31.5.4.3 Member functions

```cpp
basic_ostream<charT, traits>* tie() const;
```

**Returns**: An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

```cpp
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

**Preconditions**: If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

**Postconditions**: `tiestr == tie()`.

**Returns**: The previous value of `tie()`.

```cpp
basic_streambuf<charT, traits>* rdbuf() const;
```

**Effects**: Calls `clear()`.

**Postconditions**: `sb == rdbuf()`.

**Returns**: The previous value of `rdbuf()`.

```cpp
locale imbue(const locale& loc);
```

**Effects**: Calls `ios_base::imbue(loc)` (31.5.2.4) and if `rdbuf() != 0` then `rdbuf()->pubimbue(loc)` (31.6.3.3.1).

**Returns**: The prior value of `ios_base::imbue()`.
char narrow(char_type c, char dfault) const;

Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)

char_type widen(char(c) const;

Returns: use_facet<ctype<char_type>>(getloc()).widen(c)

char_type fill() const;

Returns: The character used to pad (fill) an output conversion to the specified field width.

char_type fill(char_type fillch);

Postconditions: traits::eq(fillch, fill()).

Returns: The previous value of fill().

basic_ios& copyfmt(const basic_ios& rhs);

Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects of *this the corresponding member objects of rhs as follows:

(16.1) calls each registered callback pair (fn, idx) as (*fn)(erase_event, *this, idx);
(16.2) then, assigns to the member objects of *this the corresponding member objects of rhs, except that
(16.2.1) rdstate(), rdbuf(), and exceptions() are left unchanged;
(16.2.2) the contents of arrays pointed at by pword and iword are copied, not the pointers themselves;279 and
(16.2.3) if any newly stored pointer values in *this point at objects stored outside the object rhs and those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;
(16.3) then, calls each callback pair that was copied from rhs as (*fn)(copyfmt_event, *this, idx);
(16.4) then, calls exceptions(rhs.exceptions()).

[Note 1: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — end note]

Postconditions: The postconditions of this function are indicated in Table 121.

Table 121: basic_ios::copyfmt() effects

</tr>
</tbody>
</table>

Returns: *this.

void move(basic_ios& rhs);
void move(basic_ios&& rhs);

Postconditions: *this has the state that rhs had before the function call, except that rdbuf() returns nullptr. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it returned before the function call, and rhs.tie() returns nullptr.

279) This suggests an infinite amount of copying, but the implementation can keep track of the maximum element of the arrays that is nonzero.
void swap(basic_ios& rhs) noexcept;
   \textbf{Effects}: The states of *this and rhs are exchanged, except that rdbuf() returns the same value as it returned before the function call, and rhs.rdbuf() returns the same value as it returned before the function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);
   \textbf{Preconditions}: sb != nullptr is true.
   \textbf{Effects}: Associates the basic_streambuf object pointed to by sb with this stream without calling clear().
   \textbf{Postconditions}: rdbuf() == sb is true.
   \textbf{Throws}: Nothing.

31.5.4.4 Flags functions \hfill [iostate.flags]

   \begin{verbatim}
   explicit operator bool() const;
   Returns: !fail().

   bool operator!() const;
   Returns: fail().

   iostate rdstate() const;
   Returns: The error state of the stream buffer.

   void clear(iostate state = goodbit);
   \textbf{Effects}: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Otherwise, the function throws an object of class ios_base::failure (31.5.2.2.1), constructed with implementation-defined argument values.
   \textbf{Postconditions}: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | ios_base::badbit).

   void setstate(iostate state);
   \textbf{Effects}: Calls clear(rdstate() | state) (which may throw ios_base::failure (31.5.2.2.1)).

   bool good() const;
   Returns: rdstate() == 0

   bool eof() const;
   Returns: true if eofbit is set in rdstate().

   bool fail() const;
   Returns: true if failbit or badbit is set in rdstate().\footnote{Checking badbit also for fail() is historical practice.}

   bool bad() const;
   Returns: true if badbit is set in rdstate().

   iostate exceptions() const;
   Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

   void exceptions(iostate except);
   \textbf{Effects}: Calls clear(rdstate()).
   \textbf{Postconditions}: except == exceptions().
\end{verbatim}

31.5.5 ios_base manipulators \hfill [std.ios.manip]

31.5.5.1 fmtflags manipulators \hfill [fmtflags.manip]

\footnote{Each function specified in this subclause is a designated addressable function (16.4.5.2.1).}
ios_base& boolalpha(ios_base& str);
   Effects: Calls str.setf(ios_base::boolalpha).
   Returns: str.

ios_base& noboolalpha(ios_base& str);
   Effects: Calls str.unsetf(ios_base::boolalpha).
   Returns: str.

ios_base& showbase(ios_base& str);
   Effects: Calls str.setf(ios_base::showbase).
   Returns: str.

ios_base& noshowbase(ios_base& str);
   Effects: Calls str.unsetf(ios_base::showbase).
   Returns: str.

ios_base& showpoint(ios_base& str);
   Effects: Calls str.setf(ios_base::showpoint).
   Returns: str.

ios_base& noshowpoint(ios_base& str);
   Effects: Calls str.unsetf(ios_base::showpoint).
   Returns: str.

ios_base& showpos(ios_base& str);
   Effects: Calls str.setf(ios_base::showpos).
   Returns: str.

ios_base& noshowpos(ios_base& str);
   Effects: Calls str.unsetf(ios_base::showpos).
   Returns: str.

ios_base& skipws(ios_base& str);
   Effects: Calls str.setf(ios_base::skipws).
   Returns: str.

ios_base& noskipws(ios_base& str);
   Effects: Calls str.unsetf(ios_base::skipws).
   Returns: str.

ios_base& uppercase(ios_base& str);
   Effects: Calls str.setf(ios_base::uppercase).
   Returns: str.

ios_base& nouppercase(ios_base& str);
   Effects: Calls str.unsetf(ios_base::uppercase).
   Returns: str.

ios_base& unitbuf(ios_base& str);
   Effects: Calls str.setf(ios_base::unitbuf).
   Returns: str.

ios_base& nounitbuf(ios_base& str);
   Effects: Calls str.unsetf(ios_base::unitbuf).
Returns: str.

31.5.5.2 adjustfield manipulators  

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& internal(ios_base& str);
  
  Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).

Returns: str.

ios_base& left(ios_base& str);
  
  Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).

Returns: str.

ios_base& right(ios_base& str);
  
  Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).

Returns: str.

31.5.5.3 basefield manipulators

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& dec(ios_base& str);
  
  Effects: Calls str.setf(ios_base::dec, ios_base::basefield).

Returns: str.

ios_base& hex(ios_base& str);
  
  Effects: Calls str.setf(ios_base::hex, ios_base::basefield).

Returns: str.

ios_base& oct(ios_base& str);
  
  Effects: Calls str.setf(ios_base::oct, ios_base::basefield).

Returns: str.

31.5.5.4 floatfield manipulators

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& fixed(ios_base& str);
  
  Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).

Returns: str.

ios_base& scientific(ios_base& str);
  
  Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).

Returns: str.

ios_base& hexfloat(ios_base& str);
  
  Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).

Returns: str.

[Note 1: ios_base::hex cannot be used to specify a hexadecimal floating-point format, because it is not part of ios_base::floatfield (Table 115). —end note]

ios_base& defaultfloat(ios_base& str);
  
  Effects: Calls str.unsetf(ios_base::floatfield).

Returns: str.

281) The function signature dec(ios_base&) can be called by the function signature basic_ostream& stream::operator<<(ios_base& (*)(ios_base&)) to permit expressions of the form cout << dec to change the format flags stored in cout.
31.5.6 Error reporting

```c++
error_code make_error_code(io_errc e) noexcept;
Returns: error_code(static_cast<int>(e), iostream_category());
```

```c++
error_condition make_error_condition(io_errc e) noexcept;
Returns: error_condition(static_cast<int>(e), iostream_category());
```

```c++
const error_category& iostream_category() noexcept;
Returns: A reference to an object of a type derived from class error_category.
The object’s default_error_condition and equivalent virtual functions shall behave as specified for the class error_category. The object’s name virtual function shall return a pointer to the string "iostream".
```

31.6 Stream buffers

31.6.1 Header <streambuf> synopsis

```c++
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;
    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}
```

The header <streambuf> defines types that control input from and output to character sequences.

31.6.2 Stream buffer requirements

Stream buffers can impose various constraints on the sequences they control. Some constraints are:

1. **The controlled input sequence can be not readable.**
2. **The controlled output sequence can be not writable.**
3. **The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.**
4. **The controlled sequences can support operations directly to or from associated sequences.**
5. **The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.**

Each sequence is characterized by three pointers which, if non-null, all point into the same charT array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

1. **the beginning pointer,** or lowest element address in the array (called xbeg here);
2. **the next pointer,** or next element address that is a current candidate for reading or writing (called xnext here);
3. **the end pointer,** or first element address beyond the end of the array (called xend here).

The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

1. If xnext is not a null pointer, then xbeg and xend shall also be non-null pointers into the same charT array, as described above; otherwise, xbeg and xend shall also be null.
2. If xnext is not a null pointer and xnext < xend for an output sequence, then a write position is available. In this case, *xnext shall be assignable as the next element to write (to put, or to store a character value, into the sequence).
3. If xnext is not a null pointer and xbeg < xnext for an input sequence, then a putback position is available. In this case, xnext[-1] shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
If \texttt{xnext} is not a null pointer and \texttt{xnext < xend} for an input sequence, then a \textit{read position} is available. In this case, \texttt{*xnext} shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 31.6.3 Class template \texttt{basic\_streambuf}

#### 31.6.3.1 General

```cpp
namespace std {
template<class charT, class traits = char_traits<charT>>
class basic_streambuf {
public:
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;
    virtual ~basic_streambuf();

    // 31.6.3.3.1, locales
    locale imbue(const locale& loc);
    locale getloc() const;

    // 31.6.3.3.2, buffer and positioning
    basic_streambuf* setbuf(char_type* s, streamsize n);
    pos_type seekoff(off_type off, ios_base::seekdir way,
                     ios_base::openmode which = ios_base::in | ios_base::out);
    pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out);
    int sync();

    // get and put areas
    // 31.6.3.3.3, get area
    streamsize in_avail();
    int_type snextc();
    int_type sbumpc();
    int_type sgetc();
    streamsize sgetn(char_type* s, streamsize n);

    // 31.6.3.3.4, putback
    int_type sputbackc(char_type c);
    int_type sungetc();

    // 31.6.3.3.5, put area
    int_type sputc(char_type c);
    streamsize sputn(const char_type* s, streamsize n);
}
```

protected:
- basic\_streambuf();
- basic\_streambuf(const basic\_streambuf& rhs);
- basic\_streambuf& operator=(const basic\_streambuf& rhs);

```cpp
void swap(basic\_streambuf& rhs);```

#### 31.6.3.4.2, get area access

```cpp
char_type* eback() const;
char_type* gptr() const;
char_type* gbump(int n);
void setg(char_type* gbeg, char_type* gnext, char_type* gend);
```
The class template `basic_streambuf` serves as an abstract base class for deriving various stream buffers whose objects each control two character sequences:

(1.1) — a character input sequence;
(1.2) — a character output sequence.

### 31.6.3.2 Constructors

```
basic_streambuf();
```

**Effects:** Initializes:

(1.1) — all pointer member objects to null pointers,
(1.2) — the `getloc()` member to a copy the global locale, `locale()`, at the time of construction.

**Remarks:** Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

```
basic_streambuf(const basic_streambuf& rhs);
```

**Postconditions:**

(3.1) — `eback()` == `rhs.eback()`
(3.2) — `gptr()` == `rhs.gptr()`
(3.3) — `egptr()` == `rhs.egptr()`
(3.4) — `pbase()` == `rhs.pbase()`

---

282) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.
Returns: If \texttt{pubimbue()} has ever been called, then the last value of \texttt{loc} supplied, otherwise the current global locale, \texttt{locale()}, in effect at the time of construction. If called after \texttt{pubimbue()} has been called but before \texttt{pubimbue} has returned (i.e., from within the call of \texttt{imbue()}) then it returns the previous value.

31.6.3.3.2 Buffer management and positioning

\begin{verbatim}
locale pubimbue(const locale& loc);

Effects: Calls \texttt{imbue(loc)}.

Postconditions: loc == getloc().

Returns: Previous value of \texttt{getloc()}.

locale getloc() const;

Returns: If \texttt{pubimbue()} has ever been called, then the last value of \texttt{loc} supplied, otherwise the current global locale, \texttt{locale()}, in effect at the time of construction. If called after \texttt{pubimbue()} has been called but before \texttt{pubimbue} has returned (i.e., from within the call of \texttt{imbue()}) then it returns the previous value.

basic_streambuf* pubsetbuf(char_type* s, streamsize n);

Returns: \texttt{setbuf(s, n)}.

pos_type pubseekoff(off_type off, ios_base::seekdir way,
  ios_base::openmode which
  = ios_base::in | ios_base::out);

Returns: \texttt{seekoff(off, way, which)}.

pos_type pubseekpos(pos_type sp,
  ios_base::openmode which
  = ios_base::in | ios_base::out);

Returns: \texttt{seekpos(sp, which)}.

int pubsync();

Returns: \texttt{sync()}.
\end{verbatim}

31.6.3.3.3 Get area

\begin{verbatim}
streamsize in_avail();

Returns: If a read position is available, returns \texttt{egptr()} - \texttt{gptr()}. Otherwise returns \texttt{showmanyc()} (31.6.3.5.3).

int_type snextc();

Effects: Calls \texttt{sbumpc()}.

Returns: If that function returns \texttt{traits::eof()}, returns \texttt{traits::eof()}. Otherwise, returns \texttt{sgetc()}.

int_type sbumpc();

Effects: If the input sequence read position is not available, returns \texttt{uflow()}. Otherwise, returns \texttt{traits::to_int_type(*gptr())} and increments the next pointer for the input sequence.

int_type sgetc();

Returns: If the input sequence read position is not available, returns \texttt{underflow()}. Otherwise, returns \texttt{traits::to_int_type(*gptr())}.
\end{verbatim}
streamsize sgetn(char_type* s, streamsize n);

Returns: xsgetn(s, n).

31.6.3.3.4 Putback

int_type sputbackc(char_type c);

Effects: If the input sequence putback position is not available, or if traits::eq(c, gptr()[−1]) is false, returns pbackfail(traits::to_int_type(c)). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

int_type sungetc();

Effects: If the input sequence putback position is not available, returns pbackfail(). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

31.6.3.3.5 Put area

int_type sputc(char_type c);

Effects: If the output sequence write position is not available, returns overflow(traits::to_int_type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and returns traits::to_int_type(c).

streamsize sputn(const char_type* s, streamsize n);

Returns: xsputn(s, n).

31.6.3.4 Protected member functions

31.6.3.4.1 Assignment

basic_streambuf& operator=(const basic_streambuf& rhs);

Postconditions:

(1.1) eback() == rhs.eback()
(1.2) gptr() == rhs.gptr()
(1.3) egptr() == rhs.egptr()
(1.4) pbase() == rhs.pbase()
(1.5) pptr() == rhs.pptr()
(1.6) eptr() == rhs.eptr()
(1.7) getloc() == rhs.getloc()

Returns: *this.

void swap(basic_streambuf& rhs);

Effects: Swaps the data members of rhs and *this.

31.6.3.4.2 Get area access

char_type* eback() const;

Returns: The beginning pointer for the input sequence.

char_type* gptr() const;

Returns: The next pointer for the input sequence.

char_type* egptr() const;

Returns: The end pointer for the input sequence.

void gbump(int n);

Effects: Adds n to the next pointer for the input sequence.

void setg(char_type* gbeg, char_type* gnext, char_type* gend);

Postconditions: gbeg == eback(), gnext == gptr(), and gend == egptr() are all true.
31.6.3.4.3 Put area access

char_type* pbase() const;

Returns: The beginning pointer for the output sequence.

char_type* pptr() const;

Returns: The next pointer for the output sequence.

char_type* epptr() const;

Returns: The end pointer for the output sequence.

void pbump(int n);

Effects: Adds n to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);

Postconditions: pbeg == pbase(), pbeg == pptr(), and pend == epptr() are all true.

31.6.3.5 Virtual functions

31.6.3.5.1 Locales

void imbue(const locale&);

Effects: Change any translations based on locale.

Remarks: Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

Default behavior: Does nothing.

31.6.3.5.2 Buffer management and positioning

basic_streambuf* setbuf(char_type* s, streamsize n);

Effects: Influences stream buffering in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2.5, 31.10.2.5).

Default behavior: Does nothing. Returns this.

pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2.5, 31.10.2.5).

Default behavior: Returns pos_type(off_type(-1)).

pos_type seekpos(pos_type sp, 
    ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2, 31.10.2).

Default behavior: Returns pos_type(off_type(-1)).

int sync();

Effects: Synchronizes the controlled sequences with the arrays. That is, if pbase() is non-null the characters between pbase() and pptr() are written to the controlled sequence. The pointers may then be reset as appropriate.

Returns: -1 on failure. What constitutes failure is determined by each derived class (31.10.2.5).

Default behavior: Returns zero.
31.6.3.5.3 Get area

streamsize showmanyc();

Returns: An estimate of the number of characters available in the sequence, or −1. If it returns a positive value, then successive calls to underflow() will not return traits::eof() until at least that number of characters have been extracted from the stream. If showmanyc() returns −1, then calls to underflow() or uflow() will fail.

Default behavior: Returns zero.

Remarks: Uses traits::eof().

streamsize xsgetn(char_type* s, streamsize n);

Effects: Assigns up to n characters to successive elements of the array whose first element is designated by s. The characters assigned are read from the input sequence as if by repeated calls to sbumpc(). Assigning stops when either n characters have been assigned or a call to sbumpc() would return traits::eof().

Returns: The number of characters assigned.

Remarks: Uses traits::eof().

int_type underflow();

The pending sequence of characters is defined as the concatenation of

(7.1) — the empty sequence if gp\texttt{tr}() is null, otherwise the characters in [gp\texttt{tr}(), eg\texttt{ptr}()) followed by

(7.2) — some (possibly empty) sequence of characters read from the input sequence.

The result character is the first character of the pending sequence if it is non-empty, otherwise the next character that would be read from the input sequence.

The backup sequence is the empty sequence if e\texttt{back}() is null, otherwise the characters in [e\texttt{back}(), gp\texttt{tr}()).

Effects: The function sets up the gp\texttt{tr}() and eg\texttt{ptr}() such that if the pending sequence is non-empty, then eg\texttt{ptr}() is non-null and the characters in [gp\texttt{tr}(), eg\texttt{ptr}()) are the characters in the pending sequence, otherwise either gp\texttt{tr}() is null or gp\texttt{tr}() == eg\texttt{ptr}().

If e\texttt{back}() and gp\texttt{tr}() are non-null then the function is not constrained as to their contents, but the “usual backup condition” is that either

(11.1) — the backup sequence contains at least gp\texttt{tr}() - e\texttt{back}() characters, in which case the characters in [e\texttt{back}(), gp\texttt{tr}()) agree with the last gp\texttt{tr}() - e\texttt{back}() characters of the backup sequence, or

(11.2) — the characters in [gp\texttt{tr}() - n, gp\texttt{tr}()) agree with the backup sequence (where n is the length of the backup sequence).

Returns: traits::to_int_type(c), where c is the first character of the pending sequence, without moving the input sequence position past it. If the pending sequence is null then the function returns traits::eof() to indicate failure.

Default behavior: Returns traits::eof().

Remarks: The public members of basic_streambuf call this virtual function only if gp\texttt{tr}() is null or gp\texttt{tr}() >= eg\texttt{ptr}().

int_type uflow();

Preconditions: The constraints are the same as for underflow(), except that the result character is transferred from the pending sequence to the backup sequence, and the pending sequence is not empty before the transfer.

---

283) The morphemes of showmanyc are “es-how-many-see”, not “show-manic”.

284) underflow or uflow can fail by throwing an exception prematurely. The intention is not only that the calls will not return eof() but that they will return “immediately”.

285) Classes derived from basic_streambuf can provide more efficient ways to implement xsgetn() and xsputn() by overriding these definitions from the base class.
Default behavior: Calls underflow(). If underflow() returns traits::eof(), returns traits::eof(). Otherwise, returns the value of traits::to_int_type(*gptr()) and increment the value of the next pointer for the input sequence.

Returns: traits::eof() to indicate failure.

31.6.3.5.4 Putback

int_type pbackfail(int_type c = traits::eof());

The pending sequence is defined as for underflow(), with the modifications that
(1.1) — If traits::eq_int_type(c, traits::eof()) returns true, then the input sequence is backed up one character before the pending sequence is determined.
(1.2) — If traits::eq_int_type(c, traits::eof()) returns false, then c is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

Postconditions: On return, the constraints of gptr(), eback(), and pptr() are the same as for underflow().

Returns: traits::eof() to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. pbackfail() is called only when put back has really failed.

Returns some value other than traits::eof() to indicate success.

Default behavior: Returns traits::eof().

Remarks: The public functions of basic_streambuf call this virtual function only when gptr() is null, gptr() == eback(), or traits::eq(traits::to_char_type(c), gptr()[-1]) returns false. Other calls shall also satisfy that constraint.

31.6.3.5.5 Put area

streamsize xsputn(const char_type* s, streamsize n);

Effects: Writes up to n characters to the output sequence as if by repeated calls to sputc(c). The characters written are obtained from successive elements of the array whose first element is designated by s. Writing stops when either n characters have been written or a call to sputc(c) would return traits::eof(). It is unspecified whether the function calls overflow() when pptr() == epptr() becomes true or whether it achieves the same effects by other means.

Returns: The number of characters written.

int_type overflow(int_type c = traits::eof());

Effects: Consumes some initial subsequence of the characters of the pending sequence. The pending sequence is defined as the concatenation of
(3.1) — the empty sequence if pbase() is null, otherwise the pptr() - pbase() characters beginning at pbase(), followed by
(3.2) — the empty sequence if traits::eq_int_type(c, traits::eof()) returns true, otherwise the sequence consisting of c.

Preconditions: Every overriding definition of this virtual function obeys the following constraints:
(4.1) — The effect of consuming a character on the associated output sequence is specified.\(^ {286} \)
(4.2) — Let r be the number of characters in the pending sequence not consumed. If r is nonzero then pbase() and pptr() are set so that: pptr() - pbase() == r and the r characters starting at pbase() are the associated output stream. In case r is zero (all characters of the pending sequence have been consumed) then either pbase() is set to nullptr, or pbase() and pptr() are both set to the same non-null value.
(4.3) — The function may fail if either appending some character to the associated output stream fails or if it is unable to establish pbase() and pptr() according to the above rules.

\(^ {286} \) That is, for each class derived from a specialization of basic_streambuf in this Clause (31.8.2, 31.10.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.
Returns: traits::eof() or throws an exception if the function fails.
Otherwise, returns some value other than traits::eof() to indicate success.\footnote{Typically, overflow returns c to indicate success, except when traits::eq_int_type(c, traits::eof()) returns true, in which case it returns traits::not_eof(c).}

Default behavior: Returns traits::eof().

Remarks: The member functions sputc() and sputn() call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

31.7 Formatting and manipulators \[iostream.format\]

31.7.1 Header \(<\text{istream}>\) synopsis \[istream.syn\]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_iostream;

    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template<class Istream, class T>
    Istream&& operator>>(Istream&& is, T&& x);
}
```

31.7.2 Header \(<\text{ostream}>\) synopsis \[ostream.syn\]

```cpp
namespace std {

template<class charT>
unspecified put_time(const tm* tmb, const charT* fmt);

31.7.4 Input streams

31.7.4.1 General

The header <istream> defines two class templates and a function template that control input from a stream buffer, along with a function template that extracts from stream rvalues.

31.7.4.2 Class template basic_istream

31.7.4.2.1 General

namespace std {
  template<class charT, class traits, class Allocator>
  unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('"'));
  template<class charT, class traits, class Allocator>
  unspecified quoted(const basic_string<charT, traits, Allocator>& s,
                     charT delim = charT('"'), charT escape = charT('"'));
  template<class charT, class traits, class Allocator>
  unspecified quoted(basic_string_view<charT, traits> s,
                     charT delim = charT('"'), charT escape = charT('"'));
}
The class template `basic_istream` defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.
Two groups of member function signatures share common properties: the *formatted input functions* (or *extractors*) and the *unformatted input functions*. Both groups of input functions are described as if they obtain (or extract) input *characters* by calling \texttt{rdbuf()\texttt{\rightarrow sbumpc}} or \texttt{rdbuf()\texttt{\rightarrow sgetc}}. They may use other public members of \texttt{istream}.

If \texttt{rdbuf()\texttt{\rightarrow sbumpc}} or \texttt{rdbuf()\texttt{\rightarrow sgetc}} returns \texttt{traits::eof()}, then the input function, except as explicitly noted otherwise, completes its actions and does \texttt{setstate(eofbit)}, which may throw \texttt{ios\_base::failure} (31.5.4.4), before returning.

If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets \texttt{badbit} in the error state. If \texttt{badbit} is set in \texttt{exceptions()}, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

### 31.7.4.2.2 Constructors

```cpp
explicit basic_istream(basic_streambuf<charT, traits>* sb);
```

*Effects:* Initializes the base class subobject with \texttt{basic_ios::init(sb)} (31.5.4.2).

*Postconditions:* \texttt{gcount() == 0}.

```cpp
basic_istream(basic_istream&& rhs);
```

*Effects:* Default constructs the base class, copies the \texttt{gcount()} from \texttt{rhs}, calls \texttt{basic_ios<charT, traits>::move(rhs)} to initialize the base class, and sets the \texttt{gcount()} for \texttt{rhs} to 0.

```cpp
virtual ~basic_istream();
```

*Remarks:* Does not perform any operations of \texttt{rdbuf()}.

### 31.7.4.2.3 Assignment and swap

```cpp
basic_istream& operator=(basic_istream&& rhs);
```

*Effects:* Equivalent to: \texttt{swap(rhs)}.

*Returns:* \texttt{*this}.

```cpp
void swap(basic_istream& rhs);
```

*Effects:* Calls \texttt{basic_ios<charT, traits>::swap(rhs)}. Exchanges the values returned by \texttt{gcount()} and \texttt{rhs.gcount()}.  

### 31.7.4.2.4 Class basic_istream::sentry

```cpp
namespace std {
    template<class charT, class traits>
    class basic_istream<charT, traits>::sentry {
        bool ok_; // exposition only
        public:
            explicit sentry(basic_istream& is, bool noskipws = false);
            ~sentry();
            explicit operator bool() const { return ok_; }
            sentry(const sentry&); // delete;
            sentry& operator=(const sentry&); // delete;
    };
}
```

*The class \texttt{sentry} defines a class that is responsible for doing exception safe prefix and suffix operations.*

```cpp
explicit sentry(basic_istream& is, bool noskipws = false);
```

*Effects:* If \texttt{is.good()} is \texttt{false}, calls \texttt{is.setstate(failbit)}. Otherwise, prepares for formatted or unformatted input. First, if \texttt{is.tie()} is not a null pointer, the function calls \texttt{is.tie()\texttt{\rightarrow flush}} to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of \texttt{is.tie()} is empty. Further an implementation is allowed to defer the call to \texttt{flush} until a call of \texttt{is.rdbuf()\texttt{\rightarrow underflow}} occurs. If no such call occurs before

§ 31.7.4.2.4 1517
the `sentry` object is destroyed, the call to `flush` may be eliminated entirely. If `noskipws` is zero and `is.flags() & ios_base::skipws` is nonzero, the function extracts and discards each character as long as the next available input character `c` is a whitespace character. If `is.rdbuf()->sbumpc()` or `is.rdbuf()->sgetc()` returns `traits::eof()`, the function calls `setstate(failbit | eofbit)` (which may throw `ios_base::failure`).

Remarks: The constructor

```cpp
class sentry
{
public:
    explicit sentry(basic_istream& is, bool noskipws = false)
    uses the currently imbued locale in `is`, to determine whether the next input character is whitespace or not.

To decide if the character `c` is a whitespace character, the constructor performs as if it executes the following code fragment:

```cpp
const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
if (ctype.is(ctype.space, c) != 0)
    // `c` is a whitespace character.
```cpp
```

If, after any preparation is completed, `is.good()` is true, `ok_` != false otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure`).

```cpp
~sentry();
```cpp
```

Effects: None.

```cpp
explicit operator bool() const;
```cpp
```
Returns: `ok_`.

31.7.4.3 Formatted input functions [istream.formatted]
31.7.4.3.1 Common requirements [istream.formatted.reqmts]

Each formatted input function begins execution by constructing an object of class `sentry` with the `noskipws` (second) argument false. If the `sentry` object returns true, when converted to a value of type `bool`, the function endeavors to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is turned on in `*this`’s error state. If `(exceptions()&badbit) != 0` then the exception is rethrown. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

31.7.4.3.2 Arithmetic extractors [istream.formatted.arithmetic]

```cpp
basic_istream& operator>>(unsigned short& val);
basic_istream& operator>>(unsigned int& val);
basic_istream& operator>>(long& val);
basic_istream& operator>>(unsigned long& val);
basic_istream& operator>>(long long& val);
basic_istream& operator>>(unsigned long long& val);
basic_istream& operator>>(float& val);
basic_istream& operator>>(double& val);
basic_istream& operator>>(long double& val);
basic_istream& operator>>(bool& val);
basic_istream& operator>>(void*& val);
```cpp
```

As in the case of the inserters, these extractors depend on the locale’s `num_get<>` (30.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.4.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment:

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iosstate err = iostate::goodbit;
use_facet<numget>(loc).get(*this, 0, *this, err, val);
setstate(err);
```cpp
```

288) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.

289) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

290) This is done without causing an `ios_base::failure` to be thrown.
In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[Note 1: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — end note]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```cpp
basic_istream& operator>>(short& val);
```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iosstate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<short>::max();
} else
    val = static_cast<short>(lval);
setstate(err);
```

```cpp
basic_istream& operator>>(int& val);
```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iosstate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
setstate(err);
```

### 31.7.4.3.3 `basic_istream::operator>>` [istream.extractors]

```cpp
1
basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
```

**Effects**: None. This extractor does not behave as a formatted input function (as described in 31.7.4.3.1).

**Returns**: `pf(*this)`.

```cpp
2
basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

**Effects**: Calls `pf(*this)`. This extractor does not behave as a formatted input function (as described in 31.7.4.3.1).

**Returns**: `*this`.

```cpp
3
basic_istream& operator>>(ios_base& (*pf)(ios_base&));
```

**Effects**: Calls `pf(*this)`.

**Returns**: `*this`.

---

291) See, for example, the function signature `ws(basic_istream&)` (31.7.4.5).
292) See, for example, the function signature `dec(ios_base&)` (31.5.5.3).
template<class charT, class traits, size_t N>
    basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);

Effects: Behaves like a formatted input member (as described in 31.7.4.3.1) of in. After a sentry object is constructed, operator>> extracts characters and stores them into s. If width() is greater than zero, n is min(size_t(width())), N). Otherwise n is N. n is the maximum number of characters stored.

Characters are extracted and stored until any of the following occurs:

- n-1 characters are stored;
- end of file occurs on the input sequence;
- letting ct be use_facet<ctype<charT>>(in.getloc()), ct.is(ct.space, c) is true.

operator>> then stores a null byte (charT()) in the next position, which may be the first position if no characters were extracted. operator>> then calls width(0).

If the function extracted no characters, it calls setstate(failbit), which may throw ios_base::failure (31.5.4.4).

Returns: in.

Effects: Behaves like a formatted input member (as described in 31.7.4.3.1) of in. After a sentry object is constructed a character is extracted from in, if one is available, and stored in c. Otherwise, the function calls in.setstate(failbit).

Returns: in.

Effects: Behaves as an unformatted input function (31.7.4.4). If sb is null, calls setstate(failbit), which may throw ios_base::failure (31.5.4.4). After a sentry object is constructed, extracts characters from *this and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:

- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);
- an exception occurs (in which case the exception is caught).

If the function inserts no characters, it calls setstate(failbit), which may throw ios_base::failure (31.5.4.4). If it inserted no characters because it caught an exception thrown while extracting characters from *this and failbit is set in exceptions() (31.5.4.4), then the caught exception is rethrown.

Returns: *this.

31.7.4.4 Unformatted input functions

Each unformatted input function begins execution by constructing an object of class sentry with the default argument noskipws (second) argument true. If the sentry object returns true, when converted to a value of type bool, the function endeavors to obtain the requested input. Otherwise, if the sentry constructor exits by throwing an exception or if the sentry object returns false, when converted to a value of type bool, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using charT()) in the first location of the array. If an exception is thrown during input then
ios_base::badbit is turned on in *this’s error state. (Exceptions thrown from basic_ios<>::clear() are not caught or rethrown.) If (exceptions()&badbit) != 0 then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the sentry object is destroyed before leaving the unformatted input function.

streamsize gcount() const;

Effects: None. This member function does not behave as an unformatted input function (as described above).

Returns: The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns numeric_limits<streamsize>::max().

int_type get();

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts a character c, if one is available. Otherwise, the function calls setstate(failbit), which may throw ios_base::failure (31.5.4.4).

Returns: c if available, otherwise traits::eof().

basic_istream& get(char_type& c);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts a character, if one is available, and assigns it to c. Otherwise, the function calls setstate(failbit) (which may throw ios_base::failure (31.5.4.4)).

Returns: *this.

basic_istream& get(char_type* s, streamsize n, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by s. Characters are extracted and stored until any of the following occurs:

1. n is less than one or n - 1 characters are stored;
2. end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit));
3. traits::eq(c, delim) for the next available input character c (in which case c is not extracted).

If the function stores no characters, it calls setstate(failbit) (which may throw ios_base::failure (31.5.4.4)). In any case, if n is greater than zero it then stores a null character into the next successive location of the array.

Returns: *this.

basic_istream& get(char_type* s, streamsize n);

Effects: Calls get(s, n, widen(’\n’)).

Returns: Value returned by the call.

basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:

1. end-of-file occurs on the input sequence;
2. inserting in the output sequence fails (in which case the character to be inserted is not extracted);
3. traits::eq(c, delim) for the next available input character c (in which case c is not extracted);
4. an exception occurs (in which case, the exception is caught but not rethrown).

If the function inserts no characters, it calls setstate(failbit) (which may throw ios_base::failure (31.5.4.4)).

Notes:

293) This is done without causing an ios_base::failure to be thrown.
294) Note that this function is not overloaded on types signed char and unsigned char.
295) Note that this function is not overloaded on types signed char and unsigned char.
Returns: *this.

`basic_istream& get(basic_streambuf<char_type, traits>& sb);`

**Effects:** Calls `get(sb, widen('
'))`.

**Returns:** Value returned by the call.

`basic_istream& getline(char_type* s, streamsize n, char_type delim);`

**Effects:** Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by `s`. Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`);
2. `traits::eq(c, delim)` for the next available input character `c` (in which case the input character is extracted but not stored);
3. `n` is less than one or `n - 1` characters are stored (in which case the function calls `setstate(failbit)`).

These conditions are tested in the order shown.

If the function extracts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)).

In any case, if `n` is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

**Returns:** *this.

[Example 1:]
```cpp
#include <iostream>

int main() {
  using namespace std;
  const int line_buffer_size = 100;

  char buffer[line_buffer_size];
  int line_number = 0;
  while (cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
    int count = cin.gcount();
    if (cin.eof())
      cout << "Partial final line";  // cin.fail() is false
    else if (cin.fail()) {
      cout << "Partial long line";
      cin.clear(cin.rdstate() & ~ios_base::failbit);
    } else {
      count--;  // Don't include newline in count
      cout << "Line " << ++line_number;
    }
    cout << " (" << count << " chars): " << buffer << endl;
  }
}
```

**Returns:** `getline(s, n, widen('\n'))`

---

296) Note that this function is not overloaded on types `signed char` and `unsigned char`.

297) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.

298) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.

299) This implies an empty input line will not cause `failbit` to be set.
basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:

- \( n \neq \text{numeric\_limits<streamsize>::max()} \) (17.3.5) and \( n \) characters have been extracted so far
- end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (31.5.4.4));
- \( \text{traits::eq\_int\_type(traits::to\_int\_type(c), delim)} \) for the next available input character \( c \) (in which case \( c \) is extracted).

[Note 1: The last condition will never occur if \( \text{traits::eq\_int\_type(delim, traits::eof())} \). —end note]

Returns: *this.

int_type peek();

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.

Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

basic_istream& read(char_type* s, streamsize n);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by \( s \). Characters are extracted and stored until either of the following occurs:

- \( n \) characters are stored;
- end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (31.5.4.4)).

Returns: *this.

streamsize readsome(char_type* s, streamsize n);

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by \( s \). If \( \text{rdbuf() -> in\_avail()} == -1 \), calls setstate(eofbit) (which may throw ios_base::failure (31.5.4.4)), and extracts no characters; otherwise extracts \( \min(\text{rdbuf() -> in\_avail()}, n) \).

Returns: The number of characters extracted.

basic_istream& putback(char_type c);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputbackc(c). If rdbuf() is null, or if sputbackc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

[Note 2: This function extracts no characters, so the value returned by the next call to gcount() is 0. —end note]

Returns: *this.

basic_istream& unget();

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sungetc(). If rdbuf() (300) Note that this function is not overloaded on types signed char and unsigned char.
is null, or if `sungetc` returns `traits::eof()`, calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)).

[Note 3: This function extracts no characters, so the value returned by the next call to `gcount()` is 0. — end note]

Returns: *this.

```cpp
int sync();
```

**Effects:** Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `rdbuf()` is a null pointer, returns -1. Otherwise, calls `rdbuf()->pubsync()` and, if that function returns -1 calls `setstate(badbit)` (which may throw `ios_base::failure` (31.5.4.4)), and returns -1. Otherwise, returns zero.

```cpp
pos_type tellg();
```

**Effects:** Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `gcount()`.

Returns: After constructing a `sentry` object, if `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, in)`.

```cpp
basic_istream& seekg(pos_type pos);
```

**Effects:** Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

Returns: *this.

```cpp
basic_istream& seekg(off_type off, ios_base::seekdir dir);
```

**Effects:** Behaves as an unformatted input function (as described above), except that the function first clears `eofbit`, does not count the number of characters extracted, and does not affect the value returned by subsequent calls to `gcount()`. After constructing a `sentry` object, if `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::in)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

Returns: *this.

### 31.7.4.5 Standard basic_istream manipulators

Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

```cpp
template<class charT, class traits>
basic_istream<charT, traits>&& ws(basic_istream<charT, traits>&& is);
```

**Effects:** Behaves as an unformatted input function (31.7.4.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to `is.gcount()`. After constructing a `sentry` object extracts characters as long as the next available character `c` is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by `sentry::sentry` (31.7.4.2.4). If `ws` stops extracting characters because there are no more available it sets `eofbit`, but not `failbit`.

Returns: `is`.

### 31.7.4.6 Rvalue stream extraction

```cpp
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

**Constraints:** The expression `is >> std::forward<T>(x)` is well-formed when treated as an unevaluated operand (7.2.3) and `Istream` is publicly and unambiguously derived from `ios_base`.

**Effects:** Equivalent to:
is >> std::forward<T>(x);
return std::move(is);

31.7.4.7  Class template basic_iostream

31.7.4.7.1  General

namespace std {

template<class charT, class traits = char_traits<charT>>
class basic_iostream
  : public basic_istream<charT, traits>,
    public basic_ostream<charT, traits> {

public:

  using char_type = charT;
  using int_type = typename traits::int_type;
  using pos_type = typename traits::pos_type;
  using off_type = typename traits::off_type;
  using traits_type = traits;

  // 31.7.4.7.2, constructor
  explicit basic_iostream(basic_streambuf<charT, traits>* sb);

  // 31.7.4.7.3, destructor
  virtual ~basic_iostream();

private:

  // 31.7.4.7.2, constructor
  basic_iostream(const basic_iostream&) = delete;
  basic_iostream(basic_iostream&& rhs);

  // 31.7.4.7.4, assignment and swap
  basic_iostream& operator=(const basic_iostream& rhs);
  basic_iostream& operator=(basic_iostream&& rhs);
  void swap(basic_iostream& rhs);

};

}  // namespace std

1 The class template basic_iostream inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.4.7.2  Constructors

explicit basic_iostream(basic_streambuf<charT, traits>* sb);

1 Effects: Initializes the base class subobjects with basic_istream<charT, traits>(sb) (31.7.4.2) and basic_ostream<charT, traits>(sb) (31.7.5.2).

2 Postconditions: rdbuf() == sb and gcount() == 0.

basic_iostream(basic_iostream&& rhs);

Effects: Move constructs from the rvalue rhs by constructing the basic_istream base class with move(rhs).

31.7.4.7.3  Destructor

virtual ~basic_iostream();

1 Remarks: Does not perform any operations on rdbuf().

31.7.4.7.4  Assignment and swap

basic_iostream& operator=(basic_iostream&& rhs);

1 Effects: Equivalent to: swap(rhs).

void swap(basic_iostream& rhs);

2 Effects: Calls basic_istream<charT, traits>::swap(rhs).
31.7.5 Output streams

31.7.5.1 General

The header `<ostream>` defines a class template and several function templates that control output to a stream buffer, along with a function template that inserts into stream rvalues.

31.7.5.2 Class template basic_ostream

31.7.5.2.1 General

namespace std {
    template<class charT, class traits = char_traits<charT> >
    class basic_ostream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (31.5.4))
        using char_type       = charT;
        using int_type        = typename traits::int_type;
        using pos_type        = typename traits::pos_type;
        using off_type        = typename traits::off_type;
        using traits_type     = traits;

        // 31.7.5.2.2, constructor/destructor
        explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
        virtual ~basic_ostream();

        // 31.7.5.2.3, prefix/suffix
        class sentry;

        // 31.7.5.2.4, formatted output
        basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
        basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
        basic_ostream& operator<<(bool n);
        basic_ostream& operator<<(short n);
        basic_ostream& operator<<(unsigned short n);
        basic_ostream& operator<<(int n);
        basic_ostream& operator<<(unsigned int n);
        basic_ostream& operator<<(long n);
        basic_ostream& operator<<(unsigned long n);
        basic_ostream& operator<<(long long n);
        basic_ostream& operator<<(unsigned long long n);
        basic_ostream& operator<<(float f);
        basic_ostream& operator<<(double f);
        basic_ostream& operator<<(long double f);
        basic_ostream& operator<<(const void* p);
        basic_ostream& operator<<(const volatile void* p);
        basic_ostream& operator<<(nullptr_t);
        basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);

        // 31.7.5.2.5, unformatted output
        basic_ostream& put(char_type c);
        basic_ostream& write(const char_type* s, streamsize n);
        basic_ostream& flush();

        // 31.7.5.2.6, seeks
        pos_type tellp();
        basic_ostream& seekp(pos_type);
        basic_ostream& seekp(off_type, ios_base::seekdir);

    protected:
        // 31.7.5.2.7, copy/move constructor
        basic_ostream(const basic_ostream&) = delete;
        basic_ostream(basic_ostream& rhs);
// 31.7.5.2.3, assignment and swap
basic_ostream basic_ostream\(\) = delete;
basic_ostream basic_ostream\& operator=(const basic_ostream\&) = delete;
void swap(basic_ostream\& rhs);
);

// 31.7.5.3.4, character inserters

// § 31.7.5.2.1 1527
The class template basic_ostream defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the formatted output functions (or inserters) and the unformatted output functions. Both groups of output functions generate (or insert) output characters by actions equivalent to calling rdbuf()->sputc(int_type). They may use other public members of basic_ostream except that they shall not invoke any virtual members of rdbuf() except overflow(), xsputn(), and sync().

If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets badbit in the error state. If badbit is set in exceptions(), the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

[Note 1: The deleted overloads of operator<< prevent formatting characters as integers and strings as pointers. —end note]

§ 31.7.5.2.2  Constructors
[ostream.cons]

---

§ 31.7.5.2.3  Assignment and swap
[ostream.assign]

---

§ 31.7.5.2.4  Class basic_ostream::sentry
[ostream.sentry]

---

1 The class sentry defines a class that is responsible for doing exception safe prefix and suffix operations.
explicit sentry(basic_ostream& os);

2 If os.good() is nonzero, prepares for formatted or unformatted output. If os.tie() is not a null pointer, calls os.tie()->flush().

3 If, after any preparation is completed, os.good() is true, ok_ == true otherwise, ok_ == false. During preparation, the constructor may call setstate(failbit) (which may throw ios_base::failure (31.5.4.4)).

~sentry();

4 If (os.flags() & ios_base::unitbuf) && !uncaught_exceptions() && os.good() is true, calls os.rdbuf()->pubsync(). If that function returns −1, sets badbit in os.rdstate() without propagating an exception.

explicit operator bool() const;

5 Effects: Returns ok_.

31.7.5.2.5 Seek members [ostream.seeks]

Each seek member function begins execution by constructing an object of class sentry. It returns by destroying the sentry object.

pos_type tellp();

2 Returns: If fail() != false, returns pos_type(-1) to indicate failure. Otherwise, returns rdbuf()->pubseekoff(0, cur, out).

basic_ostream& seekp(pos_type pos);

3 Effects: If fail() != true, executes rdbuf()->pubseekpos(pos, ios_base::out). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

4 Returns: *this.

basic_ostream& seekp(off_type off, ios_base::seekdir dir);

5 Effects: If fail() != true, executes rdbuf()->pubseekoff(off, dir, ios_base::out). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

6 Returns: *this.

31.7.5.3 Formatted output functions [ostream.formatted]

31.7.5.3.1 Common requirements [ostream.formatted.reqmts]

Each formatted output function begins execution by constructing an object of class sentry. If that object returns true when converted to a value of type bool, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does setstate(ios_base::failbit), which can throw an exception. If an exception is thrown during output, then ios_base::badbit is turned on in *this’s error state. If (exceptions()&badbit) != 0 then the exception is rethrown. Whether or not an exception is thrown, the sentry object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is *this.

The descriptions of the individual formatted output functions describe how they perform output and do not mention the sentry object.

3 If a formatted output function of a stream os determines padding, it does so as follows. Given a charT character sequence seq where charT is the character type of the stream, if the length of seq is less than os.width(), then enough copies of os.fill() are added to this sequence as necessary to pad to a width of os.width() characters. If (os.flags() & ios_base::adjustfield) == ios_base::left is true, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

31.7.5.3.2 Arithmetic inserters [ostream.inserters.arithmetic]

basic_ostream& operator<<(bool val);

basic_ostream& operator<<(short val);

301) The call os.tie()->flush() does not necessarily occur if the function can determine that no synchronization is necessary.

302) The sentry constructor and destructor can also perform additional implementation-dependent operations.

303) This is done without causing an ios_base::failure to be thrown.
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);

Effects: The classes num_get< and num_put<> handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued locale value to perform numeric formatting. When val is of type bool, long, unsigned long, long long, unsigned long long, double, long double, or const void*, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
  >(getloc()).put(*this, *this, fill(), val).failed();
```

When val is of type short the formatting conversion occurs as if it performed the following code fragment:

```cpp
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
  >(getloc()).put(*this, *this, fill(),
      baseflags == ios_base::oct || baseflags == ios_base::hex
      ? static_cast<long>(static_cast<unsigned short>(val))
      : static_cast<long>(val)).failed();
```

When val is of type int the formatting conversion occurs as if it performed the following code fragment:

```cpp
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
  >(getloc()).put(*this, *this, fill(),
      baseflags == ios_base::oct || baseflags == ios_base::hex
      ? static_cast<long>(static_cast<unsigned int>(val))
      : static_cast<long>(val)).failed();
```

When val is of type unsigned short or unsigned int the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
  >(getloc()).put(*this, *this, fill(),
      static_cast<unsigned long>(val)).failed();
```

When val is of type float the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
  >(getloc()).put(*this, *this, fill(),
      static_cast<long>(val)).failed();
```

The first argument provides an object of the ostreambuf_iterator<> class which is an iterator for class basic_ostream<. It bypasses ostream and uses streambufs directly. Class locale relies on these types as its interface to iostreams, since for flexibility it has been abstracted away from direct dependence on ostream. The second parameter is a reference to the base class subobject of type ios_base. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If failed is true then does setstate(badbit), which may throw an exception, and returns.

Returns: *this.
basic_ostream& operator<<(const volatile void* p);

Effects: Equivalent to: return operator<<(const_cast<const void*>(p));

31.7.5.3.3 basic_ostream::operator<<

basic_ostream& operator<<(basic_ostream& (*)(basic_ostream&));

Effects: None. Does not behave as a formatted output function (as described in 31.7.5.3.1).
Returns: *this.

basic_ostream& operator<<(basic_ios<charT, traits>& (*)(basic_ios<charT, traits>&));

Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described in 31.7.5.3.1).
Returns: *this.

basic_ostream& operator<<(ios_base& (*)(ios_base&));

Effects: Calls pf(*this). This inserter does not behave as a formatted output function (as described in 31.7.5.3.1).
Returns: *this.

basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);

Effects: Behaves as an unformatted output function (31.7.5.4). After the sentry object is constructed, if sb is null calls setstate(badbit) (which may throw ios_base::failure).

Gets characters from sb and inserts them in *this. Characters are read from sb and inserted until any of the following occurs:

(8.1) end-of-file occurs on the input sequence;
(8.2) inserting in the output sequence fails (in which case the character to be inserted is not extracted);
(8.3) an exception occurs while getting a character from sb.

If the function inserts no characters, it calls setstate(failbit) (which may throw ios_base::failure). If an exception was thrown while extracting a character, the function sets failbit in the error state, and if failbit is set in exceptions() the caught exception is rethrown.

Returns: *this.

basic_ostream& operator<<(nullptr_t);

Effects: Equivalent to:
return *this << s;
where s is an implementation-defined NTCTS (3.37).

31.7.5.3.4 Character inserter function templates

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);

// specialization
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);

// signed and unsigned
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, signed char c);

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, unsigned char c);

Effects: Behaves as a formatted output function (31.7.5.3.1) of out. Constructs a character sequence seq. If c has type char and the character type of the stream is not char, then seq consists of

304) See, for example, the function signature endl(basic_ostream&) (31.7.5.5).
305) See, for example, the function signature dec(ios_base&) (31.5.5.3).
out.widen(c); otherwise seq consists of c. Determines padding for seq as described in 31.7.5.3.1. Inserts seq into out. Calls os.width(0).

Returns: out.

template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const unsigned char* s);

Preconditions: s is not a null pointer.

Effects: Behaves like a formatted inserter (as described in 31.7.5.3.1) of out. Creates a character sequence seq of n characters starting at s, each widened using out.widen() (31.5.4.3), where n is the number that would be computed as if by:

(4.1) traits::length(s) for the overload where the first argument is of type basic_ostream<charT, traits>& and the second is of type const charT*, and also for the overload where the first argument is of type basic_ostream<char, traits>& and the second is of type const char*,

(4.2) char_traits<char>::length(s) for the overload where the first argument is of type basic_ostream<charT, traits>& and the second is of type const char*,

(4.3) traits::length reinterpret_cast<const char*>(s)) for the other two overloads.

Determines padding for seq as described in 31.7.5.3.1. Inserts seq into out. Calls width(0).

Returns: out.

31.7.5.4 Unformatted output functions [ostream.unformatted]

Each unformatted output function begins execution by constructing an object of class sentry. If that object returns true, while converting to a value of type bool, the function endeavors to generate the requested output. If an exception is thrown during output, then ios_base::badbit is turned on in *this’s error state. If (exceptions() & badbit) != 0 then the exception is rethrown. In any case, the unformatted output function ends by destroying the sentry object, then, if no exception was thrown, returning the value specified for the unformatted output function.

basic_ostream& put(char_type c);

Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, inserts the character c, if possible.307

Otherwise, calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

Returns: *this.

basic_ostream& write(const char_type* s, streamsize n);

Effects: Behaves as an unformatted output function (as described above). After constructing a sentry object, obtains characters to insert from successive locations of an array whose first element is designated by s.308 Characters are inserted until either of the following occurs:

(5.1) n characters are inserted;

(5.2) inserting in the output sequence fails (in which case the function calls setstate(badbit), which may throw ios_base::failure (31.5.4.4)).

Returns: *this.

306) This is done without causing an ios_base::failure to be thrown.
307) Note that this function is not overloaded on types signed char and unsigned char.
308) Note that this function is not overloaded on types signed char and unsigned char.
basic_ostream& flush();

Effects: Behaves as an unformatted output function (as described above). If rdbuf() is not a null pointer, constructs a sentry object. If that object returns true when converted to a value of type bool the function calls rdbuf()->pubsync(). If that function returns −1 calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)). Otherwise, if the sentry object returns false, does nothing.

Returns: *this.

31.7.5.5 Standard manipulators [ostream.manip]
Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

template<class charT, class traits>
basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);

Effects: Calls os.put(os.widen(’\n’)), then os.flush().

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);

Effects: Inserts a null character into the output sequence: calls os.put(charT()).

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

Effects: Calls os.flush().

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);

Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose of exposition, calls buf->set_emit_on_sync(true). Otherwise this manipulator has no effect.

[Note 1: To work around the issue that the Allocator template argument cannot be deduced, implementations can introduce an intermediate base class to basic_syncbuf that manages its emit_on_sync flag. —end note]

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);

Effects: If os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose of exposition, calls buf->set_emit_on_sync(false). Otherwise this manipulator has no effect.

Returns: os.

template<class charT, class traits>
basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

Effects: Calls os.flush(). Then, if os.rdbuf() is a basic_syncbuf<charT, traits, Allocator>*, called buf for the purpose of exposition, behaves as an unformatted output function (31.7.5.4) of os. After constructing a sentry object, calls buf->emit(). If that call returns false, calls os.setstate(ios_base::badbit).

Returns: os.

31.7.5.6 Rvalue stream insertion [ostream.rvalue]

template<class Ostream, class T>
Ostream&& operator<<(Ostream&& os, const T& x);

Constraints: The expression os << x is well-formed when treated as an unevaluated operand and Ostream is publicly and unambiguously derived from ios_base.

Effects: As if by: os << x;
31.7.6 Standard manipulators

The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

```cpp
unspecified resetiosflags(ios_base::fmtflags mask);
```

**Returns:** An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```cpp
unspecified setiosflags(ios_base::fmtflags mask);
```

**Returns:** An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```cpp
unspecified setbase(int base);
```

**Returns:** An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:

```cpp
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
        base == 10 ? ios_base::dec :
        base == 16 ? ios_base::hex :
        ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

```cpp
unspecified setfill(char_type c);
```

**Returns:** An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` and `c` has type `charT` then the expression `out << setfill(c)` behaves as if it called `f(out, c)`, where the function `f` is defined as:

---

309) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

§ 31.7.6
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, charT c) {
    // set fill character
    str.fill(c);
}

The expression out << setfill(c) has type basic_ostream<charT, traits>& and value out.

unspecified setprecision(int n);

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT,
traits> then the expression out << setprecision(n) behaves as if it called f(out, n), or if in is an
object of type basic_istream<charT, traits> then the expression in >> setprecision(n) behaves as if it called f(in, n), where the function f is defined as:

    void f(ios_base& str, int n) {
        // set precision
        str.precision(n);
    }

The expression out << setprecision(n) has type basic_ostream<charT, traits>& and value out. The
expression in >> setprecision(n) has type basic_istream<charT, traits>& and value in.

unspecified setw(int n);

Returns: An object of unspecified type such that if out is an instance of basic_ostream<charT,
traits> then the expression out << setw(n) behaves as if it called f(out, n), or if in is an object
of type basic_istream<charT, traits> then the expression in >> setw(n) behaves as if it called f(in, n), where the function f is defined as:

    void f(ios_base& str, int n) {
        // set width
        str.width(n);
    }

The expression out << setw(n) has type basic_ostream<charT, traits>& and value out. The
expression in >> setw(n) has type basic_istream<charT, traits>& and value in.

31.7.7 Extended manipulators [ext.manip]
The header <iomanip> defines several functions that support extractors and inserters that allow for the
parsing and formatting of sequences and values for money and time.

template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);

Mandates: The type moneyT is either long double or a specialization of the basic_string template
(Clause 23).

Effects: The expression in >> get_money(mon, intl) described below behaves as a formatted input
function (31.7.4.3.1).

Returns: An object of unspecified type such that if in is an object of type basic_istream<charT,
traits> then the expression in >> get_money(mon, intl) behaves as if it called f(in, mon, intl), where the function f is defined as:

template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
    using Iter = istreambuf_iterator<charT, traits>;
    using MoneyGet = money_get<charT, Iter>
    ios_base::iostate err = ios_base::goodbit;
    const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());
    mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);
    if (ios_base::goodbit != err)
        str.setstate(err);
}
The expression in $\gg$ get_money(mon, intl) has type basic_istream<charT, traits>& and value in.

template<class moneyT> unspecified put_money(const moneyT& mon, bool intl = false);

Mandates: The type moneyT is either long double or a specialization of the basic_string template (Clause 23).

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out $\ll$ put_money(mon, intl) behaves as a formatted output function (31.7.5.3.1) that calls f(out, mon, intl), where the function f is defined as:

```cpp
template<class charT, class traits, class moneyT>
void f(basic_ostream<charT, traits>& str, const moneyT& mon, bool intl) {
    using Iter = ostreambuf_iterator<charT, traits>;
    using MoneyPut = money_put<charT, Iter>;
    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), intl, str, str.fill(), mon);
    if (end.failed())
        str.setstate(ios_base::badbit);
}
```

The expression out $\ll$ put_money(mon, intl) has type basic_ostream<charT, traits>& and value out.

```cpp
template<class charT> unspecified get_time(tm* tmb, const charT* fmt);
```

Preconditions: The argument tmb is a valid pointer to an object of type tm, and [fmt, fmt + char_-
traits<charT>::length(fmt)) is a valid range.

Returns: An object of unspecified type such that if in is an object of type basic_istream<charT, traits> then the expression in $\gg$ get_time(tmb, fmt) behaves as if it called f(in, tmb, fmt), where the function f is defined as:

```cpp
template<class charT, class traits>
void f(basic_istream<charT, traits>&& str, tm* tmb, const charT* fmt) {
    using Iter = istreambuf_iterator<charT, traits>;
    using TimeGet = time_get<charT, Iter>;
    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());
    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb, fmt, fmt + traits::length(fmt));
    if (err != ios_base::goodbit)
        str.setstate(err);
}
```

The expression in $\gg$ get_time(tmb, fmt) has type basic_istream<charT, traits>& and value in.

```cpp
template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);
```

Preconditions: The argument tmb is a valid pointer to an object of type tm, and [fmt, fmt + char_-
traits<charT>::length(fmt)) is a valid range.

Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out $\ll$ put_time(tmb, fmt) behaves as if it called f(out, tmb, fmt), where the function f is defined as:

```cpp
template<class charT, class traits>
void f(basic_ostream<charT, traits>& str, const tm* tmb, const charT* fmt) {
    using Iter = ostreambuf_iterator<charT, traits>;
    using TimePut = time_put<charT, Iter>;
    const TimePut& tp = use_facet<TimePut>(str.getloc());
}
const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb, fmt, fmt + traits::length(fmt));

if (end.failed())
    str.setstate(ios_base::badbit);
}

The expression out << put_time(tmb, fmt) has type basic_ostream<charT, traits>& and value out.

### 31.7.8 Quoted manipulators

**Note 1:** Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O.

#### 2 Returns: An object of unspecified type such that if out is an instance of basic_ostream with member type char_type the same as charT and with member type traits_type, which in the second and third forms is the same as traits, then the expression out << quoted(s, delim, escape) behaves as a formatted output function (31.7.5.3.1) of out. This forms a character sequence seq, initially consisting of the following elements:

1. **(2.1)** delim.
2. **(2.2)** Each character in s. If the character to be output is equal to escape or delim, as determined by traits_type::eq, first output escape.
3. **(2.3)** delim.

Let x be the number of elements initially in seq. Then padding is determined for seq as described in 31.7.5.3.1, seq is inserted as if by calling out.rdbuf()->sputn(seq, n), where n is the larger of out.width() and x, and out.width(0) is called. The expression out << quoted(s, delim, escape) has type basic_ostream<charT, traits>& and value out.

#### 3 Returns: An object of unspecified type such that:

1. **(3.1)** If in is an instance of basic_istream with member types char_type and traits_type the same as charT and traits, respectively, then the expression in >> quoted(s, delim, escape) behaves as if it extracts the following characters from in using operator>>(basic_istream<charT, traits>&, charT&): (31.7.4.3.3) which may throw ios_base::failure (31.5.2.2.1):

    1. **(3.1.1)** If the first character extracted is equal to delim, as determined by traits_type::eq, then:
        1. **(3.1.1.1)** Turn off the skipws flag.
        2. **(3.1.1.2)** s.clear()
        3. **(3.1.1.3)** Until an unescaped delim character is reached or !in, extract characters from in and append them to s, except that if an escape is reached, ignore it and append the next character to s.
    2. **(3.1.4)** Discard the final delim character.
    3. **(3.1.5)** Restore the skipws flag to its original value.
2. **(3.1.2)** Otherwise, in >> s.
If `out` is an instance of `basic_ostream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `out << quoted(s, delim, escape)` behaves as specified for the `const basic_string<charT, traits, Allocator>&` overload of the quoted function.

The expression `in >> quoted(s, delim, escape)` has type `basic_istream<charT, traits>&` and value `in`.

The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

### 31.8 String-based streams

#### 31.8.1 Header `<sstream>` synopsis

```c++
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf;

template<class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

using stringbuf = basic_stringbuf<char>;
using wstringbuf = basic_stringbuf<wchar_t>;

template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_istringstream;

template<class charT, class traits, class Allocator>
    void swap(basic_istringstream<charT, traits, Allocator>& x,
              basic_istringstream<charT, traits, Allocator>& y);

using istringstream = basic_istringstream<char>;
using wistringstream = basic_istringstream<wchar_t>;

template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_ostringstream;

template<class charT, class traits, class Allocator>
    void swap(basic_ostringstream<charT, traits, Allocator>& x,
              basic_ostringstream<charT, traits, Allocator>& y);

using ostringstream = basic_ostringstream<char>;
using wostringstream = basic_ostringstream<wchar_t>;

template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringstream;

template<class charT, class traits, class Allocator>
    void swap(basic_stringstream<charT, traits, Allocator>& x,
              basic_stringstream<charT, traits, Allocator>& y);

using stringstream = basic_stringstream<char>;
using wstringstream = basic_stringstream<wchar_t>;
}
```

1 The header `<sstream>` defines four class templates and eight types that associate stream buffers with objects of class `basic_string`, as described in 23.4.
31.8.2 Class template `basic_stringbuf` [stringbuf]

31.8.2.1 General [stringbuf.general]

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;

            // 31.8.2.2, constructors
            basic_stringbuf() : basic_stringbuf(ios_base::in | ios_base::out) {};
            explicit basic_stringbuf(ios_base::openmode which);
            explicit basic_stringbuf(
                const basic_string<charT, traits, Allocator>& s,
                ios_base::openmode which = ios_base::in | ios_base::out);
            explicit basic_stringbuf<
                Allocator& a
            :
                basic_stringbuf(ios_base::in | ios_base::out, a) {};
            basic_stringbuf(ios_base::openmode which, const Allocator& a);
            explicit basic_stringbuf(
                basic_string<charT, traits, Allocator>&& s,
                ios_base::openmode which = ios_base::in | ios_base::out);
            template<class SAlloc>
            basic_stringbuf<
                const basic_string<charT, traits, SAlloc>& s,
                const Allocator& a
            : basic_stringbuf(s, ios_base::in | ios_base::out, a) {};
            template<class SAlloc>
            basic_stringbuf<
                const basic_string<charT, traits, SAlloc>& s,
                ios_base::openmode which, const Allocator& a);
            template<class SAlloc>
            explicit basic_stringbuf(
                const basic_string<charT, traits, SAlloc>& s,
                ios_base::openmode which = ios_base::in | ios_base::out);
            basic_stringbuf<const basic_stringbuf&> = delete;
            basic_stringbuf& operator=(basic_stringbuf& rhs);
            void swap(basic_stringbuf& rhs) noexcept;

            // 31.8.2.3, getters and setters
            allocator_type get_allocator() const noexcept;
            basic_string<charT, traits, Allocator> str() const &;
            template<class SAlloc>
            basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
            basic_string<charT, traits, Allocator> str() &;
            basic_string_view<charT, traits> view() const noexcept;

            void str(const basic_string<charT, traits, Allocator>& s);
            template<class SAlloc>
            void str(const basic_string<charT, traits, SAlloc>& s);
            void str(basic_string<charT, traits, Allocator>&& s);
    }
}
```
protected:
// 31.8.2.5, overridden virtual functions
int_type underflow() override;
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;
basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;

pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which = ios_base::in | ios_base::out) override;
pos_type seekpos(pos_type sp, 
    ios_base::openmode which = ios_base::in | ios_base::out) override;

private:
ios_base::openmode mode;       // exposition only
basic_string<charT, traits, Allocator> buf;  // exposition only
void init_buf_ptrs();          // exposition only

};

The class basic_stringbuf is derived from basic_streambuf to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence can be initialized from, or made available as, an object of class basic_string.

