## Foreword

ISO (the International Organization for Standardization) is a worldwide federation of national standards bodies (ISO member bodies). The work of preparing International Standards is normally carried out through ISO technical committees. Each member body interested in a subject for which a technical committee has been established has the right to be represented on that committee. International organizations, governmental and non-governmental, in liaison with ISO, also take part in the work. ISO collaborates closely with the International Electrotechnical Commission (IEC) on all matters of electrotechnical standardization.

International Standards are drafted in accordance with the rules given in the ISO/IEC Directives, Part 2.
The main task of technical committees is to prepare International Standards. Draft International Standards adopted by the technical committees are circulated to the member bodies for voting. Publication as an International Standard requires approval by at least $75 \%$ of the member bodies casting a vote.

Attention is drawn to the possibility that some of the elements of this document may be the subject of patent rights. ISO shall not be held responsible for identifying any or all such patent rights.

ISO/IEC TS 18661 was prepared by Technical Committee ISO JTC 1, Information Technology, Subcommittee SC 22, Programming languages, their environments, and system software interfaces.

ISO/IEC TS 18661 consists of the following parts, under the general title Floating-point extensions for C:

- Part 1: Binary floating-point arithmetic
- Part 2: Decimal floating-point arithmetic
- Part 3: Interchange and extended types
- Part 4: Supplementary functions
- Part 5: Supplementary attributes

Part 1 updates ISO/IEC 9899:2011 (Information technology - Programming languages, their environments and system software interfaces - Programming Language C), Annex F in particular, to support all required features of ISO/IEC/IEEE 60559:2011 (Information technology - Microprocessor Systems - Floating-point arithmetic).

Part 2 supersedes ISO/IEC TR 24732:2009 (Information technology - Programming languages, their environments and system software interfaces - Extension for the programming language $C$ to support decimal floating-point arithmetic).

Parts 3-5 specify extensions to ISO/IEC 9899:2011 for features recommended in ISO/IEC/IEEE 60559:2011.

## Introduction

## Background

## IEC 60559 floating-point standard

The IEEE 754-1985 standard for binary floating-point arithmetic was motivated by an expanding diversity in floating-point data representation and arithmetic, which made writing robust programs, debugging, and moving programs between systems exceedingly difficult. Now the great majority of systems provide data formats and arithmetic operations according to this standard. The IEC 60559:1989 international standard was equivalent to the IEEE 754-1985 standard. Its stated goals were:

1 Facilitate movement of existing programs from diverse computers to those that adhere to this standard.

2 Enhance the capabilities and safety available to programmers who, though not expert in numerical methods, may well be attempting to produce numerically sophisticated programs. However, we recognize that utility and safety are sometimes antagonists.

3 Encourage experts to develop and distribute robust and efficient numerical programs that are portable, by way of minor editing and recompilation, onto any computer that conforms to this standard and possesses adequate capacity. When restricted to a declared subset of the standard, these programs should produce identical results on all conforming systems.

4 Provide direct support for
a. Execution-time diagnosis of anomalies
b. Smoother handling of exceptions
c. Interval arithmetic at a reasonable cost

5 Provide for development of
a. Standard elementary functions such as exp and cos
b. Very high precision (multiword) arithmetic
c. Coupling of numerical and symbolic algebraic computation

6 Enable rather than preclude further refinements and extensions.
To these ends, the standard specified a floating-point model comprising:
formats - for binary floating-point data, including representations for Not-a-Number ( NaN ) and signed infinities and zeros
operations - basic arithmetic operations (addition, multiplication, etc.) on the format data to compose a well-defined, closed arithmetic system; also specified conversions between floating-point formats and decimal character sequences, and a few auxiliary operations
context - status flags for detecting exceptional conditions (invalid operation, division by zero, overflow, underflow, and inexact) and controls for choosing different rounding methods

The IEC 60559:2011 international standard is equivalent to the IEEE 754-2008 standard for floating-point arithmetic, which is a major revision to IEEE 754-1985.

The revised standard specifies more formats, including decimal as well as binary. It adds a 128-bit binary format to its basic formats. It defines extended formats for all of its basic formats. It specifies data interchange
formats (which may or may not be arithmetic), including a 16-bit binary format and an unbounded tower of wider formats. To conform to the floating-point standard, an implementation must provide at least one of the basic formats, along with the required operations.

The revised standard specifies more operations. New requirements include - among others - arithmetic operations that round their result to a narrower format than the operands (with just one rounding), more conversions with integer types, more classifications and comparisons, and more operations for managing flags and modes. New recommendations include an extensive set of mathematical functions and seven reduction functions for sums and scaled products.

The revised standard places more emphasis on reproducible results, which is reflected in its standardization of more operations. For the most part, behaviors are completely specified. The standard requires conversions between floating-point formats and decimal character sequences to be correctly rounded for at least three more decimal digits than is required to distinguish all numbers in the widest supported binary format; it fully specifies conversions involving any number of decimal digits. It recommends that transcendental functions be correctly rounded.

The revised standard requires a way to specify a constant rounding direction for a static portion of code, with details left to programming language standards. This feature potentially allows rounding control without incurring the overhead of runtime access to a global (or thread) rounding mode.

Other features recommended by the revised standard include alternate methods for exception handling, controls for expression evaluation (allowing or disallowing various optimizations), support for fully reproducible results, and support for program debugging.

The revised standard, like its predecessor, defines its model of floating-point arithmetic in the abstract. It neither defines the way in which operations are expressed (which might vary depending on the computer language or other interface being used), nor does it define the concrete representation (specific layout in storage, or in a processor's register, for example) of data or context, except that it does define specific encodings that are to be used for data that may be exchanged between different implementations that conform to the specification.

IEC 60559 does not include bindings of its floating-point model for particular programming languages. However, the revised standard does include guidance for programming language standards, in recognition of the fact that features of the floating-point standard, even if well supported in the hardware, are not available to users unless the programming language provides a commensurate level of support. The implementation's combination of both hardware and software determines conformance to the floating-point standard.

