static_assert(mwd.\text{weekday_last}() == Tuesday[\text{last}]);
```

—end example]

3 month_weekday_last is a trivially copyable and standard-layout class type.

29.8.12.2 Member functions

constexpr month_weekday_last(const chrono::month& m,
                             const chrono::weekday_last& wdl) noexcept;

Effects: Initializes \( m_ \) with \( m \), and \( \text{wdl} \) with \( \text{wdl} \).

constexpr chrono::month month() const noexcept;

Returns: \( m_ \).

constexpr chrono::weekday_last weekday_last() const noexcept;

Returns: \( \text{wdl} \).

constexpr bool ok() const noexcept;

Returns: \( m_.\text{ok}() \) && \( \text{wdl}_.\text{ok}() \).

29.8.12.3 Non-member functions

constexpr bool operator==(const month_weekday_last& x, const month_weekday_last& y) noexcept;

Returns: \( x.\text{month}() == y.\text{month}() \) && \( x.\text{weekday_last}() == y.\text{weekday_last}() \).
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month_weekday_last& mwdl);

Effects: Equivalent to:

    return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/:{L}"),
                       mwdl.month(), mwdl.weekday_last());

29.8.13 Class year_month

29.8.13.1 Overview

namespace std::chrono {
    class year_month {
        chronon::year y_;  // exposition only
        chronon::month m_;  // exposition only

    public:
        year_month() = default;
        constexpr year_month(const chronon::year& y, const chronon::month& m) noexcept;

        constexpr chronon::year year() const noexcept;
        constexpr chronon::month month() const noexcept;

        constexpr year_month& operator+=(const months& dm) noexcept;
        constexpr year_month& operator-=(const months& dm) noexcept;
        constexpr year_month& operator+=(const years& dy) noexcept;
        constexpr year_month& operator-=(const years& dy) noexcept;

        constexpr bool ok() const noexcept;
    };
}

1 year_month represents a specific month of a specific year, but with an unspecified day. year_month is
a field-based time point with a resolution of months. year_month meets the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30) requirements.

2 year_month is a trivially copyable and standard-layout class type.

29.8.13.2 Member functions

constexpr year_month(const chronon::year& y, const chronon::month& m) noexcept;

Effects: Initializes y_ with y, and m_ with m.

constexpr chronon::year year() const noexcept;

Returns: y_.

constexpr chronon::month month() const noexcept;

Returns: m_.

constexpr year_month& operator+=(const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this + dm.

Returns: *this.

constexpr year_month& operator-=(const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Effects: *this = *this - dm.

Returns: *this.
constexpr year_month& operator+=(const years& dy) noexcept;  

Effects: *this = *this + dy.  
Returns: *this.

constexpr year_month& operator-=(const years& dy) noexcept;  

Effects: *this = *this - dy.  
Returns: *this.

customexpr bool ok() const noexcept;  

Returns: y_.ok() && m_.ok().

29.8.13.3 Non-member functions

constexpr bool operator==(const year_month& x, const year_month& y) noexcept;  

Returns: x.year() == y.year() && x.month() == y.month().

constexpr strong_ordering operator<=>(const year_month& x, const year_month& y) noexcept;  

Effects: Equivalent to:
   if (auto c = x.year() <=> y.year(); c != 0) return c;
   return x.month() <=> y.month();

constexpr year_month operator+(const year_month& ym, const months& dm) noexcept;  

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).  
Returns: A year_month value z such that z.ok() && z - ym == dm is true.  
Complexity: $\Theta(1)$ with respect to the value of dm.