For the sake of exposition, the maintained data and internal pointer initialization is presented here as:

(2.1) — ios_base::openmode mode, has in set if the input sequence can be read, and out set if the output sequence can be written.

(2.2) — basic_string<charT, traits, Allocator> buf contains the underlying character sequence.

(2.3) — init_buf_ptrs() sets the base class’ get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to buf accordingly.

### 31.8.2.2 Constructors

#### [stringbuf.cons]

**explicit basic_stringbuf(ios_base::openmode which);**

1 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), and mode with which. It is implementation-defined whether the sequence pointers (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) are initialized to null pointers.

2 Postconditions: str().empty() is true.

**explicit basic_stringbuf(const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);**

3 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with s, then calls init_buf_ptrs().

**basic_stringbuf(ios_base::openmode which, const Allocator &a);**

4 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with a, then calls init_buf_ptrs().

5 Postconditions: str().empty() is true.

**explicit basic_stringbuf(**

**basic_string<charT, traits, Allocator>&& s,**

**ios_base::openmode which = ios_base::in | ios_base::out);**

6 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with std::move(s), then calls init_buf_ptrs().

**template<class SAlloc>**

**basic_stringbuf(**

**const basic_string<charT, traits, SAlloc>& s,**

% 31.8.2.2 1540
ios_base::openmode which, const Allocator &a);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with {s,a}, then calls init_buf_ptrs().

template<class SAlloc>
explicit basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);

Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with s, then calls init_buf_ptrs().

basic_stringbuf(basic_stringbuf&& rhs);

basic_stringbuf(basic_stringbuf&& rhs, const Allocator& a);

Effects: Copy constructs the base class from rhs and initializes mode with rhs.mode. In the first form buf is initialized from std::move(rhs).str(). In the second form buf is initialized from {std::move(rhs).str(), a}. It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had.

Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

- str() == rhs_p.str()
- gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
- egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
- pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
- epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
- if (eback()) eback() != rhs_a.eback()
- if (gptr()) gptr() != rhs_a.gptr()
- if (egptr()) egptr() != rhs_a.egptr()
- if (pbase()) pbase() != rhs_a.pbase()
- if (pptr()) pptr() != rhs_a.pptr()
- if (epptr()) epptr() != rhs_a.epptr()
- getloc() == rhs_p.getloc()
- rhs is empty but usable, as if std::move(rhs).str() was called.

31.8.2.3 Assignment and swap

basic_stringbuf operator=(basic_stringbuf&& rhs);

Effects: After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.8.2.2).

Returns: *this.

void swap(basic_stringbuf& rhs) noexcept(see below);

Preconditions: allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == rhs.get_allocator() is true.

Effects: Exchanges the state of *this and rhs.

Remarks: The exception specification is equivalent to:
 allocator_traits<Allocator>::propagate_on_container_swap::value ||
 allocator_traits<Allocator>::is_always_equal::value.

template<class charT, class traits, class Allocator>
void swap(basic_stringbuf<charT, traits, Allocator>& x,
        basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

Effects: Equivalent to: x.swap(y).
31.8.2.4 Member functions

The member functions getting the underlying character sequence all refer to a high_mark value, where high_mark represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the basic_stringbuf passing a basic_string argument, or by calling one of the str member functions passing a basic_string as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new basic_string).

```cpp
void init_buf_ptrs(); // exposition only
```

Effects: Initializes the input and output sequences from buf according to mode.

Postconditions:

1. If ios_base::out is set in mode, pbase() points to buf.front() and epitr() >= pbase() + buf.size() is true;
2. in addition, if ios_base::ate is set in mode, pptr() == pbase() + buf.size() is true,
3. otherwise pptr() == pbase() is true.
4. If ios_base::in is set in mode, eback() points to buf.front(), and (gptr() == eback() && egptr() == eback() + buf.size()) is true.

[Note 1: For efficiency reasons, stream buffer operations can violate invariants of buf while it is held encapsulated in the basic_stringbuf, e.g., by writing to characters in the range [buf.data() + buf.size(), buf.data() + buf.capacity()). All operations retrieving a basic_string from buf ensure that the basic_string invariants hold on the returned value. — end note]

```cpp
allocator_type get_allocator() const noexcept;
```

Returns: buf.get_allocator().

basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to:

```
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

```cpp
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

Constraints: SAlloc is a type that qualifies as an allocator (24.2.2.1).

Effects: Equivalent to:

```
return basic_string<charT, traits, SAlloc>(view(), sa);
```

basic_string_view<charT, traits, Allocator> view() const noexcept;

Let sv be basic_string_view<charT, traits>.

Returns: A sv object referring to the basic_stringbuf’s underlying character sequence in buf:

1. If ios_base::out is set in mode, then sv(pbase(), high_mark-pbase()) is returned.
2. Otherwise, if ios_base::in is set in mode, then sv(eback(), egptr()-eback()) is returned.
3. Otherwise, sv() is returned.

[Note 2: Using the returned sv object after destruction or invalidation of the character sequence underlying *this is undefined behavior, unless sv.empty() is true. — end note]

```cpp
void str(const basic_string<charT, traits, Allocator>& s);
```

Effects: Equivalent to:
buf = s;
init_buf_ptrs();

```cpp
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
```

**Constraints:** is_same_v<SAlloc, Allocator> is false.

**Effects:** Equivalent to:
buf = s;
init_buf_ptrs();

void str(basic_string<charT, traits, Allocator>&& s);

**Effects:** Equivalent to:
buf = std::move(s);
init_buf_ptrs();

## 31.8.2.5 Overridden virtual functions

### int_type underflow() override;

**Returns:** If the input sequence has a read position available, returns traits::to_int_type(*gptr()). Otherwise, returns traits::eof(). Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.

### int_type pbackfail(int_type c = traits::eof()) override;

**Effects:** Puts back the character designated by c to the input sequence, if possible, in one of three ways:

1. **(2.1)** If traits::eq_int_type(c, traits::eof()) returns false and if the input sequence has a putback position available, and if traits::eq(to_char_type(c), gptr()[-1]) returns true, assigns gptr() - 1 to gptr().
   Returns: c.

2. **(2.2)** If traits::eq_int_type(c, traits::eof()) returns false and if the input sequence has a putback position available, and if mode & ios_base::out is nonzero, assigns c to *--gptr().
   Returns: c.

3. **(2.3)** If traits::eq_int_type(c, traits::eof()) returns true and if the input sequence has a putback position available, assigns gptr() - 1 to gptr().
   Returns: traits::not_eof(c).

**Returns:** As specified above, or traits::eof() to indicate failure.

**Remarks:** If the function can succeed in more than one of these ways, it is unspecified which way is chosen.

### int_type overflow(int_type c = traits::eof()) override;

**Effects:** Appends the character designated by c to the output sequence, if possible, in one of two ways:

1. **(5.1)** If traits::eq_int_type(c, traits::eof()) returns false and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls sputc(c).
   Signals success by returning c.

2. **(5.2)** If traits::eq_int_type(c, traits::eof()) returns true, there is no character to append.
   Signals success by returning a value other than traits::eof().

**Returns:** As specified above, or traits::eof() to indicate failure.

**Remarks:** The function can alter the number of write positions available as a result of any call.

The function can make a write position available only if ios_base::out is set in mode. To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements to hold the current array object (if any), plus at least one additional write position. If ios_base::in is set in mode, the function alters the read end pointer egptr() to point just past the new write position.
pos_type seekoff(off_type off, ios_base::seekdir way,
   ios_base::openmode which
   = ios_base::in | ios_base::out) override;

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 122.

Table 122: seekoff positioning  [tab:stringbuf.seekoff.pos]

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>ios_base::in is set in which</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>ios_base::out is set in which</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>both ios_base::in and ios_base::out are set in which and either</td>
<td>positions both the input and the output sequences</td>
</tr>
<tr>
<td>way == ios_base::beg or</td>
<td></td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td></td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, the function determines newoff as indicated in Table 123. If the sequence’s next pointer (either gptr() or pptr()) is a null pointer and newoff is nonzero, the positioning operation fails.

Table 123: newoff values  [tab:stringbuf.seekoff.newoff]

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios_base::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios_base::cur</td>
<td>the next pointer minus the beginning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td>the high mark pointer minus the beginning pointer (high_mark - xbeg).</td>
</tr>
</tbody>
</table>

If (newoff + off) < 0, or if newoff + off refers to an uninitialized character (31.8.2.4), the positioning operation fails. Otherwise, the function assigns xbeg + newoff + off to the next pointer xnext.

Returns: pos_type(newoff), constructed from the resultant offset newoff (of type off_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is pos_type(off_type(-1)).

pos_type seekpos(pos_type sp,
   ios_base::openmode which
   = ios_base::in | ios_base::out) override;

Effects: Equivalent to seekoff(off_type(sp), ios_base::beg, which).

Returns: sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n);

Effects: implementation-defined, except that setbuf(0, 0) has no effect.

Returns: this.

31.8.3 Class template basic_istringstream  [istringstream]

31.8.3.1 General  [istringstream.general]

namespace std {
   template<class charT, class traits = char_traits<charT>,
            class Allocator = allocator<charT>>
   class basic_istringstream : public basic_istream<charT, traits> {
      public:
         using char_type = charT;

    template<class SAlloc>
    void str(const basic_string<charT, traits, SAlloc>& s);
    template<class SAlloc>
    void str(basic_string<charT, traits, Allocator>&& s);

private:
    basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

1 The class basic_istringstream<charT, traits, Allocator> supports reading objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the stringbuf object.
31.8.3.2 Constructors

explicit basic_istringstream(ios_base::openmode which);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.4.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::in) (31.8.2.2).

explicit basic_istringstream(const basic_string<charT, traits, Allocator>& s, ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) (31.7.4.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).

explicit basic_istringstream(basic_istringstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.

31.8.3.3 Swap

void swap(basic_istringstream& rhs);

Effects: Equivalent to:

basic_istream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x, basic_istringstream<charT, traits, Allocator>& y);

Effects: Equivalent to: x.swap(y).

31.8.3.4 Member functions

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).
basic_string<
charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<
charT, traits, SAlloc> str(const SAlloc & sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<
charT, traits, Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<
charT, traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<
charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

31.8.4 Class template basic_ostringstream

31.8.4.1 General

namespace std {
   template<class charT, class traits = char_traits<charT>,
            class Allocator = allocator<charT>>
   class basic_ostringstream : public basic_ostream<charT, traits> {
public:
   using char_type = charT;
   using int_type = typename traits::int_type;
   using pos_type = typename traits::pos_type;
   using off_type = typename traits::off_type;
   using traits_type = traits;
   using allocator_type = Allocator;

// 31.8.4.2, constructors
   basic_ostringstream() : basic_ostringstream(ios_base::out) {} 
   explicit basic_ostringstream(ios_base::openmode which);
   explicit basic_ostringstream( 
      const basic_string<charT, traits, Allocator>& s,
      ios_base::openmode which = ios_base::out);
   basic_ostringstream(ios_base::openmode which, const Allocator& a);
   explicit basic_ostringstream( 
      basic_string<charT, traits, Allocator>&& s,
      ios_base::openmode which = ios_base::out);
   template<class SAlloc>
   basic_ostringstream( 
      const basic_string<charT, traits, SAlloc>& s, const Allocator& a) :
   basic_ostringstream(s, ios_base::out, a) {}
   template<class SAlloc>
   basic_ostringstream( 
      const basic_string<charT, traits, SAlloc>& s,
      ios_base::openmode which, const Allocator& a);
   template<class SAlloc>
   explicit basic_ostringstream( 
      const basic_string<charT, traits, SAlloc>& s,
      ios_base::openmode which = ios_base::out);
   basic_ostringstream(const basic_ostringstream&) = delete;
   basic_ostringstream(basic_ostringstream&& rhs);

§ 31.8.4.1
The class `basic_ostringstream<charT, traits, Allocator>` supports writing objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf` object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

1. `sb`, the `stringbuf` object.

### 31.8.4.2 Constructors

1. `explicit basic_ostringstream(ios_base::openmode which);`  
   **Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>((which | ios_base::out))` (31.8.2.2).

2. `explicit basic_ostringstream(const basic_string<charT, traits, Allocator>& s, ios_base::openmode which = ios_base::out);`  
   **Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).

3. `basic_ostringstream(ios_base::openmode which, const Allocator& a);`  
   **Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out)` (31.8.2.2).

4. `template<class SAlloc> basic_ostringstream(basic_string<charT, traits, Allocator>&& s, ios_base::openmode which = ios_base::out);`  
   **Effects:** Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.5.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out)` (31.8.2.2).
template<class SAlloc>
explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);

Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

basic_ostringstream(basic_ostringstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.

31.8.4.3 Swap

void swap(basic_ostringstream& rhs);

Effects: Equivalent to:
    basic_ostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits, class Allocator>
void swap(basic_ostringstream<charT, traits, Allocator>& x,
    basic_ostringstream<charT, traits, Allocator>& y);

Effects: Equivalent to: x.swap(y).

31.8.4.4 Member functions

basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
    basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

31.8.5 Class template basic_stringstream

31.8.5.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
The class template `basic_stringstream<charT, traits>` supports reading and writing from objects of class `basic_string<charT, traits, Allocator>`. It uses a `basic_stringbuf<charT, traits, Allocator>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

\( sb \), the stringbuf object.
31.8.5.2 Constructors

**explicit basic_stringstream(ios_base::openmode which);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`. 

**explicit basic_stringstream(  
    const basic_string<charT, traits, Allocator>& s,  
    ios_base::openmode which = ios_base::out | ios_base::in);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)`. 

**basic_stringstream(ios_base::openmode which, const Allocator& a);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)` (31.8.2.2). 

**explicit basic_stringstream(  
    basic_string<charT, traits, Allocator>&& s,  
    ios_base::openmode which = ios_base::out | ios_base::in);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)` (31.8.2.2). 

**template<class SAlloc>  
    basic_stringstream(  
        const basic_string<charT, traits, SAlloc>& s,  
        ios_base::openmode which = ios_base::out | ios_base::in);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)` (31.8.2.2). 

**template<class SAlloc>  
    explicit basic_stringstream(  
        const basic_string<charT, traits, SAlloc>& s,  
        ios_base::openmode which, const Allocator& a);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2). 

**basic_stringstream(basic_stringstream&& rhs);**

*Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`. 

31.8.5.3 Swap

**void swap(basic_stringstream& rhs);**

*Effects:* Equivalent to:

```
basic_iostream<charT, traits>::swap(rhs);  
sb.swap(rhs.sb);
```

**template<class charT, class traits, class Allocator>  
    void swap(basic_stringstream<charT, traits, Allocator>& x,  
              basic_stringstream<charT, traits, Allocator>& y);**

*Effects:* Equivalent to: `x.swap(y)`. 

31.8.5.4 Member functions

**basic_stringbuf<charT, traits, Allocator>* rdbuf() const;**

*Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`. 

§ 31.8.5.4 1551
namespace std {
    template<class charT, class traits = char_traits<charT>>

        }
    }

    template<class charT, class traits>
    void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);
}

1 The class template basic_spanbuf is derived from basic_streambuf to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class span<charT>.

2 For the sake of exposition, the maintained data is presented here as:

   (2.1) — ios_base::openmode mode, has in set if the input sequence can be read, and out set if the output sequence can be written.

   (2.2) — std::span<charT> buf is the view to the underlying character sequence.

31.9.3.2 Constructors

explicit basic_spanbuf(std::span<charT> s,
    ios_base::openmode which = ios_base::in | ios_base::out);

1 Effects: Initializes the base class with basic_streambuf() (31.6.3.2), and mode with which. Initializes the internal pointers as if calling span(s).
basic_spanbuf(basic_spanbuf&& rhs);

Effects: Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this (eback(), gptr(), egptr(), pbase(), pptr(), epptr())` obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns `true` after the move.

Postconditions: Let `rhs_p` refer to the state of `rhs` just prior to this construction.

- span().data() == rhs_p.span().data()
- span().size() == rhs_p.span().size()
- eback() == rhs_p.eback()
- gptr() == rhs_p.gptr()
- egptr() == rhs_p.egptr()
- pbase() == rhs_p.pbase()
- pptr() == rhs_p.pptr()
- eppt() == rhs_p.epptr()
- getloc() == rhs_p.getloc()

31.9.3.3 Assignment and swap [spanbuf.assign]

basic_spanbuf basic_spanbuf& operator=(basic_spanbuf&& rhs);

Effects: Equivalent to:

```
basic_spanbuf tmp{std::move(rhs)};
*this->swap(tmp);
return *this;
```

void swap(basic_spanbuf& rhs);

Effects: Equivalent to:

```
basic_streambuf<charT, traits>::swap(rhs);
std::swap(mode, rhs.mode);
std::swap(buf, rhs.buf);
```

template<class charT, class traits>
void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

Effects: Equivalent to `x.swap(y)`.

31.9.3.4 Member functions [spanbuf.members]

std::span<charT> span() const noexcept;

Returns: If `ios_base::out` is set in `mode`, returns `std::span<charT>(pbase(), pptr())`, otherwise returns `buf`.

[Note 1: In contrast to basic_stringbuf, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to basic_string<charT>. — end note]

void span(std::span<charT> s) noexcept;

Effects: `buf = s`. Initializes the input and output sequences according to `mode`.

Postconditions:

- If `ios_base::out` is set in `mode`, `pbase() == s.data() && epptr() == pbase() + s.size()` is true;
- in addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + s.size()` is true,
- otherwise `pptr() == pbase()` is true.
- If `ios_base::in` is set in `mode`, `eback() == s.data() && gptr() == eback() && egptr() == eback() + s.size()` is true.

§ 31.9.3.4 1554
31.9.3.5 Overridden virtual functions

[Note 1: Because the underlying buffer is of fixed size, neither overflow, underflow, nor pbackfail can provide useful behavior. — end note]

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects:** Alters the stream position within one or both of the controlled sequences, if possible, as follows:

- If `ios_base::in` is set in `which`, positions the input sequence; `xnext` is `gptr()`, `xbeg` is `eback()`.
- If `ios_base::out` is set in `which`, positions the output sequence; `xnext` is `pptr()`, `xbeg` is `pbase()`.

If both `ios_base::in` and `ios_base::out` are set in `which` and `way` is `ios_base::cur`, the positioning operation fails.

For a sequence to be positioned, if its next pointer `xnext` (either `gptr()` or `pptr()`) is a null pointer and the new offset `newoff` as computed below is nonzero, the positioning operation fails. Otherwise, the function determines `baseoff` as a value of type `off_type` as follows:

- When `way` is `ios_base::beg`:
- `(pptr() - pbase())` for the output sequence, or `(gptr() - eback())` for the input sequence when `way` is `ios_base::cur`;
- When `way` is `ios_base::end`:
  - `(pptr() - pbase())` if `ios_base::out` is set in `mode` and `ios_base::in` is not set in `mode`,
  - `buf.size()` otherwise.

If `baseoff + off` would overflow, or if `baseoff + off` is less than zero, or if `baseoff + off` is greater than `buf.size()`, the positioning operation fails. Otherwise, the function computes

```cpp
off_type newoff = baseoff + off;
```

and assigns `xbeg + newoff` to the next pointer `xnext`.

**Returns:** `pos_type(off_type(-1))` if the positioning operation fails; `pos_type(newoff)` otherwise.

```cpp
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects:** Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

```cpp
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

**Effects:** Equivalent to:

```
this->span(std::span<charT>(s, n));
return this;
```

31.9.4 Class template basic_ispanstream

31.9.4.1 General

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream : public basic_istream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.9.4.2, constructors
            explicit basic_ispanstream(std::span<charT> s, 
                ios_base::openmode which = ios_base::in);
            basic_ispanstream(const basic_ispanstream&) = delete;
            basic_ispanstream(basic_ispanstream& rhs);
            template<class ROS> explicit basic_ispanstream(ROS& s);
```

§ 31.9.4.1 1555
basic_ispanstream& operator=(const basic_ispanstream&) = delete;
basic_ispanstream& operator=(basic_ispanstream&& rhs);

// 31.9.4.3, swap
void swap(basic_ispanstream& rhs);

// 31.9.4.4, member functions
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
std::span<const charT> span() const noexcept;
void span(std::span<charT> s) noexcept;
template<class ROS> void span(ROS&& s) noexcept;

private:
  basic_spanbuf<charT, traits> sb; // exposition only
};

template<class charT, class traits>
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

1 [Note 1: Constructing an ispanstream from a string-literal includes the termination character '\0' in the underlying spanbuf. — end note]

31.9.4.2 Constructors

explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<charT, traits>(addressof(sb)) and sb with basic_spanbuf<charT, traits>(s, which | ios_base::in) (31.9.3.2).

basic_ispanstream(basic_ispanstream&& rhs);

Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_istream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_spanbuf.

template<class ROS> explicit basic_ispanstream(ROS&& s)

Constraints: ROS models ranges::borrowed_range. !convertible_to<ROS, std::span<charT>> && convertible_to<ROS, std::span<charT const>> is true.

Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))

31.9.4.3 Swap

void swap(basic_ispanstream& rhs);

Effects: Equivalent to:
  basic_istream<charT, traits>::swap(rhs);
  sb.swap(rhs.sb);

template<class charT, class traits>
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

Effects: Equivalent to x.swap(y).

31.9.4.4 Member functions

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

Effects: Equivalent to:
  return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

std::span<const charT> span() const noexcept;

Effects: Equivalent to: return rdbuf()->span();
31.9.5 Class template basic_ospanstream

31.9.5.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream
        : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.9.5.2, constructors
            explicit basic_ospanstream(std::span<charT> s,
                ios_base::openmode which = ios_base::out);
            basic_ospanstream(const basic_ospanstream&) = delete;
            basic_ospanstream(basic_ospanstream&& rhs);
            basic_ospanstream& operator=(const basic_ospanstream&) = delete;
            basic_ospanstream& operator=(basic_ospanstream&& rhs);

            // 31.9.5.3, swap
            void swap(basic_ospanstream& rhs);

            // 31.9.5.4, member functions
            basic_spanbuf<charT, traits>* rdbuf() const noexcept;
            std::span<charT> span() const noexcept;
            void span(std::span<charT> s) noexcept;
            private:
                basic_spanbuf<charT, traits> sb;   // exposition only
                }

            template<class charT, class traits>
                void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

        } // basic_ospanstream

31.9.5.2 Constructors

explicit basic_ospanstream(std::span<charT> s,
    ios_base::openmode which = ios_base::out);

    Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) and sb with
    basic_spanbuf<charT, traits>(s, which | ios_base::out) (31.9.3.2).

    basic_ospanstream(basic_ospanstream&& rhs) noexcept;

    Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_-
    ostream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_-
    spanbuf.
31.9.5.3 Swap

```cpp
void swap(basic_ospanstream& rhs);
```

**Effects:** Equivalent to:

```cpp
basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

template<class charT, class traits>
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

**Effects:** Equivalent to x.swap(y).

31.9.5.4 Member functions

```cpp
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

**Effects:** Equivalent to:

```cpp
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```cpp
std::span<charT> span() const noexcept;
```

**Effects:** Equivalent to:

```cpp
return rdbuf()->span();
```

```cpp
void span(std::span<charT> s) noexcept;
```

**Effects:** Equivalent to rdbuf()->span(s).

31.9.6 Class template basic_spanstream

31.9.6.1 General

```cpp
namespace std {

  template<class charT, class traits = char_traits<charT>>
  class basic_spanstream
  : public basic_iostream<charT, traits> {
    public:
      using char_type = charT;
      using int_type = typename traits::int_type;
      using pos_type = typename traits::pos_type;
      using off_type = typename traits::off_type;
      using traits_type = traits;

      // 31.9.6.2, constructors
      explicit basic_spanstream(std::span<charT> s,
      ios_base::openmode which = ios_base::out | ios_base::in);
      basic_spanstream(const basic_spanstream&) = delete;
      basic_spanstream(basic_spanstream&&) = delete;
      basic_spanstream& operator=(const basic_spanstream&) = delete;
      basic_spanstream& operator=(basic_spanstream&& rhs);

      // 31.9.6.3, swap
      void swap(basic_spanstream& rhs);

      // 31.9.6.4, members
      basic_spanbuf<charT, traits>* rdbuf() const noexcept;
      std::span<charT> span() const noexcept;
      void span(std::span<charT> s) noexcept;
      private:
        basic_spanbuf<charT, traits> sb; // exposition only
    }
```

```cpp
template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```
31.9.6.2 Constructors

explicit basic_spanstream(std::span<charT> s,
    ios_base::openmode which = ios_base::out | ios_base::in);

1  Effects: Initializes the base class with basic_iostream<charT, traits>(addressof(sb)) and sb
    with basic_spanbuf<charT, traits>(s, which) (31.9.3.2).

basic_spanstream(basic_spanstream&& rhs);

2  Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next,
    basic_iostream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained
    basic_spanbuf.

31.9.6.3 Swap

void swap(basic_spanstream& rhs);

1  Effects: Equivalent to:
    basic_iostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);

template<class charT, class traits>
    void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);

2  Effects: Equivalent to x.swap(y).

31.9.6.4 Member functions

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

1  Effects: Equivalent to:
    return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));

std::span<charT> span() const noexcept;

2  Effects: Equivalent to: return rdbuf()->span();

void span(std::span<charT> s) noexcept;

3  Effects: Equivalent to rdbuf()->span(s).

31.10 File-based streams

31.10.1 Header <fstream> synopsis

namespace std {
    template<class charT, class traits = char_traits<charT>>
        class basic_filebuf;

template<class charT, class traits>
    void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

using filebuf = basic_filebuf<char>;
using wfilebuf = basic_filebuf<wchar_t>;

template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;

template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

using ifstream = basic_ifstream<char>;
using wifstream = basic_ifstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
    class basic_ofstream;

template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
using ofstream = basic_ofstream<char>;
using wofstream = basic_ofstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_fstream;

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

using fstream = basic_fstream<char>;
using wfstream = basic_fstream<wchar_t>;

1 The header `<fstream>` defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

2 [Note 1: The class template `basic_filebuf` treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the `basic_filebuf` object converts those multibyte sequences into wide character sequences. —end note]

3 In subclause 31.10, member functions taking arguments of `const filesystem::path::value_type*` are only provided on systems where `filesystem::path::value_type (31.12.6)` is not `char`.

[Note 2: These functions enable class path support for systems with a wide native path character type, such as `wchar_t`. —end note]

31.10.2 Class template `basic_filebuf` [filebuf]
31.10.2.1 General [filebuf.general]
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

        // 31.10.2.2, constructors/destructor
            basic_filebuf();
            basic_filebuf(const basic_filebuf&) = delete;
            basic_filebuf(basic_filebuf&& rhs);
            virtual ~basic_filebuf();

        // 31.10.2.3, assignment and swap
            basic_filebuf& operator=(const basic_filebuf&) = delete;
            basic_filebuf& operator=(basic_filebuf&& rhs);
            void swap(basic_filebuf& rhs);

        // 31.10.2.4, members
            bool is_open() const;
            basic_filebuf* open(const char* s, ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path::value_type* s,
                ios_base::openmode mode); // wide systems only; see 31.10.1
            basic_filebuf* open(const string& s,
                ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path& s,
                ios_base::openmode mode);
            basic_filebuf* close();

        protected:
            // 31.10.2.5, overridden virtual functions
            streamsize showmanyc() override;
            int_type underflow() override;
            int_type uflow() override;
    }
}
```cpp
int_type pbackfail(int_type c = traits::eof()) override;
int_type overflow (int_type c = traits::eof()) override;

basic_streambuf<charT, traits>* setbuf(char_type* s,
    streamsize n) override;

pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;

pos_type seekpos(pos_type sp,
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;

int sync() override;
void imbue(const locale& loc) override;
```

The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.

The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library `FILE`s.

In particular:

1. If the file is not open for reading the input sequence cannot be read.
2. If the file is not open for writing the output sequence cannot be written.
3. A joint file position is maintained for both the input sequence and the output sequence.

An instance of `basic_filebuf` behaves as described in 31.10.2 provided `traits::pos_type` is `fpos<typename traits::state_type>`. Otherwise the behavior is undefined.

In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```cpp
const codecvt<charT, char, typename traits::state_type>& a_codecvt =
use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

### 31.10.2.2 Constructors

- **basic_filebuf()**
  - **Effects**: Initializes the base class with `basic_streambuf<charT, traits>() (31.6.3.2).
  - **Postconditions**: `is_open() == false`.

- **basic_filebuf(basic_filebuf&& rhs)**
  - **Effects**: It is implementation-defined whether the sequence pointers in `*this (eback(), gptr(),
    egptr(), pbase(), pptr(), epptr())` obtain the values which `rhs` had. Whether they do or not, `*this
and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references
the file which `rhs` did before the construction, and `rhs` references no file after the construction. The
openmode, locale and any other state of `rhs` is also copied.
  - **Postconditions**: Let `rhs.p` refer to the state of `rhs` just prior to this construction and let `rhs.a` refer
to the state of `rhs` just after this construction.

  1. `is_open() == rhs_p.is_open()`
  2. `rhs_a.is_open() == false`.
  5. `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`.
  6. `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`.
  7. `if (eback()) eback() != rhs_a.eback()`.
  8. `if (gptr()) gptr() != rhs_a.gptr()`.
  9. `if (egptr()) egptr() != rhs_a.egptr()`.

§ 31.10.2.2
1561
virtual ~basic_filebuf();

Effects: Calls close(). If an exception occurs during the destruction of the object, including the call to close(), the exception is caught but not rethrown (see 16.4.6.13).

31.10.2.3 Assignment and swap

basic_filebuf& operator=(basic_filebuf&& rhs);

Effects: Calls close() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.10.2.2).

Returns: *this.

void swap(basic_filebuf& rhs);

Effects: Exchanges the state of *this and rhs.

template<class charT, class traits>
  void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

Effects: Equivalent to: x.swap(y).

31.10.2.4 Member functions

bool is_open() const;

Returns: true if a previous call to open succeeded (returned a non-null value) and there has been no intervening call to close.

basic_filebuf* open(const char* s, ios_base::openmode mode);
  basic_filebuf* open(const filesystem::path::value_type* s, ios_base::openmode mode);
    // wide systems only; see 31.10.1

Preconditions: s points to a NTCTS (3.37).

Effects: If is_open() != false, returns a null pointer. Otherwise, initializes the filebuf as required. It then opens the file to which s resolves, if possible, as if by a call to fopen with the second argument determined from mode & ~ios_base::ate as indicated in Table 124. If mode is not some combination of flags shown in the table then the open fails.

If the open operation succeeds and ios_base::ate is set in mode, positions the file to the end (as if by calling fseek(file, 0, SEEK_END), where file is the pointer returned by calling fopen).\(^{310}\)

If the repositioning operation fails, calls close() and returns a null pointer to indicate failure.

Returns: this if successful, a null pointer otherwise.

basic_filebuf* open(const string& s, ios_base::openmode mode);
  basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);

Returns: open(s.c_str(), mode);

Effects: If is_open() == false, returns a null pointer. If a put area exists, calls overflow(traits::eof()) to flush characters. If the last virtual member function called on *this (between underflow, overflow, seekoff, and seekpos) was overflow then calls a codecvt.unshift (possibly several times) to determine a termination sequence, inserts those characters and calls overflow(traits::eof()) again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling fclose(file)). If any of the calls made by the function, including fclose, fails, close fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

\(^{310}\) The macro SEEK_END is defined, and the function signatures fopen(const char*, const char*) and fseek(FILE*, long, int) are declared, in <cstdio> (31.13.1).

</table>

Postconditions: is_open() == false.

Returns: this on success, a null pointer otherwise.

31.10.2.5 Overridden virtual functions [filebuf.virtuals]

streamsize showmanyc() override;

Effects: Behaves the same as basic_streambuf::showmanyc() (31.6.3.5).

Remarks: An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

int_type underflow() override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::underflow(), with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (extern_buf) and then as if by doing:

```cpp
codeconv_base::result r =
a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
            intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (fpos_t) corresponding to each character between intern_buf and intern_end. If the value of r indicates that a_codecvt.in() ran out of space in intern_buf, retry with a larger intern_buf.

int_type uflow() override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::uflow(), with the specialization that a sequence of characters is read from the input with the same method as used by underflow.

int_type pbackfail(int_type c = traits::eof()) override;

Effects: Puts back the character designated by c to the input sequence, if possible, in one of three ways:
— If traits::eq_int_type(c, traits::eof()) returns false and if the function makes a putback position available and if traits::eq(to_char_type(c), gptr()[−1]) returns true, decrements the next pointer for the input sequence, gptr().

Returns: c.

— If traits::eq_int_type(c, traits::eof()) returns false and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores c there.

Returns: c.

— If traits::eq_int_type(c, traits::eof()) returns true, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, gptr().

Returns: traits::not_eof(c).

Returns: As specified above, or traits::eof() to indicate failure.

Remarks: If is_open() == false, the function always fails.

The function does not put back a character directly to the input sequence.

If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

int_type overflow(int_type c = traits::eof()) override;

Effects: Behaves according to the description of basic_streambuf<charT, traits>::overflow(c), except that the behavior of “consuming characters” is performed by first converting as if by:

```
charT* b = pbase();
charT* p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

(10.1) — If r == codecvt_base::error then fail.
(10.2) — If r == codecvt_base::noconv then output characters from b up to (and not including) p.
(10.3) — If r == codecvt_base::partial then output to the file characters from xbuf up to xbuf_end, and repeat using characters from end to p. If output fails, fail (without repeating).
(10.4) — Otherwise output from xbuf to xbuf_end, and fail if output fails. At this point if b != p and b == end (xbuf isn’t large enough) then increase XSIZE and repeat from the beginning.

Returns: traits::not_eof(c) to indicate success, and traits::eof() to indicate failure. If is_open() == false, the function always fails.

basic_streambuf* setbuf(char_type* s, streamsize n) override;

Effects: If setbuf(0, 0) is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that pbase() and pptr() always return null and output to the file should appear as soon as possible.

pos_type seekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out) override;

Effects: Let width denote a_codecvt.encoding(). If is_open() == false, or off != 0 && width <= 0, then the positioning operation fails. Otherwise, if way != basic_ios::cur or off != 0, and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if width > 0, call fseek(file, width * off, whence), otherwise call fseek(file, 0, whence).
Returns: A newly constructed pos_type object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns pos_type(off_type(-1)).

Remarks: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if width if less than zero then call a_codecvt.unshift(state, xbuf, xbuf+XSIZE, xbuf_end) and output the resulting unshift sequence. The function determines one of three values for the argument whence, of type int, as indicated in Table 125.

Table 125: seekoff effects

<table>

<td>SEEK_END</td>
<td></td>
</tr>
</tbody>
</table>

pos_type seekpos(pos_type sp,  
    ios_base::openmode which
    = ios_base::in | ios_base::out) override;

Alter the file position, if possible, to correspond to the position stored in sp (as described below). Altering the file position performs as follows:
1. if (om & ios_base::out) != 0, then update the output sequence and write any unshift sequence;
2. set the file position to sp as if by a call to fsetpos;
3. if (om & ios_base::in) != 0, then update the input sequence;

where om is the open mode passed to the last call to open(). The operation fails if is_open() returns false.

If sp is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If sp has not been obtained by a previous successful call to one of the positioning functions (seekoff or seekpos) on the same file the effects are undefined.

Returns: sp on success. Otherwise returns pos_type(off_type(-1)).

int sync() override;

Effects: If a put area exists, calls filebuf::overflow to write the characters to the file, then flushes the file as if by calling fflush(file). If a get area exists, the effect is implementation-defined.

void imbue(const locale& loc) override;

Preconditions: If the file is not positioned at its beginning and the encoding of the current locale as determined by a_codecvt.encoding() is state-dependent (30.4.2.5.3) then that facet is the same as the corresponding facet of loc.

Effects: Causes characters inserted or extracted after this call to be converted according to loc until another call of imbue.

Remarks: This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

31.10.3 Class template basic_ifstream
31.10.3.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream : public basic_istream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

    § 31.10.3.1 1565
1 The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

\[(1.1) \quad \text{sb, the filebuf object.}\]

### 31.10.3.2 Constructors

---

// 31.10.3.2, constructors

```cpp
basic_ifstream();
explicit basic_ifstream(const char* s,
  ios_base::openmode mode = ios_base::in);
explicit basic_ifstream(const filesystem::path::value_type* s,
  ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1
explicit basic_ifstream(const string& s,
  ios_base::openmode mode = ios_base::in);
template<class T>
  explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
```

**Effects**: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.4.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2).

```cpp
explicit basic_ifstream(const char* s,
  ios_base::openmode mode = ios_base::in);
```

**Effects**: Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.4.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

```cpp
explicit basic_ifstream(const string& s,
  ios_base::openmode mode = ios_base::in);
```

**Effects**: Equivalent to: `basic_ifstream(s.c_str(), mode)`.

```cpp
template<class T>
  explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
```

**Constraints**: `is_same_v<T, filesystem::path>` is true.

**Effects**: Equivalent to: `basic_ifstream(s.c_str(), mode)`. 

---

### 31.10.3.3 Swap

```cpp
void swap(basic_ifstream& rhs);
```
basic_ifstream(basic_ifstream&& rhs);

Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

31.10.3.3 Swap

void swap(basic_ifstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

Effects: Equivalent to: x.swap(y).

31.10.3.4 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s, // wide systems only; see 31.10.1
  ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

Effects: Calls rdbuf()->open(s, mode | ios_base::in). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);

Effects: Calls open(s.c_str(), mode).

void close();

Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

31.10.4 Class template basic_ofstream

31.10.4.1 General

namespace std {

  template<class charT, class traits = char_traits<charT>>
  class basic_ofstream : public basic_ostream<charT, traits> { public:
    // 31.10.4.2, constructors
    basic_ofstream();
    explicit basic_ofstream(const char* s,
      ios_base::openmode mode = ios_base::out);
    explicit basic_ofstream(const filesystem::path::value_type* s, // wide systems only; see 31.10.1
      ios_base::openmode mode = ios_base::out);
    explicit basic_ofstream(const string& s,
      ios_base::openmode mode = ios_base::out);
    template<class T>
    explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
    basic_ofstream(const basic_ofstream&) = delete;
    basic_ofstream(basic_ofstream&&) = delete;

    // 31.10.4.3, member functions
    basic_ofstream(const basic_ofstream&);
    basic_ofstream(basic_ofstream&& rhs);
  } // class basic_ofstream

} // namespace std

§ 31.10.4.1
basic_ofstream& operator=(const basic_ofstream& rhs);  
// 31.10.4.3, swap
void swap(basic_ofstream& rhs);

// 31.10.4.4, members
basic_filebuf<charT, traits>* rdbuf() const;

bool is_open() const;

void open(const char* s, ios_base::openmode mode = ios_base::out);

void open(const filesystem::path::value_type* s,
          ios_base::openmode mode = ios_base::out);
// wide systems only; see 31.10.1

void open(const string& s, ios_base::openmode mode = ios_base::out);

void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

void close();

private:
  basic_filebuf<charT, traits> sb;  // exposition only
};

The class basic_ofstream<charT, traits> supports writing to named files. It uses a basic_filebuf<charT, traits> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the filebuf object.

### 31.10.4.2 Constructors

**basic_ofstream();**

**Effects:** Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.5.2.2) and sb with basic_filebuf<charT, traits>() (31.10.2.2).

**explicit basic_ofstream(const char* s,**
  **ios_base::openmode mode = ios_base::out);**

**Effects:** Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.5.2.2) and sb with basic_filebuf<charT, traits>() (31.10.2.2), then calls rdbuf()->open(s, mode | ios_base::out). If that function returns a null pointer, calls setstate(failbit).

**explicit basic_ofstream(const string& s,**
  **ios_base::openmode mode = ios_base::out);**

**Effects:** Equivalent to: basic_ofstream(s.c_str(), mode).

**template<class T>**
  **explicit basic_ofstream(const Tk& s,**
    **ios_base::openmode mode = ios_base::out);**

  **Constraints:** is_same_v<T, filesystem::path> is true.

  **Effects:** Equivalent to: basic_ofstream(s.c_str(), mode).

**basic_ofstream(basic_ofstream&& rhs);**

**Effects:** Move constructs the base class, and the contained basic_filebuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

### 31.10.4.3 Swap

**void swap(basic_ofstream& rhs);**

**Effects:** Exchanges the state of *this and rhs by calling basic_ostream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).**
template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);

    Effects: Equivalent to: x.swap(y).

31.10.4.4 Member functions

    basic_filebuf<charT, traits>* rdbuf() const;

        Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

    bool is_open() const;

        Returns: rdbuf()->is_open().

    void open(const char* s, ios_base::openmode mode = ios_base::out);
    void open(const filesystem::path::value_type* s, 
              ios_base::openmode mode = ios_base::out); // wide systems only; see 31.10.1

        Effects: Calls rdbuf()->open(s, mode | ios_base::out). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

    void close();

        Effects: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

    void open(const string& s, ios_base::openmode mode = ios_base::out);
    void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);

        Effects: Calls open(s.c_str(), mode).

31.10.5 Class template basic_fstream

31.10.5.1 General

    namespace std {
        template<class charT, class traits = char_traits<charT>>
            class basic_fstream : public basic_iostream<charT, traits> { 
                public:
                    using char_type = charT;
                    using int_type = typename traits::int_type;
                    using pos_type = typename traits::pos_type;
                    using off_type = typename traits::off_type;
                    using traits_type = traits;

                        // 31.10.5.2, constructors
                        basic_fstream();
                        explicit basic_fstream(
                            const char* s,
                            ios_base::openmode mode = ios_base::in | ios_base::out);
                        explicit basic_fstream(
                            const filesystem::path::value_type* s,
                            ios_base::openmode mode = ios_base::in|ios_base::out); // wide systems only; see 31.10.1
                        explicit basic_fstream(
                            const string& s,
                            ios_base::openmode mode = ios_base::in | ios_base::out);
                        template<typename T>
                            explicit basic_fstream(const T& s, 
                                                    ios_base::openmode mode = ios_base::in | ios_base::out);
                        basic_fstream(const basic_fstream&); = delete;
                        basic_fstream& basic_fstream&& rhs);

                        basic_fstream& operator=(const basic_fstream&); = delete;
                        basic_fstream& operator=(basic_fstream&& rhs);

                        // 31.10.5.3, swap
                        void swap(basic_fstream& rhs);
The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

\[(1.1)\] 

```
sb, the basic_filebuf object.
```

### 31.10.5.2 Constructors

[fstream.cons] 

```
basic_fstream();
```

1. **Effects**: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_filebuf<charT, traits>()`.

```
explicit basic_fstream( 
const char* s,  
ios_base::openmode mode = ios_base::in | ios_base::out);
```

2. **Effects**: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_fstream( 
const filesystem::path::value_type* s,  
ios_base::openmode mode = ios_base::in | ios_base::out);  
// wide systems only; see 31.10.1
```

2. **Effects**: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.4.7.2) and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

```
explicit basic_fstream( 
const string& s,  
ios_base::openmode mode = ios_base::in | ios_base::out);
```

3. **Effects**: Equivalent to: `basic_fstream(s.c_str(), mode)`.

```
template<class T> 
explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);  
```

4. **Constraints**: `is_same_v<T, filesystem::path>` is true.

5. **Effects**: Equivalent to: `basic_fstream(s.c_str(), mode)`.

### 31.10.5.3 Swap

[fstream.swap] 

```
void swap(basic_fstream& rhs);
```

1. **Effects**: Exchanges the state of *this and rhs by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.
template<class charT, class traits>
  void swap(basic_fstream<charT, traits>& x,
             basic_fstream<charT, traits>& y);
  
  Effects: Equivalent to: \texttt{x.swap(y)}.

31.10.5.4 Member functions [fstream.members]

basic_filebuf<charT, traits>* rdbuf() const;
  
Returns: \texttt{const\_cast<basic\_filebuf<charT, traits>*>(addressof(sb))}.

bool is_open() const;
  
Returns: \texttt{rdbuf()->is\_open()}.

void open(const char* s, ios_base::openmode mode = ios_base::in | ios_base::out);
void open(const filesystem::path::value_type* s, ios_base::openmode mode = ios_base::in | ios_base::out);
// wide systems only; see 31.10.1
  
Effects: Calls \texttt{rdbuf()->open(s, mode)}. If that function does not return a null pointer calls \texttt{clear()}, otherwise calls \texttt{setstate(failbit)} (which may throw \texttt{ios\_base::failure}) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::in | ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in | ios_base::out);
  
Effects: Calls \texttt{open(s.c\_str(), mode)}.

void close();
  
Effects: Calls \texttt{rdbuf()->close()} and, if that function returns a null pointer, calls \texttt{setstate(failbit)} (which may throw \texttt{ios\_base::failure}) (31.5.4.4).

31.11 Synchronized output streams [syncstream]

31.11.1 Header <syncstream> synopsis [syncstream.syn]

```cpp
#include <ostream>
// see 31.7.2

namespace std {
  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf;
  
  // 31.11.2.6, specialized algorithms
  template<class charT, class traits, class Allocator>
    void swap(basic_syncbuf<charT, traits, Allocator>& k,
              basic_syncbuf<charT, traits, Allocator>& t);

  using syncbuf = basic_syncbuf<char>;
  using wsyncbuf = basic_syncbuf<wchar_t>;

  template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream;

  using osyncstream = basic_osyncstream<char>;
  using wosyncstream = basic_osyncstream<wchar_t>;
}
```

1 The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.
31.11.2 Class template basic_syncbuf

31.11.2.1 Overview

namespace std {

    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf : public basic_streambuf<charT, traits> {

        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;
            using streambuf_type = basic_streambuf<charT, traits>;

            basic_syncbuf() : basic_syncbuf(nullptr) {}  
            explicit basic_syncbuf(streambuf_type* obuf) : basic_syncbuf(obuf, Allocator()) {}  
            basic_syncbuf(streambuf_type*, const Allocator&);
            basic_syncbuf(basic_syncbuf&&);
            ~basic_syncbuf();

        // 31.11.2.2, construction and destruction
        basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);
        Effects: Sets \texttt{wrapped} to \texttt{obuf}.
        Postconditions: \texttt{get_wrapped()} == \texttt{obuf} and \texttt{get_allocator()} == \texttt{allocator} are true.
        Throws: Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.
        Remarks: A copy of \texttt{allocator} is used to allocate memory for internal buffers holding the associated output.

    }  

};
basic_syncbuf(basic_syncbuf&& other);

Postconditions: The value returned by this->get_wrapped() is the value returned by other.get_wrapped() prior to calling this constructor. Output stored in other prior to calling this constructor will be stored in *this afterwards. other.pbase() == other.pptr() and other.get_wrapped() == nullptr are true.

Remarks: This constructor disassociates other from its wrapped stream buffer, ensuring destruction of other produces no output.

~basic_syncbuf();

Effects: Calls emit().

Throws: Nothing. If an exception is thrown from emit(), the destructor catches and ignores that exception.

31.11.2.3 Assignment and swap

basic_syncbuf& operator=(basic_syncbuf&& rhs);

Effects: Calls emit() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (31.11.2.2).

Postconditions:

(2.1) rhs.get_wrapped() == nullptr is true.
(2.2) this->get_allocator() == rhs.get_allocator() is true when allocator_traits<Allocator>::propagate_on_container_move_assignment::value is true; otherwise, the allocator is unchanged.

Returns: *this.

Remarks: This assignment operator disassociates rhs from its wrapped stream buffer, ensuring destruction of rhs produces no output.

void swap(basic_syncbuf& other);

Preconditions: Either allocator_traits<Allocator>::propagate_on_container_swap::value is true or this->get_allocator() == other.get_allocator() is true.

Effects: Exchanges the state of *this and other.

31.11.2.4 Member functions

bool emit();

Effects: Atomically transfers the associated output of *this to the stream buffer *wrapped, so that it appears in the output stream as a contiguous sequence of characters. *wrapped->pubsync() is called if and only if a call was made to sync() since the most recent call to emit(), if any.

Synchronization: All emit() calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.2), where each emit() call synchronizes with subsequent emit() calls in that total order.

Postconditions: On success, the associated output is empty.

Returns: true if all of the following conditions hold; otherwise false:

(4.1) wrapped == nullptr is false.
(4.2) All of the characters in the associated output were successfully transferred.
(4.3) The call to wrapped->pubsync() (if any) succeeded.

Remarks: May call member functions of wrapped while holding a lock uniquely associated with wrapped.

streambuf_type* get_wrapped() const noexcept;

Returns: wrapped.

allocator_type get_allocator() const noexcept;

Returns: A copy of the allocator that was set in the constructor or assignment operator.
void set_emit_on_sync(bool b) noexcept;

Effects: emit_on_sync = b.

31.11.2.5 Overridden virtual functions

int sync() override;

Effects: Records that the wrapped stream buffer is to be flushed. Then, if emit_on_sync is true, calls emit().

[Note 1: If emit_on_sync is false, the actual flush is delayed until a call to emit(). — end note]

Returns: If emit() was called and returned false, returns -1; otherwise 0.

31.11.2.6 Specialized algorithms

template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a,
    basic_syncbuf<charT, traits, Allocator>& b);

Effects: Equivalent to a.swap(b).

31.11.3 Class template basic_osyncstream

31.11.3.1 Overview

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;
            using streambuf_type = basic_streambuf<charT, traits>;
            using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

            // 31.11.3.2, construction and destruction
            basic_osyncstream(streambuf_type*, const Allocator&);
            explicit basic_osyncstream(streambuf_type* obuf)
                : basic_osyncstream(obuf, Allocator()) {} // 31.11.3.2
            basic_osyncstream(basic_ostream<charT, traits>&& os, const Allocator& allocator)
                : basic_osyncstream(os.rdbuf(), allocator) {} // 31.11.3.2
            explicit basic_osyncstream(basic_ostream<charT, traits>&& os)
                : basic_osyncstream(os, Allocator()) {} // 31.11.3.2
            basic_osyncstream(basic_osyncstream&&) noexcept;
            basic_osyncstream(); // 31.11.3.2

            // assignment
            basic_osyncstream& operator=(basic_osyncstream&&) noexcept;

            // 31.11.3.3, member functions
            void emit();
            streambuf_type* get_wrapped() const noexcept;
            syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); } // 31.11.3.2

            private:
                syncbuf_type sb; // exposition only
        }
    }
}

1 Allocator shall meet the Cpp17Allocator requirements (16.4.4.6.1).

2 [Example 1: A named variable can be used within a block statement for streaming.]
```cpp
{  
osyncstream bout(cout);
  bout << "Hello, ";
  bout << "World!";
  bout << endl;   // flush is noted
  bout << "and more!\n";
}  // characters are transferred and cout is flushed

— end example |

Example 2: A temporary object can be used for streaming within a single statement.
osyncstream(cout) << "Hello, " << "World!" << '\n';
In this example, cout is not flushed. — end example |

31.11.3.2 Construction and destruction

[bsynstream.osyncstream.cons]

basic_osyncstream(streambuf_type* buf, const Allocator& allocator);

1 Effects: Initializes sb from buf and allocator. Initializes the base class with basic_ostream<charT, traits>(addressof(sb)).

[Note 1: The member functions of the provided stream buffer can be called from emit() while a lock is held, which might result in a deadlock if used incautiously. — end note]

3 Postconditions: get_wrapped() == buf is true.

basic_osyncstream(basic_osyncstream&& other) noexcept;

4 Effects: Move constructs the base class and sb from the corresponding subobjects of other, and calls 
basic_ostream<charT, traits>::set_rdbuf(addressof(sb)).

5 Postconditions: The value returned by get_wrapped() is the value returned by os.get_wrapped() prior to calling this constructor. nullptr == other.get_wrapped() is true.

31.11.3.3 Member functions

[synstream.osyncstream.members]

void emit();

1 Effects: Behaves as an unformatted output function (31.7.5.4). After constructing a sentry object, calls 
sb.emit(). If that call returns false, calls setstate(ios_base::badbit).

[Example 1: A flush on a basic_osyncstream does not flush immediately:
{
  osyncstream bout(cout);
  bout << "Hello," << '\n';   // no flush
  bout.emit();   // characters transferred; cout not flushed
  bout << "World!" << endl;   // flush noted; cout not flushed
  bout.emit();   // characters transferred; cout flushed
  bout << "Greetings." << '\n';   // no flush
}  // characters transferred; cout not flushed

— end example ]

[Example 2: The function emit() can be used to handle exceptions from operations on the underlying stream.
{
  osyncstream bout(cout);
 bout << "Hello, " << "World!" << '\n';
try {
  bout.emit();
} catch (...) {
  // handle exception
  }

}  // characters transferred; cout not flushed

— end example ]

streambuf_type* get_wrapped() const noexcept;

4 Returns: sb.get_wrapped().

§ 31.11.3.3 1575
Example 3: Obtaining the wrapped stream buffer with get_wrapped() allows wrapping it again with an
osyncstream. For example,

```c
{ osyncstream bout1(cout);
  bout1 << "Hello, ";
  { osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << \n
    \n
};
  bout1 << "World!" << \n
    \n
};
```

produces the uninterleaved output

Goodbye, Planet!
Hello, World!

— end example]

31.12 File systems
31.12.1 General
Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and
directories.

A file system is a collection of files and their attributes.

A file is an object within a file system that holds user or system data. Files can be written to, or read from,
or both. A file has certain attributes, including type. File types include regular files and directories. Other
types of files, such as symbolic links, may be supported by the implementation.

A directory is a file within a file system that acts as a container of directory entries that contain information
about other files, possibly including other directory files. The parent directory of a directory is the directory that
both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2)
in the given directory. The parent directory of other types of files is a directory containing a directory entry
for the file under discussion.

A link is an object that associates a filename with a file. Several links can associate names with the same file.
A hard link is a link to an existing file. Some file systems support multiple hard links to a file. If the last
hard link to a file is removed, the file itself is removed.

[Note 1: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note]

A symbolic link is a type of file with the property that when the file is encountered during pathname
resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

[Note 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the
file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

31.12.2 Conformance
31.12.2.1 General
Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance
subclauses take that into account.

31.12.2.2 POSIX conformance
Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.

[Note 1: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs.
— end note]

Implementations should provide such behavior as it is defined by POSIX. Implementations shall document
any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact
POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of
actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the
implementation shall report an error as specified in 31.12.5.

[Note 2: This allows users to rely on an exception being thrown or an error code being set when an implementation
cannot provide any reasonable behavior. — end note]
Implementations are not required to provide behavior that is not supported by a particular file system.

[Example 1: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. — end example]

31.12.2.3 Operating system dependent behavior conformance

Behavior that is specified as being operating system dependent is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.

31.12.2.4 File system race behavior

A file system race is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.

If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, Preconditions: is not specified for the function.

[Note 1: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. — end note]

31.12.3 Requirements

Throughout subclause 31.12, char, wchar_t, char8_t, char16_t, and char32_t are collectively called encoded character types.

Functions with template parameters named EcharT shall not participate in overload resolution unless EcharT is one of the encoded character types.

Template parameters named InputIterator shall meet the Cpp17InputIterator requirements (25.3.5.3) and shall have a value type that is one of the encoded character types.

[Note 1: Use of an encoded character type implies an associated character set and encoding. Since signed char and unsigned char have no implied character set and encoding, they are not included as permitted types. — end note]

Template parameters named Allocator shall meet the Cpp17Allocator requirements (16.4.4.6.1).

31.12.4 Header <filesystem> synopsis

```cpp
#include <compare>  // see 17.11.1

namespace std::filesystem {
  // 31.12.6, paths
  class path;

  // 31.12.6.8, path non-member functions
  void swap(path& lhs, path& rhs) noexcept;

path temp_directory_path();
path temp_directory_path(error_code& ec);

path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);

} // 31.12.6.9, hash support
namespace std {
    template<class T> struct hash;
    template<> struct hash<filesystem::path>;
} // 31.12.4 1580

namespace std::ranges {
    template<>
    inline constexpr bool enable_borrowed_range<filesystem::directory_iterator> = true;
    template<>
    inline constexpr bool enable_borrowed_range<filesystem::recursive_directory_iterator> = true;

    template<>
    inline constexpr bool enable_view<filesystem::directory_iterator> = true;

}
template<>
  inline constexpr bool enable_view<filesystem::recursive_directory_iterator> = true;
}

Implementations should ensure that the resolution and range of file_time_type reflect the operating system dependent resolution and range of file time values.

### 31.12.5 Error reporting  

Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an error_code.

[Note 1: This supports two common use cases:

1. Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.
2. Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

— end note]

Functions not having an argument of type error_code& handle errors as follows, unless otherwise specified:

1. When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type filesystem_error shall be thrown. For functions with a single path argument, that argument shall be passed to the filesystem_error constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the filesystem_error constructor as the path1 argument, and the second shall be passed as the path2 argument. The filesystem_error constructor’s error_code argument is set as appropriate for the specific operating system dependent error.

2. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

3. Destructors throw nothing.

Functions having an argument of type error_code& handle errors as follows, unless otherwise specified:

1. If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the error_code& argument is set as appropriate for the specific operating system dependent error. Otherwise, clear() is called on the error_code& argument.

### 31.12.6 Class path  

#### 31.12.6.1 General  

An object of class path represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

[Note 1: Class path is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]

A path is a sequence of elements that identify the location of a file within a filesystem. The elements are the root-name_opt, root-directory_opt, and an optional sequence of filenames (31.12.6.2). The maximum number of elements in the sequence is operating system dependent (31.12.2.3).

An absolute path is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A relative path is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

[Note 2: Pathnames “.” and “..” are relative paths. — end note]

A pathname is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (31.12.6.2) or according to an operating system dependent native pathname format accepted by the host operating system.

Pathname resolution is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.
namespace std::filesystem {
    class path {
        public:
            using value_type = see below;
            using string_type = basic_string<value_type>;
            static constexpr value_type preferred_separator = see below;

            // 31.12.8.1, enumeration format
            enum format;

            // 31.12.6.5.1, constructors and destructor
            path() noexcept;
            path(const path& p);
            path(path&& p) noexcept;
            path(string_type&& source, format fmt = auto_format);
            template<class Source>
                path(const Source& source, format fmt = auto_format);
            template<class InputIterator>
                path(InputIterator first, InputIterator last, format fmt = auto_format);
            ~path();

            // 31.12.6.5.2, assignments
            path& operator=(const path& p);
            path& operator=(path&& p) noexcept;
            path& assign(string_type&& source);
            template<class Source>
                path& operator=(const Source& source);
            template<class InputIterator>
                path& assign(InputIterator first, InputIterator last);

            // 31.12.6.5.3, appends
            path& operator/=(const path& p);
            template<class Source>
                path& operator/=(const Source& source);
            template<class InputIterator>
                path& append(InputIterator first, InputIterator last);

            // 31.12.6.5.4, concatenation
            path& operator+=(const path& x);
            path& operator+=(const string_type& x);
            path& operator+=(basic_string_view<value_type> x);
            path& operator+=(const value_type* x);
            template<class Source>
                path& operator+=(const Source& x);
            template<typename EcharT>
                path& operator+=(EcharT x);
            template<class InputIterator>
                path& concat(InputIterator first, InputIterator last);
        }
    }

}

7 value_type is a typedef for the operating system dependent encoded character type used to represent
pathnames.

8 The value of the preferred_separator member is the operating system dependent preferred-separator
character (31.12.6.2).

9 [Example 2: For POSIX-based operating systems, value_type is char and preferred_separator is the slash character
(‘/’). For Windows-based operating systems, value_type is wchar_t and preferred_separator is the backslash
character (L‘\’). — end example]

31.12.6.2 Generic pathname format [fs.path.generic]

pathname:
    root-name<opt> root-directory<opt> relative-path

root-name:
    operating system dependent sequences of characters
    implementation-defined sequences of characters

root-directory:
    directory-separator

relative-path:
    filename
    filename directory-separator relative-path
    an empty path

filename:
    non-empty sequence of characters other than directory-separator characters

directory-separator:
    preferred-separator directory-separator<opt>
    fallback-separator directory-separator<opt>

preferred-separator:
    operating system dependent directory separator character

fallback-separator:
    /, if preferred-separator is not /

1 A filename is the name of a file. The dot and dot-dot filenames, consisting solely of one and two period
characters respectively, have special meaning. The following characteristics of filenames are operating system
dependent:
The permitted characters.

[Example 1: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — end example]

[Note 1: Wider portability can be achieved by limiting filename characters to the POSIX Portable Filename Character Set:  
A B C D E F G H I J K L M N O P Q R S T U V W X Y Z  
a b c d e f g h i j k l m n o p q r s t u v w x y z  
0 1 2 3 4 5 6 7 8 9 _ - — end note]

The maximum permitted length.

Filenames that are not permitted.

Filenames that have special meaning.

Case awareness and sensitivity during path resolution.

Special rules that may apply to file types other than regular files, such as directories.

2 Except in a root-name, multiple successive directory-separator characters are considered to be the same as one directory-separator character.

3 The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to root-directory is implementation-defined. Specific filenames may have special meanings for a particular operating system.

4 A root-name identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent root-names, at least one implementation-defined root-name is required.

[Note 2: Many operating systems define a name beginning with two directory-separator characters as a root-name that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier – a root-name identifying a specific device such as a disk drive. — end note]

5 If a root-name is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

[Note 3: On a POSIX-like operating system, it is impossible to have a root-name and a relative-path without an intervening root-directory element. — end note]

Normalization of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the root-name with a preferred-separator.
3. Replace each directory-separator with a preferred-separator.

[Note 4: The generic pathname grammar defines directory-separator as one or more slashes and preferred-separators. — end note]

4. Remove each dot filename and any immediately following directory-separator.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a directory-separator and a dot-dot filename, along with any immediately following directory-separator.
6. If there is a root-directory, remove all dot-dot filenames and any directory-separators immediately following them.

[Note 5: These dot-dot filenames attempt to refer to nonexistent parent directories. — end note]

7. If the last filename is dot-dot, remove any trailing directory-separator.
8. If the path is empty, add a dot.

The result of normalization is a path in normal form, which is said to be normalized.
2 Several functions are defined to accept detected-format arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

[Note 2: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — end note]

4 Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let $G(n)$ and $N(g)$ in a mathematical sense be the implementation’s functions that convert native-to-generic and generic-to-native formats respectively. If $g=G(n)$ for some $n$, then $G(N(g))=g$; if $n=N(g)$ for some $g$, then $N(G(n))=n$.

[Note 3: Neither $G$ nor $N$ need be invertible. — end note]

5 If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a directory-separator, otherwise it shall be treated as a path to a regular file.

[Note 4: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]

7 When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function ($G$ or $N$).

8 When the (new) value $p$ of one representation of a path is derived from the representation of that or another path, a value $q$ is chosen for the other representation. The value $q$ converts to $p$ (by $G$ or $N$ as appropriate) if any such value does so; $q$ is otherwise unspecified.

[Note 5: If $q$ is the result of converting any path at all, it is the result of converting $p$. — end note]

31.12.6.3.2 Type and encoding conversions

The native encoding of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The native encoding for wide character strings is the implementation-defined execution-wide character set encoding (16.3.3.3.5).

For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from `path::value_type`. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

1. **char**: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.
   
   [Note 1: For POSIX-based operating systems `path::value_type` is `char` so no conversion from `char` value type arguments or to `char` value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — end note]

   [Note 2: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error prone. — end note]

2. **wchar_t**: The encoding is the native wide encoding. The method of conversion is unspecified.

   [Note 3: For Windows-based operating systems `path::value_type` is `wchar_t` so no conversion from `wchar_t` value type arguments or to `wchar_t` value type return values is performed. — end note]

3. **char8_t**: The encoding is UTF-8. The method of conversion is unspecified.

4. **char16_t**: The encoding is UTF-16. The method of conversion is unspecified.

5. **char32_t**: The encoding is UTF-32. The method of conversion is unspecified.

3 If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type `path::value_type`. 

§ 31.12.6.3.2
31.12.6.4 Requirements  

In addition to the requirements (31.12.3), function template parameters named `Source` shall be one of:

1. `basic_string<EcharT, traits, Allocator>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end())].`
2. `basic_string_view<EcharT, traits>`. A function argument `const Source& source` shall have an effective range `[source.begin(), source.end()]).`
3. A type meeting the `Cpp17InputIterator` requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source.end()) where `end` is the first iterator value with an element value equal to `iterator_traits<Source>::value_type()`.`
4. A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument `const Source& source` shall have an effective range `[source, end)` where `end` is the first iterator value with an element value equal to `iterator_traits<decay_t<Source>>::value_type()`.`

Functions taking template parameters named `Source` shall not participate in overload resolution unless `Source` denotes a type other than `path`, and either

1. `Source` is a specialization of `basic_string` or `basic_string_view`, or
2. the qualified-id `iterator_traits<decay_t<Source>>::value_type` is valid and denotes a possibly `const` encoded character type (13.10.3).

Note 1: See path conversions (31.12.6.3) for how the value types above and their encodings convert to `path::value_type` and its encoding. — end note

Arguments of type `Source` shall not be null pointers.

31.12.6.5 Members  

31.12.6.5.1 Constructors

path() noexcept;  
Postconditions: `empty() == true`.  

path(const path& p);  
path(path&& p) noexcept;  
Effects: Constructs an object of class `path` having the same pathname in the native and generic formats, respectively, as the original value of `p`. In the second form, `p` is left in a valid but unspecified state.

path(string_type&& source, format fmt = auto_format);  
Effects: Constructs an object of class `path` for which the pathname in the detected-format of `source` has the original value of `source` (31.12.6.3.1), converting format if required (31.12.6.3.1). `source` is left in a valid but unspecified state.

template<class Source>  
path(const Source& source, format fmt = auto_format);  
template<class InputIterator>  
path(InputIterator first, InputIterator last, format fmt = auto_format);  
Effects: Let `s` be the effective range of `source` (31.12.6.4) or the range `[first, last)`, with the encoding converted if required (31.12.6.3). Finds the detected-format of `s` (31.12.6.3.1) and constructs an object of class `path` for which the pathname in that format is `s`.

template<class Source>  
path(const Source& source, const locale& loc, format fmt = auto_format);  
template<class InputIterator>  
path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);  
Mandates: The value type of `Source` and `InputIterator` is `char`.  
Effects: Let `s` be the effective range of `source` or the range `[first, last)`, after converting the encoding as follows:

§ 31.12.6.5.1 1587
If value_type is wchar_t, converts to the native wide encoding (31.12.6.3.2) using the codecvt<
wchar_t, char, mbstate_t> facet of loc.

Otherwise a conversion is performed using the codecvt<wchar_t, char, mbstate_t> facet of
loc and then a second conversion to the current ordinary encoding.

Finds the detected-format of s (31.12.6.3.1) and constructs an object of class path for which the
pathname in that format is s.

Example 1: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a
directory:

```cpp
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using latin1_facet to convert ISO/IEC
8859-1 encoded latin1_string to a wide character string in the native wide encoding (31.12.6.3.2). The
resulting wide string is then converted to an ordinary character pathname string in the current native ordinary
encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8,
all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but
for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using latin1_facet to convert ISO/IEC
8859-1 encoded latin1_string to a UTF-16 encoded wide character pathname string. All of the characters in
the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — end example]

### 31.12.6.5.2 Assignments

```cpp
path& operator=(const path& p);
```

1. **Effects:** If *this and p are the same object, has no effect. Otherwise, sets both respective pathnames
   of *this to the respective pathnames of p.