## C support for IEC 60559

The C standard specifies floating-point arithmetic using an abstract model. The representation of a floatingpoint number is specified in an abstract form where the constituent components (sign, exponent, significand) of the representation are defined but not the internals of these components. In particular, the exponent range, significand size, and the base (or radix) are implementation-defined. This allows flexibility for an implementation to take advantage of its underlying hardware architecture. Furthermore, certain behaviors of operations are also implementation-defined, for example in the area of handling of special numbers and in exceptions.

The reason for this approach is historical. At the time when $C$ was first standardized, before the floating-point standard was established, there were various hardware implementations of floating-point arithmetic in common use. Specifying the exact details of a representation would have made most of the existing implementations at the time not conforming.

Beginning with ISO/IEC 9899:1999 (C99), C has included an optional second level of specification for implementations supporting the floating-point standard. C99, in conditionally normative Annex F, introduced nearly complete support for the IEC 60559:1989 standard for binary floating-point arithmetic. Also, C99's informative Annex $G$ offered a specification of complex arithmetic that is compatible with IEC 60559:1989.

ISO/IEC 9899:2011 (C11) includes refinements to the C99 floating-point specification, though is still based on IEC 60559:1989. C11 upgrades Annex G from "informative" to "conditionally normative".

ISO/IEC Technical Report 24732:2009 introduced partial C support for the decimal floating-point arithmetic in IEC 60559:2011. TR 24732, for which technical content was completed while IEEE 754-2008 was still in the later stages of development, specifies decimal types based on IEC 60559:2011 decimal formats, though it does not include all of the operations required by IEC 60559:2011.

## Purpose

The purpose of this Technical Specification is to provide a C language binding for IEC 60559:2011, based on the C11 standard, that delivers the goals of IEC 60559 to users and is feasible to implement. It is organized into five Parts.

Part 1 provides changes to C11 that cover all the requirements, plus some basic recommendations, of IEC 60559:2011 for binary floating-point arithmetic. C implementations intending to support IEC 60559:2011 are expected to conform to conditionally normative Annex $F$ as enhanced by the changes in Part 1.

Part 2 enhances TR 24732 to cover all the requirements, plus some basic recommendations, of IEC 60559:2011 for decimal floating-point arithmetic. C implementations intending to provide an extension for decimal floating-point arithmetic supporting IEC 60559:2011 are expected to conform to Part 2.

Part 3 (Interchange and extended types), Part 4 (Supplementary functions), and Part 5 (Supplementary attributes) cover recommended features of IEC 60559:2011. C implementations intending to provide extensions for these features are expected to conform to the corresponding Parts.

## Additional background on supplementary functions

This document uses the term supplementary functions to refer to functions that provide operations recommended, but not required, by IEC 60559.

IEC 60559 specifies and recommends a more extensive set of mathematical operations than C11 provides. The IEC 60559 specification is generally consistent with C11, though adds requirements for symmetry and antisymmetry. This Part of Technical Specification 18661 extends the specification in Library subclause 7.12 Mathematics to include the complete set of IEC 60559 mathematical operations. For implementations conforming to Annex F, It also requires full IEC 60559 semantics, including symmetry and antisymmetry properties.

IEC 60559 requires correct rounding for its required operations (squareRoot, fusedMultiplyAdd, etc.), and recommends correct rounding for its recommended mathematical operations. This Part of Technical Specification 18661 reserves identifiers, with cr prefixes, for $C$ functions corresponding to correct rounding versions of the IEC 60559 mathematical operations, which may be provided at the option of the implementation. For example, the identifier crexp is reserved for a correct rounding version of the exp function.

IEC 60559 also specifies and recommends reduction operations, which operate on vector operands. These operations, which compute sums and products, may associate in any order and may evaluate in any wider format. Hence, unlike other IEC 60559 operations, they do not have unique specified results. This Part of Technical Specification 18661 extends the specification in Library subclause 7.12 Mathematics to include functions corresponding to the IEC 60559 reduction operations. For implementations conforming to Annex F, it also requires the IEC 60559 specified behavior for floating-point exceptions.

# Information Technology - Programming languages, their environments, and system software interfaces - Floating-point extensions for C - Part 4: Supplementary functions 

## 1 Scope

This document, Part 4 of Technical Specification 18661, extends programming language $C$ to include functions specified and recommended in ISO/IEC/IEEE 60559:2011.

## 2 Conformance

An implementation conforms to Part 4 of Technical Specification 18661 if
a) It meets the requirements for a conforming implementation of C11 with all the changes to C11 as specified in Parts 1-4 of Technical Specification 18661;
b) It conforms to Part 1 or Part 2 (or both) of Technical Specification 18661; and
c) It defines __STDC_IEC_60559_FUNCS__ to 201 ymmL.

## 5 C standard conformance

### 5.1 Freestanding implementations

The specification in C11 + TS18661-1 + TS18661-2 + TS18661-3 allows freestanding implementations to conform to this Part of Technical Specification18661.

### 5.2 Predefined macros

Changes to C11 + TS18661-1 + TS18661-2 + TS18661-3:
In 6.10.8.3\#1, add:
__STDC_IEC_60559_FUNCS_ The integer constant 201 ymmL , intended to indicate support of functions specified and recommended in IEC 60559.

### 5.3 Standard headers

The new identifiers added to C11 library headers by this Part of Technical Specification 18661 are defined or declared by their respective headers only if $\qquad$ STDC WANT IEC 60559 FUNCS EXT $\qquad$ is defined as a macro at the point in the source file where the appropriate header is first included. The following changes to C11 + TS18661-1 + TS18661-2 + TS18661-3 list these identifiers in each applicable library subclause.

