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.

The member eof() returns WEOF.
// 23.3.6, inserters and extractors

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
          basic_string_view<charT, traits> str);
```

// basic_string_view typedef-names

```cpp
using string_view = basic_string_view<char>;
using u8string_view = basic_string_view<char8_t>;
using u16string_view = basic_string_view<char16_t>;
using u32string_view = basic_string_view<char32_t>;
using wstring_view = basic_string_view<wchar_t>;
```

// 23.3.7, hash support

```cpp
template<class T> struct hash;
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

```cpp
inline namespace literals {
    inline namespace string_view_literals {
        // 23.3.8, suffix for basic_string_view literals
        constexpr string_view operator"sv(const char* str, size_t len) noexcept;
        constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;
        constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;
        constexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;
        constexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;
    }
}
```

1 The function templates defined in 22.2.2 and 25.7 are available when `<string_view>` is included.

## 23.3.3 Class template `basic_string_view`

### [string_view.template]

#### [string_view.template.general]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_string_view {
        public:
            // types
            using traits_type = traits;
            using value_type = charT;
            using pointer = value_type*;
            using const_pointer = const value_type*;
            using reference = value_type&;
            using const_reference = const value_type&;
            using const_iterator = implementation-defined; // see 23.3.3.3
            using iterator = const_iterator;\[212\]
            using const_reverse_iterator = reverse_iterator<const_iterator>;
            using reverse_iterator = const_reverse_iterator;
            using size_type = size_t;
            using difference_type = ptrdiff_t;
            static constexpr size_type npos = size_type(-1);

            // 23.3.3.2, construction and assignment
            constexpr basic_string_view() noexcept;
            constexpr basic_string_view(const basic_string_view& other) noexcept = default;
            constexpr basic_string_view& operator=(const basic_string_view& other) noexcept = default;
            constexpr basic_string_view(const charT* str);
            static basic_string_view nullptr_t = delete;
```

\[212\] Because `basic_string_view` refers to a constant sequence, `iterator` and `const_iterator` are the same type.

private:
    const_pointer data_; // exposition only
    size_type size_; // exposition only
};

// 23.3.4, deduction guides
template<
    class It, class End
>
    basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;

template<class R>
    basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;

1 In every specialization basic_string_view<charT, traits>, the type traits shall meet the character
traits requirements (23.2).
[Note 1: The program is ill-formed if traits::char_type is not the same type as charT. — end note]
2 For a basic_string_view str, any operation that invalidates a pointer in the range
   [str.data(), str.data() + str.size())
invalidates pointers, iterators, and references returned from str’s member functions.
3 The complexity of basic_string_view member functions is \( O(1) \) unless otherwise specified.
4 basic_string_view<charT, traits> is a trivially copyable type (6.8.1).

23.3.3.2 Construction and assignment

constexpr basic_string_view() noexcept;
    Postconditions: size_ == 0 and data_ == nullptr.
constexpr basic_string_view(const charT* str);
    Preconditions: [str, str + traits::length(str)) is a valid range.
    Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with
traits::length(str).
    Complexity: \( O(1) \).
constexpr basic_string_view(const charT* str, size_type len);
    Preconditions: [str, str + len) is a valid range.
    Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.

§ 23.3.3.2
template<class It, class End>
constexpr basic_string_view(It begin, End end);

Constraints:

— It satisfies contiguous_iterator.
— End satisfies sized_sentinel_for<It>.
— is_same_v<iter_value_t<It>, charT> is true.
— is_convertible_v<End, size_type> is false.

Preconditions:

— [begin, end) is a valid range.
— It models contiguous_iterator.
— End models sized_sentinel_for<It>.

Effects: Initializes data_ with to_address(begin) and initializes size_ with end - begin.

Throws: When and what end - begin throws.

template<class R>
constexpr basic_string_view(R&& r);

Let d be an lvalue of type remove_cvref_t<R>.

Constraints:

— remove_cvref_t<R> is not the same type as basic_string_view,
— R models ranges::contiguous_range and ranges::sized_range,
— is_same_v<ranges::range_value_t<R>, charT> is true,
— is_convertible_v<R, const charT*> is false,
— d.operator::std::basic_string_view<charT, traits>() is not a valid expression, and
— if the qualified-id remove_reference_t<R>::traits_type is valid and denotes a type, is_same_v<remove_reference_t<R>::traits_type, traits> is true.

Effects: Initializes data_ with ranges::data(r) and size_ with ranges::size(r).

Throws: Any exception thrown by ranges::data(r) and ranges::size(r).

23.3.3.3 Iterator support

using const_iterator = implementation-defined;

A type that meets the requirements of a constant Cpp17RandomAccessIterator (25.3.5.7), models contiguous_iterator (25.3.4.14), and meets the constexpr iterator requirements (25.3.1), whose value_type is the template parameter charT.

All requirements on container iterators (24.2) apply to basic_string_view::const_iterator as well.

constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

Returns: An iterator such that

— if !empty(), addressof(*begin()) == data_,
— otherwise, an unspecified value such that [begin(), end()) is a valid range.

constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

Returns: begin() + size().

constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

Returns: const_reverse_iterator(end()).
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

Returns: \texttt{const_reverse_iterator(begin())}.

23.3.3.4 Capacity \hspace{1cm} \texttt{[string.view.capacity]}

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
Returns: \texttt{size_}.

constexpr size_type max_size() const noexcept;
Returns: The largest possible number of char-like objects that can be referred to by a \texttt{basic_string_view}.
[[nondiscard]] constexpr bool empty() const noexcept;
Returns: \texttt{size_ == 0}.

23.3.3.5 Element access \hspace{1cm} \texttt{[string.view.access]}

constexpr const_reference operator[](size_type pos) const;
Preconditions: \texttt{pos < size()}.  
Returns: \texttt{data_[pos]}.  
Throws: Nothing.
[Note 1: Unlike \texttt{basic_string::operator[]}, \texttt{basic_string_view::operator[](size())} has undefined behavior instead of returning \texttt{charT()}. —end note]

constexpr const_reference at(size_type pos) const;
Returns: \texttt{data_[pos]}.  
Throws: \texttt{out_of_range} if \texttt{pos >= size()}.  

constexpr const_reference front() const;
Preconditions: \texttt{!empty()}.  
Returns: \texttt{data_[0]}.  
Throws: Nothing.

constexpr const_reference back() const;
Preconditions: \texttt{!empty()}.  
Returns: \texttt{data_[size() - 1]}.  
Throws: Nothing.

constexpr const_pointer data() const noexcept;
Returns: \texttt{data_}.  
[Note 2: Unlike \texttt{basic_string::data()} and \texttt{string-literals}, \texttt{data()} can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass \texttt{data()} to a function that takes just a \texttt{const charT*} and expects a null-terminated string. —end note]

23.3.3.6 Modifiers \hspace{1cm} \texttt{[string.view.modifiers]}

constexpr void remove_prefix(size_type n);
Preconditions: \texttt{n <= size()}.  
Effects: Equivalent to: \texttt{data_ += n; size_ -= n};  

constexpr void remove_suffix(size_type n);
Preconditions: \texttt{n <= size()}.  
Effects: Equivalent to: \texttt{size_ -= n};  

§ 23.3.3.6
constexpr void swap(basic_string_view& s) noexcept;

Effects: Exchanges the values of *this and s.

### 23.3.3.7 String operations

```cpp
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

1. Let rlen be the smaller of n and size() - pos.
2. Preconditions: [s, s + rlen) is a valid range.
3. Effects: Equivalent to traits::copy(s, data() + pos, rlen).
5. Throws: out_of_range if pos > size().
6. Complexity: $\Theta(rlen)$.

```cpp
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
```

7. Let rlen be the smaller of n and size() - pos.
8. Effects: Determines rlen, the effective length of the string to reference.
9. Returns: basic_string_view(data() + pos, rlen).
10. Throws: out_of_range if pos > size().

```cpp
constexpr int compare(basic_string_view str) const noexcept;
```

11. Let rlen be the smaller of size() and str.size().
12. Effects: Determines rlen, the effective length of the strings to compare. The function then compares the two strings by calling traits::compare(data(), str.data(), rlen).
13. Returns: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 76.

**Table 76: compare() results**

<table>
<thead>
<tr>
<th>Condition</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>size() &lt; str.size()</td>
<td>&lt; 0</td>
</tr>
<tr>
<td>size() == str.size()</td>
<td>0</td>
</tr>
<tr>
<td>size() &gt; str.size()</td>
<td>&gt; 0</td>
</tr>
</tbody>
</table>

14. Complexity: $\Theta(rlen)$.

```cpp
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
```

15. Effects: Equivalent to: return substr(pos1, n1).compare(str);

```cpp
constexpr int compare(size_type pos1, size_type n1, basic_string_view str, size_type pos2, size_type n2) const;
```

16. Effects: Equivalent to: return substr(pos1, n1).compare(str.substr(pos2, n2));

```cpp
constexpr int compare(const charT* s) const;
```

17. Effects: Equivalent to: return compare(basic_string_view(s));

```cpp
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
```

18. Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s));

```cpp
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
```

19. Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s, n2));

```cpp
constexpr bool starts_with(basic_string_view x) const noexcept;
```

20. Effects: Equivalent to: return substr(0, x.size()) == x;
constexpr bool starts_with(charT x) const noexcept;

**Effects:** Equivalent to: return !empty() && traits::eq(front(), x);

constexpr bool starts_with(const charT* x) const;

**Effects:** Equivalent to: return starts_with(basic_string_view(x));

constexpr bool ends_with(basic_string_view x) const noexcept;

**Effects:** Equivalent to:
return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;

constexpr bool ends_with(charT x) const noexcept;

**Effects:** Equivalent to: return !empty() && traits::eq(back(), x);

constexpr bool ends_with(const charT* x) const;

**Effects:** Equivalent to: return ends_with(basic_string_view(x));

constexpr bool contains(basic_string_view x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;

**Effects:** Equivalent to:
return find(x) != npos;

### 23.3.3.8 Searching

**[string.view.find]**

Member functions in this subclause have complexity $O(size() \times str.size())$ at worst, although implementations should do better.

Let $F$ be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

---

(2.1) — Each member function of the form

```cpp
constexpr return-type F(const charT* s, size_type pos) const;
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
constexpr return-type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

- `F(basic_string_view(s), pos)`
- `F(basic_string_view(s, n), pos)`
- `F(basic_string_view(addressof(c), 1), pos)`

---

(3.1) Let $xpos$ be the lowest position, if possible, such that the following conditions hold:

- $pos \leq xpos$
- $xpos + str.size() \leq size()$
- traits::eq(at(xpos + I), str.at(I)) for all elements $I$ of the string referenced by $str$.

**Effects:** Determines $xpos$.

**Returns:** $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns npos.

---

(6.3) Let $xpos$ be the highest position, if possible, such that the following conditions hold:

- $xpos \leq pos$
- $xpos + str.size() \leq size()$
- traits::eq(at(xpos + I), str.at(I)) for all elements $I$ of the string referenced by $str$.

**Effects:** Determines $xpos$.

**Returns:** $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns npos.
constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;

Let xpos be the lowest position, if possible, such that the following conditions hold:

- pos <= xpos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.

Effects: Determines xpos.

Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.

Effects: Determines xpos.

Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;

Let xpos be the lowest position, if possible, such that the following conditions hold:

- pos <= xpos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.

Effects: Determines xpos.

Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.

Effects: Determines xpos.

Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

23.3.4 Deduction guides

```
template<class It, class End>
basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
```

1 Constraints:
- It satisfies contiguous_iterator.
- End satisfies sized_sentinel_for<It>.

```
template<class R>
basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;
```

2 Constraints: R satisfies ranges::contiguous_range.

23.3.5 Non-member comparison functions

```
§ 23.3.5 806
```

Let S be basic_string_view<charT, traits>, and sv be an instance of S. Implementations shall provide sufficient additional overloads marked constexpr and noexcept so that an object t with an implicit conversion to S can be compared according to Table 77.

Example 1: A sample conforming implementation for operator== would be:
Table 77: Additional basic_string_view comparison overloads

<table>
<thead>
<tr>
<th>Expression</th>
<th>Equivalent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{t == sv}</td>
<td>\texttt{S(t) == sv}</td>
</tr>
<tr>
<td>\texttt{sv == t}</td>
<td>\texttt{sv == S(t)}</td>

\item Returns: \texttt{static_cast<R>(lhs.compare(rhs) <=> 0)}.\end{enumerate}

\section*{23.3.6 Inserters and extractors}

\texttt{template<class charT, class traits>}
\begin{verbatim}
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);
\end{verbatim}

\begin{enumerate}
\item \begin{enumerate}
\item Effects: Behaves as a formatted output function (31.7.5.3.1) of \texttt{os}. Forms a character sequence \texttt{seq}, initially consisting of the elements defined by the range \texttt{[str.begin(), str.end()]). Determines padding for \texttt{seq} as described in 31.7.5.3.1. Then inserts \texttt{seq} as if by calling \texttt{os.rdbuf()->sputn(seq, n)}, where \texttt{n} is the larger of \texttt{os.width()} and \texttt{str.size()}; then calls \texttt{os.width(0)}.\end{enumerate}
\item Returns: \texttt{os}.
\end{enumerate}

\section*{23.3.7 Hash support}

\texttt{template<> struct hash<string_view>;

\texttt{template<> struct hash<u8string_view>;}
The specialization is enabled (22.10.19).

[Note 1: The hash value of a string view object is equal to the hash value of the corresponding string object (23.4.6). — end note]

23.3.8 Suffix for basic_string view literals

```cpp
constexpr string_view operator"sv(const char* str, size_t len) noexcept;
```

Returns: string_view{str, len}.

```cpp
constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;
```

Returns: u8string_view{str, len}.

```cpp
constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;
```

Returns: u16string_view{str, len}.

```cpp
constexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;
```

Returns: u32string_view{str, len}.

```cpp
constexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;
```

Returns: wstring_view{str, len}.

23.4 String classes

23.4.1 General

The header `<string>` defines the basic_string class template for manipulating varying-length sequences of char-like objects and five typedef-names, string, u8string, u16string, u32string, and wstring, that name the specializations basic_string<char>, basic_string<char8_t>, basic_string<char16_t>, basic_string<char32_t>, and basic_string<wchar_t>, respectively.

23.4.2 Header `<string>` synopsis

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2
namespace std {
  // 23.2, character traits
  template<class charT> struct char_traits;
  template<> struct char_traits<char>;
  template<> struct char_traits<char8_t>;
  template<> struct char_traits<char16_t>;
  template<> struct char_traits<char32_t>;
  template<> struct char_traits<wchar_t>;
  // 23.4.3, basic_string
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
  class basic_string;

23.4.3 Class template basic_string

The class template basic_string describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of 23.4.3, the type of the char-like objects held in a basic_string object is designated by charT.

A specialization of basic_string is a contiguous container (24.2.2.1).

In all cases, [data(), data() + size()] is a valid range, data() + size() points at an object with value charT() (a “null terminator”), and size() <= capacity() is true.

         class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;

template<class charT,
         class traits,
         class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,
            typename see below::size_type, typename see below::size_type,
            const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;

4 A size_type parameter type in a basic_string deduction guide refers to the size_type member type of
the type deduced by the deduction guide.

5 The types iterator and const_iterator meet the constexpr iterator requirements (25.3.1).

23.4.3.2 General requirements [string.require]

1 If any operation would cause size() to exceed max_size(), that operation throws an exception object of
  type length_error.

2 If any member function or operator of basic_string throws an exception, that function or operator has no
  other effect on the basic_string object.

3 In every specialization basic_string<charT, traits, Allocator>, the type allocator_traits<All-
 ocator>::value_type shall name the same type as charT. Every object of type basic_string<charT,
traits, Allocator> uses an object of type Allocator to allocate and free storage for the contained charT objects as needed. The Allocator object used is obtained as described in 24.2.2.1. In every specialization basic_string<charT, traits, Allocator>, the type traits shall meet the character traits requirements (23.2).

[Note 1: Every specialization basic_string<charT, traits, Allocator> is an allocator-aware container, but does not use the allocator's construct and destroy member functions (24.2.2.1). — end note]

[Note 2: The program is ill-formed if traits::char_type is not the same type as charT. — end note]

References, pointers, and iterators referring to the elements of a basic_string sequence may be invalidated by the following uses of that basic_string object:

(4.1) — Passing as an argument to any standard library function taking a reference to non-const basic_string as an argument.

(4.2) — Calling non-const member functions, except operator[], at, data, front, back, begin, rbegin, end, and rend.

23.4.3.3 Constructors and assignment operators

constexpr explicit basic_string(const Allocator& a) noexcept;

Postconditions: size() is equal to 0.

costexpr basic_string(const basic_string& str);
costexpr basic_string(basic_string&& str) noexcept;

Effects: Constructs an object whose value is that of str prior to this call.

Remarks: In the second form, str is left in a valid but unspecified state.

costexpr basic_string(const basic_string& str, size_type pos, const Allocator& a = Allocator());
costexpr basic_string(const basic_string& str, size_type pos, size_type n, const Allocator& a = Allocator());

Effects: Let n be npos for the first overload. Equivalent to:

basic_string(basic_string_view<charT, traits>(str).substr(pos, n), a)

template<class T>
costexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());

Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

Effects: Creates a variable, sv, as if by basic_string_view<charT, traits> sv = t; and then behaves the same as:

basic_string(sv.substr(pos, n), a);

template<class T>
costexpr explicit basic_string(const T& t, const Allocator& a = Allocator());

Constraints:

(7.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(7.2) — is_convertible_v<const T&, const charT*> is false.

Effects: Creates a variable, sv, as if by basic_string_view<charT, traits> sv = t; and then behaves the same as basic_string(sv.data(), sv.size(), a).

costexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());

Preconditions: [s, s + n) is a valid range.

Effects: Constructs an object whose initial value is the range [s, s + n).

Postconditions: size() is equal to n, and traits::compare(data(), s, n) is equal to 0.

213) For example, as an argument to non-member functions swap() (23.4.4.3), operator>>() (23.4.4.4), and getline() (23.4.4.4), or as an argument to basic_string::swap().
constexpr basic_string(const charT* s, const Allocator& a = Allocator());

**Constraints:** `Allocator` is a type that qualifies as an allocator (24.2.2.1).

**Effects:** Equivalent to: `basic_string(s, traits::length(s), a)`.

customexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());

**Constraints:** `Allocator` is a type that qualifies as an allocator (24.2.2.1).

**Effects:** Constructs an object whose value consists of `n` copies of `c`.

customexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());

**Constraints:** `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

**Effects:** Constructs a string from the values in the range `[begin, end)`, as specified in 24.2.4.

customexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());

**Effects:** Equivalent to `basic_string(il.begin(), il.end(), a)`.

customexpr basic_string(const basic_string& str, const Allocator& alloc);
custom_string(basic_string&& str, const Allocator& alloc);

**Effects:** Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

**Throws:** The second form throws nothing if `alloc == str.get_allocator()`.

customexpr basic_string(const charT* s, const Allocator& a = Allocator());

**Effects:** Equivalent to: `basic_string(s, traits::length(s), a)`.

customexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());

**Constraints:** `Allocator` is a type that qualifies as an allocator (24.2.2.1).

**Effects:** Constructs an object whose value consists of `n` copies of `c`.

customexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());

**Constraints:** `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

**Effects:** Constructs a string from the values in the range `[begin, end)`, as specified in 24.2.4.

customexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());

**Effects:** Equivalent to `basic_string(il.begin(), il.end(), a)`.

customexpr basic_string(const basic_string& str, const Allocator& alloc);
custom_string(basic_string&& str, const Allocator& alloc);

**Effects:** Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

**Throws:** The second form throws nothing if `alloc == str.get_allocator()`.

customexpr basic_string(const charT* s, const Allocator& a = Allocator());

**Effects:** Equivalent to: `basic_string(s, traits::length(s), a)`.

customexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());

**Constraints:** `Allocator` is a type that qualifies as an allocator (24.2.2.1).

**Effects:** Constructs an object whose value consists of `n` copies of `c`.
constexpr basic_string& operator=(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
    allocator_traits<Allocator>::is_always_equal::value);

    Effects: Move assigns as a sequence container (24.2), except that iterators, pointers and references may be invalidated.
    Returns: *this.

template<class T>
    constexpr basic_string& operator=(const T& t);

    Constraints:
    — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
    — is_convertible_v<const T&, const charT*> is false.

    Effects: Equivalent to:
        basic_string_view<charT, traits> sv = t;
        return assign(sv);

    constexpr basic_string& operator=(const charT* s);

    Effects: Equivalent to: return *this = basic_string_view<charT, traits>(s);

    constexpr basic_string& operator=(charT c);

    Effects: Equivalent to:
        return *this = basic_string_view<charT, traits>(addressof(c), 1);

    constexpr basic_string& operator=(initializer_list<charT> il);

    Effects: Equivalent to:
        return *this = basic_string_view<charT, traits>(il.begin(), il.size());

23.4.3.4 Iterator support

    constexpr iterator begin() noexcept;
    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator cbegin() const noexcept;

    Returns: An iterator referring to the first character in the string.

    constexpr iterator end() noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr const_iterator cend() const noexcept;

    Returns: An iterator which is the past-the-end value.

    constexpr reverse_iterator rbegin() noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;

    Returns: An iterator which is semantically equivalent to reverse_iterator(end()).

    constexpr reverse_iterator rend() noexcept;
    constexpr const_reverse_iterator rend() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;

    Returns: An iterator which is semantically equivalent to reverse_iterator(begin()).

23.4.3.5 Capacity

    constexpr size_type size() const noexcept;
    constexpr size_type length() const noexcept;

    Returns: A count of the number of char-like objects currently in the string.
    Complexity: Constant time.
constexpr size_type max_size() const noexcept;

Returns: The largest possible number of char-like objects that can be stored in a basic_string.

Complexity: Constant time.

constexpr void resize(size_type n, charT c);

Effects: Alters the value of `*this` as follows:

(5.1) If `n <= size()`, erases the last `size() - n` elements.
(5.2) If `n > size()`, appends `n - size()` copies of `c`.

constexpr void resize(size_type n);

Effects: Equivalent to `resize(n, charT())`.

template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);

Let

(7.1) `o = size()` before the call to `resize_and_overwrite`.
(7.2) `k = min(o, n)`.
(7.3) `p` be a `charT*`, such that the range `[p, p + n]` is valid and `this->compare(0, k, p, k) == 0` is true before the call. The values in the range `[p + k, p + n]` may be indeterminate (6.7.4).
(7.4) `OP` be the expression `std::move(op)(p, n)`.
(7.5) `r = OP`.

Mandates: `OP` has an integer-like type (25.3.4.4).

 Preconditions:

(9.1) `OP` does not throw an exception or modify `p` or `n`.
(9.2) `r >= 0`.
(9.3) `r <= n`.
(9.4) After evaluating `OP` there are no indeterminate values in the range `[p, p + r)`.

Effects: Evaluates `OP`, replaces the contents of `*this` with `[p, p + r)`, and invalidates all pointers and references to the range `[p, p + n]`.

Recommended practice: Implementations should avoid unnecessary copies and allocations by, for example, making `p` a pointer into internal storage and by restoring `*(p + r)` to `charT()` after evaluating `OP`.

constexpr size_type capacity() const noexcept;

Returns: The size of the allocated storage in the string.

Complexity: Constant time.

constexpr void reserve(size_type res_arg);

Effects: A directive that informs a basic_string of a planned change in size, so that the storage allocation can be managed accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`.

Throws: `length_error` if `res_arg > max_size()` or any exceptions thrown by `allocator_traits<Allocator>::allocate`.

constexpr void shrink_to_fit();

Effects: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

Complexity: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

§ 23.4.3.5
Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 2: If no reallocation happens, they remain valid. — end note]

constexpr void clear() noexcept;

Effects: Equivalent to: erase(begin(), end());

[[nodiscard]] constexpr bool empty() const noexcept;

Effects: Equivalent to: return size() == 0;

23.4.3.6 Element access

constexpr const_reference operator[](size_type pos) const;
constexpr reference operator[](size_type pos);

Preconditions: pos <= size().

Returns: *(begin() + pos) if pos < size(). Otherwise, returns a reference to an object of type charT with value charT(), where modifying the object to any value other than charT() leads to undefined behavior.

Throws: Nothing.

Complexity: Constant time.

constexpr const_reference at(size_type pos) const;
constexpr reference at(size_type pos);

Returns: operator[](pos).

Throws: out_of_range if pos >= size().

constexpr const charT& front() const;
constexpr charT& front();

Preconditions: !empty().

Effects: Equivalent to: return operator[](0);

constexpr const charT& back() const;
constexpr charT& back();

Preconditions: !empty().

Effects: Equivalent to: return operator[](size() - 1);

23.4.3.7 Modifiers

23.4.3.7.1 basic_string::operator+=

constexpr basic_string& operator+=(const basic_string& str);

Effects: Equivalent to: return append(str);

template<class T>
constexpr basic_string& operator+=(const T& t);

Constraints:
(2.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(2.2) — is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return append(sv);

constexpr basic_string& operator+=(const charT* s);

Effects: Equivalent to: return append(s);

constexpr basic_string& operator+=(charT c);

Effects: Equivalent to: return append(size_type{1}, c);
constexpr basic_string& operator+=(initializer_list<charT> il);

Effects: Equivalent to: return append(il);

23.4.3.7.2 basic_string::append

constexpr basic_string& append(const basic_string& str);

Effects: Equivalent to: return append(str.data(), str.size());

constexpr basic_string& append(const basic_string& str, size_type pos, size_type n = npos);

Effects: Equivalent to:
return append(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
constexpr basic_string& append(const T& t);

Constraints:
— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
basic_string_view<charT, traits> sv = t;
return append(sv.data(), sv.size());

template<class T>
constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);

Constraints:
— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
basic_string_view<charT, traits> sv = t;
return append(sv.substr(pos, n));

constexpr basic_string& append(const charT* s, size_type n);

Preconditions: [s, s + n) is a valid range.

Effects: Appends a copy of the range [s, s + n) to the string.

Returns: *this.

constexpr basic_string& append(const charT* s);

Effects: Equivalent to: return append(s, traits::length(s));

constexpr basic_string& append(size_type n, charT c);

Effects: Appends n copies of c to the string.

Returns: *this.

template<class InputIterator>
constexpr basic_string& append(InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).

Effects: Equivalent to: return append(basic_string(first, last, get_allocator()));

template<container-compatible-range<charT> R>
constexpr basic_string& append_range(R&& rg);

Effects: Equivalent to: return append(basic_string(from_range, std::forward<R>(rg), get_allocator()));

constexpr basic_string& append(initializer_list<charT> il);

Effects: Equivalent to: return append(il.begin(), il.size());
constexpr void push_back(charT c);

Effects: Equivalent to append(size_type{1}, c).

23.4.3.7.3 basic_string::assign

constexpr basic_string& assign(const basic_string& str);

Effects: Equivalent to: return *this = str;

constexpr basic_string& assign(basic_string&& str)
    noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
                allocator_traits<Allocator>::is_always_equal::value);

Effects: Equivalent to: return *this = std::move(str);

constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);

Effects: Equivalent to:
    return assign(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
constexpr basic_string& assign(const T& t);

Constraints:
(4.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv.data(), sv.size());

template<class T>
constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);

Constraints:
(6.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(6.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv.substr(pos, n));

constexpr basic_string& assign(const charT* s, size_type n);

Preconditions: [s, s + n) is a valid range.

Effects: Replaces the string controlled by *this with a copy of the range [s, s + n).

Returns: *this.

constexpr basic_string& assign(const charT* s);

Effects: Equivalent to: return assign(s, traits::length(s));

constexpr basic_string& assign(initializer_list<charT> il);

Effects: Equivalent to: return assign(il.begin(), il.size());

constexpr basic_string& assign(size_type n, charT c);

Effects: Equivalent to:
    clear();
    resize(n, c);
    return *this;

template<class InputIterator>
constexpr basic_string& assign(InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).
Effects: Equivalent to: return assign(basic_string(first, last, get_allocator()));

template<container-compatible-range<charT> R>
constexpr basic_string& assign_range(R&& rg);

Effects: Equivalent to: return assign(basic_string(from_range, std::forward<R>(rg), get_allocator()));

23.4.3.7.4 basic_string::insert
constexpr basic_string& insert(size_type pos, const basic_string& str);

Effects: Equivalent to: return insert(pos, str.data(), str.size());

constexpr basic_string& insert(size_type pos1, const basic_string& str,
size_type pos2, size_type n = npos);

Effects: Equivalent to:
return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);

template<class T>
constexpr basic_string& insert(size_type pos, const T& t);

Constraints:

— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return insert(pos, sv.data(), sv.size());

template<class T>
constexpr basic_string& insert(size_type pos1, const T& t,
size_type pos2, size_type n = npos);

Constraints:

— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return insert(pos1, sv.substr(pos2, n));

constexpr basic_string& insert(size_type pos, const charT* s, size_type n);

Preconditions: [s, s + n) is a valid range.

Effects: Inserts a copy of the range [s, s + n) immediately before the character at position pos if pos < size(), or otherwise at the end of the string.

Returns: *this.

Throws:

— out_of_range if pos > size(),
— length_error if n > max_size() - size(), or
— any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr basic_string& insert(size_type pos, const charT* s);

Effects: Equivalent to: return insert(pos, s, traits::length(s));

constexpr basic_string& insert(size_type pos, size_type n, charT c);

Effects: Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the end of the string.

Returns: *this

Throws:
\(\text{(14.1)}\) \text{out_of_range} \text{if pos} > \text{size()},

\(\text{(14.2)}\) \text{length_error} \text{if n} > \text{max_size()} - \text{size()}, \text{or}

\(\text{(14.3)}\) any exceptions thrown by \text{allocator_traits<Allocator>::allocate}.

\text{constexpr iterator insert(const_iterator p, charT c);} 
\begin{align*}
\text{Preconditions:} & \text{p is a valid iterator on } *\text{this}. \\
\text{Effects:} & \text{Inserts a copy of c at the position p.} \\
\text{Returns:} & \text{An iterator which refers to the inserted character.}
\end{align*}

\text{constexpr iterator insert(const_iterator p, size_type n, charT c);} 
\begin{align*}
\text{Preconditions:} & \text{p is a valid iterator on } *\text{this}. \\
\text{Effects:} & \text{Inserts n copies of c at the position p.} \\
\text{Returns:} & \text{An iterator which refers to the first inserted character, or p if n == 0.}
\end{align*}

\text{template<class InputIterator>} 
\text{constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);} 
\begin{align*}
\text{Constraints:} & \text{InputIterator is a type that qualifies as an input iterator (24.2.2.1).} \\
\text{Preconditions:} & \text{p is a valid iterator on } *\text{this}. \\
\text{Effects:} & \text{Equivalent to insert(p - begin(), basic_string(first, last, get_allocator()))}. \\
\text{Returns:} & \text{An iterator which refers to the first inserted character, or p if first == last.}
\end{align*}

\text{template<container-compatible-range<charT> R>} 
\text{constexpr iterator insert_range(const_iterator p, R&& rg);} 
\begin{align*}
\text{Preconditions:} & \text{p is a valid iterator on } *\text{this}. \\
\text{Effects:} & \text{Equivalent to insert(p - begin(), basic_string(from_range, std::forward<R>(rg), get_allocator()))}. \\
\text{Returns:} & \text{An iterator which refers to the first inserted character, or p if rg is empty.}
\end{align*}

\text{constexpr iterator insert(const_iterator p, initializer_list<charT> il);} 
\begin{align*}
\text{Effects:} & \text{Equivalent to: return insert(p, il.begin(), il.end());}
\end{align*}

\text{23.4.3.7.5 basic_string::erase} 
\text{[string.erase]}
\begin{align*}
\text{constexpr basic_string& erase(size_type pos = 0, size_type n = npos);} 
\text{Effects:} & \text{Determines the effective length xlen of the string to be removed as the smaller of n and size()} 
\text{ - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen].} \\
\text{Returns:} & *\text{this}. \\
\text{Throws:} & \text{out_of_range if pos} > \text{size}().
\end{align*}

\text{constexpr iterator erase(const_iterator p);} 
\begin{align*}
\text{Preconditions:} & \text{p is a valid dereferenceable iterator on } *\text{this}. \\
\text{Effects:} & \text{Removes the character referred to by p.} \\
\text{Returns:} & \text{An iterator which points to the element immediately following p prior to the element being} 
\text{erased. If no such element exists, end() is returned.} \\
\text{Throws:} & \text{Nothing.}
\end{align*}

\text{constexpr iterator erase(const_iterator first, const_iterator last);} 
\begin{align*}
\text{Preconditions:} & \text{first and last are valid iterators on } *\text{this. [first, last) is a valid range.} \\
\text{Effects:} & \text{Removes the characters in the range [first, last).} \\
\text{Returns:} & \text{An iterator which points to the element pointed to by last prior to the other elements being} 
\text{erased. If no such element exists, end() is returned.} \\
\text{Throws:} & \text{Nothing.}
\end{align*}
constexpr void pop_back();

**Preconditions:** !empty().

**Effects:** Equivalent to erase(end() - 1).

**Throws:** Nothing.

### § 23.4.3.7.6 basic_string::replace [string.replace]

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
```

**Effects:** Equivalent to: return replace(pos1, n1, str.data(), str.size());

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
                               size_type pos2, size_type n2 = npos);
```

**Effects:** Equivalent to:
```
return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
```

```cpp
template<class T>
constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);
```

**Constraints:**
- (3.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
- (3.2) is_convertible_v<const T&, const charT*>> is false.

**Effects:** Equivalent to:
```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());
```

```cpp
template<class T>
constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
                               size_type pos2, size_type n2 = npos);
```

**Constraints:**
- (5.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
- (5.2) is_convertible_v<const T&, const charT*>> is false.

**Effects:** Equivalent to:
```
basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));
```

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
```

**Preconditions:** [s, s + n2) is a valid range.

**Effects:** Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range [begin() + pos1, begin() + pos1 + xlen) with a copy of the range [s, s + n2).

**Returns:** *this.

**Throws:**
- (10.1) out_of_range if pos1 > size(),
- (10.2) length_error if the length of the resulting string would exceed max_size(), or
- (10.3) any exceptions thrown by allocator_traits<Alloc>::allocate.

```cpp
constexpr basic_string& replace(size_type pos, size_type n, const charT* s);
```

**Effects:** Equivalent to: return replace(pos, n, s, traits::length(s));

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);
```

**Effects:** Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range [begin() + pos1, begin() + pos1 + xlen) with n2 copies of c.
Returns: \*this.

Throws:

- out_of_range if pos1 > size(),
- length_error if the length of the resulting string would exceed max_size(), or
- any exceptions thrown by allocator_traits<Allocator>::allocate.

```cpp
customexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);

Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(str));
```

template<class T>
customexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);

Constraints:

- is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
- is_convertible_v<const T&, const charT* is false.

Preconditions: [begin(), i1) and [i1, i2) are valid ranges.

Effects: Equivalent to:

```cpp
basic_string_view<charT, traits> sv = t;
return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());
```

customexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);

Effects: Equivalent to:

```cpp
return replace(i1, i2, basic_string_view<charT, traits>(s, n));
```

customexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);

Effects: Equivalent to:

```cpp
return replace(i1, i2, basic_string_view<charT, traits>(s));
```

Preconditions: [begin(), i1) and [i1, i2) are valid ranges.

Effects: Equivalent to: return replace(i1 - begin(), i2 - i1, n, c);

```cpp
template<class InputIterator>
customexpr basic_string& replace(const_iterator i1, const_iterator i2, InputIterator j1, InputIterator j2);

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).

Effects: Equivalent to: return replace(i1, i2, basic_string(j1, j2, get_allocator()));
```

template<container-compatible-range<charT> R>
customexpr basic_string& replace_with_range(const_iterator i1, const_iterator i2, R&& rg);

Effects: Equivalent to:

```cpp
return replace(i1, i2, basic_string(from_range, std::forward<R>(rg), get_allocator()));
```

customexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);

Effects: Equivalent to: return replace(i1, i2, il.begin(), il.size());

23.4.3.7.7 basic_string::copy

```cpp
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

Effects: Equivalent to: return basic_string_view<charT, traits>(*this).copy(s, n, pos);

[Note 1: This does not terminate s with a null object. — end note]

23.4.3.7.8 basic_string::swap

```cpp
constexpr void swap(basic_string& s);
```

Preconditions: allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == s.get_allocator().

§ 23.4.3.7.8
\section*{23.4.3.8 String operations \[string.ops\]}

\subsection*{23.4.3.8.1 Accessors \[string.accessors\]}

\begin{verbatim}
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;

Returns: A pointer \( p \) such that \( p + i = \text{addressof}(\text{operator}[])(i) \) for each \( i \) in \([0, \text{size()}]\).
Complexity: Constant time.
Remarks: The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

constexpr charT* data() noexcept;

Returns: A pointer \( p \) such that \( p + i = \text{addressof}(\text{operator}[])(i) \) for each \( i \) in \([0, \text{size()}]\).
Complexity: Constant time.
Remarks: The program shall not modify the value stored at \( p + \text{size}() \) to any value other than \( \text{charT}()\); otherwise, the behavior is undefined.

constexpr operator basic_string_view<charT, traits>() const noexcept;

Effects: Equivalent to: \( \text{return basic_string_view<charT, traits>(data(), size())}; \)

constexpr allocator_type get_allocator() const noexcept;

Returns: A copy of the \text{Allocator} object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.
\end{verbatim}

\subsection*{23.4.3.8.2 Searching \[string.find\]}

Let \( F \) be one of \text{find}, \text{rfind}, \text{find_first_of}, \text{find_last_of}, \text{find_first_not_of}, \text{and find_last_not_of}.

\subsection*{23.4.3.8.2.1 Each member function of the form}

\begin{verbatim}
constexpr size_type \( F \)\text{(const basic_string& str, size_type pos) const noexcept;}
has effects equivalent to: \( \text{return } F(\text{basic_string_view<charT, traits>(str), pos}); \)
\end{verbatim}

\subsection*{23.4.3.8.2.2 Each member function of the form}

\begin{verbatim}
constexpr size_type \( F \)\text{(const charT* s, size_type pos) const;}
has effects equivalent to: \( \text{return } F(\text{basic_string_view<charT, traits>(s), pos}); \)
\end{verbatim}

\subsection*{23.4.3.8.2.3 Each member function of the form}

\begin{verbatim}
constexpr size_type \( F \)\text{(const charT* s, size_type pos, size_type n) const;}
has effects equivalent to: \( \text{return } F(\text{basic_string_view<charT, traits>(s, n), pos}); \)
\end{verbatim}

\subsection*{23.4.3.8.2.4 Each member function of the form}

\begin{verbatim}
constexpr size_type \( F \)\text{(charT c, size_type pos) const noexcept;}
has effects equivalent to:
\( \text{return } F(\text{basic_string_view<charT, traits>(addressof(c), 1), pos}); \)
\end{verbatim}

\begin{verbatim}
template<class T>
constexpr size_type find(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept(see below);
template<class T>
constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept(see below);
template<class T>
constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept(see below);
\end{verbatim}

§ 23.4.3.8.2 828
template<class T>
constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept(see below);

2 Constraints:
(2.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(2.2) — is_convertible_v<const T&, const charT*> is false.
3 Effects: Let $G$ be the name of the function. Equivalent to:
\[
\text{basic_string_view<charT, traits> } s = \text{this, } sv = t;
\text{return } s.G(sv, pos);
\]
4 Remarks: The exception specification is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

23.4.3.8.3 basic_string::substr

constexpr basic_string substr(size_type pos = 0, size_type n = npos) const;

1 Effects: Determines the effective length rlen of the string to copy as the smaller of n and size() - pos.
2 Returns: basic_string(data()+pos, rlen).
3 Throws: out_of_range if pos > size().

23.4.3.8.4 basic_string::compare

template<class T>
constexpr int compare(const T& t) const noexcept(see below);

1 Constraints:
(1.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(1.2) — is_convertible_v<const T&, const charT*> is false.
2 Effects: Equivalent to: return basic_string_view<charT, traits>(*this).compare(t);
3 Remarks: The exception specification is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t) const;

4 Constraints:
(4.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2) — is_convertible_v<const T&, const charT*> is false.
5 Effects: Equivalent to:
\[
\text{return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t)};
\]

template<class T>
constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;

6 Constraints:
(6.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(6.2) — is_convertible_v<const T&, const charT*> is false.
7 Effects: Equivalent to:
\[
\text{basic_string_view<charT, traits> } s = \text{this, } sv = t;
\text{return } s.substr(pos1, n1).compare(sv.substr(pos2, n2));
\]

constexpr int compare(const basic_string& str) const noexcept;

8 Effects: Equivalent to: return compare(basic_string_view<charT, traits>(str));

constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;

9 Effects: Equivalent to: return compare(pos1, n1, basic_string_view<charT, traits>(str));

§ 23.4.3.8.4 829
constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
            size_type pos2, size_type n2 = npos) const;

**Effects**: Equivalent to:

    return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);

constexpr int compare(const charT* s) const;

**Effects**: Equivalent to:

    return compare(basic_string_view<charT, traits>(s));

constexpr int compare(size_type pos, size_type n1, const charT* s) const;

**Effects**: Equivalent to:

    return compare(pos, n1, basic_string_view<charT, traits>(s));

constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;

**Effects**: Equivalent to:

    return compare(pos, n1, basic_string_view<charT, traits>(s, n2));

23.4.3.8.5 basic_string::starts_with

```cpp
constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
```

**Effects**: Equivalent to:

    return basic_string_view<charT, traits>(data(), size()).starts_with(x);

23.4.3.8.6 basic_string::ends_with

```cpp
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;
```

**Effects**: Equivalent to:

    return basic_string_view<charT, traits>(data(), size()).ends_with(x);

23.4.3.8.7 basic_string::contains

```cpp
constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
```

**Effects**: Equivalent to:

    return basic_string_view<charT, traits>(data(), size()).contains(x);

23.4.4 Non-member functions

23.4.4.1 operator+

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
            const basic_string<charT, traits, Allocator>& rhs);
```

**Effects**: Equivalent to:

    basic_string<charT, traits, Allocator> r = lhs;
    r.append(rhs);
    return r;

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
            const basic_string<charT, traits, Allocator>& rhs);
```

§ 23.4.4.1
template<class charT, class traits, class Allocator>  
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, const charT* rhs);

2 Effects: Equivalent to:

lhs.append(rhs);
return std::move(lhs);

template<class charT, class traits, class Allocator>  
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,  
           basic_string<charT, traits, Allocator>&& rhs);

3 Effects: Equivalent to:

lhs.append(rhs);
return std::move(lhs);

except that both lhs and rhs are left in valid but unspecified states.

[Note 1: If lhs and rhs have equal allocators, the implementation can move from either. — end note]

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,  
           basic_string<charT, traits, Allocator>&& rhs);

4 Effects: Equivalent to:

rhs.insert(0, lhs);
return std::move(rhs);

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);

5 Effects: Equivalent to:

basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);

6 Effects: Equivalent to:

basic_string<charT, traits, Allocator> r = rhs;
r.insert(r.begin(), lhs);
return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);

7 Effects: Equivalent to:

rhs.insert(rhs.begin(), rhs);
return std::move(rhs);

template<class charT, class traits, class Allocator>  
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);

8 Effects: Equivalent to:

basic_string<charT, traits, Allocator> r = lhs;
r.push_back(rhs);
return r;
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);

Effects: Equivalent to:
lhs.push_back(rhs);
return std::move(lhs);

23.4.4.2 Non-member comparison operator functions [string.cmp]

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
const basic_string<charT, traits, Allocator>& rhs) noexcept;

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
const charT* rhs);

Effects: Let op be the operator. Equivalent to:
return basic_string_view<charT, traits>(lhs)
oncall(lhs, rhs);

23.4.4.3 swap [string.special]

template<class charT, class traits, class Allocator>
constexpr void swap(basic_string<charT, traits, Allocator>& lhs,
basic_string<charT, traits, Allocator>& rhs) noexcept(noexcept(lhs.swap(rhs)));

Effects: Equivalent to lhs.swap(rhs).

23.4.4.4 Inserters and extractors [string.io]

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>&& is, basic_string<charT, traits, Allocator>& str);

Effects: Behaves as a formatted input function (31.7.4.3.1). After constructing a sentry object, if the sentry object returns true when converted to a value of type bool, calls str.erase() and then extracts characters from is and appends them to str as if by calling str.append(1, c). If is.width() is greater than zero, the maximum number n of characters appended is is.width(); otherwise n is str.max_size(). Characters are extracted and appended until any of the following occurs:

(1.1) n characters are stored;
(1.2) end-of-file occurs on the input sequence;
(1.3) isspace(c, is.getloc()) is true for the next available input character c.

After the last character (if any) is extracted, is.width(0) is called and the sentry object is destroyed.

If the function extracts no characters, it calls is.setstate(ios_base::failbit), which may throw ios_base::failure (31.5.4.4).

Returns: is.

template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&& os, const basic_string<charT, traits, Allocator>& str);

Effects: Equivalent to: return os << basic_string_view<charT, traits>(str);
template<
class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
    basic_string<charT, traits, Allocator>& str,
    charT delim);

template<
class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
    basic_string<charT, traits, Allocator>& str,
    charT delim);

template<
class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
    basic_string<charT, traits, Allocator>& str,
    charT delim);

Effects: Behaves as an unformatted input function (31.7.4.4), except that it does not affect the value returned by subsequent calls to basic_istream<>::gcount(). After constructing a sentry object, if the sentry object returns true when converted to a value of type bool, calls str.erase() and then extracts characters from is and appends them to str as if by calling str.append(1, c) until any of the following occurs:

(6.1) end-of-file occurs on the input sequence (in which case, the getline function calls is.setstate(ios_base::eofbit)).

(6.2) traits::eq(c, delim) for the next available input character c (in which case, c is extracted but not appended) (31.5.4.4)

(6.3) str.max_size() characters are stored (in which case, the function calls is.setstate(ios_base::failbit)) (31.5.4.4)

The conditions are tested in the order shown. In any case, after the last character is extracted, the sentry object is destroyed.

If the function extracts no characters, it calls is.setstate(ios_base::failbit) which may throw ios_base::failure (31.5.4.4).

Returns: is.

template<
class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is,
    basic_string<charT, traits, Allocator>& str);

template<
class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>&& is,
    basic_string<charT, traits, Allocator>& str);

Returns: getline(is, str, is.widen(’\n’)).

23.4.4.5 Erasure [string.erase]

template<
class charT, class traits, class Allocator, class U>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase(basic_string<charT, traits, Allocator>& c, const U& value);

Effects: Equivalent to:

auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<
class charT, class traits, class Allocator, class Predicate>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);

Effects: Equivalent to:

auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;
23.4.5 Numeric conversions

int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);

Effects: The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

Throws: `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion can be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll` or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
long double stdold(const string& str, size_t* idx = nullptr);

Effects: These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

Throws: `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion can be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(float val);
string to_string(double val);

Returns: Each function returns a `string` object holding the character representation of the value of its argument that would be generated by calling `sprintf(buf, fmt, val)` with a format specifier of "%d", "%u", "%ld", "%lu", "%lld", "%llu", "%f", "%f", or "%Lf", respectively, where `buf` designates an internal character buffer of sufficient size.

int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);

Effects: The first two functions call `wcstol(str.c_str(), ptr, base)`, and the last three functions call `wcstoul(str.c_str(), ptr, base)`, `wcstoll(str.c_str(), ptr, base)`, and `wcstoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

Returns: The converted result.

§ 23.4.5 834
**§ 23.4.6 Hash support**

template<> struct hash<string>;
template<> struct hash<u8string>;
template<> struct hash<u16string>;
template<> struct hash<u32string>;

**§ 23.4.7 Suffix for basic_string literals**

constexpr string operator"s(const char* str, size_t len);

Returns: string{str, len}.

constexpr u8string operator"s(const char8_t* str, size_t len);

Returns: u8string{str, len}.

constexpr u16string operator"s(const char16_t* str, size_t len);

Returns: u16string{str, len}.

constexpr u32string operator"s(const char32_t* str, size_t len);

Returns: u32string{str, len}.
constexpr wstring operator"s(const wchar_t* str, size_t len);

Returns: wstring(str, len).

[Note 1: The same suffix s is used for chrono::duration literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

23.5 Null-terminated sequence utilities

23.5.1 Header <cctype> synopsis

namespace std {
    int isalnum(int c);
    int isalpha(int c);
    int isblank(int c);
    int iscntrl(int c);
    int isdigit(int c);
    int isgraph(int c);
    int islower(int c);
    int isprint(int c);
    int ispunct(int c);
    int isspace(int c);
    int isupper(int c);
    int isxdigit(int c);
    int tolower(int c);
    int toupper(int c);
}

1 The contents and meaning of the header <cctype> are the same as the C standard library header <ctype.h>.

See also: ISO C 7.4

23.5.2 Header <cwctype> synopsis

namespace std {
    using wint_t = see below;
    using wctrans_t = see below;
    using wctype_t = see below;

    int iswalnum(wint_t wc);
    int iswalpha(wint_t wc);

}

#define WEOF see below

1 The contents and meaning of the header <cwctype> are the same as the C standard library header <wctype.h>.

See also: ISO C 7.30

23.5.3 Header <cstring> synopsis

namespace std {
    using size_t = see 17.2.4;
The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`. The functions `strerror` and `strtok` are not required to avoid data races (16.4.6.10). The functions `memcpy` and `memmove` are signal-safe (17.13.5). Both functions implicitly create objects (6.7.2) in the destination region of storage immediately prior to copying the sequence of characters to the destination.

[Note 1: The functions `strchr`, `strpbrk`, `strrchr`, `strstr`, and `memchr`, have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — end note]

See also: ISO C 7.24

### 23.5.4 Header `<cwchar>` synopsis

§ 23.5.4

838
23.5.5 Header <cuchar> synopsis

namespace std {
  using mbstate_t = see below;
  using size_t = see 17.2.4;

  size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
  size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
  size_t mbrtoc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
  size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
  size_t mbrtoc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
  size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
}

The contents and meaning of the header <cuchar> are the same as the C standard library header <uchar.h>, except that it declares the additional mbrtoc8 and c8rtomb functions and does not declare types char16_t nor char32_t.

See also: ISO C 7.28

23.5.6 Multibyte / wide string and character conversion functions

[Note 1: The headers <cstdlib> (17.2.2), <cuchar> (23.5.5), and <cwchar> (23.5.4) declare the functions described in this subclause. — end note]

int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);

Effects: These functions have the semantics specified in the C standard library.

See also: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);

Effects: These functions have the semantics specified in the C standard library.

Remarks: Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

See also: ISO C 7.22.7

size_t mbrcat(size_t mbrcat(const char* s, size_t n, mbstate_t* ps);
size_t mbtowc wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb wchar_t* s, wchar_t wchar, mbstate_t* ps);
size_t mbstowcs wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcstombs wchar_t* dst, const wchar_t** src, size_t len, mbstate_t* ps);

Effects: These functions have the semantics specified in the C standard library.

Remarks: Calling these functions with an mbstate_t* argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an mbstate_t* argument that is a null pointer value.

See also: ISO C 7.29.6.3

size_t mbrtoc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to mbrtoc8(nullptr, "", 1, ps). Otherwise, the function inspects at most n bytes beginning with the byte pointed to by s to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if pc8 is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by pc8. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000 NULL, the resulting state described is the initial conversion state.

Returns: The first of the following that applies (given the current conversion state):
(8.1) 0, if the next \( n \) or fewer bytes complete the multibyte character that corresponds to the \( \text{u+0000} \) NULL Unicode character (which is the value stored).

(8.2) Between 1 and \( n \) (inclusive), if the next \( n \) or fewer bytes complete a valid multibyte character (whose first (or only) code unit is stored); the value returned is the number of bytes that complete the multibyte character.

(8.3) \( \text{size_t}(-3) \), if the next code unit resulting from a previous call has been stored (no bytes from the input have been consumed by this call).

(8.4) \( \text{size_t}(-2) \), if the next \( n \) bytes contribute to an incomplete (but potentially valid) multibyte character, and all \( n \) bytes have been processed (no value is stored).

(8.5) \( \text{size_t}(-1) \), if an encoding error occurs, in which case the next \( n \) or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro \text{EILSEQ} is stored in \text{errno}, and the conversion state is unspecified.

size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);

Effects: If \( s \) is a null pointer, equivalent to c8rtomb(buf, u8'\0', ps) where \( \text{buf} \) is an internal buffer. Otherwise, if \( \text{c8} \) completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by \( s \). At most \text{MB_CUR_MAX} bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

Returns: The number of bytes stored in the array object (including any shift sequences). If \( \text{c8} \) does not contribute to a sequence of char8_t corresponding to a valid multibyte character, the value of the macro \text{EILSEQ} is stored in \text{errno}, (size_t) (-1) is returned, and the conversion state is unspecified.

Remarks: Calls to c8rtomb with a null pointer argument for \( s \) may introduce a data race (16.4.6.10) with other calls to c8rtomb with a null pointer argument for \( s \).
24 Containers library

24.1 General

This Clause describes components that C++ programs may use to organize collections of information.

The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 78.

24.2 Requirements

24.2.1 Preamble

Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

[Example 1: The copy constructor of type vector<vector<int>> has linear complexity, even though the complexity of copying each contained vector<int> is itself linear. — end example]

Allocators-aware containers (24.2.2.5) other than basic_string construct elements using the function allocator_traits<allocator_type>::rebind_traits<U>::construct and destroy elements using the function allocator_traits<allocator_type>::rebind_traits<U>::destroy (20.2.8.3), where U is either allocator_type::value_type or an internal type used by the container. These functions are called only for the container’s element type, not for internal types used by the container.

[Note 1: This means, for example, that a node-based container would need to construct nodes containing aligned buffers and call construct to place the element into the buffer. — end note]

24.2.2 General containers

24.2.2.1 General

In subclause 24.2.2,

1. X denotes a container class containing objects of type T,
2. a and b denote values of type X,
3. i and j denote values of type (possibly const) X::iterator,
4. u denotes an identifier,
5. r denotes a non-const value of type X, and
6. rv denotes a non-const rvalue of type X.

A type X meets the container requirements if the following types, statements, and expressions are well-formed and have the specified semantics.

typename X::value_type

Result: T
Preconditions: T is Cpp17Erasable from X (see 24.2.2.5, below).

typename X::reference
Result: T&

typename X::const_reference
Result: const T&

typename X::iterator
Result: A type that meets the forward iterator requirements (25.3.5.5) with value type T. The type X::iterator is convertible to X::const_iterator.

typename X::const_iterator
Result: A type that meets the requirements of a constant iterator and those of a forward iterator with value type T.

typename X::difference_type
Result: A signed integer type, identical to the difference type of X::iterator and X::const_iterator.

typename X::size_type
Result: An unsigned integer type that can represent any non-negative value of X::difference_type.

X u;
X u = X();
Postconditions: u.empty()
Complexity: Constant.

X u(a);
X u = a;
Preconditions: T is Cpp17CopyInsertable into X (see below).
Postconditions: u == a
Complexity: Linear.

X u(rv);
X u = rv;
Postconditions: u is equal to the value that rv had before this construction.
Complexity: Linear for array and constant for all other standard containers.

a = rv
Result: X&.
Effects: All existing elements of a are either move assigned to or destroyed.
Postconditions: If a and rv do not refer to the same object, a is equal to the value that rv had before this assignment.
Complexity: Linear.

a.~X()
Result: void
Effects: Destroys every element of a; any memory obtained is deallocated.
Complexity: Linear.

a.begin()
Result: iterator; const_iterator for constant a.
Returns: An iterator referring to the first element in the container.
Complexity: Constant.
a.end()

Result: iterator; const_iterator for constant a.
Returns: An iterator which is the past-the-end value for the container.
Complexity: Constant.

a.cbegin()

Result: const_iterator.
Returns: const_cast<X const&>(a).begin()
Complexity: Constant.

a.cend()

Result: const_iterator.
Returns: const_cast<X const&>(a).end()
Complexity: Constant.

i <=> j

Result: strong_ordering.
Constraints: X::iterator meets the random access iterator requirements.
Complexity: Constant.

a == b

Preconditions: T meets the Cpp17EqualityComparable requirements.
Result: Convertible to bool.
Returns: equal(a.begin(), a.end(), b.begin(), b.end())
[Note 1: The algorithm equal is defined in 27.6.11. — end note]
Complexity: Constant if a.size() != b.size(), linear otherwise.
Remarks: == is an equivalence relation.

a != b

Effects: Equivalent to !(a == b).

a.swap(b)

Result: void
Effects: Exchanges the contents of a and b.
Complexity: Linear for array and constant for all other standard containers.

swap(a, b)

Effects: Equivalent to a.swap(b).

r = a

Result: X&.
Postconditions: r == a.
Complexity: Linear.

a.size()

Result: size_type.
Returns: distance(a.begin(), a.end()), i.e. the number of elements in the container.
Complexity: Constant.
Remarks: The number of elements is defined by the rules of constructors, inserts, and erases.
a.max_size()

*Result:* size_type.
*Returns:* distance(begin(), end()) for the largest possible container.
*Complexity:* Constant.

a.empty()

*Result:* Convertible to bool.
*Returns:* a.begin() == a.end()
*Complexity:* Constant.
*Remarks:* If the container is empty, then a.empty() is true.

In the expressions

\[ i == j \]
\[ i != j \]
\[ i < j \]
\[ i <= j \]
\[ i >= j \]
\[ i > j \]
\[ i <-> j \]
\[ i - j \]

where \( i \) and \( j \) denote objects of a container’s iterator type, either or both may be replaced by an object of the container’s const_iterator type referring to the same element with no change in semantics.

Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see 16.4.4.6).

[Note 2: In particular, containers and iterators do not store references to allocated elements other than through the allocator’s pointer type, i.e., as objects of type \( P \) or `pointer_traits<>::template rebind<unspecified>`, where \( P \) is `allocator_traits<>::pointer`.
— end note]

Copy constructors for these container types obtain an allocator by calling `allocator_traits<>::select_on_container_copy_construction` on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a `const allocator_type&` argument.

[Note 3: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization.
— end note]

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or `swap()`. Allocators are replaced by copy assignment, move assignment, or swapping of the allocator only if

\[ \text{allocator_traits<>::propagate_on_container_copy_assignment::value} \]
\[ \text{allocator_traits<>::propagate_on_container_move_assignment::value} \]
\[ \text{allocator_traits<>::propagate_on_container_swap::value} \]

is true within the implementation of the corresponding container operation. In all container types defined in this Clause, the member `get_allocator()` returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

The expression `a.swap(b)`, for containers \( a \) and \( b \) of a standard container type other than `array`, shall exchange the values of \( a \) and \( b \) without invoking any move, copy, or swap operations on the individual container elements. If values of any `Compare`, `Pred`, or `Hash` types belonging to \( a \) and \( b \) shall be swappable and shall be exchanged by calling `swap` as described in 16.4.4.3. If `allocator_traits<>::propagate_on_container_swap::value` is true, then values of type `allocator_type` shall be swappable and the allocators of \( a \) and \( b \) shall also be exchanged by calling `swap` as described in 16.4.4.3. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless \( a.get_allocator() == b.get_allocator() \). Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value `a.end()` before the swap will have value `b.end()` after the swap.
24.2.2.3 Reversible container requirements

A type \( X \) meets the reversible container requirements if \( X \) meets the container requirements, the iterator type of \( X \) belongs to the bidirectional or random access iterator categories (25.3), and the following types and expressions are well-formed and have the specified semantics.

```cpp
typename X::reverse_iterator
```

Result: The type `reverse_iterator<X::iterator>`, an iterator type whose value type is `T`.

```cpp
typename X::const_reverse_iterator
```

Result: The type `reverse_iterator<X::const_iterator>`, a constant iterator type whose value type is `T`.

```cpp
a.rbegin()
```

Result: `reverse_iterator; const_reverse_iterator` for constant `a`.

Returns: `reverse_iterator(end())`

Complexity: Constant.

```cpp
a.rend()
```

Result: `reverse_iterator; const_reverse_iterator` for constant `a`.

Returns: `reverse_iterator(begin())`

Complexity: Constant.

```cpp
a.crbegin()
```

Result: `const_reverse_iterator`.

Returns: `const_cast<X const&>(a).rbegin()`

Complexity: Constant.

```cpp
a.crend()
```

Result: `const_reverse_iterator`.

Returns: `const_cast<X const&>(a).rend()`

Complexity: Constant.

Unless otherwise specified (see 24.2.7.2, 24.2.8.2, 24.3.8.4, and 24.3.11.5) all container types defined in this Clause meet the following additional requirements:

1. if an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.
2. if an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.
3. no `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.
4. no copy constructor or assignment operator of a returned iterator throws an exception.
5. no `swap()` function throws an exception.
6. no `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

[Note 1: The `end()` iterator does not refer to any element, so it can be invalidated. — end note]

Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

A contiguous container is a container whose member types `iterator` and `const_iterator` meet the `Cpp17RandomAccessIterator` requirements (25.3.5.7) and model `contiguous_iterator` (25.3.4.14).

24.2.2.4 Optional container requirements

The following operations are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics as described unless otherwise stated. If the
Iterators passed to `lexicographical_compare_three_way` meet the constexpr iterator requirements (25.3.1) then the operations described below are implemented by constexpr functions.

```cpp
a <=> b
```

2. **Result:** `synth-three-way-result<X::value_type>`.  

3. **Preconditions:** Either `<=>` is defined for values of type (possibly const) `T`, or `<` is defined for values of type (possibly const) `T` and `<` is a total ordering relationship.

4. **Returns:** `lexicographical_compare_three_way(a.begin(), a.end(), b.begin(), b.end(), synth-three-way)`  
   
   [Note 1: The algorithm `lexicographical_compare_three_way` is defined in Clause 27. — end note]

5. **Complexity:** Linear.

### 24.2.2.5 Allocator-aware containers

1. All of the containers defined in Clause 24 and in 23.4.3 except `array` meet the additional requirements of an `allocator-aware container`, as described below.

2. Given an allocator type `A` and given a container type `X` having a `value_type` identical to `T` and an `allocator-type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue `m` of type `A`, a pointer `p` of type `T*`, an expression `v` of type (possibly const) `T`, and an rvalue `rv` of type `T`, the following terms are defined. If `X` is not allocator-aware or is a specialization of `basic_string`, the terms below are defined as if `A` were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

   1. **(2.1)** `T` is `Cpp17DefaultInsertable into X` means that the following expression is well-formed:
      ```cpp
      allocator_traits<A>::construct(m, p)
      ```

   2. **(2.2)** An element of `X` is `default-inserted` if it is initialized by evaluation of the expression
      ```cpp
      allocator_traits<A>::construct(m, p)
      ```
      where `p` is the address of the uninitialized storage for the element allocated within `X`.

   3. **(2.3)** `T` is `Cpp17MoveInsertable into X` means that the following expression is well-formed:
      ```cpp
      allocator_traits<A>::construct(m, p, rv)
      ```
      and its evaluation causes the following postcondition to hold: The value of `*p` is equivalent to the value of `rv` before the evaluation.

   [Note 1: `rv` remains a valid object. Its state is unspecified — end note]

   4. **(2.4)** `T` is `Cpp17CopyInsertable into X` means that, in addition to `T` being `Cpp17MoveInsertable` into `X`, the following expression is well-formed:
      ```cpp
      allocator_traits<A>::construct(m, p, v)
      ```
      and its evaluation causes the following postcondition to hold: The value of `v` is unchanged and is equivalent to `*p`.

   5. **(2.5)** `T` is `Cpp17EmplaceConstructible into X from args`, for zero or more arguments `args`, means that the following expression is well-formed:
      ```cpp
      allocator_traits<A>::construct(m, p, args)
      ```

   6. **(2.6)** `T` is `Cpp17Erasable from X` means that the following expression is well-formed:
      ```cpp
      allocator_traits<A>::destroy(m, p)
      ```

   [Note 2: A container calls `allocator_traits<A>::construct(m, p, args)` to construct an element at `p` using `args`, with `m == get_allocator()`. The default `construct` in `allocator` will call `::new((void*)p) T(args)`, but specialized allocators can choose a different definition. — end note]

3. The following exposition-only concept is used in the definition of containers:

   ```cpp
template<class R, class T>
concept container-compatible-range = // exposition only
   ranges::input_range<R> && convertible_to<ranges::range_reference_t<R>, T>;
```

4. In this subclause,

   1. **(4.1)** `X` denotes an allocator-aware container class with a `value_type` of `T` using an allocator of type `A`,
(4.2) u denotes a variable,
(4.3) a and b denote non-const lvalues of type X,
(4.4) c denotes an lvalue of type const X,
(4.5) t denotes an lvalue or a const rvalue of type X,
(4.6) rv denotes a non-const rvalue of type X, and
(4.7) m is a value of type A.

A type X meets the allocator-aware container requirements if X meets the container requirements and the following types, statements, and expressions are well-formed and have the specified semantics.

typename X::allocator_type

Result: A

Preconditions: allocator_type::value_type is the same as X::value_type.

c.get_allocator()

Result: A

Complexity: Constant.

X u;
X u = X();

Preconditions: A meets the Cpp17DefaultConstructible requirements.

Postconditions: u.empty() returns true, u.get_allocator() == A().

Complexity: Constant.

X u(m);

Postconditions: u.empty() returns true, u.get_allocator() == m.

Complexity: Constant.

X u(t, m);

Preconditions: T is Cpp17CopyInsertable into X.

Postconditions: u == t, u.get_allocator() == m

Complexity: Linear.

X u(rv);

Postconditions: u has the same elements as rv had before this construction; the value of u.get_allocator() is the same as the value of rv.get_allocator() before this construction.

Complexity: Constant.

X u(rv, m);

Preconditions: T is Cpp17MoveInsertable into X.

Postconditions: u has the same elements, or copies of the elements, that rv had before this construction, u.get_allocator() == m.

Complexity: Constant if m == rv.get_allocator(), otherwise linear.

a = t

Result: X&.

Preconditions: T is Cpp17CopyInsertable into X and Cpp17CopyAssignable.

Postconditions: a == t is true.

Complexity: Linear.

a = rv

Result: X&.
Preconditions: If allocator_traits<allocator_type>::propagate_on_container_move_assignment::value is false, T is Cpp17MoveInsertable into X and Cpp17MoveAssignable.

Effects: All existing elements of a are either move assigned to or destroyed.

Postconditions: If a and rv do not refer to the same object, a is equal to the value that rv had before this assignment.

Complexity: Linear.

a.swap(b)

Result: void

Effects: Exchanges the contents of a and b.

Complexity: Constant.

The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type A shall not qualify as an allocator unless it meets both of the following conditions:

(34.1) — The qualified-id A::value_type is valid and denotes a type (13.10.3).
(34.2) — The expression declval<A&>().allocate(size_t{}) is well-formed when treated as an unevaluated operand.

24.2.3 Container data races

For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be const: begin, end, rbegin, rend, front, back, data, find, lower_bound, upper_bound, equal_range, at and, except in associative or unordered associative containers, operator[].

Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting vector<bool>, are modified concurrently.

[Note 1: For a vector<int> x with a size greater than one, x[1] = 5 and *x.begin() = 10 can be executed concurrently without a data race, but x[0] = 5 and *x.begin() = 10 executed concurrently can result in a data race. As an exception to the general rule, for a vector<bool> y, y[0] = true can race with y[1] = true. — end note]

24.2.4 Sequence containers

A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: vector, forward_list, list, and deque. In addition, array is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as stacks or queues, out of the basic sequence container kinds (or out of other kinds of sequence containers that the user defines).

[Note 1: The sequence containers offer the programmer different complexity trade-offs. vector is appropriate in most circumstances. array has a fixed size known during translation. list or forward_list support frequent insertions and deletions from the middle of the sequence. deque supports efficient insertions and deletions taking place at the beginning or at the end of the sequence. When choosing a container, remember vector is best; leave a comment to explain if you choose from the rest! — end note]

In this subclause,

(3.1) — X denotes a sequence container class,
(3.2) — a denotes a value of type X containing elements of type T,
(3.3) — u denotes the name of a variable being declared,
(3.4) — A denotes X::allocator_type if the qualified-id X::allocator_type is valid and denotes a type (13.10.3) and allocator<T> if it doesn’t,
(3.5) — i and j denote iterators that meet the Cpp17InputIterator requirements and refer to elements implicitly convertible to value_type,
(3.6) — [i, j) denotes a valid range,
rg denotes a value of a type R that models container-compatible-range<T>,

il designates an object of type initializer_list<value_type>,

n denotes a value of type X::size_type,

p denotes a valid constant iterator to a,

q denotes a valid dereferenceable constant iterator to a,

[q1, q2) denotes a valid range of constant iterators in a,

t denotes an lvalue or a const rvalue of X::value_type, and

rv denotes a non-const rvalue of X::value_type.

Args denotes a template parameter pack;

args denotes a function parameter pack with the pattern Args&&.

The complexities of the expressions are sequence dependent.

A type X meets the sequence container requirements if X meets the container requirements and the following statements and expressions are well-formed and have the specified semantics.

X u(n, t);

Preconditions: T is Cpp17CopyInsertable into X.

Effects: Constructs a sequence container with n copies of t.

Postconditions: distance(u.begin(), u.end()) == n is true.

X u(i, j);

Preconditions: T is Cpp17EmplaceConstructible into X from *i. For vector, if the iterator does not meet the Cpp17ForwardIterator requirements (25.3.5.5), T is also Cpp17MoveInsertable into X.

Effects: Constructs a sequence container equal to the range [i, j). Each iterator in the range [i, j) is dereferenced exactly once.

Postconditions: distance(u.begin(), u.end()) == distance(i, j) is true.

X(from_range, rg)

Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For vector, if R models neither sized_range nor forward_range, T is also Cpp17MoveInsertable into X.

Effects: Constructs a sequence container equal to the range rg. Each iterator in the range rg is dereferenced exactly once.

Postconditions: distance(begin(), end()) == ranges::distance(rg) is true.

X(il)

Effects: Equivalent to X(il.begin(), il.end()).

a = il

Result: X&.

Preconditions: T is Cpp17CopyInsertable into X and Cpp17CopyAssignable.

Effects: Assigns the range [il.begin(), il.end()) into a. All existing elements of a are either assigned to or destroyed.

Returns: *this.

a.emplace(p, args)

Result: iterator.

Preconditions: T is Cpp17EmplaceConstructible into X from args. For vector and deque, T is also Cpp17MoveInsertable into X and Cpp17MoveAssignable.

Effects: Inserts an object of type T constructed with std::forward<Args>(args)… before p.

[Note 2: args can directly or indirectly refer to a value in a. — end note]

Returns: An iterator that points to the new element constructed from args into a.
a.insert(p, t)
   Result: iterator.
   Preconditions: T is Cpp17CopyInsertable into X. For vector and deque, T is also Cpp17CopyAssignable.
   Effects: Inserts a copy of t before p.
   Returns: An iterator that points to the copy of t inserted into a.

a.insert(p, rv)
   Result: iterator.
   Preconditions: T is Cpp17MoveInsertable into X. For vector and deque, T is also Cpp17MoveAssignable.
   Effects: Inserts a copy of rv before p.
   Returns: An iterator that points to the copy of rv inserted into a.

a.insert(p, n, t)
   Result: iterator.
   Preconditions: T is Cpp17CopyInsertable into X and Cpp17CopyAssignable.
   Effects: Inserts n copies of t before p.
   Returns: An iterator that points to the copy of the first element inserted into a, or p if n == 0.

a.insert(p, i, j)
   Result: iterator.
   Preconditions: T is Cpp17EmplaceConstructible into X from *i. For vector and deque, T is also Cpp17MoveInsertable into X, Cpp17MoveConstructible, Cpp17MoveAssignable, and swappable (16.4.4.3). Neither i nor j are iterators into a.
   Effects: Inserts copies of elements in [i, j) before p. Each iterator in the range [i, j) shall be dereferenced exactly once.
   Returns: An iterator that points to the copy of the first element inserted into a, or p if i == j.

a.insert_range(p, rg)
   Result: iterator.
   Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For vector and deque, T is also Cpp17MoveInsertable into X, Cpp17MoveConstructible, Cpp17MoveAssignable, and swappable (16.4.4.3). rg and a do not overlap.
   Effects: Inserts copies of elements in rg before p. Each iterator in the range rg is dereferenced exactly once.
   Returns: An iterator that points to the copy of the first element inserted into a, or p if rg is empty.

a.insert(p, il)
   Effects: Equivalent to a.insert(p, il.begin(), il.end()).

a.erase(q)
   Result: iterator.
   Preconditions: For vector and deque, T is Cpp17MoveAssignable.
   Effects: Erases the element pointed to by q.
   Returns: An iterator that points to the element immediately following q prior to the element being erased. If no such element exists, a.end() is returned.

a.erase(q1, q2)
   Result: iterator.
   Preconditions: For vector and deque, T is Cpp17MoveAssignable.
   Effects: Erases the elements in the range [q1, q2).
Returns: An iterator that points to the element pointed to by \( q2 \) prior to any elements being erased. If no such element exists, \( \texttt{a.end()} \) is returned.

\( \texttt{a.clear()} \)

Result: \( \texttt{void} \)

Effects: Destroys all elements in \( \texttt{a} \). Invalidates all references, pointers, and iterators referring to the elements of \( \texttt{a} \) and may invalidate the past-the-end iterator.

Postconditions: \( \texttt{a.empty()} \) is true.

Complexity: Linear.

\( \texttt{a.assign(i, j)} \)

Result: \( \texttt{void} \)

Preconditions: \( \texttt{T} \) is \( \texttt{Cpp17EmplaceConstructible} \) into \( \texttt{X} \) from \( \texttt{*i} \) and assignable from \( \texttt{*i} \). For \texttt{vector}, if the iterator does not meet the forward iterator requirements (25.3.5.5), \( \texttt{T} \) is also \( \texttt{Cpp17MoveInsertable} \) into \( \texttt{X} \). Neither \( \texttt{i} \) nor \( \texttt{j} \) are iterators into \( \texttt{a} \).

Effects: Replaces elements in \( \texttt{a} \) with a copy of \( \texttt{[i, j)} \). Invalidates all references, pointers and iterators referring to the elements of \( \texttt{a} \). For \texttt{vector} and \texttt{deque}, also invalidates the past-the-end iterator. Each iterator in the range \( \texttt{[i, j)} \) is dereferenced exactly once.

\( \texttt{a.assign\_range(rg)} \)

Result: \( \texttt{void} \)

Mandates: \( \texttt{assignable\_from<T&, ranges::range\_reference\_t<R>}> \) is modeled.

Preconditions: \( \texttt{T} \) is \( \texttt{Cpp17EmplaceConstructible} \) into \( \texttt{X} \) from \( \texttt{ranges::begin(rg)} \). For \texttt{vector}, if \( \texttt{R} \) models neither \texttt{sized\_range} nor \texttt{forward\_range}, \( \texttt{T} \) is also \( \texttt{Cpp17MoveInsertable} \) into \( \texttt{X} \). \( \texttt{rg} \) and \( \texttt{a} \) do not overlap.

Effects: Replaces elements in \( \texttt{a} \) with a copy of each element in \( \texttt{rg} \). Invalidates all references, pointers, and iterators referring to the elements of \( \texttt{a} \). For \texttt{vector} and \texttt{deque}, also invalidates the past-the-end iterator. Each iterator in the range \( \texttt{rg} \) is dereferenced exactly once.

\( \texttt{a.assign(il)} \)

Effects: Equivalent to \( \texttt{a.assign(il.begin(), il.end())} \).

\( \texttt{a.assign(n, t)} \)

Result: \( \texttt{void} \)

Preconditions: \( \texttt{T} \) is \( \texttt{Cpp17CopyInsertable} \) into \( \texttt{X} \) and \( \texttt{Cpp17CopyAssignable} \). \( \texttt{t} \) is not a reference into \( \texttt{a} \).

Effects: Replaces elements in \( \texttt{a} \) with \( \texttt{n} \) copies of \( \texttt{t} \). Invalidates all references, pointers and iterators referring to the elements of \( \texttt{a} \). For \texttt{vector} and \texttt{deque}, also invalidates the past-the-end iterator.

For every sequence container defined in this Clause and in Clause 23:

(68.1) — If the constructor

\[
\text{template<class InputIterator>}
\text{X(InputIterator first, InputIterator last,}
\text{ const allocator\_type& alloc = allocator\_type());}
\]

is called with a type \texttt{InputIterator} that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(68.2) — If the member functions of the forms:

\[
\text{template<class InputIterator>}
\text{return\_type F(const\_iterator p,}
\text{ InputIterator first, InputIterator last);} \quad \text{// such as insert}
\]

\[
\text{template<class InputIterator>}
\text{return\_type F(InputIterator first, InputIterator last);} \quad \text{// such as append, assign}
\]
are called with a type InputIterator that does not qualify as an input iterator, then these functions shall not participate in overload resolution.

— A deduction guide for a sequence container shall not participate in overload resolution if it has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter, or if it has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.

The following operations are provided for some types of sequence containers but not others. An implementation shall implement them so as to take amortized constant time.

a.front()

Result: reference; const_reference for constant a.

Returns: *a.begin()

Remarks: Required for basic_string, array, deque, forward_list, list, and vector.

a.back()

Result: reference; const_reference for constant a.

Effects: Equivalent to:
  auto tmp = a.end();
  --tmp;
  return *tmp;

Remarks: Required for basic_string, array, deque, list, and vector.

a.emplace_front(args)

Result: reference

Preconditions: T is Cpp17EmplaceConstructible into X from args.

Effects: Prepends an object of type T constructed with std::forward<Args>(args)....

Returns: a.front().

Remarks: Required for deque, forward_list, and list.

a.emplace_back(args)

Result: reference

Preconditions: T is Cpp17EmplaceConstructible into X from args. For vector, T is also Cpp17MoveInsertable into X.

Effects: Appends an object of type T constructed with std::forward<Args>(args)....

Returns: a.back().

Remarks: Required for deque, list, and vector.

a.push_front(t)

Result: void

Preconditions: T is Cpp17CopyInsertable into X.

Effects: Prepends a copy of t.

Remarks: Required for deque, forward_list, and list.

a.push_front(rv)

Result: void

Preconditions: T is Cpp17MoveInsertable into X.

Effects: Prepends a copy of rv.

Remarks: Required for deque, forward_list, and list.
a.prepend_range(rg)

Result: void

 Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg).

 Effects: Inserts copies of elements in rg before begin(). Each iterator in the range rg is dereferenced exactly once.

 [Note 3: The order of elements in rg is not reversed. — end note]

 Remarks: Required for deque, forward_list, and list.

a.push_back(t)

Result: void

 Preconditions: T is Cpp17CopyInsertable into X.

 Effects: Appends a copy of t.

 Remarks: Required for basic_string, deque, list, and vector.

a.push_back(rv)

Result: void

 Preconditions: T is Cpp17MoveInsertable into X.

 Effects: Appends a copy of rv.

 Remarks: Required for basic_string, deque, list, and vector.

a.append_range(rg)

Result: void

 Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For vector, T is also Cpp17MoveInsertable into X.

 Effects: Inserts copies of elements in rg before end(). Each iterator in the range rg is dereferenced exactly once.

 Remarks: Required for deque, list, and vector.

a.pop_front()

Result: void

 Preconditions: a.empty() is false.

 Effects: Destroys the first element.

 Remarks: Required for deque, forward_list, and list.

a.pop_back()

Result: void

 Preconditions: a.empty() is false.

 Effects: Destroys the last element.

 Remarks: Required for basic_string, deque, list, and vector.

a[n]

Result: reference; const_reference for constant a

 Returns: *(a.begin() + n)

 Remarks: Required for basic_string, array, deque, and vector.

a.at(n)

Result: reference; const_reference for constant a

 Returns: *(a.begin() + n)

 Throws: out_of_range if n >= a.size().

 Remarks: Required for basic_string, array, deque, and vector.
24.2.5 Node handles

24.2.5.1 Overview

A node handle is an object that accepts ownership of a single element from an associative container (24.2.7) or an unordered associative container (24.2.8). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 79.

Table 79: Container types with compatible nodes

<table>
<thead>
<tr>
<th>Container Type 1</th>
<th>Container Type 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>map&lt;K, T, C1, A&gt;</td>
<td>map&lt;K, T, C2, A&gt;</td>
</tr>
<tr>
<td>map&lt;K, T, C1, A&gt;</td>
<td>multimap&lt;K, T, C2, A&gt;</td>
</tr>
<tr>
<td>set&lt;K, C1, A&gt;</td>
<td>set&lt;K, C2, A&gt;</td>
</tr>
<tr>
<td>set&lt;K, C1, A&gt;</td>
<td>multiset&lt;K, C2, A&gt;</td>
</tr>
<tr>
<td>unordered_map&lt;K, T, H1, E1, A&gt;</td>
<td>unordered_map&lt;K, T, H2, E2, A&gt;</td>
</tr>
<tr>
<td>unordered_set&lt;K, H1, E1, A&gt;</td>
<td>unordered_multiset&lt;K, H2, E2, A&gt;</td>
</tr>
</tbody>
</table>

If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

Class node-handle is for exposition only.

If a user-defined specialization of pair exists for pair<const Key, T> or pair<Key, T>, where Key is the container’s key_type and T is the container’s mapped_type, the behavior of operations involving node handles is undefined.

```cpp
template<unspecialized>
class node-handle {
  public:
    // These type declarations are described in 24.2.7 and 24.2.8.
    using value_type = see below; // not present for map containers
    using key_type = see below;   // not present for set containers
    using mapped_type = see below; // not present for set containers
    using allocator_type = see below;

    private:
    using container_node_type = unspecified; // exposition only
    using ator_traits = allocator_traits<allocator_type>; // exposition only
    typename ator_traits::template rebind_traits<container_node_type>::pointer ptr_; // exposition only
    optional<allocator_type> alloc_; // exposition only

  public:
    // 24.2.5.2, constructors, copy, and assignment
    constexpr node-handle() noexcept : ptr_(), alloc_() {}
    node-handle(node-handle&&) noexcept;
    node-handle& operator=(node-handle&&);

    ~node-handle();

    // 24.2.5.3, destructor
    ~node-handle();

    // 24.2.5.4, observers
    value_type& value() const; // not present for map containers
    key_type& key() const;     // not present for set containers
    mapped_type& mapped() const; // not present for set containers

    allocator_type get_allocator() const;
    explicit operator bool() const noexcept;
    [[nodiscard]] bool empty() const noexcept;
};
```
```cpp
// 24.2.5.5, modifiers
void swap(node-handle&)
    noexcept(ator_traits::propagate_on_container_swap::value ||
              ator_traits::is_always_equal::value);

friend void swap(node-handle& x, node-handle& y) noexcept(noexcept(x.swap(y))) {
    x.swap(y);
}

24.2.5.2 Constructors, copy, and assignment
    [container.node.cons]
node-handle(node-handle&& nh) noexcept;
1 Effects: Constructs a node-handle object initializing ptr_ with nh.ptr_. Move constructs alloc_ with
nh.alloc_. Assigns nullptr to nh.ptr_ and assigns nullopt to nh.alloc_.

node-handle operator=(node-handle&& nh);
2 Preconditions: Either !alloc_, or ator_traits::propagate_on_container_move_assignment::value is true, or alloc_ == nh.alloc_.
3 Effects:
(3.1) — If ptr_ != nullptr, destroys the value_type subobject in the container_node_type object
pointed to by ptr_ by calling ator_traits::destroy, then deallocates ptr_ by calling ator_traits::template
rebind_traits<container_node_type>::deallocate.
(3.2) — Assigns nh.ptr_ to ptr_.
(3.3) — If !alloc_ or ator_traits::propagate_on_container_move_assignment::value is true,
move assigns nh.alloc_ to alloc_.
(3.4) — Assigns nullptr to nh.ptr_ and assigns nullopt to nh.alloc_.
4 Returns: *this.
5 Throws: Nothing.

24.2.5.3 Destructor
    [container.node.dtor]
~node-handle();
1 Effects: If ptr_ != nullptr, destroys the value_type subobject in the container_node_type object
pointed to by ptr_ by calling ator_traits::destroy, then deallocates ptr_ by calling ator_traits::template
rebind_traits<container_node_type>::deallocate.

24.2.5.4 Observers
    [container.node.observers]
value_type& value() const;
1 Preconditions: empty() == false.
2 Returns: A reference to the value_type subobject in the container_node_type object pointed to by
ptr_.
3 Throws: Nothing.

key_type& key() const;
4 Preconditions: empty() == false.
5 Returns: A non-const reference to the key_type member of the value_type subobject in the container-
node_type object pointed to by ptr_.
6 Throws: Nothing.
7 Remarks: Modifying the key through the returned reference is permitted.

mapped_type& mapped() const;
8 Preconditions: empty() == false.
9 Returns: A reference to the mapped_type member of the value_type subobject in the container_node_type object pointed to by ptr_.

§ 24.2.5.4
```
10. **Throws**: Nothing.

    allocator_type get_allocator() const;

11. **Preconditions**: empty() == false.

12. **Returns**: *alloc_.

13. **Throws**: Nothing.

    explicit operator bool() const noexcept;

    [[nodiscard]] bool empty() const noexcept;

15. **Returns**: ptr_ == nullptr.

24.2.5.5 **Modifiers**

    //container.node.modifiers

    void swap(node-handle nh)
    noexcept(ator_traits::propagate_on_container_swap::value ||
             ator_traits::is_always_equal::value);

1. **Preconditions**: !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value is true, or alloc_ == nh.alloc_.

2. **Effects**: Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value is true calls swap(alloc_, nh.alloc_).

24.2.6 **Insert return type**

    //container.insert.return

    The associative containers with unique keys and the unordered containers with unique keys have a member function `insert` that returns a nested type `insert_return_type`. That return type is a specialization of the template specified in this subclause.

    template<class Iterator, class NodeType>
    struct insert-return-type
    {
        Iterator position;
        bool inserted;
        NodeType node;
    };

1. The name `insert-return-type` is exposition only. `insert-return-type` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

24.2.7 **Associative containers**

    //associative.reqmts

24.2.7.1 **General**

1. Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: set, multiset, map and multimap.

2. Each associative container is parameterized on Key and an ordering relation Compare that induces a strict weak ordering (27.8) on elements of Key. In addition, map and multimap associate an arbitrary mapped type T with the Key. The object of type Compare is called the comparison object of a container.

3. The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys k1 and k2 are considered to be equivalent if for the comparison object comp, comp(k1, k2) == false & & comp(k2, k1) == false.
   
   [Note 1: This is not necessarily the same as the result of k1 == k2. — end note]

   For any two keys k1 and k2 in the same container, calling comp(k1, k2) shall always return the same value.

4. An associative container supports unique keys if it may contain at most one element for each key. Otherwise, it supports equivalent keys. The set and map classes support unique keys; the multiset and multimap classes support equivalent keys. For multiset and multimap, insert, emplace, and erase preserve the relative ordering of equivalent elements.
For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`.

`iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[Note 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]

In this subclause,

- `X` denotes an associative container class,
- `a` denotes a value of type `X`,
- `a2` denotes a value of a type with nodes compatible with type `X` (Table 79),
- `b` denotes a possibly `const` value of type `X`,
- `u` denotes the name of a variable being declared,
- `a_uniq` denotes a value of type `X` when `X` supports unique keys,
- `a_eq` denotes a value of type `X` when `X` supports multiple keys,
- `a_tran` denotes a possibly `const` value of type `X` when the qualified-id `X::key_compare::is_transparent` is valid and denotes a type (13.10.3),
- `i` and `j` meet the `Cpp17InputIterator` requirements and refer to elements implicitly convertible to `value_type`,
- `[i, j)` denotes a valid range,
- `rg` denotes a value of a type `R` that models `container-compatible-range<value_type>`,
- `p` denotes a valid constant iterator to `a`,
- `q` denotes a valid dereferenceable constant iterator to `a`,
- `r` denotes a valid dereferenceable iterator to `a`,
- `[q1, q2)` denotes a valid range of constant iterators in `a`,
- `il` designates an object of type `initializer_list<value_type>`,
- `t` denotes a value of type `X::value_type`,
- `k` denotes a value of type `X::key_type`, and
- `c` denotes a possibly `const` value of type `X::key_compare`;
- `kl` is a value such that `a` is partitioned (27.8) with respect to `c(x, kl)`, with `x` the key value of `e` and `e` in `a`;
- `ku` is a value such that `a` is partitioned with respect to `!c(ku, x)`, with `x` the key value of `e` and `e` in `a`;
- `ke` is a value such that `a` is partitioned with respect to `c(x, ke)` and `!c(ke, x)`, with `c(x, ke)` implying `!c(ke, x)` and with `x` the key value of `e` and `e` in `a`;
- `kx` is a value such that
  - `a` is partitioned with respect to `c(x, kx)` and `!c(kx, x)`, with `c(x, kx)` implying `!c(kx, x)` and with `x` the key value of `e` and `e` in `a`, and
  - `kx` is not convertible to either `iterator` or `const_iterator`; and
- `A` denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise,
- `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`;

A type `X` meets the `associative_container` requirements if `X` meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for `map` and `multimap`, the requirements placed on `value_type` in 24.2.2.5 apply instead to `key_type` and `mapped_type`.

§ 24.2.7.1

857
[Note 3: For example, in some cases key_type and mapped_type are required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. — end note]

typename X::key_type

  Result: Key.

typename X::mapped_type

  Result: T.

  Remarks: For map and multimap only.

typename X::value_type

  Result: Key for set and multiset only; pair<const Key, T> for map and multimap only.

  Preconditions: X::value_type is Cpp17Erasable from X.

typename X::key_compare

  Result: Compare.

  Preconditions: key_compare is Cpp17CopyConstructible.

typename X::value_compare

  Result: A binary predicate type. It is the same as key_compare for set and multiset; is an ordering relation on pairs induced by the first component (i.e., Key) for map and multimap.

  X(c)

    Effects: Constructs an empty container. Uses a copy of c as a comparison object.

    Complexity: Constant.

    X u = X();
    X u;

    Preconditions: key_compare meets the Cpp17DefaultConstructible requirements.

    Effects: Constructs an empty container. Uses Compare() as a comparison object.

    Complexity: Constant.

    X(i, j, c)

    Preconditions: value_type is Cpp17EmplaceConstructible into X from *i.

    Effects: Constructs an empty container and inserts elements from the range [i, j) into it; uses c as a comparison object.

    Complexity: N log N in general, where N has the value distance(i, j); linear if [i, j) is sorted with value_comp().

    X(i, j)

    Preconditions: key_compare meets the Cpp17DefaultConstructible requirements. value_type is Cpp17EmplaceConstructible into X from *i.

    Effects: Constructs an empty container and inserts elements from the range [i, j) into it; uses Compare() as a comparison object.

    Complexity: N log N in general, where N has the value distance(i, j); linear if [i, j) is sorted with value_comp().

    X(from_range, rg, c)

    Preconditions: value_type is Cpp17EmplaceConstructible into X from *range::begin(rg).

    Effects: Constructs an empty container and inserts each element from rg into it. Uses c as the comparison object.
Complexity: \(N \log N\) in general, where \(N\) has the value \(\text{ranges}\::\text{distance}(\text{rg})\); linear if \(\text{rg}\) is sorted with \(\text{value\_comp}()\).

\(X(\text{from\_range}, \text{rg})\)

\(\text{Preconditions:}\ \text{key\_comp}()\) meets the \text{Cpp17DefaultConstructible} requirements. \(\text{value\_type}\) is \text{Cpp17EmplaceConstructible} into \(X\) from \(\text{ranges}\::\text{begin}(\text{rg})\).

\(\text{Effects:}\) Constructs an empty container and inserts each element from \(\text{rg}\) into it. Uses \(\text{Compare}()\) as the comparison object.

\(\text{Complexity:}\) Same as \(X(\text{from\_range}, \text{rg}, \text{c})\).

\(X(\text{i1}, \text{c})\)

\(\text{Effects:}\) Equivalent to \(X(\text{i1}.\text{begin()}, \text{i1}.\text{end()}, \text{c})\).

\(X(\text{i1})\)

\(\text{Effects:}\) Equivalent to \(X(\text{i1}.\text{begin()}, \text{i1}.\text{end()})\).

\(a = \text{i1}\)

\(\text{Result:}\ \text{i1}\)

\(\text{Preconditions:}\ \text{value\_type}\) is \text{Cpp17CopyInsertable} into \(X\) and \text{Cpp17CopyAssignable}.

\(\text{Effects:}\) Assigns the range \([\text{i1}.\text{begin()}, \text{i1}.\text{end()})\) into \(a\). All existing elements of \(a\) are either assigned to or destroyed.

\(\text{Complexity:}\ \(N \log N\) in general, where \(N\) has the value \(\text{i1}.\text{size()} + a.\text{size()};\) linear if \([\text{i1}.\text{begin()}, \text{i1}.\text{end()})\) is sorted with \(\text{value\_comp}()\).

\(b.\text{key\_comp()}\)

\(\text{Result:}\ \text{X}::\text{key\_comp}\)

\(\text{Returns:}\) The comparison object out of which \(b\) was constructed.

\(\text{Complexity:}\) Constant.

\(b.\text{value\_comp()}\)

\(\text{Result:}\ \text{X}::\text{value\_compare}\)

\(\text{Returns:}\) An object of \text{value\_compare} constructed out of the comparison object.

\(\text{Complexity:}\) Constant.

\(a.\text{uniq}.\text{emplace}(\text{args})\)

\(\text{Result:}\ \text{pair<iterator, bool>}\)

\(\text{Preconditions:}\ \text{value\_type}\) is \text{Cpp17EmplaceConstructible} into \(X\) from \(\text{args}\).

\(\text{Effects:}\) Inserts a \text{value\_type} object \(t\) constructed with \(\text{std}::\text{forward<Args>}(\text{args})\) if and only if there is no element in the container with key equivalent to the key of \(t\).

\(\text{Returns:}\) The \text{bool} component of the returned pair is \text{true} if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of \(t\).

\(\text{Complexity:}\) Logarithmic.

\(a.\text{eq}.\text{emplace}(\text{args})\)

\(\text{Result:}\ \text{iterator}\)

\(\text{Preconditions:}\ \text{value\_type}\) is \text{Cpp17EmplaceConstructible} into \(X\) from \(\text{args}\).

\(\text{Effects:}\) Inserts a \text{value\_type} object \(t\) constructed with \(\text{std}::\text{forward<Args>}(\text{args})\). If a range containing elements equivalent to \(t\) exists in \(a.\text{eq}\), \(t\) is inserted at the end of that range.

\(\text{Returns:}\) An iterator pointing to the newly inserted element.

\(\text{Complexity:}\) Logarithmic.
```plaintext

a.emplace_hint(p, args)

  Result: iterator
  Effects: Equivalent to `a.emplace(std::forward<Args>(args)...), except that the element is inserted as close as possible to the position just prior to `p.`
  Returns: An iterator pointing to the element with the key equivalent to the newly inserted element.
  Complexity: Logarithmic in general, but amortized constant if the element is inserted right before `p`.

a_uniq.insert(t)

  Result: pair<iterator, bool>
  Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.
  Effects: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.
  Returns: The `bool` component of the returned pair is `true` if and only if the insertion takes place, and the `iterator` component of the pair points to the element with key equivalent to the key of `t`.
  Complexity: Logarithmic.

a_eq.insert(t)

  Result: iterator
  Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.
  Effects: Inserts `t` and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to `t` exists in `a_eq`, `t` is inserted at the end of that range.
  Complexity: Logarithmic.

a.insert(p, t)

  Result: iterator
  Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.
  Effects: Inserts `t` if and only if there is no element with key equivalent to the key of `t` in containers with unique keys; always inserts `t` in containers with equivalent keys. `t` is inserted as close as possible to the position just prior to `p`.
  Returns: An iterator pointing to the element with key equivalent to the key of `t`.
  Complexity: Logarithmic in general, but amortized constant if `t` is inserted right before `p`.

a.insert(i, j)

  Result: void
  Preconditions: `value_type` is `Cpp17EmplaceConstructible` into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.
  Effects: Inserts each element from the range `[i, j)` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.
  Complexity: $N \log(a.size() + N)$, where $N$ has the value `distance(i, j)`.

a.insert_range(rg)

  Result: void
  Preconditions: `value_type` is `Cpp17EmplaceConstructible` into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.
  Effects: Inserts each element from `rg` if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.
  Complexity: $N \log(a.size() + N)$, where $N$ has the value `ranges::distance(rg)`.
```
a.insert(il)

Effects: Equivalent to a.insert(il.begin(), il.end()).

a_uniq.insert(nh)

Result: insert_return_type

Preconditions: nh is empty or a_uniq.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to nh.key().

Returns: If nh is empty, inserted is false, position is end(), and node is empty. Otherwise if the insertion took place, inserted is true, position points to the inserted element, and node is empty; if the insertion failed, inserted is false, node has the previous value of nh, and position points to an element with a key equivalent to nh.key().

Complexity: Logarithmic.

a_eq.insert(nh)

Result: iterator

Preconditions: nh is empty or a_eq.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect and returns a_eq.end(). Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to nh.key() exists in a_eq, the element is inserted at the end of that range.

Postconditions: nh is empty.

Complexity: Logarithmic.

a.insert(p, nh)

Result: iterator

Preconditions: nh is empty or a.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect and returns a.end(). Otherwise, inserts the element owned by nh if and only if there is no element with key equivalent to nh.key() in containers with unique keys; always inserts the element owned by nh in containers with equivalent keys. The element is inserted as close as possible to the position just prior to p.

Postconditions: nh is empty if insertion succeeds, unchanged if insertion fails.

Returns: An iterator pointing to the element with key equivalent to nh.key().

Complexity: Logarithmic in general, but amortized constant if the element is inserted right before p.

a.extract(k)

Result: node_type

Effects: Removes the first element in the container with key equivalent to k.

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: log(a.size())

a_tran.extract(kx)

Result: node_type

Effects: Removes the first element in the container with key r such that !c(r, kx) && !c(kx, r) is true.

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: log(a_tran.size())

a.extract(q)

Result: node_type

Effects: Removes the element pointed to by q.

Returns: A node_type owning that element.
Complexity: Amortized constant.

a.merge(a2)
Result: void
Preconditions: a.get_allocator() == a2.get_allocator().
Effects: Attempts to extract each element in a2 and insert it into a using the comparison object of a. In containers with unique keys, if there is an element in a with key equivalent to the key of an element from a2, then that element is not extracted from a2.
Postconditions: Pointers and references to the transferred elements of a2 refer to those same elements but as members of a. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into a, not into a2.
Throws: Nothing unless the comparison object throws.
Complexity: \( N \log(a.size() + N) \), where \( N \) has the value a2.size().

a.erase(k)
Result: size_type
Effects: Erases all elements in the container with key equivalent to k.
Returns: The number of erased elements.
Complexity: \( \log(a.size()) + a.count(k) \)

a.erase(r)
Result: iterator
Effects: Erases the element pointed to by r.
Returns: An iterator pointing to the element immediately following r prior to the element being erased. If no such element exists, returns a.end().
Complexity: Amortized constant.

a.erase(q)
Result: iterator
Effects: Erases the element pointed to by q.
Returns: An iterator pointing to the element immediately following q prior to the element being erased. If no such element exists, returns a.end().
Complexity: Amortized constant.

a.erase(q1, q2)
Result: iterator
Effects: Erases all the elements in the range [q1, q2).
Returns: An iterator pointing to the element pointed to by q2 prior to any elements being erased. If no such element exists, a.end() is returned.
Complexity: \( \log(a.size()) + N \), where \( N \) has the value distance(q1, q2).

a.clear()
Effects: Equivalent to a.erase(a.begin(), a.end()).
Postconditions: a.empty() is true.
Complexity: Linear in a.size().
b.find(k)

**Result:** iterator; const_iterator for constant b.

**Returns:** An iterator pointing to an element with the key equivalent to k, or b.end() if such an element is not found.

**Complexity:** Logarithmic.

```cpp
a_tran.find(ke)
```

**Result:** iterator; const_iterator for constant a_tran.

**Returns:** An iterator pointing to an element with key r such that \( !c(r, ke) \&\& !c(ke, r) \) is true, or a_tran.end() if such an element is not found.

**Complexity:** Logarithmic.

```cpp
b.count(k)
```

**Result:** size_type

**Returns:** The number of elements with key equivalent to k.

**Complexity:** \( \log(b.size()) + b.count(k) \)

```cpp
a_tran.count(ke)
```

**Result:** size_type

**Returns:** The number of elements with key r such that \( !c(r, ke) \&\& !c(ke, r) \).

**Complexity:** \( \log(a_tran.size()) + a_tran.count(ke) \)

```cpp
b.contains(k)
```

**Result:** bool

**Effects:** Equivalent to: return b.find(k) != b.end();

```cpp
a_tran.contains(ke)
```

**Result:** bool

**Effects:** Equivalent to: return a_tran.find(ke) != a_tran.end();

```cpp
b.lower_bound(k)
```

**Result:** iterator; const_iterator for constant b.

**Returns:** An iterator pointing to the first element with key not less than k, or b.end() if such an element is not found.

**Complexity:** Logarithmic.

```cpp
a_tran.lower_bound(kl)
```

**Result:** iterator; const_iterator for constant a_tran.

**Returns:** An iterator pointing to the first element with key r such that \( !c(r, kl) \), or a_tran.end() if such an element is not found.

**Complexity:** Logarithmic.

```cpp
b.upper_bound(k)
```

**Result:** iterator; const_iterator for constant b.

**Returns:** An iterator pointing to the first element with key greater than k, or b.end() if such an element is not found.

**Complexity:** Logarithmic.

```cpp
a_tran.upper_bound(ku)
```

**Result:** iterator; const_iterator for constant a_tran.

**Returns:** An iterator pointing to the first element with key r such that \( c(ku, r) \), or a_tran.end() if such an element is not found.
Complexity: Logarithmic.

b.equal_range(k)

Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant b.

Effects: Equivalent to: return make_pair(b.lower_bound(k), b.upper_bound(k));

Complexity: Logarithmic.

a_tran.equal_range(ke)

Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant a_tran.

Effects: Equivalent to: return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));

Complexity: Logarithmic.

The insert, insert_range, and emplace members shall not affect the validity of iterators and references to the container, and the erase members shall invalidate only iterators and references to the erased elements.

The extract members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a node_type is undefined behavior. References and pointers to an element obtained while it is owned by a node_type are invalidated if the element is successfully inserted.

The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators i and j such that distance from i to j is positive, the following condition holds:

value_comp(*j, *i) == false

For associative containers with unique keys the stronger condition holds:

value_comp(*i, *j) != false

When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

The member function templates find, count, contains, lower_bound, upper_bound, equal_range, erase, and extract shall not participate in overload resolution unless the qualified-id Compare::is_transparent is valid and denotes a type (13.10.3). Additionally, the member function templates extract and erase shall not participate in overload resolution if is_convertible_v<K&&, iterator> || is_convertible_v<K&&, const_iterator> is true, where K is the type substituted as the first template argument.

A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

(181.1) — It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(181.2) — It has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(181.3) — It has a Compare template parameter and a type that qualifies as an allocator is deduced for that parameter.

24.2.7.2 Exception safety guarantees

1 For associative containers, no clear() function throws an exception. erase(k) does not throw an exception unless that exception is thrown by the container’s Compare object (if any).

2 For associative containers, if an exception is thrown by any operation from within an insert or emplace function inserting a single element, the insertion has no effect.

3 For associative containers, no swap function throws an exception unless that exception is thrown by the swap of the container’s Compare object (if any).
24.2.8 Unordered associative containers

24.2.8.1 General

Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: unordered_set, unordered_map, unordered_multiset, and unordered_multimap.

Unordered associative containers conform to the requirements for Containers (24.2), except that the expressions a == b and a != b have different semantics than for the other container types.

Each unordered associative container is parameterized by Key, by a function object type Hash that meets the Cpp17Hash requirements (16.4.4.5) and acts as a hash function for argument values of type Key, and by a binary predicate Pred that induces an equivalence relation on values of type Key. Additionally, unordered_map and unordered_multimap associate an arbitrary mapped type T with the Key.

The container’s object of type Hash — denoted by hash — is called the hash function of the container. The container’s object of type Pred — denoted by pred — is called the key equality predicate of the container.

Two values k1 and k2 are considered equivalent if the container’s key equality predicate pred(k1, k2) is valid and returns true when passed those values. If k1 and k2 are equivalent, the container’s hash function shall return the same value for both.

[Note 1: Thus, when an unordered associative container is instantiated with a non-default Pred parameter it usually needs a non-default Hash parameter as well. — end note]

For any two keys k1 and k2 in the same container, calling pred(k1, k2) shall always return the same value. For any key k in a container, calling hash(k) shall always return the same value.

An unordered associative container supports unique keys if it may contain at most one element for each key. Otherwise, it supports equivalent keys. unordered_set and unordered_map support unique keys. unordered_multiset and unordered_multimap support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into equivalent-key groups such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

For unordered_set and unordered_multiset the value type is the same as the key type. For unordered_map and unordered_multimap it is pair<const Key, T>.

For unordered containers where the value type is the same as the key type, both iterator and const_iterator are constant iterators. It is unspecified whether or not iterator and const_iterator are the same type.

[Note 2: iterator and const_iterator have identical semantics in this case, and iterator is convertible to const_iterator. Users can avoid violating the one-definition rule by always using const_iterator in their function parameter lists. — end note]

The elements of an unordered associative container are organized into buckets. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For unordered_multiset and unordered_multimap, rehashing preserves the relative ordering of equivalent elements.

In this subclause:

- X denotes an unordered associative container class,
- a denotes a value of type X,
- a2 denotes a value of a type with nodes compatible with type X (Table 79),
- b denotes a possibly const value of type X,
- a_uniq denotes a value of type X when X supports unique keys,
- a_eq denotes a value of type X when X supports equivalent keys,
- a_tran denotes a possibly const value of type X when the qualified-ids X::key_equal::is_transparent and X::hasher::is_transparent are both valid and denote types (13.10.3),
— i and j denote input iterators that refer to value_type,
— [i, j) denotes a valid range,
— rg denotes a value of a type R that models container-compatible-range<value_type>,
— p and q2 denote valid constant iterators to a,
— q and q1 denote valid dereferenceable constant iterators to a,
— r denotes a valid dereferenceable iterator to a,
— [q1, q2) denotes a valid range in a,
— il denotes a value of type initializer_list<value_type>,
— t denotes a value of type X::value_type,
— k denotes a value of type key_type,
— hf denotes a possibly const value of type hasher,
— eq denotes a possibly const value of type key_equal,
— ke is a value such that
  — eq(r1, ke) == eq(ke, r1),
  — hf(r1) == hf(ke) if eq(r1, ke) is true, and
  — (eq(r1, ke) && eq(r1, r2)) == eq(r2, ke),
  where r1 and r2 are keys of elements in a_tran,
— kx is a value such that
  — eq(r1, kx) == eq(kx, r1),
  — hf(r1) == hf(kx) if eq(r1, kx) is true,
  — (eq(r1, kx) && eq(r1, r2)) == eq(r2, kx), and
  — kx is not convertible to either iterator or const_iterator,
  where r1 and r2 are keys of elements in a_tran,
— n denotes a value of type size_type,
— z denotes a value of type float, and
— nh denotes a non-const rvalue of type X::node_type.

A type X meets the unordered associative container requirements if X meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for unordered_map and unordered_multimap, the requirements placed on value_type in 24.2.2.5 apply instead to key_type and mapped_type.

[Note 3: For example, key_type and mapped_type are sometimes required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. — end note]

typename X::key_type
  
  **Result:** Key.

typename X::mapped_type
  
  **Result:** T.

  **Remarks:** For unordered_map and unordered_multimap only.

typename X::value_type
  
  **Result:** Key for unordered_set and unordered_multiset only; pair<const Key, T> for unordered_map and unordered_multimap only.

  **Preconditions:** value_type is Cpp17Erasable from X.

typename X::hasher
  
  **Result:** Hash.

  **Preconditions:** Hash is a unary function object type such that the expression hf(k) has type size_t.

§ 24.2.8.1
typedef X::key_equal

Result: Pred.

Preconditions: Pred meets the Cpp17CopyConstructible requirements. Pred is a binary predicate that takes two arguments of type Key. Pred is an equivalence relation.

typename X::local_iterator

Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::iterator's.

[Note 4: A local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typename X::const_local_iterator

Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::const_iterator's.

[Note 5: A const_local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typename X::node_type

Result: A specialization of a node-handle class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(n, hf, eq)

Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate.

Complexity: Θ(n)

X(n, hf)

Preconditions: key_equal meets the Cpp17DefaultConstructible requirements.

Effects: Constructs an empty container with at least n buckets, using hf as the hash function and key_equal() as the key equality predicate.

Complexity: Θ(n)

X(n)

Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

Effects: Constructs an empty container with at least n buckets, using hasher() as the hash function and key_equal() as the key equality predicate.

Complexity: Θ(n)

X a = X();
X a;

Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

Effects: Constructs an empty container with an unspecified number of buckets, using hasher() as the hash function and key_equal() as the key equality predicate.

Complexity: Constant.

X(i, j, n, hf, eq)

Preconditions: value_type is Cpp17EmplaceConstructible into X from *i.

Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate, and inserts elements from [i, j) into it.

Complexity: Average case Θ(N) (N is distance(i, j)), worst case Θ(N^2).

X(i, j, n, hf)

Preconditions: key_equal meets the Cpp17DefaultConstructible requirements. value_type is Cpp17-EmplaceConstructible into X from *i. 
Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \( key\_equal() \) as the key equality predicate, and inserts elements from \([i, j)\) into it.

Complexity: Average case \( \Theta(N) \) \((N = \text{distance}(i, j))\), worst case \( \Theta(N^2) \).

\[
X(i, j, n)
\]

Preconditions: \( \text{hasher} \) and \( \text{key\_equal}() \) meet the Cpp17DefaultConstructible requirements. \( \text{value\_type} \) is Cpp17EmplaceConstructible into \( X \) from \( *i \).

Effects: Constructs an empty container with at least \( n \) buckets, using \( \text{hasher}() \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \([i, j)\) into it.

Complexity: Average case \( \Theta(N) \) \((N = \text{distance}(i, j))\), worst case \( \Theta(N^2) \).

\[
X(i, j)
\]

Preconditions: \( \text{hasher} \) and \( \text{key\_equal}() \) meet the Cpp17DefaultConstructible requirements. \( \text{value\_type} \) is Cpp17EmplaceConstructible into \( X \) from \( *i \).

Effects: Constructs an empty container with an unspecified number of buckets, using \( \text{hasher}() \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \([i, j)\) into it.

Complexity: Average case \( \Theta(N) \) \((N = \text{distance}(i, j))\), worst case \( \Theta(N^2) \).

\[
X(\text{from\_range}, \text{rg}, n, hf, eq)
\]

Preconditions: \( \text{value\_type} \) is Cpp17EmplaceConstructible into \( X \) from \( \text{*ranges::begin(rg)} \).

Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \( eq \) as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) \((N = \text{ranges::distance(rg)})\), worst case \( \Theta(N^2) \).

\[
X(\text{from\_range}, \text{rg}, n, hf)
\]

Preconditions: \( \text{key\_equal}() \) meets the Cpp17DefaultConstructible requirements. \( \text{value\_type} \) is Cpp17EmplaceConstructible into \( X \) from \( \text{*ranges::begin(rg)} \).

Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) \((N = \text{ranges::distance(rg)})\), worst case \( \Theta(N^2) \).

\[
X(\text{from\_range}, \text{rg})
\]

Preconditions: \( \text{hasher} \) and \( \text{key\_equal}() \) meet the Cpp17DefaultConstructible requirements. \( \text{value\_type} \) is Cpp17EmplaceConstructible into \( X \) from \( \text{*ranges::begin(rg)} \).

Effects: Constructs an empty container with an unspecified number of buckets, using \( \text{hasher}() \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) \((N = \text{ranges::distance(rg)})\), worst case \( \Theta(N^2) \).

\[
X(\text{il})
\]

Effects: Equivalent to \( X(\text{il}.\text{begin()}, \text{il}.\text{end()}) \).

\[
X(\text{il}, n)
\]

Effects: Equivalent to \( X(\text{il}.\text{begin()}, \text{il}.\text{end()}, n) \).

\[
X(\text{il}, n, hf)
\]

Effects: Equivalent to \( X(\text{il}.\text{begin()}, \text{il}.\text{end()}, n, hf) \).
X(il, n, hf, eq)

Effects: Equivalent to X(il.begin(), il.end(), n, hf, eq).

X(b)

Effects: In addition to the container requirements (24.2.2.1), copies the hash function, predicate, and maximum load factor.

Complexity: Average case linear in b.size(), worst case quadratic.

a = b

Result: X&

Effects: In addition to the container requirements, copies the hash function, predicate, and maximum load factor.

Complexity: Average case linear in b.size(), worst case quadratic.

a = il

Result: X&

Preconditions: value_type is Cpp17CopyInsertable into X and Cpp17CopyAssignable.

Effects: Assigns the range [il.begin(), il.end()) into a. All existing elements of a are either assigned to or destroyed.

Complexity: Average case linear in il.size(), worst case quadratic.

b.hash_function()

Result: hasher

Returns: b’s hash function.

Complexity: Constant.

b.key_eq()

Result: key_equal

Returns: b’s key equality predicate.

Complexity: Constant.

a_uniq.emplace(args)

Result: pair<iterator, bool>

Preconditions: value_type is Cpp17EmplaceConstructible into X from args.

Effects: Inserts a value_type object t constructed with std::forward<Args>(args)... if and only if there is no element in the container with key equivalent to the key of t.

Returns: The bool component of the returned pair is true if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of t.

Complexity: Average case $O(1)$, worst case $O(a_uniq.size())$.

a_eq.emplace(args)

Result: iterator

Preconditions: value_type is Cpp17EmplaceConstructible into X from args.

Effects: Inserts a value_type object t constructed with std::forward<Args>(args)... and

Returns: An iterator pointing to the newly inserted element.

Complexity: Average case $O(1)$, worst case $O(a_eq.size())$.

a.emplace_hint(p, args)

Result: iterator

Preconditions: value_type is Cpp17EmplaceConstructible into X from args.

Effects: Equivalent to a.emplace(std::forward<Args>(args)...).
Returns: An iterator pointing to the element with the key equivalent to the newly inserted element. The `const_iterator p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Complexity: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

```cpp
a_uniq.insert(t)
```

Result: `pair<iterator, bool>`

Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.

Effects: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

Returns: The `bool` component of the returned pair indicates whether the insertion takes place, and the `iterator` component points to the element with key equivalent to the key of `t`.

Complexity: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

```cpp
a_eq.insert(t)
```

Result: `iterator`

Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.

Effects: Inserts `t`.

Returns: An iterator pointing to the newly inserted element.

Complexity: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

```cpp
a.insert(p, t)
```

Result: `iterator`

Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.

Effects: Equivalent to `a.insert(t)` The iterator `p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Returns: An iterator pointing to the element with the key equivalent to that of `t`.

Complexity: Average case $\mathcal{O}(1)$, worst case $\mathcal{O}(a.size())$.

```cpp
a.insert(i, j)
```

Result: `void`

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.

Effects: Equivalent to `a.insert(t)` for each element in `[i, j)`.

Complexity: Average case $\mathcal{O}(N)$, where $N$ is `distance(i, j)`, worst case $\mathcal{O}(N(a.size() + 1))$.

```cpp
a.insert_range(rg)
```

Result: `void`

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into `X` from `*ranges::begin(rg)`. `rg` and `a` do not overlap.

Effects: Equivalent to `a.insert(t)` for each element `t` in `rg`.

Complexity: Average case $\mathcal{O}(N)$, where $N$ is `ranges::distance(rg)`, worst case $\mathcal{O}(N(a.size() + 1))$.

```cpp
a.insert(il)
```

Effects: Equivalent to `a.insert(il.begin(), il.end())`.

```cpp
a_uniq.insert(nh)
```

Result: `insert_return_type`

Preconditions: `nh` is empty or `a_uniq.get_allocator() == nh.get_allocator()` is true.
Effects: If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to nh.key().

Postconditions: If nh is empty, inserted is false, position is end(), and node is empty. Otherwise if the insertion took place, inserted is true, position points to the inserted element, and node is empty; if the insertion failed, inserted is false, node has the previous value of nh, and position points to an element with a key equivalent to nh.key().

Complexity: Average case $\Theta(1)$, worst case $\Theta(a_{uniq}.size())$.

\hspace{1em} a.eq.insert(nh)

Result: iterator

Preconditions: nh is empty or a.eq.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect and returns a.eq.end(). Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element.

Postconditions: nh is empty.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a_{eq}.size())$.

\hspace{1em} a.insert(q, nh)

Result: iterator

Preconditions: nh is empty or a.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect and returns a.end(). Otherwise, inserts the element owned by nh if and only if there is no element with key equivalent to nh.key() in containers with unique keys; always inserts the element owned by nh in containers with equivalent keys. The iterator q is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Postconditions: nh is empty if insertion succeeds, unchanged if insertion fails.

Returns: An iterator pointing to the element with key equivalent to nh.key().

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\hspace{1em} a.extract(k)

Result: node_type

Effects: Removes an element in the container with key equivalent to k.

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\hspace{1em} a_tran.extract(kx)

Result: node_type

Effects: Removes an element in the container with key equivalent to kx.

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a_{tran}.size())$.

\hspace{1em} a.extract(q)

Result: node_type

Effects: Removes the element pointed to by q.

Returns: A node_type owning that element.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\hspace{1em} a.merge(a2)

Result: void

Preconditions: a.get_allocator() == a2.get_allocator().

Effects: Attempts to extract each element in a2 and insert it into a using the hash function and key equality predicate of a. In containers with unique keys, if there is an element in a with key equivalent to the key of an element from a2, then that element is not extracted from a2.
Postconditions: Pointers and references to the transferred elements of \( \text{a2} \) refer to those same elements but as members of \( \text{a} \). Iterators referring to the transferred elements and all iterators referring to \( \text{a} \) will be invalidated, but iterators to elements remaining in \( \text{a2} \) will remain valid.

Complexity: Average case \( \Theta(N) \), where \( N \) is \( \text{a2.size()} \), worst case \( \Theta(N\cdot \text{a.size()} + N) \).

\[
a.\text{erase}(k)
\]

Result: size_type

Effects: Erases all elements with key equivalent to \( k \).

Returns: The number of elements erased.

Complexity: Average case \( \Theta(\text{a.count}(k)) \), worst case \( \Theta(\text{a.size()}) \).

\[
a.\text{erase}(\text{q})
\]

Result: iterator

Effects: Erases the element pointed to by \( q \).

Returns: The iterator immediately following \( q \) prior to the erasure.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.size()}) \).

\[
a.\text{erase}(r)
\]

Result: iterator

Effects: Erases the element pointed to by \( r \).

Returns: The iterator immediately following \( r \) prior to the erasure.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.size()}) \).

\[
a.\text{erase}([q1, q2))
\]

Result: iterator

Effects: Erases all elements in the range \( [q1, q2) \).

Returns: The iterator immediately following the erased elements prior to the erasure.

Complexity: Average case linear in \( \text{distance}(q1, q2) \), worst case \( \Theta(\text{a.size()}) \).

\[
a.\text{clear()}
\]

Result: void

Effects: Erases all elements in the container.

Postconditions: \( \text{a.empty()} \) is true.

Complexity: Linear in \( \text{a.size()} \).

\[
b.\text{find}(k)
\]

Result: iterator; const_iterator for const \( b \).

Returns: An iterator pointing to an element with key equivalent to \( k \), or \( \text{b.end()} \) if no such element exists.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{b.size()}) \).

\[
a.\text{tran}.\text{find}(\text{ke})
\]

Result: iterator; const_iterator for const \( a.\text{tran} \).