constexpr year_month operator+(const months& dm, const year_month& ym) noexcept;  

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).  
Returns: ym + dm.

constexpr year_month operator-(const year_month& ym, const months& dm) noexcept;  

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).  
Returns: ym + -dm.

constexpr months operator-(const year_month& x, const year_month& y) noexcept;  

Returns:  
x.year() - y.year() + months{static_cast<int>(unsigned{x.month()}) - static_cast<int>(unsigned{y.month()})}

constexpr year_month operator+(const year_month& ym, const years& dy) noexcept;  

Returns: (ym.year() + dy) / ym.month().

constexpr year_month operator+(const years& dy, const year_month& ym) noexcept;  

Returns: ym + dy.

constexpr year_month operator-(const year_month& ym, const years& dy) noexcept;  

Returns: ym + -dy.

template<class charT, class traits>
  basic_ostream<charT, traits>&
  operator<<(basic_ostream<charT, traits>& os, const year_month& ym);

Effects: Equivalent to:
return os << format(os.getloc(), "{}/{:L}",
    ym.year(), ym.month());

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
    year_month& ym, basic_string<charT, traits, Alloc>* abbrev = nullptr,
    minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year_month ym using the format flags given in the
NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year_month, is.setstate(ios_base::failbit) is called and ym is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.14 Class year_month_day

29.8.14.1 Overview

namespace std::chrono {
    class year_month_day {
        chronom::year y_; // exposition only
        chronom::month m_; // exposition only
        chronom::day d_; // exposition only

        public:
            year_month_day() = default;
            constexpr year_month_day(const chronom::year& y, const chronom::month& m,
                const chronom::day& d) noexcept;
            constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
            constexpr year_month_day(const sys_days& dp) noexcept;
            constexpr explicit year_month_day(const local_days& dp) noexcept;

            constexpr year_month_day& operator+=(const months& m) noexcept;
            constexpr year_month_day& operator-=(const months& m) noexcept;
            constexpr year_month_day& operator+=(const years& y) noexcept;
            constexpr year_month_day& operator-=(const years& y) noexcept;

            constexpr chronom::year year() const noexcept;
            constexpr chronom::month month() const noexcept;
            constexpr chronom::day day() const noexcept;
            constexpr operator sys_days() const noexcept;
            constexpr explicit operator local_days() const noexcept;
            constexpr bool ok() const noexcept;
    };
}

1 year_month_day represents a specific year, month, and day. year_month_day is a field-based time point with a resolution of days.
[Note 1: year_month_day supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_day meets the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30) requirements.

2 year_month_day is a trivially copyable and standard-layout class type.

29.8.14.2 Member functions

constexpr year_month_day(const chronom::year& y, const chronom::month& m,
    const chronom::day& d) noexcept;

Effects: Initializes y_ with y, m_ with m, and d_ with d.
```cpp
constexpr year_month_day(const year_month_day_last& ymdl) noexcept;
Effects: Initializes y_ with ymdl.year(), m_ with ymdl.month(), and d_ with ymdl.day().
[Note 1: This conversion from year_month_day_last to year_month_day can be more efficient than converting a year_month_day_last to a sys_days, and then converting that sys_days to a year_month_day. — end note]