## Changes to C11 + TS18661-1 + TS18661-2 + TS18661-3:

After 7.12\#1d, insert the paragraph:
[1e] The following identifiers are declared only if __STDC_WANT_IEC_60559_TYPES_EXT_ is defined as a macro at the point in the source file where <math. h > is first included:

## 6 Operation binding

The following changes to C11 + TS18661-1 + TS18661-2 + TS18661-3 show how functions in C11 and in this Part of Technical Specification 18661 provide operations recommended in IEC 60559.

Changes to C11 + TS18661-1 + TS18661-2 + TS18661-3:
After F.3\#22, add:
[23] The long int type provides the logBFormat type used in IEC 60559 for the return value of the $\log B$ operation, the scale exponent operand of the scaleB operation, and other operands representing exponents and scale factors. Thus, the long int type is used in the interfaces of the llogb, scalbln, compoundn, rootn, pown, scaled_prod, scaled_prodsum, and scaled_proddif functions.
[24] The C functions in the following table provide operations recommended by IEC 60559 and similar operations:

| IEC 60559 operation | C operation | Clauses - C11 |
| :--- | :--- | :--- |
| exp | exp | 7.12 .6 .1, F.10.3.1 |
| expm1 | expm1 | 7.12 .6 .3, F.10.3.3 |

## 7 Mathematical functions in <math.h>

This clause specifies changes to C11 + TS18661-1 + TS18661-2 + TS18661-3 to include functions that support mathematical operations recommended by IEC 60559. The changes reserve names for correct rounding versions of the functions. IEC 60559 recommends support for the correct rounding functions. The changes also include support for the symmetry and antisymmetry properties that IEC 60559 specifies for mathematical functions.

Changes to C11 + TS18661-1 + TS18661-2 + TS18661-3:
After 7.12.4.7, insert the following:

### 7.12.4.8 The acospi functions

## Synopsis

_Float $N \mathbf{x}$ acospif $N \mathbf{x}$ (_Float $N \mathbf{x}$ x) ;
_DecimalN acospidN(_DecimalN x);
_DecimalNx acospidNx (_DecimalNx x);

## Description

[2] The acospi functions compute the arc cosine of $\mathbf{x}$, divided by $\pi$, thus measuring the angle in halfrevolutions. A domain error occurs for arguments not in the interval $[-1,+1]$.

## Returns

[3] The acospi functions return $\arccos (x) / \pi$, in the interval $[0,1]$.

### 7.12.4.9 The asinpi functions

## Synopsis

```
[1] #define __STDC_WANT_IEC_60559_FUNCS_EXT__
    #include <math.h>
    double asinpi(double x);
    float asinpif(float x);
    long double asinpil(long double x);
    _FloatN asinpifN(_FloatN x);
    _FloatNx asinpifNx(_FloatNx x);
    _DecimalN asinpidN(_DecimalN x);
    _DecimalNx asinpidNx(_DecimalNx x);
```

## Description

[2] The asinpi functions compute the arc sine of $\mathbf{x}$, divided by $\pi$, thus measuring the angle in halfrevolutions. A domain error occurs for arguments not in the interval [ $-1,+1$.

## Returns

[3] The asinpi functions return $\arcsin (\mathbf{x}) / \pi$, in the interval $[-1 / 2,+1 / 2]$.

### 7.12.4.10 The atanpi functions

## Synopsis

```
[1] #define __STDC_WANT_IEC_60559_FUNCS_EXT_
    #include <math.h>
    double atanpi(double x);
    float atanpif(float x);
    long double atanpil(long double x);
    _FloatN atanpifN(_FloatN x);
    _FloatNx atanpifNx(_FloatNx x);
    _DecimalN atanpidN(_DecimalN x);
    _DecimalNx atanpidNx(_DecimalNx x);
```

## Description

[2] The atanpi functions compute the arc tangent of $\mathbf{x}$, divided by $\pi$, thus measuring the angle in half-revolutions.

## Returns

[3] The atanpi functions return $\arctan (\mathbf{x}) / \pi$, in the interval $[-1 / 2,+1 / 2]$.

### 7.12.4.11 The atan2pi functions

## Synopsis

```
[1] #define __STDC_WANT_IEC_60559_FUNCS_EXT_
    #include <math.h>
    double atan2pi(double y, double x);
    float atan2pif(float y, float x);
    long double atan2pil(long double y, long double x);
    _FloatN atan2pifN(_FloatN y, _FloatN x);
    _FloatNx atan2pifNx(_FloatNx y, _FloatNx x);
    _DecimalN atan2pidN(_DecimalN y, _DecimalN x);
    _DecimalNx atan2pidNx (_DecimalNx \overline{y}, _DecimalNx x);
```

## Description

[2] The atan2pi functions compute the angle, measured in half-revolutions, subtended at the origin by the point $(\mathbf{x}, \mathbf{y})$ and the positive $x$-axis. Thus, atan2pi computes $\arctan (y / \mathbf{x}) / \pi$, in the range $[-1,+1]$. A domain error may occur if both arguments are zero.

## Returns

[3] The atan2pi functions return the computed angle, in the interval [-1, +1].

### 7.12.4.12 The cospi functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double cospi (double x);
float cospif(float x);
long double cospil(long double x);
_Float $N$ cospif $N($ Float $N$ x);
_Float Nx cospif $N \mathbf{x}$ (_Float $N \mathbf{x}$ x);
_DecimalN cospidN(_DecimalN x);
_DecimalNx cospidNx (_DecimalNx x);

## Description

[2] The cospi functions compute the cosine of $\pi \times \mathbf{x}$, thus regarding $\mathbf{x}$ as a measurement in halfrevolutions.

## Returns

[3] The cospi functions return $\cos (\pi \times \mathbf{x})$.