2. **Returns:** *this.

```cpp
path& operator=(path&& p) noexcept;
```

3. **Effects:** If *this and p are the same object, has no effect. Otherwise, sets both respective pathnames
   of *this to the respective pathnames of p. p is left in a valid but unspecified state.

4. **Returns:** *this.

```cpp
path& operator=(string_type&& source);
push_back(string_type&& source);
```

5. **Effects:** Sets the pathname in the detected-format of source to the original value of source. source
   is left in a valid but unspecified state.

6. **Returns:** *this.

```cpp
template<class Source>
path& operator=(const Source& source);
template<class Source>
path assign(const Source& source);
template<InputIterator>
path assign(InputIterator first, InputIterator last);
```

7. **Effects:** Let s be the effective range of source (31.12.6.4) or the range [first, last), with the encoding
   converted if required (31.12.6.3). Finds the detected-format of s (31.12.6.3.1) and sets the pathname in
   that format to s.

8. **Returns:** *this.

### 31.12.6.5.3 Appends

1. The append operations use operator/= to denote their semantic effect of appending preferred-separator when
   needed.
path& operator/=(const path& p);

Effects: If p.is_absolute() || (p.has_root_name() && p.root_name() != root_name()), then operator=(p).

Otherwise, modifies *this as if by these steps:

(3.1) — If p.has_root_directory(), then removes any root directory and relative path from the generic format pathname. Otherwise, if !has_root_directory() && is_absolute() || has_filename() is true, then appends path::preferred_separator to the generic format pathname.

(3.2) — Then appends the native format pathname of p, omitting any root-name from its generic format pathname, to the native format pathname.

[Example 1: Even if //host is interpreted as a root-name, both of the paths path("/host")/"foo" and path("/host")/"foo" equal "//host/foo" (although the former might use backslash as the preferred separator).]

Expression examples:

// On POSIX.
path("foo") /= path("");  // yields path("foo")
path("foo") /= path("/bar");  // yields path("/bar")

// On Windows.
path("foo") /= path("");  // yields path("foo\")
path("foo") /= path("/bar");  // yields path("/bar")
path("foo") /= path("c:/bar");  // yields path("c:\bar")
path("c:foo") /= path("/bar");  // yields path("c:bar")
path("c:foo") /= path("c:bar");  // yields path("c:foo\bar")

— end example]

Returns: *this.

template<class Source>
path& operator/=(const Source& source);
template<class Source>
path& append(const Source& source);

Effects: Equivalent to: return operator/=(path(source));

template<class InputIterator>
path& append(InputIterator first, InputIterator last);

Effects: Equivalent to: return operator/=(path(first, last));

31.12.6.5.4 Concatenation

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& operator+=(const Source& x);
template<class Source>
path& concat(const Source& x);

Effects: Appends path(x).native() to the pathname in the native format.

[Note 1: This directly manipulates the value of native(), which is not necessarily portable between operating systems. — end note]

Returns: *this.

path& operator+=(value_type x);
template<class EcharT>
path& operator+=(EcharT x);

Effects: Equivalent to: return *this += basic_string_view(&x, 1);
template<class InputIterator>
path& concat(InputIterator first, InputIterator last);

Effects: Equivalent to: return *this += path(first, last);

31.12.6.5.5 Modifiers

void clear() noexcept;

Postconditions: empty() == true.

path& make_preferred();

Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.

Returns: *this.

[Example 1:
path p("foo/bar");
std::cout << p << '
';
p.make_preferred();
std::cout << p << '
';
On an operating system where preferred-separator is a slash, the output is:
"foo/bar"
"foo/bar"
On an operating system where preferred-separator is a backslash, the output is:
"foo/bar"
"foo\bar"
— end example]

path& remove_filename();

Effects: Remove the generic format pathname of filename() from the generic format pathname.

Postconditions: !has_filename().

Returns: *this.

[Example 2:
p(path("foo/bar")).remove_filename(); // yields "foo/
p(path("foo/").remove_filename(); // yields "foo/
p(path("/foo")).remove_filename(); // yields "/
p(path("/")).remove_filename(); // yields "/
— end example]

path& replace_filename(const path& replacement);

Effects: Equivalent to:
remove_filename();
operator/=(replacement);

Returns: *this.

[Example 3:
p(path("/foo")).replace_filename("bar"); // yields "/bar" on POSIX
p(path("/")).replace_filename("bar"); // yields "/bar" on POSIX
— end example]

path& replace_extension(const path& replacement = path());

Effects:
(12.1) Any existing extension() (31.12.6.5.9) is removed from the pathname in the generic format, then
(12.2) If replacement is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then
(12.3) operator+=(replacement);

Returns: *this.
void swap(path& rhs) noexcept;

Effects: Swaps the contents (in all formats) of the two paths.

Complexity: Constant time.

### 31.12.6.5.6 Native format observers

The string returned by all native format observers is in the native pathname format (31.12.6).

```cpp
const string_type& native() const noexcept;
```

Returns: The pathname in the native format.

```cpp
const value_type* c_str() const noexcept;
```

Effects: Equivalent to: `return native().c_str();`

operator string_type() const;

Returns: `native()`.

#### 31.12.6.5.7 Generic format observers

Generic format observer functions return strings formatted according to the generic pathname format (31.12.6.2). A single slash (`/`) character is used as the directory-separator.

```cpp
template<class EcharT, class traits = char_traits<EcharT>,
    class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;
```

Returns: The pathname in the generic format.

Remarks: All memory allocation, including for the return value, shall be performed by `a`. Conversion, if any, is specified by 31.12.6.3.

std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;

Returns: The pathname in the generic format.

Remarks: Conversion, if any, is performed as specified by 31.12.6.3.
31.12.6.5.8 Compare

```cpp
int compare(const path& p) const noexcept;
```

1. **Returns:**
   1.1. Let `rootNameComparison` be the result of `this->root_name().native().compare(p.root_name().native())`. If `rootNameComparison` is not 0, `rootNameComparison`.
   1.2. Otherwise, if `!this->has_root_directory()` and `p.has_root_directory()`, a value less than 0.
   1.3. Otherwise, if `this->has_root_directory()` and `!p.has_root_directory()`, a value greater than 0.
   1.4. Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically less than `native()` for the elements of `p.relative_path()`, a value less than 0.
   1.5. Otherwise, if `native()` for the elements of `this->relative_path()` are lexicographically greater than `native()` for the elements of `p.relative_path()`, a value greater than 0.
   1.6. Otherwise, 0.

2. **Effects:** Equivalent to: `return compare(path(s));`

31.12.6.5.9 Decomposition

```cpp
path root_name() const;
```

1. **Returns:** `root-name`, if the pathname in the generic format includes `root-name`, otherwise `path()`.

```cpp
path root_directory() const;
```

2. **Returns:** `root-directory`, if the pathname in the generic format includes `root-directory`, otherwise `path()`.

```cpp
path root_path() const;
```

3. **Returns:** `root_name() / root_directory()`.

```cpp
path relative_path() const;
```

4. **Returns:** A path composed from the pathname in the generic format, if `empty()` is `false`, beginning with the first `filename` after `root_path()`. Otherwise, `path()`.

```cpp
path parent_path() const;
```

5. **Returns:** `*this` if `has_relative_path()` is `false`, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of `*this` that produces one fewer element in its iteration.

```cpp
path filename() const;
```

6. **Returns:** `relative_path().empty() ? path() : *--end()`.

7. **[Example 1:]
   ```cpp
   path("/foo/bar.txt").filename(); // yields "bar.txt"
   path("/foo/bar").filename(); // yields "bar"
   path("/foo/bar/").filename(); // yields ""
   path("/").filename(); // yields ""
   path("/host").filename(); // yields "host"
   path("..").filename(); // yields "."
   path("...").filename(); // yields ".."
   ``` — end example]

```cpp
path stem() const;
```

8. **Returns:** Let `f` be the generic format pathname of `filename()`. Returns a path whose pathname in the generic format is

§ 31.12.6.5.9
— if it contains no periods other than a leading period or consists solely of one or two periods;
— otherwise, the prefix of f ending before its last period.

[Example 2:

```cpp
std::cout << path("/foo/bar.txt").stem(); // outputs "bar"
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
    std::cout << p.extension() << 'n';
    // outputs: .tar
    // .baz
    // .bar
— end example]

path extension() const;
Returns: A path whose pathname in the generic format is the suffix of filename() not included in stem().

[Example 3:

```cpp
path("/foo/bar.txt").extension(); // yields ".txt" and stem() is "bar"
path("/foo/bar") .extension(); // yields "" and stem() is "bar"
path("/foo/.profile") .extension(); // yields "" and stem() is ".profile"
path(".bar") .extension(); // yields "" and stem() is ".bar"
path("..bar") .extension(); // yields ".bar" and stem() is "."
— end example]

[Note 1: The period is included in the return value so that it is possible to distinguish between no extension and an empty extension. — end note]

[Note 2: On non-POSIX operating systems, for a path p, it is possible that p.stem() + p.extension() == p.filename() is false, even though the generic format pathnames are the same. — end note]

31.12.6.5.10 Query

[[nodiscard]] bool empty() const noexcept;
Returns: true if the pathname in the generic format is empty, otherwise false.

bool has_root_path() const;
Returns: !root_path().empty().

bool has_root_name() const;
Returns: !root_name().empty().

bool has_root_directory() const;
Returns: !root_directory().empty().

bool has_relative_path() const;
Returns: !relative_path().empty().

bool has_parent_path() const;
Returns: !parent_path().empty().

bool has_filename() const;
Returns: !filename().empty().

bool has_stem() const;
Returns: !stem().empty().

bool has_extension() const;
Returns: !extension().empty().

§ 31.12.6.5.10 1593
bool is_absolute() const;

Returns: true if the pathname in the native format contains an absolute path (31.12.6), otherwise false.

[Example 1: path("/").is_absolute() is true for POSIX-based operating systems, and false for Windows-based operating systems. — end example]

bool is_relative() const;

Returns: !is_absolute().

31.12.6.5.11 Generation [fs.path.gen]

path lexically_normal() const;

Returns: A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname in the generic format of *this.

[Example 1:
assert(path("foo/.bar/..").lexically_normal() == "foo/");
assert(path("foo///bar/..").lexically_normal() == "foo/");
The above assertions will succeed. On Windows, the returned path's directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

path lexically_relative(const path& base) const;

Effects: If:
— (3.1) root_name() != base.root_name() is true, or
— (3.2) is_absolute() != base.is_absolute() is true, or
— (3.3) !has_root_directory() && base.has_root_directory() is true, or
— (3.4) any filename in relative_path() or base.relative_path() can be interpreted as a root-name, returns path().

[Note 1: On a POSIX implementation, no filename in a relative-path is acceptable as a root-name. — end note]

Determines the first mismatched element of *this and base as if by:
auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());

Then,
— (3.5) if a == end() and b == base.end(), returns path(""); otherwise
— (3.6) let n be the number of filename elements in [b, base.end()) that are not dot or dot-dot or empty, minus the number that are dot-dot. If n<0, returns path(); otherwise
— (3.7) if n == 0 and (a == end() || !a->empty()), returns path(""); otherwise
— (3.8) returns an object of class path that is default-constructed, followed by
— (3.8.1) application of operator/(path("..")) n times, and then
— (3.8.2) application of operator/= for each element in [a, end()).

Returns: *this made relative to base. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) *this or base.

[Example 2:
assert(path("a/d") .lexically_relative("/a/b/c") == "../..//d");
assert(path("a/b/c") .lexically_relative("/a/d") == "../b/c");
assert(path("a/b/c") .lexically_relative("/a") == "b/c");
assert(path("a/b/c") .lexically_relative("/a/b/c/x/y") == "../.."); assert(path("a/b/c") .lexically_relative("/a/b/c") == ");
assert(path("a/b") .lexically_relative("c/d") == "../a/b");
The above assertions will succeed. On Windows, the returned path's directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

[Note 2: If symlink following semantics are desired, use the operational function relative(). — end note]
path lexically_proximate(const path& base) const;

Returns: If the value of lexically_relative(base) is not an empty path, return it. Otherwise return *this.

[Note 4: If symlink following semantics are desired, use the operational function proximate(). —end note]

[Note 5: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply lexically_normal() to *this, base, or both. —end note]

31.12.6.6 Iterators

Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).

A path::iterator is a constant iterator meeting all the requirements of a bidirectional iterator (25.3.5.6) except that, for dereferenceable iterators a and b of type path::iterator with a == b, there is no requirement that *a and *b are bound to the same object. Its value_type is path.

Calling any non-const member function of a path object invalidates all iterators referring to elements of that object.

For the elements of the pathname in the generic format, the forward traversal order is as follows:

(4.1) — The root-name element, if present.
(4.2) — The root-directory element, if present.
(4.3) — Each successive filename element, if present.
(4.4) — An empty element, if a trailing non-root directory-separator is present.

The backward traversal order is the reverse of forward traversal.

iterator begin() const;

Returns: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

iterator end() const;

Returns: The end iterator.

31.12.6.7 Inserter and extractor

template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>&& os, const path& p);

Effects: Equivalent to os << quoted(p.string<charT, traits>().

[Note 1: The quoted function is described in 31.7.8. —end note]

Returns: os.

template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>&& is, path& p);

Effects: Equivalent to:

basic_string<charT, traits> tmp;
is >> quoted(tmp);
p = tmp;

Returns: is.

31.12.6.8 Non-member functions

void swap(path& lhs, path& rhs) noexcept;

Effects: Equivalent to lhs.swap(rhs).
size_t hash_value(const path& p) noexcept;

Returns: A hash value for the path p. If for two paths, p1 == p2 then hash_value(p1) == hash_value(p2).

friend bool operator==(const path& lhs, const path& rhs) noexcept;

Returns: lhs.compare(rhs) == 0.

[Note 1: Path equality and path equivalence have different semantics.]
(4.1) — Equality is determined by the path non-member operator==, which considers the two paths’ lexical representations only.
[Example 1: path(“foo”) == "bar" is never true. —end example]
(4.2) — Equivalence is determined by the equivalent() non-member function, which determines if two paths resolve (31.12.6) to the same file system entity.
[Example 2: equivalent("foo", "bar") will be true when both paths resolve to the same file. —end example]

—end note

friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;

Returns: lhs.compare(rhs) <=> 0.

friend path operator/(const path& lhs, const path& rhs);

Effects: Equivalent to: return path(lhs) /= rhs;

31.12.6.9 Hash support [fs.path.hash]

template<> struct hash<filesystem::path>;

For an object p of type filesystem::path, hash<filesystem::path>()(p) evaluates to the same result as filesystem::hash_value(p).

31.12.7 Class filesystem_error [fs.class.filesystem.error]

31.12.7.1 General [fs.class.filesystem.error.general]

namespace std::filesystem {
  class filesystem_error : public system_error {
    public:
      filesystem_error(const string& what_arg, error_code ec);
      filesystem_error(const string& what_arg, const path& p1, error_code ec);
      filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);

      const path& path1() const noexcept;
      const path& path2() const noexcept;
      const char* what() const noexcept override;
    };
  }
}

The class filesystem_error defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

31.12.7.2 Members [fs.filesystem.error.members]

Constructors are provided that store zero, one, or two paths associated with an error.

filesystem_error(const string& what_arg, error_code ec);

Postconditions:
(2.1) — code() == ec,
(2.2) — path1().empty() == true,
(2.3) — path2().empty() == true, and
(2.4) — string_view(what()).find(what_arg.c_str()) != string_view::npos.
filesystem_error(const string& what_arg, const path& p1, error_code ec);

Postconditions:

- code() == ec,
- path1() returns a reference to the stored copy of p1,
- path2().empty() == true, and
- string_view(what()).find(what_arg.c_str()) != string_view::npos.

filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);

Postconditions:

- code() == ec,
- path1() returns a reference to the stored copy of p1,
- path2() returns a reference to the stored copy of p2, and
- string_view(what()).find(what_arg.c_str()) != string_view::npos.

const path& path1() const noexcept;

Returns: A reference to the copy of p1 stored by the constructor, or, if none, an empty path.

const path& path2() const noexcept;

Returns: A reference to the copy of p2 stored by the constructor, or, if none, an empty path.

const char* what() const noexcept override;

Returns: An ntbs that incorporates the what_arg argument supplied to the constructor. The exact format is unspecified. Implementations should include the system_error::what() string and the pathnames of path1 and path2 in the native format in the returned string.

### 31.12.8 Enumerations

#### 31.12.8.1 Enum path::format

This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 126.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>native_format</td>
<td>The native pathname format.</td>
</tr>
<tr>
<td>generic_format</td>
<td>The generic pathname format.</td>
</tr>
<tr>
<td>auto_format</td>
<td>The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format. Recommended practice: For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way.</td>
</tr>
</tbody>
</table>

#### 31.12.8.2 Enum class file_type

This enum class specifies constants used to identify file types, with the meanings listed in Table 127. The values of the constants are distinct.

#### 31.12.8.3 Enum class copy_options

The enum class type copy_options is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 128. The constant none represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.
Table 127: Enum class file_type

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The type of the file has not been determined or an error occurred while trying to determine the type.</td>
</tr>
<tr>
<td>not_found</td>
<td>Pseudo-type indicating the file was not found.</td>
</tr>
<tr>
<td>regular</td>
<td>Regular file</td>
</tr>
<tr>
<td>directory</td>
<td>Directory file</td>
</tr>
<tr>
<td>symlink</td>
<td>Symbolic link file</td>
</tr>
<tr>
<td>block</td>
<td>Block special file</td>
</tr>
<tr>
<td>character</td>
<td>Character special file</td>
</tr>
<tr>
<td>fifo</td>
<td>FIFO or pipe file</td>
</tr>
<tr>
<td>socket</td>
<td>Socket file</td>
</tr>
<tr>
<td>implementation-defined</td>
<td>Implementations that support file systems having file types in addition to the above file_type types shall supply implementation-defined file_type constants to separately identify each of those additional file types</td>
</tr>
<tr>
<td>unknown</td>
<td>The file exists but the type cannot be determined</td>
</tr>
</tbody>
</table>

<td>Copy directory structure only; do not copy non-directory files.</td>
<td></td>
</tr>
<tr>
<td>create_symlinks</td>
<td>Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory.</td>
<td></td>
</tr>
<tr>
<td>create_hard_links</td>
<td>Make hard links instead of copies of files.</td>
<td></td>
</tr>
</tbody>
</table>
31.12.8.4  Enum class `perms`  

The enum class type `perms` is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 129.

<table>
<thead>
<tr>
<th>Name</th>
<th>Value (octal)</th>

<td></td>
<td>The permissions are not known, such as when a file_status object is created without specifying the permissions</td>
</tr>
</tbody>
</table>

31.12.8.5  Enum class `perm_options`  

The enum class type `perm_options` is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 130. The bitmask constants are bitmask elements. In Table 130 `perm` denotes a value of type `perms` passed to `permissions`.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace</td>
<td>permissions shall replace the file’s permission bits with perm</td>
</tr>
<tr>
<td>add</td>
<td>permissions shall replace the file’s permission bits with the bitwise OR of perm and the file’s current permission bits.</td>
</tr>
<tr>
<td>remove</td>
<td>permissions shall replace the file’s permission bits with the bitwise AND of the complement of perm and the file’s current permission bits.</td>
</tr>
<tr>
<td>nofollow</td>
<td>permissions shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.</td>
</tr>
</tbody>
</table>

31.12.8.6  Enum class `directory_options`  

The enum class type `directory_options` is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 131. The constant none represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

§ 31.12.8.6
Table 131: Enum class directory_options  [tab:fs.enum.dir.opts]

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Skip directory symlinks, permission denied is an error.</td>
</tr>
<tr>
<td>follow_directory_symlink</td>
<td>Follow rather than skip directory symlinks.</td>

<tr>
<td>skip_permission_denied</td>
<td>Skip directories that would otherwise result in permission denied.</td>
</tr>
</tbody>
</table>

31.12.9  Class file_status  [fs.class.file.status]
31.12.9.1  General  [fs.class.file.status.general]

namespace std::filesystem {
    class file_status {
        public:
            // 31.12.9.2, constructors and destructor
            file_status() noexcept : file_status(file_type::none) {}  
            explicit file_status(file_type ft,  
                                perms prms = perms::unknown) noexcept;
            file_status(const file_status&) noexcept = default;  
            file_status(file_status&&) noexcept = default;
            ~file_status();

            // assignments
            file_status& operator=(const file_status&) noexcept = default;
            file_status& operator=(file_status&&) noexcept = default;

            // 31.12.9.4, modifiers
            void type(file_type ft) noexcept;
            void permissions(perms prms) noexcept;

            // 31.12.9.3, observers
            file_type type() const noexcept;
            perms permissions() const noexcept;

            friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept  
                { return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
    }
}

1 An object of type file_status stores information about the type and permissions of a file.

31.12.9.2  Constructors  [fs.file.status.cons]

explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;

1  Postconditions: type() == ft and permissions() == prms.

31.12.9.3  Observers  [fs.file.status.obs]

file_type type() const noexcept;

1  Returns: The value of type() specified by the postconditions of the most recent call to a constructor,  
        operator=, or type(file_type) function.

perms permissions() const noexcept;

2  Returns: The value of permissions() specified by the postconditions of the most recent call to a  
        constructor, operator=, or permissions(perms) function.

31.12.9.4  Modifiers  [fs.file.status.mods]

void type(file_type ft) noexcept;

1  Postconditions: type() == ft.
void permissions(perms prms) noexcept;

Postconditions: permissions() == prms.

31.12.10 Class directory_entry

31.12.10.1 General

namespace std::filesystem {
    class directory_entry {
        public:
            // 31.12.10.2, constructors and destructor
            directory_entry() noexcept = default;
            directory_entry(const directory_entry&) = default;
            directory_entry(directory_entry&&) noexcept = default;
            explicit directory_entry(const filesystem::path& p);
            directory_entry(const filesystem::path& p, error_code& ec);
            ~directory_entry();

            // assignments
            directory_entry& operator=(const directory_entry&) = default;
            directory_entry& operator=(directory_entry&&) noexcept = default;

            // 31.12.10.3, modifiers
            void assign(const filesystem::path& p);
            void assign(const filesystem::path& p, error_code& ec);
            void replace_filename(const filesystem::path& p);
            void replace_filename(const filesystem::path& p, error_code& ec);
            void refresh();
            void refresh(error_code& ec) noexcept;

            // 31.12.10.4, observers
            const filesystem::path& path() const noexcept;
            operator const filesystem::path&() const noexcept;
            bool exists() const;
            bool exists(error_code& ec) const noexcept;
            bool is_block_file() const;
            bool is_block_file(error_code& ec) const noexcept;
            bool is_character_file() const;
            bool is_character_file(error_code& ec) const noexcept;
            bool is_directory() const;
            bool is_directory(error_code& ec) const noexcept;
            bool is_fifo() const;
            bool is_fifo(error_code& ec) const noexcept;
            bool is_other() const;
            bool is_other(error_code& ec) const noexcept;
            bool is_regular_file() const;
            bool is_regular_file(error_code& ec) const noexcept;
            bool is_socket() const;
            bool is_socket(error_code& ec) const noexcept;
            bool is_symlink() const;
            bool is_symlink(error_code& ec) const noexcept;
            uintmax_t file_size() const;
            uintmax_t file_size(error_code& ec) const noexcept;
            uintmax_t hard_link_count() const;
            uintmax_t hard_link_count(error_code& ec) const noexcept;
            file_time_type last_write_time() const;
            file_time_type last_write_time(error_code& ec) const noexcept;
            file_status status() const;
            file_status status(error_code& ec) const noexcept;
            file_status symlink_status() const;
            file_status symlink_status(error_code& ec) const noexcept;

            bool operator==(const directory_entry& rhs) const noexcept;
            strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

§ 31.12.10.1
A directory_entry object stores a path object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.

Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by directory_entry observer functions (31.12.13). Such stored file attribute values are said to be cached.

[Note 1: For purposes of exposition, class directory_iterator (31.12.11) is shown above as a friend of class directory_entry. Friendship allows the directory_iterator implementation to cache already available attribute values directly into a directory_entry object without the cost of an unneeded call to refresh(). —end note]

Example 1:

```
using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto& x : directory_iterator(""))
{
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto& x : directory_iterator(""))
{
    lengthy_function(x.path()); // cache becomes stale
    x.refresh();
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}
```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the std::filesystem::last_write_time function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the std::filesystem::last_write_time function. The code is portable to any implementation, regardless of whether or not it employs caching. —end example]
void replace_filename(const filesystem::path& p, error_code& ec);

Effects: Equivalent to pathobject.replace_filename(p), then refresh() or refresh(ec), respectively. If an error occurs, the values of any cached attributes are unspecified.

Throws: As specified in 31.12.5.

void refresh();
void refresh(error_code& ec) noexcept;

Effects: Stores the current values of any cached attributes of the file p resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.

Throws: As specified in 31.12.5.

[Note 1: Implementations of directory_iterator (31.12.11) are prohibited from directly or indirectly calling the refresh function as described in 31.12.11.1. — end note]

31.12.10.4 Observers [fs.dir.entry.obs]

Unqualified function names in the Returns: elements of the directory_entry observers described below refer to members of the std::filesystem namespace.

const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;

Returns: pathobject.

bool exists() const;
bool exists(error_code& ec) const noexcept;

Returns: exists(this->status()) or exists(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;

Returns: is_block_file(this->status()) or is_block_file(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;

Returns: is_character_file(this->status()) or is_character_file(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;

Returns: is_directory(this->status()) or is_directory(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;

Returns: is_fifo(this->status()) or is_fifo(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_other() const;
bool is_other(error_code& ec) const noexcept;

Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;

Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.
16  **Throws**: As specified in 31.12.5.

```cpp
bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;
```

**Returns**: `is_socket(this->status())` or `is_socket(this->status(ec))`, respectively.

17  **Throws**: As specified in 31.12.5.

```cpp
bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;
```

**Returns**: `is_symlink(this->symlink_status())` or `is_symlink(this->symlink_status(ec))`, respectively.

18  **Throws**: As specified in 31.12.5.

```cpp
uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;
```

**Returns**: If cached, the file size attribute value. Otherwise, `file_size(path())` or `file_size(path(ec))`, respectively.

19  **Throws**: As specified in 31.12.5.

```cpp
uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;
```

**Returns**: If cached, the hard link count attribute value. Otherwise, `hard_link_count(path())` or `hard_link_count(path(ec))`, respectively.

20  **Throws**: As specified in 31.12.5.

```cpp
file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;
```

**Returns**: If cached, the last write time attribute value. Otherwise, `last_write_time(path())` or `last_write_time(path(ec))`, respectively.

21  **Throws**: As specified in 31.12.5.

```cpp
file_status status() const;
file_status status(error_code& ec) const noexcept;
```

**Returns**: If cached, the status attribute value. Otherwise, `status(path())` or `status(path(ec))`, respectively.

22  **Throws**: As specified in 31.12.5.

```cpp
file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;
```

**Returns**: If cached, the symlink status attribute value. Otherwise, `symlink_status(path())` or `symlink_status(path(ec))`, respectively.

23  **Throws**: As specified in 31.12.5.

```cpp
bool operator==(const directory_entry& rhs) const noexcept;
```

**Returns**: `pathobject == rhs.pathobject`.

24  **Throws**: As specified in 31.12.5.

```cpp
strong_ordering operator<=>(const directory_entry& rhs) const noexcept;
```

**Returns**: `pathobject <=> rhs.pathobject`.

31.12.10.5  **Inserter**

```cpp
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);
```

**Effects**: Equivalent to: `return os << d.path();`
31.12.11 Class directory_iterator

31.12.11.1 General

An object of type directory_iterator provides an iterator for a sequence of directory_entry elements representing the path and any cached attribute values (31.12.10) for each file in a directory or in an implementation-defined directory-like file type.

[Note 1: For iteration into sub-directories, see class recursive_directory_iterator (31.12.12). — end note]

```cpp
namespace std::filesystem {
    class directory_iterator {
        public:
            using iterator_category = input_iterator_tag;
            using value_type = directory_entry;
            using difference_type = ptrdiff_t;
            using pointer = const directory_entry*;
            using reference = const directory_entry&;

            // 31.12.11.2, member functions
            directory_iterator() noexcept;
            explicit directory_iterator(const path& p);
            directory_iterator(const path& p, directory_options options);
            directory_iterator(const path& p, error_code& ec);
            directory_iterator(const path& p, directory_options options,
                               error_code& ec);
            directory_iterator(const directory_iterator& rhs);
            directory_iterator(directory_iterator&& rhs) noexcept;
            ~directory_iterator();
            directory_iterator& operator=(const directory_iterator& rhs);
            directory_iterator& operator=(directory_iterator&& rhs) noexcept;

            const directory_entry& operator*() const;
            const directory_entry* operator->() const;
            directory_iterator& operator++();
            directory_iterator& increment(error_code& ec);

            // other members as required by 25.3.5.3, input iterators
        }
    }
}
```

directory_iterator meets the Cpp17InputIterator requirements (25.3.5.3).

If an iterator of type directory_iterator reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The directory_iterator default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

The end iterator is not dereferenceable.

Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

The result of calling the path() member of the directory_entry object obtained by dereferencing a directory_iterator is a reference to a path object composed of the directory argument from which the iterator was constructed with the filename of the directory entry appended as if by \texttt{operator/=}.

Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.

The order of directory entries obtained by dereferencing successive increments of a directory_iterator is unspecified.

Constructors and non-const directory_iterator member functions store the values of any cached attributes (31.12.10) in the directory_entry element returned by operator*(). directory_iterator member functions shall not directly or indirectly call any directory_entry refresh function.

[Note 2: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class directory_iterator is shown in 31.12.10 as a friend of class directory_entry. — end note]
10 [Note 3: A path obtained by dereferencing a directory iterator might not actually exist; it could be a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries might invalidate symbolic links that are being followed. — end note]

11 [Note 4: If a file is removed from or added to a directory after the construction of a directory_iterator for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX readdir. — end note]

31.12.11.2 Members

directory_iterator() noexcept;

Effects: Constructs the end iterator.

explicit directory_iterator(const path& p);
directory_iterator(const path& p, directory_options options);
directory_iterator(const path& p, error_code& ec);
directory_iterator(const path& p, directory_options options, error_code& ec);

Effects: For the directory that p resolves to, constructs an iterator for the first element in a sequence of directory_entry elements representing the files in the directory, if any; otherwise the end iterator. However, if

(options & directory_options::skip_permission_denied) != directory_options::none
and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

Throws: As specified in 31.12.5.

[Note 1: To iterate over the current directory, use directory_iterator(".") rather than directory_iterator(""). — end note]

directory_iterator(const directory_iterator& rhs);
directory_iterator(directory_iterator&& rhs) noexcept;

Postconditions: *this has the original value of rhs.

directory_iterator& operator=(const directory_iterator& rhs);
directory_iterator& operator=(directory_iterator&& rhs) noexcept;

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions: *this has the original value of rhs.

Returns: *this.

directory_iterator& operator++();
directory_iterator& increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (25.3.5.3).

Returns: *this.

Throws: As specified in 31.12.5.

31.12.11.3 Non-member functions

These functions enable range access for directory_iterator.

directory_iterator begin(directory_iterator iter) noexcept;

Returns: iter.

directory_iterator end(directory_iterator) noexcept;

Returns: directory_iterator().
namespace std::filesystem {
    class recursive_directory_iterator {
    public:
        using iterator_category = input_iterator_tag;
        using value_type = directory_entry;
        using difference_type = ptrdiff_t;
        using pointer = const directory_entry*;
        using reference = const directory_entry&;

        // 31.12.12.2, constructors and destructor
        recursive_directory_iterator() noexcept;
        explicit recursive_directory_iterator(const path& p);
        recursive_directory_iterator(const path& p, directory_options options);
        recursive_directory_iterator(const path& p, directory_options options,
                                     error_code& ec);
        recursive_directory_iterator(const path& p, error_code& ec);
        recursive_directory_iterator(const recursive_directory_iterator& rhs);
        recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
        ~recursive_directory_iterator();

        // 31.12.12.2, observers
        directory_options options() const;
        int depth() const;
        bool recursion_pending() const;

        const directory_entry& operator*() const;
        const directory_entry* operator->() const;

        // 31.12.12.2, modifiers
        recursive_directory_iterator&
            operator=(const recursive_directory_iterator& rhs);
        recursive_directory_iterator&
            operator=(recursive_directory_iterator&& rhs) noexcept;
        recursive_directory_iterator& operator++();
        recursive_directory_iterator& increment(error_code& ec);

        void pop();
        void pop(error_code& ec);
        void disable_recursion_pending();

        // other members as required by 25.3.5.3, input iterators
    };
};

2 Calling options, depth, recursion_pending, pop or disable_recursion_pending on an iterator that is not dereferenceable results in undefined behavior.

3 The behavior of a recursive_directory_iterator is the same as a directory_iterator unless otherwise specified.

4 [Note 1: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable. —end note]

31.12.12.2 Members

recursive_directory_iterator() noexcept;

    Effects: Constructs the end iterator.

    explicit recursive_directory_iterator(const path& p);
    recursive_directory_iterator(const path& p, directory_options options);
    recursive_directory_iterator(const path& p, directory_options options,
                                  error_code& ec);
    recursive_directory_iterator(const path& p, error_code& ec);

    Effects: Constructs an iterator representing the first entry in the directory to which p resolves, if any;
    otherwise, the end iterator. However, if
and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

Postconditions: options() == options for the signatures with a directory_options argument, otherwise options() == directory_options::none.

Throws: As specified in 31.12.5.

[Note 1: Use recursive_directory_iterator(".") rather than recursive_directory_iterator("") to iterate over the current directory. — end note]

[Note 2: By default, recursive_directory_iterator does not follow directory symlinks. To follow directory symlinks, specify options as directory_options::follow_directory_symlink. — end note]

recursive_directory_iterator(const recursive_directory_iterator& rhs);

Postconditions:

(7.1) options() == rhs.options()
(7.2) depth() == rhs.depth()
(7.3) recursion_pending() == rhs.recursion_pending()

recursive_directory_iterator(recursive_directory_iterator& rhs) noexcept;

Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions:

(10.1) options() == rhs.options()
(10.2) depth() == rhs.depth()
(10.3) recursion_pending() == rhs.recursion_pending()

Returns: *this.

recursive_directory_iterator& operator=(recursive_directory_iterator& rhs) noexcept;

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

Returns: *this.

directory_options options() const;

Returns: The value of the argument passed to the constructor for the options parameter, if present, otherwise directory_options::none.

Throws: Nothing.

int depth() const;

Returns: The current depth of the directory tree being traversed.

[Note 3: The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. — end note]

Throws: Nothing.

bool recursion_pending() const;

Returns: true if disable_recursion_pending() has not been called subsequent to the prior construction or increment operation, otherwise false.

Throws: Nothing.

recursive_directory_iterator& operator++();
recursive_directory_iterator& increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (25.3.5.3), except that:

(21.1) If there are no more entries at the current depth, then if depth() != 0 iteration over the parent directory resumes; otherwise *this = recursive_directory_iterator().

(21.2) Otherwise if

    recursion_pending() && is_directory(*this)->status() ||
    (is_symlink(*this)->symlink_status()) ||
    (options() & directory_options::follow_directory_symlink) != directory_options::none

then either directory (*this)->path() is recursively iterated into or, if

    (options() & directory_options::skip_permission_denied) != directory_options::none

and an error occurs indicating that permission to access directory (*this)->path() is denied, then directory (*this)->path() is treated as an empty directory and no error is reported.

Returns: *this.

Throws: As specified in 31.12.5.

void pop();
void pop(error_code& ec);

Effects: If depth() == 0, set *this to recursive_directory_iterator(). Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

Throws: As specified in 31.12.5.

Remarks: Any copies of the previous value of *this are no longer required to be dereferenceable nor to be in the domain of ==.

void disable_recursion_pending();

Postconditions: recursion_pending() == false.

[Note 4: disable_recursion_pending() is used to prevent unwanted recursion into a directory. — end note]

31.12.13.2 Absolute [fs.op.absolute]

path filesystem::absolute(const path& p);
path filesystem::absolute(const path& p, error_code& ec);

Effects: Composes an absolute path referencing the same file system location as p according to the operating system (31.12.2.3).

Returns: The composed path. The signature with argument ec returns path() if an error occurs.

[Note 1: For the returned path, rp, rp.is_absolute() is true unless an error occurs. — end note]

Throws: As specified in 31.12.5.

[Note 2: To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider canonical (31.12.13.3). — end note]
[Note 3: Implementations are strongly encouraged to not query secondary storage, and not consider !exists(p) an error. — end note]

[Example 1: For POSIX-based operating systems, absolute(p) is simply current_path()/p. For Windows-based operating systems, absolute might have the same semantics as GetFullPathNameW. — end example]

31.12.13.3 Canonical

path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);

Effects: Converts p to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

Returns: A path that refers to the same file system object as absolute(p). The signature with argument ec returns path() if an error occurs.

Throws: As specified in 31.12.5.

Remarks: !exists(p) is an error.

31.12.13.4 Copy

void filesystem::copy(const path& from, const path& to);

Effects: Equivalent to copy(from, to, copy_options::none).

void filesystem::copy(const path& from, const path& to, error_code& ec);

Effects: Equivalent to copy(from, to, copy_options::none, ec).

void filesystem::copy(const path& from, const path& to, copy_options options);
void filesystem::copy(const path& from, const path& to, copy_options options, error_code& ec);

Preconditions: At most one element from each option group (31.12.8.3) is set in options.

Effects: Before the first use of f and t:

(4.1) If

(options & copy_options::create_symlinks) != copy_options::none ||
(options & copy_options::skip_symlinks) != copy_options::none

then auto f = symlink_status(from) and if needed auto t = symlink_status(to).

(4.2) Otherwise, if

(options & copy_options::copy_symlinks) != copy_options::none

then auto f = symlink_status(from) and if needed auto t = status(to).

(4.3) Otherwise, auto f = status(from) and if needed auto t = status(to).

Effects are then as follows:

(4.4) If f.type() or t.type() is an implementation-defined file type (31.12.8.2), then the effects are implementation-defined.

(4.5) Otherwise, an error is reported as specified in 31.12.5 if:

(4.5.1) exists(f) is false, or

(4.5.2) equivalent(from, to) is true, or

(4.5.3) is_other(f) || is_other(t) is true, or

(4.5.4) is_directory(f) && is_regular_file(t) is true.

(4.6) Otherwise, if is_symlink(f), then:

(4.6.1) If (options & copy_options::skip_symlinks) != copy_options::none then return.

(4.6.2) Otherwise if

!exists(t) && (options & copy_options::copy_symlinks) != copy_options::none

then copy_symlink(from, to).

(4.6.3) Otherwise report an error as specified in 31.12.5.

§ 31.12.13.4 1610
— Otherwise, if \texttt{is\_regular\_file(f)}, then:

\begin{itemize}
\item If \((\texttt{options} \& \texttt{copy\_options::directories\_only}) \neq \texttt{copy\_options::none}\), then return.
\item Otherwise, if \((\texttt{options} \& \texttt{copy\_options::create\_symlinks}) \neq \texttt{copy\_options::none}\), then create a symbolic link to the source file.
\item Otherwise, if \((\texttt{options} \& \texttt{copy\_options::create\_hard\_links}) \neq \texttt{copy\_options::none}\), then create a hard link to the source file.
\item Otherwise, if \(\texttt{is\_directory(t)}\), then \texttt{copy\_file(from, to/from.filename(), options)}.
\item Otherwise, \texttt{copy\_file(from, to, options)}.
\end{itemize}

— Otherwise, if

\begin{itemize}
\item \(\texttt{is\_directory(f)} \& \& \left(\texttt{options} \& \texttt{copy\_options::create\_symlinks} \neq \texttt{copy\_options::none}\right)\)
\end{itemize}

then report an error with an \texttt{error\_code} argument equal to \texttt{make\_error\_code(errc::is\_a\_directory)}.

— Otherwise, if

\begin{itemize}
\item \(\texttt{is\_directory(f)} \& \& \left(\texttt{options} \& \texttt{copy\_options::recursive} \neq \texttt{copy\_options::none} || \texttt{options} == \texttt{copy\_options::none}\right)\)
\end{itemize}

then:

\begin{itemize}
\item If \(\texttt{exists(t)}\) is \texttt{false}, then \texttt{create\_directory(to, from)}.
\item Then, iterate over the files in \texttt{from}, as if by

\begin{verbatim}
for (const directory_entry& x : directory_iterator(from))
    copy(x.path(), to/x.path().filename(),
         options | copy_options::in-recursive-copy);
\end{verbatim}

where \texttt{in-recursive-copy} is a bitmask element of \texttt{copy\_options} that is not one of the elements in 31.12.8.3.
\end{itemize}

— Otherwise, for the signature with argument \texttt{ec}, \texttt{ec.clear()}.

— Otherwise, no effects.

\textit{Throses:} As specified in 31.12.5.

\textit{Remarks:} For the signature with argument \texttt{ec}, any library functions called by the implementation shall have an \texttt{error\_code} argument if applicable.

\[\text{Example 1:}\] Given this directory structure:

```
/dir1
 file1
 file2
 dir2
 file3
```

Calling \texttt{copy("/dir1", "/dir3")} would result in:

```
/dir1
 file1
 file2
 dir2
 file3
/dir3
 file1
 file2
```

Alternatively, calling \texttt{copy("/dir1", "/dir3", \texttt{copy\_options::recursive})} would result in:

```
/dir1
 file1
 file2
 dir2
 file3
/dir3
```
31.12.13.5 Copy file

bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);

Returns: copy_file(from, to, copy_options::none) or copy_file(from, to, copy_options::none, ec), respectively.

Throws: As specified in 31.12.5.

bool filesystem::copy_file(const path& from, const path& to, copy_options options);
bool filesystem::copy_file(const path& from, const path& to, copy_options options,
error_code ec);

Preconditions: At most one element from each option group (31.12.8.3) is set in options.

Effects: As follows:

(4.1) Report an error as specified in 31.12.5 if:

(4.1.1) is_regular_file(from) is false, or
(4.1.2) exists(to) is true and is_regular_file(to) is false, or
(4.1.3) exists(to) is true and equivalent(from, to) is true, or
(4.1.4) exists(to) is true and (options & (copy_options::skip_existing |
       copy_options::overwrite_existing | copy_options::update_existing)) == copy_options::none

(4.2) Otherwise, copy the contents and attributes of the file from resolves to, to the file to resolves to, if:

(4.2.1) exists(to) is false, or
(4.2.2) (options & copy_options::overwrite_existing) != copy_options::none, or
(4.2.3) (options & copy_options::update_existing) != copy_options::none and from is
        more recent than to, determined as if by use of the last_write_time function (31.12.13.26).

(4.3) Otherwise, no effects.

Returns: true if the from file was copied, otherwise false. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

Complexity: At most one direct or indirect invocation of status(to).

31.12.13.6 Copy symlink

void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink,
error_code ec) noexcept;

Effects: Equivalent to function(read_symlink(existing_symlink), new_symlink) or
function(read_symlink(existing_symlink, ec), new_symlink, ec), respectively, where in each
case function is create_symlink or create_directory_symlink as appropriate.

Throws: As specified in 31.12.5.

31.12.13.7 Create directories

bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);

Effects: Calls create_directory() for each element of p that does not exist.
Returns: true if a new directory was created for the directory `p` resolves to, otherwise false.

Throws: As specified in 31.12.5.

Complexity: θ(n) where n is the number of elements of `p`.

### 31.12.13.8 Create directory

```c++
bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;
```

**Effects:** Creates the directory `p` resolves to, as if by POSIX `mkdir` with a second argument of `static_cast<int>(perms::all)`. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

Returns: true if a new directory was created, otherwise false.

Throws: As specified in 31.12.5.

```c++
bool filesystem::create_directory(const path& p, const path& existing_p);
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;
```

**Effects:** Creates the directory `p` resolves to, with attributes copied from directory `existing_p`. The set of attributes copied is operating system dependent. If `mkdir` fails because `p` resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[Note 1: For POSIX-based operating systems, the attributes are those copied by native API `stat(existing_p.c_str(), &attributes_stat)` followed by `mkdir(p.c_str(), attributes_stat.st_mode)`. For Windows-based operating systems, the attributes are those copied by native API `CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0)`.

—end note]

Returns: true if a new directory was created with attributes copied from directory `existing_p`, otherwise false.

Throws: As specified in 31.12.5.

### 31.12.13.9 Create directory symlink

```c++
void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink, error_code& ec) noexcept;
```

**Effects:** Establishes the postcondition, as if by POSIX `symlink()`.

**Postconditions:** `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

Throws: As specified in 31.12.5.

[Note 1: Some operating systems require symlink creation to identify that the link is to a directory. Thus, `create_symlink()` (instead of `create_directory_symlink()`) cannot be used reliably to create directory symlinks.

—end note]

[Note 2: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system.

—end note]

### 31.12.13.10 Create hard link

```c++
void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link, error_code& ec) noexcept;
```

**Effects:** Establishes the postcondition, as if by POSIX `link()`.

**Postconditions:**

1. `exists(to) && exists(new_hard_link) && equivalent(to, new_hard_link)`
2. The contents of the file or directory `to` resolves to are unchanged.

Throws: As specified in 31.12.5.

[Note 1: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file.

—end note]
31.12.13.11 Create symlink

```c++
void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
                               error_code& ec) noexcept;
```

1. **Effects**: Establishes the postcondition, as if by POSIX `symlink()`.
2. **Postconditions**: `new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.
3. **Throws**: As specified in 31.12.5.
4. [Note 1: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]

31.12.13.12 Current path

```c++
path filesystem::current_path();
path filesystem::current_path(error_code& ec);
```

1. **Returns**: The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd()`. The signature with argument `ec` returns `path()` if an error occurs.
2. **Throws**: As specified in 31.12.5.
3. **Remarks**: The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.
4. [Note 1: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name. — end note]
5. [Note 2: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

```c++
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

1. **Effects**: Establishes the postcondition, as if by POSIX `chdir()`.
2. **Postconditions**: `equivalent(p, current_path())`.
3. **Throws**: As specified in 31.12.5.
4. [Note 3: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

31.12.13.13 Equivalent

```c++
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

1. Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.
2. **Returns**: `true`, if `p1` and `p2` resolve to the same file system entity, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.
3. **Throws**: As specified in 31.12.5.
4. **Remarks**: `!exists(p1) || !exists(p2)` is an error.

31.12.13.14 Exists

```c++
bool filesystem::exists(file_status s) noexcept;
```

1. **Returns**: `status_known(s) && s.type() != file_type::not_found`.

```c++
bool filesystem::exists(const path& p);
bool filesystem::exists(const path& p, error_code& ec) noexcept;
```

1. Let `s` be a `file_status`, determined as if by `status(p)` or `status(p, ec)`, respectively.
Effects: The signature with argument `ec` calls `ec.clear()` if `status_known(s)`.

Returns: `exists(s)`.

Throws: As specified in 31.12.5.

### 31.12.13.15 File size

```cpp
uintmax_t filesystem::file_size(const path& p);
uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;
```

1. Effects: If `exists(p)` is `false`, an error is reported (31.12.5).
2. Returns:
   1. If `is_regular_file(p)`, the size in bytes of the file `p` resolves to, determined as if by the value of the POSIX `stat` class member `st_size` obtained as if by POSIX `stat()`.
   2. Otherwise, the result is implementation-defined.

The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

Throws: As specified in 31.12.5.

### 31.12.13.16 Hard link count

```cpp
uintmax_t filesystem::hard_link_count(const path& p);
uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;
```

1. Returns: The number of hard links for `p`. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.
2. Throws: As specified in 31.12.5.

### 31.12.13.17 Is block file

```cpp
bool filesystem::is_block_file(file_status s) noexcept;
```

1. Returns: `s.type() == file_type::block`.

```cpp
bool filesystem::is_block_file(const path& p);
bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;
```

2. Returns: `is_block_file(status(p))` or `is_block_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.
3. Throws: As specified in 31.12.5.

### 31.12.13.18 Is character file

```cpp
bool filesystem::is_character_file(file_status s) noexcept;
```

1. Returns: `s.type() == file_type::character`.

```cpp
bool filesystem::is_character_file(const path& p);
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;
```

2. Returns: `is_character_file(status(p))` or `is_character_file(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.
3. Throws: As specified in 31.12.5.

### 31.12.13.19 Is directory

```cpp
bool filesystem::is_directory(file_status s) noexcept;
```

1. Returns: `s.type() == file_type::directory`.

```cpp
bool filesystem::is_directory(const path& p);
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;
```

2. Returns: `is_directory(status(p))` or `is_directory(status(p, ec))`, respectively. The signature with argument `ec` returns `false` if an error occurs.
3. Throws: As specified in 31.12.5.
31.12.13.20  Is empty

bool filesystem::is_empty(const path& p);
bool filesystem::is_empty(const path& p, error_code& ec);

Effects:

(1.1) Determine file_status s, as if by status(p) or status(p, ec), respectively.
(1.2) For the signature with argument ec, return false if an error occurred.
(1.3) Otherwise, if is_directory(s):
(1.3.1) Create a variable itr, as if by directory_iterator itr(p) or directory_iterator itr(p, ec), respectively.
(1.3.2) For the signature with argument ec, return false if an error occurred.
(1.3.3) Otherwise, return itr == directory_iterator().
(1.4) Otherwise:
(1.4.1) Determine uintmax_t sz, as if by file_size(p) or file_size(p, ec), respectively.
(1.4.2) For the signature with argument ec, return false if an error occurred.
(1.4.3) Otherwise, return sz == 0.

Throws: As specified in 31.12.5.

31.12.13.21  Is fifo

bool filesystem::is_fifo(file_status s) noexcept;

Returns: s.type() == file_type::fifo.

bool filesystem::is_fifo(const path& p);
bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;

Returns: is_fifo(status(p)) or is_fifo(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.22  Is other

bool filesystem::is_other(file_status s) noexcept;

Returns: exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s).

bool filesystem::is_other(const path& p);
bool filesystem::is_other(const path& p, error_code& ec) noexcept;

Returns: is_other(status(p)) or is_other(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.23  Is regular file

bool filesystem::is_regular_file(file_status s) noexcept;

Returns: s.type() == file_type::regular.

bool filesystem::is_regular_file(const path& p);

Returns: is_regular_file(status(p)).

Throws: filesystem_error if status(p) would throw filesystem_error.

bool filesystem::is_regular_file(const path& p, error_code& ec) noexcept;

Effects: Sets ec as if by status(p, ec).

[Note 1: file_type::none, file_type::not_found and file_type::unknown cases set ec to error values. To distinguish between cases, call the status function directly. — end note]

Returns: is_regular_file(status(p, ec)). Returns false if an error occurs.
31.12.13.24 Is socket

bool filesystem::is_socket(file_status s) noexcept;

Returns: s.type() == file_type::socket.

bool filesystem::is_socket(const path& p);
bool filesystem::is_socket(const path& p, error_code& ec) noexcept;

Returns: is_socket(status(p)) or is_socket(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.25 Is symlink

bool filesystem::is_symlink(file_status s) noexcept;

Returns: s.type() == file_type::symlink.

bool filesystem::is_symlink(const path& p);
bool filesystem::is_symlink(const path& p, error_code& ec) noexcept;

Returns: is_symlink(symlink_status(p)) or is_symlink(symlink_status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.26 Last write time

file_time_type filesystem::last_write_time(const path& p);
file_time_type filesystem::last_write_time(const path& p, error_code& ec) noexcept;

Returns: The time of last data modification of p, determined as if by the value of the POSIX stat class member st_mtime obtained as if by POSIX stat(). The signature with argument ec returns file_time_type::min() if an error occurs.

Throws: As specified in 31.12.5.

void filesystem::last_write_time(const path& p, file_time_type new_time);
void filesystem::last_write_time(const path& p, file_time_type new_time, error_code& ec) noexcept;

Effects: Sets the time of last data modification of the file resolved to by p to new_time, as if by POSIX futimens().

Throws: As specified in 31.12.5.

[Note 1: A postcondition of last_write_time(p) == new_time is not specified because it does not necessarily hold for file systems with coarse time granularity. —end note]

31.12.13.27 Permissions

void filesystem::permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void filesystem::permissions(const path& p, perms prms, error_code& ec) noexcept;
void filesystem::permissions(const path& p, perms prms, perm_options opts, error_code& ec);

Preconditions: Exactly one of the perm_options constants replace, add, or remove is present in opts.

Effects: Applies the action specified by opts to the file p resolves to, or to file p itself if p is a symbolic link and perm_options::nofollow is set in opts. The action is applied as if by POSIX fchmodat().

[Note 1: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. —end note]

Throws: As specified in 31.12.5.

Remarks: The second signature behaves as if it had an additional parameter perm_options opts with an argument of perm_options::replace.

31.12.13.28 Proximate

path filesystem::proximate(const path& p, error_code& ec);

Returns: proximate(p, current_path(), ec).
2  Throws: As specified in 31.12.5.

   path filesystem::proximate(const path& p, const path& base = current_path());
   path filesystem::proximate(const path& p, const path& base, error_code& ec);

3  Returns: For the first form:
          weakly_canonical(p).lexically_proximate(weakly_canonical(base));

      For the second form:
          weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));

5  or path() at the first error occurrence, if any.

4  Throws: As specified in 31.12.5.

31.12.13.29 Read symlink  [fs.op.read.symlink]

   path filesystem::read_symlink(const path& p);
   path filesystem::read_symlink(const path& p, error_code& ec);

1  Returns: If p resolves to a symbolic link, a path object containing the contents of that symbolic link.
          The signature with argument ec returns path() if an error occurs.

2  Throws: As specified in 31.12.5.

[Note 1: It is an error if p does not resolve to a symbolic link. — end note]

31.12.13.30 Relative  [fs.op.relative]

   path filesystem::relative(const path& p, error_code& ec);

1  Returns: relative(p, current_path(), ec).

2  Throws: As specified in 31.12.5.

path filesystem::relative(const path& p, const path& base = current_path());
path filesystem::relative(const path& p, const path& base, error_code& ec);

3  Returns: For the first form:
          weakly_canonical(p).lexically_relative(weakly_canonical(base));

      For the second form:
          weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));

5  or path() at the first error occurrence, if any.

4  Throws: As specified in 31.12.5.

31.12.13.31 Remove  [fs.op.remove]

   bool filesystem::remove(const path& p);
   bool filesystem::remove(const path& p, error_code& ec) noexcept;

1  Effects: If exists(symlink_status(p, ec)), the file p is removed as if by POSIX remove().

   [Note 1: A symbolic link is itself removed, rather than the file it resolves to. — end note]

2  Postconditions: exists(symlink_status(p)) is false.

3  Returns: false if p did not exist, otherwise true. The signature with argument ec returns false if an error occurs.

4  Throws: As specified in 31.12.5.

31.12.13.32 Remove all  [fs.op.remove.all]

   uintmax_t filesystem::remove_all(const path& p);
   uintmax_t filesystem::remove_all(const path& p, error_code& ec);

1  Effects: Recursively deletes the contents of p if it exists, then deletes file p itself, as if by POSIX remove().

   [Note 1: A symbolic link is itself removed, rather than the file it resolves to. — end note]

2  Postconditions: exists(symlink_status(p)) is false.
Returns: The number of files removed. The signature with argument ec returns static_cast<uintmax_t>(-1) if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.33 Rename

```cpp
void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

Effects: Renames old_p to new_p, as if by POSIX rename().

[Note 1:
(1.1) — If old_p and new_p resolve to the same existing file, no action is taken.
(1.2) — Otherwise, the rename can include the following effects:
(1.2.1) — if new_p resolves to an existing non-directory file, new_p is removed; otherwise,
(1.2.2) — if new_p resolves to an existing directory, new_p is removed if empty on POSIX compliant operating systems but might be an error on other operating systems.
A symbolic link is itself renamed, rather than the file it resolves to. — end note]

Throws: As specified in 31.12.5.

31.12.13.34 Resize file

```cpp
void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

Effects: Causes the size that would be returned by file_size(p) to be equal to new_size, as if by POSIX truncate().

Throws: As specified in 31.12.5.

31.12.13.35 Space

```cpp
space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;
```

Returns: An object of type space_info. The value of the space_info object is determined as if by using POSIX statvfs to obtain a POSIX struct statvfs, and then multiplying its f_blocks, f_bfree, and f_bavail members by its f_frsize member, and assigning the results to the capacity, free, and available members respectively. Any members for which the value cannot be determined shall be set to static_cast<uintmax_t>(-1). For the signature with argument ec, all members are set to static_cast<uintmax_t>(-1) if an error occurs.

Throws: As specified in 31.12.5.

Remarks: The value of member space_info::available is operating system dependent.

[Note 1: available might be less than free. — end note]

31.12.13.36 Status

```cpp
file_status filesystem::status(const path& p);
```

Effects: As if:

```cpp
error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
    throw filesystem_error(implementation-supplied-message, p, ec);
return result;
```

Returns: See above.

Throws: filesystem_error.

[Note 1: result values of file_status(file_type::not_found) and file_status(file_type::unknown) are not considered failures and do not cause an exception to be thrown. — end note]
file_status filesystem::status(const path& p, error_code& ec) noexcept;

Effects: If possible, determines the attributes of the file p resolves to, as if by using POSIX stat() to obtain a POSIX struct stat. If, during attribute determination, the underlying file system API reports an error, sets ec to indicate the specific error reported. Otherwise, ec.clear().

[Note 2: This allows users to inspect the specifics of underlying API errors even when the value returned by status() is not file_status(file_type::none). — end note]

Let prms denote the result of (m & perms::mask), where m is determined as if by converting the st_mode member of the obtained struct stat to the type perms.

Returns:

(6.1) If ec != error_code():

(6.1.1) If the specific error indicates that p cannot be resolved because some element of the path does not exist, returns file_status(file_type::not_found).

(6.1.2) Otherwise, if the specific error indicates that p can be resolved but the attributes cannot be determined, returns file_status(file_type::unknown).