Returns: An iterator pointing to an element with key equivalent to \( \text{ke} \), or \( a.\text{tran}.\text{end()} \) if no such element exists.
Complexity: Average case $O(1)$, worst case $O(a_{\text{tran}}.\text{size()}$).

\texttt{b.count(k)}

\textbf{Result}: \texttt{size_type}

\textbf{Returns}: The number of elements with key equivalent to \texttt{k}.

\textbf{Complexity}: Average case $O(b.\text{count(k)}$, worst case $O(b.\text{size()}$).

\texttt{a_{\text{tran}}.\text{count(ke)}}

\textbf{Result}: \texttt{size_type}

\textbf{Returns}: The number of elements with key equivalent to \texttt{ke}.

\textbf{Complexity}: Average case $O(a_{\text{tran}}.\text{count(ke)}$, worst case $O(a_{\text{tran}}.\text{size()}$).

\texttt{b.contains(k)}

\textbf{Effects}: Equivalent to \texttt{b.find(k) != b.end()}.

\texttt{a_{\text{tran}}.\text{contains(ke)}}

\textbf{Effects}: Equivalent to \texttt{a_{\text{tran}}.find(ke) != a_{\text{tran}}.end()}.

\texttt{b.equal_range(k)}

\textbf{Result}: \texttt{pair<iterator, iterator>; pair<const_iterator, const_iterator> for const b.}

\textbf{Returns}: A range containing all elements with keys equivalent to \texttt{k}. Returns \texttt{make_pair(b.end(), b.end())} if no such elements exist.

\textbf{Complexity}: Average case $O(b.\text{count(k)}$, worst case $O(b.\text{size()}$).

\texttt{a_{\text{tran}}.\text{equal_range(ke)}}

\textbf{Result}: \texttt{pair<iterator, iterator>; pair<const_iterator, const_iterator> for const a_{\text{tran}}.}

\textbf{Returns}: A range containing all elements with keys equivalent to \texttt{ke}. Returns \texttt{make_pair(a_{\text{tran}}.end(), a_{\text{tran}}.end())} if no such elements exist.

\textbf{Complexity}: Average case $O(a_{\text{tran}}.\text{count(ke)}$, worst case $O(a_{\text{tran}}.\text{size()}$).

\texttt{b.bucket_count()}

\textbf{Returns}: The number of buckets that \texttt{b} contains.

\textbf{Complexity}: Constant.

\texttt{b.max_bucket_count()}

\textbf{Returns}: An upper bound on the number of buckets that \texttt{b} can ever contain.

\textbf{Complexity}: Constant.

\texttt{b.bucket(k)}

\textbf{Result}: \texttt{size_type}

\textbf{Preconditions}: \texttt{b.bucket_count()} > 0.

\textbf{Returns}: The index of the bucket in which elements with keys equivalent to \texttt{k} would be found, if any such element existed. The return value is in the range $[0, b.\text{bucket_count()}$).

\textbf{Complexity}: Constant.

\texttt{b.bucket_size(n)}

\textbf{Result}: \texttt{size_type}

\textbf{Preconditions}: \texttt{n} shall be in the range $[0, b.\text{bucket_count()}$).

\textbf{Returns}: The number of elements in the \texttt{n}th bucket.

\textbf{Complexity}: $O(b.\text{bucket_size(n)}$)

\section{24.2.8.1}
b.begin(n)

Result: local_iterator; const_local_iterator for const b.

Preconditions: n is in the range \([0, \text{b.bucket_count()}]\).

Returns: An iterator referring to the first element in the bucket. If the bucket is empty, then \(b\begin{b}(n) == b\end{b}(n)\).

Complexity: Constant.

b.end(n)

Result: local_iterator; const_local_iterator for const b.

Preconditions: n is in the range \([0, \text{b.bucket_count()}]\).

Returns: An iterator which is the past-the-end value for the bucket.

Complexity: Constant.

b.cbegin(n)

Result: const_local_iterator

Preconditions: n shall be in the range \([0, \text{b.bucket_count()}]\).

Returns: An iterator referring to the first element in the bucket. If the bucket is empty, then \(b\text{cbegin}(n) == b\text{cend}(n)\).

Complexity: Constant.

b.cend(n)

Result: const_local_iterator

Preconditions: n is in the range \([0, \text{b.bucket_count()}]\).

Returns: An iterator which is the past-the-end value for the bucket.

Complexity: Constant.

b.load_factor()

Result: float

Returns: The average number of elements per bucket.

Complexity: Constant.

b.max_load_factor()

Result: float

Returns: A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.

Complexity: Constant.

a.max_load_factor(z)

Result: void

Preconditions: z is positive. May change the container’s maximum load factor, using z as a hint.

Complexity: Constant.

a.rehash(n)

Result: void

Postconditions: a.bucket_count() >= a.size() / a.max_load_factor() and a.bucket_count() >= n.

Complexity: Average case linear in a.size(), worst case quadratic.

a.reserve(n)

Effects: Equivalent to a.rehash(ceil(n / a.max_load_factor())).
Two unordered containers \( a \) and \( b \) compare equal if \( a.size() == b.size() \) and, for every equivalent-key group \([Ea1, Ea2] \) obtained from \( a.equal_range(Ea1) \), there exists an equivalent-key group \([Eb1, Eb2] \) obtained from \( b.equal_range(Ea1) \), such that \( \text{is_permutation}(Ea1, Ea2, Eb1, Eb2) \) returns \( \text{true} \). For \texttt{unordered_set} and \texttt{unordered_map}, the complexity of \texttt{operator==} (i.e., the number of calls to the \( == \) operator of the value_type, to the predicate returned by \texttt{key_eq()}, and to the hasher returned by \texttt{hash_function()}) is proportional to \( N \) in the average case and to \( N^2 \) in the worst case, where \( N \) is \( a.size() \). For \texttt{unordered_multiset} and \texttt{unordered_multimap}, the complexity of \texttt{operator==} is proportional to \( \sum E_i^2 \) in the average case and to \( N^2 \) in the worst case, where \( N \) is \( a.size() \), and \( E_i \) is the size of the \( i \)th equivalent-key group in \( a \). However, if the respective elements of each corresponding pair of equivalent-key groups \( E_a \) and \( E_b \) are arranged in the same order (as is commonly the case, e.g., if \( a \) and \( b \) are unmodified copies of the same container), then the average-case complexity for \texttt{unordered_multiset} and \texttt{unordered_multimap} becomes proportional to \( N \) (but worst-case complexity remains \( \Theta(N^2) \), e.g., for a pathologically bad hash function).

The behavior of a program that uses \texttt{operator==} or \texttt{operator!=} on unordered containers is undefined unless the \texttt{Pred} function object has the same behavior for both containers and the equality comparison function for \texttt{Key} is a refinement\(^{214} \) of the partition into equivalent-key groups produced by \texttt{Pred}.

The iterator types \texttt{iterator} and \texttt{const_iterator} of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both \texttt{iterator} and \texttt{const_iterator} are constant iterators.

The \texttt{insert}, \texttt{insert_range}, and \texttt{emplace} members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The \texttt{erase} members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

The \texttt{insert}, \texttt{insert_range}, and \texttt{emplace} members shall not affect the validity of iterators if \( (N+n) <= z \ast B \), where \( N \) is the number of elements in the container prior to the insert operation, \( n \) is the number of elements inserted, \( B \) is the container’s bucket count, and \( z \) is the container’s maximum load factor.

The \texttt{extract} members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a \texttt{node_type} is undefined behavior. References and pointers to an element obtained while it is owned by a \texttt{node_type} are invalidated if the element is successfully inserted.

The member function templates \texttt{find}, \texttt{count}, \texttt{equal_range}, \texttt{contains}, \texttt{extract}, and \texttt{erase} shall not participate in overload resolution unless the \texttt{qualified-ids} \texttt{Pred::is_transparent} and \texttt{Hash::is_transparent} are both valid and denote types \((13.10.3)\). Additionally, the member function templates \texttt{extract} and \texttt{erase} shall not participate in overload resolution if \texttt{is_convertible_v<K&&, iterator>} \( \| \) \texttt{is_convertible_v<K&&, const_iterator>} is \( \text{true} \), where \( K \) is the type substituted as the first template argument.

A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

\begin{itemize}
\item It has an \texttt{InputIterator} template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
\item It has an \texttt{Allocator} template parameter and a type that does not qualify as an allocator is deduced for that parameter.
\item It has a \texttt{Hash} template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.
\item It has a \texttt{Pred} template parameter and a type that qualifies as an allocator is deduced for that parameter.
\end{itemize}

\subsection*{24.2.8.2 Exception safety guarantees}

For unordered associative containers, no \texttt{clear()} function throws an exception. \texttt{erase(k)} does not throw an exception unless that exception is thrown by the container’s \texttt{Hash} or \texttt{Pred} object (if any).

For unordered associative containers, if an exception is thrown by any operation other than the container’s hash function from within an \texttt{insert} or \texttt{emplace} function inserting a single element, the insertion has no effect.

For unordered associative containers, no \texttt{swap} function throws an exception unless that exception is thrown by the swap of the container’s \texttt{Hash} or \texttt{Pred} object (if any).

\footnote{Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.}
For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container’s hash function or comparison function, the `rehash()` function has no effect.

### 24.3 Sequence containers

#### 24.3.1 In general

The headers `<array>` (24.3.2), `<deque>` (24.3.3), `<forward_list>` (24.3.4), `<list>` (24.3.5), and `<vector>` (24.3.6) define class templates that meet the requirements for sequence containers.

The following exposition-only alias template may appear in deduction guides for sequence containers:

```cpp
template<class InputIterator>
using iter_value_type = typename iterator_traits<InputIterator>::value_type; // exposition only
```

### 24.3.2 Header `<array>` synopsis

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
    // 24.3.7, class template array
    template<class T, size_t N> struct array;
    template<class T, size_t N>
    constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
    template<class T, size_t N>
    constexpr
    synth-three-way-result<T>
    operator<=>(const array<T, N>& x, const array<T, N>& y);

    // 24.3.7.4, specialized algorithms
    template<class T, size_t N>
    constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

    // 24.3.7.6, array creation functions
    template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
    template<class T, size_t N>
    constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);

    // 24.3.7.7, tuple interface
    template<class T> struct tuple_size;
    template<size_t I, class T> struct tuple_element;
    template<class T, size_t N>
    struct tuple_size<array<T, N>>;
    template<size_t I, class T, size_t N>
    struct tuple_element<I, array<T, N>>;
    template<size_t I, class T, size_t N>
    constexpr T& get(array<T, N>&) noexcept;
    template<size_t I, class T, size_t N>
    constexpr T&& get(array<T, N>&&) noexcept;
    template<size_t I, class T, size_t N>
    constexpr const T& get(const array<T, N>&) noexcept;
    template<size_t I, class T, size_t N>
    constexpr const T&& get(const array<T, N>&&) noexcept;
}
```

### 24.3.3 Header `<deque>` synopsis

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
    // 24.3.8, class template deque
    template<class T, class Allocator = allocator<T>> class deque;
}
```
template<class T, class Allocator>
bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);

template<class T, class Allocator>
synth-three-way-result<T> operator<=>(const deque<T, Allocator>& x,

24.3.7 Class template array

24.3.7.1 Overview

The header `<array>` defines a class template for storing fixed-size sequences of objects. An `array` is a contiguous container (24.2.2.1). An instance of `array<T, N>` stores `N` elements of type `T`, so that `size()` == `N` is an invariant.

An `array` is an aggregate (9.4.2) that can be list-initialized with up to `N` elements whose types are convertible to `T`.

An `array` meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), except that a default constructed `array` object is not empty if `N` > 0. An `array` meets some of the requirements of a sequence container (24.2.4). Descriptions are provided here only for operations on `array` that are not described in one of these tables and for operations where there is additional semantic information.

`array<T, N>` is a template type (13.2) if `T` is a template argument. Two values `a1` and `a2` of type `array<T, N>` are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in `a1` and `a2` are template-argument-equivalent.

The types `iterator` and `const_iterator` meet the constexpr iterator requirements (25.3.1).

```cpp
namespace std {
    template<class T, size_t N>
    struct array {
        // types
        using value_type = T;
        using pointer = T*;
        using const_pointer = const T*;
        using reference = T&;
        using const_reference = const T&;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        using iterator = implementation_defined; // see 24.2
        using const_iterator = implementation_defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

        // no explicit construct/copy/destroy for aggregate type
        constexpr void fill(const T& u);
        constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

        // iterators
        constexpr iterator begin() noexcept;
        constexpr const_iterator begin() const noexcept;
        constexpr iterator end() noexcept;
        constexpr const_iterator end() const noexcept;
        constexpr reverse_iterator rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;
        constexpr const_iterator cbegin() const noexcept;
        constexpr const_iterator cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;

        // capacity
        [[nodiscard]] constexpr bool empty() const noexcept;
        constexpr size_type size() const noexcept;
        constexpr size_type max_size() const noexcept;

        // element access
        constexpr reference operator[](size_type n);
        constexpr const_reference operator[](size_type n) const;
    }
}
```
24.3.7.2 Constructors, copy, and assignment

1 The conditions for an aggregate (9.4.2) shall be met. Class array relies on the implicitly-declared special member functions (11.4.5.2, 11.4.7, 11.4.5.3) to conform to the container requirements table in 24.2. In addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for array require that \( T \) be Cpp17MoveConstructible or Cpp17MoveAssignable, respectively.

24.3.7.3 Member functions

constexpr size_type size() const noexcept;  

1 Returns: \( N \).

constexpr T* data() noexcept;  
constexpr const T* data() const noexcept;  

2 Returns: A pointer such that \([\text{data()}, \text{data() + size()}]\) is a valid range. For a non-empty array, \( \text{data()} == \text{addressof(front())} \).

constexpr void fill(const T& u);  

3 Effects: As if by \( \text{fill_n(begin(), N, u)} \).

constexpr void swap(array& y) noexcept(noexcept(x.swap(y)));  

4 Effects: Equivalent to \( \text{swap_ranges(begin(), end(), y.begin())} \).

5 [Note 1: Unlike the swap function for other containers, array::swap takes linear time, can exit via an exception, and does not cause iterators to become associated with the other container. — end note]

24.3.7.4 Specialized algorithms

template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));  

1 Constraints: \( N == 0 \) or \( \text{is_swappable_v<T> is true} \).

2 Effects: As if by \( \text{x.swap(y)} \).

3 Complexity: Linear in \( N \).

24.3.7.5 Zero-sized arrays

array shall provide support for the special case \( N == 0 \).

1 In the case that \( N == 0 \), \( \text{begin()} == \text{end()} == \text{unique value} \). The return value of \( \text{data()} \) is unspecified.

2 The effect of calling \( \text{front()} \) or \( \text{back()} \) for a zero-sized array is undefined.

3 Member function \( \text{swap()} \) shall have a non-throwing exception specification.
24.3.7.6 Array creation functions

```cpp
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```

1. **Mandates:** `is_array_v<T>` is false and `is_constructible_v<T, T&>` is true.
2. **Preconditions:** `T` meets the `Cpp17CopyConstructible` requirements.
3. **Returns:** `{ a[0], ..., a[N - 1] }`.

```cpp
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

4. **Mandates:** `is_array_v<T>` is false and `is_move_constructible_v<T>` is true.
5. **Preconditions:** `T` meets the `Cpp17MoveConstructible` requirements.
6. **Returns:** `{ std::move(a[0]), ..., std::move(a[N - 1]) }`.

24.3.7.7 Tuple interface

```cpp
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };`
```

1. **Mandates:** `I < N` is true.
2. **Returns:** A reference to the `I`th element of `a`, where indexing is zero-based.

24.3.8 Class template `deque`

24.3.8.1 Overview

A `deque` is a sequence container that supports random access iterators (25.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.

2 A `deque` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on `deque` that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class deque {
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation_defined; // see 24.2
        using difference_type = implementation_defined; // see 24.2
    public:
    //
```
using iterating = implementation-defined; // see 24.2
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// 24.3.8.2, construct/copy/destroy
deque() : deque(Allocator()) { }
explicit deque(const Allocator&);
explicit deque(size_type n, const Allocator& = Allocator());

// element access
reference operator[](size_type n);
const_reference operator[](size_type n) const;
reference at(size_type n);
const_reference at(size_type n) const;
reference front();
const_reference front() const;
reference back();

§ 24.3.8.1
const_reference back() const;

// 24.3.8.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);

void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
  void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
  void append_range(R&& rg);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  iterator insert_range(const_iterator position, R&& rg);
  iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;

template<class InputIterator, class Allocator = allocator<iter_value_type<InputIterator>>>
  deque(InputIterator, InputIterator, Allocator = Allocator())
  -> deque<iter_value_type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
  deque(from_range_t, R&&, Allocator = Allocator())
  -> deque<ranges::range_value_t<R>, Allocator>;

24.3.8.2 Constructors, copy, and assignment

explicit deque(const Allocator&);

    Effects: Constructs an empty deque, using the specified allocator.

    Complexity: Constant.

explicit deque(size_type n, const Allocator& = Allocator());

    Preconditions: T is Cpp17DefaultInsertable into *this.

    Effects: Constructs a deque with n default-inserted elements using the specified allocator.

    Complexity: Linear in n.

deque(size_type n, const T& value, const Allocator& = Allocator());

    Preconditions: T is Cpp17CopyInsertable into *this.

    Effects: Constructs a deque with n copies of value, using the specified allocator.

    Complexity: Linear in n.
template<class InputIterator>
  deque(InputIterator first, InputIterator last, const Allocator& = Allocator());

Effects: Constructs a deque equal to the range [first, last), using the specified allocator.

Complexity: Linear in distance(first, last).

template<container-compatible-range<T> R>
deque(from_range_t, R&& rg, const Allocator& = Allocator());

Effects: Constructs a deque with the elements of the range rg, using the specified allocator.

Complexity: Linear in ranges::distance(rg).

24.3.8.3 Capacity

void resize(size_type sz);

Preconditions: T is Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.

Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

void resize(size_type sz, const T& c);

Preconditions: T is Cpp17CopyInsertable into *this.

Effects: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

void shrink_to_fit();

Preconditions: T is Cpp17MoveInsertable into *this.

Effects: shrink_to_fit is a non-binding request to reduce memory use but does not change the size of the sequence.

[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T, then there are no effects.

Complexity: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

Remarks: If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

24.3.8.4 Modifiers

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
  void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
void append_range(R&& rg);

1 Effects: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

2 Complexity: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

3 Remarks: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();

4 Effects: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[Note 1: pop_front and pop_back are erase operations. — end note]

5 Throws: Nothing unless an exception is thrown by the assignment operator of T.

6 Complexity: The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

24.3.8.5 Erasure
[deque.earasure]
template<class T, class Allocator, class U>
type erase(deque<T, Allocator>& c, const U& value);

1 Effects: Equivalent to:
    auto it = remove(c.begin(), c.end(), value);
    auto r = distance(it, c.end());
    c.erase(it, c.end());
    return r;

template<class T, class Allocator, class Predicate>
type erase_if(deque<T, Allocator>& c, Predicate pred);

2 Effects: Equivalent to:
    auto it = remove_if(c.begin(), c.end(), pred);
    auto r = distance(it, c.end());
    c.erase(it, c.end());
    return r;

24.3.9 Class template forward_list
[forward.list]
24.3.9.1 Overview
[forward.list.overview]
1 A forward_list is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.

[Note 1: It is intended that forward_list have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — end note]

2 A forward_list meets all of the requirements of a container (24.2.2.2), except that the size() member function is not provided and operator== has linear complexity, A forward_list also meets all of the
requirements for an allocator-aware container (24.2.2.5). In addition, a forward_list provides the assign member functions and several of the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on forward_list that are not described in that table or for operations where there is additional semantic information.

3 [Note 2: Modifying any list requires access to the element preceding the first element of interest, but in a forward_list there is no constant-time way to access a preceding element. For this reason, erase_after and splice_after take fully-open ranges, not semi-open ranges. — end note]

namespace std {
    template<class T, class Allocator = allocator<T>>
    class forward_list {
        public:
            // types
            using value_type = T;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 24.2
            using difference_type = implementation-defined; // see 24.2
            using iterator = implementation-defined; // see 24.2
            using const_iterator = implementation-defined; // see 24.2

            // 24.3.9.2, construct/copy/destroy
            forward_list() : forward_list(Allocator()) { }
            explicit forward_list(const Allocator&);
            explicit forward_list(size_type n, const Allocator& = Allocator());
            forward_list(size_type n, const T& value, const Allocator& = Allocator());
            template<class InputIterator>

void sort();
template<class Compare> void sort(Compare comp);

void reverse() noexcept;
}
An incomplete type \( T \) may be used when instantiating `forward_list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). \( T \) shall be complete before any member of the resulting specialization of `forward_list` is referenced.

### 24.3.9.2 Constructors, copy, and assignment

#### [forward.list.cons]

```cpp
explicit forward_list(const Allocator&);
1 Effects: Constructs an empty `forward_list` object using the specified allocator.
2 Complexity: Constant.

explicit forward_list(size_type n, const Allocator& = Allocator());
3 Preconditions: \( T \) is `Cpp17DefaultInsertable` into `*this`.
4 Effects: Constructs a `forward_list` object with \( n \) default-inserted elements using the specified allocator.
5 Complexity: Linear in \( n \).

forward_list(size_type n, const T& value, const Allocator& = Allocator());
6 Preconditions: \( T \) is `Cpp17CopyInsertable` into `*this`.
7 Effects: Constructs a `forward_list` object with \( n \) copies of `value` using the specified allocator.
8 Complexity: Linear in \( n \).

template<class InputIterator>
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
9 Effects: Constructs a `forward_list` object equal to the range `[first, last)`.
10 Complexity: Linear in distance(first, last).

template<container-compatible-range<R> R> forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
11 Effects: Constructs a `forward_list` object with the elements of the range `rg`.
12 Complexity: Linear in ranges::distance(rg).
```

### 24.3.9.3 Iterators

#### [forward.list.iter]

```cpp
iterator before_begin() noexcept;
1 const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;
1 Effects: `cbefore_begin()` is equivalent to `const_cast<forward_list const&>(*this).before_begin()`.
2 Returns: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by `begin()`.
3 Remarks: `before_begin() == end()` shall equal `false`.
```

### 24.3.9.4 Element access

#### [forward.list.access]

```cpp
reference front();
1 const_reference front() const;
1 Returns: *begin()
```

§ 24.3.9.4 888
24.3.9.5 Modifiers

None of the overloads of `insert_after` shall affect the validity of iterators and references, and `erase_after` shall invalidate only iterators and references to the erased elements. If an exception is thrown during `insert_after` there shall be no effect. Inserting `n` elements into a `forward_list` is linear in `n`, and the number of calls to the copy or move constructor of `T` is exactly equal to `n`. Erasing `n` elements from a `forward_list` is linear in `n` and the number of calls to the destructor of type `T` is exactly equal to `n`.

```cpp
template<class... Args> reference emplace_front(Args&&... args);
```

**Effects:** Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args))...` at the beginning of the list.

```cpp
void push_front(const T& x);
void push_front(T&& x);
```

**Effects:** Inserts a copy of `x` at the beginning of the list.

```cpp
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
```

**Effects:** Inserts a copy of each element of `rg` at the beginning of the list.

```cpp
[Note 1: The order of elements is not reversed. —end note]
```

```cpp
void pop_front();
```

**Effects:** As if by `erase_after(before_begin())`.

```cpp
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
```

**Preconditions:** `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

**Effects:** Inserts a copy of `x` after `position`.

**Returns:** An iterator pointing to the copy of `x`.

```cpp
iterator insert_after(const_iterator position, size_type n, const T& x);
```

**Preconditions:** `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

**Effects:** Inserts `n` copies of `x` after `position`.

**Returns:** An iterator pointing to the last inserted copy of `x` or `position` if `n == 0`.

```cpp
template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
```

**Preconditions:** `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. Neither `first` nor `last` are iterators in `*this`.

**Effects:** Inserts copies of elements in `[first, last)` after `position`.

**Returns:** An iterator pointing to the last inserted element or `position` if `first == last`.

```cpp
template<container-compatible-range<T> R>
iterator insert_range_after(const_iterator position, R&& rg);
```

**Preconditions:** `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `rg` and `*this` do not overlap.

**Effects:** Inserts copies of elements in the range `rg` after `position`.

**Returns:** An iterator pointing to the last inserted element, or `position` if `rg` is empty.

```cpp
iterator insert_after(const_iterator position, initializer_list<T> il);
```

**Effects:** `insert_after(p, il.begin(), il.end())`.

**Returns:** An iterator pointing to the last inserted element or `position` if `il` is empty.
template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).
Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args))... after position.
Returns: An iterator pointing to the new object.

iterator erase_after(const_iterator position);

Preconditions: The iterator following position is dereferenceable.
Effects: Erases the element pointed to by the iterator following position.
Returns: An iterator pointing to the element following the one that was erased, or end() if no such element exists.
Throws: Nothing.

iterator erase_after(const_iterator position, const_iterator last);

Preconditions: All iterators in the range (position, last) are dereferenceable.
Effects: Erases the elements in the range (position, last).
Returns: last.
Throws: Nothing.

void resize(size_type sz);

Preconditions: T is Cpp17DefaultInsertable into *this.
Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end()) default-inserted elements at the end of the list.

void resize(size_type sz, const value_type& c);

Preconditions: T is Cpp17CopyInsertable into *this.
Effects: If sz < distance(begin(), end()), erases the last distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end()) copies of c at the end of the list.

void clear() noexcept;

Effects: Erases all elements in the range [begin(), end()).
Remarks: Does not invalidate past-the-end iterators.

24.3.9.6 Operations [forward.list.ops]

In this subclause, arguments for a template parameter named Predicate or BinaryPredicate shall meet the corresponding requirements in 27.2. The semantics of i + n, where i is an iterator into the list and n is an integer, are the same as those of next(i, n). The expression i - n, where i is an iterator into the list and n is an integer, means an iterator j such that j + n == i is true. For merge and sort, the definitions and requirements in 27.8 apply.

void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()). get_allocator() == x.get_allocator() is true. addressof(x) != this is true.
Effects: Inserts the contents of x after position, and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.
Throws: Nothing.
Complexity: \(O(\text{distance}(x\text{.begin()}, x\text{.end()}))\)

```cpp
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
```

**Preconditions:** position is before\_begin() or is a dereferenceable iterator in the range [begin(), end()). The iterator following i is a dereferenceable iterator in x. get\_allocator() == x.get\_-allocator() is true.

**Effects:** Inserts the element following i into \*this, following position, and removes it from x. The result is unchanged if position == i or position == ++i. Pointers and references to +++i continue to refer to the same element but as a member of \*this. Iterators to +++i continue to refer to the same element, but now behave as iterators into \*this, not into x.

**Throws:** Nothing.

**Complexity:** \(O(1)\)

```cpp
void splice_after(const_iterator position, forward_list& x, const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x, const_iterator first, const_iterator last);
```

**Preconditions:** position is before\_begin() or is a dereferenceable iterator in the range [begin(), end()). (first, last) is a valid range in x, and all iterators in the range (first, last) are dereferenceable. position is not an iterator in the range (first, last). get\_allocator() == x.get\_-allocator() is true.

**Effects:** Inserts elements in the range (first, last) after position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of \*this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \*this, not into x.

**Complexity:** \(O(\text{distance(first, last)})\)

```cpp
size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
```

**Effects:** Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: \*i == value (for remove()), pred(\*i) is true (for remove\_if()). Invalidates only the iterators and references to the erased elements.

**Returns:** The number of elements erased.

**Throws:** Nothing unless an exception is thrown by the equality comparison or the predicate.

**Complexity:** Exactly distance(begin(), end()) applications of the corresponding predicate.

**Remarks:** Stable (16.4.6.8).

```cpp
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);
```

Let binary\_pred be equal\_to<>{} for the first overload.

**Preconditions:** binary\_pred is an equivalence relation.

**Effects:** Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator i in the range [begin() + 1, end()) for which binary\_pred(*i, *(i - 1)) is true. Invalidates only the iterators and references to the erased elements.

**Returns:** The number of elements erased.

**Throws:** Nothing unless an exception is thrown by the predicate.

**Complexity:** If empty() is false, exactly distance(begin(), end()) - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

```cpp
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
```
template<class Compare> void merge(forward_list&& x, Compare comp);

Let comp be less<> for the first two overloads.

Preconditions: *this and x are both sorted with respect to the comparator comp, and get_allocator() == x.get_allocator() is true.

Effects: If addressof(x) == this, there are no effects. Otherwise, merges the two sorted ranges [begin(), end()) and [x.begin(), x.end())]. The result is a range that is sorted with respect to the comparator comp. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Complexity: At most distance(begin(), end()) + distance(x.begin(), x.end()) - 1 comparisons if addressof(x) != this; otherwise, no comparisons are performed.

Remarks: Stable (16.4.6.8). If addressof(x) != this, x is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

void sort();
template<class Compare> void sort(Compare comp);

Effects: Sorts the list according to the operator< or the comp function object. If an exception is thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and references.

Complexity: Approximately N log N comparisons, where N is distance(begin(), end()).

Remarks: Stable (16.4.6.8).

void reverse() noexcept;

Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

Complexity: Linear time.

24.3.9.7 Erasure [forward.list erasure]

template<class T, class Allocator, class U>
    typename forward_list<T, Allocator>::size_type
    erase(forward_list<T, Allocator>& c, const U& value);

Effects: Equivalent to: return erase_if(c, [\&](auto& elem) { return elem == value; });

template<class T, class Allocator, class Predicate>
    typename forward_list<T, Allocator>::size_type
    erase_if(forward_list<T, Allocator>& c, Predicate pred);

Effects: Equivalent to: return c.remove_if(pred);

24.3.10 Class template list [list]

24.3.10.1 Overview [list overview]

A list is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (24.3.11) and deques (24.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

A list meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including most of the optional sequence container requirements (24.2.4). The exceptions are the operator[] and at member functions, which are not provided. Descriptions are provided here only for operations on list that are not described in one of these tables or for operations where there is additional semantic information.

215 These member functions are only provided by containers whose iterators are random access iterators.
namespace std {
    template<class T, class Allocator = allocator<T>>
    class list {
public:
    // types
    using value_type = T;

list(from_range_t, R&&, Allocator = Allocator());

}  

An incomplete type \( T \) may be used when instantiating \( \text{list} \) if the allocator meets the allocator completeness requirements (16.4.4.6.2). \( T \) shall be complete before any member of the resulting specialization of \( \text{list} \) is referenced.

### 24.3.10.2 Constructors, copy, and assignment [list.cons]

**explicit list(const Allocator&);**

Effects: Constructs an empty list, using the specified allocator.

Complexity: Constant.

**explicit list(size_type n, const Allocator& = Allocator());**

Preconditions: \( T \) is \( \text{Cpp17DefaultInsertable} \) into *this.

Effects: Constructs a list with \( n \) default-inserted elements using the specified allocator.

Complexity: Linear in \( n \).

**list(size_type n, const T& value, const Allocator& = Allocator());**

Preconditions: \( T \) is \( \text{Cpp17CopyInsertable} \) into *this.

Effects: Constructs a list with \( n \) copies of \( value \), using the specified allocator.

Complexity: Linear in \( n \).

**template<class InputIterator>**

list(InputIterator first, InputIterator last, const Allocator& = Allocator());

Effects: Constructs a list equal to the range \([\text{first}, \text{last})\].

Complexity: Linear in \( \text{distance} \)(first, last).

**template<container-compatible-range<T> R>**

list(from_range_t, R&& rg, const Allocator& = Allocator());

Effects: Constructs a list object with the elements of the range \( rg \).

Complexity: Linear in \( \text{ranges::distance} \)(rg).

### 24.3.10.3 Capacity [list.capacity]

**void resize(size_type sz);**

Preconditions: \( T \) is \( \text{Cpp17DefaultInsertable} \) into *this.

Effects: If \( \text{size()} < sz \), appends \( sz - \text{size()} \) default-inserted elements to the sequence. If \( sz \leq \text{size()} \), equivalent to:

\[
\text{list<T>::iterator it} = \text{begin()};  
\text{advance(it, sz);}  
\text{erase(it, end());}
\]

void resize(size_type sz, const T& c);

Preconditions: \( T \) is \( \text{Cpp17CopyInsertable} \) into *this.

Effects: As if by:

\[
\text{if}(sz > \text{size()}) \quad \text{insert(end(), sz-size(), c);}  
\text{else if}(sz < \text{size()}) \quad \text{iterator i} = \text{begin()};  
\text{advance(i, sz);}  
\]

§ 24.3.10.3
erase(i, end());

24.3.10.4 Modifiers

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  iterator insert_range(const_iterator position, R&& rg);
  iterator insert(const_iterator position, initializer_list<T>);

template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
  void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
  void append_range(R&& rg);

1 Complexity: Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.

2 Remarks: Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();
void clear() noexcept;

3 Effects: Invalidates only the iterators and references to the erased elements.

4 Throws: Nothing.

5 Complexity: Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

24.3.10.5 Operations

Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them. In this subclause, arguments for a template parameter named Predicate or BinaryPredicate shall meet the corresponding requirements in 27.2. The semantics of i + n and i - n, where i is an iterator into the list and n is an integer, are the same as those of next(i, n) and prev(i, n), respectively. For merge and sort, the definitions and requirements in 27.8 apply.

1

2 list provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if get_allocator() != x.get_allocator().

void splice(const_iterator position, list& x);

§ 24.3.10.5
void splice(const_iterator position, list&& x);

Preconditions: addressof(x) != this is true.

Effects: Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);

Preconditions: i is a valid dereferenceable iterator of x.

Effects: Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if position == i or position == ++i. Pointers and references to *i continue to refer to this same element but as a member of *this. Iterators to *i (including i itself) continue to refer to the same element, but now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

Preconditions: [first, last) is a valid range in x. position is not an iterator in the range [first, last).

Effects: Inserts elements in the range [first, last) before position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements as but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time if addressof(x) == this; otherwise, linear time.

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

Effects: Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value, pred(*i) != false. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by *i == value or pred(*i) != false.

Complexity: Exactly size() applications of the corresponding predicate.

Remarks: Stable (16.4.6.8).

size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

Let binary_pred be equal_to<>{} for the first overload.

Preconditions: binary_pred is an equivalence relation.

Effects: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator i in the range [begin() + 1, end()) for which binary_pred(*i, *(i - 1)) is true. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the predicate.
25  Complexity: If empty() is false, exactly size() - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

26  void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);

27  Let comp be less<> for the first two overloads.

28  Preconditions: *this and x are both sorted with respect to the comparator comp, and get_allocator() == x.get_allocator() is true.

29  Effects: If addressof(x) == this, there are no effects. Otherwise, merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). The result is a range that is sorted with respect to the comparator comp. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

30  Complexity: At most size() + x.size() - 1 comparisons if addressof(x) != this; otherwise, no comparisons are performed.

31  Remarks: Stable (16.4.6.8). If addressof(x) != this, x is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison there are no effects.

32  void reverse() noexcept;

33  Effects: Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

34  Complexity: Linear time.

35  void sort();
template<class Compare> void sort(Compare comp);

36  Effects: Sorts the list according to the operator< or a Compare function object. If an exception is thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and references.

37  Complexity: Approximately N log N comparisons, where N == size().

38  Remarks: Stable (16.4.6.8).

24.3.10.6 Erasure  [list.erasure]

39  template<class T, class Allocator, class U>
typename list<T, Allocator>::size_type
erase(list<T, Allocator>& c, const U& value);

40  Effects: Equivalent to: return erase_if(c, [&] (auto& elem) { return elem == value; });

41  template<class T, class Allocator, class Predicate>
typename list<T, Allocator>::size_type
erase_if(list<T, Allocator>& c, Predicate pred);

42  Effects: Equivalent to: return c.remove_if(pred);

24.3.11 Class template vector  [vector]

24.3.11.1 Overview  [vector.overview]

1  A vector is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.

2  A vector meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of a sequence container, including most of the optional sequence container requirements (24.2.4), and, for an element type other than bool, of a contiguous container (24.2.2.1). The exceptions are the push_front, prepend_range, pop_front, and emplace_front member functions, which are not provided. Descriptions are provided here only for operations on vector that are not described in one of these tables or for operations where there is additional semantic information.
The types \texttt{iterator} and \texttt{const\_iterator} meet the constexpr iterator requirements (25.3.1).

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 24.2
        using difference_type = implementation-defined; // see 24.2
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        // 24.3.11.2, construct/copy/destroy
        constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }
        constexpr explicit vector(const Allocator&) noexcept;
        constexpr explicit vector(size_type n, const Allocator& = Allocator());
        constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
        template<class InputIterator>
        constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
        template<container-compatible-range<T> R>
        constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
        constexpr vector(const vector& x);
        constexpr vector(vector&&) noexcept;
        constexpr vector(const vector&, const type_identity_t<Allocator>&);
        constexpr vector(vector&&, const type_identity_t<Allocator>&);
        constexpr vector(initializer_list<T>, const Allocator& = Allocator());
        constexpr ~vector();
        constexpr vector& operator=(const vector& x);
        constexpr vector& operator=(vector&& x) noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
            allocator_traits<Allocator>::is_always_equal::value);
        constexpr vector& operator=(initializer_list<T>);
        template<class InputIterator>
        constexpr void assign(InputIterator first, InputIterator last);
        template<container-compatible-range<T> R>
        constexpr void assign_range(R&& rg);
        constexpr void assign(size_type n, const T& u);
        constexpr void assign(initializer_list<T>);
        constexpr allocator_type get_allocator() const noexcept;
        // iterators
        constexpr iterator begin() noexcept;
        constexpr const_iterator begin() const noexcept;
        constexpr iterator end() noexcept;
        constexpr const_iterator end() const noexcept;
        constexpr reverse_iterator rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;
        constexpr const_iterator cbegin() const noexcept;
        constexpr const_iterator cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;
    }
```
// 24.3.11.3, capacity
constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz);
constexpr void resize(size_type sz, const T& c);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr reference at(size_type n);
constexpr const_reference at(size_type n) const;
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// 24.3.11.4, data access
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

// 24.3.11.5, modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);

// 24.3.11.6, input

4 An incomplete type T may be used when instantiating vector if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of vector is referenced.
24.3.11.2 Constructors

constexpr explicit vector(const Allocator&) noexcept;

Effects: Constructs an empty vector, using the specified allocator.
Complexity: Constant.

constexpr explicit vector(size_type n, const Allocator& = Allocator());

Preconditions: T is Cpp17DefaultInsertable into *this.
Effects: Constructs a vector with n default-inserted elements using the specified allocator.
Complexity: Linear in n.

constexpr vector(size_type n, const T& value, const Allocator& = Allocator());

Preconditions: T is Cpp17CopyInsertable into *this.
Effects: Constructs a vector with n copies of value, using the specified allocator.
Complexity: Linear in n.

template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());

Effects: Constructs a vector equal to the range [first, last), using the specified allocator.
Complexity: Makes only N calls to the copy constructor of T (where N is the distance between first and last) and no reallocations if iterators first and last are of forward, bidirectional, or random access categories. It makes order N calls to the copy constructor of T and order log N reallocations if they are just input iterators.

template<container-compatible-range<T> R>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());

Effects: Constructs a vector object with the elements of the range rg, using the specified allocator.
Complexity: Initializes exactly N elements from the results of dereferencing successive iterators of rg, where N is ranges::distance(rg). Performs no reallocations if R models ranges::forward_range or ranges::sized_range; otherwise, performs order log N reallocations and order N calls to the copy or move constructor of T.

24.3.11.3 Capacity

constexpr size_type capacity() const noexcept;

Returns: The total number of elements that the vector can hold without requiring reallocation.
Complexity: Constant time.

constexpr void reserve(size_type n);

Preconditions: T is Cpp17MoveInsertable into *this.
Effects: A directive that informs a vector of a planned change in size, so that it can manage the storage allocation accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve(). If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable type, there are no effects.

Throws: length_error if n > max_size().\(^{217}\)

Complexity: It does not change the size of the sequence and takes at most linear time in the size of the sequence.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 1: If no reallocation happens, they remain valid. — end note]

\(^{217}\) reserve() uses Allocator::allocate() which can throw an appropriate exception.
No reallocation shall take place during insertions that happen after a call to reserve() until an insertion would make the size of the vector greater than the value of capacity().

```cpp
constexpr void shrink_to_fit();
```

**Preconditions:** T is Cpp17MoveInsertable into *this.

**Effects:** shrink_to_fit is a non-binding request to reduce capacity() to size().

[Note 2: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase capacity(), but may reduce capacity() by causing reallocation. If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T there are no effects.

**Complexity:** If reallocation happens, linear in the size of the sequence.

**Remarks:** Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

[Note 3: If no reallocation happens, they remain valid. — end note]

```cpp
constexpr void swap(vector& x) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value || allocator_traits<Allocator>::is_always_equal::value);
```

**Effects:** Exchanges the contents and capacity() of *this with that of x.

**Complexity:** Constant time.

```cpp
constexpr void resize(size_type sz);
```

**Preconditions:** T is Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.

**Effects:** If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

**Remarks:** If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T there are no effects.

```cpp
constexpr void resize(size_type sz, const T& c);
```

**Preconditions:** T is Cpp17CopyInsertable into *this.

**Effects:** If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

**Remarks:** If an exception is thrown there are no effects.

### 24.3.11.4 Data

```cpp
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

**Returns:** A pointer such that [data(), data() + size()] is a valid range. For a non-empty vector, data() == addressof(front()).

**Complexity:** Constant time.

### 24.3.11.5 Modifiers

```cpp
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);
template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
```
template<container-compatible-range<T> R>
constexpr void append_range(R&& rg);

Complexity: If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

Remarks: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T or by any InputIterator operation there are no effects. If an exception is thrown while inserting a single element at the end and T is Cpp17CopyInsertable or is_nothrow_move_constructible_v<T> is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();

Effects: Invalidates iterators and references at or after the point of the erase.

Throws: Nothing unless an exception is thrown by the assignment operator or move assignment operator of T.

Complexity: The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.

24.3.11.6 Erasure

template<class T, class Allocator, class U>
constexpr typename vector<T, Allocator>::size_type
erase(vector<T, Allocator>& c, const U& value);

Effects: Equivalent to:
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<class T, class Allocator, class Predicate>
constexpr typename vector<T, Allocator>::size_type
erase_if(vector<T, Allocator>& c, Predicate pred);

Effects: Equivalent to:
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

24.3.12 Class vector<bool>

To optimize space allocation, a specialization of vector for bool elements is provided:

namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
public:
// types
    using value_type = bool;
    using allocator_type = Allocator;
    using pointer = implementation-defined;
    using const_pointer = implementation-defined;
    using const_reference = bool;
    using size_type = implementation-defined; // see 24.2
    using difference_type = implementation-defined; // see 24.2
    using iterator = implementation-defined; // see 24.2
§ 24.3.12 903
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// bit reference
class reference {
friend class vector;
constexpr reference() noexcept;
public:
constexpr reference(const reference&) = default;
constexpr ~reference();
constexpr operator bool() const noexcept;
constexpr reference& operator=(bool x) noexcept;
constexpr reference& operator=(const reference& x) noexcept;
constexpr const reference& operator=(bool x) const noexcept;
constexpr void flip() noexcept; // flips the bit
};

// construct/copy/destroy
constexpr vector() : vector(Allocator()) {}
constexpr explicit vector(const Allocator&);
constexpr explicit vector(size_type n, const Allocator& = Allocator());
constexpr vector(size_type n, const bool& value, const Allocator& = Allocator());
template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<container-compatible-range<bool> R>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
constexpr vector(const vector& x);
constexpr vector(vector&& x);
constexpr vector(const vector&, const type_identity_t<Allocator>&);
constexpr vector(vector&&, const type_identity_t<Allocator>&);
constexpr vector(initializer_list<bool>, const Allocator& = Allocator());
constexpr ~vector();
constexpr vector& operator=(const vector& x);
constexpr vector& operator=(vector&& x);
constexpr vector& operator=(initializer_list<bool>);
template<class InputIterator>
constexpr void assign(InputIterator first, InputIterator last);
template<container-compatible-range<bool> R>
constexpr void assign_range(R&& rg);
constexpr void assign(size_type n, const bool& t);
constexpr void assign(initializer_list<bool>);
constexpr allocator_type get_allocator() const noexcept;

// iterators
constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// capacity
[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz, bool c = false);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr const_reference at(size_type n) const;
constexpr reference at(size_type n);
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const bool& x);
template<container-compatible-range<bool> R>
constexpr void append_range(R&& rg);
constexpr void pop_back();
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const bool& x);
constexpr iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<bool> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<bool> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&);
constexpr static void swap(reference x, reference y) noexcept;
constexpr void flip() noexcept;  // flips all bits
constexpr void clear() noexcept;
};

2 Unless described below, all operations have the same requirements and semantics as the primary vector template, except that operations dealing with the bool value type map to bit values in the container storage and allocator_traits::construct (20.2.8.3) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of bool values. A space-optimized representation of bits is recommended instead.

4 reference is a class that simulates the behavior of references of a single bit in vector<bool>. The conversion function returns true when the bit is set, and false otherwise. The assignment operators set the bit when the argument is (convertible to) true and clear it otherwise. flip reverses the state of the bit.

constexpr void flip() noexcept;

5 Effects: Replaces each element in the container with its complement.

constexpr static void swap(reference x, reference y) noexcept;

6 Effects: Exchanges the contents of x and y as if by:

bool b = x;
x = y;
y = b;

template<class Allocator> struct hash<vector<bool, Allocator>>;

7 The specialization is enabled (22.10.19).
24.4 Associative containers

24.4.1 In general

1 The header `<map>` defines the class templates map and multimap; the header `<set>` defines the class templates set and multiset.

2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```cpp
template<class InputIterator>
using iter-value-type = typename iterator_traits<InputIterator>::value_type; // exposition only

template<class InputIterator>
using iter-key-type = remove_const_t<typename iterator_traits<InputIterator>::value_type::first_type>; // exposition only

template<class InputIterator>
using iter-mapped-type = typename iterator_traits<InputIterator>::value_type::second_type; // exposition only

template<class InputIterator>
using iter-to-alloc-type = pair<
    add_const_t<typename iterator_traits<InputIterator>::value_type::first_type>,
    typename iterator_traits<InputIterator>::value_type::second_type>; // exposition only

template<ranges::input_range Range>
using range-key-type = remove_const_t<typename ranges::range_value_t<Range>::first_type>; // exposition only

template<ranges::input_range Range>
using range-mapped-type = typename ranges::range_value_t<Range>::second_type; // exposition only

template<ranges::input_range Range>
using range-to-alloc-type =
    pair<add_const_t<typename ranges::range_value_t<Range>::first_type>,
    typename ranges::range_value_t<Range>::second_type>; // exposition only
```

24.4.2 Header `<map>` synopsis

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {

    // 24.4.4, class template map
    template<class Key, class T, class Compare = less<Key>,
    class Allocator = allocator<pair<const Key, T>>>
    class map;

    template<class Key, class T, class Compare, class Allocator>
    bool operator==(const map<Key, T, Compare, Allocator>& x,
    const map<Key, T, Compare, Allocator>& y); // 24.4.4.2

    template<class Key, class T, class Compare, class Allocator>
    synth-three-way-result<pair<const Key, T>>
    operator<=>(const map<Key, T, Compare, Allocator>& x,
    const map<Key, T, Compare, Allocator>& y); // 24.4.4.2

    template<class Key, class T, class Compare, class Allocator>
    void swap(map<Key, T, Compare, Allocator>& x,
    map<Key, T, Compare, Allocator>& y)
    noexcept(noexcept(x.swap(y)));

    template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename map<Key, T, Compare, Allocator>::size_type
    erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred); // 24.4.4.2

    // 24.4.5, class template multimap
    template<class Key, class T, class Compare = less<Key>,
    class Allocator = allocator<pair<const Key, T>>>
    class multimap;
```
template<class Key, class T, class Compare, class Allocator>
    bool operator==(const multimap<Key, T, Compare, Allocator>& x,

}

24.4.4 Class template map

24.4.4.1 Overview

A map is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. The map class supports bidirectional iterators.

A map meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A map also provides most operations described in 24.2.7 for unique keys. This means that a map supports the a_uniq operations in 24.2.7 but not the a_eq operations. For a map<Key,T> the key_type is Key and the value_type is pair<const Key, T>. Descriptions are provided here only for operations on map that are not described in one of those tables or for operations where there is additional semantic information.

namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
        class map {
            public:
                // types
                using key_type = Key;
                using mapped_type = T;
                using value_type = pair<const Key, T>;
                using key_compare = Compare;
                using allocator_type = Allocator;
                using pointer = typename allocator_traits<Allocator>::pointer;
                using const_pointer = typename allocator_traits<Allocator>::const_pointer;
                using reference = value_type&;
                using const_reference = const value_type&;

24.4.4.2 Constructors, copy, and assignment

explicit map(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty map using the specified comparison object and allocator.

Complexity: Constant.
const Compare& comp = Compare(), const Allocator& = Allocator());

**Effects:** Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range [first, last).

**Complexity:** Linear in $N$ if the range [first, last) is already sorted using comp and otherwise $N \log N$, where $N$ is last - first.

template<container-compatible-range<value_type> R>
map(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

**Effects:** Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range rg.

**Complexity:** Linear in $N$ if rg is already sorted using comp and otherwise $N \log N$, where $N$ is ranges::distance(rg).

### 24.4.4.3 Element access

mapped_type& operator[](const key_type& x);

**Effects:** Equivalent to: return try_emplace(x).first->second;

mapped_type& operator[](key_type&& x);

**Effects:** Equivalent to: return try_emplace(move(x)).first->second;

mapped_type& at(const key_type& x);

const mapped_type& at(const key_type& x) const;

**Returns:** A reference to the mapped_type corresponding to x in *this.

**Throws:** An exception object of type out_of_range if no such element is present.

**Complexity:** Logarithmic.

### 24.4.4.4 Modifiers

```
template<class P>
pair<iterator, bool> insert(P&& x);
``` 

**Constraints:** is_constructible_v<value_type, P&&> is true.

**Effects:** The first form is equivalent to return emplace(std::forward<P>(x)). The second form is equivalent to return emplace_hint(position, std::forward<P>(x)).

```
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
``` 

**Preconditions:** value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

**Effects:** If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

**Returns:** In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

**Complexity:** The same as emplace and emplace_hint, respectively.

```
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
``` 

**Preconditions:** value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

**Effects:** The same as emplace and emplace_hint, respectively.
Effects: If the map already contains an element whose key is equivalent to \( k \), there is no effect. Otherwise inserts an object of type \( \text{value	extunderscore type} \) constructed with \( \text{piecewise	extunderscore construct, forward	extunderscore as	extunderscore tuple} (\text{std}::\text{move}(k)), \text{forward	extunderscore as	extunderscore tuple} (\text{std}::\text{forward}\langle \text{Args} \rangle (\text{args})...) \).

Returns: In the first overload, the \( \text{bool} \) component of the returned pair is \text{true} if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as \text{emplace} and \text{emplace	extunderscore hint}, respectively.

\template{\text{class M}}
\pair{\text{iterator, bool}} \text{insert	extunderscore or	extunderscore assign}(\text{const key	extunderscore type} & k, M &\& obj);
\template{\text{class M}}
\iter\\tor\text{insert	extunderscore or	extunderscore assign}(\text{const\_iterator hint, const key	extunderscore type} & k, M &\& obj);

\text{Mandates:} is\_assignable	extunderscore v<\text{mapped	extunderscore type}, M &\&> is \text{true}.

Preconditions: \text{value	extunderscore type} is \text{Cpp17EmplaceConstructible} into \text{map} from \( k, \text{forward}<M>(\text{obj}) \).

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns std::\text{forward}<M>(\text{obj}) to \( e.second \). Otherwise inserts an object of type \text{value	extunderscore type} constructed with \( k, \text{std}::\text{forward}<M>(\text{obj}) \).

Returns: In the first overload, the \text{bool} component of the returned pair is \text{true} if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as \text{emplace} and \text{emplace	extunderscore hint}, respectively.

\template{\text{class M}}
\pair{\text{iterator, bool}} \text{insert	extunderscore or	extunderscore assign}(\text{key	extunderscore type} & k, M &\& obj);
\template{\text{class M}}
\iter\\tor\text{insert	extunderscore or	extunderscore assign}(\text{const\_iterator hint, key	extunderscore type} & k, M &\& obj);

\text{Mandates:} is\_assignable	extunderscore v<\text{mapped	extunderscore type}, M &\&> is \text{true}.

Preconditions: \text{value	extunderscore type} is \text{Cpp17EmplaceConstructible} into \text{map} from \text{move}(k), \text{forward}<M>(\text{obj})

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns std::\text{move}<M>(\text{obj}) to \( e.second \). Otherwise inserts an object of type \text{value	extunderscore type} constructed with std::\text{move}(k), std::\text{forward}<M>(\text{obj})

Returns: In the first overload, the \text{bool} component of the returned pair is \text{true} if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as \text{emplace} and \text{emplace	extunderscore hint}, respectively.

\section*{24.4.4.5 Erasure \[\text{map	extunderscore erasure}\]}

\template{\text{class Key, class T, class Compare, class Allocator, class Predicate}}
\text{typename} \text{map<Key, T, Compare, Allocator>::size	extunderscore type}
\text{erase	extunderscore if}(\text{map<Key, T, Compare, Allocator>& c, Predicate pred);}

Effects: Equivalent to:

\begin{verbatim}
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
\end{verbatim}

\section*{24.4.5 Class template multimap \[\text{multimap}\]}

\subsection*{24.4.5.1 Overview \[\text{multimap\textunderscore overview}\]}

A \text{multimap} is an associative container that supports equivalent keys (possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type \( T \) based on the keys. The \text{multimap} class supports bidirectional iterators.

A \text{multimap} meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A \text{multimap} also provides most
operations described in 24.2.7 for equal keys. This means that a **multimap** supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `multimap<Key, T>` the `key_type` is `Key` and the `value_type` is `pair<const Key, T>`. Descriptions are provided here only for operations on **multimap** that are not described in one of those tables or for operations where there is additional semantic information.

```cpp

    multimap<InputIterator, InputIterator, Allocator)
        -> multimap<iter::key_type<InputIterator>, iter::mapped_type<InputIterator>,
            less<iter::key_type<InputIterator>>, Allocator>;

§ 24.4.5.1
template<ranges::input_range R, class Allocator>
multimap(from_range_t, R&&, Allocator)
  -> multimap<range-key-type<R>, range-mapped-type<R>, less<range-key-type<R>>, Allocator>;

template<class Key, class T, class Allocator>
multimap(initializer_list<pair<Key, T>>, Allocator)
  -> multimap<Key, T, less<Key>, Allocator>;

24.4.5.2 Constructors

explicit multimap(const Compare& comp, const Allocator& = Allocator());

1 Effects: Constructs an empty multimap using the specified comparison object and allocator.

2 Complexity: Constant.

template<class InputIterator>
multimap(InputIterator first, InputIterator last,
          const Compare& comp = Compare(),
          const Allocator& = Allocator());

3 Effects: Constructs an empty multimap using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 Complexity: Linear in \( N \) if the range [first, last) is already sorted using comp and otherwise \( N \log N \), where \( N \) is last - first.

template<container-compatible-range<value_type> R>
multimap(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

5 Effects: Constructs an empty multimap using the specified comparison object and allocator, and inserts elements from the range rg.

6 Complexity: Linear in \( N \) if rg is already sorted using comp and otherwise \( N \log N \), where \( N \) is ranges::distance(rg).

24.4.5.3 Modifiers

template<class P> iterator insert(P&& x);

1 Constraints: is_constructible_v<value_type, P&&> is true.

2 Effects: The first form is equivalent to return emplace(std::forward<P>(x)). The second form is equivalent to return emplace_hint(position, std::forward<P>(x)).

24.4.5.4 Erasure

template<class Key, class T, class Compare, class Allocator, class Predicate>
typename multimap<Key, T, Compare, Allocator>::size_type
erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);

1 Effects: Equivalent to:

```cpp
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

24.4.6 Class template set

24.4.6.1 Overview

A set is an associative container that supports unique keys (contains at most one of each key value) and provides for fast retrieval of the keys themselves. The set class supports bidirectional iterators.

§ 24.4.6.1 917
A set meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A set also provides most operations described in 24.2.7 for unique keys. This means that a set supports the `a_uniq` operations in 24.2.7 but not the `a_eq` operations. For a `set<Key>` both the `key_type` and `value_type` are `Key`. Descriptions are provided here only for operations on `set` that are not described in one of these tables and for operations where there is additional semantic information.

```cpp
namespace std {
    template<class Key, class Compare = less<Key>,
             class Allocator = allocator<Key>>
    class set {
        public:
            // types
            using key_type = Key;
            using key_compare = Compare;
            using value_type = Key;
            using value_compare = Compare;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 24.2
            using difference_type = implementation-defined; // see 24.2
            using iterator = implementation-defined; // see 24.2
            using const_iterator = implementation-defined; // see 24.2
            using reverse_iterator = std::reverse_iterator<iterator>;
            using const_reverse_iterator = std::reverse_iterator<const_iterator>;
            using node_type = unspecified;
            using insert_return_type = insert-return-type<iterator, node_type>;

            // 24.4.6.2, construct/copy/destroy
            set() : set(Compare()) { }

}  

24.4.6.2 Constructors, copy, and assignment

explicit set(const Compare& comp, const Allocator& = Allocator());

1 Effects: Constructs an empty set using the specified comparison objects and allocator.

2 Complexity: Constant.
template<class InputIterator>
set(InputIterator first, InputIterator last,
    const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range [first, last).

Complexity: Linear in N if the range [first, last) is already sorted using comp and otherwise $N \log N$, where $N$ is last - first.

template<container-compatible-range<value_type> R>
set(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range rg.

Complexity: Linear in N if rg is already sorted using comp and otherwise $N \log N$, where $N$ is ranges::distance(rg).

24.4.6.3 Erasure

template<class Key, class Compare, class Allocator, class Predicate>
typename set<Key, Compare, Allocator>::size_type
erase_if(set<Key, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:

```c++
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.4.7 Class template multiset

24.4.7.1 Overview

A multiset is an associative container that supports equivalent keys (possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The multiset class supports bidirectional iterators.

A multiset meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.5), of an associative container (24.2.7). multiset also provides most operations described in 24.2.7 for duplicate keys. This means that a multiset supports the \texttt{a\_eq} operations in 24.2.7 but not the \texttt{a\_uniq} operations. For a \texttt{multiset<Key>} both the \texttt{key\_type} and \texttt{value\_type} are \texttt{Key}. Descriptions are provided here only for operations on multiset that are not described in one of these tables and for operations where there is additional semantic information.

        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

24.5 Unordered associative containers

24.5.1 In general

The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.

The exposition-only alias templates `iter-value-type`, `iter-key-type`, `iter-mapped-type`, and `iter-to-alloc-type` defined in 24.4.1 may appear in deduction guides for unordered containers.

24.5.2 Header `<unordered_map>` synopsis

```cpp
#include <compare>    // see 17.11.1
#include <initializer_list>    // see 17.10.2

namespace std {
    // 24.5.4, class template unordered_map
    template<class Key,
        class T,
        class Hash = hash<Key>,
        class Pred = equal_to<Key>,
        class Alloc = allocator<pair<const Key, T>>>
    class unordered_map;
    // 24.5.5, class template unordered_multimap
    template<class Key,
        class T,
        class Hash = hash<Key>,
        class Pred = equal_to<Key>,
        class Alloc = allocator<pair<const Key, T>>>
    class unordered_multimap;

    template<class Key, class T, class Hash, class Pred, class Alloc>
    bool operator==(const unordered_map<Key, T, Hash, Pred, Alloc>& a,

equal_to<range-key-type<R>>, Allocator>;

4 A size_type parameter type in an unordered_map deduction guide refers to the size_type member type of the type deduced by the deduction guide.

24.5.4.2 Constructors

unordered_map() : unordered_map(size_type(see below)) {}  
explicit unordered_map(size_type n,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),

§ 24.5.4.2 931
const allocator_type& a = allocator_type();

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least \( n \) buckets. For the default constructor, the number of buckets is implementation-defined. \( \text{max_load_factor()} \) returns 1.0.

Complexity: Constant.

```cpp
template<typename InputIterator>
unordered_map(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());
```

```cpp
template<typename container-compatible-range <value_type> R>
unordered_map(from_range_t, R&& rg,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());
```

```cpp
unordered_map(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());
```

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least \( n \) buckets. If \( n \) is not provided, the number of buckets is implementation-defined. Then inserts elements from the range \([f, l])\), \(rg\), or \(il\), respectively. \( \text{max_load_factor()} \) returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.4.3 Element access

```cpp
mapped_type& operator[](const key_type& k);
```

Effects: Equivalent to: \( \text{return try_emplace(k).first}\rightarrow\text{second}; \)

```cpp
mapped_type& operator[](key_type&& k);
```

Effects: Equivalent to: \( \text{return try_emplace(move(k)).first}\rightarrow\text{second}; \)

```cpp
mapped_type& at(const key_type& k);
cast mapped_type& at(const key_type& k) const;
```

Returns: A reference to \( x.\text{second} \), where \( x \) is the (unique) element whose key is equivalent to \( k \).

Throws: An exception object of type \( \text{out_of_range} \) if no such element is present.

24.5.4.4 Modifiers

```cpp
template<typename P>
pair<iterator, bool> insert(P&& obj);
```

Constraints: \( \text{is_constructible_v<value_type, P&&> is true.} \)

Effects: Equivalent to: \( \text{return emplace(std::forward<P>(obj));} \)

```cpp
template<typename P>
iterator insert(const_iterator hint, P&& obj);
```

Constraints: \( \text{is_constructible_v<value_type, P&&> is true.} \)

Effects: Equivalent to: \( \text{return emplace_hint(hint, std::forward<P>(obj));} \)

```cpp
template<typename... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);

Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.

template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);

Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);

Mandates: is_assignable_v<mapped_type&, M&&> is true.

Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from k, std::forward<M>(obj).

Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with k, std::forward<M>(obj).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);

Mandates: is_assignable_v<mapped_type&, M&&> is true.

Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from std::move(k), std::forward<M>(obj).

Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with std::move(k), std::forward<M>(obj).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.
24.5.4.5 Erasure

```
template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_map<K, T, H, P, A>::size_type
erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

1. **Effects**: Equivalent to:

   ```
   auto original_size = c.size();
   for (auto i = c.begin(), last = c.end(); i != last; ) {
     if (pred(*i)) {
       i = c.erase(i);
     } else {
       ++i;
     }
   }
   return original_size - c.size();
   ```

24.5.5 Class template unordered_multimap

24.5.5.1 Overview

1. An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.

2. An `unordered_multimap` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, but not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the key type is `Key`, the mapped type is `T`, and the value type is `pair<const Key, T>`.

3. Subclause 24.5.5 only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```
namespace std {
  template<class Key, class T, class Hash = hash<Key>,
          class Pred = equal_to<Key>,
          class Allocator = allocator<pair<const Key, T>>>
  class unordered_multimap {
    public:
      // types
      using key_type = Key;
      using mapped_type = T;
      using value_type = pair<const Key, T>;
      using hasher = Hash;
      using key_equal = Pred;
      using allocator_type = Allocator;
      using pointer = typename allocator_traits<Allocator>::pointer;
      using const_pointer = typename allocator_traits<Allocator>::const_pointer;
      using reference = value_type&;
      using const_reference = const value_type&;
      using size_type = implementation-defined; // see 24.2
      using difference_type = implementation-defined; // see 24.2
      using iterator = implementation-defined; // see 24.2
      using const_iterator = implementation-defined; // see 24.2

unordered_multimap(initializer_list<pair<Key, T>>, typename see below::size_type, Allocator)
  -> unordered_multimap<Key, T, hash<Key>, equal_to<Key>, Allocator>;

A size_type parameter type in an unordered_multimap deduction guide refers to the size_type member type of the type deduced by the deduction guide.

### 24.5.5.2 Constructors [unord.multimap.cnstr]

unordered_multimap() : unordered_multimap(size_type(see below)) { }

explicit unordered_multimap(size_type n,
  const hasher& hf = hasher(),
  const key_equal& eql = key_equal(),
  const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.

template<class InputIterator>
unordered_multimap(InputIterator f, InputIterator l,
  size_type n = see below,
  const hasher& hf = hasher(),
  const key_equal& eql = key_equal(),
  const allocator_type& a = allocator_type());

template<container-compatible-range<value_type> R>
unordered_multimap(from_range_t, R&& rg,
  size_type n = see below,
  const hasher& hf = hasher(),
  const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type();

unordered_multimap(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f,l), rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.5.3 Modifiers

template<class P>
iterator insert(P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace(std::forward<P>(obj));

template<class P>
iterator insert(const_iterator hint, P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

24.5.5.4 Erasure

template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_multimap<K, T, H, P, A>::size_type
erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);

Effects: Equivalent to:
  auto original_size = c.size();
  for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
      i = c.erase(i);
    } else {
      ++i;
    }
  }
  return original_size - c.size();

24.5.6 Class template unordered_set

24.5.6.1 Overview

An unordered_set is an unordered associative container that supports unique keys (an unordered_set contains at most one of each key value) and in which the elements’ keys are the elements themselves. The unordered_set class supports forward iterators.

An unordered_set meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_set supports the a_uniq operations in that table, not the a_eq operations. For an unordered_set<Key> the key type and the value type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 24.5.6 only describes operations on unordered_set that are not described in one of the requirement tables, or for which there is additional semantic information.

  equal_to<ranges::range_value_t<R>>, Allocator>;

template<class T, class Allocator>
unordered_set(initializer_list<T>, typename see below::size_type, Allocator)
-> unordered_set<T, hash<T>, equal_to<T>, Allocator>;

template<class T, class Hash, class Allocator>
unordered_set(initializer_list<T>, typename see below::size_type, Hash, Allocator)
-> unordered_set<T, Hash, equal_to<T>, Allocator>;

4 A size_type parameter type in an unordered_set deduction guide refers to the size_type member type of the type deduced by the deduction guide.

24.5.6.2 Constructors

unordered_set() : unordered_set(size_type(see below)) {} 
explicit unordered_set(size_type n,
  const hasher& hf = hasher(),
  const key_equal& eqi = key_equal(),
  const allocator_type& a = allocator_type());

1 Effects: Constructs an empty unordered_set using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

2 Complexity: Constant.
template<class InputIterator>
unordered_set(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

template<container-compatible-range <value_type> R>
unordered_multiset(from_range_t, R&& rg,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

unordered_set(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_set using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f,l), rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.6.3 Erasure

template<class K, class H, class P, class A, class Predicate>
typename unordered_set<K, H, P, A>::size_type
erase_if(unordered_set<K, H, P, A>& c, Predicate pred);

Effects: Equivalent to:
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
if (pred(*i)) {
  i = c.erase(i);
} else {
  ++i;
}
}
return original_size - c.size();

24.5.7 Class template unordered_multiset

24.5.7.1 Overview

An unordered_multiset is an unordered associative container that supports equivalent keys (an instance of unordered_multiset may contain multiple copies of the same key value) and in which each element’s key is the element itself. The unordered_multiset class supports forward iterators.

An unordered_multiset meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multiset supports the a_eq operations in that table, not the a_uniq operations. For an unordered_multiset<Key> the key type and the value type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 24.5.7 only describes operations on unordered_multiset that are not described in one of the requirement tables, or for which there is additional semantic information.

4 A size_type parameter type in an unordered_multiset deduction guide refers to the size_type member
type of the type deduced by the deduction guide.

24.5.7.2 Constructors

unordered_multiset() : unordered_multiset(size_type(see below)) { }

explicit unordered_multiset(size_type n,
                           const hasher& hf = hasher(),
                           const key_equal& eql = key_equal(),
                           const allocator_type& a = allocator_type());

1 Effects: Constructs an empty unordered_multiset using the specified hash function, key equality
predicate, and allocator, and using at least n buckets. For the default constructor, the number of
buckets is implementation-defined. max_load_factor() returns 1.0.

2 Complexity: Constant.
template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

template<container-compatible-range <value_type> R>
unordered_multiset(from_range_t, R&& rg,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multiset using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f,l), rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.7.3 Erasure [unord.multiset.erasure]

template<class K, class H, class P, class A, class Predicate>
typename unordered_multiset<K, H, P, A>::size_type
erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);

Effects: Equivalent to:

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();

24.6 Container adaptors [container.adaptors]

24.6.1 In general [container.adaptors.general]

The headers <queue> and <stack> define the container adaptors queue, priority_queue, and stack.

The container adaptors each take a Container template parameter, and each constructor takes a Container reference argument. This container is copied into the Container member of each adaptor. If the container takes an allocator, then a compatible allocator may be passed in to the adaptor’s constructor. Otherwise, normal copy or move construction is used for the container argument. The first template parameter T of the container adaptors shall denote the same type as Container::value_type.

For container adaptors, no swap function throws an exception unless that exception is thrown by the swap of the adaptor’s Container or Compare object (if any).

A constructor template of a container adaptor shall not participate in overload resolution if it has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

(5.1) — It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(5.2) — It has a Compare template parameter and a type that qualifies as an allocator is deduced for that parameter.
It has a container template parameter and a type that qualifies as an allocator is deduced for that parameter.

— It has no container template parameter, and it has an allocator template parameter, and a type that does not qualify as an allocator is deduced for that parameter.

— It has both container and allocator template parameters, and uses_allocator_v<Container, Allocator> is false.

The exposition-only alias template iter_value_type defined in 24.3.1 may appear in deduction guides for container adaptors.

24.6.2 Header <queue> synopsis

```cpp
#include <compare>  // see 17.11.1
#include <initializer_list>  // see 17.10.2

namespace std {
    template<class T, class Container = deque<T>> class queue;

template<class T, class Container>
bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);

template<class T, class Container>
bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);

// operator<=> for three-way comparison

// swap function

// uses_allocator

24.6.4 Class template queue

24.6.4.1 Definition

Any sequence container supporting operations `front()`, `back()`, `push_back()` and `pop_front()` can be used to instantiate queue. In particular, `list` (24.3.10) and `deque` (24.3.8) can be used.

```cpp
namespace std {
    template<class T, class Container = deque<T>>
    class queue {
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;

        public:
            using allocator_type = Container::allocator_type;

            queue() : queue(std::move(Container())) {}
            explicit queue(const Container&);
            explicit queue(Container&&);
            template<class InputIterator> queue(InputIterator first, InputIterator last);
            template<container-compatible-range<T> R> queue(from_range_t, R&& rg);
            template<class Alloc> explicit queue(const Alloc&);
            template<class Alloc> queue(const Container&, const Alloc&);
            template<class Alloc> queue(Container&&, const Alloc&);
            template<class Alloc> queue(const queue&, const Alloc&);
            template<class Alloc> queue(queue&&, const Alloc&);
            template<class InputIterator, class Alloc>
            queue(InputIterator first, InputIterator last, const Alloc&);
            template<container-compatible-range<T> R, class Alloc>
            queue(from_range_t, R&& rg, const Alloc&);

            [[nodiscard]] bool empty() const { return c.empty(); }
            size_type size() const { return c.size(); }
            reference front() { return c.front(); }
            const_reference front() const { return c.front(); }
            reference back() { return c.back(); }
            const_reference back() const { return c.back(); }
            void push(const value_type& x) { c.push_back(x); }
            void push(value_type&& x) { c.push_back(std::move(x)); }
            template<container-compatible-range<T> R> void push_range(R&& rg);
            template<container-compatible-range<T> R, class Alloc>
            void push_range(R&& rg, const Alloc&);
            template<... Args>
            decltype(auto) emplace(Args&&... args) {
                return c.emplace_back(std::forward<Args>(args)...);
            }
            void pop() {
                c.pop_front();
            }
    }
} // namespace std
```
```cpp
void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
    { using std::swap; swap(c, q.c); }
};

queue(from_range_t, R&&, Allocator) ->
    queue<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;

template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc> : uses_allocator<Container, Alloc>::type { };
```

### 24.6.4.2 Constructors

- **explicit queue(const Container& cont);**
  
  **Effects:** Initializes `c` with `cont`.

- **explicit queue(Container&& cont);**
  
  **Effects:** Initializes `c` with `std::move(cont)`.

- **template<class InputIterator>
  queue(InputIterator first, InputIterator last);**
  
  **Effects:** Initializes `c` with `first` as the first argument and `last` as the second argument.

- **template<container-compatible-range<T> R>
  queue(from_range_t, R&& rg);**
  
  **Effects:** Initializes `c` with `ranges::to<Container>(std::forward<R>(rg))`.

### 24.6.4.3 Constructors with allocators

1. If `uses_allocator_v<container_type, Alloc>` is `false` the constructors in this subclause shall not participate in overload resolution.

- **template<Alloc> explicit queue(const Alloc& a);**
  
  **Effects:** Initializes `c` with `a`.

- **template<Alloc> queue(const container_type& cont, const Alloc& a);**
  
  **Effects:** Initializes `c` with `cont` as the first argument and `a` as the second argument.

- **template<container_type&& cont, const Alloc& a);**
  
  **Effects:** Initializes `c` with `std::move(cont)` as the first argument and `a` as the second argument.

- **template<Alloc> queue(const queue& q, const Alloc& a);**
  
  **Effects:** Initializes `c` with `q.c` as the first argument and `a` as the second argument.
template<class Alloc> queue(queue&& q, const Alloc& a);

Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.

template<class InputIterator, class Alloc>
queue(InputIterator first, InputIterator last, const Alloc& alloc);

Effects: Initializes c with first as the first argument, last as the second argument, and alloc as the third argument.

template<container-compatible-range<T> R, class Alloc>
queue(from_range_t, R&& rg, const Alloc& a);

Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a).

24.6.4.4 Modifiers [queue.mod]

template<container-compatible-range<T> R>
void push_range(R&& rg);

Effects: Equivalent to c.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise ranges::copy(rg, back_inserter(c)).

24.6.4.5 Operators [queue.ops]

template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c == y.c.

template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c != y.c.

template<class T, class Container>
bool operator<(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c < y.c.

template<class T, class Container>
bool operator>(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c > y.c.

template<class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c <= y.c.

template<class T, class Container>
bool operator>=(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c >= y.c.

template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c <=> y.c.

24.6.4.6 Specialized algorithms [queue.special]

template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));
24.6.5 Class template priority_queue

24.6.5.1 Overview

Any sequence container with random access iterator and supporting operations `front()`, `push_back()` and `pop_back()` can be used to instantiate priority_queue. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used. Instantiating `priority_queue` also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (27.8).

```cpp
namespace std {
    template<class T, class Container = vector<T>,
             class Compare = less<typename Container::value_type>>
    class priority_queue {
    public:
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;
        using value_compare = Compare;

    protected:
        Container c;
        Compare comp;

    public:
        priority_queue() : priority_queue(Compare()) {}
        explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {}
        priority_queue(const Compare& x, const Container&);
        template<class InputIterator>
        priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
        template<class InputIterator>
        priority_queue(InputIterator first, InputIterator last, const Compare& x,
                        const Container&);
        template<class InputIterator>
        priority_queue(InputIterator first, InputIterator last, const Compare& x,
                        Container&&);
        template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Alloc&);
        template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Compare&, const Alloc&);
        template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Compare&, const Container&,
                        const Alloc&);
        template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Compare&, Container&&,
                        const Alloc&);
        template<class InputIterator, class Alloc>
        priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
        template<class Alloc> explicit priority_queue(const Alloc&);
        template<class Alloc> priority_queue(const Compare&, const Alloc&);
        template<class Alloc> priority_queue(const Compare&, const Container&, const Alloc&);
        template<class Alloc> priority_queue(const Compare&, Container&&, const Alloc&);
        template<class Alloc> priority_queue(const priority_queue&, const Alloc&);
        template<class Alloc> priority_queue(priority_queue&&, const Alloc&);
        [[nodiscard]] bool empty() const { return c.empty(); }
        size_type size() const { return c.size(); }
        const_reference top() const { return c.front(); }
        void push(const value_type& x);
    }
```

§ 24.6.5.1
void push(value_type&& x);
void push_range(R&& rg);
void emplace(Args&&... args);
void pop();
void swap(priority_queue& q) noexcept(is_nothrow_swappable_v<Container> &&
  is_nothrow_swappable_v<Compare>)
{ using std::swap; swap(c, q.c); swap(comp, q.comp); }
};

template<class Compare, class Container>
  priority_queue(Compare, Container)
  -> priority_queue<typename Container::value_type, Container, Compare>;

template<class InputIterator, class Compare = less<
  iter_value_type<InputIterator>>,
  class Container = vector<
  iter_value_type<InputIterator>>>;
  priority_queue(InputIterator, InputIterator, Compare = Compare(), Container = Container())
  -> priority_queue<
  iter_value_type<InputIterator>, Container, Compare>;

template<class Compare, class Container, class Allocator>
  priority_queue(Compare, Container, Allocator)
  -> priority_queue<typename Container::value_type, Container, Compare>;

template<class InputIterator, class Allocator>
  priority_queue(InputIterator, InputIterator, Allocator)
  -> priority_queue<
  iter_value_type<InputIterator>,
  vector<
  iter_value_type<InputIterator>, Allocator>,
  less<
  iter_value_type<InputIterator>>>;

// no equality is provided

template<class T, class Container, class Compare, class Alloc>
  struct uses_allocator<priority_queue<T, Container, Compare>, Alloc>
  : uses_allocator<Container, Alloc>::type { };
Effects: Initializes \( \text{comp} \) with \( x \) and \( c \) with \( y \) (copy constructing or move constructing as appropriate); calls `make_heap(c.begin(), c.end(), \text{comp})`.

```cpp
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
```  
**Preconditions:** \( x \) defines a strict weak ordering (27.8).

Effects: Initializes \( c \) with \( \text{first} \) as the first argument and \( \text{last} \) as the second argument, and initializes \( \text{comp} \) with \( x \); then calls `make_heap(c.begin(), c.end(), \text{comp})`.

```cpp
template<class InputIterator>
priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);
```

Effects: Initializes \( \text{comp} \) with \( x \) and \( c \) with \( y \) (copy constructing or move constructing as appropriate); calls `c.insert(c.end(), \text{first}, \text{last})`; and finally calls `make_heap(c.begin(), c.end(), \text{comp})`.

```cpp
template<class Container& R>
priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
```

Effects: Initializes \( \text{comp} \) with \( x \) and \( c \) with `ranges::to<Container>(std::forward<R>(rg))` and finally calls `make_heap(c.begin(), c.end(), \text{comp})`.

### 24.6.5.3 Constructors with allocators

If `uses_allocator_{vt}container_type, Alloc` is `false` the constructors in this subclause shall not participate in overload resolution.

```cpp
template<class Alloc> explicit priority_queue(const Alloc& a);
```

Effects: Initializes \( c \) with \( a \) and value-initializes \( \text{comp} \).

```cpp
template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);
```

Effects: Initializes \( c \) with \( a \) and initializes \( \text{comp} \) with \( \text{compare} \).

```cpp
template<class Alloc>
priority_queue(const Compare& compare, const Container& cont, const Alloc& a);
```

Effects: Initializes \( c \) with \( \text{cont} \) as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with \( \text{compare} \); calls `make_heap(c.begin(), c.end(), \text{comp})`.

```cpp
template<class Alloc>
priority_queue(const Compare& compare, Container&& cont, const Alloc& a);
```

Effects: Initializes \( c \) with `std::move(cont)` as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with `std::move(\text{compare})`; calls `make_heap(c.begin(), c.end(), \text{comp})`.

```cpp
template<class Alloc>
priority_queue(const priority_queue& q, const Alloc& a);
```

Effects: Initializes \( c \) with \( q.c \) as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with \( q.\text{comp} \).

```cpp
template<class Alloc>
priority_queue(priority_queue&& q, const Alloc& a);
```

Effects: Initializes \( c \) with `std::move(q.c)` as the first argument and \( a \) as the second argument, and initializes \( \text{comp} \) with `std::move(q.\text{comp})`.

```cpp
template<class InputIterator, class Alloc>
priority_queue(InputIterator first, InputIterator last, const Alloc& a);
```

Effects: Initializes \( c \) with \( \text{first} \) as the first argument, \( \text{last} \) as the second argument, and \( a \) as the third argument, and value-initializes \( \text{comp} \); calls `make_heap(c.begin(), c.end(), \text{comp})`. 

§ 24.6.5.3 956
template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Compare& compare, const Alloc& a);

Effects: Initializes c with first as the first argument, last as the second argument, and a as the third argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Compare& compare, const Container& cont, const Alloc& a);

Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Compare& compare, Container&& cont, const Alloc& a);

Effects: Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

template<container-compatible-range<T> R, class Alloc>
    priority_queue(from_range_t, R&& rg, const Compare& compare, const Alloc& a);

Effects: Initializes comp with compare and c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

24.6.5.4 Members

void push(const value_type& x);

Effects: As if by:
    c.push_back(x);
    push_heap(c.begin(), c.end(), comp);

void push(value_type&& x);

Effects: As if by:
    c.push_back(std::move(x));
    push_heap(c.begin(), c.end(), comp);

template<container-compatible-range<T> R>
    void push_range(R&& rg);

Effects: Insert all elements of rg in c.

Postconditions: is_heap(c.begin(), c.end(), comp) is true.

template<class... Args> void emplace(Args&&... args);

Effects: As if by:
    c.emplace_back(std::forward<Args>(args)...);
    push_heap(c.begin(), c.end(), comp);

void pop();

Effects: As if by:
    pop_heap(c.begin(), c.end(), comp);
    c.pop_back();
24.6.5.5 Specialized algorithms

```
template<class T, class Container, class Compare>
  void swap(priority_queue<T, Container, Compare>& x,
             priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));
```

1. Constraints: `is_swappable_v<Container>` is true and `is_swappable_v<Compare>` is true.

2. Effects: As if by `x.swap(y)`.

24.6.6 Class template stack

24.6.6.1 General

Any sequence container supporting operations `back()`, `push_back()` and `pop_back()` can be used to instantiate stack. In particular, `vector (24.3.11)`, `list (24.3.10)` and `deque (24.3.8)` can be used.

24.6.6.2 Definition

```
namespace std {
  template<class T, class Container = deque<T>>
  class stack {
    public:
      using value_type = typename Container::value_type;
      using reference = typename Container::reference;
      using const_reference = typename Container::const_reference;
      using size_type = typename Container::size_type;
      using container_type = Container;

    protected:
      Container c;

    public:
      stack() : stack(Container()) {}
      explicit stack(const Container&);
      explicit stack(Container&&);
      template<class InputIterator> stack(InputIterator first, InputIterator last);
      template<container-compatible-range<T> R> stack(from_range_t, R&& rg);
      template<class Alloc> explicit stack(const Alloc&);
      template<class Alloc> stack(const Container&, const Alloc&);
      template<class Alloc> stack(Container&&, const Alloc&);
      template<class Alloc> stack(const stack&, const Alloc&);
      template<class Alloc> stack(stack&&, const Alloc&);
      template<class InputIterator, class Alloc>
        stack(InputIterator first, InputIterator last, const Alloc&);
      template<container-compatible-range<T> R, class Alloc>
        stack(from_range_t, R&& rg, const Alloc&);

    public:
      [[nodiscard]] bool empty() const { return c.empty(); }
      size_type size() const { return c.size(); }
      reference top() const { return c.back(); }
      const_reference top() const { return c.back(); }
      void push(const value_type& x) { c.push_back(x); }
      void push(value_type&& x) { c.push_back(std::move(x)); }
      template<container-compatible-range<T> R>
        void push_range(R&& rg);
      template<class... Args>
        decltype(auto) emplace(Args&&... args)
        { return c.emplace_back(std::forward<Args>(args)...); }
      void pop() { c.pop_back(); }
      void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
        { using std::swap; swap(c, s.c); }
  };

  template<class Container>
  stack(Container) -> stack<typename Container::value_type, Container>;
```

§ 24.6.6.2 958
template<class InputIterator>
stack(InputIterator, InputIterator) -> stack<iter-value-type<InputIterator>>;

template<ranges::input_range R>
stack(from_range_t, R&&) -> stack<ranges::range_value_t<R>>;

template<class Container, class Allocator>
stack(Container, Allocator) -> stack<typename Container::value_type, Container>;

template<class InputIterator, class Allocator>
stack(InputIterator, InputIterator, Allocator)
-> stack<iter-value-type<InputIterator>, deque<iter-value-type<InputIterator>, Allocator>>;

template<ranges::input_range R, class Allocator>
stack(from_range_t, R&&, Allocator)
-> stack<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;

template<class T, class Container, class Alloc>
struct uses_allocator<stack<T, Container>, Alloc>
: uses_allocator<Container, Alloc>::type { };}

24.6.6.3 Constructors

explicit stack(const Container& cont);
1 Effects: Initializes c with cont.

explicit stack(Container&& cont);
2 Effects: Initializes c with std::move(cont).

template<class InputIterator>
stack(InputIterator first, InputIterator last);
3 Effects: Initializes c with first as the first argument and last as the second argument.

template<container-compatible-range<T> R>
stack(from_range_t, R&& rg);
4 Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.6.4 Constructors with allocators

1 If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit stack(const Alloc& a);
2 Effects: Initializes c with a.

template<class Alloc> stack(const container_type& cont, const Alloc& a);
3 Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> stack(container_type&& cont, const Alloc& a);
4 Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> stack(const stack& s, const Alloc& a);
5 Effects: Initializes c with s.c as the first argument and a as the second argument.

template<class Alloc> stack(stack&& s, const Alloc& a);
6 Effects: Initializes c with std::move(s.c) as the first argument and a as the second argument.
template<class InputIterator, class Alloc>
    stack(InputIterator first, InputIterator last, const Alloc& alloc);

    Effects: Initializes $c$ with $first$ as the first argument, $last$ as the second argument, and $alloc$ as the third argument.

template<container-compatible-range<T> R, class Alloc>
    stack(from_range_t, R&& rg, const Alloc& a);

    Effects: Initializes $c$ with ranges::to<Container>(std::forward<R>(rg), a).

24.6.6.5 Modifiers [stack.mod]

    template<container-compatible-range<T> R>
        void push_range(R&& rg);

    Effects: Equivalent to $c$.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise ranges::copy(rg, back_inserter(c)).

24.6.6.6 Operators [stack.ops]

    template<class T, class Container>
        bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c == y.c$.

    template<class T, class Container>
        bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c != y.c$.

    template<class T, class Container>
        bool operator<(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c < y.c$.

    template<class T, class Container>
        bool operator>(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c > y.c$.

    template<class T, class Container>
        bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c <= y.c$.

    template<class T, class Container>
        bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c >= y.c$.

    template<class T, three_way_comparable Container>
        compare_three_way_result_t<Container>
            operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: $x.c <=> y.c$.

24.6.6.7 Specialized algorithms [stack.special]

    template<class T, class Container>
        void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));

    Constraints: is_swappable_v<Container> is true.

    Effects: As if by x.swap(y).

24.7 Views [views]

24.7.1 General [views.general]

1 The header <span> defines the view span.
24.7.2 Header `<span>` synopsis

```cpp
namespace std {
    // constants
    inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

    // 24.7.3, class template span
    template<class ElementType, size_t Extent = dynamic_extent>
    class span;

    template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_view<span<ElementType, Extent>> = true;
    template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

    // 24.7.3.8, views of object representation
    template<class ElementType, size_t Extent>
    span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
    as_bytes(span<ElementType, Extent> s) noexcept;
    template<class ElementType, size_t Extent>
    span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
    as_writable_bytes(span<ElementType, Extent> s) noexcept;
}
```

24.7.3 Class template `span` [views.span]

### 24.7.3.1 Overview [span.overview]

1. A `span` is a view over a contiguous sequence of objects, the storage of which is owned by some other object.
2. All member functions of `span` have constant time complexity.

```cpp
namespace std {
    template<class ElementType, size_t Extent = dynamic_extent>
    class span {
        public:
            // constants and types
            using element_type = ElementType;
            using value_type = remove_cv_t<ElementType>;
            using size_type = size_t;
            using difference_type = ptrdiff_t;
            using pointer = element_type*;
            using const_pointer = const element_type*;
            using reference = element_type&;
            using const_reference = const element_type&;
            using iterator = implementation-defined; // see 24.7.3.7
            using reverse_iterator = std::reverse_iterator<iterator>;
            static constexpr size_type extent = Extent;

            // 24.7.3.2, constructors, copy, and assignment
            constexpr span() noexcept;
            template<class It>
            constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
            template<class It, class End>
            constexpr explicit(extent != dynamic_extent) span(It first, End last);
            template<size_t N>
            constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
            template<class T, size_t N>
            constexpr span(array<T, N>& arr) noexcept;
            template<class T, size_t N>
            constexpr span(const array<T, N>& arr) noexcept;
            template<class R>
            constexpr explicit(extent != dynamic_extent) span(R&& r);
            constexpr span(const span& other) noexcept = default;
            template<class OtherElementType, size_t OtherExtent>
            constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;
```
```cpp
constexpr span() noexcept = default;

constexpr span& operator=(const span& other) noexcept = default;

// 24.7.3.4, subviews
template<size_t Count>
constexpr span<element_type, Count> first() const;

// 24.7.3.4, subviews
template<size_t Count>
constexpr span<element_type, Count> last() const;

// 24.7.3.4, subviews
template<Size Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;

constexpr span<element_type, dynamic_extent> first(size_type count) const;

constexpr span<element_type, dynamic_extent> last(size_type count) const;

constexpr span<element_type, dynamic_extent> subspan(
    size_type offset, size_type count = dynamic_extent) const;

// 24.7.3.5, observers
constexpr size_type size() const noexcept;
constexpr size_type size_bytes() const noexcept;

[[nodiscard]] constexpr bool empty() const noexcept;

// 24.7.3.6, element access
constexpr reference operator[](size_type idx) const;
constexpr reference front() const;
constexpr reference back() const;
constexpr pointer data() const noexcept;

// 24.7.3.7, iterator support
constexpr iterator begin() const noexcept;
constexpr iterator end() const noexcept;
constexpr reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() const noexcept;

private:
    pointer data_;   // exposition only
    size_type size_; // exposition only
};
```

3 span<ElementType, Extent> is a trivially copyable type (6.8.1).

4 ElementType is required to be a complete object type that is not an abstract class type.

### 24.7.3.2 Constructors, copy, and assignment

```cpp
constexpr span() noexcept;
```

1 Constraints: Extent == dynamic_extent || Extent == 0 is true.

2 Postconditions: size() == 0 && data() == nullptr.

```cpp
template<class It>
constexpr explicit(extent != dynamic_extent) span(It first, size_type count);
```

3 Constraints: Let U be remove_reference_t<iter_reference_t<It>>.
It satisfies contiguous_iterator.

is_convertible_v<
U(*[]),
\text{element_type(*[])}> is true.

[Note 1: The intent is to allow only qualification conversions of the iterator reference type to element_type.
—end note]

Preconditions:

— [first, first + count) is a valid range.
— It models contiguous_iterator.
— If extent is not equal to dynamic_extent, then count is equal to extent.

Effects: Initializes data_ with to_address(first) and size_ with count.

Throws: Nothing.

template<class It, class End>
  constexpr explicit(extent != dynamic_extent) span(It first, End last);

Constraints: Let \( U \) be remove_reference_t<iter_reference_t<It>>.

— is_convertible_v<\U(*[]), \text{element_type(*[])}> is true.

[Note 2: The intent is to allow only qualification conversions of the iterator reference type to element_type.
—end note]

— It satisfies contiguous_iterator.
— End satisfies sized_sentinel_for<It>.
— is_convertible_v<End, size_t> is false.

Preconditions:

— If extent is not equal to dynamic_extent, then last - first is equal to extent.
— [first, last) is a valid range.
— It models contiguous_iterator.
— End models sized_sentinel_for<It>.

Effects: Initializes data_ with to_address(first) and size_ with last - first.

Throws: When and what last - first throws.

template<size_t N> constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;

template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;

template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;

Constraints: Let \( U \) be remove_pointer_t<
decltype(data(arr))>.

— extent == dynamic_extent || N == extent is true, and
— is_convertible_v<\U(*[]), \text{element_type(*[])}> is true.

[Note 3: The intent is to allow only qualification conversions of the array element type to element_type.
—end note]

Effects: Constructs a span that is a view over the supplied array.

[Note 4: type_identity_t affects class template argument deduction. —end note]

Postconditions: size() == N \&\& data() == data(arr) is true.

template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);

Constraints: Let \( U \) be remove_reference_t<branges::range_reference_t<R>>.

— \( R \) satisfies ranges::contiguous_range and ranges::sized_range.
— Either \( R \) satisfies ranges::borrowed_range or is_const_v<element_type> is true.
— remove_cvref_t<R> is not a specialization of span.
— remove_cvref_t<R> is not a specialization of array.
— is_array_v<\text{remove_cvref_t<R>>} is false.
— is_convertible_v<\U(*[]), element_type(*[])> is true.
Preconditions:
— If extent is not equal to dynamic_extent, then ranges::size(r) is equal to extent.
— R models ranges::contiguous_range and ranges::sized_range.
— If is_convertible_v<element_type(*)[], element_type(*)[]> is true.

Effects: Initializes data_ with ranges::data(r) and size_ with ranges::size(r).

Throws: What and when ranges::data(r) and ranges::size(r) throw.

default;

Postconditions: other.size() == size() & other.data() == data().

template<class OtherElementType, size_t OtherExtent>
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

Constraints:
— extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent is true, and
— is_convertible_v<OtherElementType(*)[], element_type(*)[]> is true.

Preconditions: If extent is not equal to dynamic_extent, then s.size() is equal to extent.

Effects: Constructs a span that is a view over the range [s.data(), s.data() + s.size()).

Postconditions: size() == s.size() & data() == s.data().

Remarks: The expression inside explicit is equivalent to:

constexpr span& operator=(const span& other) noexcept = default;

Postconditions: size() == other.size() & data() == other.data().

4.7.3.3 Deduction guides

template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;

Constraints: It satisfies contiguous_iterator.

template<class R>
span(R&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;

Constraints: R satisfies ranges::contiguous_range.

4.7.3.4 Subviews

template<size_t Count> constexpr span<element_type, Count> first() const;

Mandates: Count <= Extent is true.

Preconditions: Count <= size() is true.

Effects: Equivalent to: return R(data(), Count); where R is the return type.

template<size_t Count> constexpr span<element_type, Count> last() const;

Mandates: Count <= Extent is true.

Preconditions: Count <= size() is true.

Effects: Equivalent to: return R(data() + (size() - Count), Count); where R is the return type.

template<size_t Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;

Mandates:
Offset <= Extent && (Count == dynamic_extent || Count <= Extent - Offset)
is true.

Preconditions:
Offset <= size() && (Count == dynamic_extent || Count <= size() - Offset)
is true.

Effects: Equivalent to:
return span<ElementType, see below>(data() + Offset, Count != dynamic_extent ? Count : size() - Offset);

Remarks: The second template argument of the returned span type is:

constexpr span<element_type, dynamic_extent> first(size_type count) const;
Preconditions: count <= size() is true.
Effects: Equivalent to: return {data(), count};

constexpr span<element_type, dynamic_extent> last(size_type count) const;
Preconditions: count <= size() is true.
Effects: Equivalent to: return {data() + (size() - count), count};

constexpr span<element_type, dynamic_extent> subspan(
    size_type offset, size_type count = dynamic_extent) const;
Preconditions:
offset <= size() && (count == dynamic_extent || count <= size() - offset)
is true.
Effects: Equivalent to:
return {data() + offset, count == dynamic_extent ? size() - offset : count};

24.7.3.5 Observers

constexpr size_type size() const noexcept;
Effects: Equivalent to: return size_;

constexpr size_type size_bytes() const noexcept;
Effects: Equivalent to: return size() * sizeof(element_type);
[[nodiscard]] constexpr bool empty() const noexcept;
Effects: Equivalent to: return size() == 0;

24.7.3.6 Element access

constexpr reference operator[](size_type idx) const;
Preconditions: idx < size() is true.
Effects: Equivalent to: return *(data() + idx);

constexpr reference front() const;
Preconditions: empty() is false.
Effects: Equivalent to: return *data();

constexpr reference back() const;
Preconditions: empty() is false.
Effects: Equivalent to: return *(data() + (size() - 1));
constexpr pointer data() const noexcept;

**Effects**: Equivalent to: return data_;  

### 24.7.3.7 Iterator support

using iterator = implementation-defined;

1. The type models contiguous_iterator (25.3.4.14), meets the Cpp17RandomAccessIterator requirements (25.3.5.7), and meets the requirements for constexpr iterators (25.3.1), whose value type is value_type and whose reference type is reference.

2. All requirements on container iterators (24.2) apply to span::iterator as well.

constexpr iterator begin() const noexcept;

3. **Returns**: An iterator referring to the first element in the span. If empty() is true, then it returns the same value as end().

constexpr iterator end() const noexcept;

4. **Returns**: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() const noexcept;

5. **Effects**: Equivalent to: return reverse_iterator(end());

constexpr reverse_iterator rend() const noexcept;

6. **Effects**: Equivalent to: return reverse_iterator(begin());

### 24.7.3.8 Views of object representation

```cpp
template<class ElementType, size_t Extent>
span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_bytes(span<ElementType, Extent> s) noexcept;
```

1. **Effects**: Equivalent to: return R{reinterpret_cast<const byte*>(s.data()), s.size_bytes()}; where R is the return type.

```cpp
template<class ElementType, size_t Extent>
span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_writable_bytes(span<ElementType, Extent> s) noexcept;
```

2. **Constraints**: is_const_v<ElementType> is false.

3. **Effects**: Equivalent to: return R{reinterpret_cast<byte*>(s.data()), s.size_bytes()}; where R is the return type.
25 Iterators library

25.1 General

This Clause describes components that C++ programs may use to perform iterations over containers (Clause 24), streams (31.7), stream buffers (31.6), and other ranges (Clause 26).

The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 80.

Table 80: Iterators library summary

template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());
template<class C> constexpr auto rbegin(initializer_list<typename C::value_type>& il);
template<class C> constexpr auto rend(initializer_list<typename C::value_type>& il);
template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
template<class C> constexpr auto auto size(const C& c) noexcept;
template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
template<class C> [[nodiscard]] constexpr auto empty(const C& c) noexcept;
template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
template<class T, size_t N> constexpr T* data(T (&array)[N]);
template<class E> constexpr const E* data(initializer_list<E> il) noexcept;}

25.3 Iterator requirements

25.3.1 In general

Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator \( i \) supports the expression \( *i \), resulting in a value of some object type \( T \), called the value type of the iterator. An output iterator \( i \) has a non-empty set of types that are indirectlyritable to the iterator; for each such type \( T \), the expression \( *i = o \) is valid where \( o \) is a value of type \( T \). For every iterator type \( X \), there is a corresponding signed integer-like type (25.3.4.4) called the difference type of the iterator.

Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: input iterators, output iterators, forward iterators, bidirectional iterators, random access iterators, and contiguous iterators, as shown in Table 81.

Table 81: Relations among iterator categories

<table>
<thead>
<tr>
<th>Contiguous</th>
<th>Random Access</th>
<th>Bidirectional</th>
<th>Forward</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
</table>

The six categories of iterators correspond to the iterator concepts

(3.1) — input_iterator (25.3.4.9),
(3.2) — output_iterator (25.3.4.10),
(3.3) — forward_iterator (25.3.4.11),
(3.4) — bidirectional_iterator (25.3.4.12),
(3.5) — random_access_iterator (25.3.4.13), and
(3.6) — contiguous_iterator (25.3.4.14),

respectively. The generic term iterator refers to any type that models the input_or_output_iterator concept (25.3.4.6).

Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.

Iterators that further meet the requirements of output iterators are called mutable iterators. Nonmutable iterators are referred to as constant iterators.

In addition to the requirements in this subclause, the nested typedef-names specified in 25.3.2.3 shall be provided for the iterator type.

[Note 1: Either the iterator type must provide the typedef-names directly (in which case iterator_traits pick them up automatically), or an iterator_traits specialization must provide them. — end note]

Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a past-the-end value. Values of an iterator \( i \) for which the expression \( *i \) is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the Cpp17DefaultConstructible requirements, using a value-initialized iterator as the source of a copy or move operation.
Note 2: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note]

In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

8 Most of the library's algorithmic templates that operate on data structures have interfaces that use ranges. A range is an iterator and a sentinel that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.

9 An iterator and a sentinel denoting a range are comparable. A range \((i, s)\) is empty if \(i == s\); otherwise, \([i, s)\) refers to the elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the first iterator \(j\) such that \(j == s\).

10 A sentinel \(s\) is called reachable from an iterator \(i\) if and only if there is a finite sequence of applications of the expression \(++i\) that makes \(i == s\). If \(s\) is reachable from \(i\), \([i, s)\) denotes a valid range.

11 A counted range \(i + [0, n)\) is empty if \(n == 0\); otherwise, \(i + [0, n)\) refers to the \(n\) elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the result of \(n\) applications of \(++i\). A counted range \(i + [0, n)\) is valid if and only if \(n == 0\); or \(n\) is positive, \(i\) is dereferenceable, and \(++i + [0, -n)\) is valid.

12 The result of the application of library functions to invalid ranges is undefined.

13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.

15 An invalid iterator is an iterator that may be singular.

16 Iterators are called constexpr iterators if all operations provided to meet iterator category requirements are constexpr functions.

[Note 3: For example, the types “pointer to int” and reverse_iterator<int*> are constexpr iterators. — end note]

25.3.2 Associated types [iterator.assoc.types]

25.3.2.1 Incrementable traits [incrementable.traits]

To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if \(WI\) is the name of a type that models the weakly_incrementable concept (25.3.4.4), the type

\[
\text{iter_difference_t<}WI>\]

be defined as the incrementable type's difference type.

```cpp
namespace std {
    template<class> struct incrementable_traits { };  
    template<class T>  
        requires is_object_v<T>  
    struct incrementable_traits<T> {            
        using difference_type = ptrdiff_t; 
    };  
    template<class I>  
    struct incrementable_traits<const I>  
        : incrementable_traits<I> { };  
    template<class T>  
        requires requires { typename T::difference_type; }  
```
struct incrementable_traits<T> {  
    using difference_type = typename T::difference_type;  
};

template<class T>  
    requires (!requires { typename T::difference_type; } &&  
               requires(const T& a, const T& b) { { a - b } -> integral; })
struct incrementable_traits<T> {  
    using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
};

template<class T>  
    using iter_difference_t = see below;

Let $R_I$ be remove_cvref_t$I$. The type iter_difference_t$I$ denotes

(2.1) — incrementable_traits$<R_I>::difference_type$ if iterator_traits$<R_I>$ names a specialization generated from the primary template, and

(2.2) — iterator_traits$<R_I>::difference_type$ otherwise.

Users may specialize incrementable_traits on program-defined types.

25.3.2.2 Indirectly readable traits [readable.traits]

To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if $R$ is the name of a type that models the indirectly_readable concept (25.3.4.2), the type

iter_value_t$<R>$

be defined as the indirectly readable type's value type.

template<class> struct cond_value_type { }; // exposition only

template<class T>  
    requires is_object_v<T>
struct cond_value_type<T> {  
    using value_type = remove_cv_t<T>;
};

template<class T>  
    concept has_member_value_type = requires { typename T::value_type; }; // exposition only

template<class T>  
    concept has_member_element_type = requires { typename T::element_type; }; // exposition only

template<class> struct indirectly_readable_traits { };  

// exposition only

template<class T>  
    struct indirectly_readable_traits<T*>  
        : cond_value_type<T> { };  

// exposition only

template<class I>  
    requires is_array_v<I>
struct indirectly_readable_traits<I> {  
    using value_type = remove_cv_t<remove_extent_t<I>>;
};

// exposition only

template<class I>  
    struct indirectly_readable_traits<const I>  
        : indirectly_readable_traits<I> { };  

// exposition only

§ 25.3.2.2 976
template<has-member-element-type T>
struct indirectly_readable_traits<T>:
cond-value-type<typename T::element_type> { };

template<has-member-value-type T>
requires has-member-element-type<T>
struct indirectly_readable_traits<T> { };

template<has-member-value-type T>
requires has-member-element-type<T> &&
same_as<remove_cv_t<typename T::element_type>, remove_cv_t<typename T::value_type>>
struct indirectly_readable_traits<T>:
cond-value-type<typename T::value_type> { };

template<class T> using iter_value_t = see below;

Let \( R_I \) be remove_cvref_t<I>. The type iter_value_t<I> denotes

(2.1) — indirectly_readable_traits<\( R_I \)>::value_type if iterator_traits<\( R_I \)> names a specialization
generated from the primary template, and

(2.2) — iterator_traits<\( R_I \)>::value_type otherwise.

Class template indirectly_readable_traits may be specialized on program-defined types.

[Note 1: Some legacy output iterators define a nested type named value_type that is an alias for void. These types
are not indirectly_readable and have no associated value types. — end note]

[Note 2: Smart pointers like shared_ptr<int> are indirectly_readable and have an associated value type, but a
smart pointer like shared_ptr<void> is not indirectly_readable and has no associated value type. — end note]

25.3.2.3 Iterator traits

To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator
category that corresponds to a particular iterator type. Accordingly, it is required that if I is the type of an
iterator, the type

iterator_traits<I>::iterator_category

be defined as the iterator’s iterator category. In addition, the types

iterator_traits<I>::pointer
iterator_traits<I>::reference

shall be defined as the iterator’s pointer and reference types; that is, for an iterator object \( a \) of class
type, the same type as decrype(a.operator->()) and decrype(*a), respectively. The type iterator_traits<\( I \)>::pointer shall be void for an iterator of class type \( I \) that does not support operator->. Additionally, in the case of an output iterator, the types

iterator_traits<\( I \)>::value_type
iterator_traits<\( I \)>::difference_type
iterator_traits<\( I \)>::reference

may be defined as void.

The definitions in this subclause make use of the following exposition-only concepts:

template<class I>
concept cpp17-iterator =

requires(I i) {
{ *i } -> can-reference;
{ ++i } -> same_as<I&>;
{ i++ } -> can-reference;
} && copyable<I>;

template<class I>
concept cpp17-input_iterator =
cpp17-iterator <I> && equality_comparable <I> && requires(I i) {
 typename incrementable_traits<\( I \)>::difference_type;
 typename indirectly_readable_traits<\( I \)>::value_type;
 typename common_reference_t<iter_reference_t<\( I \)>&,
 typename indirectly_readable_traits<\( I \)>::value_type&>;}
template<class I>
concept cpp17-forward-iterator =
cpp17-input-iterator<I> && constructible_from<I> &&
is_lvalue_reference_v<iter_reference_t<I>> &&
same_as<remove_cvref_t<iter_reference_t<I>>>,
type_name indirectly_readable_traits<I>::value_type> &&
requires(I i) {
  { ++i } -> convertible_to<const I&>;
  { *i++ } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-bidirectional-iterator =
cpp17-forward-iterator<I> && requires(I i) {
  { --i } -> same_as<I&>;
  { i-- } -> convertible_to<const I&>;
  { *i-- } -> same_as<iter_reference_t<I>>;
};

template<class I>
concept cpp17-random-access-iterator =
cpp17-bidirectional-iterator<I> && totally_ordered<I> &&
requires(I i, typename incrementable_traits<I>::difference_type n) {
  { i += n } -> same_as<I&>;
  { i == n } -> same_as<I&>;
  { i - n } -> same_as<I&>;
  { n + i } -> same_as<I&>;
  { i - i } -> same_as<decay_type(n)>;
  { i[n] } -> convertible_to<iter_reference_t<I>>;
};

3 The members of a specialization iterator_traits<I> generated from the iterator_traits primary tem-
plate are computed as follows:

(3.1) — If I has valid (13.10.3) member types difference_type, value_type, reference, and iterator category, then iterator_traits<I> has the following publicly accessible members:

using iterator_category = typename I::iterator_category;
using value_type = typename I::value_type;
using difference_type = typename I::difference_type;
using pointer = see below;
using reference = typename I::reference;

If the qualified-id I::pointer is valid and denotes a type, then iterator_traits<I>::pointer names that type; otherwise, it names void.

(3.2) — Otherwise, if I satisfies the exposition-only concept cpp17-input-iterator, iterator_traits<I> has the following publicly accessible members:

using iterator_category = see below;
using value_type = typename indirectly_readable_traits<I>::value_type;
using difference_type = typename incrementable_traits<I>::difference_type;
using pointer = see below;
using reference = see below;

(3.2.1) — If the qualified-id I::pointer is valid and denotes a type, pointer names that type. Other-
wise, if decltype(declval<I&>().operator->()) is well-formed, then pointer names that type.
Otherwise, pointer names void.

(3.2.2) — If the qualified-id I::reference is valid and denotes a type, reference names that type. Otherwise, reference names iter_reference_t<I>.

§ 25.3.2.3
If the qualified-id `I::iterator_category` is valid and denotes a type, `iterator_category` names that type. Otherwise, `iterator_category` names:

- random_access_iterator_tag if `I` satisfies `cpp17-random-access-iterator`, or otherwise
- bidirectional_iterator_tag if `I` satisfies `cpp17-bidirectional-iterator`, or otherwise
- forward_iterator_tag if `I` satisfies `cpp17-forward-iterator`, or otherwise
- input_iterator_tag.

Otherwise, if `I` satisfies the exposition-only concept `cpp17-iterator`, then `iterator_traits<I>` has the following publicly accessible members:

```cpp
using iterator_category = output_iterator_tag;
using value_type = void;
using difference_type = see below;
using pointer = void;
using reference = void;
```

If the qualified-id `incrementable_traits<I>::difference_type` is valid and denotes a type, then `difference_type` names that type; otherwise, it names `void`.

Otherwise, `iterator_traits<I>` has no members by any of the above names.

Explicit or partial specializations of `iterator_traits` may have a member type `iterator_concept` that is used to indicate conformance to the iterator concepts (25.3.4).

**Example 1:** To indicate conformance to the `input_iterator` concept but a lack of conformance to the `Cpp17InputIterator` requirements (25.3.5.3), an `iterator_traits` specialization might have `iterator_concept` denote `input_iterator_tag` but not define `iterator_category`.  —end example

`iterator_traits` is specialized for pointers as

```cpp
namespace std {
    template<class T>
    requires is_object_v<T>
    struct iterator_traits<T*> {
        using iterator_concept = contiguous_iterator_tag;
        using iterator_category = random_access_iterator_tag;
        using value_type = remove_cv_t<T>;
        using difference_type = ptrdiff_t;
        using pointer = T*;
        using reference = T&;
    }
};
```

**Example 2:** To implement a generic reverse function, a C++ program can do the following:

```cpp
void reverse(BI first, BI last) {
    typename iterator_traits<BI>::difference_type n = distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BI>::value_type tmp = *first;
        *first++ = *--last;
        *last = tmp;
        n -= 2;
    }
}
```

—end example

### 25.3.3 Customization point objects

#### 25.3.3.1 ranges::iter_move

The name `ranges::iter_move` denotes a customization point object (16.3.3.3.6). The expression `ranges::iter_move(E)` for a subexpression `E` is expression-equivalent to:

---
1.1 — iter_move(E), if E has class or enumeration type and iter_move(E) is a well-formed expression when treated as an unevaluated operand, with overload resolution performed in a context that does not include a declaration of ranges::iter_move but does include the declaration

```
void iter_move();
```

(1.2) — Otherwise, if the expression *E is well-formed:

(1.2.1) — if *E is an lvalue, std::move(*E);

(1.2.2) — otherwise, *E.

(1.3) — Otherwise, ranges::iter_move(E) is ill-formed.

[Note 1: This case can result in substitution failure when ranges::iter_move(E) appears in the immediate context of a template instantiation. —end note]

2 If ranges::iter_move(E) is not equal to *E, the program is ill-formed, no diagnostic required.

25.3.3.2 ranges::iter_swap

The name ranges::iter_swap denotes a customization point object (16.3.3.3.6) that exchanges the values (18.4.9) denoted by its arguments.

Let iter-exchange-move be the exposition-only function:

```
template<class X, class Y>
constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
    noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
    noexcept(*x = iter_move(y)));
```

Effects: Equivalent to:

```
iter_value_t<X> old_value(iter_move(x));
*x = iter_move(y);
return old_value;
```

2 The expression ranges::iter_swap(E1, E2) for subexpressions E1 and E2 is expression-equivalent to:

(4.1) — (void)iter_swap(E1, E2), if either E1 or E2 has class or enumeration type and iter_swap(E1, E2) is a well-formed expression with overload resolution performed in a context that includes the declaration

```
template<class I1, class I2>
void iter_swap(I1, I2) = delete;
```

and does not include a declaration of ranges::iter_swap. If the function selected by overload resolution does not exchange the values denoted by E1 and E2, the program is ill-formed, no diagnostic required.

(4.2) — Otherwise, if the types of E1 and E2 each model indirectly_readable, and if the reference types of E1 and E2 model swappable_with (18.4.9), then ranges::swap(*E1, *E2).

(4.3) — Otherwise, if the types T1 and T2 of E1 and E2 model indirectly_movable_storable<T1, T2> and indirectly_movable_storable<T2, T1>, then (void)(*E1 = iter-exchange-move(E2, E1)), except that E1 is evaluated only once.

(4.4) — Otherwise, ranges::iter_swap(E1, E2) is ill-formed.

[Note 1: This case can result in substitution failure when ranges::iter_swap(E1, E2) appears in the immediate context of a template instantiation. —end note]

25.3.4 Iterator concepts

25.3.4.1 General

For a type I, let ITER_TRAITS(I) denote the type I if iterator_traits<I> names a specialization generated from the primary template. Otherwise, ITER_TRAITS(I) denotes iterator_traits<I>.

(1.1) — If the qualified-id ITER_TRAITS(I)::iterator_concept is valid and names a type, then ITER_CONCEPT(I) denotes that type.

(1.2) — Otherwise, if the qualified-id ITER_TRAITS(I)::iterator_category is valid and names a type, then ITER_CONCEPT(I) denotes that type.

(1.3) — Otherwise, if iterator_traits<I> names a specialization generated from the primary template, then ITER_CONCEPT(I) denotes random_access_iterator_tag.

(1.4) — Otherwise, ITER_CONCEPT(I) does not denote a type.
[Note 1: ITER_TRAITS enables independent syntactic determination of an iterator's category and concept. — end note]

[Example 1:

```cpp
struct I {
    using value_type = int;
    using difference_type = int;

    int operator*() const;
    I& operator++();
    I operator++(int);
    I& operator--();
    I operator--(int);

    bool operator==(I) const;
};
```

`iterator_traits<I>::iterator_category` denotes `input_iterator_tag`, and `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`. — end example]

25.3.4.2 Concept indirectly_readable

[iterator.concept.readable]

1 Types that are indirectly readable by applying `operator*` model the `indirectly_readable` concept, including pointers, smart pointers, and iterators.

```cpp
template<class In>
concept indirectly-readable-impl =
    requires(const In in) {
        typename iter_value_t<In>;
        typename iter_reference_t<In>;
        typename iter_rvalue_reference_t<In>;
        { *in } -> same_as<iter_reference_t<In>>;
        { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
    }

    common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> &&
    common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
    common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;
```

```cpp
template<class In>
concept indirectly_readable = indirectly-readable-impl<remove_cvref_t<In>>;
```

2 Given a value `i` of type `I`, `I` models `indirectly_readable` only if the expression `*i` is equality-preserving.

[Note 1: The expression `*i` is indirectly required to be valid via the exposition-only `dereferenceable` concept (25.2). — end note]

25.3.4.3 Concept indirectly_writable

[iterator.concept.writable]

1 The `indirectly_writable` concept specifies the requirements for writing a value into an iterator’s referenced object.

```cpp
template<class Out, class T>
concept indirectly_writable =
    requires(Out&& o, T&& t) { // not required to be equality-preserving
        *o = std::forward<T>(t); // not required to be equality-preserving
        std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*o) =
            std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
            std::forward<T>(t); // not required to be equality-preserving
    };
```

2 Let `E` be an expression such that `decltype((E))` is `T`, and let `o` be a dereferenceable object of type `Out`. `Out` and `T` model `indirectly_writable<Out, T>` only if

(2.1) — If `Out` and `T` model `indirectly_readable<Out> && same_as<iter_value_t<Out>, decay_t<T>>`, then `o` after any above assignment is equal to the value of `E` before the assignment.

3 After evaluating any above assignment expression, `o` is not required to be dereferenceable.
If \( E \) is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.15).

[Note 1: The only valid use of an operator* is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once. — end note]

[Note 2: indirectly_writable has the awkward const_cast expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit const rvalue assignment. Consequently, an iterator type \( I \) that returns std::string by value does not model indirectly_writable\( I, \) std::string>. — end note]

25.3.4.4 Concept weakly_incrementable

The weakly_incrementable concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be equality_comparable.