### 7.12.4.13 The sinpi functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double sinpi(double x);
float sinpif(float x);
long double sinpil(long double x);
_Float $N$ sinpif $N($ Float $N$ x);
_Float $N \mathbf{x}$ sinpif $N \mathbf{x}$ (_Float $N \mathbf{x}$ x);
_Decimal $N$ sinpidN(_DecimalN $\mathbf{x}$ );
_DecimalNx sinpidNx (_DecimalNx x);

## Description

[2] The sinpi functions compute sine of $\pi \times \mathbf{x}$, thus regarding $\mathbf{x}$ as a measurement in halfrevolutions.

## Returns

[3] The sinpi functions return $\sin (\pi \times \mathbf{x})$.

### 7.12.4.14 The tanpi functions

## Synopsis

```
[1] #define __STDC_WANT_IEC_60559_FUNCS_EXT_
    #include <math.h>
    double tanpi(double x);
    float tanpif(float x);
    long double tanpil(long double x);
    _FloatN tanpifN(_FloatN x);
    _FloatNx tanpifNx(_FloatNx x);
    _DecimalN tanpidN(_DecimalN x);
    _DecimalNx tanpidNx(_DecimalNx x);
```

## Description

[2] The tanpi functions compute the tangent of $\pi \times \mathbf{x}$, thus regarding $\mathbf{x}$ as a measurement in halfrevolutions.

## Returns

[3] The tanpi functions return $\tan (\pi \times \mathbf{x})$.
After 7.12.6.13, insert the following:

### 7.12.6.14 The exp2m1 functions

## Synopsis

## Description

[2] The exp2m1 functions compute the base-2 exponential of the argument, minus 1. A range error occurs if finite $\mathbf{x}$ is too large.

## Returns

[3] The $\exp 2 \mathrm{~m} 1$ functions return $2^{\mathrm{x}}-1$.

### 7.12.6.15 The exp10 functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double exp10 (double x) ;
float explof(float x);
long double exp101(long double x);
_Float $N \exp 10 f N$ (_Float $N$ x);
_Float Nx exp10f $N$ x (_Float $N$ x x);
_DecimalN $\exp 10 d N\left(\_D e c i m a l N \quad x\right)$;
_DecimalNx exp10dNx (_DecimalNx x);

## Description

[2] The exp10 functions compute the base-10 exponential of the argument. A range error occurs if finite $\mathbf{x}$ is too large.

## Returns

[3] The exp10 functions return 10*.

### 7.12.6.16 The exp10m1 functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double exp10m1 (double x);
float explomlf(float x);
long double exp10m11 (long double x);
_Float $N$ exp10m1fN(_Float $N$ x);
_Float Nx exp10m1fNx (_FloatNx x);
_DecimalN exp10m1dN(_DecimalN x);
_DecimalNx exp10m1dNx (_DecimalNx x);

## Description

[2] The exp10m1 functions compute the base-10 exponential of the argument, minus 1. A range error occurs if finite $\mathbf{x}$ is too large.

## Returns

[3] The exp10m1 functions return $10^{\mathbf{x}}-1$.

### 7.12.6.17 The $\log 21 p$ functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double $\log 21 p(d o u b l e x)$;
float log21pf(float x);
long double log21pl(long double $x$ );
_Float $N$ log21pf $N($ Float $N$ x);
_Float $N \mathrm{x}$ log21pf $N \mathrm{x}($ _Float $N \mathrm{x}$ x) ;
-DecimalN log21pdN(_DecimalN x);
_DecimalNx log21pdNx (_DecimalNx x);

ISSUE 1: The naming style here matches $\log 1 \mathrm{p}$, where the 1 before the p is intended to help distinguish modifying the argument from modifying the result, as in expm1 where the 1 is after the $m$. With log21p and $\log 101 \mathrm{p}$ this might be confusing. Changing to $\log 2 p 1$ and $\log 10 p 1$ would be inconsistent with the established $\log 1 \mathrm{p}$. Another option might be $\log 1 \mathrm{p} 2$ and $\log 1 \mathrm{p} 10$, though with the disadvantage of separating the base ( 2 or 10) from "log".

## Description

[2] The $\log 21$ p functions compute the base-2 logarithm of 1 plus the argument. A domain error occurs if the argument is less than -1 . A pole error may occur if the argument equals -1 .

## Returns

[3] The $\log 21 p$ functions return $\log _{2}(1+\mathbf{x})$.

### 7.12.6.18 The log101p functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT_ \#include <math.h> double log101p (double x); float log101pf(float x); long double log101pl(long double x); _Float $N$ log101pf $N($ Float $N$ x); _Float $N \mathrm{x}$ log101pf $N \mathrm{x}\left(\_\right.$Float $N \mathrm{x}$ x);
_DecimalN log101pdN(_DecimalN x);
_DecimalNx log101pdNx (_DecimalNx x);

## Description

[2] The log101p functions compute the base-10 logarithm of 1 plus the argument. A domain error occurs if the argument is less than -1 . A pole error may occur if the argument equals -1 .

## Returns

[3] The $\log 101 p$ functions return $\log _{10}(1+\mathbf{x})$.

After 7.12.7.5, insert the following:

### 7.12.7.6 The rsqrt functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT_
\#include <math.h>
double rsqrt(double x);
float rsqrtf(float $x$ );
long double rsqrtl(long double x);
_Float $N$ rsqrtf $N\left(\_\right.$Float $N$ x);
_Float Nx rsqrtf $N \bar{x}$ (_Float $N \mathbf{x}$ x);
_DecimalN rsqrtdN(_DecimalN x);
_DecimalNx rsqrtdNx (_DecimalNx x);

## Description

[2] The rsqrt functions compute the reciprocal of the square root of the argument. A domain error occurs if the argument is less than zero. A pole error may occur if the argument equals zero.

## Returns

[3] The rsqrt functions return $1 / \sqrt{ } \mathbf{x}$.