(6.1.3) Otherwise, returns file_status(file_type::none).

[Note 3: These semantics distinguish between p being known not to exist, p existing but not being able to determine its attributes, and there being an error that prevents even knowing if p exists. These distinctions are important to some use cases. — end note]

(6.2) Otherwise,

(6.2.1) If the attributes indicate a regular file, as if by POSIX S_ISREG, returns file_status(file_type::regular, prms).

[Note 4: file_type::regular implies appropriate <fstream> operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of file_type::regular does not necessarily imply <fstream> operations would fail on a directory. — end note]

(6.2.2) Otherwise, if the attributes indicate a directory, as if by POSIX S_ISDIR, returns file_status(file_type::directory, prms).

[Note 5: file_type::directory implies that calling directory_iterator(p) would succeed. — end note]

(6.2.3) Otherwise, if the attributes indicate a block special file, as if by POSIX S_ISBLK, returns file_status(file_type::block, prms).

(6.2.4) Otherwise, if the attributes indicate a character special file, as if by POSIX S_ISCHR, returns file_status(file_type::character, prms).

(6.2.5) Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX S_ISFIFO, returns file_status(file_type::fifo, prms).

(6.2.6) Otherwise, if the attributes indicate a socket, as if by POSIX S_ISSOCK, returns file_status(file_type::socket, prms).

(6.2.7) Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns file_status(file_type::A, prms), where A is the constant for the implementation-defined file type.

(6.2.8) Otherwise, returns file_status(file_type::unknown, prms).

Remarks: If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

31.12.13.37 Status known

bool filesystem::status_known(file_status s) noexcept;

Returns: s.type() != file_type::none.

31.12.13.38 Symlink status

file_status filesystem::symlink_status(const path& p);
file_status filesystem::symlink_status(const path& p, error_code& ec) noexcept;

1. Effects: Same as status(), above, except that the attributes of p are determined as if by using POSIX lstat() to obtain a POSIX struct stat.

2. Let prms denote the result of (m & perms::mask), where m is determined as if by converting the st_mode member of the obtained struct stat to the type perms.

3. Returns: Same as status(), above, except that if the attributes indicate a symbolic link, as if by POSIX S_ISLNK, returns file_status(file_type::symlink, prms). The signature with argument ec returns file_status(file_type::none) if an error occurs.

5. Remarks: Pathname resolution terminates if p names a symbolic link.

31.12.13.39 Temporary directory path

path filesystem::temp_directory_path();
path filesystem::temp_directory_path(error_code& ec);

1. Let p be an unspecified directory path suitable for temporary files.

2. Effects: If exists(p) is false or is_directory(p) is false, an error is reported (31.12.5).

3. Returns: The path p. The signature with argument ec returns path() if an error occurs.

5. [Example 1: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list TMPDIR, TMP, TEMP, TEMPDIR, or if none of these are found, "/tmp".
For Windows-based operating systems, an implementation might return the path reported by the Windows GetTempPath API function. —end example]

31.12.13.40 Weakly canonical

path filesystem::weakly_canonical(const path& p);
path filesystem::weakly_canonical(const path& p, error_code& ec);

1. Effects: Using status(p) or status(p, ec), respectively, to determine existence, return a path composed by operator/= from the result of calling canonical() with a path argument composed of the leading elements of p that exist, if any, followed by the elements of p that do not exist, if any. For the first form, canonical() is called without an error_code argument. For the second form, canonical() is called with ec as an error_code argument, and path() is returned at the first error occurrence, if any.

2. Postconditions: The returned path is in normal form (31.12.6.2).

5. Remarks: Implementations should avoid unnecessary normalization such as when canonical has already been called on the entirety of p.

The contents and meaning of the header `<cinttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

(1.1) The header `<cinttypes>` includes the header `<cstdint>` (17.4.2) instead of `<stdint.h>`, and

(1.2) if and only if the type `intmax_t` designates an extended integer type (6.8.2), the following function signatures are added:

```c
intmax_t abs(intmax_t);
imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `intmax_t imaxabs(intmax_t)` and `imaxdiv_t imaxdiv(intmax_t, intmax_t)`, respectively.

**See also:** ISO C 7.8

Each of the PRI macros listed in this subclause is defined if and only if the implementation defines the corresponding `typedef-name` in 17.4.2. Each of the SCN macros listed in this subclause is defined if and only if the implementation defines the corresponding `typedef-name` in 17.4.2 and has a suitable `fscanf` length modifier for the type.
# 32 Regular expressions library

## 32.1 General

This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.

The following subclauses describe a basic regular expression class template and its traits that can handle char-like (23.1) template arguments, two specializations of this class template that handle sequences of `char` and `wchar_t`, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 132.

## 32.2 Requirements

This subclause defines requirements on classes representing regular expression traits.

1. In the following requirements,
   - `X` denotes a traits class defining types and functions for the character container type `charT`;
   - `u` is an object of type `X`;
   - `v` is an object of type `const X`;
   - `p` is a value of type `const charT*`;
   - `I1` and `I2` are input iterators (25.3.5.3);
   - `F1` and `F2` are forward iterators (25.3.5.5);
   - `c` is a value of type `const charT`;
   - `s` is an object of type `X::string_type`;
   - `cs` is an object of type `const X::string_type`;
   - `b` is a value of type `bool`;
   - `I` is a value of type `int`;
   - `cl` is an object of type `X::char_class_type` and
loc is an object of type X::locale_type.

A traits class X meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

typename X::char_type

  Result: charT, the character container type used in the implementation of class template basic_regex.

typename X::string_type

  Result: basic_string<charT>

typename X::locale_type

  Result: A copy constructible type that represents the locale used by the traits class.

typename X::char_class_type

  Result: A bitmask type (16.3.3.3.4) representing a particular character classification.

X::length(p)

  Result: size_t

  Returns: The smallest i such that p[i] == 0.

  Complexity: Linear in i.

v.translate(c)

  Result: X::char_type

  Returns: A character such that for any character d that is to be considered equivalent to c then v.translate(c) == v.translate(d).

v.translate_nocase(c)

  Result: X::char_type

  Returns: For all characters C that are to be considered equivalent to c when comparisons are to be performed without regard to case, then v.translate_nocase(c) == v.translate_nocase(C).

v.transform(F1, F2)

  Result: X::string_type

  Returns: A sort key for the character sequence designated by the iterator range [F1,F2) such that if the character sequence [G1,G2) sorts before the character sequence [H1,H2) then v.transform(G1, G2) < v.transform(H1, H2).

v.transform_primary(F1, F2)

  Result: X::string_type

  Returns: A sort key for the character sequence designated by the iterator range [F1,F2) such that if the character sequence [G1,G2) sorts before the character sequence [H1,H2) when character case is not considered then v.transform_primary(G1, G2) < v.transform_primary(H1, H2).

v.lookup_collatename(F1, F2)

  Result: X::string_type

  Returns: A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range [F1,F2). Returns an empty string if the character sequence is not a valid collating element.

v.lookup_classname(F1, F2, b)

  Result: X::char_class_type

  Returns: Converts the character sequence designated by the iterator range [F1,F2) into a value of a bitmask type that can subsequently be passed to isctype. Values returned from lookup_classname can be bitwise OR'ed together; the resulting value represents membership in either of the corresponding character classes. If b is true, the returned bitmask is suitable for matching characters without regard

§ 32.2
to their case. Returns 0 if the character sequence is not the name of a character class recognized by X. The value returned shall be independent of the case of the characters in the sequence.

\texttt{v.isctype(c, cl)}

\textit{Result: bool}

\textit{Returns:} Returns \texttt{true} if character \texttt{c} is a member of one of the character classes designated by \texttt{cl}, \texttt{false} otherwise.

\texttt{v.value(c, I)}

\textit{Result: int}

\textit{Returns:} Returns the value represented by the digit \texttt{c} in base \texttt{I} if the character \texttt{c} is a valid digit in base \texttt{I}; otherwise returns \texttt{-1}.

[\textit{Note 2:} The value of \texttt{I} will only be 8, 10, or 16. — \textit{end note}]

\texttt{u.imbue(loc)}

\textit{Result: X::locale_type}

\textit{Effects:} Imbues \texttt{u} with the locale \texttt{loc} and returns the previous locale used by \texttt{u} if any.

\texttt{v.getloc()}

\textit{Result: X::locale_type}

\textit{Returns:} Returns the current locale used by \texttt{v}, if any.

[\textit{Note 3:} Class template \texttt{regex_traits} meets the requirements for a regular expression traits class when it is specialized for \texttt{char} or \texttt{wchar_t}. This class template is described in the header \texttt{<regex>}, and is described in \texttt{32.6}. — \textit{end note}]

### 32.3 Header <regex> synopsis

    using smatch = match_results<string::const_iterator>;
    using wsmatch = match_results<wstring::const_iterator>;
}

32.4 Namespace std::regex_constants

32.4.1 General

The namespace std::regex_constants holds symbolic constants used by the regular expression library. This namespace provides three types, syntax_option_type, match_flag_type, and error_type, along with several constants of these types.

32.4.2 Bitmask type syntax_option_type

namespace std::regex_constants {
    using syntax_option_type = T1;
    inline constexpr syntax_option_type icase = unspecified;
    inline constexpr syntax_option_type nosubs = unspecified;
    inline constexpr syntax_option_type optimize = unspecified;
    inline constexpr syntax_option_type collate = unspecified;
    inline constexpr syntax_option_type ECMAScript = unspecified;
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
}

The type syntax_option_type is an implementation-defined bitmask type (16.3.3.3.4). Setting its elements has the effects listed in Table 133. A valid value of type syntax_option_type shall have at most one of the grammar elements ECMAScript, basic, extended, awk, grep, egrep, set. If no grammar element is set, the default grammar is ECMAScript.

32.4.3 Bitmask type match_flag_type

namespace std::regex_constants {
    using match_flag_type = T2;
    inline constexpr match_flag_type match_default = {};
    inline constexpr match_flag_type match_not_bol = unspecified;
    inline constexpr match_flag_type match_not_eol = unspecified;
    inline constexpr match_flag_type match_not_bow = unspecified;
    inline constexpr match_flag_type match_not_eow = unspecified;
    inline constexpr match_flag_type match_any = unspecified;
    inline constexpr match_flag_type match_not_null = unspecified;
    inline constexpr match_flag_type match_continuous = unspecified;
    inline constexpr match_flag_type match_prev_avail = unspecified;
    inline constexpr match_flag_type format_default = {};
    inline constexpr match_flag_type format_sed = unspecified;
    inline constexpr match_flag_type format_no_copy = unspecified;
    inline constexpr match_flag_type format_first_only = unspecified;
}

The type match_flag_type is an implementation-defined bitmask type (16.3.3.3.4). The constants of that type, except for match_default and format_default, are bitmask elements. The match_default and format_default constants are empty bitmasks. Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 134 for any bitmask elements set.
**Table 133: syntax_option_type effects**  

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>icase</td>
<td>Specifies that matching of regular expressions against a character container sequence shall be performed without regard to case.</td>
</tr>
<tr>
<td>nosubs</td>
<td>Specifies that no sub-expressions shall be considered to be marked, so that when a regular expression is matched against a character container sequence, no sub-expression matches shall be stored in the supplied <code>match_results</code> object.</td>
</tr>
<tr>
<td>optimize</td>
<td>Specifies that the regular expression engine should pay more attention to the speed with which regular expressions are matched, and less to the speed with which regular expression objects are constructed. Otherwise it has no detectable effect on the program output.</td>
</tr>
<tr>
<td>collate</td>
<td>Specifies that character ranges of the form &quot;[a-b]&quot; shall be locale sensitive.</td>
</tr>
</tbody>
</table>
| ECMAScript | Specifies that the grammar recognized by the regular expression engine shall be that used by ECMA-262, as modified in 32.12.  
*See also:* ECMA-262 15.10 |
| basic    | Specifies that the grammar recognized by the regular expression engine shall be that used by basic regular expressions in POSIX.  
*See also:* POSIX, Base Definitions and Headers, Section 9.3 |
| extended | Specifies that the grammar recognized by the regular expression engine shall be that used by extended regular expressions in POSIX.  
*See also:* POSIX, Base Definitions and Headers, Section 9.4 |
| awk      | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility awk in POSIX. |
| grep     | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep in POSIX. |
| egrep    | Specifies that the grammar recognized by the regular expression engine shall be that used by the utility grep when given the -E option in POSIX. |
| multiline | Specifies that ^ shall match the beginning of a line and $ shall match the end of a line, if the ECMAScript engine is selected. |

**Table 134: regex_constants::match_flag_type effects when obtaining a match against a character container sequence `[first, last)`**  

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>match_not_bol</td>
<td>The first character in the sequence <code>[first, last)</code> shall be treated as though it is not at the beginning of a line, so the character ^ in the regular expression shall not match <code>[first, first)</code>.</td>
</tr>
<tr>
<td>match_not_eol</td>
<td>The last character in the sequence <code>[first, last)</code> shall be treated as though it is not at the end of a line, so the character &quot;$&quot; in the regular expression shall not match <code>[last, last)</code>.</td>
</tr>
<tr>
<td>match_not_bow</td>
<td>The expression &quot;\b&quot; shall not match the sub-sequence <code>[first, first)</code>.</td>

32.4.4 Implementation-defined error_type

namespace std::regex_constants {
    using error_type = T3;
    inline constexpr error_type error_collate = unspecified;
    inline constexpr error_type error_ctype = unspecified;
    inline constexpr error_type error_escape = unspecified;
    inline constexpr error_type error_backref = unspecified;
    inline constexpr error_type error_brack = unspecified;
    inline constexpr error_type error_paren = unspecified;
    inline constexpr error_type error_brace = unspecified;
    inline constexpr error_type error_badbrace = unspecified;
    inline constexpr error_type error_range = unspecified;
    inline constexpr error_type error_space = unspecified;
    inline constexpr error_type error_badrepeat = unspecified;
    inline constexpr error_type error_complexity = unspecified;
    inline constexpr error_type error_stack = unspecified;
}

1 The type error_type is an implementation-defined enumerated type (16.3.3.3.3). Values of type error_type represent the error conditions described in Table 135:

Table 135: error_type values in the C locale [tab:re.err]

<table>
<thead>
<tr>
<th>Value</th>
<th>Error condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_collate</td>
<td>The expression contains an invalid collating element name.</td>
</tr>
<tr>
<td>error_ctype</td>
<td>The expression contains an invalid character class name.</td>
</tr>
<tr>
<td>error_escape</td>
<td>The expression contains an invalid escaped character, or a trailing escape.</td>
</tr>
<tr>
<td>error_backref</td>
<td>The expression contains an invalid back reference.</td>
</tr>
<tr>
<td>error_brack</td>
<td>The expression contains mismatched [ and ].</td>
</tr>
<tr>
<td>error_paren</td>
<td>The expression contains mismatched ( and ).</td>
</tr>
<tr>
<td>error_brace</td>
<td>The expression contains mismatched { and }</td>
</tr>
<tr>
<td>error_badbrace</td>
<td>The expression contains an invalid range in a { } expression.</td>
</tr>
<tr>
<td>error_range</td>
<td>The expression contains an invalid character range, such as [b-a] in most encodings.</td>
</tr>
<tr>
<td>error_space</td>
<td>There is insufficient memory to convert the expression into a finite state machine.</td>
</tr>
<tr>
<td>error_badrepeat</td>
<td>One of *?+{ is not preceded by a valid regular expression.</td>
</tr>
<tr>
<td>error_complexity</td>
<td>The complexity of an attempted match against a regular expression exceeds a pre-set level.</td>
</tr>
<tr>
<td>error_stack</td>
<td>There is insufficient memory to determine whether the regular expression matches the specified character sequence.</td>
</tr>
</tbody>
</table>

32.5 Class regex_error

namespace std {
    class regex_error : public runtime_error {
    public:
        explicit regex_error(regex_constants::error_type ecode);
        regex_constants::error_type code() const;
    }
}

§ 32.5 1633
The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```cpp
regex_error(regex_constants::error_type ecode);
```

**Postconditions:** `ecode == code()`.

```cpp
regex_constants::error_type code() const;
```

**Returns:** The error code that was passed to the constructor.

### 32.6 Class template `regex_traits`

```cpp
namespace std {
    template<class charT>
    struct regex_traits {
        using char_type = charT;
        using string_type = basic_string<char_type>;
        using locale_type = locale;
        using char_class_type = bitmask_type;

        regex_traits();
        static size_t length(const char_type* p);
        charT translate(charT c) const;
        charT translate_nocase(charT c) const;
        template<class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        char_class_type lookup_classname(ForwardIterator first, ForwardIterator last, bool icase = false) const;
        int value(charT ch, int radix) const;
        locale_type imbue(locale_type l);
        locale_type getloc() const;
    };
}
```

The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (32.2).

```cpp
using char_class_type = bitmask_type;
```

The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```cpp
static size_t length(const char_type* p);
```

**Returns:** `char_traits<charT>::length(p)`.

```cpp
charT translate(charT c) const;
```

**Returns:** `c`.

```cpp
charT translate_nocase(charT c) const;
```

**Returns:** `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```cpp
template<class ForwardIterator>
string_type transform(ForwardIterator first, ForwardIterator last) const;
```

**Effects:** As if by:
```cpp
string_type str(first, last);
return use_facet<collate<charT>>(
    getloc()).transform(str.data(), str.data() + str.length());
```

```cpp
template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
```

**Effects:** If

```cpp
typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)
```
and the form of the sort key returned by `collate_byname<charT>::transform(first, last)` is known and can be converted into a primary sort key then returns that key, otherwise returns an empty string.

```cpp
template<class ForwardIterator>
string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
```

**Returns:** A sequence of one or more characters that represents the collating element consisting of the character sequence designated by the iterator range `[first, last)`. Returns an empty string if the character sequence is not a valid collating element.

```cpp
template<class ForwardIterator>
char_class_type lookup_classname(
    ForwardIterator first, ForwardIterator last, bool icase = false) const;
```

**Returns:** An unspecified value that represents the character classification named by the character sequence designated by the iterator range `[first, last)`. If the parameter `icase` is `true` then the returned mask identifies the character classification without regard to the case of the characters being matched, otherwise it does honor the case of the characters being matched.\(^{311}\) The value returned shall be independent of the case of the characters in the character sequence. If the name is not recognized then returns `char_class_type()`.\(^{311}\)

**Remarks:** For `regex_traits<char>`, at least the narrow character names in Table 136 shall be recognized. For `regex_traits<wchar_t>`, at least the wide character names in Table 136 shall be recognized.

```cpp
bool isctype(charT c, char_class_type f) const;
```

**Effects:** Determines if the character `c` is a member of the character classification represented by `f`.

```cpp
// for exposition only
template<class C>
ctype_base::mask convert(typename regex_traits<C>::char_class_type f);
```

that returns a value in which each `ctype_base::mask` value corresponding to a value in `f` named in Table 136 is set, then the result is determined as if by:

```cpp
cctype_base::mask m = convert<charT>(f);
const cctype<charT>& ct = use_facet<cctype<charT>>(getloc());
if (ct.is(m, c)) {
    return true;
} else if (c == ct.widen('_')) {
    charT w[1] = { ct.widen('w') };
    char_class_type x = lookup_classname(w, w+1);
    return (f&x) == x;
} else {
    return false;
}
```

**Example 1:**

```cpp
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());
```

\(^{311}\) For example, if the parameter `icase` is `true` then `[:lower:]` is the same as `[:alpha:]`.\(^{311}\)
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
— end example]

[Example 2:

regex_traits<char> t;
string w("w");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(w.begin(), w.end());
t.isctype('A', f); // returns true
t.isctype('_', f); // returns true
t.isctype(' ', f); // returns false
— end example]

int value(charT ch, int radix) const;
13 Preconditions: The value of radix is 8, 10, or 16.
14 Returns: The value represented by the digit ch in base radix if the character ch is a valid digit in base
radix; otherwise returns -1.

locale_type imbue(locale_type loc);
15 Effects: Imbues this with a copy of the locale loc.
16 [Note 1: Calling imbue with a different locale than the one currently in use invalidates all cached data held by
*this. — end note]
17 Postconditions: getloc() == loc.
18 Returns: If no locale has been previously imbued then a copy of the global locale in effect at the time
of construction of *this, otherwise a copy of the last argument passed to imbue.

locale_type getloc() const;
18 Returns: If no locale has been imbued then a copy of the global locale in effect at the time of construction
of *this, otherwise a copy of the last argument passed to imbue.

32.7 Class template basic_regex [re.regex]

32.7.1 General [re.regex.general]

For a char-like type charT, specializations of class template basic_regex represent regular expressions
constructed from character sequences of charT characters. In the rest of 32.7, charT denotes a given char-like
type. Storage for a regular expression is allocated and freed as necessary by the member functions of class
basic_regex.
Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[Note 1: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this. — end note]

The functions described in 32.7 report errors by throwing exceptions of type `regex_error`.

```cpp
namespace std {
    template<class charT, class traits = regex_traits<charT>>
    class basic_regex {
        public:
            // types
            using value_type = charT;
            using traits_type = traits;
            using string_type = typename traits::string_type;
            using flag_type = regex_constants::syntax_option_type;
            using locale_type = typename traits::locale_type;

            // 32.4.2, constants
            static constexpr flag_type icase = regex_constants::icase;
            static constexpr flag_type nosubs = regex_constants::nosubs;
            static constexpr flag_type optimize = regex_constants::optimize;
            static constexpr flag_type collate = regex_constants::collate;
            static constexpr flag_type ECMAScript = regex_constants::ECMAScript;
            static constexpr flag_type basic = regex_constants::basic;
            static constexpr flag_type extended = regex_constants::extended;
            static constexpr flag_type awk = regex_constants::awk;
            static constexpr flag_type grep = regex_constants::grep;
            static constexpr flag_type egrep = regex_constants::egrep;
            static constexpr flag_type multiline = regex_constants::multiline;

            // 32.7.2, construct/copy/destroy
            basic_regex();
            explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
            basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
            basic_regex(const basic_regex&);
            basic_regex(basic_regex&&) noexcept;
            template<class ST, class SA>
                explicit basic_regex(const basic_string<charT, ST, SA>& s,
                                 flag_type f = regex_constants::ECMAScript);
            template<class ForwardIterator>
                basic_regex(ForwardIterator first, ForwardIterator last,
                             flag_type f = regex_constants::ECMAScript);
            basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
            ~basic_regex();

            // 32.7.3, assign
            basic_regex& operator=(const basic_regex& e);
            basic_regex& operator=(basic_regex&& e) noexcept;
            basic_regex& operator=(const charT* p);
            basic_regex& operator=(const character_list<charT> il);
            template<class ST, class SA>
                basic_regex& operator=(const basic_string<charT, ST, SA>& s);

            template<class ST, class SA>
                basic_regex& assign(const basic_string<charT, ST, SA>& s,
                                    flag_type f = regex_constants::ECMAScript);
        }
    }
```
template<class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
    flag_type f = regex_constants::ECMAScript);
basic_regex& assign(initializer_list<charT>,
    flag_type f = regex_constants::ECMAScript);

// 32.7.4, const operations
unsigned mark_count() const;
flag_type flags() const;

// 32.7.5, locale
locale_type imbue(locale_type loc);
locale_type getloc() const;

// 32.7.6, swap
void swap(basic_regex&);
};

template<class ForwardIterator>
basic_regex(ForwardIterator, ForwardIterator,
    regex_constants::syntax_option_type = regex_constants::ECMAScript)
    -> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;

32.7.2 Constructors

basic_regex();
   Postconditions: *this does not match any character sequence.

explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
   Preconditions: [p, p + char_traits<charT>::length(p)) is a valid range.
   Effects: The object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters [p, p + char_traits<charT>::length(p)), and interpreted according to the flags f.
   Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.
   Throws: regex_error if [p, p + char_traits<charT>::length(p)) is not a valid regular expression.

basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
   Preconditions: [p, p + len) is a valid range.
   Effects: The object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters [p, p + len), and interpreted according to the flags specified in f.
   Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.
   Throws: regex_error if [p, p + len) is not a valid regular expression.

basic_regex(const basic_regex& e);
   Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;
   Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before construction.

template<class ST, class SA>
    explicit basic_regex(const basic_string<charT, ST, SA>& s,
    flag_type f = regex_constants::ECMAScript);
   Effects: The object’s internal finite state machine is constructed from the regular expression contained in the string s, and interpreted according to the flags specified in f.
Postconditions: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if \( s \) is not a valid regular expression.

\[
\text{template<typename ForwardIterator>}
\]
\[
\text{basic_regex(ForwardIterator first, ForwardIterator last,}
\]
\[
\text{flag_type f = regex_constants::ECMAScript);}
\]

Effects: The object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters \([\text{first, last}]\), and interpreted according to the flags specified in \( f \).

Postconditions: flags() returns \( f \). mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if the sequence \([\text{first, last}]\) is not a valid regular expression.

\[
\text{basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);}
\]

Effects: Same as basic_regex(il.begin(), il.end(), \( f \)).

### 32.7.3 Assignment

\[
\text{basic_regex& operator=(const basic_regex& e);}\]

Postconditions: flags() and mark_count() return \( e.\text{flags()} \) and \( e.\text{mark_count()} \), respectively.

\[
\text{basic_regex& operator=(basic_regex&& e) noexcept;}
\]

Postconditions: flags() and mark_count() return the values that \( e.\text{flags()} \) and \( e.\text{mark_count()} \), respectively, had before assignment. \( e \) is in a valid state with unspecified value.

\[
\text{basic_regex& operator=(const charT* p);}\]

Effects: Equivalent to: return assign(p);

\[
\text{basic_regex& operator=(initializer_list<charT> il);}\]

Effects: Equivalent to: return assign(il.begin(), il.end());

\[
\text{template<typename ST, class SA>}
\]
\[
\text{basic_regex& operator=(const basic_string<charT, ST, SA>& s);}\]

Effects: Equivalent to: return assign(s);

\[
\text{basic_regex& assign(const basic_regex& e);}\]

Effects: Equivalent to: return *this = e;

\[
\text{basic_regex& assign(basic_regex&& e) noexcept;}
\]

Effects: Equivalent to: return *this = std::move(e);

\[
\text{basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);}\]

Effects: Equivalent to: return assign(string_type(p), \( f \));

\[
\text{basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);}\]

Effects: Equivalent to: return assign(string_type(p, len), \( f \));

Effects: Assigns the regular expression contained in the string \( s \), interpreted according the flags specified in \( f \). If an exception is thrown, *this is unchanged.

Postconditions: If no exception is thrown, flags() returns \( f \) and mark_count() returns the number of marked sub-expressions within the expression.

Returns: *this.

Throws: regex_error if \( s \) is not a valid regular expression.
template<class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
    flag_type f = regex_constants::ECMAScript);

    Effects: Equivalent to: return assign(string_type(first, last), f);

basic_regex& assign(initializer_list<charT> il,
    flag_type f = regex_constants::ECMAScript);

    Effects: Equivalent to: return assign(il.begin(), il.end(), f);

32.7.4 Constant operations

unsigned mark_count() const;

    Effects: Returns the number of marked sub-expressions within the regular expression.

flag_type flags() const;

    Effects: Returns a copy of the regular expression syntax flags that were passed to the object’s constructor
or to the last call to assign.

32.7.5 Locale

locale_type imbue(locale_type loc);

    Effects: Returns the result of traits_inst.imbue(loc) where traits_inst is a (default-initialized)
instance of the template type argument traits stored within the object. After a call to imbue the
basic_regex object does not match any character sequence.

locale_type getloc() const;

    Effects: Returns the result of traits_inst.getloc() where traits_inst is a (default-initialized)
instance of the template parameter traits stored within the object.

32.7.6 Swap

void swap(basic_regex& e);

    Effects: Swaps the contents of the two regular expressions.

    Postconditions: *this contains the regular expression that was in e, e contains the regular expression
that was in *this.

    Complexity: Constant time.

32.7.7 Non-member functions

template<class charT, class traits>
    void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);

    Effects: Calls lhs.swap(rhs).

32.8 Class template sub_match

32.8.1 General

Class template sub_match denotes the sequence of characters matched by a particular marked sub-expression.

namespace std {
    template<class BidirectionalIterator>
        class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> {
        public:
            using value_type =
                typename iterator_traits<BidirectionalIterator>::value_type;
            using difference_type =
                typename iterator_traits<BidirectionalIterator>::difference_type;
            using iterator = BidirectionalIterator;
            using string_type = basic_string<value_type>;

            bool matched;

§ 32.8.1

1 Class template sub_match denotes the sequence of characters matched by a particular marked sub-expression.
constexpr sub_match();
difference_type length() const;
operator string_type() const;
string_type str() const;

int compare(const sub_match& s) const;
int compare(const string_type& s) const;
int compare(const value_type* s) const;
}

32.8.2 Members

constexpr sub_match();

Effects: Value-initializes the pair base class subobject and the member matched.

difference_type length() const;

Returns: matched ? distance(first, second) : 0.

operator string_type() const;

Returns: matched ? string_type(first, second) : string_type().

string_type str() const;

Returns: matched ? string_type(first, second) : string_type().

int compare(const sub_match& s) const;

Returns: str().compare(s.str()).

int compare(const string_type& s) const;

Returns: str().compare(s).

int compare(const value_type* s) const;

Returns: str().compare(s).

32.8.3 Non-member operators

Let SM-CAT(I) be

\text{compare\_three\_way\_result\_t}<\text{basic\_string<typename iterator\_traits<I>::value\_type}>$

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs, const sub_match<BiIter>& rhs);

Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter, class ST, class SA>
bool operator==(const sub_match<BiIter>& lhs,
const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

Returns:

lhs.compare(typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())) == 0

template<class BiIter, class ST, class SA>
auto operator<=>(const sub_match<BiIter>& lhs,
const basic_string<typename iterator_traits<BiIter>::value_type, ST, SA>& rhs);

Returns:
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())
  <=> 0
)
}

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
    const typename iterator_traits<BiIter>::value_type* rhs);

Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
    const typename iterator_traits<BiIter>::value_type* rhs);

Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
    const typename iterator_traits<BiIter>::value_type& rhs);

Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
    const typename iterator_traits<BiIter>::value_type& rhs);

Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(1, rhs))
  <=> 0
)

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>&
operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);

Returns: os << m.str().

32.9 Class template match_results

32.9.1 General

Class template match_results denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.

The class template match_results meets the requirements of an allocator-aware container and of a sequence container (24.2.2.1, 24.2.4) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.

A default-constructed match_results object has no fully established result state. A match result is ready when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a match_results object that is not ready are undefined.

The sub_match object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the sub_match member matched is always true. The sub_match object stored at index n denotes what matched the marked sub-expression n within the matched expression. If the sub-expression n participated in a regular expression match then the sub_match member matched evaluates to true, and members first and second denote the range of characters [first, second) which formed that match. Otherwise matched is false, and members first and second point to the end of the sequence that was searched.

[Note 1: The sub_match objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — end note]
namespace std {
    template<class BidirectionalIterator, 
    class Allocator = allocator<sub_match<BidirectionalIterator>>>
    class match_results {
public:
    using value_type = sub_match<BidirectionalIterator>;

}
string_type
  format(const char_type* fmt,
          regex_constants::match_flag_type flags = regex_constants::format_default) const;

  // 32.9.7, allocator
  allocator_type get_allocator() const;

  // 32.9.8, swap
  void swap(match_results& that);
};

32.9.2 Constructors

Table 137 lists the postconditions of \texttt{match_results} copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter \( m \) denote the values they had before the respective function calls.

\begin{enumerate}
\item explicit \texttt{match_results}(const Allocator& a);
  \begin{itemize}
  \item Postconditions: \texttt{ready()} returns \texttt{false}. \texttt{size()} returns 0.
  \end{itemize}
\item \texttt{match_results}(const match_results& m);
  \begin{itemize}
  \item Postconditions: As specified in Table 137.
  \end{itemize}
\item \texttt{match_results(match_results&& m)} noexcept;
  \begin{itemize}
  \item Effects: The stored \texttt{Allocator} value is move constructed from \texttt{m.get_allocator()}.
  \item Postconditions: As specified in Table 137.
  \end{itemize}
\item \texttt{match_results& operator=(const match_results& m)};
  \begin{itemize}
  \item Postconditions: As specified in Table 137.
  \end{itemize}
\item \texttt{match_results& operator=(match_results&& m)};
  \begin{itemize}
  \item Postconditions: As specified in Table 137.
  \end{itemize}
\end{enumerate}

Table 137: \texttt{match_results} copy/move operation postconditions

\begin{tabular}{|l|l|}
\hline
Element & Value \\
\hline
\texttt{ready()} & \texttt{m.ready()} \\
\texttt{size()} & \texttt{m.size()} \\
\texttt{str(n)} & \texttt{m.str(n)} for all non-negative integers \( n < \texttt{m.size()} \) \\
\texttt{prefix()} & \texttt{m.prefix()} \\
\texttt{suffix()} & \texttt{m.suffix()} \\
\texttt{(*this)[n]} & \texttt{m[n]} for all non-negative integers \( n < \texttt{m.size()} \) \\
\texttt{length(n)} & \texttt{m.length(n)} for all non-negative integers \( n < \texttt{m.size()} \) \\
\texttt{position(n)} & \texttt{m.position(n)} for all non-negative integers \( n < \texttt{m.size()} \) \\
\hline
\end{tabular}

32.9.3 State

\begin{itemize}
\item bool \texttt{ready()} const;
  \begin{itemize}
  \item Returns: \texttt{true} if \texttt{*this} has a fully established result state, otherwise \texttt{false}.
  \end{itemize}
\end{itemize}

32.9.4 Size

\begin{itemize}
\item size_type \texttt{size()} const;
  \begin{itemize}
  \item Returns: One plus the number of marked sub-expressions in the regular expression that was matched if \texttt{*this} represents the result of a successful match. Otherwise returns 0.
  \end{itemize}
\end{itemize}
size_type max_size() const;

Returns: The maximum number of sub_match elements that can be stored in *this.

[[nodiscard]] bool empty() const;

Returns: size() == 0.

32.9.5 Element access

difference_type length(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: (*this)[sub].length().

difference_type position(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: The distance from the start of the target sequence to (*this)[sub].first.

string_type str(size_type sub = 0) const;

Preconditions: ready() == true.

Returns: string_type((*this)[sub]).

const_reference operator[](size_type n) const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence that matched marked
sub-expression n. If n == 0 then returns a reference to a sub_match object representing the character
sequence that matched the whole regular expression. If n >= size() then returns a sub_match object
representing an unmatched sub-expression.

const_reference prefix() const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence from the start of the
string being matched/searched to the start of the match found.

const_reference suffix() const;

Preconditions: ready() == true.

Returns: A reference to the sub_match object representing the character sequence from the end of the
match found to the end of the string being matched/searched.

const_iterator begin() const;
const_iterator cbegin() const;

Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;

Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

32.9.6 Formatting

template<class OutputIter>
OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;

Preconditions: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator
(25.3.5.4).
Effects: Copies the character sequence \([\text{fmt\_first, fmt\_last}]\) to OutputIter \(\text{out}\). Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within \(*\text{this}\) to which it refers. The bitmasks specified in flags determine which format specifiers and escape sequences are recognized.

Returns: \(\text{out}\).

```cpp
template<class OutputIter, class ST, class SA>
OutputIter format(
    OutputIter out,
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Effects: Equivalent to:

\[
\text{return format(out, fmt.data(), fmt.data() + fmt.size(), flags)};
\]

```cpp
template<class ST, class SA>
basic_string<char_type, ST, SA> format(
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Effects: Constructs an empty string result of type basic_string<char_type, ST, SA> and calls:

\[
\text{format(back inserter(result), fmt, flags)};
\]

Returns: result.

```cpp
string_type format(
    const char_type* fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Effects: Constructs an empty string result of type string_type and calls:

\[
\text{format(back inserter(result), fmt + char_traits<char_type>::length(fmt), flags)};
\]

Returns: result.

### 32.9.7 Allocator

```cpp
allocator_type get_allocator() const;
```

Returns: A copy of the Allocator that was passed to the object’s constructor or, if that allocator has been replaced, a copy of the most recent replacement.

### 32.9.8 Swap

```cpp
void swap(match_results& that);
```

Effects: Swaps the contents of the two sequences.

Postconditions: \(*\text{this}\) contains the sequence of matched sub-expressions that were in \(\text{that}\), \(\text{that}\) contains the sequence of matched sub-expressions that were in \(*\text{this}\).

Complexity: Constant time.

```cpp
template<class BidirectionalIterator, class Allocator>
void swap(match_results<BidirectionalIterator, Allocator>& m1,
    match_results<BidirectionalIterator, Allocator>& m2);
```

Effects: As if by \(m1\).\(\text{swap}(m2)\).

### 32.9.9 Non-member functions

```cpp
template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
    const match_results<BidirectionalIterator, Allocator>& m2);
```

Returns: \(\text{true}\) if neither match result is ready, \(\text{false}\) if one match result is ready and the other is not. If both match results are ready, returns \(\text{true}\) only if:
— m1.empty() && m2.empty(), or
— !m1.empty() && !m2.empty(), and the following conditions are satisfied:
— m1.prefix() == m2.prefix(),
— m1.size() == m2.size() && equal(m1.begin(), m1.end(), m2.begin()), and
— m1.suffix() == m2.suffix).

[Note 1: The algorithm equal is defined in Clause 27. — end note]

32.10 Regular expression algorithms

32.10.1 Exceptions

The algorithms described in subclause 32.10 may throw an exception of type regex_error. If such an exception e is thrown, e.code() shall return either regex_constants::error_complexity or regex_constants::error_stack.

32.10.2 regex_match

```cpp
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
                 match_results<BidirectionalIterator, Allocator>& m,
                 const basic_regex<charT, traits>& e,
                 regex_constants::match_flag_type flags = regex_constants::match_default);
```

1 Preconditions: BidirectionalIterator meets the Cpp17BidirectionalIterator requirements (25.3.5.6).

Effect: Determines whether there is a match between the regular expression e, and all of the character sequence [first, last). The parameter flags is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns true if such a match exists, false otherwise.

[Example 1:
```cpp
std::regex re("Get\|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); // returns true, and m[0] contains "Get"
regex_match ("Get\|Value", m, re); // returns true, and m[0] contains "GetValue"
regex_search("GetValues", m, re); // returns true, and m[0] contains "Get"
regex_match ("GetValues", m, re); // returns false
```
— end example]

3 Postconditions: m.ready() == true in all cases. If the function returns false, then the effect on parameter m is unspecified except that m.size() returns 0 and m.empty() returns true. Otherwise the effects on parameter m are given in Table 138.

Table 138: Effects of regex_match algorithm

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>m.size()</td>
<td>1 + e.mark_count()</td>
</tr>
<tr>
<td>m.empty()</td>
<td>false</td>
</tr>
<tr>
<td>m.prefix().first</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().second</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().matched</td>
<td>false</td>
</tr>
<tr>
<td>m.suffix().first</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().second</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().matched</td>
<td>false</td>
</tr>
<tr>
<td>m[0].first</td>
<td>first</td>
</tr>
<tr>
<td>m[0].second</td>
<td>last</td>
</tr>
<tr>
<td>m[0].matched</td>
<td>true</td>
</tr>
<tr>
<td>m[n].first</td>
<td>For all integers 0 &lt; n &lt; m.size(), the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
</tbody>
</table>
### Table 138: Effects of `regex_match` algorithm (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>m[n].second</code></td>
<td>For all integers $0 &lt; n &lt; m.size()$, the end of the sequence that matched sub-expression $n$. Alternatively, if sub-expression $n$ did not participate in the match, then <code>last</code>.</td>
</tr>
<tr>
<td><code>m[n].matched</code></td>
<td>For all integers $0 &lt; n &lt; m.size()$, <code>true</code> if sub-expression $n$ participated in the match, <code>false</code> otherwise.</td>
</tr>
</tbody>
</table>

```cpp
template<class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,  
const basic_regex<charT, traits>& e,  
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Effects:** Behaves “as if” by constructing an instance of `match_results<BidirectionalIterator>` what, and then returning the result of `regex_match(first, last, what, e, flags)`.

```cpp
template<class charT, class Allocator, class traits>
bool regex_match(const charT* str,  
match_results<const charT*, Allocator>& m,  
const basic_regex<charT, traits>& e,  
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```cpp
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,  
match_results<typename basic_string<charT, ST, SA>::const_iterator, Allocator>& m,  
const basic_regex<charT, traits>& e,  
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(s.begin(), s.end(), m, e, flags)`.

```cpp
template<class charT, class traits>
bool regex_match(const charT* str,  
const basic_regex<charT, traits>& e,  
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(str, str + char_traits<charT>::length(str), e, flags)`.

```cpp
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s,  
const basic_regex<charT, traits>& e,  
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(s.begin(), s.end(), e, flags)`.

---

### 32.10.3 `regex_search`  

```cpp
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,  
match_results<BidirectionalIterator, Allocator>& m,  
const basic_regex<charT, traits>& e,  
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Preconditions:** `BidirectionalIterator` meets the `Cpp17BidirectionalIterator` requirements (25.3.5.6).

**Effects:** Determines whether there is some sub-sequence within `[first, last)` that matches the regular expression `e`. The parameter `flags` is used to control how the expression is matched against the character sequence. Returns `true` if such a sequence exists, `false` otherwise.

**Postconditions:** `m.ready()` == `true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns 0 and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 139.
Table 139: Effects of `regex_search` algorithm  

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>m.size()</td>
<td><code>1 + e.mark_count()</code></td>
</tr>
<tr>
<td>m.empty()</td>
<td>false</td>
</tr>
<tr>
<td>m.prefix().first</td>
<td>first</td>
</tr>
<tr>
<td>m.prefix().second</td>
<td><code>m[0].first</code></td>
</tr>
<tr>
<td>m.prefix().matched</td>
<td><code>m.prefix().first != m.prefix().second</code></td>
</tr>
<tr>
<td>m.suffix().first</td>
<td><code>m[0].second</code></td>
</tr>
<tr>
<td>m.suffix().second</td>
<td>last</td>
</tr>
<tr>
<td>m.suffix().matched</td>
<td><code>m.suffix().first != m.suffix().second</code></td>
</tr>
<tr>
<td>m[0].first</td>
<td>The start of the sequence of characters that matched the regular expression</td>
</tr>
<tr>
<td>m[0].second</td>
<td>The end of the sequence of characters that matched the regular expression</td>
</tr>
<tr>
<td>m[0].matched</td>
<td>true</td>
</tr>
<tr>
<td>m[n].first</td>
<td>For all integers <code>0 &lt; n &lt; m.size()</code>, the start of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].second</td>
<td>For all integers <code>0 &lt; n &lt; m.size()</code>, the end of the sequence that matched sub-expression n. Alternatively, if sub-expression n did not participate in the match, then last.</td>
</tr>
<tr>
<td>m[n].matched</td>
<td>For all integers <code>0 &lt; n &lt; m.size()</code>, true if sub-expression n participated in the match, false otherwise.</td>
</tr>
</tbody>
</table>

template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m, 
                 const basic_regex<charT, traits>& e, 
                 regex_constants::match_flag_type flags = regex_constants::match_default);

4 Returns: `regex_search(str, str + char_traits<charT>::length(str), m, e, flags)`. 

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s, 
                 match_results<typename basic_string<charT, ST, SA>::const_iterator, 
                 Allocator>& m, 
                 const basic_regex<charT, traits>& e, 
                 regex_constants::match_flag_type flags = regex_constants::match_default);

5 Returns: `regex_search(s.begin(), s.end(), m, e, flags)`. 

Effects: Behaves “as if” by constructing an object what of type `match_results<BidirectionalIterator>` and returning `regex_search(first, last, what, e, flags)`. 

template<class charT, class traits>
bool regex_search(const charT* str, 
                 const basic_regex<charT, traits>& e, 
                 regex_constants::match_flag_type flags = regex_constants::match_default);

7 Returns: `regex_search(str, str + char_traits<charT>::length(str), e, flags)`. 

template<class ST, class SA, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s, 
                 const basic_regex<charT, traits>& e, 
                 regex_constants::match_flag_type flags = regex_constants::match_default);

8 Returns: `regex_search(s.begin(), s.end(), e, flags)`. 

§ 32.10.3 1649
### 32.10.4 regex_replace

**template<**class OutputIterator, class BidirectionalIterator,
    class traits, class charT, class ST, class SA>
**OutputIterator**
    regex_replace(OutputIterator out,
    BidirectionalIterator first, BidirectionalIterator last,
    const basic_regex<charT, traits>& e,
    const basic_string<charT, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::match_default);

**template<**class OutputIterator, class BidirectionalIterator, class traits, class charT>
**OutputIterator**
    regex_replace(OutputIterator out,
    BidirectionalIterator first, BidirectionalIterator last,
    const basic_regex<charT, traits>& e,
    const charT* fmt,
    regex_constants::match_flag_type flags = regex_constants::match_default);

**Effects:** Constructs a regex_iterator object \( i \) as if by

\[
\text{regex_iterator<BidirectionalIterator, charT, traits> } i\text{(first, last, e, flags)}
\]

and uses \( i \) to enumerate through all of the matches \( m \) of type match_results<BidirectionalIterator> that occur within the sequence \([first, last)\). If no such matches are found and \(!\text{(flags & regex_constants::format_no_copy)}\)
then calls
\[
\text{out = copy(first, last, out)}
\]

If any matches are found then, for each such match:

1. If \(!\text{(flags & regex_constants::format_no_copy)}\), calls
   \[
   \text{out = copy(m.prefix().first, m.prefix().second, out)}
   \]

2. Then calls
   \[
   \text{out = m.format(out, fmt, flags)}
   \]
   for the first form of the function and
   \[
   \text{out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)}
   \]
   for the second.

Finally, if such a match is found and \(!\text{(flags & regex_constants::format_no_copy)}\), calls
\[
\text{out = copy(last_m.suffix().first, last_m.suffix().second, out)}
\]

where \( last_m \) is a copy of the last match found. If flags \& regex_constants::format_first_only is nonzero, then only the first match found is replaced.

**Returns:** out.

**template<**class traits, class charT, class ST, class SA, class FST, class FSA>
**basic_string<charT, ST, SA>**
    regex_replace(const basic_string<charT, ST, SA>& s,
    const basic_regex<charT, traits>& e,
    const basic_string<charT, FST, FSA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::match_default);

**template<**class traits, class charT, class ST, class SA>
**basic_string<charT, ST, SA>**
    regex_replace(const basic_string<charT, ST, SA>& s,
    const basic_regex<charT, traits>& e,
    const charT* fmt,
    regex_constants::match_flag_type flags = regex_constants::match_default);

**Effects:** Constructs an empty string result of type basic_string<charT, ST, SA> and calls:

\[
\text{regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags)}
\]

**Returns:** result.
const basic_regex<charT, traits>& e,
const basic_string<charT, ST, SA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

template<class traits, class charT>
basic_string<charT>
regex_replace(const charT* s,
const basic_regex<charT, traits>& e,
const charT* fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

**Effects:** Constructs an empty string result of type basic_string<charT> and calls:
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);

**Returns:** result.

### 32.11 Regular expression iterators

#### 32.11.1 Class template regex_iterator

The class template `regex_iterator` is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A `regex_iterator` uses `regex_search` to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time `operator++` is used, the iterator finds and stores a value of `match_results<BidirectionalIterator>`. If the end of the sequence is reached (`regex_search` returns `false`), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of `operator*` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>&` is returned. The result of `operator->` on an end-of-sequence iterator is not defined. For any other iterator value a `const match_results<BidirectionalIterator>*` is returned. It is impossible to store things into `regex_iterator`s. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

```cpp
namespace std {
    template<class BidirectionalIterator,
             class charT = typename iterator_traits<BidirectionalIterator>::value_type,
             class traits = regex_traits<charT>>
    class regex_iterator {
        public:
            using regex_type = basic_regex<charT, traits>;
            using iterator_category = forward_iterator_tag;
            using value_type = match_results<BidirectionalIterator>;
            using difference_type = ptrdiff_t;
            using pointer = const value_type*;
            using reference = const value_type&;

            regex_iterator();
            regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                          const regex_type& re,
                          regex_constants::match_flag_type m = regex_constants::match_default);
            regex_iterator(BidirectionalIterator, BidirectionalIterator,
                           const regex_type&&,
                           regex_constants::match_flag_type = regex_constants::match_default) = delete;
            regex_iterator(const regex_iterator&);
            regex_iterator& operator=(const regex_iterator&);
            bool operator==(const regex_iterator&) const;
            const value_type& operator*() const;
            const value_type* operator->() const;
            regex_iterator& operator++();
            regex_iterator operator++(int);

        private:
            BidirectionalIterator begin; // exposition only
            BidirectionalIterator end; // exposition only
    }
}
```
const regex_type* pregex;  // exposition only
regex_constants::match_flag_type flags;  // exposition only
match_results<BidirectionalIterator> match;  // exposition only
};

2 An object of type regex_iterator that is not an end-of-sequence iterator holds a zero-length match if
match[0].matched == true and match[0].first == match[0].second.
[Note 1: For example, this can occur when the part of the regular expression that matched consists only of an assertion
(such as `'.'`, `'$'`, `''`, `'\B'`). —end note]

32.11.1.2 Constructors [re.regiter.cnstr]

regex_iterator();
1
Effects: Constructs an end-of-sequence iterator.

regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
const regex_type& re,
regex_constants::match_flag_type m = regex_constants::match_default);
2
Effects: Initializes begin and end to a and b, respectively, sets pregex to addressof(re), sets flags
to m, then calls regex_search(begin, end, match, *pregex, flags). If this call returns false the
constructor sets *this to the end-of-sequence iterator.

32.11.1.3 Comparisons [re.regiter.comp]

bool operator==(const regex_iterator& right) const;
1
Returns: true if this and right are both end-of-sequence iterators or if the following conditions all
hold:

(1.1) — begin == right.begin,
(1.2) — end == right.end,
(1.3) — pregex == right.pregex,
(1.4) — flags == right.flags, and
(1.5) — match[0] == right.match[0];
otherwise false.

32.11.1.4 Indirection [re.regiter.deref]

const value_type& operator*() const;
1
Returns: match.

const value_type* operator->() const;
2
Returns: addressof(match).

32.11.1.5 Increment [re.regiter.incr]

regex_iterator& operator++();
1
Effects: Constructs a local variable start of type BidirectionalIterator and initializes it with the
value of match[0].second.
2
If the iterator holds a zero-length match and start == end the operator sets *this to the end-of-
sequence iterator and returns *this.
3
Otherwise, if the iterator holds a zero-length match, the operator calls:

regex_search(start, end, match, *pregex,
flags | regex_constants::match_not_null | regex_constants::match_continuous)
4
If the call returns true the operator returns *this. Otherwise the operator increments start and
continues as if the most recent match was not a zero-length match.

If the most recent match was not a zero-length match, the operator sets flags to flags | regex_consts-
tants::match_prev_avail and calls regex_search(start, end, match, *pregex, flags). If
the call returns false the iterator sets *this to the end-of-sequence iterator. The iterator then returns *this.
5
In all cases in which the call to regex_search returns true, match.prefix().first shall be equal to
the previous value of match[0].second, and for each index i in the half-open range [0, match.size())
for which match[i].matched is true, match.position(i) shall return distance(begin, match[i].
first).
6
[Note 1: This means that match.position(i) gives the offset from the beginning of the target sequence, which
is often not the same as the offset from the sequence passed in the call to regex_search. — end note]
7
It is unspecified how the implementation makes these adjustments.
8
[Note 2: This means that an implementation can call an implementation-specific search function, in which case
a program-defined specialization of regex_search will not be called. — end note]

regex_iterator operator++(int);
9
Effects: As if by:
   regex_iterator tmp = *this;
   ++(*this);
   return tmp;
32.11.2 Class template regex_token_iterator
[re.tokiter]
32.11.2.1 General
[re.tokiter.general]
1
The class template regex_token_iterator is an iterator adaptor; that is to say it represents a new view of
an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence,
and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator
is a sub_match class template instance that represents what matched a particular sub-expression within the
regular expression.
2
When class regex_token_iterator is used to enumerate a single sub-expression with index −1 the iterator
performs field splitting: that is to say it enumerates one sub-expression for each section of the character
container sequence that does not match the regular expression specified.
3
After it is constructed, the iterator finds and stores a value regex_iterator<BidirectionalIterator>
position and sets the internal count N to zero. It also maintains a sequence subs which contains a list of
the sub-expressions which will be enumerated. Every time operator++ is used the count N is incremented; if
N exceeds or equals subs.size(), then the iterator increments member position and sets count N to zero.
4
If the end of sequence is reached (position is equal to the end of sequence iterator), the iterator becomes
equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index −1, in
which case the iterator enumerates one last sub-expression that contains all the characters from the end of
the last regular expression match to the end of the input sequence being enumerated, provided that this
would not be an empty sub-expression.
5
The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator
to be used for the end condition. The result of operator* on an end-of-sequence iterator is not defined.
For any other iterator value a const sub_match<BidirectionalIterator>& is returned. The result of
operator-> on an end-of-sequence iterator is not defined. For any other iterator value a const sub_match
BidirectionalIterator>* is returned.
6
It is impossible to store things into regex_token_iterators. Two end-of-sequence iterators are always equal.
An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators
are equal when they are constructed from the same arguments.

namespace std {
   template<class BidirectionalIterator,
            class charT = typename iterator_traits<BidirectionalIterator>::value_type,
            class traits = regex_traits<charT>>
   class regex_token_iterator {
      public:
         using regex_type = basic_regex<charT, traits>;
         using iterator_category = forward_iterator_tag;
         using value_type = sub_match<BidirectionalIterator>;
         using difference_type = ptrdiff_t;
         using pointer = const value_type*;

§ 32.11.2.1
1653
using reference = const value_type&;

regex_token_iterator();
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    int submatch = 0,
    regex_constants::match_flag_type m =
    regex_constants::match_default);
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    const vector<int>& submatches,
    regex_constants::match_flag_type m =
    regex_constants::match_default);
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    initializer_list<int> submatches,
    regex_constants::match_flag_type m =
    regex_constants::match_default);

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    const int (&submatches)[N],
    regex_constants::match_flag_type m =
    regex_constants::match_default) = delete;
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    const vector<int>& submatches,
    regex_constants::match_flag_type m =
    regex_constants::match_default) = delete;
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    initializer_list<int> submatches,
    regex_constants::match_flag_type m =
    regex_constants::match_default) = delete;

template<size_t N>
regex_token_iterator(const regex_token_iterator&);
regex_token_iterator& operator=(const regex_token_iterator&);
bool operator==(const regex_token_iterator& const);
const value_type* operator*() const;
const value_type* operator->() const;
regex_token_iterator& operator++();
regex_token_iterator operator++(int);

private:
using position_iterator =
    regex_iterator<BidirectionalIterator, charT, traits>; // exposition only
position_iterator position; // exposition only
const value_type* result; // exposition only
value_type suffix; // exposition only
size_t N; // exposition only
vector<int> subs; // exposition only
}
A suffix iterator is a regex_token_iterator object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member result holds a pointer to the data member suffix, the value of the member suffix.match is true, suffix.first points to the beginning of the final sequence, and suffix.second points to the end of the final sequence.

[Note 1: For a suffix iterator, data member suffix.first is the same as the end of the last match found, and suffix.second is the same as the end of the target sequence. —end note]

The current match is (*position).prefix() if subs[N] == -1, or (*position)[subs[N]] for any other value of subs[N].

### 32.11.2.2 Constructors

regex_token_iterator();

*Effects:* Constructs the end-of-sequence iterator.

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, int submatch = 0, regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, const vector<int>& submatches, regex_constants::match_flag_type m = regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, initializer_list<int> submatches, regex_constants::match_flag_type m = regex_constants::match_default);

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b, const regex_type& re, const int (&submatches)[N], regex_constants::match_flag_type m = regex_constants::match_default);

*Preconditions:* Each of the initialization values of submatches is >= -1.

*Effects:* The first constructor initializes the member subs to hold the single value submatch. The second, third, and fourth constructors initialize the member subs to hold a copy of the sequence of integer values pointed to by the iterator range [begin(submatches), end(submatches)].

Each constructor then sets N to 0, and position to position_iterator(a, b, re, m). If position is not an end-of-sequence iterator the constructor sets result to the address of the current match. Otherwise if any of the values stored in subs is equal to -1 the constructor sets *this to a suffix iterator that points to the range [a,b), otherwise the constructor sets *this to an end-of-sequence iterator.

### 32.11.2.3 Comparisons

bool operator==(const regex_token_iterator& right) const;

*Returns:* true if *this and right are both end-of-sequence iterators, or if *this and right are both suffix iterators and suffix == right.suffix; otherwise returns false if *this or right is an end-of-sequence iterator or a suffix iterator. Otherwise returns true if position == right.position, N == right.N, and subs == right.subs. Otherwise returns false.

### 32.11.2.4 Indirection

const value_type& operator*() const;

*Returns:* result.

const value_type* operator->() const;

*Returns:* result.
32.11.2.5 Increment

```
regex_token_iterator& operator++();
```

1. **Effects**: Constructs a local variable `prev` of type `position_iterator`, initialized with the value of `position`.
2. If `*this` is a suffix iterator, sets `*this` to an end-of-sequence iterator.
3. Otherwise, if `N + 1 < subs.size()`, increments `N` and sets `result` to the address of the current match.
4. Otherwise, sets `N` to 0 and increments `position`. If `position` is not an end-of-sequence iterator the operator sets `result` to the address of the current match.
5. Otherwise, if any of the values stored in `subs` is equal to −1 and `prev->suffix().length()` is not 0 the operator sets `*this` to a suffix iterator that points to the range `[prev->suffix().first, prev->suffix().second)`.
6. Otherwise, sets `*this` to an end-of-sequence iterator.
7. **Returns**: `*this`

```
regex_token_iterator& operator++(int);
```

1. **Effects**: Constructs a copy `tmp` of `*this`, then calls `++(*this)`.
2. **Returns**: `tmp`.

32.12 Modified ECMAScript regular expression grammar

```
The regular expression grammar recognized by `basic_regex` objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.
```

1. Objects of type specialization of `basic_regex` store within themselves a default-constructed instance of their `traits` template parameter, henceforth referred to as `traits_inst`. This `traits_inst` object is used to support localization of the regular expression; `basic_regex` member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.
2. The following productions within the ECMAScript grammar are modified as follows:

   - **ClassAtom**::
     - `ClassAtomNoDash`
     - `ClassAtomExClass`
     - `ClassAtomCollatingElement`
     - `ClassAtomEquivalence`

   - **IdentityEscape**::
     - `SourceCharacter but not c`

3. The following new productions are then added:

   - **ClassAtomExClass**::
     - `[ : ClassName :]`
   - **ClassAtomCollatingElement**::
     - `[ . ClassName ]`
   - **ClassAtomEquivalence**::
     - `[ = ClassName = ]`

   - **ClassName**::
     - `ClassNameCharacter`
     - `ClassNameCharacter ClassName`

4. The productions `ClassAtomExClass`, `ClassAtomCollatingElement` and `ClassAtomEquivalence` provide functionality equivalent to that of the same features in regular expressions in POSIX.

5. The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in Table 133.
A `ClassName` production, when used in `ClassAtomExtClass`, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid `ClassNames` are determined by the type of the traits class, but at least the following names shall be recognized: `alnum`, `alpha`, `blank`, `cntrl`, `digit`, `graph`, `lower`, `print`, `punct`, `space`, `upper`, `xdigit`, `d`, `s`, `w`. In addition the following expressions shall be equivalent:

\d and `[:digit:]`
\D and `[^[:digit:]]`
\s and `[:space:]`
\S and `[^[:space:]]`
\w and `[[:alnum:]]`
\W and `[^[:alnum:]]`

A `ClassName` production when used in a `ClassAtomCollatingElement` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.

The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR’ed together and subsequently passed to `traits_inst.isctype`.

A `ClassName` production when used in a `ClassAtomEquivalence` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

If the `CV` of a `UnicodeEscapeSequence` is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

[Note 1: This means that values of the form “uxxxx” that do not fit in a character are invalid. — end note]

Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (32.4.3) specified when using the regular expression object in one of the regular expression algorithms (32.10). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) — During matching of a regular expression finite state machine against a sequence of characters, two characters `c` and `d` are compared using the following rules:

(14.1.1) — if `flags() & regex_constants::icase` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d);`

(14.1.2) — otherwise, if `flags() & regex_constants::collate` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d);`

(14.1.3) — otherwise, the two characters are equal if `c == d`.

(14.2) — During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range `c1-c2` against a character `c` is conducted as follows: if `flags() & regex_constants::collate` is false then the character `c` is matched if `c1 <= c && c <= c2`, otherwise `c` is matched in accordance with the following algorithm:

```c
string_type str1 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
string_type str2 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c) : traits_inst.translate(c));
```
return traits_inst.transform(str1.begin(), str1.end())
  <= traits_inst.transform(str.begin(), str.end())
  && traits_inst.transform(str.begin(), str.end())
  <= traits_inst.transform(str2.begin(), str2.end());

(14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing
whether a collating element is a member of a primary equivalence class is conducted by first converting
the collating element and the equivalence class to sort keys using traits::transform_primary, and
then comparing the sort keys for equality.

(14.4) — During matching of a regular expression finite state machine against a sequence of characters, a
character c is a member of a character class designated by an iterator range [first, last) if traits_-
inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase)) is true.

</tbody>
</table>

33.2  Requirements [thread.req]

33.2.1  Template parameter names [thread.req.paramname]

Throughout this Clause, the names of template parameters are used to express type requirements. If a template parameter is named **Predicate**, `operator()` applied to the template argument shall return a value that is convertible to `bool`. If a template parameter is named **Clock**, the corresponding template argument shall be a type `C` that meets the `Cpp17Clock` requirements (29.3); the program is ill-formed if `is_clock_v<C>` is false.

33.2.2  Exceptions [thread.req.exception]

Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.8). Such exceptions are thrown if any of the function’s error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.4.6.13.

[Example 1: Consider a function in this Clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — end example]

The `error_code` reported by such an exception’s `code()` member function compares equal to one of the conditions specified in the function’s error condition element.

33.2.3  Native handles [thread.req.native]

Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined.

[Note 1: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — end note]

33.2.4  Timing specifications [thread.req.timing]

Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in Clause 29.

Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration $D_i$. Ideally,
this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration $D_m$. The delay durations may vary from timeout to timeout, but in all cases shorter is better.

3 The functions whose names end in `for` take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.\(^3\) Given a duration argument $D_t$, the real-time duration of the timeout is $D_t + D_i + D_m$.

4 The functions whose names end in `until` take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument $C_t$, the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time $C_a$ during the timeout, the behavior should be as follows:

\[(4.1)\] If $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.

\[(4.2)\] If $C_a \leq C_t$, the waiting function should not time out until `Clock::now()` returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

[Note 1: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — end note]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between $C_t$ and the time point of the call to the `until` function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

5 [Note 2: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality. — end note]

6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the native resolution.

7 Implementation-provided clocks that are used for these functions meet the `Cpp17TrivialClock` requirements (29.3).

8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as timeout-related exceptions.