```cpp
template<class T>
inline constexpr bool is_integer_like = see below;  // exposition only

template<class T>
inline constexpr bool is_signed_integer_like = see below;  // exposition only

template<class I>
concept weakly_incrementable = movable<I> &&
requires(I i) {
  typename iter_difference_t<I>;
  requires is_signed_integer_like<iter_difference_t<I>>;
  { ++i } -> same_as<I&>;  // not required to be equality-preserving
  i++;
  // not required to be equality-preserving
};
```

A type \( I \) is an integer-class type if it is in a set of implementation-defined types that behave as integer types do, as defined below.

[Note 1: An integer-class type is not necessarily a class type. — end note]

The range of representable values of an integer-class type is the continuous set of values over which it is defined. For any integer-class type, its range of representable values is either \(-2^{N-1} \) to \( 2^{N-1} - 1 \) (inclusive) for some integer \( N \), in which case it is a signed_integer-class type, or \( 0 \) to \( 2^N - 1 \) (inclusive) for some integer \( N \), in which case it is an unsigned_integer-class type. In both cases, \( N \) is called the width of the integer-class type. The width of an integer-class type is greater than that of every integral type of the same signedness.

A type \( I \) other than cv bool is integer-like if it models integral\( I \) or if it is an integer-class type. An integer-like type \( I \) is signed_integer-like if it models signed_integral\( I \) or if it is a signed_integer-class type. An integer-like type \( I \) is unsigned_integer-like if it models unsigned_integral\( I \) or if it is an unsigned_integer-class type.

For every integer-class type \( I \), let B(\( I \)) be a unique hypothetical extended integer type of the same signedness with the same width (6.8.2) as \( I \).

[Note 2: The corresponding hypothetical specialization numeric_limits\( B(I) \) meets the requirements on numeric_limits specializations for integral types (17.3.5). — end note]

For every integral type \( J \), let B(\( J \)) be the same type as \( J \).

Expressions of integer-class type are explicitly convertible to any integer-like type, and implicitly convertible to any integer-class type of equal or greater width and the same signedness. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types and between two integer-class types do not exit via an exception. The result of such a conversion is the unique value of the destination type that is congruent to the source modulo \( 2^N \), where \( N \) is the width of the destination type.

Let \( a \) be an object of integer-class type \( I \), let \( b \) be an object of integer-like type \( I2 \) such that the expression \( b \) is implicitly convertible to \( I \), let \( x \) and \( y \) be, respectively, objects of type B(\( I \)) and B(\( I2 \)) as described above that represent the same values as \( a \) and \( b \), and let \( c \) be an lvalue of any integral type.

— The expressions \( a++ \) and \( a-- \) shall be prvalues of type \( I \) whose values are equal to that of \( a \) prior to the evaluation of the expressions. The expression \( a++ \) shall modify the value of \( a \) by adding 1 to it. The expression \( a-- \) shall modify the value of \( a \) by subtracting 1 from it.
The expressions `++a`, `--a`, and `&a` shall be expression-equivalent to `a += 1`, `a -= 1`, and `addressof(a)`, respectively.

For every unary-operator `@` other than `&` for which the expression `@x` is well-formed, `@a` shall also be well-formed and have the same value, effects, and value category as `@x`. If `@x` has type `bool`, so too does `@a`; if `@x` has type `B(I)`, then `@a` has type `I`.

For every assignment operator `@=` for which `c @= x` is well-formed, `c @= a` shall also be well-formed and shall have the same value and effects as `c @= x`. The expression `c @= a` shall be an lvalue referring to `c`.

For every assignment operator `@=` for which `x @= y` is well-formed, `a @= b` shall also be well-formed and shall have the same effects as `x @= y`, except that the value that would be stored into `x` is stored into `a`. The expression `a @= b` shall be an lvalue referring to `a`.

For every non-assignment binary operator `@` for which `x @ y` and `y @ x` are well-formed, `a @ b` and `b @ a` shall also be well-formed and shall have the same value, effects, and value category as `x @ y` and `y @ x`, respectively. If `x @ y` or `y @ x` has type `B(I)`, then `a @ b` or `b @ a`, respectively, has type `I`; if `x @ y` or `y @ x` has type `B(I2)`, then `a @ b` or `b @ a`, respectively, has type `I2`; if `x @ y` or `y @ x` has any other type, then `a @ b` or `b @ a`, respectively, has that type.

An expression `E` of integer-class type `I` is contextually convertible to `bool` as if by `bool(E != I(0))`.

All integer-class types model `regular` (18.6) and `three_way_comparable<`strong_ordering>` (17.11.4).

A value-initialized object of integer-class type has value 0.

For every (possibly cv-qualified) integer-class type `I`, `numeric_limits<I>` is specialized such that each static data member `m` has the same value as `numeric_limits<B(I)>::m`, and each static member function `f` returns `I(numeric_limits<B(I)>::f())`.

For any two integer-like types `I1` and `I2`, at least one of which is an integer-class type, `common_type_t<I1, I2>` denotes an integer-class type whose width is not less than that of `I1` or `I2`. If both `I1` and `I2` are signed-integer-like types, then `common_type_t<I1, I2>` is also a signed-integer-like type.

`is-integer-like<I>` is true if and only if `I` is an integer-like type. `is-signed-integer-like<I>` is true if and only if `I` is a signed-integer-like type.

Let `i` be an object of type `I`. When `i` is in the domain of both pre- and post-increment, `i` is said to be `incrementable`. `I` models `weakly_incrementable<I>` only if

- The expressions `++i` and `i++` have the same domain.
- If `i` is incrementable, then both `++i` and `i++` advance `i` to the next element.
- If `i` is incrementable, then `addressof(++i)` is equal to `addressof(i)`.

Recommended practice: The implementaton of an algorithm on a weakly incrementable type should never attempt to pass through the same incrementable value twice; such an algorithm should be a single-pass algorithm.

[Note 3: For `weakly_incrementable` types, `a` equals `b` does not imply that `++a` equals `++b`. (Equality does not guarantee the substitution property or referential transparency.) Such algorithms can be used with istreams as the source of the input data through the `istream_iterator` class template. — end note]

25.3.4.5 Concept `incrementable` [iterator.concept.inc]

The `incrementable` concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be `equality_comparable`.

[Note 1: This supersedes the annotations on the increment expressions in the definition of `weakly_incrementable`. — end note]

```cpp
template<class I>
concept incrementable =
    regular<I> &&
    weakly_incrementable<I> &&
    requires(I i) {
        { i++ } -> same_as<I>;
    };
```
Let \( a \) and \( b \) be incrementable objects of type \( I \). \( I \) models incrementable only if

\[
(2.1) \quad \text{If } \text{bool}(a == b) \text{ then } \text{bool}(\text{a}++ == \text{b}).
\]

\[
(2.2) \quad \text{If } \text{bool}(a == b) \text{ then } \text{bool}((\text{void})\text{a}++, a) == ++b).
\]

[Note 2: The requirement that \( a \) equals \( b \) implies \( ++a \) equals \( ++b \) (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model incrementable. — end note]

### 25.3.4.6 Concept input_or_output_iterator

The \textit{input_or_output_iterator} concept forms the basis of the iterator concept taxonomy; every iterator models \textit{input_or_output_iterator}. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (25.3.4.7), to read (25.3.4.9) or write (25.3.4.10) values, or to provide a richer set of iterator movements (25.3.4.11, 25.3.4.12, 25.3.4.13).

```cpp
template<class I>
concept input_or_output_iterator =
    requires(I i) {
        { *i } -> can-reference;
    } &&
    weakly_incrementable<I>;
```

[Note 1: Unlike the \texttt{C++17Iterator} requirements, the \textit{input_or_output_iterator} concept does not require copyability. — end note]

### 25.3.4.7 Concept sentinel_for

The \textit{sentinel_for} concept specifies the relationship between an \textit{input_or_output_iterator} type and a \textit{semiregular} type whose values denote a range.

```cpp
template<class S, class I>
concept sentinel_for =
    semiregular<S> &&
    input_or_output_iterator<I> &&
    weakly-equality-comparable-with<S, I>;
```

Let \( s \) and \( i \) be values of type \( S \) and \( I \) such that \([i, s)\) denotes a range. Types \( S \) and \( I \) model \textit{sentinel_for} only if

\[
(2.1) \quad i == s \text{ is well-defined.}
\]

\[
(2.2) \quad \text{If bool}(i != s) \text{ then } i \text{ is dereferenceable and } [+i, s) \text{ denotes a range.}
\]

\[
(2.3) \quad \text{assignable_from}<I&, S> \text{ is either modeled or not satisfied.}
\]

[Note 2: The domain of \( == \) is not static. Given an iterator \( i \) and sentinel \( s \) such that \([i, s)\) denotes a range and \( i != s \), \( i \) and \( s \) are not required to continue to denote a range after incrementing any other iterator equal to \( i \). Consequently, \( i == s \) is no longer required to be well-defined.]

### 25.3.4.8 Concept sized_sentinel_for

The \textit{sized_sentinel_for} concept specifies requirements on an \textit{input_or_output_iterator} type \( I \) and a corresponding \textit{sentinel_for} that allow the use of the \texttt{-} operator to compute the distance between them in constant time.

```cpp
template<class S, class I>
concept sized_sentinel_for =
    sentinel_for<S, I> &&
    !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
    requires(const I& i, const S& s) {
        { s - i } -> same_as<iter_difference_t<I>>;
        { i - s } -> same_as<iter_difference_t<I>>;
    };
```

Let \( i \) be an iterator of type \( I \), and \( s \) a sentinel of type \( S \) such that \([i, s)\) denotes a range. Let \( N \) be the smallest number of applications of \( ++i \) necessary to make \text{bool}(i == s) \text{ be true}. \( S \) and \( I \) model \textit{sized_sentinel_for} only if

\[
(2.1) \quad \text{If } N \text{ is representable by iterator_difference_t}<I>, \text{ then } s - i \text{ is well-defined and equals } N.
\]

\[
(2.2) \quad \text{If } -N \text{ is representable by iterator_difference_t}<I>, \text{ then } i - s \text{ is well-defined and equals } -N.
\]
template<class S, class I>
inline constexpr bool disable_sized_sentinel_for = false;

Remarks: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_sentinel_for` for cv-unqualified non-array object types `S` and `I` if `S` and/or `I` is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

[Note 1: `disable_sized_sentinel_for` allows use of sentinels and iterators with the library that satisfy but do not in fact model `sized_sentinel_for`. — end note]

[Example 1: The `sized_sentinel_for` concept is modeled by pairs of `random_access_iterators` (25.3.4.13) and by counted iterators and their sentinels (25.5.6.1). — end example]

25.3.4.9 Concept `input_iterator` [iterator.concept.input]

The `input_iterator` concept defines requirements for a type whose referenced values can be read (from the requirement for `indirectly_readable` (25.3.4.2)) and which can be both pre- and post-incremented.

[Note 1: Unlike the `Cpp17InputIterator` requirements (25.3.5.3), the `input_iterator` concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

template<class I>
concept input_iterator =
input_or_output_iterator<I> &&
indirectly_readable<I> &&
requires { typename ITER_CONCEPT(I); } &&
derived_from<ITER_CONCEPT(I), input_iterator_tag>;

25.3.4.10 Concept `output_iterator` [iterator.concept.output]

The `output_iterator` concept defines requirements for a type that can be used to write values (from the requirement for `indirectly_writable` (25.3.4.3)) and which can be both pre- and post-incremented.

[Note 1: Output iterators are not required to model `equality_comparable`. — end note]

template<class I, class T>
concept output_iterator =
input_or_output_iterator<I> &&
indirectly_writable<I, T> &&
requires(I i, T&& t) {
    *i++ = std::forward<T>(t); // not required to be equality-preserving
};

Let `E` be an expression such that `decltype((E))` is `T`, and let `i` be a dereferenceable object of type `I`. `I` and `T` model `output_iterator<I, T>` only if `*i++ = E`; has effects equivalent to:

`*i = E;
++i;`

Recommended practice: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

25.3.4.11 Concept `forward_iterator` [iterator.concept.forward]

The `forward_iterator` concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

template<class I>
concept forward_iterator =
input_iterator<I> &&
derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
incrementable<I> &&
sentinel_for<I, I>;

The domain of `==` for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

Pointers and references obtained from a forward iterator into a range `[i, s)` shall remain valid while `[i, s)` continues to denote a range.

Two dereferenceable iterators `a` and `b` of type `X` offer the multi-pass guarantee if:
— a == b implies ++a == ++b and

the expression ((void)[X x]{++x;}(a), *a) is equivalent to the expression *a.

[Note 2: The requirement that a == b implies ++a == ++b and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. —end note]

25.3.4.12 Concept `bidirectional_iterator`  

The `bidirectional_iterator` concept adds the ability to move an iterator backward as well as forward.

```cpp
template<class I>
concept bidirectional_iterator =
    forward_iterator<I> &&
    derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
    requires(I i) {
        { --i } -> same_as<I&>;
        { i-- } -> same_as<I>;
    };
```

A bidirectional iterator `r` is decrementable if and only if there exists some `q` such that ++q == r. Decrementable iterators `r` shall be in the domain of the expressions --r and r--.

Let a and b be equal objects of type I. I models `bidirectional_iterator` only if:

1. If a and b are decrementable, then all of the following are true:
   1.1. addressof(--a) == addressof(a)
   1.2. bool(a-- == b)
   1.3. after evaluating both a-- and --b, bool(a == b) is still true
   1.4. bool(++(--a) == b)

2. Let a and b be valid iterators of type I such that b is reachable from a after n applications of ++a, let D be `iter_difference_t<I>`, and let n denote a value of type D. I models `random_access_iterator` only if

   2.1. (a += n) is equal to b.
   2.2. addressof(a += n) is equal to addressof(a).
   2.3. (a + n) is equal to (a += n).
   2.4. For any two positive values x and y of type D, if (a + D(x + y)) is valid, then (a + D(x + y)) is equal to ((a + x) + y).
   2.5. (a + D(0)) is equal to a.
   2.6. If (a + D(n - 1)) is valid, then (a + n) is equal to [](I c){ return ++c; })(a + D(n - 1)).
(2.7) \((b += D(-n))\) is equal to \(a\).
(2.8) \((b -= n)\) is equal to \(a\).
(2.9) \(\text{addressof}(b -= n)\) is equal to \(\text{addressof}(b)\).
(2.10) \((b - n)\) is equal to \((b -= n)\).
(2.11) If \(b\) is dereferenceable, then \(a[n]\) is valid and is equal to \(*b.\)
(2.12) \(\text{bool}(a < b)\) is true.

25.3.4.14 Concept contiguous_iterator

The contiguous_iterator concept provides a guarantee that the denoted elements are stored contiguously in memory.

```cpp
template<class I>
concept contiguous_iterator =
    random_access_iterator<I> &&
    derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
    requires(const I & i) {
        to_address(i) -> same_as<add_pointer_t<iter_reference_t<I>>>;
    };
```

Let \(a\) and \(b\) be dereferenceable iterators and \(c\) be a non-dereferenceable iterator of type \(I\) such that \(b\) is reachable from \(a\) and \(c\) is reachable from \(b\), and let \(D\) be \(\text{iter_difference_t}<I>\). The type \(I\) models contiguous_iterator only if

- (2.1) \(\text{to_address}(a) == \text{addressof}(\ast a)\),
- (2.2) \(\text{to_address}(b) == \text{to_address}(a) + D(b - a)\),
- (2.3) \(\text{to_address}(c) == \text{to_address}(a) + D(c - a)\),
- (2.4) \(\text{ranges::iter_move}(a)\) has the same type, value category, and effects as \(\text{std::move}(\ast a)\), and
- (2.5) if \(\text{ranges::iter_swap}(a, b)\) is well-formed, it has effects equivalent to \(\text{ranges::swap}(\ast a, \ast b)\).

25.3.5 C++17 iterator requirements

25.3.5.1 General

The Cpp17Iterator requirements form the basis of the iterator taxonomy; every iterator meets the Cpp17-Iterator requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (25.3.5.3) or write (25.3.5.4) values, or to provide a richer set of iterator movements (25.3.5.5, 25.3.5.6, 25.3.5.7).

Let \(a\) and \(b\) denote values of type \(X\) or const \(X\), \(\text{difference_type}\) and \(\text{reference}\) refer to the types \(\text{iterator_traits}<X>::\text{difference_type}\) and \(\text{iterator_traits}<X>::\text{reference}\), respectively, \(n\) denotes a value of \(\text{difference_type}\), \(u\), \(\text{tmp}\), and \(m\) denote identifiers, \(r\) denotes a value of \(X\), \(t\) denotes a value of value type \(T\), \(o\) denotes a value of some type that is writable to the output iterator.

[Note 1: For an iterator type \(X\) there must be an instantiation of \(\text{iterator_traits}<X>\) (25.3.2.3). — end note]

25.3.5.2 Cpp17Iterator

A type \(X\) meets the Cpp17Iterator requirements if:

- (2.1) \(X\) meets the \(\text{Cpp17CopyConstructible}, \text{Cpp17CopyAssignable}, \text{and Cpp17Destructible}\) requirements (16.4.4.2) and lvalues of type \(X\) are swappable (16.4.4.3), and
- (2.2) \(\text{iterator_traits}<X>::\text{difference_type}\) is a signed integer type or void, and
- (2.3) the expressions in Table 82 are valid and have the indicated semantics.

25.3.5.3 Input iterators

A class or pointer type \(X\) meets the requirements of an input iterator for the value type \(T\) if \(X\) meets the Cpp17Iterator (25.3.5.2) and Cpp17EqualityComparable (Table 27) requirements and the expressions in Table 83 are valid and have the indicated semantics.

In Table 83, the term the domain of \(==\) is used in the ordinary mathematical sense to denote the set of values over which \(==\) is (required to be) defined. This set can change over time. Each algorithm places additional
Table 82: *Cpp17Iterator* requirements  [tab:iterator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>*r</td>
<td>unspecified</td>
<td></td>
<td>Preconditions: r is dereferenceable.</td>
</tr>
<tr>
<td>++r</td>
<td>X&amp;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`.

*Example 1:* The call `find(a,b,x)` is defined only if the value of `a` has the property `p` defined as follows: `b` has property `p` and a value `i` has property `p` if (`*i==x`) or if (`*i!=x` and `++i` has property `p`). — end example

Table 83: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*)  [tab:inputiterator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>a != b</td>
<td>contextually convertible to bool</td>
<td>!(a == b)</td>
<td>Preconditions: (a, b) is in the domain of <code>==</code>.</td>
</tr>
<tr>
<td>*a</td>
<td>reference, convertible to T</td>
<td></td>
<td>Preconditions: a is dereferenceable. The expression (void)*a, *a is equivalent to *a. If a == b and (a, b) is in the domain of <code>==</code> then *a is equivalent to *b.</td>
</tr>
<tr>
<td>a-&gt;m</td>
<td>(*a).m</td>
<td></td>
<td>Preconditions: a is dereferenceable.</td>
</tr>
<tr>
<td>++r</td>
<td>X&amp;</td>
<td></td>
<td>Preconditions: r is dereferenceable. Postconditions: r is dereferenceable or r is past-the-end; any copies of the previous value of r are no longer required to be dereferenceable nor to be in the domain of <code>==</code>.</td>
</tr>
<tr>
<td>(void)r++</td>
<td></td>
<td></td>
<td>equivalent to (void)++r</td>
</tr>
<tr>
<td>*r++</td>
<td>convertible to T</td>
<td>{ T tmp = *r; ++r; return tmp; }</td>
<td></td>
</tr>
</tbody>
</table>

3  Recommended practice: The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.
[Note 1: For input iterators, \(a == b\) does not imply \(++a == ++b\). (Equality does not guarantee the substitution property or referential transparency.) Value type \(T\) is not required to be a \textit{Cpp17CopyAssignable} type (Table 33). Such an algorithm can be used with streams as the source of the input data through the \texttt{istream_iterator} class template. — end note]

### 25.3.5.4 Output iterators

A class or pointer type \(X\) meets the requirements of an output iterator if \(X\) meets the \textit{Cpp17Iterator} requirements (25.3.5.2) and the expressions in Table 84 are valid and have the indicated semantics.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>(\ast r = o)</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incremental.</td>
</tr>
<tr>
<td>++(r)</td>
<td>(X&amp;)</td>
<td>_addressof((r)) == addressof((++r)). Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incremental.</td>
<td></td>
</tr>
<tr>
<td>(r++)</td>
<td>convertible to (\text{const } X&amp;)</td>
<td>{ (X) tmp = (r); ++(r); return tmp; }</td>
<td>Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incremental.</td>
</tr>
<tr>
<td>(\ast r++ = o)</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incremental.</td>
</tr>
</tbody>
</table>

2 \textit{Recommended practice:} The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

[Note 1: The only valid use of an \texttt{operator\textasciitilde} is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality are not necessarily defined. — end note]

### 25.3.5.5 Forward iterators

A class or pointer type \(X\) meets the requirements of a forward iterator if

1. \(X\) meets the \textit{Cpp17InputIterator} requirements (25.3.5.3),
2. \(X\) meets the \textit{Cpp17DefaultConstructible} requirements (16.4.4.2),
3. if \(X\) is a mutable iterator, \texttt{reference} is a reference to \(T\); if \(X\) is a constant iterator, \texttt{reference} is a reference to \texttt{const }\(T\),
4. the expressions in Table 85 are valid and have the indicated semantics, and
5. objects of type \(X\) offer the multi-pass guarantee, described below.

2 The domain of \(==\) for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

### 25.3.5.6 Random-access iterators

A class or pointer type \(X\) meets the requirements of a random-access iterator if

1. \(X\) meets the \textit{Cpp17InputIterator} requirements (25.3.5.3),
2. \(X\) meets the \textit{Cpp17DefaultConstructible} requirements (16.4.4.2),
3. \(X\) meets the \textit{Cpp17CopyAssignable} requirements (Table 33),
4. if \(X\) is a mutable iterator, \texttt{reference} is a reference to \(T\); if \(X\) is a constant iterator, \texttt{reference} is a reference to \texttt{const }\(T\),
5. the expressions in Table 85 are valid and have the indicated semantics, and
6. objects of type \(X\) offer the multi-pass guarantee, described below.

3 Two dereferenceable iterators \(a\) and \(b\) of type \(X\) offer the \textit{multi-pass guarantee} if:

1. \(a == b\) implies \(++a == ++b\)

\section*{§ 25.3.5.5}
— \( X \) is a pointer type or the expression \((\text{void})++X(a)\), \(*a\) is equivalent to the expression \(*a\).

\[\text{(Note 2): The requirement that } a == b \text{ implies } ++a == ++b \text{ (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — end note}\]

**Table 85: Ccpp17ForwardIterator requirements (in addition to Ccpp17InputIterator)**

\[\text{Note 2:} \text{ If } a \text{ and } b \text{ are equal, then either } a \text{ and } b \text{ are both dereferenceable or else neither is dereferenceable.}\]

\[\text{Note 3:} \text{ If } a \text{ and } b \text{ are both dereferenceable, then } a == b \text{ if and only if } *a \text{ and } *b \text{ are bound to the same object.}\]

### 25.3.5.6 Bidirectional iterators

A class or pointer type \( X \) meets the requirements of a bidirectional iterator if, in addition to meeting the Ccpp17ForwardIterator requirements, the following expressions are valid as shown in Table 86.

**Table 86: Ccpp17BidirectionalIterator requirements (in addition to Ccpp17ForwardIterator)**

</tbody>
</table>

25.3.6 Indirect callable requirements

25.3.6.1 General

1 There are several concepts that group requirements of algorithms that take callable objects (22.10.3) as arguments.

25.3.6.2 Indirect callables

1 The indirect callable concepts are used to constrain those algorithms that accept callable objects (22.10.3) as arguments.

```cpp
namespace std {
    template<class F, class I>
    concept indirectly_unary_invocable =
        indirectly_readable<I> &&
        copy_constructible<F> &&
        invocable<F&, iter_value_t<I>&> &&
        invocable<F&, iter_reference_t<I>> &&
        invocable<F&, iter_common_reference_t<I>> &&
        common_reference_with<
```
invoke_result_t<F&, iter_value_t<I>&>,
invoke_result_t<F&, iter_reference_t<I>>&;

template<class F, class I>
concept indirectly_regular_unary_invocable =
indirectly_readable<I> &&
copy_constructible<F> &&
regular_invocable<F&, iter_value_t<I>&> &&
regular_invocable<F&, iter_reference_t<I>>& &&
regular_invocable<F&, iter_common_reference_t<I>>& &&
common_reference_with<
invoke_result_t<F&, iter_value_t<I>&>,
invoke_result_t<F&, iter_reference_t<I>>;
25.3.7 Common algorithm requirements

25.3.7.1 General

There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between `indirectly_readable` and `indirectly_writable` types: `indirectly_movable`, `indirectly_copyable`, and `indirectly_swappable`. There are three relational concepts for rearrangements: `permutable`, `mergeable`, and `sortable`. There is one relational concept for comparing values from different sequences: `indirectly_comparable`.

[Note 1: The `ranges::less` function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (22.10.9). — end note]

25.3.7.2 Concept `indirectly_movable`

The `indirectly_movable` concept specifies the relationship between a `indirectly_readable` type and a `indirectly_writable` type between which values may be moved.

```cpp
template<class In, class Out>
concept indirectly_movable =
  indirectly_readable<In> &&
  indirectly_writable<Out, iter_rvalue_reference_t<In>>;
```

The `indirectly_movable_storable` concept augments `indirectly_movable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type.

```cpp
template<class In, class Out>
concept indirectly_movable_storable =
  indirectly_movable<In, Out> &&
  indirectly_writable<Out, iter_value_t<In>> &&
  movable<iter_value_t<In>> &&
  constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
  assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

Let `i` be a dereferenceable value of type `In`. `In` and `Out` model `indirectly_movable_storable<In, Out>` only if after the initialization of the object `obj` in

```cpp
iter_value_t<In> obj(ranges::iter_move(i));
```

`obj` is equal to the value previously denoted by `*i`. If `iter_rvalue_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.15).

25.3.7.3 Concept `indirectly_copyable`

The `indirectly_copyable` concept specifies the relationship between a `indirectly_readable` type and a `indirectly_writable` type between which values may be copied.

```cpp
template<class In, class Out>
concept indirectly_copyable =
  indirectly_readable<In> &&
  indirectly_writable<Out, iter_reference_t<In>>;
```

The `indirectly_copyable_storable` concept augments `indirectly_copyable` with additional requirements enabling the transfer to be performed through an intermediate object of the `indirectly_readable` type's value type. It also requires the capability to make copies of values.

```cpp
template<class In, class Out>
concept indirectly_copyable_storable =
  indirectly_copyable<In, Out> &&
  indirectly_writable<Out, iter_value_t<In>>& &&
  indirectly_writable<Out, const iter_value_t<In>>& &&
  indirectly_writable<Out, const iter_value_t<In>&&> &&
```
Let \( i \) be a dereferenceable value of type \( \text{In} \). \( \text{In} \) and \( \text{Out} \) model `indirectly_copyable_storable<\text{In}, \text{Out}>` only if after the initialization of the object \( \text{obj} \) in
\[
\text{iter\_value\_t<\text{In> obj(*i));}
\]
\( \text{obj} \) is equal to the value previously denoted by \(*i\). If `iter\_reference\_t<\text{In}>` is an rvalue reference type, the resulting state of the value denoted by \(*i\) is valid but unspecified (16.4.6.15).

### 25.3.7.4 Concept indirectly_swappable  
**[alg.req.ind.swap]**

The `indirectly_swappable` concept specifies a swappable relationship between the values referenced by two `indirectly_readable` types.

```cpp
template<class I1, class I2 = I1>
concept indirectly_swappable =
    indirectly_readable<I1> && indirectly_readable<I2> &&
    requires(const I1 i1, const I2 i2) {
        ranges::iter_swap(i1, i1);
        ranges::iter_swap(i2, i2);
        ranges::iter_swap(i1, i2);
        ranges::iter_swap(i2, i1);
    };
```

### 25.3.7.5 Concept indirectly_comparable  
**[alg.req.ind.cmp]**

The `indirectly_comparable` concept specifies the common requirements of algorithms that compare values from two different sequences.

```cpp
template<class I1, class I2, class R, class P1 = identity, class P2 = identity>
concept indirectly_comparable =
    indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;
```

### 25.3.7.6 Concept permutable  
**[alg.req.permutable]**

The `permutable` concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

```cpp
template<class I>
concept permutable =
    forward_iterator<I> &&
    indirectly_movable_storable<I, I> &&
    indirectly_swappable<I, I>;
```

### 25.3.7.7 Concept mergeable  
**[alg.req.mergeable]**

The `mergeable` concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

```cpp
template<class I1, class I2, class Out, class R = ranges::less, class P1 = identity, class P2 = identity>
concept mergeable =
    input_iterator<I1> &&
    input_iterator<I2> &&
    weakly_incrementable<Out> &&
    indirectly_copyable<I1, Out> &&
    indirectly_copyable<I2, Out> &&
    indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;
```

### 25.3.7.8 Concept sortable  
**[alg.req.sortable]**

The `sortable` concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```cpp
template<class I, class R = ranges::less, class P = identity>
concept sortable =
    permutable<I> &&
    indirect_strict_weak_order<R, projected<I, P>>;
```
To simplify the use of iterators, the library provides several classes and functions.

It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces category tag classes which are used as compile time tags for algorithm selection. They are: output_iterator_tag, input_iterator_tag, forward_iterator_tag, bidirectional_iterator_tag, random_access_iterator_tag, and contiguous_iterator_tag. For every iterator of type I, iterator_traits< I >::iterator_category shall be defined to be a category tag that describes the iterator’s behavior. Additionally, iterator_traits< I >::iterator_concept may be used to indicate conformance to the iterator concepts (25.3.4).

namespace std {
    struct output_iterator_tag { };
    struct input_iterator_tag { };
    struct forward_iterator_tag: public input_iterator_tag { };
    struct bidirectional_iterator_tag: public forward_iterator_tag { };
    struct random_access_iterator_tag: public bidirectional_iterator_tag { };
    struct contiguous_iterator_tag: public random_access_iterator_tag { };
}

[Example 1: A program-defined iterator BinaryTreeIterator can be included into the bidirectional iterator category by specializing the iterator_traits template:]

    template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
        using iterator_category = bidirectional_iterator_tag;
        using difference_type = ptrdiff_t;
        using value_type = T;
        using pointer = T*;
        using reference = T&;
    };
    —end example]

[Example 2: If evolve() is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:]

    template<class BidirectionalIterator>
    inline void
    evolve(BidirectionalIterator first, BidirectionalIterator last) {
        evolve(first, last,
               typename iterator_traits<BidirectionalIterator>::iterator_category());
    }

    template<class BidirectionalIterator>
    void evolve(BidirectionalIterator first, BidirectionalIterator last,
                bidirectional_iterator_tag) {
        // more generic, but less efficient algorithm
    }

    template<class RandomAccessIterator>
    void evolve(RandomAccessIterator first, RandomAccessIterator last,
                random_access_iterator_tag) {
        // more efficient, but less generic algorithm
    }
    —end example]

Since only random access iterators provide + and - operators, the library provides two function templates advance and distance. These function templates use + and - for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use ++ to provide linear time implementations.
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);

Preconditions: n is negative only for bidirectional iterators.
Effects: Increments i by n if n is non-negative, and decrements i by -n otherwise.

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);

Preconditions: last is reachable from first, or InputIterator meets the Cpp17RandomAccessIterator
requirements and first is reachable from last.
Effects: If InputIterator meets the Cpp17RandomAccessIterator
requirements, returns (last - first); otherwise, increments first until last is reached and returns the number of increments.

template<class InputIterator>
constexpr InputIterator next(InputIterator x, typename iterator_traits<InputIterator>::difference_type n = 1);

Effects: Equivalent to: advance(x, n); return x;

template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x, typename iterator_traits<BidirectionalIterator>::difference_type n = 1);

Effects: Equivalent to: advance(x, -n); return x;

25.4.4 Range iterator operations § 25.4.4.1 General

The library includes the function templates ranges::advance, ranges::distance, ranges::next, and
ranges::prev to manipulate iterators. These operations adapt to the set of operators provided by each
iterator category to provide the most efficient implementation possible for a concrete iterator type.

[Example 1: ranges::advance uses the + operator to move a random_access_iterator forward n steps in constant
time. For an iterator type that does not model random_access_iterator, ranges::advance instead performs n
individual increments with the ++ operator. —end example]

The function templates defined in 25.4.4 are not found by argument-dependent name lookup (6.5.4). When
found by unqualified (6.5.3) name lookup for the postfix-expression in a function call (7.6.1.3), they inhibit
argument-dependent name lookup.

[Example 2: void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1,2,3};
    distance(begin(vec), end(vec)); // #1
}
The function call expression at #1 invokes std::ranges::distance, not std::distance, despite that (a) the iterator
type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::distance is more
specialized (13.7.7.3) than std::ranges::distance since the former requires its first two parameters to have the same
type. —end example]

The number and order of deducible template parameters for the function templates defined in 25.4.4 is
unspecified, except where explicitly stated otherwise.

25.4.4.2 ranges::advance § 25.4.4.2.1

template<input_or_output_iterator I>
constexpr void ranges::advance(I& i, iter_difference_t<I> n);

Preconditions: If I does not model bidirectional_iterator, n is not negative.
Effects:
(2.1) If I models random_access_iterator, equivalent to i += n.
(2.2) Otherwise, if n is non-negative, increments i by n.
(2.3) Otherwise, decrements i by -n.
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr void ranges::advance(I& i, S bound);

3 Preconditions: Either assignable_from<I&, S> || sized_sentinel_for<S, I> is modeled, or [i, bound) denotes a range.

4 Effects:
   (4.1) — If I and S model assignable_from<I&, S>, equivalent to i = std::move(bound).
   (4.2) — Otherwise, if S and I model sized_sentinel_for<S, I>, equivalent to ranges::advance(i, bound - i).
   (4.3) — Otherwise, while bool(i != bound) is true, increments i.

template<input_or_output_iterator I, sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);

5 Preconditions: If n > 0, [i, bound) denotes a range. If n == 0, [i, bound) or [bound, i) denotes a range. If n < 0, [bound, i) denotes a range, I models bidirectional_iterator, and I and S model same_as<I, S>.

6 Effects:
   (6.1) — If S and I model sized_sentinel_for<S, I>:
      (6.1.1) — If |n| ≥ |bound - i|, equivalent to ranges::advance(i, bound).
      (6.1.2) — Otherwise, equivalent to ranges::advance(i, n).
   (6.2) — Otherwise,
      (6.2.1) — if n is non-negative, while bool(i != bound) is true, increments i but at most n times.
      (6.2.2) — Otherwise, while bool(i != bound) is true, decrements i but at most -n times.

7 Returns: n - M, where M is the difference between the ending and starting positions of i.

25.4.4.3 ranges::distance

template<input_or_output_iterator I, sentinel_for<I> S>
requires (!sized_sentinel_for<S, I>)
constexpr iter_difference_t<I> ranges::distance(I first, S last);

1 Preconditions: [first, last) denotes a range.

2 Effects: Increments first until last is reached and returns the number of increments.

template<input_or_output_iterator I, sized_sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::distance(const I& first, const S& last);

3 Effects: Equivalent to: return last - first;

template<range R>
constexpr range_difference_t<R> ranges::distance(R&& r);

4 Effects: If R models sized_range, equivalent to:
   return static_cast<range_difference_t<R>>(ranges::size(r)); // 26.3.10
   Otherwise, equivalent to:
   return ranges::distance(ranges::begin(r), ranges::end(r)); // 26.3

25.4.4.4 ranges::next

template<input_or_output_iterator I>
constexpr I ranges::next(I x);

1 Effects: Equivalent to: ++x; return x;

template<input_or_output_iterator I>
constexpr I ranges::next(I x, iter_difference_t<I> n);

2 Effects: Equivalent to: ranges::advance(x, n); return x;
```cpp
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, S bound);

Effects: Equivalent to: ranges::advance(x, bound); return x;

template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);

Effects: Equivalent to: ranges::advance(x, n, bound); return x;

25.4.4.5 ranges::prev

template<bidirectional_iterator I>
constexpr I ranges::prev(I x);

Effects: Equivalent to: --x; return x;

template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n);

Effects: Equivalent to: ranges::advance(x, -n); return x;

template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);

Effects: Equivalent to: ranges::advance(x, -n, bound); return x;

25.5 Iterator adaptors

25.5.1 Reverse iterators

25.5.1.1 General

Class template reverse_iterator is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

25.5.1.2 Class template reverse_iterator

namespace std {
    template<class Iterator>
    class reverse_iterator {
    public:
        using iterator_type = Iterator;
        using iterator_concept = see below;
        using iterator_category = see below;
        using value_type = iter_value_t<Iterator>;
        using difference_type = iter_difference_t<Iterator>;
        using pointer = typename iterator_traits<Iterator>::pointer;
        using reference = iter_reference_t<Iterator>;

        constexpr reverse_iterator();
    
    constexpr explicit reverse_iterator(Iterator x);
    
    template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
    template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

    constexpr Iterator base() const;
    constexpr reference operator*() const;
    constexpr pointer operator->() const requires see below;

    constexpr reverse_iterator& operator++();
    constexpr reverse_iterator operator++(int);
    constexpr reverse_iterator& operator--();
    constexpr reverse_iterator operator--(int);

    constexpr reverse_iterator operator+ (difference_type n) const;
    constexpr reverse_iterator& operator+=(difference_type n);
    constexpr reverse_iterator operator- (difference_type n) const;
    constexpr reverse_iterator& operator-=(difference_type n);

    constexpr unspecified operator[](difference_type n) const;
}
```
friend constexpr iter_rvalue_reference_t<Iterator> iter_move(const reverse_iterator& i) noexcept(see below);

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void iter_swap(const reverse_iterator& x, const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:
    Iterator current;
};

1 The member typedef-name iterator_concept denotes
   — random_access_iterator_tag if Iterator models random_access_iterator, and
   — bidirectional_iterator_tag otherwise.

2 The member typedef-name iterator_category denotes
   — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models derived_from<random_access_iterator_tag>, and
   — iterator_traits<Iterator>::iterator_category otherwise.

25.5.1.3 Requirements
[reverse.iter.requirements]

1 The template parameter Iterator shall either meet the requirements of a Cpp17BidirectionalIterator (25.3.5.6) or model bidirectional_iterator (25.3.4.12).

2 Additionally, Iterator shall either meet the requirements of a Cpp17RandomAccessIterator (25.3.5.7) or model random_access_iterator (25.3.4.13) if the definitions of any of the members
   — operator+, operator-, operator+=, operator-= (25.5.1.7), or
   — operator[] (25.5.1.6),
   or the non-member operators (25.5.1.8)
   — operator<, operator>, operator<=, operator>=, operator-, or operator+ (25.5.1.9)
   are instantiated (13.9.2).

25.5.1.4 Construction and assignment
[reverse.iter.cons]

constexpr reverse_iterator();
1 Effects: Value-initializes current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.

constexpr explicit reverse_iterator(Iterator x);
2 Effects: Initializes current with x.

template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
3 Constraints: is_same_v<U, Iterator> is false and const U& models convertible_to<Iterator>.
4 Effects: Initializes current with u.current.

template<class U>
constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);
5 Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and assignable_from<Iterator&, const U&> is modeled.
6 Effects: Assigns u.current to current.
7 Returns: *this.
25.5.1.5 Conversion

```cpp
constexpr Iterator base() const;  // explicit

Returns: current.
```

25.5.1.6 Element access

```cpp
constexpr reference operator*() const;

Effects: As if by:
    Iterator tmp = current;
    return *--tmp;

constexpr pointer operator->() const
    requires (is_pointer_v<Iterator> ||
             requires(const Iterator i) { i.operator->(); });

Effects:
(2.1) — If Iterator is a pointer type, equivalent to: return prev(current);
(2.2) — Otherwise, equivalent to: return prev(current).operator->();
```

```cpp
constexpr unspecified operator[](difference_type n) const;

Returns: current[-n-1].
```

25.5.1.7 Navigation

```cpp
constexpr reverse_iterator operator+(difference_type n) const;
    Returns: reverse_iterator(current-n).

constexpr reverse_iterator operator-(difference_type n) const;
    Returns: reverse_iterator(current+n).

constexpr reverse_iterator& operator++();
    Effects: As if by: --current;
    Returns: *this.

constexpr reverse_iterator operator++(int);
    Effects: As if by:
        reverse_iterator tmp = *this;
        --current;
        return tmp;

constexpr reverse_iterator& operator--();
    Effects: As if by ++current.
    Returns: *this.

constexpr reverse_iterator operator--(int);
    Effects: As if by:
        reverse_iterator tmp = *this;
        ++current;
        return tmp;

constexpr reverse_iterator& operator+=(difference_type n);
    Effects: As if by:
        current -= n;
    Returns: *this.

constexpr reverse_iterator& operator-=(difference_type n);
    Effects: As if by: current -= n;
    Returns: *this.
```

§ 25.5.1.7
25.5.1.8 Comparisons

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator==(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y);  

Constraints: \( x.\text{base}() == y.\text{base}() \) is well-formed and convertible to \( \text{bool} \).

Returns: \( x.\text{base}() == y.\text{base}() \).
```

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator!=(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y);  

Constraints: \( x.\text{base}() \neq y.\text{base}() \) is well-formed and convertible to \( \text{bool} \).

Returns: \( x.\text{base}() \neq y.\text{base}() \).
```

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y);  

Constraints: \( x.\text{base}() > y.\text{base}() \) is well-formed and convertible to \( \text{bool} \).

Returns: \( x.\text{base}() > y.\text{base}() \).
```

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator>(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y);  

Constraints: \( x.\text{base}() < y.\text{base}() \) is well-formed and convertible to \( \text{bool} \).

Returns: \( x.\text{base}() < y.\text{base}() \).
```

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<=(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y);  

Constraints: \( x.\text{base}() \geq y.\text{base}() \) is well-formed and convertible to \( \text{bool} \).

Returns: \( x.\text{base}() \geq y.\text{base}() \).
```

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator>=(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y);  

Constraints: \( x.\text{base}() \leq y.\text{base}() \) is well-formed and convertible to \( \text{bool} \).

Returns: \( x.\text{base}() \leq y.\text{base}() \).
```

```cpp
template<class Iterator1, class Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>  
operator<=>(const reverse_iterator<Iterator1>& x,  
             const reverse_iterator<Iterator2>& y);  

Returns: \( y.\text{base}() \leftrightarrow x.\text{base}() \).
[Note 1: The argument order in the Returns: element is reversed because this is a reverse iterator. — end note]
```

25.5.1.9 Non-member functions

```cpp
template<class Iterator1, class Iterator2>
constexpr auto operator-(  
    const reverse_iterator<Iterator1>& x,  
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());  

Returns: \( y.\text{base}() - x.\text{base}() \).
```
template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(iter_difference_t<Iterator> n, 
    const reverse_iterator<Iterator>& x);

Returns: reverse_iterator<Iterator>(x.base() - n).

friend constexpr iter_rvalue_reference_t<Iterator> iter_move(const reverse_iterator& i) noexcept(see below);

Effects: Equivalent to:
auto tmp = i.base();
return ranges::iter_move(--tmp);

Remarks: The exception specification is equivalent to:
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator&>()))

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void iter_swap(const reverse_iterator& x, 
    const reverse_iterator<Iterator2>& y) noexcept(see below);

Effects: Equivalent to:
auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);

Remarks: The exception specification is equivalent to:
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

Returns: reverse_iterator<Iterator>(i).

25.5.2 Insert iterators

25.5.2.1 General

To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called insert iterators, are provided in the library. With regular iterator classes,

while (first != last) *result++ = *first++;

causes a range [first,last) to be copied into a range starting with result. The same code with result being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the insert mode instead of the regular overwrite mode.

An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. operator* returns the insert iterator itself. The assignment operator=(const T& x) is defined on insert iterators to allow writing into them, it inserts x right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. back_insert_iterator inserts elements at the end of a container, front_insert_iterator inserts elements at the beginning of a container, and insert_iterator inserts elements where the iterator points to in a container. back_inserter, front_inserter, and inserter are three functions making the insert iterators out of a container.
public:
using iterator_category = output_iterator_tag;
using value_type = void;
using difference_type = ptrdiff_t;
using pointer = void;
using reference = void;
using container_type = Container;

constexpr explicit back_insert_iterator(Container& x);
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
constexpr back_insert_iterator& operator*();
constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator operator++(int);

25.5.2.2.1 Operations [back.insert.iter.ops]

constexpr explicit back_insert_iterator(Container& x);
1
Effects: Initializes container with addressof(x).

constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
2
Effects: As if by: container->push_back(value);
Returns: *this.

constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
3
Effects: As if by: container->push_back(std::move(value));
Returns: *this.

constexpr back_insert_iterator& operator*();
Returns: *this.

constexpr back_insert_iterator& operator++();
4
constexpr back_insert_iterator operator++(int);
Returns: *this.

25.5.2.2 back_inserter [back.inserter]

template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);

Returns: back_insert_iterator<Container>(x).

25.5.2.3 Class template front_insert_iterator [front.insert.iterator]

namespace std {
    template<class Container>
    class front_insert_iterator {
    protected:
        Container* container;

    public:
using iterator_category = output_iterator_tag;
using value_type = void;
using difference_type = ptrdiff_t;
using pointer = void;
using reference = void;
using container_type = Container;

constexpr explicit front_insert_iterator(Container& x);
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

§ 25.5.2.3
1003
constexpr front_insert_iterator& operator*();
constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator operator++(int);
}

25.5.2.3.1 Operations

constexpr explicit front_insert_iterator(Container& x);

1 Effects: Initializes container with addressof(x).

constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
2 Effects: As if by: container->push_front(value);
3 Returns: *this.

constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
4 Effects: As if by: container->push_front(std::move(value));
5 Returns: *this.

constexpr front_insert_iterator& operator*();
6 Returns: *this.

constexpr front_insert_iterator& operator++();
7 Returns: *this.

constexpr front_insert_iterator& operator++(int);

25.5.2.3.2 front_inserter

template<class Container>
constexpr front_insert_iterator<Container> front_inserter(Container& x);
1 Returns: front_insert_iterator<Container>(x).

25.5.2.4 Class template insert_iterator

namespace std {
  template<class Container>
  class insert_iterator {
    protected:
    Container* container;
    ranges::iterator_t<Container> iter;

    public:
    using iterator_category = output_iterator_tag;
    using value_type = void;
    using difference_type = ptrdiff_t;
    using pointer = void;
    using reference = void;
    using container_type = Container;

    constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
    constexpr insert_iterator& operator=(const typename Container::value_type& value);
    constexpr insert_iterator& operator=(typename Container::value_type&& value);
    constexpr insert_iterator& operator*();
    constexpr insert_iterator& operator++();
    constexpr insert_iterator& operator++(int);
  };
}

25.5.2.4.1 Operations

constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
1 Effects: Initializes container with addressof(x) and iter with i.
constexpr insert_iterator& operator=(const typename Container::value_type& value);

Effects: As if by:
iter = container->insert(iter, value);
++iter;

Returns: *this.

constexpr insert_iterator& operator=(typename Container::value_type&& value);

Effects: As if by:
iter = container->insert(iter, std::move(value));
++iter;

Returns: *this.

constexpr insert_iterator& operator*();

Returns: *this.

constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);

Returns: *this.

25.5.2.4.2 inserter

template<class Container>
constexpr insert_iterator<Container> inserter(Container& x, ranges::iterator_t<Container> i);

Returns: insert_iterator<Container>(x, i).

25.5.3 Move iterators and sentinels

25.5.3.1 General

Class template move_iterator is an iterator adaptor with the same behavior as the underlying iterator except that its indirect operator implicitly converts the value returned by the underlying iterator's indirect operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

[Example 1:

list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end());  // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
                 make_move_iterator(s.end()));  // moves strings into v2

—end example]

25.5.3.2 Class template move_iterator

namespace std {

template<class Iterator>
class move_iterator {

public:
using iterator_type = Iterator;
using iterator_concept = input_iterator_tag;
using iterator_category = see below;  // not always present
using value_type = iter_value_t<Iterator>;
using difference_type = iter_difference_t<Iterator>;
using pointer = Iterator;
using reference = iter_rvalue_reference_t<Iterator>;

constexpr move_iterator();
constexpr explicit move_iterator(Iterator i);

template<class U> constexpr move_iterator(const move_iterator<U>& u);

template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

§ 25.5.3.2
```cpp
cconstexpr const Iterator& base() const & noexcept;
cconstexpr Iterator base() &&;
cconstexpr reference operator*() const;
cconstexpr move_iterator& operator++();
cconstexpr auto operator++(int);
cconstexpr move_iterator& operator--();
cconstexpr move_iterator operator--(int);
cconstexpr move_iterator operator+(difference_type n) const;
cconstexpr move_iterator& operator+=(difference_type n);
cconstexpr move_iterator operator-(difference_type n) const;
cconstexpr move_iterator& operator-=(difference_type n);
cconstexpr reference operator[](difference_type n) const;

template<sentinel_for<Iterator> S>
friend constexpr bool
operator==(const move_iterator& x, const move_sentinel<S>& y);

template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
    Iterator current;  // exposition only
};
```

1 The member typedef-name `iterator_category` is defined if and only if the qualified-id `iterator_traits<Iterator>::iterator_category` is valid and denotes a type. In that case, `iterator_category` denotes

(1.1) — `random_access_iterator_tag` if the type `iterator_traits<Iterator>::iterator_category` models derived from `random_access_iterator_tag`, and

(1.2) — `iterator_traits<Iterator>::iterator_category` otherwise.

### 25.5.3.3 Requirements

The template parameter `Iterator` shall either meet the `Cpp17InputIterator` requirements (25.3.5.3) or model `input_iterator` (25.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the `Cpp17BidirectionalIterator` requirements (25.3.5.6) or model `bidirectional_iterator` (25.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the `Cpp17RandomAccessIterator` requirements (25.3.5.7) or model `random_access_iterator` (25.3.4.13).

### 25.5.3.4 Construction and assignment

1 `constexpr move_iterator();`

   **Effects:** Value-initializes `current`.

2 `constexpr explicit move_iterator(Iterator i);`

   **Effects:** Initializes `current` with `std::move(i)`.

   ```cpp
template<class U> constexpr move_iterator(const move_iterator<U>& u);
```

   **Constraints:** `is_same_v<U, Iterator>` is false and `const U&` models `convertible_to<Iterator>`.

   **Effects:** Initializes `current` with `u.current`. 

§ 25.5.3.4
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and assignable_from<Iterator&, const U&> is modeled.

Effects: Assigns u.current to current.

25.5.3.5 Conversion [move.iter.op.conv]

constexpr const Iterator& base() const & noexcept;

Returns: current.

constexpr Iterator base() &&;

Returns: std::move(current).

25.5.3.6 Element access [move.iter.elem]

constexpr reference operator*() const;

Effects: Equivalent to: return ranges::iter_move(current);

constexpr reference operator[](difference_type n) const;

Effects: Equivalent to: return ranges::iter_move(current + n);

25.5.3.7 Navigation [move.iter.nav]

constexpr move_iterator& operator++();

Effects: As if by ++current.

Returns: *this.

constexpr auto operator++(int);

Effects: If Iterator models forward_iterator, equivalent to:

move_iterator tmp = *this;
++current;
return tmp;

Otherwise, equivalent to ++current.

constexpr move_iterator& operator--();

Effects: As if by --current.

Returns: *this.

constexpr move_iterator operator--(int);

Effects: As if by:

move_iterator tmp = *this;
--current;
return tmp;

constexpr move_iterator operator+(difference_type n) const;

Returns: move_iterator(current + n).

constexpr move_iterator& operator+=(difference_type n);

Effects: As if by: current += n;

Returns: *this.

constexpr move_iterator operator-(difference_type n) const;

Returns: move_iterator(current - n).

constexpr move_iterator& operator-=(difference_type n);

Effects: As if by: current -= n;

Returns: *this.
25.5.3.8 Comparisons

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);

template<sentinel_for<Iterator> S>
friend constexpr bool operator==(const move_iterator& x, const move_sentinel<S>& y);
```

1. Constraints: `x.base() == y.base()` is well-formed and convertible to `bool`.
2. Returns: `x.base() == y.base()`.

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

3. Constraints: `x.base() < y.base()` is well-formed and convertible to `bool`.
4. Returns: `x.base() < y.base()`.

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

5. Constraints: `y.base() < x.base()` is well-formed and convertible to `bool`.
6. Returns: `y < x`.

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

7. Constraints: `y.base() < x.base()` is well-formed and convertible to `bool`.
8. Returns: `!(y < x)`.

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

9. Constraints: `x.base() < y.base()` is well-formed and convertible to `bool`.
10. Returns: `!(x < y)`.

```cpp
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y);
```

11. Returns: `x.base() <=> y.base()`.

25.5.3.9 Non-member functions

```cpp
template<class Iterator1, class Iterator2>
constexpr auto operator-(const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());
```

1. Returns: `x.base() - y.base()`.

```cpp
template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);
```

2. Constraints: `x.base() + n` is well-formed and has type `Iterator`.
3. Returns: `x + n`.

§ 25.5.3.9
friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

Effects: Equivalent to: return ranges::iter_move(i.current);

 template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);

Returns: move_iterator<Iterator>(std::move(i)).

25.5.3.10 Class template move_sentinel

Class template move_sentinel is a sentinel adaptor useful for denoting ranges together with move_iterator. When an input iterator type $I$ and sentinel type $S$ model sentinel_for<$S$, $I$>, move_sentinel<$S$> and move_iterator<$I$> model sentinel_for<move_sentinel<$S$>, move_iterator<$I$>> as well.

[Example 1: A move_if algorithm is easily implemented with copy_if using move_iterator and move_sentinel:

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, indirect_unary_predicate<I> Pred>
requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
  std::ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
```
—end example]

namespace std {
    template<semiregular S>
    class move_sentinel {
        public:
            constexpr move_sentinel();
            constexpr explicit move_sentinel(S s);
            template<class S2>
            requires convertible_to<const S2&, S>
            constexpr move_sentinel(const move_sentinel<S2>& s);
            template<class S2>
            requires assignable_from<S&, const S2&>
            constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

            constexpr S base() const;
        private:
            S last; // exposition only
        };
    }

25.5.3.11 Operations

constexpr move_sentinel();

Effects: Value-initializes last. If is_trivially_default_constructible_v<$S$> is true, then this constructor is a constexpr constructor.

constexpr explicit move_sentinel(S s);

Effects: Initializes last with std::move(s).

template<class S2>
requires convertible_to<const S2&, S>
constexpr move_sentinel(const move_sentinel<S2>& s);

Effects: Initializes last with s.last.
template<class S2>
requires assignable_from<S&, const S2&>
    constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

    Effects: Equivalent to: last = s.last; return *this;

    constexpr S base() const;

Returns: last.

25.5.4 Common iterators

25.5.4.1 Class template common_iterator

Class template common_iterator is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

[Note 1: The common_iterator type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — end note]

[Example 1:

```cpp
template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
```

—end example]

namespace std {

    template<input_or_output_iterator I, sentinel_for<I> S>
    requires (!same_as<I, S> && copyable<I>)
    class common_iterator {
    public:
        constexpr common_iterator() requires default_initializable<I> = default;
        constexpr common_iterator(I i);
        constexpr common_iterator(S s);
        template<class I2, class S2>
        requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
        constexpr common_iterator(const common_iterator<I2, S2>& x);
        template<class I2, class S2>
        requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
        assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
        constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

        constexpr decltype(auto) operator*();
        constexpr decltype(auto) operator*() const
        requires dereferenceable<const I>;
        constexpr decltype(auto) operator->() const
        requires see below;

        constexpr common_iterator& operator++();
        constexpr decltype(auto) operator++(int);
        template<class I2, sentinel_for<I> S2>
        requires sentinel_for<S, I2>
        friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
        template<class I2, sentinel_for<I> S2>
        requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
        friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
    }

§ 25.5.4.1
template<
  sized_sentinel_for<I> I2,
  sized_sentinel_for<S> S2>
requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
    const common_iterator& x, const common_iterator<I2, S2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
noexcept(noexcept(ranges::iter_move(declval<const I&>())))
requires input_iterator<I>;

template<indirectly_swappable<I> I2, class S2>
friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))
private:

  variant<I, S> v_;  // exposition only

};

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
  using difference_type = iter_difference_t<I>;
};

template<input_iterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
  using iterator_concept = see below;
  using iterator_category = see below;
  using value_type = iter_value_t<I>;
  using difference_type = iter_difference_t<I>;
  using pointer = see below;
  using reference = iter_reference_t<I>;
};

§ 25.5.4.2  Associated types
The nested typedef-names of the specialization of iterator_traits for common_iterator<I, S> are defined
as follows.

(1.1) — iterator_concept denotes forward_iterator_tag if I models forward_iterator; otherwise it
denotes input_iterator_tag.

(1.2) — iterator_category denotes forward_iterator_tag if the qualified-id iterator_traits<I>::iter-
ator_category is valid and denotes a type that models derived_from<forward_iterator_tag>;
otherwise it denotes input_iterator_tag.

(1.3) — Let a denote an lvalue of type const common_iterator<I, S>. If the expression a.operator->() is
well-formed, then pointer denotes decltype(a.operator->()). Otherwise, pointer denotes void.

§ 25.5.4.3  Constructors and conversions

castexpr common_iterator(I i);
  Effects: Initializes v_ as if by v_{in_place_type<I>, std::move(i)}.

castexpr common_iterator(S s);
  Effects: Initializes v_ as if by v_{in_place_type<S>, std::move(s)}.

template<class I2, class S2>
requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
  castexpr common_iterator(const common_iterator<I2, S2>& x);
  Preconditions: x.v_.valueless_by_exception() is false.
  Effects: Initializes v_ as if by v_{in_place_index<i>, get<i>(x.v_)}, where i is x.v_.index().
template<class I2, class S2>
requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

Preconditions: x.v_.valueless_by_exception() is false.

Effects: Equivalent to:

(6.1) — If v_.index() == x.v_.index(), then get<i>(v_) = get<i>(x.v_).
(6.2) — Otherwise, v_.emplace<i>(get<i>(x.v_)).

where i is x.v_.index().

Returns: *this

25.5.4.4 Accessors

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
requires dereferenceable<const I>;

Preconditions: holds_alternative<I>(v_) is true.

Effects: Equivalent to: return *get<I>(v_);

constexpr decltype(auto) operator->() const
requires see below;

The expression in the requires-clause is equivalent to:

indirectly_readable<const I> &&
(requires(const I& i) { i.operator->(); } ||
is_reference_v<ioperator_reference_t<I>> ||
constructible_from<ioperator_value_t<I>, ioperator_reference_t<I>>)

Preconditions: holds_alternative<I>(v_) is true.

Effects:

(5.1) — If I is a pointer type or if the expression get<I>(v_).operator->() is well-formed, equivalent
to: return get<I>(v_);
(5.2) — Otherwise, if ioperator_reference_t<I> is a reference type, equivalent to:
auto&& tmp = *get<I>(v_);
return addressof(tmp);
(5.3) — Otherwise, equivalent to: return proxy(*get<I>(v_)); where proxy is the exposition-only
class:

class proxy {
  ioperator_value_t<I> keep_;  
  constexpr proxy(ioperator_reference_t<I>&& x) : keep_(std::move(x)) {}
  public:
    constexpr const ioperator_value_t<I>* operator->() const noexcept {
      return addressof(keep_);
    }
};

25.5.4.5 Navigation

constexpr common_iterator& operator++();

Preconditions: holds_alternative<I>(v_) is true.

Effects: Equivalent to ++get<I>(v_).

Returns: *this

constexpr decltype(auto) operator++(int);

Preconditions: holds_alternative<I>(v_) is true.

Effects: If I models forward_iterator, equivalent to:
common_iterator tmp = *this;
++*this;
return tmp;

Otherwise, if requires(I& i) { { *i++ } -> can-reference; } is true or
indirectly_readable<I> && constructible_from<iter_value_t<I>, iter_reference_t<I>> &&
move_constructible<iter_value_t<I>>
is false, equivalent to:
return get<I>(v_++)++;

Otherwise, equivalent to:
postfix-proxy p(**this);
++*this;
return p;

where postfix-proxy is the exposition-only class:
class postfix-proxy {
  iter_value_t<I> keep_;
  constexpr postfix-proxy(iter_reference_t<I>&& x)
    : keep_(std::forward<iter_reference_t<I>>(x)) {} 
  public:
    constexpr const iter_value_t<I>& operator*() const noexcept {
      return keep_; 
    }
};

25.5.4.6 Comparisons
[common.iter.cmp]

```cpp
template<class I2, sentinel_for<I> S2>
requires sentinel_for<S, I2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
```

1 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.

2 Returns: true if i == j, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

```cpp
template<class I2, sentinel_for<I> S2>
requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
```

3 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.

4 Returns: true if i and j are each 1, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

```cpp
template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
  const common_iterator& x, const common_iterator<I2, S2>& y);
```

5 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.

6 Returns: 0 if i and j are each 1, and otherwise get<i>(x.v_) - get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

25.5.4.7 Customizations
[common.iter.cust]

```cpp
friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
oxcept(noexcept(ranges::iter_move(declval<const I&>())))
requires input_iterator<I>;
```

1 Preconditions: holds_alternative<I>(i.v_) is true.
Effects: Equivalent to: `return ranges::iter_move(get<I>(i.v_));`

```cpp
template<indirectly_swappable<I> I2, class S2>
friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))
```

Preconditions: `holds_alternative<I>(x.v_)` and `holds_alternative<I2>(y.v_)` are each true.

Effects: Equivalent to `ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_));`

### 25.5.5 Default sentinel

```cpp
namespace std {
    struct default_sentinel_t {};
}
```

1. Class `default_sentinel_t` is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (25.5.6.1)).

### 25.5.6 Counted iterators

#### 25.5.6.1 Class template counted_iterator

1. Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with `default_sentinel` in calls to generic algorithms to operate on a range of `N` elements starting at a given position without needing to know the end position a priori.

2. [Example 1:

   ```cpp
   list<string> s;
   // populate the list s with at least 10 strings
   vector<string> v;
   // copies 10 strings into v:
   ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
   -- end example]

3. Two values `i1` and `i2` of types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if there exists some integer `n` such that `next(i1.base(), i1.count() + n)` and `next(i2.base(), i2.count() + n)` refer to the same (possibly past-the-end) element.

```cpp
namespace std {
    template<input_or_output_iterator I>
    class counted_iterator {
        public:
            using iterator_type = I;
            using value_type = iter_value_t<I>;
                // present only
            // if I models indirectly_readable
            using difference_type = iter_difference_t<I>;
            using iterator_concept = typename I::iterator_concept;
                // present only
            // if the qualified-id I::iterator_concept is valid and denotes a type
            using iterator_category = typename I::iterator_category;
                // present only
            // if the qualified-id I::iterator_category is valid and denotes a type
            constexpr counted_iterator() requires default_initializable<I> = default;
            constexpr counted_iterator(I x, iter_difference_t<I> n);
            template<class I2>
                requires convertible_to<const I2&, I>
            constexpr counted_iterator(const counted_iterator<I2>& x);
            template<class I2>
                requires assignable_from<I&, const I2&>
            constexpr counted_iterator(const counted_iterator<I2>& x);
            constexpr const I& base() const & noexcept;
            constexpr I base() &&;
            constexpr iter_difference_t<I> count() const noexcept;
            constexpr decltype(auto) operator*();
            constexpr decltype(auto) operator*() const
                requires dereferenceable<const I>;
        }
```
```cpp
constexpr auto operator->() const noexcept
  requires contiguous_iterator<I>;

constexpr counted_iterator& operator++();
constexpr decltype(auto) operator++(int);
constexpr counted_iterator operator++(int)
  requires forward_iterator<I>;
constexpr counted_iterator operator--();
constexpr counted_iterator operator--(int)
  requires bidirectional_iterator<I>;
constexpr counted_iterator operator+(iter_difference_t<I> n) const
  requires random_access_iterator<I>;
friend constexpr counted_iterator operator+(iter_difference_t<I> n, const counted_iterator& x)
  requires random_access_iterator<I>;
constexpr counted_iterator operator==(iter_difference_t<I> n)
  requires random_access_iterator<I>;

constexpr counted_iterator operator-(iter_difference_t<I> n) const
  requires random_access_iterator<I>;

template<common_with<I> I2>
  friend constexpr iter_difference_t<I2> operator-(
    const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr iter_difference_t<I> operator-(
  default_sentinel_t, const counted_iterator& y);
constexpr counted_iterator operator-(iter_difference_t<I> n)
  requires random_access_iterator<I>;

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
  requires random_access_iterator<I>;

template<common_with<I> I2>
  friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);

template<common_with<I> I2>
  friend constexpr strong_ordering operator<=>(const counted_iterator& x, const counted_iterator<I2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const counted_iterator& i)
  noexcept(noexcept(ranges::iter_move(i.current)))
  requires input_iterator<I>;

template<indirectly_swappable<I> I2>
  friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
  noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
  I current = I();                // exposition only
  iter_difference_t<I> length = 0; // exposition only
};

template<input_iterator I>
  requires same_as<ITER_TRAITS(I), iterator_traits<I>> // see 25.3.4.1
struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
  using pointer = conditional_t<counted_iterator<I>,
    add_pointer_t<iterator_traits<I>::add_pointer_t<I>>, void>;
};
```
25.5.6.2 Constructors and conversions

```cpp
constexpr counted_iterator(I i, iter_difference_t<I> n);
```

1. **Preconditions**: \( n \geq 0 \).
2. **Effects**: Initializes `current` with `std::move(i)` and `length` with `n`.

```cpp
template<class I2>
requires convertible_to<const I2&, I>
constexpr counted_iterator(const counted_iterator<I2>& x);
```

3. **Effects**: Initializes `current` with `x.current` and `length` with `x.length`.

```cpp
template<class I2>
requires assignable_from<I&, const I2&>
constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
```

4. **Effects**: Assigns `x.current` to `current` and `x.length` to `length`.
5. **Returns**: `*this`.

25.5.6.3 Accessors

```cpp
constexpr const I& base() const & noexcept;
```

1. **Effects**: Equivalent to: `return current;`

```cpp
constexpr I& base() &&;
```

2. **Returns**: `std::move(current)`.

```cpp
constexpr iter_difference_t<I> count() const noexcept;
```

3. **Effects**: Equivalent to: `return length;`

25.5.6.4 Element access

```cpp
constexpr decltype(auto) operator*();
```

1. **Effects**: Equivalent to: `return *current;`

```cpp
constexpr decltype(auto) operator*() const
requires dereferenceable<const I>;
```

2. **Preconditions**: `length > 0` is true.
3. **Effects**: Equivalent to: `return to_address(current);`

```cpp
constexpr decltype(auto) operator[](iter_difference_t<I> n) const
requires random_access_iterator<I>;
```

4. **Preconditions**: \( n < \text{length} \).
5. **Effects**: Equivalent to: `return current[n];`

25.5.6.5 Navigation

```cpp
constexpr counted_iterator& operator++();
```

1. **Preconditions**: `length > 0`.
2. **Effects**: Equivalent to:
   ```cpp
   ++current;
   --length;
   return *this;
   ```

```cpp
constexpr decltype(auto) operator++(int);
```

3. **Preconditions**: `length > 0`.
4. **Effects**: Equivalent to:
   ```cpp
   --length;
   ```
```cpp
try { return current++; }
catch(...) { ++length; throw; }

castexpr counted_iterator operator++(int)
requires forward_iterator<I>;

**Effects**: Equivalent to:

```cpp
counted_iterator tmp = *this;
++*this;
return tmp;
```

```cpp
castexpr counted_iterator& operator--()
requires bidirectional_iterator<I>;

**Effects**: Equivalent to:

```cpp
--current;
++length;
return *this;
```

```cpp
castexpr counted_iterator operator--(int)
requires bidirectional_iterator<I>;

**Effects**: Equivalent to:

```cpp
counted_iterator tmp = *this;
--*this;
return tmp;
```

```cpp
castexpr counted_iterator operator+(iter_difference_t<I> n) const
requires random_access_iterator<I>;

**Effects**: Equivalent to:

```cpp
return counted_iterator(current + n, length - n);
```

```cpp
friend castexpr counted_iterator operator+(iter_difference_t<I> n, const counted_iterator& x)
requires random_access_iterator<I>;

**Effects**: Equivalent to: return x + n;

```cpp
castexpr counted_iterator& operator+=(iter_difference_t<I> n)
requires random_access_iterator<I>;

**Preconditions**: n <= length.

**Effects**: Equivalent to:

```cpp
current += n;
length -= n;
return *this;
```

```cpp
castexpr counted_iterator operator-(iter_difference_t<I> n) const
requires random_access_iterator<I>;

**Effects**: Equivalent to: return counted_iterator(current - n, length + n);

```cpp
template<common_with<I> I2>
castexpr iter_difference_t<I2> operator-(
const counted_iterator& x, const counted_iterator<I2>& y);

**Preconditions**: x and y refer to elements of the same sequence (25.5.6.1).

**Effects**: Equivalent to: return y.length - x.length;

```cpp
friend castexpr iter_difference_t<I> operator-(
const counted_iterator& x, default_sentinel_t);

**Effects**: Equivalent to: return -x.length;

```cpp
friend castexpr iter_difference_t<I> operator-(
default_sentinel_t, const counted_iterator& y);

**Effects**: Equivalent to: return y.length;
```

§ 25.5.6.5
constexpr counted_iterator& operator-=(iter_difference_t<I> n)
    requires random_access_iterator<I>;

Preconditions: \( -n \leq \text{length} \).

Effects: Equivalent to:
    current -= n;
    length += n;
    return *this;

25.5.6.6 Comparisons

template<common_with<I> I2>
    friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: \( x \) and \( y \) refer to elements of the same sequence (25.5.6.1).

Effects: Equivalent to: \( \text{return } x.\text{length} = y.\text{length} \);

friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: \( \text{return } x.\text{length} = 0 \);

template<common_with<I> I2>
    friend constexpr strong_ordering operator<=>(const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: \( x \) and \( y \) refer to elements of the same sequence (25.5.6.1).

Effects: Equivalent to: \( \text{return } y.\text{length} <=> x.\text{length} \);

[Note 1: The argument order in the Effects: element is reversed because \( \text{length} \) counts down, not up. — end note]

25.5.6.7 Customizations

friend constexpr iter_rvalue_reference_t<I>
    iter_move(const counted_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)))
    requires input_iterator<I>;

Preconditions: \( i.\text{length} > 0 \) is true.

Effects: Equivalent to: \( \text{return } \text{ranges::iter_move}(i.\text{current}) \);

template<indirectly_swappable<I> I2>
    friend constexpr void
    iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
    noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Preconditions: Both \( x.\text{length} > 0 \) and \( y.\text{length} > 0 \) are true.

Effects: Equivalent to \( \text{ranges::iter_swap}(x.\text{current}, y.\text{current}) \).

25.5.7 Unreachable sentinel

Class unreachable_sentinel_t can be used with any weakly_incrementable type to denote the “upper bound” of an unbounded interval.

[Example 1:
    char* p;
    // set p to point to a character buffer containing newlines
    char* nl = find(p, unreachable_sentinel, '\n');

Provided a newline character really exists in the buffer, the use of unreachable_sentinel above potentially makes the call to find more efficient since the loop test against the sentinel does not require a conditional branch. — end example]
namespace std {
    struct unreachable_sentinel_t {
        template<weakly_incrementable I>
        friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
        { return false; }
    }
}

25.6 Stream iterators

25.6.1 General

To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

[Example 1:
    partial_sum(istream_iterator<double, char>(cin),
               istream_iterator<double, char>(),
               ostream_iterator<double, char>(cout, "\n"));
    reads a file containing floating-point numbers from cin, and prints the partial sums onto cout. —end example]

25.6.2 Class template `istream_iterator`

25.6.2.1 General

The class template `istream_iterator` is an input iterator (25.3.5.3) that reads successive elements from the input stream for which it was constructed.

namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>,
             class Distance = ptrdiff_t>
    class istream_iterator {
    public:
        using iterator_category = input_iterator_tag;
        using value_type = T;
        using difference_type = Distance;
        using pointer = const T*;
        using reference = const T&;
        using char_type = charT;
        using traits_type = traits;
        using istream_type = basic_istream<charT,traits>;

        constexpr istream_iterator();
        constexpr istream_iterator(default_sentinel_t);
        istream_iterator(istream_type& s);
        ~istream_iterator() = default;
        istream_iterator& operator=(const istream_iterator& x) = default;
        istream_iterator& operator=(const istream_iterator& x) = default;

        const T& operator*() const;
        const T* operator->() const;
        istream_iterator& operator++();
        istream_iterator operator++(int);

        friend bool operator==(const istream_iterator& i, default_sentinel_t);

    private:
        basic_istream<charT,traits>* in_stream; // exposition only
        T value; // exposition only
    }
}

2 The type `T` shall meet the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and `Cpp17CopyAssignable` requirements.
25.6.2.2 Constructors and destructor

```cpp
constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
```

**Effects**: Constructs the end-of-stream iterator, value-initializing `value`.

**Postconditions**: `in_stream == nullptr` is true.

**Remarks**: If the initializer `T()` in the declaration `auto x = T();` is a constant initializer (7.7), then these constructors are `constexpr` constructors.

```cpp
istream_iterator(istream_type& s);
```

**Effects**: Initializes `in_stream` with `addressof(s)`, value-initializes `value`, and then calls `operator++()`.

**Postconditions**: `in_stream == x.in_stream` is true.

**Remarks**: If `is_trivially_copy_constructible_v<T>` is true, then this constructor is trivial.

```cpp
~istream_iterator() = default;
```

**Remarks**: If `is_trivially_destructible_v<T>` is true, then this destructor is trivial.

25.6.2.3 Operations

```cpp
const T& operator*() const;
```

**Preconditions**: `in_stream != nullptr` is true.

**Returns**: `value`.

```cpp
const T* operator->() const;
```

**Preconditions**: `in_stream != nullptr` is true.

**Returns**: `addressof(value)`.

```cpp
istream_iterator& operator++();
```

**Preconditions**: `in_stream != nullptr` is true.

**Effects**: Equivalent to:

```
if (!(*in_stream >> value))
in_stream = nullptr;
```

**Returns**: `*this`.

```cpp
istream_iterator operator++(int);
```

**Preconditions**: `in_stream != nullptr` is true.

**Effects**: Equivalent to:

```
istream_iterator tmp = *this;
++*this;
return tmp;
```

```cpp
template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x,
               const istream_iterator<T,charT,traits,Distance>& y);
```

**Returns**: `x.in_stream == y.in_stream`.

```cpp
friend bool operator==(const istream_iterator& i, default_sentinel_t);
```

**Returns**: `!i.in_stream`.

25.6.3 Class template ostream_iterator

### 25.6.3.1 General

**ostream_iterator** writes (using `operator<<`) successive elements onto the output stream from which it was constructed. If it was constructed with `charT*` as a constructor argument, this string, called a delimiter string, is written to the stream after every `T` is written.
namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>>
    class ostream_iterator {
public:
    using iterator_category = output_iterator_tag;
    using value_type = void;
    using difference_type = ptrdiff_t;
    using pointer = void;
    using reference = void;
    using char_type = charT;
    using traits_type = traits;
    using ostream_type = basic_ostream<charT,traits>;
    
    ostream_iterator(ostream_type& s);
    ostream_iterator(ostream_type& s, const charT* delimiter);
    ostream_iterator(const ostream_iterator& x);
    ~ostream_iterator();
    
    ostream_iterator& operator=(const ostream_iterator&);
    ostream_iterator& operator=(const T& value);
    
    ostream_iterator& operator*();
    ostream_iterator& operator++();
    ostream_iterator& operator++(int);
};

25.6.3.2 Constructors and destructor

ostream_iterator(ostream_type& s);

1 Effects: Initializes out_stream with addressof(s) and delim with nullptr.

ostream_iterator(ostream_type& s, const charT* delimiter);

2 Effects: Initializes out_stream with addressof(s) and delim with delimiter.

25.6.3.3 Operations

ostream_iterator& operator=(const T& value);

1 Effects: As if by:
    *out_stream << value;
    if (delim)
        *out_stream << delim;
    return *this;

ostream_iterator& operator*();

2 Returns: *this.

ostream_iterator& operator++();
ostream_iterator& operator++(int);

3 Returns: *this.

25.6.4 Class template istreambuf_iterator

25.6.4.1 General

The class template istreambuf_iterator defines an input iterator (25.3.5.3) that reads successive characters
from the streambuf for which it was constructed. operator* provides access to the current input character,
if any. Each time operator++ is evaluated, the iterator advances to the next input character. If the end
of stream is reached (streambuf_type::sgetc() returns traits::eof()), the iterator becomes equal to
the end-of-stream iterator value. The default constructor istreambuf_iterator() and the constructor
istreambuf_iterator(nullptr) both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of istreambuf_iterator shall have a trivial copy constructor, a constexpr default constructor, and a trivial destructor.

2 The result of operator*() on an end-of-stream iterator is undefined. For any other iterator value a char_type value is returned. It is impossible to assign a character via an input iterator.

    namespace std {
        template<class charT, class traits = char_traits<charT>>
        class istreambuf_iterator {
            public:
                using iterator_category = input_iterator_tag;
                using value_type = charT;
                using difference_type = typename traits::off_type;
                using pointer = unspecified;
                using reference = charT;
                using char_type = charT;
                using traits_type = traits;
                using int_type = typename traits::int_type;
                using streambuf_type = basic_streambuf<charT,traits>
                    using istream_type = basic_istream<charT,traits>;
                class proxy;  // exposition only

                constexpr istreambuf_iterator() noexcept;
                constexpr istreambuf_iterator(default_sentinel_t) noexcept;
                istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
                ~istreambuf_iterator() = default;
                istreambuf_iterator(istream_type& s) noexcept;
                istreambuf_iterator(streambuf_type* s) noexcept;
                istreambuf_iterator(const proxy& p) noexcept;
                istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
                charT operator*() const;
                istreambuf_iterator& operator++();
                proxy operator++(int);
                bool equal(const istreambuf_iterator& b) const;
                friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

                private:
                    streambuf_type* sbuf_;  // exposition only
                }
            
    25.6.4.2 Class istreambuf_iterator::proxy [istreambuf.iterator.proxy]

1 Class istreambuf_iterator<charT,traits>::proxy is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class istreambuf_iterator<charT,traits>::proxy provides a temporary placeholder as the return value of the post-increment operator (operator++). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

    namespace std {
        template<class charT, class traits>
        class istreambuf_iterator<charT, traits>::proxy { // exposition only
            charT keep_;  
            basic_streambuf<charT,traits>* sbuf_;  
            proxy(charT c, basic_streambuf<charT,traits>* sbuf)
                : keep_(c), sbuf_(sbuf) { }
            public:
                charT operator*() { return keep_; }  
            }
        }

§ 25.6.4.2
25.6.4.3 Constructors [istreambuf.iterator.cons]

1 For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```cpp
constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
```

2 **Effects**: Initializes `sbuf_` with `nullptr`.

```cpp
istreambuf_iterator(istream_type& s) noexcept;
```

3 **Effects**: Initializes `sbuf_` with `s.rdbuf()`.

```cpp
istreambuf_iterator(streambuf_type* s) noexcept;
```

4 **Effects**: Initializes `sbuf_` with `s`.

```cpp
istreambuf_iterator(const proxy& p) noexcept;
```

5 **Effects**: Initializes `sbuf_` with `p.sbuf_`.

25.6.4.4 Operations [istreambuf.iterator.ops]

```cpp
charT operator*() const;
```

1 **Returns**: The character obtained via the `streambuf` member `sbuf_->sgetc()`.

```cpp
istreambuf_iterator& operator++();
```

2 **Effects**: As if by `sbuf_->sbumpc()`.

3 **Returns**: `*this`.

```cpp
proxy operator++(int);
```

4 **Returns**: `proxy(sbuf_->sbumpc(), sbuf_)`.

```cpp
bool equal(const istreambuf_iterator& b) const;
```

5 **Returns**: `true` if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what `streambuf` object they use.

```cpp
template<class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a, const istreambuf_iterator<charT,traits>& b);
```

6 **Returns**: `a.equal(b)`.

```cpp
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

7 **Returns**: `i.equal(s)`.

25.6.5 Class template ostreambuf_iterator [ostreambuf.iterator]

25.6.5.1 General [ostreambuf.iterator.general]

1 The class template `ostreambuf_iterator` writes successive `characters` onto the output stream from which it was constructed.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class ostreambuf_iterator {
    public:
        using iterator_category = output_iterator_tag;
        using value_type = void;
        using difference_type = ptrdiff_t;
        using pointer = void;
        using reference = void;
        using char_type = charT;
        using traits_type = traits;
        using streambuf_type = basic_streambuf<charT,traits>;
        using ostream_type = basic_ostream<charT,traits>;
    };
}
```
ostreambuf_iterator(ostream_type& s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);
ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:
    streambuf_type* sbuf_;       // exposition only
};

25.6.5.2 Constructors

ostreambuf_iterator(ostream_type& s) noexcept;
1  Preconditions: s.rdbuf() is not a null pointer.
2  Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;
3  Preconditions: s is not a null pointer.
4  Effects: Initializes sbuf_ with s.

25.6.5.3 Operations

ostreambuf_iterator& operator=(charT c);
1  Effects: If failed() yields false, calls sbuf_->sputc(c); otherwise has no effect.
2  Returns: *this.

ostreambuf_iterator& operator*();
3  Returns: *this.

ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
4  Returns: *this.

bool failed() const noexcept;
5  Returns: true if in any prior use of member operator=, the call to sbuf_->sputc() returned traits::eof(); or false otherwise.

25.7 Range access

In addition to being available via inclusion of the <iterator> header, the function templates in 25.7 are available when any of the following headers are included: <array> (24.3.2), <deque> (24.3.3), <forward_list> (24.3.4), <list> (24.3.5), <map> (24.4.2), <regex> (32.3), <set> (24.4.3), <span> (24.7.2), <string> (23.4.2), <string_view> (23.3.2), <unordered_map> (24.5.2), <unordered_set> (24.5.3), and <vector> (24.3.6). Each of these templates is a designated customization point (16.4.5.2.1).

template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());
1  Returns: c.begin().

template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());
2  Returns: c.end().

template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;
3  Returns: array.
template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;

Returns: array + N.

template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
  -> decltype(std::begin(c));

Returns: std::begin(c).

template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
  -> decltype(std::end(c));

Returns: std::end(c).

template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());

Returns: c.rbegin().

template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);

Returns: reverse_iterator<T*>(array + N).

template<class T, size_t N> constexpr reverse_iterator<T*> rend(T (&array)[N]);

Returns: reverse_iterator<T*>(array).

template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.end()).

template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.begin()).

template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));

Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));

Returns: std::rend(c).

template<class C> constexpr auto size(const C& c) -> decltype(c.size());

Returns: c.size().

template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;

Returns: N.

template<class C> constexpr auto ssize(const C& c)
  -> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;

Effects: Equivalent to:

return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());

template<class T, ptrdiff_t N> constexpr ptrdiff_t ssize(const T (&array)[N]) noexcept;

Returns: N.

template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());

Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;

Returns: false.
template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;

Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());

Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;

Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;

Returns: il.begin().
26 Ranges library

26.1 General

1 This Clause describes components for dealing with ranges of elements.

2 The following subclauses describe range and view requirements, and components for range primitives as summarized in Table 88.

Table 88: Ranges library summary

template<class I, class S, ranges::subrange_kind K>
struct tuple_element<0, const ranges::subrange<I, S, K>> {
  using type = I;
};
template<class I, class S, ranges::subrange_kind K>
struct tuple_element<1, const ranges::subrange<I, S, K>> {
  using type = S;
};

struct from_range_t { explicit from_range_t() = default; }; inline constexpr from_range_t from_range{};

Within this Clause, for an integer-like type X (25.3.4.4), make_unsigned-like-t<X> denotes make_unsigned-t<X> if X is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as X. For an expression x of type X, to_unsigned-like(x) is x explicitly converted to make_unsigned-like-t<X>.

Also within this Clause, make_signed-like-t<X> for an integer-like type X denotes make_signed_t<X> if X is an integer type; otherwise, it denotes a corresponding unspecified signed-integer-like type of the same width as X.

26.3 Range access

26.3.1 General

In addition to being available via inclusion of the <ranges> header, the customization point objects in 26.3 are available when <iterator> (25.2) is included.

Within 26.3, the reified object of a subexpression E denotes

(2.1) — the same object as E if E is a glvalue, or
(2.2) — the result of applying the temporary materialization conversion (7.3.5) to E otherwise.

26.3.2 ranges::begin

The name ranges::begin denotes a customization point object (16.3.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

(2.1) — If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::begin(E) is ill-formed.
(2.2) — Otherwise, if T is an array type (9.3.4.5) and remove_all_extents_t<T> is an incomplete type, ranges::begin(E) is expression-equivalent to t + 0.
(2.3) — Otherwise, if T is an array type, ranges::begin(E) is expression-equivalent to t.begin() if auto(t.begin()) is a valid expression whose type models input_or_output_iterator, ranges::begin(E) is expression-equivalent to auto(t.begin()).
(2.4) — Otherwise, if T is a class or enumeration type and auto(begin(t)) is a valid expression whose type models input_or_output_iterator with overload resolution performed in a context in which unqualified lookup for begin finds only the declarations

    void begin(auto&) = delete;
    void begin(const auto&) = delete;

    then ranges::begin(E) is expression-equivalent to auto(begin(t)) with overload resolution performed in the above context.
(2.5) — Otherwise, ranges::begin(E) is ill-formed.

[Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::begin(E) appears in the immediate context of a template instantiation. — end note]

(2.6) — Otherwise, ranges::begin(E) is ill-formed.

[Note 2: Whenever ranges::begin(E) is a valid expression, its type models input_or_output_iterator. — end note]
26.3.3  `ranges::end` [range.access.end]

1 The name `ranges::end` denotes a customization point object (16.3.3.3.6).
2 Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
   (2.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::end(E)` is ill-formed.
   (2.2) — Otherwise, if T is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::end(E)` is ill-formed with no diagnostic required.
   (2.3) — Otherwise, if T is an array of unknown bound, `ranges::end(E)` is ill-formed.
   (2.4) — Otherwise, if T is an array, `ranges::end(E)` is expression-equivalent to `t + extent_v<T>.
   (2.5) — Otherwise, if `auto(t.end())` is a valid expression whose type models `sentinel_for<iterator_t<T>>` then `ranges::end(E)` is expression-equivalent to `auto(t.end())`.
   (2.6) — Otherwise, `ranges::end(E)` is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::end(E)` appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever `ranges::end(E)` is a valid expression, the types S and I of the expressions `ranges::end(E)` and `ranges::begin(E)` model `sentinel_for<S, I>`. — end note]

26.3.4  `ranges::cbegin` [range.access.cbegin]

1 The name `ranges::cbegin` denotes a customization point object (16.3.3.3.6). The expression `ranges::cbegin(E)` for a subexpression E of type T is expression-equivalent to:
   (1.1) — `ranges::begin(static_cast<const T&>(E))` if E is an lvalue.
   (1.2) — Otherwise, `ranges::begin(static_cast<const T&&>(E))`.

2 [Note 1: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

26.3.5  `ranges::cend` [range.access.cend]

1 The name `ranges::cend` denotes a customization point object (16.3.3.3.6). The expression `ranges::cend(E)` for a subexpression E of type T is expression-equivalent to:
   (1.1) — `ranges::end(static_cast<const T&>(E))` if E is an lvalue.
   (1.2) — Otherwise, `ranges::end(static_cast<const T&&>(E))`.

2 [Note 1: Whenever `ranges::cend(E)` is a valid expression, the types S and I of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. — end note]

26.3.6  `ranges::rbegin` [range.access.rbegine]

1 The name `ranges::rbegin` denotes a customization point object (16.3.3.3.6).
2 Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
   (2.1) — If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rbegin(E)` is ill-formed.
   (2.2) — Otherwise, if T is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.
   (2.3) — Otherwise, if `auto(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to `auto(t.rbegin())`.

§ 26.3.6 1035
Otherwise, if $T$ is a class or enumeration type and $\text{auto}(\text{rbegin}(t))$ is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `rbegin` finds only the declarations

```c++
void rbegin(auto&) = delete;
void rbegin(const auto&) = delete;
```

then `ranges::rbegin(E)` is expression-equivalent to $\text{auto}(\text{rbegin}(t))$ with overload resolution performed in the above context.

Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.

Otherwise, `ranges::rbegin(E)` is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

### 26.3.7 ranges::rend

The name `ranges::rend` denotes a customization point object (16.3.3.3.6).

Given a subexpression $E$ with type $T$, let $t$ be an lvalue that denotes the reified object for $E$. Then:

1

- If $E$ is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rend(E)` is ill-formed.

2

- Otherwise, if $T$ is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.

3

- Otherwise, if `auto(t.rend())` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` then `ranges::rend(E)` is expression-equivalent to `auto(t.rend())`.

4

- Otherwise, if $T$ is a class or enumeration type and `auto(rend(t))` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` with overload resolution performed in a context in which unqualified lookup for `rend` finds only the declarations

```c++
void rend(auto&) = delete;
void rend(const auto&) = delete;
```

then `ranges::rend(E)` is expression-equivalent to `auto(rend(t))` with overload resolution performed in the above context.

Otherwise, `ranges::rend(E)` is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever `ranges::rend(E)` is a valid expression, the types $S$ and $I$ of the expressions `ranges::rend(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`. — end note]

### 26.3.8 ranges::crbegin

The name `ranges::crbegin` denotes a customization point object (16.3.3.3.6). The expression `ranges::crbegin(E)` for a subexpression $E$ of type $T$ is expression-equivalent to:

1

- `ranges::rbegin(static_cast<const T&>(E))` if $E$ is an lvalue.

2

- Otherwise, `ranges::rbegin(static_cast<const T&&>(E))`.

3 [Note 1: Whenever `ranges::crbegin(E)` is a valid expression, the types $S$ and $I$ of the expressions `ranges::rend(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`. — end note]

### 26.3.9 ranges::crend

The name `ranges::crend` denotes a customization point object (16.3.3.3.6). The expression `ranges::crend(E)` for a subexpression $E$ of type $T$ is expression-equivalent to:
ranges::rend(static_cast<const T&>(E)) if E is an lvalue.

Otherwise, ranges::rend(static_cast<const T&&>(E)).

[Note 1: Whenever ranges::crend(E) is a valid expression, the types S and I of the expressions ranges::crend(E) and ranges::crbegin(E) model sentinel_for<S, I>. — end note]

26.3.10 ranges::size

The name ranges::size denotes a customization point object (16.3.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

— If T is an array of unknown bound (9.3.4.5), ranges::size(E) is ill-formed.

— Otherwise, if T is an array type, ranges::size(E) is expression-equivalent to auto(extent_v<T>).

— Otherwise, if disable_sized_range<remove_cv_t<T>> (26.4.3) is false and auto(t.size()) is a valid expression of integer-like type (25.3.4.4), ranges::size(E) is expression-equivalent to auto(t.size()).

— Otherwise, if T is a class or enumeration type, disable_sized_range<remove_cv_t<T>> is false and auto(size(t)) is a valid expression of integer-like type with overload resolution performed in a context in which unqualified lookup for size finds only the declarations

```cpp
void size(auto&) = delete;
void size(const auto&) = delete;
```

then ranges::size(E) is expression-equivalent to auto(size(t)) with overload resolution performed in the above context.

— Otherwise, if to_unsigned-like(ranges::end(t) - ranges::begin(t)) (26.2) is a valid expression and the types I and S of ranges::begin(t) and ranges::end(t) (respectively) model both sized_sentinel_for<S, I> (25.3.4.8) and forward_iterator<I>, then ranges::size(E) is expression-equivalent to to_unsigned-like(ranges::end(t) - ranges::begin(t)).

— Otherwise, ranges::size(E) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::size(E) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever ranges::size(E) is a valid expression, its type is integer-like. — end note]

26.3.11 ranges::ssize

The name ranges::ssize denotes a customization point object (16.3.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. If ranges::size(t) is ill-formed, ranges::ssize(E) is ill-formed. Otherwise let D be make_signed-like-t<decltype(ranges::size(t))>, or ptrdiff_t if it is wider than that type; ranges::ssize(E) is expression-equivalent to static_cast<D>(ranges::size(t)).

26.3.12 ranges::empty

The name ranges::empty denotes a customization point object (16.3.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

— If T is an array of unknown bound (9.3.4.5), ranges::empty(E) is ill-formed.

— Otherwise, if bool(t.empty()) is a valid expression, ranges::empty(E) is expression-equivalent to bool(t.empty()).

— Otherwise, if (ranges::size(t) == 0) is a valid expression, ranges::empty(E) is expression-equivalent to (ranges::size(t) == 0).

— Otherwise, if bool(ranges::begin(t) == ranges::end(t)) is a valid expression and the type of ranges::begin(t) models forward_iterator, ranges::empty(E) is expression-equivalent to bool(ranges::begin(t) == ranges::end(t)).

— Otherwise, ranges::empty(E) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::empty(E) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever ranges::empty(E) is a valid expression, it has type bool. — end note]
26.3.13 ranges::data

The name ranges::data denotes a customization point object (16.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::data(E) is ill-formed.
2. Otherwise, if T is an array type (9.3.4.5) and remove_all_extents_t<T> is an incomplete type, ranges::data(E) is ill-formed with no diagnostic required.
3. Otherwise, if auto(t.data()) is a valid expression of pointer to object type, ranges::data(E) is expression-equivalent to auto(t.data()).
4. Otherwise, ranges::data(E) is ill-formed.

[Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::data(E) appears in the immediate context of a template instantiation. —end note]

26.3.14 ranges::cdata

The name ranges::cdata denotes a customization point object (16.3.3.6). The expression ranges::cdata(E) for a subexpression E of type T is expression-equivalent to:

1. ranges::data(static_cast<const T&>(E)) if E is an lvalue.
2. Otherwise, ranges::data(static_cast<const T&&>(E)).

[Note 1: Whenever ranges::cdata(E) is a valid expression, it has pointer to object type. —end note]

26.4 Range requirements

26.4.1 General

Ranges are an abstraction that allow a C++ program to operate on elements of data structures uniformly. Calling ranges::begin on a range returns an object whose type models input_or_output_iterator (25.3.4.6). Calling ranges::end on a range returns an object whose type S, together with the type I of the object returned by ranges::begin, models sentinel_for<S, I>. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

The range concept requires that ranges::begin and ranges::end return an iterator and a sentinel, respectively. The sized_range concept refines range with the requirement that ranges::size be amortized O(1). The view concept specifies requirements on a range type to provide operations with predictable complexity.

Several refinements of range group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which ranges::begin and ranges::end return objects of the same type. Random access ranges are ranges for which ranges::begin returns a type that models random_access_iterator (25.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

26.4.2 Ranges

The range concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```cpp
template<class T>
concept range =
    requires(T& t) {
        ranges::begin(t); // sometimes equality-preserving (see below)
        ranges::end(t);
    };
```

The required expressions ranges::begin(t) and ranges::end(t) of the range concept do not require implicit expression variations (18.2).

Given an expression t such that decltype((t)) is T& T models range only if
— [ranges::begin(t), ranges::end(t)] denotes a range (25.3.1),
— both ranges::begin(t) and ranges::end(t) are amortized constant time and non-modifying, and
— if the type of ranges::begin(t) models forward_iterator, ranges::begin(t) is equality-preserving.

[Note 1: Equality preservation of both ranges::begin and ranges::end enables passing a range whose iterator type models forward_iterator to multiple algorithms and making multiple passes over the range by repeated calls to ranges::begin and ranges::end. Since ranges::begin is not required to be equality-preserving when the return type does not model forward_iterator, it is possible for repeated calls to not return equal values or to not be well-defined. — end note]

```cpp
template<class T>
concept borrowed_range =
  range<T> && (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

Let U be remove_reference_t<T> if T is an rvalue reference type, and T otherwise. Given a variable u of type U, T models borrowed_range only if the validity of iterators obtained from u is not tied to the lifetime of that variable.

[Note 2: Since the validity of iterators is not tied to the lifetime of a variable whose type models borrowed_range, a function with a parameter of such a type can return iterators obtained from it without danger of dangling. — end note]

```cpp
template<class>
inline constexpr bool enable_borrowed_range = false;
```

Remarks: Pursuant to 16.4.5.2.1, users may specialize enable_borrowed_range for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

```cpp
[Example 1: Each specialization S of class template subrange (26.5.4) models borrowed_range because
(8.1) — enable_borrowed_range<S> is specialized to have the value true, and
(8.2) — S’s iterators do not have validity tied to the lifetime of an S object because they are “borrowed” from some other range.
— end example]
```

### 26.4.3 Sized ranges

The sized_range concept refines range with the requirement that the number of elements in the range can be determined in amortized constant time using ranges::size.

```cpp
template<class T>
concept sized_range =
  range<T> && requires(T& t) { ranges::size(t); };
```

Given an lvalue t of type remove_reference_t<T>, T models sized_range only if

(2.1) — ranges::size(t) is amortized $O(1)$, does not modify t, and is equal to ranges::distance(ranges::begin(t), ranges::end(t)), and
(2.2) — if iterator_t<T> models forward_iterator, ranges::size(t) is well-defined regardless of the evaluation of ranges::begin(t).

[Note 1: ranges::size(t) is otherwise not required to be well-defined after evaluating ranges::begin(t). For example, it is possible for ranges::size(t) to be well-defined for a sized_range whose iterator type does not model forward_iterator only if evaluated before the first call to ranges::begin(t). — end note]

```cpp
template<class>
inline constexpr bool disable_sized_range = false;
```

Remarks: Pursuant to 16.4.5.2.1, users may specialize disable_sized_range for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

```cpp
[Note 2: disable_sized_range allows use of range types with the library that satisfy but do not in fact model sized_range. — end note]
```
26.4.4 Views [range.view]

The view concept specifies the requirements of a range type that has the semantic properties below, which make it suitable for use in constructing range adaptor pipelines (26.7).

```cpp
template<class T>
concept view =
    range<T> && movable<T> && enable_view<T>;
```

1. **T models view only if:**

   - T has O(1) move construction; and
   - move assignment of an object of type T is no more complex than destruction followed by move construction; and
   - if N copies and/or moves are made from an object of type T that contained M elements, then those N objects have O(N + M) destruction; and
   - copy_constructible<T> is false, or T has O(1) copy construction; and
   - copyable<T> is false, or copy assignment of an object of type T is no more complex than destruction followed by copy construction.

2. [Note 1: The constraints on copying and moving imply that a moved-from object of type T has O(1) destruction. — end note]

3. [Example 1: Examples of views are:

   - A range type that wraps a pair of iterators.
   - A range type that holds its elements by shared_ptr and shares ownership with all its copies.
   - A range type that generates its elements on demand.

A container such as vector<string> does not meet the semantic requirements of view since copying the container copies all of the elements, which cannot be done in constant time. — end example]

4. Since the difference between range and view is largely semantic, the two are differentiated with the help of enable_view.

5. Remarks: Pursuant to 16.4.5.2.1, users may specialize enable_view to true for cv-unqualified program-defined types which model view, and false for types which do not. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

26.4.5 Other range refinements [range.refinements]

1. The output_range concept specifies requirements of a range type for which ranges::begin returns a model of output_iterator (25.3.4.10). input_range, forward_range, bidirectional_range, and random_access_range are defined similarly.

```cpp
template<class R, class T>
concept output_range =
    range<R> && output_iterator<iterator_t<R>, T>;

template<class T>
concept input_range =
    range<T> && input_iterator<iterator_t<T>>;

template<class T>
concept forward_range =
    range<T> && forward_iterator<iterator_t<T>>;
```
template<class T>
concept bidirectional_range =
  forward_range<T> && bidirectional_iterator<iterator_t<T>>;

template<class T>
concept random_access_range =
  bidirectional_range<T> && random_access_iterator<iterator_t<T>>;

2 contiguous_range additionally requires that the ranges::data customization point object (26.3.13) is usable with the range.

template<class T>
concept contiguous_range =
  random_access_range<T> && contiguous_iterator<iterator_t<T>> && requires(T& t) {
    { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
  };

3 Given an expression t such that decltype((t)) is T&, T models contiguous_range only if to_address(ranges::begin(t)) == ranges::data(t) is true.

4 The common_range concept specifies requirements of a range type for which ranges::begin and ranges::end return objects of the same type.

[Example 1: The standard containers (Clause 24) model common_range. — end example]

template<class T>
concept common_range =
  range<T> && same_as<iterator_t<T>, sentinel_t<T>>;

5 For a type R, is-initializer-list<R> is true if and only if remove_cvref_t<R> is a specialization of initializer_list.

6 The viewable_range concept specifies the requirements of a range type that can be converted to a view safely.

template<class T>
concept viewable_range =
  range<T> && ((view<remove_cvref_t<T>> && constructible_from<remove_cvref_t<T>, T>) ||
                 (view<remove_cvref_t<T>> &&
                  (is_lvalue_reference_v<T> || (movable<remove_reference_t<T>> && !is-initializer-list<T>))));

26.5 Range utilities [range.utility]
26.5.1 General [range.utility.general]
1 The components in 26.5 are general utilities for representing and manipulating ranges.

26.5.2 Helper concepts [range.utility.helpers]
1 Many of the types in subclause 26.5 are specified in terms of the following exposition-only concepts:

template<class R>
concept simple-view =
  view<R> && range<const R> &&
  same_as<iterator_t<R>, iterator_t<const R>> &&
  same_as<sentinel_t<R>, sentinel_t<const R>>;

template<class I>
concept has-arrow =
  input_iterator<I> && (is_pointer_v<I> || requires(I i) { i.operator->(); });

template<class T, class U>
concept different-from =
  !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;
26.5.3 View interface

26.5.3.1 General

The class template `view_interface` is a helper for defining view-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```cpp
namespace std::ranges {
  template<class D>
  requires is_class_v<D> && same_as<D, remove_cv_t<D>>
  class view_interface {
    private:
      constexpr D& derived() noexcept {
        // exposition only
        return static_cast<D&>(*this);
      }
      constexpr const D& derived() const noexcept {
        // exposition only
        return static_cast<const D&>(*this);
      }

    public:
      constexpr bool empty() requires forward_range<D> {
        return ranges::begin(derived()) == ranges::end(derived());
      }
      constexpr bool empty() const requires forward_range<const D> {
        return ranges::begin(derived()) == ranges::end(derived());
      }

      constexpr explicit operator bool() requires requires { ranges::empty(derived()); } {
        return !ranges::empty(derived());
      }
      constexpr explicit operator bool() const requires requires { ranges::empty(derived()); } {
        return !ranges::empty(derived());
      }

      constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
        return to_address(ranges::begin(derived()));
      }
      constexpr auto data() const requires range<const D> && contiguous_iterator<iterator_t<const D>> {
        return to_address(ranges::begin(derived()));
      }

      constexpr auto size() requires forward_range<D> && sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
        return ranges::end(derived()) - ranges::begin(derived());
      }
      constexpr auto size() const requires forward_range<const D> && sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
        return ranges::end(derived()) - ranges::begin(derived());
      }

      constexpr decltype(auto) front() requires forward_range<D>; // bidirectional_range<D>;
      constexpr decltype(auto) front() const requires forward_range<const D>; // bidirectional_range<const D>;

      constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
      constexpr decltype(auto) back() const requires bidirectional_range<const D> && common_range<const D>;

      // template<random_access_range R = D>
      // constexpr decltype(auto) operator[](range_difference_t<R> n) {
      //   return ranges::begin(derived())[n];
      // }
  }
}
```
The template parameter \( D \) for \view_interface\ may be an incomplete type. Before any member of the resulting specialization of \view_interface\ other than special member functions is referenced, \( D \) shall be complete, and model both \derived_from<\view_interface<D>>\ and \view\.

### 26.5.3.2 Members

[view.interface.members]

```cpp
constexpr decltype(auto) front() requires forward_range<D>; // Preconditions: !empty() is true.
constexpr decltype(auto) front() const requires forward_range<const D>;
```

```cpp
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>; // Preconditions: !empty() is true.
constexpr decltype(auto) back() const requires bidirectional_range<const D> && common_range<const D>;
```

### 26.5.4 Sub-ranges

[range.subrange]

#### 26.5.4.1 General

[range.subrange.general]

The \subrange\ class template combines together an iterator and a sentinel into a single object that models the \view\ concept. Additionally, it models the \sized_range\ concept when the final template parameter is \subrange_kind::sized\.

```cpp
namespace std::ranges {
    template<class From, class To>
    concept uses-nonqualification-pointer-conversion = // exposition only
        is_pointer_v<From> && is_pointer_v<To> &&
        !convertible_to<remove_pointer_t<From>(*)[], remove_pointer_t<To>(*)[]>;

    template<class From, class To>
    concept convertible-to-non-slicing = // exposition only
        convertible_to_non_slicing<From, To> &&
        !uses-nonqualification-pointer-conversion<decay_t<From>, decay_t<To>>;

    template<class T>
    concept pair-like = // exposition only
        !is_reference_v<T> && requires(T t) {
            typename tuple_size<T>::type; // ensures tuple_size<T> is complete
            requires derived_from<tuple_size<T>, integral_constant<size_t, 2>>;
            typename tuple_element_t<0, remove_const_t<T>>;
            typename tuple_element_t<1, remove_const_t<T>>;
            { std::get<0>(t) } -> convertible_to<const tuple_element_t<0, T>>&;
            { std::get<1>(t) } -> convertible_to<const tuple_element_t<1, T>>&;
        };

    template<class T, class U, class V>
    concept pair-like-convertible-from = // exposition only
        !range<T> && pair-like<T> &&
        constructible_from<T, U, V> &&
        convertible-to-non-slicing<U, tuple_element_t<0, T>>&
        &&
        convertible_to<V, tuple_element_t<1, T>>&;
```
template<input_or_output_iterator I, sentinel_for<I> S = I, subrange_kind K = sized_sentinel_for<S, I> ? subrange_kind::sized : subrange_kind::unsized>
requires (K == subrange_kind::sized || !sized_sentinel_for<S, I>)
class subrange : public view_interface<subrange<I, S, K>> {
private:
    static constexpr bool StoreSize =
        // exposition only
        K == subrange_kind::sized && !sized_sentinel_for<S, I>;
    I begin_ = I();
    // exposition only
    S end_ = S();
    // exposition only

        requires bidirectional_iterator<I>;
    constexpr subrange& advance(iter_difference_t<I> n);
};

§ 26.5.4.1 1044
? subrange_kind::sized : subrange_kind::unsized>

```
template<borrowed_range R>
subrange(R&&, make-unsigned-like-t<range_difference_t<R>>) ->
subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;
```

```
template<size_t N, class I, class S, subrange_kind K>
requires ((N == 0 && copyable<I>) || N == 1)
constexpr auto get(const subrange<I, S, K>& r);
```

```
template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);
```

```
namespace std {
  using ranges::get;
}
```

### 26.5.4.2 Constructors and conversions

**constructor**

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);
```

1. **Preconditions:** \([i, s)\) is a valid range.
2. **Effects:** Initializes `\(\text{begin}_i\)` with `std::move(i)` and `\(\text{end}_s\)` with `s`.

```
constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
make-unsigned-like-t<iter_difference_t<I>> n)
requires (K == subrange_kind::sized);
```

3. **Preconditions:** \([i, s)\) is a valid range, and \(n == \text{to-unsigned-like(ranges::distance}(i, s))\) is true.
4. **Effects:** Initializes `\(\text{begin}_i\)` with `std::move(i)` and `\(\text{end}_s\)` with `s`. If `StoreSize` is true, initializes `\(\text{size}_s\)` with `n`.

[Note 1: Accepting the length of the range and storing it to later return from `size()` enables `subrange` to model `sized_range` even when it stores an iterator and sentinel that do not model `sized_sentinel_for`. — end note]

```
template<different-from<subrange> R>
requires borrowed_range<R> &&
convertible-to-non-slicing<iterator_t<R>, I> &&
convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);
```

6. **Effects:** Equivalent to:

6.1. If `StoreSize` is true, `subrange(r, static_cast< decltype(size_)> (ranges::size(r)))`.
6.2. Otherwise, `subrange(ranges::begin(r), ranges::end(r))`.

```
template<different-from<subrange> PairLike>
requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

7. **Effects:** Equivalent to: `return PairLike(begin_, end_)`;

### 26.5.4.3 Accessors

```
constexpr I begin() const requires copyable<I>;
```

1. **Effects:** Equivalent to: `return begin_;`

2. **Effects:** Equivalent to: `return std::move(begin_)`;

```
constexpr S end() const;
```

3. **Effects:** Equivalent to: `return end_;`
constexpr bool empty() const;

Effects: Equivalent to: return begin_ == end_

constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
requires (K == subrange_kind::sized);

Effects:
- If StoreSize is true, equivalent to: return size_
- Otherwise, equivalent to: return to-unsigned-like(end_ - begin_)

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
requires forward_iterator<I>

Effects: Equivalent to:
auto tmp = *this;
tmp.advance(n);
return tmp;

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&
requires bidirectional_iterator<I>

Effects: Equivalent to:
auto tmp = *this;
tmp.advance(-n);
return tmp;

constexpr subrange& advance(iter_difference_t<I> n);

Effects: Equivalent to:
if constexpr (bidirectional_iterator<I>) {
  if (n < 0) {
    ranges::advance(begin_, n);
    if constexpr (StoreSize)
      size_ += to-unsigned-like(-n);
    return *this;
  }
}

auto d = n - ranges::advance(begin_, n, end_);
if constexpr (StoreSize)
  size_ -= to-unsigned-like(d);
return *this;

template<size_t N, class I, class S, subrange_kind K>
requires ((N == 0 && copyable<I>) || N == 1)
constexpr auto get(const subrange<I, S, K>& r);

template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);

Effects: Equivalent to:
if constexpr (N == 0)
  return r.begin();
else
  return r.end();
26.5.5 Dangling iterator handling

The tag type **dangling** is used together with the template aliases `borrowed_iterator_t` and `borrowed_subrange_t`. When an algorithm that typically returns an iterator into, or a subrange of, a range argument is called with an rvalue range argument that does not model `borrowed_range` (26.4.2), the return value possibly refers to a range whose lifetime has ended. In such cases, the tag type **dangling** is returned instead of an iterator or subrange.

```cpp
namespace std::ranges {
    struct dangling {
        constexpr dangling() noexcept = default;
        constexpr dangling(auto&&...) noexcept {};
    };
}
```

**Example 1:**

```cpp
vector<int> f();
auto result1 = ranges::find(f(), 42); // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42); // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
auto result3 = ranges::find(ranges::subrange{vec}, 42); // #3
static_assert(same_as<decltype(result3), vector<int>::iterator>);
```

The call to `ranges::find` at #1 returns `ranges::dangling` since `f()` is an rvalue vector; it is possible for the vector to be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue `vec` and specializations of `subrange` model `borrowed_range`. —end example]

26.5.6 Range conversions

26.5.6.1 General

The range conversion functions construct an object (usually a container) from a range, by using a constructor taking a range, a `from_range_t` tagged constructor, or a constructor taking a pair of iterators, or by inserting each element of the range into the default-constructed object.

**Example 1:**

```cpp
string_view str = "the quick brown fox";
auto words = views::split(str, ' ') | to<vector<string>>();
// words is vector<string>\{"the", "quick", "brown", "fox"\}
```

—end example]

3 For a type `R` that models `range`:

- if `R` models `borrowed_range`, then `borrowed_iterator_t<R>` denotes `iterator_t<R>`, and `borrowed_subrange_t<R>` denotes `subrange<iterator_t<R>>`;
- otherwise, both `borrowed_iterator_t<R>` and `borrowed_subrange_t<R>` denote `dangling`.

### § 26.5.6.1 1047
Let *container-inserter* be defined as follows:

```cpp
template<typename Ref>
auto container-inserter(C& c) {
  // exposition only
  if constexpr (requires { c.push_back(declval<Ref>()); })
    return back_inserter(c);
  else
    return inserter(c, c.end());
}
```

### 26.5.6.2 ranges::to

`template<class C, input_range R, class... Args> requires (!view<C>)
constexpr C to(R&& r, Args&&... args);`

1 Returns: An object of type C constructed from the elements of r in the following manner:

   (1.1) If convertible_to<range_reference_t<R>, range_value_t<C>> is true:
       (1.1.1) If constructible_from<C, R, Args...> is true:
       C(std::forward<R>(r), std::forward<Args>(args)...)  
       (1.1.2) Otherwise, if constructible_from<C, from_range_t, R, Args...> is true:
       C(from_range, std::forward<R>(r), std::forward<Args>(args)...)  
       (1.1.3) Otherwise, if
       (1.1.3.1) common_range<R> is true,
       (1.1.3.2) cpp17-input-iterator<iterator_t<R>> is true, and
       (1.1.3.3) constructible_from<C, iterator_t<R>, sentinel_t<R>, Args...> is true:
       C(ranges::begin(r), ranges::end(r), std::forward<Args>(args)...)  
       (1.1.4) Otherwise, if
       (1.1.4.1) constructible_from<C, Args...> is true, and
       (1.1.4.2) container-insertable<C, range_reference_t<R>> is true:
       C r(std::forward<Args>(args)...);  
       if constexpr (sized_range<R> && reservable-container<C>)
       c.reserve(ranges::size(r));
       ranges::copy(r, container-inserter<range_reference_t<R>>(c));  
   (1.2) Otherwise, if input_range<range_reference_t<R>> is true:
      to<C>(r | views::transform([](auto&& elem) {
        return to<range_value_t<C>>(std::forward<decltype(elem)>(elem));  
      }), std::forward<Args>(args)...)  
   (1.3) Otherwise, the program is ill-formed.
```

2 Let *input-iterator* be an exposition-only type:

```cpp
struct input-iterator {
  // exposition only
  using iterator_category = input_iterator_tag;
  using value_type = range_value_t<R>;
  using difference_type = ptrdiff_t;
  using pointer = add_pointer_t<range_reference_t<R>>;
  using reference = range_reference_t<R>;
  reference operator*() const;
  pointer operator->() const;
  input-iterator& operator++();
  input-iterator operator++(int);
  bool operator==(const input-iterator&) const;
};
```

[Note 1: *input-iterator* meets the syntactic requirements of Cpp17InputIterator. — end note]

3 Let *DEDUCE_EXPR* be defined as follows:

---

**© ISO/IEC N4910**

§ 26.5.6.2 1048
3.1 — C(declval<R>(), declval<Args>()...) if that is a valid expression,

3.2 — otherwise, C(from_range, declval<R>(), declval<Args>()...) if that is a valid expression,

3.3 — otherwise,

C(declval<input_iterator>()(), declval<input_iterator>()(), declval<Args>()...)

if that is a valid expression,

3.4 — otherwise, the program is ill-formed.

Returns: to<decltype(DEDUCE_EXPR)>(std::forward<R>(r), std::forward<Args>(args)...).

26.5.6.3 ranges::to adaptors

template<class C, class... Args> requires (!view<C>)
constexpr auto to(Args&&... args);

template<template<class...> class C, class... Args>
constexpr auto to(Args&&... args);

Returns: A range adaptor closure object (26.7.2) f that is a perfect forwarding call wrapper (22.10.4) with the following properties:

1. It has no target object.

2. Its bound argument entities bound_args consist of objects of types decay_t<Args>... direction-non-list-initialized with std::forward<Args>(args)..., respectively.

3. Its call pattern is to<C>(r, bound_args...), where r is the argument used in a function call expression of f.

26.6 Range factories

26.6.1 General

Subclause 26.6 defines range factories, which are utilities to create a view.

Range factories are declared in namespace std::ranges::views.

26.6.2 Empty view

26.6.2.1 Overview

empty_view produces a view of no elements of a particular type.

[Example 1:

auto e = views::empty<int>;
static_assert(ranges::empty(e));
static_assert(0 == e.size());

— end example]

26.6.2.2 Class template empty_view

namespace std::ranges {

template<class T>
requires is_object_v<T>

class empty_view : public view_interface<empty_view<T>> { public:

static constexpr T* begin() noexcept { return nullptr; }
static constexpr T* end() noexcept { return nullptr; }
static constexpr T* data() noexcept { return nullptr; }
static constexpr size_t size() noexcept { return 0; }
static constexpr bool empty() noexcept { return true; }

};

}

26.6.3 Single view

26.6.3.1 Overview

single_view produces a view that contains exactly one element of a specified value.
The name `views::single` denotes a customization point object (16.3.3.3.6). Given a subexpression `E`, the expression `views::single(E)` is expression-equivalent to `single_view<decay_t<decltype(E)>> (E)`.

**Example 1:**
```cpp
for (int i : views::single(4))
    cout << i;  // prints 4
```

---

### 26.6.3.2 Class template `single_view`

```cpp
namespace std::ranges {
    template<copy_constructible T>
    requires is_object_v<T>
    class single_view : public view_interface<single_view<T>> {
        private:
            copyable-box<T> value_;
            // exposition only (see 26.7.3)

        public:
            single_view() requires default_initializable<T> = default;
            constexpr explicit single_view(const T& t);
            constexpr explicit single_view(T&& t);
            template<class... Args>
            requires constructible_from<T, Args...>
            constexpr explicit single_view(in_place_t, Args&&... args);

            constexpr T* begin() noexcept;
            constexpr const T* begin() const noexcept;
            constexpr T* end() noexcept;
            constexpr const T* end() const noexcept;
            static constexpr size_t size() noexcept;
            constexpr T* data() noexcept;
            constexpr const T* data() const noexcept;
    }
}
```

**Effects:**

1. Initializes `value_` with `t`.
2. Initializes `value_` with `std::move(t)`.
3. Initializes `value_` as if by `value_(in_place, std::forward<Args>(args)...)`.

```cpp
constexpr explicit single_view(T) -> single_view<T>;
```

**Effects:** Equivalent to:`data()`.

```cpp
template<class T>
    single_view(T) -> single_view<T>;
```

**Effects:** Equivalent to:`data()`.

```cpp
constexpr explicit single_view(const T& t);
```

**Effects:** Equivalent to:`data()`.

```cpp
constexpr explicit single_view(T&& t);
```

**Effects:** Equivalent to:`data()`.

```cpp
template<class... Args>
    requires constructible_from<T, Args...>
    constexpr explicit single_view(in_place_t, Args&&... args);
```

**Effects:** Equivalent to:`data()`.

```cpp
constexpr T* begin() noexcept;
```

**Effects:** Equivalent to:`return data()`.

```cpp
constexpr const T* begin() const noexcept;
```

**Effects:** Equivalent to:`return data() + 1`.

```cpp
constexpr T* end() noexcept;
```

**Effects:** Equivalent to:`return 1`.

```cpp
constexpr const T* end() const noexcept;
```

**Effects:** Equivalent to:`return value_.operator->()`.
26.6.4 Iota view

26.6.4.1 Overview

1. `iota_view` generates a sequence of elements by repeatedly incrementing an initial value.

2. The name `views::iota` denotes a customization point object (16.3.3.3.6). Given subexpressions `E` and `F`, the expressions `views::iota(E)` and `views::iota(E, F)` are expression-equivalent to `iota_view(E)` and `iota_view(E, F)`, respectively.

[Example 1:
for (int i : views::iota(1, 10))
    cout << i << ' '; // prints: 1 2 3 4 5 6 7 8 9
—end example]

26.6.4.2 Class template iota_view

```cpp
namespace std::ranges {
    template<class I>
    concept decrementable = see below; // exposition only

    template<class I>
    concept advanceable = see below; // exposition only

template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
    requires weakly-equality-comparable-with< W, Bound> && copyable< W>
    class iota_view : public view_interface<iota_view<W, Bound>> {
        private:
            // 26.6.4.3, class iota_view::iterator
            struct iterator;
                // exposition only

            // 26.6.4.4, class iota_view::sentinel
            struct sentinel;
                // exposition only

        W value_ = W();  // exposition only
        Bound bound_ = Bound();  // exposition only

        public:
            iota_view() requires default_initializable< W> = default;
            constexpr explicit iota_view(W value);
            constexpr iota_view(type_identity_t< W> value, type_identity_t<Bound> bound);
            constexpr iota_view(iterator first, see below last);

            constexpr iterator begin() const;
            constexpr auto end() const requires same_as< W, Bound>;
            constexpr iterator end() const requires same_as< W, Bound>;

            constexpr auto size() const requires see below;
    };

template<class W, class Bound>
    requires (!is_integer_like< W> || !is_integer_like<Bound> ||
        (is_signed_integer_like< W> == is_signed_integer_like<Bound>))
    iota_view(W,Bound) -> iota_view< W, Bound>;
}
```

1. Let `IOTA-DIFF-T(W)` be defined as follows:

(1.1) — If `W` is not an integral type, or if it is an integral type and `sizeof(iter_difference_t< W>)` is greater than `sizeof(W)`, then `IOTA-DIFF-T(W)` denotes `iter_difference_t< W>.`

(1.2) — Otherwise, `IOTA-DIFF-T(W)` is a signed integer type of width greater than the width of `W` if such a type exists.

(1.3) — Otherwise, `IOTA-DIFF-T(W)` is an unspecified signed-integer-like type (25.3.4.4) of width not less than the width of `W`.

[Note 1: It is unspecified whether this type satisfies `weakly_incrementable. — end note]
The exposition-only decrementable concept is equivalent to:

```cpp
template<class I>
concept decrementable =
    // exposition only
    incrementalable<I> && requires(I i) {
        { --i } -> same_as<I&>;
        { i-- } -> same_as<I>;
    };
```

When an object is in the domain of both pre- and post-decrement, the object is said to be decrementable.