### 7.12.7.7 The compoundn functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT_
\#include <math.h>
double compoundn (double $x$, long int $n$ );
float compoundnf(float $x$, long int $n$ );
long double compoundnl(long double $x$, long int $n$ );
_Float $N$ compoundnf $N$ (_Float $N$ x, long int n);
_Float $N \mathbf{x}$ compoundnf $N \mathbf{x}($ _Float $N \mathbf{x} \mathbf{x}$, long int $n$ );
_DecimalN compoundnd $N$ (_DecimalN $\mathbf{x}$, long int n);
_DecimalNx compoundndNx (_DecimalNx x, long int n);

## Description

[2] The compoundn functions compute 1 plus $\mathbf{x}$, raised to the power $n$. A domain error occurs if $\mathbf{x}<-1$. A range error may occur if finite $\mathbf{x}$ and $\mathbf{n}$ are too large. A pole error may occur if $\mathbf{x}$ equals -1 and $\mathrm{n}<0$.

## Returns

[3] The compoundn functions return $(1+\mathbf{x})^{n}$.

### 7.12.7.8 The rootn functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double rootn (double $x$, long int $n$ );
float rootnf(float $x$, long int $n$ );
long double rootnl(long double $x$, long int $n$ );
_Float $N$ rootnf $N$ (_Float $N$ x, long int n);
_Float $N \mathbf{x}$ rootnf $N \mathbf{x}$ (_Float $N \mathbf{x}$ x, long int $n$ );
_DecimalN rootndN(_DecimalN $\mathbf{x}$, long int n );
_DecimalNx rootndNx(_DecimalNx x, long int n);

## Description

[2] The rootn functions compute the principal nth root of $\mathbf{x}$. A domain error occurs if n is 0 or if $\mathbf{x}<0$ and n is even. A range error may occur if n is -1 . A pole error may occur if $\mathbf{x}$ equals zero and $\mathrm{n}<0$.

## Returns

[3] The rootn functions return $\mathbf{x}^{1 / n}$.

### 7.12.7.9 The pown functions

## Synopsis

## Description

[2] The pown functions compute $\mathbf{x}$ raised to the nth power. A range error may occur. A pole error may occur if $\mathbf{x}$ equals zero and $\mathrm{n}<0$.

## Returns

[3] The pown functions return $\mathbf{x}^{\mathrm{n}}$.

### 7.12.7.10 The powr functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT_
\#include <math.h>
double powr (double $x$, double $y$ );
float powrf(float $x$, float $y$ ) ;
long double powrl(long double $x$, long double $y$ );
_Float $N$ powrf $N($ _Float $N$ x, _Float $N$ y);
_Float $N \mathbf{x}$ powrf $N \mathbf{x}($ Float $N \mathbf{x}$ x, _Float $N \mathbf{x}$ y);
_DecimalN powrdN(_DecimalN x, _DecimalN y);
_DecimalNx powrdNx (_DecimalNx x, _DecimalNx y);

## Description

[2] The powr functions compute $\mathbf{x}$ raised to the power $\mathbf{y}$ as $\exp (\mathbf{y} \times \log (\mathbf{x}))$. A domain error occurs if $\mathbf{x}<0$ or if $\mathbf{x}$ and $\mathbf{y}$ are both zero. A range error may occur. A pole error may occur if $\mathbf{x}$ equals zero and finite $\mathrm{y}<0$.

## Returns

[3] The powr functions return $\mathbf{x}^{y}$.
After 7.31.6, insert:

### 7.31.6a Mathematics <math .h>

The function names

| crexp | crhypot | cratanpi |
| :--- | :--- | :--- |
| crexpm1 | crrsqrt | cratan2pi |
| crexp2 | crcompoundn | crasin |
| crexp2m1 | crrootn | cracos |
| crexp10 | crpown | cratan |
| crexp10m1 | crpow | cratan2 |
| crlog | crpowr | crsinh |
| crlog2 | crsin | crcosh |
| crlog10 | crcos | crtanh |
| crlog1p | crtan | crasinh |
| crlog21p | crsinpi | cracosh |
| crlog101p |  |  |

and the same names suffixed with $\mathrm{f}, \mathrm{l}, \mathrm{f} N, \mathrm{f} N \mathbf{x}, \mathrm{~d} N$, or $\mathrm{d} N \mathbf{x}$ may be added to the <math. $\mathrm{h}>$ header.

After F.10\#2, insert:
[2a] For each single-argument function $f$ in <math. h> whose mathematical counterpart is symmetric, $f(x)$ is $f(-x)$ for all rounding modes and for all $x$ in the (valid) domain of the function. For each singleargument function $f$ in <math. h> whose mathematical counterpart is antisymmetric, $f(-x)$ is $-f(x)$ for the IEC 6059 rounding modes roundTiesToEven, roundTiesToAway, and roundTowardZero, and for all $x$ in the (valid) domain of the function. The $\operatorname{atan} 2$ and atan2pi functions are odd in their first argument.

After F.10.1.7, insert the following:

## F.10.1.8 The acospi functions

- acospi (+1) returns +0.
- acospi ( $x$ ) returns a NaN and raises the "invalid" floating-point exception for $|x|>1$.

## F.10.1.9 The asinpi functions

$-\quad$ asinpi $( \pm 0)$ returns $\pm 0$.

- asinpi ( $x$ ) returns a NaN and raises the "invalid" floating-point exception for $|x|>1$.
F.10.1.10 The atanpi functions
- atanpi ( $\pm 0$ ) returns $\pm 0$.
- atanpi $( \pm \infty)$ returns $\pm 1 / 2$.

## F.10.1.11 The atan2pi functions

$-\operatorname{atan} 2 \mathrm{pi}( \pm 0,-0)$ returns $\pm 1$.
$-\operatorname{atan} 2 \mathrm{pi}( \pm 0,+0)$ returns $\pm 0$.
$-\operatorname{atan} 2 \mathrm{pi}( \pm 0, x)$ returns $\pm 1$ for $x<0$.