[Note 3: Instantiations of clock, time point and duration types supplied by the implementation as specified in 29.7 do not throw exceptions. — end note]

### 33.2.5 Requirements for `Cpp17Lockable` types

#### 33.2.5.1 In general

1 An execution agent is an entity such as a thread that may perform work in parallel with other execution agents.

[Note 1: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — end note]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

2 [Note 2: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — end note]

The standard library templates `unique_lock` (33.6.5.4), `shared_lock` (33.6.5.5), `scoped_lock` (33.6.5.3), `lock_guard` (33.6.5.2), `lock`, `try_lock` (33.6.6), and `condition_variable_any` (33.7.5) all operate on user-supplied lockable objects. The `Cpp17BasicLockable` requirements, the `Cpp17Lockable` requirements, the `Cpp17TimedLockable` requirements, the `Cpp17SharedLockable` requirements, and the `Cpp17SharedTimedLockable` requirements list the requirements imposed by these library types in order to acquire or release ownership of a `lock` by a given execution agent.

312) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.
A lock on an object \( m \) is said to be

- a non-shared lock if it is acquired by a call to `lock`, `try_lock`, `try_lock_for`, or `try_lock_until` on \( m \), or
- a shared lock if it is acquired by a call to `lock_shared`, `try_lock_shared`, `try_lock_shared_for`, or `try_lock_shared_until` on \( m \).

[Note 4: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions. — end note]

### 33.2.5.2 **Cpp17BasicLockable** requirements [thread.req.lockable.basic]

A type \( L \) meets the **Cpp17BasicLockable** requirements if the following expressions are well-formed and have the specified semantics (\( m \) denotes a value of type \( L \)).

\[
m.\text{lock}()
\]

Effects: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

\[
m.\text{unlock}()
\]

Preconditions: The current execution agent holds a non-shared lock on \( m \).

Effects: Releases a non-shared lock on \( m \) held by the current execution agent.

Throws: Nothing.

### 33.2.5.3 **Cpp17Lockable** requirements [thread.req.lockable.req]

A type \( L \) meets the **Cpp17Lockable** requirements if it meets the **Cpp17BasicLockable** requirements and the following expressions are well-formed and have the specified semantics (\( m \) denotes a value of type \( L \)).

\[
m.\text{try_lock}()
\]

Effects: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

Returns: \text{true} if the lock was acquired, otherwise \text{false}.

### 33.2.5.4 **Cpp17TimedLockable** requirements [thread.req.lockable.timed]

A type \( L \) meets the **Cpp17TimedLockable** requirements if it meets the **Cpp17Lockable** requirements and the following expressions are well-formed and have the specified semantics (\( m \) denotes a value of type \( L \), \( \text{rel\_time} \) denotes a value of an instantiation of `duration` (29.5), and \( \text{abs\_time} \) denotes a value of an instantiation of `time_point` (29.6)).

\[
m.\text{try_lock_for}(<\text{rel\_time})
\]

Effects: Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by \( \text{rel\_time} \). The function will not return within the timeout specified by \( \text{rel\_time} \) unless it has obtained a lock on \( m \) for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns: \text{true} if the lock was acquired, otherwise \text{false}.

\[
m.\text{try_lock_until}(<\text{abs\_time})
\]

Effects: Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by \( \text{abs\_time} \). The function will not return before the timeout specified by \( \text{abs\_time} \) unless it has obtained a lock on \( m \) for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns: \text{true} if the lock was acquired, otherwise \text{false}.
33.2.5.5  **Cpp17SharedLockable requirements**  

A type `L` meets the **Cpp17SharedLockable** requirements if the following expressions are well-formed, have the specified semantics, and the expression `m.try_lock_shared()` has type `bool` (`m` denotes a value of type `L`):

```cpp
m.lock_shared()
```

*Effects:* Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

```cpp
m.try_lock_shared()
```

*Effects:* Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

*Returns:* `true` if the lock was acquired, `false` otherwise.

```cpp
m.unlock_shared()
```

*Preconditions:* The current execution agent holds a shared lock on `m`.

*Effects:* Releases a shared lock on `m` held by the current execution agent.

*Throws:* Nothing.

33.2.5.6  **Cpp17SharedTimedLockable requirements**  

A type `L` meets the **Cpp17SharedTimedLockable** requirements if it meets the **Cpp17SharedLockable** requirements, and the following expressions are well-formed, have type `bool`, and have the specified semantics (`m` denotes a value of type `L`, `rel_time` denotes a value of a specialization of `chrono::duration`, and `abs_time` denotes a value of a specialization of `chrono::time_point`).

```cpp
m.try_lock_shared_for(rel_time)
```

*Effects:* Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

*Returns:* `true` if the lock was acquired, `false` otherwise.

```cpp
m.try_lock_shared_until(abs_time)
```

*Effects:* Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

*Returns:* `true` if the lock was acquired, `false` otherwise.

33.3  **Stop tokens**  

33.3.1  **Introduction**  

Subclause 33.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a **stop request**.

**stop_source**, **stop_token**, and **stop_callback** implement semantics of shared ownership of a **stop state**. Any **stop_source**, **stop_token**, or **stop_callback** that shares ownership of the same stop state is an **associated** **stop_source**, **stop_token**, or **stop_callback**, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

A **stop_token** can be passed to an operation which can either

1. actively poll the token to check if there has been a stop request, or
2. register a callback using the **stop_callback** class template which will be called in the event that a stop request is made.

A stop request made via a **stop_source** will be visible to all associated **stop_token** and **stop_source** objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).
Callbacks registered via a `stop_callback` object are called when a stop request is first made by any associated `stop_source` object.

Calls to the functions `request_stop`, `stop_requested`, and `stop_possible` do not introduce data races. A call to `request_stop` that returns `true` synchronizes with a call to `stop_requested` on an associated `stop_token` or `stop_source` object that returns `true`. Registration of a callback synchronizes with the invocation of that callback.

### 33.3.2 Header `<stop_token>` synopsis

```cpp
namespace std {
    // 33.3.3, class stop_token
    class stop_token;
    // 33.3.4, class stop_source
    class stop_source;
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};
    // 33.3.5, class stop_callback
    template<class Callback>
    class stop_callback;
}
```

### 33.3.3 Class stop_token

#### 33.3.3.1 General

The class `stop_token` provides an interface for querying whether a stop request has been made (`stop_requested`) or can ever be made (`stop_possible`) using an associated `stop_source` object (33.3.4). A `stop_token` can also be passed to a `stop_callback` (33.3.5) constructor to register a callback to be called when a stop request has been made from an associated `stop_source`.

```cpp
namespace std {
    class stop_token {
        public:
            // 33.3.3.2, constructors, copy, and assignment
            stop_token() noexcept;
            stop_token(const stop_token&) noexcept;
            stop_token(stop_token&&) noexcept;
            stop_token& operator=(const stop_token&) noexcept;
            stop_token& operator=(stop_token&&) noexcept;
            ~stop_token();
            void swap(stop_token&) noexcept;

            // 33.3.3.3, stop handling
            [[nodiscard]] bool stop_requested() const noexcept;
            [[nodiscard]] bool stop_possible() const noexcept;

            [[nodiscard]] friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
            friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
        }
    }
}
```

### 33.3.3.2 Constructors, copy, and assignment

```cpp
stop_token() noexcept;
```

Postconditions: `stop_possible()` is false and `stop_requested()` is false.

[Note 1: Because the created `stop_token` object can never receive a stop request, no resources are allocated for a stop state. — end note]
33.3.3 Members

[[nodiscard]] bool stop_requested() const noexcept;

Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

[[nodiscard]] bool stop_possible() const noexcept;

Returns: false if:

(2.1) *this does not have ownership of a stop state, or
(2.2) a stop request was not made and there are no associated stop_source objects;

otherwise, true.

33.3.4 Non-member functions

[[nodiscard]] bool operator==(const stop_token &lhs, const stop_token &rhs) noexcept;

Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_token &x, stop_token &y) noexcept;

Effects: Equivalent to: x.swap(y).

33.3.4 Class stop_source

33.3.4.1 General

The class stop_source implements the semantics of making a stop request. A stop request made on a stop_source object is visible to all associated stop_source and stop_token (33.3.3) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

namespace std {
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};
}
class stop_source {
public:
   // 33.3.4.2, constructors, copy, and assignment
   stop_source();
   explicit stop_source(nostopstate_t) noexcept;
   stop_source(const stop_source&) noexcept;
   stop_source(stop_source&&) noexcept;
   stop_source& operator=(const stop_source&) noexcept;
   stop_source& operator=(stop_source&&) noexcept;
   ~stop_source();
   void swap(stop_source&) noexcept;

   // 33.3.4.3, stop handling
   [[nodiscard]] stop_token get_token() const noexcept;
   [[nodiscard]] bool stop_possible() const noexcept;
   [[nodiscard]] bool stop_requested() const noexcept;
   bool request_stop() noexcept;
   [[nodiscard]] friend bool operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
   friend void swap(stop_source& lhs, stop_source& rhs) noexcept;
};

33.3.4.2 Constructors, copy, and assignment [stopsource.cons]

stop_source();
   Effects: Initialises *this to have ownership of a new stop state.
   Postconditions: stop_possible() is true and stop_requested() is false.
   Throws: bad_alloc if memory cannot be allocated for the stop state.

explicit stop_source(nostopstate_t) noexcept;
   Postconditions: stop_possible() is false and stop_requested() is false.
   [Note 1: No resources are allocated for the state. — end note]

stop_source(const stop_source& rhs) noexcept;
   Postconditions: *this == rhs is true.
   [Note 2: *this and rhs share the ownership of the same stop state, if any. — end note]

stop_source(stop_source&& rhs) noexcept;
   Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_possible() is false.

~stop_source();
   Effects: Releases ownership of the stop state, if any.

stop_source& operator=(const stop_source& rhs) noexcept;
   Effects: Equivalent to: stop_source(rhs).swap(*this).
   Returns: *this.

stop_source& operator=(stop_source&& rhs) noexcept;
   Effects: Equivalent to: stop_source(std::move(rhs)).swap(*this).
   Returns: *this.

void swap(stop_source& rhs) noexcept;
   Effects: Exchanges the values of *this and rhs.
33.3.4.3 Members

[[nodiscard]] stop_token get_token() const noexcept;

Returns: stop_token() if stop_possible() is false; otherwise a new associated stop_token object.

[[nodiscard]] bool stop_possible() const noexcept;

Returns: true if *this has ownership of a stop state; otherwise, false.

[[nodiscard]] bool stop_requested() const noexcept;

Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

bool request_stop() noexcept;

Effects: If *this does not have ownership of a stop state, returns false. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.2). If the request was made, the callbacks registered by associated stop_callback objects are synchronously called. If an invocation of a callback exits via an exception then terminate is invoked (14.6.2).

[Note 1: A stop request includes notifying all condition variables of type condition_variable_any temporarily registered during an interruptible wait (33.7.5.3). — end note]

Postconditions: stop_possible() is false or stop_requested() is true.

Returns: true if this call made a stop request; otherwise false.

33.3.4.4 Non-member functions

[[nodiscard]] friend bool operator==(const stop_source& lhs, const stop_source& rhs) noexcept;

Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_source& x, stop_source& y) noexcept;

Effects: Equivalent to: x.swap(y).

33.3.5 Class template stop_callback

33.3.5.1 General

namespace std {
    template<class Callback>
    class stop_callback {

    public:
        using callback_type = Callback;

        // 33.3.5.2, constructors and destructor
        template<class C>
        explicit stop_callback(const stop_token& st, C&& cb)
            noexcept(is_nothrow_constructible_v<Callback, C>);
        template<class C>
        explicit stop_callback(stop_token&& st, C&& cb)
            noexcept(is_nothrow_constructible_v<Callback, C>);

        ~stop_callback();

        stop_callback(const stop_callback&) = delete;
        stop_callback(stop_callback&&) = delete;
        stop_callback& operator=(const stop_callback&) = delete;
        stop_callback& operator=(stop_callback&&) = delete;

    private:
        Callback callback; // exposition only
    };

§ 33.3.5.1 1666
template<class Callback>
    stop_callback(stop_token, Callback) -> stop_callback<Callback>;

2 Mandates: stop_callback is instantiated with an argument for the template parameter Callback that satisfies both invocable and destructible.

3 Preconditions: stop_callback is instantiated with an argument for the template parameter Callback that models both invocable and destructible.

33.3.5.2 Constructors and destructor

33.4 Threads

33.4.1 General

33.4 describes components that can be used to create and manage threads.

[Note 1: These threads are intended to map one-to-one with operating system threads. — end note]
33.4.3 Class thread

33.4.3.1 General

The class `thread` provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A `thread` object uniquely represents a particular thread of execution. That representation may be transferred to other `thread` objects in such a way that no two `thread` objects simultaneously represent the same thread of execution. A thread of execution is detached when no `thread` object represents that thread. Objects of class `thread` can be in a state that does not represent a thread of execution.

[Note 1: A `thread` object does not represent a thread of execution after default construction, after being moved from, or after a successful call to `detach` or `join`. — end note]

```cpp
namespace std {

// 33.4.3.2, class thread::id
class id {
    using native_handle_type = implementation-defined; // see 33.2.3

    // construct/copy/destroy
    thread() noexcept;
    template<class F, class... Args> explicit thread(F&& f, Args&&... args);
    ~thread();
    thread(const thread&) = delete;
    thread(thread&&) noexcept;
    thread& operator=(const thread&) = delete;
    thread& operator=(thread&&) noexcept;

    // 33.4.3.6, members
    void swap(thread&) noexcept;
    bool joinable() const noexcept;
    void join();
    void detach();
    id get_id() const noexcept;
    native_handle_type native_handle(); // see 33.2.3

    // static members
    static unsigned int hardware_concurrency() noexcept;
};

33.4.3.2 Class thread::id

namespace std {
    class thread::id {
        id() noexcept;
    };

    bool operator==(thread::id x, thread::id y) noexcept;
    strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

    template<class charT, class traits>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& out, thread::id id);

```

§ 33.4.3.2
// hash support

```cpp
template<class T> struct hash;
```

```cpp
template<> struct hash<thread::id>;
```

1. An object of type `thread::id` provides a unique identifier for each thread of execution and a single distinct value for all `thread` objects that do not represent a thread of execution (33.4.3). Each thread of execution has an associated `thread::id` object that is not equal to the `thread::id` object of any other thread of execution and that is not equal to the `thread::id` object of any `thread` object that does not represent threads of execution.

2. `thread::id` is a trivially copyable class (11.2). The library may reuse the value of a `thread::id` of a terminated thread that can no longer be joined.

3. [Note 1: Relational operators allow `thread::id` objects to be used as keys in associative containers. — end note]

```cpp
id() noexcept;
```

4. **Postconditions:** The constructed object does not represent a thread of execution.

```cpp
bool operator==(thread::id x, thread::id y) noexcept;
```

5. **Returns:** `true` only if `x` and `y` represent the same thread of execution or neither `x` nor `y` represents a thread of execution.

```cpp
strong_ordering operator<=>(thread::id x, thread::id y) noexcept;
```

6. Let `P(x,y)` be an unspecified total ordering over `thread::id` as described in 27.8.

7. **Returns:** `strong_ordering::less` if `P(x,y)` is `true`. Otherwise, `strong_ordering::greater` if `P(y,x)` is `true`. Otherwise, `strong_ordering::equal`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, thread::id id);
```

8. **Effects:** Inserts an unspecified text representation of `id` into `out`. For two objects of type `thread::id` `x` and `y`, if `x == y` the `thread::id` objects have the same text representation and if `x != y` the `thread::id` objects have distinct text representations.

9. **Returns:** `out`.

10. The specialization is enabled (22.10.19).

### 33.4.3.3 Constructors

[thread.thread.constr]

```cpp
thread() noexcept;
```

1. **Effects:** The object does not represent a thread of execution.

```cpp
template<class F, class... Args> explicit thread(F&& f, Args&&... args);
```

2. **Constraints:** `remove_cvref_t<F>` is not the same type as `thread`.

3. **Mandates:** The following are all `true`:

   ```cpp
   (is_constructible_v<decay_t<F>, F>,
   (is_constructible_v<decay_t<Args>, Args> && ...), and
   (is_invocable_v<decay_t<F>, decay_t<Args>...>.
   ```

4. **Effects:** The new thread of execution executes `invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)` with the values produced by `auto` being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

   [Note 1: This implies that any exceptions not thrown from the invocation of the copy of `f` will be thrown in the constructing thread, not the new thread. — end note]
If the invocation of `invoke` terminates with an uncaught exception, `terminate` is invoked (14.6.2).

**Synchronization:** The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

**Postconditions:** `get_id() != id()`. `*this` represents the newly started thread.

**Throws:** `system_error` if unable to start the new thread.

**Error conditions:**

- `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```cpp
thread(thread&& x) noexcept;
```

**Postconditions:** `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

### 33.4.3.4 Destructor

```cpp
~thread();
```

**Effects:** If `joinable()`, invokes `terminate` (14.6.2). Otherwise, has no effects.

[Note 1: Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable. — end note]

### 33.4.3.5 Assignment

```cpp
thread& operator=(thread&& x) noexcept;
```

**Effects:** If `joinable()`, invokes `terminate` (14.6.2). Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

**Postconditions:** `x.get_id() == id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

**Returns:** `*this`.

### 33.4.3.6 Members

```cpp
void swap(thread& x) noexcept;
```

**Effects:** Swaps the state of `*this` and `x`.

```cpp
bool joinable() const noexcept;
```

**Returns:** `get_id() != id()`.

```cpp
void join();
```

**Effects:** Blocks until the thread represented by `*this` has completed.

**Synchronization:** The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.

[Note 1: Operations on `*this` are not synchronized. — end note]

**Postconditions:** The thread represented by `*this` has completed. `get_id() == id()`.

**Throws:** `system_error` when an exception is required (33.2.2).

**Error conditions:**

- `resource_deadlock_would_occur` — if deadlock is detected or `get_id() == this_thread::get_id()`.
- `no_such_process` — if the thread is not valid.
- `invalid_argument` — if the thread is not joinable.
void detach();

Effects: The thread represented by *this continues execution without the calling thread blocking. When detach() returns, *this no longer represents the possibly continuing thread of execution. When the thread previously represented by *this ends execution, the implementation releases any owned resources.

Postconditions: get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

— no_such_process — if the thread is not valid.
— invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if *this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this.

33.4.3.7 Static members

unsigned hardware_concurrency() noexcept;

Returns: The number of hardware thread contexts.
[Note 1: This value should only be considered to be a hint. — end note]
If this value is not computable or well-defined, an implementation should return 0.

33.4.3.8 Specialized algorithms

void swap(thread& x, thread& y) noexcept;

Effects: As if by x.swap(y).

33.4.4 Class jthread

33.4.4.1 General

The class jthread provides a mechanism to create a new thread of execution. The functionality is the same as for class thread (33.4.3) with the additional abilities to provide a stop_token (33.3) to the new thread of execution, make stop requests, and automatically join.

namespace std {
    class jthread {
    public:
        // types
        using id = thread::id;
        using native_handle_type = thread::native_handle_type;

        // 33.4.4.2, constructors, move, and assignment
        jthread() noexcept;
        template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
        ~jthread();
        jthread(const jthread&) = delete;
        jthread(jthread&&) noexcept;
        jthread& operator=(const jthread&) = delete;
        jthread& operator=(jthread&&) noexcept;

        // 33.4.4.3, members
        void swap(jthread&) noexcept;
        [[nodiscard]] bool joinable() const noexcept;
        void join();
        void detach();
        [[nodiscard]] id get_id() const noexcept;
        [[nodiscard]] native_handle_type native_handle(); // see 33.2.3
    }
// 33.4.4.4, stop token handling
[[nodiscard]] stop_source get_stop_source() noexcept;
[[nodiscard]] stop_token get_stop_token() const noexcept;
bool request_stop() noexcept;

// 33.4.4.5, specialized algorithms
friend void swap(jthread& lhs, jthread& rhs) noexcept;

// 33.4.4.6, static members
[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

private:
    stop_source ssource;  // exposition only
};

33.4.4.2 Constructors, move, and assignment

jthread() noexcept;

Effects: Constructs a jthread object that does not represent a thread of execution.

Postconditions: get_id() == id() is true and ssource.stop_possible() is false.

template<class F, class... Args> explicit jthread(F&& f, Args&&... args);

Constraints: remove_cvref_t<F> is not the same type as jthread.

Mandates: The following are all true:
(4.1) is_constructible_v<decay_t<F>, F>,
(4.2) (is_constructible_v<decay_t<Args>, Args> && ...), and
(4.3) is_invocable_v<decay_t<F>, decay_t<Args>...> ||
      is_invocable_v<decay_t<F>, stop_token, decay_t<Args>...>.

Effects: Initializes ssource. The new thread of execution executes
      invoke(auto(std::forward<F>(f)), get_stop_token(),
            auto(std::forward<Args>(args))...)  
if that expression is well-formed, otherwise
      invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...) 
with the values produced by auto being materialized (7.3.5) in the constructing thread. Any return
value from this invocation is ignored.

[Note 1: This implies that any exceptions not thrown from the invocation of the copy of f will be thrown in
the constructing thread, not the new thread. —end note]

If the invoke expression exits via an exception, terminate is called.

Synchronization: The completion of the invocation of the constructor synchronizes with the beginning
of the invocation of the copy of f.

Postconditions: get_id() != id() is true and ssource.stop_possible() is true and *this represents
the newly started thread.

[Note 2: The calling thread can make a stop request only once, because it cannot replace this stop token.
—end note]

Throws: system_error if unable to start the new thread.

Error conditions:
(9.1) resource_unavailable_try_again — the system lacked the necessary resources to create another
thread, or the system-imposed limit on the number of threads in a process would be exceeded.

jthread(jthread&& x) noexcept;

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the
start of construction. ssource has the value of x.ssource prior to the start of construction and
x.ssource.stop_possible() is false.
Effects: If joinable() is true, calls request_stop() and then join().

[Note 3: Operations on *this are not synchronized. — end note]

jthread& operator=(jthread&& x) noexcept;

Effects: If joinable() is true, calls request_stop() and then join(). Assigns the state of x to *this and sets x to a default constructed state.

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the assignment. ssource has the value of x.ssource prior to the assignment and x.ssource.stop_possible() is false.

Returns: *this.

33.4.4.3 Members

void swap(jthread& x) noexcept;

Effects: Exchanges the values of *this and x.

[[nodiscard]] bool joinable() const noexcept;

Returns: get_id() != id().

void join();

Effects: Blocks until the thread represented by *this has completed.

Synchronization: The completion of the thread represented by *this synchronizes with (6.9.2) the corresponding successful join() return.

[Note 1: Operations on *this are not synchronized. — end note]

Postconditions: The thread represented by *this has completed. get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

(7.1) — resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::get_id().
(7.2) — no_such_process — if the thread is not valid.
(7.3) — invalid_argument — if the thread is not joinable.

void detach();

Effects: The thread represented by *this continues execution without the calling thread blocking. When detach() returns, *this no longer represents the possibly continuing thread of execution. When the thread previously represented by *this ends execution, the implementation releases any owned resources.

Postconditions: get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

(11.1) — no_such_process — if the thread is not valid.
(11.2) — invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if *this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this.

33.4.4.4 Stop token handling

[[nodiscard]] stop_source get_stop_source() noexcept;

Effects: Equivalent to: return ssource;
[[nodiscard]] stop_token get_stop_token() const noexcept;

Effects: Equivalent to: return ssource.get_token();

bool request_stop() noexcept;

Effects: Equivalent to: return ssource.request_stop();

33.4.4.5 Specialized algorithms

friend void swap(jthread& x, jthread& y) noexcept;

Effects: Equivalent to: x.swap(y).

33.4.4.6 Static members

[[nodiscard]] static unsigned int hardware_concurrency() noexcept;

Returns: thread::hardware_concurrency().

33.4.5 Namespace this_thread

namespace std::this_thread {
    thread::id get_id() noexcept;
    void yield() noexcept;
    template<class Clock, class Duration>
    void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
    void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}

thread::id this_thread::get_id() noexcept;

Returns: An object of type thread::id that uniquely identifies the current thread of execution. No other thread of execution has this id and this thread of execution always has this id. The object returned does not compare equal to a default constructed thread::id.

void this_thread::yield() noexcept;

Effects: Offers the implementation the opportunity to reschedule.

Synchronization: None.

template<class Clock, class Duration>
void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);

Effects: Blocks the calling thread for the absolute timeout (33.2.4) specified by abs_time.

Synchronization: None.

Throws: Timeout-related exceptions (33.2.4).

template<class Rep, class Period>
void sleep_for(const chrono::duration<Rep, Period>& rel_time);

Effects: Blocks the calling thread for the relative timeout (33.2.4) specified by rel_time.

Synchronization: None.

Throws: Timeout-related exceptions (33.2.4).

33.5 Atomic operations

33.5.1 General

Subclause 33.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

33.5.2 Header <atomic> synopsis

namespace std {
    // 33.5.4, order and consistency
    enum class memory_order : unspecified;
}
template<class T>
    T kill_dependency(T y) noexcept;

### 33.5.3 Type aliases

The type aliases `atomic_int N_t`, `atomic_uint N_t`, `atomic_intptr_t`, and `atomic_uintptr_t` are defined if and only if `int N_t`, `uint N_t`, `intptr_t`, and `uintptr_t` are defined, respectively.

The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is true.

[Note 1: These aliases are optional in freestanding implementations (16.4.2.4). — end note]

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (33.5.6) are most efficient.

### 33.5.4 Order and consistency

```
namespace std {
  enum class memory_order : unspecified {
    relaxed, consume, acquire, release, acq_rel, seq_cst
  };
  inline constexpr memory_order memory_order_relaxed = memory_order::relaxed;
  inline constexpr memory_order memory_order_consume = memory_order::consume;
  inline constexpr memory_order memory_order_acquire = memory_order::acquire;
  inline constexpr memory_order memory_order_release = memory_order::release;
  inline constexpr memory_order memory_order_acq_rel = memory_order::acq_rel;
  inline constexpr memory_order memory_order_seq_cst = memory_order::seq_cst;
}
```

The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

1. `memory_order::relaxed`: no operation orders memory.
2. `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
3. `memory_order::consume`: a load operation performs a consume operation on the affected memory location.
   
   [Note 1: Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration. — end note]
4. `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.
   
   [Note 2: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — end note]

An atomic operation `A` that performs a release operation on an atomic object `M` synchronizes with an atomic operation `B` that performs an acquire operation on `M` and takes its value from any side effect in the release sequence headed by `A`.

An atomic operation `A` on some atomic object `M` is coherence-ordered before another atomic operation `B` on `M` if

1. `A` is a modification, and `B` reads the value stored by `A`, or
2. `A` precedes `B` in the modification order of `M`, or
3. `A` and `B` are not the same atomic read-modify-write operation, and there exists an atomic modification `X` of `M` such that `A` reads the value stored by `X` and `X` precedes `B` in the modification order of `M`, or
4. there exists an atomic modification `X` of `M` such that `A` is coherence-ordered before `X` and `X` is coherence-ordered before `B`.

There is a single total order `S` on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if `A` and `B` are `memory_order::seq_cst` operations and `A` strongly happens before `B`, then `A` precedes `B` in `S`. Second, for every pair of atomic operations `A` and `B` on an object `M`, where `A` is coherence-ordered before `B`, the following four conditions are required to be satisfied by `S`:
— if \( A \) and \( B \) are both `memory_order::seq_cst` operations, then \( A \) precedes \( B \) in \( S \); and

— if \( A \) is a `memory_order::seq_cst` operation and \( B \) happens before a `memory_order::seq_cst` fence \( Y \), then \( A \) precedes \( Y \) in \( S \); and

— if a `memory_order::seq_cst` fence \( X \) happens before \( A \) and \( B \) is a `memory_order::seq_cst` operation, then \( X \) precedes \( B \) in \( S \); and

— if a `memory_order::seq_cst` fence \( X \) happens before \( A \) and \( B \) happens before a `memory_order::seq_cst` fence \( Y \), then \( X \) precedes \( Y \) in \( S \).

\[ \text{Note 3: This definition ensures that } S \text{ is consistent with the modification order of any atomic object } M. \text{ It also ensures that a `memory_order::seq_cst` load } A \text{ of } M \text{ gets its value either from the last modification of } M \text{ that precedes } A \text{ in } S \text{ or from some non-`memory_order::seq_cst` modification of } M \text{ that does not happen before any modification of } M \text{ that precedes } A \text{ in } S. \quad \text{—end note} \]

\[ \text{Note 4: We do not require that } S \text{ be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. —end note} \]

\[ \text{Note 5: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. —end note} \]

Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

\[ \text{Note 6: For example, with } x \text{ and } y \text{ initially zero,} \]

```
// Thread 1:
r1 = y.load(memory_order::relaxed);
x.store(r1, memory_order::relaxed);
// Thread 2:
r2 = x.load(memory_order::relaxed);
y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing \( r1 == r2 == 42 \), since the store of 42 to \( y \) is only possible if the store to \( x \) stores 42, which circularly depends on the store to \( y \) storing 42. Note that without this restriction, such an execution is possible. —end note]

\[ \text{Note 7: The recommendation similarly disallows } r1 == r2 == 42 \text{ in the following example, with } x \text{ and } y \text{ again initially zero:} \]

```
// Thread 1:
r1 = x.load(memory_order::relaxed);
if (r1 == 42) y.store(42, memory_order::relaxed);
// Thread 2:
r2 = y.load(memory_order::relaxed);
if (r2 == 42) x.store(42, memory_order::relaxed);
```

— end note]

Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```
template<class T>
T kill_dependency(T y) noexcept;
```

\[ \text{Effects: The argument does not carry a dependency to the return value (6.9.2).} \]

\[ \text{Returns: } y. \]

33.5.5 Lock-free property

```c
#define ATOMIC_BOOL_LOCK_FREE unspecified
#define ATOMIC_CHAR_LOCK_FREE unspecified
#define ATOMIC_CHAR8_T_LOCK_FREE unspecified
#define ATOMIC_CHAR16_T_LOCK_FREE unspecified
#define ATOMIC_CHAR32_T_LOCK_FREE unspecified
#define ATOMIC_WCHAR_T_LOCK_FREE unspecified
```
The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

At least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.

>Note 1: This requirement is optional in freestanding implementations (16.4.2.4). — end note

The functions `atomic<T>::is_lock_free` and `atomic_is_lock_free` indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.

Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).

>Recommended practice: Operations that are lock-free should also be address-free. The implementation of these operations should not depend on any per-process state.

>Note 2: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — end note

### 33.5.6 Waiting and notifying

Atomic waiting operations and atomic notifying operations provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function’s effects.

>Note 1: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — end note

>Note 2: The following functions are atomic waiting operations:

(2.1) — `atomic<T>::wait`,

(2.2) — `atomic_flag::wait`,

(2.3) — `atomic_wait` and `atomic_wait_explicit`,

(2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and

(2.5) — `atomic_ref<T>::wait`.

— end note

>Note 3: The following functions are atomic notifying operations:

(3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`,

(3.2) — `atomic_flag::notify_one` and `atomic_flag::notify_all`,

(3.3) — `atomic_notify_one` and `atomic_notify_all`,

(3.4) — `atomic_flag_notify_one` and `atomic_flag_notify_all`, and

(3.5) — `atomic_ref<T>::notify_one` and `atomic_ref<T>::notify_all`.

— end note

A call to an atomic waiting operation on an atomic object `M` is `eligible to be unblocked` by a call to an atomic notifying operation on `M` if there exist side effects `X` and `Y` on `M` such that:

(4.1) — the atomic waiting operation has blocked after observing the result of `X`,

(4.2) — `X` precedes `Y` in the modification order of `M`, and

(4.3) — `Y` happens before the call to the atomic notifying operation.

---

313) That is, atomic operations on the same memory location via two different addresses will communicate atomically.
33.5.7 Class template atomic_ref

33.5.7.1 General

namespace std {
    template<class T> struct atomic_ref {
        private:
            T* ptr; // exposition only
        public:
            using value_type = T;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(T, memory_order = memory_order::seq_cst) const noexcept;
            T operator=(T) const noexcept;
            T load(memory_order = memory_order::seq_cst) const noexcept;
            operator T() const noexcept;
            T exchange(T, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T&, T, memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T&, T, memory_order, memory_order) const noexcept;
            void wait(T, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
}

1 An atomic_ref object applies atomic operations (33.5.1) to the object referenced by *ptr such that, for the lifetime (6.7.3) of the atomic_ref object, the object referenced by *ptr is an atomic object (6.9.2.2).

2 The program is ill-formed if is_trivially_copyable_v<T> is false.

3 The lifetime (6.7.3) of an object referenced by *ptr shall exceed the lifetime of all atomic_ref objects that reference the object. While any atomic_ref instances exist that reference the *ptr object, all accesses to that object shall exclusively occur through those atomic_ref instances. No subobject of the object referenced by atomic_ref shall be concurrently referenced by any other atomic_ref object.

4 Atomic operations applied to an object through a referencing atomic_ref are atomic with respect to atomic operations applied through any other atomic_ref referencing the same object.

[Note 1: Atomic operations or the atomic_ref constructor can acquire a shared resource, such as a lock associated with the referenced object, to enable atomic operations to be applied to the referenced object. — end note]

33.5.7.2 Operations

static constexpr size_t required_alignment;

1 The alignment required for an object to be referenced by an atomic reference, which is at least alignof(T).

2 [Note 1: Hardware could require an object referenced by an atomic_ref to have stricter alignment (6.7.6) than other objects of type T. Further, whether operations on an atomic_ref are lock-free could depend on the alignment of the referenced object. For example, lock-free operations on std::complex<double> could be supported only if aligned to 2*alignof(double). — end note]
static constexpr bool is_always_lock_free;

The static data member is_always_lock_free is true if the atomic_ref type’s operations are always lock-free, and false otherwise.

bool is_lock_free() const noexcept;

Returns: true if operations on all objects of the type atomic_ref<T> are lock-free, false otherwise.

atomic_ref(T& obj);

Preconditions: The referenced object is aligned to required_alignment.

Postconditions: *this references obj.

Throws: Nothing.

atomic_ref(const atomic_ref&amp; ref) noexcept;

Postconditions: *this refers to the object referenced by ref.

void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

Effects: Atomically replaces the value referenced by *ptr with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) const noexcept;

Effects: Equivalent to:

store(desired);
return desired;

T load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns the value referenced by *ptr.

operator T() const noexcept;

Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with desired. Memory is affected according to the value of order. This operation is an atomic read-modify-write operation (6.9.2).

Returns: Atomically returns the value referenced by *ptr immediately before the effects.

bool compare_exchange_weak(T&amp; expected, T desired,
memory_order success, memory_order failure) const noexcept;

bool compare_exchange_strong(T&amp; expected, T desired,
memory_order success, memory_order failure) const noexcept;

bool compare_exchange_weak(T&amp; expected, T desired,
memory_order order = memory_order::seq_cst) const noexcept;

bool compare_exchange_strong(T&amp; expected, T desired,
memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Retrieves the value in expected. It then atomically compares the value represented by *ptr for equality with that previously retrieved from expected, and if true, replaces the value referenced by *ptr with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected.
according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value read from the value referenced by *ptr during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2.2) on the value referenced by *ptr. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and ptr are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. —end note]

```cpp
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

(23.1) — Evaluates load(order) and compares its value representation for equality against that of old.

(23.2) — If they compare unequal, returns.

(23.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: This function is an atomic waiting operation (33.5.6) on atomic object *ptr.

```cpp
void notify_one() const noexcept;
```

Effects: Unblocks the execution of at least one atomic waiting operation on *ptr that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6) on atomic object *ptr.

```cpp
void notify_all() const noexcept;
```

Effects: Unblocks the execution of all atomic waiting operations on *ptr that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6) on atomic object *ptr.

33.5.7.3 Specializations for integral types

There are specializations of the atomic_ref class template for the integral types char, signed char, unsigned char, short, unsigned short, int, unsigned int, long, unsigned long, long long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header <cstdint> (17.4.2). For each such type integral, the specialization atomic_ref<integral> provides additional atomic operations appropriate to integral types.

[Note 1: The specialization atomic_ref<bool> uses the primary template (33.5.7). —end note]

```cpp
namespace std {
    template<> struct atomic_ref<integral> {
        private:
            integral* ptr; // exposition only
        public:
            using value_type = integral;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;

            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
    };
}
```
explicit atomic_ref(integral&);
atomic_ref(const atomic_ref&) noexcept;
atomic_ref& operator=(const atomic_ref&) = delete;

void store(integral, memory_order = memory_order::seq_cst) const noexcept;
integral operator=(integral) const noexcept;
integral load(memory_order = memory_order::seq_cst) const noexcept;
operator integral() const noexcept;

integral exchange(integral,
    memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_weak(integral&, integral,
    memory_order, memory_order) const noexcept;
bool compare_exchange_strong(integral&, integral,
    memory_order, memory_order) const noexcept;
bool compare_exchange_weak(integral&, integral,
    memory_order = memory_order::seq_cst) const noexcept;
bool compare_exchange_strong(integral&, integral,
    memory_order = memory_order::seq_cst) const noexcept;

integral fetch_add(integral,
    memory_order = memory_order::seq_cst) const noexcept;
integral fetch_sub(integral,
    memory_order = memory_order::seq_cst) const noexcept;
integral fetch_and(integral,
    memory_order = memory_order::seq_cst) const noexcept;
integral fetch_or(integral,
    memory_order = memory_order::seq_cst) const noexcept;
integral fetch_xor(integral,
    memory_order = memory_order::seq_cst) const noexcept;

integral operator++(int) const noexcept;
integral operator--(int) const noexcept;
integral operator++() const noexcept;
integral operator--() const noexcept;
integral operator+=(integral) const noexcept;
integral operator-=(integral) const noexcept;
integral operator&=(integral) const noexcept;
integral operator|=(integral) const noexcept;
integral operator^=(integral) const noexcept;

void wait(integral, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};

2 Descriptions are provided below only for members that differ from the primary template.
3 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 141.

integral fetch_key(integral operand, memory_order_order = memory_order::seq_cst) const noexcept;

4 Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.2).
5 Returns: Atomically, the value referenced by *ptr immediately before the effects.
6 Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]
integral operator \( \text{op}=(\text{integral operand}) \) const noexcept;

\[\text{Effects: Equivalent to: return } \text{fetch_key(operand)} \text{ op operand;}\]

### 33.5.7.4 Specializations for floating-point types

There are specializations of the `atomic_ref` class template for the floating-point types `float`, `double`, and `long double`. For each such type `floating-point`, the specialization `atomic_ref<floating-point>` provides additional atomic operations appropriate to floating-point types.

```cpp
namespace std {
  template<> struct atomic_ref<floating-point> {
    private:
      floating-point* ptr; // exposition only
    public:
      using value_type = floating-point;
      using difference_type = value_type;
      static constexpr size_t required_alignment = implementation-defined;
      static constexpr bool is_always_lock_free = implementation-defined;
      bool is_lock_free() const noexcept;
      explicit atomic_ref(floating-point&);
      atomic_ref(const atomic_ref&) noexcept;
      atomic_ref& operator=(const atomic_ref&) = delete;
      void store(floating-point, memory_order = memory_order::seq_cst) const noexcept;
      floating-point operator=(floating-point) const noexcept;
      floating-point load(memory_order = memory_order::seq_cst) const noexcept;
      operator floating-point() const noexcept;
      floating-point exchange(floating-point,
        memory_order = memory_order::seq_cst) const noexcept;
      bool compare_exchange_weak(floating-point&, floating-point,
        memory_order, memory_order) const noexcept;
      bool compare_exchange_strong(floating-point&, floating-point,
        memory_order, memory_order) const noexcept;
      bool compare_exchange_weak(floating-point&, floating-point,
        memory_order = memory_order::seq_cst) const noexcept;
      bool compare_exchange_strong(floating-point&, floating-point,
        memory_order = memory_order::seq_cst) const noexcept;
      floating-point fetch_add(floating-point,
        memory_order = memory_order::seq_cst) const noexcept;
      floating-point fetch_sub(floating-point,
        memory_order = memory_order::seq_cst) const noexcept;
      floating-point operator+=(floating-point) const noexcept;
      floating-point operator-=(floating-point) const noexcept;
      void wait(floating-point, memory_order = memory_order::seq_cst) const noexcept;
      void notify_one() const noexcept;
      void notify_all() const noexcept;
  };
}
```

2 Descriptions are provided below only for members that differ from the primary template.

3 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 141.

```cpp
floating-point fetch_key(floating-point operand,
  memory_order = memory_order::seq_cst) const noexcept;
```

4 \[\text{Effects: Atomically replaces the value referenced by } \ast \text{ptr} \text{ with the result of the computation applied to the value referenced by } \ast \text{ptr} \text{ and the given operand. Memory is affected according to the value of } \text{order}. \text{ These operations are atomic read-modify-write operations (6.9.2.2).}\]
Returns: Atomically, the value referenced by \(*ptr\) immediately before the effects.

Remarks: If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the \texttt{std::numeric\_limits<floating-point>} traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point may be different than the calling thread's floating-point environment.

\texttt{floating-point} operator \texttt{op}(\texttt{floating-point}\ operand) const noexcept;

Effects: Equivalent to: return \texttt{fetch\_key}\ (operand) \texttt{op} operand;

33.5.7.5 Partial specialization for pointers

```
namespace std {
    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr; // exposition only
        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T*);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(T*, memory_order = memory_order::seq_cst) const noexcept;
            T* operator=(T*) const noexcept;
            T* load(memory_order = memory_order::seq_cst) const noexcept;
            operator T*() const noexcept;
            T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T*, T*,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T*, T*,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T*, T*,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T*, T*,
                memory_order = memory_order::seq_cst) const noexcept;
            T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
            T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;
            T* operator++(int) const noexcept;
            T* operator--(int) const noexcept;
            T* operator++() const noexcept;
            T* operator--() const noexcept;
            void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
```

1 Descriptions are provided below only for members that differ from the primary template.

2 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 142.
T* fetch_key(difference_type operand, memory_order order = memory_order::seq_cst) const noexcept;

Mandates: T is a complete object type.

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.2).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(difference_type operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

value_type operator++(int) const noexcept;

Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) const noexcept;

Effects: Equivalent to: return fetch_sub(1);

value_type operator++() const noexcept;

Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() const noexcept;

Effects: Equivalent to: return fetch_sub(1) - 1;

33.5.8 Class template atomic [atomics.types.generic]

33.5.8.1 General [atomics.types.generic.general]

namespace std {
    template<class T> struct atomic {
        using value_type = T;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
    // 33.5.8.2, operations on atomic types
        constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
        constexpr atomic(T) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
    T load(memory_order = memory_order::seq_cst) const volatile noexcept;
    T load(memory_order = memory_order::seq_cst) const noexcept;
    operator T() const volatile noexcept;
    operator T() const noexcept;
    void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
    void store(T, memory_order = memory_order::seq_cst) noexcept;
    T operator=(T) volatile noexcept;
    T operator=(T) noexcept;
    T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
    T exchange(T, memory_order = memory_order::seq_cst) noexcept;
    bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
    bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
    bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
    bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
    bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
    bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;

§ 33.5.8.1
bool compare_exchange_strong(T& t, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& t, T, memory_order = memory_order::seq_cst) noexcept;

void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

1 The template argument for T shall meet the Cpp17CopyConstructible and Cpp17CopyAssignable requirements.
The program is ill-formed if any of

(1.1) — is_trivially_copyable_v<T>,
(1.2) — is_copy_constructible_v<T>,
(1.3) — is_move_constructible_v<T>,
(1.4) — is_copy_assignable_v<T>, or
(1.5) — is_move_assignable_v<T>

is false.

[Note 1: Type arguments that are not also statically initializable can be difficult to use. — end note]

2 The specialization atomic<bool> is a standard-layout struct.

3 [Note 2: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]

33.5.8.2 Operations on atomic types

constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);  
1 Mandates: is_default_constructible_v<T> is true.

constexpr atomic(T desired) noexcept;
2 Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

static constexpr bool is_always_lock_free = implementation-defined;
4 The static data member is_always_lock_free is true if the atomic type’s operations are always lock-free, and false otherwise.

[Note 2: The value of is_always_lock_free is consistent with the value of the corresponding ATOMIC_...-_LOCK_FREE macro, if defined. — end note]

bool is_lock_free() const volatile noexcept;
5 Returns: true if the object’s operations are lock-free, false otherwise.

[Note 3: The return value of the is_lock_free member function is consistent with the value of is_always_lock_free for the same type. — end note]

void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
6 Constraints: For the volatile overload of this function, is_always_lock_free is true.

Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.
Effects: Atomically replaces the value pointed to by this with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to store(desired).

Returns: desired.

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns the value pointed to by this.

operator T() const volatile noexcept;
operator T() const noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Atomically replaces the value pointed to by this with desired. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically returns the value pointed to by this immediately before the effects.

bool compare_exchange_weak(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Retrieves the value in expected. It then atomically compares the value representation of the value pointed to by this for equality with that previously retrieved from expected, and if true, replaces the value pointed to by this with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value pointed to by this during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2).
operations (6.9.2) on the memory pointed to by this. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

[Note 4: For example, the effect of compare_exchange_strong on objects without padding bits (6.8.1) is]

```c
if (memcmp(this, &expected, sizeof(*this)) == 0)
    memcpy(this, &desired, sizeof(*this));
else
    memcpy(&expected, this, sizeof(*this));
```

—end note]

[Example 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update expected when another iteration of the loop is needed.]

```c
expected = current.load();
do {
    desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
```

—end example]

[Example 2: Because the expected value is updated only on failure, code releasing the memory containing the expected value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:]

```c
do {
    p->next = head; // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert
```

—end example]

Implementations should ensure that weak compare-and-exchange operations do not consistently return false unless either the atomic object has value different from expected or there are concurrent modifications to the atomic object.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and this are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 5: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. —end note]

[Note 6: Under cases where the memcpy and memcmp semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with operator== if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point -0.0 and +0.0 will not compare equal with memcmp but will compare equal with operator==, and NaNs with the same payload will compare equal with memcmp but will not compare equal with operator==. —end note]

[Note 7: Because compare-and-exchange acts on an object’s value representation, padding bits that never participate in the object’s value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:]

```c
struct padded {
    char clank = 0x42;
    // Padding here.
    unsigned biff = 0xC0DEFEFE;
};
atomic<padded> pad = {};

bool zap() {
    padded expected, desired({0, 0});
    return pad.compare_exchange_strong(expected, desired);
}
```

—end note]
[Note 8: For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

```c
union pony {
    double celestia = 0.;
    short luna;  // padded
};
atomic<pony> princesses = {};

bool party(pony desired) {
    pony expected;
    return princesses.compare_exchange_strong(expected, desired);
}
```

—end note]

```c
void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;
```

29  **Preconditions:** order is neither `memory_order::release` nor `memory_order::acq_rel`.

30  **Effects:** Repeatedly performs the following steps, in order:

1. Evaluates `load(order)` and compares its value representation for equality against that of `old`.
2. If they compare unequal, returns.
3. Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

31  **Remarks:** This function is an atomic waiting operation (33.5.6).

```c
void notify_one() volatile noexcept;
void notify_one() noexcept;
```

32  **Effects:** Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

33  **Remarks:** This function is an atomic notifying operation (33.5.6).

```c
void notify_all() volatile noexcept;
void notify_all() noexcept;
```

34  **Effects:** Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

35  **Remarks:** This function is an atomic notifying operation (33.5.6).

### 33.5.8.3 Specializations for integers

There are specializations of the `atomic` class template for the integral types `char`, `signed char`, `unsigned char`, `short`, `unsigned short`, `int`, `unsigned int`, `long`, `unsigned long`, `long long`, `char8_t`, `char16_t`, `char32_t`, `wchar_t`, and any other types needed by the typedefs in the header `<cstdint>` (17.4.2). For each such type `integral`, the specialization `atomic<integral>` provides additional atomic operations appropriate to integral types.

[Note 1: The specialization `atomic<bool>` uses the primary template (33.5.8).]
atomic\& operator=(const atomic\&) volatile = delete;

void store(integral, memory_order = memory_order::seq_cst) volatile noexcept;
void store(integral, memory_order = memory_order::seq_cst) noexcept;
integral operator=(integral) volatile noexcept;

integral fetch_sub(integral, memory_order = memory_order::seq_cst) noexcept;
integral fetch_and(integral, memory_order = memory_order::seq_cst) volatile noexcept;
integral fetch_and(integral, memory_order = memory_order::seq_cst) noexcept;
integral fetch_or(integral, memory_order = memory_order::seq_cst) volatile noexcept;
integral fetch_or(integral, memory_order = memory_order::seq_cst) noexcept;
integral fetch_xor(integral, memory_order = memory_order::seq_cst) volatile noexcept;
integral fetch_xor(integral, memory_order = memory_order::seq_cst) noexcept;

integral operator++(int) volatile noexcept;
integral operator++(int) noexcept;
integral operator--(int) volatile noexcept;
integral operator--(int) noexcept;
integral operator++() volatile noexcept;
integral operator++() noexcept;
integral operator--() volatile noexcept;
integral operator--() noexcept;
integral operator+=(integral) volatile noexcept;
integral operator+=(integral) noexcept;
integral operator-=(integral) volatile noexcept;
integral operator-=(integral) noexcept;
integral operator&=(integral) volatile noexcept;
integral operator&=(integral) noexcept;
integral operator|=(integral) volatile noexcept;
integral operator|=(integral) noexcept;
integral operator^=(integral) volatile noexcept;
integral operator^=(integral) noexcept;

void wait(integral, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(integral, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
The atomic integral specializations are standard-layout structs. They each have a trivial destructor. Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 141.

<table>
<thead>
<tr>
<th>key</th>

</tbody>
</table>

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order_order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value pointed to by this immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return fetch_key(operand) op operand;

### Specializations for floating-point types

There are specializations of the atomic class template for the floating-point types float, double, and long double. For each such type floating-point, the specialization atomic<floating-point> provides additional atomic operations appropriate to floating-point types.

namespace std {
    template<>
    struct atomic<floating-point> {
        using value_type = floating-point;
        using difference_type = value_type;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
        constexpr atomic() noexcept;
        constexpr atomic(floating-point) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(floating-point, memory_order order = memory_order::seq_cst) volatile noexcept;
        void store(floating-point, memory_order order = memory_order::seq_cst) noexcept;
        floating-point operator=(floating-point) volatile noexcept;
        floating-point operator=(floating-point) noexcept;
    }
}

§ 33.5.8.4
The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.

Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in Table 141.

\[ T \text{ fetch}_{-}\text{key}(T \text{ operand}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ T \text{ fetch}_{-}\text{key}(T \text{ operand}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ exchange}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ exchange}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{weak}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{weak}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{strong}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{strong}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{weak}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{weak}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{strong}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{bool compare}_{-}\text{exchange}_{-}\text{strong}(\text{volatile float}_{-}\text{ing-point}, \text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ fetch}_{-}\text{add}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ fetch}_{-}\text{add}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ fetch}_{-}\text{sub}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ fetch}_{-}\text{sub}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ operator}+=\text{(volatile float}_{-}\text{ing-point}) \text{ volatile noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ operator}+=\text{(volatile float}_{-}\text{ing-point}) \text{ noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ operator}-=\text{(volatile float}_{-}\text{ing-point}) \text{ volatile noexcept}; \]

\[ \text{volatile float}_{-}\text{ing-point} \text{ operator}-=\text{(volatile float}_{-}\text{ing-point}) \text{ noexcept}; \]

\[ \text{void wait}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ const volatile noexcept}; \]

\[ \text{void wait}(\text{volatile float}_{-}\text{ing-point}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ const noexcept}; \]

\[ \text{void notify}_{-}\text{one()} \text{ volatile noexcept}; \]

\[ \text{void notify}_{-}\text{one()} \text{ noexcept}; \]

\[ \text{void notify}_{-}\text{all()} \text{ volatile noexcept}; \]

\[ \text{void notify}_{-}\text{all()} \text{ noexcept}; \]

\};

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.

3 Descriptions are provided below only for members that differ from the primary template.

4 The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in Table 141.

\[ \text{T fetch}_{-}\text{key}(\text{T operand}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ volatile noexcept}; \]

\[ \text{T fetch}_{-}\text{key}(\text{T operand}, \text{memory_order} = \text{memory_order::seq_cst}) \text{ noexcept}; \]

5 Constraints: For the volatile overload of this function, is_always_lock_free is true.

6 Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

7 Returns: Atomically, the value pointed to by this immediately before the effects.
Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point` should conform to the `std::numeric_limits` traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on `floating-point` may be different than the calling thread’s floating-point environment.

```cpp
T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;
```

Constraints: For the `volatile` overload of this function, `is_always_lock_free` is true.

Effects: Equivalent to: `return fetch_key(operand) op operand;`

Remarks: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point` should conform to the `std::numeric_limits` traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on `floating-point` may be different than the calling thread’s floating-point environment.

### 33.5.8.5 Partial specialization for pointers

[atomics.types.pointer]

```cpp
namespace std {
    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(T*) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(T*, memory_order = memory_order::seq_cst) noexcept;
        T* operator=(T*) volatile noexcept;
        T* operator=(T*) noexcept;
        T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T* load(memory_order = memory_order::seq_cst) const noexcept;
        operator T*() const volatile noexcept;
        operator T*() const noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(T*& T, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(T*& T, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(T*& T, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(T*& T, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_weak(T*& T, T*, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_weak(T*& T, T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(T*& T, T*, memory_order = memory_order::seq_cst) volatile noexcept;
        bool compare_exchange_strong(T*& T, T*, memory_order = memory_order::seq_cst) noexcept;
        T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
        T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
        T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
        T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
    }
}
```
T* operator++(int) volatile noexcept;
T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
T* operator++() volatile noexcept;
T* operator++() noexcept;
T* operator--() volatile noexcept;
T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
T* operator-=(ptrdiff_t) noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;

There is a partial specialization of the atomic class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.

Descriptions are provided below only for members that differ from the primary template.

The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in Table 142.

T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Mandates: T is a complete object type.

[Note 1: Pointer arithmetic onvoid* or function pointers is ill-formed. — end note]
Effects: Atomically replaces the value pointed to bythis with the result of the computation applied to the value pointed to bythis and the givenoperand. Memory is affected according to the value oforder. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value pointed to bythis immediately before the effects.
Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.8.6 Member operators common to integers and pointers to objects[atomics.types.memop]

value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_add(1);
value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return fetch_sub(1);

value_type operator++() volatile noexcept;
value_type operator++() noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() volatile noexcept;
value_type operator--() noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return fetch_sub(1) - 1;

33.5.8.7 Partial specializations for smart pointers

33.5.8.7.1 General

The library provides partial specializations of the atomic template for shared-ownership smart pointers (20.3.2).

[Note 1: The partial specializations are declared in header <memory> (20.2.2). — end note]

The behavior of all operations is as specified in 33.5.8, unless specified otherwise. The template parameter T of these partial specializations may be an incomplete type.

All changes to an atomic smart pointer in 33.5.8.7, and all associated use_count increments, are guaranteed to be performed atomically. Associated use_count decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[Note 2: If the atomic operation uses locks, locks acquired by the implementation will be held when any use_count adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — end note]

[Example 1]

```cpp
template<typename T> class atomic_list {
    struct node {
        T t;
        shared_ptr<node> next;
    };
    atomic<shared_ptr<node>> head;

    public:
    auto find(T t) const {
        auto p = head.load();
        while (p && p->t != t)
            p = p->next;
        return shared_ptr<node>(move(p));
    }

    void push_front(T t) {
        auto p = make_shared<node>();
        p->t = t;
        p->next = head;
        while (!head.compare_exchange_weak(p->next, p)) {}
    }
};
```

—end example]
33.5.8.7.2 Partial specialization for `shared_ptr`

```cpp
namespace std {
    template<class T> struct atomic<shared_ptr<T>> {
        using value_type = shared_ptr<T>;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;
        constexpr atomic() noexcept;
        constexpr atomic(nullptr_t) noexcept : atomic() { }
        atomic(shared_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;
        shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator shared_ptr<T>() const noexcept;
        void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(shared_ptr<T> desired) noexcept;
        shared_ptr<T> exchange(shared_ptr<T> desired,
                               memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                     memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                       memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
                                     memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
                                       memory_order order = memory_order::seq_cst) noexcept;
        void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;
    }
}
```

1. **Effects**: Initializes `p`.
2. **Effects**: Initializes the object with the value `desired`. Initialization is not an atomic operation (6.9.2).
   [Note 1: It is possible to have an access to an atomic object `A` race with its construction, for example, by communicating the address of the just-constructed object `A` to another thread via `memory_order::relaxed` operations on a suitable atomic pointer variable, and then immediately accessing `A` in the receiving thread. This results in undefined behavior. — end note]
3. **Preconditions**: `order` is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.
4. **Effects**: Atomically replaces the value pointed to by this with the value of `desired` as if by `p.swap(desired)`. Memory is affected according to the value of `order`.
5. **Effects**: Equivalent to `store(desired)`.
6. **Preconditions**: `order` is neither `memory_order::release` nor `memory_order::acq_rel`.
7. **Effects**: Memory is affected according to the value of `order`. 

§ 33.5.8.7.2

1699
Returns: Atomically returns p.

operator shared_ptr<T>() const noexcept;

Effects: Equivalent to: return load();

shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.2).

Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
   memory_order success, memory_order failure) noexcept;

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
   memory_order success, memory_order failure) noexcept;

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
   memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

   return compare_exchange_weak(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
   memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

   return compare_exchange_strong(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

   (20.1) Evaluates load(order) and compares it to old.
   (20.2) If the two are not equivalent, returns.
   (20.3) Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).
void notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

void notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

33.5.8.7.3 Partial specialization for weak_ptr

namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;

        atomic() noexcept;
        atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;

        weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator weak_ptr<T>() const noexcept;
        void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(weak_ptr<T> desired) noexcept;

        weak_ptr<T> exchange(weak_ptr<T> desired,
                           memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                   memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                      memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                    memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                      memory_order order = memory_order::seq_cst) noexcept;

        void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;

        private:
        weak_ptr<T> p; // exposition only
    };
}

constexpr atomic() noexcept;

Effects: Initializes p{}.

atomic(weak_ptr<T> desired) noexcept;

Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]
void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Preconditions: order is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

Effects: Atomically replaces the value pointed to by this with the value of desired as if by p.swap(desired). Memory is affected according to the value of order.

void operator=(weak_ptr<T> desired) noexcept;

Effects: Equivalent to store(desired).

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns p.

operator weak_ptr<T>() const noexcept;

Effects: Equivalent to: return load();

weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.2).

Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order success, memory_order failure) noexcept;

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order success, memory_order failure) noexcept;

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two weak_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_weak(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_strong(expected, desired, order, fail_order);
where \texttt{fail\_order} is the same as \texttt{order} except that a value of \texttt{memory\_order::acq\_rel} shall be replaced by the value \texttt{memory\_order::acquire} and a value of \texttt{memory\_order::release} shall be replaced by the value \texttt{memory\_order::relaxed}.

```cpp
void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

\textbf{Preconditions:} \texttt{order} is neither \texttt{memory\_order::release} nor \texttt{memory\_order::acq\_rel}.

\textbf{Effects:} Repeatedly performs the following steps, in order:

- Evaluates \texttt{load(order)} and compares it to \texttt{old}.
- If the two are not equivalent, returns.
- Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

\textbf{Remarks:} Two \texttt{weak\_ptr} objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

```cpp
void notify_one() noexcept;
```

\textbf{Effects:} Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

\textbf{Remarks:} This function is an atomic notifying operation (33.5.6).

```cpp
void notify_all() noexcept;
```

\textbf{Effects:} Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

\textbf{Remarks:} This function is an atomic notifying operation (33.5.6).

### 33.5.9 Non-member functions

A non-member function template whose name matches the pattern \texttt{atomic\_f} or the pattern \texttt{atomic\_f\_}\texttt{-}\texttt{explicit} invokes the member function \texttt{f}, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type \texttt{atomic<T>::value\_type} is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

[Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

### 33.5.10 Flag type and operations

```cpp
namespace std {

struct atomic_flag {
    constexpr atomic_flag() noexcept;
    atomic_flag(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag& volatile) = delete;

    bool test(memory_order = memory_order::seq_cst) const volatile noexcept;
    bool test(memory_order = memory_order::seq_cst) const noexcept;
    bool test_and_set(memory_order = memory_order::seq_cst) volatile noexcept;
    bool test_and_set(memory_order = memory_order::seq_cst) noexcept;
    void clear(memory_order = memory_order::seq_cst) volatile noexcept;
    void clear(memory_order = memory_order::seq_cst) noexcept;
    void wait(bool, memory_order = memory_order::seq_cst) const volatile noexcept;
    void wait(bool, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    void notify_one() noexcept;
    void notify_all() volatile noexcept;
    void notify_all() noexcept;
};

}
```

\textbf{1} The \texttt{atomic\_flag} type provides the classic test-and-set functionality. It has two states, set and clear.

\textbf{2} Operations on an object of type \texttt{atomic\_flag} shall be lock-free. The operations should also be address-free.
3 The atomic_flag type is a standard-layout struct. It has a trivial destructor.

```cpp
constexpr atomic_flag::atomic_flag() noexcept;
```

4 Effects: Initializes *this to the clear state.

```cpp
bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;
```

5 For atomic_flag_test, let order be memory_order::seq_cst.

6 Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

7 Effects: Memory is affected according to the value of order.

8 Returns: Atomically returns the value pointed to by object or this.

```cpp
bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;
```

9 Effects: Atomically sets the value pointed to by object or by this to true. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

10 Returns: Atomically, the value of the object immediately before the effects.

```cpp
void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;
```

11 Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

12 Effects: Atomically sets the value pointed to by object or by this to false. Memory is affected according to the value of order.

```cpp
void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const noexcept;
```

13 For atomic_flag_wait, let order be memory_order::seq_cst. Let flag be object for the non-member functions and this for the member functions.

14 Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

15 Effects: Repeatedly performs the following steps, in order:

15.1 Evaluates flag->test(order) != old.

15.2 If the result of that evaluation is true, returns.

15.3 Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

16 Remarks: This function is an atomic waiting operation (33.5.6).
void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

33.5.11 Fences

This subclause introduces synchronization primitives called fences. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an acquire fence. A fence with release semantics is called a release fence.

A release fence $A$ synchronizes with an acquire fence $B$ if there exist atomic operations $X$ and $Y$, both operating on some atomic object $M$, such that $A$ is sequenced before $X$, $X$ modifies $M$, $Y$ is sequenced before $B$, and $Y$ reads the value written by $X$ or a value written by any side effect in the hypothetical release sequence $X$ would head if it were a release operation.

A release fence $A$ synchronizes with an atomic operation $B$ that performs an acquire operation on an atomic object $M$ if there exists an atomic operation $X$ such that $A$ is sequenced before $X$, $X$ modifies $M$, and $B$ reads the value written by $X$ or a value written by any side effect in the hypothetical release sequence $X$ would head if it were a release operation.

An atomic operation $A$ that is a release operation on an atomic object $M$ synchronizes with an acquire fence $B$ if there exists some atomic operation $X$ on $M$ such that $X$ is sequenced before $B$ and reads the value written by $A$ or a value written by any side effect in the release sequence $X$ headed by $A$.

extern "C" void atomic_thread_fence(memory_order order) noexcept;

Effects: Depending on the value of order, this operation:

1. has no effects, if order == memory_order::relaxed;
2. is an acquire fence, if order == memory_order::acquire or order == memory_order::consume;
3. is a release fence, if order == memory_order::release;
4. is both an acquire fence and a release fence, if order == memory_order::acq_rel;
5. is a sequentially consistent acquire and release fence, if order == memory_order::seq_cst.

extern "C" void atomic_signal_fence(memory_order order) noexcept;

Effects: Equivalent to atomic_thread_fence(order), except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

[Note 1: atomic_signal_fence can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with atomic_thread_fence, but the hardware fence instructions that atomic_thread_fence would have inserted are not emitted. — end note]

33.5.12 C compatibility

The header <stdatomic.h> provides the following definitions:

1 Each using-declaration for some name \( A \) in the synopsis above makes available the same entity as \( \text{std::}\!A \) declared in <atomic> (33.5.2). Each macro listed above other than _Atomic(T) is defined as in <atomic>. It is unspecified whether <stdatomic.h> makes available any declarations in namespace std.