Let a and b be equal objects of type I. I models decrementable only if

- If a and b are decrementable, then the following are all true:
  1. `addressof(--a) == addressof(a)`
  2. `bool(a-- == b)`
  3. `bool(((void)a--, a) == --b)`
  4. `bool(++(--a) == b)`. (4.2)

The exposition-only advanceable concept is equivalent to:

```cpp
template<class I>
concept advanceable =
    // exposition only
    decrementable<I> && totally_ordered<I> && requires(I i, const I j, const IOTA-DIFF-T(I) n) {
        { i += n } -> same_as<I&>;
        { i -= n } -> same_as<I&>;
        I(j + n);
        I(n + j);
        I(j - n);
        { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
    };
```

Let D be IOTA-DIFF-T(I). Let a and b be objects of type I such that b is reachable from a after n applications of ++a, for some value n of type D. I models advanceable only if

- (a += n) is equal to b. (5.1)
- addressof(a += n) is equal to addressof(a). (5.2)
- I(a + n) is equal to (a += n). (5.3)
- For any two positive values x and y of type D, if I(a + D(x + y)) is well-defined, then I(a + D(x + y)) is equal to I(I(a + x) + y). (5.4)
- I(a + D(0)) is equal to a. (5.5)
- If I(a + D(n - 1)) is well-defined, then I(a + n) is equal to \( (I(i) \{ \text{return ++c; } \}(a + D(n - 1))) \). (5.6)
- (b += -n) is equal to a. (5.7)
- (b -= n) is equal to a. (5.8)
- addressof(b -= n) is equal to addressof(b). (5.9)
- I(b - n) is equal to (b -= n). (5.10)
- D(b - a) is equal to n. (5.11)
- D(a - b) is equal to D(-n). (5.12)
- bool(a <= b) is true. (5.13)

```cpp
constexpr explicit iota_view(W value);
```

**Preconditions:** Bound denotes unreachable_sentinel_t or Bound() is reachable from value.

**Effects:** Initializes value_ with value.
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);

**Preconditions:** Bound denotes unreachable_sentinel_t or bound is reachable from value. When W and Bound model totally_ordered_with, then bool(value <= bound) is true.

**Effects:** Initializes value_ with value and bound_ with bound.

constexpr iota_view(iterator first, see below last);

**Effects:** Equivalent to:

- If same_as=W, Bound> is true, iota_view(first.value_, last.value_).
- Otherwise, if Bound denotes unreachable_sentinel_t, iota_view(first.value_, last).
- Otherwise, iota_view(first.value_, last.bound_).

**Remarks:** The type of last is:

- If same_as=W, Bound> is true, iterator.
- Otherwise, if Bound denotes unreachable_sentinel_t, Bound.
- Otherwise, sentinel.

constexpr iterator begin() const;

**Effects:** Equivalent to: return iterator{value_};

constexpr auto end() const;

**Effects:** Equivalent to:

\[
\text{if constexpr (same_as<Bound, unreachable_sentinel_t>)}
\]
\[
\text{return unreachable_sentinel;}
\]
\[
\text{else}
\]
\[
\text{return sentinel{bound_};}
\]

constexpr iterator end() const requires same_as<W, Bound>;

**Effects:** Equivalent to: return iterator{bound_};

constexpr auto size() const requires see below;

**Effects:** Equivalent to:

\[
\text{if constexpr (is-integer-like<W> \&\& is-integer-like<Bound>)}
\]
\[
\text{return (value_ < 0)}
\]
\[
\text{? ((bound_ < 0)}
\]
\[
\text{? to-unsigned-like(-value_) - to-unsigned-like(-bound_)}
\]
\[
\text{: to-unsigned-like(bound_) + to-unsigned-like(-value_)}
\]
\[
\text{: to-unsigned-like(bound_) - to-unsigned-like(value_))}
\]
\[
\text{else}
\]
\[
\text{return to-unsigned-like(bound_ - value_);}
\]

**Remarks:** The expression in the requires-clause is equivalent to:

\[
\text{(same_as=W, Bound> \&\& advanceable<W>) || (is-integer-like<W> \&\& is-integer-like<Bound>) || sized_sentinel_for<Bound, W>}
\]

### 26.6.4.3 Class iota_view::iterator

```cpp
namespace std::ranges {
    template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound> \&\& copyable<W>
    struct iota_view<W, Bound>::iterator {
        private:
            W value_ = W(); // exposition only
        public:
            using iterator_concept = see below;
            using iterator_category = input_iterator_tag; // present only if W models incrementable
            using value_type = W;
            using difference_type = IOTA-DIFF-T(W);
    }
}
```
iterator() requires default_initializable<W> = default;
constexpr explicit iterator(W value);

constexpr W operator*(() const noexcept(is_nothrow_copy_constructible_v<W>);
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires incrementable<W>;

constexpr iterator& operator--() requires decrementable<W>;
constexpr iterator operator--(int) requires decrementable<W>;

constexpr iterator& operator+=(difference_type n) requires advanceable<W>;
constexpr iterator& operator-=(difference_type n) requires advanceable<W>;
constexpr W operator[](difference_type n) const
  requires advanceable<W>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<W>;
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires totally_ordered<W>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires totally_ordered<W> && three_way_comparable<W>;

friend constexpr iterator operator+(iterator i, difference_type n)
  requires advanceable<W>;
friend constexpr iterator operator+(difference_type n, iterator i)
  requires advanceable<W>;

friend constexpr iterator operator-(iterator i, difference_type n)
  requires advanceable<W>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires advanceable<W>;

1 iterator::iterator_concept is defined as follows:
(1.1) — If W models advanceable, then iterator_concept is random_access_iterator_tag.
(1.2) — Otherwise, if W models decrementable, then iterator_concept is bidirectional_iterator_tag.
(1.3) — Otherwise, if W models incrementable, then iterator_concept is forward_iterator_tag.
(1.4) — Otherwise, iterator_concept is input_iterator_tag.

2 [Note 1: Overloads for iter_move and iter_swap are omitted intentionally. — end note]

constexpr explicit iterator(W value);

Effects: Initializes value_ with value.

constexpr W operator*(() const noexcept(is_nothrow_copy_constructible_v<W>);

Effects: Equivalent to: return value_;

4
5 [Note 2: The noexcept clause is needed by the default iter_move implementation. — end note]

constexpr iterator& operator++();

Effects: Equivalent to:

§ 26.6.4.3
constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires incrementable<W>;

Effects: Equivalent to:
    auto tmp = *this;
    +++this;
    return tmp;

constexpr iterator& operator--() requires decrementable<W>;

Effects: Equivalent to:
    --value_;
    return *this;

constexpr iterator& operator--(int) requires decrementable<W>;

Effects: Equivalent to:
    auto tmp = *this;
    --*this;
    return tmp;

constexpr iterator& operator+=(difference_type n) requires advanceable<W>;

Effects: Equivalent to:
    if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
        if (n >= difference_type(0))
            value_ += static_cast<W>(n);
        else
            value_ -= static_cast<W>(-n);
    } else {
        value_ += n;
    }
    return *this;

constexpr iterator& operator-=(difference_type n) requires advanceable<W>;

Effects: Equivalent to:
    if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
        if (n >= difference_type(0))
            value_ -= static_cast<W>(n);
        else
            value_ += static_cast<W>(-n);
    } else {
        value_ -= n;
    }
    return *this;

constexpr W operator[](difference_type n) const
    requires advanceable<W>;

Effects: Equivalent to: return W(value_ + n);

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires equality_comparable<W>;

Effects: Equivalent to: return x.value_ == y.value_;

friend constexpr bool operator<(const iterator& x, const iterator& y)
requires totally_ordered<W>;

Effects: Equivalent to: return x.value_ < y.value_;  

friend constexpr bool operator<(const iterator& x, const iterator& y)  
requires totally_ordered<W>;

Effects: Equivalent to: return y < x;  

friend constexpr bool operator<=(const iterator& x, const iterator& y)  
requires totally_ordered<W>;

Effects: Equivalent to: return !(y < x);  

friend constexpr bool operator>=(const iterator& x, const iterator& y)  
requires totally_ordered<W>;

Effects: Equivalent to: return !(x < y);  

friend constexpr bool operator>(const iterator& x, const iterator& y)  
requires totally_ordered<W> && three_way_comparable<W>;

Effects: Equivalent to: return y < x;  

friend constexpr bool operator<=(const iterator& x, const iterator& y)  
requires totally_ordered<W> && three_way_comparable<W>;

Effects: Equivalent to: return !(y < x);  

friend constexpr bool operator>=(const iterator& x, const iterator& y)  
requires totally_ordered<W> && three_way_comparable<W>;

Effects: Equivalent to: return !(x < y);  

friend constexpr auto operator<=>(const iterator& x, const iterator& y)  
requires totally_ordered<W> && three_way_comparable<W>;

Effects: Equivalent to: return x.value_ <=> y.value_;  

friend constexpr iterator operator+(iterator i, difference_type n)  
requires advanceable<W>;

Effects: Equivalent to:  
i += n;  
return i;  

friend constexpr iterator operator+(difference_type n, iterator i)  
requires advanceable<W>;

Effects: Equivalent to:  
return i + n;  

friend constexpr iterator operator-(iterator i, difference_type n)  
requires advanceable<W>;

Effects: Equivalent to:  
i -= n;  
return i;  

friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
requires advanceable<W>;

Effects: Equivalent to:  
using D = difference_type;  
if constexpr (is_integer_like<W>) {  
  if constexpr (is_signed_integer_like<W>)  
    return D(D(x.value_) - D(y.value_));  
  else  
    return (y.value_ > x.value_)  
    ? D(-D(y.value_ - x.value_))  
    : D(x.value_ - y.value_);  
} else {  
  return x.value_ - y.value_;  
}

26.6.4.4 Class iota_view::sentinel

namespace std::ranges {

template<weakly_incrementable W, semiregular Bound>  
requires weakly-equality-comparable-with<W, Bound> && copyable<W>  
struct iota_view<W, Bound>::sentinel {

private:  
  Bound bound_ = Bound();  // exposition only

public:  
  sentinel() = default;  
  constexpr sentinel(Bound bound);
friend constexpr bool operator==(const iterator x, const sentinel& y);
friend constexpr bool operator==(const iterator& x, const sentinel& y);
friend constexpr iter_difference_t<W> operator-(const iterator x, const sentinel& y)
  requires sized_sentinel_for<Bound, W>;
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator y)
  requires sized_sentinel_for<Bound, W>;
};
}
constexpr explicit sentinel(Bound bound);  

1 Effects: Initializes bound_ with bound.

friend constexpr bool operator==(const iterator x, const sentinel& y);

2 Effects: Equivalent to: return x.value_ == y.bound_; 

friend constexpr iter_difference_t<W> operator-(const iterator x, const sentinel& y)
  requires sized_sentinel_for<Bound, W>;

3 Effects: Equivalent to: return x.value_ - y.bound_; 

friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator y)
  requires sized_sentinel_for<Bound, W>;

4 Effects: Equivalent to: return -(y - x); 

26.6.5 Istream view [range.istream]

26.6.5.1 Overview [range.istream.overview] 

1 basic_istream_view models input_range and reads (using operator>>) successive elements from its corresponding input stream.

2 The name views::istream<T> denotes a customization point object (16.3.3.3.6). Given a type T and a subexpression E of type U, if U models derived_from<basic_istream<typename U::char_type, typename U::traits_type>>, then the expression views::istream<T>(E) is expression-equivalent to basic_istream_view<T, typename U::char_type, typename U::traits_type>(E); otherwise, views::istream<T>(E) is ill-formed.

3 [Example 1]:

```cpp
auto ints = istringstream{"0 1 2 3 4"};
ranges::copy(ranges::istream_view<int>(ints), ostream_iterator<int>{cout, "-"});
// prints 0-1-2-3-4-
```

— end example]

26.6.5.2 Class template basic_istream_view [range.istream.view] 

namespace std::ranges {
  template<class Val, class CharT, class Traits>
  concept stream-extractable =
    requires(basic_istream<CharT, Traits>& is, Val& t) {
      is >> t;
    };

template<movable Val, class CharT, class Traits = char_traits<CharT>>
  requires default_initializable<Val> && stream-extractable<Val, CharT, Traits>
  class basic_istream_view : public view_interface<basic_istream_view, Val, CharT, Traits>> {
    public:
      constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

      constexpr auto begin() {
        *stream_ >> value_; 
        return iterator{*this};
      }

      constexpr default_sentinel_t end() const noexcept;

§ 26.6.5.2 1057
private:
    struct iterator;       // exposition only
    basic_istream<CharT, Traits>* stream_;       // exposition only
    Val value_ = Val();       // exposition only
};

constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

Effects: Initializes stream_ with addressof(stream).

constexpr default_sentinel_t end() const noexcept;

Effects: Equivalent to: return default_sentinel;

26.6.5.3 Class template basic_istream_view::iterator

namespace std::ranges {
    template<movable Val, class CharT, class Traits>
    requires default_initializable<Val> &&
    stream-extractable<Val, CharT, Traits>
    class basic_istream_view<Val, CharT, Traits>::iterator {
public:
    using iterator_concept = input_iterator_tag;
    using difference_type = ptrdiff_t;
    using value_type = Val;

    constexpr explicit iterator(basic_istream_view& parent) noexcept;

    iterator(const iterator&) = delete;
    iterator(iterator&&) = default;
    iterator& operator=(const iterator&) = delete;
    iterator& operator=(iterator&&) = default;
    iterator& operator++();
    void operator++(int);
    Val& operator*() const;
    friend bool operator==(const iterator& x, default_sentinel_t);

private:
    basic_istream_view* parent_;       // exposition only

    constexpr explicit iterator(basic_istream_view& parent) noexcept;

Effects: Initializes parent_ with addressof(parent).

    iterator& operator++();

Effects: Equivalent to:
    *parent_->stream_ >> parent_->value_;
    return *this;

void operator++(int);

Effects: Equivalent to +++this.

    Val& operator*() const;

Effects: Equivalent to: return parent_->value_;

    friend bool operator==(const iterator& x, default_sentinel_t);

Effects: Equivalent to: return x.parent_->stream_;

§ 26.6.5.3
26.7 Range adaptors

26.7.1 General

Subclause 26.7 defines range adaptors, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

Range adaptors are declared in namespace std::ranges::views.

The bitwise OR operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

Example 1:
```cpp
vector<int> ints{0,1,2,3,4,5};
auto even = [] (int i) { return 0 == i % 2; };
auto square = [] (int i) { return i * i; };
for (int i : ints | views::filter(even) | views::transform(square)) {
    cout << i << ' '; // prints: 0 4 16
}
assert(ranges::equal(ints | views::filter(even), views::filter(ints, even));
```

26.7.2 Range adaptor objects

A range adaptor closure object is a unary function object that accepts a range argument. For a range adaptor closure object C and an expression R such that decltype((R)) models range, the following expressions are equivalent:

\[ C(R) \]
\[ R | C \]

Given an additional range adaptor closure object D, the expression C | D produces another range adaptor closure object E. E is a perfect forwarding call wrapper (22.10.4) with the following properties:

(1.1) Its target object is an object d of type decay_t<decltype((D))> direct-non-list-initialized with D.

(1.2) It has one bound argument entity, an object c of type decay_t<decltype((C))> direct-non-list-initialized with C.

(1.3) Its call pattern is d(c(arg)), where arg is the argument used in a function call expression of E.

The expression C | D is well-formed if and only if the initializations of the state entities of E are all well-formed.

Given an object t of type T, where

(2.1) t is a unary function object that accepts a range argument,

(2.2) T models derived_from<range_adaptor_closure<T>>,

(2.3) T has no other base classes of type range_adaptor_closure<U> for any other type U, and

(2.4) T does not model range

then the implementation ensures that t is a range adaptor closure object.

The template parameter D for range_adaptor_closure may be an incomplete type. If an expression of type cv D is used as an operand to the | operator, D shall be complete and model derived_from<range_adaptor_closure<D>>. The behavior of an expression involving an object of type cv D as an operand to the | operator is undefined if overload resolution selects a program-defined operator| function.

If an expression of type cv U is used as an operand to the | operator, where U has a base class of type range_adaptor_closure<T> for some type T other than U, the behavior is undefined.

The behavior of a program that adds a specialization for range_adaptor_closure is undefined.

A range adaptor object is a customization point object (16.3.3.6) that accepts a viewable_range as its first argument and returns a view.

If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

If a range adaptor object adaptor accepts more than one argument, then let range be an expression such that decltype((range)) models viewable_range, let args... be arguments such that adaptor(range, args...) is a well-formed expression as specified in the rest of subclause 26.7, and let BoundArgs be a...
pack that denotes `decay_t<decltype((args))>...`. The expression `adaptor(args...)` produces a range adaptor closure object `f` that is a perfect forwarding call wrapper (22.10.4) with the following properties:

1. Its target object is a copy of `adaptor`.
2. Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward<decay_t<decltype((args))>>(args)...`, respectively.
3. Its call pattern is `adaptor(r, bound_args...)`, where `r` is the argument used in a function call expression of `f`.

The expression `adaptor(args...)` is well-formed if and only if the initialization of the bound argument entities of the result, as specified above, are all well-formed.

### 26.7.3 Copyable wrapper

Many types in this subclause are specified in terms of an exposition-only class template `copyable-box<T>` behaves exactly like `optional<T>` with the following differences:

1. `copyable-box<T>` constrains its type parameter `T` with `copy_constructible<T> && is_object_v<T>`.
2. The default constructor of `copyable-box<T>` is equivalent to:
   ```cpp
   constexpr copyable-box() noexcept(is_nothrow_default_constructible_v<T>)
   requires default_initializable<T>
   : copyable-box{in_place} {}  
   ```
3. If `copyable<T>` is not modeled, the copy assignment operator is equivalent to:
   ```cpp
   constexpr copyable-box& operator=(const copyable-box& that)
   noexcept(is_nothrow_copy_constructible_v<T>) {
     if (this != addressof(that)) {
       if (that) emplace(*that);
       else reset();
     }
     return *this;
   }  
   ```
4. If `movable<T>` is not modeled, the move assignment operator is equivalent to:
   ```cpp
   constexpr copyable-box& operator=(copyable-box&& that)
   noexcept(is_nothrow_move_constructible_v<T>) {
     if (this != addressof(that)) {
       if (that) emplace(std::move(*that));
       else reset();
     }
     return *this;
   }  
   ```

2. **Recommended practice:** `copyable-box<T>` should store only a `T` if either `T` models `copyable` or `is_nothrow_move_constructible_v<T>` is true.

### 26.7.4 Non-propagating cache

Some types in subclause 26.7 are specified in terms of an exposition-only class template `non-propagating-cache<T>` behaves exactly like `optional<T>` with the following differences:

1. `non-propagating-cache<T>` constrains its type parameter `T` with `is_object_v<T>`.
2. The copy constructor is equivalent to:
   ```cpp
   constexpr non-propagating-cache(const non-propagating-cache&) noexcept {}
   ```
3. The move constructor is equivalent to:
   ```cpp
   constexpr non-propagating-cache(non-propagating-cache&& other) noexcept {
     other.reset();
   }
   ```
4. The copy assignment operator is equivalent to:
   ```cpp
   constexpr non-propagating-cache& operator=(const non-propagating-cache& other) noexcept {
     if (addressof(other) != this)
     reset();
   }
   ```
— The move assignment operator is equivalent to:

```cpp
constexpr non-propagating-cache& operator=(non-propagating-cache& other) noexcept {
  reset();
  other.reset();
  return *this;
}
```

— `non-propagating-cache`<T> has an additional member function template specified as follows:

```cpp
template<class I>
constexpr T& emplace-deref(const I& i); // exposition only
```

Mandates: The declaration `T t(*i);` is well-formed for some invented variable `t.`

[Note 1: If `*i` is a prvalue of type `cv T`, there is no requirement that it is movable (9.4.1). — end note]

Effects: Calls `reset()`. Then direct-non-list-initializes the contained value with `*i`.

Postconditions: `*this` contains a value.

Returns: A reference to the new contained value.

 Throws: Any exception thrown by the initialization of the contained value.

Remarks: If an exception is thrown during the initialization of `T`, `*this` does not contain a value, and the previous value (if any) has been destroyed.

2 [Note 2: `non-propagating-cache` enables an input view to temporarily cache values as it is iterated over. — end note]

### 26.7.5 All view

#### 26.7.5.1 General

`views::all` returns a `view` that includes all elements of its `range` argument.

The name `views::all` denotes a range adaptor object (26.7.2). Given a subexpression `E`, the expression `views::all(E)` is expression-equivalent to:

1. `decay-copy(E)` if the decayed type of `E` models `view`.
2. Otherwise, `ref_view{E}` if that expression is well-formed.
3. Otherwise, `owning_view{E}`.

#### 26.7.5.2 Class template `ref_view`

`ref_view` is a `view` of the elements of some other `range`.

```cpp
namespace std::ranges {
template<range R>
requires is_object_v<R>
class ref_view : public view_interface<ref_view<R>> { 

  private:
  R* r_;                // exposition only

  public:
  template<different-from<ref_view> T>
  requires see below
cconstexpr ref_view(T& t);

  constexpr R& base() const { return *r_; }

  constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
  constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

  constexpr bool empty() const
    requires requires { ranges::empty(*r_); }
    { return ranges::empty(*r_); }

  constexpr auto size() const requires sized_range<R>
    { return ranges::size(*r_); }

2 § 26.7.5.2 1061
```
```cpp
constexpr auto data() const requires contiguous_range<R>
    { return ranges::data(*r_); }
};

template<class R>
    ref_view(R&) -> ref_view<R>;
}

```
26.7.6 Filter view

26.7.6.1 Overview

`filter_view` presents a view of the elements of an underlying sequence that satisfy a predicate.

The name `views::filter` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `P`, the expression `views::filter(E, P)` is expression-equivalent to `filter_view(E, P)`.

[Example 1:

```cpp
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };
auto evens = views::filter(is, [](int i) { return 0 == i % 2; });
for (int i : evens)
    cout << i << ' '; // prints: 0 2 4 6
```
—end example]

26.7.6.2 Class template filter_view

```cpp
namespace std::ranges {
    template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
        requires view<V> && is_object_v<Pred>
    class filter_view : public view_interface<filter_view<V, Pred>> {
        private:
            V base_ = V(); // exposition only
            copyable-box<Pred> pred_; // exposition only

        // 26.7.6.3, class filter_view::iterator
class iterator;
        // exposition only

        // 26.7.6.4, class filter_view::sentinel
class sentinel; // exposition only

        public:
            filter_view() requires default_initializable<V> && default_initializable<Pred> = default;
            constexpr filter_view(V base, Pred pred);

            constexpr V base() const & requires copy_constructible<V> { return base_; } // exposition only
            constexpr V base() && { return std::move(base_); }

            constexpr const Pred& pred() const;

            constexpr iterator begin();
            constexpr auto end() {
                if constexpr (common_range<V>)
                    return iterator{*this, ranges::end(base_)};
                else
                    return sentinel{*this};
            }
        };

    template<class R, class Pred>
        filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
}
```

`constexpr filter_view(V base, Pred pred);`

1 *Effects:* Initializes `base_` with `std::move(base)` and initializes `pred_` with `std::move(pred)`.

`constexpr const Pred& pred() const;`

2 *Effects:* Equivalent to: `return *pred_;`
constexpr iterator begin();

3 Preconditions: pred_.has_value() is true.

4 Returns: {*this, ranges::find_if(base_, ref(*pred_))}.

5 Remarks: In order to provide the amortized constant time complexity required by the range concept when filter_view models forward_range, this function caches the result within the filter_view for use on subsequent calls.

26.7.6.3 Class filter_view::iterator

namespace std::ranges {
  template<input_range V, indirect Unary Predicate<iterator_t<V>> Pred>
  requires view<V> & is object_v<Pred>
  class filter_view<V, Pred>::iterator {
    private:
      iterator_t<V> current_ = iterator_t<V>(); // exposition only
      filter_view* parent_ = nullptr; // exposition only
    public:
      using iterator_concept = see below;
      using iterator_category = see below; // not always present
      using value_type = range_value_t<V>;
      using difference_type = range_difference_t<V>;

      iterator() requires default_initializable<iterator_t<V>> = default;
      constexpr iterator(filter_view& parent, iterator_t<V> current);

      constexpr const iterator_t<V>& base() const & noexcept;
      constexpr iterator_t<V> base() &&;
      constexpr range_reference_t<V> operator*() const;
      constexpr iterator_t<V> operator->() const
        requires has arrow<iterator_t<V>> && copyable<iterator_t<V>>;

      constexpr iterator& operator++();
      constexpr void operator++(int);
      constexpr iterator operator++(int) requires forward_range<V>;

      constexpr iterator& operator--() requires bidirectional_range<V>;
      constexpr iterator operator--(int) requires bidirectional_range<V>;

      friend constexpr bool operator==(const iterator& x, const iterator& y)
        requires equality comparable<iterator_t<V>>;

      friend constexpr range rvalue_reference_t<V> iter_move(const iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current_)));

      friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
        requires indirectly swappable<iterator_t<V>>;
  };
}

1 Modification of the element a filter_view::iterator denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 iterator::iterator concept is defined as follows:

  (2.1) If V models bidirectional_range, then iterator concept denotes bidirectional_iterator_tag.

  (2.2) Otherwise, if V models forward_range, then iterator concept denotes forward_iterator_tag.

  (2.3) Otherwise, iterator concept denotes input_iterator_tag.

3 The member typedef-name iterator category is defined if and only if V models forward_range. In that case, iterator::iterator category is defined as follows:

  (3.1) Let C denote the type iterator_traits<iterator_t<V>>::iterator category.
— If \( C \) models \( \text{derived_from}\langle \text{bidirectional\_iterator\_tag} \rangle \), then \( \text{iterator\_category} \) denotes \( \text{bidirectional\_iterator\_tag} \).

— Otherwise, if \( C \) models \( \text{derived_from}\langle \text{forward\_iterator\_tag} \rangle \), then \( \text{iterator\_category} \) denotes \( \text{forward\_iterator\_tag} \).

— Otherwise, \( \text{iterator\_category} \) denotes \( C \).

```cpp
cconstexpr iterator(filter_view& parent, iterator_t<V> current);
```

**Effects:** Initializes \( \text{current\_} \) with \( \text{std::move}(\text{current}) \) and \( \text{parent\_} \) with \( \text{addressof}(\text{parent}) \).

```cpp
cconstexpr const iterator_t<V>& base() const & noexcept;
```

**Effects:** Equivalent to: \( \text{return \ current\_} \).  

```cpp
cconstexpr iterator_t<V> base() &&;
```

**Effects:** Equivalent to: \( \text{return std::move}(\text{current\_}) \).

```cpp
cconstexpr range_reference_t<V> operator*() const;
```

**Effects:** Equivalent to: \( \text{return \*}\text{current\_} \).

```cpp
cconstexpr iterator_t<V> operator->() const
requires has\_arrow<iterator_t<V>> && copyable<iterator_t<V>>;
```

**Effects:** Equivalent to: \( \text{return \ current\_} \).

```cpp
cconstexpr iterator& operator++();
```

**Effects:** Equivalent to:

```cpp
\text{current\_} = \text{ranges::find\_if}(\text{std::move}(++\text{current\_}), \text{ranges::end}(...\text{base}\_),
\text{ref}(...\text{pred}\_));
\text{return \*this;}
```

```cpp
cconstexpr void operator++(int);
```

**Effects:** Equivalent to \(++\*this\).

```cpp
cconstexpr iterator operator++(int) requires forward\_range<V>;
```

**Effects:** Equivalent to:

```cpp
\text{auto tmp = \*this; \;++this; \;return tmp;}
```

```cpp
cconstexpr iterator& operator--() requires bidirectional\_range<V>;
```

**Effects:** Equivalent to:

```cpp
\text{do \;--\current\_; \;while (!\text{invoke}(...\text{pred}\_, \;\text{current}\_;)) \;return \*\text{this;}}
```

```cpp
cconstexpr iterator operator--(int) requires bidirectional\_range<V>;
```

**Effects:** Equivalent to:

```cpp
\text{auto tmp = \*\text{this; \;--\*this; \;return tmp;}
```

```cpp
\text{friend constexpr bool operator==(const iterator\& x, const iterator\& y)
\text{requires equality\_comparable<iterator\_t<V>>; \;return x.\text{current\_} \;== \;y.\text{current\_;}}
```

```cpp
\text{friend constexpr range\_rvalue\_reference\_t<V> iter\_move(const iterator\& i)
\text{noexcept(noexcept(\text{ranges::iter\_move}(i.\text{current}\_)))};
```

**Effects:** Equivalent to: \( \text{return ranges::iter\_move}(i.\text{current\_}) \);
friend constexpr void iter_swap(const iterator& x, const iterator& y)
    noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
requires indirectly_swappable<iterator_t<V>>;

Effects: Equivalent to ranges::iter_swap(x.current_, y.current_).

26.7.6.4 Class filter_view::sentinel

namespace std::ranges {
    template<input_range V, indirect unary predicate<iterator_t<V>> Pred>
    requires view<V> && is object_v<Pred>
    class filter_view<V, Pred>::sentinel {
private:
    sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

public:
    sentinel() = default;
    constexpr explicit sentinel(filter_view& parent);
    constexpr sentinel_t<V> base() const;

friend constexpr bool operator==(const iterator& x, const sentinel& y);
    };
}

constexpr explicit sentinel(filter_view& parent);

Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel_t<V> base() const;

Effects: Equivalent to: return end_;

friend constexpr bool operator==(const iterator& x, const sentinel& y);

Effects: Equivalent to: return x.current_ == y.end_;

26.7.7 Transform view

26.7.7.1 Overview

transform_view presents a view of an underlying sequence after applying a transformation function to each element.

The name views::transform denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::transform(E, F) is expression-equivalent to transform_view(E, F).

[Example 1:

    vector<int> is{ 0, 1, 2, 3, 4 };
    auto squares = views::transform(is, [](int i) { return i * i; });
    for (int i : squares)
        cout << i << ' '; // prints: 0 1 4 9 16
    —end example]

26.7.7.2 Class template transform_view

namespace std::ranges {
    template<input_range V, copy constructible F>
    requires view<V> && is object_v<F> &&
    regular invocable<F, range reference_t<V>> &&
    can reference<invoke result_t<F, range reference_t<V>>>.
    class transform_view : public view interface<transform view<V, F>> {
private:
    // 26.7.7.3, class template transform view::iterator
    template<bool> struct iterator;
    // exposition only

    // 26.7.7.4, class template transform view::sentinel
    template<bool> struct sentinel;
    // exposition only

§ 26.7.7.2
V base_ = V(); // exposition only
copyable-box<F> fun_; // exposition only

public:
    transform_view() requires default_initializable<V> && default_initializable<F> = default;
    constexpr transform_view(V base, F fun);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr iterator<false> begin();
    constexpr iterator<true> begin() const
        requires range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;

    constexpr sentinel<false> end();
    constexpr iterator<false> end() requires common_range<V>;
    constexpr sentinel<true> end() const
        requires common_range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;

    constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
    constexpr auto size() const requires sized_range<const V>
    { return ranges::size(base_); }
};

template<class R, class F>
    transform_view(R&&, F) -> transform_view<views::all_t<R>, F>;

    constexpr transform_view(V base, F fun);

1  Effects: Initializes base_ with std::move(base) and fun_ with std::move(fun).

    constexpr iterator<false> begin();
2  Effects: Equivalent to:
    return iterator<false>{*this, ranges::begin(base_)};

    constexpr iterator<true> begin() const
        requires range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;
3  Effects: Equivalent to:
    return iterator<true>{*this, ranges::begin(base_)};

    constexpr sentinel<false> end();
4  Effects: Equivalent to:
    return sentinel<false>{ranges::end(base_)};

    constexpr iterator<false> end() requires common_range<V>;
5  Effects: Equivalent to:
    return iterator<false>{*this, ranges::end(base_)};

    constexpr sentinel<true> end() const
        requires range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;
6  Effects: Equivalent to:
    return sentinel<true>{ranges::end(base_)};
```cpp
constexpr iterator<true> end() const
  requires common_range<const V> &&
    regular_invocable<Const F, range_reference_t<const V>>;

Effects: Equivalent to:

    return iterator<true>{*this, ranges::end(base_)};

26.7.7.3 Class template transform_view::iterator

namespace std::ranges {
  template<input_range V, copy_constructible F>
    requires view<V> && is_object_v<F> &&
      regular_invocable<F&, range_reference_t<V>> &&
      can_reference<invoke_result_t<F&, range_reference_t<V>>>
  template<bool Const>
  class transform_view<V, F>::iterator {
    private:
      using Parent = maybe_const<Const, transform_view>;       // exposition only
      using Base = maybe_const<Const, V>;                      // exposition only
      iterator_t<Base> current_ = iterator_t<Base>();          // exposition only
      Parent* parent_ = nullptr;                               // exposition only

    public:
      using iterator_concept = see below;
      using iterator_category = see below;                     // not always present
      using value_type = remove_cvref_t<invoke_result_t<F&, range_reference_t<Base>>>;
      using difference_type = range_difference_t<Base>;

      iterator() requires default_initializable<iterator_t<Base>> = default;
      constexpr iterator(Parent& parent, iterator_t<Base> current);
      constexpr iterator(iterator<!Const> i)
        requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
      constexpr const iterator_t<Base>& base() const & noexcept;
      constexpr iterator_t<Base>& base() &&;

      constexpr decltype(auto) operator*() const
        noexcept(noexcept(invoke(*parent_->fun_, *current_))) {
        return invoke(*parent_->fun_, current_);
      }

      constexpr iterator& operator++();
      constexpr void operator++(int);
      constexpr iterator operator++(int) requires forward_range<Base>;

      constexpr iterator& operator--() requires bidirectional_range<Base>;
      constexpr iterator operator--(int) requires bidirectional_range<Base>;

      constexpr iterator& operator+=(difference_type n)
        requires random_access_range<Base>;
      constexpr iterator& operator-=(difference_type n)
        requires random_access_range<Base>;

      constexpr decltype(auto) operator[](difference_type n) const
        requires random_access_range<Base> {
        return invoke(*parent_->fun_, current_[n]);
      }

    friend constexpr bool operator==(const iterator& x, const iterator& y)
      requires equality_comparable<iterator_t<Base>>;

    friend constexpr bool operator<(const iterator& x, const iterator& y)
      requires random_access_range<Base>;
  }
}  // namespace std::ranges
```
friend constexpr bool operator>(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

friend constexpr iterator operator+(iterator i, difference_type n) requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, iterator i) requires random_access_range<Base>;
friend constexpr iterator operator-(iterator i, difference_type n) requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
}

1 iterator::iterator_concept is defined as follows:
   (1.1) If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
   (1.2) Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
   (1.3) Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.
   (1.4) Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows: Let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.
   (2.1) If is_lvalue_reference_v<invoke_result_t<F&, range_reference_t<Base>>> is true, then
      (2.1.1) if C models derived_from<contiguous_iterator_tag>, iterator_category denotes random_access_iterator_tag;
      (2.1.2) otherwise, iterator_category denotes C.
   (2.2) Otherwise, iterator_category denotes input_iterator_tag.

constexpr iterator (Parent& parent, iterator_t<Base> current);
3 Effects: Initializes current_ with std::move(current) and parent_ with addressof(parent).

constexpr iterator (iterator<!Const> i) requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
4 Effects: Initializes current_ with std::move(i.current_) and parent_ with i.parent_.

constexpr const iterator_t<Base>& base() const & noexcept;
5 Effects: Equivalent to: return current_;

constexpr iterator_t<Base> base() &&;
6 Effects: Equivalent to: return std::move(current_);

constexpr iterator& operator++();
7 Effects: Equivalent to:
   ++current_
   return *this;

constexpr void operator++(int);
8 Effects: Equivalent to ++current_.

§ 26.7.7.3
constexpr iterator operator++(int) requires forward_range<Base>;

Effects: Equivalent to:
auto tmp = *this;
++*this;
return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Effects: Equivalent to:
--current_;
return *this;

constexpr iterator operator--(int) requires bidirectional_range<Base>;

Effects: Equivalent to:
auto tmp = *this;
--*this;
return tmp;

constexpr iterator& operator+=(difference_type n) requires random_access_range<Base>;

Effects: Equivalent to:
current_ += n;
return *this;

constexpr iterator& operator-=(difference_type n) requires random_access_range<Base>;

Effects: Equivalent to:
current_ -= n;
return *this;

friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<iterator_t<Base>>;

Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr bool operator<(const iterator& x, const iterator& y) requires random_access_range<Base>;

Effects: Equivalent to: return x.current_ < y.current_;

Effects: Equivalent to: return y.end_ - x.current_;

26.7.8 Take view

26.7.8.1 Overview

take_view produces a view of the first \( N \) elements from another view, or all the elements if the adapted view contains fewer than \( N \).

The name views::take denotes a range adaptor object (26.7.2). Let \( E \) and \( F \) be expressions, let \( T \) be remove_cvref_t<decltype((E))>, and let \( D \) be range_difference_t<decltype((E))>. If decltype((F)) does not model convertible_to<D>, views::take(E, F) is ill-formed. Otherwise, the expression views::take(E, F) is expression-equivalent to:

1. If \( T \) is a specialization of ranges::empty_view (26.6.2.2), then ((void) F, decay-copy(E)), except that the evaluations of \( E \) and \( F \) are indeterminately sequenced.
2. Otherwise, if \( T \) models random_access_range and sized_range and is a specialization of span (24.7.3), basic_string_view (23.3), or ranges::subrange (26.5.4), then \( U(ranges::begin(E), ranges::begin(E) + std::min<D>(ranges::distance(E), F)) \), except that \( E \) is evaluated only once, where \( U \) is a type determined as follows:
   1. If \( T \) is a specialization of span, then \( U \) is span<typename T::element_type>;
   2. otherwise, if \( T \) is a specialization of basic_string_view, then \( U \) is \( T \);
   3. otherwise, \( T \) is a specialization of ranges::subrange, and \( U \) is ranges::subrange_iterator_t<T>;
   4. otherwise, if \( T \) is a specialization of ranges::iota_view (26.6.4.2) that models random_access_range and sized_range, then ranges::iota_view(*ranges::begin(E), *(ranges::begin(E) + std::min<D>(ranges::distance(E), F)))

— Otherwise, ranges::take_view(E, F).

3 [Example 1:

```cpp
vector<int> is{0,1,2,3,4,5,6,7,8,9};
for (int i : is | views::take(5))
    cout << i << ' '; // prints: 0 1 2 3 4
```

— end example]

26.7.8.2 Class template take_view

   friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);
4
   Effects: Equivalent to: return y.count() == 0 || y.base() == x.end_;

26.7.9 Take while view
26.7.9.1 Overview
1
   Given a unary predicate pred and a view r, take_while_view produces a view of the range [begin(r),
   ranges::find_if_not(r, pred)).

2
   The name views::take_while denotes a range adaptor object (26.7.2). Given subexpressions E and F, the
   expression views::take_while(E, F) is expression-equivalent to take_while_view(E, F).

[Example 1:]
   auto input = istringstream{"0 1 2 3 4 5 6 7 8 9"};
   auto small = []((const auto x) noexcept { return x < 5; });
auto small_ints = istream_view<int>(input) | views::take_while(small);
for (const auto i : small_ints) {
    cout << i << ' ';
}  // prints 0 1 2 3 4
auto i = 0;
input >> i;
cout << i;  // prints 6
— end example]

26.7.9.2 Class template take_while_view

namespace std::ranges {
    template<view V, class Pred>
        requires input_range<V> && is_object_v<Pred> &&
            indirect_unary_predicate<const Pred, iterator_t<V>>
    class take_while_view : public view_interface<take_while_view<V, Pred>> {
        // 26.7.9.3, class template take_while_view::sentinel
        template<bool> class sentinel;  // exposition only
        V base_ = V();  // exposition only
        copyable-box<Pred> pred_;  // exposition only
    public:
        take_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
        constexpr take_while_view(V base, Pred pred);

        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }
        constexpr const Pred& pred() const;
        constexpr auto begin() requires (!simple_view<V>) { return ranges::begin(base_); }
        constexpr auto begin() const requires range<const V> &&
            indirect_unary_predicate<const Pred, iterator_t<const V>> { return ranges::begin(base_); }
        constexpr auto end() requires (!simple_view<V>) { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }
        constexpr auto end() const requires range<const V> &&
            indirect_unary_predicate<const Pred, iterator_t<const V>> { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
    }

    template<class R, class Pred>
        take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
}

constexpr take_while_view(V base, Pred pred);
1 Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;
2 Effects: Equivalent to: return *pred_;

26.7.9.3 Class template take_while_view::sentinel

namespace std::ranges {
    template<view V, class Pred>
        requires input_range<V> && is_object_v<Pred> &&
            indirect_unary_predicate<const Pred, iterator_t<V>>
    template<bool Const>
class take_while_view<V, Pred>::sentinel {
    using Base = maybe-const<Const, V>; // exposition only

    sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
    const Pred* pred_ = nullptr; // exposition only

public:
    sentinel() = default;

    constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);

    constexpr sentinel(sentinel<!Const> s) requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    constexpr sentinel_t<Base> base() const { return end_; }

    friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

    template<bool OtherConst = !Const> requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x, const sentinel& y);
}

constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);

1 Effects: Initializes end_ with end and pred_ with pred.

constexpr sentinel(sentinel<!Const> s) requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

2 Effects: Initializes end_ with s.end_ and pred_ with s.pred_.

friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

template<bool OtherConst = !Const> requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x, const sentinel& y);

3 Effects: Equivalent to: return y.end_ == x || !invoke(*y.pred_, *x);

26.7.10 Drop view [range.drop]
26.7.10.1 Overview [range.drop.overview]

drop_view produces a view excluding the first \( N \) elements from another view, or an empty range if the adapted view contains fewer than \( N \) elements.

(2.1) If \( T \) is a specialization of ranges::empty_view (26.6.2.2), then \((\text{void}) F, \text{decay}-\text{copy}(E))\), except that the evaluations of \( E \) and \( F \) are indeterminately sequenced.

(2.2) Otherwise, if \( T \) models random_access_range and sized_range and is

(2.2.1) a specialization of span (24.7.3),

(2.2.2) a specialization of basic_string_view (23.3),

(2.2.3) a specialization of ranges::iota_view (26.6.4.2), or

(2.2.4) a specialization of ranges::subrange (26.5.4) where \( T::\text{StoreSize} \) is false, then \( U(\text{ranges}::\text{begin}(E) + \text{std}::\text{min}<D>(\text{ranges}::\text{distance}(E), F), \text{ranges}::\text{end}(E))\), except that \( E \) is evaluated only once, where \( U \) is \text{span<typename } T::\text{element_type}> if \( T \) is a specialization of span and \( T \) otherwise.
— Otherwise, if \( T \) is a specialization of `ranges::subrange` (26.5.4) that models `random_access_range` and `sized_range`, then

\[
T(\text{\texttt{ranges::begin}}(E) + \text{\texttt{std::min}}<D>(\text{\texttt{ranges::distance}}(E), F), \text{\texttt{ranges::end}}(E), \text{\texttt{to-unsigned-like}}(\text{\texttt{ranges::distance}}(E) - \text{\texttt{std::min}}<D>(\text{\texttt{ranges::distance}}(E), F)));
\]

except that \( E \) and \( F \) are each evaluated only once.

— Otherwise, \`ranges::drop_view\( (E, F) \).

3

[Example 1:]

```cpp
auto ints = views::iota(0) | views::take(10);
for (auto i : ints | views::drop(5)) {
    cout << i << ', '
}  // prints 5 6 7 8 9
```

— end example]

### 26.7.10.2 Class template `drop_view` [range.drop.view]

```cpp
namespace std::ranges {

    template<class V>
    class drop_view : public view_interface<drop_view<V>> {
    public:
        drop_view() requires default_initializable<V> = default;
        constexpr drop_view(V base, range_difference_t<V> count);

        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }

        constexpr auto begin() requires (!\((\text{\texttt{simple-view}}<V> && 
            \text{\texttt{random_access_range}}<\text{\texttt{const V}}> && \text{\texttt{sized_range}}<\text{\texttt{const V}}>)\));
        constexpr auto begin() const requires \text{\texttt{range}}<\text{\texttt{const V}}>
        { return ranges::begin(base_); }

        constexpr auto end() requires (!\((\text{\texttt{simple-view}}<V>)\))
        { return ranges::end(base_); }
        constexpr auto end() const requires \text{\texttt{range}}<\text{\texttt{const V}}>
        { return ranges::end(base_); }

        constexpr auto size() requires sized_range<V> {
            const auto s = ranges::size(base_);
            const auto c = static_cast<decltype(s)>\((\text{\texttt{count}}\_);\)
            return s < c ? 0 : s - c;
        }
        constexpr auto size() const requires sized_range<\text{\texttt{const V}}>
        { const auto s = ranges::size(base_);
            const auto c = static_cast<decltype(s)>\((\text{\texttt{count}}\_);\)
            return s < c ? 0 : s - c;
        }

    private:
        V base_ = V();  
        range_difference_t<V> count_ = 0;  
    };

    template<class R>
    drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;
}
```

1

**Preconditions:** \text{\texttt{count}} >= 0 is true.

2

**Effects:** Initializes `base_` with `std::move(base)` and `count_` with `count`.

§ 26.7.10.2
constexpr auto begin()
requires (!((simple_view<V> &&
random_access_range<const V> && sized_range<const V>)));

constexpr auto begin() const
requires random_access_range<const V> && sized_range<const V>;

Returns: ranges::next(ranges::begin(base_), count_, ranges::end(base_)).

Remarks: In order to provide the amortized constant-time complexity required by the range concept when drop_view models forward_range, the first overload caches the result within the drop_view for use on subsequent calls.

[Note 1: Without this, applying a reverse_view over a drop_view would have quadratic iteration complexity. —end note]

§ 26.7.11 Drop while view  [range.drop.while]
26.7.11 Overview  [range.drop.while.overview]

Given a unary predicate pred and a view r, drop_while_view produces a view of the range [ranges::find_if_not(r, pred), ranges::end(r)].

The name views::drop_while denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::drop_while(E, F) is expression-equivalent to drop_while_view(E, F).

[Example 1]:

```cpp
constexpr auto source = " \t \t \t hello there";
auto is_invisible = [] (const auto x) { return x == ' ' || x == '\t';};
auto skip_ws = views::drop_while(source, is_invisible);
for (auto c : skip_ws) {
    cout << c; // prints hello there with no leading space
}
```

—end example

§ 26.7.11.2 Class template drop_while_view  [range.drop.while.view]

```cpp
namespace std::ranges {
    template<view V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
    indirect_unary_predicate<const Pred, iterator_t<V>>
class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
public:
    drop_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr drop_while_view(V base, Pred pred);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr auto begin();
    constexpr auto end() { return ranges::end(base_); }

    private:
    V base_ = V(); // exposition only
    copyable_box<Pred> pred_; // exposition only
};
```

```cpp
    template<class R, class Pred>
    drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
}
```

constexpr drop_while_view(V base, Pred pred);

Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).
constexpr const Pred& pred() const;

Effects: Equivalent to: return *pred_

constexpr auto begin();

Preconditions: pred_.has_value() is true.

Returns: ranges::find_if_not(base_, cref(*pred_)).

Remarks: In order to provide the amortized constant-time complexity required by the range concept when drop_while_view models forward_range, the first call caches the result within the drop_while_view for use on subsequent calls.

[Note 1: Without this, applying a reverse_view over a drop_while_view would have quadratic iteration complexity. — end note]

26.7.12 Join view

26.7.12.1 Overview

join_view flattens a view of ranges into a view.

The name views::join denotes a range adaptor object (26.7.2). Given a subexpression E, the expression views::join(E) is expression-equivalent to join_view<views::all_t<decltype((E))>>{E}.

[Example 1:

vector<string> ss{"hello", " ", "world", "!"};
for (char ch : ss | views::join)
  cout << ch; // prints: hello world!
—end example]

26.7.12.2 Class template join_view

namespace std::ranges {
    template<input_range V>
    requires view<V> && input_range<range_reference_t<V>>
    class join_view : public view_interface<join_view<V>> {
        private:
            using InnerRng = range_reference_t<V>; // exposition only

            // 26.7.12.3, class template join_view::iterator
            template<bool Const>
            struct iterator;
                // exposition only

            // 26.7.12.4, class template join_view::sentinel
            template<bool Const>
            struct sentinel;
                // exposition only

        V base_ = V(); // exposition only

        non-propagating-cache<remove_cv_t<InnerRng>> inner_; // exposition only, present only
            // when !is_reference_v<InnerRng>

        public:
            join_view() requires default_initializable<V> = default;
            constexpr explicit join_view(V base);

            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr auto begin() {
                constexpr bool use_const = simple_view<V> &&
                    is_reference_v<range_reference_t<V>>;
                return iterator<use_const>{*this, ranges::begin(base_)};
            }
        }
    }
}
constexpr auto begin() const  
__requires,input_range<const V> &&

  Effects: Equivalent to: return x.outer_ == y.end_;

26.7.13 Join with view

26.7.13.1 Overview

1 join_with_view takes a view and a delimiter, and flattens the view, inserting every element of the delimiter in between elements of the view. The delimiter can be a single element or a view of elements.

2 The name views::join_with denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::join_with(E, F) is expression-equivalent to join_with_view(E, F).

3 [Example 1:
  vector<string> vs = {"the", "quick", "brown", "fox"};
  for (char c : vs | join_with(‘-‘)) {
    cout << c;
  }
  
The above prints: the-quick-brown-fox — end example]

26.7.13.2 Class template join_with_view

        }
}

§ 26.7.13.3
iterator::iterator_concept is defined as follows:

(1.1) If \( \text{ref-is-glvalue} \) is true, \( \text{Base} \) models \text{bidirectional\_range}, and \( \text{InnerBase} \) and \( \text{PatternBase} \) each model \text{bidirectional\_common}, then \text{iterator\_concept} denotes \text{bidirectional\_iterator\_tag}.

(1.2) Otherwise, if \( \text{ref-is-glvalue} \) is true and \( \text{Base} \) and \( \text{InnerBase} \) each model \text{forward\_range}, then \text{iterator\_concept} denotes \text{forward\_iterator\_tag}.

(1.3) Otherwise, \text{iterator\_concept} denotes \text{input\_iterator\_tag}.

The member typedef-name \text{iterator\_category} is defined if and only if \( \text{ref-is-glvalue} \) is true, and \( \text{Base} \) and \( \text{InnerBase} \) each model \text{forward\_range}. In that case, \text{iterator\_concept} is defined as follows:

(2.1) Let \( \text{OUTERC} \) denote \text{iterator\_traits<OuterIter>::iterator\_category}, let \( \text{INNERC} \) denote \text{iterator\_traits<InnerIter>::iterator\_category}, and let \( \text{PATTERNC} \) denote \text{iterator\_traits<PatternIter>::iterator\_category}.

(2.2) If

\[
\text{is\_lvalue\_reference\_v<common\_reference\_t<iter\_reference\_t<InnerIter>, iter\_reference\_t<PatternIter>>>}
\]

is false, \text{iterator\_category} denotes \text{input\_iterator\_tag}.

(2.3) Otherwise, if \( \text{OUTERC}, \text{INNERC}, \) and \( \text{PATTERNC} \) each model \text{derived\_from<bidirectional\_iterator\_category>} and \( \text{InnerBase} \) and \( \text{PatternBase} \) each model \text{common\_range}, \text{iterator\_category} denotes \text{bidirectional\_iterator\_tag}.

(2.4) Otherwise, if \( \text{OUTERC}, \text{INNERC}, \) and \( \text{PATTERNC} \) each model \text{derived\_from<forward\_iterator\_tag>}, \text{iterator\_category} denotes \text{forward\_iterator\_tag}.

(2.5) Otherwise, \text{iterator\_category} denotes \text{input\_iterator\_tag}.

\text{iterator\_::value\_type} denotes the type:

\[
\text{common\_type\_t<iter\_value\_t<InnerIter>, iter\_value\_t<PatternIter>>}
\]

\text{iterator\_::difference\_type} denotes the type:

\[
\text{common\_type\_t<}
\quad \text{iter\_difference\_t<OuterIter>,}
\quad \text{iter\_difference\_t<InnerIter>,}
\quad \text{iter\_difference\_t<PatternIter>>}
\]

\text{constexpr auto&&} update-inner(const OuterIter& x);

\text{Effects:} Equivalent to:

\[
\begin{align*}
\text{if constexpr (ref-is-glvalue)} & \quad \text{return } *x; \\
& \quad \text{else} \\
& \quad \text{return } \parent\_\to inner\_.emplace\_deref(x);
\end{align*}
\]

\text{constexpr auto&&} get-inner(const OuterIter& x);

\text{Effects:} Equivalent to:

\[
\begin{align*}
\text{if constexpr (ref-is-glvalue)} & \quad \text{return } *x; \\
& \quad \text{else} \\
& \quad \text{return } *\parent\_\to inner\_;
\end{align*}
\]

\text{constexpr void} satisfy();

\text{Effects:} Equivalent to:

\[
\text{while (true) } \{
\text{if (inner\_it\_.index() == 0) } \{
\text{if (std::get<0>(inner\_it_) != ranges::end(\parent\_\to pattern_)) break;}
\text{auto&& inner = update-inner(outer\_it_);}
\text{inner\_it\_.emplace<1>(ranges::begin(inner));}
\text{\}}
\text{\}}
\]

§ 26.7.13.3
else {

Effects: Equivalent to:

return x.outer_it_ == y.outer_it_ && x.inner_it_ == y.inner_it_;

26.7.13.4 Class template join_with_view::sentinel

namespace std::ranges {
    template<input_range V, forward_range Pattern>
    requires view<V> && input_range<range_reference_t<V>>
        && view<Pattern> && compatible-joinable-ranges
        <range_reference_t<V>, Pattern>
    template<bool Const>
    class join_with_view<V, Pattern>::sentinel {
        using Parent = maybe-const<Const, join_with_view>;  // exposition only
        using Base = maybe-const<Const, V>;  // exposition only
        sentinel_t<Base> end_ = sentinel_t<Base>();  // exposition only

        constexpr explicit sentinel(Parent& parent);  // exposition only

    public:
        sentinel() = default;
        constexpr sentinel(sentinel<!Const> s)
            requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
    }
template <bool OtherConst>
requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel<y>);
}
constexpr explicit sentinel(Parent& parent);
1 Effects: Initializes end_ with ranges::end(parent.base_).
constexpr sentinel(s sentinel<Const> s)
requires Const && convertible_to<sentinel_t<Base>, sentinel_t<V>>;
2 Effects: Initializes end_ with std::move(s.end_).
template <bool OtherConst>
requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel<y>);
3 Effects: Equivalent to: return x.outer_it_ == y.end_;

26.7.14 Lazy split view
[range.lazy.split]

26.7.14.1 Overview
[range.lazy.split.overview]
lazy_split_view takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

2 The name views::lazy_split denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::lazy_split(E, F) is expression-equivalent to lazy_split_view(E, F).

3 [Example 1:

```c++
string str("the quick brown fox");
for (auto word : str | views::lazy_split(' ')) {
    for (char ch : word)
        cout << ch;
    cout << '*';
}
// The above prints: the*quick*brown*fox*
-- end example]
```

26.7.14.2 Class template lazy_split_view
[range.lazy.split.view]
namespace std::ranges {
    template<auto> struct require-constant; // exposition only

template<class R>
concept tiny-range = // exposition only
    sized_range<R> &&
    requires { typename require-constant<remove_reference_t<R>::size>(); } &&

}
constexpr explicit value_type(outer-iterator i);

Effects: Initializes i_ with std::move(i).

constexpr inner-iterator<Const> begin() const;
Effects: Equivalent to: return inner-iterator<Const>{i_};
constexpr default_sentinel_t end() const noexcept;
Effects: Equivalent to: return default_sentinel;

26.7.14.5 Class template lazy_split_view::inner-iterator [range.lazy.split.inner]

namespace std::ranges {

    template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
        indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
        (forward_range<V> || tiny-range<Pattern>)

    template<bool Const>
    struct lazy_split_view<V, Pattern>::inner-iterator {

        private:
            using Base = maybe-const<Const, V>; // exposition only
            outer-iterator<Const> i_ = outer-iterator<Const>(); // exposition only
            bool incremented_ = false; // exposition only

        public:
            using iterator_concept = typename outer-iterator<Const>::iterator_concept;
            using iterator_category = see below; // present only if Base
            // models forward_range
            using value_type = range_value_t<Base>;
            using difference_type = range_difference_t<Base>;

        inner-iterator() = default;
        constexpr explicit inner-iterator(outer-iterator<Const> i);

        constexpr const iterator_t<Base>& base() const & noexcept;
        constexpr iterator_t<Base> base() && requires forward_range<V>;

        constexpr decltype(auto) operator*() const { return *i_.current; }

        constexpr inner-iterator& operator++();
        constexpr decltype(auto) operator++(int) {
            if constexpr (forward_range<Base>) {
                auto tmp = *this;
                +++this;
                return tmp;
            } else
                +++this;
        }

        friend constexpr bool operator==(const inner-iterator& x, const inner-iterator& y)
            requires forward_range<Base>;

        friend constexpr bool operator==(const inner-iterator& x, default_sentinel_t);

            noexcept(noexcept(ranges::iter_move(i.i_.current))) {
            return ranges::iter_move(i.i_.current);
        }

    } // struct lazy_split_view<V, Pattern>::inner-iterator

} // namespace std::ranges
friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
requires indirectly_swappable<iterator_t<Base>>;
};

1 If Base does not model forward_range there is no member iterator_category. Otherwise, the typedef-name iterator_category denotes:

(1.1) — forward_iterator_tag if iterator_traits<iterator_t<Base>>::iterator_category models derived_from<forward_iterator_tag>;

(1.2) — otherwise, iterator_traits<iterator_t<Base>>::iterator_category.

cconstexpr explicit inner_iterator(outer_iterator<Const> i);
2 Effects: Initializes i_ with std::move(i).

cconstexpr const iterator_t<Base>& base() const & noexcept;
3 Effects: Equivalent to: return i_.current;

cconstexpr iterator_t<Base> base() && requires forward_range<V>;
4 Effects: Equivalent to: return std::move(i_.current);

cconstexpr inner_iterator& operator++();
5 Effects: Equivalent to:
   incremented_ = true;
   if constexpr (!forward_range<Base>) {
      if constexpr (Pattern::size() == 0) {
         return *this;
      }
   }
   ++i_.current;
   return *this;

friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y)
requires forward_range<Base>;
6 Effects: Equivalent to: return x.i_.current == y.i_.current;

friend constexpr bool operator==(const inner_iterator& x, default_sentinel_t);
7 Effects: Equivalent to:
   auto [pcur, pend] = subrange{x.i_.parent_->pattern_};
   auto end = ranges::end(x.i_.parent_->base_);
   if constexpr (tiny_range<Pattern>) {
      const auto & cur = x.i_.current;
      if (cur == end) return true;
      if (pcur == pend) return x.incremented_;
      return *cur == *pcur;
   } else {
      auto cur = x.i_.current;
      if (cur == end) return true;
      if (pcur == pend) return x.incremented_;
      do {
         if (*cur != *pcur) return false;
         if (++pcur == pend) return true;
      } while (++cur != end);
      return false;
   }

friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
requires indirectly_swappable<iterator_t<Base>>;
8 Effects: Equivalent to ranges::iter_swap(x.i_.current, y.i_.current).
26.7.15 Split view

26.7.15.1 Overview

`split_view` takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

The name `views::split` denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression `views::split(E, F)` is expression-equivalent to `split_view(E, F)`.  

[Example 1:]

```cpp
string str{"the quick brown fox");
for (string_view word : split(str, ' ')) {
    cout << word << ' ';
}
// The above prints: the quick brown fox
```

--- end example

26.7.15.2 Class template split_view

```cpp
namespace std::ranges {

    template<forward_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
        indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
    class split_view : public view_interface<split_view<V, Pattern>> {

        private:
            V base_ = V(); // exposition only
            Pattern pattern_ = Pattern(); // exposition only

        // 26.7.15.3, class split_view::iterator
        struct iterator;
        // exposition only

        // 26.7.15.4, class split_view::sentinel
        struct sentinel;
        // exposition only

        public:

            split_view()
                requires default_initializable<V> && default_initializable<Pattern> = default;
                constexpr split_view(V base, Pattern pattern);

            template<forward_range R>
                requires constructible_from<V, views::all_t<R>> &&
                    constructible_from<Pattern, single_view<range_value_t<R>>>;
                constexpr split_view(R&& r, range_value_t<R> e);

            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr iterator begin();

            constexpr auto end() {
                if constexpr (common_range<V>) {
                    return iterator{*this, ranges::end(base_), {}};
                } else {
                    return sentinel{*this};
                }
            }

            constexpr subrange<iterator_t<V>> find-next(iterator_t<V>); // exposition only
        }

    template<class R, class P>
        split_view(R&&, P&&) -> split_view<views::all_t<R>, views::all_t<P>>;
```
template<forward_range R>
    split_view(R&&, range_value_t<R>)
        -> split_view<views::all_t<R>, single_view<range_value_t<R>>>; 

constexpr split_view(V base, Pattern pattern);

Effects: Initializes base_ with std::move(base), and pattern_ with std::move(pattern).

template<forward_range R>
        requires constructible_from<V, views::all_t<R>> &&
                constructible_from<Pattern, single_view<range_value_t<R>>>}
        constexpr split_view(R&& r, range_value_t<R> e);

Effects: Initializes base_ with views::all(std::forward<R>(r)), and pattern_ with views::
        single(std::move(e)).

constexpr iterator begin();

Returns: {*this, ranges::begin(base_), find-next(ranges::begin(base_))}.

Remarks: In order to provide the amortized constant time complexity required by the range
        concept, this function caches the result within the split_view for use on subsequent calls.

constexpr subrange<iterator_t<V>> find-next(iterator_t<V> it); // exposition only

Effects: Equivalent to:
        auto [b, e] = ranges::search(subrange(it, ranges::end(base_)), pattern_);
        if (b != ranges::end(base_) && ranges::empty(pattern_)) {
            ++b;
            ++e;
        }
        return {b, e};

26.7.15.3 Class split_view::iterator
        [range.split.iterator]

        public:
            sentinel() = default;
            constexpr explicit sentinel(split_view& parent);
            friend constexpr bool operator==(const iterator& x, const sentinel& y);
        }
    }

constexpr explicit sentinel(split_view& parent);

Effects: Initializes end_ with ranges::end(parent.base_).

friend constexpr bool operator==(const iterator& x, const sentinel& y);

Effects: Equivalent to: return x.cur_ == y.end_ && !x.trailing_empty_;
26.7.16 Counted view

1 A counted view presents a view of the elements of the counted range \( i + [0, n] \) for an iterator \( i \) and non-negative integer \( n \).

2 The name \( \text{views}::\text{counted} \) denotes a customization point object (16.3.3.6). Let \( E \) and \( F \) be expressions, let \( T \) be \( \text{decay_t< decltype((E))>} \), and let \( D \) be \( \text{iter_difference_t<T>} \). If \( \text{decltype}((F)) \) does not model \( \text{convertible_to<D>} \), \( \text{views}::\text{counted}(E, F) \) is ill-formed.

[Note 1: This case can result in substitution failure when \( \text{views}::\text{counted}(E, F) \) appears in the immediate context of a template instantiation. — end note]

Otherwise, \( \text{views}::\text{counted}(E, F) \) is expression-equivalent to:

1. If \( T \) models \( \text{contiguous_iterator} \), then \( \text{span(to_address}(E), \text{static_cast< size_t>}(\text{static_cast< D>(F)})) \).
2. Otherwise, if \( T \) models \( \text{random_access_iterator} \), then \( \text{subrange}(E, E + \text{static_cast< D>(F)}) \), except that \( E \) is evaluated only once.
3. Otherwise, \( \text{subrange(counted_iterator}(E, F), \text{default_sentinel}) \).

26.7.17 Common view

26.7.17.1 Overview

1 \( \text{common_view} \) takes a view which has different types for its iterator and sentinel and turns it into a view of the same elements with an iterator and sentinel of the same type.

2 [Note 1: \( \text{common_view} \) is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — end note]

3 The name \( \text{views}::\text{common} \) denotes a range adaptor object (26.7.2). Given a subexpression \( E \), the expression \( \text{views}::\text{common}(E) \) is expression-equivalent to:

1. If \( \text{decltype}((E)) \) models \( \text{common_range} \) and \( \text{views}::\text{all}(E) \) is a well-formed expression.
2. Otherwise, \( \text{common_view}(E) \).

[Example 1:

```
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
    auto&& common = views::common(r);
    auto cnt = count(common.begin(), common.end());
    // ...
}
```
—end example]

26.7.17.2 Class template \texttt{common\_view}

namespace std::ranges {
    template<typename V>
    requires (!std::ranges::common_range<V> && std::copyable<iterator_t<V>>)
    class common_view : public std::view_interface<common_view<V>> { 
        private:
        V base_ = V(); // exposition only
        public:
        common_view() requires std::default_initializable<V> = default;
        constexpr explicit common_view(V r);
        constexpr V base() const & requires std::copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }
    }
}
constexpr auto begin() {
    if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_);
    else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
}

constexpr auto begin() const requires range<const V> {
    if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_);
    else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
}

constexpr auto end() {
    if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_) + ranges::size(base_);
    else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
}

constexpr auto end() const requires range<const V> {
    if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_) + ranges::size(base_);
    else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
}

constexpr auto size() requires sized_range<V> {
    return ranges::size(base_);
}

constexpr auto size() const requires sized_range<const V> {
    return ranges::size(base_);
}

};

template<class R>
common_view(R&&) -> common_view<views::all_t<R>>;

constexpr explicit common_view(V base);

Effects: Initializes base_ with std::move(base).

26.7.18 Reverse view

26.7.18.1 Overview

reverse_view takes a bidirectional view and produces another view that iterates the same elements in reverse order.

1 The name views::reverse denotes a range adaptor object (26.7.2). Given a subexpression E, the expression views::reverse(E) is expression-equivalent to:

(2.1) — If the type of E is a (possibly cv-qualified) specialization of reverse_view, equivalent to E.base().

(2.2) — Otherwise, if the type of E is cv subrange<reverse_iterator<I>, reverse_iterator<I>, K> for some iterator type I and value K of type subrange_kind,

(2.2.1) — if K is subrange_kind::sized, equivalent to:

    subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())

(2.2.2) — otherwise, equivalent to:

    subrange<I, I, K>(E.end().base(), E.begin().base())

However, in either case E is evaluated only once.

(2.3) — Otherwise, equivalent to reverse_view(E).
3 [Example 1:
vector<int> is {0,1,2,3,4};
for (int i : is | views::reverse)
    cout << i << ' ' ; // prints: 4 3 2 1 0
—end example]

26.7.18.2 Class template reverse_view

namespace std::ranges {
    template<view V>
        requires bidirectional_range<V>
    class reverse_view : public view_interface<reverse_view<V>> {
    private:
        V base_ = V(); // exposition only
    public:
        reverse_view() requires default_initializable<V> = default;

        constexpr explicit reverse_view(V r);

        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }

        constexpr reverse_iterator<iterator_t<V>> begin();
        constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
        constexpr auto begin() const requires common_range<const V>;

        constexpr reverse_iterator<iterator_t<V>> end();
        constexpr auto end() const requires common_range<const V>;

        constexpr auto size() requires sized_range<V> {
            return ranges::size(base_);
        }
        constexpr auto size() const requires sized_range<const V> {
            return ranges::size(base_);
        }
    };

    template<class R>
        reverse_view(R&&) -> reverse_view<views::all_t<R>>;
}

    constexpr explicit reverse_view(V base);
    Effects: Initializes base_ with std::move(base).

    constexpr reverse_iterator<iterator_t<V>> begin();
    Returns:
        make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))
    Remarks: In order to provide the amortized constant time complexity required by the range concept, this function caches the result within the reverse_view for use on subsequent calls.

    constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
    constexpr auto begin() const requires common_range<const V>;
    Effects: Equivalent to: return make_reverse_iterator(ranges::end(base_));

    constexpr reverse_iterator<iterator_t<V>> end();
    constexpr auto end() const requires common_range<const V>;
    Effects: Equivalent to: return make_reverse_iterator(ranges::begin(base_));
26.7.19 Elements view

26.7.19.1 Overview

1 elements_view takes a view of tuple-like values and a size_t, and produces a view with a value-type of the \(N^{th}\) element of the adapted view's value-type.

2 The name views::elements<N> denotes a range adaptor object (26.7.2). Given a subexpression \(E\) and constant expression \(N\), the expression views::elements<N>(E) is expression-equivalent to elements_view<views::all_t<decltype((E))>, N>(E).

[Example 1:]
```
auto historical_figures = map{
  pair("Lovelace"sv, 1815),
  {"Turing"sv, 1912},
  {"Babbage"sv, 1791},
  {"Hamilton"sv, 1936} }

auto names = historical_figures | views::elements<0>
for (auto&& name : names) {
  cout << name << ' ' << // prints Babbage Hamilton Lovelace Turing
}
```

—end example]

3 keys_view is an alias for elements_view<R, 0>, and is useful for extracting keys from associative containers.

[Example 2:]
```
auto names = historical_figures | views::keys;
for (auto&& name : names) {
  cout << name << ' ' << // prints Babbage Hamilton Lovelace Turing
}
```

—end example]

4 values_view is an alias for elements_view<R, 1>, and is useful for extracting values from associative containers.

[Example 3:]
```
auto is_even = [](const auto x) { return x % 2 == 0; }
cout << ranges::count_if(historical_figures | views::values, is_even); // prints 2
```

—end example]

26.7.19.2 Class template elements_view

```cpp
define<
```
```cpp
template<input_range V, size_t N>
requires
view<V> && has-tuple-element<range_value_t<V>, N> &&
has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
returnable-element<range_reference_t<V>, N>
class elements_view : public view_interface<elements_view<V, N>> {
public:

  constexpr explicit elements_view(V base) requires default_initializable<V> = default;
  constexpr explicit elements_view(V base);

  constexpr V base() const & requires copy_constructible<V> { return base_; }
  constexpr V base() && { return std::move(base_); }

  constexpr auto begin() requires (!simple_view<V>)
  { return iterator<false>(ranges::begin(base_)); }
  constexpr auto begin() const requires range<const V>
  { return iterator<true>(ranges::begin(base_)); }

  constexpr auto end() requires (!simple_view<V> && !common_range<V>)
  { return sentinel<false>{ranges::end(base_)}; }
  constexpr auto end() requires (!simple_view<V> && common_range<V>)
  { return sentinel<false>{ranges::end(base_)}; }
  constexpr auto end() const requires range<const V>
  { return sentinel<true>{ranges::end(base_)}; }
  constexpr auto end() const requires common_range<const V>
  { return iterator<true>{ranges::end(base_)}; }
  constexpr auto size() requires sized_range<V>
  { return ranges::size(base_); }
  constexpr auto size() const requires sized_range<const V>
  { return ranges::size(base_); }

private:
  // 26.7.19.3, class template elements_view::iterator
template<bool> struct iterator;
  // exposition only

  // 26.7.19.4, class template elements_view::sentinel
template<bool> struct sentinel;
  // exposition only

  V base_ = V();
  // exposition only
};

constexpr explicit elements_view(V base);

Effects: Initializes base_ with std::move(base).

26.7.19.3 Class template elements_view::iterator

namespace std::ranges {

  template<input_range V, size_t N>
  requires
  view<V> && has-tuple-element<range_value_t<V>, N> &&
  has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
  returnable-element<range_reference_t<V>, N>
template<Const>
class elements_view<V, N>::iterator {
using Base = maybe-const<Const, V>;
  // exposition only

  iterator<Base> current_ = iterator<Base>();
  // exposition only

  static constexpr decltype(auto) get_element(const iterator_t<Base>& i);
  // exposition only

};
```
The member typedef-name iterator_concept is defined as follows:

1. If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
2. Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
— Otherwise, if `Base` models `forward_range`, then `iterator_concept` denotes `forward_iterator_tag`.

— Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2 The member `typedef-name iterator_category` is defined if and only if `Base` models `forward_range`. In that case, `iterator_category` is defined as follows: Let `C` denote the type `iterator_traits<iterator_t<Base>>::iterator_category`.

— If `std::get<N>(*i)` is an rvalue, `iterator_category` denotes `input_iterator_tag`.

— Otherwise, if `C` models `derived_from<random_access_iterator_tag>`, `iterator_category` denotes `random_access_iterator_tag`.

— Otherwise, `iterator_category` denotes `C`.

```cpp
static constexpr decltype(auto) get_element(const iterator_t<Base>& i);

Effects: Equivalent to:
if constexpr (is_reference_v<range_reference_t<Base>>) {
   return std::get<N>(*i);
} else {
   using E = remove_cv_t<tuple_element_t<N, range_reference_t<Base>>>
   return static_cast<E>(std::get<N>(*i));
}
```

```cpp
constexpr explicit iterator(iterator_t<Base> current);

Effects: Initializes `current_` with `std::move(current)`.
```

```cpp
constexpr iterator(iterator_t<Base> current);

Effects: Equivalent to: `++current_`.
```

```cpp
constexpr iterator operator++();

Effects: Equivalent to: `auto temp = *this; ++current_; return temp;`
```

```cpp
constexpr iterator operator++(int);

Effects: Equivalent to: `++current_`.
```

```cpp
constexpr iterator operator++(int) requires forward_range<Base>;

Effects: Equivalent to:
auto temp = *this;
++current_; return temp;
```

```cpp
constexpr iterator operator--() requires bidirectional_range<Base>;

Effects: Equivalent to:
--current_; return *this;
```

```cpp
constexpr iterator operator--(int) requires bidirectional_range<Base>;

Effects: Equivalent to:
auto temp = *this;
--current_; return temp;
```
constexpr iterator& operator+=(difference_type n);
  
  **Effects:** Equivalent to:
  
  current_ += n;
  return *this;

constexpr iterator& operator-=(difference_type n);
  
  **Effects:** Equivalent to:
  
  current_ -= n;
  return *this;

friend constexpr bool operator==(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return x.current_ == y.current_;

friend constexpr bool operator<(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return x.current_ < y.current_;

friend constexpr bool operator>(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return x.current_ <=> y.current_;

friend constexpr iterator operator+(const iterator& x, difference_type y);
  
  **Effects:** Equivalent to:
  
  return iterator{x} += y;

friend constexpr iterator operator+(difference_type x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return y + x;

friend constexpr iterator operator-(const iterator& x, difference_type y);
  
  **Effects:** Equivalent to:
  
  return iterator{x} -= y;

friend constexpr difference_type operator-(const iterator& x, const iterator& y);
  
  **Effects:** Equivalent to:
  
  return sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

### 26.7.19.4 Class template `elements_view::sentinel` [range.elements.sentinel]

```cpp
namespace std::ranges {

  template<input_range V, size_t N>
  requires view<V> && has-tuple-element<range_value_t<V>, N> &&
  has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
  returnable-element<range_reference_t<V>, N>
  template<bool Const>
```
class elements_view<V, N>::sentinel {
  private:
    using Base = maybe-const<Const, V>;       // exposition only
    sentinel_t<Base> end_ = sentinel_t<Base>(); // exposition only
  public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end);
    constexpr sentinel(sentinel<!Const> other)
        requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
    constexpr sentinel_t<Base> base() const;

    template<bool OtherConst>
        requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
        operator-(const sentinel& x, const iterator<OtherConst>& y);

    template<bool OtherConst>
        requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
        operator-(const sentinel& x, const iterator<OtherConst>& y);
}

constexpr explicit sentinel(sentinel_t<Base> end);

1 Effects: Initializes end_ with end.

constexpr sentinel(sentinel<!Const> other)
    requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

2 Effects: Initializes end_ with std::move(other.end_).

constexpr sentinel_t<Base> base() const;

3 Effects: Equivalent to: return end_;

template<bool OtherConst>
    requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

4 Effects: Equivalent to: return x.current_ == y.end_;

template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const iterator<OtherConst>& x, const sentinel& y);

5 Effects: Equivalent to: return x.current_ - y.end_;

template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& x, const iterator<OtherConst>& y);

6 Effects: Equivalent to: return x.end_ - y.current_;

26.7.20 Zip view

26.7.20.1 Overview

1 zip_view takes any number of views and produces a view of tuples of references to the corresponding elements of the constituent views.

2 The name views::zip denotes a customization point object (16.3.3.3.6). Given a pack of subexpressions Es..., the expression views::zip(Es...) is expression-equivalent to
(2.1) — auto(views::empty<tuple<>>()) if Es is an empty pack,
(2.2) — otherwise, zip_view<views::all<decltype((Es...))>>(Es...).

[Example 1]

```cpp
vector v = {1, 2};
list l = {'a', 'b', 'c'};
auto z = views::zip(v, l);
range_reference_t<decltype(z)> f = z.front(); // f is a pair<int&, char&>
// that refers to the first element of v and l

for (auto& [x, y] : z) {
    cout << '(' << x << ' ' << y << ')' << endl; // prints: (1, a) (2, b)
}
```

—end example]

26.7.20.2 Class template zip_view

```cpp
namespace std::ranges {
    template<class... Rs>
    concept zip-is-common = // exposition only
        (sizeof...(Rs) == 1 && (common_range<Rs> && ...)) ||
        (!(bidirectional_range<Rs> && ...) && (common_range<Rs> && ...)) ||
        ((random_access_range<Rs> && ...) && (sized_range<Rs> && ...));

    template<class... Ts>
    using tuple-or-pair = see below; // exposition only

    template<class F, class Tuple>
    constexpr auto tuple-transform(F&& f, Tuple&& tuple) { // exposition only
        return apply([&]<class... Ts>(Ts&&... elements) {
            return tuple-or-pair<invoke_result_t<F&, Ts>...>(
                invoke(f, std::forward<Ts>(elements))...);
        }, std::forward<Tuple>(tuple));
    }

    template<class F, class Tuple>
    constexpr void tuple-for-each(F&& f, Tuple&& tuple) { // exposition only
        apply([&]<class... Ts>(Ts&&... elements) {
            invoke(f, std::forward<Ts>(elements), ...);
        }, std::forward<Tuple>(tuple));
    }

    template<input_range... Views>
    requires (view<Views> && ... && (sizeof...(Views) > 0))
    class zip_view : public view_interface<zip_view<Views...>> {
        tuple<Views...> views_; // exposition only

        // 26.7.20.3, class template zip_view::iterator
        template<bool> class iterator;
        // exposition only

        // 26.7.20.4, class template zip_view::sentinel
        template<bool> class sentinel;
        // exposition only

    public:
        zip_view() = default;
        constexpr explicit zip_view(Views... views);

        constexpr auto begin() requires (!is_simple_view<View>) {
            return iterator<false>(tuple-transform(ranges::begin, views_));
        }
        constexpr auto begin() const requires (ranges::begin) {
            return iterator<true>(tuple-transform(ranges::begin, views_));
        }
```
Given some pack of types \( Ts \), the alias template \( \text{tuple-or-pair} \) is defined as follows:

1. If \( \text{sizeof}(...) (Ts) \) is 2, \( \text{tuple-or-pair<}Ts\ldots\text{>} \) denotes \( \text{pair<}Ts\ldots\text{>} \).
2. Otherwise, \( \text{tuple-or-pair<}Ts\ldots\text{>} \) denotes \( \text{tuple<}Ts\ldots\text{>} \).

Two \( \text{zip_view} \) objects have the same underlying sequence if and only if the corresponding elements of \( \text{views} \) are equal (18.2) and have the same underlying sequence.

\[
\text{constexpr explicit zip_view(Views... views);}
\]

**Effects:** Initializes \( \text{views}_\text{with std::move}(\text{views}) \ldots \).

\[
\text{constexpr auto size() requires (sized_range<Views> \&\& ...) const requires (sized_range<const Views> \&\& ...);}
\]

**Effects:** Equivalent to:

\[
\text{return apply(\{\text{auto... sizes}\) }
\]

\[
\text{\quad using CT = make_unsigned_like_t<common_type_t<\text{decltype(sizes)\ldots}>>;}
\]

\[
\text{return ranges::min({CT(sizes)\ldots});}
\]

\[
\text{, tuple-transform(ranges::size, \text{views}_\text{with std::move}(\text{views})\ldots);}
\]

### 26.7.20.3 Class template \( \text{zip_view::iterator} \)

    iterator& r) noexcept(see below)
    requires (indirectly_swappable<
      iterator_t<
        maybe-const<
          Const, Views>>> && ...);
iterator::iterator_concept is defined as follows:

1. If all-random-access<Const, Views...> is modeled, then iterator_concept denotes random-access_iterator_tag.
2. Otherwise, if all-bidirectional<Const, Views...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.
3. Otherwise, if all-forward<Const, Views...> is modeled, then iterator_concept denotes forward_iterator_tag.
4. Otherwise, iterator_concept denotes input_iterator_tag.

iterator::iterator_category is present if and only if all-forward<Const, Views...> is modeled.

If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr explicit iterator(tuple-or-pair<iterator_t<maybe-const<Const, Views>>...> current);

Effects: Initializes current_ with std::move(current).

constexpr iterator(iterator<!Const> i)
requires Const &&
(convertible_to<iterator_t<Views>, iterator_t<maybe-const<Const, Views>>> && ...);

Effects: Initializes current_ with std::move(i.current_).

constexpr auto operator*() const;

Effects: Equivalent to:
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();

Effects: Equivalent to:
tuple-for-each([](auto& i) { ++i; }, current_);
return *this;

constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires all-forward<Const, Views...>;

Effects: Equivalent to:
auto tmp = *this;
+++this;
return tmp;

constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;

Effects: Equivalent to:
tuple-for-each([](auto& i) { --i; }, current_);
return *this;

constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;

Effects: Equivalent to:
auto tmp = *this;
---this;
return tmp;

constexpr iterator& operator+=(difference_type x)
requires all-random-access<Const, Views...>;

Effects: Equivalent to:
tuple-for-each([&]<class I>(I& i) { i += iter_difference_t<I>(x); }, current_);
```cpp
return *this;

constexpr iterator& operator-=(difference_type x)
    requires all-random-access<Const, Views...>;

Effects: Equivalent to:
    tuple-for-each([&]<class I>(I& i) { i -= iter_difference_t<I>(x); }, current_);
    return *this;

constexpr auto operator[](difference_type n) const
    requires all-random-access<Const, Views...>;

Effects: Equivalent to:
    return tuple-transform([&]<class I>(I& i) -> decltype(auto) { return i[iter_difference_t<I>(n)]; }, current_);

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

Returns:
    — x.current_ == y.current_ if all-bidirectional<Const, Views...> is true.
    — Otherwise, true if there exists an integer 0 ≤ i < sizeof...(Views) such that bool(std::get<i>(x.current_)) == std::get<i>(y.current_)) is true.
      [Note 1: This allows zip_view to model common_range when all constituent views model common_range.
       — end note]
    — Otherwise, false.

friend constexpr bool operator<(const iterator& x, const iterator& y)
    requires all-random-access<Const, Views...>;

Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)
    requires all-random-access<Const, Views...>;

Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)
    requires all-random-access<Const, Views...>;

Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)
    requires all-random-access<Const, Views...>;

Effects: Equivalent to: return !(x < y);

Returns: x.current_ <= y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires all-random-access<Const, Views...>;

friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires all-random-access<Const, Views...>;

Effects: Equivalent to:
    auto r = i;
    r += n;
    return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires all-random-access<Const, Views...>;

Effects: Equivalent to:
```
auto r = i;
r -= n;
return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
requires (sized_sentinel_for<iterator_t<maybe-const(Const, Views)>>,
        iterator_t<maybe-const(Const, Views)>> && ...);

Let DIST(i) be difference_type(std::get<i>(x.current_) - std::get<i>(y.current_)).
Returns: The value with the smallest absolute value among DIST(n) for all integers 0 ≤ n < sizeof...(Views).

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
Effects: Equivalent to:
return tuple-transform(ranges::iter_move, i.current_);
Remarks: The exception specification is equivalent to:
(noexcept(ranges::iter_move(declval<iterator_t<maybe-const<Const, Views>>>&>())) && ...) &&
(is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const, Views>>> && ...)

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);
Effects: For every integer 0 ≤ i < sizeof...(Views), performs:
ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))
Remarks: The exception specification is equivalent to the logical AND of the following expressions:
noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_)))
for every integer 0 ≤ i < sizeof...(Views).

26.7.20.4 Class template zip_view::sentinel
[range.zip.sentinel]
namespace std::ranges {
    template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)

                  iterator_t<maybe-const<OtherConst, Views>>> && ...)
        friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>>...
        operator-(const iterator<OtherConst>& x, const sentinel<y> y);

        template<bool OtherConst>
        requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>>,
                  iterator_t<maybe-const<OtherConst, Views>>> && ...)
        friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>>...
        operator-(const sentinel<y>, const iterator<OtherConst>& x);

§ 26.7.20.4
```cpp
constexpr explicit sentinel((tuple-or-pair<sentinel_t<maybe-const<Const, Views>>>...) end);

Effects: Initializes end_ with end.

constexpr sentinel(sentinel<!Const> i)
requires Const &&
(convertible_to<sentinel_t<Views>, sentinel_t<maybe-const<Const, Views>>> && ...);

Effects: Initializes end_ with std::move(i.end_).

template<bool OtherConst>
requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>, iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

Returns: true if there exists an integer 0 ≤ i < sizeof...(Views) such that bool(std::get<i>(x.current_) == std::get<i>(y.end_)) is true. Otherwise, false.

template<bool OtherConst>
requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>, iterator_t<maybe-const<OtherConst, Views>>> && ...)
friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...> operator-(const iterator<OtherConst>& x, const sentinel& y);

Effects: Equivalent to return -(x - y);
```

### 26.7.21 Zip transform view

#### 26.7.21.1 Overview

zip_transform_view takes an invocable object and any number of views and produces a view whose \( M \)th element is the result of applying the invocable object to the \( M \)th elements of all views.

The name views::zip_transform denotes a customization point object (16.3.3.3.6). Let \( F \) be a subexpression, and let \( E_s... \) be a pack of subexpressions.

1. If \( E_s \) is an empty pack, let \( FD \) be \( \text{decay}_t<\text{decltype}(F)> \).
2. If \( \text{copy_constructible<FD> \&\& regular_invocable<FD\&> \text{ is false, or if } \text{decay}_t<\text{invoke_result_t<FD\&>}> \text{ is not an object type, views::zip_transform(F, Es...) is ill-formed.} \)
3. Otherwise, the expression views::zip_transform(F, Es...) is expression-equivalent to

\[
((\text{void})F, \text{auto(views::empty<\text{decay}_t<\text{invoke_result_t<FD\&>}})})
\]

— Otherwise, the expression views::zip_transform(F, Es...) is expression-equivalent to zip_transform_view(F, Es...).

#### Example 1:

```cpp
vector v1 = {1, 2};
vector v2 = {4, 5, 6};

for (auto i : views::zip_transform(plus(), v1, v2)) {
cout << i << ' '; // prints: 5 7
}
```
26.7.21.2 Class template `zip_transform_view`

```cpp
namespace std::ranges {
    template<copy_constructible F, input_range... Views>
    requires (view<Views> && ... && (sizeof...(Views) > 0) && is_object_v<F> &&
        regular_invocable<F, range_reference_t<Views>...> &&
        can-reference<invoke_result_t<F, range_reference_t<Views>...> >
    class zip_transform_view : public view_interface<zip_transform_view<F, Views...>> {
        copyable-box<F> fun_; // exposition only
        zip_view<Views...> zip_; // exposition only
        using InnerView = zip_view<Views...>; // exposition only
        template<bool Const>
        using ziperator = iterator_t<maybe-const<Const, InnerView>>; // exposition only
        template<bool Const>
        using zentinel = sentinel_t<maybe-const<Const, InnerView>>; // exposition only

        // 26.7.21.3, class template `zip_transform_view`::iterator
        template<bool> class iterator;
        // exposition only

        // 26.7.21.4, class template `zip_transform_view`::sentinel
        template<bool> class sentinel;
        // exposition only

    public:
        zip_transform_view() = default;
        constexpr explicit zip_transform_view(F fun, Views... views);
        constexpr auto begin() { return iterator<false>(*this, zip_.begin()); }
        constexpr auto begin() const requires range<const InnerView> &&
            regular_invocable<const F, range_reference_t<const Views>...> {
            return iterator<true>(*this, zip_.begin());
        }
        constexpr auto end() if constexpr (common_range<InnerView>) {
            return iterator<false>(*this, zip_.end());
        } else {
            return sentinel<false>(zip_.end());
        }
        constexpr auto end() const requires range<const InnerView> &&
            regular_invocable<const F, range_reference_t<const Views>...> {
            if constexpr (common_range<const InnerView>) {
                return iterator<true>(*this, zip_.end());
            } else {
                return sentinel<true>(zip_.end());
            }
        }
        constexpr auto size() requires sized_range<InnerView> {
            return zip_.size();
        }
        constexpr auto size() const requires sized_range<const InnerView> {
            return zip_.size();
        }
    };
```
template<class F, class... Rs>
    zip_transform_view(F, Rs&&...) -> zip_transform_view<F, views::all_t<Rs>...>;

constexpr explicit zip_transform_view(F fun, Views... views);

Effects: Initializes fun_ with std::move(fun) and zip_ with std::move(views)....

### 26.7.21.3 Class template zip_transform_view::iterator

```cpp
namespace std::ranges {

    template<copy_constructible F, input_range... Views>
    requires (view<Views> && ... && (sizeof...(Views) > 0) && is_object_v<F> &&
        regular_invocable<F&, range_reference_t<Views>...> &&
        can_reference<invoke_result_t<F&, range_reference_t<Views>...>>

    template<bool Const>
    class zip_transform_view<F, Views...>::iterator {

        using Parent = maybe-const<Const, zip_transform_view>; // exposition only
        using Base = maybe-const<Const, InnerView>; // exposition only
        Parent* parent_ = nullptr; // exposition only
        ziperator<Const> inner_; // exposition only

        constexpr iterator(Parent& parent, ziperator<Const> inner); // exposition only

        public:
            using iterator_category = see below; // not always present
            using iterator_concept = typename ziperator<Const>::iterator_concept;
            using value_type = remove_cvref_t<invoke_result_t<maybe-const<Const, F>&,
                inner_>>::range_reference_t<maybe-const<Const, Views>...>;
            using difference_type = range_difference_t<Base>;

            iterator() = default;
            constexpr iterator(iterator<!Const> i)
                requires Const && convertible_to<zierator<false>, ziperator<Const>>;

            constexpr decltype(auto) operator*() const noexcept(see below);
            constexpr iterator& operator++();
            constexpr void operator++(int);
            constexpr iterator operator++(int) requires forward_range<Base>;

            constexpr iterator& operator--() requires bidirectional_range<Base>;
            constexpr iterator operator--(int) requires bidirectional_range<Base>;

            constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
            constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

            constexpr decltype(auto) operator[](difference_type n) const
                requires random_access_range<Base>;

            friend constexpr bool operator==(const iterator& x, const iterator& y)
                requires equality_comparable<zierator<Const>>;

            friend constexpr bool operator<(const iterator& x, const iterator& y)
                requires random_access_range<Base>;

            friend constexpr bool operator>(const iterator& x, const iterator& y)
                requires random_access_range<Base>;

            friend constexpr bool operator<=(const iterator& x, const iterator& y)
                requires random_access_range<Base>;

            friend constexpr bool operator>=(const iterator& x, const iterator& y)
                requires random_access_range<Base>;

            friend constexpr auto operator<>((const iterator& x, const iterator& y)
                requires random_access_range<Base> && three_way_comparable<zierator<Const>>;
```
friend constexpr iterator operator+(const iterator& i, difference_type n)  
   requires random_access_range<Base>;  
friend constexpr iterator operator+(difference_type n, const iterator& i)  
   requires random_access_range<Base>;  
friend constexpr iterator operator-(const iterator& i, difference_type n)  
   requires random_access_range<Base>;  
friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
   requires sized_sentinel_for<typename iterator<Const, ziperator<Const>>>;  
};

The member typedef-name iterator::iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows:

(1.1) — If

   invoke_result_t<
      maybe-const<Const, F>&, range_reference_t<
      maybe-const<Const, Views>>&...>

   is not an lvalue reference, iterator_category denotes input_iterator_tag.

(1.2) — Otherwise, let Cs denote the pack of types iterator_traits<

   iterator_t<
      maybe-const<Proto, Views>>>::iterator_category...

(1.2.1) — If (derived_from<Cs, random_access_iterator_tag> && ...) is true, iterator_category denotes random_access_iterator_tag.

(1.2.2) — Otherwise, if (derived_from<Cs, bidirectional_iterator_tag> && ...) is true, iterator_category denotes bidirectional_iterator_tag.

(1.2.3) — Otherwise, if (derived_from<Cs, forward_iterator_tag> && ...) is true, iterator_category denotes forward_iterator_tag.

(1.2.4) — Otherwise, iterator_category denotes input_iterator_tag.

constexpr iterator(Parent& parent, ziperator<Const> inner);

Effects: Initializes parent_ with addressof(parent) and inner_ with std::move(inner).

constexpr iterator(iterator<Proto> i)
   requires Const && convertible_to<
      ziperator<false>, ziperator<Const>>;

Effects: Initializes parent_ with i.parent_ and inner_ with std::move(i.inner_).

constexpr decltype(auto) operator*() const noexcept(see below);

Effects: Equivalent to:

   return apply([&](const auto&... iters) -> decltype(auto) {
      return invoke(*parent_->fun_, *iters...);
   }, inner_.current_);

Remarks: Let Is be the pack 0, 1, ..., (size...(Views)-1). The exception specification is equivalent to: noexcept(invoke(*parent_->fun_, std::get<Is>(inner_.current_)...)).

constexpr iterator& operator++();

Effects: Equivalent to:

   ++inner_;  
   return *this;

castexpr void operator++(int);

Effects: Equivalent to: +++this.

constexpr iterator operator++(int) requires forward_range<Base>;

Effects: Equivalent to:

   auto tmp = *this;  
   +++this;  
   return tmp;
constexpr iterator operator--() requires bidirectional_range<Base>;

**Effects**: Equivalent to:

```
--inner_;  
return *this;
```

constexpr iterator operator--(int) requires bidirectional_range<Base>;

**Effects**: Equivalent to:

```
auto tmp = *this;  
--*this;  
return tmp;
```

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;

**Effects**: Equivalent to:

```
inner_ += x;  
return *this;
```

constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

**Effects**: Equivalent to:

```
inner_ -= x;  
return *this;
```

constexpr decltype(auto) operator[](difference_type n) const requires random_access_range<Base>;

**Effects**: Equivalent to:

```
return apply([&]<class... Is>(const Is&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, iters[iter_difference_t<Is>(n)]...);
}, inner_.current_);
```

friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<ziperator<Const>>;

friend constexpr bool operator<(const iterator& x, const iterator& y) requires random_access_range<Base>;

friend constexpr bool operator>(const iterator& x, const iterator& y) requires random_access_range<Base>;

friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;

friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<ziperator<Const>>;

**Effects**: Equivalent to:

```
return x.inner_ op y.inner_;  
```

friend constexpr auto operator+(const iterator& i, difference_type n) requires random_access_range<Base>;

**Effects**: Equivalent to:

```
return iterator(*i.parent_, i.inner_ + n);
```

friend constexpr auto operator+(difference_type n, const iterator& i) requires random_access_range<Base>;

**Effects**: Equivalent to:

```
return iterator(*i.parent_, i.inner_ + n);
```

friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;

**Effects**: Equivalent to:

```
return x.inner_ - y.inner_;  
```
26.7.21.4 Class template `zip_transform_view::sentinel` [range.zip.transform.sentinel]

namespace std::ranges {
    template<
copy_constructible F, input_range... Views>
    requires (view<Views> && ... &&

        template<bool OtherConst>
            requires sentinel_for<sentinel<Const>, ziperator<OtherConst>>
            friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
        template<bool OtherConst>
            requires sized_sentinel_for<sentinel<Const>, ziperator<OtherConst>>
            friend constexpr range_difference_t<
                maybe-const<OtherConst, InnerView>>
                operator-(const sentinel& x, const iterator<OtherConst>& y);
        template<bool OtherConst>
            requires sized_sentinel_for<sentinel<Const>, ziperator<OtherConst>>
            friend constexpr range_difference_t<
                maybe-const<OtherConst, InnerView>>
                operator-(const iterator<OtherConst>& x, const sentinel& y);
    }
}

1 Effects: Initializes `inner_` with `inner`.
2 ```
constexpr explicit sentinel(sentinell Const i) :
    requires Const && convertible_to<sentinel<false>, sentinel<Const>>;
2 Effects: Initializes `inner_` with `std::move(i. inner_)`.
```  
3 Effects: Equivalent to: return x. inner_ == y. inner_;  
4 Effects: Equivalent to: return x. inner_ - y. inner_;  

26.7.22 Adjacent view [range.adjacent]

26.7.22.1 Overview [range.adjacent.overview]

1 `adjacent_view` takes a view and produces a view whose `M`th element is a tuple of references to the `M`th through `(M + N - 1)`th elements of the original view. If the original view has fewer than `N` elements, the resulting view is empty.

2 The name `views::adjacent<N>` denotes a range adaptor object (26.7.2). Given a subexpression `E` and a constant expression `N`, the expression `views::adjacent<N>(E)` is expression-equivalent to
— if $N$ is equal to 0,
— otherwise, adjacent_view<views::all_t<decltype((E))>, N>(E).

[Example 1]:
vector v = {1, 2, 3, 4};
for (auto i : v | views::adjacent<2>) {
  cout << "(" << i.first << ", " << i.second << ")" << endl; // prints: (1, 2) (2, 3) (3, 4)
}
—end example]

3 Define $\texttt{REPEAT}(T, N)$ as a pack of $N$ types, each of which denotes the same type as $T$.

### 26.7.22.2 Class template adjacent_view

```cpp
namespace std::ranges {
  template<forward_range V, size_t N>
  requires view<V> && (N > 0)
  class adjacent_view : public view_interface<adjacent_view<V, N>> {
    V base_ = V(); // exposition only
    // 26.7.22.3, class template adjacent_view::iterator
    template<bool> class iterator; // exposition only
    // 26.7.22.4, class template adjacent_view::sentinel
    template<bool> class sentinel; // exposition only
    struct as_sentinel{}; // exposition only
  }

  public:
    adjacent_view() requires default_initializable<V> = default;
    constexpr explicit adjacent_view(V base);
    constexpr auto begin() requires (!simple_view<V>) {
      return iterator<false>(ranges::begin(base_), ranges::end(base_));
    }
    constexpr auto begin() const requires range<const V> {
      return iterator<true>(ranges::begin(base_), ranges::end(base_));
    }
    constexpr auto end() requires (!simple_view<V>) {
      if constexpr (common_range<V>) {
        return iterator<false>(as_sentinel{}, ranges::begin(base_), ranges::end(base_));
      } else {
        return sentinel<false>(ranges::end(base_));
      }
    }
    constexpr auto end() const requires range<const V> {
      if constexpr (common_range<const V>) {
        return iterator<true>(as_sentinel{}, ranges::begin(base_), ranges::end(base_));
      } else {
        return sentinel<true>(ranges::end(base_));
      }
    }
    constexpr auto size() requires sized_range<V>;
    constexpr auto size() const requires sized_range<const V>;
  };
}
```
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;

Effects: Equivalent to:

using ST = decltype(ranges::size(base_));
using CT = common_type_t<ST, size_t>;
auto sz = static_cast<CT>(ranges::size(base_));
sz -= std::min<CT>(sz, N - 1);
return static_cast<ST>(sz);

26.7.22.3 Class template adjacent_view::iterator

namespace std::ranges {
  template<forward_range V, size_t N>
  requires view<V> && (N > 0)
  template<bool Const>
  class adjacent_view<V, N>::iterator {
    using Base = maybe-const<Const, V>;
    array<iterator_t<Base>, N> current_ = array<iterator_t<Base>, N>();
    constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);
    constexpr iterator(as sentinel, iterator_t<Base> first, iterator_t<Base> last);

public:
  using iterator_category = input_iterator_tag;
  using iterator_concept = see below;
  using value_type = tuple-or-pair<REPEAT(range_value_t<Base>, N)...>;
  using difference_type = range_difference_t<Base>;
  iterator() = default;
  constexpr iterator(iterator_t<!Const> i)
      requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
  constexpr auto operator*() const;
  constexpr iterator& operator++();
  constexpr iterator operator++(int);
  constexpr iterator& operator--() requires bidirectional_range<Base>;
  constexpr iterator operator--(int) requires bidirectional_range<Base>;
  constexpr iterator& operator+=(difference_type x)
      requires random_access_range<Base>;
  constexpr iterator& operator-=(difference_type x)
      requires random_access_range<Base>;
  constexpr auto operator[](difference_type n) const
      requires random_access_range<Base>;

  friend constexpr bool operator==(const iterator& x, const iterator& y) requires random_access_range<Base>;&
  friend constexpr bool operator!=(const iterator& x, const iterator& y) requires random_access_range<Base>;
  friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;
  friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base>;
  friend constexpr bool operator<=>(const iterator& x, const iterator& y)
      requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

  friend constexpr iterator operator+(const iterator& i, difference_type n) requires random_access_range<Base>;
  friend constexpr iterator operator+(difference_type n, const iterator& i) requires random_access_range<Base>;

  // exposition only
}

§ 26.7.22.3 1121
friend constexpr iterator operator-(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below) requires indirectly_swappable<iterator_t<Base>>;
}

iterator::iterator_concept is defined as follows:

— If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
— Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
— Otherwise, iterator_concept denotes forward_iterator_tag.

If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr iterator(iterator_t<Base> first, sentinel_t<Base> last);  
Postconditions: current_[0] == first is true, and for every integer 1 ≤ i < N, current_[i] == ranges::next(current_[i-1], 1, last) is true.

constexpr iterator(as-sentinel, iterator_t<Base> first, iterator_t<Base> last);  
Postconditions: If Base does not model bidirectional_range, each element of current_ is equal to last. Otherwise, current_[N-1] == last is true, and for every integer 0 ≤ i < (N - 1), current_[i] == ranges::prev(current_[i+1], 1, first) is true.

constexpr iterator(iterator<!Const> i) requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;  
Effects: Initializes each element of current_ with the corresponding element of i.current_ as an xvalue.

constexpr auto operator*() const;  
Effects: Equivalent to:
return tuple_transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();  
 Preconditions: current_.back() is incrementable.
Postconditions: Each element of current_ is equal to ranges::next(i), where i is the value of that element before the call.
Returns: *this.

constexpr iterator& operator++(int);  
 Preconditions: Equivalent to:
  auto tmp = *this;
  ***this;
  return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;  
 Preconditions: current_.front() is decrementable.
Postconditions: Each element of current_ is equal to ranges::prev(i), where i is the value of that element before the call.
Returns: *this.
constexpr iterator operator--(int) requires bidirectional_range<Base>;

**Effects:** Equivalent to:

```cpp
    auto tmp = *this;
    --*this;
    return tmp;
```

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;

**Preconditions:** current_.back() + x has well-defined behavior.

**Postconditions:** Each element of current_ is equal to i + x, where i is the value of that element before the call.

**Returns:** *this.

customexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

**Preconditions:** current_.front() - x has well-defined behavior.

**Postconditions:** Each element of current_ is equal to i - x, where i is the value of that element before the call.

**Returns:** *this.

customexpr auto operator[](difference_type n) const requires random_access_range<Base>;

**Effects:** Equivalent to:

```cpp
    return tuple-transform([&](auto& i) -> decltype(auto) { return i[n]; }, current_);
```

friend constexpr bool operator==(const iterator& x, const iterator& y);

**Returns:** x.current_.back() == y.current_.back().

friend constexpr bool operator<(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Returns:** x.current_.back() < y.current_.back().

friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Effects:** Equivalent to: return y < x;

friend constexpr bool operator>(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Effects:** Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Effects:** Equivalent to: return !(x < y);

friend constexpr auto operator<(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

**Returns:** x.current_.back() <= y.current_.back().

friend constexpr iterator operator+(const iterator& i, difference_type n) requires random_access_range<Base>;

friend constexpr iterator operator+(difference_type n, const iterator& i) requires random_access_range<Base>;

**Effects:** Equivalent to:

```cpp
    auto r = i;
    r += n;
    return r;
```
friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires random_access_range<Base>;

    Effects: Equivalent to:
    
    auto r = i;
    r -= n;
    return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

    Effects: Equivalent to: return x.current_.back() - y.current_.back();

friend constexpr auto iter_move(const iterator& i) noexcept(see below);

    Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);

Remarks: The exception specification is equivalent to:
    noexcept(ranges::iter_move(declval<const iterator_t<Base>>&())) &&
    is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
    requires indirectly_swappable<iterator_t<Base>>;

    Preconditions: None of the iterators in l.current_ is equal to an iterator in r.current_.

    Effects: For every integer 0 ≤ i < N, performs ranges::iter_swap(l.current_[i], r.current_[i]).

Remarks: The exception specification is equivalent to:
    noexcept(ranges::iter_swap(declval<iterator_t<Base>>(), declval<iterator_t<Base>>()))

§ 26.7.22.4  Class template adjacent_view::sentinel

namespace std::ranges {

    template<forward_range V, size_t N>
    requires view<V> && (N > 0)
    template<bool Const>
    class adjacent_view<V, N>::sentinel {
        using Base = maybe-const<Const, V>;
        sentinel_t<Base> end_ = sentinel_t<Base>();
        constexpr explicit sentinel(sentinel_t<Base> end);
    }

public:
    sentinel() = default;
    constexpr sentinel(sentinel<!Const> i)
        requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    template<bool OtherConst>
    requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>> friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>> friend constexpr range_difference_t<maybe-const<OtherConst, V>>
        operator-(const iterator<OtherConst>& x, const sentinel& y);

    template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>> friend constexpr range_difference_t<maybe-const<OtherConst, V>>
        operator-(const sentinel& y, const iterator<OtherConst>& x);

    constexpr explicit sentinel(sentinel_t<Base> end);

    Effects: Initializes end_ with end.

§ 26.7.22.4 1124
constexpr sentinel(sentinel<NotConst> i)
    requires NotConst && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

2 Effects: Initializes end_with std::move(i.end_).

template<bool OtherConst>
    requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

3 Effects: Equivalent to: return x.current_.back() == y.end_;

template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const iterator<OtherConst>& x, const sentinel& y);

4 Effects: Equivalent to: return x.current_.back() - y.end_;

template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& y, const iterator<OtherConst>& x);

5 Effects: Equivalent to: return y.end_ - x.current_.back();

26.7.23 Adjacent transform view

26.7.23.1 Overview

1 adjacent_transform_view takes an invocable object and a view and produces a view whose Mth element is the result of applying the invocable object to the Mth through (M + N - 1)th elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name views::adjacent_transform<N> denotes a range adaptor object (26.7.2). Given subexpressions E and F and a constant expression N:

(2.1) If N is equal to 0, views::adjacent_transform<N>(E, F) is expression-equivalent to ((void)E, views::zip_transform(F)), except that the evaluations of E and F are indeterminately sequenced.

(2.2) Otherwise, the expression views::adjacent_transform<N>(E, F) is expression-equivalent to adjacent_transform_view<views::all_t<decltype((E))>, decay_t<decltype((F))>, N>(E, F).

3 [Example 1:]

```
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
    cout << i << ' ';  // prints: 2 6 12
}
```

—end example]

26.7.23.2 Class template adjacent_transform_view

```
namespace std::ranges {

template<forward_range V, copy_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
    regular_invocable<F, REPEAT(range_reference_t<V>, N)...> &&
    can-reference<invoke_result_t<F, REPEAT(range_reference_t<V>, N)...>>
class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
    copyable-box<F> & fun_;  // exposition only
    adjacent_view<V, N> & inner_;  // exposition only

    using InnerView = adjacent_view<V, N>;  // exposition only

template<bool Const>
    using inner_iterator = iterator_t<maybe-const<Const, InnerView>>;  // exposition only

template<bool Const>
    using inner_sentinel = sentinel_t<maybe-const<Const, InnerView>>;  // exposition only

    // 26.7.23.3, class template adjacent_transform_view::iterator

template<bool> class iterator;  // exposition only

§ 26.7.23.2 1125
```
// 26.7.23.4, class template adjacent_transform_view::sentinel
template<bool> class sentinel; // exposition only

public:
adjacent_transform_view() = default;
constexpr explicit adjacent_transform_view(V base, F fun);

constexpr auto begin() {
    return iterator(false)(*this, inner_.begin());
}

constexpr auto begin() const
requires range<const InnerView> &&
    regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
    return iterator(true)(*this, inner_.begin());
}

constexpr auto end() {
    if constexpr (common_range<InnerView>) {
        return iterator(false)(*this, inner_.end());
    } else {
        return sentinel(false)(inner_.end());
    }
}

constexpr auto end() const
requires range<const InnerView> &&
    regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
    if constexpr (common_range<const InnerView>) {
        return iterator(true)(*this, inner_.end());
    } else {
        return sentinel(true)(inner_.end());
    }
}

constexpr auto size() requires sized_range<InnerView> {
    return inner_.size();
}

constexpr auto size() const requires sized_range<const InnerView> {
    return inner_.size();
}

constexpr explicit adjacent_transform_view(V base, F fun);

Effects: Initializes fun with std::move(fun) and inner with std::move(base).

26.7.23.3 Class template adjacent_transform_view::iterator
[range.adjacent.transform.iterator]

namespace std::ranges {
    template<forward_range V, copy_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
        regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
            can-reference<invoke_result_t<F&, REPEAT(range_reference_t<V>, N)...>>
    template<bool Const>
    class adjacent_transform_view<F, V...>::iterator {
        using Parent = maybe-const<Const, adjacent_transform_view>;
        using Base = maybe-const<Const, V>;
        Parent* parent_ = nullptr;
        inner_iterator<Const> inner_;

        constexpr iterator(Parent& parent, inner_iterator<Const> inner); // exposition only

    };
}
public:
using iterator_category = see below;
using iterator_concept = typename inner_iterator<Const>::iterator_concept;
using value_type = remove_cvref_t<invoke_result_t<
maybe-const<Const, F>&, 
REPEAT(range_reference_t<Base>, N)...>>;
using difference_type = range_difference_t<Base>;

iterator() = default;
constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<inner_iterator<false>, inner_iterator<Const>>;
constexpr decltype(auto) operator*() const noexcept;
constexpr iterator& operator++();
constexpr iterator operator++(int);
constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;
constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;
constexpr decltype(auto) operator[](difference_type n) const requires random_access_range<Base>;
friend constexpr bool operator==(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator<(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<inner_iterator<Const>>;
friend constexpr iterator operator+(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i) requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<inner_iterator<Const>, inner_iterator<Const>>;

1 The member typedef-name iterator::iterator_category is defined as follows:
(1.1) If invoke_result_t<maybe-const<Const, F>&, 
REPEAT(range_reference_t<Base>, N)...> is not an lvalue reference, iterator_category denotes input_iterator_tag.
(1.2) Otherwise, let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.
(1.2.1) If derived_from<C, random_access_iterator_tag> is true, iterator_category denotes random_access_iterator_tag.
(1.2.2) Otherwise, if derived_from<C, bidirectional_iterator_tag> is true, iterator_category denotes bidirectional_iterator_tag.
(1.2.3) Otherwise, if derived_from<C, forward_iterator_tag> is true, iterator_category denotes forward_iterator_tag.
(1.2.4) Otherwise, iterator_category denotes input_iterator_tag.

constexpr iterator(Parent& parent, inner_iterator<Const> inner);

2 Effects: Initializes parent_ with addressof(parent) and inner_ with std::move(inner).
constexpr iterator<iterator<!Const> i)  
requires Const && convertible_to<inner-iterator<false>, inner-iterator<Const>>;

Effects: Initializes parent_ with i.parent_ and inner_ with std::move(i.inner_).

constexpr decltype(auto) operator*() const noexcept(see below);

Effects: Equivalent to:
    return apply([&](const auto&... iters) -> decltype(auto) {
        return invoke(*parent_->fun_, *iters...);
    }, inner_.current_);

Remarks: Let Is be the pack 0, 1, ..., (N-1). The exception specification is equivalent to:
    noexcept(invoke(*parent_->fun_, *std::get<Is>((inner_.current_...)))

constexpr iterator& operator++();

Effects: Equivalent to:
    ++inner_;  
    return *this;

constexpr iterator operator++(int);

Effects: Equivalent to:
    auto tmp = *this;  
    +++this;  
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Effects: Equivalent to:
    --inner_;  
    return *this;

Effects: Equivalent to:
    auto tmp = *this;  
    --*this;  
    return tmp;

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;

Effects: Equivalent to:
    inner_ += x;  
    return *this;

constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

Effects: Equivalent to:
    inner_ -= x;  
    return *this;

constexpr decltype(auto) operator[](difference_type n) const
requires random_access_range<Base>;

Effects: Equivalent to:
    return apply([&](const auto&... iters) -> decltype(auto) {
        return invoke(*parent_->fun_, iters[n]...);
    }, inner_.current_);

friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator<(const iterator& x, const iterator& y)
requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
requires random_access_range<Base>;

§ 26.7.23.3
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<inner_iterator<Const>>;

Let \textit{op} be the operator.

**Effects:** Equivalent to: \( \text{return } x.\text{inner}_. \text{op} y.\text{inner}_. \)

friend constexpr iterator operator+(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i) requires random_access_range<Base>;

**Effects:** Equivalent to: \( \text{return } \text{iterator}(*i.\text{parent}_., i.\text{inner}_.+ n); \)

friend constexpr iterator operator-(const iterator& i, difference_type n) requires random_access_range<Base>;

**Effects:** Equivalent to: \( \text{return } \text{iterator}(*i.\text{parent}_., i.\text{inner}_.- n); \)

friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<inner_iterator<Const>, inner_iterator<Const>>;

**Effects:** Equivalent to: \( \text{return } x.\text{inner}_.- y.\text{inner}_. \)

### 26.7.23.4 Class template adjacent_transform_view::sentinel

```cpp
namespace std::ranges {
    template<forward_range V, copy_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
    regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
    can_reference<invoke_result_t<F&,
    REPEAT(range_reference_t<V>, N)...>>
    template<bool Const>
    requires sentinel_for<inner_iterator<Const>, inner_iterator<Const>>
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
    template<bool OtherConst>
    requires sized_sentinel_for<inner_iterator<Const>, inner_iterator<OtherConst>>
    friend constexpr range_difference_t<maybe_const<OtherConst, InnerView>>
    operator-(const iterator<OtherConst>& x, const sentinel& y);
}
```

**Effects:** Initializes \( \text{inner}_. \) with \( \text{inner}_. \).
constexpr sentinel(sentinel<!Const> i)
  requires Const && convertible_to<inner-sentinel<false>, inner-sentinel<Const>>;

Effects: Initializes inner_ with std::move(i.inner_).

template<bool OtherConst>
  requires sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
  friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

Effects: Equivalent to return x.inner_ == y.inner_

template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
  friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
    operator-(const iterator<OtherConst>& x, const sentinel& y);

Effects: Equivalent to return x.inner_ - y.inner_

26.7.24 Chunk view

26.7.24.1 Overview

chunk_view takes a view and a number N and produces a range of views that are N-sized non-overlapping successive chunks of the elements of the original view, in order. The last view in the range can have fewer than N elements.

The name views::chunk denotes a range adaptor object (26.7.2). Given subexpressions E and N, the expression views::chunk(E, N) is expression-equivalent to chunk_view(E, N).

[Example 1:

```cpp
vector v = {1, 2, 3, 4, 5};
for (auto r : v | views::chunk(2)) {
  cout << '[';
  auto sep = "";
  for(auto i : r) {
    cout << sep << i;
    sep = ", ";
  }
  cout << "]";
}
```

The above prints: [1, 2] [3, 4] [5] — end example]

26.7.24.2 chunk_view for input ranges

namespace std::ranges {
  template<class I>
   constexpr I div-ceil(I num, I denom) {
      I r = num / denom;
      if (num % denom)
        ++r;
      return r;
    }

template<class V>
  requires input_range<V>
  class chunk_view : public view_interface<chunk_view<V>> {
    V base_ = V();
    range_difference_t<V> n_ = 0;
    range_difference_t<V> remainder_ = 0;
    non-propagating-cache<iterator_t<V>> current_;
// 26.7.24.3, class chunk_view::outer-iterator
class outer-iterator;     // exposition only

// 26.7.24.5, class chunk_view::inner-iterator
class inner-iterator;     // exposition only

public:
chunk_view() requires default_initializable<V> = default;
constexpr explicit chunk_view(V base, range_difference_t<V> n);

constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr outer-iterator begin();
constexpr default_sentinel_t end() noexcept;

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
};

template<class R>
chunk_view(R&& r, range_difference_t<R>) -> chunk_view<views::all_t<R>>;

constexpr explicit chunk_view(V base, range_difference_t<V> n);

Preconditions: n > 0 is true.

Effects: Initializes base_ with std::move(base) and n_ with n.

constexpr outer-iterator begin();

Effects: Equivalent to:
    current_ = ranges::begin(base_);
    remainder_ = n_;
    return outer-iterator(*this);

constexpr default_sentinel_t end() noexcept;

Returns: default_sentinel.

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;

Effects: Equivalent to:
    return to_unsigned_like(div ceil(ranges::distance(base_), n_));

26.7.24.3 Class chunk_view::outer-iterator

namespace std::ranges {
    template<view V>

friend constexpr difference_type operator-(const outer_iterator& x, default_sentinel_t y)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
};

constexpr explicit outer_iterator(chunk_view& parent);

Effects: Initializes parent_ with addressof(parent).

constexpr value_type operator*() const;
Preconditions: *this == default_sentinel is false.
Returns: value_type(*parent_).

constexpr outer_iterator& operator++();
Preconditions: *this == default_sentinel is false.
Effects: Equivalent to:

ranges::advance(*parent_->current_, parent_->remainder_, ranges::end(parent_->base));
parent_->remainder_ = parent_->n_;
return *this;

constexpr void operator++(int);
Effects: Equivalent to ++*this.

friend constexpr bool operator==(const outer_iterator& x, default_sentinel_t);
Effects: Equivalent to:

return *x.parent_->current_ == ranges::end(x.parent_->base) && x.parent_->remainder_ != 0;

friend constexpr difference_type operator-(default_sentinel_t y, const outer_iterator& x)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
Effects: Equivalent to:

const auto dist = ranges::end(x.parent_->base) - *x.parent_->current_;
if (dist < x.parent_->remainder_) {
    return dist == 0 ? 0 : 1;
}
return div-ceil(dist - x.parent_->remainder_, x.parent_->n_) + 1;

friend constexpr difference_type operator-(const outer_iterator& x, default_sentinel_t y)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
Effects: Equivalent to: return -(y - x);

26.7.24.4 Class chunk_view::outer_iterator::value_type
[range.chunk.outer.value]

namespace std::ranges {
    template<view V>
    requires input_range<V>
    struct chunk_view<V>::outer_iterator::value_type : view_interface<value_type> {

friend constexpr difference_type operator-(const iterator & x, default_sentinel_t y)
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

  Effects: Equivalent to: return -(y - x);

26.7.25 Slide view

26.7.25.1 Overview

slide_view takes a view and a number N and produces a view whose Mth element is a view over the Mth through (M + N - 1)th elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

The name view::slide denotes a range adaptor object (26.7.2). Given subexpressions E and N, the expression view::slide(E, N) is expression-equivalent to slide_view(E, N).

[Example 1]:
  vector v = {1, 2, 3, 4};
N4910

© ISO/IEC

for (auto i : v | views::slide(2)) {
cout << '[' << i[0] << ", " << i[1] << "] ";
}

// prints: [1, 2] [2, 3] [3, 4]

— end example]

26.7.25.2

Class template slide_view

[range.slide.view]

namespace std::ranges {
template<class V>
concept slide-caches-nothing = random_access_range<V> && sized_range<V>;

// exposition only

template<class V>
concept slide-caches-last =
// exposition only
!slide-caches-nothing <V> && bidirectional_range<V> && common_range<V>;
template<class V>
concept slide-caches-first =
!slide-caches-nothing <V> && !slide-caches-last <V>;

// exposition only

template<forward_range V>
requires view<V>
class slide_view : public view_interface<slide_view<V>> {
V base_ = V();
// exposition only
range_difference_t<V> n_ = 0;
// exposition only
// 26.7.25.3, class template slide_view::iterator
template<bool> class iterator ;
// exposition only
// 26.7.25.4, class slide_view::sentinel
class sentinel ;
// exposition only
public:
slide_view() requires default_initializable<V> = default;
constexpr explicit slide_view(V base, range_difference_t<V> n);
constexpr auto begin()
requires (!(simple-view <V> && slide-caches-nothing <const V>));
constexpr auto begin() const requires slide-caches-nothing <const V>;
constexpr auto end()
requires (!(simple-view <V> && slide-caches-nothing <const V>));
constexpr auto end() const requires slide-caches-nothing <const V>;
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
};
template<class R>
slide_view(R&& r, range_difference_t<R>) -> slide_view<views::all_t<R>>;
}
constexpr explicit slide_view(V base, range_difference_t<V> n);
1

Effects: Initializes base_ with std::move(base) and n_ with n.
constexpr auto begin()
requires (!(simple-view <V> && slide-caches-nothing <const V>));

2
(2.1)

Returns:
— If V models slide-caches-first ,
iterator <false>(ranges::begin(base_),
ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)

(2.2)

— Otherwise, iterator <false>(ranges::begin(base_), n_).

§ 26.7.25.2

1139


Remarks: In order to provide the amortized constant-time complexity required by the range concept, this function caches the result within the slide_view for use on subsequent calls when V models slide-caches-first.