- atan2pi $( \pm 0, x)$ returns $\pm 0$ for $x>0$.
- atan2pi $(y, \pm 0)$ returns $-1 / 2$ for $y<0$.
$-\quad \operatorname{atan} 2 \mathrm{pi}(y, \pm 0)$ returns $+1 / 2$ for $y>0$.
$-\operatorname{atan} 2 \mathrm{pi}( \pm y,-\infty)$ returns $\pm 1$ for finite $y>0$.
$-\operatorname{atan} 2 \mathrm{pi}( \pm y,+\infty)$ returns $\pm 0$ for finite $y>0$.
- atan2pi $( \pm \infty, X)$ returns $\pm 1 / 2$ for finite $x$.
- atan2pi $( \pm \infty,-\infty)$ returns $\pm 3 / 4$ for finite $x$.
- atan2pi $( \pm \infty,+\infty)$ returns $\pm 1 / 4$ for finite $x$.

## F.10.1.12 The cospi functions

- cospi ( $\pm 0$ ) returns 1 .
- cospi $( \pm \infty)$ returns a NaN and raises the "invalid" floating-point exception.

## F.10.1.13 The sinpi functions

- sinpi ( $\pm 0$ ) returns $\pm 0$.
- sinpi $( \pm \infty)$ returns a NaN and raises the "invalid" floating-point exception.

## F.10.1.14 The tanpi functions

- tanpi $( \pm 0)$ returns $\pm 0$.
- tanpi $( \pm \infty)$ returns a NaN and raises the "invalid" floating-point exception.

After F.10.3.13, insert the following:

## F.10.3.14 The exp2m1 functions

- exp2m1 ( $\pm 0)$ returns $\pm 0$.
- exp2m1 (- - ) returns -1 .
- exp2m1 ( $+\infty$ ) returns $+\infty$.

## F.10.3.15 The exp10 functions

$-\exp 10( \pm 0)$ returns 1.

- exp10 $(-\infty)$ returns +0 .
- exp10 (+ ${ }^{+\infty}$ ) returns $+\infty$.

## F.10.3.16 The exp 10 m 1 functions

- exp10m1 ( $\pm 0)$ returns $\pm 0$.
- exp10m1 (- $)$ returns -1 .
- exp10m1 ( $+\infty$ ) returns $+\infty$.

## F.10.3.17 The $\log 21 p$ functions

$-\log 21 p( \pm 0)$ returns $\pm 0$.

- $\log 21 p(-1)$ returns $-\infty$ and raises the "divide-by-zero" floating-point exception.
- $\log 21 \mathrm{p}(x)$ returns a NaN and raises the "invalid" floating-point exception for $x<-1$.
- $\log 21 p(+\infty)$ returns $+\infty$.

## F.10.3.18 The $\log 101 p$ functions

$-\log 101 p( \pm 0)$ returns $\pm 0$.

- $\log 101 p(-1)$ returns $-\infty$ and raises the "divide-by-zero" floating-point exception.
- $\log 101 \mathrm{p}(X)$ returns a NaN and raises the "invalid" floating-point exception for $x<-1$.
$-\log 101 \mathrm{p}(+\infty)$ returns $+\infty$.
After F.10.4.5, insert the following:

## F.10.4.6 The rsqrt functions

- rsqrt ( $\pm 0$ ) returns $\pm \infty$ and raises the "divide-by-zero" floating-point exception.
- rsqrt ( $X$ ) returns a NaN and raises the "invalid" floating-point exception for $x<0$.
- rsqrt ( $+\infty$ ) returns +0 .

## F.10.4.7 The compoundn functions

- compoundn ( $x, 0$ ) returns 1 for $x<-1$.
- compoundn ( $+\infty, 0$ ) returns 1.
- compoundn $(x, 0)$ returns 1 for $x$ a NaN .
- compoundn ( $-1, n$ ) returns $+\infty$ and raises the divide-by-zero floating-point exception for $n<0$.
- compoundn $(-1, n)$ returns +0 for $n>0$.

## F.10.4.8 The rootn functions

- rootn $( \pm 0, n)$ returns $\pm \infty$ and raises the "divide-by-zero" floating-point exception for odd $n<0$.
- rootn $( \pm 0, n)$ returns $+\infty$ and raises the "divide-by-zero" floating-point exception for even $n<0$.
- rootn $( \pm 0, n)$ returns +0 for even $n>0$.
$-\operatorname{rootn}( \pm 0, n)$ returns $\pm 0$ for odd $n>0$.
- rootn $( \pm \infty, n)$ is equivalent to rootn $( \pm 0,-n)$ for $n$ not 0 .
- rootn $(x, 0)$ returns a NaN and raises the "invalid" floating-point exception for all numbers $x$.
- rootn $(x, n)$ returns a NaN and raises the "invalid" floating-point exception for $x<0$ and $n$ even.

## F.10.4.9 The pown functions

- pown $(x, 0)$ returns 1 for all $x$ not a signaling NaN .
- pown ( $\pm 0, n$ ) returns $\pm \infty$ and raises the "divide-by-zero" floating-point exception for odd $n<0$.
- pown $( \pm 0, n)$ returns $+\infty$ and raises the "divide-by-zero" floating-point exception for even $n<0$.
- pown $( \pm 0, n)$ returns +0 for even $n>0$.
- pown $( \pm 0, n)$ returns $\pm 0$ for odd $n>0$.
- pown $( \pm \infty, n)$ is equivalent to pown $( \pm 0,-n)$ for $n$ not 0 .

## F.10.4.10 The powr functions

- powr $(x, \pm 0)$ returns 1 for finite $x>0$.
- powr $( \pm 0, y)$ returns $+\infty$ and raises the "divide-by-zero" floating-point exception for finite $y<0$.
- powr $( \pm 0,-\infty)$ returns $+\infty$.
- powr $( \pm 0, y)$ returns +0 for $y>0$.
- powr $(+1, y)$ returns 1 for finite $y>0$.
- powr $(x, y)$ returns a NaN and raises the "invalid" floating-point exception for $x<0$.
- powr $( \pm 0, \pm 0)$ returns a NaN and raises the "invalid" floating-point exception.
- powr $(+\infty, \pm 0)$ returns a NaN and raises the "invalid" floating-point exception.
- powr $(1, \pm \infty)$ returns a NaN and raises the "invalid" floating-point exception.