2 Each of the using-declarations for int\(N\)_t, uint\(N\)_t, intptr_t, and uintptr_t listed above is defined if and only if the implementation defines the corresponding typedef-name in 33.5.2.

3 Neither the _Atomic macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than <stdatomic.h>.

4 Recommended practice: Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an _Atomic(T) from C code and an atomic<T> from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.

33.6 Mutual exclusion

33.6.1 General

1 Subclause 33.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

33.6.2 Header <mutex> synopsis

33.6.3 Header <shared_mutex> synopsis

namespace std {

// 33.6.4.4.2, class shared_mutex
class shared_mutex;
// 33.6.4.5.2, class shared_timed_mutex
class shared_timed_mutex;
// 33.6.5.5, class template shared_lock
template<class Mutex> class shared_lock;
template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;

} // namespace std

33.6.4 Mutex requirements

33.6.4.1 In general

A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (33.2.5). An execution agent owns a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.

33.6.4.2 Mutex types

The mutex types are the standard library types mutex, recursive_mutex, timed_mutex, recursive_timed_mutex, shared_mutex, and shared_timed_mutex. They meet the requirements set out in 33.6.4.2. In this description, m denotes an object of a mutex type.

[Note 1: The mutex types meet the Cpp17Lockable requirements (33.2.5.3). — end note]

The mutex types meet Cpp17DefaultConstructible and Cpp17Destructible. If initialization of an object of a mutex type fails, an exception of type system_error is thrown. The mutex types are neither copyable nor movable.

[Note 2: The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

(3.1) — resource_unavailable_try_again — if any native handle type manipulated is not available.
(3.2) — operation_not_permitted — if the thread does not have the privilege to perform the operation.
(3.3) — invalid_argument — if any native handle type manipulated as part of mutex construction is incorrect.
— end note]
The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appear to occur in a single total order.

[Note 2: This can be viewed as the modification order (6.9.2) of the mutex. — end note]

[Note 3: Construction and destruction of an object of a mutex type need not be thread-safe; other synchronization can be used to ensure that mutex objects are initialized and visible to other threads. — end note]

The expression `m.lock()` is well-formed and has the following semantics:

**Preconditions:** If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

**Effects:** Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.

**Synchronization:** Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

**Postconditions:** The calling thread owns the mutex.

**Return type:** `void`.

**Throws:** `system_error` when an exception is required (33.2.2).

**Error conditions:**

- `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

The expression `m.try_lock()` is well-formed and has the following semantics:

**Preconditions:** If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.

**Effects:** Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

[Note 4: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5). — end note]

An implementation should ensure that `try_lock()` does not consistently return `false` in the absence of contending mutex acquisitions.

**Synchronization:** If `try_lock()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

[Note 5: Since `lock()` does not synchronize with a failed subsequent `try_lock()`, the visibility rules are weak enough that little would be known about the state after a failure, even in the absence of spurious failures. — end note]

**Return type:** `bool`.

**Returns:** `true` if ownership was obtained, otherwise `false`.

**Throws:** Nothing.

The expression `m.unlock()` is well-formed and has the following semantics:

**Preconditions:** The calling thread owns the mutex.

**Effects:** Releases the calling thread’s ownership of the mutex.

**Return type:** `void`.

**Synchronization:** This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.

**Throws:** Nothing.

### 33.6.4.2.2 Class mutex

```cpp
namespace std {
    class mutex {
        public:
            constexpr mutex() noexcept;
            ~mutex();
    }
}
```
mutex(const mutex&) = delete;
mutex& operator=(const mutex&) = delete;

void lock();
bool try_lock();
void unlock();

using native_handle_type = implementation-defined; // see 33.2.3
native_handle_type native_handle(); // see 33.2.3
};

1 The class mutex provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for try_lock()) or block (for lock()) until the owning thread has released ownership with a call to unlock().

[Note 1: After a thread A has called unlock(), releasing a mutex, it is possible for another thread B to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread A appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread A doesn’t access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. — end note]

2 The class mutex meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).

3 Note 2: A program can deadlock if the thread that owns a mutex object calls lock() on that object. If the implementation can detect the deadlock, a resource_deadlock_would_occur error condition might be observed. — end note]

4 The behavior of a program is undefined if it destroys a mutex object owned by any thread or a thread terminates while owning a mutex object.

33.6.4.2.3 Class recursive_mutex

namespace std {
    class recursive_mutex {
    public:
        recursive_mutex();
        ~recursive_mutex();

        recursive_mutex(const recursive_mutex&) = delete;
        recursive_mutex& operator=(const recursive_mutex&) = delete;

        void lock();
        bool try_lock() noexcept;
        void unlock();

        using native_handle_type = implementation-defined; // see 33.2.3
        native_handle_type native_handle(); // see 33.2.3
    };
}

1 The class recursive_mutex provides a recursive mutex with exclusive ownership semantics. If one thread owns a recursive_mutex object, attempts by another thread to acquire ownership of that object will fail (for try_lock()) or block (for lock()) until the first thread has completely released ownership.

2 The class recursive_mutex meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).

3 A thread that owns a recursive_mutex object may acquire additional levels of ownership by calling lock() or try_lock() on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a recursive_mutex object, additional calls to try_lock() fail, and additional calls to lock() throw an exception of type system_error. A thread shall call unlock() once for each level of ownership acquired by calls to lock() and try_lock(). Only when all levels of ownership have been released may ownership be acquired by another thread.

4 The behavior of a program is undefined if:

   (4.1) it destroys a recursive_mutex object owned by any thread or
   (4.2) a thread terminates while owning a recursive_mutex object.
33.6.4.3 Timed mutex types

33.6.4.3.1 General

The **timed mutex types** are the standard library types `timed_mutex`, `recursive_timed_mutex`, and `shared_timed_mutex`. They meet the requirements set out below. In this description, `m` denotes an object of a mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

[Note 1: The timed mutex types meet the `Cpp17TimedLockable` requirements (33.2.5.4). — end note]

The expression `m.try_lock_for(rel_time)` is well-formed and has the following semantics:

3. **Preconditions:** If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

4. **Effects:** The function attempts to obtain ownership of the mutex within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns within the timeout specified by `rel_time` only if it has obtained ownership of the mutex object.

[Note 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

5. **Synchronization:** If `try_lock_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

6. **Return type:** `bool`.

7. **Returns:** `true` if ownership was obtained, otherwise `false`.

8. **Throws:** Timeout-related exceptions (33.2.4).

The expression `m.try_lock_until(abs_time)` is well-formed and has the following semantics:

9. **Preconditions:** If `m` is of type `timed_mutex` or `shared_timed_mutex`, the calling thread does not own the mutex.

10. **Effects:** The function attempts to obtain ownership of the mutex. If `abs_time` has already passed, the function attempts to obtain ownership without blocking (as if by calling `try_lock()`). The function returns before the absolute timeout (33.2.4) specified by `abs_time` only if it has obtained ownership of the mutex object.

[Note 3: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

11. **Synchronization:** If `try_lock_until()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.

12. **Return type:** `bool`.

13. **Returns:** `true` if ownership was obtained, otherwise `false`.

14. **Throws:** Timeout-related exceptions (33.2.4).

33.6.4.3.2 Class `timed_mutex`

```
namespace std {
    class timed_mutex {
        public:
            timed_mutex();  // blocking
            ~timed_mutex();
            timed_mutex(const timed_mutex&) = delete;
            timed_mutex& operator=(const timed_mutex&) = delete;
            void lock();    // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
                void unlock();
    }
```
The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

The class `timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

The behavior of a program is undefined if:

1. it destroys a `timed_mutex` object owned by any thread,
2. a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
3. a thread terminates while owning a `timed_mutex` object.

### 33.6.4.3.3 Class `recursive_timed_mutex`

```cpp
namespace std {
    class recursive_timed_mutex {
        public:
            recursive_timed_mutex();
            ~recursive_timed_mutex();
            recursive_timed_mutex(const recursive_timed_mutex&) = delete;
            recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;

            void lock(); // blocking
            bool try_lock() noexcept;
            template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            using native_handle_type = implementation-defined; // see 33.2.3
            native_handle_type native_handle(); // see 33.2.3
        }
    }
}
```

The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has completely released ownership or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

The class `recursive_timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

A thread that owns a `recursive_timed_mutex` object may acquire additional levels of ownership by calling `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a `recursive_timed_mutex` object, additional calls to `try_lock()`, `try_lock_for()`, or `try_lock_until()` fail, and additional calls to `lock()` throw an exception of type `system_error`. A thread shall call `unlock()` once for each level of ownership acquired by calls to `lock()`, `try_lock()`, `try_lock_for()`, and `try_lock_until()`. Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

The behavior of a program is undefined if:

1. it destroys a `recursive_timed_mutex` object owned by any thread, or
— a thread terminates while owning a `recursive_timed_mutex` object.

### 33.6.4.4 Shared mutex types

#### 33.6.4.4.1 General

The standard library types `shared_mutex` and `shared_timed_mutex` are *shared mutex types*. Shared mutex types meet the requirements of mutex types (33.6.4.2) and additionally meet the requirements set out below. In this description, \( m \) denotes an object of a shared mutex type.

[Note 1: The shared mutex types meet the Cpp17SharedLockable requirements (33.2.5.5). — end note]

In addition to the exclusive lock ownership mode specified in 33.6.4.2, shared mutex types provide a *shared lock ownership mode*. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

The expression \( m\)\texttt{.lock\_shared()} is well-formed and has the following semantics:

- **Preconditions**: The calling thread has no ownership of the mutex.
- **Effects**: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.
- **Synchronization**: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
- **Postconditions**: The calling thread has a shared lock on the mutex.
- **Return type**: `void`.
- **Throws**: `system\_error` when an exception is required (33.2.2).
- **Error conditions**:
  - `operation\_not\_permitted` — if the thread does not have the privilege to perform the operation.
  - `resource\_deadlock\_would\_occur` — if the implementation detects that a deadlock would occur.

The expression \( m\)\texttt{.unlock\_shared()} is well-formed and has the following semantics:

- **Preconditions**: The calling thread holds a shared lock on the mutex.
- **Effects**: Releases a shared lock on the mutex held by the calling thread.
- **Return type**: `void`.
- **Synchronization**: This operation synchronizes with (6.9.2) subsequent `lock()` operations that obtain ownership on the same object.
- **Throws**: Nothing.

The expression \( m\)\texttt{.try\_lock\_shared()} is well-formed and has the following semantics:

- **Preconditions**: The calling thread has no ownership of the mutex.
- **Effects**: Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and `try\_lock\_shared()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.
- **Synchronization**: If `try\_lock\_shared()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
- **Return type**: `bool`.
- **Returns**: `true` if the shared lock was acquired, otherwise `false`.
- **Throws**: Nothing.

### 33.6.4.4.2 Class `shared_mutex`

```cpp
namespace std {
    class shared_mutex {
    public:
        shared_mutex();
    }
```
The class `shared_mutex` provides a non-recursive mutex with shared ownership semantics.

The class `shared_mutex` meets all of the shared mutex requirements (33.6.4.4). It is a standard-layout class (11.2).

The behavior of a program is undefined if:

- it destroys a `shared_mutex` object owned by any thread,
- a thread attempts to recursively gain any ownership of a `shared_mutex`, or
- a thread terminates while possessing any ownership of a `shared_mutex`.

`shared_mutex` may be a synonym for `shared_timed_mutex`.

### 33.6.4.5 Shared timed mutex types

The standard library type `shared_timed_mutex` is a shared timed mutex type. Shared timed mutex types meet the requirements of timed mutex types (33.6.4.3), shared mutex types (33.6.4.4), and additionally meet the requirements set out below. In this description, `m` denotes an object of a shared timed mutex type, `rel_time` denotes an object of an instantiation of `duration` (29.5), and `abs_time` denotes an object of an instantiation of `time_point` (29.6).

[Note 1: The shared timed mutex types meet the `Cpp17SharedTimedLockable` requirements (33.2.5.6). — end note]

The expression `m.try_lock_shared_for(rel_time)` is well-formed and has the following semantics:

- **Preconditions:** The calling thread has no ownership of the mutex.
- **Effects:** Attempts to obtain shared lock ownership for the calling thread within the relative timeout (33.2.4) specified by `rel_time`. If the time specified by `rel_time` is less than or equal to `rel_time.zero()`, the function attempts to obtain ownership without blocking (as if by calling `try_lock_shared()`). The function returns within the timeout specified by `rel_time` only if it has obtained shared ownership of the mutex object.

[Note 2: As with `try_lock()`, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

- **Synchronization:** If `try_lock_shared_for()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
- **Return type:** `bool`.
- **Returns:** `true` if the shared lock was acquired, otherwise `false`.
- **Throws:** Timeout-related exceptions (33.2.4).

The expression `m.try_lock_shared_until(abs_time)` is well-formed and has the following semantics:

- **Preconditions:** The calling thread has no ownership of the mutex.
Effects: The function attempts to obtain shared ownership of the mutex. If \texttt{abs\_time} has already passed, the function attempts to obtain shared ownership without blocking (as if by calling \texttt{try\_lock\_shared()}). The function returns before the absolute timeout (33.2.4) specified by \texttt{abs\_time} only if it has obtained shared ownership of the mutex object.

[Note 3: As with \texttt{try\_lock()}, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note]

If an exception is thrown then a shared lock has not been acquired for the current thread.

Synchronization: If \texttt{try\_lock\_shared\_until()} returns \texttt{true}, prior \texttt{unlock()} operations on the same object synchronize with (6.9.2) this operation.

Return type: \texttt{bool}.

Returns: \texttt{true} if the shared lock was acquired, otherwise \texttt{false}.

Throws: Timeout-related exceptions (33.2.4).

### 33.6.4.5.2 Class \texttt{shared\_timed\_mutex}

```cpp
namespace std {
    class shared\_timed\_mutex {
        public:
            shared\_timed\_mutex();
            ~shared\_timed\_mutex();
            shared\_timed\_mutex(const shared\_timed\_mutex&) = delete;
            shared\_timed\_mutex\& operator=(const shared\_timed\_mutex&) = delete;

            // exclusive ownership
            void lock();          // blocking
            bool try\_lock();
            template<class Rep, class Period>
                bool try\_lock\_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try\_lock\_until(const chrono::time\_point<Clock, Duration>& abs_time);
            void unlock();

            // shared ownership
            void lock\_shared();     // blocking
            bool try\_lock\_shared();
            template<class Rep, class Period>
                bool try\_lock\_shared\_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try\_lock\_shared\_until(const chrono::time\_point<Clock, Duration>& abs_time);
            void unlock\_shared();
    };
}
```

1 The class \texttt{shared\_timed\_mutex} provides a non-recursive mutex with shared ownership semantics.

2 The class \texttt{shared\_timed\_mutex} meets all of the shared timed mutex requirements (33.6.4.5). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:

   (3.1) — it destroys a \texttt{shared\_timed\_mutex} object owned by any thread,

   (3.2) — a thread attempts to recursively gain any ownership of a \texttt{shared\_timed\_mutex}, or

   (3.3) — a thread terminates while possessing any ownership of a \texttt{shared\_timed\_mutex}.

### 33.6.5 Locks

#### 33.6.5.1 General

1 A \texttt{lock} is an object that holds a reference to a lockable object and may unlock the lockable object during the lock’s destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to \textit{own} a lockable object if it is
currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[Note 1: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — end note]

2 Some lock constructors take tag types which describe what should be done with the lockable object during the lock’s construction.

```cpp
namespace std {

  struct defer_lock_t { }; // do not acquire ownership of the mutex
  struct try_to_lock_t { }; // try to acquire ownership of the mutex
  struct adopt_lock_t { }; // assume the calling thread has already
                           // obtained mutex ownership and manage it

  inline constexpr defer_lock_t defer_lock { };   
  inline constexpr try_to_lock_t try_to_lock { }; 
  inline constexpr adopt_lock_t adopt_lock { };   
}
```

### 33.6.5.2 Class template lock_guard

```cpp
namespace std {

  template<class Mutex>
  class lock_guard {
  public:
    using mutex_type = Mutex;

    explicit lock_guard(mutex_type& m);
    lock_guard(mutex_type& m, adopt_lock_t);
    ~lock_guard();

    lock_guard(const lock_guard&) = delete;
    lock_guard& operator=(const lock_guard&) = delete;

  private:
    mutex_type& pm; // exposition only
  };
}
```

1 An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object’s lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the `Cpp17BasicLockable` requirements (33.2.5.2).

2 **Effects**: Initializes `pm` with `m`. Calls `m.lock()`.

3 **Preconditions**: The calling thread holds a non-shared lock on `m`.

4 **Effects**: Initializes `pm` with `m`.

5 **Throws**: Nothing.

6 **Effects**: Equivalent to: `pm.unlock()`

### 33.6.5.3 Class template scoped_lock

```cpp
namespace std {

  template<class... MutexTypes>
  class scoped_lock {
  public:
    using mutex_type = see below; // Only if sizeof...(MutexTypes) == 1 is true
  }
```

§ 33.6.5.3
An object of type `scoped_lock` controls the ownership of lockable objects within a scope. A `scoped_lock` object maintains ownership of lockable objects throughout the `scoped_lock` object’s lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by `pm` do not exist for the entire lifetime of the `scoped_lock` object.

(1.1) If `sizeof...(MutexTypes)` is one, let `Mutex` denote the sole type constituting the pack `MutexTypes`. `Mutex` shall meet the `Cpp17BasicLockable` requirements (33.2.5.2). The member `typedef-name mutex_type` denotes the same type as `Mutex`.

(1.2) Otherwise, all types in the template parameter pack `MutexTypes` shall meet the `Cpp17Lockable` requirements (33.2.5.3) and there is no member `mutex_type`.

### 33.6.5.4 Class template unique_lock

> `unique_lock` is a class template that provides a unique lock on a `Mutex`. It is used to acquire and release a lock in a thread-safe manner.

```cpp
namespace std {
    template<class Mutex>
    class unique_lock {
    public:
        using mutex_type = Mutex;

        unique_lock() noexcept;
        explicit unique_lock(mutex_type& m);
        unique_lock(mutex_type& m, defer_lock_t) noexcept;
        unique_lock(mutex_type& m, try_to_lock_t);
        unique_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
        unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
        unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~unique_lock();
        unique_lock(const unique_lock&) = delete;
        unique_lock& operator=(const unique_lock&) = delete;
        unique_lock(unique_lock&& u) noexcept;
        unique_lock& operator=(unique_lock&& u);
    };

    // 33.6.5.4.2, construct/copy/destroy
    unique_lock() noexcept;
    explicit unique_lock(mutex_type& m);
    unique_lock(mutex_type& m, defer_lock_t) noexcept;
    unique_lock(mutex_type& m, try_to_lock_t);
    unique_lock(mutex_type& m, adopt_lock_t);
    template<class Clock, class Duration>
    unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
    unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
    ~unique_lock();

    unique_lock(const unique_lock&) = delete;
    unique_lock& operator=(const unique_lock&) = delete;
    unique_lock(unique_lock&& u) noexcept;
    unique_lock& operator=(unique_lock&& u);
};
```
// 33.6.5.4.3, locking
void lock();
bool try_lock();

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

void unlock();

// 33.6.5.4.4, modifiers
void swap(unique_lock& u) noexcept;
mutex_type* release() noexcept;

// 33.6.5.4.5, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

private:
  mutex_type* pm;  // exposition only
  bool owns;  // exposition only
};

An object of type unique_lock controls the ownership of a lockable object within a scope. Ownership of
the lockable object may be acquired at construction or after construction, and may be transferred, after
acquisition, to another unique_lock object. Objects of type unique_lock are not copyable but are movable.
The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed
to by pm does not exist for the entire remaining lifetime (6.7.3) of the unique_lock object. The supplied
Mutex type shall meet the Cpp17BasicLockable requirements (33.2.5.2).

[Note 1: unique_lock<Mutex> meets the Cpp17BasicLockable requirements. If Mutex meets the Cpp17Lockable
requirements (33.2.5.3), unique_lock<Mutex> also meets the Cpp17Lockable requirements; if Mutex meets the
Cpp17TimedLockable requirements (33.2.5.4), unique_lock<mutex> also meets the Cpp17TimedLockable requirements.
—end note]

33.6.5.4.2 Constructors, destructor, and assignment [thread.lock.unique.cons]
unique_lock() noexcept;

1 Postconditions: pm == 0 and owns == false.

explicit unique_lock(mutex_type& m);

2 Effects: Calls m.lock().
3 Postconditions: pm == addressof(m) and owns == true.

unique_lock(mutex_type& m, defer_lock_t) noexcept;

4 Postconditions: pm == addressof(m) and owns == false.

unique_lock(mutex_type& m, try_to_lock_t);

5 Preconditions: The supplied Mutex type meets the Cpp17Lockable requirements (33.2.5.3).
6 Effects: Calls m.try_lock().
7 Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call
to m.try_lock().

unique_lock(mutex_type& m, adopt_lock_t);

8 Preconditions: The calling thread holds a non-shared lock on m.
9 Postconditions: pm == addressof(m) and owns == true.
10 Throws: Nothing.

§ 33.6.5.4.2 1718
template<class Clock, class Duration>
unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).
Effects: Calls m.try_lock_until(abs_time).
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_until(abs_time).

template<class Rep, class Period>
unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).
Effects: Calls m.try_lock_for(rel_time).
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_for(rel_time).

unique_lock(unique_lock&& u) noexcept;
Postconditions: pm == u_p.pm and owns == u_p.owns (where u_p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.

unique_lock& operator=(unique_lock&& u);
Effects: If owns calls pm->unlock().
Postconditions: pm == u_p.pm and owns == u_p.owns (where u_p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.

[Note 1: With a recursive mutex it is possible for both *this and u to own the same mutex before the assignment. In this case, *this will own the mutex after the assignment and u will not. — end note]

Throws: Nothing.

~unique_lock();
Effects: If owns calls pm->unlock().

33.6.5.4.3 Locking [thread.lock.unique.locking]

void lock();
Effects: As if by pm->lock().
Postconditions: owns == true.
Throws: Any exception thrown by pm->lock(). system_error when an exception is required (33.2.2).

Error conditions:
(4.1) operation_not_permitted — if pm is nullptr.
(4.2) resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();
Preconditions: The supplied Mutex meets the Cpp17Lockable requirements (33.2.5.3).
Effects: As if by pm->try_lock().
Postconditions: owns == res, where res is the value returned by the call to try_lock().
Returns: The value returned by the call to try_lock().
Throws: Any exception thrown by pm->try_lock(). system_error when an exception is required (33.2.2).

Error conditions:
(10.1) operation_not_permitted — if pm is nullptr.
(10.2) resource_deadlock_would_occur — if on entry owns is true.

§ 33.6.5.4.3
template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).

Effects: As if by pm->try_lock_until(abs_time).

Postconditions: owns == res, where res is the value returned by the call to try_lock_until(abs_time).

Returns: The value returned by the call to try_lock_until(abs_time).

Throws: Any exception thrown by pm->try_lock_until(). system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).

Effects: As if by pm->try_lock_for(rel_time).

Postconditions: owns == res, where res is the value returned by the call to try_lock_for(rel_time).

Returns: The value returned by the call to try_lock_for(rel_time).

Throws: Any exception thrown by pm->try_lock_for(). system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

void unlock();

Effects: As if by pm->unlock().

Postconditions: owns == false.

Throws: system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if on entry owns is false.

33.6.5.4.4 Modifiers

void swap(unique_lock& u) noexcept;

Effects: Swaps the data members of *this and u.

mutex_type* release() noexcept;

Postconditions: pm == 0 and owns == false.

Returns: The previous value of pm.

template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

Effects: As if by x.swap(y).

33.6.5.4.5 Observers

bool owns_lock() const noexcept;

Returns: owns.

explicit operator bool() const noexcept;

Returns: owns.
mutex_type *mutex() const noexcept;

Returns: pm.

33.6.5.5 Class template shared_lock

33.6.5.5.1 General

namespace std {
    template<class Mutex>
    class shared_lock {
    public:
        using mutex_type = Mutex;

        // 33.6.5.5.2, construct/copy/destroy
        shared_lock() noexcept;
        explicit shared_lock(mutex_type& m);
        shared_lock(mutex_type& m, defer_lock_t) noexcept;
        shared_lock(mutex_type& m, try_to_lock_t);
        shared_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
            shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
            shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~shared_lock();

        shared_lock(const shared_lock&) = delete;
        shared_lock& operator=(const shared_lock&) = delete;
        shared_lock(shared_lock&& u) noexcept;
        shared_lock& operator=(shared_lock&& u) noexcept;

        // 33.6.5.5.3, locking
        void lock();
        bool try_lock();
        template<class Rep, class Period>
            bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
        template<class Clock, class Duration>
            bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
        void unlock();

        // 33.6.5.5.4, modifiers
        void swap(shared_lock& u) noexcept;
        mutex_type* release() noexcept;

        // 33.6.5.5.5, observers
        bool owns_lock() const noexcept;
        explicit operator bool () const noexcept;
        mutex_type* mutex() const noexcept;

    private:
        mutex_type* pm;        // exposition only
        bool owns;             // exposition only
    }
}

1 An object of type shared_lock controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another shared_lock object. Objects of type shared_lock are not copyable but are movable. The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed to by pm does not exist for the entire remaining lifetime (6.7.3) of the shared_lock object. The supplied Mutex type shall meet the Cpp17SharedLockable requirements (33.2.5.5).

2 [Note 1: shared_lock<Mutex> meets the Cpp17Lockable requirements (33.2.5.3). If Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6), shared_lock<Mutex> also meets the Cpp17TimedLockable requirements (33.2.5.4). — end note]
### 33.6.5.5.2 Constructors, destructor, and assignment

- **shared_lock() noexcept;**
  - **Postconditions:** `pm == nullptr` and `owns == false`.

- **explicit shared_lock(mutex_type& m);**
  - **Effects:** Calls `m.lock_shared()`.
  - **Postconditions:** `pm == addressof(m)` and `owns == true`.

- **shared_lock(mutex_type& m, defer_lock_t) noexcept;**
  - **Postconditions:** `pm == addressof(m)` and `owns == false`.

- **shared_lock(mutex_type& m, try_to_lock_t);**
  - **Effects:** Calls `m.try_lock_shared()`.
  - **Postconditions:** `pm == addressof(m)` and `owns == false`.

- **shared_lock(mutex_type& m, adopt_lock_t);**
  - **Preconditions:** The calling thread holds a shared lock on `m`.
  - **Postconditions:** `pm == addressof(m)` and `owns == true`.

- **template<class Clock, class Duration>**
  - **shared_lock(mutex_type& m,**
    - **const chrono::time_point<Clock, Duration>& abs_time);**
  - **Preconditions:** Mutex meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).
  - **Effects:** Calls `m.try_lock_shared_until(abs_time)`.
  - **Postconditions:** `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_until(abs_time)`.

- **template<class Rep, class Period>**
  - **shared_lock(mutex_type& m,**
    - **const chrono::duration<Rep, Period>& rel_time);**
  - **Preconditions:** Mutex meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).
  - **Effects:** Calls `m.try_lock_shared_for(rel_time)`.
  - **Postconditions:** `pm == addressof(m)` and `owns == res` where `res` is the value returned by the call to `m.try_lock_shared_for(rel_time)`.

- **~shared_lock();**
  - **Effects:** If `owns` calls `pm->unlock_shared()`.

- **shared_lock(shared_lock&& sl) noexcept;**
  - **Postconditions:** `pm == sl_p.pm and owns == sl_p.owns` (where `sl_p` is the state of `sl` just prior to this construction), `sl.pm == nullptr` and `sl.owns == false`.

- **shared_lock& operator=(shared_lock&& sl) noexcept;**
  - **Effects:** If `owns` calls `pm->unlock_shared()`.
  - **Postconditions:** `pm == sl_p.pm and owns == sl_p.owns` (where `sl_p` is the state of `sl` just prior to this assignment), `sl.pm == nullptr` and `sl.owns == false`.

### 33.6.5.5.3 Locking

- **void lock();**
  - **Effects:** As if by `pm->lock_shared()`.
  - **Postconditions:** `owns == true`.
  - **Throws:** Any exception thrown by `pm->lock_shared()`.

---

§ 33.6.5.5.3
Error conditions:
— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();

Effects: As if by pm->try_lock_shared().

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared().

Returns: The value returned by the call to pm->try_lock_shared().

Throws: Any exception thrown by pm->try_lock_shared(). system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: As if by pm->try_lock_shared_until(abs_time).

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared_until(abs_time).

Returns: The value returned by the call to pm->try_lock_shared_until(abs_time).

Throws: Any exception thrown by pm->try_lock_shared_until(abs_time). system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: As if by pm->try_lock_shared_for(rel_time).

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared_for(rel_time).

Returns: The value returned by the call to pm->try_lock_shared_for(rel_time).

Throws: Any exception thrown by pm->try_lock_shared_for(rel_time). system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

void unlock();

Effects: As if by pm->unlock_shared().

Postconditions: owns == false.

Throws: system_error when an exception is required (33.2.2).

Error conditions:
— operation_not_permitted — if on entry owns is false.
33.6.5.5.4 Modifiers

```cpp
void swap(shared_lock& sl) noexcept;
```

**Effects:** Swaps the data members of *this and sl.

```cpp
mutex_type* release() noexcept;
```

**Postconditions:** pm == nullptr and owns == false.

**Returns:** The previous value of pm.

```cpp
template<class Mutex>
void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
```

**Effects:** As if by x.swap(y).

33.6.5.5 Observers

```cpp
bool owns_lock() const noexcept;
```

**Returns:** owns.

```cpp
explicit operator bool() const noexcept;
```

**Returns:** owns.

```cpp
mutex_type* mutex() const noexcept;
```

**Returns:** pm.

33.6.6 Generic locking algorithms

```cpp
template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
```

**Preconditions:** Each template parameter type meets the `Cpp17Lockable` requirements.

**Note 1:** The `unique_lock` class template meets these requirements when suitably instantiated. — end note

**Effects:** Calls `try_lock()` for each argument in order beginning with the first until all arguments have been processed or a call to `try_lock()` fails, either by returning `false` or by throwing an exception. If a call to `try_lock()` fails, `unlock()` is called for all prior arguments with no further calls to `try_lock()`.

**Returns:** -1 if all calls to `try_lock()` returned `true`, otherwise a zero-based index value that indicates the argument for which `try_lock()` returned `false`.

```cpp
template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);
```

**Preconditions:** Each template parameter type meets the `Cpp17Lockable` requirements.

**Note 2:** The `unique_lock` class template meets these requirements when suitably instantiated. — end note

**Effects:** All arguments are locked via a sequence of calls to `lock()`, `try_lock()`, or `unlock()` on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

**Note 3:** A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — end note

If a call to `lock()` or `try_lock()` throws an exception, `unlock()` is called for any argument that had been locked by a call to `lock()` or `try_lock()`.

33.6.7 Call once

33.6.7.1 Struct once_flag

```cpp
namespace std {
    struct once_flag {
        constexpr once_flag() noexcept;
        once_flag(const once_flag&) = delete;
        once_flag& operator=(const once_flag&) = delete;
    };
}
```

**Note:** The class `once_flag` is an opaque data structure that `call_once` uses to initialize data without causing a data race or deadlock.
constexpr once_flag() noexcept;

Synchronization: The construction of a once_flag object is not synchronized.

Postconditions: The object’s internal state is set to indicate to an invocation of call_once with the object as its initial argument that no function has been called.

33.6.7.2 Function call_once

[thread.once.callonce]

template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);

Mandates: is_invocable_v<Callable, Args...> is true.

Effects: An execution of call_once that does not call its func is a passive execution. An execution of call_once that calls its func is an active execution. An active execution calls INVOKE( std::forward<Callable>(func), std::forward<Args>(args)...). If such a call to func throws an exception the execution is exceptional, otherwise it is returning. An exceptional execution propagates the exception to the caller of call_once. Among all executions of call_once for any given once_flag: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

[Note 1: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. —end note]

Synchronization: For any given once_flag: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

Throws: system_error when an exception is required (33.2.2), or any exception thrown by func.

[Example 1:

// global flag, regular function
void init();
std::once_flag flag;

void f() {
    std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
    void operator()();
};

void g() {
    static std::once_flag flag2;
    std::call_once(flag2, initializer());
}

// object flag, member function
class information {
    std::once_flag verified;
    void verifier();
    public:
        void verify() { std::call_once(verified, &information::verifier, *this); }
};

—end example]

33.7 Condition variables

33.7.1 General

Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class condition_variable provides a condition variable that can only wait on an object of type unique_lock<mutex>, allowing the implementation to be more efficient. Class condition_variable_any provides a general condition variable that can wait on objects of user-supplied lock types.
Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.

The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:

1. the release of the mutex and entry into the waiting state;
2. the unblocking of the wait; and
3. the reacquisition of the lock.

The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the “happens before” order.

Condition variable construction and destruction need not be synchronized.

### 33.7.2 Header `<condition_variable>` synopsis

```cpp
namespace std {
    // 33.7.4, class condition_variable
    class condition_variable;
    // 33.7.5, class condition_variable_any
    class condition_variable_any;

    // 33.7.3, non-member functions
    void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

    enum class cv_status { no_timeout, timeout };
}
```

### 33.7.3 Non-member functions

```cpp
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

**Preconditions:** `lk` is locked by the calling thread and either

1. no other thread is waiting on `cond`, or
2. `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

**Effects:** Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```cpp
lk.unlock();
cond.notify_all();
```

**Synchronization:** The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.

**Note 1:** The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering issues. — end note

**Note 2:** It is the user’s responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on `lk`, and that this lock is not released and reacquired prior to calling `notify_all_at_thread_exit`. — end note

### 33.7.4 Class `condition_variable`

```cpp
namespace std {
    class condition_variable {
    public:
        condition_variable();
        ~condition_variable();

        condition_variable(const condition_variable&) = delete;
        condition_variable& operator=(const condition_variable&) = delete;
    }
}```
The class `condition_variable` is a standard-layout class (11.2).

```cpp
condition_variable();
```

**Throws:** `system_error` when an exception is required (33.2.2).

**Error conditions:**

1. `resource_unavailable_try_again` — if some non-memory resource limitation prevents initialization.

```cpp
~condition_variable();
```

**Preconditions:** There is no thread blocked on `*this`.

1. That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on `*this` once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of `wait`, `wait_for`, or `wait_until` that take a predicate. — end note

```cpp
void notify_one() noexcept;
void notify_all() noexcept;
void wait(unique_lock<mutex>& lock);
```

**Effects:** If any threads are blocked waiting for `*this`, unblocks one of those threads.

```cpp
void notify_one() noexcept;
void notify_all() noexcept;
void wait(unique_lock<mutex>& lock);
```

**Effects:** Unblocks all threads that are blocked waiting for `*this`.

```cpp
void wait_for(unique_lock<mutex>& lock, const chrono::duration<Rep, Period>& rel_time);
```

**Effects:**

1. Atomically calls `lock.unlock()` and blocks on `*this`.
2. When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
3. The function will unblock when signaled by a call to `notify_one()` or a call to `notify_all()`, or spuriously.

§ 33.7.4
Postconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

Throws: Nothing.

Remarks: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);

Preconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either
— no other thread is waiting on this `condition_variable` object or
— `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently
  waiting (via `wait`, `wait_for`, or `wait_until`) threads.

Effects: Equivalent to:

while (!pred())
  wait(lock);

Postconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

Throws: Any exception thrown by `pred`.

Remarks: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
  const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either
— no other thread is waiting on this `condition_variable` object or
— `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently
  waiting (via `wait`, `wait_for`, or `wait_until`) threads.

Effects:
— Atomically calls `lock.unlock()` and blocks on `*this`.
— When unblocked, calls `lock.lock()` (possibly blocking on the lock), then returns.
— The function will unblock when signaled by a call to `notify_one()`, a call to `notify_all()`,
  expiration of the absolute timeout (33.2.4) specified by `abs_time`, or spuriously.
— If the function exits via an exception, `lock.lock()` is called prior to exiting the function.

Postconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.

Returns: `cv_status::timeout` if the absolute timeout (33.2.4) specified by `abs_time` expired, otherwise
`cv_status::no_timeout`.

Throws: Timeout-related exceptions (33.2.4).

Remarks: If the function fails to meet the postcondition, `terminate()` is invoked (14.6.2).

[Note 4: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Rep, class Period>
cv_status wait_for(unique_lock<mutex>& lock,
  const chrono::duration<Rep, Period>& rel_time);

Preconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread, and either
— no other thread is waiting on this `condition_variable` object or
— `lock.mutex()` returns the same value for each of the `lock` arguments supplied by all concurrently
  waiting (via `wait`, `wait_for`, or `wait_until`) threads.

Effects: Equivalent to:

return wait_until(lock, chrono::steady_clock::now() + rel_time);

Postconditions: `lock.owns_lock()` is true and `lock.mutex()` is locked by the calling thread.
Returns: \( \text{cv\_status::timeout} \) if the relative timeout (33.2.4) specified by \( \text{rel\_time} \) expired, otherwise \( \text{cv\_status::no\_timeout} \).

Throws: Timeout-related exceptions (33.2.4).

Remarks: If the function fails to meet the postcondition, \text{terminate} is invoked (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

\[
\text{template<class Clock, class Duration, class Predicate>}
\text{bool wait\_until(unique\_lock<mutex>& lock,}
\text{ const \text{chrono::time\_point<Clock, Duration>}& abs\_time,}
\text{ Predicate pred);}\]

Preconditions: \text{lock.owns\_lock()} is \text{true} and \text{lock.mutex()} is locked by the calling thread, and either

(29.1) — no other thread is waiting on this \text{condition\_variable} object or

(29.2) — \text{lock.mutex()} returns the same value for each of the \text{lock} arguments supplied by all concurrently waiting (via \text{wait, wait\_for, or wait\_until}) threads.

Effects: Equivalent to:

\[
\text{while (!pred())}
\text{if (wait\_until(lock, abs\_time) == cv\_status::timeout)}
\text{return pred();}
\text{return true;}\]

Postconditions: \text{lock.owns\_lock()} is \text{true} and \text{lock.mutex()} is locked by the calling thread.

[Note 6: The returned value indicates whether the predicate evaluated to \text{true} regardless of whether the timeout was triggered. — end note]

Throws: Timeout-related exceptions (33.2.4) or any exception thrown by \text{pred}.

Remarks: If the function fails to meet the postcondition, \text{terminate()} is invoked (14.6.2).

[Note 7: This can happen if the re-locking of the mutex throws an exception. — end note]

\[
\text{template<class Rep, class Period, class Predicate>}
\text{bool wait\_for(unique\_lock<mutex>& lock,}
\text{ const \text{chrono::duration<Rep, Period>}& rel\_time,}
\text{ Predicate pred);}\]

Preconditions: \text{lock.owns\_lock()} is \text{true} and \text{lock.mutex()} is locked by the calling thread, and either

(35.1) — no other thread is waiting on this \text{condition\_variable} object or

(35.2) — \text{lock.mutex()} returns the same value for each of the \text{lock} arguments supplied by all concurrently waiting (via \text{wait, wait\_for, or wait\_until}) threads.

Effects: Equivalent to:

\[
\text{return wait\_until(lock, \text{chrono::steady\_clock::now()} + rel\_time, std::move(pred));}\]

Postconditions: \text{lock.owns\_lock()} is \text{true} and \text{lock.mutex()} is locked by the calling thread.

[Note 8: There is no blocking if \text{pred()} is initially \text{true}, even if the timeout has already expired. — end note]

Throws: Timeout-related exceptions (33.2.4) or any exception thrown by \text{pred}.

Remarks: If the function fails to meet the postcondition, \text{terminate()} is invoked (14.6.2).

[Note 10: This can happen if the re-locking of the mutex throws an exception. — end note]
namespace std {
    class condition_variable_any {
    public:
        condition_variable_any();
        ~condition_variable_any();

        condition_variable_any(const condition_variable_any&) = delete;
        condition_variable_any& operator=(const condition_variable_any&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;

        // 33.7.5.2, noninterruptible waits
        template<class Lock>
        void wait(Lock& lock);
        template<class Lock, class Predicate>
        void wait(Lock& lock, Predicate pred);

        template<class Lock, class Clock, class Duration>
        cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Lock, class Clock, class Duration, class Predicate>
        bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                        Predicate pred);
        template<class Lock, class Rep, class Period>
        cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
        template<class Lock, class Rep, class Period, class Predicate>
        bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

        // 33.7.5.3, interruptible waits
        template<class Lock, class Predicate>
        bool wait(Lock& lock, stop_token stoken, Predicate pred);
        template<class Lock, class Clock, class Duration, class Predicate>
        bool wait_until(Lock& lock, stop_token stoken,
                        const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
        template<class Lock, class Rep, class Period, class Predicate>
        bool wait_for(Lock& lock, stop_token stoken,
                      const chrono::duration<Rep, Period>& rel_time, Predicate pred);
    }
}

condition_variable_any();

Throws: bad_alloc or system_error when an exception is required (33.2.2).

Error conditions:

- resource_unavailable_try_again — if some non-memory resource limitation prevents initialization.

- operation_not_permitted — if the thread does not have the privilege to perform the operation.

Preconditions: There is no thread blocked on *this.

[Note 2: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. — end note]

void notify_one() noexcept;

Effects: If any threads are blocked waiting for *this, unblocks one of those threads.

void notify_all() noexcept;

Effects: Unblocks all threads that are blocked waiting for *this.

§ 33.7.5.1
33.7.5.2 Noninterruptible waits

template<class Lock>
void wait(Lock& lock);

Effects:
(1.1) Atomically calls lock.unlock() and blocks on *this.
(1.2) When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.
(1.3) The function will unblock when signaled by a call to notify_one(), a call to notify_all(), or spuriously.

Postconditions: lock is locked by the calling thread.

Throws: Nothing.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 1: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);

Effects: Equivalent to:
while (!pred())
  wait(lock);

template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);

Effects:
(6.1) Atomically calls lock.unlock() and blocks on *this.
(6.2) When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.
(6.3) The function will unblock when signaled by a call to notify_one(), a call to notify_all(), expiration of the absolute timeout (33.2.4) specified by abs_time, or spuriously.
(6.4) If the function exits via an exception, lock.lock() is called prior to exiting the function.

Postconditions: lock is locked by the calling thread.

Returns: cv_status::timeout if the absolute timeout (33.2.4) specified by abs_time expired, otherwise cv_status::no_timeout.

Throws: Timeout-related exceptions (33.2.4).

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);

Effects: Equivalent to:
return wait_until(lock, chrono::steady_clock::now() + rel_time);

Postconditions: lock is locked by the calling thread.

Returns: cv_status::timeout if the relative timeout (33.2.4) specified by rel_time expired, otherwise cv_status::no_timeout.

Throws: Timeout-related exceptions (33.2.4).

Remarks: If the function fails to meet the postcondition, terminate is invoked (14.6.2).
[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
    return true;

[Note 4: There is no blocking if pred() is initially true, or if the timeout has already expired. — end note]

[Note 5: The returned value indicates whether the predicate evaluates to true regardless of whether the timeout was triggered. — end note]

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

Effects: Equivalent to:

    return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));

33.7.5.3 Interruptible waits

The following wait functions will be notified when there is a stop request on the passed stop_token. In that case the functions return immediately, returning false if the predicate evaluates to false.

template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);

Effects: Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

    while (!stoken.stop_requested()) {
        if (pred())
            return true;
        wait(lock);
    }
    return pred();

[Note 1: The returned value indicates whether the predicate evaluated to true regardless of whether there was a stop request. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.2).

[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
    const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);

Effects: Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

    while (!stoken.stop_requested()) {
        if (pred())
            return true;
        if (wait_until(lock, abs_time) == cv_status::timeout)
            return pred();
    }
    return pred();

[Note 3: There is no blocking if pred() is initially true, stoken.stop_requested() was already true or the timeout has already expired. — end note]

[Note 4: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered or a stop request was made. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Timeout-related exceptions (33.2.4), or any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
    const chrono::duration<Rep, Period>& rel_time, Predicate pred);

**Effects:** Equivalent to:

```cpp
return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
    std::move(pred));
```

### 33.8 Semaphore

#### 33.8.1 General

Semaphore are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

#### 33.8.2 Header <semaphore> synopsis

```cpp
namespace std {
    // 33.8.3, class template counting_semaphore
    template<ptrdiff_t least_max_value = implementation-defined>
        class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
}
```

#### 33.8.3 Class template counting_semaphore

```cpp
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
    class counting_semaphore {
        public:
            static constexpr ptrdiff_t max() noexcept;
            constexpr explicit counting_semaphore(ptrdiff_t desired);
            ~counting_semaphore();
            counting_semaphore(const counting_semaphore&) = delete;
            counting_semaphore& operator=(const counting_semaphore&) = delete;
            void release(ptrdiff_t update = 1);
            void acquire();
            bool try_acquire() noexcept;
            template<class Rep, class Period>
                bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

        private:
            pptrdiff_t counter; // exposition only
    };
}
```

1. Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

2. `least_max_value` shall be non-negative; otherwise the program is ill-formed.

3. Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.
static constexpr ptrdiff_t max() noexcept;

Returns: The maximum value of counter. This value is greater than or equal to least_max_value.

cconstexpr explicit counting_semaphore(ptrdiff_t desired);

Preconditions: desired >= 0 is true, and desired <= max() is true.

Effects: Initializes counter with desired.

Throws: Nothing.

void release(ptrdiff_t update = 1);

Preconditions: update >= 0 is true, and update <= max() - counter is true.

Effects: Atomically execute counter += update. Then, unblocks any threads that are waiting for counter to be greater than zero.

Synchronization: Strongly happens before invocations of try_acquire that observe the result of the effects.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

bool try_acquire() noexcept;

Effects: Attempts to atomically decrement counter if it is positive, without blocking. If counter is not decremented, there is no effect and try_acquire immediately returns. An implementation may fail to decrement counter even if it is positive.

[Note 1: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5). — end note]

An implementation should ensure that try_acquire does not consistently return false in the absence of contending semaphore operations.

Returns: true if counter was decremented, otherwise false.

void acquire();

Effects: Repeatedly performs the following steps, in order:

— Evaluates try_acquire. If the result is true, returns.

— Blocks on *this until counter is greater than zero.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

template<class Rep, class Period>
bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);

template<class Clock, class Duration>
bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);

Effects: Repeatedly performs the following steps, in order:

— Evaluates try_acquire(). If the result is true, returns true.

— Blocks on *this until counter is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns false.

The timeout expires (33.2.4) when the current time is after abs_time (for try_acquire_until) or when at least rel_time has passed from the start of the function (for try_acquire_for).

Throws: Timeout-related exceptions (33.2.4), or system_error when a non-timeout-related exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

33.9 Coordination types

33.9.1 General

Subclause 33.9 describes various concepts related to thread coordination, and defines the coordination types latch and barrier. These types facilitate concurrent computation performed by a number of threads.
A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

### Header `<latch>` synopsis

```cpp
namespace std {
    class latch;
}
```

### Class `latch`

```cpp
namespace std {
    class latch {
        public:
            static constexpr ptrdiff_t max() noexcept;
            constexpr explicit latch(ptrdiff_t expected);
            ~latch();
            latch(const latch&) = delete;
            latch& operator=(const latch&) = delete;
            void count_down(ptrdiff_t update = 1);
            bool try_wait() const noexcept;
            void wait() const;
            void arrive_and_wait(ptrdiff_t update = 1);

        private:
            ptdiff_t counter;  // exposition only
    };
}
```

A _latch_ maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.

Concurrent invocations of the member functions of _latch_, other than its destructor, do not introduce data races.

#### `max()`

```
static constexpr ptrdiff_t max() noexcept;
```

**Returns:** The maximum value of `counter` that the implementation supports.

```
constexpr explicit latch(ptrdiff_t expected);
```

**Preconditions:** `expected >= 0` is true and `expected <= max()` is true.

**Effects:** Initializes `counter` with `expected`.

**Throws:** Nothing.

```
void count_down(ptrdiff_t update = 1);
```

**Preconditions:** `update >= 0` is true, and `update <= counter` is true.

**Effects:** Atomically decrements `counter` by `update`. If `counter` is equal to zero, unblocks all threads blocked on `*this`.

**Synchronization:** Strongly happens before the returns from all calls that are unblocked.

**Throws:** `system_error` when an exception is required (33.2.2).

**Error conditions:** Any of the error conditions allowed for mutex types (33.6.4.2).

```
bool try_wait() const noexcept;
```

**Returns:** With very low probability `false`. Otherwise `counter == 0`.

§ 33.9.2.3
```cpp
void wait() const;  
  Effects: If counter equals zero, returns immediately. Otherwise, blocks on *this until a call to 
  count_down that decrements counter to zero.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

void arrive_and_wait(ptrdiff_t update = 1);
  Effects: Equivalent to:
    count_down(update);
    wait();
```

### 33.9.3 Barriers

#### 33.9.3.1 General

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where each phase allows at most an expected number of threads to block until the expected number of threads arrive at the barrier.

[Note 1: A barrier is useful for managing repeated tasks that are handled by multiple threads. — end note]

#### 33.9.3.2 Header <barrier> synopsis

```cpp
namespace std {
  template<class CompletionFunction = see below>
  class barrier;
}
```

#### 33.9.3.3 Class template barrier

```cpp
namespace std {
  template<class CompletionFunction = see below>
  class barrier {
    public:
      using arrival_token = see below;

      static constexpr ptrdiff_t max() noexcept;
      constexpr explicit barrier(ptrdiff_t expected,
                               CompletionFunction f = CompletionFunction());
      ~barrier();

      barrier(const barrier&) = delete;
      barrier& operator=(const barrier&) = delete;

      [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
      void wait(arrival_token& arrival) const;
      void arrive_and_wait();
      void arrive_and_drop();

    private:
      CompletionFunction completion; // exposition only
  };
}
```

1. Each barrier phase consists of the following steps:

   (1.1) The expected count is decremented by each call to `arrive` or `arrive_and_drop`.

   (1.2) When the expected count reaches zero, the phase completion step is run. For the specialization with
   the default value of the CompletionFunction template parameter, the completion step is run as part
   of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other
   specializations, the completion step is run on one of the threads that arrived at the barrier during the
   phase.

§ 33.9.3.3
— When the completion step finishes, the expected count is reset to what was specified by the \texttt{expected} argument to the constructor, possibly adjusted by calls to \texttt{arrive\_and\_drop}, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling \texttt{wait}, and will remain blocked until the phase completion step is run.

The phase completion step that is executed at the end of each phase has the following effects:

— Invokes the completion function, equivalent to \texttt{completion()}.

— Unblocks all threads that are blocked on the phase synchronization point.

The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the \texttt{CompletionFunction} template parameter, the behavior is undefined if any of the barrier object’s member functions other than \texttt{wait} are called while the completion step is in progress.

Concurrent invocations of the member functions of \texttt{barrier}, other than its destructor, do not introduce data races. The member functions \texttt{arrive} and \texttt{arrive\_and\_drop} execute atomically.

\texttt{CompletionFunction} shall meet the \texttt{Cpp17MoveConstructible} (Table 30) and \texttt{Cpp17Destructible} (Table 34) requirements. \texttt{is\_nothrow\_invocable\_v<CompletionFunction\&>} shall be \texttt{true}.

The default value of the \texttt{CompletionFunction} template parameter is an unspecified type, such that, in addition to satisfying the requirements of \texttt{CompletionFunction}, it meets the \texttt{Cpp17DefaultConstructible} requirements (Table 29) and \texttt{completion()} has no effects.

\texttt{barrier::arrival\_token} is an unspecified type, such that it meets the \texttt{Cpp17MoveConstructible} (Table 30), \texttt{Cpp17MoveAssignable} (Table 32), and \texttt{Cpp17Destructible} (Table 34) requirements.

\begin{verbatim}
static constexpr ptrdiff_t max() noexcept;
\end{verbatim}

Returns: The maximum expected count that the implementation supports.

\begin{verbatim}
constexpr explicit barrier(ptrdiff_t expected, 
CompletionFunction f = CompletionFunction());
\end{verbatim}

Preconditions: \texttt{expected} \(\geq 0\) is \texttt{true} and \texttt{expected} \(\leq\) \texttt{max()} is \texttt{true}.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to \texttt{expected}. Initializes \texttt{completion} with \texttt{std::move(f)}. Starts the first phase.

[Note 1: If \texttt{expected} is 0 this object can only be destroyed. — end note]

 Throws: Any exception thrown by \texttt{CompletionFunction}’s move constructor.

\begin{verbatim}
[[nodiscard]] arrival\_token arrive(ptrdiff_t update = 1);
\end{verbatim}

Preconditions: \texttt{update} > 0 is \texttt{true}, and \texttt{update} is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type \texttt{arrival\_token} that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by \texttt{update}.

Synchronization: The call to \texttt{arrive} strongly happens before the start of the phase completion step for the current phase.

Returns: The constructed \texttt{arrival\_token} object.

Throws: \texttt{system\_error} when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

[Note 2: This call can cause the completion step for the current phase to start. — end note]

\begin{verbatim}
void wait(arrival\_token&& arrival) const;
\end{verbatim}

Preconditions: \texttt{arrival} is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with \texttt{std::move(arrival)} until the phase completion step of the synchronization point’s phase is run.

[Note 3: If \texttt{arrival} is associated with the synchronization point for a previous phase, the call returns immediately. — end note]
Throws: system_error when an exception is required (33.2.2).
Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

`void arrive_and_wait();`

`Effects:` Equivalent to: `wait(arrive());`

`void arrive_and_drop();`

Preconditions: The expected count for the current barrier phase is greater than zero.
Effects: Decrement the initial expected count for all subsequent phases by one. Then decrement the expected count for the current phase by one.
Synchronization: The call to `arrive_and_drop` strongly happens before the start of the phase completion step for the current phase.

Throws: system_error when an exception is required (33.2.2).
Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

[Note 4: This call can cause the completion step for the current phase to start. — end note]

### 33.10 Futures

#### 33.10.1 Overview

33.10 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

#### 33.10.2 Header `<future>` synopsis

```cpp
namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    };

    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    };

    enum class future_status {
        ready,
        timeout,
        deferred
    };

    // 33.10.3, error handling
    template<> struct is_error_code_enum<future_errc> : public true_type { };
    error_code make_error_code(future_errc e) noexcept;
    error_condition make_error_condition(future_errc e) noexcept;
    const error_category& future_category() noexcept;

    // 33.10.4, class future_error
    class future_error;

    // 33.10.6, class template promise
    template<class R> class promise;
    template<class R> class promise<R&>;
    template<> class promise<void>;
```
template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

// 33.10.7, class template future
template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

// 33.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

// 33.10.10, class template packaged_task
template<class> class packaged_task;
// not defined
template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>; // not defined

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 33.10.9, function template async
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);

template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);

The enum type launch is a bitmask type (16.3.3.3.4) with elements launch::async and launch::deferred.
[Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by
async() applicable to a corresponding subset of available launch policies. Implementations can extend the behavior
of the first overload of async() by adding their extensions to the launch policy under the “as if” rule. — end note]

33.10.3 Error handling

const error_category& future_category() noexcept;

Returns: A reference to an object of a type derived from class error_category.

The object’s default_error_condition and equivalent virtual functions shall behave as specified for the
class error_category. The object’s name virtual function returns a pointer to the string "future”.

error_code make_error_code(future_errc e) noexcept;

Returns: error_code(static_cast<int>(e), future_category()).

error_condition make_error_condition(future_errc e) noexcept;

Returns: error_condition(static_cast<int>(e), future_category()).

33.10.4 Class future_error

namespace std {
    class future_error : public logic_error {
    public:
        explicit future_error(future_errc e); // not defined
        
        const error_code& code() const noexcept;
        const char* what() const noexcept;
    }
}
private:
  error_code ec_; // exposition only
};

explicit future_error(future_errc e);

Effects: Initializes \texttt{ec_} with \texttt{make_error_code(e)}.

const error_code& code() const noexcept;

Returns: \texttt{ec_}.

const char* what() const noexcept;

Returns: An \texttt{ntbs} incorporating \texttt{code().message()}.

\section{Shared state} \label{futures.state}

Many of the classes introduced in subclause \ref{futures.state} use some state to communicate results. This \textit{shared state} consists of some state information and some (possibly not yet evaluated) \textit{result}, which can be a (possibly void) value or an exception.

[Note 1: Futures, promises, and tasks defined in this Clause reference such shared state. — end note]

[Note 2: The result can be any kind of object including a function to compute that result, as used by \texttt{async} when \texttt{policy} is \texttt{launch::deferred}. — end note]

An \textit{asynchronous return object} is an object that reads results from a shared state. A \textit{waiting function} of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (\ref{futures.schedule}), then it is a \textit{timed waiting function}, otherwise it is a \textit{non-timed waiting function}.

An \textit{asynchronous provider} is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[Note 3: Such as promises or tasks. — end note]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

1. if the return object or provider holds the last reference to its shared state, the shared state is destroyed;
2. the return object or provider gives up its reference to its shared state; and
3. these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to \texttt{std::async}, the shared state is not yet ready, and this was the last reference to the shared state.

When an asynchronous provider is said to make its shared state ready, it means:

1. first, the provider marks its shared state as ready; and
2. second, the provider unblocks any execution agents waiting for its shared state to become ready.

When an asynchronous provider is said to abandon its shared state, it means:

1. first, if that state is not ready, the provider
   1. stores an exception object of type \texttt{future_error} with an error condition of \texttt{broken_promise} within its shared state; and then
   2. makes its shared state ready;
2. second, the provider releases its shared state.

A shared state is \textit{ready} only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

Calls to functions that successfully set the stored result of a shared state synchronize with (\ref{futures.temporary}) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether
normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a
waiting function on the shared state.

Some functions (e.g., promise::set_value_at_thread_exit) delay making the shared state ready until the
calling thread exits. The destruction of each of that thread’s objects with thread storage duration (6.7.5.3) is
sequenced before making that shared state ready.

Access to the result of the same shared state may conflict (6.9.2).

[Note 4: This explicitly specifies that the result of the shared state is visible in the objects that reference this state
in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by
shared_future::get() (33.10.8) must either use read-only operations or provide additional synchronization. — end
note]

### 33.10.6 Class template promise

```cpp
namespace std {
    class promise {
        public:
            promise();
            template<class Allocator>
                promise(allocator_arg_t, const Allocator& a);
            promise(promise&& rhs) noexcept;
            promise(const promise&) = delete;
            ~promise();

            // assignment
            promise& operator=(promise&& rhs) noexcept;
            promise& operator=(const promise&) = delete;
            void swap(promise& other) noexcept;

            // retrieving the result
            future<R> get_future();

            // setting the result
            void set_value(see below);
            void set_exception(exception_ptr p);

            // setting the result with deferred notification
            void set_value_at_thread_exit(see below);
            void set_exception_at_thread_exit(exception_ptr p);
    };

    template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc> : true_type { };
}
```

1 For the primary template, R shall be an object type that meets the Cpp17Destructible requirements.

2 The implementation provides the template promise and two specializations, promise<R&> and promise<void>. These differ only in the argument type of the member functions set_value and set_value_at_thread_exit, as set out in their descriptions, below.

3 The set_value, set_exception, set_value_at_thread_exit, and set_exception_at_thread_exit member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

4 Preconditions: Alloc meets the Cpp17Allocator requirements (16.4.4.6.1).

promise();
template<class Allocator>
    promise(allocation_arg_t, const Allocator& a);

Effects: Creates a shared state. The second constructor uses the allocator \( a \) to allocate memory for the shared state.

promise(promise&& rhs) noexcept;

Effects: Transfers ownership of the shared state of \( rhs \) (if any) to the newly-constructed object.

Postconditions: \( rhs \) has no shared state.

\~promise();

Effects: Abandons any shared state (33.10.5).

promise operator=(promise&& rhs) noexcept;

Effects: Abandons any shared state (33.10.5) and then as if \( \text{promise(std::move(rhs)).swap(*this)} \).

Returns: \*this.

void swap(promise& other) noexcept;

Effects: Exchanges the shared state of \*this and other.

Postconditions: \*this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that \*this had prior to the call to swap.

future<R> get_future();

Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to \set_value, \set_exception, \set_value_at_thread_exit, or \set_exception_at_thread_exit.

[Note 1: Such calls need not synchronize with each other. —end note]

Returns: A future<R> object with the same shared state as \*this.

Throws: future_error if \*this has no shared state or if get_future has already been called on a promise with the same shared state as \*this.

Error conditions:

(16.1) — future_already_retrieved if get_future has already been called on a promise with the same shared state as \*this.

(16.2) — no_state if \*this has no shared state.

void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R>::set_value(R& r);
void promise<void>::set_value();

Effects: Atomically stores the value \( r \) in the shared state and makes that state ready (33.10.5).

Throws:

(18.1) — future_error if its shared state already has a stored value or exception, or

(18.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or

(18.3) — for the second version, any exception thrown by the constructor selected to move an object of R.

Error conditions:

(19.1) — promise_already_satisfied if its shared state already has a stored value or exception.

(19.2) — no_state if \*this has no shared state.

void set_exception(exception_ptr p);

Preconditions: \( p \) is not null.

Effects: Atomically stores the exception pointer \( p \) in the shared state and makes that state ready (33.10.5).

Throws: future_error if its shared state already has a stored value or exception.

Error conditions:

§ 33.10.6 1742
promise_already_satisfied if its shared state already has a stored value or exception.

no_state if *this has no shared state.

```cpp
void promise::set_value_at_thread_exit(const R& r);
void promise::set_value_at_thread_exit(R&& r);
void promise<R&>::set_value_at_thread_exit(R& r);
void promise<void>::set_value_at_thread_exit();
```

**Effects:** Stores the value \( r \) in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

**Throws:**
- future_error if its shared state already has a stored value or exception, or
- for the first version, any exception thrown by the constructor selected to copy an object of \( R \), or
- for the second version, any exception thrown by the constructor selected to move an object of \( R \).

**Error conditions:**
- promise_already_satisfied if its shared state already has a stored value or exception.
- no_state if *this has no shared state.

```cpp
void set_exception_at_thread_exit(exception_ptr p);
```

**Preconditions:** \( p \) is not null.

**Effects:** Stores the exception pointer \( p \) in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

**Throws:** future_error if an error condition occurs.

**Error conditions:**
- promise_already_satisfied if its shared state already has a stored value or exception.
- no_state if *this has no shared state.