```cpp
conestexpr auto begin() const requires slide-caches-nothing<const V>;
```

Returns: iterator<true>(ranges::begin(base_), n_).

```cpp
conestexpr auto end()
    requires (!((simple-view<V> && slide-caches-nothing<const V>));
```

Returns: (5.1) If V models slide-caches-nothing,
        iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)
(5.2) Otherwise, if V models slide-caches-last,
        iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)
(5.3) Otherwise, if V models common_range,
        iterator<false>(ranges::end(base_), ranges::end(base_), n_)
(5.4) Otherwise, sentinel(ranges::end(base_)).

Remarks: In order to provide the amortized constant-time complexity required by the range concept, this function caches the result within the slide_view for use on subsequent calls when V models slide-caches-last.

```cpp
conestexpr auto end() const requires slide-caches-nothing<const V>;
```

Returns: begin() + range_difference_t<const V>(size()).

```cpp
conestexpr auto size() requires sized_range<V>;
conestexpr auto size() const requires sized_range<const V>;
```

Effects: Equivalent to:
```cpp
auto sz = ranges::distance(base_) - n_ + 1;
if (sz < 0) sz = 0;
return to-unsigned-like(sz);
```

26.7.25.3 Class template slide_view::iterator

```cpp
namespace std::ranges {
    template<forward_range V>
    requires view<V>
    template<bool Const>
    class slide_view<V>::iterator {
        using Base = maybe-const<Const, V>;
        // exposition only
        iterator_t<Base> current_ = iterator_t<Base>();
        // exposition only
        iterator_t<Base> last_ele_ = iterator_t<Base>();
        // exposition only,
        // present only if Base models slide-caches-first
        range_difference_t<Base> n_ = 0;
        // exposition only
        constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n) // exposition only
            requires (!slide-caches-first<Base>);
        constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele, // exposition only
            range_difference_t<Base> n)
            requires slide-caches-first<Base>;

        public:
            using iterator_category = input_iterator_tag;
            using iterator_concept = see below;
            using value_type = decltype(views::counted(current_, n_));
            using difference_type = range_difference_t<Base>;

            iterator() = default;
    }
}```
```cpp
constexpr iterator(iterator<!Const> i)
    requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

constexpr auto operator*() const;
constexpr iterator& operator++();
constexpr iterator operator++(int);
constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;
constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
constexpr iterator& operator-=(difference_type x)
    requires random_access_range<Base>;
constexpr auto operator[](difference_type n) const
    requires random_access_range<Base>;

friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator<(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
    requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires random_access_range<Base> &&
            three_way_comparable<iterator_t<Base>>;
friend constexpr iterator operator+(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)
    requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& i, difference_type n)
    requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
```

1. `iterator::iterator_concept` is defined as follows:
   (1.1) If `Base` models `random_access_range`, then `iterator_concept` denotes `random_access_iterator_tag`.
   (1.2) Otherwise, if `Base` models `bidirectional_range`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
   (1.3) Otherwise, `iterator_concept` denotes `forward_iterator_tag`.

2. If the invocation of any non-const member function of `iterator` exits via an exception, the `iterator` acquires a singular value.

3. `constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n)`
   requires (!slide-caches-first<Base>);
   **Effects:** Initializes `current_` with `current` and `n_` with `n`.

4. `constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele, range_difference_t<Base> n)`
   requires slide-caches-first<Base>;
   **Effects:** Initializes `current_` with `current`, `last_ele_` with `last_ele`, and `n_` with `n`.

§ 26.7.25.3
constexpr iterator (iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

  Effects: Initializes current_ with std::move(i.current_) and n_ with i.n_.

  [Note 1: iterator<true> can only be formed when Base models slide-caches-nothing, in which case
  last_ele_ is not present. — end note]

constexpr auto operator*() const;

Returns: views::counted(current_, n_).

constexpr iterator& operator++();

Preconditions: current_ and last_ele_ (if present) are incrementable.

Postconditions: current_ and last_ele_ (if present) are each equal to ranges::next(i), where i is
the value of that data member before the call.

Returns: *this.

constexpr iterator operator++(int);

Effects: Equivalent to:
  auto tmp = *this;
  +++*this;
  return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Preconditions: current_ and last_ele_ (if present) are decrementable.

Postconditions: current_ and last_ele_ (if present) are each equal to ranges::prev(i), where i is
the value of that data member before the call.

Returns: *this.

constexpr iterator operator--(int) requires bidirectional_range<Base>;

Preconditions: current_ and last_ele_ (if present) have well-defined behavior.

Postconditions: current_ and last_ele_ (if present) are each equal to i + x, where i is the value of
that data member before the call.

Returns: *this.

constexpr iterator& operator+=(difference_type x)
  requires random_access_range<Base>;

Preconditions: current_ + x and last_ele_ + x (if last_ele_ is present) have well-defined behavior.

Postconditions: current_ and last_ele_ (if present) are each equal to i + x, where i is the value of
that data member before the call.

Returns: *this.

constexpr iterator& operator-=(difference_type x)
  requires random_access_range<Base>;

Preconditions: current_ - x and last_ele_ - x (if last_ele_ is present) have well-defined behavior.

Postconditions: current_ and last_ele_ (if present) are each equal to i - x, where i is the value of
that data member before the call.

Returns: *this.

constexpr auto operator[](difference_type n) const
  requires random_access_range<Base>;

Effects: Equivalent to: return views::counted(current_ + n, n_);

friend constexpr bool operator==(const iterator& x, const iterator& y);

Returns: If last_ele_ is present, x.last_ele_ == y.last_ele_; otherwise, x.current_ == y.current_.
friend constexpr bool operator<(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)  
requires random_access_range<Base> &&  
three_way_comparable<iterator_t<Base>>;

Returns: x.current_ <= y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)  
requires random_access_range<Base>;

friend constexpr iterator operator+(difference_type n, const iterator& i)  
requires random_access_range<Base>;

Effects: Equivalent to:
auto r = i;  
\[r += n;\]
return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)  
requires random_access_range<Base>;

Effects: Equivalent to:
auto r = i;  
\[r -= n;\]
return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

Returns: If \texttt{last\_ele\_} is present, x.last\_ele\_ - y.last\_ele\_; otherwise, x.current_ - y.current_.

### 26.7.25.4 Class \texttt{slide\_view::sentinel} [range.slide.sentinel]

```cpp
namespace std::ranges {
    template<forward_range V>  
    requires view<V>  
    class slide_view<V>::sentinel {
        sentinel_t<V> end_ = sentinel_t<V>();  // exposition only
        constexpr explicit sentinel(sentinel_t<V> end);  // exposition only
    
    public:
        sentinel() = default;

        friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

        friend constexpr range_difference_t<V>  
        operator-(const iterator<false>& x, const sentinel& y)  
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
    }
}
```
friend constexpr sentinel(sentinel_t<V> end);

**Effects:** Initializes end_ with end.

friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

**Returns:** x.last_ele_ == y.end_.

friend constexpr range_difference_t<V> operator-(const iterator<false>& x, const sentinel& y);

**Returns:** x.last_ele_ - y.end_.

friend constexpr range_difference_t<V> operator-(const sentinel& y, const iterator<false>& x);

**Returns:** y.end_ - x.last_ele_.

### 26.7.26 Chunk by view

#### 26.7.26.1 Overview

`chunk_by_view` takes a `view` and a predicate, and splits the `view` into subranges between each pair of adjacent elements for which the predicate returns `false`. The name `views::chunk_by` denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression `views::chunk_by(E, F)` is expression-equivalent to `chunk_by_view(E, F).

**Example 1:**

```cpp
vector v = {1, 2, 2, 3, 0, 4, 5, 2};
for (auto r : v | views::chunk_by(ranges::less_equal{})) {
    cout << '[';
    auto sep = "";
    for(auto i : r) {
        cout << sep << i;
        sep = ", ";
    }
    cout << "]";
}
```

The above prints: `[1, 2, 2, 3] [0, 4, 5] [2]" — end example"

#### 26.7.26.2 Class template `chunk_by_view`

```cpp
namespace std::ranges {
    template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
    class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
        V base_; // exposition only
copyable-box<Pred> pred_ = Pred(); // exposition only
    }
}
```

**Public:**

```cpp
chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
constexpr explicit chunk_by_view(V base, Pred pred);

constexpr V base() const && { return base_; }
constexpr V base() const { return std::move(base_); }
```
chunk_by_view(base, pred);

Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr explicit chunk_by_view(V base, Pred pred);

Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;

Effects: Equivalent to: return *pred_;
constexpr iterator(chunk_by_view& parent, iterator_t<V> current, // exposition only
                iterator_t<V> next);

public:
    using value_type = subrange<iterator_t<V>>;
    using difference_type = range_difference_t<V>;
    using iterator_category = input_iterator_tag;
    using iterator_concept = see below;

    iterator() = default;

    constexpr value_type operator*() const;
    constexpr iterator& operator++();
    constexpr iterator operator++(int);
    constexpr iterator& operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;

    friend constexpr bool operator==(const iterator& x, const iterator& y);
    friend constexpr bool operator==(const iterator& x, default_sentinel_t);

};

1 iterator::iterator_concept is defined as follows:
(1.1) — If V models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.2) — Otherwise, iterator_concept denotes forward_iterator_tag.

constexpr iterator(chunk_by_view parent, iterator_t<V> current, iterator_t<V> next);

2 Effects: Initializes parent_ with addressof(parent), current_ with current, and next_ with next.

constexpr value_type operator*() const;
3 Preconditions: current_ is not equal to next_.
4 Returns: subrange(current_, next_).

constexpr iterator& operator++();
5 Preconditions: current_ is not equal to next_.
6 Effects: Equivalent to:
    current_ = next_;
    next_ = parent_->find-next(current_); return *this;

constexpr iterator& operator++(int);
7 Effects: Equivalent to:
    auto tmp = *this;
    +++this;
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;
8 Effects: Equivalent to:
    next_ = current_; current_ = parent_->find-prev(next_);
    return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;
9 Effects: Equivalent to:
    auto tmp = *this;
    --*this;
    return tmp;
friend constexpr bool operator==(const iterator& x, const iterator& y);

Returns: \( x.\text{current} == y.\text{current} \).

friend constexpr bool operator==(const iterator& x, default_sentinel_t);

Returns: \( x.\text{current} == x.\text{next} \).
27 Algorithms library

27.1 General

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 24) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 89.

Table 89: Algorithms library summary

27.2 Algorithms requirements

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the std::ranges namespace in this Clause are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the postfix-expression in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[Example 1:]

```c++
void foo() {
  using namespace std::ranges;
  std::vector<int> vec{1,2,3};
  find(begin(vec), end(vec), 2); // #1
}
```

The function call expression at #1 invokes std::ranges::find, not std::find, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::find is more specialized (13.7.7.3) than std::ranges::find since the former requires its first two parameters to have the same type. — end example

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) — If an algorithm’s template parameter is named InputIterator, InputIterator1, or InputIterator2, the template argument shall meet the Cpp17InputIterator requirements (25.3.5.3).

(4.2) — If an algorithm’s template parameter is named OutputIterator, OutputIterator1, or OutputIterator2, the template argument shall meet the Cpp17OutputIterator requirements (25.3.5.4).

(4.3) — If an algorithm’s template parameter is named ForwardIterator, ForwardIterator1, or ForwardIterator2, the template argument shall meet the Cpp17ForwardIterator requirements (25.3.5.5).

(4.4) — If an algorithm’s template parameter is named NoThrowForwardIterator, the template argument shall meet the Cpp17ForwardIterator requirements (25.3.5.5), and is required to have the property that no
exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

(4.5) If an algorithm’s template parameter is named BidirectionalIterator, BidirectionalIterator1, or BidirectionalIterator2, the template argument shall meet the Cpp17BidirectionalIterator requirements (25.3.5.6).

(4.6) If an algorithm’s template parameter is named RandomAccessIterator, RandomAccessIterator1, or RandomAccessIterator2, the template argument shall meet the Cpp17RandomAccessIterator requirements (25.3.5.7).

5 If an algorithm’s Effects element specifies that a value pointed to by any iterator passed as an argument is modified, then that algorithm has an additional type requirement: The type of that argument shall meet the requirements of a mutable iterator (25.3).

[Note 1: This requirement does not affect arguments that are named OutputIterator, OutputIterator1, or OutputIterator2, because output iterators must always be mutable, nor does it affect arguments that are constrained, for which mutability requirements are expressed explicitly. —end note]

6 Both in-place and copying versions are provided for certain algorithms. When such a version is provided for algorithm it is called algorithm_copy. Algorithms that take predicates end with the suffix _if (which follows the suffix _copy).

7 When not otherwise constrained, the Predicate parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as true. In other words, if an algorithm takes Predicate pred as its argument and first as its iterator argument with value type T, it should work correctly in the construct pred(*first) contextually converted to bool (7.3). The function object pred shall not apply any non-constant function through the dereferenced iterator. Given a glvalue u of type (possibly const) T that designates the same object as *first, pred(u) shall be a valid expression that is equal to pred(*first).

8 When not otherwise constrained, the BinaryPredicate parameter is used whenever an algorithm expects a function object that when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type T when T is part of the signature returns a value testable as true. In other words, if an algorithm takes BinaryPredicate binary_pred as its argument and first1 and first2 as its iterator arguments with respective value types T1 and T2, it should work correctly in the construct binary_pred(*first1, *first2) contextually converted to bool (7.3). Unless otherwise specified, BinaryPredicate always takes the first iterator’s value_type as its first argument, that is, in those cases when T value is part of the signature, it should work correctly in the construct binary_pred(*first1, value) contextually converted to bool (7.3). binary_pred shall not apply any non-constant function through the dereferenced iterators. Given a glvalue u of type (possibly const) T1 that designates the same object as *first1, and a glvalue v of type (possibly const) T2 that designates the same object as *first2, binary_pred(u, *first2), binary_pred(*first1, v), and binary_pred(u, v) shall each be a valid expression that is equal to binary_pred(*first1, *first2), and binary_pred(u, value) shall be a valid expression that is equal to binary_pred(*first1, value).

9 The parameters UnaryOperation, BinaryOperation, BinaryOperation1, and BinaryOperation2 are used whenever an algorithm expects a function object (22.10).

[Note 2: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a noncopied implementation object such as reference_wrapper<T> (22.10.6), or some equivalent solution, can be used. —end note]

10 When the description of an algorithm gives an expression such as *first == value as a condition, the expression shall evaluate to either true or false in boolean contexts.

11 In the description of the algorithms, operator + is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of a + n are the same as those of

```c++
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

220 The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, sort_copy is not included because the cost of sorting is much more significant, and users can invoke copy followed by sort.
Similarly, operator - is used for some combinations of iterators and sentinel types for which it does not have to be defined. If \([a, b)\) denotes a range, the semantics of \(b - a\) in these cases are the same as those of

\[
\text{iter_difference_t<typename(a)> } n = 0;
\]

\[
\text{for (auto tmp = a; tmp != b; ++tmp) } ++n;
\]

\[
\text{return } n;
\]

and if \([b, a)\) denotes a range, the same as those of

\[
\text{iter_difference_t<typename(b)> } n = 0;
\]

\[
\text{for (auto tmp = b; tmp != a; ++tmp) } --n;
\]

\[
\text{return } n;
\]

In the description of the algorithms, given an iterator \(a\) whose difference type is \(D\), and an expression \(n\) of integer-like type other than \(cv\ D\), the semantics of \(a + n\) and \(a - n\) are, respectively, those of \(a + D(n)\) and \(a - D(n)\).

In the description of algorithm return values, a sentinel value \(s\) denoting the end of a range \([i, s)\) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using \(\text{ranges::next}(i, s)\).

Overloads of algorithms that take \(\text{range}\) arguments \((26.4.2)\) behave as if they are implemented by calling \(\text{ranges::begin}\) and \(\text{ranges::end}\) on the \(\text{range}(s)\) and dispatching to the overload in namespace \(\text{ranges}\) that takes separate iterator and sentinel arguments.

The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

[Note 3: Consequently, an implementation can declare an algorithm with different template parameters than those presented. — end note]

27.3 Parallel algorithms

27.3.1 Preamble

Subclause 27.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

A parallel algorithm is a function template listed in this document with a template parameter named \(\text{ExecutionPolicy}\).

Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

1. All operations of the categories of the iterators that the algorithm is instantiated with.
2. Operations on those sequence elements that are required by its specification.
3. User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
4. Operations on those function objects required by the specification.

[Note 1: See 27.2. — end note]

These functions are herein called element access functions.

[Example 1: The \text{sort}\ function may invoke the following element access functions:

1. Operations of the random-access iterator of the actual template argument (as per 25.3.5.7), as implied by the name of the template parameter \(\text{RandomAccessIterator}\).
2. The \text{swap}\ function on the elements of the sequence (as per the preconditions specified in 27.8.2.1).
3. The user-provided \text{Compare}\ function object.

— end example]

A standard library function is \text{vectorization-unsafe} if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

[Note 2: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — end note]

[Example 2:

\[
\text{int } x = 0;
\]

§ 27.3.1
std::mutex m;
void f() {
    int a[] = {1,2};
    std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
        std::lock_guard<mutex> guard(m);          // incorrect: lock_guard constructor calls m.lock()
        ++x;
    });
}

The above program may result in two consecutive calls to m.lock() on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution.

—end example

27.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

Unless otherwise specified, function objects passed into parallel algorithms as objects of type Predicate, BinaryPredicate, Compare, UnaryOperation, BinaryOperation, BinaryOperation1, BinaryOperation2, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

27.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

1 Parallel algorithms have template parameters named ExecutionPolicy (22.12) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

[Note 1: For example, swap, ++, --, @=, and assignments modify the object. For the assignment and @= operators, only the left argument is modified. —end note]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type T) from sequences where is_trivially_copy_constructible_v<T> and is_trivially_destructible_v<T> are true.

[Note 2: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as reference_wrapper<T> (22.10.6), or some equivalent solution, can be used. —end note]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type std::execution::sequenced_policy all occur in the calling thread of execution.

[Note 3: The invocations are not interleaved; see 6.9.1. —end note]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type std::execution::unsequenced_policy are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

[Note 4: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. —end note]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a execution::unsequenced_policy algorithm.

[Note 5: Because execution::unsequenced_policy allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. —end note]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type std::execution::parallel_policy are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by thread (33.4.3) or jthread (33.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

[Note 6: It is the caller’s responsibility to ensure that the invocation does not introduce data races or deadlocks. —end note]
Example 1:
```
int a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
    v.push_back(i*2+1);  // incorrect: data race
});
```
The program above has a data race because of the unsynchronized access to the container v. — end example

Example 2:
```
std::atomic<int> x{0};
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    x.fetch_add(1, std::memory_order::relaxed);
    // spin wait for another iteration to change the value of x
    while (x.load(std::memory_order::relaxed) == 1) { }
    // incorrect: assumes execution order
});
```
The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — end example

Example 3:
```
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);
    ++x;
});
```
The above example synchronizes access to object x ensuring that it is incremented correctly. — end example

The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

[Note 7: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::parallel_unsequenced_policy` algorithm.

[Note 8: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note]

9 If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

(9.1) temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or

(9.2) eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

[Note 10: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — end note]
27.3.4 Parallel algorithm exceptions

1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a bad_alloc exception.

2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the ExecutionPolicy.

27.3.5 ExecutionPolicy algorithm overloads

1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named ExecutionPolicy, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type ExecutionPolicy&&, which is the first function parameter.

[Note 1: Not all algorithms have parallel algorithm overloads. — end note]

2 Unless otherwise specified, the semantics of ExecutionPolicy algorithm overloads are identical to their overloads without.

3 Unless otherwise specified, the complexity requirements of ExecutionPolicy algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most expr” or “exactly expr” and does not specify the number of assignments or swaps, and expr is not already expressed with $O()$ notation, the complexity of the algorithm shall be $O(expr)$.

4 Parallel algorithms shall not participate in overload resolution unless is_execution_policy_v<remove_cvref_t<ExecutionPolicy>> is true.

27.6 Non-modifying sequence operations [alg.nonmodifying]
27.6.1 All of [alg.all.of]

Let \(E\) be:

1. (1.1) \(\text{pred}(*i)\) for the overloads in namespace \(\text{std}\);
2. (1.2) \(\text{invoke(pred, invoke(proj, *i))}\) for the overloads in namespace \(\text{ranges}\).

Returns: \(\text{false}\) if \(E\) is \(\text{false}\) for some iterator \(i\) in the range \([\text{first}, \text{last})\), and \(\text{true}\) otherwise.

Complexity: At most \(\text{last} - \text{first}\) applications of the predicate and any projection.

27.6.2 Any of [alg.any.of]

Let \(E\) be:

1. (1.1) \(\text{pred}(*i)\) for the overloads in namespace \(\text{std}\);
2. (1.2) \(\text{invoke(pred, invoke(proj, *i))}\) for the overloads in namespace \(\text{ranges}\).
Returns: true if \( E \) is true for some iterator \( i \) in the range \([\texttt{first}, \texttt{last}]\), and false otherwise.

Complexity: At most \( \texttt{last} - \texttt{first} \) applications of the predicate and any projection.

### 27.6.3 None of

\[ \text{alg.none.of} \]

```cpp
template<class InputIterator, class Predicate>
constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
             Predicate pred);
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
           indirectly_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
template<input_range R, class Proj = identity,
           indirectly_unary_predicate<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

Let \( E \) be:

1. \( \texttt{pred}(*\texttt{i}) \) for the overloads in namespace \texttt{std};
2. \( \texttt{invoke} \left( \texttt{pred}, \texttt{invoke} \left( \texttt{proj}, *\texttt{i} \right) \right) \) for the overloads in namespace \texttt{ranges}.

Returns: false if \( E \) is true for some iterator \( i \) in the range \([\texttt{first}, \texttt{last}]\), and true otherwise.

Complexity: At most \( \texttt{last} - \texttt{first} \) applications of the predicate and any projection.

### 27.6.4 For each

\[ \text{alg.foreach} \]

```cpp
template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);
```

Preconditions: Function meets the \texttt{Cpp17MoveConstructible} requirements (Table 30).

[Note 1: Function need not meet the requirements of \texttt{Cpp17CopyConstructible} (Table 31). — end note]

Effects: Applies \( f \) to the result of dereferencing every iterator in the range \([\texttt{first}, \texttt{last}]\), starting from \texttt{first} and proceeding to \texttt{last} - 1.

[Note 2: If the type of \texttt{first} meets the requirements of a mutable iterator, \( f \) can apply non-constant functions through the dereferenced iterator. — end note]

Returns: \( f \).

Complexity: Applies \( f \) exactly \( \texttt{last} - \texttt{first} \) times.

Remarks: If \( f \) returns a result, the result is ignored.

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Function>
void for_each(ExecutionPolicy&& exec,
             ForwardIterator first, ForwardIterator last,
             Function f);
```

Preconditions: Function meets the \texttt{Cpp17CopyConstructible} requirements.

Effects: Applies \( f \) to the result of dereferencing every iterator in the range \([\texttt{first}, \texttt{last}]\).

[Note 3: If the type of \texttt{first} meets the requirements of a mutable iterator, \( f \) can apply non-constant functions through the dereferenced iterator. — end note]

Complexity: Applies \( f \) exactly \( \texttt{last} - \texttt{first} \) times.

Remarks: If \( f \) returns a result, the result is ignored. Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

[Note 4: Does not return a copy of its Function parameter, since parallelization often does not permit efficient state accumulation. — end note]

```cpp
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
           indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_result<I, Fun>
ranges::for_each(I first, S last, Fun f, Proj proj = {});
```
template<input_range R, class Proj = identity, indirectly_unary_invocable<projected<iterator_t<R>, Proj>> Fun>
constexpr ranges::for_each_result<borrowed_iterator_t<R>, Fun>
ranges::for_each(R&& r, Fun f, Proj proj = {});

Effects: Calls invoke(f, invoke(proj, *i)) for every iterator i in the range [first, last), starting from first and proceeding to last - 1.

[Note 5: If the result of invoke(proj, *i) is a mutable reference, f can apply non-constant functions. — end note]

Returns: {last, std::move(f)}.

Complexity: Applies f and proj exactly last - first times.

Remarks: If f returns a result, the result is ignored.

[Note 6: The overloads in namespace ranges require Fun to model copy_constructible. — end note]

template<class InputIterator, class Size, class Function>
constexpr InputIterator for_each_n(InputIterator first, Size n, Function f);

Mandates: The type Size is convertible to an integral type (7.3.9, 11.4.8).

Preconditions: n >= 0 is true. Function meets the Cpp17MoveConstructible requirements.

[Note 7: Function need not meet the requirements of Cpp17CopyConstructible. — end note]

Effects: Applies f to the result of dereferencing every iterator in the range [first, first + n) in order.

[Note 8: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator. — end note]

Returns: first + n.

Remarks: If f returns a result, the result is ignored.

Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

Note 10: If the result of invoke(proj, *i) is a mutable reference, f can apply non-constant functions. — end note]

Returns: {first + n, std::move(f)}.

Remarks: If f returns a result, the result is ignored.

[Note 11: The overload in namespace ranges requires Fun to model copy_constructible. — end note]

27.6.5 Find

template<class InputIterator, class T>
constexpr InputIterator find(InputIterator first, InputIterator last, T)
Let \( E \) be:

1. \( \ast i == \text{value for find} \)  
2. \( \text{pred}(\ast i) != \text{false for find_if} \)  
3. \( \text{pred}(\ast i) == \text{false for find_if_not} \)  
4. \( \text{bool}(\text{invoke}(\text{proj}, \ast i)) == \text{value for ranges::find} \)  
5. \( \text{bool}(\text{invoke}(\text{pred, invoke}(\text{proj}, \ast i))) \) for ranges::find_if  
6. \( \text{bool}(!\text{invoke}(\text{pred, invoke}(\text{proj}, \ast i))) \) for ranges::find_if_not.

Let \( E \) be:

- \( \ast i == \text{value for find} \)
- \( \text{pred}(\ast i) != \text{false for find_if} \)
- \( \text{pred}(\ast i) == \text{false for find_if_not} \)
- \( \text{bool}(\text{invoke}(\text{proj}, \ast i)) == \text{value for ranges::find} \)
- \( \text{bool}(\text{invoke}(\text{pred, invoke}(\text{proj}, \ast i))) \) for ranges::find_if
- \( \text{bool}(!\text{invoke}(\text{pred, invoke}(\text{proj}, \ast i))) \) for ranges::find_if_not.

Returns: The first iterator \( i \) in the range \([\text{first, last})\) for which \( E \) is true. Returns \( \text{last} \) if no such iterator is found.

**Complexity:** At most \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

### 27.6.6 Find end

#### algorithm find.end

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1 find_end(ForwardIterator1 first1, ForwardIterator1 last1, 
                                    ForwardIterator2 first2, ForwardIterator2 last2);
```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
class BinaryPredicate>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class BinaryPredicate>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
BinaryPredicate pred);

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2,
class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::find_end(R1&& r1, R2&& r2, Pred pred = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let:
(1.1) — pred be equal_to{} for the overloads with no parameter pred;
(1.2) — E be:
(1.2.1) — invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))) for the overloads in namespace std;
(1.2.2) — invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))) for the overloads in namespace ranges;
(1.3) — i be last1 if [first2, last2) is empty, or if (last2 - first2) > (last1 - first1) is true,
or if there is no iterator in the range [first1, last1 - (last2 - first2)) such that for every non-negative integer n < (last2 - first2), E is true. Otherwise i is the last such iterator in
[first1, last1 - (last2 - first2)].

Returns:
(2.1) — i for the overloads in namespace std.
(2.2) — {i, i + (i == last1 ? 0 : last2 - first2)} for the overloads in namespace ranges.

Complexity: At most (last2 - first2) * (last1 - first1 - (last2 - first2) + 1) applications of the corresponding predicate and any projections.

27.6.7 Find first [alg.find.first.of]
template<class InputIterator, class ForwardIterator,
         class BinaryPredicate>
constexpr InputIterator
    find_first_of(InputIterator first1, InputIterator last1,
                  ForwardIterator first2, ForwardIterator last2,
                  BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
    find_first_of(ExecutionPolicy&& exec,
                  ForwardIterator1 first1, ForwardIterator1 last1,
                  ForwardIterator2 first2, ForwardIterator2 last2,
                  BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr I1 ranges::find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
                                   Pred pred = {},
                                   Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_iterator_t<R1>
    ranges::find_first_of(R1&& r1, R2&& r2,
                          Pred pred = {},
                          Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let $E$ be:
   
   (1.1) $i == j$ for the overloads with no parameter $pred$;
   
   (1.2) $\text{pred}(i, j) \neq false$ for the overloads with a parameter $pred$ and no parameter $proj$;
   
   (1.3) $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, i), \text{invoke}(\text{proj2}, j)))$ for the overloads with parameters $pred$ and $proj$.

2 **Effects**: Finds an element that matches one of a set of values.

3 **Returns**: The first iterator $i$ in the range $[\text{first1}, \text{last1})$ such that for some iterator $j$ in the range $[\text{first2}, \text{last2}) E$ holds. Returns last1 if $[\text{first2}, \text{last2})$ is empty or if no such iterator is found.

4 **Complexity**: At most $(\text{last1}-\text{first1}) \times (\text{last2}-\text{first2})$ applications of the corresponding predicate and any projections.

### § 27.6.8 Adjacent find

[alg.adjacent.find]
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_binary_predicate<projected<I>, Proj>,
        projected<I, Proj>> Pred = ranges::equal_to>
constexpr I ranges::adjacent_find(I first, S last, Pred pred = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
        indirect_binary_predicate<projected<iterator_t<R>>, Proj>,
        projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});

Let $E$ be:

(1.1) $\ast i == \ast(i + 1)$ for the overloads with no parameter $\text{pred}$;
(1.2) $\text{pred}(\ast i, \ast(i + 1)) \neq \text{false}$ for the overloads with a parameter $\text{pred}$ and no parameter $\text{proj}$;
(1.3) $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, \ast i), \text{invoke}(\text{proj}, \ast(i + 1))))$ for the overloads with both parameters $\text{pred}$ and $\text{proj}$.

Returns: The first iterator $i$ such that both $i$ and $i + 1$ are in the range $[\text{first}, \text{last})$ for which $E$ holds. Returns last if no such iterator is found.

Complexity: For the overloads with no ExecutionPolicy, exactly

$$\min((i - \text{first}) + 1, (\text{last} - \text{first}) - 1)$$

applications of the corresponding predicate, where $i$ is adjacent_find’s return value. For the overloads
with an ExecutionPolicy, $O(\text{last} - \text{first})$ applications of the corresponding predicate, and no more than twice as many applications of any projection.

## 27.6.9 Count

### [alg.count]

```cpp
template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class T>
constexpr typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
     ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
constexpr typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, Predicate pred);
```

Let $E$ be:

(1.1) $\ast i == \text{value}$ for the overloads with no parameter $\text{pred}$ or $\text{proj}$;
(1.2) $\text{pred}(\ast i) \neq \text{false}$ for the overloads with a parameter $\text{pred}$ but no parameter $\text{proj}$;
(1.3) \[ \text{invoke(proj, *i) == value for the overloads with a parameter proj but no parameter pred}; \]

(1.4) \[ \text{bool(invoke(pred, invoke(proj, *i))) for the overloads with both parameters proj and pred.} \]

\[ \frac{2}{E\text{ffects: Returns the number of iterators } i \text{ in the range } \text{[first, last)} \text{ for which } E \text{ holds.}} \]

\[ \frac{3}{\text{Complexity: Exactly last - first applications of the corresponding predicate and any projection.}} \]

### 27.6.10 Mismatch

**mismatch**

```cpp
template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2> mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2> mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2);
```

```cpp
template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2> mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, BinaryPredicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2> mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);
```

```cpp
template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2> mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2> mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr ranges::mismatch_result<I1, I2> ranges::mismatch_result<I1, I2, Pred, Proj1, Proj2>
ranges::mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```
template<input_range R1, input_range R2, 
   class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
   requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
   constexpr ranges::mismatch_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
   ranges::mismatch(R1&& r1, R2&& r2, Pred pred = {},
   Proj1 proj1 = {}, Proj2 proj2 = {});

1. Let last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2.
2. Let E be:
   - !(*(first1 + n) == *(first2 + n)) for the overloads with no parameter pred;
   - pred(*(first1 + n), *(first2 + n)) == false for the overloads with a parameter pred and
     no parameter proj1;
   - !invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n))) for the
     overloads with both parameters pred and proj1.
3. Let N be min(last1 - first1, last2 - first2).
4. Returns: { first1 + n, first2 + n }, where n is the smallest integer in [0, N) such that E holds,
   or N if no such integer exists.
5. Complexity: At most N applications of the corresponding predicate and any projections.

27.6.11 Equal

template<class InputIterator1, class InputIterator2> 
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2> 
bool equal(ExecutionPolicy&& exec, 
  ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2, 
   class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
   class BinaryPredicate>
bool equal(ExecutionPolicy&& exec, 
  ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool equal(ExecutionPolicy&& exec, 
  ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, 
   class BinaryPredicate>
constexpr bool equal(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
   class BinaryPredicate>
bool equal(ExecutionPolicy&& exec, 
  ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, 
  BinaryPredicate pred);
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,  
class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>  
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>  
constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,  
    Pred pred = {},  
    Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to,  
class Proj1 = identity, class Proj2 = identity>  
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>  
constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},  
    Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let:  
   (1.1) last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2;  
   (1.2) pred be equal_to{} for the overloads with no parameter pred;  
   (1.3) E be:  
      (1.3.1) pred(*i, *(first2 + (i - first1))) for the overloads with no parameter proj1;  
      (1.3.2) invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1)))) for  
            the overloads with parameter proj1.

2 Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if E holds  
            for every iterator i in the range [first1, last1) Otherwise, returns false.

Complexity: If  
   (3.1) the types of first1, last1, first2, and last2 meet the Cpp17RandomAccessIterator require-  
            ments (25.3.5.7) and last1 - first1 != last2 - first2 for the overloads in namespace std;  
   (3.2) the types of first1, last1, first2, and last2 pairwise model sized_sentinel_for (25.3.4.8)  
            and last1 - first1 != last2 - first2 for the first overload in namespace ranges,  
   (3.3) R1 and R2 each model sized_range and ranges::distance(r1) != ranges::distance(r2) for  
            the second overload in namespace ranges,  
   then no applications of the corresponding predicate and each projection; otherwise,  
   (3.4) For the overloads with no ExecutionPolicy, at most min(last1 - first1, last2 - first2)  
            applications of the corresponding predicate and any projections.  
   (3.5) For the overloads with an ExecutionPolicy, \(O(\min(last1 - first1, last2 - first2))\) appli-  
            cations of the corresponding predicate.

27.6.12 Is permutation  

[alg.is.permutation]

template<class ForwardIterator1, class ForwardIterator2>  
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,  
    ForwardIterator2 first2);  

template<class ForwardIterator1, class ForwardIterator2,  
class BinaryPredicate>  
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,  
    ForwardIterator2 first2, BinaryPredicate pred);  

template<class ForwardIterator1, class ForwardIterator2>  
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,  
    ForwardIterator2 first2, ForwardIterator2 last2);  

template<class ForwardIterator1, class ForwardIterator2,  
class BinaryPredicate>  
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,  
    ForwardIterator2 first2, ForwardIterator2 last2,  
    BinaryPredicate pred);  

1 Let last2 be first2 + (last1 - first1) for the overloads with no parameter named last2, and  
   let pred be equal_to{} for the overloads with no parameter pred.

2 Mandates: ForwardIterator1 and ForwardIterator2 have the same value type.

3 Preconditions: The comparison function is an equivalence relation.
Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin, pred) returns true; otherwise, returns false.

Complexity: No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2, pred) would return true; otherwise, at worst \(O(N^2)\), where \(N\) has the value last1 - first1.

27.6.13 Search

template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
     ForwardIterator2 first2, ForwardIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
search(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2,
class BinaryPredicate>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class BinaryPredicate>
ForwardIterator1
search(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
BinaryPredicate pred);

Returns: The first iterator \( i \) in the range \([first1, last1 - (last2-first2))\) such that for every non-negative integer \( n \) less than \( last2 - first2 \) the following corresponding conditions hold: \( *(i + n) == *(first2 + n) \), \( \text{pred}(*(i + n), *(first2 + n)) != false \). Returns \( first1 \) if \([first2, last2)\) is empty, otherwise returns \( last1 \) if no such iterator is found.

Complexity: At most \((last1 - first1) \times (last2 - first2)\) applications of the corresponding predicate.

\[
\begin{align*}
\text{template}<\text{forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity> &
\text{ranges::search}(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {}); &
\text{template}<\text{forward_range R1, forward_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity> &
\text{ranges::search}(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
\end{align*}
\]

Returns:

1. \( \{i, i + (last2 - first2)) \), where \( i \) is the first iterator in the range \([first1, last1 - (last2 - first2))\) such that for every non-negative integer \( n \) less than \( last2 - first2 \) the condition
   \[
   \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, *(i + n)), \text{invoke}(\text{proj2}, *(first2 + n))))
   \]
   is true.

2. Returns \( \{last1, last1\} \) if no such iterator exists.

Complexity: At most \((last1 - first1) \times (last2 - first2)\) applications of the corresponding predicate and projections.

\[
\begin{align*}
\text{template}<\text{class ForwardIterator, class Size, class T}> &
\text{constexpr ForwardIterator search_n(ForwardIterator first, ForwardIterator last, Size count, const T& value);} &
\text{template}<\text{class ExecutionPolicy, class ForwardIterator, class Size, class T}> &
\text{ForwardIterator search_n(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Size count, const T& value);} &
\text{template}<\text{class ForwardIterator, class Size, class T, class BinaryPredicate}> &
\text{constexpr ForwardIterator search_n(ForwardIterator first, ForwardIterator last, Size count, const T& value, BinaryPredicate pred);} &
\text{template}<\text{class ExecutionPolicy, class ForwardIterator, class Size, class T, class BinaryPredicate}> &
\text{ForwardIterator search_n(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Size count, const T& value, BinaryPredicate pred);} &
\end{align*}
\]

Mandates: The type \( \text{Size} \) is convertible to an integral type \((7.3.9, 11.4.8)\).

Returns: The first iterator \( i \) in the range \([first, last-count)\) such that for every non-negative integer \( n \) less than \( \text{count} \) the following corresponding conditions hold: \( *(i + n) == \text{value}, \text{pred}(*(i + n), \text{value}) != false \). Returns \( last \) if no such iterator is found.
Complexity: At most last - first applications of the corresponding predicate.

```cpp
template<forward_iterator I, sentinel_for<I> S, class T, class Pred = ranges::equal_to, class Proj = identity>
  requires indirectly_comparable<I, const T*, Pred, Proj>
  constexpr subrange<I>
  ranges::search_n(I first, S last, iter_difference_t<I> count,
  const T& value, Pred pred = {}, Proj proj = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires (forward_range<R1> || sized_range<R1>) &&
  (forward_range<R2> || sized_range<R2>) &&
  indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
  constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

1 Returns:
  ranges::mismatch(std::move(first1), last1, std::move(first2), last2, pred, proj1, proj2).in2 == last2
```

27.6.15 Ends with

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
  requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
  (forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
  indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
  constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let N1 be last1 - first1 and N2 be last2 - first2.

2 Returns: false if N1 < N2, otherwise
  ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2, pred, proj1, proj2)
```

27.6.14 Starts with

```
```
Proj1 proj1 = {}, Proj2 proj2 = {};

Let N1 be ranges::distance(r1) and N2 be ranges::distance(r2).

Returns: false if N1 < N2, otherwise
ranges::equal(ranges::drop_view(ranges::ref_view(r1), N1 - N2), r2, pred, proj1, proj2)

27.7 Mutating sequence operations [alg.modifying.operations]

27.7.1 Copy [alg.copy]

template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last,
OutputIterator result);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);

template<input_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);

Let N be last - first.

Preconditions: result is not in the range [first, last).

Effects: Copies elements in the range [first, last) into the range [result, result + N) starting from first and proceeding to last. For each non-negative integer n < N, performs *(result + n) = *(first + n).

Returns:

(4.1) result + N for the overload in namespace std.
(4.2) {last, result + N} for the overloads in namespace ranges.

Complexity: Exactly N assignments.

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 copy(ExecutionPolicy&& policy,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result);

Preconditions: The ranges [first, last) and [result, result + (last - first)) do not overlap.

Effects: Copies elements in the range [first, last) into the range [result, result + (last - first)). For each non-negative integer n < (last - first), performs *(result + n) = *(first + n).

Returns: result + (last - first).

Complexity: Exactly last - first assignments.

template<class InputIterator, class Size, class OutputIterator>
constexpr OutputIterator copy_n(InputIterator first, Size n,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
ForwardIterator2 copy_n(ExecutionPolicy&& exec,
ForwardIterator1 first, Size n,
ForwardIterator2 result);

Mandates: The type Size is convertible to an integral type (7.3.9, 11.4.8).

Effects: For each non-negative integer i < N, performs *(result + i) = *(first + i).

Returns:

(13.1) result + N for the overloads in namespace std.
template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator copy_if(InputIterator first, InputIterator last, OutputIterator result, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Predicate>
ForwardIterator2 copy_if(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
constexpr ranges::copy_if_result<I, O> ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});  

Let E be:
- bool(pred(*i)) for the overloads in namespace std;
- bool(invoke(pred, invoke(proj, *i))) for the overloads in namespace ranges,

and N be the number of iterators i in the range [first, last) for which the condition E holds.

**Preconditions:** The ranges [first, last) and [result.result + (last - first)) do not overlap.

**Note 1:** For the overload with an ExecutionPolicy, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` is not `Cpp17MoveConstructible` (Table 30). — end note

**Effects:** Copies all of the elements referred to by the iterator i in the range [first, last) for which E is true.

**Returns:**
- result + N for the overloads in namespace std.
- {last, result + N} for the overloads in namespace ranges.

**Complexity:** Exactly last - first applications of the corresponding predicate and any projection.

**Remarks:** Stable (16.4.6.8).

template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2 copy_backward(BidirectionalIterator1 first, BidirectionalIterator1 last, BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
requires indirectly_copyable<I1, I2>
constexpr ranges::copy_backward_result<I1, I2> ranges::copy_backward(I1 first, S1 last, I2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
requires indirectly_copyable<I1, I2>
constexpr ranges::copy_backward_result<I1, I2> ranges::copy_backward(I1 first, S1 last, I2 result);

Let N be last - first.

**Preconditions:** result is not in the range [first, last).

**Effects:** Copies elements in the range [first, last) into the range [result - N, result) starting from last - 1 and proceeding to first.221 For each positive integer n ≤ N, performs *(result - n) =
Returns:

(24.1) \( \text{result} - N \) for the overload in namespace \( \text{std} \).

(24.2) \( \{\text{last}, \text{result} - N\} \) for the overloads in namespace \( \text{ranges} \).

Complexity: Exactly \( N \) assignments.

27.7.2 Move

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator move(InputIterator first, InputIterator last,
                                OutputIterator result);
```

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_movable<I, O>
constexpr ranges::move_result<I, O>
ranges::move(I first, S last, O result);
```

```
template<input_range R, weakly_incrementable O>
requires indirectly_movable<iterator_t<R>, O>
constexpr ranges::move_result<borrowed_iterator_t<R>, O>
ranges::move(R&& r, O result);
```

1. Let \( E \) be

(1.1) \( \text{std}::\text{move}(*\text{(first} + n)) \) for the overload in namespace \( \text{std} \);

(1.2) \( \text{ranges}::\text{iter}\_\text{move}(\text{first} + n) \) for the overloads in namespace \( \text{ranges} \).

Let \( N \) be \( \text{last} - \text{first} \).

2. Preconditions: result is not in the range \( [\text{first}, \text{last}) \).

3. Effects: Moves elements in the range \( [\text{first}, \text{last}) \) into the range \( [\text{result}, \text{result} + N) \) starting from \( \text{first} \) and proceeding to \( \text{last} \). For each non-negative integer \( n < N \), performs \( *(\text{result} + n) = E \).

4. Returns:

(4.1) \( \text{result} + N \) for the overload in namespace \( \text{std} \).

(4.2) \( \{\text{last}, \text{result} + N\} \) for the overloads in namespace \( \text{ranges} \).

Complexity: Exactly \( N \) assignments.

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 move(ExecutionPolicy&& policy,
                       ForwardIterator1 first, ForwardIterator1 last,
                       ForwardIterator2 result);
```

```
template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
requires indirectly_movable<I1, I2>
constexpr ranges::move_backward_result<I1, I2>
ranges::move_backward(I1 first, S1 last, I2 result);
```

§ 27.7.2
template<bidirectional_range R, bidirectional_iterator I>
requires indirectly_movable<iterator_t<R>, I>
ranges::move_backward_result<borrowed_iterator_t<R>, I>
ranges::move_backward(R&& r, I result);

Let \( E \) be
\[(1.1) \quad \text{std::move(*((last - n)) \ for \ the \ overload \ in \ namespace \ std;}
\]
\[(1.2) \quad \text{ranges::iter_move(last - n) \ for \ the \ overloads \ in \ namespace \ ranges.}
\]
Let \( N \) be \( \text{last - first} \).

\[\text{Preconditions: result is not in the range } \text{[first, last].}\]

\[\text{Effects: Moves elements in the range } \text{[first, last)} \text{ into the range } \text{[result - N, result)} \text{ starting from last - 1 and proceeding to first.}\]

\[\text{For each positive integer } n \leq N, \text{performs } *\text{(result - n)} = E.\]

\[\text{Returns:}
\]
\[(1.1) \quad \text{result - N \ for \ the \ overload \ in \ namespace \ std.}
\]
\[(1.2) \quad \text{[last, result - N) \ for \ the \ overloads \ in \ namespace \ ranges.}
\]

\[\text{Complexity: Exactly } N \text{ assignments.}\]

\[\text{§ 27.7.3 Swap} \quad [\text{alg.swap}]
\]
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
swap_ranges(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
requires indirectly_swappable<I1, I2>
ranges::swap_ranges_result<I1, I2>
ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);

template<input_range R1, input_range R2>
requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::swap_ranges(R1&& r1, R2&& r2);

Let:
\[(1.1) \quad \text{last2 be first2 + (last1 - first1) \ for \ the \ overloads \ with \ no \ parameter \ named \ last2;}
\]
\[(1.2) \quad \text{M be min(last1 - first1, last2 - first2).}
\]

\[\text{Preconditions: The two ranges } \text{[first1, last1)} \text{ and } \text{[first2, last2)} \text{ do not overlap. For the overloads in namespace std, *[(first1 + n)] is swappable with (16.4.4.3) *[(first2 + n)].}
\]

\[\text{Effects: For each non-negative integer } n < M \text{ performs:}
\]
\[(3.1) \quad \text{swap(*[(first1 + n)], *[(first2 + n)]) \ for \ the \ overloads \ in \ namespace \ std;}
\]
\[(3.2) \quad \text{ranges::iter_swap(first1 + n, first2 + n) \ for \ the \ overloads \ in \ namespace \ ranges.}
\]

\[\text{Returns:}
\]
\[(4.1) \quad \text{last2 \ for \ the \ overloads \ in \ namespace \ std.}
\]
\[(4.2) \quad \text{[first1 + M, first2 + M) \ for \ the \ overloads \ in \ namespace \ ranges.}
\]

\[\text{Complexity: Exactly } M \text{ swaps.}\]

\[\text{move\_backward \ can \ be \ used \ instead \ of \ move \ when \ last \ is \ in \ the \ range } \text{[result - N, result).}\]
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);

Preconditions: a and b are dereferenceable. *a is swappable with (16.4.4.3) *b.

Effects: As if by swap(*a, *b).

27.7.4  Transform

Let:
  —  (1.1)  last2 be first2 + (last1 - first1) for the overloads with parameter first2 but no parameter last2;
(1.2) — let \( N \) be \( \text{last1} - \text{first1} \) for unary transforms, or \( \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}) \) for binary transforms;

(1.3) — let \( E \) be

(1.3.1) — \( \text{op}(*\text{(first1 + (i - result)})) \) for unary transforms defined in namespace std;

(1.3.2) — \( \text{binary_op}(*\text{(first1 + (i - result)}), *\text{(first2 + (i - result)}) \) for binary transforms defined in namespace std;

(1.3.3) — \( \text{invoke} \text{op, invoke(proj, *\text{(first1 + (i - result)})} \) for unary transforms defined in namespace ranges;

(1.3.4) — \( \text{invoke(binary_op, invoke(proj1, *\text{(first1 + (i - result)})}, \text{invoke(proj2, *\text{(first2 + (i - result)})} \) for binary transforms defined in namespace ranges.

2 Preconditions: \text{op} and \text{binary_op} do not invalidate iterators or subranges, nor modify elements in the ranges

(2.1) — \([\text{first1},\text{first1} + N] \),

(2.2) — \([\text{first2},\text{first2} + N] \), and

(2.3) — \([\text{result},\text{result} + N] \). 223

3 Effects: Assigns through every iterator \( i \) in the range \([\text{result},\text{result} + N] \) a new corresponding value equal to \( E \).

4 Returns:

(4.1) — \( \text{result} + N \) for the overloads defined in namespace std.

(4.2) — \( \{\text{first1} + N, \text{result} + N\} \) for unary transforms defined in namespace ranges.

(4.3) — \( \{\text{first1} + N, \text{first2} + N, \text{result} + N\} \) for binary transforms defined in namespace ranges.

5 Complexity: Exactly \( N \) applications of \text{op} or \text{binary_op}, and any projections. This requirement also applies to the overload with an ExecutionPolicy.

6 Remarks: \text{result} may be equal to \text{first1} or \text{first2}.

27.7.5 Replace [alg.replace]

```cpp
template<class ForwardIterator, class T>
  constexpr void replace(ForwardIterator first, ForwardIterator last, const T& old_value, const T& new_value);

template<class ExecutionPolicy, class ForwardIterator, class T>
  void replace(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
  constexpr void replace_if(ForwardIterator first, ForwardIterator last, Predicate pred, const T& new_value);

template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
  void replace_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>
  requires indirectly_writable<I, const T2&> && indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>;
  constexpr I ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});

template<input_range R, class T1, class T2, class Proj = identity>
  requires indirectly_writable<iterator_t<R>, const T2&> && indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>;
  constexpr borrowed_iterator_t<R>
    ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});
```

223) The use of fully closed ranges is intentional.
template<
input_iterator I, sentinel_for<I> S, class T, class Proj = identity,
    indirect unary predicate<Projected<I, Proj>> Pred
>constexpr I ranges::replace_if(I first, S last, Pred pred, const T& new_value, Proj proj = {});

template<input_range R, class T, class Proj = identity,
    indirect unary predicate<Projected<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::replace_if(R&& r, Pred pred, const T& new_value, Proj proj = {});

Let \( E \) be

1. \( \text{bool}(\*i == \text{old\_value}) \) for replace;
2. \( \text{bool}(\text{pred}(\*i)) \) for replace\_if;
3. \( \text{bool}((\text{invoke})(\text{proj}, \*i) == \text{old\_value}) \) for ranges::replace;
4. \( \text{bool}((\text{invoke})(\text{pred}, (\text{invoke})(\text{proj}, \*i))) \) for ranges::replace\_if.

**Mandates:** \( \text{new\_value} \) is writable (25.3.1) to \( \text{first} \).

**Effects:** Substitutes elements referred by the iterator \( i \) in the range \([\text{first}, \text{last})\) with \( \text{new\_value} \), when \( E \) is true.

**Returns:** \( \text{last} \) for the overloads in namespace ranges.

**Complexity:** Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.
Let \( E \) be

\[ \begin{align*}
(6.1) & \quad \text{bool}(\ast(first + (i - result)) == old_value) \quad \text{for replace_copy}; \\
(6.2) & \quad \text{bool}(pred(\ast(first + (i - result)))) \quad \text{for replace_copy_if}; \\
(6.3) & \quad \text{bool}(\text{invoke(proj, } \ast(first + (i - result))) == old_value) \quad \text{for ranges::replace_copy}; \\
(6.4) & \quad \text{bool}(\text{invoke(pred, invoke(proj, } \ast(first + (i - result)))) \quad \text{for ranges::replace_copy_if}.
\end{align*} \]

Mandates: The results of the expressions *first and new_value are writable (25.3.1) to result.

Preconditions: The ranges \([first, last)\) and \([result, result + (last - first))\) do not overlap.

Effects: Assigns through every iterator \( i \) in the range \([result, result + (last - first))\) a new corresponding value

\[ \begin{align*}
(9.1) & \quad \text{new_value if } E \text{ is true or} \\
(9.2) & \quad \ast(first + (i - result)) \text{ otherwise.}
\end{align*} \]

Returns:

\[ \begin{align*}
(10.1) & \quad \text{result + (last - first) for the overloads in namespace std.} \\
(10.2) & \quad \{last, result + (last - first)} \text{ for the overloads in namespace ranges.}
\end{align*} \]

Complexity: Exactly \( last - first \) applications of the corresponding predicate and any projection.

### 27.7.6 Fill

\[ \text{[alg.fill]} \]

```
template<class ForwardIterator, class T>
    constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
    void fill(ExecutionPolicy&& exec, 
              ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
    constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
    ForwardIterator fill_n(ExecutionPolicy&& exec, 
                           ForwardIterator first, Size n, const T& value);
```
27.7.7 Generate

template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last,
                     Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last,
              Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
                           ForwardIterator first, Size n, Generator gen);

template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate(O first, S last, F gen);
template<class R, copy_constructible F>
requires invocable<F&> && output_range<R, invoke_result_t<F&>>
constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);
template<input_or_output_iterator O, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

Let $N$ be $\max(0, n)$ for the generate_n algorithms, and $\text{last} - \text{first}$ for the generate algorithms.

Mandates: $\text{Size}$ is convertible to an integral type (7.3.9, 11.4.8).

Effects: Assigns the result of successive evaluations of $\text{gen}()$ through each iterator in the range
$[\text{first}, \text{first} + N)$.

Returns: $\text{first} + N$.

Complexity: Exactly $N$ evaluations of $\text{gen}()$ and assignments.

27.7.8 Remove

template<class ForwardIterator, class T>
constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last,
                                const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator remove(ExecutionPolicy&& exec,
                       ForwardIterator first, ForwardIterator last,
                       const T& value);

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last,
                                    Predicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator remove_if(ExecutionPolicy&& exec,
                          ForwardIterator first, ForwardIterator last,
                          Predicate pred);

template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>>
constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
template<forward_range R, class T, class Proj = identity>
requires permutable<iterator_t<R>>
&& indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>(
ranges::borrowed_subrange_t<R> ranges::remove(R&& r, const T& value, Proj proj = {});
template<permutable I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});

template<forward_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R>
ranges::remove_if(R&& r, Pred pred, Proj proj = {});

Let \( E \) be
1. \( \text{bool(*i == value)} \) for \text{remove};
2. \( \text{bool(pred(*i))} \) for \text{remove_if};
3. \( \text{bool(invoke(proj, *i) == value)} \) for \text{ranges::remove};
4. \( \text{bool(invoke(pred, invoke(proj, *i)))} \) for \text{ranges::remove_if}.

Preconditions: For the algorithms in namespace \text{std}, the type of \*first meets the \text{Cpp17MoveAssignable} requirements (Table 32).

Effects: Eliminates all the elements referred to by iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

Returns: Let \( j \) be the end of the resulting range. Returns:
1. \( j \) for the overloads in namespace \text{std}.
2. \( \{j, \text{last}\} \) for the overloads in namespace \text{ranges}.

Complexity: Exactly \( \text{last - first} \) applications of the corresponding predicate and any projection.

Remarks: Stable (16.4.6.8).

[Note 1: Each element in the range \([\text{ret}, \text{last})\), where \text{ret} is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — end note]
Let $E$ be

\begin{align*}
\text{(8.1)} & \quad \text{bool(*)i == value) for remove_copy;} \\
\text{(8.2)} & \quad \text{bool(pred(*i)) for remove_copy_if;} \\
\text{(8.3)} & \quad \text{bool(invoke(proj, *i) == value) for ranges::remove_copy;} \\
\text{(8.4)} & \quad \text{bool(invoke(pred, invoke(proj, *i)) for ranges::remove_copy_if.}
\end{align*}

Let $N$ be the number of elements in $[\text{first, last})$ for which $E$ is false.

Mandates: $\text{first}$ is writable (25.3.1) to result.

Preconditions: The ranges $[\text{first, last})$ and $[\text{result, result + (last - first})$ do not overlap.

[Note 2: For the overloads with an ExecutionPolicy, there might be a performance cost if iterator_traits<ForwardIterator>::value_type does not meet the Cpp17MoveConstructible (Table 30) requirements.
—end note]

Effects: Copies all the elements referred to by the iterator $i$ in the range $[\text{first, last})$ for which $E$ is false.

Returns:

\begin{align*}
\text{(13.1)} & \quad \text{result + N, for the algorithms in namespace std.} \\
\text{(13.2)} & \quad \text{\{last, result + N\}, for the algorithms in namespace ranges.}
\end{align*}

Complexity: Exactly $\text{last - first}$ applications of the corresponding predicate and any projection.

Remarks: Stable (16.4.6.8).

### 27.7.9 Unique

[alg.unique]

\begin{verbatim}
template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity, indirect_equivalence_relation<projected<I>, Proj>> C = ranges::equal_to>
constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity, indirect_equivalence_relation<iterator_t<R>, Proj>> C = ranges::equal_to>
requires permutable<iterator_t<R>>
ranges::unique(R&& r, C comp = {}, Proj proj = {});

Let $\text{pred}$ be equal_to{} for the overloads with no parameter $\text{pred}$, and let $E$ be

\begin{align*}
\text{(1.1)} & \quad \text{bool(pred(*(i - 1), *i)) for the overloads in namespace std;}
\end{align*}
\end{verbatim}
— \( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *(\text{i} - 1)), \text{invoke}(\text{proj}, *\text{i}))) \) for the overloads in namespace ranges.

**Preconditions:** For the overloads in namespace std, \( \text{pred} \) is an equivalence relation and the type of 
*first meets the Cpp17MoveAssignable requirements (Table 32).

**Effects:** For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator \( \text{i} \) in the range \([\text{first} + 1, \text{last})\) for which \( E \) is true.

**Returns:** Let \( j \) be the end of the resulting range. Returns:
— \( j \) for the overloads in namespace std.
— \{\( j \), last\} for the overloads in namespace ranges.

**Complexity:** For nonempty ranges, exactly \((\text{last} - \text{first}) - 1\) applications of the corresponding predicate and no more than twice as many applications of any projection.

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
            OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result);

template<class InputIterator, class OutputIterator,
         class BinaryPredicate>
constexpr OutputIterator
unique_copy(InputIterator first, InputIterator last,
            OutputIterator result, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator2
unique_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 last,
            ForwardIterator2 result, BinaryPredicate pred);
```

Let \( \text{pred} \) be \text{equal_to}\{\} for the overloads in namespace std with no parameter \( \text{pred} \), and let \( E \) be

— \( \text{bool}(\text{pred}(*\text{i}, *(\text{i} - 1))) \) for the overloads in namespace std;
— \( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *\text{i}), \text{invoke}(\text{proj}, *(\text{i} - 1)))) \) for the overloads in namespace ranges.

**Mandates:** *first is writable (25.3.1) to result.

**Preconditions:**
— The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) do not overlap.
For the overloads in namespace `std`:

- The comparison function is an equivalence relation.

For the overloads with no `ExecutionPolicy`, let T be the value type of `InputIterator`. If `InputIterator` meets the `Cpp17ForwardIterator` requirements, then there are no additional requirements for T. Otherwise, if `OutputIterator` meets the `Cpp17ForwardIterator` requirements and its value type is the same as T, then T meets the `Cpp17CopyAssignable` (Table 33) requirements. Otherwise, T meets both the `Cpp17CopyConstructible` (Table 31) and `Cpp17CopyAssignable` requirements.

[Note 1: For the overloads with an `ExecutionPolicy`, there might be a performance cost if the value type of `ForwardIterator1` does not meet both the `Cpp17CopyConstructible` and `Cpp17CopyAssignable` requirements. —end note]

**Effects:** Copies only the first element from every consecutive group of equal elements referred to by the iterator i in the range `[first, last)` for which E holds.

**Returns:**

- `result + N` for the overloads in namespace `std`.
- `{last, result + N}` for the overloads in namespace `ranges`.

**Complexity:** Exactly `last - first - 1` applications of the corresponding predicate and no more than twice as many applications of any projection.

### 27.7.10 Reverse

```cpp
template<class BidirectionalIterator>
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void reverse(ExecutionPolicy&& exec,
             BidirectionalIterator first, BidirectionalIterator last);

template<bidirectional_iterator I, sentinel_for<I> S>
requires permutable<I>
constexpr I ranges::reverse(I first, S last);

template<bidirectional_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
```

**Preconditions:** For the overloads in namespace `std`, `BidirectionalIterator` meets the `Cpp17Value-Swappable` requirements (16.4.4.3).

**Effects:** For each non-negative integer `i < (last - first) / 2`, applies `std::iter_swap` or `ranges::iter_swap` for the overloads in namespace `ranges`, to all pairs of iterators `first + i`, `(last - i) - 1`.

**Returns:** `last` for the overloads in namespace `ranges`.

**Complexity:** Exactly `(last - first)/2` swaps.

```cpp
template<class BidirectionalIterator, class OutputIterator>
constexpr OutputIterator reverse_copy(BidirectionalIterator first, BidirectionalIterator last,
                                       OutputIterator result);

template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>
ForwardIterator reverse_copy(ExecutionPolicy&& exec,
                             BidirectionalIterator first, BidirectionalIterator last,
                             ForwardIterator result);

template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::reverse_copy_result<I, O> ranges::reverse_copy(I first, S last, O result);
```
template<bidirectional_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O>
ranges::reverse_copy(R&& r, O result);

Let \( N \) be \( \text{last} - \text{first} \).

Preconditions: The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + N)\) do not overlap.

Effects: Copies the range \([\text{first}, \text{last})\) to the range \([\text{result}, \text{result} + N)\) such that for every non-negative integer \( i < N \) the following assignment takes place: \(*(\text{result} + N - 1 - i) = *(\text{first} + i)\).

Returns:

(8.1) \( \text{result} + N \) for the overloads in namespace \text{std}.

(8.2) \{\text{last}, \text{result} + N\} for the overloads in namespace \text{ranges}.

Complexity: Exactly \( N \) assignments.

27.7.11 Rotate

template<class ForwardIterator>
constexpr ForwardIterator
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);

Preconditions: \([\text{first}, \text{middle})\) and \([\text{middle}, \text{last})\) are valid ranges. For the overloads in namespace \text{std}, \text{ForwardIterator} meets the \text{Cpp17ValueSwappable} requirements (16.4.4.3), and the type of \(*\text{first}\) meets the \text{Cpp17MoveConstructible} (Table 30) and \text{Cpp17MoveAssignable} (Table 32) requirements.

Effects: For each non-negative integer \( i < (\text{last} - \text{first}) \), places the element from the position \( \text{first} + i \) into position \( \text{first} + (i + (\text{last} - \text{middle})) \% (\text{last} - \text{first}) \).

[Note 1: This is a left rotate. — end note]

Returns:

(3.1) \( \text{first} + (\text{last} - \text{middle}) \) for the overloads in namespace \text{std}.

(3.2) \{\text{first} + (\text{last} - \text{middle}), \text{last}\} for the overload in namespace \text{ranges}.

Complexity: At most \( \text{last} - \text{first} \) swaps.

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);

Effects: Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

template<class ForwardIterator, class OutputIterator>
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
            OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
rotate_copy(ExecutionPolicy&& exec,
            ForwardIterator1 first, ForwardIterator1 middle, ForwardIterator1 last,
            ForwardIterator2 result);

template<forward_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::rotate_copy_result<I, O>
ranges::rotate_copy(I first, I middle, S last, O result);

Let $N$ be $last - first$.

Preconditions: $[first, middle]$ and $[middle, last)$ are valid ranges. The ranges $[first, last)$ and $[result, result + N)$ do not overlap.

Effects: Copies the range $[first, last)$ to the range $[result, result + N)$ such that for each non-negative integer $i < N$ the following assignment takes place: *(result + i) = *(first + (i + (middle - first)) % N).

Returns:

(9.1) — result + $N$ for the overloads in namespace std.
(9.2) — {last, result + $N$} for the overload in namespace ranges.

Complexity: Exactly $N$ assignments.

template<forward_range R, weakly_incrementable O>
  requires indirectly_copyable<iterator_t<R>, O>
  constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O>
ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);

Effects: Equivalent to:

  return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), result);

27.7.12 Sample [alg.random.sample]

template<class PopulationIterator, class SampleIterator,
  class Distance, class UniformRandomBitGenerator>
SampleIterator sample(PopulationIterator first, PopulationIterator last,
  SampleIterator out, Distance n,
  UniformRandomBitGenerator&& g);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
  requires (forward_iterator<I> || random_access_iterator<O>) &&
  indirectly_copyable<I, O> &&
  uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);

template<input_range R, weakly_incrementable O, class Gen>
  requires (forward_range<R> || random_access_iterator<O>) &&
  indirectly_copyable<iterator_t<R>, O> &&
  uniform_random_bit_generator<remove_reference_t<Gen>>
  O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);

Mandates: For the overload in namespace std, Distance is an integer type and *first is writable (25.3.1) to out.

Preconditions: out is not in the range $[first, last)$. For the overload in namespace std:

(2.1) — PopulationIterator meets the Cpp17InputIterator requirements (25.3.5.3).
(2.2) — SampleIterator meets the Cpp17OutputIterator requirements (25.3.5.4).
(2.3) — SampleIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) unless PopulationIterator meets the Cpp17ForwardIterator requirements (25.3.5.5).
(2.4) — remove_reference_t<UniformRandomBitGenerator> meets the requirements of a uniform random bit generator type (28.5.3.3).

Effects: Copies min(last - first, n) elements (the sample) from $[first, last)$ (the population) to out such that each possible sample has equal probability of appearance.

[Note 1: Algorithms that obtain such effects include selection sampling and reservoir sampling. — end note]

Returns: The end of the resulting sample range.

Complexity: $O(last - first)$.

Remarks:
For the overload in namespace `std`, stable if and only if `PopulationIterator` meets the `Cpp17ForwardIterator` requirements. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.

To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation’s source of randomness.

### 27.7.13 Shuffle

[alg.random.shuffle]

```cpp
template<class RandomAccessIterator, class UniformRandomBitGenerator>
void shuffle(RandomAccessIterator first,
             RandomAccessIterator last,
             UniformRandomBitGenerator&& g);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);
```

```cpp
template<random_access_range R, class Gen>
requires permutable<iterator_t<R>> &&
uniform_random_bit_generator<remove_reference_t<Gen>>
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 **Preconditions:** For the overload in namespace `std`:

   1.1 RandomAccessIterator meets the `Cpp17ValueSwappable` requirements (16.4.4.3).
   1.2 The type remove_reference_t<UniformRandomBitGenerator> meets the uniform random bit generator (28.5.3.3) requirements.

2 **Effects:** Permutes the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

3 **Returns:** last for the overloads in namespace `ranges`.

4 **Complexity:** Exactly `(last - first) - 1` swaps.

5 **Remarks:** To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation’s source of randomness.

### 27.7.14 Shift

[alg.shift]

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
           typename iterator_traits<ForwardIterator>::difference_type n);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
           typename iterator_traits<ForwardIterator>::difference_type n);
```

```cpp
template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);
```

```cpp
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)
```

1 **Preconditions:** `n >= 0` is true. For the overloads in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements.

2 **Effects:** If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer `i < (last - first) - n`. For the overloads without an `ExecutionPolicy` template parameter, does so in order starting from `i = 0` and proceeding to `i = (last - first) - n - 1`.

3 **Returns:** Let `NEW_LAST` be `first + (last - first - n)` if `n < last - first`, otherwise `first`.

(3.1) **NEW_LAST** for the overloads in namespace `std`.

(3.2) `{first, NEW_LAST}` for the overloads in namespace `ranges`. 

§ 27.7.14 1220
Complexity: At most \((last - first) - n\) assignments.

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
shift_right(ForwardIterator first, ForwardIterator last,
          typename iterator_traits<ForwardIterator>::difference_type n);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
          typename iterator_traits<ForwardIterator>::difference_type n);
```

```cpp
template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);
```

```cpp
template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n);
```

Preconditions: \(n \geq 0\) is true. For the overloads in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements, and `ForwardIterator` meets the `Cpp17BidirectionalIterator` requirements (25.3.5.6) or the `Cpp17ValueSwappable` requirements.

Effects: If \(n = 0\) or \(n \geq last - first\), does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer \(i < (last - first) - n\). Does so in order starting from \(i = (last - first) - n - 1\) and proceeding to \(i = 0\) if:

1. For the overload in namespace `std` without an `ExecutionPolicy` template parameter, `ForwardIterator` meets the `Cpp17BidirectionalIterator` requirements,
2. For the overloads in namespace `ranges`, `I` models `bidirectional_iterator`.

Returns: Let `NEW_FIRST` be `first + n` if \(n < last - first\), otherwise `last`.

1. `NEW_FIRST` for the overloads in namespace `std`.
2. `{NEW_FIRST, last}` for the overloads in namespace `ranges`.

Complexity: At most \((last - first) - n\) assignments or swaps.

### 27.8 Sorting and related operations

**27.8.1 General**

The operations in 27.8 defined directly in namespace `std` have two versions: one that takes a function object of type `Compare` and one that uses an `operator<`.

`Compare` is a function object type (22.10) that meets the requirements for a template parameter named `BinaryPredicate` (27.2). The return value of the function call operation applied to an object of type `Compare`, when contextually converted to `bool` (7.3), yields `true` if the first argument of the call is less than the second, and `false` otherwise. `Compare comp` is used throughout for algorithms assuming an ordering relation.

For all algorithms that take `Compare`, there is a version that uses `operator<` instead. That is, `comp(*i, *j)` != `false` defaults to `*i < *j` != `false`. For algorithms other than those described in 27.8.4, `comp` shall induce a strict weak ordering on the values.

The term `strict` refers to the requirement of an irreflexive relation (\(!comp(x, x)\) for all \(x\)), and the term `weak` to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define `equiv(a, b)` as `!comp(a, b) && !comp(b, a)`, then the requirements are that `comp` and `equiv` both be transitive relations:

1. `comp(a, b) && comp(b, c)` implies `comp(a, c)`
2. `equiv(a, b) && equiv(b, c)` implies `equiv(a, c)`

[Note I: Under these conditions, it can be shown that]

3. `equiv` is an equivalence relation,
4. `comp` induces a well-defined relation on the equivalence classes determined by `equiv`, and
5. the induced relation is a strict total ordering.

---

§ 27.8.1
A sequence is sorted with respect to a \texttt{comp} and \texttt{proj} for a comparator and projection \texttt{comp} and \texttt{proj} if for every iterator \texttt{i} pointing to the sequence and every non-negative integer \texttt{n} such that \texttt{i + n} is a valid iterator pointing to an element of the sequence,

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *(\text{i + n})), \text{invoke}(\text{proj}, *\text{i})))
\]
is false.

A sequence \([\text{start,finish}]\) is partitioned with respect to an expression \(f(e)\) if there exists an integer \(n\) such that for all \(0 \leq i < (\text{finish - start})\), \(f(\text{*(start + i)})\) is true if and only if \(i < n\).

In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an \texttt{operator==}, but an equivalence relation induced by the strict weak ordering. That is, two elements \(a\) and \(b\) are considered equivalent if and only if \(!(a < b) \&\& !(b < a)\).

### 27.8.2 Sorting

#### 27.8.2.1 sort

\[\text{sort}\]

\begin{verbatim}
template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::sort(R&& r, Comp comp = {}, Proj proj = {});
\end{verbatim}

Let \texttt{comp} be \texttt{less{}} and \texttt{proj} be \texttt{identity{}} for the overloads with no parameters by those names.

\textbf{Preconditions:} For the overloads in namespace \texttt{std, RandomAccessIterator} meets the \texttt{Cpp17Value-Swappable} requirements (16.4.4.3) and the type of \texttt{*first} meets the \texttt{Cpp17MoveConstructible} (Table 30) and \texttt{Cpp17MoveAssignable} (Table 32) requirements.

\textbf{Effects:} Sorts the elements in the range \([\text{first, last}]\) with respect to \texttt{comp} and \texttt{proj}.

\textbf{Returns:} last for the overloads in namespace \texttt{ranges}.

\textbf{Complexity:} Let \(N\) be \texttt{last - first}. \(\Theta(N \log N)\) comparisons and projections.

#### 27.8.2.2 stable_sort

\[\text{stable_sort}\]

\begin{verbatim}
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
\end{verbatim}
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
    RandomAccessIterator first, RandomAccessIterator last,
    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});

Let \texttt{comp} be \texttt{less\{} and \texttt{proj} be \texttt{identity\{} for the overloads with no parameters by those names.

2 Preconditions: For the overloads in namespace \texttt{std}, \texttt{RandomAccessIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.4.4.3) and the type of \texttt{*first} meets the \texttt{Cpp17MoveConstructible} (Table 30) and \texttt{Cpp17MoveAssignable} (Table 32) requirements.

3 Effects: Sorts the elements in the range \([\texttt{first}, \texttt{last})\) with respect to \texttt{comp} and \texttt{proj}.

4 Returns: \texttt{last} for the overloads in namespace \texttt{ranges}.

5 Complexity: Let \(N\) be \texttt{last} - \texttt{first}. If enough extra memory is available, \(N \log(N)\) comparisons. Otherwise, at most \(N \log^2(N)\) comparisons. In either case, twice as many projections as the number of comparisons.

6 Remarks: Stable (16.4.6.8).

27.8.2.3 partial_sort

template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
requires sortable<I, Comp, Proj>
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});

1 Let \texttt{comp} be \texttt{less\{} and \texttt{proj} be \texttt{identity\{} for the overloads with no parameters by those names.

2 Preconditions: \texttt{[first, middle)} and \texttt{[middle, last)} are valid ranges. For the overloads in namespace \texttt{std}, \texttt{RandomAccessIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.4.4.3) and the type of \texttt{*first} meets the \texttt{Cpp17MoveConstructible} (Table 30) and \texttt{Cpp17MoveAssignable} (Table 32) requirements.
Effects: Places the first `middle - first` elements from the range `[first, last)` as sorted with respect to `comp` and `proj` into the range `[first, middle)`. The rest of the elements in the range `[middle, last)` are placed in an unspecified order.

Returns: `last` for the overload in namespace `ranges`.

Complexity: Approximately `(last - first) * log(middle - first)` comparisons, and twice as many projections.

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

Effects: Equivalent to:

```cpp
return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

### 27.8.2.4 partial_sort_copy

```cpp
template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last, 
RandomAccessIterator result_first, RandomAccessIterator result_last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, 
RandomAccessIterator result_first, RandomAccessIterator result_last);
```

```cpp
template<class InputIterator, class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last, 
RandomAccessIterator result_first, RandomAccessIterator result_last, 
Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator, class Compare>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, 
RandomAccessIterator result_first, RandomAccessIterator result_last, 
Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2, 
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
constexpr ranges::partial_sort_copy_result<I1, I2>
ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last, 
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<input_range R1, random_access_range R2, class Comp = ranges::less, 
class Proj1 = identity, class Proj2 = identity>
requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
sortable<iterator_t<R2>, Comp, Proj2> &&
indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>, 
projected<iterator_t<R2>, Proj2>>
constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::partial_sort_copy(R1&& r1, R2&& r2, result_r, Comp comp = {}, 
Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let \( N \) be \( \min(last - first, result_last - result_first) \). Let `comp` be `less{}`, and `proj1` and `proj2` be `identity{}` for the overloads with no parameters by those names.

§ 27.8.2.4 1224
Mandates: For the overloads in namespace std, the expression \*first is writable (25.3.1) to result_first.

Preconditions: For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3), the type of \*result_first meets the Cpp17MoveConstructible (Table 30) and Cpp17MoveAssignable (Table 32) requirements.

For iterators \texttt{a1} and \texttt{b1} in \([\texttt{first}, \texttt{last})\), and iterators \texttt{x2} and \texttt{y2} in \([\texttt{result_first}, \texttt{result_last})\), after evaluating the assignment \texttt{*y2 = *b1}, let \(E\) be the value of
\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj1}, \*\texttt{a1}), \text{invoke}(\text{proj2}, \*\texttt{y2}))).
\]
Then, after evaluating the assignment \texttt{*x2 = *a1}, \(E\) is equal to
\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, \*\texttt{x2}), \text{invoke}(\text{proj2}, \*\texttt{y2}))).
\]
[Note 1: Writing a value from the input range into the output range does not affect how it is ordered by \texttt{comp} and \texttt{proj1} or \texttt{proj2}. — end note]

Effects: Places the first \(N\) elements as sorted with respect to \texttt{comp} and \texttt{proj2} into the range \([\texttt{result_first}, \texttt{result_first} + N)\).

Returns:
\[
\begin{align*}
& \text{(6.1) } \texttt{result_first} + N \text{ for the overloads in namespace std.} \\
& \text{(6.2) } \{\texttt{last}, \texttt{result_first} + N\} \text{ for the overloads in namespace ranges.}
\end{align*}
\]

Complexity: Approximately \((\texttt{last} - \texttt{first}) \ast \log N\) comparisons, and twice as many projections.

27.8.2.5 \texttt{is_sorted} \[is.sorted\]

\begin{verbatim}
template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);

Effects: Equivalent to: return is_sorted_until(first, last) == last;

template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last);

Effects: Equivalent to: return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                        Compare comp);

Effects: Equivalent to: return is_sorted_until(first, last, comp) == last;

template<class ExecutionPolicy, class Compare, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);

Effects: Equivalent to: return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_sorted(I first, S last, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_sorted_until(first, last, comp, proj) == last;

template<class ForwardIterator>
constexpr ForwardIterator is_sorted_until(ForwardIterator first, ForwardIterator last);
\end{verbatim}
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last,
Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I
ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
indirect_strict_weak_order<iterator_t<R>, Proj>>
ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});

Let comp be \texttt{less{}} and proj be \texttt{identity{}} for the overloads with no parameters by those names.

Returns: The last iterator \(i\) in \([\text{first}, \text{last}]\) for which the range \([\text{first}, i)\) is sorted with respect to \(\text{comp}\) and \(\text{proj}\).

Complexity: Linear.

27.8.3 Nth element

§ 27.8.3 1226
Complexity: For the overloads with no \texttt{ExecutionPolicy}, linear on average. For the overloads with an \texttt{ExecutionPolicy}, $\Theta(N)$ applications of the predicate, and $\Theta(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});

Effects: Equivalent to:

\[
\text{return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);}
\]

27.8.4 Binary search

27.8.4.1 General

All of the algorithms in 27.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

27.8.4.2 lower_bound

\[
\text{template<class ForwardIterator, class T>}
\text{constexpr ForwardIterator}
\text{lower_bound(ForwardIterator first, ForwardIterator last, const T\& value);}
\]

\[
\text{template<class ForwardIterator, class T, class Compare>}
\text{constexpr ForwardIterator}
\text{lower_bound(ForwardIterator first, ForwardIterator last, const T\& value, Compare comp);}
\]

\[
\text{template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,}
\text{indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>}
\text{constexpr I}
\text{ranges::lower_bound(I first, S last, const T\& value, Comp comp = {}, Proj proj = {});}
\]

\[
\text{template<forward_range R, class T, class Proj = identity,}
\text{indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>}
\text{constexpr borrowed_iterator_t<R>}
\text{ranges::lower_bound(R&& r, const T\& value, Comp comp = {}, Proj proj = {});}
\]

1 Let \texttt{comp} be \texttt{less{}} and \texttt{proj} be \texttt{identity{}} for overloads with no parameters by those names.

2 Preconditions: The elements \texttt{e} of \texttt{[first, last]} are partitioned with respect to the expression \texttt{bool(invoke(comp, invoke(proj, e), value))}.

3 Returns: The furthermost iterator \texttt{i} in the range \texttt{[first, last]} such that for every iterator \texttt{j} in the range \texttt{[first, i)}, \texttt{bool(invoke(comp, invoke(proj, *j), value))} is true.

4 Complexity: At most $\log_2(\text{last} - \text{first}) + \Theta(1)$ comparisons and projections.

27.8.4.3 upper_bound

\[
\text{template<class ForwardIterator, class T>}
\text{constexpr ForwardIterator}
\text{upper_bound(ForwardIterator first, ForwardIterator last, const T\& value);}
\]

\[
\text{template<class ForwardIterator, class T, class Compare>}
\text{constexpr ForwardIterator}
\text{upper_bound(ForwardIterator first, ForwardIterator last, const T\& value, Compare comp);}
\]
template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, 
  indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity, 
  indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
  constexpr borrowed_iterator_t<R> ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression !bool(invoke(comp, value, invoke(proj, e))).
3 Returns: The furthermost iterator i in the range [first, last] such that for every iterator j in the range [first, i), !bool(invoke(comp, value, invoke(proj, *j))) is true.
4 Complexity: At most log₂(last - first) + O(1) comparisons and projections.

27.8.4.4 equal_range [equal.range]

template<class ForwardIterator, class T>
  constexpr pair<ForwardIterator, ForwardIterator> equal_range(ForwardIterator first, 
  ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
  constexpr pair<ForwardIterator, ForwardIterator> equal_range(ForwardIterator first, 
  ForwardIterator last, const T& value, 
  Compare comp);

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expressions bool(invoke(comp, invoke(proj, e), value)) and !bool(invoke(comp, value, invoke(proj, e))). Also, for all elements e of [first, last), bool(comp(e, value)) implies !bool(comp(value, e)) for the overloads in namespace std.
3 Returns:
(3.1) — For the overloads in namespace std:
  {lower_bound(first, last, value, comp),
   upper_bound(first, last, value, comp)}
(3.2) — For the overloads in namespace ranges:
  {ranges::lower_bound(first, last, value, comp, proj),
   ranges::upper_bound(first, last, value, comp, proj)}
4 Complexity: At most 2 * log₂(last - first) + O(1) comparisons and projections.

27.8.4.5 binary_search [binary.search]

template<class ForwardIterator, class T>
  constexpr bool binary_search(ForwardIterator first, ForwardIterator last, 
  const T& value);
template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last,  
const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,  
indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},  
Proj proj = {});

template<forward_range R, class T, class Proj = identity,  
indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {},  
Proj proj = {});

Let \( \text{comp} \) be \( \text{less}{} \) and \( \text{proj} \) be \( \text{identity}{} \) for overloads with no parameters by those names.

Preconditions: The elements \( e \) of \([\text{first}, \text{last})\) are partitioned with respect to the expressions 
\( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, e), \text{value})) \) and \( \neg \text{bool}(\text{invoke}(\text{comp}, \text{value, invoke}(\text{proj}, e))) \). Also, for all elements \( e \) of \([\text{first}, \text{last})\), \( \text{bool}(\text{comp}(e, \text{value})) \) implies \( \neg \text{bool}(\text{comp}(\text{value, e})) \) for the overloads in namespace std.

Returns: true if and only if for some iterator \( i \) in the range \([\text{first}, \text{last})\), \( \neg \text{bool}(\text{invoke}(\text{comp, invoke}(\text{proj}, *i), \text{value})) \) \&\& \( \neg \text{bool}(\text{invoke}(\text{comp, value, invoke}(\text{proj}, *i))) \) is true.

Complexity: At most \( \log_2(\text{last} - \text{first}) + \Theta(1) \) comparisons and projections.

### 27.8.5 Partitions

[alg.partitions]

template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,  
ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,  
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,  
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});

Let \( \text{proj} \) be \( \text{identity}{} \) for the overloaded with no parameter named \( \text{proj} \).

Returns: true if and only if the elements \( e \) of \([\text{first}, \text{last})\) are partitioned with respect to the expression 
\( \text{bool}(\text{invoke}(\text{pred, invoke}(\text{proj}, e))) \).

Complexity: Linear. At most \( \text{last} - \text{first} \) applications of \( \text{pred} \) and \( \text{proj} \).
ranges::partition(R&& r, Pred pred, Proj proj = {});

Let \texttt{proj} be \texttt{identity()} for the overloads with no parameter named \texttt{proj} and let \(E(x)\) be \texttt{bool(invoke(pred, invoke(proj, x)))}.

**Preconditions:** For the overloads in namespace \texttt{std}, \texttt{ForwardIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.4.4.3).

**Effects:** Places all the elements \(e\) in \([\texttt{first}, \texttt{last})\) that satisfy \(E(e)\) before all the elements that do not.

**Returns:** Let \(i\) be an iterator such that \(E(*j)\) is \texttt{true} for every iterator \(j\) in \([\texttt{first}, i)\) and \texttt{false} for every iterator \(j\) in \([i, \texttt{last})\). Returns:

- \(i\) for the overloads in namespace \texttt{std}.
- \{\texttt{i, last}\} for the overloads in namespace \texttt{ranges}.

**Complexity:** Let \(N = \texttt{last} - \texttt{first}:

- For the overload with no \texttt{ExecutionPolicy}, exactly \(N\) applications of the predicate and projection. At most \(N/2\) swaps if the type of \texttt{first} meets the \texttt{Cpp17BidirectionalIterator} requirements for the overloads in namespace \texttt{std} or models \texttt{bidirectional_iterator} for the overloads in namespace \texttt{ranges}, and at most \(N\) swaps otherwise.

- For the overload with an \texttt{ExecutionPolicy}, \(\mathcal{O}(N \log N)\) swaps and \(\mathcal{O}(N)\) applications of the predicate.

\[
\begin{align*}
\text{template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,} \\
\text{indirect_unary_predicate<projected<I>, Proj>} & \text{ Pred>}
\text{ requires permuturable<I>} \\
\text{ subrange<I>} & \text{ ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});} \\
\text{template<bidirectional_range R, class Proj = identity,} \\
\text{indirect_unary_predicate<projected<iterator_t<R>>, Proj>} & \text{ Pred>}
\text{ requires permutatable<iterator_t<R>>} \\
\text{borrowed_subrange_t<R>} & \text{ ranges::stable_partition(R&& r, Pred pred, Proj proj = {});} \\
\end{align*}
\]

Let \texttt{proj} be \texttt{identity()} for the overloads with no parameter named \texttt{proj} and let \(E(x)\) be \texttt{bool(invoke(pred, invoke(proj, x)))}.

**Preconditions:** For the overloads in namespace \texttt{std}, \texttt{BidirectionalIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.4.4.3) and the type of \texttt{*first} meets the \texttt{Cpp17MoveConstructible} (Table 30) and \texttt{Cpp17MoveAssignable} (Table 32) requirements.

**Effects:** Places all the elements \(e\) in \([\texttt{first}, \texttt{last})\) that satisfy \(E(e)\) before all the elements that do not. The relative order of the elements in both groups is preserved.

**Returns:** Let \(i\) be an iterator such that for every iterator \(j\) in \([\texttt{first}, i)\), \(E(*j)\) is \texttt{true}, and for every iterator \(j\) in the range \([i, \texttt{last})\), \(E(*j)\) is \texttt{false}. Returns:

- \(i\) for the overloads in namespace \texttt{std}.
- \{\texttt{i, last}\} for the overloads in namespace \texttt{ranges}.

**Complexity:** Let \(N = \texttt{last} - \texttt{first}:

- For the overloads with no \texttt{ExecutionPolicy}, at most \(N \log N\) swaps, but only \(\mathcal{O}(N)\) swaps if there is enough extra memory. Exactly \(N\) applications of the predicate and projection.

- For the overload with an \texttt{ExecutionPolicy}, \(\mathcal{O}(N \log N)\) swaps and \(\mathcal{O}(N)\) applications of the predicate.
template<typename OutputIterator1, typename OutputIterator2, typename Predicate>
OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred();

template<typename ExecutionPolicy, typename ForwardIterator1, typename ForwardIterator2, typename Predicate>
pair<ForwardIterator1, ForwardIterator2>
partition_copy(ExecutionPolicy&& exec,
ForwadIterator first, ForwardIterator last,
ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<typename InputIterator, typename Sentinel, typename ForwardIterator1, typename ForwardIterator2, typename Predicate = identity, typename Proj = identity, typename Pred = indirect_unary_predicate<projected<InputIterator, Proj>>>
requires indirectly_copyable<InputIterator, ForwardIterator1> && indirectly_copyable<InputIterator, ForwardIterator2>
constexpr ranges::partition_copy_result<InputIterator, ForwardIterator1, ForwardIterator2>
ranges::partition_copy(InputIterator first, Sentinel last, ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred, Proj proj = {});

template<typename Range, typename ForwardIterator1, typename ForwardIterator2, typename Predicate = identity, typename Proj = identity, typename Pred = indirect_unary_predicate<projected<iterator_t<Range>, Proj>>>
requires indirectly_copyable<iterator_t<Range>, ForwardIterator1> && indirectly_copyable<iterator_t<Range>, ForwardIterator2>
constexpr borrowed_iterator_t<Range>
ranges::partition_copy(Range&& r, ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred, Proj proj = {});

Let proj be identity() for the overloads with no parameter named proj and let \( E(x) \) be \( \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, x))) \).

Mandates: For the overloads in namespace std, the expression \(*\text{first}\) is writable (25.3.1) to out_true and out_false.

Preconditions: The input range and output ranges do not overlap.

[Note 1: For the overload with an ExecutionPolicy, there might be a performance cost if first’s value type does not meet the \texttt{Cpp17CopyConstructible} requirements. —end note]

Effects: For each iterator \( i \) in [first, last], copies \( *i \) to the output range beginning with out_true if \( E(*i) \) is true, or to the output range beginning with out_false otherwise.

Returns: Let \( o1 \) be the end of the output range beginning at out_true, and \( o2 \) the end of the output range beginning at out_false. Returns

\( - \{o1, o2\} \) for the overloads in namespace std.

\( - \{\text{last}, o1, o2\} \) for the overloads in namespace ranges.

Complexity: Exactly \( \text{last} - \text{first} \) applications of \texttt{pred} and \texttt{proj}.

27.8.6  
Merge [alg.merge]

\( \text{§ 27.8.6} \)
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
     InputIterator2 first2, InputIterator2 last2,
     OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result);

template<class InputIterator1, class InputIterator2,
         class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
     InputIterator2 first2, InputIterator2 last2,
     OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
          weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
          class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
          class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::merge(R1&& r1, R2&& r2, O result,
              Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( N \) be \((last1 - first1) + (last2 - first2)\). Let \( \text{comp} \) be \( \text{less}() \), \( \text{proj1} \) be \( \text{identity}() \), and \( \text{proj2} \) be \( \text{identity}() \), for the overloads with no parameters by those names.

Preconditions: The ranges \([first1, last1)\) and \([first2, last2)\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively. The resulting range does not overlap with either of the original ranges.

Effects: Copies all the elements of the two ranges \([first1, last1)\) and \([first2, last2)\) into the range \([\text{result}, \text{result}\_\text{last})\), where \( \text{result}\_\text{last} = \text{result} + N \). If an element \( a \) precedes \( b \) in an input range, \( a \) is copied into the output range before \( b \). If \( e1 \) is an element of \([first1, last1)\) and \( e2 \) of \([first2, last2)\), \( e2 \) is copied into the output range before \( e1 \) if and only if \( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, e2), \text{invoke}(\text{proj1}, e1))) \) is true.

Returns:

(4.1) \( \text{result}\_\text{last} \) for the overloads in namespace \( \text{std} \).
(4.2) \{last1, last2, result\_last\} for the overloads in namespace \( \text{ranges} \).

Complexity:

(5.1) For the overloads with no \( \text{ExecutionPolicy} \), at most \( N - 1 \) comparisons and applications of each projection.
(5.2) For the overloads with an \( \text{ExecutionPolicy} \), \( \mathcal{O}(N) \) comparisons.

Remarks: Stable (16.4.6.8).
template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first, 
    BidirectionalIterator middle, 
    BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec, 
    BidirectionalIterator first, 
    BidirectionalIterator middle, 
    BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first, 
    BidirectionalIterator middle, 
    BidirectionalIterator last, Compare comp);

template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec, 
    BidirectionalIterator first, 
    BidirectionalIterator middle, 
    BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less, 
    class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Preconditions: [first,middle) and [middle,last) are valid ranges sorted with respect to comp and proj. For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 30) and Cpp17MoveAssignable (Table 32) requirements.

Effects: Merges two sorted consecutive ranges [first,middle) and [middle,last), putting the result of the merge into the range [first,last). The resulting range is sorted with respect to comp and proj.

Returns: last for the overload in namespace ranges.

Complexity: Let \( N = \text{last} - \text{first} \):

- For the overloads with no ExecutionPolicy, and if enough additional memory is available, exactly \( N - 1 \) comparisons.
- Otherwise, \( \Theta(N \log N) \) comparisons.

In either case, twice as many projections as comparisons.

Remarks: Stable (16.4.6.8).

template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});

Effects: Equivalent to:

return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);

27.8.7 Set operations on sorted structures

27.8.7.1 General

Subclause 27.8.7 defines all the basic set operations on sorted structures. They also work with multisets (24.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to multisets in a standard way by defining set_union to contain the maximum number of occurrences of every element, set_intersection to contain the minimum, and so on.

27.8.7.2 includes

template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1, 
    InputIterator2 first2, InputIterator2 last2);
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
  ForwardIterator1 first1, ForwardIterator1 last1,
  ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
  InputIterator2 first2, InputIterator2 last2, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
  ForwardIterator1 first1, ForwardIterator1 last1,
  ForwardIterator2 first2, ForwardIterator2 last2,
  Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
  class Proj1 = identity, class Proj2 = identity,
  indirect_strict_weak_order<projected<I1, Proj1>,
    projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
  Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Proj1 = identity,
  class Proj2 = identity,
  indirect_strict_weak_order<iterator_t<R1>, Proj1>,
  projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {},
  Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let comp be less{}, proj1 be identity{}, and proj2 be identity{}, for the overloads with no
   parameters by those names.
2 Preconditions: The ranges [first1, last1) and [first2, last2) are sorted with respect to comp and
   proj1 or proj2, respectively.
3 Returns: true if and only if [first2, last2) is a subsequence of [first1, last1).
   [Note 1: A sequence S is a subsequence of another sequence T if S can be obtained from T by removing some,
    all, or none of T’s elements and keeping the remaining elements in the same order. — end note]
4 Complexity: At most 2 * ((last1 - first1) + (last2 - first2)) - 1 comparisons and applications
   of each projection.

27.8.7.3 set_union

template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
  InputIterator2 first2, InputIterator2 last2,
  OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
  class ForwardIterator3>
ForwardIterator
set_union(ExecutionPolicy&& exec,
  ForwardIterator1 first1, ForwardIterator1 last1,
  ForwardIterator2 first2, ForwardIterator2 last2,
  ForwardIterator3 result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
  InputIterator2 first2, InputIterator2 last2,
  OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
  class ForwardIterator3, class Compare>
ForwardIterator
set_union(ExecutionPolicy&& exec,
  ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O>, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<I1, I2, O>
ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( \text{comp} \) be less\{\}, and \( \text{proj1} \) and \( \text{proj2} \) be identity\{\} for the overloads with no parameters by those names.

2. **Preconditions:** The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively. The resulting range does not overlap with either of the original ranges.

3. **Effects:** Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

4. **Returns:** Let \( \text{result.last} \) be the end of the constructed range. Returns

\[
\text{(4.1)} \quad \text{result.last} \\
\text{(4.2)} \quad \{\text{last1}, \text{last2}, \text{result.last}\}
\]

5. **Complexity:** At most \( 2 \ast ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1 \) comparisons and applications of each projection.

6. **Remarks:** Stable (16.4.6.8). If \([\text{first1}, \text{last1})\) contains \( m \) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \( n \) elements that are equivalent to them, then all \( m \) elements from the first range are copied to the output range, in order, and then the final \( \max(n - m, 0) \) elements from the second range are copied to the output range, in order.

### 27.8.7.4 set_intersection

**set.intersection**

```cpp
template<class InputIterator1, class InputIterator2,
class OutputIterator>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);

template<class InputIterator1, class InputIterator2,
class OutputIterator, class Compare>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
```
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, 
weakly_incrementable O, class Comp = ranges::less, 
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result, 
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

27.8.7.5 set_difference

Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by 
those names.

Preconditions: The ranges [first1, last1) and [first2, last2) are sorted with respect to comp and 
proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.

Effects: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements 
that are present in both of the ranges.

Returns: Let result_last be the end of the constructed range. Returns
— result_last for the overloads in namespace std.
— {last1, last2, result_last} for the overloads in namespace ranges.

Complexity: At most \(2 \times ((last1 - first1) + (last2 - first2)) - 1\) comparisons and applications 
of each projection.

Remarks: Stable (16.4.6.8). If [first1, last1) contains \(m\) elements that are equivalent to each other 
and [first2, last2) contains \(n\) elements that are equivalent to them, the first \(\min(m, n)\) elements are 
copied from the first range to the output range, in order.
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O>
ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
ranges::set_difference(R1&& r1, R2&& r2, O result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let \texttt{comp} be \texttt{less{}}, and \texttt{proj1} and \texttt{proj2} be \texttt{identity{}} for the overloads with no parameters by those names.

Preconditions: The ranges \([\texttt{first1}, \texttt{last1})\) and \([\texttt{first2}, \texttt{last2})\) are sorted with respect to \texttt{comp} and \texttt{proj1} or \texttt{proj2}, respectively. The resulting range does not overlap with either of the original ranges.

Effects: Copies the elements of the range \([\texttt{first1}, \texttt{last1})\) which are not present in the range \([\texttt{first2}, \texttt{last2})\) to the range beginning at \texttt{result}. The elements in the constructed range are sorted.

Returns: Let \texttt{result\_last} be the end of the constructed range. Returns

\begin{align*}
1 & \text{— } \texttt{result\_last} \text{ for the overloads in namespace \texttt{std}.} \\
2 & \text{— } \{\texttt{last1}, \texttt{result\_last}\} \text{ for the overloads in namespace \texttt{ranges}.}
\end{align*}

Complexity: At most \(2 * ((\texttt{last1} - \texttt{first1}) + (\texttt{last2} - \texttt{first2})) - 1\) comparisons and applications of each projection.

Remarks: If \([\texttt{first1}, \texttt{last1})\) contains \(m\) elements that are equivalent to each other and \([\texttt{first2}, \texttt{last2})\) contains \(n\) elements that are equivalent to them, the last \(\max(m - n, 0)\) elements from \([\texttt{first1}, \texttt{last1})\) is copied to the output range, in order.

27.8.7.6 \texttt{set\_symmetric\_difference} [set.symmetric.difference]

\begin{verbatim}
template<class InputIterator1, class InputIterator2,
class OutputIterator>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);

template<class InputIterator1, class InputIterator2,
class OutputIterator, class Compare>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);
\end{verbatim}
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<I1, I2, O>
ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
borrowed_iterator_t<R2>, O>
ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( \text{comp} \) be \( \text{less}{} \), and \( \text{proj1} \) and \( \text{proj2} \) be \( \text{identity}{} \) for the overloads with no parameters by those names.

Preconditions: The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively. The resulting range does not overlap with either of the original ranges.

Effects: Copies the elements of the range \([\text{first1}, \text{last1})\) that are not present in the range \([\text{first2}, \text{last2})\), and the elements of the range \([\text{first2}, \text{last2})\) that are not present in the range \([\text{first1}, \text{last1})\) to the range beginning at \( \text{result} \). The elements in the constructed range are sorted.

Returns: Let \( \text{result_last} \) be the end of the constructed range. Returns

\[ \text{result_last} \]

— \( \text{result_last} \) for the overloads in namespace \( \text{std} \).

— \( \{\text{last1}, \text{last2}, \text{result_last}\} \) for the overloads in namespace \( \text{ranges} \).

Complexity: At most \( 2 * ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1 \) comparisons and applications of each projection.

Remarks: Stable (16.4.6.8). If \([\text{first1}, \text{last1})\) contains \( m \) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \( n \) elements that are equivalent to them, then \( |m - n| \) of those elements shall be copied to the output range: the last \( m - n \) of these elements from \([\text{first1}, \text{last1})\) if \( m > n \), and the last \( n - m \) of these elements from \([\text{first2}, \text{last2})\) if \( m < n \). In either case, the elements are copied in order.

27.8.8 Heap operations [alg.heap.operations]

27.8.8.1 General [alg.heap.operations.general]

A random access range \([a, b)\) is a heap with respect to \( \text{comp} \) and \( \text{proj} \) for a comparator and projection \( \text{comp} \) and \( \text{proj} \) if its elements are organized such that:

\[ \text{(1.1)} \]
— With \( N = b - a \), for all \( i, 0 < i < N \), \( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, a[\lfloor i/2 \rfloor])), \text{invoke}(\text{proj}, a[i]))) \) is false.

\[ \text{(1.2)} \]
— \( *a \) may be removed by \( \text{pop_heap} \), or a new element added by \( \text{push_heap} \), in \( \mathcal{O}(\log N) \) time.

These properties make heaps useful as priority queues.

\text{make_heap} \text{ converts a range into a heap and \text{sort_heap} \text{ turns a heap into a sorted sequence.}

27.8.8.2 push_heap [push.heap]

template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});

§ 27.8.8.2 1238
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \text{less\{\}} and \( \text{proj} \) be \text{identity\{\}} for the overloads with no parameters by those names.

**Preconditions:** The range \([\text{first}, \text{last} - 1)\) is a valid heap with respect to \( \text{comp} \) and \( \text{proj} \). For the overloads in namespace std, the type of \*\text{first} meets the \text{Cpp17MoveConstructible} requirements (Table 30) and the \text{Cpp17MoveAssignible} requirements (Table 32).

**Effects:** Places the value in the location \( \text{last} - 1 \) into the resulting heap \([\text{first}, \text{last})\).

**Returns:** last for the overloads in namespace ranges.

**Complexity:** At most \( \log(\text{last} - \text{first}) \) comparisons and twice as many projections.

### 27.8.8.3 pop_heap

```
template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
          class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
```

Let \( \text{comp} \) be \text{less\{\}} and \( \text{proj} \) be \text{identity\{\}} for the overloads with no parameters by those names.

**Preconditions:** The range \([\text{first}, \text{last})\) is a valid non-empty heap with respect to \( \text{comp} \) and \( \text{proj} \). For the overloads in namespace std, \text{RandomAccessIterator} meets the \text{Cpp17ValueSwappable} requirements (16.4.4.3) and the type of \*\text{first} meets the \text{Cpp17MoveConstructible} (Table 30) and \text{Cpp17MoveAssignible} (Table 32) requirements.

**Effects:** Swaps the value in the location \( \text{first} \) with the value in the location \( \text{last} - 1 \) and makes \([\text{first}, \text{last} - 1)\) into a heap with respect to \( \text{comp} \) and \( \text{proj} \).

**Returns:** last for the overloads in namespace ranges.

**Complexity:** At most \( 2 \log(\text{last} - \text{first}) \) comparisons and twice as many projections.

### 27.8.8.4 make_heap

```
template<class RandomAccessIterator>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```
template<class RandomAccessIterator, class Compare>
constexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
          class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::make_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::make_heap(R&& r, Comp comp = {}, Proj proj = {});
```

Let \( \text{comp} \) be \text{less\{\}} and \( \text{proj} \) be \text{identity\{\}} for the overloads with no parameters by those names.
2 Preconditions: For the overloads in namespace std, the type of *first meets the Cpp17MoveConstructible (Table 30) and Cpp17MoveAssignable (Table 32) requirements.

3 Effects: Constructs a heap with respect to comp and proj out of the range [first, last).

4 Returns: last for the overloads in namespace ranges.

5 Complexity: At most 3(last - first) comparisons and twice as many projections.

27.8.8.5 sort_heap

```cpp
template<class RandomAccessIterator>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last, 
                        Compare comp);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, 
          class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::sort_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

2 Preconditions: The range [first, last) is a valid heap with respect to comp and proj. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 30) and Cpp17MoveAssignable (Table 32) requirements.

3 Effects: Sorts elements in the heap [first, last) with respect to comp and proj.

4 Returns: last for the overloads in namespace ranges.

5 Complexity: At most 2N log N comparisons, where N = last - first, and twice as many projections.

27.8.8.6 is_heap

```cpp
template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec, 
             RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last, 
                      Compare comp);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec, 
             RandomAccessIterator first, RandomAccessIterator last, 
             Compare comp);
```

1 Effects: Equivalent to: return is_heap_until(first, last) == last;

2 Effects: Equivalent to: return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

3 Effects: Equivalent to: return is_heap_until(first, last, comp) == last;

4 Effects: Equivalent to: return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

template<class RandomAccessIterator>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
    RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
    Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
    RandomAccessIterator first, RandomAccessIterator last,
    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Returns: The last iterator i in [first, last) for which the range [first, i) is a heap with respect to
comp and proj.

Complexity: Linear.

27.8.9 Minimum and maximum

template<class T>
constexpr const T& min(const T& a, const T& b);

template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
    indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 28).

Returns: The smaller value. Returns the first argument when the arguments are equivalent.

Complexity: Exactly one comparison and two applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr T min(initializer_list<T> r);

template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);
template<
copyable T, class Proj = identity,
    indirect_strict_weak_order<
        projected<const T*, Proj>
    > Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});

template<input_range R, class Proj = identity,
    indirect_strict_weak_order<
        projected<
            iterator_t<R>, Proj
        >
    > Comp = ranges::less>
requires indirectly_copyable_storable<
    iterator_t<R>, range_value_t<R>
>
constexpr range_value_t<R>
ranges::min(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
(Table 28).

Returns: The smallest value in the input range. Returns a copy of the leftmost element when several
elements are equivalent to the smallest.

Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr const T& max(const T& a, const T& b);  
template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);  

template<class T, class Proj = identity,
    indirect_strict_weak_order<
        projected<const T*, Proj>
    > Comp = ranges::less>
constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 28).

Returns: The larger value. Returns the first argument when the arguments are equivalent.

Complexity: Exactly one comparison and two applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr T max(initializer_list<T> r);  
template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);  

template<
copyable T, class Proj = identity,
    indirect_strict_weak_order<
        projected<const T*, Proj>
    > Comp = ranges::less>
constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});

template<input_range R, class Proj = identity,
    indirect_strict_weak_order<
        projected<
            iterator_t<R>, Proj
        >
    > Comp = ranges::less>
requires indirectly_copyable_storable<
    iterator_t<R>, range_value_t<R>
>
constexpr range_value_t<R>
ranges::max(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
(Table 28).

Returns: The largest value in the input range. Returns a copy of the leftmost element when several
elements are equivalent to the largest.

Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<const T&>
ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 28).

Returns: \{b, a\} if b is smaller than a, and \{a, b\} otherwise.

Complexity: Exactly one comparison and two applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr pair<const T&, const T&> minmax(initializer_list<T> t);

template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(initializer_list<T> t, Compare comp);

template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<T>
ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});

template<input_range R, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*>
constexpr ranges::minmax_result<range_value_t<R>>
ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, type T meets the Cpp17LessThanComparable
requirements (Table 28).

Returns: Let X be the return type. Returns X\{x, y\}, where x is a copy of the leftmost element with
the smallest value and y a copy of the rightmost element with the largest value in the input range.

Complexity: At most \(\frac{3}{2}\) ranges::distance(r) applications of the corresponding predicate and twice
as many applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
    Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<I>, Proj>> Comp = ranges::less>
constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
Returns: The first iterator \(i\) in the range \([\text{first}, \text{last})\) such that for every iterator \(j\) in the range \([\text{first}, \text{last})\),

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \ast j), \text{invoke}(\text{proj}, \ast i)))
\]

is false. Returns \(\text{last}\) if \(\text{first} == \text{last}\).

Complexity: Exactly \(\max(\text{last} - \text{first} - 1, 0)\) comparisons and twice as many projections.

```
template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);
```

```
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator max_element(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
Compare comp);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator max_element(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});
```

Let \(\text{comp}\) be \(\text{less}\{})\) and \(\text{proj}\) be \(\text{identity}\){}\) for the overloads with no parameters by those names.

Returns: The first iterator \(i\) in the range \([\text{first}, \text{last})\) such that for every iterator \(j\) in the range \([\text{first}, \text{last})\),

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \ast i), \text{invoke}(\text{proj}, \ast j)))
\]

is false. Returns \(\text{last}\) if \(\text{first} == \text{last}\).

Complexity: Exactly \(\max(\text{last} - \text{first} - 1, 0)\) comparisons and twice as many projections.

```
template<class ForwardIterator>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last);
```

```
template<class ExecutionPolicy, class ForwardIterator>
pair<ForwardIterator, ForwardIterator>
minmax_element(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);
```

```
template<class ForwardIterator, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
minmax_element(ForwardIterator first, ForwardIterator last,
Compare comp);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Compare>
pair<ForwardIterator, ForwardIterator>
minmax_element(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
Compare comp);
```

```
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<I>
ranges::minmax_element(I first, S last, Comp comp = {}, Proj proj = {});
```

```
template<forward_range R, class Proj = identity,
indirect_strict_weak_order<projected<iterator_t<R>>, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<borrowed_iterator_t<R>>
ranges::minmax_element(R&& r, Comp comp = {}, Proj proj = {});
```

Returns: \{first, first\} if \([\text{first}, \text{last})\) is empty, otherwise \{m, M\}, where \(m\) is the first iterator in
\([\text{first}, \text{last})\) such that no iterator in the range refers to a smaller element, and where \(M\) is the last
iterator in \([\texttt{first}, \texttt{last})\) such that no iterator in the range refers to a larger element.

**Complexity:** Let \(N\) be \(\texttt{last} - \texttt{first}\). At most \(\max\left(\frac{3}{2}(N-1), 0\right)\) comparisons and twice as many applications of the projection, if any.

### 27.8.10 Bounded value

\[\texttt{template<class T> constexpr const T& clamp(const T& v, const T& lo, const T& hi);}\]

\[\texttt{template<class T, class Compare> constexpr const T& clamp(const T& v, const T& lo, const T& hi, Compare comp);}\]

\[\texttt{template<class T, class Proj = \text{identity},\
\hspace{1em} indirect_strict_weak_order<\text{projected<const T*, Proj>> Comp = \text{ranges::less}>\
\hspace{1em} constexpr const T&\
\hspace{1em} ranges::clamp(const T& v, const T& lo, const T& hi, Comp comp = {}, Proj proj = {});}\]

1. Let \(\text{comp}\) be \text{less\{} for the overloads with no parameter \(\text{comp}\), and let \(\text{proj}\) be \text{identity\} for the overloads with no parameter \(\text{proj}\).

2. **Preconditions:** \(\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \text{hi}), \text{invoke}(\text{proj}, \text{lo}))\) is \(\text{false}\). For the first form, type \(T\) meets the \text{Cpp17LessThanComparable} requirements (Table 28).

3. **Returns:** \(\text{lo}\) if \(\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, v), \text{invoke}(\text{proj}, \text{lo})))\) is \(\text{true}\), \(\text{hi}\) if \(\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \text{hi}), \text{invoke}(\text{proj}, v)))\) is \(\text{true}\), otherwise \(v\).

4. **Note 1:** If NaN is avoided, \(T\) can be a floating-point type. — end note

5. **Complexity:** At most two comparisons and three applications of the projection.

### 27.8.11 Lexicographical comparison

\[\texttt{template<class InputIterator1, class InputIterator2>\
\hspace{1em} constexpr bool lexicographical_compare(InputIterator1 first1, InputIterator1 last1,\
\hspace{1em} InputIterator2 first2, InputIterator2 last2);}\]

\[\texttt{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>\
\hspace{1em} bool lexicographical_compare(ExecutionPolicy&& exec,\
\hspace{1em} ForwardIterator1 first1, ForwardIterator1 last1,\
\hspace{1em} ForwardIterator2 first2, ForwardIterator2 last2);}\]

\[\texttt{template<class InputIterator1, class InputIterator2, class Compare>\
\hspace{1em} constexpr bool lexicographical_compare(InputIterator1 first1, InputIterator1 last1,\
\hspace{1em} InputIterator2 first2, InputIterator2 last2, Compare comp);}\]

\[\texttt{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,\
\hspace{1em} class Compare>\
\hspace{1em} bool lexicographical_compare(ExecutionPolicy&& exec,\
\hspace{1em} ForwardIterator1 first1, ForwardIterator1 last1,\
\hspace{1em} ForwardIterator2 first2, ForwardIterator2 last2, Compare comp);}\]

\[\texttt{template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,\
\hspace{1em} class Proj1 = \text{identity}, class Proj2 = \text{identity},\
\hspace{1em} indirect_strict_weak_order<\text{projected<I1, Proj1>,\
\hspace{1em} projected<I2, Proj2>> Comp = \text{ranges::less}>\
\hspace{1em} constexpr bool\
\hspace{1em} ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,\
\hspace{1em} Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});}\]

224) This behavior intentionally differs from \texttt{max_element}.
template<input_range R1, input_range R2, class Proj1 = identity, class Proj2 = identity, indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>, projected<iterator_t<R2>, Proj2>> Comp = ranges::less>

cconstexpr bool ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

1 Returns: true if and only if the sequence of elements defined by the range [first1, last1) is lexicographically less than the sequence of elements defined by the range [first2, last2).

2 Complexity: At most \(2 \min(\text{last1} - \text{first1}, \text{last2} - \text{first2})\) applications of the corresponding comparison and each projection, if any.

3 Remarks: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

[Example 1: ranges::lexicographical_compare(I1, S1, I2, S2, Comp, Proj1, Proj2) can be implemented as:

```cpp
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
    if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
```
—end example]

4 [Note 1: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — end note]

27.8.12 Three-way comparison algorithms [alg.three.way]

template<class InputIterator1, class InputIterator2, class Cmp>

cconstexpr auto

lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1, InputIterator2 b2, InputIterator2 e2, Cmp comp)

-> decltype(comp(*b1, *b2));

1 Let \(N\) be \(\min(e1 - b1, e2 - b2)\). Let \(E(n)\) be \(\text{comp}(* (b1 + n), *(b2 + n))\).

2 Mandates: \(\text{decltype}(\text{comp}(*b1, *b2))\) is a comparison category type.

3 Returns: \(E(i)\), where \(i\) is the smallest integer in \([0, N)\) such that \(E(i) \neq 0\), or \((e1 - b1) <= (e2 - b2)\) if no such integer exists.

4 Complexity: At most \(N\) applications of \(\text{comp}\).

template<class InputIterator1, class InputIterator2>

cconstexpr auto

lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1, InputIterator2 b2, InputIterator2 e2);

5 Effects: Equivalent to:

```cpp
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

27.8.13 Permutation generators [alg.permutation.generators]

template<class BidirectionalIterator>

cconstexpr bool next_permutation(BidirectionalIterator first, BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>

cconstexpr bool next_permutation(BidirectionalIterator first, BidirectionalIterator last, Compare comp);
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
        class Proj = identity>
constexpr ranges::next_permutation_result<borrowed_iterator_t<I>>
ranges::next_permutation(I&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

2 Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17Value-
Swappable requirements (16.4.4.3).

3 Effects: Takes a sequence defined by the range [first, last) and transforms it into the next permutation.
The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to comp and proj. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4 Returns: Let B be true if a next permutation was found and otherwise false. Returns:

(4.1) — B for the overloads in namespace std.
(4.2) — { last, B } for the overloads in namespace ranges.

5 Complexity: At most (last - first) / 2 swaps.

template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
        BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
        BidirectionalIterator last, Compare comp);

6 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

7 Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17Value-
Swappable requirements (16.4.4.3).

8 Effects: Takes a sequence defined by the range [first, last) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to comp and proj. If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

9 Returns: Let B be true if a previous permutation was found and otherwise false. Returns:

(9.1) — B for the overloads in namespace std.
(9.2) — { last, B } for the overloads in namespace ranges.

10 Complexity: At most (last - first) / 2 swaps.

27.10 Generalized numeric operations [numeric.ops]

27.10.1 General [numeric.ops.general]

[Note 1: The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional. —end note]

27.10.2 Definitions [numerics.defns]

1 Define \texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\texttt{op}, a_1, \ldots, a_N) as follows:

(1.1) \quad \text{a}_1 \text{ when } N \text{ is 1, otherwise}

(1.2) \quad \text{op}(\texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\texttt{op}, a_1, \ldots, a_K),
\texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\texttt{op}, a_M, \ldots, a_N)) \text{ for any } K \text{ where } 1 < K + 1 = M \leq N.

2 Define \texttt{GENERALIZED\_SUM}(\texttt{op}, a_1, \ldots, a_N) as \texttt{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\texttt{op}, b_1, \ldots, b_N), where \texttt{b}_1, \ldots, b_N may be any permutation of \texttt{a}_1, \ldots, a_N.

27.10.3 Accumulate [accumulate]

template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);

[Preconditions: \texttt{T} meets the \texttt{Cpp17CopyConstructible} (Table 31) and \texttt{Cpp17CopyAssignable} (Table 33) requirements. In the range \texttt{[first,last]}, \texttt{binary_op} neither modifies elements nor invalidates iterators or subranges.]

2 Effect: Computes its result by initializing the accumulator \texttt{acc} with the initial value \texttt{init} and then modifies it with \texttt{acc = std::move(acc) + *i} or \texttt{acc = binary_op(std::move(acc), *i)} for every iterator \texttt{i} in the range \texttt{[first,last]} in order.

225) The use of fully closed ranges is intentional.

226) \texttt{accumulate} is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.
27.10.4 Reduce

\[\text{reduce}\]

\[
template<\text{class InputIterator}>
\text{constexpr typename iterator_traits<InputIterator>::value_type}
\text{reduce(InputIterator first, InputIterator last);}\]

1. **Effects:** Equivalent to:
   \[
   \text{return reduce(first, last,}
   \text{typename iterator_traits<InputIterator>::value_type());}\]

\[
template<\text{class ExecutionPolicy, class ForwardIterator}>
\text{typename iterator_traits<ForwardIterator>::value_type}
\text{reduce(ExecutionPolicy\&\& exec,}
\text{ForwardIterator first, ForwardIterator last);}\]

2. **Effects:** Equivalent to:
   \[
   \text{return reduce(std::forward<ExecutionPolicy>(exec), first, last,}
   \text{typename iterator_traits<ForwardIterator>::value_type());}\]

\[
template<\text{class InputIterator, class T}>
\text{constexpr T reduce(InputIterator first, InputIterator last, T init);}\]

3. **Effects:** Equivalent to:
   \[
   \text{return reduce(first, last, init, plus<>());}\]

\[
template<\text{class ExecutionPolicy, class ForwardIterator, class T}>
\text{T reduce(ExecutionPolicy\&\& exec,}
\text{ForwardIterator first, ForwardIterator last, T init);}\]

4. **Effects:** Equivalent to:
   \[
   \text{return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());}\]

\[
template<\text{class InputIterator, class T, class BinaryOperation}>
\text{constexpr T reduce(InputIterator first, InputIterator last, T init,}
\text{BinaryOperation binary_op);}\]

5. **Mandates:** All of
   - binary_op(init, *first),
   - binary_op(*first, init),
   - binary_op(init, init), and
   - binary_op(*first, *first)
     are convertible to T.

6. **Preconditions:**
   - T meets the Ccpp17MoveConstructible (Table 30) requirements.
   - binary_op neither invalidates iterators or subranges, nor modifies elements in the range [first, last].

7. **Returns:** GENERALIZED_SUM(binary_op, init, *i, ...) for every i in [first, last).

8. **Complexity:** \(\Theta(|\text{last} - \text{first}|)\) applications of binary_op.

9. [Note 1: The difference between reduce and accumulate is that reduce applies binary_op in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative binary_op such as floating-point addition. — end note]

27.10.5 Inner product

\[\text{inner.product}\]

\[
template<\text{class InputIterator1, class InputIterator2, class T}>
\text{constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,}
\text{InputIterator2 first2, T init);}\]
template<class InputIterator1, class InputIterator2, class T,
class BinaryOperation1, class BinaryOperation2>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2, T init,
    BinaryOperation1 binary_op1,
    BinaryOperation2 binary_op2);

Preconditions: T meets the Cpp17CopyConstructible (Table 31) and Cpp17CopyAssignable (Table 33) requirements. In the ranges \([first1, \text{last1}]\) and \([first2, first2 + (last1 - first1)]\), binary_op1 and \(\text{binary\_op\_2}\) neither modifies elements nor invalidates iterators or subranges.\(^{227}\)

Effects: Computes its result by initializing the accumulator \(\text{acc}\) with the initial value \(\text{init}\) and then modifying it with \(\text{acc} = \text{std::move} (\text{acc}) + (\text{*}\text{i1}) \times (\text{*}\text{i2})\) or \(\text{acc} = \text{binary\_op\_1} (\text{std::move} (\text{acc}), \text{binary\_op\_2}(\text*i1, \text{i2}))\) for every iterator \(\text{i1}\) in the range \([first1, \text{last1}]\) and iterator \(\text{i2}\) in the range \([first2, first2 + (last1 - first1)]\) in order.

### 27.10.6 Transform reduce

#### [transform.reduce]

template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2,
    T init);

Effects: Equivalent to:

\[
\text{return transform\_reduce (first1, last1, first2, init, plus()\rangle, multiplies()\rangle)};
\]

template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2,
    T init);

Effects: Equivalent to:

\[
\text{return transform\_reduce (std::forward<ExecutionPolicy>(exec),
    first1, last1, first2, init, plus()\rangle, multiplies()\rangle)};
\]

template<class InputIterator1, class InputIterator2, class T,
class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2,
    T init,
    BinaryOperation1 binary_op1,
    BinaryOperation2 binary_op2);

template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T,
    class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2,
    T init,
    BinaryOperation1 binary_op1,
    BinaryOperation2 binary_op2);

Mandates: All of

\[(3.1)\] — binary_op1(init, init),

\[(3.2)\] — binary_op1(init, binary_op2(*first1, *first2)),

\[(3.3)\] — binary_op1(binary_op2(*first1, *first2), init), and

\[(3.4)\] — binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))

\(^{227}\) The use of fully closed ranges is intentional.
are convertible to T.

**Preconditions:**

1. T meets the Cpp17MoveConstructible (Table 30) requirements.
2. Neither binary_op1 nor binary_op2 invalidates subranges, nor modifies elements in the ranges [first1,last1] and [first2,first2 + (last1 - first1)].

**Returns:**

GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)

for every iterator i in [first1,last1].

**Complexity:** $O(\text{last1} - \text{first1})$ applications each of binary_op1 and binary_op2.