## 8 Reduction functions in <math.h>

This clause specifies changes to C11 + TS18661-1 + TS18661-2 + TS18661-3 to include functions that support reduction operations recommended by IEC 60559.

Changes to C11 + TS18661-1 + TS18661-2 + TS18661-3:
After 7.12.13, insert the following:

### 7.12.13a Reduction functions

The functions in this subclause should be implemented so that intermediate computations do not overflow or underflow.

Sums of length $n=0$ have the value +0 . Products of length $n=0$ have the value 1 .

### 7.12.13a. 1 The reduc_sum functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double reduc_sum(size_t $n$, const double $p$ [static $n$ ]);
float reduc_sumf(size_t $n$, const float $p[s t a t i c n])$;
long double reduc_suml (size_t $n$, const long double p[static n]);
Float $N$ reduc_sumf $N x($ size_t $n$, const _Float $N$ p [static n]);
Float $N$ x reduc_sumf $N$ (size_t $n$, const _Float $N \mathbf{x}$ p[static n]);
_Decimal $N$ reduc_sumd $N($ size_t $n$, const _DecimalN p[static n]);
_Decimal $N \mathbf{x}$ reduc_sumdNx(size_t $n$, const _DecimalNx p[static n]);

## Description

[2] The reduc_sum functions compute the sum of the $n$ members of array $p: \sum_{i=0, n-1} p$ [i]. A range error may occur.

## Returns

[3] The reduc_sum functions return the computed sum.
7.12.13a.2 The reduc_sumabs functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT_

## Description

[2] The reduc_sumsq functions compute the sum of squares of the values of the $n$ members of array $p: \Sigma_{i=0, n-1}(p[i] \times p[i])$. A range error may occur.

## Returns

[3] The reduc_sumsq functions return the computed sum.

### 7.12.13a. 4 The reduc_sumprod functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double reduc_sumprod(size_t $n$, const double $p$ [static $n$ ], const double q[static $\bar{n}])$;
float reduc_sumprodf(size_t $n$, const float $p[s t a t i c n]$, const float $q[$ static n$]$ );
long double reduc_sumprodl (size_t $n$, const long double $p$ [static $n$ ], const long double q[static n]);
_Float $N$ reduc_sumprodf $N x$ (size_t $n$, const _Float $N$ p[static n], const _FloatN q[static n]);
_Float $N \mathrm{x}$ reduc_sumprodf $N \mathrm{x}$ (size_t n , const _Float $N \mathrm{x}$ p[static n$]$, const _FloatNx q[static n]);
_DecimalN reduc_sumproddN(size_t n, const _DecimalN p[static n], const _DecimalN q[static n]);
_Decimal $N \bar{x}$ reduc_sumprodd $N$ (size_t $n$, const _Decimal $N x$ p[static $n]$, const _Decimal $N$ x $q$ [static $n]$ );

## Description

[2] The reduc_sumprod functions compute the dot product of the sequences of members of the arrays p and $\mathrm{q}: \bar{\Sigma}_{\mathrm{i}=0, \mathrm{n}-1}(\mathrm{p}[\mathrm{i}] \times \mathrm{q}[\mathrm{i}])$. A range error may occur.

## Returns

[3] The reduc_sumprod functions return the computed sum.
7.12.13a. 5 The scaled_prod functions

## Synopsis

```
[1] #define __STDC_WANT_IEC_60559_FUNCS_EXT_
    #include <math.h>
    double scaled_prod(size_t n, const double p[static n],
        long int * restrict sfptr);
    float scaled_prodf(size_t n, const float p[static n],
        long int * restrict sfptr);
    long double scaled_prodl(size_t n, const long double p[static n],
        long int * restrict sfptr);
    _FloatN scaled_prodfNx(size_t n, const _FloatN p[static n],
        long int * restrict sfptr);
    _FloatNx scaled_prodfNx(size_t n, const _FloatNx p[static n],
        long int * restrict sfptr);
    DecimalN scaled_proddN(size_t n, const _DecimalN p[static n],
        long int * restrict sfptr);
    _DecimalNx scaled_proddNx(size_t n, const _DecimalNx p[static n],
        long int * restrict sfptr);
```

## Description

[2] The scaled_prod functions compute a scaled product pr of the n members of the array pand a scale factor sf, such that: scalbn ( $p r$, sf) computes $\Pi_{i=0, \mathrm{n}-1} \mathrm{p}[\mathrm{i}]$, where scalbn is the scalbln function of the same type. These functions store the scale factor $s f$ in the object pointed to by sfptr. The functions should not cause a range error.

## Returns

[3] The scaled_prod functions return the computed scaled product pr.

### 7.12.13a. 6 The scaled_prodsum functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__ \#include <math.h>
double scaled_prodsum(size_t n, const double p[static n],
const double q[static $\bar{n}]$, long int * restrict sfptr);
float scaled_prodsumf(size_t $n$, const float p[static n],
const float $q[$ static $n$ ], long int * restrict sfptr);
long double scaled_prodsuml(size_t $n$, const long double p[static n],
const long double q[static n], long int * restrict sfptr);
_Float $N$ scaled_prodsumf $N$ (size_t n , const _FloatN p[static n],
const _Float $N$ q[static $n]$, long int * restrict sfptr);
_Float $N x$ scaled_prodsumf $N$ (size_t $n$, const _Float $N x$ p[static n],
const _Float $N$ x q[static n], long int * restrict sfptr);
_DecimalN scaled_prodsumdN(size_t n, const _DecimalN p[static n],
const _DecimalN q[static n], long int * restrict sfptr);
_Decimal $N \bar{x}$ scaled_prodsumd $N$ (size_t $n$, const _DecimalNx p[static n],
const _DecimalNx q[static n], long int * restrict sfptr);

## Description

[2] The scaled_prodsum functions compute a scaled product pr of the sums of the corresponding members of the arrays p and q and a scale factor $s f$, such that: scalbn ( $p r, s f$ ) computes $\Pi_{i=0, n-1}(p[i]+q[i])$, where scalbn is the scalbln function of the same type. These functions store the scale factor $s f$ in the object pointed to by sfptr. These functions should not cause a range error.