```cpp
template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;
```

**Effects:** As if by \( x.swap(y) \).

### 33.10.7 Class template future

The class template `future` defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed `future` object has no shared state. A `future` object with shared state can be created by functions on asynchronous providers (33.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a `future` object can be set by calling a respective function on an object that shares the same shared state.

**Note 1:** Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`.  
*end note*

The effect of calling any member function other than the destructor, the move-assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined.

**Note 2:** It is valid to move from a future object for which `valid() == false`.  
*end note*

**Recommended practice:** Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```cpp
namespace std {
    template<class R>
    class future {
    public:
        future() noexcept;
        future(future&&) noexcept;
        future(future& x, future& y) noexcept;
        future(const future& x, future& y) noexcept;
        future(const future& x) noexcept;
        future(const future& x) = delete;
```
future();
future& operator=(const future&) = delete;
future& operator=(future&&) noexcept;
shared_future<R> share() noexcept;

// retrieving the value
see below get();

// functions to check state
bool valid() const noexcept;

void wait() const;
template<class Rep, class Period>
  future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
template<class Clock, class Duration>
  future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
};

4 For the primary template, $R$ shall be an object type that meets the Cpp17Destructible requirements.

5 The implementation provides the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

future() noexcept;

Effects: The object does not refer to a shared state.

Postconditions: `valid() == false`.

future(future&& rhs) noexcept;

Effects: Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

Postconditions:

(9.1) `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.

(9.2) `rhs.valid() == false`.

future();

Effects:

(10.1) Releases any shared state (33.10.5);

(10.2) destroys *this.

future& operator=(future&& rhs) noexcept;

Effects:

(11.1) Releases any shared state (33.10.5).

(11.2) move assigns the contents of `rhs` to *this.

Postconditions:

(12.1) `valid()` returns the same value as `rhs.valid()` prior to the assignment.

(12.2) `rhs.valid() == false`.

shared_future<R> share() noexcept;

Postconditions: valid() == false.

Returns: shared_future<R>(std::move(*this)).

R future::get();
R& future<R&>::get();
void future<void>::get();

[Note 3: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

Effects:
— wait()s until the shared state is ready, then retrieves the value stored in the shared state;
— releases any shared state (33.10.5).

Postconditions: valid() == false.

Returns:
— future::get() returns the value v stored in the object’s shared state as std::move(v).
— future<R&>::get() returns the reference stored as value in the object’s shared state.
— future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.

Returns:
— future_status::deferred if the shared state contains a deferred function.
— future_status::ready if the shared state is ready.
— future_status::timeout if the function is returning because the relative timeout (33.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (33.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by abs_time has expired.

Returns:
— future_status::deferred if the shared state contains a deferred function.
— future_status::ready if the shared state is ready.
— future_status::timeout if the function is returning because the absolute timeout (33.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (33.2.4).

### 33.10.8 Class template shared_future

The class template shared_future defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed shared_future object has no shared state. A shared_future object with shared state can be created by conversion from a future object and shares its shared state with the original asynchronous provider (33.10.5) of the shared state. The result (value or exception) of a shared_future object can be set by calling a respective function on an object that shares the same shared state.

[Note 1: Member functions of shared_future do not synchronize with themselves, but they synchronize with the shared state. — end note]
The effect of calling any member function other than the destructor, the move-assignment operator, the copy-assignment operator, or \texttt{valid()} on a \texttt{shared_future} object for which \texttt{valid()} == \texttt{false} is undefined.

[Note 2: It is valid to copy or move from a \texttt{shared_future} object for which \texttt{valid()} is \texttt{false}. — end note]

\textbf{Recommended practice:} Implementations should detect this case and throw an object of type \texttt{future_error} with an error condition of \texttt{future_errc::no_state}.

```cpp
namespace std {
    template<class R>
    class shared_future {
    public:
        shared_future() noexcept;
        shared_future(const shared_future& rhs) noexcept;
        shared_future(future<R>&& rhs) noexcept;
        shared_future(shared_future&& rhs) noexcept;
        ~shared_future();
        shared_future& operator=(const shared_future& rhs) noexcept;
        shared_future& operator=(shared_future&& rhs) noexcept;

        // retrieving the value
        see below get() const;

        // functions to check state
        bool valid() const noexcept;
        void wait() const;
        template<class Rep, class Period>
        future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
        template<class Clock, class Duration>
        future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

For the primary template, \texttt{R} shall be an object type that meets the \texttt{Cpp17Destructible} requirements.

The implementation provides the template \texttt{shared_future} and two specializations, \texttt{shared_future<R&>} and \texttt{shared_future<void>}. These differ only in the return type and return value of the member function \texttt{get}, as set out in its description, below.

```cpp
shared_future() noexcept;
Effects: The object does not refer to a shared state.
Postconditions: valid() == false.
```

```cpp
shared_future(const shared_future& rhs) noexcept;
Effects: The object refers to the same shared state as \texttt{rhs} (if any).
Postconditions: valid() returns the same value as \texttt{rhs.valid()}.
```

```cpp
shared_future(future<R>&& rhs) noexcept;
shared_future(shared_future&& rhs) noexcept;
Effects: Move constructs a \texttt{shared_future} object that refers to the shared state that was originally referred to by \texttt{rhs} (if any).
Postconditions:
(11.1) valid() returns the same value as \texttt{rhs.valid()} returned prior to the constructor invocation.
(11.2) \texttt{rhs.valid()} == false.
```

```cpp
~shared_future();
Effects:
(12.1) Releases any shared state (33.10.5);
(12.2) destroys \texttt{*this}.
```
shared_future& operator=(shared_future&& rhs) noexcept;

Effects:
— Releases any shared state (33.10.5);
— move assigns the contents of rhs to *this.

Postconditions:
— valid() returns the same value as rhs.valid() returned prior to the assignment.
— rhs.valid() == false.

shared_future& operator=(const shared_future& rhs) noexcept;

Effects:
— Releases any shared state (33.10.5);
— assigns the contents of rhs to *this.

Postconditions:
valid() == rhs.valid().

const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;

[Note 4: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

[Note 5: Access to a value object stored in the shared state is unsynchronized, so operations on R might introduce a data race (6.9.2). — end note]

Effects: wait()s until the shared state is ready, then retrieves the value stored in the shared state.

Returns:
— shared_future::get() returns a const reference to the value stored in the object’s shared state.

[Note 6: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the shared_future object that returned the reference. — end note]

— shared_future<R&>::get() returns the reference stored as value in the object’s shared state.

— shared_future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.

Returns:
— future_status::deferred if the shared state contains a deferred function.
— future_status::ready if the shared state is ready.
— future_status::timeout if the function is returning because the relative timeout (33.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (33.2.4).

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by abs_time has expired.

Returns:

- **future_status::deferred** if the shared state contains a deferred function.
- **future_status::ready** if the shared state is ready.
- **future_status::timeout** if the function is returning because the absolute timeout (33.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (33.2.4).

33.10.9 Function template async

The function template async provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a future object with which it shares a shared state.

```cpp
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>> async(F&& f, Args&&... args);
```

Mandates: The following are all true:

- (is_constructible_v<decay_t<F>, F>, F),
- (is_constructible_v<decay_t<Args>, Args> && ...), and
- (is_invocable_v<decay_t<F>, decay_t<Args>...>.

Effects: The first function behaves the same as a call to the second function with a policy argument of launch::async | launch::deferred and the same arguments for F and Args. The second function creates a shared state that is associated with the returned future object. The further behavior of the second function depends on the policy argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

- If launch::async is set in policy, calls invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...) (22.10.4, 33.4.3.3) as if in a new thread of execution represented by a thread object with the values produced by auto being materialized (7.3.5) in the thread that called async. Any return value is stored as the result in the shared state. Any exception propagated from the execution of invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...) is stored as the exceptional result in the shared state. The thread object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

- If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

Synchronization: The invocation of async synchronizes with the invocation of f. The completion of the function f is sequenced before the shared state is made ready.
If the implementation chooses the `launch::async` policy,

---

1. A call to a waiting function on an asynchronous return object that shares the shared state created by this `async` call shall block until the associated thread has completed, as if joined, or else time out (33.4.3.6);

2. The associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

**Returns:** An object of type `future<invoke_result_t<decay_t<F>, decay_t<Args>...>>` that refers to the shared state created by this call to `async`.

---

**Throws:** `system_error` if `policy == launch::async` and the implementation is unable to start a new thread, or `std::bad_alloc` if memory for the internal data structures cannot be allocated.

**Error conditions:**

---

**Example 1:**

```cpp
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async([=]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get();   // #1
}
```

**Note 3:** Line #1 might not result in concurrency because the `async` call uses the default policy, which might use `launch::deferred`, in which case the lambda might not be invoked until the `get()` call; in that case, `work1` and `work2` are called on the same thread and there is no concurrency. —end note

---

### 33.10.10 Class template `packaged_task`

**General**

The class template `packaged_task` defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.

When the `packaged_task` object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```cpp
namespace std {
    template<class> class packaged_task;  // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>
    {
        public:
            // construction and destruction
            packaged_task() noexcept;
            template<class F>
                explicit packaged_task(F&& f);
            ~packaged_task();

            // no copy
            packaged_task(const packaged_task&) = delete;
            packaged_task& operator=(const packaged_task&) = delete;
    }
}
```
// move support
packaged_task(packaged_task&& rhs) noexcept;
packaged_task& operator=(packaged_task&& rhs) noexcept;
void swap(packaged_task& other) noexcept;

bool valid() const noexcept;

// result retrieval
future<R> get_future();

// execution
void operator() (ArgTypes...);
void make_ready_at_thread_exit(ArgTypes...);
void reset();

};

template<class R, class... ArgTypes>
packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>
;

template<class F> packaged_task(F) -> packaged_task<see below>;

33.10.10.2 Member functions [futures.task.members]

packaged_task() noexcept;
   Effects: The object has no shared state and no stored task.

template<class F>
packaged_task(F&& f);
   Constraints: remove_cvref_t<F> is not the same type as packaged_task<R(ArgTypes...)>
.
   Mandates: is_invocable_r_v<R, F&, ArgTypes...> is true.
   Preconditions: Invoking a copy of f behaves the same as invoking f.
   Effects: Constructs a new packaged_task object with a shared state and initializes the object’s stored
task with std::forward<F>(f).
   Throws: Any exceptions thrown by the copy or move constructor of f, or bad_alloc if memory for the
internal data structures cannot be allocated.

template<class F> packaged_task(F) -> packaged_task<see below>;
   Constraints: &F::operator() is well-formed when treated as an unevaluated operand (7.2.3) and
decltype(&F::operator()) is of the form R(G::*)(A...) ev &opt noexcept for a class type G.
   Remarks: The deduced type is packaged_task<R(A...)>
.
packaged_task(packaged_task&& rhs) noexcept;
   Effects: Transfers ownership of rhs’s shared state to *this, leaving rhs with no shared state. Moves
the stored task from rhs to *this.
   Postconditions: rhs has no shared state.

packaged_task& operator=(packaged_task&& rhs) noexcept;
   Effects:
   (11.1) — Releases any shared state (33.10.5);
   (11.2) — calls packaged_task(std::move(rhs)).swap(*this).

~packaged_task();
   Effects: Abandons any shared state (33.10.5).

void swap(packaged_task& other) noexcept;
   Effects: Exchanges the shared states and stored tasks of *this and other.

§ 33.10.10.2
Postconditions: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

bool valid() const noexcept;

Returns: true only if *this has a shared state.

future<R> get_future();

Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or make_ready_at_thread_exit.

[Note 1: Such calls need not synchronize with each other. — end note]

Returns: A future object that shares the same shared state as *this.

Throws: A future_error object if an error occurs.

Error conditions:

(19.1) — future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.

(19.2) — no_state if *this has no shared state.

void operator()(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t₁, t₂, ..., tₙ) (22.10.4), where f is the stored task of *this and t₁, t₂, ..., tₙ are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.

Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.

Error conditions:

(22.1) — promise_already_satisfied if the stored task has already been invoked.

(22.2) — no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);

Effects: As if by INVOKE<R>(f, t₁, t₂, ..., tₙ) (22.10.4), where f is the stored task and t₁, t₂, ..., tₙ are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (33.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

Throws: future_error if an error condition occurs.

Error conditions:

(25.1) — promise_already_satisfied if the stored task has already been invoked.

(25.2) — no_state if *this has no shared state.

void reset();

Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.

[Note 2: This constructs a new shared state for *this. The old state is abandoned (33.10.5). — end note]

Throws:

(27.1) — bad_alloc if memory for the new shared state cannot be allocated.

(27.2) — any exception thrown by the move constructor of the task stored in the shared state.

(27.3) — future_error with an error condition of no_state if *this has no shared state.

33.10.10.3 Globals

template<class R, class... ArgTypes>

§ 33.10.10.3 1751
```cpp
void swap(packaged_task<R(ArgTypes...)> & x, packaged_task<R(ArgTypes...)> & y) noexcept;

1

Effects: As if by x.swap(y).
```
Annex A  (informative)
Grammar summary

A.1 General

This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

A.2 Keywords

New context-dependent keywords are introduced into a program by typedef (9.2.4), namespace (9.8.2), class (Clause 11), enumeration (9.7.1), and template (Clause 13) declarations.

typedef-name:
  identifier
  simple-template-id

namespace-name:
  identifier
  namespace-alias

namespace-alias:

Annex B  (normative)
Implementation quantities [implimits]

1 Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.

2 The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.

(2.1) Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
(2.2) Nesting levels of conditional inclusion (15.2) [256].
(2.3) Pointer (9.3.4.2), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a class, arithmetic, or incomplete type in a declaration [256].
(2.4) Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
(2.5) Number of characters in an internal identifier (5.10) or macro name (15.6) [1024].
(2.6) Number of characters in an external identifier (5.10, 6.6) [1024].
(2.7) External identifiers (6.6) in one translation unit [65536].
(2.8) Identifiers with block scope declared in one block (6.4.3) [1024].
(2.9) Structured bindings (9.6) introduced in one declaration [256].
(2.10) Macro identifiers (15.6) simultaneously defined in one translation unit [65536].
(2.11) Parameters in one function definition (9.5.1) [256].
(2.12) Arguments in one function call (7.6.1.3) [256].
(2.13) Parameters in one macro definition (15.6) [256].
(2.14) Arguments in one macro invocation (15.6) [256].
(2.15) Characters in one logical source line (5.2) [65536].
(2.16) Characters in a string-literal (5.13.5) (after concatenation (5.2)) [65536].
(2.17) Size of an object (6.7.2) [262144].
(2.18) Nesting levels for #include files (15.3) [256].
(2.19) Case labels for a switch statement (8.5.3) (excluding those for any nested switch statements) [16384].
(2.20) Non-static data members (including inherited ones) in a single class (11.4) [16384].
(2.21) Lambda-captures in one lambda-expression (7.5.5.3) [256].
(2.22) Enumeration constants in a single enumeration (9.7.1) [4096].
(2.23) Levels of nested class definitions (11.4.12) in a single member-specification [256].
(2.24) Functions registered by atexit() (17.5) [32].
(2.25) Functions registered by at_quick_exit() (17.5) [32].
(2.26) Direct and indirect base classes (11.7) [16384].
(2.27) Direct base classes for a single class (11.7) [1024].
(2.28) Class members declared in a single member-specification (including member functions) (11.4) [4096].
(2.29) Final overriding virtual functions in a class, accessible or not (11.7.3) [16384].
(2.30) Direct and indirect virtual bases of a class (11.7.2) [1024].

Annex C  (informative)
Compatibility

C.1  C++ and ISO C++ 2020

C.1.1 General

Subclause C.1 lists the differences between C++ and ISO C++ 2020 (ISO/IEC 14882:2020, Programming Languages — C++), by the chapters of this document.

C.1.2 Clause 5: lexical conventions

1. Affected subclause: 5.10
   Change: Previously valid identifiers containing characters not present in UAX #44 properties XID_Start or XID_Continue, or not in Normalization Form C, are now rejected.
   Rationale: Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.
   Effect on original feature: Some identifiers are no longer well-formed.

2. Affected subclause: 5.13.5
   Change: Concatenated string-literals can no longer have conflicting encoding-prefixes.
   Rationale: Removal of unimplemented conditionally-supported feature.
   Effect on original feature: Concatenation of string-literals with different encoding-prefixes is now ill-formed.

   [Example 1:
    auto c = L"a" U"b";
    // was conditionally-supported; now ill-formed
   — end example]

C.1.3 Clause 7: expressions

1. Affected subclause: 7.6.1.2
   Change: Change the meaning of comma in subscript expressions.
   Rationale: Enable repurposing a deprecated syntax to support multidimensional indexing.
   Effect on original feature: Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile. For example:

   arr[1, 2]
   // was equivalent to arr[(1, 2)],
   // now equivalent to arr.operator[](1, 2) or ill-formed

C.1.4 Clause 16: library introduction

1. Affected subclause: 16.4.2.3
   Change: New headers.
   Rationale: New functionality.
   Effect on original feature: The following C++ headers are new: <expected> (22.8.2), <stdatomic.h> (33.5.12), <spanstream> (31.9.2), and <stacktrace> (19.6.2). Valid C++ 2020 code that #includes headers with these names may be invalid in this revision of C++.

C.1.5 Clause 22: general utilities library

1. Affected subclause: 22.14
   Change: Signature changes: format, format_to, vformat_to, format_to_n, formatted_size. Removal of format_args_t.
   Rationale: Improve safety via compile-time format string checks, avoid unnecessary template instantiations.
   Effect on original feature: Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or format_args_t may become ill-formed. For example:

   auto s = std::format("{:d}", "I am not a number");  // ill-formed,
   // previously threw format_error

   2. Affected subclause: 22.14
      Change: Signature changes: format, format_to, format_to_n, formatted_size.

§ C.1.5
Rationale: Enable formatting of views that do not support iteration when const-qualified and that are not copyable.

Effect on original feature: Valid C++ 2020 code that passes bit fields to formatting functions may become ill-formed. For example:

```cpp
struct tiny {
    int bit: 1;
};

auto t = tiny();
std::format("{t.bit}");     // ill-formed, previously returned "0"
```

C.1.6 Clause 24: containers library

Affected subclauses: 24.2.7 and 24.2.8

Change: Heterogeneous extract and erase overloads for associative containers.

Rationale: Improve efficiency of erasing elements from associative containers.

Effect on original feature: Valid C++ 2020 code may fail to compile in this revision of C++. For example:

```cpp
struct B {
    auto operator<=>(const B&) const = default;
};

struct D : private B {
    void f(std::set<B, std::less<>>& s) {
        s.erase(*this);      // ill formed; previously well-formed
    }
};
```

C.2 C++ and ISO C++ 2017

C.2.1 General

Subclause C.2 lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, Programming Languages — C++), by the chapters of this document.

C.2.2 Clause 5: lexical conventions

Affected subclauses: 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5

Change: New identifiers with special meaning.

Rationale: Required for new features.

Effect on original feature: Logical lines beginning with module or import may be interpreted differently in this revision of C++.

Example 1:

```cpp
class module{};
module m1;       // was variable declaration; now module-declaration
module *m2;     // variable declaration

class import{};
import j1;      // was variable declaration; now module-import-declaration
::import j2;    // variable declaration

—end example
```

Example 2:

```cpp
template<typename> class import{};
import<int> f();    // ill-formed; previously well-formed
::import<int> g();   // OK

—end example
```
Affected subclause: 5.11
Change: New keywords.
Rationale: Required for new features.

- The `char8_t` keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- The `concept` keyword is added to enable the definition of concepts (13.7.9).
- The `constexpr` keyword is added to declare immediate functions (9.2.6).
- The `constinit` keyword is added to prevent unintended dynamic initialization (9.2.7).
- The `co_await`, `co_yield`, and `co_return` keywords are added to enable the definition of coroutines (9.5.4).
- The `requires` keyword is added to introduce constraints through a `requires-clause` (13.1) or a `requires-expression` (7.5.7).

Effect on original feature: Valid C++ 2017 code using `char8_t`, `concept`, `constexpr`, `constinit`, `co_await`, `co_yield`, `co_return`, or `requires` as an identifier is not valid in this revision of C++.

Affected subclause: 5.12
Change: New operator `<=>.
Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code that contains a `<=` token immediately followed by a `>` token may be ill-formed or have different semantics in this revision of C++:

```cpp
namespace N {
  struct X {};
  bool operator<=(X, X);
  template<bool(X, X)> struct Y {};
  Y<operator<=> y; // ill-formed; previously well-formed
}
```

Affected subclause: 5.13
Change: Type of UTF-8 string and character literals.
Rationale: Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

Effect on original feature: Valid C++ 2017 code that depends on UTF-8 string literals having type “array of const char” and UTF-8 character literals having type “char” is not valid in this revision of C++.

```cpp
const auto *u8s = u8"text"; // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s; // ill-formed; previously well-formed

auto u8c = u8'c'; // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c; // ill-formed; previously well-formed

std::string s = u8"text"; // ill-formed; previously well-formed
void f(const char *s);
f(u8"text"); // ill-formed; previously well-formed
```

C.2.3 Clause 6: basics

Affected subclause: 6.7.3
Change: A pseudo-destructor call ends the lifetime of the object to which it is applied.
Rationale: Increase consistency of the language model.

Effect on original feature: Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++.

Example 1:
```cpp
int f() {
  int a = 123;
} [diff.cpp17.basic]"
using T = int;
a. -T();
return a; // undefined behavior; previously returned 123
}
— end example]  

Affected subclause: 6.9.2.2  
Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.  
Rationale: Removal of rarely used and confusing feature.  
Effect on original feature: If a memory_order_release atomic store is followed by a memory_order_relaxed store to the same variable by the same thread, then reading the latter value with a memory_order_acquire load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.2.4 Clause 7: expressions  

Affected subclause: 7.5.5.3  
Change: Implicit lambda capture may capture additional entities.  
Rationale: Rule simplification, necessary to resolve interactions with constexpr if.  
Effect on original feature: Lambdas with a capture-default may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

C.2.5 Clause 9: declarations  

Affected subclause: 9.2.4  
Change: Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.  
Rationale: Necessary for implementability.  
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++.

typedef struct {
    void f() {}
} S;  

Affected subclause: 9.3.4.7  
Change: A function cannot have different default arguments in different translation units.  
Rationale: Required for modules support.  
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required.

// Translation unit 1
int f(int a = 42);
int g() { return f(); }  

// Translation unit 2
int f(int a = 76) { return a; } // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); } // used to return 42

Affected subclause: 9.4.2  
Change: A class that has user-declared constructors is never an aggregate.  
Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.  
Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++.

struct A {
    A() = delete;
};  

struct B {
    B() = default;
    int i = 0;
};

§ C.2.5 1780
struct C { // not an aggregate; previously an aggregate
    C(C&&) = default;
    int a, b;
};

A a{}; // ill-formed; previously well-formed
B b = {1}; // ill-formed; previously well-formed
auto* c = new C{2, 3}; // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};

struct Y {
    // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y(x()); // copy constructor call; previously aggregate-initialization

4 Affected subclause: 9.4.5
Change: Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.
Rationale: Catches bugs.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
bool y[] = { "bc" }; // ill-formed; previously well-formed
```

C.2.6 Clause 11: classes [diff.cpp17.class]

1 Affected subclauses: 11.4.5 and 11.4.8.3
Change: The class name can no longer be used parenthesized immediately after an explicit decl-specifier in a constructor declaration. The conversion-function-id can no longer be used parenthesized immediately after an explicit decl-specifier in a conversion function declaration.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
struct S {
    explicit (S)(const S&); // ill-formed; previously well-formed
    explicit (operator int)(); // ill-formed; previously well-formed
    explicit(true) (S)(int); // OK
};
```

2 Affected subclauses: 11.4.5 and 11.4.7
Change: A simple-template-id is no longer valid as the declarator-id of a constructor or destructor.
Rationale: Remove potentially error-prone option for redundancy.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
template<class T>
struct A {
    A<T>(); // error: simple-template-id not allowed for constructor
    A(int); // OK, injected-class-name used
    ~A<T>(); // error: simple-template-id not allowed for destructor
};
```

3 Affected subclause: 11.9.6
Change: A function returning an implicitly movable entity may invoke a constructor taking an rvalue reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.
Rationale: Side effect of making it easier to write more efficient code that takes advantage of moves.
Effect on original feature: Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++. For example:

```cpp
struct base {
    base();
    base(base const &); ```

§ C.2.6 1781
private:
    base(base &&);
};

struct derived : base {};

base f(base b) {
    throw b; // error: base(base &&) is private
    derived d; // error: base(base &&) is private
    return d;
}

struct S {
    S(const char *s) : m(s) { }
    S(const S&) = default;
    S(S&& other) : m(other.m) { other.m = nullptr; }
    const char * m;
};

S consume(S&& s) { return s; }

void g() {
    S s("text");
    consume(static_cast<S&&>(s));
    char c = *s.m; // undefined behavior; previously ok
}

C.2.7 Clause 12: overloading

Affected subclause: 12.2.2.3
Change: Equality and inequality expressions can now find reversed and rewritten candidates.
Rationale: Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.
Effect on original feature: Equality and inequality expressions between two objects of different types, where one is convertible to the other, could invoke a different operator. Equality and inequality expressions between two objects of the same type could become ambiguous.

struct A {
    operator int() const;
};

bool operator==(A, int); // #1
    // #2 is built-in candidate: bool operator==(int, int);
    // #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) + // ill-formed; previously well-formed
        (10 == x) + // calls #1, previously selected #2
        (10 != x); // calls #1, previously selected #3
}

C.2.8 Clause 13: templates

Affected subclause: 13.3
Change: An unqualified-id that is followed by a < and for which name lookup finds nothing or finds a function will be treated as a template-name in order to potentially cause argument dependent lookup to be performed.
Rationale: It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.
Effect on original feature: Previously valid code that uses a function name as the left operand of a < operator would become ill-formed.

struct A {};
    bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
    f < a;  // ill-formed; previously well-formed
    (f) < a;  // still well formed
}

C.2.9 Clause 14: exception handling [diff.cpp17.except]

Affected subclause: 14.5
Change: Remove throw() exception specification.
Rationale: Removal of obsolete feature that has been replaced by noexcept.
Effect on original feature: A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses throw() for its exception specification will be rejected as ill-formed in this revision of C++. It should simply be replaced with noexcept for no change of meaning since C++ 2017.

[Note 1: There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — end note]

C.2.10 Clause 16: library introduction [diff.cpp17.library]

Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <barrier> (33.9.3.2), <bit> (22.15.2), <charconv> (22.13.1), <compare> (17.11.1), <concepts> (18.3), <coroutine> (17.12.2), <cmath> (22.14.1), <latch> (33.9.2.2), <numbers> (28.8.1), <ranges> (26.2), <semaphore> (33.8.2), <source_location> (17.8.1), <span> (24.7.2), <stop_token> (33.3.2), <syncstream> (31.11.1), and <version> (17.3.1). Valid C++ 2017 code that #include s headers with these names may be invalid in this revision of C++.

Affected subclause: 16.4.2.3
Change: Remove vacuous C++ header files.
Rationale: The empty headers implied a false requirement to achieve C compatibility with the C++ headers.
Effect on original feature: A valid C++ 2017 program that #includes any of the following headers may fail to compile: <ccomplex>, <ciso646>, <cstdlibalign>, <cstdlibbool>, and <ctgmath>. To retain the same behavior:

(2.1) — a #include of <ccomplex> can be replaced by a #include of <complex> (28.4.2),
(2.2) — a #include of <ctgmath> can be replaced by a #include of <cmath> (28.7.1) and a #include of <complex>, and
(2.3) — a #include of <ciso646>, <cstdlibalign>, or <cstdlibbool> can simply be removed.

C.2.11 Clause 24: containers library [diff.cpp17.containers]

Affected subclauses: 24.3.9 and 24.3.10
Change: Return types of remove, remove_if, and unique changed from void to container::size_type.
Rationale: Improve efficiency and convenience of finding number of removed elements.
Effect on original feature: Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.

C.2.12 Clause 25: iterators library [diff.cpp17.iterators]

Affected subclause: 25.3.2.3
Change: The specialization of iterator_traits for void* and for function pointer types no longer contains any nested typedefs.
Rationale: Corrects an issue misidentifying pointer types that are not incrementable as iterator types.
Effect on original feature: A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.
C.2.13 Clause 27: algorithms library

Affected subclause: 27.2
Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.
Rationale: Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.
Effect on original feature: A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

C.2.14 Clause 31: input/output library

Affected subclause: 31.7.4.3.3
Change: Character array extraction only takes array types.
Rationale: Increase safety via preventing buffer overflow at compile time.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++:

```cpp
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p; // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q; // OK
```

Affected subclause: 31.7.5.3.4
Change: Overload resolution for ostream inserters used with UTF-8 literals.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2017 code that passes UTF-8 literals to basic_ostream<char, ...>::operator<< or basic_ostream<wchar_t, ...>::operator<< is now ill-formed.

```cpp
std::cout << u8"text"; // previously called operator<<(const char*) and printed a string;
// now ill-formed
std::cout << u8'X'; // previously called operator<<(char) and printed a character;
// now ill-formed
```

Affected subclause: 31.7.5.3.4
Change: Overload resolution for ostream inserters used with wchar_t, char16_t, or char32_t types.
Rationale: Removal of surprising behavior.
Effect on original feature: Valid C++ 2017 code that passes wchar_t, char16_t, or char32_t characters or strings to basic_ostream<char, ...>::operator<< or that passes char16_t or char32_t characters or strings to basic_ostream<wchar_t, ...>::operator<< is now ill-formed.

```cpp
std::cout << u"text"; // previously formatted the string as a pointer value;
// now ill-formed
std::cout << u'X'; // previously formatted the character as an integer value;
// now ill-formed
```

Affected subclause: 31.12.6
Change: Return type of filesystem path format observer member functions.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2017 code that depends on the u8string() and generic_u8string() member functions of std::filesystem::path returning std::string is not valid in this revision of C++.

```cpp
std::filesystem::path p;
std::string s1 = p.u8string(); // ill-formed; previously well-formed
std::string s2 = p.generic_u8string(); // ill-formed; previously well-formed
```

C.2.15 Annex D: compatibility features

Affected subclause: 31.4.3.3
Change: Remove uncaught_exception.
Rationale: The function did not have a clear specification when multiple exceptions were active, and has been superseded by uncaught_exceptions.
Effect on original feature: A valid C++ 2017 program that calls std::uncaught_exception may fail to compile. It can be revised to use std::uncaught_exceptions instead, for clear and portable semantics.

Change: Remove support for adaptable function API.
Rationale: The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with decltype, and by the std::bind and std::not_fn function templates.

§ C.2.15
Effect on original feature: A valid C++ 2017 program that relies on the presence of `result_type`, `argument_type`, `first_argument_type`, or `second_argument_type` in a standard library class may fail to compile. A valid C++ 2017 program that calls `not1` or `not2`, or uses the class templates `unary_negate` or `binary_negate`, may fail to compile.

3 Change: Remove redundant members from `std::allocator`.
Rationale: `std::allocator` was overspecified, encouraging direct usage in user containers rather than relying on `std::allocator_traits`, leading to poor containers.
Effect on original feature: A valid C++ 2017 program that directly makes use of the `pointer`, `const_pointer`, `reference`, `const_reference`, `rebind`, `address`, `construct`, `destroy`, or `max_size` members of `std::allocator`, or that directly calls `allocate` with an additional hint argument, may fail to compile.

4 Change: Remove `raw_storage_iterator`.
Rationale: The iterator encouraged use of algorithms that might throw exceptions, but did not return the number of elements successfully constructed that might need to be destroyed in order to avoid leaks.
Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

5 Change: Remove temporary buffers API.
Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.
Effect on original feature: A valid C++ 2017 program that calls `get_temporary_buffer` or `return_temporary_buffer` may fail to compile.

6 Change: Remove `shared_ptr::unique`.
Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function `use_count` is similarly unreliable, but has a clearer contract in such cases, and remains available for well defined use in single-threaded cases.
Effect on original feature: A valid C++ 2017 program that calls `unique` on a `shared_ptr` object may fail to compile.

7 Affected subclause: D.15
Change: Remove deprecated type traits.
Rationale: The traits had unreliable or awkward interfaces. The `is_literal_type` trait provided no way to detect which subset of constructors and member functions of a type were declared `constexpr`. The `result_of` trait had a surprising syntax that could not report the result of a regular function type. It has been superseded by the `invoke_result` trait.
Effect on original feature: A valid C++ 2017 program that relies on the `is_literal_type` or `result_of` type traits, on the `is_literal_type_v` variable template, or on the `result_of_t` alias template may fail to compile.

C.3 C++ and ISO C++ 2014

C.3.1 General

Subclause C.3 lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.3.2 Clause 5: lexical conventions

1 Affected subclause: 5.2
Change: Removal of trigraph support as a required feature.
Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.
Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from physical source file characters to the translation character set.

2 Affected subclause: 5.9
Change: `pp-number` can contain `p` sign and `P` sign.
Rationale: Necessary to enable `hexadecimal-floating-point-literals`.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like `0p+0` and `0e1_p+0` are three separate tokens each in C++ 2014, but one single token in this revision of C++. For example:
C.3.3 Clause 7: expressions

1. Affected subclauses: 7.6.1.6 and 7.6.2.3
   Change: Remove increment operator with bool operand.
   Rationale: Obsolete feature with occasionally surprising semantics.
   Effect on original feature: A valid C++ 2014 expression utilizing the increment operator on a bool lvalue is ill-formed in this revision of C++. Note that this might occur when the lvalue has a type given by a template parameter.

2. Affected subclauses: 7.6.2.8 and 7.6.2.9
   Change: Dynamic allocation mechanism for over-aligned types.
   Rationale: Simplify use of over-aligned types.
   Effect on original feature: In C++ 2014 code that uses a new-expression to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, ::operator new(std::size_t) is used to allocate the memory. In this revision of C++, ::operator new(std::size_t, std::align_val_t) is used instead.

C.3.4 Clause 9: declarations

1. Affected subclause: 9.2.2
   Change: Removal of register storage-class-specifier.
   Rationale: Enable repurposing of deprecated keyword in future revisions of C++.
   Effect on original feature: A valid C++ 2014 declaration utilizing the register storage-class-specifier is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

2. Affected subclause: 9.2.9.6
   Change: auto deduction from braced-init-list.
   Rationale: More intuitive deduction behavior.
   Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:
   ```
   auto x1{1}; // was std::initializer_list<int>, now int
   auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
   ```

3. Affected subclause: 9.3.4.6
   Change: Make exception specifications be part of the type system.
   Rationale: Improve type-safety.
   Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this revision of C++. For example:
   ```
   void g1() noexcept;
   void g2();
   template<class T> int f(T *, T *);
   int x = f(g1, g2); // ill-formed; previously well-formed
   ```

4. Affected subclause: 9.4.2
   Change: Definition of an aggregate is extended to apply to user-defined types with base classes.
   Rationale: To increase convenience of aggregate initialization.
   Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:
   ```
   struct derived;
   struct base {
     friend struct derived;
     private:
     base();
   };
   struct derived : base {};
   derived d1{}; // error; the code was well-formed in C++ 2014
   derived d2; // still OK
   ```

§ C.3.4
C.3.5 Clause 11: classes

Affected subclause: 11.9.4
Change: Inheriting a constructor no longer injects a constructor into the derived class.
Rationale: Better interaction with other language features.
Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A using-declaration that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors.

```cpp
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L); // now calls B(int), used to call B<long>(long),
    // which called A(int) due to substitution failure
    // in A<long>(long).
```

C.3.6 Clause 13: templates

Affected subclause: 13.10.3.6
Change: Allowance to deduce from the type of a non-type template argument.
Rationale: In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. For example:

```cpp
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
    foo(p);    // ill-formed; previously well-formed
}
```

C.3.7 Clause 14: exception handling

Affected subclause: 14.5
Change: Remove dynamic exception specifications.
Rationale: Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.
Effect on original feature: A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, or function reference declaration, or function reference declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls terminate rather than unexpected, and it is unspecified whether stack unwinding is performed prior to such a call.

C.3.8 Clause 16: library introduction

Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <any> (22.7.2), <charconv> (22.13.1), <execution> (22.12.2), <filesystem> (31.12.4), <memory_resource> (20.4.1), <optional> (22.5.2), <string_view> (23.3.2), and <variant> (22.6.2). Valid C++ 2014 code that includes headers with these names may be invalid in this revision of C++.

Affected subclause: 16.4.5.2.3
Change: New reserved namespaces.
Rationale: Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.

§ C.3.8 1787
Effect on original feature: The global namespaces `std` followed by an arbitrary sequence of digits (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.

C.3.9 Clause 22: general utilities library [diff.cpp14.utilities]

Affected subclause: 22.10.17
Change: Constructors taking allocators removed.
Rationale: No implementation consensus.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

Affected subclause: 20.3.2.2
Change: Different constraint on conversions from `unique_ptr`.
Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```cpp
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

C.3.10 Clause 23: strings library [diff.cpp14.string]

Affected subclause: 23.4.3
Change: Non-const `.data()` member added.
Rationale: The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.
Effect on original feature: Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string’s `.data()` member in this revision of C++. For example:

```cpp
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

C.3.11 Clause 24: containers library [diff.cpp14.containers]

Affected subclause: 24.2.7
Change: Requirements change.
Rationale: Increase portability, clarification of associative container requirements.
Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++:

```cpp
#include <set>
struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};

int main()
{
    const std::set<int, compare> s;
    s.find(0);
}
```

Change: The class templates `auto_ptr`, `unary_function`, and `binary_function`, the function templates `random_shuffle`, and the function templates (and their return types) `ptr_fun`, `mem_fun`, `mem_fun_ref`, `bind1st`, and `bind2nd` are not defined.
Rationale: Superseded by new features.
Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

Change: Remove old iostreams members [depr.ios.members].
Rationale: Redundant feature for compatibility with pre-standard code has served its time.
Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

C.4 C++ and ISO C++ 2011

C.4.1 General

Subclause C.4 lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.4.2 Clause 5: lexical conventions

Affected subclause: 5.9
Change: pp-number can contain one or more single quotes.
Rationale: Necessary to enable single quotes as digit separators.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a character-literal in C++ 2011, whereas they are digit separators in this revision of C++:

```c++
#define M(x, ...) _VA_ARGS_
// int x[2] = { 3'4, 5 }; — this revision of C++
```

C.4.3 Clause 6: basics

Affected subclause: 6.7.5.5.3
Change: New usual (non-placement) deallocator.
Rationale: Required for sized deallocation.
Effect on original feature: Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```c++
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```

In this revision of C++, however, the declaration of `operator delete` might match a predefined usual (non-placement) `operator delete` (6.7.5.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

C.4.4 Clause 7: expressions

Affected subclause: 7.6.16
Change: A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.
Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.
Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++:

```c++
struct S {
    int x = 1;
    void mf() { x = 2; }
};
int f(bool cond) {
    S s;
    (cond ? s : throw 0).mf();
    return s.x;
}
```
In C++ 2011, \(f(\text{true})\) returns 1. In this revision of C++, it returns 2.

```cpp
sizeof(true ? "" : throw 0)
```

In C++ 2011, the expression yields `sizeof(const char*)`. In this revision of C++, it yields `sizeof(const char[1])`.

### C.4.5 Clause 9: declarations

1. **Affected subclause:** 9.2.6
   - **Change:** `constexpr` non-static member functions are not implicitly `const` member functions.
   - **Rationale:** Necessary to allow `constexpr` member functions to mutate the object.
   - **Effect on original feature:** Valid C++ 2011 code may fail to compile in this revision of C++. For example, the following code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types:

   ```cpp
   struct S {
   constexpr const int &f();
   int &f();
   };
   ```

2. **Affected subclause:** 9.4.2
   - **Change:** Classes with default member initializers can be aggregates.
   - **Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.
   - **Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example:

   ```cpp
   struct S {
       int m = 1;
   };
   struct X {
       operator int();
       operator S();
   };
   X a{};
   S b(a);  // uses copy constructor in C++ 2011,
   // performs aggregate initialization in this revision of C++
   ```

### C.4.6 Clause 16: library introduction

1. **Affected subclause:** 16.4.2.3
   - **Change:** New header.
   - **Rationale:** New functionality.
   - **Effect on original feature:** The C++ header `<shared_mutex>` (33.6.3) is new. Valid C++ 2011 code that includes a header with that name may be invalid in this revision of C++.

### C.4.7 Clause 31: input/output library

1. **Affected subclause:** 31.13
   - **Change:** `gets` is not defined.
   - **Rationale:** Use of `gets` is considered dangerous.
   - **Effect on original feature:** Valid C++ 2011 code that uses the `gets` function may fail to compile in this revision of C++.

### C.5 C++ and ISO C++ 2003

1. **Affected subclause:** 5.4
   - **Change:** New kinds of `string-literals`.
   - **Rationale:** Required for new features.
   - **Effect on original feature:** Valid C++ 2003 code may fail to compile or produce different results in this...
revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a string-literal but will be interpreted as part of the string-literal. For example:

```c
#define u8 "abc"
const char* s = u8"def";    // Previously "abcdef", now "def"
```

2 Affected subclause: 5.4

Change: User-defined literal string support.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```c
#define _x "there"
"hello"_x    // #1
```

Previously, #1 would have consisted of two separate preprocessing tokens and the macro _x would have been expanded. In this revision of C++, #1 consists of a single preprocessing token, so the macro is not expanded.

3 Affected subclause: 5.11

Change: New keywords.
Rationale: Required for new features.
Effect on original feature: Added to Table 5, the following identifiers are new keywords: alignas, alignof, char16_t, char32_t, constexpr, decltype, noexcept, nullptr, static_assert, and thread_local. Valid C++ 2003 code using these identifiers is invalid in this revision of C++.

4 Affected subclause: 5.13.2

Change: Type of integer literals.
Rationale: C99 compatibility.
Effect on original feature: Certain integer literals larger than can be represented by long could change from an unsigned integer type to signed long long.

C.5.3 Clause 7: expressions

1 Affected subclause: 7.3.12

Change: Only literals are integer null pointer constants.
Rationale: Removing surprising interactions with templates and constant expressions.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```c
void f(void *);    // #1
void f(...);       // #2
template<int N> void g() {
    f(0*N);   // calls #2; used to call #1
}
```

2 Affected subclause: 7.6.5

Change: Specify rounding for results of integer / and %.
Rationale: Increase portability, C99 compatibility.
Effect on original feature: Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.

3 Affected subclause: 7.6.14

Change: && is valid in a type-name.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```c
bool b1 = new int && false;    // previously false, now ill-formed
struct S { operator int(); };;
bool b2 = &S::operator int && false;    // previously false, now ill-formed
```

C.5.4 Clause 9: declarations

1 Affected subclause: 9.2

Change: Remove auto as a storage class specifier.
Rationale: New feature.
Effect on original feature: Valid C++ 2003 code that uses the keyword auto as a storage class specifier
may be invalid in this revision of C++. In this revision of C++, `auto` indicates that the type of a variable is to be deduced from its initializer expression.

2 **Affected subclause:** 9.4.5  
**Change:** Narrowing restrictions in aggregate initializers.  
**Rationale:** Catches bugs.  
**Effect on original feature:** Valid C++ 2003 code may fail to compile in this revision of C++. For example, the following code is valid in C++ 2003 but invalid in this revision of C++ because `double` to `int` is a narrowing conversion:

```c++
int x[] = { 2.0 };
```

### C.5.5 Clause 11: classes

1 **Affected subclauses:** 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6  
**Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.  
**Rationale:** Improves template argument deduction failure.  
**Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

2 **Affected subclause:** 11.4.7  
**Change:** User-declared destructors have an implicit exception specification.  
**Rationale:** Clarification of destructor requirements.  
**Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call `std::terminate` (without calling `std::unexpected`) if their exception specification is non-throwing.

### C.5.6 Clause 13: templates

1 **Affected subclause:** 13.2  
**Change:** Repurpose `export` for modules (Clause 10, 15.4, 15.5).  
**Rationale:** No implementation consensus for the C++ 2003 meaning of `export`.  
**Effect on original feature:** A valid C++ 2003 program containing `export` is ill-formed in this revision of C++.

2 **Affected subclause:** 13.4  
**Change:** Remove whitespace requirement for nested closing template right angle brackets.  
**Rationale:** Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.  
**Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (”>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example, the following code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>” closes two templates.

```c++
template <class T> struct X { };  
template <int N> struct Y { };  
X<< Y<< 1 >> 2 >> x;
```

3 **Affected subclause:** 13.8.4.2  
**Change:** Allow dependent calls of functions with internal linkage.  
**Rationale:** Overly constrained, simplify overload resolution rules.  
**Effect on original feature:** A valid C++ 2003 program could get a different result than in this revision of C++.

### C.5.7 Clause 16: library introduction

1 **Affected:** Clause 16 – Clause 33  
**Change:** New reserved identifiers.  
**Rationale:** Required by new features.  
**Effect on original feature:** Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++. A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.
2 Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: <array> (24.3.2), <atomic> (33.5.2), <chrono> (29.2), <codecvt> (D.22.2), <condition_variable> (33.7.2), <forward_list> (24.3.4), <future> (33.10.2), <initializer_list> (17.10.2), <mutex> (33.6.2), <random> (28.5.2), <ratio> (21.4.2), <regex> (32.3), <scoped_allocator> (20.5.1), <system_error> (19.5.2), <thread> (33.4.2), <tuple> (22.4.2), <type-index> (22.11.1), <type_traits> (21.3.3), <unordered_map> (24.5.2), and <unordered_set> (24.5.3). In addition the following C compatibility headers are new: <cfenv> (28.3.1), <cinttypes> (31.13.2), <cstdint> (17.4.2), and <cuchar> (23.5.5). Valid C++ 2003 code that #includes headers with these names may be invalid in this revision of C++.

3 Affected subclause: 16.4.4.3
Effect on original feature: Function swap moved to a different header
Rationale: Remove dependency on <algorithm> (27.4) for swap.
Effect on original feature: Valid C++ 2003 code that has been compiled expecting swap to be in <algorithm> (27.4) may have to instead include <utility> (22.2.1).

4 Affected subclause: 16.4.5.2.2
Change: New reserved namespace.
Rationale: New functionality.
Effect on original feature: The global namespace posix is now reserved for standardization. Valid C++ 2003 code that uses a top-level namespace posix may be invalid in this revision of C++.

5 Affected subclause: 16.4.6.3
Change: Additional restrictions on macro names.
Rationale: Avoid hard to diagnose or non-portable constructs.
Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines override, final, carries_dependency, or noreturn as macros is invalid in this revision of C++.

C.5.8 Clause 17: language support library

1 Affected subclause: 17.6.3.2
Change: operator new may throw exceptions other than std::bad_alloc.
Rationale: Consistent application of noexcept.
Effect on original feature: Valid C++ 2003 code that assumes that global operator new only throws std::bad_alloc may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable operator new is ill-formed in this revision of C++, because the exception specification of throw(std::bad_alloc) was removed.

C.5.9 Clause 19: diagnostics library

1 Affected subclause: 19.4
Change: Thread-local error numbers.
Rationale: Support for new thread facilities.
Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on errno being the same across threads may change behavior in this revision of C++.

C.5.10 Clause 22: general utilities library

1 Affected subclauses: 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11
Change: Standard function object types no longer derived from std::unary_function or std::binary_function.
Rationale: Superseded by new feature; unary_function and binary_function are no longer defined.
Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from unary_function or binary_function may fail to compile in this revision of C++.

C.5.11 Clause 23: strings library

1 Affected subclause: 23.4
Change: basic_string requirements no longer allow reference-counted strings.
Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior.
Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++.
2 Affected subclause: 23.4.3.2
Change: Loosen basic_string invalidation rules.
Rationale: Allow small-string optimization.
Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++. Some const member functions, such as data and c_str, no longer invalidate iterators.

C.5.12 Clause 24: containers library [diff.cpp03.containers]

1 Affected subclause: 24.2
Change: Complexity of size() member functions now constant.
Rationale: Lack of specification of complexity of size() resulted in divergent implementations with inconsistent performance characteristics.
Effect on original feature: Some container implementations that conform to C++ 2003 may not conform to the specified size() requirements in this revision of C++. Adjusting containers such as std::list to the stricter requirements may require incompatible changes.

2 Affected subclause: 24.2
Change: Requirements change: relaxation.
Rationale: Clarification.
Effect on original feature: Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

(2.1) — not all containers provide size(); use empty() instead of size() == 0;
(2.2) — not all containers are empty after construction (array);
(2.3) — not all containers have constant complexity for swap() (array).

3 Affected subclause: 24.2
Change: Requirements change: default constructible.
Rationale: Clarification of container requirements.
Effect on original feature: Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

4 Affected subclauses: 24.2.4 and 24.2.7
Change: Signature changes: from void return types.
Rationale: Old signature threw away useful information that may be expensive to recalculate.
Effect on original feature: The following member functions have changed:

(4.1) — erase(iter) for set, multiset, map, multimap
(4.2) — erase(begin, end) for set, multiset, map, multimap
(4.3) — insert(pos, num, val) for vector, deque, list, forward_list
(4.4) — insert(pos, beg, end) for vector, deque, list, forward_list

Valid C++ 2003 code that relies on these functions returning void (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

5 Affected subclauses: 24.2.4 and 24.2.7
Change: Signature changes: from iterator to const_iterator parameters.
Rationale: Overspecification.
Effect on original feature: The signatures of the following member functions changed from taking an iterator to taking a const_iterator:

(5.1) — insert(iter, val) for vector, deque, list, set, multiset, map, multimap
(5.2) — insert(pos, beg, end) for vector, deque, list, forward_list
(5.3) — erase(begin, end) for set, multiset, map, multimap
(5.4) — all forms of list::splice
(5.5) — all forms of list::merge

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

6 Affected subclauses: 24.2.4 and 24.2.7
Change: Signature changes: resize.
Rationale: Performance, compatibility with move semantics.
Effect on original feature: For vector, deque, and list the fill value passed to resize is now passed by reference instead of by value, and an additional overload of resize has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

C.5.13 Clause 27: algorithms library  [diff.cpp03.algorithms]

1 Affected subclause: 27.1
Change: Result state of inputs after application of some algorithms.
Rationale: Required by new feature.
Effect on original feature: A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, std::remove and std::remove_if may leave the tail of the input sequence with a different set of values than previously.

C.5.14 Clause 28: numerics library  [diff.cpp03.numerics]

1 Affected subclause: 28.4
Change: Specified representation of complex numbers.
Rationale: Compatibility with C99.
Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of std::complex may not be compatible with this revision of C++.

C.5.15 Clause 30: localization library  [diff.cpp03.locale]

1 Affected subclause: 30.4.3.2.3
Change: The num_get facet recognizes hexadecimal floating point values.
Rationale: Required by new feature.
Effect on original feature: Valid C++ 2003 code may have different behavior in this revision of C++.

C.5.16 Clause 31: input/output library  [diff.cpp03.input.output]

1 Affected subclauses: 31.7.4.2.4, 31.7.5.2.4, and 31.5.4.4
Change: Specify use of explicit in existing boolean conversion functions.
Rationale: Clarify intentions, avoid workarounds.
Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

(1.1) — passing a value to a function that takes an argument of type bool;
(1.2) — using operator== to compare to false or true;
(1.3) — returning a value from a function with a return type of bool;
(1.4) — initializing members of type bool via aggregate initialization;
(1.5) — initializing a const bool& which would bind to a temporary object.

2 Affected subclause: 31.5.2.2.1
Change: Change base class of std::ios_base::failure.
Rationale: More detailed error messages.
Effect on original feature: std::ios_base::failure is no longer derived directly from std::exception, but is now derived from std::system_error, which in turn is derived from std::runtime_error. Valid C++ 2003 code that assumes that std::ios_base::failure is derived directly from std::exception may execute differently in this revision of C++.

3 Affected subclause: 31.5.2
Change: Flag types in std::ios_base are now bitmasks with values defined as constexpr static members.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code that relies on std::ios_base flag types being represented as std::bitset or as an integer type may fail to compile with this revision of C++. For example:

```cpp
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag); // error: setf does not take argument of type int
}
```
C.6  C++ and ISO C

C.6.1  General

Subclause C.6 lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

C.6.2  Clause 5: lexical conventions

1  Affected subclause: 5.11
   Change: New Keywords
   New keywords are added to C++; see 5.11.
   Rationale: These keywords were added in order to implement the new semantics of C++.
   Effect on original feature: Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.
   Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.
   How widely used: Common.

2  Affected subclause: 5.13.3
   Change: Type of character-literal is changed from int to char.
   Rationale: This is needed for improved overloaded function argument type matching. For example:
   ```c
   int function( int i );
   int function( char c );
   function( 'x' );
   ```
   It is preferable that this call match the second version of function rather than the first.
   Effect on original feature: Change to semantics of well-defined feature. ISO C programs which depend on `sizeof( 'x' ) == sizeof(int)` will not work the same as C++ programs.
   Difficulty of converting: Simple.
   How widely used: Programs which depend upon `sizeof('x')` are probably rare.

3  Affected subclause: 5.13.5
   Change: Concatenated string-literals can no longer have conflicting encoding-prefixes.
   Rationale: Removal of non-portable feature.
   Effect on original feature: Concatenation of string-literals with different encoding-prefixes is now ill-formed.
   Difficulty of converting: Syntactic transformation.
   How widely used: Seldom.

4  Affected subclause: 5.13.5
   Change: String literals made const.
   The type of a string-literal is changed from “array of char” to “array of const char”. The type of a UTF-8 string literal is changed from “array of char” to “array of const char8_t”. The type of a UTF-16 string literal is changed from “array of some-integer-type” to “array of const char16_t”. The type of a UTF-32 string literal is changed from “array of some-integer-type” to “array of const char32_t”. The type of a wide string literal is changed from “array of wchar_t” to “array of const wchar_t”.
   Rationale: This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.
   Effect on original feature: Change to semantics of well-defined feature.
   Difficulty of converting: Syntactic transformation. The fix is to add a cast:
   ```c
   char* p = "abc";  // valid in C, invalid in C++
   void f(char*) {
     char* p = (char*)"abc";  // OK, cast added
     f(p);
     f((char*)"def");  // OK, cast added
   }
   ```
   How widely used: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.
C.6.3 Clause 6: basics

1 Affected subclause: 6.2
Change: C++ does not have “tentative definitions” as in C.
E.g., at file scope,

```c
int i;
int i;
```
is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```c
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };  // Error: &a is undefined in C++
static struct X a = { 1, &b };
```

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.
How widely used: Seldom.

2 Affected subclause: 6.4
Change: A struct is a scope in C++, not in C. For example,

```c
struct X {
    struct Y { int a; } b;
};
struct Y c;
```
is valid in C but not in C++, which would require `X::Y c`.

Rationale: Class scope is crucial to C++, and a struct is a class.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: C programs use `struct` extremely frequently, but the change is only noticeable when `struct`, enumeration, or enumerator names are referred to outside the `struct`. The latter is probably rare.

3 Affected subclause: 6.6 [also 9.2.9]
Change: A name of file scope that is explicitly declared `const`, and not explicitly declared `extern`, has internal linkage, while in C it would have external linkage.

Rationale: Because `const` objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each `const` object. This feature allows the user to put `const` objects in source files that are included in more than one translation unit.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

4 Affected subclause: 6.9.3.1
Change: The `main` function cannot be called recursively and cannot have its address taken.

Rationale: The `main` function may require special actions.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Trivial: create an intermediary function such as `mymain(argc, argv)`.
How widely used: Seldom.

5 Affected subclause: 6.8
Change: C allows “compatible types” in several places, C++ does not.
For example, otherwise-identical `struct` types with different tag names are “compatible” in C but are distinctly different types in C++.

Rationale: Stricter type checking is essential for C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.
How widely used: Common.
C.6.4 Clause 7: expressions

Affected subclause: 7.3.12
Change: Converting `void*` to a pointer-to-object type requires casting.

```c
char a[10];
void* b = a;
void foo() {
    char* c = b;
}
```

ISO C accepts this usage of pointer to `void` being assigned to a pointer to object type. C++ does not.

Rationale: C++ tries harder than C to enforce compile-time type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```c
char* c = (char*) b;
```

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

---

Affected subclause: 7.6.1.3
Change: Implicit declaration of functions is not allowed.

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature. Note: the original feature was labeled as “obsolete” in ISO C.

Difficulty of converting: Syntactic transformation. Facilities for producing explicit function declarations are fairly widespread commercially.

How widely used: Common.

---

Affected subclauses: 7.6.1.6 and 7.6.2.3
Change: Decrement operator is not allowed with `bool` operand.

Rationale: Feature with surprising semantics.

Effect on original feature: A valid ISO C expression utilizing the decrement operator on a `bool` lvalue (for instance, via the C typedef in `<stdbool.h>` (17.14.5)) is ill-formed in C++.

---

Affected subclauses: 7.6.2.5 and 7.6.3
Change: In C++, types can only be defined in declarations, not in expressions.

In C, a `sizeof` expression or cast expression may define a new type. For example,

```c
p = (void*)(struct x {int i;}) *0;
```

defines a new type, struct x.

Rationale: This prohibition helps to clarify the location of definitions in the source code.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

---

Affected subclauses: 7.6.16, 7.6.19, and 7.6.20
Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.

Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.

Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```c
char arr[100];
sizeof(0, arr)
```

yields 100 in C++ and `sizeof(char*)` in C.

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.

How widely used: Rare.

C.6.5 Clause 8: statements

Affected subclauses: 8.5.3 and 8.7.6
Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire
Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, any use of the uninitialized object could be a disaster. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

Affected subclause: 8.7.4
Change: It is now invalid to return (explicitly or implicitly) from a function which is declared to return a value without actually returning a value.

Rationale: The caller and callee may assume fairly elaborate return-value mechanisms for the return of class objects. If some flow paths execute a return without specifying any value, the implementation must embody many more complications. Besides, promising to return a value of a given type, and then not returning such a value, has always been recognized to be a questionable practice, tolerated only because very-old C had no distinction between functions with void and int return types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.

How widely used: Seldom. For several years, many existing C implementations have produced warnings in this case.

C.6.6 Clause 9: declarations

Affected subclause: 9.2.2
Change: In C++, the static or extern specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:

```c
static struct S {
    int i;
};
```

Rationale: Storage class specifiers don’t have any meaning when associated with a type. In C++, class members can be declared with the static storage class specifier. Allowing storage class specifiers on type declarations could render the code confusing for users.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Add an appropriate return value to the source code, such as zero.

How widely used: Seldom.

Affected subclause: 9.2.2
Change: In C++, register is not a storage class specifier.

Rationale: The storage class specifier had no effect in C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Common.

Affected subclause: 9.2.4
Change: A C++ typedef-name must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a typedef-name and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

Example:

```c
typedef struct namel { /* ... */ } namel;       // valid C and C++
struct name { /* ... */ };                  // valid C, invalid C++
typedef int name;                         // valid C, invalid C++
```

Rationale: For ease of use, C++ doesn’t require that a type name be prefixed with the keywords class, struct or union when used in object declarations or type casts.

Example:

```c
class name { /* ... */ };
```
name i;         // i has type class name

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.
How widely used: Seldom.

Affected subclause: 9.2.9 [see also 6.6]
Change: Const objects must be initialized in C++ but can be left uninitialized in C.
Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

Affected subclause: 9.2.9
Change: Banning implicit int.
In C++ a decl-specifier-seq must contain a type-specifier, unless it is followed by a declarator for a constructor, a destructor, or a conversion function. In the following example, the left-hand column presents valid C; the right-hand column presents equivalent C++:

```
void f(const parm);    void f(const int parm);
const n = 3;           const int n = 3;
main()                int main()
    /* ... */          /* ... */
```

Rationale: In C++, implicit int creates several opportunities for ambiguity between expressions involving function-like casts and declarations. Explicit declaration is increasingly considered to be proper style. Liaison with WG14 (C) indicated support for (at least) deprecating implicit int in the next revision of C.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. Can be automated.
How widely used: Common.

Affected subclause: 9.2.9.6
Change: The keyword auto cannot be used as a storage class specifier.

```
void f() {
    auto int x;    // valid C, invalid C++
}
```

Rationale: Allowing the use of auto to deduce the type of a variable from its initializer results in undesired interpretations of auto as a storage class specifier in certain contexts.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Rare.

Affected subclause: 9.3.4.6
Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

```
int f();    // means int f(void) in C++
            // int f( unknown ) in C
```

Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).
Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolete” in C.
Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be completed to become full prototype declarations. A program may need to be updated further if different calls to the same (non-prototype) function have different numbers of arguments or if the type of corresponding arguments differed.
How widely used: Common.

Affected subclause: 9.3.4.6 [see 7.6.2.5]
Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:
void f( struct S { int a; } arg ) {}  // valid C, invalid C++
enum E { A, B, C } f() {}           // valid C, invalid C++

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.

How widely used: Seldom. This style of type definition is seen as poor coding style.

9  Affected subclause: 9.5
Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.

Rationale: Prototypes are essential to type safety.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common in old programs, but already known to be obsolescent.

10 Affected subclause: 9.4.2
Change: In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2};  // valid C, invalid C++
int arr[3] = {{1} = 5};         // valid C, invalid C++
struct B b = {.a.x = 0};        // valid C, invalid C++
struct A c = {.x = 1, 2};       // valid C, invalid C++

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with lambda-expression syntax. Nested designators are seldom used.

Effect on original feature: Deletion of feature that is incompatible with C++.

Difficulty of converting: Syntactic transformation.

How widely used: Out-of-order initializers are common. The other features are seldom used.

11 Affected subclause: 9.4.3
Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating ‘\0’) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating ‘\0’.

Example:
char array[4] = "abcd";           // valid C, invalid C++

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string terminating ‘\0’.

How widely used: Seldom. This style of array initialization is seen as poor coding style.

12 Affected subclause: 9.7.1
Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:
enum color { red, blue, green };
enum color c = 1;                 // valid C, invalid C++

Rationale: The type-safe nature of C++.

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)

How widely used: Common.

Affected subclause: 9.7.1
Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is int.

Example:

```c
enum e { A };  
sizeof(A) == sizeof(int)  // in C
sizeof(A) == sizeof(e)    // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */
```

Rationale: In C++, an enumeration is a distinct type.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is taken. Taking the size of an enumerator is not a common C coding practice.

C.6.7 Clause 11: classes

Affected subclause: 11.3 [see also 9.2.4]
Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration of a struct tag name never hides the name of an object or function in an outer scope.

Example:

```c
int x[99];
void f() {
    struct x { int a; };
    sizeof(x);  // size of the array in C
    /* size of the struct in C++ */
}
```

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new C++ name space definition where a name can be declared as a type and as a non-type in a single scope causing the non-type name to hide the type name and requiring that the keywords class, struct, union or enum be used to refer to the type name. This new name space definition provides important notational conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible to the use of fundamental types. The advantages of the new name space definition were judged to outweigh by far the incompatibility with C described above.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at global scope, the :: C++ operator can be used. If the hidden name is at block scope, either the type or the struct tag has to be renamed.

How widely used: Seldom.

Affected subclause: 11.4.5.3
Change: Copying volatile objects.

The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a copy of a volatile lvalue. For example, the following is valid in ISO C:

```c
struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1;    // invalid C++
struct X x3;
x3 = x1;            // also invalid C++
```

Rationale: Several alternatives were debated at length. Changing the parameter to volatile const X& would greatly complicate the generation of efficient code for class objects. Discussion of providing two alternative signatures for these implicitly-defined operations raised unanswered concerns about creating ambiguities and complicating the rules that specify the formation of these operators according to the bases and members.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a
user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit
\texttt{const\_cast} can be used.

\textbf{How widely used:} Seldom.

\textbf{3 Affected subclause: 11.4.10}

\textbf{Change:} Bit-fields of type plain \texttt{int} are signed.

\textbf{Rationale:} Leaving the choice of signedness to implementations could lead to inconsistent definitions of
template specializations. For consistency, the implementation freedom was eliminated for non-dependent
types, too.

\textbf{Effect on original feature:} The choice is implementation-defined in C, but not so in C++.

\textbf{Difficulty of converting:} Syntactic transformation.

\textbf{How widely used:} Seldom.

\textbf{4 Affected subclause: 11.4.12}

\textbf{Change:} In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class
belongs to the same scope as the name of the outermost enclosing class.