```cpp
template<class InputIterator, class T, 
    class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init, 
    BinaryOperation binary_op, UnaryOperation unary_op);
```

**Mandates:** All of

1. binary_op(init, init),
2. binary_op(init, unary_op(*first)),
3. binary_op(unary_op(*first), init), and
4. binary_op(unary_op(*first), unary_op(*first))

are convertible to T.

**Preconditions:**

1. T meets the Cpp17MoveConstructible (Table 30) requirements.
2. Neither unary_op nor binary_op invalidates subranges, nor modifies elements in the range [first, last].

**Returns:**

GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)

for every iterator i in [first, last].

**Complexity:** $O(\text{last} - \text{first})$ applications each of unary_op and binary_op.

[Note 1: transform_reduce does not apply unary_op to init. — end note]

27.10.7 Partial sum

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator partial_sum(InputIterator first, InputIterator last, 
    OutputIterator result);
```

**Mandates:** InputIterator’s value type is constructible from *first. The result of the expression std::move(acc) + *i or binary_op(std::move(acc), *i) is implicitly convertible to InputIterator’s value type. acc is writable (25.3.1) to result.

**Preconditions:** In the ranges [first, last] and [result, result + (last - first)] binary_op neither modifies elements nor invalidates iterators or subranges.²²₈

²²₈ The use of fully closed ranges is intentional.
Effects: For a non-empty range, the function creates an accumulator `acc` whose type is `InputIterator`'s value type, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, `acc` is then modified by `acc = std::move(acc) + *i` or `acc = binary_op(std::move(acc), *i)` and the result is assigned to `*(result + (i - first))`.

Returns: `result + (last - first)`.

Complexity: Exactly `(last - first) - 1` applications of the binary operation.

Remarks: `result` may be equal to `first`.

27.10.8 Exclusive scan

```cpp
template<class InputIterator, class OutputIterator, class T> constexpr OutputIterator exclusive_scan(InputIterator first, InputIterator last, OutputIterator result, T init);
```

**Effects:** Equivalent to:

```cpp
return exclusive_scan(first, last, result, init, plus<>());
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T> ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, T init);
```

**Effects:** Equivalent to:

```cpp
return exclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, init, plus<>());
```

```cpp
template<class InputIterator, class OutputIterator, class T, class BinaryOperation> constexpr OutputIterator exclusive_scan(InputIterator first, InputIterator last, OutputIterator result, T init, BinaryOperation binary_op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation> ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, T init, BinaryOperation binary_op);
```

Mandates: All of

1. `binary_op(init, init)`,
2. `binary_op(init, *first)`, and
3. `binary_op(*first, *first)`

are convertible to `T`.

Preconditions:

1. `T` meets the *Cpp17MoveConstructible* (Table 30) requirements.
2. `binary_op` neither invalidates iterators or subranges, nor modifies elements in the ranges `[first, last)` or `[result, result + (last - first)]`.

Effects: For each integer `K` in `[0, last - first)` assigns through `result + K` the value of:

```
= GENERALIZED_NONCOMMUTATIVE_SUM
```

```cpp
binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))
```

Returns: The end of the resulting range beginning at `result`.

Complexity: `O(last - first)` applications of `binary_op`.

Remarks: `result` may be equal to `first`.

[Note 1: The difference between `exclusive_scan` and `inclusive_scan` is that `exclusive_scan` excludes the `i`th input element from the `i`th sum. If `binary_op` is not mathematically associative, the behavior of `exclusive_scan` can be nondeterministic. — end note]
27.10.9 Inclusive scan

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result);
```

**Effects:** Equivalent to:
```
return inclusive_scan(first, last, result, plus<>());
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
              ForwardIterator1 first, ForwardIterator1 last,
              ForwardIterator2 result);
```

**Effects:** Equivalent to:
```
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());
```

```cpp
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result, BinaryOperation binary_op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryOperation>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
              ForwardIterator1 first, ForwardIterator1 last,
              ForwardIterator2 result, BinaryOperation binary_op);
```

```cpp
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
               OutputIterator result, BinaryOperation binary_op, T init);
```

```cpp
template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
              ForwardIterator1 first, ForwardIterator1 last,
              ForwardIterator2 result, BinaryOperation binary_op, T init);
```

Let \( U \) be the value type of \( \text{decltype}(\text{first}) \).

**Mandates:** If \( \text{init} \) is provided, all of

1. \( \text{binary_op}(\text{init}, \text{init}) \)
2. \( \text{binary_op}(\text{init}, \text{*first}) \)
3. \( \text{binary_op}(*\text{first}, *\text{first}) \)

are convertible to \( T \); otherwise, \( \text{binary_op}(\text{*first}, \text{*first}) \) is convertible to \( U \).

**Preconditions:**

1. If \( \text{init} \) is provided, \( T \) meets the \( \text{Cpp17MoveConstructible} \) requirements; otherwise, \( U \) meets the \( \text{Cpp17MoveConstructible} \) requirements.
2. \( \text{binary_op} \) neither invalidates iterators or subranges, nor modifies elements in the ranges \([\text{first}, \text{last}]\) or \([\text{result}, \text{result} + (\text{last} - \text{first})]\).

**Effects:** For each integer \( K \) in \([0, \text{last} - \text{first}]\) assigns through \( \text{result} + K \) the value of

1. \( \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{binary_op}, \text{init}, \text{*(first + 0)}, \text{*(first + 1)}, \ldots, \text{*(first + K)}) \)
   if \( \text{init} \) is provided, or
2. \( \text{GENERALIZED_NONCOMMUTATIVE_SUM}(\text{binary_op}, \text{*(first + 0)}, \text{*(first + 1)}, \ldots, \text{*(first + K)}) \)
   otherwise.
Returns: The end of the resulting range beginning at result.

Complexity: $\Theta(\text{last} - \text{first})$ applications of binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between exclusive_scan and inclusive_scan is that inclusive_scan includes the $i^{th}$ input element in the $i^{th}$ sum. If binary_op is not mathematically associative, the behavior of inclusive_scan can be nondeterministic. — end note]

### 27.10.10 Transform exclusive scan

Template:

```cpp
template<class InputIterator, class OutputIterator, class T, class BinaryOperation, class UnaryOperation>
constexpr OutputIterator transform_exclusive_scan(InputIterator first, InputIterator last,
                                                OutputIterator result, T init,
                                                BinaryOperation binary_op, UnaryOperation unary_op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation, class UnaryOperation>
ForwardIterator2 transform_exclusive_scan(ExecutionPolicy&& exec,
                                           ForwardIterator1 first, ForwardIterator1 last,
                                           ForwardIterator2 result, T init,
                                           BinaryOperation binary_op, UnaryOperation unary_op);
```

Mandates: All of

1. binary_op(init, init),
2. binary_op(init, unary_op(*first)), and
3. binary_op(unary_op(*first), unary_op(*first))

are convertible to T.

Preconditions:

1. T meets the Cpp17MoveConstructible (Table 30) requirements.
2. Neither unary_op nor binary_op invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer $K$ in $[0, \text{last} - \text{first})$ assigns through result + $K$ the value of:

```
GENERALIZED_NONCOMMUTATIVE_SUM

binary_op, init,
unary_op(*first + 0), unary_op(*first + 1), ..., unary_op(*first + k - 1))
```

Returns: The end of the resulting range beginning at result.

Complexity: $\Theta(\text{last} - \text{first})$ applications each of unary_op and binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_exclusive_scan excludes the $i^{th}$ input element from the $i^{th}$ sum. If binary_op is not mathematically associative, the behavior of transform_exclusive_scan can be nondeterministic. transform_exclusive_scan does not apply unary_op to init. — end note]

### 27.10.11 Transform inclusive scan

Template:

```cpp
template<class InputIterator, class OutputIterator, class BinaryOperation, class UnaryOperation>
constexpr OutputIterator transform_inclusive_scan(InputIterator first, InputIterator last,
                                                OutputIterator result,
                                                BinaryOperation binary_op, UnaryOperation unary_op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class UnaryOperation>
ForwardIterator2 transform_inclusive_scan(ExecutionPolicy&& exec,
                                           ForwardIterator1 first, ForwardIterator1 last,
                                           ForwardIterator2 result,
                                           BinaryOperation binary_op, UnaryOperation unary_op);
```

§ 27.10.11
transform_inclusive_scan(ExecutionPolicy&& exec,  
  ForwardIterator1 first, ForwardIterator1 last,  
  ForwardIterator2 result,  
  BinaryOperation binary_op, UnaryOperation unary_op);

template<class InputIterator, class OutputIterator,  
  class BinaryOperation, class UnaryOperation, class T>  
constexpr OutputIterator  
transform_inclusive_scan(InputIterator first, InputIterator last,  
  OutputIterator result,  
  BinaryOperation binary_op, UnaryOperation unary_op,  
  T init);

transform_inclusive_scan(ExecutionPolicy&& exec,  
  ForwardIterator1 first, ForwardIterator1 last,  
  ForwardIterator2 result,  
  BinaryOperation binary_op, UnaryOperation unary_op,  
  T init);

Let U be the value type of decltype(first).

Mandates: If init is provided, all of

(2.1) — binary_op(init, init),
(2.2) — binary_op(init, unary_op(*first)), and
(2.3) — binary_op(unary_op(*first), unary_op(*first))

are convertible to T; otherwise, binary_op(unary_op(*first), unary_op(*first)) is convertible to U.

Preconditions:

(3.1) — If init is provided, T meets the Ccpp17MoveConstructible (Table 30) requirements; otherwise, U meets the Ccpp17MoveConstructible requirements.
(3.2) — Neither unary_op nor binary_op invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of

(4.1) — GENERALIZED_NONCOMMUTATIVE_SUM(  
  binary_op, init,  
  unary_op(*((first + 0)), unary_op(*((first + 1)), ..., unary_op(*((first + K))  
if init is provided, or
(4.2) — GENERALIZED_NONCOMMUTATIVE_SUM(  
  binary_op,  
  unary_op(*((first + 0)), unary_op(*((first + 1)), ..., unary_op(*((first + K))  
otherwise.

Returns: The end of the resulting range beginning at result.

Complexity: \(\Theta(last - first)\) applications each of unary_op and binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_inclusive_scan includes the \(i^{th}\) input element in the \(i^{th}\) sum. If binary_op is not mathematically associative, the behavior of transform_inclusive_scan can be nondeterministic. transform_inclusive_scan does not apply unary_op to init. — end note]
adjacent_difference(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);

```cpp
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last, OutputIterator result, BinaryOperation binary_op);
```

Let $T$ be the value type of `decltype(first)`. For the overloads that do not take an argument `binary_op`, let `binary_op` be an lvalue that denotes an object of type `minus<>`.

**Mandates:**
- For the overloads with no `ExecutionPolicy`, $T$ is constructible from `*first`. acc (defined below) is writable (25.3.1) to the result output iterator. The result of the expression `binary_op(val, std::move(acc))` is writable to result.
- For the overloads with an `ExecutionPolicy`, the result of the expressions `binary_op(*first, *first)` and `*first` are writable to `result`.

**Preconditions:**
- For the overloads with no `ExecutionPolicy`, $T$ meets the `Cpp17MoveAssignable` (Table 32) requirements.
- For all overloads, in the ranges `[first, last]` and `[result, result + (last - first)]`, `binary_op` neither modifies elements nor invalidate iterators or subranges.229

**Effects:** For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator acc of type $T$, initializes it with `*first`, and assigns the result to `*result`. For every iterator $i$ in `[first + 1, last)` in order, creates an object `val` whose type is $T$, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to acc.

For the overloads with an ExecutionPolicy and a non-empty range, performs `*result = *first`. Then, for every $d$ in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

**Returns:** `result + (last - first)`.

**Complexity:** Exactly `(last - first) - 1` applications of the binary operation.

**Remarks:** For the overloads with no `ExecutionPolicy`, `result` may be equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last)` and `[result, result + (last - first))` shall not overlap.

### 27.10.13 Iota

```cpp
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

**Mandates:** $T$ is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type $T$, is well-formed.

**Effects:** For each element referred to by the iterator $i$ in the range `[first, last]`, assigns `*i = value` and increments `value` as if by `++value`.

**Complexity:** Exactly `last - first` increments and assignments.

---

229) The use of fully closed ranges is intentional.
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
requires indirectly_writable<O, const T&>
constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);

template<weakly_incrementable T, output_range<const T&> R>
constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);

Effects: Equivalent to:
while (first != last) {
  *first = as_const(value);
  ++first;
  ++value;
} return {std::move(first), std::move(value)};

27.10.14 Greatest common divisor [numeric.ops.gcd]

template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);

M mandates: M and N both are integer types other than cv bool.

Preconditions: |m| and |n| are representable as a value of common_type_t<M, N>.
[Note 1: These requirements ensure, for example, that gcd(m, m) = |m| is representable as a value of type M. —end note]

Returns: Zero when m and n are both zero. Otherwise, returns the greatest common divisor of |m| and |n|.

Throws: Nothing.

27.10.15 Least common multiple [numeric.ops.lcm]

template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);

M mandates: M and N both are integer types other than cv bool.

Preconditions: |m| and |n| are representable as a value of common_type_t<M, N>. The least common multiple of |m| and |n| is representable as a value of type common_type_t<M, N>.

Returns: Zero when either m or n is zero. Otherwise, returns the least common multiple of |m| and |n|.

Throws: Nothing.

27.10.16 Midpoint [numeric.ops.midpoint]

template<class T>
constexpr T midpoint(T a, T b) noexcept;

Constraints: T is an arithmetic type other than bool.

Returns: Half the sum of a and b. If T is an integer type and the sum is odd, the result is rounded towards a.

Remarks: No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

template<class T>
constexpr T* midpoint(T* a, T* b);

Constraints: T is an object type.

M mandates: T is a complete type.

Preconditions: a and b point to, respectively, elements i and j of the same array object x.
[Note 1: As specified in 6.8.3, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. —end note]

Returns: A pointer to array element i + \frac{j-i}{2} of x, where the result of the division is truncated towards zero.

§ 27.10.16 1260
27.11 Specialized `<memory>` algorithms

27.11.1 General

The contents specified in 27.11 are declared in the header `<memory>` (20.2.2).

Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement new-expression (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

[Note 1: When invoked on ranges of potentially-overlapping subobjects (6.7.2), the algorithms specified in 27.11 result in undefined behavior. — end note]

Some algorithms specified in 27.11 make use of the exposition-only function `voidify`:

```cpp
template<class T>
constexpr void* voidify(T& obj) noexcept {
    return const_cast<void*>(static_cast<const volatile void*>(addressof(obj)));
}
```

27.11.2 Special memory concepts

Some algorithms in this subclause are constrained with the following exposition-only concepts:

```cpp
template<class I>
concept nothrow-input-iterator = // exposition only
    input_iterator<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

A type `I` models `nothrow-input-iterator` only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.

[Note 1: This concept allows some `input_iterator` (25.3.4.9) operations to throw exceptions. — end note]

```cpp
template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only
```

Types `S` and `I` model `nothrow-sentinel-for` only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type `I` and `S`.

[Note 2: This concept allows some `sentinel_for` (25.3.4.7) operations to throw exceptions. — end note]

```cpp
template<class R>
concept nothrow-input-range = // exposition only
    range<R> &&
    nothrow-input-iterator<iterator_t<R>> &&
    nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

A type `R` models `nothrow-input-range` only if no exceptions are thrown from calls to `ranges::begin` and `ranges::end` on an object of type `R`.

```cpp
template<class I>
concept nothrow-forward-iterator = // exposition only
    nothrow-input-iterator<I> &&
    forward_iterator<I> &&
    nothrow-sentinel-for<I, I>;
```

[Note 3: This concept allows some `forward_iterator` (25.3.4.11) operations to throw exceptions. — end note]

```cpp
template<class R>
concept nothrow-forward-range = // exposition only
    nothrow-input-range<R> &&
    nothrow-forward-iterator<iterator_t<R>>;
```

27.11.3 uninitialized_default_construct

```cpp
template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

[uninitialized.construct.default]

1 Effects: Equivalent to:
namespace ranges {
  for (; first != last; ++first)
    ::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type;
}

Effects: Equivalent to:
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
return first;

template<class NoThrowForwardIterator, class Size>
NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);

Effects: Equivalent to:
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
  typename iterator_traits<NoThrowForwardIterator>::value_type;
return first;

namespace ranges {
  template<typename I>
  requires default_initializable<iter_value_t<I>>
  I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
return uninitialized_default_construct_n(counted_iterator(first, n),
  default_sentinel).base();

27.11.4 uninitialized_value_construct [uninitialized.construct.value]

template<class NoThrowForwardIterator>
void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
for (; first != last; ++first)
  ::new (voidify(*first))
  typename iterator_traits<NoThrowForwardIterator>::value_type();

namespace ranges {
  template<typename I, nothrow-sentinel-for<I> S>
  requires default_initializable<iter_value_t<I>>
  I uninitialized_value_construct(I first, S last);
  template<typename R>
  requires default_initializable<range_value_t<R>>
  borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}

Effects: Equivalent to:
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
return first;

template<class NoThrowForwardIterator, class Size>
NoThrowForwardIterator uninitialized_value_construct_n(NoThrowForwardIterator first, Size n);

Effects: Equivalent to:
for (; n > 0; (void)++first, --n)
::new (voidify(*first))
    typename iterator_traits<NoThrowForwardIterator>::value_type();
return first;

namespace ranges {  
    template<nothrow-forward_iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
    return uninitialized_value_construct(counted_iterator(first, n),
                                           default_sentinel).base();

27.11.5 uninitialized_copy

template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
                                          NoThrowForwardIterator result);

Preconditions: result + [0, (last - first)) does not overlap with [first, last).

Effects: Equivalent to:
    for (; first != last; ++result, (void) ++first)
        ::new (voidify(*result))
            typename iterator_traits<NoThrowForwardIterator>::value_type(*first);

Returns: result.

namespace ranges {  
    template<input_iterator I, sentinel_for<I> S1,
             nothrow-forward_iterator O, nothrow-sentinel_for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_result<I, O>
    uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
    uninitialized_copy(IR&& in_range, OR&& out_range);
}

Preconditions: [ofirst, olast) does not overlap with [ifirst, ilast).

Effects: Equivalent to:
    for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
        ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
    return {std::move(ifirst), ofirst};

template<class InputIterator, class Size, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy_n(InputIterator first, Size n,
                                          NoThrowForwardIterator result);

Preconditions: result + [0, n) does not overlap with first + [0, n).

Effects: Equivalent to:
    for ( ; n > 0; ++result, (void) ++first, --n)
        ::new (voidify(*result))
            typename iterator_traits<NoThrowForwardIterator>::value_type(*first);

Returns: result.

namespace ranges {  
    template<input_iterator I, nothrow-forward_iterator O, nothrow-sentinel_for<O> S>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_n_result<I, O>
    uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

§ 27.11.5
Preconditions: \([\text{ofirst}, \text{olast})\) does not overlap with \(\text{ifirst} + [0, n)\).

Effects: Equivalent to:

\[
\begin{align*}
\text{auto } t &= \text{uninitialized_copy(} \text{counted_iterator(} \text{ifirst}, n), \\
& \quad \text{default_sentinel, ofirst, olast}); \\
\text{return } \{\text{std::move(} t.\text{in}.\text{base}), t.\text{out}\};
\end{align*}
\]

27.11.6 uninitialized_move

\[
\text{template}<\text{class InputIterator, class NoThrowForwardIterator} > \\
\text{NoThrowForwardIterator \text{uninitialized}\_move(InputIterator \text{first}, InputIterator \text{last},} \\
\text{NoThrowForwardIterator \text{result})};
\]

Preconditions: \(\text{result} + [0, (\text{last} - \text{first}))\) does not overlap with \([\text{first}, \text{last})\).

Effects: Equivalent to:

\[
\begin{align*}
&\text{for (; \text{first} != \text{last}; (void)++\text{result}, ++\text{first})} \\
&\quad \text{::new (} \text{voidify(} *\text{result}) \\
&\quad \text{typename iterator_traits<NoThrowForwardIterator>::value_type(} \text{std::move(} *\text{first}); \\
&\text{return } \text{result};
\end{align*}
\]

namespace ranges {

\[
\begin{align*}
&\text{template<\text{input_iterator I, sentinel_for<I> S1,} \\
&\quad \text{nothrow-forward-iterator O, nothrow-sentinel-for<O> S2}> \\
&\quad \text{requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>}> \\
&\quad \text{uninitialized_move_result<I, O>}; \\
&\text{uninitialized_move(I \text{ifirst}, S1 \text{ilast}, O \text{ofirst}, S2 \text{olast});}
\end{align*}
\]

\[
\begin{align*}
&\text{template<\text{input_range IR, nothrow-forward-range OR}> \\
&\quad \text{requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>}> \\
&\quad \text{uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>}> \\
&\quad \text{uninitialized_move(IR&& \text{in_range}, OR&& \text{out_range});}
\end{align*}
\]

Preconditions: \([\text{ofirst}, \text{olast})\) does not overlap with \([\text{ifirst}, \text{ilast})\).

Effects: Equivalent to:

\[
\begin{align*}
&\text{for (; \text{ifirst} != \text{ilast} \&\& \text{ofirst} != \text{olast}; ++\text{ofirst}, (void)++\text{ifirst})} \\
&\quad \text{::new (} \text{voidify(} *\text{ofirst}) \\
&\quad \text{remove_reference_t<iter_reference_t<O>>(} \text{ranges::iter_move(} \text{ifirst}); \\
&\text{return} \{\text{std::move(} \text{ifirst), \text{ofirst}\};
\end{align*}
\]

[Note 1: If an exception is thrown, some objects in the range \([\text{first}, \text{last})\) are left in a valid, but unspecified state. — end note]

\[
\begin{align*}
&\text{template<\text{class InputIterator, class Size, class NoThrowForwardIterator} >} \\
&\quad \text{pair<InputIterator, NoThrowForwardIterator>} \\
&\quad \text{uninitialized_move_n(InputIterator \text{first}, Size n, NoThrowForwardIterator \text{result})};
\end{align*}
\]

Preconditions: \(\text{result} + [0, n)\) does not overlap with \(\text{first} + [0, n)\).

Effects: Equivalent to:

\[
\begin{align*}
&\text{for (; } n > 0; ++\text{result}, (void)++\text{first}, \text{--}n) \\
&\quad \text{::new (} \text{voidify(} *\text{result}) \\
&\quad \text{typename iterator_traits<NoThrowForwardIterator>::value_type(} \text{std::move(} *\text{first}); \\
&\text{return } \{\text{first, result}\};
\end{align*}
\]

namespace ranges {

\[
\begin{align*}
&\text{template<\text{input_iterator I, nothrow-forward-iterator O, nothrow-sentinel-for<O> S}> \\
&\quad \text{requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>}> \\
&\quad \text{uninitialized_move_n_result<I, O>}; \\
&\text{uninitialized_move_n(I \text{ifirst}, \text{iter_difference_t<I> n, O \text{ofirst}, S \text{olast});}
\end{align*}
\]

Preconditions: \([\text{ofirst}, \text{olast})\) does not overlap with \([\text{ifirst}, [0, n])\).

Effects: Equivalent to:
auto t = uninitialized_move(counted_iterator(ifirst, n),
    default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};

[Note 2: If an exception is thrown, some objects in the range first + [0, n) are left in a valid but unspecified state. — end note]

### 27.11.7 uninitialized_fill

```
template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);
```

**Effects:** Equivalent to:
```
for (; first != last; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type(x);
```

**namespace ranges**
```
template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S, class T> 
    requires constructible_from<iter_value_t<I>, const T&>
    I uninitialized_fill(I first, S last, const T& x);
```

**Effects:** Equivalent to:
```
for (; first != last; ++first)
    ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);
return first;
```

```
template<class NoThrowForwardIterator, class Size, class T>
    NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);
```

**Effects:** Equivalent to:
```
for (; n--; ++first)
    ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type(x);
return first;
```

**namespace ranges**
```
template<nothrow-forward-iterator I, class T> 
    requires constructible_from<iter_value_t<I>, const T&>
    I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
```

**Effects:** Equivalent to:
```
return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();
```

### 27.11.8 construct_at

```
template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
```

**namespace ranges**
```
template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
```

**Constraints:** The expression ::new (declval<void*>(void)) T(declval<Args>(...)) is well-formed when treated as an unevaluated operand (7.2.3).

**Effects:** Equivalent to:
```
return ::new (voidify(*location)) T(std::forward<Args>(args)...);
```
27.11.9  destroy

```
template<class T>
constexpr void destroy_at(T* location);
```

```
namespace ranges {
    template<destructible T>
    constexpr void destroy_at(T* location) noexcept;
}
```

1  **Effects:**

1.1  If T is an array type, equivalent to `destroy(begin(*location), end(*location))`.

1.2  Otherwise, equivalent to `location->~T()`.

```
template<class NoThrowForwardIterator>
constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

2  **Effects:** Equivalent to:

```
for (; first != last; ++first)
    destroy_at(addressof(*first));
```

```
namespace ranges {
    template<nothrow-input-iterator I, nothrow-sentinel-for<I> S>
    requires destructible<iter_value_t<I>>
    constexpr I destroy(I first, S last) noexcept;
    template<nothrow-input-range R>
    requires destructible<range_value_t<R>>
    constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}
```

3  **Effects:** Equivalent to:

```
for (; first != last; ++first)
    destroy_at(addressof(*first));
return first;
```

```
template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);
```

4  **Effects:** Equivalent to:

```
for (; n > 0; (void)++first, --n)
    destroy_at(addressof(*first));
return first;
```

```
namespace ranges {
    template<nothrow-input-iterator I>
    requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}
```

5  **Effects:** Equivalent to:

```
return destroy(counted_iterator(first, n), default_sentinel).base();
```

27.12  C library algorithms

1  **[Note 1:]** The header `<cstdlib>` (17.2.2) declares the functions described in this subclause.  — end note**

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
               c-compare-pred* compar);
```

```
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
               compare-pred* compar);
```

```
void qsort(void* base, size_t nmemb, size_t size,
           c-compare-pred* compar);
```

```
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);
```

2  **Preconditions:** For `qsort`, the objects in the array pointed to by `base` are of trivially copyable type.

3  **Effects:** These functions have the semantics specified in the C standard library.

4  **Throws:** Any exception thrown by `compar` (16.4.6.13).

28 Numerics library [numerics]

28.1 General [numerics.general]

1 This Clause describes components that C++ programs may use to perform seminumerical operations.

2 The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 90.

Table 90: Numerics library summary [tab:numerics.summary]

<table>

<tr>
<td>28.8</td>
<td>Numbers</td>
</tr>
</tbody>
</table>

28.2 Numeric type requirements [numeric.requirements]

1 The complex and valarray components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A numeric type is a cv-unqualified object type T that meets the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (16.4.4.2).\(^\text{230}\)

2 If any operation on T throws an exception the effects are undefined.

3 In addition, many member and related functions of valarray<T> can be successfully instantiated and will exhibit well-defined behavior if and only if T meets additional requirements specified for each such member or related function.

4 [Example 1: It is valid to instantiate valarray<complex>, but operator() will not be successfully instantiated for valarray<complex> operands, since complex does not have any ordering operators. —end example]

28.3 The floating-point environment [cfenv]

28.3.1 Header <cfenv> synopsis [cfenv.syn]

    #define FE_ALL_EXCEPT see below
    #define FE_DIVBYZERO see below // optional
    #define FE_INEXACT see below // optional
    #define FE_INVALID see below // optional
    #define FE_OVERFLOW see below // optional
    #define FE_UNDERFLOW see below // optional
    #define FE_DOWNWARD see below // optional
    #define FE_TONEAREST see below // optional
    #define FE_TOWARDZERO see below // optional
    #define FE_UPWARD see below // optional
    #define FE_DFL_ENV see below

    namespace std {
      // types
      using fenv_t = object type;
      using fexcept_t = integer type;
    }

\(^{230}\) In other words, value types. These include arithmetic types, pointers, the library class complex, and instantiations of valarray for value types.
// functions
int feclearexcept(int except);
int fegetexceptflag(fexcept_t* pflag, int except);
int feraiseexcept(int except);
int fesetexceptflag(const fexcept_t* pflag, int except);
int fetestexcept(int except);

int fegetround();
int fesetround(int mode);

int fegetenv(fenv_t* penv);
int feholdexcept(fenv_t* penv);
int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);

The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`.

[Note 1: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — end note]

See also: ISO C 7.6

28.3.2 Threads

The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread’s floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding thread object (33.4.3) or jthread object (33.4.4) at the time it constructed the object.

[Note 1: That is, the child thread gets the floating-point state of the parent thread at the time of the child’s creation. — end note]

A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

28.4 Complex numbers

28.4.1 General

The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

The effect of instantiating the template complex for any type other than float, double, or long double is unspecified. The specializations complex<float>, complex<double>, and complex<long double> are literal types (6.8.1).

If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

If z is an lvalue of type cv complex<T> then:

(4.1) — the expression reinterpret_cast<cv T(&)[2]>(z) is well-formed,
(4.2) — reinterpret_cast<cv T(&)[2]>(z)[0] designates the real part of z, and
(4.3) — reinterpret_cast<cv T(&)[2]>(z)[1] designates the imaginary part of z.

Moreover, if a is an expression of type cv complex<T>* and the expression a[i] is well-defined for an integer expression i, then:

(4.4) — reinterpret_cast<cv T*>(a)[2*i] designates the real part of a[i], and
(4.5) — reinterpret_cast<cv T*>(a)[2*i + 1] designates the imaginary part of a[i].

28.4.3 Class template complex

namespace std {
    template<class T> class complex {
        public:
            using value_type = T;
            constexpr complex(const T& re = T(), const T& im = T());
            constexpr complex(const complex&);
            template<class X> constexpr complex(const complex<X>&);
            constexpr T real() const;
            constexpr void real(T);
            constexpr T imag() const;
            constexpr void imag(T);
            constexpr complex& operator= (const T&);
            constexpr complex& operator+=(const T&);
            constexpr complex& operator-=(const T&);
            constexpr complex& operator*=(const T&);
            constexpr complex& operator/=(const T&);
            template<class X> constexpr complex& operator= (const complex<X>&);
            template<class X> constexpr complex& operator+=(const complex<X>&);
            template<class X> constexpr complex& operator-=(const complex<X>&);
            template<class X> constexpr complex& operator*=(const complex<X>&);
            template<class X> constexpr complex& operator/=(const complex<X>&);
    };
}

1 The class complex describes an object that can store the Cartesian components, real() and imag(), of a complex number.

28.4.4 Specializations

namespace std {
    template<> class complex<float> {
        public:
            using value_type = float;
            constexpr complex(float re = 0.0f, float im = 0.0f);
            constexpr complex(const complex<float>&) = default;
            constexpr explicit complex(const complex<double>&);
            constexpr explicit complex(const complex<long double>&);
    };
}
constexpr float real() const;
constexpr void real(float);
constexpr float imag() const;
constexpr void imag(float);

constexpr complex& operator= (float);
constexpr complex& operator+=(float);
constexpr complex& operator-=(float);
constexpr complex& operator*=(float);
constexpr complex& operator/=(float);

constexpr complex& operator=(const complex&);
template<class X> constexpr complex& operator= (const complex<X>&);
template<class X> constexpr complex& operator+=(const complex<X>&);
template<class X> constexpr complex& operator-=(const complex<X>&);
template<class X> constexpr complex& operator*=(const complex<X>&);
template<class X> constexpr complex& operator/=(const complex<X>&);

};

template<> class complex<double> {
public:
    using value_type = double;

customexpr complex(double re = 0.0, double im = 0.0);
constexpr complex(const complex<float>&);
constexpr complex(const complex<double>&) = default;
constexpr explicit complex(const complex<long double>&);

constexpr double real() const;
constexpr void real(double);
constexpr double imag() const;
constexpr void imag(double);

constexpr complex& operator= (double);
constexpr complex& operator+=(double);
constexpr complex& operator-=(double);
constexpr complex& operator*=(double);
constexpr complex& operator/=(double);

constexpr complex& operator=(const complex&);
template<class X> constexpr complex& operator= (const complex<X>&);
template<class X> constexpr complex& operator+=(const complex<X>&);
template<class X> constexpr complex& operator-=(const complex<X>&);
template<class X> constexpr complex& operator*=(const complex<X>&);
template<class X> constexpr complex& operator/=(const complex<X>&);
};

template<> class complex<long double> {
public:
    using value_type = long double;

customexpr complex(long double re = 0.0L, long double im = 0.0L);
constexpr complex(const complex<float>&);
constexpr complex(const complex<double>&);
constexpr complex(const complex<long double>&) = default;

constexpr long double real() const;
constexpr void real(long double);
constexpr long double imag() const;
constexpr void imag(long double);

constexpr complex& operator= (long double);
constexpr complex& operator+=(long double);
constexpr complex& operator-=(long double);

};
constexpr complex& operator*=(long double);
constexpr complex& operator/=(long double);

template<class X> constexpr complex& operator= (const complex<X>&);

template<class X> constexpr complex& operator+=(const complex<X>&);

template<class X> constexpr complex& operator-=(const complex<X>&);

template<class X> constexpr complex& operator*=(const complex<X>&);

template<class X> constexpr complex& operator/=(const complex<X>&);

28.4.5 Member functions

template<class T> constexpr complex(const T& re = T(), const T& im = T());
1

Postconditions: real() == re && imag() == im is true.

constexpr T real() const;
2
Returns: The value of the real component.

constexpr void real(T val);
3
Effects: Assigns val to the real component.

constexpr T imag() const;
4
Returns: The value of the imaginary component.

constexpr void imag(T val);
5
Effects: Assigns val to the imaginary component.

28.4.6 Member operators

constexpr complex& operator+=(const T& rhs);
1
Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

Returns: *this.

constexpr complex& operator-=(const T& rhs);
3
Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.

Returns: *this.

constexpr complex& operator*=(const T& rhs);
5
Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.

Returns: *this.

constexpr complex& operator/=(const T& rhs);
7
Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.

Returns: *this.

template<class X> constexpr complex& operator+=(const complex<X>& rhs);
9
Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.

Returns: *this.

template<class X> constexpr complex& operator-=(const complex<X>& rhs);
11
Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.

Returns: *this.
template<class X> constexpr complex& operator*=(const complex<X>& rhs);

Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.

Returns: *this.

Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.

Returns: *this.

28.4.7 Non-member operations [complex.ops]

template<class T> constexpr complex<T> operator+(const complex<T>& lhs);

Returns: complex<T>(lhs).

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) += rhs.

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);

Returns: complex<T>(-lhs.real(),-lhs.imag()).

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) -= rhs.

Returns: complex<T>(lhs) /= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr complex<T> operator/(const complex<T>& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) /= rhs.

Returns: complex<T>(lhs) /= rhs.

Returns: complex<T>(lhs) /= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);

Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

Remarks: The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T, class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);

Preconditions: The input values are convertible to T.

Effects: Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is the imaginary part (31.7.4.3).

If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)).

Remarks: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

Returns: is.

template<class T, class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);

Effects: Inserts the complex number x onto the stream o as if it were implemented as follows:

basic_ostream<CharT, traits> s;
"s.flags(o.flags());

§ 28.4.7 1274
N4910

© ISO/IEC

s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << "," << x.imag() << ')';
return o << s.str();
15

[Note 1 : In a locale in which comma is used as a decimal point character, the use of comma as a field separator
can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal
point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — end
note]

28.4.8

Value operations

[complex.value.ops]

template<class T> constexpr T real(const complex<T>& x);
1

Returns: x.real().
template<class T> constexpr T imag(const complex<T>& x);

2

Returns: x.imag().
template<class T> T abs(const complex<T>& x);

3

Returns: The magnitude of x.
template<class T> T arg(const complex<T>& x);

4

Returns: The phase angle of x, or atan2(imag(x), real(x)).
template<class T> constexpr T norm(const complex<T>& x);

5

Returns: The squared magnitude of x.
template<class T> constexpr complex<T> conj(const complex<T>& x);

6

Returns: The complex conjugate of x.
template<class T> complex<T> proj(const complex<T>& x);

7

Returns: The projection of x onto the Riemann sphere.

8

Remarks: Behaves the same as the C function cproj. See also: ISO C 7.3.9.5
template<class T> complex<T> polar(const T& rho, const T& theta = T());

9
10

Preconditions: rho is non-negative and non-NaN. theta is finite.
Returns: The complex value corresponding to a complex number whose magnitude is rho and whose
phase angle is theta.

28.4.9

Transcendentals

[complex.transcendentals]

template<class T> complex<T> acos(const complex<T>& x);
1

Returns: The complex arc cosine of x.

2

Remarks: Behaves the same as the C function cacos. See also: ISO C 7.3.5.1
template<class T> complex<T> asin(const complex<T>& x);

3

Returns: The complex arc sine of x.

4

Remarks: Behaves the same as the C function casin. See also: ISO C 7.3.5.2
template<class T> complex<T> atan(const complex<T>& x);

5

Returns: The complex arc tangent of x.

6

Remarks: Behaves the same as the C function catan. See also: ISO C 7.3.5.3
template<class T> complex<T> acosh(const complex<T>& x);

7

Returns: The complex arc hyperbolic cosine of x.

8

Remarks: Behaves the same as the C function cacosh. See also: ISO C 7.3.6.1

§ 28.4.9

1275


template<class T> complex<T> asinh(const complex<T>& x);

   Returns: The complex arc hyperbolic sine of x.

   Remarks: Behaves the same as the C function casinh. See also: ISO C 7.3.6.2

template<class T> complex<T> atanh(const complex<T>& x);

   Returns: The complex arc hyperbolic tangent of x.

   Remarks: Behaves the same as the C function catanh. See also: ISO C 7.3.6.3

template<class T> complex<T> cos(const complex<T>& x);

   Returns: The complex cosine of x.

template<class T> complex<T> cosh(const complex<T>& x);

   Returns: The complex hyperbolic cosine of x.

template<class T> complex<T> exp(const complex<T>& x);

   Returns: The complex base-e exponential of x.

template<class T> complex<T> log(const complex<T>& x);

   Returns: The complex natural (base-e) logarithm of x. For all x, \(\text{imag(log}(x))\) lies in the interval \([-\pi, \pi]\).

   [Note 1: The semantics of this function are intended to be the same in C++ as they are for clog in C. — end note]

   Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> log10(const complex<T>& x);

   Returns: The complex common (base-10) logarithm of x, defined as \(\text{log}(x) / \text{log}(10)\).

   Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);

   Returns: The complex power of base \(x\) raised to the \(y\)th power, defined as \(\exp(y \times \text{log}(x))\). The value returned for \(\text{pow}(0, 0)\) is implementation-defined.

   Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> sin(const complex<T>& x);

   Returns: The complex sine of x.

template<class T> complex<T> sinh(const complex<T>& x);

   Returns: The complex hyperbolic sine of x.

template<class T> complex<T> sqrt(const complex<T>& x);

   Returns: The complex square root of x, in the range of the right half-plane.

   [Note 2: The semantics of this function are intended to be the same in C++ as they are for csqrt in C. — end note]

   Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> tan(const complex<T>& x);

   Returns: The complex tangent of x.

template<class T> complex<T> tanh(const complex<T>& x);

   Returns: The complex hyperbolic tangent of x.

28.4.10 Additional overloads

1 The following function templates shall have additional overloads:
2 The additional overloads shall be sufficient to ensure:

(2.1) — If the argument has type `long double`, then it is effectively cast to `complex<long double>`.
(2.2) — Otherwise, if the argument has type `double` or an integer type, then it is effectively cast to `complex<double>`.
(2.3) — Otherwise, if the argument has type `float`, then it is effectively cast to `complex<float>`.

3 Function template `pow` shall have additional overloads sufficient to ensure, for a call with at least one argument of type `complex<T>`:

(3.1) — If either argument has type `complex<long double>` or type `long double`, then both arguments are effectively cast to `complex<long double>`.
(3.2) — Otherwise, if either argument has type `complex<double>`, `double`, or an integer type, then both arguments are effectively cast to `complex<double>`.
(3.3) — Otherwise, if either argument has type `complex<float>` or `float`, then both arguments are effectively cast to `complex<float>`.

28.4.11 Suffixes for complex number literals

This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```cpp
constexpr complex<long double> operator"il(long double d);
constexpr complex<long double> operator"il(unsigned long long d);
Returns: complex<long double>{0.0L, static_cast<long double>(d)}.
```

```cpp
constexpr complex<double> operator"i(long double d);
constexpr complex<double> operator"i(unsigned long long d);
Returns: complex<double>{0.0, static_cast<double>(d)}.
```

```cpp
constexpr complex<float> operator"if(long double d);
constexpr complex<float> operator"if(unsigned long long d);
Returns: complex<float>{0.0f, static_cast<float>(d)}.
```

28.5 Random number generation

28.5.1 General

Subclause 28.5 defines a facility for generating (pseudo-)random numbers. In addition to a few utilities, four categories of entities are described: `uniform random bit generators`, `random number engines`, `random number engine adaptors`, and `random number distributions`. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[Note 1: These entities are specified in such a way as to permit the binding of any `uniform random bit generator` object `e` as the argument to any random number distribution object `d`, thus producing a zero-argument function object such as given by `bind(d,e)`. — end note]

Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as `result_type`. With `T` as the `result_type` thus associated with such an entity, that entity is characterized:

(3.1) — as `boolean` or equivalently as `boolean-valued`, if `T` is `bool`;
(3.2) — otherwise as `integral` or equivalently as `integer-valued`, if `numeric_limits<T>::is_integer` is `true`;
(3.3) — otherwise as `floating-point` or equivalently as `real-valued`.

If integer-valued, an entity may optionally be further characterized as `signed` or `unsigned`, according to `numeric_limits<T>::is_signed`.

Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.
Throughout 28.5, the operators \texttt{bitand}, \texttt{bitor}, and \texttt{xor} denote the respective conventional bitwise operations. Further:

(5.1) — the operator \texttt{rshift} denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and

(5.2) — the operator \texttt{lshift} denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo $2^w$.

28.5.3 Requirements
28.5.3.1 General requirements

(1.1) that has a template type parameter named Sseq is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).
(1.2) that has a template type parameter named URBG is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).
(1.3) that has a template type parameter named Engine is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).
(1.4) that has a template type parameter named RealType is undefined unless the corresponding template argument is cv-unqualified and is one of float, double, or long double.
(1.5) that has a template type parameter named IntType is undefined unless the corresponding template argument is cv-unqualified and is one of short, int, long, long long, unsigned short, unsigned int, unsigned long, or unsigned long long.
(1.6) that has a template type parameter named UIntType is undefined unless the corresponding template argument is cv-unqualified and is one of unsigned short, unsigned int, unsigned long, or unsigned long long.

2 Throughout this subclause 28.5, phrases of the form “x is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “x is a value of a type meeting the requirements of the specified iterator type”.

3 Throughout this subclause 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared explicit.

28.5.3.2 Seed sequence requirements

A seed sequence is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values $i$, $0 \leq i < 2^{32}$, based on the consumed data.

[Note 1: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]

(2.1) that T is the type named by S’s associated result_type;
(2.2) that q is a value of S and r is a possibly const value of S;
(2.3) that ib and ie are input iterators with an unsigned integer value_type of at least 32 bits;
— rb and re are mutable random access iterators with an unsigned integer value_type of at least 32 bits;
— ob is an output iterator; and
— il is a value of initializer_list<T>.

Table 91: Seed sequence requirements  [tab:rand.req.seedseq]

<tr>
<td>r.param(ob)</td>
<td>void</td>
<td>Copies to the given destination a sequence of 32-bit units that can be provided to the constructor of a second object of type S, and that would reproduce in that second object a state indistinguishable from the state of the first object.</td>
<td>$O(r.size())$</td>
</tr>
</tbody>
</table>

28.5.3.3 Uniform random bit generator requirements  [rand.req.urng]

A uniform random bit generator g of type G is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[Note 1: The degree to which g's results approximate the ideal is often determined statistically. — end note]

```cpp
template<class G>
concept uniform_random_bit_generator =
  invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
  requires {
    { G::min() } -> same_as<invoke_result_t<G&>>;
    { G::max() } -> same_as<invoke_result_t<G&>>;
    requires bool_constant<(G::min() < G::max()))::value;
  };
```

Let g be an object of type G. G models uniform_random_bit_generator only if

1. $G::min() <= g()$,
2. $g() <= G::max()$, and
A class \( G \) meets the uniform random bit generator requirements if \( G \) models \texttt{uniform\_random\_bit\_generator} \((6.8.2)\), and \( G \) provides a nested \texttt{typedef-name result\_type} that denotes the same type as \texttt{invoke\_result\_t\langle\&G\rangle}.

### 28.5.3.4 Random number engine requirements

1. A random number engine (commonly shortened to engine) \( e \) of type \( E \) is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

2. At any given time, \( e \) has a state \( e_i \) for some integer \( i \geq 0 \). Upon construction, \( e \) has an initial state \( e_0 \). An engine’s state may be established via a constructor, a seed function, assignment, or a suitable operator\(\gg\).

3. \( E \)'s specification shall define:
   
   \begin{enumerate}
   \item the size of \( E \)'s state in multiples of the size of \texttt{result\_type}, given as an integral constant expression;
   \item the transition algorithm \( TA \) by which \( e \)'s state \( e_i \) is advanced to its successor state \( e_{i+1} \); and
   \item the generation algorithm \( GA \) by which an engine’s state is mapped to a value of type \texttt{result\_type}.
   \end{enumerate}

4. A class \( E \) that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a random number engine if the expressions shown in Table 92 are valid and have the indicated semantics, and if \( E \) also meets all other requirements of this subclause 28.5.3.4. In that Table and throughout this subclause:
   
   \begin{enumerate}
   \item \( T \) is the type named by \( E \)'s associated \texttt{result\_type};
   \item \( e \) is a value of \( E \), \( v \) is an lvalue of \( E \), \( x \) and \( y \) are (possibly \texttt{const}) values of \( E \);
   \item \( s \) is a value of \( T \);
   \item \( q \) is an lvalue meeting the requirements of a seed sequence (28.5.3.2);
   \item \( z \) is a value of type \texttt{unsigned long long};
   \item \( os \) is an lvalue of the type of some class template specialization \texttt{basic\_ostream\langle charT, traits\rangle}; and
   \item \( is \) is an lvalue of the type of some class template specialization \texttt{basic\_istream\langle charT, traits\rangle};
   \end{enumerate}

where \texttt{charT} and \texttt{traits} are constrained according to Clause 23 and Clause 31.

#### Table 92: Random number engine requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Pre/post-condition</th>
<th>Complexity</th>
</tr>
</thead>
<tbody>
<tr>
<td>( E() )</td>

<td>\texttt{void}</td>
<td>\texttt{Postconditions: e == E(s)}.</td>
<td>same as ( E(s) )</td>
</tr>
<tr>
<td>( e_.\text{seed}(q) )</td>
<td>\texttt{void}</td>
<td>\texttt{Postconditions: e == E(q)}.</td>
<td>same as ( E(q) )</td>
</tr>
<tr>
<td>( e() )</td>
<td>( T )</td>
<td>Advances ( e )'s state ( e_i ) to ( e_{i+1} ) ( = TA(e_i) ) and returns ( GA(e_i) ).</td>
<td>per 28.5.3.3</td>
</tr>
</tbody>
</table>

231) This constructor (as well as the subsequent corresponding \texttt{seed()} function) can be particularly useful to applications requiring a large number of independent random sequences.
<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Pre/post-condition</th>
<th>Complexity</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>e.discard(z)</code></td>
<td>void</td>
<td>Advances e’s state e, to e_{i+z} by any means equivalent to z consecutive calls e().</td>
<td>no worse than the complexity of z consecutive calls e().</td>
</tr>
<tr>
<td><code>x == y</code></td>
<td>bool</td>
<td>This operator is an equivalence relation. With S_x and S_y as the infinite sequences of values that would be generated by repeated future calls to x() and y(), respectively, returns true if S_x = S_y; else returns false.</td>
<td>(O(\text{size of state}))</td>
</tr>
<tr>
<td><code>x != y</code></td>
<td>bool</td>
<td>!(x == y).</td>
<td>(O(\text{size of state}))</td>
</tr>
<tr>
<td><code>os &lt;&lt; x</code></td>
<td>reference to the type of os</td>
<td>With os.fmtflags set to ios_base::dec</td>
<td>ios_base::left and the fill character set to the space character, writes to os the textual representation of x’s current state. In the output, adjacent numbers are separated by one or more space characters. <strong>Postconditions:</strong> The os.fmtflags and fill character are unchanged.</td>
</tr>
<tr>
<td><code>is &gt;&gt; v</code></td>
<td>reference to the type of is</td>
<td>With is.fmtflags set to ios_base::dec, sets v’s state as determined by reading its textual representation from is. If bad input is encountered, ensures that v’s state is unchanged by the operation and calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)). If a textual representation written via os &lt;&lt; x was subsequently read via is &gt;&gt; v, then x == v provided that there have been no intervening invocations of x or of v. <strong>Preconditions:</strong> is provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of is, and whose type’s template specialization arguments charT and traits were respectively the same as those of is. <strong>Postconditions:</strong> The is.fmtflags are unchanged.</td>
<td>(O(\text{size of state}))</td>
</tr>
</tbody>
</table>

5 E shall meet the Cpp17CopyConstructible (Table 31) and Cpp17CopyAssignable (Table 33) requirements. These operations shall each be of complexity no worse than \(O(\text{size of state})\).

232) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes z consecutive calls e().
28.5.3.5 Random number engine adaptor requirements [rand.req.adapt]

1 A random number engine adaptor (commonly shortened to adaptor) \(a\) of type \(A\) is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine \(b\) of type \(B\) adapted in this way is termed a base engine in this context. The expression \(a\text{.base()}\) shall be valid and shall return a const reference to \(a\)'s base engine.

2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

\[A::A();\]

3 Effects: The base engine is initialized as if by its default constructor.

\[\text{bool operator==}(\text{const } A & a1, \text{const } A & a2);\]

4 Returns: true if \(a1\)'s base engine is equal to \(a2\)'s base engine. Otherwise returns false.

\[A::A(\text{result_type } s);\]

5 Effects: The base engine is initialized with \(s\).

\[\text{template<class Sseq> } A::A(Sseq & q);\]

6 Effects: The base engine is initialized with \(q\).

\[\text{void seed();}\]

7 Effects: With \(b\) as the base engine, invokes \(b\text{.seed()}.\)

\[\text{void seed(\text{result_type } s);}\]

8 Effects: With \(b\) as the base engine, invokes \(b\text{.seed(s)}.\)

\[\text{template<class Sseq> void seed(Sseq & q);}\]

9 Effects: With \(b\) as the base engine, invokes \(b\text{.seed(q)}.\)

10 \(A\) shall also meet the following additional requirements:

10.1 — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.

10.2 — The state of \(A\) shall include the state of its base engine. The size of \(A\)'s state shall be no less than the size of the base engine.

10.3 — Copying \(A\)'s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of \(A\).

10.4 — The textual representation of \(A\) shall include the textual representation of its base engine.

28.5.3.6 Random number distribution requirements [rand.req.dist]

1 A random number distribution (commonly shortened to distribution) \(d\) of type \(D\) is a function object returning values that are distributed according to an associated mathematical probability density function \(p(z)\) or according to an associated discrete probability function \(P(z_i)\). A distribution's specification identifies its associated probability function \(p(z)\) or \(P(z_i)\).

2 An associated probability function is typically expressed using certain externally-supplied quantities known as the parameters of the distribution. Such distribution parameters are identified in this context by writing, for example, \(p(z \mid a, b)\) or \(P(z_i \mid a, b)\), to name specific parameters, or by writing, for example, \(p(z \mid \{p\})\) or \(P(z_i \mid \{p\})\), to denote a distribution's parameters \(p\) taken as a whole.

3 A class \(D\) meets the requirements of a random number distribution if the expressions shown in Table 93 are valid and have the indicated semantics, and if \(D\) and its associated types also meet all other requirements of this subclause 28.5.3.6. In that Table and throughout this subclause,

3.1 — \(T\) is the type named by \(D\)'s associated result_type;

3.2 — \(P\) is the type named by \(D\)'s associated param_type;

3.3 — \(d\) is a value of \(D\), and \(x\) and \(y\) are (possibly const) values of \(D\);
— \( glb \) and \( lub \) are values of \( T \) respectively corresponding to the greatest lower bound and the least upper bound on the values potentially returned by \( d \)’s \texttt{operator()}, as determined by the current values of \( d \)’s parameters;

— \( p \) is a (possibly \texttt{const}) value of \( P \);

— \( g, g_1, \) and \( g_2 \) are lvalues of a type meeting the requirements of a uniform random bit generator (28.5.3.3);

— \( os \) is an lvalue of the type of some class template specialization \texttt{basic_ostream<charT, traits>}; and

— \( is \) is an lvalue of the type of some class template specialization \texttt{basic_istream<charT, traits>};

where \texttt{charT} and \texttt{traits} are constrained according to Clause 23 and Clause 31.

If bad input is encountered, ensures that d is unchanged by the operation and calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)). Preconditions: is provides a textual representation that was previously written using an os whose imbued locale and whose type's template specialization arguments charT and traits were the same as those of is. Postconditions: The is.fmtflags are unchanged.</td>
<td></td>
</tr>
</tbody>
</table>

4 D shall meet the Cpp17CopyConstructible (Table 31) and Cpp17CopyAssignable (Table 33) requirements.

5 The sequence of numbers produced by repeated invocations of d(g) shall be independent of any invocation of os << d or of any const member function of D between any of the invocations d(g).

6 If a textual representation is written using os << x and that representation is restored into the same or a different object y of the same type using is >> y, repeated invocations of y(g) shall produce the same sequence of numbers as would repeated invocations of x(g).

7 It is unspecified whether D::param_type is declared as a (nested) class or via a typedef. In this subclause 28.5, declarations of D::param_type are in the form of typedefs for convenience of exposition only.

8 P shall meet the Cpp17CopyConstructible (Table 31), Cpp17CopyAssignable (Table 33), and Cpp17EqualityComparable (Table 27) requirements.

9 For each of the constructors of D taking arguments corresponding to parameters of the distribution, P shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of D that return values corresponding to parameters of the distribution, P shall have a corresponding member function with the identical name, type, and semantics.

10 P shall have a declaration of the form

```cpp
using distribution_type = D;
```
28.5.4 Random number engine class templates

28.5.4.1 General

1 Each type instantiated from a class template specified in 28.5.4 meets the requirements of a random number engine (28.5.3.4) type.

2 Except where specified otherwise, the complexity of each function specified in 28.5.4 is constant.

3 Except where specified otherwise, no function described in 28.5.4 throws an exception.

4 Every function described in 28.5.4 that has a function parameter q of type Sseq& for a template type parameter named Sseq that is different from type seed_seq throws what and when the invocation of q.generate throws.

5 Descriptions are provided in 28.5.4 only for engine operations that are not described in 28.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

7 For every random number engine and for every random number engine adaptor X defined in 28.5.4 and in 28.5.5:

(7.1) — if the constructor

    template<class Sseq> explicit X(Sseq& q);

is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

(7.2) — if the member function

    template<class Sseq> void seed(Sseq& q);

is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

28.5.4.2 Class template linear_congruential_engine

1 A linear_congruential_engine random number engine produces unsigned integer random numbers. The state \( x_i \) of a linear_congruential_engine object \( x \) is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form \( TA(x_i) = (a \cdot x_i + c) \mod m \); the generation algorithm is \( GA(x_i) = x_{i+1} \).

namespace std {
    template<class UIntType, UIntType a, UIntType c, UIntType m>
    class linear_congruential_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr result_type multiplier = a;
            static constexpr result_type increment = c;
            static constexpr result_type modulus = m;
            static constexpr result_type min() { return c == 0u ? 1u: 0u; }
            static constexpr result_type max() { return m - 1u; }
            static constexpr result_type default_seed = 1u;

            // constructors and seeding functions
            linear_congruential_engine() : linear_congruential_engine(default_seed) {}
            explicit linear_congruential_engine(result_type s);
            template<class Sseq> explicit linear_congruential_engine(Sseq& q);
            void seed(result_type s = default_seed);
    }
Let

With

Concatenate the upper

The generation algorithm determines the unsigned integer values

Effects

If the template parameter

The transition algorithm employs a twisted generalized feedback shift register defined by shift values

A

mersenne_twister_engine

random number engine produces unsigned integer random numbers in the closed interval \([0, 2^w - 1]\). The state \(x_i\) of a mersenne_twister_engine object \(x\) is of size \(n\) and consists of a sequence \(X\) of \(n\) values of the type delivered by \(x\); all subscripts applied to \(X\) are to be taken modulo \(n\).

The transition algorithm employs a twisted generalized feedback shift register defined by shift values \(n\) and

The state transition is performed as follows:

\begin{align}
(2.1) & \quad \text{Concatenate the upper } w - r \text{ bits of } X_{i-n} \text{ with the lower } r \text{ bits of } X_{i+1-n} \text{ to obtain an unsigned integer value } Y. \\
(2.2) & \quad \text{With } \alpha = a \cdot (Y \text{ bitand } 1), \text{ set } X_1 \text{ to } X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha. \\
\end{align}

The sequence \(X\) is initialized with the help of an initialization multiplier \(f\).

The generation algorithm determines the unsigned integer values \(z_1, z_2, z_3, z_4\) as follows, then delivers \(z_4\) as its result:

\begin{align}
(3.1) & \quad \text{Let } z_1 = X_1 \text{ xor } ((X_1 \text{ rshift } u) \text{ bitand } d). \\
(3.2) & \quad \text{Let } z_2 = z_1 \text{ xor } ((z_1 \text{ lshift } s) \text{ bitand } b). \\
(3.3) & \quad \text{Let } z_3 = z_2 \text{ xor } ((z_2 \text{ lshift } t) \text{ bitand } c). \\
\end{align}

The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.
Let $z_4 = z_3 \text{xor} (z_3 \text{rshift} \ell)$.

```cpp
namespace std {

template<class UIntType, size_t w, size_t n, size_t m, size_t r,
        UIntType a, size_t u, UIntType d, size_t s,
        UIntType b, size_t t,
       UIntType c, size_t l, UIntType f>
class mersenne_twister_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr size_t word_size = w;
    static constexpr size_t state_size = n;
    static constexpr size_t shift_size = m;
    static constexpr size_t mask_bits = r;
    static constexpr UIntType xor_mask = a;
    static constexpr size_t tempering_u = u;
    static constexpr UIntType tempering_d = d;
    static constexpr size_t tempering_s = s;
    static constexpr UIntType tempering_b = b;
    static constexpr size_t tempering_t = t;
    static constexpr UIntType tempering_c = c;
    static constexpr size_t tempering_l = l;
    static constexpr UIntType initialization_multiplier = f;
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w - 1; }
    static constexpr result_type default_seed = 5489u;

    // constructors and seeding functions
    mersenne_twister_engine() : mersenne_twister_engine(default_seed) {} 
    explicit mersenne_twister_engine(result_type value);
    template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
    void seed(result_type value = default_seed);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);
};
```

§ 28.5.4.3

4 The following relations shall hold: $0 < m, m <= n, 2u < w, r <= w, u <= w, s <= w, l <= w, w <= \text{numeric\_limits<UIntType>\_digits}, a <= (1u<<w) - 1u, b <= (1u<<w) - 1u, c <= (1u<<w) - 1u, d <= (1u<<w) - 1u, \text{and} f <= (1u<<w) - 1u.$

5 The textual representation of $x_i$ consists of the values of $X_{i-n}, \ldots, X_{i-1}$, in that order.

```cpp
explicit mersenne_twister_engine(result_type value);
```

Effects: Sets $X_{i-n}$ to value mod $2^w$. Then, iteratively for $i = 1 - n, \ldots, -1$, sets $X_i$ to

$\lfloor f \cdot (X_{i-1} \text{xor} (X_{i-1} \text{rshift} (w - 2))) + i \mod n \rfloor \mod 2^w.$
7 Complexity: \( \Theta(n) \).

```
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
```

8 Effects: With \( k = \lceil w/32 \rceil \) and \( a \) an array (or equivalent) of length \( n \cdot k \), invokes \( q \).generate\((a + 0, a + n \cdot k) \) and then, iteratively for \( i = \neg n, \ldots, -1 \), sets \( X_i \) to \( \left( \sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j} \right) \mod 2^w \). Finally, if the most significant \( w - r \) bits of \( X_{-n} \) are zero, and if each of the other resulting \( X_i \) is 0, changes \( X_{-n} \) to \( 2^{w-1} \).

28.5.4.4 Class template subtract_with_carry_engine

```
28.5.4.4 Class template subtract_with_carry_engine
```

1 A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

2 The state \( x_i \) of a `subtract_with_carry_engine` object \( x \) is of size \( \Theta(r) \), and consists of a sequence \( X \) of \( r \) integer values \( 0 \leq X_i < m = 2^w \); all subscripts applied to \( X \) are to be taken modulo \( r \). The state \( x_i \) additionally consists of an integer \( c \) (known as the `carry`) whose value is either 0 or 1.

3 The state transition is performed as follows:

\[
\begin{align*}
(3.1) & \quad \text{Let } Y = X_{i-s} - X_{i-r} - c. \\
(3.2) & \quad \text{Set } X_i \text{ to } y = Y \mod m. \text{ Set } c \text{ to 1 if } Y < 0, \text{ otherwise set } c \text{ to 0.}
\end{align*}
\]

[Note 1: This algorithm corresponds to a modular linear function of the form \( TA(x_i) = (a \cdot x_i) \mod b \), where \( b \) is of the form \( m^r - m^s + 1 \) and \( a = b - (b - 1)/m \). — end note]

4 The generation algorithm is given by \( GA(x_i) = y \), where \( y \) is the value produced as a result of advancing the engine’s state as described above.

```cpp
namespace std {
    template<class UIntType, size_t w, size_t s, size_t r>
    class subtract_with_carry_engine {
    public:
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr size_t word_size = w;
        static constexpr size_t short_lag = s;
        static constexpr size_t long_lag = r;
        static constexpr result_type min() { return 0; }
        static constexpr result_type max() { return m - 1; }
        static constexpr result_type default_seed = 19780503u;

        // constructors and seeding functions
        subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
        explicit subtract_with_carry_engine(result_type value);
        template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
        void seed(result_type value = default_seed);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const subtract_with_carry_engine& x, const subtract_with_carry_engine& y);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
    };
}
```
The following relations shall hold: \( 0u < s, s < r, 0 < w, \) and \( w \leq \text{numeric_limits}<\text{UIntType}>::\text{digits} \).

The textual representation consists of the values of \( X_{i-r}, \ldots, X_{i-1} \), in that order, followed by \( c \).

```cpp
explicit subtract_with_carry_engine(result_type value);
```

**Effects:** Sets the values of \( X_{i-r}, \ldots, X_{i-1} \), in that order, as specified below. If \( X_{i-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

To set the values \( X_k \), first construct \( e \), a `linear_congruential_engine` object, as if by the following definition:

```cpp
linear_congruential_engine<result_type, 
40014u,0u,2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each \( X_k \), obtain new values \( z_0, \ldots, z_{n-1} \) from \( n = \lfloor w/32 \rfloor \) successive invocations of \( e \). Set \( X_k \) to \( \sum_{j=0}^{n-1} z_j \cdot 2^{32j} \mod m \).

**Complexity:** Exactly \( n \cdot r \) invocations of \( e \).

```cpp
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
```

**Effects:** With \( k = \lfloor w/32 \rfloor \) and \( a \) an array (or equivalent) of length \( r \cdot k \), invokes \( q\_generate(a + 0, a + r \cdot k) \) and then, iteratively for \( i = -r, \ldots, -1 \), sets \( X_i \) to \( \sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j} \mod m \). If \( X_{i-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

### 28.5.5 Random number engine adaptor class templates

#### 28.5.5.1 In general

Each type instantiated from a class template specified in this subclause 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.

Except where specified otherwise, the complexity of each function specified in this subclause 28.5.5 is constant.

Except where specified otherwise, no function described in this subclause 28.5.5 throws an exception.

Every function described in this subclause 28.5.5 that has a function parameter \( q \) of type \( Sseq\& \) for a template type parameter named \( Sseq \) that is different from type \( seed\_seq \) throws what and when the invocation of \( q\_generate \) throws.

Descriptions are provided in this subclause 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

Each template specified in this subclause 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

#### 28.5.5.2 Class template discard_block_engine

A `discard_block_engine` random number engine adaptor produces random numbers selected from those produced by some base engine \( e \). The state \( x_i \) of a `discard_block_engine` engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \) and an additional integer \( n \). The size of the state is the size of \( e \)'s state plus 1.

The transition algorithm discards all but \( r > 0 \) values from each block of \( p \geq r \) values delivered by \( e \). The state transition is performed as follows: If \( n \geq r \), advance the state of \( e \) from \( e_i \) to \( e_{i+p-r} \) and set \( n \) to 0. In any case, then increment \( n \) and advance \( e \)'s then-current state \( e_j \) to \( e_{j+1} \).

The generation algorithm yields the value returned by the last invocation of \( e() \) while advancing \( e \)'s state as described above.

```cpp
namespace std {
    template<class Engine, size_t p, size_t r>
    class discard_block_engine {
        public:
            // types
            using result_type = typename Engine::result_type;
```
// engine characteristics
static constexpr size_t block_size = p;
static constexpr size_t used_block = r;
static constexpr result_type min() { return Engine::min(); }
static constexpr result_type max() { return Engine::max(); }

// constructors and seeding functions
discard_block_engine();
explicit discard_block_engine(const Engine& e);
explicit discard_block_engine(Engine&& e);
template<class Sseq> explicit discard_block_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// exposition only
private:
    Engine e;
    // exposition only
    size_t n;  // exposition only
};

The following relations shall hold: 0 < r and r <= p.
The textual representation consists of the textual representation of e followed by the value of n.
In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor sets n to 0.

28.5.5.3 Class template independent_bits_engine

An independent_bits_engine random number engine adaptor combines random numbers that are produced by some base engine e, so as to produce random numbers with a specified number of bits w. The state x_i of an independent_bits_engine engine adaptor object x consists of the state e_i of its base engine e; the size of the state is the size of e's state.

The transition and generation algorithms are described in terms of the following integral constants:

(2.1) Let \( R = e.\max() - e.\min() + 1 \) and \( m = \lceil \log_2 R \rceil \).

(2.2) With n as determined below, let \( w_0 = \lceil w/n \rceil \), \( n_0 = n - w \mod n \), \( y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor \), and \( y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor \).

(2.3) Let \( n = \lceil w/m \rceil \) if and only if the relation \( R - y_0 \leq \lfloor y_0/n \rfloor \) holds as a result. Otherwise let \( n = 1 + \lceil w/m \rceil \).

[Note 1: The relation \( w = n_0 w_0 + (n - n_0)(w_0 + 1) \) always holds. — end note]

3 The transition algorithm is carried out by invoking e() as often as needed to obtain \( n_0 \) values less than \( y_0 + e.\min() \) and \( n - n_0 \) values less than \( y_1 + e.\min() \).
The generation algorithm uses the values produced while advancing the state as described above to yield a quantity \( S \) obtained as if by the following algorithm:

\[
S = 0;
\]

\[
\text{for } (k = 0; k \neq n_0; k += 1) \{ \\
\quad \text{do } u = e() - e.\text{min}(); \text{ while } (u \geq y_0); \\
\quad S = 2^{n_0} \cdot S + u \text{ mod } 2^{n_0}; \\
\}
\]

\[
\text{for } (k = n_0; k \neq n_1; k += 1) \{ \\
\quad \text{do } u = e() - e.\text{min}(); \text{ while } (u \geq y_1); \\
\quad S = 2^{n_0+1} \cdot S + u \text{ mod } 2^{n_0+1}; \\
\}
\]

```cpp
template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr result_type min() { return 0; }
    static constexpr result_type max() { return 2^w - 1; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);
private:
    Engine e;  // exposition only
};
```

The following relations shall hold: \( 0 < w \) and \( w \leq \text{numeric_limits<result_type>::digits} \).

The textual representation consists of the textual representation of \( e \).

### 28.5.5.4 Class template shuffle_order_engine

A `shuffle_order_engine` random number engine adaptor produces the same random numbers that are produced by some base engine \( e \), but delivers them in a different sequence. The state \( x \) of a `shuffle_order_engine` engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \), an additional value \( Y \) of the type delivered by \( e \), and an additional sequence \( V \) of \( k \) values also of the type delivered by \( e \). The size of the state is the size of \( e \)'s state plus \( k + 1 \).
2 The transition algorithm permutes the values produced by \( e \). The state transition is performed as follows:

\[
\text{(2.1)} \quad \text{Calculate an integer } j = \left\lfloor \frac{k \cdot (Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor.
\]

\[
\text{(2.2)} \quad \text{Set } Y \text{ to } V_j \text{ and then set } V_j \text{ to } e() \text{.}
\]

3 The generation algorithm yields the last value of \( Y \) produced while advancing \( e \)'s state as described above.

```cpp
namespace std {
    template<class Engine, size_t k>
    class shuffle_order_engine {
    public:
        // types
        using result_type = typename Engine::result_type;

        // engine characteristics
        static constexpr size_t table_size = k;
        static constexpr result_type min() { return Engine::min(); }
        static constexpr result_type max() { return Engine::max(); }

        // constructors and seeding functions
        shuffle_order_engine();
        explicit shuffle_order_engine(const Engine& e);
        explicit shuffle_order_engine(Engine&& e);
        explicit shuffle_order_engine(result_type s);
        template<class Sseq> explicit shuffle_order_engine(Sseq& q);
        void seed();
        void seed(result_type s);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // property functions
        const Engine& base() const noexcept { return e; };

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);
    private:
        Engine e;    // exposition only
        result_type V[k];  // exposition only
        result_type Y;   // exposition only
    };
}
```

4 The following relation shall hold: \( 0 < k \).

5 The textual representation consists of the textual representation of \( e \), followed by the \( k \) values of \( V \), followed by the value of \( Y \).

6 In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes \( V[0], \ldots, V[k-1] \) and \( Y \), in that order, with values returned by successive invocations of \( e() \).

28.5.6 Engines and engine adaptors with predefined parameters [rand.predef] using minstd_rand0 =
linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;

1 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type minstd rand0 produces the value 1043618065.

using minstd_rand = linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;

2 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type minstd rand produces the value 399268537.

using mt19937 = mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
0x9908'b0df, 11, 0xfffe'ffff, 7, 0x9d2c'5680, 15, 0xefc6'0000, 18, 1'812'433'253>;

3 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type mt19937 produces the value 4123659995.

using mt19937_64 = mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,
0x71d6'7ff'edaf'0000, 37, 0xfffe'ee00'0000'0000, 43, 6'364'136'223'846'793'005>;

4 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type mt19937_64 produces the value 9981545732273789042.

using ranlux24_base = subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;

5 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type ranlux24_base produces the value 7937952.

using ranlux48_base = subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;

6 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type ranlux48_base produces the value 6183912858275.

using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;

7 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type ranlux24 produces the value 9901578.

using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;

8 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type ranlux48 produces the value 249142670248501.

using knuth_b = shuffle_order_engine<minstd_rand0,256>;

9 Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type knuth_b produces the value 1112339016.

using default_random_engine = implementation-defined;

Remarks: The choice of engine type named by this typedef is implementation-defined.

[Note 1: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this typedef need not generate identical sequences across implementations. — end note]

28.5.7 Class random_device

A random_device uniform random bit generator produces nondeterministic random numbers.

If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

namespace std {
    class random_device {
        public:

§ 28.5.7 1295
// types
using result_type = unsigned int;

// generator characteristics
static constexpr result_type min() { return numeric_limits<result_type>::min(); }
static constexpr result_type max() { return numeric_limits<result_type>::max(); }

// constructors
random_device() : random_device(implementation-defined) {} explicit random_device(const string& token);

// generating functions
result_type operator()();

// property functions
double entropy() const noexcept;

// no copy functions
random_device(const random_device&) = delete; void operator=(const random_device&) = delete;

explicit random_device(const string& token);

Throws: A value of an implementation-defined type derived from exception if the random_device cannot be initialized.

Remarks: The semantics of the token parameter and the token value used by the default constructor are implementation-defined.

double entropy() const noexcept;

Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate for the random numbers returned by operator(), in the range min() to log2(max() + 1).

result_type operator()();

Returns: A nondeterministic random value, uniformly distributed between min() and max() (inclusive). It is implementation-defined how these values are generated.

 Throws: A value of an implementation-defined type derived from exception if a random number cannot be obtained.

28.5.8 Utilities [rand.util]

28.5.8.1 Class seed_seq [rand.util.seedseq]

namespace std {
    class seed_seq {
    public:
        // types
        using result_type = uint_least32_t;

        // constructors
        seed_seq() noexcept;
        template<class T>
        seed_seq(initializer_list<T> il);
        template<class InputIterator>
        seed_seq(InputIterator begin, InputIterator end);

234) The parameter is intended to allow an implementation to differentiate between different sources of randomness.
235) If a device has \( n \) states whose respective probabilities are \( P_0, \ldots, P_{n-1} \), the device entropy \( S \) is defined as
\[
S = - \sum_{i=0}^{n-1} P_i \cdot \log P_i.
\]
// generating functions
template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);

// property functions
size_t size() const noexcept;
template<class OutputIterator>
void param(OutputIterator dest) const;

// no copy functions
seed_seq(const seed_seq&) = delete;
void operator=(const seed_seq&) = delete;

private:
  vector<result_type> v;  // exposition only
};

seed_seq() noexcept;

1 Postconditions: v.empty() is true.

template<class T>
seed_seq(initializer_list<T> il);

2 Constraints: T is an integer type.

3 Effects: Same as seed_seq(il.begin(), il.end()).

template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);

4 Mandates: iterator_traits<InputIterator>::value_type is an integer type.

5 Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3).

6 Effects: Initializes v by the following algorithm:
  for (InputIterator s = begin; s != end; ++s)
      v.push_back((*s) mod 32);

7 Mandates: iterator_traits<RandomAccessIterator>::value_type is an unsigned integer type capable of accommodating 32-bit quantities.

8 Preconditions: RandomAccessIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) and the requirements of a mutable iterator.

9 Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin, end) according to the following algorithm in which each operation is to be carried out modulo $2^{32}$, each indexing operator applied to begin is to be taken modulo n, and $T(x)$ is defined as $x \xor (x \text{shift } 27)$:

9.1 By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let $p = (n - t)/2$ and let $q = p + t$, where

$$t = (n \geq 623) \ ? 11 : (n \geq 68) \ ? 7 : (n \geq 39) \ ? 5 : (n \geq 7) \ ? 3 : (n - 1)/2;$$

9.2 With $m$ as the larger of $s + 1$ and $n$, transform the elements of the range: iteratively for $k = 0, \ldots, m - 1$, calculate values

$$r_1 = 1664525 \cdot T(begin[k] \xor begin[k + p] \xor begin[k - 1])$$

$$r_2 = r_1 + \begin{cases} 
  s, & k = 0 \\
  k \mod n + v[k - 1], & 0 < k \leq s \\
  k \mod n, & s < k 
\end{cases}$$

and, in order, increment begin[k + p] by $r_1$, increment begin[k + q] by $r_2$, and set begin[k] to $r_2$. 

§ 28.5.8.1
Transform the elements of the range again, beginning where the previous step ended: iteratively for \( k = m, \ldots, m + n - 1 \), calculate values

\[
\begin{align*}
  r_3 &= 1566083941 \cdot T(b_{\text{begin}[k]} + b_{\text{begin}[k+p]} + b_{\text{begin}[k-1]}) \\
  r_4 &= r_3 - (k \mod n)
\end{align*}
\]

and, in order, update \( b_{\text{begin}[k+p]} \) by xoring it with \( r_3 \), update \( b_{\text{begin}[k+q]} \) by xoring it with \( r_4 \), and set \( b_{\text{begin}[k]} \) to \( r_4 \).

Throws: What and when RandomAccessIterator operations of \( \text{begin} \) and \( \text{end} \) throw.

\[
\text{size_t size() const noexcept;}
\]

Returns: The number of 32-bit units that would be returned by a call to \( \text{param}() \).

Complexity: Constant time.

\[
\text{template<class OutputIterator>}
\begin{align*}
  \text{void param(OutputIterator dest) const;}
\end{align*}
\]

Mandates: Values of type result_type are writable (25.3.1) to \( \text{dest} \).

Preconditions: OutputIterator meets the Cpp17OutputIterator requirements (25.3.5.4).

Effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

\[
\text{copy(v.begin(), v.end(), dest)};
\]

Throws: What and when OutputIterator operations of \( \text{dest} \) throw.

28.5.8.2 Function template \text{generate\_canonical} \ [rand.util.canonical]

\[
\text{template<class RealType, size_t bits, class URBG>}
\begin{align*}
  \text{RealType generate\_canonical(URBG& g);} \\
  \text{Effects: Invokes } g() \text{ } k \text{ times to obtain values } g_0, \ldots, g_{k-1}, \text{ respectively. Calculates a quantity}
\end{align*}
\]

\[
S = \sum_{i=0}^{k-1} (g_i - g.\text{min}) \cdot R^i
\]

using arithmetic of type RealType.

Returns: \( S/R^k \).

[Note 1: \( 0 \leq S/R^k < 1 \) — end note]

Throws: What and when \( g \) throws.

Complexity: Exactly \( k = \max(1, \lceil b/\log_2 R \rceil) \) invocations of \( g \), where \( b \)\(^{236}\) is the lesser of \( \text{numeric\_limits<RealType>::digits} \) and \( \text{bits} \), and \( R \) is the value of \( g.\text{max}() - g.\text{min}() + 1 \).

[Note 2: If the values \( g_i \) produced by \( g \) are uniformly distributed, the instantiation’s results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — end note]

28.5.9 Random number distribution class templates \ [rand.dist]

28.5.9.1 In general \ [rand.dist.general]

Each type instantiated from a class template specified in this subclause 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.

Descriptions are provided in this subclause 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

The algorithms for producing each of the specified distributions are implementation-defined.

The value of each probability density function \( p(z) \) and of each discrete probability function \( P(z_i) \) specified in this subclause is \( 0 \) everywhere outside its stated domain.

\(^{236}\) \( b \) is introduced to avoid any attempt to produce more bits of randomness than can be held in RealType.
28.5.9.2 Uniform distributions

28.5.9.2.1 Class template `uniform_int_distribution`

A `uniform_int_distribution` random number distribution produces random integers \( i, a \leq i \leq b \), distributed according to the constant discrete probability function

\[
P(i \mid a, b) = \frac{1}{b - a + 1}.
\]

namespace std {
    template<class IntType = int>
    class uniform_int_distribution {
        public:
            // types
            using result_type = IntType;
            using param_type = unspecified;

            // constructors and reset functions
            uniform_int_distribution() : uniform_int_distribution(0) {} 
            explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
            explicit uniform_int_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            result_type a() const;
            result_type b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<=(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>=(basic_istream<charT, traits>& is, uniform_int_distribution& x);
    };
}

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

Preconditions: \( a \leq b \).

Remarks: \( a \) and \( b \) correspond to the respective parameters of the distribution.

1. result_type a() const;
   Returns: The value of the \( a \) parameter with which the object was constructed.

2. result_type b() const;
   Returns: The value of the \( b \) parameter with which the object was constructed.

28.5.9.2.2 Class template `uniform_real_distribution`

A `uniform_real_distribution` random number distribution produces random numbers \( x, a \leq x < b \), distributed according to the constant probability density function

\[
p(x \mid a, b) = \frac{1}{b - a}.
\]
namespace std {
    template<class RealType = double>
    class uniform_real_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    uniform_real_distribution() : uniform_real_distribution(0.0) {};
    explicit uniform_real_distribution(RealType a, RealType b = 1.0);
    explicit uniform_real_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const uniform_real_distribution& x, const uniform_real_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    result_type a() const;
    result_type b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);
    }
}

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

Preconditions: $a \leq b$ and $b - a \leq \text{numeric_limits}<\text{RealType}>::\text{max}().$

Remarks: $a$ and $b$ correspond to the respective parameters of the distribution.

result_type a() const;

Returns: The value of the $a$ parameter with which the object was constructed.

result_type b() const;

Returns: The value of the $b$ parameter with which the object was constructed.

28.5.9.3 Bernoulli distributions

28.5.9.3.1 Class bernoulli_distribution

A bernoulli_distribution random number distribution produces bool values $b$ distributed according to the discrete probability function

$$P(b | p) = \begin{cases} p & \text{if } b = \text{true}, \\
1 - p & \text{if } b = \text{false}. \end{cases}$$
namespace std {
    class bernoulli_distribution {
    public:
        // types
        using result_type = bool;
        using param_type = unspecified;

        // constructors and reset functions
        bernoulli_distribution() : bernoulli_distribution(0.5) {}
        explicit bernoulli_distribution(double p);
        explicit bernoulli_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        double p() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);
    };
}

explicit bernoulli_distribution(double p);

Preconditions: $0 \leq p \leq 1$.
Remarks: $p$ corresponds to the parameter of the distribution.

Returns: The value of the $p$ parameter with which the object was constructed.

### 28.5.9.3.2 Class template binomial_distribution

A `binomial_distribution` random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i \mid t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i}.$$

namespace std {
    template<class IntType = int>
    class binomial_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;
    };
}
// constructors and reset functions
binomial_distribution() : binomial_distribution(1) {}
explicit binomial_distribution(IntType t, double p = 0.5);
explicit binomial_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);

explicit binomial_distribution(IntType t, double p = 0.5);

Preconditions: 0 \leq p \leq 1 and 0 \leq t.

Remarks: t and p correspond to the respective parameters of the distribution.

IntType t() const;
Returns: The value of the t parameter with which the object was constructed.
double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.3.3 Class template geometric_distribution [rand.dist.bern.geo]
A geometric_distribution random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function
\[
P(i \mid p) = p \cdot (1 - p)^i.
\]

namespace std {
    template<class IntType = int>
    class geometric_distribution {
        public:
            // types
            using result_type = IntType;
            using param_type = unspecified;

            // constructors and reset functions
            geometric_distribution() : geometric_distribution(0.5) {}
            explicit geometric_distribution(double p);
            explicit geometric_distribution(const param_type& parm);
            void reset();
        }
// equality operators
friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

// generating functions
template<class URBG>
  result_type operator()(URBG& g);
template<class URBG>
  result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
  operator<<(basic_ostream<charT, traits>& os, const geometric_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
  operator>>(basic_istream<charT, traits>& is, geometric_distribution& x);

explicit geometric_distribution(double p);

Preconditions: 0 < p < 1.
Remarks: p corresponds to the parameter of the distribution.

double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.3.4 Class template negative_binomial_distribution [rand.dist.bern.negbin]

A negative_binomial_distribution random number distribution produces random integers \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i \mid k, p) = \binom{k + i - 1}{i} \cdot p^k \cdot (1 - p)^i.
\]

[Note 1: This implies that \( P(i \mid k, p) \) is undefined when \( p = 1 \). —end note]

namespace std {
  template<class IntType = int>
  class negative_binomial_distribution {
  public:
    // types
    using result_type = IntType;
    using param_type = unspecified;
    
    // constructor and reset functions
    negative_binomial_distribution() : negative_binomial_distribution(1) {} 
    explicit negative_binomial_distribution(IntType k, double p = 0.5); 
    explicit negative_binomial_distribution(const param_type& parm); 
    void reset(); 

    // equality operators
    friend bool operator==(const negative_binomial_distribution& x, 
                          const negative_binomial_distribution& y);

    // generating functions
    template<class URBG>
      result_type operator()(URBG& g);
  }
}
template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

// property functions
IntType k() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);

explicit negative_binomial_distribution(IntType k, double p = 0.5);

2
Preconditions:
0 < p ≤ 1 and 0 < k.

3
Remarks:
k and p correspond to the respective parameters of the distribution.

IntType k() const;
Returns: The value of the k parameter with which the object was constructed.

double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.4 Poisson distributions
28.5.9.4.1 Class template poisson_distribution
A poisson_distribution random number distribution produces integer values i ≥ 0 distributed according to the discrete probability function

\[ P(i | \mu) = \frac{e^{-\mu} \mu^i}{i!} \].

The distribution parameter \( \mu \) is also known as this distribution’s mean.

template<class IntType = int>
class poisson_distribution
{
  public:
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
// property functions
double mean() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);

explicit poisson_distribution(double mean);

Preconditions: 0 < mean.
Remarks: mean corresponds to the parameter of the distribution.

Returns: The value of the mean parameter with which the object was constructed.

28.5.9.4.2 Class template exponential_distribution

An exponential_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x | \lambda) = \lambda e^{-\lambda x}.
\]

namespace std {
  template<class RealType = double>
class exponential_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructors and reset functions
    exponential_distribution() : exponential_distribution(1.0) {}  
exponential_distribution(RealType lambda);  
exponential_distribution(const param_type& parm);  
void reset();

    // equality operators
    friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);  
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType lambda() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&  
    operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
};

explicit exponential_distribution(RealType lambda);  

Preconditions: 0 < lambda.

Remarks: lambda corresponds to the parameter of the distribution.

RealType lambda() const;

Returns: The value of the lambda parameter with which the object was constructed.

28.5.9.4.3  Class template gamma_distribution  [rand.dist.pois.gamma]

A gamma_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \Gamma(\alpha)} \cdot x^{\alpha-1}.
\]

namespace std {

    template<class RealType = double>
    class gamma_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        gamma_distribution() : gamma_distribution(1.0) {} 
        explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
        explicit gamma_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType alpha() const;
        RealType beta() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
    };

§ 28.5.9.4.3  1306
explicit gamma_distribution(RealType alpha, RealType beta = 1.0);

Preconditions: $0 < \alpha$ and $0 < \beta$.

Remarks: $\alpha$ and $\beta$ correspond to the parameters of the distribution.

RealType alpha() const;

Returns: The value of the $\alpha$ parameter with which the object was constructed.

RealType beta() const;

Returns: The value of the $\beta$ parameter with which the object was constructed.

28.5.9.4.4 Class template weibull_distribution

A weibull_distribution random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x | a, b) = \frac{a}{b} \left( \frac{x}{b} \right)^{a-1} \exp \left( - \left( \frac{x}{b} \right)^a \right).$$

namespace std {
    template<class RealType = double>
    class weibull_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            weibull_distribution(); // weibull_distribution(1.0) {}
            explicit weibull_distribution(RealType a, RealType b = 1.0);
            explicit weibull_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType a() const;
            RealType b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<<basic_ostream<charT, traits>& os, const weibull_distribution& x>;
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
        }

    explicit weibull_distribution(RealType a, RealType b = 1.0);

    Preconditions: $0 < a$ and $0 < b$.

    Remarks: $a$ and $b$ correspond to the respective parameters of the distribution.
RealType a() const;

Returns: The value of the a parameter with which the object was constructed.

RealType b() const;

Returns: The value of the b parameter with which the object was constructed.

28.5.9.4.5 Class template extreme_value_distribution

An extreme_value_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid a, b) = \frac{1}{b} \exp \left( \frac{a - x}{b} - \exp \left( \frac{a - x}{b} \right) \right).
\]

namespace std {
    template<class RealType = double>
    class extreme_value_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        extreme_value_distribution() : extreme_value_distribution(0.0) {};
        explicit extreme_value_distribution(RealType a, RealType b = 1.0);
        explicit extreme_value_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const extreme_value_distribution& x,
                               const extreme_value_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType a() const;
        RealType b() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
    };
}

explicit extreme_value_distribution(RealType a, RealType b = 1.0);

Preconditions: 0 < b.

Remarks: a and b correspond to the respective parameters of the distribution.

237) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.
RealType a() const;

Returns: The value of the \( a \) parameter with which the object was constructed.

RealType b() const;

Returns: The value of the \( b \) parameter with which the object was constructed.

### 28.5.9.5 Normal distributions

#### 28.5.9.5.1 Class template normal_distribution

A normal_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x | \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).
\]

The distribution parameters \( \mu \) and \( \sigma \) are also known as this distribution’s mean and standard deviation.

```cpp
namespace std {
    template<class RealType = double>
    class normal_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        normal_distribution() : normal_distribution(0.0) {} // The default constructor.
        explicit normal_distribution(RealType mean, RealType stddev = 1.0);
        explicit normal_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const normal_distribution& x, const normal_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType mean() const;
        RealType stddev() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
    }
}
```

### Preconditions

\( 0 < \text{stddev} \).

### Remarks

\( \text{mean} \) and \( \text{stddev} \) correspond to the respective parameters of the distribution.

RealType mean() const;

Returns: The value of the \( \text{mean} \) parameter with which the object was constructed.
RealType stddev() const;

Returns: The value of the stddev parameter with which the object was constructed.

28.5.9.5.2 Class template lognormal_distribution

A lognormal_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x | m, s) = \frac{1}{sx\sqrt{2\pi}} \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).
\]

namespace std {
    template<class RealType = double>
    class lognormal_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        lognormal_distribution() : lognormal_distribution(0.0) {};
        explicit lognormal_distribution(RealType m, RealType s = 1.0);
        explicit lognormal_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType m() const;
        RealType s() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
    };
}

explicit lognormal_distribution(RealType m, RealType s = 1.0);

Preconditions: 0 < s.

Remarks: m and s correspond to the respective parameters of the distribution.

RealType m() const;

Returns: The value of the m parameter with which the object was constructed.

RealType s() const;

Returns: The value of the s parameter with which the object was constructed.
28.5.9.5.3 Class template chi_squared_distribution

A chi_squared_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x \mid n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.
\]

```cpp
namespace std {
    template<class RealType = double>
    class chi_squared_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        chi_squared_distribution() : chi_squared_distribution(1.0) {}
        explicit chi_squared_distribution(RealType n);
        explicit chi_squared_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
    };

    explicit chi_squared_distribution(RealType n);
}
```

2

Preconditions: 0 < n.

Remarks: n corresponds to the parameter of the distribution.

RealType n() const;

Returns: The value of the n parameter with which the object was constructed.

28.5.9.5.4 Class template cauchy_distribution

A cauchy_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid a, b) = \left(\pi b \left(1 + \left(\frac{x-a}{b}\right)^2\right)\right)^{-1}.
\]
namespace std {
  template<class RealType = double>
  class cauchy_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type = unspecified;
    // constructor and reset functions
    cauchy_distribution() : cauchy_distribution(0.0) {}
    explicit cauchy_distribution(RealType a, RealType b = 1.0);
    explicit cauchy_distribution(const param_type& parm);
    void reset();
    // equality operators
    friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);
  // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
  // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
  }

explicit cauchy_distribution(RealType a, RealType b = 1.0);
2 Preconditions: 0 < b.
3 Remarks: a and b correspond to the respective parameters of the distribution.

RealType a() const;
4 Returns: The value of the a parameter with which the object was constructed.

RealType b() const;
5 Returns: The value of the b parameter with which the object was constructed.

28.5.9.5.5 Class template fisher_f_distribution [rand.dist.norm.f]
1 A fisher_f_distribution random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x | m, n) = \frac{\Gamma((m + n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2) - 1} \cdot \left(1 + \frac{m x}{n}\right)^{-(m+n)/2}.
\]
namespace std {
    template<class RealType = double>
    class fisher_f_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            fisher_f_distribution() : fisher_f_distribution(1.0) {}
            explicit fisher_f_distribution(RealType m, RealType n = 1.0);
            explicit fisher_f_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType m() const;
            RealType n() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
    }
}

explicit fisher_f_distribution(RealType m, RealType n = 1);

Preconditions: 0 < m and 0 < n.

Remarks: m and n correspond to the respective parameters of the distribution.

RealType m() const;

Returns: The value of the m parameter with which the object was constructed.

RealType n() const;

Returns: The value of the n parameter with which the object was constructed.

28.5.9.5.6 Class template student_t_distribution [rand.dist.norm.t]

A student_t_distribution random number distribution produces random numbers x distributed according to the probability density function

\[ p(x \mid n) = \frac{1}{\sqrt{n \pi}} \cdot \frac{\Gamma\left((n + 1)/2\right)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}. \]
namespace std {
    template<class RealType = double>
    class student_t_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    student_t_distribution() : student_t_distribution(1.0) {}
    explicit student_t_distribution(RealType n);
    explicit student_t_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
    }

explicit student_t_distribution(RealType n);

Preconditions: 0 < n.
Remarks: n corresponds to the parameter of the distribution.

Returns: The value of the n parameter with which the object was constructed.

28.5.9.6 Sampling distributions

28.5.9.6.1 Class template discrete_distribution

A discrete_distribution random number distribution produces random integers \( i, 0 \leq i < n \), distributed according to the discrete probability function

\[
P(i \mid p_0, \ldots, p_{n-1}) = p_i .
\]

Unless specified otherwise, the distribution parameters are calculated as: \( p_k = w_k / S \) for \( k = 0, \ldots, n - 1 \), in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).

namespace std {
    template<class IntType = int>
    class discrete_distribution {
public:
// types
using result_type = IntType;
using param_type = unspecified;

// constructor and reset functions
discrete_distribution();
template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);
discrete_distribution(initializer_list<double> wl);
template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
explicit discrete_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<double> probabilities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);
}

discrete_distribution();
3

Effects: Constructs a discrete_distribution object with $n = 1$ and $p_0 = 1$.

[Note 1: Such an object will always deliver the value 0. — end note]

template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);
4

Mandates: is_convertible_v<iterator_traits<InputIterator>::value_type, double> is true.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3). If \begin{array}{l}
\text{firstW} \not= \text{lastW}, \text{let } n = 1 \text{ and } w_0 = 1. \\
\text{Otherwise, } [\text{firstW}, \text{lastW}) \text{ forms a sequence } w \text{ of length } n > 0.
\end{array}

Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

discrete_distribution(initializer_list<double> wl);
5

Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
6

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: If $nw = 0$, let $n = 1$, otherwise let $n = nw$. The relation $0 < \delta = (\text{xmax} - \text{xmin})/n$ holds.
Effects: Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If \( n_w = 0 \), let \( w_0 = 1 \). Otherwise, let \( w_k = f_w(x_{\text{min}} + k \cdot \delta + \delta/2) \) for \( k = 0, \ldots, n - 1 \).

Complexity: The number of invocations of \( f_w \) does not exceed \( n \).

```cpp
def probabilities() const;
```

Returns: A `vector<double>` whose `size` member returns \( n \) and whose `operator[]` member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1 \).

### 28.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

A `piecewise_constant_distribution` random number distribution produces random numbers \( x, b_0 \leq x < b_n \), uniformly distributed over each subinterval \( [b_i, b_{i+1}) \) according to the probability density function

\[
p(x \mid b_0, \ldots, b_n, \rho_0, \ldots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.
\]

The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution's interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n - 1 \). Unless specified otherwise, the remaining \( n \) distribution parameters are calculated as:

\[
\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n - 1,
\]

in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).

```cpp
namespace std {
    template<class RealType = double>
    class piecewise_constant_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            piecewise_constant_distribution();
            template<class InputIteratorB, class InputIteratorW>
                piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                                InputIteratorW firstW);
            template<class UnaryOperation>
                piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
            template<class UnaryOperation>
                piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,
                                                UnaryOperation fw);
            explicit piecewise_constant_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const piecewise_constant_distribution& x,
                                   const piecewise_constant_distribution& y);

            // generating functions
            template<class URBG>
                result_type operator()(URBG& g);
            template<class URBG>
                result_type operator()(URBG& g, const param_type& parm);

            // property functions
            vector<result_type> intervals() const;
            vector<result_type> densities() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;
    };
}
```
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_istream<charT, traits>& is, const piecewise_constant_distribution& x);
}

piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with \( n = 1, \rho_0 = 1, b_0 = 0, \) and \( b_1 = 1. \)

template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
InputIteratorW firstW);

Mandates: Both of

\[
\begin{align*}
&\text{— } \text{is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>} \\
&\text{— } \text{is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>}
\end{align*}
\]

to true.

Preconditions: InputIteratorB and InputIteratorW each meet the C++17InputIterator requirements (25.3.5.3). If \( \text{firstB} == \text{lastB} \) or \( ++\text{firstB} == \text{lastB} \), let \( n = 1, \rho_0 = 1, b_0 = 0, \) and \( b_1 = 1. \) Otherwise, \( [\text{firstB}, \text{lastB}] \) forms a sequence \( b \) of length \( n + 1 \), the length of the sequence \( w \) starting from \( \text{firstW} \) is at least \( n \), and any \( w_k \) for \( k \geq n \) are ignored by the distribution.

Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

Mandates: \text{is_invocable_r_v<double, UnaryOperation&, double>} is true.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: If \( \text{bl.size()} < 2 \), let \( n = 1, \rho_0 = 1, b_0 = 0, \) and \( b_1 = 1. \) Otherwise, let \( [\text{bl.begin()}, \text{bl.end()}] \) form a sequence \( b_0, \ldots, b_n \), and let \( w_k = f w((b_{k+1} + b_k)/2) \) for \( k = 0, \ldots, n - 1 \).

Complexity: The number of invocations of \( fw \) does not exceed \( n \).

template<class UnaryOperation>

piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

Mandates: \text{is_invocable_r_v<double, UnaryOperation&, double>} is true.

Preconditions: If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin)/n \) holds.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated from the following values: Let \( b_k = xmin + k \cdot \delta \) for \( k = 0, \ldots, n \), and \( w_k = fw(b_k + \delta/2) \) for \( k = 0, \ldots, n - 1 \).

Complexity: The number of invocations of \( fw \) does not exceed \( n \).

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns \( n + 1 \) and whose operator[] member returns \( b_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n \).

vector<result_type> densities() const;

Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1 \).

28.5.9.6.3 Class template piecewise_linear_distribution

A piecewise_linear_distribution random number distribution produces random numbers \( x, b_0 \leq x < b_n \), distributed over each subinterval \( [b_i, b_{i+1}) \) according to the probability density function

\[
p(x \mid b_0, \ldots, b_n, p_0, \ldots, p_n) = p_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + p_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \text{ for } b_i \leq x < b_{i+1}.
\]
The $n + 1$ distribution parameters $b_i$, also known as this distribution’s interval boundaries, shall satisfy the relation $b_i < b_{i+1}$ for $i = 0, \ldots, n - 1$. Unless specified otherwise, the remaining $n + 1$ distribution parameters are calculated as $\rho_k = w_k / S$ for $k = 0, \ldots, n$, in which the values $w_k$, commonly known as the weights at boundaries, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

$$0 < S = \frac{1}{2} \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).$$

namespace std {
    template<class RealType = double>
    class piecewise_linear_distribution {
        public:
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            piecewise_linear_distribution();
            template<class InputIteratorB, class InputIteratorW>
                piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                    InputIteratorW firstW);
            template<class UnaryOperation>
                piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
            template<class UnaryOperation>
                piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
            explicit piecewise_linear_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const piecewise_linear_distribution& x,
                        const piecewise_linear_distribution& y);

            // generating functions
            template<class URBG>
                result_type operator()(URBG& g);
            template<class URBG>
                result_type operator()(URBG& g, const param_type& parm);

            // property functions
            vector<result_type> intervals() const;
            vector<result_type> densities() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
                friend basic_ostream<charT, traits>&
                    operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
            template<class charT, class traits>
                friend basic_istream<charT, traits>&
                    operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
    }

Effects: Constructs a piecewise_linear_distribution object with $n = 1$, $\rho_0 = \rho_1 = 1$, $b_0 = 0$, and $b_1 = 1$. 

§ 28.5.9.6.3
template<class InputIteratorB, class InputIteratorW>
  piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                 InputIteratorW firstW);

  // Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.
  // Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements
  // (25.3.5.3). If firstB == lastB or ++firstB == lastB, let n = 1, ρ0 = ρ1 = 1, b0 = 0, and b1 = 1.
  // Otherwise, [firstB, lastB] forms a sequence b of length n + 1, the length of the sequence w starting
  // from firstW is at least n + 1, and any wk for k ≥ n + 1 are ignored by the distribution.
  // Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.
  
  template<class UnaryOperation>
  
  piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

  // Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.
  // Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
  // from the following values: If bl.size() < 2, let n = 1, ρ0 = ρ1 = 1, b0 = 0, and b1 = 1. Otherwise, let
  // [bl.begin(), bl.end()) form a sequence b0, ..., bn, and let wk = fw(bk) for k = 0, ..., n.

  template<class UnaryOperation>
  piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

  // Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.
  // Preconditions: If nw = 0, let n = 1, otherwise let n = nw. The relation 0 < δ = (xmax − xmin)/n holds.
  // Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
  // from the following values: Let bk = xmin + k · δ for k = 0, ..., n, and wk = fw(bk) for k = 0, ..., n.
  // Complexity: The number of invocations of fw does not exceed n + 1.

  vector<result_type> intervals() const;

  // Returns: A vector<result_type> whose size member returns n + 1 and whose operator[] member
  // returns bk when invoked with argument k for k = 0, ..., n.

  vector<result_type> densities() const;

  // Returns: A vector<result_type> whose size member returns n and whose operator[] member
  // returns pk when invoked with argument k for k = 0, ..., n.

  28.5.10 Low-quality random number generation  [c.math.rand]

  [Note 1: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note]
  int rand();
  void srand(unsigned int seed);

  // Effects: The rand and srand functions have the semantics specified in the C standard library.

  // Remarks: The implementation may specify that particular library functions may call rand. It is
  // implementation-defined whether the rand function may introduce data races (16.4.6.10).

  [Note 2: The other random number generation facilities in this document (28.5) are often preferable to rand,
  // because rand’s underlying algorithm is unspecified. Use of rand therefore continues to be non-portable, with
  // unpredictable and oft-questionable quality and performance. — end note]

  See also: ISO C 7.22.2

template<class T> valarray<T> exp (const valarray<T>&);

template<class T> valarray<T> log (const valarray<T>&);

template<class T> valarray<T> log10 (const valarray<T>&);
template<class T> valarray<T> pow(const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> pow(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> pow(const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> sin (const valarray<T>&);

template<class T> valarray<T> sinh (const valarray<T>&);

template<class T> valarray<T> sqrt (const valarray<T>&);

template<class T> valarray<T> tan (const valarray<T>&);

template<class T> valarray<T> tanh (const valarray<T>&);

template<class T> unspecified1 begin(valarray<T>& v);

template<class T> unspecified1 end(valarray<T>& v);

The header <valarray> defines five class templates (valarray, slice_array, gslice_array, mask_array, and indirect_array), two classes (slice and gslice), and a series of related function templates for representing and manipulating arrays of values.

The valarray array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

Any function returning a valarray<T> is permitted to return an object of another type, provided all the const member functions of valarray<T> are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.

Implementations introducing such replacement types shall provide additional functions and operators as follows:

1. for every function taking a const valarray<T>& other than begin and end, identical functions taking the replacement types shall be added;
2. for every function taking two const valarray<T>& arguments, identical functions taking every combination of const valarray<T>& and replacement types shall be added.

In particular, an implementation shall allow a valarray<T> to be constructed from such replacement types and shall allow assignments and compound assignments of such types to valarray<T>, slice_array<T>, gslice_array<T>, mask_array<T> and indirect_array<T> objects.

These library functions are permitted to throw a bad_alloc (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

28.6.2 Class template valarray

namespace std {
  template<class T> class valarray {
  public:
    using value_type = T;
    // 28.6.2.2, construct/destroy
    valarray();
    explicit valarray(size_t);
    valarray(const T& , size_t);
    valarray(const T*, size_t);
    valarray(const valarray&);
    valarray(valarray&&) noexcept;
    valarray(const slice_array<T>&);
    valarray(const gslice_array<T>&);
    valarray(const mask_array<T>&);
    valarray(const indirect_array<T>&);
    valarray(initializer_list<T>);
    ~valarray();
  }
}

Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.
// 28.6.2.3, assignment
valarray& operator=(const valarray&);
valarray& operator=(valarray&&) noexcept;
valarray& operator=(initializer_list<T>);
valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

// 28.6.2.4, element access
const T& operator[](size_t) const;
T& operator[](size_t);

// 28.6.2.5, subset operations
valarray operator[](slice) const;
slice_array<T> operator[](slice);
valarray operator[](const gslice&);
gslice_array<T> operator[](const gslice&);
valarray operator[](const valarray<bool>&) const;
mask_array<T> operator[](const valarray<bool>&);
valarray operator[](const valarray<size_t>&) const;
indirect_array<T> operator[](const valarray<size_t>&);

// 28.6.2.6, unary operators
valarray operator+(() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

// 28.6.2.7, compound assignment
valarray& operator*= (const T&);
valarray& operator/= (const T&);
valarray& operator%= (const T&);
valarray& operator+= (const T&);
valarray& operator-= (const T&);
valarray& operator^= (const T&);
valarray& operator|= (const T&);
valarray& operator&= (const T&);
valarray& operator<<=(const T&);
valarray& operator>>=(const T&);
valarray& operator*= (const valarray&);
valarray& operator/= (const valarray&);
valarray& operator%= (const valarray&);
valarray& operator+= (const valarray&);
valarray& operator-= (const valarray&);
valarray& operator^= (const valarray&);
valarray& operator|= (const valarray&);
valarray& operator&= (const valarray&);
valarray& operator<<=(const valarray&);
valarray& operator>>=(const valarray&);

// 28.6.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;
T sum() const;
T min() const;
T max() const;

valarray shift (int) const;
valarray cshift(int) const;
The class template `valarray<T>` is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type `valarray<T>` is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.\footnote{The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the `valarray` template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.}

### 28.6.2.2 Constructors

- **valarray();**
  - **Effects:** Constructs a `valarray` that has zero length.\footnote{This default constructor is essential, since arrays of `valarray` can be useful. After initialization, the length of an empty array can be increased with the `resize` member function.}

- **explicit valarray(size_t n);**
  - **Effects:** Constructs a `valarray` that has length `n`. Each element of the array is value-initialized (9.4).

- **valarray(const T& v, size_t n);**
  - **Effects:** Constructs a `valarray` that has length `n`. Each element of the array is initialized with `v`.

- **valarray(const T* p, size_t n);**
  - **Preconditions:** `[p, p + n)` is a valid range.
  - **Effects:** Constructs a `valarray` that has length `n`. The values of the elements of the array are initialized with the first `n` values pointed to by the first argument.\footnote{This constructor is the preferred method for converting a C array to a `valarray` object.}

- **valarray(const valarray& v);**
  - **Effects:** Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.\footnote{This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.}

- **valarray(valarray&& v) noexcept;**
  - **Effects:** Constructs a `valarray` that has the same length as `v`. The elements are initialized with the values of the corresponding elements of `v`.

- **valarray(initializer_list<T> il);**
  - **Effects:** Equivalent to `valarray(il.begin(), il.size())`.

- **valarray(const slice_array<T>&);**
- **valarray(const gslice_array<T>&);**
- **valarray(const mask_array<T>&);**
- **valarray(const indirect_array<T>&);**

These conversion constructors convert one of the four reference templates to a `valarray`.

- **~valarray();**
  - **Effects:** The destructor is applied to every element of `*this`; an implementation may return all allocated memory.
28.6.2.3 Assignment \hfill \text{[valarray.assign]}

\text{valarray}\& \text{operator=} (\text{const valarray}\& \text{v});

\hspace{1em} \text{Effects}: Each element of the \text{*this} array is assigned the value of the corresponding element of \text{v}. If the length of \text{v} is not equal to the length of \text{*this}, resizes \text{*this} to make the two arrays the same length, as if by calling \text{resize(v.size())}, before performing the assignment.

\hspace{1em} \text{Postconditions}: \text{size()} == \text{v.size()}. \hfill \text{1}

\hspace{1em} \text{Returns}: \text{*this}. \hfill \text{2}

\text{valarray}\& \text{operator=} (\text{valarray&& \text{v}) noexcept;}

\hspace{1em} \text{Effects}: \text{*this} obtains the value of \text{v}. The value of \text{v} after the assignment is not specified.

\hspace{1em} \text{Returns}: \text{*this}. \hfill \text{3}

\hspace{1em} \text{Complexity}: Linear. \hfill \text{4}

\text{valarray}\& \text{operator=} (\text{initializer_list<T> il});

\hspace{1em} \text{Effects}: Equivalent to: return \text{*this} = \text{valarray(il)}; \hfill \text{5}

\text{valarray}\& \text{operator=} (\text{const T& \text{v});}

\hspace{1em} \text{Effects}: Assigns \text{v} to each element of \text{*this}. \hfill \text{6}

\hspace{1em} \text{Returns}: \text{*this}. \hfill \text{7}

\text{valarray}\& \text{operator=} (\text{const slice_array<T>&});
\text{valarray}\& \text{operator=} (\text{const gslice_array<T>&});
\text{valarray}\& \text{operator=} (\text{const mask_array<T>&});
\text{valarray}\& \text{operator=} (\text{const indirect_array<T>&});

\hspace{1em} \text{Preconditions}: The length of the array to which the argument refers equals \text{size()}. The value of an element in the left-hand side of a \text{valarray} assignment operator does not depend on the value of another element in that left-hand side.

\hspace{1em} These operators allow the results of a generalized subscripting operation to be assigned directly to a \text{valarray}. \hfill \text{8}

28.6.2.4 Element access \hfill \text{[valarray.access]}

\text{const T& \text{operator[]} (\text{size_t n}) const;}
\text{T& \text{operator[]} (\text{size_t n);}}

\hspace{1em} \text{Preconditions}: \text{n} < \text{size()} is true. \hfill \text{1}

\hspace{1em} \text{Returns}: A reference to the corresponding element of the array.

\hspace{1em} \text{[Note 1: The expression \text{a[i]} = \text{q}, \text{a[i]} == \text{q} evaluates to true for any non-constant \text{valarray<T> a}, any \text{T q}, and for any \text{size_t i} such that the value of \text{i} is less than the length of \text{a}. — end note]}

\hspace{1em} \text{Remarks}: The expression \text{offsetof(a[i+j]) == offsetof(a[i]) + j} evaluates to true for all \text{size_t i} and \text{size_t j} such that \text{i+j < a.size()}. \hfill \text{2}

\hspace{1em} The expression \text{offsetof(a[i]) != offsetof(b[j])} evaluates to true for any two arrays \text{a} and \text{b} and for any \text{size_t i} and \text{size_t j} such that \text{i < a.size()} and \text{j < b.size()}. \hfill \text{3}

\hspace{1em} \text{[Note 2: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from operator \text{new}, and other techniques to generate efficient \text{valarrays}. — end note]}

\hspace{1em} The reference returned by the subscript operator for an array shall be valid until the member function \text{resize(size_t, T) (28.6.2.8)} is called for that array or until the lifetime of that array ends, whichever happens first. \hfill \text{4}

28.6.2.5 Subset operations \hfill \text{[valarray.sub]}

\hspace{1em} The member \text{operator[]} is overloaded to provide several ways to select sequences of elements from among those controlled by \text{*this}. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new \text{valarray} object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of \text{operator=}.
and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

valarray operator[](slice slicearr) const;

Returns: A valarray containing those elements of the controlled sequence designated by slicearr.

[Example 1:
  const valarray<char> v0("abcdefghijklmnop", 16);
  // v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
  —end example]

slice_array<T> operator[](slice slicearr);

Returns: An object that holds references to elements of the controlled sequence selected by slicearr.

[Example 2:
  valarray<char> v0("abcdefghijklmnop", 16);
  valarray<char> v1("ABCDE", 5);
  v0[slice(2, 5, 3)] = v1;
  // v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
  —end example]

valarray operator[](const gslice& gslicearr) const;

Returns: A valarray containing those elements of the controlled sequence designated by gslicearr.

[Example 3:
  const valarray<char> v0("abcdefghijklmnop", 16);
  const size_t lv[] = { 2, 3 };
  const size_t dv[] = { 7, 2 };
  const valarray<size_t> len(lv, 2), str(dv, 2);
  // v0[gslice(3, len, str)] returns
  // valarray<char>("dfhkmo", 6)
  —end example]

gslice_array<T> operator[](const gslice& gslicearr);

Returns: An object that holds references to elements of the controlled sequence selected by gslicearr.

[Example 4:
  valarray<char> v0("abcdefghijklmnop", 16);
  const size_t lv[] = { 2, 3 };
  const size_t dv[] = { 7, 2 };
  const valarray<size_t> len(lv, 2), str(dv, 2);
  v0[gslice(3, len, str)] = v1;
  // v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
  —end example]

valarray operator[](const valarray<bool>& boolarr) const;

Returns: A valarray containing those elements of the controlled sequence designated by boolarr.

[Example 5:
  const valarray<char> v0("abcdefghijklmnop", 16);
  const bool vb[] = { false, false, true, true, false, true };
  // v0[valarray<bool>(vb, 6)] returns
  // valarray<char>("cdf", 3)
  —end example]

mask_array<T> operator[](const valarray<bool>& boolarr);

Returns: An object that holds references to elements of the controlled sequence selected by boolarr.

[Example 6:
  valarray<char> v0("abcdefghijklmnop", 16);

§ 28.6.2.5
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true }
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
—end example
valarray operator[] (const valarray<size_t>& indarr) const;

Returns: A valarray containing those elements of the controlled sequence designated by indarr.

[Example 7]:
const valarray<char> v0("abcdefghijkmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 }
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
—end example
indirect_array<T> operator[] (const valarray<size_t>& indarr);

Returns: An object that holds references to elements of the controlled sequence selected by indarr.

[Example 8]:
valarray<char> v0("abcdefghijkmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 }
// v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
—end example

28.6.2.6 Unary operators

valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T (bool for operator!) or which may be unambiguously implicitly converted to type T (bool for operator!).

Returns: A valarray whose length is size(). Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

28.6.2.7 Compound assignment

valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<<= (const valarray& v);
valarray& operator>>>= (const valarray& v);

Mandates: The indicated operator can be applied to two operands of type T.

Preconditions: size() == v.size() is true.

The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

Effects: Each of these operators performs the indicated operation on each of the elements of *this and the corresponding element of v.

Returns: *this.
5 Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);

6 Mandates: The indicated operator can be applied to two operands of type T.

7 Effects: Each of these operators applies the indicated operation to each element of *this and v.

8 Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

28.6.2.8 Member functions

void swap(valarray& v) noexcept;

1 Effects: *this obtains the value of v. v obtains the value of *this.

2 Complexity: Constant.

size_t size() const;

3 Returns: The number of elements in the array.

4 Complexity: Constant time.

T sum() const;

5 Mandates: operator+= can be applied to operands of type T.

6 Preconditions: size() > 0 is true.

7 Returns: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying operator+= to a copy of an element of the array and all other elements of the array in an unspecified order.

T min() const;

8 Preconditions: size() > 0 is true.

9 Returns: The minimum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

T max() const;

10 Preconditions: size() > 0 is true.

11 Returns: The maximum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

valarray shift(int n) const;

12 Returns: A valarray of length size(), each of whose elements I is (*this)[I + n] if I + n is non-negative and less than size(), otherwise T().

[Note 1: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. — end note]

[Example 1: If the argument has the value −2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of the argument; etc. — end example]
valarray cshift(int n) const;

Returns: A valarray of length size() that is a circular shift of *this. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right −n places.

valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;

Returns: A valarray whose length is size(). Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of *this.

void resize(size_t sz, T c = T());

Effects: Changes the length of the *this array to sz and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

28.6.3 valarray non-member operations [valarray.nonmembers]

28.6.3.1 Binary operators [valarray.binary]

template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Preconditions: The argument arrays have the same length.

Returns: A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> operator| (const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> operator| (const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> operator<<(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> operator<<(const typename valarray<T>::value_type&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Returns: A valarray whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

28.6.3.2 Logical operators [valarray.comparison]

Mandates: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.

Preconditions: The two array arguments have the same length.

Returns: A valarray<bool> whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
template<class T> valarray<bool> operator&&(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.

Returns: A valarray<bool> whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

28.6.3.3 Transcendentals

Mandates: A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

28.6.3.4 Specialized algorithms

Effects: Equivalent to x.swap(y).

28.6.4 Class slice

28.6.4.1 Overview
The `slice` class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.

### 28.6.4.2 Constructors

- `slice();`
- `slice(size_t start, size_t length, size_t stride);`
- `slice(const slice&);`

The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

*Example 1: `slice(3, 8, 2)` constructs a slice which selects elements 3, 5, 7, ..., 17 from an array.*

### 28.6.4.3 Access functions

- `size_t start() const;`
- `size_t size() const;`
- `size_t stride() const;`

*Returns:* The start, length, or stride specified by a `slice` object.

*Complexity:* Constant time.

### 28.6.4.4 Operators

```cpp
friend bool operator==(const slice& x, const slice& y);
```

*Effects:* Equivalent to:

```cpp
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

### 28.6.5 Class template `slice_array`

#### 28.6.5.1 Overview

```cpp
namespace std {
  template<class T> class slice_array {
    using value_type = T;

    public:
      using value_type = T;

      void operator= (const valarray<T>&) const;
      void operator*= (const valarray<T>&) const;
      void operator/= (const valarray<T>&) const;
      void operator%= (const valarray<T>&) const;
      void operator+= (const valarray<T>&) const;
      void operator-= (const valarray<T>&) const;
      void operator^= (const valarray<T>&) const;
      void operator&= (const valarray<T>&) const;
      void operator|= (const valarray<T>&) const;
      void operator<<=(const valarray<T>&) const;
      void operator>>=(const valarray<T>&) const;

      slice_array(const slice_array&);  // as implied by declaring copy constructor above
    ~slice_array();
    const slice_array& operator=(const slice_array&);  
    void operator=(const T&);  
    slice_array() = delete;  
  };
}
```

This template is a helper template used by the `slice` subscript operator

```cpp
slice_array<T> valarray<T>::operator[](slice);
```

---

243) BLAS stands for *Basic Linear Algebra Subprograms*. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: *A set of Level 3 Basic Linear Algebra Subprograms*; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.
It has reference semantics to a subset of an array specified by a \texttt{slice} object.

