P3560 ERROR HANDLING IN REFLECTION

Hagenberg

- POLL: `std::meta::exception` should inherit from `std::exception` (explore required modifications for `what()`)

SF	F	N	A	SA
4	3	5	1	3

- Attendance: 20 (IP) + 3 (R)
- Author's Position: SA
- Outcome: No Consensus
 - *VZ/NL/MH: but close*

- POLL: Forward P3560R1 to LWG for C++26

SF	F	N	A	SA
5	9	0	2	1

- Attendance: 21 (IP) + 3 (R)
- Author's Position: SF
- Outcome: Consensus in favor
- A: Name exception for ADL reasons
- **SA: Not inheriting from `std::exception`**

THE WHAT() ISSUE

- Later discussion showed encoding concern based on outdated information from LWG4087
Standard exception messages have unspecified encoding
 - Already addressed in [exception]:

`constexpr virtual const char what () const noexcept;`

Returns: An implementation-defined NTBS, which during constant evaluation is encoded with the ordinary literal encoding.

Remarks: The message may be a `null-terminated multibyte string`, suitable for conversion and display as a `wstring`. The return value remains valid until the exception object from which it is obtained is destroyed or a non-`const` member function of the exception object is called.

THE WHAT() ISSUE

- Encoding-wise this is compatible with P3560
- This addresses the motivation for not inheriting from `std::exception`

WHY INHERIT FROM `STD::EXCEPTION`?

- Consistency
 - This would be the first standard exception not inheriting from `std::exception`
 - Users typically inherit from `std::exception` as well
- Generic exception handling
 - It is a very common pattern to catch `std::exception` (including for tests, logging, etc.) when more specific info is not needed
 - Adding a new hierarchy means they have to add another catch block

WHY INHERIT FROM `STD::EXCEPTION`?

Minor differences from other standard exceptions

- Copy operations can throw
- Move operations exist
- Neither of these violates [exception]:

Except where explicitly specified otherwise, each standard library class `T` that derives from class `exception` has the following publicly accessible member functions, each of them having a non-throwing exception specification:

- *default constructor (unless the class synopsis shows other constructors)*
- *copy constructor*
- *copy assignment operator*

MAIN CHANGES TO P3560

```
class exception : public std::exception {
private:
    optional<string> what_; // exposition only
    u8string u8 what_;      // exposition only
    info from_;             // exposition only
    source_location where_; // exposition only

public:
    constexpr const char* what() const noexcept override;
    constexpr string what() const noexcept;
    // ...
};
```

```
constexpr exception(u8string_view
what, /* ... */) noexcept;
```

Effects : Initializes `u8what_` with `what`, `from_` with `from` and `where_` with `where`. If `what` can be represented in the ordinary literal encoding, initializes `what_` with `what`, transcoded from UTF-8 to the ordinary literal encoding.

CURRENT STATUS OF P3560

- The author of P3560 already added this to P3560R1!
 - Modulo bugs, such as they accidentally used private inheritance. They will have that fixed in P3560R2.
 - P3560 author(s) are now in favor of this change!
- We need LEWG to poll this.

- This research used resources from the Argonne Leadership Computing Facility, a U.S. DOE Office of Science user facility at Argonne National Laboratory, which is supported by the Office of Science of the U.S. DOE under Contract No. DE-AC02-06CH11357.