\textbf{Example:}

\begin{verbatim}
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy;              // valid C, invalid C++
\end{verbatim}

\textbf{Rationale:} C++ classes have member functions which require that classes establish scopes. The C rule would
leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining
locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated
and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving
nested or local functions.

\textbf{Effect on original feature:} Change to semantics of well-defined feature.

\textbf{Difficulty of converting:} Semantic transformation. To make the struct type name visible in the scope of
the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing
struct is defined. Example:

\begin{verbatim}
struct Y;                   // struct Y and struct X are at the same scope
struct X {
    struct Y { /* ... */ } y;
};
\end{verbatim}

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of
the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the
difference in scope rules, which is documented in 6.4.

\textbf{How widely used:} Seldom.

\textbf{5 Affected subclause: 6.5.2}

\textbf{Change:} In C++, a \texttt{typedef-name} may not be redeclared in a class definition after being used in that
definition.

\textbf{Example:}

\begin{verbatim}
typedef int I;
struct S {
    I i;
    int I;          // valid C, invalid C++
};
\end{verbatim}

\textbf{Rationale:} When classes become complicated, allowing such a redefinition after the type has been used can
create confusion for C++ programmers as to what the meaning of \texttt{I} really is.

\textbf{Effect on original feature:} Deletion of semantically well-defined feature.

\textbf{Difficulty of converting:} Semantic transformation. Either the type or the struct member has to be
renamed.

\textbf{How widely used:} Seldom.

\section{Clause 15: preprocessing directives

\textbf{[diff.cpp]}

\textbf{1 Affected subclause: 15.11}

\textbf{Change:} Whether \texttt{__STDC__} is defined and if so, what its value is, are implementation-defined.

\textbf{Rationale:} C++ is not identical to ISO C. Mandating that \texttt{__STDC__} be defined would require that
translators make an incorrect claim.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Programs and headers that reference __STDC__ are quite common.

C.7 C standard library [diff.library]

C.7.1 General [diff.library.general]

Subclause C.7 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.7.2 Modifications to headers [diff.mods.to.headers]

1 For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in 17.14.

2 There are no C++ headers for the C standard library’s headers <stdnoreturn.h> and <threads.h>, nor are these headers from the C standard library headers themselves part of C++.

3 The C headers <complex.h> and <tgmath.h> do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.7.3 Modifications to definitions [diff.mods.to.declarations]

C.7.3.1 Types char16_t and char32_t [diff.char16]

1 The types char16_t and char32_t are distinct types rather than typedefs to existing integral types. The tokens char16_t and char32_t are keywords in C++ (5.11). They do not appear as macro or type names defined in <cuchar> (23.5.5).

C.7.3.2 Type wchar_t [diff.wchar.t]

1 The type wchar_t is a distinct type rather than a typedef to an existing integral type. The token wchar_t is a keyword in C++ (5.11). It does not appear as a macro or type name defined in any of <cassert> (19.3.2), <cstdlib> (17.2.2), or <cwchar> (23.5.4).

C.7.3.3 Header <assert.h> [diff.header.assert.h]

1 The token static_assert is a keyword in C++. It does not appear as a macro name defined in <cassert> (19.3.2).

C.7.3.4 Header <iso646.h> [diff.header.iso646.h]

1 The tokens and, and_eq, bitand, bitor, compl, not, not_eq, or, or_eq, xor, and xor_eq are keywords in C++ (5.11), and are not introduced as macros by <iso646.h> (17.14.3).

C.7.3.5 Header <stdalign.h> [diff.header.stdalign.h]

1 The token alignas is a keyword in C++ (5.11), and is not introduced as a macro by <stdalign.h> (17.14.4).

C.7.3.6 Header <stdbool.h> [diff.headerstdbool.h]

1 The tokens bool, true, and false are keywords in C++ (5.11), and are not introduced as macros by <stdbool.h> (17.14.5).

C.7.3.7 Macro NULL [diff.null]

1 The macro NULL, defined in any of <locale> (30.5.1), <cstdlib> (17.2.1), <cstdio> (31.13.1), <cstdlib> (17.2.2), <cstring> (23.5.3), <ctime> (29.14), or <cwchar> (23.5.4), is an implementation-defined null pointer constant in C++ (17.2).

C.7.4 Modifications to declarations [diff.mods.to.declarations]

1 Header <cstring> (23.5.3): The following functions have different declarations:

- strchr
- strpbrk
- strrchr
C.7.5 Modifications to behavior

C.7.5.1 General

1 Header `<cstdlib>` (17.2.2): The following functions have different behavior:
   (1.1) `atexit`
   (1.2) `exit`
   (1.3) `abort`

   Subclause 17.5 describes the changes.

2 Header `<csetjmp>` (17.13.3): The following functions have different behavior:
   (2.1) `longjmp`

   Subclause 17.13.3 describes the changes.

C.7.5.2 Macro `offsetof(type, member-designator)`

1 The macro `offsetof`, defined in `<cassert>` (17.2.1), accepts a restricted set of `type` arguments in C++. Subclause 17.2.4 describes the change.

C.7.5.3 Memory allocation functions

1 The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.11 describes the changes.
Annex D  (normative)
Compatibility features  [depr]

D.1 General  [depr.general]
1 This Annex describes features of the C++ Standard that are specified for compatibility with existing implementations.
2 These are deprecated features, where deprecated is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the deprecated attribute (9.12.4).

D.2 Arithmetic conversion on enumerations  [depr.arith.conv.enum]
1 The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated.

[Note 1: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note]

[Example 1:
enum E1 { e };
enum E2 { f };
bool b = e <= 3.7; // deprecated
int k = f - e; // deprecated
auto cmp = e <=> f; // error
—end example]

D.3 Implicit capture of *this by reference  [depr.capture.this]
1 For compatibility with prior revisions of C++, a lambda-expression with capture-default = (7.5.5.3) may implicitly capture *this by reference.

[Example 1:
struct X {
    int x;
    void foo(int n) {
        auto f = [=]() { x = n; }; // deprecated: x means this->x, not a copy thereof
        auto g = [=, this]() { x = n; }; // recommended replacement
    }
};
—end example]

D.4 Array comparisons  [depr.array.comp]
1 Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

[Note 1: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note]

[Example 1:
int arr1[5];
int arr2[5];
bool same = arr1 == arr2; // deprecated, same as &arr1[0] == &arr2[0],
// does not compare array contents
auto cmp = arr1 <=> arr2; // error
—end example]

D.5 Deprecated volatile types  [depr.volatile.type]
1 Postfix ++ and -- expressions (7.6.1.6) and prefix ++ and -- expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[Example 1:
volatile int velociraptor;
++velociraptor;  // deprecated
—end example]  

2 Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2:
  int neck, tail;
  volatile int brachiosaur;
  brachiosaur = neck;  // OK
  tail = brachiosaur;  // OK
  tail = brachiosaur = neck;  // deprecated
  brachiosaur += neck;  // deprecated
  brachiosaur = brachiosaur + neck;  // OK
—end example]

A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3:
  volatile struct amber jurassic();  // deprecated
  void trex(volatile short left_arm, volatile short right_arm);  // deprecated
  void fly(volatile struct pterosaur* pteranodon);  // OK
—end example]

4 A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example 4:
  struct linhenykus { short forelimb; };
  void park(linhenykus alvarezsauroid) {
    volatile auto [what_is_this] = alvarezsauroid;  // deprecated
    // ...
  }
—end example]

D.6 Redeclaration of static constexpr data members [depr.static.constexpr]

For compatibility with prior revisions of C++, a constexpr static data member may be redundantly redeclared outside the class with no initializer. This usage is deprecated.

[Example 1:
  struct A {
    static constexpr int n = 5;  // definition (declaration in C++ 2014)
  };
  constexpr int A::n;  // redundant declaration (definition in C++ 2014)
—end example]

D.7 Non-local use of TU-local entities [depr.local]

A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[Note 1: Such a declaration in an importable module unit is ill-formed. — end note]

[Example 1:
  namespace {
    struct A {
      void f() {}
    };
  }
  A h();  // deprecated: not internal linkage
  inline void g() {A().f();}  // deprecated: inline and not internal linkage
—end example]
D.8 Implicit declaration of copy functions

The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.5.3).

D.9 template keyword before qualified names

The use of the keyword template before the qualified name of a class or alias template without a template argument list is deprecated.

D.10 Requires paragraph

In addition to the elements specified in 16.3.2.4, descriptions of function semantics may also contain a Requires: element to denote the preconditions for calling a function.

2 Violation of any preconditions specified in a function’s Requires: element results in undefined behavior unless the function’s Throws: element specifies throwing an exception when the precondition is violated.

D.11 Relational operators

The header <utility> (22.2.1) has the following additions:

```cpp
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
}
```

2 To avoid redundant definitions of operator!= out of operator== and operators >, <=, and >= out of operator<, the library provides the following:

```cpp
template<class T> bool operator!=(const T& x, const T& y);
Requires: Type T is Cpp17EqualityComparable (Table 27).
Returns: !(x == y).
```

```cpp
template<class T> bool operator>(const T& x, const T& y);
Requires: Type T is Cpp17LessThanComparable (Table 28).
Returns: y < x.
```

```cpp
template<class T> bool operator<=(const T& x, const T& y);
Requires: Type T is Cpp17LessThanComparable (Table 28).
Returns: !(y < x).
```

```cpp
template<class T> bool operator>=(const T& x, const T& y);
Requires: Type T is Cpp17LessThanComparable (Table 28).
Returns: !(x < y).
```

D.12 char* streams

D.12.1 Header <strstream> synopsis

The header <strstream> defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```cpp
namespace std {
    class strstreambuf;
    class istrstream;
    class ostrstream;
    class strstream;
}
```
D.12.2 Class strstreambuf

D.12.2.1 General

namespace std {
    class strstreambuf : public basic_streambuf<char> {
        public:
            strstreambuf() : strstreambuf(0) {}
            explicit strstreambuf(streamsize alsize_arg);
            strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));
            strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
            strstreambuf(const char* gnext_arg, streamsize n);
            strstreambuf(signed char* gnext_arg, streamsize n,
                         signed char* pbeg_arg = nullptr);
            strstreambuf(const signed char* gnext_arg, streamsize n,
                          unsigned char* pbeg_arg = nullptr);
            strstreambuf(const unsigned char* gnext_arg, streamsize n);
            virtual ~strstreambuf();

            void freeze(bool freezefl = true);
            char* str();
            int pcount();

        protected:
            int_type overflow (int_type c = EOF) override;
            int_type pbackfail(int_type c = EOF) override;
            int_type underflow() override;
            pos_type seekoff(off_type off, ios_base::seekdir way,
                             ios_base::openmode which = ios_base::in | ios_base::out) override;
            pos_type seekpos(pos_type sp,
                             ios_base::openmode which = ios_base::in | ios_base::out) override;
            streambuf* setbuf(char* s, streamsize n) override;

        private:
            using strstate = T1;  // exposition only
            static const strstate allocated;  // exposition only
            static const strstate constant;  // exposition only
            static const strstate dynamic;  // exposition only
            static const strstate frozen;  // exposition only
            strstate strmode;  // exposition only
            streamsize alsize;  // exposition only
            void* (*palloc)(size_t);  // exposition only
            void (*pfree)(void*);  // exposition only
    };  // end of class strstreambuf

1 The class strstreambuf associates the input sequence, and possibly the output sequence, with an object of some character array type, whose elements store arbitrary values. The array object has several attributes.

2 [Note 1: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called strstate. The elements are:

(2.1) — allocated, set when a dynamic array object has been allocated, and hence will be freed by the destructor for the strstreambuf object;
(2.2) — constant, set when the array object has const elements, so the output sequence cannot be written;
(2.3) — dynamic, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;
(2.4) — frozen, set when the program has requested that the array object not be altered, reallocated, or freed.

— end note]

3 [Note 2: For the sake of exposition, the maintained data is presented here as:

(3.1) — strstate strmode, the attributes of the array object associated with the strstreambuf object;]
— int alsize, the suggested minimum size for a dynamic array object;
— void* (*palloc)(size_t), points to the function to call to allocate a dynamic array object;
— void (*pfree)(void*), points to the function to call to free a dynamic array object.

— end note]

Each object of class strstreambuf has a seekable area, delimited by the pointers seeklow and seekhigh. If

gnext is a null pointer, the seekable area is undefined. Otherwise, seeklow equals gbeg and seekhigh is

either pend, if pend is not a null pointer, or gend.

D.12.2.2 strstreambuf constructors

explicit strstreambuf(streamsize alsize_arg);

1 Effects: Initializes the base class with streambuf(). The postconditions of this function are indicated

in Table 143.

Table 143: strstreambuf(streamsize) effects  [tab:depr.strstreambuf.cons.sz]

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsize</td>
<td>alsize_arg</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));

2 Effects: Initializes the base class with streambuf(). The postconditions of this function are indicated

in Table 144.

Table 144: strstreambuf(void* (*)(size_t), void (*)(void*)) effects  [tab:depr.strstreambuf.cons.alloc]

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsize</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>palloc_arg</td>
</tr>
<tr>
<td>pfree</td>
<td>pfree_arg</td>
</tr>
</tbody>
</table>

strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
strstreambuf(signed char* gnext_arg, streamsize n,

signed char* pbeg_arg = nullptr);
strstreambuf(unsigned char* gnext_arg, streamsize n,

unsigned char* pbeg_arg = nullptr);

3 Effects: Initializes the base class with streambuf(). The postconditions of this function are indicated

in Table 145.

Table 145: strstreambuf(charT*, streamsize, charT*) effects  [tab:depr.strstreambuf.cons.ptr]

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>0</td>
</tr>
<tr>
<td>alsize</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

gnext_arg shall point to the first element of an array object whose number of elements N is determined

as follows:

— If n > 0, N is n.
If \( n == 0 \), \( N \) is \( \text{std::strlen(gnext_arg)} \).

If \( n < 0 \), \( N \) is \( \text{INT_MAX} \).\(^{314}\)

If \( \text{pbeg_arg} \) is a null pointer, the function executes:

\[
\text{setg(gnext_arg, gnext_arg, gnext_arg + N)};
\]

Otherwise, the function executes:

\[
\text{setg(gnext_arg, gnext_arg, pbeg_arg)};
\]

\[
\text{setp(pbeg_arg, pbeg_arg + N)};
\]

**strstreambuf(const char* gnext_arg, streamsize n);**

**strstreambuf(const signed char* gnext_arg, streamsize n);**

**strstreambuf(const unsigned char* gnext_arg, streamsize n);**

**Effects:** Behaves the same as \( \text{strstreambuf((char*)gnext_arg,n)} \), except that the constructor also sets \text{constant} in \text{strmode}.

**virtual ~strstreambuf();**

**Effects:** Destroys an object of class \text{strstreambuf}. The function frees the dynamically allocated array object only if \((\text{strmode} & \text{allocated}) != 0 \text{ and } (\text{strmode} & \text{frozen}) == 0\). (D.12.2.4 describes how a dynamically allocated array object is freed.)

### D.12.2.3 Member functions

void \text{freeze(bool freezefl = true);} \[\text{[depr.strstreambuf.members]}\]

**Effects:** If \text{strmode} \& \text{dynamic} is nonzero, alters the freeze status of the dynamic array object as follows:

1. (1.1) If \text{freezefl} is \text{true}, the function sets \text{frozen} in \text{strmode}.
2. (1.2) Otherwise, it clears \text{frozen} in \text{strmode}.

char* \text{str();} \[\text{Effects: Calls freeze()}, \text{then returns the beginning pointer for the input sequence, gbeg.}\]

\[\text{Remarks: The return value can be a null pointer.}\]

int \text{pcount() const;} \[\text{Effects: The next pointer for the output sequence, pnext, is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, pnext - pbeg.}\]

### D.12.2.4 strstreambuf overridden virtual functions

int_type \text{overflow(int_type c = EOF) override;} \[\text{[depr.strstreambuf.virtuals]}\]

**Effects:** Appends the character designated by \( c \) to the output sequence, if possible, in one of two ways:

1. (1.1) If \( c != \text{EOF} \) and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns \( c \) to \(*\text{pnext}++\).

   Returns \((\text{unsigned char})c\).

2. (1.2) If \( c == \text{EOF} \), there is no character to append.

   Returns a value other than \text{EOF}.

**Remarks:** The function can alter the number of write positions available as a result of any call.

To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements \( n \) to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If \text{palloc} is not a null pointer, the function calls \((\text{*palloc})(n)\) to allocate the new dynamic array object.

---

\(^{314}\)The function signature \text{strlen(const char*)} is declared in \text{<cstring> (23.5.3)}. The macro \text{INT_MAX} is defined in \text{<climits> (17.3.6)}.
Otherwise, it evaluates the expression `new charT[n]`. In either case, if the allocation fails, the function returns `EOF`. Otherwise, it sets `allocated` in `strmode`.

To free a previously existing dynamic array object whose first element address is `p`: If `pfree` is not a null pointer, the function calls `(*pfree)(p)`. Otherwise, it evaluates the expression `delete[]p`.

If `(strmode & dynamic) == 0`, or if `(strmode & frozen) != 0`, the function cannot extend the array (reallocating it with greater length) to make a write position available.

*Recommended practice:* An implementation should consider `alsize` in making the decision how many additional write positions to make available.

```cpp
int_type pbackfail(int_type c = EOF) override;
```

Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

(8.1) If `c != EOF`, if the input sequence has a putback position available, and if `(char)c == gnext[-1]`, assigns `gnext - 1` to `gnext`.

Returns `c`.

(8.2) If `c != EOF`, if the input sequence has a putback position available, and if `strmode & constant` is zero, assigns `c` to `*--gnext`.

Returns `c`.

(8.3) If `c == EOF` and if the input sequence has a putback position available, assigns `gnext - 1` to `gnext`.

Returns a value other than `EOF`.

Returns `EOF` to indicate failure.

*Remarks:* If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```cpp
int_type underflow() override;
```

*Effects:* Reads a character from the input sequence, if possible, without moving the stream position past it, as follows:

(11.1) If the input sequence has a read position available, the function signals success by returning `(unsigned char)*gnext`.

(11.2) Otherwise, if the current write next pointer `pnext` is not a null pointer and is greater than the current read end pointer `gend`, makes a read position available by assigning to `gend` a value greater than `gnext` and no greater than `pnext`.

Returns `(unsigned char)*gnext`.

Returns `EOF` to indicate failure.

*Remarks:* The function can alter the number of read positions available as a result of any call.

```cpp
pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;
```

*Effects:* Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 146.

Table 146: `seekoff` positioning  
[tab:depr.strstreambuf.seekoff.pos]

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>(which &amp; ios::in) != 0</code></td>
<td>positions the input sequence</td>
</tr>
<tr>
<td><code>(which &amp; ios::out) != 0</code></td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>`(which &amp; (ios::in</td>
<td>ios::out)) == (ios::in</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines `newoff` as indicated in Table 147.
Table 147: \texttt{newoff} values  

<table>
<thead>
<tr>
<th>Condition</th>
<th>\texttt{newoff} Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{way == ios::beg}</td>
<td>0</td>
</tr>
<tr>
<td>\texttt{way == ios::cur}</td>
<td>the next pointer minus the beginning pointer ($xnext - xbeg$).</td>
</tr>
<tr>
<td>\texttt{way == ios::end}</td>
<td>seekhigh minus the beginning pointer ($seekhigh - xbeg$).</td>
</tr>
</tbody>
</table>

If $(\texttt{newoff} + \texttt{off}) < (\texttt{seeklow} - xbeg)$ or $(\texttt{seekhigh} - xbeg) < (\texttt{newoff} + \texttt{off})$, the positioning operation fails. Otherwise, the function assigns $xbeg + \texttt{newoff} + \texttt{off}$ to the next pointer $xnext$.

Returns: \texttt{pos_type(newoff)}, constructed from the resultant offset \texttt{newoff} (of type \texttt{off_type}), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \texttt{pos_type(off_type(-1))}.

\begin{verbatim}
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
\end{verbatim}

Effects: Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in \texttt{sp} (as described below).

1. If $(\text{which} & \text{ios::in}) \neq 0$, positions the input sequence.
2. If $(\text{which} & \text{ios::out}) \neq 0$, positions the output sequence.
3. If the function positions neither sequence, the positioning operation fails.

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines \texttt{newoff} from \texttt{sp.offset}():

1. If \texttt{newoff} is an invalid stream position, has a negative value, or has a value greater than $(\texttt{seekhigh} - \texttt{seeklow})$, the positioning operation fails
2. Otherwise, the function adds \texttt{newoff} to the beginning pointer $xbeg$ and stores the result in the next pointer $xnext$.

Returns: \texttt{pos_type(newoff)}, constructed from the resultant offset \texttt{newoff} (of type \texttt{off_type}), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \texttt{pos_type(off_type(-1))}.

\begin{verbatim}
streambuf<char*>* setbuf(char* s, streamsize n) override;
\end{verbatim}

Effects: Behavior is implementation-defined, except that \texttt{setbuf(0, 0)} has no effect.

D.12.3 Class istrstream

D.12.3.1 General

The class istrstream supports the reading of objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:
D.12.3.2 **istream constructors**

```cpp
explicit istrstream(const char* s);
explicit istrstream(char* s);
```

1. **Effects**: Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, 0)`. `s` shall designate the first element of an `ntbs`.

```cpp
istrstream(const char* s, streamsize n);
istrstream(char* s, streamsize n);
```

2. **Effects**: Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

D.12.3.3 **Member functions**

```cpp
strstreambuf* rdbuf() const;
```

1. **Returns**: `const_cast<strstreambuf*>(&sb)`.

```cpp
char* str();
```

2. **Returns**: `rdbuf()->str()`.

D.12.4 **Class ostrstream**

D.12.4.1 **General**

```cpp
namespace std {
    class ostrstream : public basic_ostream<char> {
        public:
            ostrstream();
            ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
            virtual ~ostrstream();

            strstreambuf* rdbuf() const;
            void freeze(bool freezefl = true);
            char* str();
            int pcount() const;
        private:
            strstreambuf sb; // exposition only
    };
}
```

1. The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

(1.1) — `sb`, the `strstreambuf` object.

D.12.4.2 **ostrstream constructors**

```cpp
ostrstream();
```

1. **Effects**: Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

```cpp
ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
```

2. **Effects**: Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

(2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements. The constructor is `strstreambuf(s, n, s)`.

(2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an `ntbs` whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.\(^{315}\)

---

\(^{315}\) The function signature `strlen(const char*)` is declared in `<cstring>` (23.5.3).
D.12.4.3 Member functions

strstreambuf* rdbuf() const;
1
Returns: (strstreambuf*)&sb.

void freeze(bool freezefl = true);
2
Effects: Calls rdbuf()->freeze(freezefl).

char* str();
3
Returns: rdbuf()->str().

int pcount() const;
4
Returns: rdbuf()->pcount().

D.12.5 Class strstream

D.12.5.1 General

namespace std {

class strstream
   : public basic_iostream<char> {

   public:
   // types
   using char_type = char;
   using int_type = char_traits<char>::int_type;
   using pos_type = char_traits<char>::pos_type;
   using off_type = char_traits<char>::off_type;

   // constructors/destructor
   strstream();
   strstream(char* s, int n,
         ios_base::openmode mode = ios_base::in|ios_base::out);
   virtual ~strstream();

   // members
   strstreambuf* rdbuf() const;
   void freeze(bool freezefl = true);
   int pcount() const;
   char* str();

   private:
   strstreambuf sb; // exposition only
   }
}

1 The class strstream supports reading and writing from objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

   (1.1) — sb, the strstreambuf object.

D.12.5.2 strstream constructors

strstream();
1
Effects: Initializes the base class with iostream(&sb).

strstream(char* s, int n,
         ios_base::openmode mode = ios_base::in|ios_base::out);
2
Effects: Initializes the base class with iostream(&sb), and sb with one of the two constructors:

(2.1) — If (mode & app) == 0, then s shall designate the first element of an array of n elements. The constructor is strstreambuf(s,n,s).

(2.2) — If (mode & app) != 0, then s shall designate the first element of an array of n elements that contains an NTBS whose first element is designated by s. The constructor is strstreambuf(s,n,s + std::strlen(s)).
D.12.5.3 `strstream` destructor

virtual ~strstream();

Effects: Destroys an object of class `strstream`.

D.12.5.4 `strstream` operations

`strstreambuf* rdbuf() const;`

Returns: `const_cast<strstreambuf*>(&sb)`.

void freeze(bool freezefl = true);

Effects: Calls `rdbuf() -> freeze(freezefl)`.

`char* str();`

Returns: `rdbuf() -> str()`.

`int pcount() const;`

Returns: `rdbuf() -> pcount()`.

D.13 The default allocator

The following member is defined in addition to those specified in 20.2.9:

```c
namespace std {
    template<class T> class allocator {
        public:
            using is_always_equal = true_type;
    }
}
```

D.14 Deprecated polymorphic_allocator member function

The following member is declared in addition to those members specified in 20.4.3.3:

```c
namespace std::pmr {
    template<class Tp = byte>
    class polymorphic_allocator {
        public:
            template <class T>
            void destroy(T* p);
    }
}
```

template<class T>
void destroy(T* p);

Effects: As if by `p -> T()`.

D.15 Deprecated type traits

The header `<type_traits>` (21.3.3) has the following addition:

```c
namespace std {
    template<class T> struct is_pod;
    template<class T> inline constexpr bool is_pod_v = is_pod<T>::value;
    template<size_t Len, size_t Align = default-alignment> // see below
    struct aligned_storage;
    template<size_t Len, size_t Align = default-alignment> // see below
    using aligned_storage_t = typename aligned_storage<Len, Align>::type;
    template<size_t Len, class... Types>
    struct aligned_union;
    template<size_t Len, class... Types>
    using aligned_union_t = typename aligned_union<Len, Types...>::type;
}
```
The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

```cpp
template<class T> struct is_pod;

Requires: remove_all_extents_t<T> shall be a complete type or cv void.

is_pod<T> is a Cpp17UnaryTypeTrait (21.3.2) with a base characteristic of true_type if T is a POD type, and false_type otherwise. A POD class is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A POD type is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

[Note 1: It is unspecified whether a closure type (7.5.5.2) is a POD type. — end note]
```

```cpp
template<size_t Len, size_t Align = default-alignment>
struct aligned_storage;

The value of default-alignment is the most stringent alignment requirement for any object type whose size is no greater than Len (6.8).

Mandates: Len is not zero. Align is equal to alignof(T) for some type T or to default-alignment.

The member typedef type is a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most Len and whose alignment is a divisor of Align.

[Note 2: Uses of aligned_storage<Len, Align>::type can be replaced by an array std::byte[Len] declared with alignas(Align). — end note]

[Note 3: A typical implementation would define aligned_storage as:

```cpp
template<size_t Len, size_t Alignment>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};
```

— end note]
```

```cpp
template<size_t Len, class... Types>
struct aligned_union;

Mandates: At least one type is provided. Each type in the template parameter pack Types is a complete object type.

The member typedef type is a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in Types; its size shall be at least Len. The static member alignment_value is an integral constant of type size_t whose value is the strictest alignment of all types listed in Types.
```

D.16 Tuple

[depr.tuple]

The header <tuple> (22.4.2) has the following additions:

```cpp
namespace std {
    template<class T> class tuple_size<volatile T>;
    template<class T> class tuple_size<const volatile T>;

    template<size_t I, class T> class tuple_element<I, volatile T>;
    template<size_t I, class T> class tuple_element<I, const volatile T>;
}
```

```cpp
template<class T> class tuple_size<volatile T>;
template<class T> class tuple_size<const volatile T>;
```

Let TS denote tuple_size<T> of the cv-unqualified type T. If the expression TS::value is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the Cpp17TransformationTrait requirements with a base characteristic of integral_constant<size_t, TS::value>. Otherwise, they have no member value.

Access checking is performed as if in a context unrelated to TS and T. Only the validity of the immediate context of the expression is considered.
In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

```cpp
template<size_t I, class T> class tuple_element<I, volatile T>;
template<size_t I, class T> class tuple_element<I, const volatile T>;
```

Let \( \text{TE} \) denote `tuple_element_t<I, T>` of the cv-unqualified type \( T \). Then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a member typedef `type` that names the following type:

1. For the first specialization, `add_volatile_t<TE>`, and
2. For the second specialization, `add_cv_t<TE>`.

In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

### D.17 Variant

The header `<variant>` (22.6.2) has the following additions:

```cpp
namespace std {
  template<class T> struct variant_size<volatile T>;
  template<class T> struct variant_size<const volatile T>;

  template<size_t I, class T> struct variant_alternative<I, volatile T>;
  template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}
```

Let \( \text{VS} \) denote `variant_size<T>` of the cv-unqualified type \( T \). Then specializations of each of the two templates meet the `Cpp17UnaryTypeTrait` requirements with a base characteristic of `integral_constant<size_t, \text{VS}::value>`.

```cpp
template<size_t I, class T> class variant_alternative<I, volatile T>;
template<size_t I, class T> class variant_alternative<I, const volatile T>;
```

Let \( \text{VA} \) denote `variant_alternative<I, T>` of the cv-unqualified type \( T \). Then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a member typedef `type` that names the following type:

1. For the first specialization, `add_volatile_t<\text{VA}::type>`, and
2. For the second specialization, `add_cv_t<\text{VA}::type>`.

### D.18 Deprecated iterator class template

The header `<iterator>` (25.2) has the following addition:

```cpp
namespace std {
  template<class Category, class T, class Distance = ptrdiff_t, class Pointer = T*, class Reference = T&>
  struct iterator {
    using iterator_category = Category;
    using value_type = T;
    using difference_type = Distance;
    using pointer = Pointer;
    using reference = Reference;
  };
}
```

The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

[Note 1: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]

[Example 1: If a C++ program wants to define a bidirectional iterator for some data structure containing `double` and such that it works on a large memory model of the implementation, it can do so with:]
class MyIterator :
public iterator<bidirectional_iterator_tag, double, long, T*, T&> {
    // code implementing ++, etc.
};
—end example]

D.19 Deprecated move_iterator access [depr.move.iter.elem]
1 The following member is declared in addition to those members specified in 25.5.3.6:

```cpp
namespace std {
    template<class Iterator>
    class move_iterator {
    public:
        constexpr pointer operator->() const;
    }
}
```

2 
`constexpr pointer operator->() const;`

Returns: current.

D.20 Deprecated shared_ptr atomic access [depr.util.smartptr.shared.atomic]
1 The header `<memory>` (20.2.2) has the following additions:

```cpp
namespace std {
    template<class T>
    bool atomic_is_lock_free(const shared_ptr<T>* p);
    template<class T>
    shared_ptr<T> atomic_load(const shared_ptr<T>* p);
    template<class T>
    shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);
    template<class T>
    void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
    template<class T>
    void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
    template<class T>
    shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
    template<class T>
    shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);
    template<class T>
    bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
    template<class T>
    bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
    template<class T>
    bool atomic_compare_exchange_weak_explicit(
        shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
        memory_order success, memory_order failure);
    template<class T>
    bool atomic_compare_exchange_strong_explicit(
        shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
        memory_order success, memory_order failure);
}
```

2 Concurrent access to a shared_ptr object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

3 The meaning of the arguments of type memory_order is explained in 33.5.4.

```cpp
template<class T> bool atomic_is_lock_free(const shared_ptr<T>* p);
```

4 Requires: p shall not be null.

5 Returns: true if atomic access to *p is lock-free, false otherwise.
template<class T> shared_ptr<T> atomic_load(const shared_ptr<T>* p);

Requires: p shall not be null.

Returns: atomic_load_explicit(p, memory_order::seq_cst).

Throws: Nothing.

template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

Requires: p shall not be null.

Requires: mo shall not be memory_order::release or memory_order::acq_rel.

Returns: *p.

Throws: Nothing.

template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.

Effects: As if by atomic_store_explicit(p, r, memory_order::seq_cst).

Throws: Nothing.

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.

Requires: mo shall not be memory_order::acquire or memory_order::acq_rel.

Effects: As if by p->swap(r).

Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.

Returns: atomic_exchange_explicit(p, r, memory_order::seq_cst).

Throws: Nothing.

template<class T>

shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.

Effects: As if by p->swap(r).

Returns: The previous value of *p.

Throws: Nothing.

template<class T>

bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Requires: p shall not be null and v shall not be null.

Returns:

atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)

Throws: Nothing.

template<class T>

bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Returns:

atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)

template<class T>

bool atomic_compare_exchange_weak_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);
template<class T>
bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

Requires: p shall not be null and v shall not be null. The failure argument shall not be memory_
order::release nor memory_order::acq_rel.

Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to
the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to
the value of failure.

Returns: true if *p was equivalent to *v, false otherwise.

Throws: Nothing.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and share
ownership. The weak form may fail spuriously. See 33.5.8.2.

D.21 Deprecated basic_string capacity

The following member is declared in addition to those members specified in 23.4.3.5:

namespace std {
    template<class charT, class traits = char_traits<charT>,
    class Allocator = allocator<charT>>
    class basic_string {
    public:
        void reserve();
    };  // end class basic_string
}

void reserve();

Effects: After this call, capacity() has an unspecified value greater than or equal to size().

[Note 1: This is a non-binding shrink to fit request. — end note]

D.22 Deprecated standard code conversion facets

D.22.1 General

The header <codecvt> provides code conversion facets for various character encodings.

D.22.2 Header <codecvt> synopsis

namespace std {
    enum codecvt_mode {
        consume_header = 4,
        generate_header = 2,
        little_endian = 1
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8(size_t refs = 0);  
        ~codecvt_utf8();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf16 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf16(size_t refs = 0);  
        ~codecvt_utf16();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8_utf16 : public codecvt<Elem, char, mbstate_t> {
    public:
        explicit codecvt_utf8_utf16(size_t refs = 0);  
    };
}
D.22.3 Requirements

1 For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

   (1.1) `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.
   (1.2) `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.
   (1.3) If `(Mode & consume_header)`, the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.
   (1.4) If `(Mode & generate_header)`, the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.
   (1.5) If `(Mode & little_endian)`, the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.

2 For the facet `codecvt_utf8`:

   (2.1) The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.
   (2.2) Endianness shall not affect how multibyte sequences are read or written.
   (2.3) The multibyte sequences may be written as either a text or a binary file.

3 For the facet `codecvt_utf16`:

   (3.1) The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.
   (3.2) Multibyte sequences shall be read or written according to the `Mode` flag, as set out above.
   (3.3) The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.

4 For the facet `codecvt_utf8_utf16`:

   (4.1) The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.
   (4.2) Endianness shall not affect how multibyte sequences are read or written.
   (4.3) The multibyte sequences may be written as either a text or a binary file.

5 The encoding forms UTF-8, UTF-16, and UTF-32 are specified in ISO/IEC 10646. The encoding form UCS-2 is specified in ISO/IEC 10646:2003.\(^\text{316}\)

D.23 Deprecated convenience conversion interfaces

D.23.1 General

The header `<locale>`\(^\text{(30.2)}\) has the following additions:

```cpp
namespace std {
    template<class Codecvt, class Elem = wchar_t,
             class WideAlloc = allocator<Elem>,
             class ByteAlloc = allocator<char>>
    class wstring_convert;

    template<class Codecvt, class Elem = wchar_t,
             class Tr = char_traits<Elem>>
    class wbuffer_convert;
}
```

\(^{316}\) Cancelled and replaced by ISO/IEC 10646:2017.
D.23.2 Class template **wstring_convert**  

Class template **wstring_convert** performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales.

**[Example 1]** If you want to use the code conversion facet `codecvt_utf8` to output to `cout` a UTF-8 multibyte sequence corresponding to a wide string, but you don’t want to alter the locale for `cout`, you can write something like:

```cpp
wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
```

--- end example ---

```cpp	namespace std {
  template<class Codecvt, class Elem = wchar_t,
           class WideAlloc = allocator<Elem>,
           class ByteAlloc = allocator<char>>
  class wstring_convert {
    public:
    using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
    using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
    using state_type = typename Codecvt::state_type;
    using int_type = typename wide_string::traits_type::int_type;

    wstring_convert() : wstring_convert(new Codecvt) {}  
    explicit wstring_convert(Codecvt* pcvt);
    wstring_convert(Codecvt* pcvt, state_type state);
    explicit wstring_convert(const byte_string& byte_err,
                               const wide_string& wide_err = wide_string());
    ~wstring_convert();

    wstring_convert(const wstring_convert&) = delete;
    wstring_convert& operator=(const wstring_convert&) = delete;

    wide_string from_bytes(char byte);
    wide_string from_bytes(const char* ptr);
    wide_string from_bytes(const byte_string& str);
    wide_string from_bytes(const Elem* first, const Elem* last);

    byte_string to_bytes(Elem wchar);
    byte_string to_bytes(const Elem* wptr);
    byte_string to_bytes(const wide_string& wstr);
    byte_string to_bytes(const Elem* first, const Elem* last);

    size_t converted() const noexcept;
    state_type state() const;
  }
  private:
    byte_string byte_err_string;  // exposition only
    wide_string wide_err_string;  // exposition only
    Codecvt* cvtptr;              // exposition only
    state_type cvtstate;          // exposition only
    size_t cvtcount;              // exposition only
  }
```
(3.2) — wide_err_string — a wide string to display on errors
(3.3) — cvtptr — a pointer to the allocated conversion object (which is freed when the wstring_convert
object is destroyed)
(3.4) — cvtstate — a conversion state object
(3.5) — cvtcount — a conversion count

using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
The type shall be a synonym for basic_string<char, char_traits<char>, ByteAlloc>.

size_t converted() const noexcept;
Returns: cvtcount.

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);
Effects: The first member function shall convert the single-element sequence byte to a wide string.
The second member function shall convert the null-terminated sequence beginning at ptr to a wide
string. The third member function shall convert the sequence stored in str to a wide string. The
fourth member function shall convert the sequence defined by the range [first, last) to a wide string.
In all cases:
(7.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value
(the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
(7.2) — The number of input elements successfully converted shall be stored in cvtcount.
Returns: If no conversion error occurs, the member function shall return the converted wide string.
Otherwise, if the object was constructed with a wide-error string, the member function shall return the
wide-error string. Otherwise, the member function throws an object of class range_error.

using int_type = typename wide_string::traits_type::int_type;
The type shall be a synonym for wide_string::traits_type::int_type.

state_type state() const;
Returns: cvtstate.

using state_type = typename Codecvt::state_type;
The type shall be a synonym for Codecvt::state_type.

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);
Effects: The first member function shall convert the single-element sequence wchar to a byte string.
The second member function shall convert the null-terminated sequence beginning at wptr to a byte
string. The third member function shall convert the sequence stored in wstr to a byte string. The
fourth member function shall convert the sequence defined by the range [first, last) to a byte string.
In all cases:
(13.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value
(the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
(13.2) — The number of input elements successfully converted shall be stored in cvtcount.
Returns: If no conversion error occurs, the member function shall return the converted byte string.
Otherwise, if the object was constructed with a byte-error string, the member function shall return the
byte-error string. Otherwise, the member function shall throw an object of class range_error.

using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
The type shall be a synonym for basic_string<Elem, char_traits<Elem>, WideAlloc>.

§ D.23.2 1824
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
    const wide_string& wide_err = wide_string());

Requires: For the first and second constructors, pcvt != nullptr.

Effects: The first constructor shall store pcvt in cvtptr and default values in cvtstate, byte_-
    err_string, and wide_err_string. The second constructor shall store pcvt in cvtptr, state in
cvtstate, and default values in byte_err_string and wide_err_string; moreover the stored state
shall be retained between calls to from_bytes and to_bytes. The third constructor shall store new
Codecvt in cvtptr, state_type() in cvtstate, byte_err in byte_err_string, and wide_err in
wide_err_string.

~wstring_convert();

Effects: The destructor shall delete cvtptr.

D.23.3 Class template wbuffer_convert [depr.conversions.buffer]

Class template wbuffer_convert looks like a wide stream buffer, but performs all its I/O through an
underlying byte stream buffer that you specify when you construct it. Like class template wstring_convert,
it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

namespace std {
    template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
    class wbuffer_convert : public basic_streambuf<Elem, Tr> {
        public:
            using state_type = typename Codecvt::state_type;

            wbuffer_convert() : wbuffer_convert(nullptr) {}
        explicit wbuffer_convert(streambuf* bytebuf,
            Codecvt* pcvt = new Codecvt,
            state_type state = state_type());

        ~wbuffer_convert();

        wbuffer_convert(const wbuffer_convert&) = delete;
wbuffer_convert& operator=(const wbuffer_convert&) = delete;

        streambuf* rdbuf() const;
        streambuf* rdbuf(streambuf* bytebuf);

        state_type state() const;

    private:
        streambuf* bufptr;    // exposition only
        Codecvt* cvtptr;      // exposition only
        state_type cvtstate;  // exposition only
    };
}

The class template describes a stream buffer that controls the transmission of elements of type Elem, whose
character traits are described by the class Tr, to and from a byte stream buffer of type streambuf. Conversion
between a sequence of Elem values and multibyte sequences is performed by an object of class Codecvt, which
shall meet the requirements of the standard code-conversion facet codecvt<Elem, char, mbstate_t>.

An object of this class template stores:

(3.1) — bufptr — a pointer to its underlying byte stream buffer
(3.2) — cvtptr — a pointer to the allocated conversion object (which is freed when the wbuffer_convert
        object is destroyed)
(3.3) — cvtstate — a conversion state object

state_type state() const;

Returns: cvtstate.
streambuf* rdbuf() const;
Returns: bufptr.

streambuf* rdbuf(streambuf* bytebuf);
Effects: Stores bytebuf in bufptr.
Returns: The previous value of bufptr.

using state_type = typename Codecvt::state_type;
The type shall be a synonym for Codecvt::state_type.

explicit wbuffer_convert(
streambuf* bytebuf,
Codecvt* pcvt = new Codecvt,
state_type state = state_type());
Requires: pcvt != nullptr.
Effects: The constructor constructs a stream buffer object, initializes bufptr to bytebuf, initializes cvtptr to pcvt, and initializes cvtstate to state.
~wbuffer_convert();
Effects: The destructor shall delete cvtptr.

D.24 Deprecated locale category facets [depr.locale.category]
The ctype locale category includes the following facets as if they were specified in table Table 100 of 30.3.1.2.1.
- codecvt<char16_t, char, mbstate_t>
- codecvt<char32_t, char, mbstate_t>

The ctype locale category includes the following facets as if they were specified in table Table 101 of 30.3.1.2.1.
- codecvt_byname<char16_t, char, mbstate_t>
- codecvt_byname<char32_t, char, mbstate_t>

The following class template specializations are required in addition to those specified in 30.4.2.5. The specialization codecvt<char16_t, char, mbstate_t> converts between the UTF-16 and UTF-8 encoding forms, and the specialization codecvt<char32_t, char, mbstate_t> converts between the UTF-32 and UTF-8 encoding forms.

D.25 Deprecated filesystem path factory functions [depr.fs.path.factory]
template<class Source>
path u8path(const Source& source);
template<class InputIterator>
path u8path(InputIterator first, InputIterator last);
Requires: The source and [first, last) sequences are UTF-8 encoded. The value type of Source and InputIterator is char or char8_t. Source meets the requirements specified in 31.12.6.4.
Returns:
(2.1) — If value_type is char and the current native narrow encoding (31.12.6.3.2) is UTF-8, return path(source) or path(first, last); otherwise,
(2.2) — if value_type is wchar_t and the native wide encoding is UTF-16, or if value_type is char16_t or char32_t, convert source or [first, last) to a temporary, tmp, of type string_type and return path(tmp); otherwise,
(2.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).
Remarks: Argument format conversion (31.12.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

[Example 1: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));]
For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs.

—end example

[Note 1: The example above is representative of a historical use of filesystem::u8path. To indicate a UTF-8 encoding, passing a std::u8string to path's constructor is preferred as it is consistent with path's handling of other encodings. —end note]

D.26 Deprecated atomic operations[ depr.atomics]

D.26.1 General[ depr.atomics.general]

1 The header <atomic> (33.5.2) has the following additions.

```cpp
namespace std {
    template<class T>
    void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
    template<class T>
    void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

    #define ATOMIC_VAR_INIT(value) see below

    #define ATOMIC_FLAG_INIT see below
}
```

D.26.2 Volatile access[ depr.atomics.volatile]

1 If an atomic specialization has one of the following overloads, then that overload participates in overload resolution even if atomic<T>::is_always_lock_free is false:

```cpp
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
```

D.26.3 Non-member functions[ depr.atomics.nonmembers]

```cpp
template<class T>
void atomic_init(volatile atomic<T>** object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>** object, typename atomic<T>::value_type desired) noexcept;
```

Effects: Equivalent to: atomic_store_explicit(object, desired, memory_order::relaxed);

D.26.4 Operations on atomic types[ depr.atomics.types.operations]

```cpp
#define ATOMIC_VAR_INIT(value) see below
```

1 The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with value.

[Note 1: This operation possibly needs to initialize locks. —end note]
Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

[Example 1:
   atomic<int> v = ATOMIC_VAR_INIT(5);
—end example]

D.26.5 Flag type and operations

#define ATOMIC_FLAG_INIT see below

1 Remarks: The macro ATOMIC_FLAG_INIT is defined in such a way that it can be used to initialize an object of type atomic_flag to the clear state. The macro can be used in the form:
   atomic_flag guard = ATOMIC_FLAG_INIT;

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.
Annex E  (informative)
Conformance with UAX #31

E.1 General

This Annex describes the choices made in application of UAX #31 (“Unicode Identifier and Pattern Syntax”) to C++ in terms of the requirements from UAX #31 and how they do or do not apply to C++. In terms of UAX #31, C++ conforms by meeting the requirements R1 “Default Identifiers” and R4 “Equivalent Normalized Identifiers”. The other requirements, also listed below, are either alternatives not taken or do not apply to C++.

E.2 R1 Default identifiers

E.2.1 General

UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

<Identifier> := <Start> <Continue>* (<Medial> <Continue>)*

where <Start> has the XID_Start property, <Continue> has the XID_Continue property, and <Medial> is a list of characters permitted between continue characters. For C++ we add the character u+005F LOW_LINE, or _, to the set of permitted <Start> characters, the <Medial> set is empty, and the <Continue> characters are unmodified. In the grammar used in UAX #31, this is

<Identifier> := <Start> <Continue>*
<Start> := XID_Start + u+005F
<Continue> := <Start> + XID_Continue

This is described in the C++ grammar in 5.10, where identifier is formed from identifier-start or identifier followed by identifier-continue.

E.2.2 R1a Restricted format characters

If an implementation of UAX #31 wishes to allow format characters such as ZERO WIDTH JOINER or ZERO WIDTH NON-JOINER it must define a profile allowing them, or describe precisely which combinations are permitted.

C++ does not allow format characters in identifiers, so this does not apply.

E.2.3 R1b Stable identifiers

An implementation of UAX #31 may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.

C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the XID_Start and XID_Continue properties.

E.3 R2 Immutable identifiers

An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.

C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

E.4 R3 Pattern_White_Space and Pattern_Syntax characters

UAX #31 describes how languages that use or interpret patterns of characters, such as regular expressions or number formats, may describe that syntax with Unicode properties.

C++ does not do this as part of the language, deferring to library components for such usage of patterns. This requirement does not apply to C++.
E.5 R4 Equivalent normalized identifiers  

1 UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.

2 C++ requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.10.

E.6 R5 Equivalent case-insensitive identifiers  

1 C++ considers case to be significant in identifier comparison, and does not do any case folding. This requirement does not apply to C++.

E.7 R6 Filtered normalized identifiers  

1 If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.

2 C++ does not make any such exclusions.

E.8 R7 Filtered case-insensitive identifiers  

1 C++ identifiers are case sensitive, and therefore this requirement does not apply.

E.9 R8 Hashtag identifiers  

1 There are no hashtags in C++, so this requirement does not apply.

Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

**convertible-to-non-slicing**, 1043, 1043–1045

**convertible_to**, 114, 393, 546, 549, 549, 553, 778, 846, 978, 999, 1006, 1007, 1009–1012, 1014, 1016, 1043–1045, 1048, 1052, 1062, 1068, 1069, 1071, 1072, 1074, 1076, 1081–1084, 1086, 1089, 1090, 1092, 1093, 1099, 1102, 1104, 1105, 1107, 1110, 1111, 1113, 1114, 1116, 1117, 1119, 1211, 1122, 1124, 1125, 1127–1130, 1135, 1136, 1141, 1142, 1189–1192, 1556, 1557

**copy_constructible**, 547, 553, 553, 556, 696, 991, 992, 1029, 1030, 1032, 1033, 1040, 1050, 1060, 1063, 1066–1068, 1071, 1073, 1075, 1077–1079, 1085, 1091, 1096, 1099, 1101, 1103, 1114–1116, 1119, 1125, 1126, 1129, 1131, 1134, 1144, 1165, 1167, 1194, 1209, 1213

**copyable**, 556, 556, 972, 977, 994, 1010, 1029, 1031, 1040, 1044–1046, 1051, 1053, 1056, 1060, 1064, 1065, 1081, 1082, 1099, 1185, 1186, 1242, 1243

**cpp17-bidirectional-iterator**, 978, 978, 979
**cpp17-forward-iterator**, 978, 978, 979
**cpp17-input_iterator**, 977, 978, 1048
**cpp17-iterator**, 977, 977, 979
**cpp17-random-access-iterator**, 978, 979

**decrementable**, 1051, 1052, 1052, 1054, 1055

**default_initializable**, 547, 553, 556, 580, 581, 1010, 1014, 1044, 1050, 1051, 1054, 1057, 1058, 1060, 1062–1064, 1067, 1068, 1072, 1075, 1077–1080, 1084, 1086, 1091, 1096, 1099, 1101, 1103, 1104, 1120, 1131, 1134, 1139, 1144, 1262, 1263

**dereferenceable**, 967, 967, 968, 981, 1010, 1012, 1014, 1016

**derived_from**, 546, 548, 548, 985–987, 999, 1006, 1011, 1040, 1043, 1057, 1059, 1065, 1069, 1081, 1087, 1095, 1105, 1117, 1127

**destructible**, 467, 547, 552, 552, 583, 1266, 1667

**different_from**, 1041, 1044, 1045, 1061, 1062

Index of library concepts 1979
Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

#pragma, 461
additional execution policies supported by parallel algorithms, 767, 1152
additional file_type enumerators for file systems supporting additional types of file, 1598
additional formats for time_get::do_get_date, 1476
additional supported forms of preprocessing directive, 449
algorithms for producing the standard random number distributions, 1298
alignment, 68
alignment additional values, 68
alignment of bit-fields within a class object, 281
allocation of bit-fields within a class object, 281
any use of an invalid pointer other than to perform indirection or deallocate, 65
argument values to construct ios_base::failure, 1503
assignability of placeholder objects, 755
behavior of istream classes when traits::pos_type is not streampos or when traits::off_type is not streamoff, 1486
behavior of non-standard attributes, 240
behavior of strstreambuf::setbuf, 1813
bits in a byte, 59
choice of larger or smaller value of floating-point-literal, 25
code unit sequence for conditional-escape-sequence, 28
code unit sequence for non-representable string-literal, 27
column value of source_location::current, 522
conversions between pointers and integers, 126
converting function pointer to object pointer and vice versa, 126
default configuration of a pool, 628
default next_buffer_size for a monotonic_buffer_resource, 629
default number of buckets in unordered_map, 932
default number of buckets in unordered_multiset, 948, 949
default number of buckets in unordered_set, 943, 944
default value for least_max_value template parameter of counting_semaphore, 1733
defining main in freestanding environment, 86
definition and meaning of __STDC__, 463, 1803
definition and meaning of __STDC_VERSION__, 463
definition of NULL, 497, 1804
derived type for typeid, 123
diagnostic message, 4
dynamic initialization of static inline variables before main, 88
dynamic initialization of static variables before main, 88
dynamic initialization of thread-local variables before entry, 88
effect of calling associated Laguerre polynomials with n >= 128 or n >= 128, 1348
effect of calling associated Legendre polynomials with l >= 128, 1348
effect of calling basic_filebuf::setbuf with nonzero arguments, 1564
effect of calling basic_filebuf::sync when a get area exists, 1565
effect of calling basic_streambuf::setbuf with nonzero arguments, 1544
effect of calling cylindrical Bessel functions of the first kind with nu >= 128, 1350
effect of calling cylindrical Neumann functions with nu >= 128, 1350
effect of calling Hermite polynomials with n >= 128, 1351
effect of calling ios_base::sync_with_stdio after any input or output operation on standard streams, 1497
effect of calling irregular modified cylindrical Bessel functions with nu >= 128, 1350
effect of calling Laguerre polynomials with n >= 128, 1352
effect of calling Legendre polynomials with l >= 128, 1352
effect of calling regular modified cylindrical Bessel functions with nu >= 128, 1350
effect of calling spherical associated Legendre functions with l >= 128, 1353
effect of calling spherical Bessel functions with n >= 128, 1352
effect of calling spherical Neumann functions with \( n \geq 128, 1353 \)
effect of \emph{conditional-escape-sequence} on encoding state, 28
effect of \texttt{filesystem::copy}, 1610
effect on C locale of calling \texttt{locale::global}, 1452
encoding assumption for \texttt{format} width computation, 775
\texttt{error_category} for errors originating outside the operating system, 493
exception type when \texttt{random_device} constructor fails, 1296
exception type when \texttt{random_device::operator()} fails, 1296
exceptions thrown by standard library functions that have a potentially-throwing exception specification, 493
exit status, 512
extended signed integer types, 74
file type of the file argument of \texttt{filesystem::status}, 1620
formatted character sequence generated by \texttt{time_put::do_put} in C locale, 1478
forward progress guarantees for implicit threads of parallel algorithms (if not defined for \texttt{thread}), 1151
growth factor for \texttt{monotonic_buffer_resource}, 629
headers for freestanding implementation, 475
how \texttt{random_device::operator()} generates values, 1296
how the set of importable headers is determined, 251
integer-class type, 982
interactive device, 11
interpretation of the path character sequence with \texttt{format path::auto_format}, 1597
largest supported value to configure the largest allocation satisfied directly by a pool, 627
largest supported value to configure the maximum number of blocks to replenish a pool, 627
last enumerator of \texttt{launch}, 1738
linkage of \texttt{main}, 86
linkage of names from C standard library, 476
linkage of objects between C++ and other languages, 239
locale names, 1451
value-to-rvalue conversion of an invalid pointer value, 95
manner of search for included source file, 452
mapping from name to catalog when calling \texttt{messages::do_open}, 1484
mapping header name to header or external source file, 18
mapping of pointer to integer, 125
mapping physical source file characters to translation character set, 13, 1785
mapping to message when calling \texttt{messages::do_get}, 1484
maximum depth of recursive template instantiations, 412
maximum size of an allocated object, 133, 518
meaning of ‘, \, /, * or // in a \texttt{q-char-sequence} or an \texttt{h-char-sequence}, 18
meaning of \texttt{asm} declaration, 236
meaning of \texttt{attribute declaration}, 166
meaning of dot-dot in \texttt{root-directory}, 1585
nesting limit for \#include directives, 453
\texttt{NTCTS} in \texttt{basic_ostream<charT, traits>& \operator<<(nullptr_t)}, 1531
number of placeholders for bind expressions, 739, 754
number of threads in a program under a freestanding implementation, 81
operating system on which implementation depends, 1577
ordinary and wide literal encodings, 16
parameters to \texttt{main}, 86
passing argument of class type through ellipsis, 120
physical source file characters, 13
presence and meaning of \texttt{native_handle_type} and \texttt{native_handle}, 1659
rank of extended signed integer type, 78
required alignment for \texttt{atomic_ref} type’s operations, 1682, 1684, 1686, 1687
required libraries for freestanding implementation, 10
resource limits on a message catalog, 1485
result of \texttt{filesystem::file_size}, 1615
result of inexact floating-point conversion, 97
resuming a coroutine on a different execution agent, 538
return value of \texttt{bad_alloc::what}, 518
return value of \texttt{bad_any_cast::what}, 712
return value of \texttt{bad_array_new_length::what}, 518
return value of \texttt{bad_cast::what}, 520
return value of \texttt{bad_exception::what}, 524
return value of \texttt{bad_function_call::what}, 755
return value of \texttt{bad_optional_access::what}, 697
return value of \texttt{bad_typeid::what}, 521
return value of \texttt{bad_variant_access::what}, 711
return value of \texttt{bad_weak_ptr::what}, 603

Search locations for "**" header: 453

Search locations for `<**` header: 452

Semantics of an access through a volatile glvalue, 176

Semantics of linkage specifiers, 237

Semantics of parallel algorithms invoked with implementation-defined execution policies, 1152

Semantics of `stacktrace_entry::native_handle`, 573

Semantics of `token` parameter and default token value used by `random_device` constructors, 1296

Sequence of places searched for a header: 452

Set of character types that istreams templates can be instantiated for: 1450, 1486

Signedness of `char`, 177

`sizeof` applied to fundamental types other than `char`, `signed char`, and `unsigned char`, 131

Stack unwinding before invocation of `std::terminate`, 443, 447

`stacktrace_entry::native_handle_type`, 572

Startup and termination in freestanding environment, 86

Strict total order over pointer values, 5

String resulting from `_func__`, 218

Support for always lock-free integral atomic types in freestanding environments, 476

Support for extended alignments, 68

Support for `module-import-declarations` with non-C++ language linkage, 237

Supported multibyte character encoding rules, 796

Supported `root-names` in addition to any operating system dependent `root-names`, 1584, 1585

Text of `_DATE__` when date of translation is not available, 461

Text of `_TIME__` when time of translation is not available, 462

Threads and program points at which deferred dynamic initialization is performed, 88

Type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` in freestanding environments, 476

Type of a directory-like file, 1605, 1606

Type of `array::const_iterator`, 879

Type of `array::iterator`, 879

Type of `basic_stacktrace::const_iterator`, 573

Type of `basic_stacktrace::difference_type`, 573

Type of `basic_stacktrace::size_type`, 573

Type of `basic_string::const_iterator`, 812

Type of `basic_string::iterator`, 812

Type of `basic_string_view::const_iterator`, 799, 802

Type of `default_random_engine`, 1295

Type of `deque::const_iterator`, 882

Type of `deque::difference_type`, 881

Type of `deque::iterator`, 882

Type of `deque::size_type`, 881

Type of `forward_list::const_iterator`, 886

Type of `forward_list::difference_type`, 886

Type of `forward_list::iterator`, 886

Type of `forward_list::size_type`, 886

Type of `list::const_iterator`, 893

Type of `list::difference_type`, 893

Type of `list::iterator`, 893

Type of `list::size_type`, 893

Type of `map::const_iterator`, 908

Type of `map::difference_type`, 908

Type of `map::iterator`, 908

Type of `map::size_type`, 908

Type of `multimap::const_iterator`, 914

Type of `multimap::difference_type`, 914

Type of `multimap::iterator`, 914

Type of `multimap::size_type`, 914

Type of `multiset::const_iterator`, 922

Type of `multiset::difference_type`, 921

Type of `multiset::iterator`, 922

Type of `multiset::size_type`, 921

Type of `ptdiff_t`, 141, 498

Type of `regex_constants::error_type`, 1633

Type of `regex_constants::match_flag_type`, 1631

Type of `set::const_iterator`, 918

Type of `set::difference_type`, 918

Type of `set::iterator`, 918

Type of `set::size_type`, 918

Type of `size_t`, 498

Type of `span::iterator`, 961, 966

Type of `streamoff`, 1486

Type of `syntax_option_type`, 1631

Type of `unordered_map::const_iterator`, 927

Type of `unordered_map::const_local_iterator`, 927

Type of `unordered_map::difference_type`, 927

Type of `unordered_map::iterator`, 927

Type of `unordered_map::size_type`, 927

Type of `unordered_multimap::const_iterator`, 934

Type of `unordered_multimap::difference_type`, 934

Type of `unordered_multimap::iterator`, 934

Type of `unordered_multimap::size_type`, 934

Index of impl.-def. behavior 1984
type of `unordered_multimap::iterator`, 934
value of `unordered_multimap::size_type`, 934

value of `unordered_multiset::const_iterator`, 945
type of `unordered_multiset::const_local_iterator`, 945
type of `unordered_multiset::const_iterator`, 945
type of `unordered_multiset::local_iterator`, 945
type of `unordered_multiset::size_type`, 945
type of `unordered_set::const_iterator`, 940
type of `unordered_set::const_local_iterator`, 940
type of `unordered_set::size_type`, 940

value of `vector::const_iterator`, 899
type of `vector::difference_type`, 899
type of `vector::size_type`, 899

value of `vector<bool>::iterator`, 903
value of `vector<bool>::difference_type`, 903
value of `vector<bool>::size_type`, 903

value of `vector<
bool>::const_iterator`, 904
value of `vector<
bool>::const_pointer`, 903

value of `vector<
bool>::size_type`, 903
value of `vector<
bool>::pointer`, 903
type of `vector<
bool>::size_type`, 903

underlying type for enumeration, 225
underlying type of `bool`, 75
underlying type of `char`, 75
underlying type of `wchar_t`, 75

unit suffix when `Period::type` is micro, 1377

value of bit-field that cannot represent
assigned value, 148
incremented value, 121
initializer, 204

value of `conditional-escape-sequence`, 24
value of `ctype<char>::table_size`, 1457
value of `future_errc::broken.promise`, 1738
value of `future_errc::future_already_retrieved`, 1738
value of `future_errc::no_state`, 1738

value of `future_errc::promise_already_satisfied`, 1738
value of `has-attribute-expression` for non-standard attributes, 451

value of `pow(0,0)`, 1276
value of result of inexact integer to floating-point conversion, 97
value of floating-point types, 75

values of a trivially copyable type, 72
values of various `ATOMIC_..._LOCK_FREE` macros, 1680

whether `<cfenv>` functions can be used to manage
floating-point status, 1269
whether a given atomic type’s operations are
always lock free, 1688, 1689, 1692, 1694, 1696, 1699, 1701
whether a given atomic_ref type’s operations are
always lock free, 1682, 1684, 1686, 1687

whether basic_spanbuf’s move source is empty
after a move, 1554

whether functions from Annex K of the C
standard library are declared when C++
headers are included, 475

whether locale object is global or per-thread, 1449
whether `pragma FENV_ACCESS` is supported, 1269
whether `rand` may introduce a data race, 1319

whether sequence pointers are copied by
basic_filebuf move constructor, 1561
whether sequence pointers are copied by
basic_stringbuf move constructor, 1541

whether sequence pointers are initialized to null
pointers, 1540
whether source file inclusion of importable header
is replaced with `import` directive, 453
whether source of translation units must be
available to locate template definitions, 14

whether stack is unwound before invoking the
function `std::terminate` when a
`noexcept` specification is violated, 447

whether the implementation is hosted or
freestanding, 475

whether the lifetime of a parameter ends when the
callee returns or at the end of the
calling full-expression, 119

whether the sources for module units and header
units on which the current translation unit has an interface dependency are
required to be available during
translation, 14

whether the thread that executes `main` and the
threads created by `std::thread` or
`std::jthread` provide concurrent
forward progress guarantees, 85

whether `time_get::do_get_year` accepts
two-digit year numbers, 1476

whether values are rounded or truncated to the
required precision when converting
between `time_t` values and `time_point`
objects, 1381

which functions in the C++ standard library may
be recursively reentered, 492

which non-standard-layout objects containing no
data are considered empty, 61
which scalar types have unique object representations, 649
width of integral type, 75