\textit{Example 1:} The expression $a[slice(1, 5, 3)] = b$ has the effect of assigning the elements of $b$ to a slice of the elements in $a$. For the slice shown, the elements selected from $a$ are $1, 4, \ldots, 13$. \textit{— end example}

\subsection*{28.6.5.2 Assignment}

\begin{verbatim}
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
\end{verbatim}

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the \texttt{valarray<T>} object to which the \texttt{slice_array} object refers.

\subsection*{28.6.5.3 Compound assignment}

\begin{verbatim}
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
\end{verbatim}

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the \texttt{valarray<T>} object to which the \texttt{slice_array} object refers.

\subsection*{28.6.5.4 Fill function}

\begin{verbatim}
void operator=(const T&) const;
\end{verbatim}

This function has reference semantics, assigning the value of its argument to the elements of the \texttt{valarray<T>} object to which the \texttt{slice_array} object refers.

\section*{28.6.6 The \texttt{gslice} class}

\subsection*{28.6.6.1 Overview}

\begin{verbatim}
namespace std {
    class gslice {
    public:
        gslice();
        gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);
        size_t start() const;
        valarray<size_t> size() const;
        valarray<size_t> stride() const;
    }
}
\end{verbatim}

This class represents a generalized slice out of an array. A \texttt{gslice} is defined by a starting offset ($s$), a set of lengths ($l_j$), and a set of strides ($d_j$). The number of lengths shall equal the number of strides.

A \texttt{gslice} represents a mapping from a set of indices ($i_j$), equal in number to the number of strides, to a single index $k$. It is useful for building multidimensional array classes using the \texttt{valarray} template, which is one-dimensional. The set of one-dimensional index values specified by a \texttt{gslice} are

$$k = s + \sum_j i_j d_j$$

where the multidimensional indices $i_j$ range in value from 0 to $l_j - 1$.

\textit{Example 1:} The \texttt{gslice} specification

\begin{verbatim}
    start = 3
    length = {2, 4, 3}
    stride = {19, 4, 1}
\end{verbatim}
yields the sequence of one-dimensional indices

\[ k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1 \]

which are ordered as shown in the following table:

\[
\begin{align*}
(i_0, & \quad i_1, \quad i_2, \quad k) = \\
(0, & \quad 0, \quad 0, \quad 3), \\
(0, & \quad 0, \quad 1, \quad 4), \\
(0, & \quad 0, \quad 2, \quad 5), \\
(0, & \quad 1, \quad 0, \quad 7), \\
(0, & \quad 1, \quad 1, \quad 8), \\
(0, & \quad 1, \quad 2, \quad 9), \\
(0, & \quad 2, \quad 0, \quad 11), \\
(0, & \quad 2, \quad 1, \quad 12), \\
(0, & \quad 2, \quad 2, \quad 13), \\
(0, & \quad 3, \quad 0, \quad 15), \\
(0, & \quad 3, \quad 1, \quad 16), \\
(0, & \quad 3, \quad 2, \quad 17), \\
(1, & \quad 0, \quad 0, \quad 22), \\
(1, & \quad 0, \quad 1, \quad 23), \\
\ldots \\
(1, & \quad 3, \quad 2, \quad 36)
\end{align*}
\]

That is, the highest-ordered index turns fastest. — end example]
28.6.7 Class template gslice_array

28.6.7.1 Overview

```cpp
namespace std {
    template<class T> class gslice_array {
        public:
            using value_type = T;

            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%= (const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^= (const valarray<T>&) const;
            void operator&= (const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;

            gslice_array(const gslice_array&);
            ~gslice_array();
            const gslice_array& operator=(const gslice_array&) const;
            void operator=(const T&) const;
            gslice_array() = delete;  // as implied by declaring copy constructor above
    };
}
```

1 This template is a helper template used by the `gslice` subscript operator:
   ```cpp
   gslice_array<T> valarray<T>::operator[](const gslice&);
   ```

2 It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression
   ```cpp
   a[gslice(1, length, stride)] = b
   ```
   has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

28.6.7.2 Assignment

```cpp
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

28.6.7.3 Compound assignment

```cpp
void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` refers.

28.6.7.4 Fill function

```cpp
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.
28.6.8 Class template mask_array

28.6.8.1 Overview

namespace std {
    template<class T> class mask_array {
        using value_type = T;

        public:

            void operator= (const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^= (const valarray<T>&) const;
            void operator&= (const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;

            mask_array(const mask_array&);
            ~mask_array();
            const mask_array& operator=(const mask_array&) const;
            void operator=(const T&) const;

            mask_array() = delete; // as implied by declaring copy constructor above
    };
}

1 This template is a helper template used by the mask subscript operator:

    mask_array<T> valarray<T>::operator[](const valarray<bool>&).

2 It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression a[mask] = b; has the effect of assigning the elements of b to the masked elements in a (those for which the corresponding element in mask is true).

28.6.8.2 Assignment

void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which the mask_array object refers.

28.6.8.3 Compound assignment

void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the mask_array object refers.

28.6.8.4 Fill function

void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the mask_array object refers.
28.6.9 Class template \texttt{indirect\_array}

28.6.9.1 Overview

namespace std {
    template<class T> class indirect\_array {
        public:
            using value\_type = T;
            void operator\=(const valarray<T>&) const;
            void operator\*=(const valarray<T>&) const;
            void operator/=(const valarray<T>&) const;
            void operator\%= (const valarray<T>&) const;
            void operator\+=(const valarray<T>&) const;
            void operator\-=(const valarray<T>&) const;
            void operator\^=(const valarray<T>&) const;
            void operator\&=(const valarray<T>&) const;
            void operator\|=(const valarray<T>&) const;
            void operator\<<(const valarray<T>&) const;
            void operator\>>(const valarray<T>&) const;
            indirect\_array(const indirect\_array&);
            ~indirect\_array();
            const indirect\_array& operator=(const indirect\_array&) const;
            void operator=(const T&) const;
            indirect\_array() = delete; // as implied by declaring copy constructor above
    };
}

1 This template is a helper template used by the indirect subscript operator

\texttt{indirect\_array} T \texttt{valarray\langle} T \rangle \texttt{::operator[] (const valarray<\texttt{size\_t}>&)}.

2 It has reference semantics to a subset of an array specified by an \texttt{indirect\_array}. Thus, the expression \texttt{a[indirect] = b;} has the effect of assigning the elements of \texttt{b} to the elements in \texttt{a} whose indices appear in \texttt{indirect}.

28.6.9.2 Assignment

void operator\=(const valarray<T>&) const;
const indirect\_array& operator\=(const indirect\_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the \texttt{valarray<T>} object to which it refers.

2 If the \texttt{indirect\_array} specifies an element in the \texttt{valarray<T>} object to which it refers more than once, the behavior is undefined.

3 [\textit{Example 1}:]

int addr[] = \{2, 3, 1, 4, 4\};
valarray<\texttt{size\_t}> indirect(addr, 5);
valarray<\texttt{double}> a(0., 10), b(1., 5);
\texttt{a[indirect] = b;} results in undefined behavior since element 4 is specified twice in the indirection. — end example]

28.6.9.3 Compound assignment

void operator\*=(const valarray<T>&) const;
void operator/=(const valarray<T>&) const;
void operator\%=(const valarray<T>&) const;
void operator\+=(const valarray<T>&) const;
void operator\-=(const valarray<T>&) const;
void operator\^=(const valarray<T>&) const;
void operator\&=(const valarray<T>&) const;
void operator\|=(const valarray<T>&) const;
void operator\<<(const valarray<T>&) const;
void operator\>>(const valarray<T>&) const;

§ 28.6.9.3  1337
void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the indirect_array object refers.

2 If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

28.6.9.4 Fill function

void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the indirect_array object refers.

28.6.10 valarray range access

In the begin and end function templates that follow, unspecified1 is a type that meets the requirements of a mutable Cpp17RandomAccessIterator (25.3.5.7) and models contiguous_iterator (25.3.4.14), whose value_type is the template parameter T and whose reference type is T&. unspecified2 is a type that meets the requirements of a constant Cpp17RandomAccessIterator and models contiguous_iterator, whose value_type is the template parameter T and whose reference type is const T&.

2 The iterators returned by begin and end for an array are guaranteed to be valid until the member function resize(size_t, T) (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);

3 Returns: An iterator referencing the first value in the array.

template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);

4 Returns: An iterator referencing one past the last value in the array.

// 28.7.6.22, spherical Neumann functions;
// spherical Bessel functions of the second kind
double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
}

1 The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.
[Note 1: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — end note]

2 For each set of overloaded functions within `<cmath>`, with the exception of `abs`, there shall be additional overloads sufficient to ensure:

(2.1) — If any argument of arithmetic type corresponding to a `double` parameter has type `long double`, then all arguments of arithmetic type (6.8.2) corresponding to `double` parameters are effectively cast to `long double`.

(2.2) — Otherwise, if any argument of arithmetic type corresponding to a `double` parameter has type `double` or an integer type, then all arguments of arithmetic type corresponding to `double` parameters are effectively cast to `double`.

(2.3) — [Note 2: Otherwise, all arguments of arithmetic type corresponding to `double` parameters have type `float`. — end note]

[Note 3: `abs` is exempted from these rules in order to stay compatible with C. — end note]

See also: ISO C 7.12

28.7.2 Absolute values

1 [c.math.abs]

constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);
constexpr float abs(float j);
constexpr double abs(double j);
constexpr long double abs(long double j);

2 Effects: The `abs` functions have the semantics specified in the C standard library for the functions `abs`, `labs`, `llabs`, `fabsf`, `fabs`, and `fabsl`.

3 Remarks: If `abs()` is called with an argument of type `X` for which `is_unsigned_v<X>` is true and if `X` cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[Note 2: Arguments that can be promoted to `int` are permitted for compatibility with C. — end note]

See also: ISO C 7.12.7.2, 7.22.6.1

28.7.3 Three-dimensional hypotenuse

[c.math.hypot3]

float hypot(float x, float y, float z);
double hypot(double x, double y, double z);
long double hypot(long double x, long double y, long double z);

1 Returns: $\sqrt{x^2 + y^2 + z^2}$.

28.7.4 Linear interpolation

[c.math.lerp]

constexpr float lerp(float a, float b, float t) noexcept;
castexpr double lerp(double a, double b, double t) noexcept;
costexpr long double lerp(long double a, long double b, long double t) noexcept;

1 Returns: $a + t(b - a)$.
Remarks: Let \( r \) be the value returned. If isfinite(a) \&\& isfinite(b), then:

\[ \begin{align*}
(2.1) & \quad \text{If } t == 0, \text{ then } r == a. \\
(2.2) & \quad \text{If } t == 1, \text{ then } r == b. \\
(2.3) & \quad \text{If } t >= 0 \&\& t <= 1, \text{ then isfinite(r).} \\
(2.4) & \quad \text{If isfinite(t) \&\& a == b, then } r == a. \\
(2.5) & \quad \text{If isfinite(t) || !isnan(t) \&\& b-a != 0, then !isnan(r).}
\end{align*} \]

Let \( CMP(x, y) \) be 1 if \( x > y \), -1 if \( x < y \), and 0 otherwise. For any \( t_1 \) and \( t_2 \), the product of \( CMP(lerp(a, b, t_2), lerp(a, b, t_1)) \), \( CMP(t_2, t_1) \), and \( CMP(b, a) \) is non-negative.

### 28.7.5 Classification / comparison functions

The classification / comparison functions behave the same as the C macros with the corresponding names defined in the C standard library. Each function is overloaded for the three floating-point types.

See also: ISO C 7.12.3, 7.12.4

### 28.7.6 Mathematical special functions

#### 28.7.6.1 General

If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for just those argument values for which:

\[ \begin{align*}
(1.1) & \quad \text{the function description’s Returns: element explicitly specifies a domain and those argument values fall outside the specified domain, or} \\
(1.2) & \quad \text{the corresponding mathematical function value has a nonzero imaginary component, or} \\
(1.3) & \quad \text{the corresponding mathematical function is not mathematically defined.} \quad \text{(244)}
\end{align*} \]

Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

#### 28.7.6.2 Associated Laguerre polynomials

\[
\begin{align*}
\text{double} & \quad \text{assoc_laguerre(unsigned n, unsigned m, double x);} \\
\text{float} & \quad \text{assoc_laguerref(unsigned n, unsigned m, float x);} \\
\text{long double} & \quad \text{assoc_laguerrel(unsigned n, unsigned m, long double x);} \\
\end{align*}
\]

**Effects:** These functions compute the associated Laguerre polynomials of their respective arguments \( n \), \( m \), and \( x \).

**Returns:**

\[
L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0,
\]

where \( n \) is \( n \), \( m \) is \( m \), and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n >= 128 \) or if \( m >= 128 \).

#### 28.7.6.3 Associated Legendre functions

\[
\begin{align*}
\text{double} & \quad \text{assoc_legendre(unsigned l, unsigned m, double x);} \\
\text{float} & \quad \text{assoc_legendref(unsigned l, unsigned m, float x);} \\
\text{long double} & \quad \text{assoc_legendrel(unsigned l, unsigned m, long double x);} \\
\end{align*}
\]

**Effects:** These functions compute the associated Legendre functions of their respective arguments \( l \), \( m \), and \( x \).

**Returns:**

\[
P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x), \quad \text{for } |x| \leq 1,
\]

where \( l \) is \( l \), \( m \) is \( m \), and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( l >= 128 \).

---

244) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.
28.7.6.4 Beta function

\texttt{double beta(double x, double y);}  
\texttt{float betaf(float x, float y);}  
\texttt{long double betal(long double x, long double y);}  

\textbf{Effects:} These functions compute the beta function of their respective arguments \(x\) and \(y\).

\textbf{Returns:}

\[ B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)} , \quad \text{for } x > 0, \ y > 0, \]

where \(x\) is \(x\) and \(y\) is \(y\).

28.7.6.5 Complete elliptic integral of the first kind

\texttt{double comp_ellint_1(double k);}  
\texttt{float comp_ellint_1f(float k);}  
\texttt{long double comp_ellint_1l(long double k);}  

\textbf{Effects:} These functions compute the complete elliptic integral of the first kind of their respective arguments \(k\).

\textbf{Returns:}

\[ K(k) = F(k, \pi/2) , \quad \text{for } |k| \leq 1, \]

where \(k\) is \(k\).

See also 28.7.6.12.

28.7.6.6 Complete elliptic integral of the second kind

\texttt{double comp_ellint_2(double k);}  
\texttt{float comp_ellint_2f(float k);}  
\texttt{long double comp_ellint_2l(long double k);}  

\textbf{Effects:} These functions compute the complete elliptic integral of the second kind of their respective arguments \(k\).

\textbf{Returns:}

\[ E(k) = E(k, \pi/2) , \quad \text{for } |k| \leq 1, \]

where \(k\) is \(k\).

See also 28.7.6.13.

28.7.6.7 Complete elliptic integral of the third kind

\texttt{double comp_ellint_3(double k, double nu);}  
\texttt{float comp_ellint_3f(float k, float nu);}  
\texttt{long double comp_ellint_3l(long double k, long double nu);}  

\textbf{Effects:} These functions compute the complete elliptic integral of the third kind of their respective arguments \(k\) and \(\nu\).

\textbf{Returns:}

\[ \Pi(\nu, k) = \Pi(\nu, k, \pi/2) , \quad \text{for } |k| \leq 1, \]

where \(k\) is \(k\) and \(\nu\) is \(\nu\).

See also 28.7.6.14.

28.7.6.8 Regular modified cylindrical Bessel functions

\texttt{double cyl_bessel_i(double nu, double x);}  
\texttt{float cyl_bessel_if(float nu, float x);}  
\texttt{long double cyl_bessel_il(long double nu, long double x);}  

\textbf{Effects:} These functions compute the regular modified cylindrical Bessel functions of their respective arguments \(\nu\) and \(x\).

\textbf{Returns:}

\[ I_{\nu}(x) = i^{-\nu} J_{\nu}(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)} , \quad \text{for } x \geq 0, \]
where \( \nu \) is \( nu \) and \( x \) is \( x \).

**Remarks**: The effect of calling each of these functions is implementation-defined if \( nu \geq 128 \).

See also 28.7.6.9.

### 28.7.6.9 Cylindrical Bessel functions of the first kind

[\texttt{sf.cmath.cyl.bessel.j}]

double cyl_bessel_j(double nu, double x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);

**Effects**: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments \( nu \) and \( x \).

**Returns**:

\[
J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for} \ x \geq 0,
\]

where \( \nu \) is \( nu \) and \( x \) is \( x \).

**Remarks**: The effect of calling each of these functions is implementation-defined if \( nu \geq 128 \).

### 28.7.6.10 Irregular modified cylindrical Bessel functions

[\texttt{sf.cmath.cyl.bessel.k}]

double cyl_bessel_k(double nu, double x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);

**Effects**: These functions compute the irregular modified cylindrical Bessel functions of their respective arguments \( nu \) and \( x \).

**Returns**:

\[
K_\nu(x) = (\pi/2)^{\nu+1} (J_\nu(ix) + iN_\nu(ix)) = \begin{cases} 
\frac{\pi I_{-\nu}(x) - I_\nu(x)}{\sin \nu \pi}, & \text{for} \ x \geq 0 \text{ and non-integral} \ \nu \\
\frac{\pi}{2} \lim_{\mu \to \nu} \frac{I_{-\mu}(x) - I_\mu(x)}{\sin \mu \pi}, & \text{for} \ x \geq 0 \text{ and integral} \ \nu
\end{cases}
\]

where \( \nu \) is \( nu \) and \( x \) is \( x \).

**Remarks**: The effect of calling each of these functions is implementation-defined if \( nu \geq 128 \).

See also 28.7.6.8, 28.7.6.9, 28.7.6.11.

### 28.7.6.11 Cylindrical Neumann functions

[\texttt{sf.cmath.cyl.neumann}]

double cyl_neumann(double nu, double x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);

**Effects**: These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments \( nu \) and \( x \).

**Returns**:

\[
N_\nu(x) = \begin{cases} 
\frac{J_\nu(x) \cos \nu \pi - J_{-\nu}(x)}{\sin \nu \pi}, & \text{for} \ x \geq 0 \text{ and non-integral} \ \nu \\
\lim_{\mu \to \nu} \frac{J_\mu(x) \cos \mu \pi - J_{-\mu}(x)}{\sin \mu \pi}, & \text{for} \ x \geq 0 \text{ and integral} \ \nu
\end{cases}
\]

where \( \nu \) is \( nu \) and \( x \) is \( x \).

**Remarks**: The effect of calling each of these functions is implementation-defined if \( nu \geq 128 \).

See also 28.7.6.9.
28.7.6.12 Incomplete elliptic integral of the first kind

```c
double ellint_1(double k, double phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

**Effects**: These functions compute the incomplete elliptic integral of the first kind of their respective arguments $k$ and $\phi$ ($\phi$ measured in radians).

**Returns**: 

$$F(k, \phi) = \int_{0}^{\phi} \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,$$

where $k$ is $k$ and $\phi$ is $\phi$.

28.7.6.13 Incomplete elliptic integral of the second kind

```c
double ellint_2(double k, double phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

**Effects**: These functions compute the incomplete elliptic integral of the second kind of their respective arguments $k$ and $\phi$ ($\phi$ measured in radians).

**Returns**: 

$$E(k, \phi) = \int_{0}^{\phi} \sqrt{1 - k^2 \sin^2 \theta} d\theta, \text{ for } |k| \leq 1,$$

where $k$ is $k$ and $\phi$ is $\phi$.

28.7.6.14 Incomplete elliptic integral of the third kind

```c
double ellint_3(double k, double nu, double phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);
```

**Effects**: These functions compute the incomplete elliptic integral of the third kind of their respective arguments $k$, $nu$, and $\phi$ ($\phi$ measured in radians).

**Returns**: 

$$\Pi(\nu, k, \phi) = \int_{0}^{\phi} \frac{d\theta}{(1 - \nu \sin^2 \theta)\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,$$

where $\nu$ is $nu$, $k$ is $k$, and $\phi$ is $\phi$.

28.7.6.15 Exponential integral

```c
double expint(double x);
float expintf(float x);
long double expintl(long double x);
```

**Effects**: These functions compute the exponential integral of their respective arguments $x$.

**Returns**: 

$$\text{Ei}(x) = -\int_{-x}^{\infty} \frac{e^{-t}}{t} dt$$

where $x$ is $x$.

28.7.6.16 Hermite polynomials

```c
double hermite(unsigned n, double x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);
```

**Effects**: These functions compute the Hermite polynomials of their respective arguments $n$ and $x$.

**Returns**: 

$$H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2}$$

where $n$ is $n$ and $x$ is $x$.

**Remarks**: The effect of calling each of these functions is implementation-defined if $n \geq 128$. 

§ 28.7.6.16
28.7.6.17  Laguerre polynomials

double     laguerre(unsigned n, double x);
float      laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);

Effects: These functions compute the Laguerre polynomials of their respective arguments \( n \) and \( x \).

Returns:

\[ L_n(x) = e^x \frac{d^n}{dx^n} (x^n e^{-x}) \text{, for } x \geq 0, \]

where \( n \) is \( n \) and \( x \) is \( x \).

Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

28.7.6.18  Legendre polynomials

double     legendre(unsigned l, double x);
float      legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);

Effects: These functions compute the Legendre polynomials of their respective arguments \( l \) and \( x \).

Returns:

\[ P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l \text{, for } |x| \leq 1, \]

where \( l \) is \( l \) and \( x \) is \( x \).

Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

28.7.6.19  Riemann zeta function

double     riemann_zeta(double x);
float      riemann_zetaf(float x);
long double riemann_zetal(long double x);

Effects: These functions compute the Riemann zeta function of their respective arguments \( x \).

Returns:

\[ \zeta(x) = \begin{cases} 
\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\
\frac{1}{1 - 2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\
2^x \pi^{x-1} \sin(\frac{\pi x}{2}) \Gamma(1 - x) \zeta(1 - x), & \text{for } x < 0 
\end{cases} \]

where \( x \) is \( x \).

28.7.6.20  Spherical Bessel functions of the first kind

double     sph_bessel(unsigned n, double x);
float      sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);

Effects: These functions compute the spherical Bessel functions of the first kind of their respective arguments \( n \) and \( x \).

Returns:

\[ j_n(x) = (\pi/2x)^{1/2} J_{n+1/2}(x) \text{, for } x \geq 0, \]

where \( n \) is \( n \) and \( x \) is \( x \).

Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

See also 28.7.6.9.
28.7.6.21 Spherical associated Legendre functions

```c
double sph_legendre(unsigned l, unsigned m, double theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

**Effects:** These functions compute the spherical associated Legendre functions of their respective arguments \( l \), \( m \), and \( \theta \) (\( \theta \) measured in radians).

**Returns:**

\[
Y^m_\ell(\theta, 0) = (-1)^m \left[ \frac{(2\ell + 1)}{4\pi} \frac{\ell - m)!}{(\ell + m)!} \right]^{1/2} P^m_\ell(\cos \theta)e^{im\phi}, \quad \text{for } |m| \leq \ell,
\]

where \( l \) is \( l \), \( m \) is \( m \), and \( \theta \) is \( \theta \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

See also 28.7.6.3.

28.7.6.22 Spherical Neumann functions

```c
double sph_neumann(unsigned n, double x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments \( n \) and \( x \).

**Returns:**

\[
n_n(x) = (\pi/2x)^{1/2}N_{n+1/2}(x), \quad \text{for } x \geq 0,
\]

where \( n \) is \( n \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

See also 28.7.6.11.

28.8 Numbers

28.8.2 Mathematical constants
[math.constants]

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of $e$, $\log_2 e$, $\log_{10} e$, $\pi$, $\frac{1}{\pi}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{3}}$, the Euler-Mascheroni $\gamma$ constant, and the golden ratio $\phi$ constant $\frac{1 + \sqrt{5}}{2}$, respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.
29  Time library

29.1 General

This Clause describes the chrono library (29.2) and various C functions (29.14) that provide generally useful time utilities, as summarized in Table 94.

### 29.3 \textit{Cpp17Clock} requirements \[time.clock.req\]

1. A clock is a bundle consisting of a \textit{duration}, a \textit{time_point}, and a function \texttt{now()} to get the current \textit{time_point}. The origin of the clock’s \textit{time_point} is referred to as the clock’s \textit{epoch}. A clock shall meet the requirements in Table 95.

2. In Table 95 \texttt{C1} and \texttt{C2} denote clock types. \texttt{t1} and \texttt{t2} are values returned by \texttt{C1::now()} where the call returning \texttt{t1} happens before (6.9.2) the call returning \texttt{t2} and both of these calls occur before \texttt{C1::time_point::max()}.

   \begin{itemize}
   \item [Note 1: This means \texttt{C1} did not wrap around between \texttt{t1} and \texttt{t2}. -- end note]
   \end{itemize}

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
</tr>
</thead>
<tbody>
<tr>

<td>\texttt{C1::time_point}</td>
<td>Returns a \textit{time_point} object representing the current point in time.</td>
</tr>
</tbody>
</table>

3. \begin{itemize} \item [Note 2: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. -- end note] \end{itemize}

4. A type \texttt{TC} meets the \textit{Cpp17TrivialClock} requirements if:

   \begin{itemize}
   \item [(4.1)] \texttt{TC} meets the \textit{Cpp17Clock} requirements,
   \item [(4.2)] the types \texttt{TC::rep}, \texttt{TC::duration}, and \texttt{TC::time_point} meet the \textit{Cpp17EqualityComparable} (Table 27) and \textit{Cpp17LessThanComparable} (Table 28) requirements and the requirements of numeric types (28.2).
   \item [Note 3: This means, in particular, that operations on these types will not throw exceptions. -- end note]
   \item [(4.3)] \texttt{lvalues} of the types \texttt{TC::rep}, \texttt{TC::duration}, and \texttt{TC::time_point} are swappable (16.4.4.3),
   \item [(4.4)] the function \texttt{TC::now()} does not throw exceptions, and
   \item [(4.5)] the type \texttt{TC::time_point::clock} meets the \textit{Cpp17TrivialClock} requirements, recursively.
   \end{itemize}
29.4 Time-related traits

29.4.1 treat_as_floating_point

```cpp
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { };
```

1. The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick period. If `treat_as_floating_point_v<Rep>` is true, then implicit conversions are allowed among `duration`s. Otherwise, the implicit convertibility depends on the tick periods of the `duration`s.

[Note 1: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is false, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — end note]

29.4.2 duration_values

```cpp
template<class Rep>
struct duration_values {
  public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};
```

1. The `duration` template uses the `duration_values` trait to construct special values of the `duration`'s representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```cpp
static constexpr Rep zero() noexcept;
```

2. Returns: `Rep(0)`.

[Note 1: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — end note]

3. Remarks: The value returned shall be the additive identity.

```cpp
static constexpr Rep min() noexcept;
```

5. Remarks: The value returned shall compare less than or equal to `zero()`.

```cpp
static constexpr Rep max() noexcept;
```

7. Remarks: The value returned shall compare greater than `zero()`.

29.4.3 Specializations of common_type

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
  using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

1. The period of the `duration` indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[Note 1: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. — end note]

2. [Note 2: The typedef name `type` is a synonym for the `duration` with the largest tick period possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point `duration`s can have round-off errors. — end note]

```cpp
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
  using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```

§ 29.4.3 1370
The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two durations.

### 29.4.4 Class template `is_clock`

```cpp
template<class T> struct is_clock;
```

`is_clock` is a `Cpp17UnaryTypeTrait` (21.3.2) with a base characteristic of `true_type` if `T` meets the `Cpp17Clock` requirements (29.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the `Cpp17Clock` requirements is unspecified, except that as a minimum a type `T` shall not qualify as a `Cpp17Clock` unless it meets all of the following conditions:

1. The qualified-ids `T::rep, T::period, T::duration, and T::time_point` are valid and each denotes a type (13.10.3),
2. The expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),
3. The expression `T::now()` is well-formed when treated as an unevaluated operand.

The behavior of a program that adds specializations for `is_clock` is undefined.

### 29.5 Class template `duration`

#### 29.5.1 General

A `duration` type measures time between two points in time (`time_point`s). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```cpp
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
        public:
            using rep = Rep;
            using period = typename Period::type;

        private:
            rep rep_; // exposition only

        public:
            // 29.5.2, construct/copy/destroy
            constexpr duration() = default;
            template<class Rep2>
                constexpr explicit duration(const Rep2& r);
            template<class Rep2, class Period2>
                constexpr duration(const duration<Rep2, Period2>& d);
            ~duration() = default;
            duration(const duration&) = default;
            duration& operator=(const duration&);

            // 29.5.3, observer
            constexpr rep count() const;

            // 29.5.4, arithmetic
            constexpr common_type_t<duration> operator+() const;
            constexpr common_type_t<duration> operator-() const;
            constexpr duration& operator++();
            constexpr duration& operator+=(const duration& d);
            constexpr duration& operator--();
            constexpr duration& operator-=(const duration& d);
        }
    }
}
```
constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);

// 29.5.5, special values
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
};

Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.

If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.

Members of duration do not throw exceptions other than those thrown by the indicated operations on their representations.

The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep_ for copy and move, respectively, would satisfy the requirements for a constexpr function.

[Example 1:
  duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long, milli> d1; // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of 1/30 of a second
  // (30 Hz) using a double
—end example]

29.5.2 Constructors

template<class Rep2>
constexpr explicit duration(const Rep2& r);

1 Constraints: is_convertible_v<const Rep2&, rep> is true and
(1.1) — treat_as_floating_point_v<rep> is true or
(1.2) — treat_as_floating_point_v<Rep2> is false.

[Example 1:
  duration<int, milli> d(3); // OK
duration<int, milli> d(3.5); // error
—end example]

2 Effects: Initializes rep_ with r.

template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);

3 Constraints: No overflow is induced in the conversion and treat_as_floating_point_v<rep> is true or both ratio_divide<Period2, period>::den is 1 and treat_as_floating_point_v<Rep2> is false.

[Note 1: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction could easily lead to confusion about the value of the duration. —end note]

[Example 2:
  duration<int, milli> ms(3);
duration<int, micro> us = ms; // OK
duration<int, milli> ms2 = us; // error
—end example]

4 Effects: Initializes rep_ with duration_cast<duration>(d).count().
29.5.3 Observer

```cpp
constexpr rep count() const;  
    Returns: rep_.
```

29.5.4 Arithmetic

```cpp
constexpr common_type_t<duration> operator+() const;  
    Returns: common_type_t<duration>(*this).
```

```cpp
constexpr common_type_t<duration> operator-() const;  
    Returns: common_type_t<duration>(-rep_).
```

```cpp
constexpr duration& operator++();  
    Effects: Equivalent to: ++rep_.  
    Returns: *this.
```

```cpp
constexpr duration operator++(int);  
    Effects: Equivalent to: return duration(rep_++);
```

```cpp
constexpr duration& operator--();  
    Effects: Equivalent to: --rep_.  
    Returns: *this.
```

```cpp
constexpr duration operator--(int);  
    Effects: Equivalent to: return duration(rep--);
```

```cpp
constexpr duration& operator+=(const duration& d);  
    Effects: Equivalent to: rep_ += d.count().  
    Returns: *this.
```

```cpp
constexpr duration& operator-=(const duration& d);  
    Effects: Equivalent to: rep_ -= d.count().  
    Returns: *this.
```

```cpp
constexpr duration& operator*=(const rep& rhs);  
    Effects: Equivalent to: rep_ *= rhs.  
    Returns: *this.
```

```cpp
constexpr duration& operator/=(const rep& rhs);  
    Effects: Equivalent to: rep_ /= rhs.  
    Returns: *this.
```

```cpp
constexpr duration& operator%=(const duration& rhs);  
    Effects: Equivalent to: rep_ %= rhs.count().  
    Returns: *this.
```

29.5.5 Special values

```cpp
static constexpr duration zero() noexcept;  
    Returns: duration(duration_values<rep>::zero()).
```

§ 29.5.5
static constexpr duration min() noexcept;  
   Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;  
   Returns: duration(duration_values<rep>::max()).

29.5.6 Non-member arithmetic

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
   operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
   Returns: CD(CD(lhs).count() + CD(rhs).count()).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
   operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
   Returns: CD(CD(lhs).count() - CD(rhs).count()).

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
   operator*(const duration<Rep1, Period>& d, const Rep2& s);
   Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.
   Returns: CD(CD(d).count() * s).

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
   operator*(const Rep1& s, const duration<Rep2, Period>& d);
   Constraints: is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.
   Returns: d * s.

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
   operator%(const duration<Rep1, Period>& d, const Rep2& s);
   Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is
   not a specialization of duration.
   Returns: CD(CD(d).count() / s).

template<class Rep1, class Rep2, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
   operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
   Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.
   Returns: CD(lhs).count() / CD(rhs).count().

§ 29.5.6
29.5.7 Comparisons

In the function descriptions that follow, CT represents `common_type_t<A, B>`, where A and B are the types of the two arguments to the function.

\[\text{template<class Rep1, class Period1, class Rep2, class Period2>}
\text{constexpr bool operator==}(\text{const duration<Rep1, Period1>&} \text{lhs},
\text{const duration<Rep2, Period2>&} \text{rhs});\]

\[\text{Returns: CT(lhs).count() == CT(rhs).count().}\]

\[\text{template<class Rep1, class Period1, class Rep2, class Period2>}
\text{constexpr bool operator<}(\text{const duration<Rep1, Period1>&} \text{lhs},
\text{const duration<Rep2, Period2>&} \text{rhs});\]

\[\text{Returns: CT(lhs).count() < CT(rhs).count().}\]

\[\text{template<class Rep1, class Period1, class Rep2, class Period2>}
\text{constexpr bool operator>(\text{const duration<Rep1, Period1>&} \text{lhs},
\text{const duration<Rep2, Period2>&} \text{rhs});\]

\[\text{Returns: rhs < lhs.}\]

\[\text{template<class Rep1, class Period1, class Rep2, class Period2>}
\text{constexpr bool operator<=}(\text{const duration<Rep1, Period1>&} \text{lhs},
\text{const duration<Rep2, Period2>&} \text{rhs});\]

\[\text{Returns: !(rhs < lhs).}\]

\[\text{template<class Rep1, class Period1, class Rep2, class Period2>}
\text{constexpr bool operator>=}(\text{const duration<Rep1, Period1>&} \text{lhs},
\text{const duration<Rep2, Period2>&} \text{rhs});\]

\[\text{Returns: !(lhs < rhs).}\]

\[\text{template<class Rep1, class Period1, class Rep2, class Period2>}
\text{requires three_way_comparable<\text{typename CT::rep}>}
\text{constexpr auto operator<=>}(\text{const duration<Rep1, Period1>&} \text{lhs},
\text{const duration<Rep2, Period2>&} \text{rhs});\]

\[\text{Returns: CT(lhs).count() <=> CT(rhs).count().}\]

29.5.8 Conversions

\[\text{template<class ToDuration, class Rep, class Period>}
\text{constexpr ToDuration duration_cast(const duration<Rep, Period>& d);}\]

\[\text{Constraints: ToDuration is a specialization of duration.}\]

\[\text{Returns: Let CF be ratio_divide<Period, \text{typename ToDuration::period>, and CR be common_type<\text{typename ToDuration::rep, Rep, intmax_t::type.}}\]

\[\text{(2.1) If CF::num == 1 and CF::den == 1, returns}
\text{ToDuration(static_cast<\text{typename ToDuration::rep}>(d.count()))}\]

\[\text{(2.2) Otherwise, if CF::num != 1 and CF::den == 1, returns}
\text{ToDuration(static_cast<\text{typename ToDuration::rep}>(}
\text{static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))}\]

\[\text{(2.3) Otherwise, if CF::num == 1 and CF::den != 1, returns}
\text{ToDuration(static_cast<\text{typename ToDuration::rep}>(}
\text{static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))}\]

\[\text{(2.4) Otherwise, returns}
\text{ToDuration(static_cast<\text{typename ToDuration::rep}>(}
\text{static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))}\]

\[\text{[Note 1: This function does not use any implicit conversions; all conversions are done with static_cast.}
\text{It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1.}
\text{Intermediate computations are carried out in the widest representation and only converted to the destination}
\text{representation at the final step. — end note]}\]
template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.
Returns: The greatest result t representable in ToDuration for which t <= d.

template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.
Returns: The least result t representable in ToDuration for which t >= d.

template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration and treat_as_floating_point_v<typename ToDuration::rep> is false.
Returns: The value of ToDuration that is closest to d. If there are two closest values, then return the value t for which t % 2 == 0.

29.5.9 Suffixes for duration literals

This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds, and nanoseconds respectively if they are applied to integer-literal.

If any of these suffixes are applied to a floating-point-literal the result is a chrono::duration literal with an unspecified floating-point representation.

If any of these suffixes are applied to an integer-literal and the resulting chrono::duration value cannot be represented in the result type because of overflow, the program is ill-formed.

[Example 1: The following code shows some duration literals.
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
—end example]

constexpr chrono::hours operator"h(unsigned long long hours);
constexpr chrono::duration<unspecified, ratio<3600, 1>> operator"h(long double hours);

Returns: A duration literal representing hours hours.

constexpr chrono::minutes operator"min(unsigned long long minutes);
constexpr chrono::duration<unspecified, ratio<60, 1>> operator"min(long double minutes);

Returns: A duration literal representing minutes minutes.

constexpr chrono::seconds operator"s(unsigned long long sec);
constexpr chrono::duration<unspecified> operator"s(long double sec);

Returns: A duration literal representing sec seconds.

[Note 1: The same suffix s is used for basic_string but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. —end note]

constexpr chrono::milliseconds operator"ms(unsigned long long msec);
constexpr chrono::duration<unspecified, milli> operator"ms(long double msec);

Returns: A duration literal representing msec milliseconds.

constexpr chrono::microseconds operator"us(unsigned long long usec);
constexpr chrono::duration<unspecified, micro> operator"us(long double usec);

Returns: A duration literal representing usec microseconds.

constexpr chrono::nanoseconds operator"ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator""ns(long double nsec);

Returns: A duration literal representing nsec nanoseconds.

29.5.10 Algorithms

```cpp
template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);
```

1 Constraints: numeric_limits<Rep>::is_signed is true.

2 Returns: If d >= d.zero(), return d, otherwise return -d.

29.5.11 I/O

```cpp
template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);
```

1 Effects: Inserts the duration d onto the stream os as if it were implemented as follows:

```
basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();
```

where units-suffix depends on the type Period::type as follows:

1. If Period::type is atto, units-suffix is "as".
2. Otherwise, if Period::type is femto, units-suffix is "fs".
3. Otherwise, if Period::type is pico, units-suffix is "ps".
4. Otherwise, if Period::type is nano, units-suffix is "ns".
5. Otherwise, if Period::type is micro, it is implementation-defined whether units-suffix is "µs" ("\u00b5\u0073") or "us".
6. Otherwise, if Period::type is milli, units-suffix is "ms".
7. Otherwise, if Period::type is centi, units-suffix is "cs".
8. Otherwise, if Period::type is deci, units-suffix is "ds".
9. Otherwise, if Period::type is ratio<1>, units-suffix is "s".
10. Otherwise, if Period::type is deca, units-suffix is "das".
11. Otherwise, if Period::type is hecto, units-suffix is "hs".
12. Otherwise, if Period::type is kilo, units-suffix is "ks".
13. Otherwise, if Period::type is mega, units-suffix is "Ms".
14. Otherwise, if Period::type is giga, units-suffix is "Gs".
15. Otherwise, if Period::type is tera, units-suffix is "Ts".
16. Otherwise, if Period::type is peta, units-suffix is "Ps".
17. Otherwise, if Period::type is exa, units-suffix is "Es".
18. Otherwise, if Period::type is ratio<60>, units-suffix is "min".
19. Otherwise, if Period::type is ratio<3600>, units-suffix is "h".
20. Otherwise, if Period::type is ratio<86400>, units-suffix is "d".
21. Otherwise, if Period::type::den == 1, units-suffix is 
   
   
2 Returns: os.

In the list above, the use of num and den refer to the static data members of Period::type, which are converted to arrays of charT using a decimal conversion with no leading zeroes.
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
        duration<Rep, Period>& d,
        basic_string<charT, traits, Alloc>** abbrev = nullptr,
        minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the duration d using the format flags given in the
NTCTS fmt as specified in 29.13. If the parse fails to decode a valid duration, is.setstate(ios_base::failbit)
is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev
if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned
to *offset if offset is non-null.

Returns: is.

29.6 Class template time_point

29.6.1 General

namespace std::chrono {
    template<class Clock, class Duration = typename Clock::duration>
    class time_point {
        using clock = Clock;
        using duration = Duration;
        using rep = typename duration::rep;
        using period = typename duration::period;

        private:
            duration d_; // exposition only

        public:

            // 29.6.2, construct
            constexpr time_point(); // has value epoch
            constexpr explicit time_point(const duration& d); // same as time_point() + d
            template<class Duration2>
                constexpr time_point(const time_point<Clock, Duration2>& t);

            // 29.6.3, observer
            constexpr duration time_since_epoch() const;

            // 29.6.4, arithmetic
            constexpr time_point& operator++();
            constexpr time_point operator++(int);
            constexpr time_point& operator--();
            constexpr time_point operator--(int);
            constexpr time_point& operator+=(const duration& d);
            constexpr time_point& operator-=(const duration& d);

            // 29.6.5, special values
            static constexpr time_point min() noexcept;
            static constexpr time_point max() noexcept;
    };
}

1 If Duration is not a specialization of duration, the program is ill-formed.

29.6.2 Constructors

constexpr time_point();

Effects: Initializes d_ with duration::zero(). Such a time_point object represents the epoch.

constexpr explicit time_point(const duration& d);

Effects: Initializes d_ with d. Such a time_point object represents the epoch + d.
template<class Duration2>
    constexpr time_point(const time_point<clock, Duration2>& t);

  Constraints: is_convertible_v<Duration2, duration> is true.
  Effects: Initializes d_ with t.time_since_epoch().

29.6.3 Observer

constexpr duration time_since_epoch() const;

  Returns: d_.

29.6.4 Arithmetic

constexpr time_point& operator++();

  Effects: Equivalent to: ++d_.
  Returns: *this.

constexpr time_point operator++(int);

  Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();

  Effects: Equivalent to: --d_.
  Returns: *this.

constexpr time_point operator--(int);

  Effects: Equivalent to: return time_point{d_--};

constexpr time_point& operator+=(const duration& d);

  Effects: Equivalent to: d_ += d.
  Returns: *this.

constexpr time_point& operator-=(const duration& d);

  Effects: Equivalent to: d_ -= d.
  Returns: *this.

29.6.5 Special values

static constexpr time_point min() noexcept;

  Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;

  Returns: time_point(duration::max()).

29.6.6 Non-member arithmetic

template<class Clock, class Duration1, class Rep2, class Period2>
    constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>
        operator+(const time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>>& lhs, const duration<Rep2, Period2>& rhs);

  Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
    constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
        operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);

  Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
    constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>& rhs);

  Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.
template<class Clock, class Duration1, class Duration2>  
constexpr common_type_t<Duration1, Duration2>  
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);  

Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

29.6.7 Comparisons

template<class Clock, class Duration1, class Duration2>  
constexpr bool operator==(const time_point<Clock, Duration1>& lhs,  
const time_point<Clock, Duration2>& rhs);  

Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>  
constexpr bool operator<(const time_point<Clock, Duration1>& lhs,  
const time_point<Clock, Duration2>& rhs);  

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>  
constexpr bool operator>(const time_point<Clock, Duration1>& lhs,  
const time_point<Clock, Duration2>& rhs);  

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>  
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs,  
const time_point<Clock, Duration2>& rhs);  

Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>  
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs,  
const time_point<Clock, Duration2>& rhs);  

Returns: !(lhs < rhs).

template<class Clock, class Duration1, class Duration2>  
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs,  
const time_point<Clock, Duration2>& rhs);  

Returns: lhs.time_since_epoch() <=> rhs.time_since_epoch().

29.6.8 Conversions

template<class ToDuration, class Clock, class Duration>  
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);  

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>  
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);  

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>  
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);  

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch())).

29.7 Clocks
29.7.1 General

The types defined in 29.7 meet the Cpp17TrivialClock requirements (29.3) unless otherwise specified.

29.7.2 Class system_clock
29.7.2.1 Overview

namespace std::chrono {
    class system_clock {
        using rep = unspecified;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<system_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;
        static time_t to_time_t (const time_point& t) noexcept;
        static time_point from_time_t(time_t t) noexcept;
    };
}

Objects of type system_clock represent wall clock time from the system-wide realtime clock. Objects of type sys_time<Duration> measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as Unix time. This measure facilitates an efficient mapping between sys_time and calendar types (29.8).

Example 1:
sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
—end example

29.7.2.2 Members

using system_clock::rep = unspecified;

Constraints: system_clock::duration::min() < system_clock::duration::zero() is true.
[Note 1: This implies that rep is a signed type. — end note]

static time_t to_time_t(const time_point& t) noexcept;

Returns: A time_t object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

static time_point from_time_t(time_t t) noexcept;

Returns: A time_point object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

29.7.2.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);

Constraints: treat_as_floating_point_v<typename Duration::rep> is false, and Duration{1} < days{1} is true.

Effects: Equivalent to:
return os << format(os.getloc(), STATICA LLY-WIDEN("{:L%F %T}"), tp);

Example 1:
cout << sys_seconds{0s} << '\n';  // 1970-01-01 00:00:00
cout << sys_seconds{946'684'800s} << '\n';  // 2000-01-01 00:00:00
cout << sys_seconds{946'688'523s} << '\n';  // 2000-01-01 01:02:03
—end example

Effects:
eturn os << year_month_day{dp}.

Returns: os.

Effects: Attempts to parse the input stream is into the sys_time tp using the format flags given in
the NCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

29.7.3 Class utc_clock

29.7.3.1 Overview

namespace std::chrono {

class utc_clock {

  using rep = a signed arithmetic type;

  using period = ratio<unspecified, unspecified>;

  using duration = chrono::duration<rep, period>;

  using time_point = chrono::time_point<utc_clock>;

  static constexpr bool is_steady = unspecified;

  static time_point now();

  template<class Duration>

  static sys_time<common_type_t<Duration, seconds>>

    to_sys(const utc_time<Duration>& t);

  template<class Duration>

  static utc_time<common_type_t<Duration, seconds>>

    from_sys(const sys_time<Duration>& t);

};

In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated
time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[Note 1: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant sys_days{1972y/1/1} - sys_days{1970y/1/1} (63'072'000s) from the utc_time. — end note]
Example 1:
clock_cast<utc_clock>(sys_seconds{sys_days{1970y/January/1}}).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds{sys_days{2000y/January/1}}).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
— end example

utc_clock is not a Cpp17TrivialClock unless the implementation can guarantee that utc_clock::now() does not propagate an exception.

[Note 2: noexcept(from_sys(system_clock::now())) is false. — end note]

29.7.3.2 Member functions

time_point now();

static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);

Returns: A sys_time t, such that from_sys(t) == u if such a mapping exists. Otherwise u represents
a time_point during a positive leap second insertion, the conversion counts that leap second as not
inserted, and the last representable value of sys_time prior to the insertion of the leap second is
returned.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);

Returns: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the
sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second
insertion, then the conversion counts that leap second as inserted.

[Example 1:
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
— end example]

29.7.3.3 Non-member functions

operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

[Example 1:
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
cout << u << " UTC\n";
Produces this output:
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC

§ 29.7.3.3
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the utc_time tp using the format flags given in
the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

struct leap_second_info {
  bool  is_leap_second;
  seconds elapsed;
};

The type leap_second_info has data members and special members specified above. It has no base
classes or members other than those specified.

template<class Duration>
leap_second_info get_leap_second_info(const utc_time<Duration>& ut);

Returns: A leap_second_info lsi, where lsi.is_leap_second is true if ut is during a positive leap
second insertion, and otherwise false. lsi.elapsed is the sum of leap seconds between 1970-01-01
and ut. If lsi.is_leap_second is true, the leap second referred to by ut is included in the sum.

29.7.4 Class tai_clock

29.7.4.1 Overview

The clock tai_clock measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this
date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not
inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with
respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted
so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

§ 29.7.4.1 1384
tai_clock is not a Cpp17TrivialClock unless the implementation can guarantee that tai_clock::now() does not propagate an exception.

[Note 1: noexcept(from_utc(utc_clock::now())) is false. —end note]

### 29.7.4.2 Member functions

Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp. Returns: is.</td>
</tr>
</tbody>
</table>

§ 29.7.4.3
29.7.5  Class gps_clock

29.7.5.1  Overview

namespace std::chrono {
    class gps_clock {
    public:
        using rep = a signed arithmetic type;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<gps_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now();

        template<class Duration>
        static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;
        template<class Duration>
        static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
    };
}

The clock gps_clock measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

gps_clock is not a Cpp17TrivialClock unless the implementation can guarantee that gps_clock::now() does not propagate an exception.

[Note 1: noexcept(from_utc(utc_clock::now())) is false. — end note]

29.7.5.2  Member functions

static time_point now();

Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;

Returns:
    utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s

[Note 1: 315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s — end note]

template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;

Returns:
    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s

[Note 2: 315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s — end note]

29.7.5.3  Non-member functions

template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

**Effects:** Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
```

**Example 1:**

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

—end example—

```template<class charT, class traits, class Duration, class Alloc = allocator<charT>>

basic_istream<charT, traits>&

from_stream(basic_istream<charT, traits>& is, const charT* fmt, gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);
```

**Effects:** Attempts to parse the input stream `is` into the `gps_time` `tp` using the format flags given in the NTCTS `fmt` as specified in 29.13. If the parse fails to decode a valid date, `is.setstate(ios_base::failbit)` is called and `tp` is not modified. If `%Z` is used and successfully parsed, that value will be assigned to `*abbrev` if `abbrev` is non-null. If `%z` (or a modified variant) is used and successfully parsed, that value will be assigned to `*offset` if `offset` is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to `tp`.

**Returns:** `is`.

### 29.7.6 Type file_clock

**[time.clock.file]**

#### 29.7.6.1 Overview

**[time.clock.file.overview]**

```
namespace std::chrono {
    using file_clock = see below;
}
```

**Note 1:** The type that `file_clock` denotes can be in a different namespace than `std::chrono`, such as `std::filesystem`.

—end note—

#### 29.7.6.2 Member functions

**[time.clock.file.members]**

The type denoted by `file_clock` provides precisely one of the following two sets of static member functions:

```template<class Duration>

static sys_time<see below>

to_sys(const file_time<Duration>&);
```

```template<class Duration>

to_utc(const file_time<Duration>&);
```

or:

```template<class Duration>

static utc_time<see below>

to_utc(const file_time<Duration>&);
```

These member functions shall provide `time_point` conversions consistent with those specified by `utc_clock`, `tai_clock`, and `gps_clock`. The `Duration` of the resultant `time_point` is computed from the `Duration` of the input `time_point`. 

§ 29.7.6.2
29.7.6.3 Non-member functions

Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.}
\text{Returns: is.}\]

29.7.7 Class steady_clock

\[\text{namespace std::chrono {}
\text{class steady_clock {}
\text{public:}
\text{using rep = unspecified;}
\text{using period = ratio<unspecified, unspecified>;}\]
\[\text{using duration = chrono::duration<rep, period>;}\]
\[\text{using time_point = chrono::time_point<unspecified, duration>;}\]
\[\text{static constexpr bool is_steady = true;}\]
\[\text{static time_point now() noexcept;}
\text{}}\]
\[\text{}}\]
\[\text{1 Objects of class steady_clock represent clocks for which values of time_point never decrease as physical}
\text{time advances and for which values of time_point advance at a steady rate relative to real time. That is,}
\text{the clock may not be adjusted.}\]

29.7.8 Class high_resolution_clock

\[\text{namespace std::chrono {}
\text{class high_resolution_clock {}
\text{public:}
\text{using rep = unspecified;}
\text{using period = ratio<unspecified, unspecified>;}\]
\[\text{using duration = chrono::duration<rep, period>;}\]
\[\text{using time_point = chrono::time_point<unspecified, duration>;}\]
\[\text{static constexpr bool is_steady = unspecified;}\]
\[\text{static time_point now() noexcept;}
\text{}}\]
\[\text{}}\]
\[\text{1 Objects of class high_resolution_clock represent clocks with the shortest tick period. high_resolution_}
\text{clock may be a synonym for system_clock or steady_clock.}\]

29.7.9 Local time

\[\text{The family of time points denoted by local_time<Duration> are based on the pseudo clock local_t.}
\text{local_t has no member now() and thus does not meet the clock requirements. Nevertheless local_time<}
\text{Duration> serves the vital role of representing local time with respect to a not-yet-specified time zone.}
\text{Aside from being able to get the current time, the complete time_point algebra is available for}
\text{local_time<Duration> (just as for sys_time<Duration>).}\]

\[\text{§ 29.7.9}\]
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);

    Effects:
    os << sys_time<Duration>{lt.time_since_epoch()};

    Returns: os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);

    Effects: Attempts to parse the input stream is into the local_time tp using the format flags given
    in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

    Returns: is.

29.7.10 time_point conversions

29.7.10.1 Class template clock_time_conversion

namespace std::chrono {
    template<class DestClock, class SourceClock>
    struct clock_time_conversion {};
}

clock_time_conversion serves as a trait which can be used to specify how to convert a source time_point of
type time_point<SourceClock, Duration> to a destination time_point of type time_point<DestClock, Duration> via a specialization: clock_time_conversion<DestClock, SourceClock>. A specialization of clock_time_conversion<DestClock, SourceClock> shall provide a const-qualified operator() that takes a parameter of type time_point<SourceClock, Duration> and returns a time_point<DestClock, OtherDuration> representing an equivalent point in time. OtherDuration is a chrono::duration whose specialization is computed from the input Duration in a manner which can vary for each clock_time_conversion specialization. A program may specialize clock_time_conversion if at least one of the template parameters is a user-defined clock type.

Several specializations are provided by the implementation, as described in 29.7.10.2, 29.7.10.3, 29.7.10.4, and 29.7.10.5.

29.7.10.2 Identity conversions

template<class Clock>
    struct clock_time_conversion<Clock, Clock> {
        template<class Duration>
            time_point<Clock, Duration>
                operator()(const time_point<Clock, Duration>& t) const;
    };

    template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;

        Returns: t.

    template<>
    struct clock_time_conversion<system_clock, system_clock> {
        template<class Duration>
            sys_time<Duration>
                operator()(const sys_time<Duration>& t) const;
    };
template<class Duration>
    sys_time<Duration>
        operator()(const sys_time<Duration>& t) const;

>Returns: t.

template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
        utc_time<Duration>
            operator()(const utc_time<Duration>& t) const;
    
};

template<class Duration>
    utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;

>Returns: t.

29.7.10.3 Conversions between system_clock and utc_clock

template<>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
        utc_time<common_type_t<Duration, seconds>>
            operator()(const sys_time<Duration>& t) const;
    
};

template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;

>Returns: utc_clock::from_sys(t).

template<>
struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
        sys_time<Duration>
            operator()(const utc_time<Duration>& t) const;
    
};

template<class Duration>
    sys_time<Duration>
        operator()(const utc_time<Duration>& t) const;

(Returns: utc_clock::to_sys(t).

29.7.10.4 Conversions between system_clock and other clocks

template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
        auto operator()(const time_point<SourceClock, Duration>& t) const
            -> decltype(SourceClock::to_sys(t));
    
};

template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));

1 Constraints: SourceClock::to_sys(t) is well-formed.

2 Mandates: SourceClock::to_sys(t) returns a sys_time<Duration2> for some type Duration2
(29.6.1).

(Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
        auto operator()(const sys_time<Duration>& t) const
            -> decltype(DestClock::from_sys(t));

§ 29.7.10.4 1390

};

template<class Duration>
auto operator()(const sys_time<Duration>& t) const
  -> decltype(DestClock::from_sys(t));

Constraints: DestClock::from_sys(t) is well-formed.

Mandates: DestClock::from_sys(t) returns a time_point<DestClock, Duration2> for some type Duration2 (29.6.1).

Returns: DestClock::from_sys(t).

29.7.10.5 Conversions between utc_clock and other clocks

[time.clock.cast.utc]
template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
  template<class Duration>
  auto operator()(const time_point<SourceClock, Duration>& t) const
    -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
  -> decltype(SourceClock::to_utc(t));

Constraints: SourceClock::to_utc(t) is well-formed.

Mandates: SourceClock::to_utc(t) returns a utc_time<Duration2> for some type Duration2 (29.6.1).

Returns: SourceClock::to_utc(t).

template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
  template<class Duration>
  auto operator()(const utc_time<Duration>& t) const
    -> decltype(DestClock::from_utc(t));
};

template<class Duration>
auto operator()(const utc_time<Duration>& t) const
  -> decltype(DestClock::from_utc(t));

Constraints: DestClock::from_utc(t) is well-formed.

Mandates: DestClock::from_utc(t) returns a time_point<DestClock, Duration2> for some type Duration2 (29.6.1).

Returns: DestClock::from_utc(t).

29.7.10.6 Function template clock_cast

[time.clock.cast.fn]
template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);

Constraints: At least one of the following clock time conversion expressions is well-formed:

(1.1)  — clock_time_conversion<DestClock, SourceClock>{t}

(1.2)  — clock_time_conversion<DestClock, system_clock>{
          clock_time_conversion<system_clock, SourceClock>{t}}

(1.3)  — clock_time_conversion<DestClock, utc_clock>{
          clock_time_conversion<utc_clock, SourceClock>{t}}

(1.4)  — clock_time_conversion<DestClock, utc_clock>{
          clock_time_conversion<utc_clock, system_clock>{
            clock_time_conversion<system_clock, SourceClock>{t}}}

(1.5)  — clock_time_conversion<DestClock, system_clock>{
          clock_time_conversion<system_clock, utc_clock>{
            clock_time_conversion<utc_clock, SourceClock>{t}}}

§ 29.7.10.6
A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer `operator()` calls on `clock_time_conversion` specializations.

**Mandates:** Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

**Returns:** The best well-formed clock time conversion expression in the above list.

### 29.8 The civil calendar

#### 29.8.1 In general

The types in 29.8 describe the civil (Gregorian) calendar and its relationship to `sys_days` and `local_days`.

#### 29.8.2 Class `last_spec`

```cpp
namespace std::chrono {
  struct last_spec {
    explicit last_spec() = default;
  };
}
```

The type `last_spec` is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

#### 29.8.3 Class `day`

#### 29.8.3.1 Overview

```cpp
namespace std::chrono {
  class day {
    unsigned char d_;  // exposition only
    public:
      day() = default;
      constexpr explicit day(unsigned d) noexcept;
      constexpr day& operator++() noexcept;
      constexpr day operator++(int) noexcept;
      constexpr day& operator--() noexcept;
      constexpr day operator--(int) noexcept;
      constexpr day& operator+=(const days& d) noexcept;
      constexpr day& operator-=(const days& d) noexcept;
      constexpr explicit operator unsigned() const noexcept;
      constexpr bool ok() const noexcept;
  };
}
```

day represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any `unsigned` value, which will be subsequently truncated to fit into `day`'s unspecified internal storage. `day` meets the `Cpp17EqualityComparable` (Table 27) and `Cpp17LessThanComparable` (Table 28) requirements, and participates in basic arithmetic with `days` objects, which represent a difference between two `day` objects.

`day` is a trivially copyable and standard-layout class type.

#### 29.8.3.2 Member functions

```cpp
constexpr explicit day(unsigned d) noexcept;
```

**Effects:** Initializes `d_` with `d`. The value held is unspecified if `d` is not in the range `[0, 255]`.

```cpp
constexpr day& operator++() noexcept;
```

**Effects:** `++d_`.

**Returns:** `*this`. 
constexpr day operator++(int) noexcept;

Effects: ++(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator--() noexcept;

Effects: Equivalent to: --d_.

Returns: *this.

constexpr day operator--(int) noexcept;

Effects: --(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator+=(const days& d) noexcept;

Effects: *this = *this + d.

Returns: *this.

constexpr day& operator-=(const days& d) noexcept;

Effects: *this = *this - d.

Returns: *this.

constexpr explicit operator unsigned() const noexcept;

Returns: d_.

constexpr bool ok() const noexcept;

Returns: 1 <= d_ && d_ <= 31.

29.8.3.3 Non-member functions

constexpr bool operator==(const day& x, const day& y) noexcept;

Returns: unsigned{x} == unsigned{y}.

constexpr strong_ordering operator<=>(const day& x, const day& y) noexcept;

Returns: unsigned{x} <=> unsigned{y}.

constexpr day operator+(const day& x, const days& y) noexcept;

Returns: day(unsigned{x} + y.count()).

constexpr day operator+(const days& x, const day& y) noexcept;

Returns: y + x.

constexpr day operator-(const day& x, const days& y) noexcept;

Returns: x + -y.

constexpr days operator-(const day& x, const day& y) noexcept;

Returns: days{int(unsigned{x}) - int(unsigned{y})}.

template<class charT, class traits>
 basic_ostream<charT, traits>&
 operator<<(basic_ostream<charT, traits>& os, const day& d);

Effects: Equivalent to:

return os << (d.ok() ?
    format("{:%d}", d) :
    format("{:%d} is not a valid day");

template<class charT, class traits, class Alloc = allocator<charT>>
 basic_istream<charT, traits>&
 from_stream(basic_istream<charT, traits>& is, const charT* fmt, day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the day d using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid day, is.setstate(ios_base::failbit) is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

cconstexpr chrono::day operator"d(unsigned long long d) noexcept;

Returns: day{static_cast<unsigned>(d)}.

29.8.4 Class month

29.8.4.1 Overview

namespace std::chrono {
  class month {
    unsigned char m_; // exposition only
  public:
    month() = default;
    constexpr explicit month(unsigned m) noexcept;
    constexpr month& operator++() noexcept;
    constexpr month operator++(int) noexcept;
    constexpr month& operator--() noexcept;
    constexpr month operator--(int) noexcept;
    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;
    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
  };
}

1 month represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into month’s unspecified internal storage. month meets the Cpp17EqualityComparable (Table 27) and Cpp17LessThanComparable (Table 28) requirements, and participates in basic arithmetic with months objects, which represent a difference between two month objects.

2 month is a trivially copyable and standard-layout class type.

29.8.4.2 Member functions

cconstexpr explicit month(unsigned m) noexcept;

Effects: Initializes m_ with m. The value held is unspecified if m is not in the range [0, 255].

1

cconstexpr month& operator++() noexcept;

Effects: *this += months{1}.

Returns: *this.

2

cconstexpr month operator++(int) noexcept;

Effects: ++(*this).

Returns: A copy of *this as it existed on entry to this member function.

3

cconstexpr month& operator--() noexcept;

Effects: *this -= months{1}.

Returns: *this.

4

§ 29.8.4.2 1394
constexpr month operator--(int) noexcept;
8    Effects: --(*this).
9    Returns: A copy of *this as it existed on entry to this member function.

constexpr month& operator+=(const months& m) noexcept;
10   Effects: *this = *this + m.
11   Returns: *this.

constexpr month& operator-=(const months& m) noexcept;
12   Effects: *this = *this - m.
13   Returns: *this.

constexpr explicit operator unsigned() const noexcept;
14   Returns: m_.

constexpr bool ok() const noexcept;
15   Returns: 1 <= m_ && m_ <= 12.

29.8.4.3 Non-member functions  [time.cal.month.nonmembers]

constexpr bool operator===(const month& x, const month& y) noexcept;
1   Returns: unsigned{x} == unsigned{y}.

constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
2   Returns: unsigned{x} <=> unsigned{y}.

constexpr month operator+(const month& x, const months& y) noexcept;
3   Returns: month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
where modulo(n, 12) computes the remainder of n divided by 12 using Euclidean division.
[Note 1: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 11]. Assuming no overflow in the signed summation, this operation results in a month holding a value in the range [1, 12] even if !x.ok(). — end note]
[Example 1: February + months{11} == January. — end example]

constexpr month operator+(const months& x, const month& y) noexcept;
4   Returns: y + x.

constexpr month operator-(const month& x, const months& y) noexcept;
5   Returns: x + -y.

constexpr months operator-(const month& x, const month& y) noexcept;
6   Returns: If x.ok() == true and y.ok() == true, returns a value m in the range [months{0}, months{11}] satisfying y + m == x. Otherwise the value returned is unspecified.
[Example 2: January - February == months{11}. — end example]

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const month& m);
7   Effects: Equivalent to:
   return os << (m.ok() ?
      format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) :
      format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"),
      static_cast<unsigned>(m)));
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt,
              month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
              minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the month m using the format flags given in the
NTCTS fmt as specified in 29.13. If the parse fails to decode a valid month, is.setstate(ios_base::failbit) is called and m is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.5 Class year

29.8.5.1 Overview

namespace std::chrono {
  class year {
    short y_; // exposition only
  public:
    year() = default;
    constexpr explicit year(int y) noexcept;
    constexpr year& operator++() noexcept;
    constexpr year operator++(int) noexcept;
    constexpr year& operator--() noexcept;
    constexpr year operator--(int) noexcept;
    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;
    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;
    constexpr bool is_leap() const noexcept;
    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;
    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
  };
}

1 year represents a year in the civil calendar. It can represent values in the range [min(), max()]. It can be
constructed with any int value, which will be subsequently truncated to fit into year’s unspecified internal
storage. year meets the Cpp17EqualityComparable (Table 27) and Cpp17LessThanComparable (Table 28)
requirements, and participates in basic arithmetic with years objects, which represent a difference between
two year objects.

2 year is a trivially copyable and standard-layout class type.

29.8.5.2 Member functions

constexpr explicit year(int y) noexcept;

1 Effects: Initializes y_ with y. The value held is unspecified if y is not in the range [-32767, 32767].

constexpr year& operator++() noexcept;

2 Effects: ++y_.

3 Returns: *this.

constexpr year operator++(int) noexcept;

4 Effects: ++(*this).
Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator--() noexcept;
   Effects: --y_.
   Returns: *this.

constexpr year operator--(int) noexcept;
   Effects: --(*this).
   Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator+=(const years& y) noexcept;
   Effects: *this = *this + y.
   Returns: *this.

constexpr year& operator-=(const years& y) noexcept;
   Effects: *this = *this - y.
   Returns: *this.

constexpr year operator+(const years& x, const year& y) noexcept;
   Returns: *this.

constexpr year operator+(const year& x, const years& y) noexcept;
   Returns: *this.

constexpr year year::operator-() const noexcept;
   Returns: year{-y_}.

static constexpr year min() noexcept;
   Returns: year{-32767}.

static constexpr year max() noexcept;
   Returns: year{32767}.

29.8.5.3 Non-member functions

constexpr bool operator==(const year& x, const year& y) noexcept;
   Returns: int{x} == int{y}.

constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;
   Returns: int{x} <=> int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;
   Returns: year{int{x} + static_cast<int>(y.count())}.

constexpr year operator+(const years& x, const year& y) noexcept;
   Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;
   Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;
   Returns: years{int{x} - int{y}}.
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);

Effects: Equivalent to:

    return os << (y.ok() ?
        format(STATICALLY-WIDEN<charT>("{:%Y}"), y) :
        format(STATICALLY-WIDEN<charT>("{:%Y} is not a valid year"), y));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year y using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year, is.setstate(ios_base::failbit) is called and y is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

constexpr chrono::year operator"y(unsigned long long y) noexcept;

Returns: year{static_cast<int>(y)}.

29.8.6 Class weekday

29.8.6.1 Overview

namespace std::chrono {

    class weekday { // exposition only

    public:
        weekday() = default;
        constexpr explicit weekday(unsigned wd) noexcept;
        constexpr weekday(const sys_days& dp) noexcept;
        constexpr explicit weekday(const local_days& dp) noexcept;

        constexpr weekday& operator++() noexcept;
        constexpr weekday operator++(int) noexcept;
        constexpr weekday& operator--() noexcept;
        constexpr weekday operator--(int) noexcept;
        constexpr weekday& operator+=(const days& d) noexcept;
        constexpr weekday& operator-=(const days& d) noexcept;
        constexpr unsigned c_encoding() const noexcept;
        constexpr unsigned iso_encoding() const noexcept;
        constexpr bool ok() const noexcept;
        constexpr weekday_indexed operator[](unsigned index) const noexcept;
        constexpr weekday_last operator[](last_spec) const noexcept;
    }

}\n
weekday represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6, corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into weekday's unspecified internal storage. weekday meets the Cpp17EqualityComparable (Table 27) requirements. 

[Note 1: weekday is not Cpp17LessThanComparable because there is no universal consensus on which day is the first day of the week. weekday's arithmetic operations treat the days of the week as a circular range, with no beginning and no end. — end note]

weekday is a trivially copyable and standard-layout class type.
29.8.6.2 Member functions

constexpr explicit weekday(unsigned wd) noexcept;
1   Effects: Initializes wd_ with wd == 7 ? 0 : wd. The value held is unspecified if wd is not in the range [0, 255].

constexpr weekday(const sys_days& dp) noexcept;
2   Effects: Computes what day of the week corresponds to the sys_days dp, and initializes that day of the week in wd_.
3   [Example 1: If dp represents 1970-01-01, the constructed weekday represents Thursday by storing 4 in wd_. — end example]

constexpr explicit weekday(const local_days& dp) noexcept;
4   Effects: Computes what day of the week corresponds to the local_days dp, and initializes that day of the week in wd_.
5   Postconditions: The value is identical to that constructed from sys_days(dp.time_since_epoch()).

constexpr weekday& operator++() noexcept;
6   Effects: *this += days{1}.
7   Returns: *this.

constexpr weekday operator++(int) noexcept;
8   Effects: ++(*this).
9   Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator--() noexcept;
10  Effects: *this -= days{1}.
11  Returns: *this.

constexpr weekday operator--(int) noexcept;
12  Effects: --(*this).
13  Returns: A copy of *this as it existed on entry to this member function.

constexpr weekday& operator=(const days& d) noexcept;
14  Effects: *this = *this + d.
15  Returns: *this.

constexpr weekday& operator=(const days& d) noexcept;
16  Effects: *this = *this - d.
17  Returns: *this.

constexpr unsigned c_encoding() const noexcept;
18  Returns: wd_.

constexpr unsigned iso_encoding() const noexcept;
19  Returns: wd_ == 0u ? 7u : wd_.

constexpr bool ok() const noexcept;
20  Returns: wd_ <= 6.

constexpr weekday_indexed operator[](unsigned index) const noexcept;
21  Returns: {*this, index}.

constexpr weekday_last operator[](last_spec) const noexcept;
22  Returns: weekday_last{*this}.
29.8.6.3 Non-member functions

\texttt{constexpr bool operator\(==\)(const \texttt{weekday} \& x, const \texttt{weekday} \& y) noexcept;}

\textit{Returns:} \(x.wd_ == y.wd_\).

\texttt{constexpr \texttt{weekday} operator\(+\)(const \texttt{weekday} \& x, const \texttt{days} \& y) noexcept;}

\textit{Returns:}

\texttt{\texttt{weekday}(\texttt{modulo}(\texttt{static\_cast<long long>}(x.wd_), y.count(), 7))}

where \texttt{modulo}(n, 7) computes the remainder of \(n\) divided by 7 using Euclidean division.

\textit{Note 1:} Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of \([0, 6]\). Assuming no overflow in the signed summation, this operation results in a \texttt{weekday} holding a value in the range \([0, 6]\) even if \(!x.ok()\). — end note

\textit{Example 1:} \texttt{Monday + days\{6\} == Sunday}. — end example

\texttt{constexpr \texttt{weekday} operator\(-\)(const \texttt{weekday} \& x, const \texttt{days} \& y) noexcept;}

\textit{Returns:} \(x + -y\).

\texttt{constexpr \texttt{days} operator\(-\)(const \texttt{weekday} \& x, const \texttt{weekday} \& y) noexcept;}

\textit{Returns:} If \(x.ok() == true\) and \(y.ok() == true\), returns a value \(d\) in the range \([\texttt{days}\{0\}, \texttt{days}\{6\}]\) satisfying \(y + d == x\). Otherwise the value returned is unspecified.

\textit{Example 2:} \texttt{Sunday - Monday == days\{6\}}. — end example

\texttt{template<class charT, class traits> basic_ostream<\texttt{charT}, \texttt{traits}>\& operator<<\(\)(basic_ostream<\texttt{charT}, \texttt{traits}>\& os, const \texttt{weekday} \& \texttt{wd});}

\textit{Effects:} Equivalent to:

\begin{verbatim}
return os << (wd.ok() ?
    format(os.getloc(), STATICALLY-WIDEN<\texttt{charT}>("{:L%a}\"), wd) :
    format(os.getloc(), STATICALLY-WIDEN<\texttt{charT}>("{} is not a valid weekday"),
        static\_cast<\texttt{unsigned}>((\texttt{wd}.wd_)));
\end{verbatim}

\texttt{template<class charT, class traits, class Alloc = \texttt{allocator<\texttt{charT}>}}>

\texttt{basic\_istream<\texttt{charT}, \texttt{traits}>\& from\_stream\(\)(basic\_istream<\texttt{charT}, \texttt{traits}>\& is, const \texttt{charT}\* fmt, \texttt{weekday} \& \texttt{wd}, basic\_string<\texttt{charT}, \texttt{traits}, \texttt{Alloc}>\* \texttt{abbrev} = \texttt{nullptr}, \texttt{minutes}\* \texttt{offset} = \texttt{nullptr});}

\textit{Effects:} Attempts to parse the input stream \texttt{is} into the \texttt{weekday} \texttt{wd} using the format flags given in the NTCTS \texttt{fmt} as specified in 29.13. If the parse fails to decode a valid weekday, \texttt{is.setstate(ios\_-base::failbit)} is called and \texttt{wd} is not modified. If \%Z is used and successfully parsed, that value will be assigned to \*\texttt{abbrev} if \texttt{abbrev} is non-null. If \%Z (or a modified variant) is used and successfully parsed, that value will be assigned to \*\texttt{offset} if \texttt{offset} is non-null.

\textit{Returns:} \texttt{is}.

29.8.7 Class \texttt{weekday\_indexed}

29.8.7.1 Overview

\texttt{namespace std::chrono \{\
    class weekday\_indexed \{ \\
    chrono::weekday wd_; // exposition only \\
    unsigned char index_; // exposition only \\
    \\
    public: \\
        weekday\_indexed() = default; \\
        constexpr weekday\_indexed(const chrono::weekday\& wd, unsigned index) noexcept;
\}}
weekday_indexed represents a weekday and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

[Note 1: A weekday_indexed object can be constructed by indexing a weekday with an unsigned. —end note]

[Example 1:
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
—end example]

weekday_indexed is a trivially copyable and standard-layout class type.

### 29.8.7.2 Member functions

```cpp
cconstexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
1 Effects: Initializes wd_ with wd and index_ with index. The values held are unspecified if !wd.ok() or index is not in the range [0, 7].
```

```cpp
cconstexpr chrono::weekday weekday() const noexcept;
2 Returns: wd_.
```

```cpp
cconstexpr unsigned index() const noexcept;
3 Returns: index_.
```

```cpp
cconstexpr bool ok() const noexcept;
4 Returns: wd_.ok() && 1 <= index_ && index_ <= 5.
```

### 29.8.7.3 Non-member functions

```cpp
cconstexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
1 Returns: x.weekday() == y.weekday() && x.index() == y.index().
```

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
2 Effects: Equivalent to:
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
  format(os.getloc(), "{:L}[{}]", wdi.weekday(), i) :
  format(os.getloc(), "{:L}[{} is not a valid index]", wdi.weekday(), i));
```

### 29.8.8 Class weekday_last

#### 29.8.8.1 Overview

```cpp
namespace std::chrono {
  class weekday_last {
    chrono::weekday wd_; // exposition only
  
  public:
    constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
    
    constexpr chrono::weekday weekday() const noexcept;
    constexpr bool ok() const noexcept;
  
  }
```

§ 29.8.8.1
\texttt{weekday\_last} represents the last weekday of a month.

[Note 1: A \texttt{weekday\_last} object can be constructed by indexing a \texttt{weekday} with \texttt{last}. — end note]

\begin{verbatim}
constexpr auto wdl = Sunday[\texttt{last}];  // \texttt{wdl} is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
\end{verbatim}

— end example

\texttt{weekday\_last} is a trivially copyable and standard-layout class type.

29.8.8.2 Member functions

\texttt{constexpr explicit weekday\_last\(\texttt{const chrono::weekday\& wd}\) noexcept;}

\begin{enumerate}
\item \textbf{Effects}: Initializes \texttt{wd\_} with \texttt{wd}.
\item \textbf{Returns}: \texttt{wd\_}.
\item \texttt{constexpr bool ok\() const noexcept;}
\item \textbf{Returns}: \texttt{wd\_.ok\()\).}
\end{enumerate}

29.8.8.3 Non-member functions

\texttt{constexpr bool operator==(\texttt{const weekday\_last& x, const weekday\_last& y}) noexcept;}

\begin{enumerate}
\item \textbf{Returns}: \texttt{x.weekday\() == y.weekday\()\).
\end{enumerate}

29.8.9 Class \texttt{month\_day}

29.8.9.1 Overview

\begin{verbatim}
namespace std::chrono {
    class month\_day {
        \texttt{chrono::month m\_;}  // exposition only
        \texttt{chrono::day d\_;}  // exposition only

        public:
        \texttt{month\_day()} = default;
        \texttt{constexpr month\_day\(\texttt{const chrono::month\& m, const chrono::day\& d}\) noexcept;}

        \texttt{constexpr chrono::month month\() const noexcept;}
        \texttt{constexpr chrono::day day\() const noexcept;}
        \texttt{constexpr bool ok\() const noexcept;}
    };
}
\end{verbatim}

\texttt{month\_day} represents a specific day of a specific month, but with an unspecified year. \texttt{month\_day} meets the \textit{Cpp17EqualityComparable} (Table 27) and \textit{Cpp17LessThanComparable} (Table 28) requirements.

\texttt{month\_day} is a trivially copyable and standard-layout class type.

29.8.9.2 Member functions

\texttt{constexpr month\_day\(\texttt{const chrono::month\& m, const chrono::day\& d}\) noexcept;}

\begin{enumerate}
\item \textbf{Effects}: Initializes \texttt{m\_} with \texttt{m}, and \texttt{d\_} with \texttt{d}.
\item \textbf{Returns}: \texttt{m\_}.
\end{enumerate}
constexpr chrono::day day() const noexcept;

Returns: d_.

constexpr bool ok() const noexcept;

Returns: true if m_.ok() is true, 1d <= d_ and d_ is less than or equal to the number of days in month m_; otherwise returns false. When m_ == February, the number of days is considered to be 29.

29.8.9.3 Non-member functions

constexpr bool operator==(const month_day& x, const month_day& y) noexcept;

Returns: x.month() == y.month() && x.day() == y.day().

constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;

Effects: Equivalent to:

if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{}"),
md.month(), md.day());

Effects: Attempts to parse the input stream is into the month_day md using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid month_day, is.setstate(ios_base::failbit) is called and md is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.10 Class month_day_last

namespace std::chrono {

class month_day_last {

chrono::month m_; // exposition only

public:

constexpr explicit month_day_last(const chrono::month& m) noexcept;

constexpr chrono::month month() const noexcept;

constexpr bool ok() const noexcept;

};

month_day_last represents the last day of a month.

[Note 1: A month_day_last object can be constructed using the expression m/last or last/m, where m is an expression of type month. — end note]

[Example 1:]

cconstexpr auto mdl = February/last; // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);

— end example]

month_day_last is a trivially copyable and standard-layout class type.

§ 29.8.10
constexpr explicit month_day_last(const chrono::month& m) noexcept;

Effects: Initializes m_ with m.

constexpr month month() const noexcept;

Returns: m_.

constexpr bool ok() const noexcept;

Returns: m_.ok().

constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;

Returns: x.month() == y.month().

constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;

Returns: x.month() <=> y.month().

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L}/last"), mdl.month());

29.8.11 Class month_weekday [time.cal.mwd]

29.8.11.1 Overview [time.cal.mwd.overview]

namespace std::chrono {

class month_weekday {
    chrono::month m_;  // exposition only
    chrono::weekday_indexed wdi_;  // exposition only

public:
    constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

    constexpr month month() const noexcept;

    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

    constexpr bool ok() const noexcept;

};
}

month_weekday represents the \( n \)th weekday of a month, of an as yet unspecified year. To do this the month_weekday stores a month and a weekday_indexed.

[Example 1:

```c++
constexpr auto mwd = February/Tuesday[3]; // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
```

— end example]

month_weekday is a trivially copyable and standard-layout class type.

29.8.11.2 Member functions [time.cal.mwd.members]

constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

Effects: Initializes m_ with m, and wdi_ with wdi.

constexpr chrono::month month() const noexcept;

Returns: m_.

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

Returns: wdi_.

constexpr bool ok() const noexcept;

Returns: m_.ok() && wdi_.ok().

§ 29.8.11.2
29.8.11.3 Non-member functions

```cpp
constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;
```

Returns:
\[ x.m() == y.m() \&\& x.w() == y.w(). \]

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);
```

Effects:
\[ \text{return } os \ll \text{format(os.getloc(), } \text{STATICALLY-WIDEN}\ll<\text{charT}>\ll("\{L\}/\{L\}"), mwd.m(), mwd.w()); } \]

29.8.12 Class month_weekday_last

29.8.12.1 Overview

```cpp
namespace std::chrono {
    class month_weekday_last {
    // exposition only
    chrono::month m_; // exposition only
    chrono::weekday_last wdl_; // exposition only
    public:
    constexpr month_weekday_last(const chrono::month& m,
                        const chrono::weekday_last& wdl) noexcept;
    constexpr chrono::month m() const noexcept;
    constexpr chrono::weekday_last wdl() const noexcept;
    constexpr bool ok() const noexcept;
    };
}
```

`month_weekday_last` represents the last weekday of a month, of an as yet unspecified year. To do this the `month_weekday_last` stores a `month` and a `weekday_last`.

```cpp
constexpr auto mwd
    = February/Tuesday[last]; // mwd is the last Tuesday of February of an as yet unspecified year
static_assert(mwd.m() == February);
static_assert(mwd.wdl() == Tuesday[last]);
```

Example 1:

```cpp
constexpr chrono::month m();
constexpr chrono::weekday_last wdl();
```

29.8.12.2 Member functions

```cpp
constexpr month_weekday_last(const chrono::month& m,
                        const chrono::weekday_last& wdl) noexcept;
```

Effects:
\[ \text{Initializes } m_ \text{ with } m, \text{ and } wdl_ \text{ with } wdl. \]

Returns:
\[ m_. \]

```cpp
constexpr chrono::weekday_last wdl() const noexcept;
```

Returns:
\[ wdl_. \]

```cpp
constexpr bool ok() const noexcept;
```

Returns:
\[ m_.ok() \&\& wdl_.ok(). \]

29.8.12.3 Non-member functions

```cpp
constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;
```

Returns:
\[ x.m() == y.m() \&\& x.w() == y.w(). \]
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);

Effects: Equivalent to:

    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}"),
                        mwdl.month(), mwdl.weekday_last());

29.8.13 Class year_month

29.8.13.1 Overview

namespace std::chrono {
    class year_month {
        chrono::year y_; // exposition only
        chrono::month m_; // exposition only

    public:
        year_month() = default;
        constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;
        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr year_month& operator+=(const months& dm) noexcept;
        constexpr year_month& operator-=(const months& dm) noexcept;
        constexpr year_month& operator+=(const years& dy) noexcept;
        constexpr year_month& operator-=(const years& dy) noexcept;
        constexpr bool ok() const noexcept;
    };
}

1 year_month represents a specific month of a specific year, but with an unspecified day. year_month is
a field-based time point with a resolution of months. year_month meets the Cpp17EqualityComparable
(Table 27) and Cpp17LessThanComparable (Table 28) requirements.

2 year_month is a trivially copyable and standard-layout class type.

29.8.13.2 Member functions

constexpr year_month(const chrono::year& y, const chrono::month& m) noexcept;

Effects: Initializes y_ with y, and m_ with m.

constexpr chrono::year year() const noexcept;

Returns: y_.

constexpr chrono::month month() const noexcept;

Returns: m_.

constexpr year_month& operator+=(const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this + dm.

Returns: *this.

constexpr year_month& operator-=(const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this - dm.

Returns: *this.
constexpr year_month& operator+=(const years& dy) noexcept;
   Effects: *this = *this + dy.
   Returns: *this.
constexpr year_month& operator-=(const years& dy) noexcept;
   Effects: *this = *this - dy.
   Returns: *this.
constexpr bool ok() const noexcept;
   Returns: y_.ok() && m_.ok().

29.8.13.3 Non-member functions [time.cal.ym.nonmembers]

constexpr bool operator==(const year_month& x, const year_month& y) noexcept;
   Returns: x.year() == y.year() && x.month() == y.month().

constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;
   Effects: Equivalent to:
   if (auto c = x.year() <=> y.year(); c != 0) return c;
   return x.month() <=> y.month();

constexpr year_month operator+ (const year_month& ym, const months& dm) noexcept;
   Constraints: If the argument supplied by the caller for the months parameter
               is convertible to years, its implicit conversion sequence to years
               is worse than its implicit conversion sequence to months (12.2.4.3).
   Returns: A year_month value z such that z.ok() && z - ym == dm is true.
   Complexity: $O(1)$ with respect to the value of dm.

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;
   Constraints: If the argument supplied by the caller for the months parameter
               is convertible to years, its implicit conversion sequence to years
               is worse than its implicit conversion sequence to months (12.2.4.3).
   Returns: ym + -dm.

constexpr months operator-(const year_month& x, const year_month& y) noexcept;
   Returns:
   x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) -
   static_cast<int>(unsigned{y.month()})}

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;
   Returns: (ym.year() + dy) / ym.month().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;
   Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;
   Returns: ym + -dy.

template<class charT, class traits>
   basic_ostream<charT, traits>&
       operator<<(basic_ostream<charT, traits>& os, const year_month& ym);
   Effects: Equivalent to:

§ 29.8.13.3 1407
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("/{}/:L"),
        ym.year(), ym.month());

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month ym using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year_month, is.setstate(ios_base::failbit) is called and ym is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.14 Class year_month_day [time.cal.ymd]
29.8.14.1 Overview [time.cal.ymd.overview]
namespace std::chrono {
    class year_month_day {
        chrono::year y_; // exposition only
        chrono::month m_; // exposition only
        chrono::day d_; // exposition only

    public:
        year_month_day() = default;
        constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                                   const chrono::day& d) noexcept;
        constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
        constexpr year_month_day(const sys_days& dp) noexcept;
        constexpr explicit year_month_day(const local_days& dp) noexcept;

        constexpr year_month_day& operator+=(const months& m) noexcept;
        constexpr year_month_day& operator-=(const months& m) noexcept;
        constexpr year_month_day& operator+=(const years& y) noexcept;
        constexpr year_month_day& operator-=(const years& y) noexcept;

        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;

        constexpr bool ok() const noexcept;
    };
}

1 year_month_day represents a specific year, month, and day. year_month_day is a field-based time point with a resolution of days.

[Note 1: year_month_day supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_day meets the Cpp17EqualityComparable (Table 27) and Cpp17LessThanComparable (Table 28) requirements.

2 year_month_day is a trivially copyable and standard-layout class type.

29.8.14.2 Member functions [time.cal.ymd.members]

constexpr year_month_day(const chrono::year& y, const chrono::month& m,
                         const chrono::day& d) noexcept;

1 Effects: Initializes y_ with y, m_ with m, and d_ with d.
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;

Effects: Initializes y_ with ymdl.year(), m_ with ymdl.month(), and d_ with ymdl.day().

[Note 1: This conversion from year_month_day_last to year_month_day can be more efficient than converting a year_month_day_last to a sys_days, and then converting that sys_days to a year_month_day. — end note]

constexpr year_month_day(const sys_days& dp) noexcept;

Effects: Constructs an object of type year_month_day that corresponds to the date represented by dp.

Remarks: For any value ymd of type year_month_day for which ymd.ok() is true, ymd == year_-
month_day(sys_days{ymd}) is true.

constexpr explicit year_month_day(const local_days& dp) noexcept;

Effects: Equivalent to constructing with sys_days{dp.time_since_epoch()}.  

constexpr year_month_day& operator+=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this + m.

Returns: *this.

constexpr year_month_day& operator-=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this - m.

Returns: *this.

constexpr year_month_day& year_month_day::operator+=(const years& y) noexcept;

Effects: *this = *this + y.

Returns: *this.

constexpr year_month_day& year_month_day::operator-=(const years& y) noexcept;

Effects: *this = *this - y.

Returns: *this.

constexpr chrono::year year() const noexcept;

Returns: y_.

constexpr chrono::month month() const noexcept;

Returns: m_.

constexpr chrono::day day() const noexcept;

Returns: d_.

constexpr operator sys_days() const noexcept;

Returns: If ok(), returns a sys_days holding a count of days from the sys_days epoch to *this (a negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok() && m_.ok() is true, returns sys_days{y_/m_/1d} + (d_ - 1d). Otherwise the value returned is unspecified.

Remarks: A sys_days in the range [days{-12687428}, days{11248737}] which is converted to a year_month_day has the same value when converted back to a sys_days.

[Example 1]:

static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);

— end example]
constexpr explicit operator local_days() const noexcept;

Returns: local_days(sys_days{*this}.time_since_epoch()).

constexpr bool ok() const noexcept;

Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d, (y_/m_/last).day()], then returns true; otherwise returns false.

29.8.14.3 Non-member functions

constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;

Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;

Effects: Equivalent to:
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();

constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: (ymd.year() / ymd.month() + dm) / ymd.day().

[Note 1: If ymd.day() is in the range [1d,28d], ok() will return true for the resultant year_month_day. — end note]

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymd + dm.

constexpr year_month_day operator~(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;

Returns: (ymd.year() + dy) / ymd.month() / ymd.day().

[Note 2: If ymd.month() is February and ymd.day() is not in the range [1d,28d], ok() can return false for the resultant year_month_day. — end note]

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;

Returns: ymd + dy.

constexpr year_month_day operator~(const year_month_day& ymd, const years& dy) noexcept;

Returns: ymd + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);

Effects: Equivalent to:
return os << (ymd.ok() ?
(format(STATICALLY-WIDEN<charT>("{:F}"), ymd) :
format(STATICALLY-WIDEN<charT>("{:F} is not a valid date"), ymd));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
year_month_day& ymd, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year_month_day, is.setstate(ios_base::failbit) is called and ymd is not modified. If %Z (or a modified variant) is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.15 Class year_month_day_last

29.8.15.1 Overview

namespace std::chrono {
  class year_month_day_last {
    chrono::year y_; // exposition only
    chrono::month_day_last mdl_; // exposition only
  public:
    constexpr year_month_day_last(const chrono::year& y, const chrono::month_day_last& mdl) noexcept;
    constexpr year_month_day_last& operator+=(const months& m) noexcept;
    constexpr year_month_day_last& operator-=(const months& m) noexcept;
    constexpr year_month_day_last& operator+=(const years& y) noexcept;
    constexpr year_month_day_last& operator-=(const years& y) noexcept;
    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::month_day_last month_day_last() const noexcept;
    constexpr chrono::day day() const noexcept;
    constexpr operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
  };
}

year_month_day_last represents the last day of a specific year and month. year_month_day_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a year and month.

[Note 1: year_month_day_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. —end note]

year_month_day_last meets the Cpp17EqualityComparable (Table 27) and Cpp17LessThanComparable (Table 28) requirements.

year_month_day_last is a trivially copyable and standard-layout class type.

29.8.15.2 Member functions

constexpr year_month_day_last(const chrono::year& y, const chrono::month_day_last& mdl) noexcept;

Effects: Initializes y_ with y and mdl_ with mdl.

constexpr year_month_day_last& operator+=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this + m.

Returns: *this.

constexpr year_month_day_last& operator-=(const months& m) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
```cpp
constexpr year_month_day_last& operator+=(const years& y) noexcept;
Effects: *this = *this + y.
Returns: *this.

constexpr year_month_day_last& operator-=(const years& y) noexcept;
Effects: *this = *this - y.
Returns: *this.

constexpr chrono::year year() const noexcept;
Returns: y_.

constexpr chrono::month month() const noexcept;
Returns: mdl_.month().

constexpr chrono::month_day_last month_day_last() const noexcept;
Returns: mdl_.

constexpr operator sys_days() const noexcept;
Returns: sys_days{year()/month()/day()}.  

constexpr explicit operator local_days() const noexcept;
Returns: local_days{sys_days{*this}.time_since_epoch()}. 

constexpr bool ok() const noexcept;
Returns: y_.ok() && mdl_.ok().
```

### 29.8.15.3 Non-member functions

```cpp
constexpr bool operator==(const year_month_day_last& x, const year_month_day_last& y) noexcept;
Returns: x.year() == y.year() && x.month_day_last() == y.month_day_last().

constexpr strong_ordering operator<=>(const year_month_day_last& x, const year_month_day_last& y) noexcept;
Effects: Equivalent to:
if (auto c = x.year() <=> y.year(); c != 0) return c;
return x.month_day_last() <=> y.month_day_last();

constexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const months& dm) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).  
Returns: (ymdl.year() / ymdl.month() + dm) / last.

constexpr year_month_day_last
operator+(const months& dm, const year_month_day_last& ymdl) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).  
Returns: ymdl + dm.
```
constexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymdl + (-dm).

cconstexpr year_month_day_last
operator+(const year_month_day_last& ymdl, const years& dy) noexcept;

Returns: {ymdl.year()+dy, ymdl.month_day_last()}.  
cconstexpr year_month_day_last
operator+(const years& dy, const year_month_day_last& ymdl) noexcept;

Returns: ymdl + dy.

cconstexpr year_month_day_last
operator-(const year_month_day_last& ymdl, const years& dy) noexcept;

Returns: ymdl + (-dy).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{}"),
ymdl.year(), ymdl.month_day_last());

§ 29.8.16 Class year_month_weekday  [time.cal.ymwd]

namespace std::chrono {
class year_month_weekday {
  chrono::year y_; // exposition only
  chrono::month m_; // exposition only
  chrono::weekday_indexed wdi_; // exposition only

c  public:
  year_month_weekday() = default;
  constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                              const chrono::weekday_indexed& wdi) noexcept;
  constexpr year_month_weekday(const sys_days& dp) noexcept;
  constexpr explicit year_month_weekday(const local_days& dp) noexcept;
  constexpr year_month_weekday& operator+=(const months& m) noexcept;
  constexpr year_month_weekday& operator-=(const months& m) noexcept;
  constexpr year_month_weekday& operator+=(const years& y) noexcept;
  constexpr year_month_weekday& operator-=(const years& y) noexcept;
  constexpr chrono::year year() const noexcept;
  constexpr chrono::month month() const noexcept;
  constexpr chrono::weekday weekday() const noexcept;
  constexpr unsigned index() const noexcept;
  constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
  constexpr operator sys_days() const noexcept;
  constexpr explicit operator local_days() const noexcept;
  constexpr bool ok() const noexcept;
}
year_month_weekday meets the Cpp17EqualityComparable (Table 27) requirements.
year_month_weekday is a trivially copyable and standard-layout class type.

29.8.16.2 Member functions

```cpp
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
    const chrono::weekday_indexed& wdi) noexcept;
Effects: Initializes y_ with y, m_ with m, and wdi_ with wdi.
```

```cpp
constexpr year_month_weekday(const sys_days& dp) noexcept;
Effects: Constructs an object of type year_month_weekday which corresponds to the date represented by dp.
Remarks: For any value ymwd of type year_month_weekday for which ymwd.ok() is true, ymwd == year_month_weekday{sys_days{ymwd}} is true.
```

```cpp
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
Effects: Equivalent to constructing with sys_days{dp.time_since_epoch()}.
```

```cpp
constexpr year_month_weekday& operator+=(const months& m) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Effects: *this = *this + m.
Returns: *this.
```

```cpp
constexpr year_month_weekday& operator-=(const months& m) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Effects: *this = *this - m.
Returns: *this.
```

```cpp
constexpr year_month_weekday& operator+=(const years& y) noexcept;
Effects: *this = *this + y.
Returns: *this.
```

```cpp
constexpr year_month_weekday& operator-=(const years& y) noexcept;
Effects: *this = *this - y.
Returns: *this.
```

```cpp
constexpr chrono::year year() const noexcept;
Returns: y_.
```

```cpp
constexpr chrono::month month() const noexcept;
Returns: m_.
```

```cpp
constexpr chrono::weekday weekday() const noexcept;
Returns: wdi_.weekday().
```

```cpp
constexpr unsigned index() const noexcept;
Returns: wdi_.index().
```

```cpp
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
Returns: wdi_.
```

```cpp
constexpr operator sys_days() const noexcept;
Returns: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
```
the returned `sys_days` represents the date 7 days prior to the first `weekday()` of `year()/month()`. Otherwise the returned value is unspecified.

```cpp
constexpr explicit operator local_days() const noexcept;
```

*Returns:* `local_days(sys_days{*this}.time_since_epoch())`.

```cpp
constexpr bool ok() const noexcept;
```

*Returns:* If any of `y_.ok()`, `m_.ok()`, or `wdi_.ok()` is false, returns false. Otherwise, if `*this` represents a valid date, returns true. Otherwise, returns false.

### 29.8.16.3 Non-member functions

```cpp
constexpr bool operator==(const year_month_weekday& x, const year_month_weekday& y) noexcept;
```

*Returns:* `x.year() == y.year() && x.month() == y.month() && x.weekday_indexed() == y.weekday_indexed()`.

```cpp
constexpr year_month_weekday operator+(const year_month_weekday& ymwd, const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `(ymwd.year() / ymwd.month() + dm) / ymwd.weekday_indexed()`.

```cpp
constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `ymwd + dm`.

```cpp
constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const months& dm) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `ymwd + (-dm)`.

```cpp
constexpr year_month_weekday operator+(const months& dm, const year_month_weekday& ymwd) noexcept;
```

*Constraints:* If the argument supplied by the caller for the `months` parameter is convertible to `years`, its implicit conversion sequence to `years` is worse than its implicit conversion sequence to `months` (12.2.4.3).

*Returns:* `{ymwd.year()+dy, ymwd.month(), ymwd.weekday_indexed()}`.

```cpp
constexpr year_month_weekday operator+(const years& dy, const year_month_weekday& ymwd) noexcept;
```

*Returns:* `ymwd + dy`.

```cpp
constexpr year_month_weekday operator-(const year_month_weekday& ymwd, const years& dy) noexcept;
```

*Returns:* `ymwd + (-dy)`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_weekday& ymwd);
```

*Effects:* Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{/:{L}/:{L}}"),
ymwd.year(), ymwd.month(), ymwd.weekday_indexed());
```

### 29.8.17 Class year_month_weekday_last

#### 29.8.17.1 Overview

```cpp
namespace std::chrono {
    class year_month_weekday_last {
    
    public:
        constexpr year_month_weekday_last(const chrono::year y, const chrono::month m, 
                                          const chrono::weekday_last wdl) noexcept;
    
    chrono::year y_;  // exposition only
    chrono::month m_;  // exposition only
    chrono::weekday_last wdl_;  // exposition only

    
};
```
constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;
constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::weekday weekday() const noexcept;
constexpr chrono::weekday_last weekday_last() const noexcept;
constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;

year_month_weekday_last represents a specific year, month, and last weekday of the month. year_month_weekday_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last weekday of a year and month.

[Note 1: year_month_weekday_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. —end note]

year_month_weekday_last meets the Cpp17EqualityComparable (Table 27) requirements.

year_month_weekday_last is a trivially copyable and standard-layout class type.
constexpr chrono::weekday_last weekday_last() const noexcept;
  Returns: wdl_.

constexpr operator sys_days() const noexcept;
  Returns: If ok() == true, returns a sys_days that represents the last weekday() of year()/month(). Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;
  Returns: local_days(*this).time_since_epoch() / years().

constexpr bool ok() const noexcept;
  Returns: y_.ok() && m_.ok() && wdl_.ok() / years().

29.8.17.3  Non-member functions

constexpr bool operator==(const year_month_weekday_last& x, const year_month_weekday_last& y) noexcept;
  Returns: x.year() == y.year() && x.month() == y.month() && x.weekday_last() == y.weekday_last() / years().

constexpr year_month_weekday_last operator+(const year_month_weekday_last& ymwdl, const months& dm) noexcept;
  Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
  Returns: ymwdl / years(). + dm / years(). / years().

constexpr year_month_weekday_last operator+(const years& dy, const year_month_weekday_last& ymwdl) noexcept;
  Returns: ymwdl + dy / years().

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const year_month_weekday_last& ymwdl);
  Effects: Equivalent to:
  return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}/{:L}"), ymwdl.year(), ymwdl.month(), ymwdl.weekday_last());
29.8.18 Conventional syntax operators [time.cal.operators]

A set of overloaded operator/ functions provides a conventional syntax for the creation of civil calendar dates.

[Note 1: The year, month, and day are accepted in any of the following 3 orders:

- year/month/day
- month/day/year
- day/month/year

Anywhere a day is required, any of the following can also be specified:

- last
- weekday[i]
- weekday[last]

—end note]

[Note 2: Partial-date types such as year_month and month_day can be created by not applying the second division operator for any of the three orders. For example:

- year_month ym = 2015y/April;
- month_day md1 = April/4;
- month_day md2 = 4d/April;

—end note]

[Example 1:

- auto a = 2015/4/4;  // a == int(125)
- auto b = 2015y/4/4;  // b == year_month_day{year(2015), month(4), day(4)}
- auto c = 2015y/4d/April;  // error: no viable operator/ for first /
- auto d = 2015/April/4;  // error: no viable operator/ for first /

—end example]

constexpr year_month operator/(const year& y, const month& m) noexcept;
Returns: {y, m}.

constexpr year_month operator/(const year& y, int m) noexcept;
Returns: y / month(m).

constexpr month_day operator/(const month& m, const day& d) noexcept;
Returns: {m, d}.

constexpr month_day operator/(const month& m, int d) noexcept;
Returns: m / day(d).

constexpr month_day operator/(int m, const day& d) noexcept;
Returns: month(m) / d.

constexpr month_day operator/(const day& d, const month& m) noexcept;
Returns: m / d.

constexpr month_day operator/(const day& d, int m) noexcept;
Returns: month(m) / d.

constexpr month_day_last operator/(const month& m, last_spec) noexcept;
Returns: month_day_last(m).
constexpr month_day_last
operator/(int m, last_spec) noexcept;

Returns: month(m) / last.

constexpr month_day_last
operator/(last_spec, const month& m) noexcept;

Returns: m / last.

constexpr month_day_last
operator/(last_spec, int m) noexcept;

Returns: month(m) / last.

constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;

Returns: {m, wdi}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;

Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;

Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;

Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;

Returns: {m, wdl}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;

Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;

Returns: m / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;

Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;

Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;

Returns: ym / day(d).

constexpr year_month_day
operator/(const year_month& ym, const month_day& md) noexcept;

Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;

Returns: year(y) / md.
constexpr year_month_day
operator/(const month_day& md, const year& y) noexcept;

Returns: y / md.

constexpr year_month_day
operator/(const month_day& md, int y) noexcept;

Returns: year(y) / md.

constexpr year_month_day_last
operator/(const year_month& ym, last_spec) noexcept;

Returns: {ym.year(), month_day_last{ym.month()))}.

constexpr year_month_day_last
operator/(const year& y, const month_day_last& mdl) noexcept;

Returns: {y, mdl}.

constexpr year_month_day_last
operator/(const month_day_last& mdl, const year& y) noexcept;

Returns: y / mdl.

constexpr year_month_day_last
operator/(const month_day_last& mdl, int y) noexcept;

Returns: year(y) / mdl.

constexpr year_month_weekday
operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;

Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
operator/(const year& y, const month_weekday& mwd) noexcept;

Returns: {y, mwd.month(), mwd.weekday_indexed()}.

constexpr year_month_weekday
operator/(int y, const month_weekday& mwd) noexcept;

Returns: year(y) / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, const year& y) noexcept;

Returns: y / mwd.

constexpr year_month_weekday
operator/(const month_weekday& mwd, int y) noexcept;

Returns: year(y) / mwd.

constexpr year_month_weekday_last
operator/(const year_month& ym, const weekday_last& wdl) noexcept;

Returns: {ym.year(), ym.month(), wdl}.

constexpr year_month_weekday_last
operator/(const year& y, const month_weekday_last& mwdl) noexcept;

Returns: {y, mwdl.month(), mwdl.weekday_last()}.

constexpr year_month_weekday_last
operator/(int y, const month_weekday_last& mwdl) noexcept;

Returns: year(y) / mwdl.
constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;

Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;

Returns: year(y) / mwdl.

29.9 Class template hh_mm_ss
[time.hms]

29.9.1 Overview
[time.hms.overview]

namespace std::chrono {
    template<class Duration> class hh_mm_ss {
    public:
        static constexpr unsigned fractional_width = see below;
        using precision = see below;

        constexpr hh_mm_ss() noexcept : hh_mm_ss(Duration::zero()) {} 
        constexpr explicit hh_mm_ss(Duration d);

        constexpr bool is_negative() const noexcept;
        constexpr chrono::hours hours() const noexcept;
        constexpr chrono::minutes minutes() const noexcept;
        constexpr chrono::seconds seconds() const noexcept;
        constexpr precision subseconds() const noexcept;
        constexpr explicit operator precision() const noexcept;
        constexpr precision to_duration() const noexcept;
    private:
        bool is_neg; // exposition only
        chrono::hours h; // exposition only
        chrono::minutes m; // exposition only
        chrono::seconds s; // exposition only
        precision ss; // exposition only
    };
}

1 The hh_mm_ss class template splits a duration into a multi-field time structure hours:minutes:seconds and possibly subseconds, where subseconds will be a duration unit based on a non-positive power of 10. The Duration template parameter dictates the precision to which the time is split. A hh_mm_ss models negative durations with a distinct is_negative getter that returns true when the input duration is negative. The individual duration fields always return non-negative durations even when is_negative() indicates the structure is representing a negative duration.

2 If Duration is not a specialization of duration, the program is ill-formed.

29.9.2 Members
[time.hms.members]

static constexpr unsigned fractional_width = see below;

1 fractional_width is the number of fractional decimal digits represented by precision. fractional_width has the value of the smallest possible integer in the range [0, 18] such that precision will exactly represent all values of Duration. If no such value of fractional_width exists, then fractional_width is 6.

[Example 1: See Table 96 for some durations, the resulting fractional_width, and the formatted fractional second output of Duration(1).]

<table>
<thead>
<tr>
<th>Duration</th>
<th>fractional_width</th>
<th>Formatted fractional second output</th>
</tr>
</thead>
<tbody>
<tr>
<td>hours, minutes, and seconds</td>
<td>0</td>
<td>0.001</td>

<td>6</td>
<td>0.111111</td>
</tr>
<tr>
<td>\texttt{duration&lt;int, ratio&lt;756, 625&gt;&gt;}</td>
<td>4</td>
<td>0.2096</td>
</tr>
</tbody>
</table>

--- end example ---

using precision = see below;

2 precision is

\begin{verbatim}
duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10>>
\end{verbatim}

constexpr explicit \texttt{hh\_mm\_ss}(Duration \texttt{d});

3 Effects: Constructs an object of type \texttt{hh\_mm\_ss} which represents the \texttt{Duration} \texttt{d} with precision \texttt{precision}.

(3.1) — Initializes \texttt{is\_neg} with \texttt{d < Duration::zero()}.
(3.2) — Initializes \texttt{h} with \texttt{duration\_cast<chrono::hours>(abs(d))}.
(3.3) — Initializes \texttt{m} with \texttt{duration\_cast<chrono::minutes>(abs(d) - hours())}.
(3.4) — Initializes \texttt{s} with \texttt{duration\_cast<chrono::seconds>(abs(d) - hours() - minutes())}.
(3.5) — If \texttt{treat\_as\_floating\_point_v<precision::rep> is true}, initializes \texttt{ss} with \texttt{abs(d) - hours() - minutes() - seconds()}. Otherwise, initializes \texttt{ss} with \texttt{duration\_cast<precision>(abs(d) - hours() - minutes() - seconds())}.

[Note 1: When \texttt{precision::rep} is integral and \texttt{precision::period} is \texttt{ratio<1>}, \texttt{subseconds()} always returns a value equal to 0s. — end note]

4 Postconditions: If \texttt{treat\_as\_floating\_point_v<precision::rep>} is true, \texttt{to\_duration()} returns \texttt{d}, otherwise \texttt{to\_duration()} returns \texttt{duration\_cast<precision>(d)}.

constexpr bool \texttt{is\_negative()} const noexcept;

Returns: \texttt{is\_neg}.

constexpr chrono::hours hours() const noexcept;

Returns: \texttt{h}.

constexpr chrono::minutes minutes() const noexcept;

Returns: \texttt{m}.

constexpr chrono::seconds seconds() const noexcept;

Returns: \texttt{s}.

constexpr precision subseconds() const noexcept;

Returns: \texttt{ss}.

constexpr precision to\_duration() const noexcept;

Returns: If \texttt{is\_neg}, returns \texttt{-(h + m + s + ss)}, otherwise returns \texttt{h + m + s + ss}.

constexpr explicit operator precision() const noexcept;

Returns: \texttt{to\_duration}().

§ 29.9.2
### 29.9.3 Non-members  
**template<class charT, class traits, class Duration>**
**basic_ostream<charT, traits>&**
**operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);**

*Effects:* Equivalent to:

```cpp
return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L%T}"), hms);
```

**Example 1:**

```cpp
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm.ss hms{ms};
    cout << hms << '\n';
}
```

```
cout << hh_mm.ss{65745s} << '\n';
```

Produces the output (assuming the 'C' locale):

-01:08:03.007  
01:08:03.007  
18:15:45.123  
18:15:45

— end example

### 29.10 12/24 hours functions  
**[time.12]**

These functions aid in translating between a 12h format time of day and a 24h format time of day.

```cpp
constexpr bool is_am(const hours& h) noexcept;
```

*Returns:* $0h \leq h \&\& h \leq 11h$.

```cpp
constexpr bool is_pm(const hours& h) noexcept;
```

*Returns:* $12h \leq h \&\& h \leq 23h$.

```cpp
constexpr hours make12(const hours& h) noexcept;
```

*Returns:* The 12-hour equivalent of $h$ in the range $[1h, 12h]$. If $h$ is not in the range $[0h, 23h]$, the value returned is unspecified.

```cpp
constexpr hours make24(const hours& h, bool is_pm) noexcept;
```

*Returns:* If $is_pm$ is false, returns the 24-hour equivalent of $h$ in the range $[0h, 11h]$, assuming $h$ represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of $h$ in the range $[12h, 23h]$, assuming $h$ represents a post meridiem hour. If $h$ is not in the range $[1h, 12h]$, the value returned is unspecified.

### 29.11 Time zones  
**[time.zone]**

#### 29.11.1 In general  
**[time.zone.general]**

29.11 describes an interface for accessing the IANA Time Zone Database that interoperates with sys_time and local_time. This interface provides time zone support to both the civil calendar types (29.8) and to user-defined calendars.

#### 29.11.2 Time zone database  
**[time.zone.db]**

##### 29.11.2.1 Class tzdb  
**[time.zone.db.tzdb]**

```cpp
namespace std::chrono {
    struct tzdb {
        string version;
        vector<time_zone> zones;
        vector<time_zone_link> links;
        vector<leap_second> leap_seconds;
        
        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```
Each vector in a tzdb object is sorted to enable fast lookup.

    const time_zone* locate_zone(string_view tz_name) const;

Returns:

(2.1) If zones contains an element tz for which tz.name() == tz_name, a pointer to tz;
(2.2) otherwise, if links contains an element tz_l for which tz_l.name() == tz_name, then a pointer to the element tz of zones for which tz.name() == tz_l.target().

[Note 1: A time_zone_link specifies an alternative name for a time_zone. — end note]

Throws: If a const time_zone* cannot be found as described in the Returns: element, throws a runtime_error.

[Note 2: On non-exceptional return, the return value is always a pointer to a valid time_zone. — end note]

const time_zone* current_zone() const;

Returns: A pointer to the time zone which the computer has set as its local time zone.

29.11.2.2 Class tzdb_list

namespace std::chrono {
    class tzdb_list {
    public:
        tzdb_list(const tzdb_list&) = delete;
        tzdb_list& operator=(const tzdb_list&) = delete;

        // unspecified additional constructors

        class const_iterator {
            const tzdb& front() const noexcept;
            const_iterator erase_after(const_iterator p);
            const_iterator begin() const noexcept;
            const_iterator end() const noexcept;
            const_iterator cbegin() const noexcept;
            const_iterator cend() const noexcept;
        };
    };
}

The tzdb_list database is a singleton; the unique object of type tzdb_list can be accessed via the get_tzdb_list() function.

[Note 1: This access is only needed for those applications that need to have long uptimes and have a need to update the time zone database while running. Other applications can implicitly access the front() of this list via the read-only namespace scope functions get_tzdb(), locate_zone(), and current_zone(). — end note]

The tzdb_list object contains a list of tzdb objects.

tzdb_list::const_iterator is a constant iterator which meets the Cpp17ForwardIterator requirements and has a value type of tzdb.

const tzdb& front() const noexcept;

Synchronization: This operation is thread-safe with respect to reload_tzdb().

[Note 2: reload_tzdb() pushes a new tzdb onto the front of this container. — end note]

Returns: A reference to the first tzdb in the container.

const_iterator erase_after(const_iterator p);

Preconditions: The iterator following p is dereferenceable.

Effects: Erases the tzdb referred to by the iterator following p.

Postconditions: No pointers, references, or iterators are invalidated except those referring to the erased tzdb.
[Note 3: It is not possible to erase the tzdb referred to by begin(). — end note]

8 Returns: An iterator pointing to the element following the one that was erased, or end() if no such element exists.

9 Throws: Nothing.

const_iterator begin() const noexcept;

10 Returns: An iterator referring to the first tzdb in the container.

const_iterator end() const noexcept;

11 Returns: An iterator referring to the position one past the last tzdb in the container.

const_iterator cbegin() const noexcept;

12 Returns: begin().

const_iterator cend() const noexcept;

13 Returns: end().

29.11.2.3 Time zone database access [time.zone.db.access]

tzdb_list& get_tzdb_list();

1 Effects: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a tzdb_list holding a single initialized tzdb.

2 Synchronization: It is safe to call this function from multiple threads at one time.

3 Returns: A reference to the database.

4 Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb_list containing one or more valid tzdb.

const tzdb& get_tzdb();

5 Returns: get_tzdb_list().front().

const time_zone* locate_zone(string_view tz_name);

6 Returns: get_tzdb().locate_zone(tz_name).

7 [Note 1: The time zone database will be initialized if this is the first reference to the database. — end note]

const time_zone* current_zone();

8 Returns: get_tzdb().current_zone().

29.11.2.4 Remote time zone database support [time.zone.db.remote]

The local time zone database is that supplied by the implementation when the program first accesses the database, for example via current_zone(). While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the remote time zone database.

const tzdb& reload_tzdb();

1 Effects: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the tzdb_list accessed by get_tzdb_list().

2 Synchronization: This function is thread-safe with respect to get_tzdb_list().front() and get_tzdb_list().erase_after().

3 Postconditions: No pointers, references, or iterators are invalidated.

4 Returns: get_tzdb_list().front().

5 Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb.
string remote_version();

Returns: The latest remote database version.

[Note 1: This can be compared with get_tzdb().version to discover if the local and remote databases are equivalent. — end note]

29.11.3 Exception classes

29.11.3.1 Class nonexistent_local_time

namespace std::chrono {
  class nonexistent_local_time : public runtime_error {
    public:
      template<class Duration>
      nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    }
  }
}

1 nonexistent_local_time is thrown when an attempt is made to convert a non-existent local_time to a sys_time without specifying choose::earliest or choose::latest.

template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);

2 Preconditions: i.result == local_info::nonexistent is true.

3 Effects: Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

   ostringstream os;
   os << tp << " is in a gap between\n" << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << ',' << i.first.abbrev << ' and\n" << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << ',' << i.second.abbrev << " which are both equivalent to\n" << i.first.end << " UTC";

4 [Example 1]:

   #include <chrono>
   #include <iostream>

   int main() {
     using namespace std::chrono;
     try {
       auto zt = zoned_time("America/New_York",
           local_days{Sunday[2]/March/2016} + 2h + 30min);
     } catch (const nonexistent_local_time&) e) {
       std::cout << e.what() << '\n';
     }
   }

Produces the output:

   2016-03-13 02:30:00 is in a gap between
   2016-03-13 02:00:00 EST and
   2016-03-13 03:00:00 EDT which are both equivalent to
   2016-03-13 07:00:00 UTC

   —end example]

29.11.3.2 Class ambiguous_local_time

namespace std::chrono {
  class ambiguous_local_time : public runtime_error {
    public:
      template<class Duration>
      ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
    }
  }
}
ambiguous_local_time is thrown when an attempt is made to convert an ambiguous local_time to a sys_time without specifying choose::earliest or choose::latest.