## Returns

[3] The scaled_prodsum functions return the computed scaled product pr.

### 7.12.13a. 7 The scaled_proddiff functions

## Synopsis

[1] \#define __STDC_WANT_IEC_60559_FUNCS_EXT__
\#include <math.h>
double scaled_proddiff(size_t $n$, const double $p[$ static $n$ ], const double q[static $n$ ], long int * restrict sfptr);
float scaled_proddifff(size_t n, const float p[static n], const float $q[$ static $n]$, long int * restrict sfptr);
long double scaled_proddiffl(size_t $n$, const long double $p[s t a t i c n]$, const long double q[static $n]$, long int * restrict sfptr);
_Float $N$ scaled_proddifff $N$ (size_t $n$, const _FloatN p[static n], const _FloatN q[static n], long int * restrict sfptr);
_FloatNx scaled_proddifff $N$ (size_t $n$, const _FloatNx p[static n], const _FloatNx q[static n], long int * restrict sfptr);
_DecimalN scaled_proddiffdN(size_t $n$, const _DecimalN p[static n], const _DecimalN q[static n], long int * restrict sfptr);
_Decimal $N \bar{x}$ scaled_proddiffd $N$ (size_t $n$, const _DecimalNx p[static n], const _DecimalNx q[static n], long int * restrict sfptr);

## Description

[2] The scaled_proddiff functions compute a scaled product pr of the differences of the corresponding members of the arrays p and q and a scale factor $s f$, such that: scalbn ( $p r$, $s f$ ) computes $\Pi_{i=0, \mathrm{n}-1}(\mathrm{p}[\mathrm{i}]-\mathrm{q}[\mathrm{i}])$, where scalbn is the scalbln function of the same type. These

## F.10.10a. 5 The scaled_prod functions

- scaled_prod (n, p, sfptr) returns a NaN if any member of array p is a NaN .
- scaled_prod (n, p, sfptr) returns a NaN and raises the "invalid" floating-point exception if any two members of array $p$ are a zero and an infinity.
- Otherwise, scaled_prod( $n, p$, sfptr) returns an infinity if any member of array $p$ is an infinity.
- Otherwise, scaled_prod ( $n, p, s f p t r$ ) returns a zero if any member of array $p$ is a zero.

## F.10.10a. 6 The scaled_prodsum functions

- scaled_prodsum (n, p, q, sfptr) returns a $N a N$ if any member of $p$ or $q$ is a $N a N$.
- scaled_prodsum (n, p, q, sfptr) returns a NaN and raises the "invalid" floating-point exception if any two factors (each of which is a sum) are zero and infinity (exactly).
- scaled_prodsum (n, p, q, sfptr) returns a NaN and raises the "invalid" floating-point exception if any of the sums is of two infinities with different signs.
- Otherwise, scaled_prodsum (n, p, q, sfptr) returns an infinity if any factor is an exact infinity.
- Otherwise, scaled_prodsum ( $n, p, q, s f p t r$ ) returns a zero if any factor is a zero.

## F.10.10a. 7 The scaled_proddiff functions

- scaled_proddiff(n, p, q, sfptr) returns a $N a N$ if any member of $p$ or $q$ is a NaN .
- scaled_proddiff(n, p, q, sfptr) returns a NaN and raises the "invalid" floating-point exception if any two factors (each of which is a difference) are zero and infinity (exactly).
- scaled_proddiff ( $n, p, q, s f p t r$ ) returns a NaN and raises the "invalid" floating-point exception if any of the differences is of two infinities with the same signs.
- Otherwise, scaled_proddiff(n, p, q, sfptr) returns an infinity if any factor is an exact infinity.
- Otherwise, scaled_proddiff(n, p, q, sfptr) returns a zero if any factor is a zero.

## 9 Future directions for <complex.h>

This clause extends the list of function names reserved for future library directions under <complex.h> to include complex versions of math functions that this part of Technical Specification 18661 adds to C11.

Change to C11 + TS18661-1 + TS18661-2 + TS18661-3:
In 7.31.1, add the following to the list of function names:

| cexp2m1 | ccompoundn | catanpi |
| :--- | :--- | :--- |
| cexp10 | crootn | ccospi |
| cexp10m1 | cpown | csinpi |
| clog21p | cpowr | ctanpi |
| clog101p | cacospi |  |
| crsqrt | casinpi |  |

## 10 Type-generic macros <tgmath.h>

The following changes to C11 + TS18661-1 + TS18661-2 + TS18661-3 enhance the specification of typegeneric macros in <tgmath. h> to apply to the math functions that this Part of Technical Specification 18661 adds to C11.

## Changes to C11 + TS18661-1 + TS18661-2 + TS18661-3:

In 7.25\#5, change:
For each unsuffixed function in <math.h> without a c-prefixed counterpart in <complex. h> (except modf, setpayload, setpayloadsig, and canonicalize)...
to:
For each unsuffixed function in <math. h> without a c-prefixed counterpart in <complex.h> (except modf, setpayload, setpayloadsig, canonicalize, and the reduction functions) ...

In 7.25\#5, add the following to the list of type-generic macros:

| exp2m1 | compoundn | atanpi |
| :--- | :--- | :--- |
| exp10 | rootn | atan2pi |
| exp10m1 | pown | cospi |
| log21p | powr | sinpi |
| log101p | acospi | tanpi |
| rsqrt | asinpi |  |