```cpp
template<class Duration>
ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
```

**Preconditions:** i.result == local_info::ambiguous is true.

**Effects:** Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

```cpp
ostringstream os;
os << tp << " is ambiguous. It could be\n" << tp << " \" << i.first.abbrev << " == " << tp - i.first.offset << " UTC or\n" << tp << " \" << i.second.abbrev << " == " << tp - i.second.offset << " UTC];
```

**Example 1:**

```cpp
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
                             local_days{Sunday[1]/November/2016} + 1h + 30min);
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << "\n";
    }
}
```

Produces the output:

```
2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC
```

-- end example --

29.11.4 Information classes

29.11.4.1 Class sys_info

```cpp
namespace std::chrono {
    struct sys_info {
        sys_seconds begin;
        sys_seconds end;
        seconds offset;
        minutes save;
        string abbrev;
    };
}
```

1. **A sys_info object can be obtained from the combination of a time_zone and either a sys_time or local_time. It can also be obtained from a zoned_time, which is effectively a pair of a time_zone and sys_time.**

2. **[Note 1: This type provides a low-level interface to time zone information. Typical conversions from sys_time to local_time will use this class implicitly, not explicitly. — end note]**

3. The begin and end data members indicate that, for the associated time_zone and time_point, the offset and abbrev are in effect in the range [begin,end). This information can be used to efficiently iterate the transitions of a time_zone.

4. The offset data member indicates the UTC offset in effect for the associated time_zone and time_point. The relationship between local_time and sys_time is:
   
   offset = local_time - sys_time

5. **The save data member is extra information not normally needed for conversion between local_time and sys_time. If save != 0min, this sys_info is said to be on “daylight saving” time, and offset - save**
suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin, end)` (if `save != 0min` for this `sys_info`).

The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

7 Effects: Streams out the `sys_info` object `r` in an unspecified format.

8 Returns: `os`.

### 29.11.4.2 Class `local_info`

```cpp
namespace std::chrono {
  struct local_info {
    static constexpr int unique = 0;
    static constexpr int nonexistent = 1;
    static constexpr int ambiguous = 2;

    int result;
    sys_info first;
    sys_info second;
  };
}
```

1 [Note 1: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. — end note]

2 Describes the result of converting a `local_time` to a `sys_time` as follows:

- (2.1) When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.

- (2.2) If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.

- (2.3) If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

3 Effects: Streams out the `local_info` object `r` in an unspecified format.

4 Returns: `os`.

### 29.11.5 Class `time_zone`

#### 29.11.5.1 Overview

```cpp
namespace std::chrono {
  class time_zone {
  public:
    time_zone(time_zone&&) = default;
    time_zone& operator=(time_zone&&) = default;

    // unspecified additional constructors

    string_view name() const noexcept;
  }
}
```
template<class Duration> sys_info get_info(const sys_time<Duration>& st) const;
template<class Duration> local_info get_info(const local_time<Duration>& tp) const;

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp) const;

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp, choose z) const;

template<class Duration>
    local_time<common_type_t<Duration, seconds>>
    to_local(const sys_time<Duration>& tp) const;

1 A time_zone represents all time zone transitions for a specific geographic area. time_zone construction is
unspecified, and performed as part of database initialization.

[Note 1: const time_zone objects can be accessed via functions such as locate_zone. — end note]

29.11.5.2 Member functions

string_view name() const noexcept;

1 Returns: The name of the time_zone.

2 [Example 1: "America/New_York". — end example]

template<class Duration>
    sys_info get_info(const sys_time<Duration>& st) const;

3 Returns: A sys_info i for which st is in the range [i.begin, i.end).

template<class Duration>
    local_info get_info(const local_time<Duration>& tp) const;

4 Returns: A local_info for tp.

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp) const;

5 Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer
precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone.

6 Throws: If the conversion from tp to a sys_time is ambiguous, throws ambiguous_local_time. If the
tp represents a non-existent time between two UTC time_points, throws nonexistent_local_time.

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
    to_sys(const local_time<Duration>& tp, choose z) const;

7 Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer
precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone. If the conversion from tp to a sys_time is ambiguous, returns the earlier sys_time if z ==
choose::earliest, and returns the later sys_time if z == choose::latest. If the tp represents a
non-existent time between two UTC time_points, then the two UTC time_points will be the same,
and that UTC time_point will be returned.

template<class Duration>
    local_time<common_type_t<Duration, seconds>>
    to_local(const sys_time<Duration>& tp) const;

8 Returns: The local_time associated with tp and this time_zone.
29.11.5.3 Non-member functions

bool operator==(const timeZone& x, const timeZone& y) noexcept;

Returns: x.name() == y.name().

strong_ordering operator<=>(const timeZone& x, const timeZone& y) noexcept;

Returns: x.name() <=> y.name().

29.11.6 Class template zoned_traits

namespace std::chrono {
    template<class T> struct zoned_traits {};
}

zoned_traits provides a means for customizing the behavior of zoned_time<Duration, TimeZonePtr> for the zoned_time default constructor, and constructors taking string_view. A specialization for const time_zone* is provided by the implementation:

namespace std::chrono {
    template<> struct zoned_traits<const time_zone*> {
        static const time_zone* default_zone();
        static const time_zone* locate_zone(string_view name);
    };
}

static const time_zone* default_zone();

Returns: std::chrono::locate_zone("UTC").

static const time_zone* locate_zone(string_view name);

Returns: std::chrono::locate_zone(name).

29.11.7 Class template zoned_time

29.11.7.1 Overview

namespace std::chrono {
    template<class Duration, class TimeZonePtr = const time_zone*> class zoned_time {
        using duration = common_type_t<Duration, seconds>;
        private:
            TimeZonePtr zone_;                     // exposition only
            sys_time<duration> tp_;                 // exposition only
            
            using traits = zoned_traits<TimeZonePtr>; // exposition only

        public:
            zoned_time();
            zoned_time(const zoned_time&); = default;
            zoned_time& operator=(const zoned_time&); = default;
            zoned_time(const sys_time<Duration>& st);
            explicit zoned_time(TimeZonePtr z);
            explicit zoned_time(string_view name);
            
            template<class Duration2>
            zoned_time(const zoned_time<Duration2, TimeZonePtr>& zt);
            zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
            zoned_time(string_view name, const sys_time<Duration>& st);
            zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
            zoned_time(string_view name, const local_time<Duration>& tp);
            zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
            zoned_time(string_view name, const local_time<Duration>& tp, choose c);

zoned_time represents a logical pairing of a time_zone and a time_point with precision Duration. zoned_time maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

If Duration is not a specialization of chrono::duration, the program is ill-formed.

Every constructor of zoned_time that accepts a string_view as its first parameter does not participate in class template argument deduction (12.2.2.9).
29.11.7.2 Constructors

zoned_time();
   Constraints: traits::default_zone() is a well-formed expression.
   Effects: Initializes zone_ with traits::default_zone() and default constructs tp_.

zoned_time(const sys_time<Duration>& st);
   Constraints: traits::default_zone() is a well-formed expression.
   Effects: Initializes zone_ with traits::default_zone() and tp_ with st.

explicit zoned_time(TimeZonePtr z);
   Preconditions: z refers to a time zone.
   Effects: Initializes zone_ with std::move(z) and default constructs tp_.

explicit zoned_time(string_view name);
   Constraints: traits::locate_zone(string_view{}) is a well-formed expression and zoned_time is constructible from the return type of traits::locate_zone(string_view{}).
   Effects: Initializes zone_ with traits::locate_zone(name) and default constructs tp_.

template<class Duration2>
    zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
   Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.
   Effects: Initializes zone_ with y.zone_ and tp_ with y.tp_.

zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
   Preconditions: z refers to a time zone.
   Effects: Initializes zone_ with std::move(z) and tp_ with st.

zoned_time(string_view name, const sys_time<Duration>& st);
   Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and st.
   Effects: Equivalent to construction with {traits::locate_zone(name), st}.

zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
   Constraints:
       is_convertible_v<
           decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>({})),
           sys_time<duration>>
       is true.
   Preconditions: z refers to a time zone.
   Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp).

zoned_time(string_view name, const local_time<Duration>& tp);
   Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and tp.
   Effects: Equivalent to construction with {traits::locate_zone(name), tp}.

zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
   Constraints:
       is_convertible_v<
           decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>({}, choose::earliest)),
           sys_time<duration>>
       is true.
   Preconditions: z refers to a time zone.
Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp, c).

zoned_time(string_view name, const local_time<Duration>& tp, choose c);

Constraints: zoned_time is constructible from the return type of traits::locate_zone(name), local_time<Duration>, and choose.

Effects: Equivalent to construction with {traits::locate_zone(name), tp, c}.

template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);

    Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

    Preconditions: z refers to a valid time zone.

    Effects: Initializes zone_ with std::move(z) and tp_ with y.tp_.

template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);

    Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.

    Preconditions: z refers to a valid time zone.

    Effects: Equivalent to construction with {z, y}.

[Note 1: The choose parameter has no effect. —end note]

template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);

    Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and the type zoned_time<Duration2, TimeZonePtr2>.

    Effects: Equivalent to construction with {traits::locate_zone(name), y}.

template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose c);

    Constraints: zoned_time is constructible from the return type of traits::locate_zone(name), the type zoned_time<Duration2, TimeZonePtr2>, and the type choose.

    Effects: Equivalent to construction with {traits::locate_zone(name), y, c}.

[Note 2: The choose parameter has no effect. —end note]

29.11.7.3 Member functions [time.zone.zonedtime.members]

    zoned_time& operator=(const sys_time<Duration>& st);

    Effects: After assignment, get_sys_time() == st. This assignment has no effect on the return value of get_time_zone().

    Returns: *this.

    zoned_time& operator=(const local_time<Duration>& lt);

    Effects: After assignment, get_local_time() == lt. This assignment has no effect on the return value of get_time_zone().

    Returns: *this.

operator sys_time<duration>() const;

    Returns: get_sys_time().

explicit operator local_time<duration>() const;

    Returns: get_local_time().

TimeZonePtr get_time_zone() const;

    Returns: zone_.

local_time<duration> get_local_time() const;

    Returns: zone_->to_local(tp_).
sys_time<duration> get_sys_time() const;

    Returns: tp_.

sys_info get_info() const;

    Returns: zone_->get_info(tp_).

29.11.7.4 Non-member functions

    template<class Duration1, class Duration2, class TimeZonePtr>
    bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
                    const zoned_time<Duration2, TimeZonePtr>& y);

    Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

    template<class charT, class traits, class Duration, class TimeZonePtr>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os,
                    const zoned_time<Duration, TimeZonePtr>& t);

    Effects: Equivalent to:
            return os << format(os.getloc(), STATICALLY_WIDEN("{:L%F %T %Z}"), t);

29.11.8 Class leap_second

29.11.8.1 Overview

    namespace std::chrono {
    class leap_second {
    public:
        leap_second(const leap_second&) = default;
        leap_second& operator=(const leap_second&) = default;
    // unspecified additional constructors
        constexpr sys_seconds date() const noexcept;
        constexpr seconds value() const noexcept;
    
    };
    }

    Objects of type leap_second representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

    [Example 1:]
            for (auto& l : get_tzdb().leap_seconds)
                if (l <= 2018y/March/17d)
                    cout << l.date() << " : " << l.value() << 'n';

    Produces the output:

    1972-07-01 00:00:00: 1s
    1973-01-01 00:00:00: 1s
    1974-01-01 00:00:00: 1s
    1975-01-01 00:00:00: 1s
    1976-01-01 00:00:00: 1s
    1977-01-01 00:00:00: 1s
    1978-01-01 00:00:00: 1s
    1979-01-01 00:00:00: 1s
    1980-01-01 00:00:00: 1s
    1981-07-01 00:00:00: 1s
    1982-07-01 00:00:00: 1s
    1983-07-01 00:00:00: 1s
    1985-07-01 00:00:00: 1s
    1988-01-01 00:00:00: 1s
    1990-01-01 00:00:00: 1s
    1991-01-01 00:00:00: 1s
    1992-07-01 00:00:00: 1s
    1993-07-01 00:00:00: 1s
29.11.8.2 Member functions

```cpp
constexpr sys_seconds date() const noexcept;
```

Returns: The date and time at which the leap second was inserted.

```cpp
constexpr seconds value() const noexcept;
```

Returns: \(+1\)s to indicate a positive leap second or \(-1\)s to indicate a negative leap second.

[Note 1: All leap seconds inserted up through 2019 were positive leap seconds. — end note]

29.11.8.3 Non-member functions

```cpp
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

Returns: \(x.date() == y.date()\).

```cpp
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
```

Returns: \(x.date() <=> y.date()\).

```cpp
template<class Duration>
constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: \(x.date() == y\).

```cpp
template<class Duration>
constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: \(x.date() < y\).

```cpp
template<class Duration>
constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: \(!y < x\).

```cpp
template<class Duration>
constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: \(y < x\).

```cpp
template<class Duration>
constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

Returns: \(!x < y\).

§ 29.11.8.3
template<class Duration>
constexpr bool operator>= (const sys_time<Duration>& x, const leap_second& y) noexcept;

Returns: !(x < y).

template<class Duration>
requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
constexpr auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;

Returns: x.date() <=> y.

29.11.9 Class time_zone_link

namespace std::chrono {
    class time_zone_link {
    public:
        time_zone_link(time_zone_link&&) = default;
        time_zone_link& operator=(time_zone_link&&) = default;

        // unspecified additional constructors

        string_view name() const noexcept;
        string_view target() const noexcept;
    };
}

A time_zone_link specifies an alternative name for a time_zone. time_zone_links are constructed when the time zone database is initialized.

29.11.9.2 Member functions

string_view name() const noexcept;

Returns: The alternative name for the time zone.

string_view target() const noexcept;

Returns: The name of the time_zone for which this time_zone_link provides an alternative name.

29.11.9.3 Non-member functions

bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;

Returns: x.name() == y.name().

strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;

Returns: x.name() <=> y.name().

29.12 Formatting

Each formatter (22.14.6) specialization in the chrono library (29.2) meets the Formatter requirements (22.14.6.1). The parse member functions of these formatters interpret the format specification as a chrono-format-spec according to the following syntax:

chrono-format-spec:
    fill-and-align|opt width|opt precision|opt L|opt chrono-specs|opt

chrono-specs:
    conversion-spec
    chrono-specs conversion-spec
    chrono-specs literal-char

literal-char:
    any character other than {, }, or %

conversion-spec:
    % modifier|opt type
    modifier: one of
    E 0
The productions fill-and-align, width, and precision are described in [22.14.2]. Giving a precision specification in the \texttt{chrono-format-spec} is valid only for \texttt{std::chrono::duration} types where the representation type Rep is a floating-point type. For all other Rep types, an exception of type \texttt{format_error} is thrown if the \texttt{chrono-format-spec} contains a precision specification. All ordinary multibyte characters represented by literal-char are copied unchanged to the output.

A formatting locale is an instance of \texttt{locale} used by a formatting function, defined as

\begin{itemize}
\item [(2.1)] the "C" locale if the \texttt{L} option is not present in \texttt{chrono-format-spec}, otherwise
\item [(2.2)] the locale passed to the formatting function if any, otherwise
\item [(2.3)] the global locale.
\end{itemize}

Each conversion specifier conversion-spec is replaced by appropriate characters as described in Table 97; the formats specified in ISO 8601:2004 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the formatted object does not contain the information the conversion specifier refers to, an exception of type \texttt{format_error} is thrown.

The result of formatting a \texttt{std::chrono::duration} instance holding a negative value, or an \texttt{hh_mm_ss} object \texttt{h} for which \texttt{h.is_negative()} is true, is equivalent to the output of the corresponding positive value, with a \texttt{STATICALLY-WIDEN<charT>("-")} character sequence placed before the replacement of the initial conversion specifier.

```
Example 1:

```
Table 97: Meaning of conversion specifiers (continued)

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%d</td>
<td>The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command %Od produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%D</td>
<td>Equivalent to %m/%d/%y.</td>
</tr>
<tr>
<td>%e</td>
<td>The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command %Oe produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%F</td>
<td>Equivalent to %Y-%m-%d.</td>
</tr>
<tr>
<td>%g</td>
<td>The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by 0.</td>
</tr>
<tr>
<td>%G</td>
<td>The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.</td>
</tr>
<tr>
<td>%h</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>%H</td>
<td>The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OH produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%I</td>
<td>The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OI produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%j</td>
<td>If the type being formatted is a specialization of duration, the decimal number of days without padding. Otherwise, the day of the year as a decimal number. Jan 1 is 001. If the result is less than three digits, it is left-padded with 0 to three digits.</td>
</tr>
<tr>
<td>%m</td>
<td>The month as a decimal number. Jan is 01. If the result is a single digit, it is prefixed with 0. The modified command %Om produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%M</td>
<td>The minute as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OM produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%n</td>
<td>A new-line character.</td>
</tr>
<tr>
<td>%p</td>
<td>The locale’s equivalent of the AM/PM designations associated with a 12-hour clock.</td>
</tr>
<tr>
<td>%q</td>
<td>The duration’s unit suffix as specified in 29.5.11.</td>
</tr>
<tr>
<td>%Q</td>
<td>The duration’s numeric value (as if extracted via .count()).</td>
</tr>
<tr>
<td>%r</td>
<td>The locale’s 12-hour clock time.</td>
</tr>
<tr>
<td>%s</td>
<td>Equivalent to %H:%M:%S.</td>
</tr>
<tr>
<td>%S</td>
<td>Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %OS produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%t</td>
<td>A horizontal-tab character.</td>
</tr>
<tr>
<td>%T</td>
<td>Equivalent to %H:%M:%S.</td>
</tr>
<tr>
<td>%u</td>
<td>The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %Ou produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%U</td>
<td>The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OU produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%V</td>
<td>The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OV produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%w</td>
<td>The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Ow produces the locale’s alternative representation.</td>
</tr>
</tbody>
</table>
### Table 97: Meaning of conversion specifiers (continued)

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%W</td>
<td>The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command <code>%OW</code> produces the locale's alternative representation.</td>
</tr>
<tr>
<td>%x</td>
<td>The locale's date representation. The modified command <code>%Ex</code> produces the locale's alternate date representation.</td>
</tr>
<tr>
<td>%X</td>
<td>The locale's time representation. The modified command <code>%EX</code> produces the locale's alternate time representation.</td>
</tr>
<tr>
<td>%y</td>
<td>The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command <code>%Oy</code> produces the locale's alternative representation. The modified command <code>%Ey</code> produces the locale's alternative representation of offset from <code>%EC</code> (year only).</td>
</tr>
<tr>
<td>%Y</td>
<td>The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command <code>%EY</code> produces the locale's alternative full year representation.</td>
</tr>
<tr>
<td>%z</td>
<td>The offset from UTC in the ISO 8601:2004 format. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands <code>%Ez</code> and <code>%Oz</code> insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%Z</td>
<td>The time zone abbreviation. If the time zone abbreviation is not available, an exception of type <code>format_error</code> is thrown.</td>
</tr>
</tbody>
</table>

7 If the `chrono-specs` is omitted, the chrono object is formatted as if by streaming it to `std::stringstream os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

```
[Example 3:

```c++
string s = format("{:=>8}", 42ms); // value of s is "====42ms"

-- end example]
```

8 **template<class Duration, class charT>**

```c++
struct formatter<chrono::sys_time<Duration>, charT>;
```

**Remarks:** If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted.

9 **template<class Duration, class charT>**

```c++
struct formatter<chrono::utc_time<Duration>, charT>;
```

**Remarks:** If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("UTC")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is `STATICALLY-WIDEN<charT>("60")`.

10 **template<class Duration, class charT>**

```c++
struct formatter<chrono::tai_time<Duration>, charT>;
```

**Remarks:** If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("TAI")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with `sys_time<Duration>(tp.time_since_epoch()) - (sys_days{1970y/January/1} - sys_days{1958y/January/1})`

11 **template<class Duration, class charT>**

```c++
struct formatter<chrono::gps_time<Duration>, charT>;
```

**Remarks:** If `%Z` is used, it is replaced with `STATICALLY-WIDEN<charT>("GPS")`. If `%z` (or a modified variant of `%z`) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

§ 29.12 1439
sys_time<Duration>{tp.time_since_epoch()} +
(sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})

template<class Duration, class charT>
struct formatter<chrono::file_time<Duration>, charT>;

Remarks: If %Z is used, it is replaced with \texttt{STATICALLY-WIDEN\langle charT\rangle\text{"UTC"}}. If %z (or a modified variant of \%z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a \texttt{sys_time} initialized with \texttt{clock_cast\langle system_clock\rangle\langle t\rangle}, or by a \texttt{utc_time} initialized with \texttt{clock_cast\langle utc_clock\rangle\langle t\rangle}, where \texttt{t} is the first argument to \texttt{format}.

template<class Duration, class charT>
struct formatter<chrono::local_time<Duration>, charT>;

Remarks: If %Z, %z, or a modified version of %z is used, an exception of type \texttt{format_error} is thrown.

template<class Duration> struct local-time-format-t {
  // exposition only
  local_time<Duration> time;
  // exposition only
  const string* abbrev;
  // exposition only
  const seconds* offset_sec;
};

template<class Duration>
local_time-format-t<Duration>
local_time_format(local_time<Duration> time, const string* abbrev = nullptr,
const seconds* offset_sec = nullptr);

Returns: \{time, abbrev, offset_sec\}.

template<class Duration, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>
  : formatter<chrono::local-time-format-t<Duration>, charT> {
  template<class FormatContext>
  typename FormatContext::iterator
  format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);
};

template<class FormatContext>
typename FormatContext::iterator
format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);

Effects: Equivalent to:

\begin{verbatim}
sys_info info = tp.get_info();
return formatter<chrono::local-time-format-t<Duration>, charT>::
  format((tp.get_local_time(), &info.abbrev, &info.offset), ctx);
\end{verbatim}

29.13 Parsing [time.parse]

1 Each \texttt{parse} overload specified in this subclause calls \texttt{from_stream} unqualified, so as to enable argument dependent lookup (6.5.4). In the following paragraphs, let \texttt{is} denote an object of type \texttt{basic_istream\langle charT, traits\rangle} and let \texttt{I} be \texttt{basic_istream\langle charT, traits\rangle\&}, where \texttt{charT} and \texttt{traits} are template parameters in that context.

2 \textit{Recommended practice}: Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by \texttt{parse} immovable and preventing stream extraction into an lvalue of such a manipulator type.
template<class charT, class Parsable>
  unspecified
  parse(const charT* fmt, Parsable& tp);

template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

Let $F$ be $fmt$ for the first overload and $fmt\.c\_str()$ for the second overload. Let $traits$ be $char\_traits<charT>$ for the first overload.

Constraints: The expression

$$\text{from\_stream(declval<basic\_istream<charT, traits>>&()), } F, \ tp$$

is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression $is >> parse(fmt, tp)$ has type $I$, has value $is$, and calls $\text{from\_stream(is, } F, \ tp)$.

template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const charT* fmt, Parsable& tp, basic_string<charT, traits, Alloc>& abbrev);

template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp, basic_string<charT, traits, Alloc>& abbrev);

Let $F$ be $fmt$ for the first overload and $fmt\.c\_str()$ for the second overload.

Constraints: The expression

$$\text{from\_stream(declval<basic\_istream<charT, traits>>&()), } F, \ tp, \ \text{addressof(abbrev)}$$

is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression $is >> parse(fmt, tp, abbrev)$ has type $I$, has value $is$, and calls $\text{from\_stream(is, } F, \ tp, \ \text{addressof(abbrev)})$.

template<class charT, class Parsable>
  unspecified
  parse(const charT* fmt, Parsable& tp, minutes& offset);

template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp, minutes& offset);

Let $F$ be $fmt$ for the first overload and $fmt\.c\_str()$ for the second overload. Let $traits$ be $char\_traits<charT>$ and $Alloc$ be $\text{allocator}<charT>$ for the first overload.

Constraints: The expression

$$\text{from\_stream(declval<basic\_istream<charT, traits>>&()), } F, \ tp,$$

$$\text{declval<basic\_string<charT, traits, Alloc>>&(), }&\text{static\_cast<basic\_string<charT, traits, Alloc>&>(nullptr), }&\text{offset})$$

is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression $is >> parse(fmt, tp, offset)$ has type $I$, has value $is$, and calls:

$$\text{from\_stream(is, } F, \ tp,$$

$$\text{static\_cast<basic\_string<charT, traits, Alloc>&>(nullptr), }&\text{offset})$$

template<class charT, class traits, class Alloc, class Parsable>
  unspecified
  parse(const charT* fmt, Parsable& tp, basic_string<charT, traits, Alloc>& abbrev, minutes& offset);
Let $F$ be $\text{fmt}$ for the first overload and $\text{fmt}.\text{c_str}()$ for the second overload.

Constraints: The expression

$$\text{from_stream(declval<basic_istream<charT, traits>&>(), F, tp, addressof(abbrev), &offset)}$$

is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression $\text{is} >> \text{parse}(\text{fmt}, \text{tp}, \text{abbrev}, \text{offset})$ has type $I$, has value $\text{is}$, and calls $\text{from_stream(is, F, tp, addressof(abbrev), koffset)}$.

All $\text{from_stream}$ overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to $\text{basic_istream<>::gcount()}$. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%`. Some flags can be modified by E or O. During parsing each flag interprets characters as parts of date and time types according to Table 98. Some flags can be modified by a width parameter given as a positive decimal integer called out as $N$ below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 98, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

If the type being parsed cannot represent the information that the format flag refers to, $\text{is.setstate(ios_-_base::failbit)}$ is called.

[Example 1: A duration cannot represent a weekday. — end example]

However, if a flag refers to a “time of day” (e.g. `%H`, `%I`, `%p`, etc.), then a specialization of duration is parsed as the time of day elapsed since midnight.

If the $\text{from_stream}$ overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, $\text{setstate(ios_-_base::failbit)}$ is called on the $\text{basic_istream}$.

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>%a</code></td>
<td>The locale’s full or abbreviated case-insensitive weekday name.</td>

29.14 Header `<ctime>` synopsis

```cpp
#include <ctime>

#define NULL see 17.2.3
#define CLOCKS_PER_SEC see below
#define TIME_UTC see below

namespace std {

    using size_t = see 17.2.4;
    using clock_t = see below;
    using time_t = see below;

    struct timespec;
    struct tm;

    clock_t clock();
    double difftime(time_t time1, time_t time0);
    time_t mktime(const tm* timeptr);
    time_t time(time_t* timer);
    int timespec_get(timespec* ts, int base);
    char* asctime(const tm* timeptr);
    char* ctime(const time_t* timer);
    tm* gmtime(const time_t* timer);
    tm* localtime(const time_t* timer);
    size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}
```

1 The contents of the header `<ctime>` are the same as the C standard library header `<time.h>`.\(^{245}\)

---

\(^{245}\) `strftime` supports the C conversion specifiers C, D, E, F, G, h, r, R, t, T, u, V, and z, and the modifiers E and O.
The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (16.4.6.10).

30 Localization library

30.1 General

This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 99.

    // 30.4.8, message retrieval
    class messages_base;
    template<class charT> class messages;
    template<class charT> class messages_byname;
}

1 The header `<locale>` defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.\[246\]

30.3 Locales

30.3.1 Class locale

30.3.1.1 General

namespace std {
    class locale {
        public:
            // types
            class facet;
            class id;
            using category = int;
            static const category // values assigned here are for exposition only
                none = 0,
                collate = 0x010, ctype = 0x020,
                monetary = 0x040, numeric = 0x080,
                time = 0x100, messages = 0x200,
                all = collate | ctype | monetary | numeric | time | messages;

            // construct/copy/destroy
            locale() noexcept;
            locale(const locale& other) noexcept;
            explicit locale(const char* std_name);
            explicit locale(const string& std_name);
            locale(const locale& other, const char* std_name, category);

\[246\] In this subclause, the type name `tm` is an incomplete type that is defined in `<ctime>` (29.14).
locale(const locale& other, const string& std_name, category);
template<class Facet> locale(const locale& other, Facet* f);
locale(const locale& other, const locale& one, category);
~locale(); // not virtual
const locale& operator=(const locale& other) noexcept;
template<class Facet> locale combine(const locale& other) const;

// locale operations
string name() const;

bool operator==(const locale& other) const;
template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
                const basic_string<charT, traits, Allocator>& s2) const;

// global locale objects
static locale global(const locale&);
static const locale& classic();

Class `locale` implements a type-safe polymorphic set of facets, indexed by facet type. In other words, a facet has a dual role: in one sense, it's just a class interface; at the same time, it's an index into a locale's set of facets.

Access to the facets of a `locale` is via two function templates, `use_facet<>` and `has_facet<>`.

[Example 1: An iostream operator<< can be implemented as:

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& operator<< (basic_ostream<charT, traits>& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
        tm tmbuf; d.extract(tmbuf);
        bool failed =
            use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc()).put(s, s, s.fill(), &tmbuf, 'x').failed();
        if (failed)
            s.setstate(s.badbit); // can throw
    }
    return s;
}
```

—end example]

In the call to `use_facet<Facet>(loc)`, the type argument chooses a facet, making available all members of the named type. If `Facet` is not present in a locale, it throws the standard exception `bad_cast`. A C++ program can check if a locale implements a particular facet with the function template `has_facet<Facet>()`. User-defined facets may be installed in a locale, and used identically as may standard facets.

[Note 1: All locale semantics are accessed via `use_facet<>` and `has_facet<>`, except that:

(5.1) A member operator template

```cpp
operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)
```

is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

(5.2) Convenient global interfaces are provided for traditional `ctype` functions such as `isdigit()` and `isspace()`, so that given a locale object `loc` a C++ program can call `isspace(c, loc)`. (This eases upgrading existing extractors (31.7.4.3).)

—end note]

Once a facet reference is obtained from a locale object by calling `use_facet<>`, that reference remains usable, and the results from member functions of it may be cached and re-used, as long as some locale object refers to that facet.

247) Note that in the call to `put`, the stream is implicitly converted to an `ostreambuf_iterator<charT, traits>`. 

§ 30.3.1.1
In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

A locale constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "*".

Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

### 30.3.1.2 Types

#### 30.3.1.2.1 Type `locale::category`

```cpp
using category = int;
```

Valid category values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

```
(collate | ctype | monetary | numeric | time | messages | all) == all
```

is `true`, and represents the union of all categories. Further, the expression `(X | Y)`, where `X` and `Y` each represent a single category, represents the union of the two categories.

`locale` member functions expecting a `category` argument require one of the category values defined above, or the union of two or more such values. Such a category value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 100.

<table>

</tr>
<tr>
<td><code>messages</code></td>
<td><code>messages&lt;char&gt;</code>, <code>messages&lt;wchar_t&gt;</code></td>
</tr>
</tbody>
</table>

For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 100, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 101.

The provided implementation of members of facets `num_get<charT>` and `num_put<charT>` calls `use_facet<F>(1)` only for facet `F` of types `numpunct<charT>` and `ctype<charT>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the `Cpp17InputIterator` requirements or

</tbody>
</table>

*Cp17OutputIterator* requirements, respectively (25.3). A template parameter with name *C* represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

### 30.3.1.2.2 Class `locale::facet`

```cpp
namespace std {
    class locale::facet {
        protected:
            explicit facet(size_t refs = 0);
            virtual ~facet();
            facet(const facet&) = delete;
            void operator=(const facet&) = delete;
    };
}
```

1. Class `facet` is the base class for locale feature sets. A class is a `facet` if it is publicly derived from another facet, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:248

   ```cpp
   static ::std::locale::id id;
   ```

2. Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is *not* a facet, or a type that refers to a volatile-qualified facet, as an (explicit or deduced) template parameter to a locale function expecting a facet, is ill-formed. A const-qualified facet is a valid template argument to any locale function that expects a `Facet` template parameter.

3. The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4. Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are *explicit*, preventing their participation in implicit conversions.

---

248 This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.
For some standard facets a standard “...byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “...byname” version of a facet, the base class implements named locale semantics itself by reference to other facets.

### 30.3.1.2.3 Class `locale::id`

```cpp
namespace std {
    class locale::id {
        public:
            id();
            void operator=(const id&) = delete;
            id(const id&) = delete;
    };
}
```

1. The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

2. [Note 1: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet’s id member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2). — end note]

### 30.3.1.3 Constructors and destructor

```cpp
locale() noexcept;
```

1. **Effects:** Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

   [Note 1: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. — end note]

```cpp
explicit locale(const char* std_name);
```

2. **Effects:** Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

3. **Throws:** `runtime_error` if the argument is not valid, or is null.

4. **Remarks:** The set of valid string argument values is "C", ",", and any implementation-defined values.

```cpp
explicit locale(const string& std_name);
```

5. **Effects:** The same as `locale(std_name.c_str())`.

```cpp
locale(const locale& other, const char* std_name, category);
```

6. **Effects:** Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

7. **Throws:** `runtime_error` if the argument is not valid, or is null.

8. **Remarks:** The locale has a name if and only if `other` has a name.

```cpp
locale(const locale& other, const string& std_name, category cat);
```

9. **Effects:** The same as `locale(other, std_name.c_str(), cat)`.

```cpp
template<class Facet> locale(const locale& other, Facet* f);
```

10. **Effects:** Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

11. **Remarks:** The resulting locale has no name.
locale(const locale& other, const locale& one, category cats);

**Effects**: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.

**Remarks**: The resulting locale has a name if and only if the first two arguments have names.

const locale& operator=(const locale& other) noexcept;

**Effects**: Creates a copy of other, replacing the current value.

**Returns**: *this.

30.3.1.4 Members

template<class Facet> locale combine(const locale& other) const;

**Effects**: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.

**Returns**: The newly created locale.

**Throws**: runtime_error if has_facet<Facet>(other) is false.

**Remarks**: The resulting locale has no name.

string name() const;

**Returns**: The name of *this, if it has one; otherwise, the string "*".

30.3.1.5 Operators

bool operator==(const locale& other) const;

**Returns**: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1, const basic_string<charT, traits, Allocator>& s2) const;

**Effects**: Compares two strings according to the collate<charT> facet.

**Returns**:

use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(), 
   s2.data(), s2.data() + s2.size()) < 0

**Remarks**: This member operator template (and therefore locale itself) meets the requirements for a comparator predicate template argument (Clause 27) applied to strings.

[Example 1: A vector of strings v can be collated according to collation rules in locale loc simply by (27.8.2, 24.3.11):

std::sort(v.begin(), v.end(), loc);
—end example]

30.3.1.6 Static members

static locale global(const locale& loc);

**Effects**: Sets the global locale to its argument. Causes future calls to the constructor locale() to return a copy of the argument. If the argument has a name, does

setlocale(LC_ALL, loc.name().c_str());

otherwise, the effect on the C locale, if any, is implementation-defined.

**Returns**: The previous value of locale().

**Remarks**: No library function other than locale::global() affects the value returned by locale().

[Note 1: See 30.5 for data race considerations when setlocale is invoked. — end note]
static const locale& classic();

The "C" locale.

Returns: A locale that implements the classic "C" locale semantics, equivalent to the value locale("C").

Remarks: This locale, its facets, and their member functions, do not change with time.

30.3.2 locale globals

template<class Facet> const Facet& use_facet(const locale& loc);

Mandates: Facet is a facet class whose definition contains the public static member id as defined in 30.3.1.2.2.

Returns: A reference to the corresponding facet of loc, if present.

Throws: bad_cast if has_facet<Facet>(loc) is false.

Remarks: The reference returned remains valid at least as long as any copy of loc exists.

template<class Facet> bool has_facet(const locale& loc) noexcept;

Returns: true if the facet requested is present in loc; otherwise false.

30.3.3 Convenience interfaces

30.3.3.1 Character classification

template<class charT> bool isspace (charT c, const locale& loc);
template<class charT> bool isprint (charT c, const locale& loc);
template<class charT> bool iscntrl (charT c, const locale& loc);
template<class charT> bool isupper (charT c, const locale& loc);
template<class charT> bool islower (charT c, const locale& loc);
template<class charT> bool isalpha (charT c, const locale& loc);
template<class charT> bool isdigit (charT c, const locale& loc);
template<class charT> bool ispunct (charT c, const locale& loc);
template<class charT> bool isxdigit (charT c, const locale& loc);
template<class charT> bool isalnum (charT c, const locale& loc);
template<class charT> bool isgraph (charT c, const locale& loc);
template<class charT> bool isblank (charT c, const locale& loc);

Each of these functions isF returns the result of the expression:

use_facet<ctype<charT>>(loc).is(ctype_base::F, c)

where F is the ctype_base::mask value corresponding to that function (30.4.2).

30.3.3.2 Character conversions

template<class charT> charT toupper (charT c, const locale& loc);
template<class charT> charT tolower (charT c, const locale& loc);

Returns: use_facet<ctype<charT>>(loc).toupper(c).

Returns: use_facet<ctype<charT>>(loc).tolower(c).

30.4 Standard locale categories

30.4.1 General

Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users’ iostream operators << and >>, as members put() and get(), respectively. Each such member function takes an ios_base& argument whose members flags(), precision(), and width(), specify the format of the corresponding datum (31.5.2). Those functions which need to use other facets call its member getloc() to retrieve the locale imbued there. Formatting facets use the character argument fill to fill out the specified width where necessary.

The put() members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The get() members take an ios_base::iostate& argument whose value they ignore, but set to ios_base::failbit in case of a parse error.

249) When used in a loop, it is faster to cache the ctype<> facet and use it directly, or use the vector form of ctype<>::is.
Within subclause 30.4 it is unspecified whether one virtual function calls another virtual function.

### 30.4.2 The ctype category

#### 30.4.2.1 General

```cpp
namespace std {
    class ctype_base {
    public:
        using mask = see below;

        // numeric values are for exposition only.
        static const mask space = 1 << 0;
        static const mask print = 1 << 1;
        static const mask cntrl = 1 << 2;
        static const mask upper = 1 << 3;
        static const mask lower = 1 << 4;
        static const mask alpha = 1 << 5;
        static const mask digit = 1 << 6;
        static const mask punct = 1 << 7;
        static const mask xdigit = 1 << 8;
        static const mask blank = 1 << 9;
        static const mask alnum = alpha | digit;
        static const mask graph = alnum | punct;
    }
}
```

1 The type `mask` is a bitmask type (16.3.3.3.4).

#### 30.4.2.2 Class template ctype

```cpp
namespace std {
    template<class charT>
    class ctype : public locale::facet, public ctype_base {
    public:
        using char_type = charT;

        explicit ctype(size_t refs = 0);

        bool is(mask m, charT c) const;
        const charT* is(const charT* low, const charT* high, mask* vec) const;
        const charT* scan_is(mask m, const charT* low, const charT* high) const;
        const charT* scan_not(mask m, const charT* low, const charT* high) const;
        charT toupper(charT c) const;
        const charT* toupper(charT* low, const charT* high) const;
        charT tolower(charT c) const;
        const charT* tolower(charT* low, const charT* high) const;
        charT widen(char c) const;
        const char* widen(const char* low, const char* high, charT* to) const;
        char narrow(charT c, char dfault) const;
        const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

        static locale::id id;
    protected:
        ~ctype();
        virtual bool do_is(mask m, charT c) const;
        virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
        virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
        virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
        virtual charT do_toupper(charT) const;
        virtual const charT* do_toupper(charT* low, const charT* high) const;
        virtual charT do_tolower(charT) const;
        virtual const charT* do_tolower(charT* low, const charT* high) const;
    }
```
Class `ctype` encapsulates the C library `<cctype>` features. `istream` members are required to use `ctype<>` for character classing during input parsing.

The specializations required in Table 100 (30.3.1.2.1), namely `ctype<char>` and `ctype<wchar_t>`, implement character classing appropriate to the implementation’s native character set.

### 30.4.2.2.2 ctype members

```cpp
bool is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```cpp
const charT* scan_is(mask m, const charT* low, const charT* high) const;
const charT* scan_not(mask m, const charT* low, const charT* high) const;
```

Returns: The smallest pointer `p` in the range `[low, high)` such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```cpp
charT toupper(charT c) const;
const charT* toupper(charT* low, const charT* high) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```cpp
charT widen(char c) const;
const char* widen(const char* low, const char* high, charT* to) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```cpp
char narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

### 30.4.2.2.3 ctype virtual functions

```cpp
bool do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```cpp
const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
```

Returns: The smallest pointer `p` in the range `[low, high)` such that `is(m, *p)` would return `true`; otherwise, returns `high`.

```cpp
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.

```cpp
char do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* to) const;
```

Returns: The first form returns the result of the expression `(M & m) != 0`; i.e., `true` if the character has the characteristics specified. The second form returns `high`.
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;

Effects: Converts a character or characters to upper case. The second form replaces each character *p in the range [low, high) for which a corresponding upper-case character exists, with that character.

Returns: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns high.

charT do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;

Effects: Converts a character or characters to lower case. The second form replaces each character *p in the range [low, high) and for which a corresponding lower-case character exists, with that character.

Returns: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns high.

charT do_widen(char c) const;
const char* do_widen(const char* low, const char* high, charT* dest) const;

Effects: Applies the simplest reasonable transformation from a char value or sequence of char values to the corresponding charT value or values.\(^{250}\) The only characters for which unique transformations are required are those in the basic character set (5.3).

For any named ctype category with a ctype<charT> facet ctc and valid ctype_base::mask value M, (ctc.is(M, c) || !is(M, do_widen(c))) is true.\(^{251}\) The second form transforms each character *p in the range [low, high), placing the result in dest[p - low].

Returns: The first form returns the transformed value. The second form returns high.

char do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;

Effects: Applies the simplest reasonable transformation from a charT value or sequence of charT values to the corresponding char value or values. For any character c in the basic character set (5.3) the transformation is such that do_widen(do_narrow(c, 0)) == c

For any named ctype category with a ctype<char> facet ctc however, and ctype_base::mask value M,

(is(M, c) || !ctc.is(M, do_narrow(c, dfault)))

is true (unless do_narrow returns dfault). In addition, for any digit character c, the expression (do_narrow(c, dfault) - '0') evaluates to the digit value of the character. The second form transforms each character *p in the range [low, high), placing the result (or dfault if no simple transformation is readily available) in dest[p - low].

Returns: The first form returns the transformed value; or dfault if no mapping is readily available. The second form returns high.

30.4.2.3 Class template ctype_byname

namespace std {

    template<class charT>
    class ctype_byname : public ctype<charT> { public:
        using mask = typename ctype<charT>::mask;
        explicit ctype_byname(const char*, size_t refs = 0);
        explicit ctype_byname(const string&, size_t refs = 0);

    protected:
        ~ctype_byname();

    private:

250) The parameter c of do_widen is intended to accept values derived from character-literals for conversion to the locale’s encoding.
251) In other words, the transformed character is not a member of any character classification that c is not also a member of.
30.4.2.4 `ctype<char>` specialization

30.4.2.4.1 General

```cpp
namespace std {
    template<>
    class ctype<char> : public locale::facet, public ctype_base {
        using char_type = char;
        explicit ctype(const mask* tab = nullptr, bool del = false, size_t refs = 0);

        bool is(mask m, char c) const;
        const char* is(const char* low, const char* high, mask* vec) const;
        const char* scan_is (mask m, const char* low, const char* high) const;
        const char* scan_not(mask m, const char* low, const char* high) const;

        char toupper(char c) const;
        const char* toupper(char* low, const char* high) const;
        char tolower(char c) const;
        const char* tolower(char* low, const char* high) const;
        char widen(char c) const;
        const char* widen(const char* low, const char* high, char* to) const;
        char narrow(char c, char dfault) const;
        const char* narrow(const char* low, const char* high, char dfault, char* to) const;

        static locale::id id;
        static const size_t table_size = implementation-defined;
        const mask* table() const noexcept;
        static const mask* classic_table() noexcept;
    };
}
```

1 A specialization `ctype<char>` is provided so that the member functions on type `char` can be implemented inline.\(^{252}\) The implementation-defined value of member `table_size` is at least 256.

30.4.2.4.2 Destructor

```cpp
~ctype();
```

1 *Effects*: If the constructor’s first argument was nonzero, and its second argument was `true`, does delete `[]` table().

---

\(^{252}\) Only the `char` (not `unsigned char` and `signed char`) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for `ctype<char>`.
30.4.2.4.3 Members

In the following member descriptions, for unsigned char values v where v >= table_size, table()[v] is assumed to have an implementation-specific value (possibly different for each such value v) without performing the array lookup.

```cpp
explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);
```

**Preconditions:** Either tbl == nullptr is true or [tbl, tbl+table_size) is a valid range.

**Effects:** Passes its refs argument to its base class constructor.

```cpp
bool is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;
```

**Effects:** The second form, for all *p in the range [low, high), assigns into vec[p - low] the value table()[(unsigned char)*p].

**Returns:** The first form returns table()[(unsigned char)c] & m; the second form returns high.

```cpp
const char* scan_is(mask m, const char* low, const char* high) const;
```

**Returns:** The smallest p in the range [low, high) such that table()[(unsigned char) *p] & m is true.

```cpp
const char* scan_not(mask m, const char* low, const char* high) const;
```

**Returns:** The smallest p in the range [low, high) such that table()[(unsigned char) *p] & m is false.

```cpp
char toupper(char c) const;
const char* toupper(char* low, const char* high) const;
```

**Returns:** do_toupper(c) or do_toupper(low, high), respectively.

```cpp
char tolower(char c) const;
const char* tolower(char* low, const char* high) const;
```

**Returns:** do_tolower(c) or do_tolower(low, high), respectively.

```cpp
char widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;
```

**Returns:** do_widen(c) or do_widen(low, high, to), respectively.

```cpp
char narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char* to) const;
```

**Returns:** do_narrow(c, dfault) or do_narrow(low, high, dfault, to), respectively.

```cpp
const mask* table() const noexcept;
```

**Returns:** The first constructor argument, if it was nonzero, otherwise classic_table().

30.4.2.4.4 Static members

```cpp
static const mask* classic_table() noexcept;
```

**Returns:** A pointer to the initial element of an array of size table_size which represents the classifications of characters in the "C" locale.

30.4.2.4.5 Virtual functions

```cpp
char do_toupper(char) const;
const char* do_toupper(char* low, const char* high) const;
char do_tolower(char) const;
const char* do_tolower(char* low, const char* high) const;
```
virtual char  do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char  do_narrow(char c, char dfault) const;
virtual const char* do_narrow(const char* low, const char* high,
  char dfault, char* to) const;

1 These functions are described identically as those members of the same name in the ctype class template (30.4.2.2.2).

30.4.2.5  Class template codecvt

30.4.2.5.1 General

namespace std {

  class codecvt_base {

    public:

    enum result { ok, partial, error, noconv };  
  
  };

  template<class internT, class externT, class stateT>
  class codecvt : public locale::facet, public codecvt_base {

    public:

    using intern_type = internT;
    using extern_type = externT;
    using state_type = stateT;

    explicit codecvt(size_t refs = 0);

    result out(
      stateT& state,
      const internT* from, const internT* from_end, const internT*& from_next,
      externT* to,     externT* to_end,     externT*& to_next) const;

    result unshift(
      stateT& state,
      externT* to,     externT* to_end,     externT*& to_next) const;

    result in(
      stateT& state,
      const externT* from, const externT* from_end, const externT*& from_next,
      internT* to,      internT* to_end,      internT*& to_next) const;

    int encoding() const noexcept;
    bool always_noconv() const noexcept;
    int length(stateT& state, const externT* from, const externT* end, size_t max) const;

    static locale::id id;

  };

  protected:

  ~codecvt();

  virtual result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to,     externT* to_end,     externT*& to_next) const;

  virtual result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to,      internT* to_end,      internT*& to_next) const;

  virtual result do_unshift(
    stateT& state,
    externT* to,     externT* to_end,     externT*& to_next) const;

  virtual int do_encoding() const noexcept;

  virtual bool do_always_noconv() const noexcept;

  virtual int do_length(stateT& state, const externT* from, const externT* end, size_t max) const;

  };
The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

The `stateT` argument selects the pair of character encodings being mapped between.

The specializations required in Table 100 (30.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

### 30.4.2.5.2 Members

#### result out

```cpp
result out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;
```

Returns: `do_out(state, from, from_end, from_next, to, to_end, to_next)` const;

### result unshift

```cpp
result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;
```

Returns: `do_unshift(state, to, to_end, to_next)` const;

### result in

```cpp
result in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
```

Returns: `do_in(state, from, from_end, from_next, to, to_end, to_next)` const;

### int encoding

```cpp
int encoding() const noexcept;
```

Returns: `do_encoding()`.

### bool always_noconv

```cpp
bool always_noconv() const noexcept;
```

Returns: `do_always_noconv()`.

### int length

```cpp
int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;
```

Returns: `do_length(state, from, from_end, max)`.

### int max_length

```cpp
int max_length() const noexcept;
```

Returns: `do_max_length()`.

### 30.4.2.5.3 Virtual functions

#### result do_out

```cpp
result do_out(
    stateT& state,
    const internT* from, const internT* from_end, const internT*& from_next,
    externT* to, externT* to_end, externT*& to_next) const;
```

#### result do_in

```cpp
result do_in(
    stateT& state,
    const externT* from, const externT* from_end, const externT*& from_next,
    internT* to, internT* to_end, internT*& to_next) const;
```

Preconditions: `(from <= from_end && to <= to_end)` is well-defined and true; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.
Effects: Translates characters in the source range [from, from_end), placing the results in sequential positions starting at destination to. Converts no more than (from_end - from) source elements, and stores no more than (to_end - to) destination elements.

3 Stops if it encounters a character it cannot convert. It always leaves the from_next and to_next pointers pointing one beyond the last element successfully converted. If returns noconv, internT and externT are the same type and the converted sequence is identical to the input sequence [from, from_next). to_next is set equal to to, the value of state is unchanged, and there are no changes to the values in [to, to_end).

4 A codecvt facet that is used by basic_filebuf (31.10) shall have the property that if
   do_out(state, from, from_end, from_next, to, to_end, to_next)
would return ok, where from != from_end, then
   do_out(state, from, from + 1, from_next, to, to_end, to_next)
shall also return ok, and that if
   do_in(state, from, from_end, from_next, to, to_end, to_next)
would return ok, where to != to_end, then
   do_in(state, from, from_end, from_next, to, +1, to_next)
shall also return ok.253

[Note 1: As a result of operations on state, it can return ok or partial and set from_next == from and to_next != to. —end note]

Returns: An enumeration value, as summarized in Table 102.

Table 102: do_in/do_out result values  [tab:locale.codecvt.inout]

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the conversion</td>
</tr>
<tr>
<td>partial</td>
<td>not all source characters converted</td>
</tr>
<tr>
<td>error</td>
<td>encountered a character in [from, from_end) that cannot be converted</td>
</tr>
<tr>
<td>noconv</td>
<td>internT and externT are the same type, and input sequence is identical to converted sequence</td>
</tr>
</tbody>
</table>

A return value of partial, if (from_next == from_end), indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

Remarks: Its operations on state are unspecified.

[Note 2: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets. —end note]

result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

Preconditions: (to <= to_end) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

Effects: Places characters starting at to that should be appended to terminate a sequence when the current stateT is given by state.254 Stores no more than (to_end - to) destination elements, and leaves the to_next pointer pointing one beyond the last element successfully stored.

Returns: An enumeration value, as summarized in Table 103.

253) Informally, this means that basic_filebuf assumes that the mappings from internal to external characters is 1 to N: that a codecvt facet that is used by basic_filebuf can translate characters one internal character at a time.

254) Typically these will be characters to return the state to stateT().

§ 30.4.2.5.3 1461
Table 103: \texttt{do\_unshift} result values
tab:locale.codecvt.unshift

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{ok}</td>
<td>completed the sequence</td>
</tr>
<tr>
<td>\texttt{partial}</td>
<td>space for more than \texttt{to_end} - \texttt{to} destination elements was needed to terminate a sequence given the value of \texttt{state}</td>
</tr>
<tr>
<td>\texttt{error}</td>
<td>an unspecified error has occurred</td>
</tr>
<tr>
<td>\texttt{noconv}</td>
<td>no termination is needed for this \texttt{state_type}</td>
</tr>
</tbody>
</table>

\begin{verbatim}
int do_encoding() const noexcept;

Returns: \(-1\) if the encoding of the \texttt{externT} sequence is state-dependent; else the constant number of \texttt{externT} characters needed to produce an internal character; or \(0\) if this number is not a constant.\(^{255}\)

bool do_always_noconv() const noexcept;

Returns: \texttt{true} if \texttt{do\_in()} and \texttt{do\_out()} return \texttt{noconv} for all valid argument values. \texttt{codecvt<char, char, mbstate\_t>} returns \texttt{true}.

int do_length(stateT& state, const externT* from, const externT* from\_end, size\_t max) const;

Preconditions: \((from \leq from\_end)\) is well-defined and \texttt{true}; \texttt{state} is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

Effects: The effect on the \texttt{state} argument is as if it called \texttt{do\_in(state, from, from\_end, from, to, to+max, to)} for to pointing to a buffer of at least \texttt{max} elements.

Returns: \((from\_next-from)\) where \(from\_next\) is the largest value in the range \([from, from\_end)\) such that the sequence of values in the range \([from, from\_next)\) represents \texttt{max} or fewer valid complete characters of type \texttt{internT}. The specialization \texttt{codecvt<char, char, mbstate\_t>\_do\_max\_length()} returns the lesser of \texttt{max} and \((from\_end-from)\).

int do_max_length() const noexcept;

Returns: The maximum value that \texttt{do\_length(state, from, from\_end, 1)} can return for any valid range \([from, from\_end)\) and \texttt{state\_t} value \texttt{state}. The specialization \texttt{codecvt<char, char, mbstate\_t>\_do\_max\_length()} returns \(1\).
\end{verbatim}

30.4.2.6 Class template \texttt{codecvt\_byname} [locale.codecvt.byname]

namespace std {
    template<class internT, class externT, class stateT>
    class codecvt\_byname : public codecvt<internT, externT, stateT> {
        public:
            explicit codecvt\_byname(const char*, size\_t refs = 0);
            explicit codecvt\_byname(const string&, size\_t refs = 0);

        protected:
            -codecvt\_byname();
        }
    }

30.4.3 The numeric category [category.numeric]
30.4.3.1 General [category.numeric.general]

1 The classes \texttt{num\_get<>} and \texttt{num\_put<>} handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.\(^{256}\)

\begin{verbatim}
255\) If \texttt{encoding()} yields \(-1\), then more than \texttt{max\_length()} \texttt{externT} elements can be consumed when producing a single \texttt{internT} character, and additional \texttt{externT} elements can appear at the end of a sequence after those that yield the final \texttt{internT} character.\(^{256}\) Parsing \("-1"\) correctly into, e.g., an \texttt{unsigned short} requires that the corresponding member \texttt{get()} at least extract the sign before delegating.

\section{§ 30.4.3.1}{1462}

2 All specifications of member functions for **num_put** and **num_get** in the subclauses of 30.4.3 only apply to the specializations required in Tables 100 and 101 (30.3.1.2.1), namely **num_get<**`char`>**, **num_get<wchar_t>`**, **num_-**`get<C, InputIterator>`**, **num_put<`char`>**, **num_put<wchar_t>`**, and **num_put<C, OutputIterator>`**. These specializations refer to the **ios_base<`b`** argument for formatting specifications (30.4), and to its imbued locale for the **numpunct<>** facet to identify all numeric punctuation preferences, and also for the **ctype<>** facet to perform character classification. 

3 Extractor and inserter members of the standard iostreams use **num_get<>** and **num_put<>** member functions for formatting and parsing numeric values (31.7.4.3.1, 31.7.5.3.1).

### 30.4.3.2 Class template **num_get**

**[locale.num.get]**

#### 30.4.3.2.1 General

**[locale.num.get.general]**

```cpp
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit num_get(size_t refs = 0);

            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, bool& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned short& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned int& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, unsigned long long& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, float& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, long double& v) const;
            iter_type get(iter_type in, iter_type end, ios_base&,
                          ios_base::iostate& err, void*& v) const;

            static locale::id id;

            protected:
            ~num_get();
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, bool& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, long long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, unsigned short& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, unsigned int& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, unsigned long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, unsigned long long& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, float& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, double& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, long double& v) const;
            virtual iter_type do_get(iter_type in, iter_type end, ios_base&,
                                       ios_base::iostate& err, void*& v) const;

        protected:
            ~num_get();
    }
}
```

§ 30.4.3.2.1 1463
The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

### 30.4.3.2.2 Members

```cpp
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate& err, float& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate& err, double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate& err, long double& v) const;
virtual iter_type do_get(iter_type, iter_type, ios_base&, ios_base::iostate& err, void*& v) const;
};
```

1 The facet `num_get` is used to parse numeric values from an input sequence such as an istream.

### 30.4.3.2.3 Virtual functions

```cpp
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, bool& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned short& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned int& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned long long& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, float& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, void*& val) const;
```

1 Returns: `do_get(in, end, str, err, val)`.

### 30.4.3.2.3 Virtual functions

```cpp
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, long double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, void*& val) const;
```

1 Effects: Reads characters from `in`, interpreting them according to `str.flags()`, `use_facet<ctype<charT> >(loc)`, and `use_facet<numpunct<charT> >(loc)`, where `loc` is `str.getloc()`.

2 The details of this operation occur in three stages.
Stage 1: Determine a conversion specifier

Stage 2: Extract characters from in and determine a corresponding char value for the format expected by the conversion specification determined in stage 1.

Stage 3: Store results

The details of the stages are presented below.

**Stage 1:** The function initializes local variables via

```c
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 104. The table is ordered. That is, the first line whose condition is true applies.

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == oct</td>
<td>%o</td>
</tr>
<tr>
<td>basefield == hex</td>
<td>%X</td>
</tr>
<tr>
<td>basefield == 0</td>
<td>%d</td>
</tr>
<tr>
<td>signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversions to a floating-point type the specifier is %g, with a length modifier added as indicated in Table 105.

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>h</td>
</tr>
<tr>
<td>unsigned short</td>
<td>h</td>
</tr>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>double</td>
<td>l</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
</tbody>
</table>

**Stage 2:** If in == end then stage 2 terminates. Otherwise a charT is taken from in and local variables are initialized as if by

```c
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>>(loc).decimal_point())
  c = '.';
bool discard =
  ct == use_facet<numpunct<charT>>>(loc).thousands_sep() 
  && use_facet<numpunct<charT>>>(loc).grouping().length() != 0;
```

where the values src and atoms are defined as if by:

```c
static const char src[] = "0123456789abcdefpfxABCDEFPX+-";
char_type atoms[sizeof(src)];
use_facet<ctype<charT>>>(loc).widen(src, src + sizeof(src), atoms);
```

for this value of loc.

If discard is true, then if ',' has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if ',' has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a
check is made to determine if \( c \) is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then \( \text{in} \) is advanced by \( \text{++in} \) and processing returns to the beginning of stage 2.

[Example 1: Given an input sequence of "0x1a.bp+07p",]

(3.1) if the conversion specifier returned by Stage 1 is \( %d, "0\) is accumulated;
(3.2) if the conversion specifier returned by Stage 1 is \( %i, "0x1a\) are accumulated;
(3.3) if the conversion specifier returned by Stage 1 is \( %g, "0x1a.bp+07\) are accumulated.

In all cases, the remainder is left in the input. — end example]

Stage 3: The sequence of chars accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header \(<\text{cstdlib}\>:

(3.4) For a signed integer value, the function \text{strtol}.
(3.5) For an unsigned integer value, the function \text{strtoul}.
(3.6) For a float value, the function \text{strtof}.
(3.7) For a double value, the function \text{strtod}.
(3.8) For a long double value, the function \text{strtold}.

The numeric value to be stored can be one of:

(3.9) zero, if the conversion function does not convert the entire field.
(3.10) the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in \( \text{val} \).
(3.11) the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in \( \text{val} \).
(3.12) the converted value, otherwise.

The resultant numeric value is stored in \( \text{val} \). If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, \text{ios_base}\::\text{failbit} is assigned to \( \text{err} \).

Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with \text{use_facet<\text{numpunct<charT>>>(loc)}.\text{grouping()}}. If they are not consistent then \text{ios_base}\::\text{failbit} is assigned to \( \text{err} \).

In any case, if stage 2 processing was terminated by the test for \( \text{in == end} \) then \( \text{err |=} \text{ios_base}\::\text{eofbit} \) is performed.

\[
\text{iter_type do_get(iter_type in, iter_type end, ios_base& str,}
\text{ ios_base::iostate& err, bool& val) const;}
\]

**Effects:** If \( (\text{str.flags()&ios_base::boolalpha}) == 0 \) then input proceeds as it would for a long except that if a value is being stored into \( \text{val} \), the value is determined according to the following: If the value to be stored is 0 then \text{false} is stored. If the value is 1 then \text{true} is stored. Otherwise \text{true} is stored and \text{ios_base}\::\text{failbit} is assigned to \( \text{err} \).

Otherwise target sequences are determined “as if” by calling the members \text{falseName()} and \text{trueName()} of the facet obtained by \text{use_facet<\text{numpunct<charT>>>(str.getloc())}. Successive characters in the range \([\text{in,end})\) (see 24.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator \( \text{in} \) is compared to \( \text{end} \) only when necessary to obtain a character. If a target sequence is uniquely matched, \( \text{val} \) is set to the corresponding value. Otherwise \text{false} is stored and \text{ios_base}\::\text{failbit} is assigned to \( \text{err} \).

The \( \text{in} \) iterator is always left pointing one position beyond the last character successfully matched. If \( \text{val} \) is set, then \( \text{err} \) is set to \text{str.goodbit}; or to \text{str.eofbit} if, when seeking another character to match, it is found that \( (\text{in == end}) \). If \( \text{val} \) is not set, then \( \text{err} \) is set to \text{str.failbit}; or to \( (\text{str.failbit}|\text{str.eofbit}) \) if the reason for the failure was that \( (\text{in == end}) \).

[Example 2: For targets \text{true: } "a" and \text{false: } "abb\), the input sequence "a\) yields \( \text{val} == \text{true} \) and \( \text{err} == \text{str.eofbit}\); the input sequence "abc\) yields \( \text{err} == \text{str.failbit}\), with \text{in} ending at the 'c' element. For targets \text{true: } "1" and \text{false: } "0\), the input sequence "1\) yields \( \text{val} == \text{true} \) and \( \text{err} == \text{str.goodbit}. \) For empty targets ("\), any input sequence yields \( \text{err} == \text{str.failbit}. — end example]

Returns: \text{in}.
30.4.3.3 Class template num_put

30.4.3.3.1 General

namespace std {

    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit num_put(size_t refs = 0);

            iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;

        protected:
            ~num_put();
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
        }

    };

1 The facet num_put is used to format numeric values to a character sequence such as an ostream.

30.4.3.3.2 Members

iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

1 Returns: do_put(out, str, fill, val).

30.4.3.3.3 Virtual functions

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

1 Effects: Writes characters to the sequence out, formatting val as desired. In the following description, loc names a local variable initialized as

    locale loc = str.getloc();

2 The details of this operation occur in several stages:
Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables

```cpp
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 106.

**Table 106: Integer conversions**  
<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == ios_base::oct</td>
<td>%o</td>
</tr>
<tr>
<td>(basefield == ios_base::hex) &amp;&amp; !uppercase</td>
<td>%x</td>
</tr>
<tr>
<td>(basefield == ios_base::hex)</td>
<td>%X</td>
</tr>
<tr>
<td>for a signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>for an unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 107.

**Table 107: Floating-point conversions**  
<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>floatfield == ios_base::fixed</td>
<td>%f</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific &amp;&amp; !uppercase</td>
<td>%e</td>
</tr>
<tr>
<td>floatfield == ios_base::scientific</td>
<td>%E</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific) &amp;&amp; !uppercase</td>
</tr>
<tr>
<td>floatfield == (ios_base::fixed</td>
<td>ios_base::scientific)</td>
</tr>
<tr>
<td>!uppercase</td>
<td>%g</td>
</tr>
<tr>
<td>otherwise</td>
<td>%G</td>
</tr>
</tbody>
</table>

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 108.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 109.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.
Table 108: Length modifier [tab:facet.num.put.length]

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
<tr>
<td>otherwise</td>
<td>none</td>
</tr>
</tbody>
</table>

Table 109: Numeric conversions [tab:facet.num.put.conv]

<table>
<thead>
<tr>
<th>Type(s)</th>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>an integral type</td>
<td>showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showbase</td>
<td>#</td>
</tr>
<tr>
<td>a floating-point type</td>
<td>showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showpoint</td>
<td>#</td>
</tr>
</tbody>
</table>

For conversion from void* the specifier is %p.

The representations at the end of stage 1 consists of the char’s that would be printed by a call of printf(s, val) where a is the conversion specifier determined above.

**Stage 2:** Any character c other than a decimal point(.) is converted to a charT via

use_facet<ctype<charT>>(loc).widen(c)

A local variable punct is initialized via

const numnumpunct<charT>& punct = use_facet<numnumpunct<charT>>(loc);

For arithmetic types, punct.thousands_sep() characters are inserted into the sequence as determined by the value returned by punct.do_grouping() using the method described in 30.4.4.1.3. Decimal point characters(.) are replaced by punct.decimal_point().

**Stage 3:** A local variable is initialized as

fmtflags adjustfield = (flags & (ios_base::adjustfield));

The location of any padding\(^{257}\) is determined according to Table 110.

Table 110: Fill padding [tab:facet.num.put.fill]

<table>
<thead>
<tr>
<th>State</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield == ios_base::left</td>
<td>pad after</td>
</tr>
<tr>
<td>adjustfield == ios_base::right</td>
<td>pad before</td>
</tr>
<tr>
<td>adjustfield == internal and a sign occurs in the representation</td>
<td>pad after the sign</td>
</tr>
<tr>
<td>adjustfield == internal and representation after stage 1 began with 0x or 0X</td>
<td>pad after x or X</td>
</tr>
<tr>
<td>otherwise</td>
<td>pad before</td>
</tr>
</tbody>
</table>

If str.width() is nonzero and the number of charT’s in the sequence after stage 2 is less than str.width(), then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to str.width(). str.width(0) is called.

**Stage 4:** The sequence of charT’s at the end of stage 3 are output via

*out++ = c

\(^{257}\) The conversion specification #o generates a leading 0 which is not a padding character.
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;

5 Returns: If (str.flags() & ios_base::boolalpha) == 0 returns do_put(out, str, fill, (int)val), otherwise obtains a string \( s \) as if by

\[
\text{string\_type } s =
\begin{align*}
\text{val } & \Rightarrow \text{use\_facet<numpunct<charT>>(loc).truename()} \\
\text{false } & \Rightarrow \text{use\_facet<numpunct<charT>>(loc).falsename()}
\end{align*}
\]

and then inserts each character \( c \) of \( s \) into \( out \) via \( *out++ = c \) and returns \( out \).

30.4.4 The numeric punctuation facet
30.4.4.1 Class template numpunct
30.4.4.1.1 General

namespace std {
    template<class charT>
    class numpunct : public locale::facet {
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;

            explicit numpunct(size_t refs = 0);

            char_type decimal_point() const;
            char_type thousands_sep() const;
            string grouping() const;
            string_type truename() const;
            string_type falsename() const;

            static locale::id id;
        protected:
            ~numpunct();  // virtual
            virtual char_type do_decimal_point() const;
            virtual char_type do_thousands_sep() const;
            virtual string do_grouping() const;
            virtual string_type do_truename() const;  // for bool
            virtual string_type do_falsename() const;  // for bool
        }
    }

1 numpunct<> specifies numeric punctuation. The specializations required in Table 100 (30.3.1.2.1), namely numpunct<wchar_t> and numpunct<char>, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to widen.

2 The syntax for number formats is as follows, where digit represents the radix set specified by the fmtflags argument value, and thousands-sep and decimal-point are the results of corresponding numpunct<charT> members. Integer values have the format:

\[
\text{intval}: \quad \text{sign}_{\text{opt}} \text{ units} \\
\text{sign}: \quad + \quad - \\
\text{units}: \quad \text{digits} \\
\text{digits thousands-sep units} \\
\text{digits}: \quad \text{digit digits}_{\text{opt}}
\]

and floating-point values have:

\[
\text{floatval}: \quad \text{sign}_{\text{opt}} \text{ units fractional}_{\text{opt}} \text{ exponent}_{\text{opt}} \quad \text{sign}_{\text{opt}} \text{ decimal-point digits exponent}_{\text{opt}}
\]
fractional:
    decimal-point digits_{opt}
exponent:
    e sign_{opt} digits
e:
    e
E

where the number of digits between thousands-seps is as specified by do_grouping(). For parsing, if the digits portion contains no thousands-separators, no grouping constraint is applied.

30.4.4.1.2 Members

char_type decimal_point() const;
  Returns: do_decimal_point().

char_type thousands_sep() const;
  Returns: do_thousands_sep().

string grouping() const;
  Returns: do_grouping().

string_type truename() const;
string_type falsename() const;
  Returns: do_truename() or do_falsename(), respectively.

30.4.4.1.3 Virtual functions

char_type do_decimal_point() const;
  Returns: A character for use as the decimal radix separator. The required specializations return '.' or L'.'.

char_type do_thousands_sep() const;
  Returns: A character for use as the digit group separator. The required specializations return ',' or L','.

string do_grouping() const;
  Returns: A string vec used as a vector of integer values, in which each element vec[i] represents the number of digits in the group at position i, starting with position 0 as the rightmost group. If vec.size() <= i, the number is the same as group (i - 1); if (i < 0 || vec[i] <= 0 || vec[i] == CHAR_MAX), the size of the digit group is unlimited.

  The required specializations return the empty string, indicating no grouping.

string_type do_truename() const;
string_type do_falsename() const;
  Returns: A string representing the name of the boolean value true or false, respectively.

In the base class implementation these names are "true" and "false", or L"true" and L"false".

30.4.4.2 Class template numpunct_byname

namespace std {
  template<class charT>
  class numpunct_byname : public numpunct<charT> {
    // this class is specialized for char and wchar_t.
    public:
      using char_type = charT;
      using string_type = basic_string<charT>;

258) Thus, the string "\003" specifies groups of 3 digits each, and "3" probably indicates groups of 51 (!) digits each, because 51 is the ASCII value of "3".
explicit numpunct_byname(const char*, size_t refs = 0);
explicit numpunct_byname(const string&, size_t refs = 0);

protected:
- numpunct_byname();
};

30.4.5 The collate category

30.4.5.1 Class template collate

30.4.5.1.1 General

namespace std {
  template<class charT>
  class collate : public locale::facet {
    public:
      using char_type = charT;
      using string_type = basic_string<charT>;

      explicit collate(size_t refs = 0);

      int compare(const charT* low1, const charT* high1,
                  const charT* low2, const charT* high2) const;
      string_type transform(const charT* low, const charT* high) const;
      long hash(const charT* low, const charT* high) const;

      static locale::id id;
    protected:
      ~collate();
      virtual int do_compare(const charT* low1, const charT* high1,
                             const charT* low2, const charT* high2) const;
      virtual string_type do_transform(const charT* low, const charT* high) const;
      virtual long do_hash (const charT* low, const charT* high) const;
    };
  }
}

1 The class collate<charT> provides features for use in the collation (comparison) and hashing of strings. A locale member function template, operator(), uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 27) and containers operating on strings. The specializations required in Table 100 (30.3.1.2.1), namely collate<char> and collate<wchar_t>, apply lexicographic ordering (27.8.11).

2 Each function compares a string of characters *p in the range [low,high).

30.4.5.1.2 Members

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;

1 Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;

2 Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;

3 Returns: do_hash(low, high).

30.4.5.1.3 Virtual functions

int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;

1 Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 100 (30.3.1.2.1), namely collate<char> and collate<wchar_t>, implement a lexicographical comparison (27.8.11).
string_type do_transform(const charT* low, const charT* high) const;

Returns: A basic_string<charT> value that, compared lexicographically with the result of calling transform() on another string, yields the same result as calling do_compare() on the same two strings.  

long do_hash(const charT* low, const charT* high) const;

Returns: An integer value equal to the result of calling hash() on any other string for which do_compare() returns 0 (equal) when passed the two strings.

Recommended practice: The probability that the result equals that for another string which does not compare equal should be very small, approaching \((1.0/\text{numeric_limits<unsigned long>::max()})\).

30.4.5.2 Class template collate_byname

namespace std {
    template<class charT>
    class collate_byname : public collate<charT> {
        public:
            using string_type = basic_string<charT>;
            explicit collate_byname(const char*, size_t refs = 0);
            explicit collate_byname(const string&, size_t refs = 0);

            protected:
                ~collate_byname();
    };  
}

30.4.6 The time category

30.4.6.1 General

Templates time_get<charT, InputIterator> and time_put<charT, OutputIterator> provide date and time formatting and parsing. All specifications of member functions for time_put and time_get in the subclauses of 30.4.6 only apply to the specializations required in Tables 100 and 101 (30.3.1.2.1). Their members use their ios_base&, ios_base::iostate&, and fill arguments as described in 30.4, and the ctype<> facet, to determine formatting details.

30.4.6.2 Class template time_get

namespace std {
    class time_base {
        public:
            enum dateorder { no_order, dmy, mdy, ymd, ydm };
    };

    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
        public:
            using char_type = charT;
            using iter_type = InputIterator;

            explicit time_get(size_t refs = 0);

            dateorder date_order() const { return do_date_order(); }
            iter_type get_time(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
            iter_type get_date(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
            iter_type get_weekday(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
            iter_type get_monthname(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;

            259) This function is useful when one string is being compared to many other strings.
iter_type get_year(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t) const;
iter_type get(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t, char format, char modifier = 0) const;
iter_type get(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t, const char_type* fmt, 
const char_type* fmtend) const;

static locale::id id;

protected:
- time_get();

virtual dateorder do_date_order() const;
virtual iter_type do_get_time(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t) const;
virtual iter_type do_get_date(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t) const;
virtual iter_type do_get_weekday(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t) const;
virtual iter_type do_get_monthname(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t) const;
virtual iter_type do_get_year(iter_type s, iter_type end, ios_base& f, 
ios_base::iostate& err, tm* t, char format, char modifier) const;

1 time_get is used to parse a character sequence, extracting components of a time or date into a tm object. Each get member parses a format as produced by a corresponding format specifier to time_put<>::put. If the sequence being parsed matches the correct format, the corresponding members of the tm argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.260

2 If the end iterator is reached during parsing by any of the get() member functions, the member sets ios_base::eofbit in err.

30.4.6.2.2 Members [locale.time.get.members]
dateorder date_order() const;

1 Returns: do_date_order().

iter_type get_time(iter_type s, iter_type end, ios_base& str, 
ios_base::iostate& err, tm* t) const;

2 Returns: do_get_time(s, end, str, err, t).

iter_type get_date(iter_type s, iter_type end, ios_base& str, 
ios_base::iostate& err, tm* t) const;

3 Returns: do_get_date(s, end, str, err, t).

iter_type get_weekday(iter_type s, iter_type end, ios_base& str, 
ios_base::iostate& err, tm* t) const;
iter_type get_monthname(iter_type s, iter_type end, ios_base& str, 
ios_base::iostate& err, tm* t) const;

4 Returns: do_get_weekday(s, end, str, err, t) or do_get_monthname(s, end, str, err, t).

iter_type get_year(iter_type s, iter_type end, ios_base& str, 
ios_base::iostate& err, tm* t) const;

5 Returns: do_get_year(s, end, str, err, t).

260 In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t, char format, char modifier = 0) const;

6  Returns: do_get(s, end, f, err, t, format, modifier).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t, const char_type* fmt, const char_type* fmtend) const;

7  Preconditions: [fmt, fmtend] is a valid range.

Effects: The function starts by evaluating err == ios_base::goodbit. It then enters a loop, reading zero or more characters from s at each iteration. Unless otherwise specified below, the loop terminates when the first of the following conditions holds:

8.1 — The expression fmt == fmtend evaluates to true.

8.2 — The expression err == ios_base::goodbit evaluates to false.

8.3 — The expression s == end evaluates to true, in which case the function evaluates err = ios_base::eofbit | ios_base::failbit.

8.4 — The next element of fmt is equal to '%', optionally followed by a modifier character, followed by a conversion specifier character, format, together forming a conversion specification valid for the POSIX function strftime. If the number of elements in the range [fmt, fmtend] is not sufficient to unambiguously determine whether the conversion specification is complete and valid, the function evaluates err = ios_base::failbit. Otherwise, the function evaluates

8.5 — The expression isspace(*fmt, f.getloc()) evaluates to true, in which case the function first increments fmt until fmt == fmtend || !isspace(*fmt, f.getloc()) evaluates to true, then advances s until s == end || !isspace(*s, f.getloc()) is true, and finally resumes looping.

8.6 — The next character read from s matches the element pointed to by fmt in a case-insensitive comparison, in which case the function evaluates ++fmt, ++s and continues looping. Otherwise, the function evaluates err = ios_base::failbit.

9  [Note 1: The function uses the ctype<charT> facet installed in f’s locale to determine valid whitespace characters. It is unspecified by what means the function performs case-insensitive comparison or whether multi-character sequences are considered while doing so. — end note]

Returns: s.

30.4.6.2.3 Virtual functions

[locale.time.get.virtuals]

dateorder do_date_order() const;

1  Returns: An enumeration value indicating the preferred order of components for those date formats that are composed of day, month, and year. Returns no_order if the date format specified by 'x' contains other variable components (e.g., Julian day, week number, week day).

iter_type do_get_time(iter_type s, iter_type end, ios_base& str, ios_base::iostate& err, tm* t) const;

2  Effects: Reads characters starting at s until it has extracted those tm members, and remaining format characters, used by time_put<>::put to produce the format specified by "%%H:%M:%S", or until it encounters an error or end of sequence.

Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid time.

iter_type do_get_date(iter_type s, iter_type end, ios_base& str, ios_base::iostate& err, tm* t) const;

3  Effects: Reads characters starting at s until it has extracted those tm members and remaining format characters used by time_put<>::put to produce one of the following formats, or until it encounters an error. The format depends on the value returned by date_order() as shown in Table 111.

261) This function is intended as a convenience only, for common formats, and can return no_order in valid locales.

§ 30.4.6.2.3 1475
Table 111: do\_get\_date effects

<table>
<thead>
<tr>
<th>date_order()</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_order</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>dmy</td>
<td>&quot;%d%m%y&quot;</td>
</tr>
<tr>
<td>mdy</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>ymd</td>
<td>&quot;%y%m%d&quot;</td>
</tr>
<tr>
<td>ydm</td>
<td>&quot;%y%d%m&quot;</td>
</tr>
</tbody>
</table>

An implementation may also accept additional implementation-defined formats.

Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

\begin{verbatim}
iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
\end{verbatim}

Effects: Reads characters starting at \texttt{s} until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate \texttt{tm} member accordingly.

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid name.

\begin{verbatim}
iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;
\end{verbatim}

Effects: Reads characters starting at \texttt{s} until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the \texttt{t->tm\_year} member accordingly.

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

\begin{verbatim}
iter_type do_get(iter_type s, iter_type end, ios_base& f,
    ios_base::iostate& err, tm* t, char format, char modifier) const;
\end{verbatim}

Preconditions: \texttt{t} points to an object.

Effects: The function starts by evaluating \texttt{err = ios\_base::goodbit}. It then reads characters starting at \texttt{s} until it encounters an error, or until it has extracted and assigned those \texttt{tm} members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function \texttt{strptime}, formed by concatenating \texttt{"%"}, the \texttt{modifier} character, when non-NUL, and the \texttt{format} character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by \texttt{t} unchanged and evaluates \texttt{err |= ios\_base::failbit}. When \texttt{s == end} evaluates to \texttt{true} after reading a character the function evaluates \texttt{err |= ios\_base::eofbit}.

For complex conversion specifications such as \texttt{%c}, \texttt{%x}, or \texttt{%X}, or conversion specifications that involve the optional modifiers \texttt{E} or \texttt{O}, when the function is unable to unambiguously determine some or all \texttt{tm} members from the input sequence \texttt{[s, end)}, it evaluates \texttt{err |= ios\_base::eofbit}. In such cases the values of those \texttt{tm} members are unspecified and may be outside their valid range.

Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given \texttt{format} and \texttt{modifier}.

Remarks: It is unspecified whether multiple calls to \texttt{do\_get() with the address of the same \texttt{tm} object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

### 30.4.6.3 Class template time\_get\_byname

\begin{verbatim}
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
        class time_get_byname : public time_get<charT, InputIterator> {
\end{verbatim}
public:
    using dateorder = time_base::dateorder;
    using iter_type = InputIterator;

    explicit time_getbyname(const char*, size_t refs = 0);
    explicit time_getbyname(const string&, size_t refs = 0);

protected:
    ~time_getbyname();
};

30.4.6.4 Class template time_put

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;

            explicit time_put(size_t refs = 0);

            // the following is implemented in terms of other member functions.
            iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                          const charT* pattern, const charT* pat_end) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                          char format, char modifier = 0) const;

            static locale::id id;

        protected:
            ~time_put();
            virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                                      char format, char modifier) const;
        }
    }

30.4.6.4.1 Members

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
             const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
             char format, char modifier = 0) const;

1 Effects: The first form steps through the sequence from pattern to pat_end, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to s immediately, and each format sequence, as it is identified, results in a call to do_put; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character c to a char value as if by ct.narrow(c, 0), where ct is a reference to ctype<charT> obtained from str.getloc(). The first character of each sequence is equal to '%', followed by an optional modifier character mod and a format specifier character spec as defined for the function strftime. If no modifier character is present, mod is zero. For each valid format sequence identified, calls do_put(s, str, fill, t, spec, mod).

2 The second form calls do_put(s, str, fill, t, format, modifier).

3 [Note 1: The fill argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — end note]

4 Returns: An iterator pointing immediately after the last character produced.

262) Although the C programming language defines no modifiers, most vendors do.
30.4.6.4.2 Virtual functions

```cpp
iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
                 char format, char modifier) const;
```

1. **Effects**: Formats the contents of the parameter `t` into characters placed on the output sequence `s`. Formatting is controlled by the parameters `format` and `modifier`, interpreted identically as the format specifiers in the string argument to the standard library function `strftime()`, except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

   [Note 1: Interpretation of the `modifier` argument is implementation-defined. — end note]

2. **Returns**: An iterator pointing immediately after the last character produced.

   [Note 2: The `fill` argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — end note]

3. **Recommended practice**: Interpretation of the `modifier` should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

30.4.6.5 Class template time_put_byname

```cpp
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
    public:
        using char_type = charT;
        using iter_type = OutputIterator;
        explicit time_put_byname(const char*, size_t refs = 0);
        explicit time_put_byname(const string&, size_t refs = 0);
        ~time_put_byname();
    }
}
```

30.4.7 The monetary category

30.4.7.1 General

1. These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

2. All specifications of member functions for `money_put` and `money_get` in the subclauses of 30.4.7 only apply to the specializations required in Tables 100 and 101 (30.3.1.2.1). Their members use their `ios_base&`, `ios_base::iostate&`, and `fill` arguments as described in 30.4, and the `moneypunct<>` and `ctype<>` facets, to determine formatting details.

30.4.7.2 Class template money_get

```cpp
namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
    public:
        using char_type = charT;
        using iter_type = InputIterator;
        using string_type = basic_string<charT>;
        explicit money_get(size_t refs = 0);
        iter_type get(iter_type s, iter_type end, bool intl,
                      ios_base& f, ios_base::iostate& err,
                      long double& units) const;
        iter_type get(iter_type s, iter_type end, bool intl,
                      ios_base& f, ios_base::iostate& err,
                      string_type& digits) const;
    }
}```
static locale::id id;

protected:
- money_get();

virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
  ios_base::iostate& err, long double& units) const;
virtual iter_type do_get(iter_type, iter_type, bool, ios_base&,
  ios_base::iostate& err, string_type& digits) const;
};

30.4.7.2.1 Members [locale.money.get.members]

iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
  ios_base::iostate& err, long double& quant) const;
iter_type get(iter_type s, iter_type end, bool intl, ios_base& f,
  ios_base::iostate& err, string_type& quant) const;

Returns: do_get(s, end, intl, f, err, quant).

30.4.7.2.2 Virtual functions [locale.money.get.virtuals]

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
  ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
  ios_base::iostate& err, string_type& digits) const;

Effects: Reads characters from s to parse and construct a monetary value according to the format specified by a moneypunct<charT, Intl> facet reference mp and the character mapping specified by a ctype<charT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags(). If a valid sequence is recognized, does not change err; otherwise, sets err to (err|str.failbit), or (err|str.failbit|str.eofbit) if no more characters are available, and does not change units or digits. Uses the pattern returned by mp.neg_format() to parse all values. The result is returned as an integral value stored in units or as a sequence of digits possibly preceded by a minus sign (as produced by ct.widen(c) where c is '-' or in the range from '0' through '9' (inclusive)) stored in digits.

[Example 1: The sequence $1,056.23 in a common United States locale would yield, for units, 105623, or, for digits, "105623". — end example]

If mp.grouping() indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

Where money_base::space or money_base::none appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where money_base::space appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where money_base::none appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If (str.flags() & str.showbase) is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

If the first character (if any) in the string pos returned by mp.positive_sign() or the string neg returned by mp.negative_sign() is recognized in the position indicated by sign in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

[Example 2: If showbase is off, then for a neg value of "()" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if neg is "-", the "L" in "-100 L" is not consumed. — end example]

If pos or neg is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of pos or neg, and the result is given the corresponding sign. If the first character of pos is equal to the first character of neg, or if both strings are empty, the result is given a positive sign.
Digits in the numeric monetary component are extracted and placed in digits, or into a character buffer buf1 for conversion to produce a value for units, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value units is produced as if by

\[
\text{for } (\text{int } i = 0; i < n; ++i) \\
\quad \text{buf2}[i] = \text{src}[\text{find}(\text{atoms}, \text{atoms} + \text{sizeof}(\text{src}), \text{buf1}[i]) - \text{atoms}]; \\
\text{buf2}[n] = 0; \\
\text{sscanf}(\text{buf2}, "\%Lf", &\text{units});
\]

where \(n\) is the number of characters placed in buf1, buf2 is a character buffer, and the values src and atoms are defined as if by

\[
\text{static const char src[]} = "0123456789-"; \\
\text{charT atoms}[\text{sizeof}(\text{src})]; \\
\text{ct.widen(src, src + \text{sizeof}(\text{src}) - 1, atoms)};
\]

`Returns`: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

### 30.4.7.3 Class template money_put

```cpp
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            using string_type = basic_string<charT>;
            explicit money_put(size_t refs = 0);
            iter_type put(iter_type s, bool intl, ios_base& f, 
                          char_type fill, long double units) const;
            iter_type put(iter_type s, bool intl, ios_base& f, 
                          char_type fill, const string_type& digits) const;

        private:
            ~money_put();
            virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill, 
                                      long double units) const;
            virtual iter_type do_put(iter_type, bool, ios_base&, char_type fill, 
                                      const string_type& digits) const;
    };
}
```

#### 30.4.7.3.1 Members

```cpp
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

`Returns`: do_put(s, intl, f, loc, quant).

#### 30.4.7.3.2 Virtual functions

```cpp
iter_type do_put(iter_type s, bool intl, ios_base& str, 
                 char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str, 
                 char_type fill, const string_type& digits) const;
```

`Effects`: Writes characters to s according to the format specified by a moneypunct<charT, Intl> facet reference mp and the character mapping specified by a ctype<charT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags(). The argument units is transformed into a sequence of wide characters as if by

\[
\text{ct.widen(buf1, buf1 + sprintf(buf1, "\%Lf", units), buf2)}
\]

The semantics here are different from ct.narrow.
for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to \texttt{ct.widen(’-’)}, then the pattern used for formatting is the result of \texttt{mp.neg_format()}; otherwise the pattern is the result of \texttt{mp.pos_format()}. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls \texttt{str.width(0)}.

Returns: An iterator pointing immediately after the last character produced.

Remarks: The currency symbol is generated if and only if (\texttt{str.flags() & str.showbase}) is nonzero. If the number of characters generated for the specified format is less than the value returned by \texttt{str.width()} on entry to the function, then copies of \texttt{fill} are inserted as necessary to pad to the specified width. For the value \texttt{af} equal to (\texttt{str.flags() & str.adjustfield}), if (\texttt{af == str.internal}) is true, the fill characters are placed where none or space appears in the formatting pattern; otherwise if (\texttt{af == str.left}) is true, they are placed after the other characters; otherwise, they are placed before the other characters.

[Note 1: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using \texttt{num_get<>::get}. — end note]

### 30.4.7.4 Class template moneypunct

#### General

namespace std {
    class money_base {
        public:
            enum part { none, space, symbol, sign, value };
            struct pattern { char field[4]; };
    }

    template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
        public:
            using char_type = charT;
            using string_type = basic_string<charT>;

            explicit moneypunct(size_t refs = 0);  

            charT decimal_point() const;
            charT thousands_sep() const;
            string grouping() const;
            string_type curr_symbol() const;
            string_type positive_sign() const;
            string_type negative_sign() const;
            int frac_digits() const;
            pattern pos_format() const;
            pattern neg_format() const;

            static locale::id id;
            static const bool intl = International;

        protected:
            ~moneypunct();
            virtual charT do_decimal_point() const;
            virtual charT do_thousands_sep() const;
            virtual string do_grouping() const;
            virtual string_type do_curr_symbol() const;
            virtual string_type do_positive_sign() const;
            virtual string_type do_negative_sign() const;
            virtual int do_frac_digits() const;
            virtual pattern do_pos_format() const;
            virtual pattern do_neg_format() const;
    };
}
The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `i`th component of the format.\(^{264}\) In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

The format of the numeric monetary value is a decimal number:

```
value:
  units fractional_opt
  decimal-point digits
fractional:
  decimal-point digits_opt
```

If `frac_digits()` returns a positive value, or

```
value:
  units
```

otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```
units:
  digits
  digits thousands-sep units
digits:
  adigit digits_opt
```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range ‘0’ through ‘9’ (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `moneypunct<>::do_grouping()`.

### 30.4.7.4.2 Members

```
locale.moneypunct.members

charT decimal_point() const;
charT thousands_sep() const;
string grouping() const;
string_type curr_symbol() const;
string_type positive_sign() const;
string_type negative_sign() const;
int frac_digits() const;
pattern pos_format() const;
pattern neg_format() const;
```

Each of these functions `F` returns the result of calling the corresponding virtual member function `do_F()`.

### 30.4.7.4.3 Virtual functions

```locale.moneypunct.virtuals

charT do_decimal_point() const;
```

Returns: The radix separator to use in case `do_frac_digits()` is greater than zero.\(^{265}\)

\(^{264}\) An array of `char`, rather than an array of `part`, is specified for `pattern::field` purely for efficiency.

\(^{265}\) In common U.S. locales this is ‘.‘.
charT do_thousands_sep() const;

Returns: The digit group separator to use in case do_grouping() specifies a digit grouping pattern.\textsuperscript{266}

string do_grouping() const;

Returns: A pattern defined identically as, but not necessarily equal to, the result of numpunct<charT>::do_grouping().\textsuperscript{267}

string_type do_curr_symbol() const;

Returns: A string to use as the currency identifier symbol.

[Note 1: For specializations where the second template parameter is \texttt{true}, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. — end note]

string_type do_positive_sign() const;
string_type do_negative_sign() const;

Returns: do_positive_sign() returns the string to use to indicate a positive monetary value;\textsuperscript{268} do_negative_sign() returns the string to use to indicate a negative value.

int do_frac_digits() const;

Returns: The number of digits after the decimal radix separator, if any.\textsuperscript{269}

pattern do_pos_format() const;
pattern do_neg_format() const;

Returns: The specializations required in Table 101 (30.3.1.2.1), namely
\begin{align*}
&\text{— moneypunct<char>}, \\
&\text{— moneypunct<wchar_t>}, \\
&\text{— moneypunct<char, true>, and} \\
&\text{— moneypunct<wchar_t, true>},
\end{align*}
return an object of type pattern initialized to \{ symbol, sign, none, value \}.\textsuperscript{270}

30.4.7.5 Class template moneypunct_byname\textsuperscript{[locale.moneypunct.basename]}

namespace std {
    template<class charT, bool Intl = false>
    class moneypunct_byname : public moneypunct<charT, Intl> {
    public:
        using pattern = money_base::pattern;
        using string_type = basic_string<charT>;

        explicit moneypunct_byname(const char*, size_t refs = 0);
        explicit moneypunct_byname(const string&, size_t refs = 0);

        protected:
            ~moneypunct_byname();
    };
}

30.4.8 The message retrieval category\textsuperscript{[category.messages]}

30.4.8.1 General\textsuperscript{[category.messages.general]}

Class messages<charT> implements retrieval of strings from message catalogs.

\textsuperscript{266} In common U.S. locales this is ‘,’.
\textsuperscript{267} To specify grouping by 3s, the value is “\003” not “3”.
\textsuperscript{268} This is usually the empty string.
\textsuperscript{269} In common U.S. locales, this is 2.
\textsuperscript{270} Note that the international symbol returned by do_curr_symbol() usually contains a space, itself; for example, ”USD “.
30.4.8.2 Class template messages

30.4.8.2.1 General

namespace std {
    class messages_base {
    public:
        using catalog = unspecified signed integer type;
    };

template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;
        explicit messages(size_t refs = 0);
        catalog open(const string& fn, const locale& loc) const;
        string_type get(catalog c, int set, int msgid,
            const string_type& dfault) const;
        void close(catalog c) const;
        static locale::id id;
    protected:
        ~messages();
        virtual catalog do_open(const string&, const locale&) const;
        virtual string_type do_get(catalog, int set, int msgid,
            const string_type& dfault) const;
        virtual void do_close(catalog) const;
    }
}

1 Values of type messages_base::catalog usable as arguments to members get and close can be obtained only by calling member open.

30.4.8.2.2 Members

catalog open(const string& name, const locale& loc) const;

1 Returns: do_open(name, loc).

string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;

2 Returns: do_get(cat, set, msgid, dfault).

void close(catalog cat) const;

3 Effects: Calls do_close(cat).

30.4.8.2.3 Virtual functions

catalog do_open(const string& name, const locale& loc) const;

1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().

2 Returns a value less than 0 if no such catalog can be opened.

3 Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;

4 Preconditions: cat is a catalog obtained from open() and not yet closed.

5 Returns: A message identified by arguments set, msgid, and dfault, according to an implementation-defined mapping. If no such message can be found, returns dfault.
void do_close(catalog cat) const;

6  **Preconditions:** cat is a catalog obtained from open() and not yet closed.
7  **Effects:** Releases unspecified resources associated with cat.
8  **Remarks:** The limit on such resources, if any, is implementation-defined.

### 30.4.8.3 Class template messagesbyname

```cpp
namespace std {
    template<class charT>
    class messagesbyname : public messages<charT> {
    public:
        using catalog = messages_base::catalog;
        using string_type = basic_string<charT>;

        explicit messagesbyname(const char*, size_t refs = 0);
        explicit messagesbyname(const string&, size_t refs = 0);

    protected:
        ~messagesbyname();
    };
}
```

### 30.5 C library locales

#### 30.5.1 Header <locale>

```cpp
namespace std {
    struct lconv;
    char* setlocale(int category, const char* locale);
    lconv* localeconv();
}
```

#### 1 The contents and meaning of the header <locale> are the same as the C standard library header <locale.h>.

#### 30.5.2 Data races

1 Calls to the function `setlocale` may introduce a data race (16.4.6.10) with other calls to `setlocale` or with calls to the functions listed in Table 112.

**See also:** ISO C 7.11

# 31 Input/output library

## 31.1 General

This Clause describes components that C++ programs may use to perform input/output operations.

The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostreams objects, base iostreams classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 113.

### Table 113: Input/output library summary

## 31.2 Iostreams requirements

### 31.2.1 Imbue limitations

No function described in Clause 31 except for `ios_base::imbue` and `basic_filebuf::pubimbue` causes any instance of `basic_ios::imbue` or `basic_streambuf::imbue` to be called. If any user function called from a function declared in Clause 31 or as an overriding virtual function of any class declared in Clause 31 calls `imbue`, the behavior is undefined.

### 31.2.2 Types

```cpp
using streamoff = implementation-defined;
```

The type `streamoff` is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.\(^{271}\)

```cpp
using streamsize = implementation-defined;
```

The type `streamsize` is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.\(^{272}\)

### 31.2.3 Positioning type limitations

The classes of Clause 31 with template arguments `charT` and `traits` behave as described if `traits::pos_type` and `traits::off_type` are `streampos` and `streamoff` respectively. Except as noted explicitly below, their behavior when `traits::pos_type` and `traits::off_type` are other types is implementation-defined.

\[Note 1: \text{For each of the specializations of } \text{char_traits defined in 23.2.4, state_type denotes mbstate_t, pos_type denotes fpos<mbstate_t>, and off_type denotes streamoff.} \text{— end note}\]

In the classes of Clause 31, a template parameter with name `charT` represents a member of the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

\(^{271}\) Typically `long long`.

\(^{272}\) Most places where `streamsize` is used would use `size_t` in ISO C, or `ssize_t` in POSIX.
31.2.4 Thread safety

Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

[Note 1: Data races result in undefined behavior (6.9.2). — end note]

If one thread makes a library call a that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call b such that this does not result in a data race, then a’s write synchronizes with b’s read.

31.3 Forward declarations

31.3.1 Header <iosfwd> synopsis

```cpp
namespace std {
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;
    template<> struct char_traits<char16_t>;
    template<> struct char_traits<char32_t>;
    template<> struct char_traits<wchar_t>;
    template<class T> class allocator;
    template<class charT, class traits = char_traits<charT>>
        class basic_iostream;

using wfilebuf = basic_filebuf<wchar_t>;
using wifstream = basic_ifstream<wchar_t>;
using wofstream = basic_ofstream<wchar_t>;
using wfstream = basic_fstream<wchar_t>;

using wsyncbuf = basic_syncbuf<wchar_t>;
using wosyncstream = basic_osyncstream<wchar_t>;

template<class state> class fpos;
using streampos = fpos<char_traits<char>::state_type>;
using wstreampos = fpos<char_traits<wchar_t>::state_type>;

§ 31.3.1 1488
using u8streampos = fpos<char_traits<char8_t>::state_type>;
using u16streampos = fpos<char_traits<char16_t>::state_type>;
using u32streampos = fpos<char_traits<char32_t>::state_type>;
}

1 Default template arguments are described as appearing both in <iosfwd> and in the synopsis of other headers but it is well-formed to include both <iosfwd> and one or more of the other headers.274

31.3.2 Overview

The class template specialization basic_ios<
T, traits> serves as a virtual base class for the class templates basic_istream, basic_ostream, and class templates derived from them. basic_ios is a class template derived from both basic_istream<
T, traits> and basic_ostream<
T, traits>.

2 The class template specialization basic_streambuf<
T, traits> serves as a base class for class templates basic_stringbuf, basic_filebuf, and basic_syncbuf.

3 The class template specialization basic_istream<
T, traits> serves as a base class for class templates basic_istringstream and basic_ifstream.

4 The class template specialization basic_ostream<
T, traits> serves as a base class for class templates basic_ostringstream, basic_ofstream, and basic_osyncstream.

5 The class template specialization basic_iostream<
T, traits> serves as a base class for class templates basic_stringstream and basic_fstream.

[Note 1: For each of the class templates above, the program is ill-formed if traits::char_type is not the same type as char
T (23.2). — end note]

7 Other typedef-names define instances of class templates specialized for char or wchar_t types.

8 Specializations of the class template fpos are used for specifying file position information.

[Example 1: The types streampos and wstreampos are used for positioning streams specialized on char and wchar_t respectively. — end example]

9 [Note 2: This synopsis suggests a circularity between streampos and char_traits<char>. An implementation can avoid this circularity by substituting equivalent types. — end note]

31.4 Standard iostream objects

31.4.1 Header <iostream> synopsis

#include <ios>    // see 31.5.1
#include <streambuf>    // see 31.6.1
#include <iostream>    // see 31.7.1
#include <ostream>    // see 31.7.2

namespace std {
    extern istream cin;
    extern ostream cout;
    extern ostream cerr;
    extern ostream clog;
    
    extern wistream wcin;
    extern wostream wcout;
    extern wostream wcerr;
    extern wostream wclog;
}

31.4.2 Overview

In this Clause, the type name FILE refers to the type FILE declared in <stdio> (31.13.1).

The header <iostream> declares objects that associate objects with the standard C streams provided for by the functions declared in <stdio>, and includes all the headers necessary to use these objects.

274 It is the implementation's responsibility to implement headers so that including <iosfwd> and other headers does not violate the rules about multiple occurrences of default arguments.
The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.\(^\text{274}\)

**Recommended practice:** If it is possible for them to do so, implementations should initialize the objects earlier than required.

The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration.

Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on FILEs, as specified in the C standard library.

Concurrent access to a synchronized (31.5.2.5) standard iostream object’s formatted and unformatted input (31.7.4.2) and output (31.7.5.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

\[\text{Note 1: Unsyncrhonized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — end note} \]

See also: ISO C 7.21.2

### 31.4.3 Narrow stream objects

`istream cin;`

The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream cout;`

The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`ostream cerr;`

The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

After the object `cerr` is initialized, `cerr.flags()` & `unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

`ostream clog;`

The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.4.4 Wide stream objects

`wistream wcin;`

The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

`wostream wcout;`

The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

`wostream wcerr;`

The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

\(^{274}\) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`. 
After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

```cpp
wostream wclog;
```

The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.5 Iostreams base classes

#### [iostreams.base] 31.5.1 Header `<ios>` synopsis

```cpp
#include <iosfwd> // see 31.3.1
```

namespace std {

```cpp
using streamoff = implementation-defined;
using streamsize = implementation-defined;
template<class stateT> class fpos;

class ios_base;
template<class charT, class traits = char_traits<charT>>
    class basic_ios;
```

// 31.5.5, manipulators
```cpp
ios_base& boolalpha (ios_base& str);
ios_base& noboolalpha(ios_base& str);
ios_base& showbase (ios_base& str);
ios_base& noshowbase (ios_base& str);
ios_base& showpoint (ios_base& str);
ios_base& noshowpoint(ios_base& str);
ios_base& shoupos (ios_base& str);
ios_base& noshoupos (ios_base& str);
ios_base& skipws (ios_base& str);
ios_base& noskipws (ios_base& str);
ios_base& uppercase (ios_base& str);
ios_base& nouppercase(ios_base& str);
ios_base& unitbuf (ios_base& str);
ios_base& nounitbuf (ios_base& str);
```

// 31.5.5.2, adjustfield
```cpp
ios_base& internal (ios_base& str);
ios_base& left (ios_base& str);
ios_base& right (ios_base& str);
```

// 31.5.5.3, basefield
```cpp
ios_base& dec (ios_base& str);
ios_base& hex (ios_base& str);
ios_base& oct (ios_base& str);
```

// 31.5.5.4, floatfield
```cpp
ios_base& fixed (ios_base& str);
ios_base& scientific (ios_base& str);
ios_base& hexfloat (ios_base& str);
ios_base& defaultfloat(ios_base& str);
```

// 31.5.6, error reporting
```cpp
enum class io_errc {
    stream = 1
};
```
template<> struct is_error_code_enum<io_errc> : public true_type { }
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;

31.5.2 Class ios_base

31.5.2.1 General

namespace std {
  class ios_base {
  public:
    class failure; // see below

    // 31.5.2.2, fmtflags
    using fmtflags = T1;
    static constexpr fmtflags boolalpha = unspecified;
    static constexpr fmtflags dec = unspecified;
    static constexpr fmtflags fixed = unspecified;
    static constexpr fmtflags hex = unspecified;
    static constexpr fmtflags internal = unspecified;
    static constexpr fmtflags left = unspecified;
    static constexpr fmtflags oct = unspecified;
    static constexpr fmtflags right = unspecified;
    static constexpr fmtflags scientific = unspecified;
    static constexpr fmtflags showbase = unspecified;
    static constexpr fmtflags showpoint = unspecified;
    static constexpr fmtflags showpos = unspecified;
    static constexpr fmtflags skipws = unspecified;
    static constexpr fmtflags unitbuf = unspecified;
    static constexpr fmtflags uppercase = unspecified;
    static constexpr fmtflags adjustfield = see below;
    static constexpr fmtflags basefield = see below;
    static constexpr fmtflags floatfield = see below;

    // 31.5.2.3, iostate
    using iostate = T2;
    static constexpr iostate badbit = unspecified;
    static constexpr iostate eofbit = unspecified;
    static constexpr iostate failbit = unspecified;
    static constexpr iostate goodbit = see below;

    // 31.5.2.4, openmode
    using openmode = T3;
    static constexpr openmode app = unspecified;
    static constexpr openmode ate = unspecified;
    static constexpr openmode binary = unspecified;
    static constexpr openmode in = unspecified;
    static constexpr openmode out = unspecified;
    static constexpr openmode trunc = unspecified;

    // 31.5.2.5, seekdir
    using seekdir = T4;
    static constexpr seekdir beg = unspecified;
    static constexpr seekdir cur = unspecified;
    static constexpr seekdir end = unspecified;

    class Init;

    // 31.5.2.6, fmtflags state
    fmtflags flags() const;
    fmtflags flags(fmtflags fmtfl);
    fmtflags setf(fmtflags fmtfl);
    fmtflags setf(fmtflags fmtfl, fmtflags mask);
  };
}
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

    // 31.5.2.4, locales
locale imbue(const locale& loc);
locale getloc() const;

    // 31.5.2.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

    // destructor
virtual ~ios_base();

    // 31.5.2.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;
static bool sync_with_stdio(bool sync = true);

protected:
ios_base();

private:
    static int index;       // exposition only
    long* iarray;           // exposition only
    void** parray;          // exposition only
};

ios_base defines several member types:

(1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;

(1.2) — a class Init;

(1.3) — three bitmask types, fmtflags, iostate, and openmode;

(1.4) — an enumerated type, seekdir.

It maintains several kinds of data:

(2.1) — state information that reflects the integrity of the stream buffer;

(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;

(2.3) — additional information that is stored by the program for its private use.

[Note 1: For the sake of exposition, the maintained data is presented here as:

(3.1) — static int index, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

(3.2) — long* iarray, points to the first element of an arbitrary-length long array maintained for the private use of the program;

(3.3) — void** parray, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

— end note]
31.5.2.2 Types

31.5.2.2.1 Class ios_base::failure

namespace std {
    class ios_base::failure : public system_error {
    public:
        explicit failure(const string& msg, const error_code& ec = io_errc::stream);
        explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    }
}

An implementation is permitted to define ios_base::failure as a synonym for a class with equivalent functionality to class ios_base::failure shown in this subclause.

[Note 1: When ios_base::failure is a synonym for another type, that type is required to provide a nested type failure to emulate the injected-class-name. — end note]

The class failure defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.

When throwing ios_base::failure exceptions, implementations should provide values of ec that identify the specific reason for the failure.

[Note 2: Errors arising from the operating system would typically be reported as system_category() errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as error_code(io_errc::stream, iostream_category()). — end note]

explicit failure(const string& msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with msg and ec.

explicit failure(const char* msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with msg and ec.

31.5.2.2.2 Type ios_base::fmtflags

using fmtflags = T1;

The type fmtflags is a bitmask type (16.3.3.3.4). Setting its elements has the effects indicated in Table 114.

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>boolalpha</td>
<td>insert and extract bool type in alphabetic format</td>
</tr>
<tr>
<td>dec</td>
<td>converts integer input or generates integer output in decimal base</td>
</tr>
<tr>
<td>fixed</td>
<td>generate floating-point output in fixed-point notation</td>
</tr>
<tr>
<td>hex</td>
<td>converts integer input or generates integer output in hexadecimal base</td>
</tr>
<tr>
<td>internal</td>
<td>adds fill characters at a designated internal point in certain generated output, or identical to right if no such point is designated</td>
</tr>
<tr>
<td>left</td>
<td>adds fill characters on the right (final positions) of certain generated output</td>
</tr>
<tr>
<td>oct</td>
<td>converts integer input or generates integer output in octal base</td>
</tr>
<tr>
<td>right</td>
<td>adds fill characters on the left (initial positions) of certain generated output</td>
</tr>
<tr>
<td>scientific</td>
<td>generates floating-point output in scientific notation</td>
</tr>
<tr>
<td>showbase</td>
<td>generates a prefix indicating the numeric base of generated integer output</td>
</tr>
<tr>
<td>showpoint</td>
<td>generates a decimal-point character unconditionally in generated floating-point output</td>
</tr>
<tr>
<td>showpos</td>
<td>generates a + sign in non-negative generated numeric output</td>
</tr>
<tr>
<td>skipws</td>
<td>skips leading whitespace before certain input operations</td>
</tr>
<tr>
<td>unitbuf</td>
<td>flushes output after each output operation</td>
</tr>
<tr>
<td>uppercase</td>
<td>replaces certain lowercase letters with their uppercase equivalents in generated output</td>
</tr>
</tbody>
</table>

Type fmtflags also defines the constants indicated in Table 115.
Table 115: fmtflags constants [tab:ios.fmtflags.const]

<table>
<thead>
<tr>
<th>Constant</th>
<th>Allowable values</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield</td>
<td>left</td>
</tr>
<tr>
<td>basefield</td>
<td>dec</td>
</tr>
<tr>
<td>floatfield</td>
<td>scientific</td>
</tr>
</tbody>
</table>

31.5.2.2.3 Type ios_base::iostate [ios.iostate]

using iostate = T2;

1 The type iostate is a bitmask type (16.3.3.4) that contains the elements indicated in Table 116.

Table 116: iostate effects [tab:ios.iostate]

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>badbit</td>
<td>indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);</td>
</tr>
<tr>
<td>eofbit</td>
<td>indicates that an input operation reached the end of an input sequence;</td>
</tr>
<tr>
<td>failbit</td>
<td>indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.</td>
</tr>
</tbody>
</table>

2 Type iostate also defines the constant:

(2.1) goodbit, the value zero.

31.5.2.2.4 Type ios_base::openmode [ios.openmode]

using openmode = T3;

1 The type openmode is a bitmask type (16.3.3.4). It contains the elements indicated in Table 117.

Table 117: openmode effects [tab:ios.openmode]

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>seek to end before each write</td>
</tr>
<tr>
<td>ate</td>
<td>open and seek to end immediately after opening</td>
</tr>
<tr>
<td>binary</td>
<td>perform input and output in binary mode (as opposed to text mode)</td>
</tr>
<tr>
<td>in</td>
<td>open for input</td>
</tr>
<tr>
<td>out</td>
<td>open for output</td>
</tr>
<tr>
<td>trunc</td>
<td>truncate an existing stream when opening</td>
</tr>
</tbody>
</table>

31.5.2.2.5 Type ios_base::seekdir [ios.seekdir]

using seekdir = T4;

1 The type seekdir is an enumerated type (16.3.3.3) that contains the elements indicated in Table 118.

Table 118: seekdir effects [tab:ios.seekdir]

<table>
<thead>
<tr>
<th>Element</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>beg</td>
<td>request a seek (for subsequent input or output) relative to the beginning of the stream</td>
</tr>
<tr>
<td>cur</td>
<td>request a seek relative to the current position within the sequence</td>
</tr>
<tr>
<td>end</td>
<td>request a seek relative to the current end of the sequence</td>
</tr>
</tbody>
</table>
31.5.2.2.6 Class ios_base::Init

namespace std {
    class ios_base::Init {
    public:
        Init();
        Init(const Init&) = default;
        ~Init();
        Init& operator=(const Init&) = default;
    private:
        static int init_cnt;  // exposition only
    }
}

1 The class Init describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

2 For the sake of exposition, the maintained data is presented here as:

(2.1) — static int init_cnt, counts the number of constructor and destructor calls for class Init, initialized to zero.

Init();

3 Effects: Constructs and initializes the objects cin, cout, cerr, clog, wcin, wcout, wcerr, and wclog if they have not already been constructed and initialized.

~Init();

4 Effects: If there are no other instances of the class still in existence, calls cout.flush(), cerr.flush(), clog.flush(), wcout.flush(), wcerr.flush(), wclog.flush().

31.5.2.3 State functions

fmtflags flags() const;

1 Returns: The format control information for both input and output.

fmtflags flags(fmtflags fmtfl);

2 Postconditions: fmtfl == flags().

3 Returns: The previous value of flags().

fmtflags setf(fmtflags fmtfl);

4 Effects: Sets fmtfl in flags().

5 Returns: The previous value of flags().

fmtflags setf(fmtflags fmtfl, fmtflags mask);

6 Effects: Clears mask in flags(), sets fmtfl & mask in flags().

7 Returns: The previous value of flags().

void unsetf(fmtflags mask);

8 Effects: Clears mask in flags().

streamsize precision() const;

9 Returns: The precision to generate on certain output conversions.

streamsize precision(streamsize prec);

10 Postconditions: prec == precision().

11 Returns: The previous value of precision().

streamsize width() const;

12 Returns: The minimum field width (number of characters) to generate on certain output conversions.
streamsize width(streamsize wide);

   Postconditions: wide == width().

   Returns: The previous value of width().

### 31.5.2.4 Functions

```cpp
locale imbue(const locale& loc);
```

1. **Effects:** Calls each registered callback pair (fn, idx) (31.5.2.7) as (*fn)(imbue_event, *this, idx) at such a time that a call to ios_base::getloc() from within fn returns the new locale value loc.

2. **Postconditions:** loc == getloc().

3. **Returns:** The previous value of getloc().

```cpp
locale getloc() const;
```

4. **Returns:** If no locale has been imbued, a copy of the global C++ locale, locale(), in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

### 31.5.2.5 Static members

```cpp
static bool sync_with_stdio(bool sync = true);
```

1. **Effects:** If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a `false` argument, it allows the standard streams to operate independently of the standard C streams.

2. **Returns:** `true` if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns `false`. The first time it is called, the function returns `true`.

3. **Remarks:** When a standard iostream object `str` is synchronized with a standard stdio stream `f`, the effect of inserting a character `c` by

   ```cpp
   fputc(f, c);
   ```

   is the same as the effect of

   ```cpp
   str.rdbuf()->sputc(c);
   ```

   for any sequences of characters; the effect of extracting a character `c` by

   ```cpp
   c = fgetc(f);
   ```

   is the same as the effect of

   ```cpp
   c = str.rdbuf()->sbumpc();
   ```

   for any sequences of characters; and the effect of pushing back a character `c` by

   ```cpp
   ungetc(c, f);
   ```

   is the same as the effect of

   ```cpp
   str.rdbuf()->sputbackc(c);
   ```

   for any sequence of characters.

### 31.5.2.6 Storage functions

```cpp
static int xalloc();
```

1. **Returns:** `index ++`.

2. **Remarks:** Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

```cpp
long& iword(int idx);
```

3. **Preconditions:** idx is a value obtained by a call to xalloc.

   Effects: If iarray is a null pointer, allocates an array of long of unspecified size and stores a pointer to its first element in iarray. The function then extends the array pointed at by iarray as necessary.
to include the element iarray[idx]. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to copyfmt, calling iword with the same index yields another reference to the same value. If the function fails and *this is a base class subobject of a basic_ios<> object or subobject, the effect is equivalent to calling basic_ios<>::setstate(badbit) on the derived object (which may throw failure).

Returns: On success iarray[idx]. On failure, a valid long& initialized to 0.

void*& pword(int idx);

Preconditions: idx is a value obtained by a call to xalloc.

Effects: If parray is a null pointer, allocates an array of pointers to void of unspecified size and stores a pointer to its first element in parray. The function then extends the array pointed at by parray as necessary to include the element parray[idx]. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operations on the object. However, the value of the storage referred to is retained, so that until the next call to copyfmt, calling pword with the same index yields another reference to the same value. If the function fails and *this is a base class subobject of a basic_ios<> object or subobject, the effect is equivalent to calling basic_ios<>::setstate(badbit) on the derived object (which may throw failure).

Returns: On success parray[idx]. On failure a valid void*& initialized to 0.

Remarks: After a subsequent call to pword(int) for the same object, the earlier return value may no longer be valid.

31.5.2.7 Callbacks

void register_callback(event_callback fn, int idx);

Preconditions: The function fn does not throw exceptions.

Effects: Registers the pair (fn, idx) such that during calls to imbue() (31.5.2.4), copyfmt(), or ~ios_base() (31.5.2.8), the function fn is called with argument idx. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

Remarks: Identical pairs are not merged. A function registered twice will be called twice.

31.5.2.8 Constructors and destructor

ios_base();

Effects: Each ios_base member has an indeterminate value after construction. The object’s members shall be initialized by calling basic_ios::init before the object’s first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

~ios_base();

Effects: Calls each registered callback pair (fn, idx) (31.5.2.7) as (*fn)(erase_event, *this, idx) at such time that any ios_base member function called from within fn has well-defined results. Then, any memory obtained is deallocated.

31.5.3 Class template fpos

namespace std {
    template<class stateT> class fpos {
    public:
        // 31.5.3.1, members
        stateT state() const;
        void state(stateT);
    private:
        stateT st;
        // exposition only
    }
}

276) An implementation is free to implement both the integer array pointed at by iarray and the pointer array pointed at by parray as sparse data structures, possibly with a one-element cache for each.
277) For example, because it cannot allocate space.
278) For example, because it cannot allocate space.
31.5.3.1 Members

void state(stateT s);

Effects: Assigns s to st.

stateT state() const;

Returns: Current value of st.

31.5.3.2 Requirements

An fpos type specifies file position information. It holds a state object whose type is equal to the template parameter stateT. Type stateT shall meet the Cpp17DefaultConstructible (Table 29), Cpp17CopyConstructible (Table 31), Cpp17CopyAssignable (Table 33), and Cpp17Destructible (Table 34) requirements. If is_trivially_copy_constructible_v<stateT> is true, then fpos<stateT> has a trivial copy constructor. If is_trivially_copy_assignable<stateT> is true, then fpos<stateT> has a trivial copy assignment operator. If is_trivially_destructible_v<stateT> is true, then fpos<stateT> has a trivial destructor. All specializations of fpos meet the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, Cpp17Destructible, and Cpp17EqualityComparable (Table 27) requirements. In addition, the expressions shown in Table 119 are valid and have the indicated semantics. In that table,

1. P refers to a specialization of fpos,
2. p and q refer to values of type P or const P,
3. pl and ql refer to modifiable lvalues of type P,
4. 0 refers to type streamoff, and
5. o refers to a value of type streamoff or const streamoff.

Table 119: Position type requirements

</tr>
</tbody>
</table>

Stream operations that return a value of type traits::pos_type return P(O(-1)) as an invalid value to signal an error. If this value is used as an argument to any istream, ostream, or streambuf member that accepts a value of type traits::pos_type then the behavior of that function is undefined.
### 31.5.4 Class template basic_ios

#### 31.5.4.1 Overview

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ios : public ios_base {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.5.4.4, flags functions
            explicit operator bool() const;
            bool operator!() const;
            iostate rdstate() const;
            void clear(iostate state = goodbit);
            void setstate(iostate state);
            bool good() const;
            bool eof() const;
            bool fail() const;
            bool bad() const;

            iostate exceptions() const;
            void exceptions(iostate except);

        // 31.5.4.2, constructor/destructor
        explicit basic_ios(basic_streambuf<charT, traits>* sb);
        virtual ~basic_ios();

        // 31.5.4.3, members
        basic_ostream<charT, traits>* tie() const;
        basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);

        basic_streambuf<charT, traits>* rdbuf() const;
        basic_streambuf<charT, traits>* rdbuf(basic_streambuf<charT, traits>* sb);

        basic_ios& copyfmt(const basic_ios& rhs);
        char_type fill() const;
        char_type fill(char_type ch);
        locale imbue(const locale& loc);

        char    narrow(char_type c, char dfault) const;
        char_type widen(char c) const;

        basic_ios(const basic_ios&) = delete;
        basic_ios& operator=(const basic_ios&) = delete;

        protected:
            basic_ios();
            void init(basic_streambuf<charT, traits>* sb);
            void move(basic_ios& rhs);
            void move(basic_ios&& rhs);
            void swap(basic_ios& rhs) noexcept;
            void set_rdbuf(basic_streambuf<charT, traits>* sb);
    }
}
```
31.5.4.2 Constructors

```cpp
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

**Effects**: Assigns initial values to its member objects by calling `init(sb)`.

```cpp
basic_ios();
```

**Effects**: Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```
~basic_ios();
```

**Remarks**: The destructor does not destroy `rdbuf()`.

```cpp
void init(basic_streambuf<charT, traits>* sb);
```