constexpr year_month_day(const sys_days& dp) noexcept;
Effects: Constructs an object of type year_month_day that corresponds to the date represented by dp.
Remarks: For any value ymd of type year_month_day for which ymd.ok() is true, ymd == year_month_day(sys_days(ymd)) is true.

constexpr explicit year_month_day(const local_days& dp) noexcept;
Effects: Equivalent to constructing with sys_days(dp.time_since_epoch()).

constexpr year_month_day& operator+=(const months& m) noexcept;
Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).
Effects: *this = *this + m.
Returns: *this.

castexpr year_month_day& operator-=(const months& m) noexcept;
Effects: *this = *this - m.
Returns: *this.

constexpr year_month_day& operator+=(const years& y) noexcept;
Effects: *this = *this + y.
Returns: *this.

constexpr year_month_day& operator-=(const years& y) noexcept;
Effects: *this = *this - y.
Returns: *this.

constexpr chrono::year year() const noexcept;
Returns: y_.

constexpr chrono::month month() const noexcept;
Returns: m_.

constexpr chrono::day day() const noexcept;
Returns: d_.

constexpr operator sys_days() const noexcept;
Returns: If ok(), returns a sys_days holding a count of days from the sys_days epoch to *this (a negative value if *this represents a date prior to the sys_days epoch). Otherwise, if y_.ok() && m_.ok() is true, returns sys_days(y_/m_/1d) + (d_ - 1d). Otherwise the value returned is unspecified.
Remarks: A sys_days in the range [days{-12687428}, days{11248737}] which is converted to a year_month_day has the same value when converted back to a sys_days.
[Example 1:]
static_assert(year_month_day{sys_days{2017y/January/0}} == 2016y/December/31);
static_assert(year_month_day{sys_days{2017y/January/31}} == 2017y/January/31);
static_assert(year_month_day{sys_days{2017y/January/32}} == 2017y/February/1);
— end example]
```
constexpr explicit operator local_days() const noexcept;

Returns: local_days(sys_days{*this}.time_since_epoch()).

constexpr bool ok() const noexcept;

Returns: If y_.ok() is true, and m_.ok() is true, and d_ is in the range [1d,(y_/m_/last).day()], then returns true; otherwise returns false.

29.8.14.3 Non-member functions

constexpr bool operator==(const year_month_day& x, const year_month_day& y) noexcept;

Returns: x.year() == y.year() && x.month() == y.month() && x.day() == y.day().

constexpr strong_ordering operator<=>(const year_month_day& x, const year_month_day& y) noexcept;

Effects: Equivalent to:
if (auto c = x.year() <=> y.year(); c != 0) return c;
if (auto c = x.month() <=> y.month(); c != 0) return c;
return x.day() <=> y.day();

constexpr year_month_day operator+(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: (ymd.year() / ymd.month() + dm) / ymd.day().

[Note 1: If ymd.day() is in the range [1d,28d], ok() will return true for the resultant year_month_day. — end note]

constexpr year_month_day operator+(const months& dm, const year_month_day& ymd) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymd + dm.

constexpr year_month_day operator-(const year_month_day& ymd, const months& dm) noexcept;

Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

Returns: ymd + (-dm).

constexpr year_month_day operator+(const year_month_day& ymd, const years& dy) noexcept;

Returns: ymd + dy.

constexpr year_month_day operator+(const years& dy, const year_month_day& ymd) noexcept;

Returns: ymd + dy.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year_month_day& ymd);

Effects: Equivalent to:
return os << (ymd.ok() ?
    format(STATICALLY-WIDEN<charT>("{:%F}"), ymd):
    format(STATICALLY-WIDEN<charT>("{:%F} is not a valid date"), ymd));
minutes* offset = nullptr);

15Effects: Attempts to parse the input stream is into the year_month_day ymd using the format flags
given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid year_month_day,
is.setstate(ios_base::failbit) is called and ymd is not modified. If %Z (or a modified variant) is
used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is
used and successfully parsed, that value will be assigned to *offset if offset is non-null.

16Returns: is.

29.8.15 Class year_month_day_last

29.8.15.1 Overview

namespace std::chrono {
    class year_month_day_last {
        chrono::year y_; // exposition only
        chrono::month_day_last mdl_; // exposition only
    public:
        constexpr year_month_day_last(const chrono::year& y,
                                       const chrono::month_day_last& mdl) noexcept;
        constexpr year_month_day_last& operator+=(const months& m) noexcept;
        constexpr year_month_day_last& operator-=(const months& m) noexcept;
        constexpr year_month_day_last& operator+=(const years& y) noexcept;
        constexpr year_month_day_last& operator-=(const years& y) noexcept;
        constexpr chrono::year year() const noexcept;
        constexpr chrono::month month() const noexcept;
        constexpr chrono::month_day_last month_day_last() const noexcept;
        constexpr chrono::day day() const noexcept;
        constexpr operator sys_days() const noexcept;
        constexpr explicit operator local_days() const noexcept;
        constexpr bool ok() const noexcept;
    };
}

1year_month_day_last represents the last day of a specific year and month. year_month_day_last is a
field-based time point with a resolution of days, except that it is restricted to pointing to the last day of a
year and month.

[Note 1: year_month_day_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic.
For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_day_last meets the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30) requirements.

2year_month_day_last is a trivially copyable and standard-layout class type.

29.8.15.2 Member functions

constexpr year_month_day_last(const chrono::year& y,
                              const chrono::month_day_last& mdl) noexcept;

1Effects: Initializes y_ with y and mdl_ with mdl.

constexpr year_month_day_last& operator+=(const months& m) noexcept;

2Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

3Effects: *this = *this + m.

4Returns: *this.

constexpr year_month_day_last& operator-=(const months& m) noexcept;

5Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its
implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

        operator<<(basic_ostream<charT, traits>& os, const year_month_day_last& ymdl);

Effects: Equivalent to:
        return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{}/{:L}"),
            ymdl.year(), ymdl.month_day_last());

29.8.16 Class year_month_weekday [time.cal.ymwd]

29.8.16.1 Overview [time.cal.ymwd.overview]

amespace std::chrono {
    class year_month_weekday {
        chrono::year        y_;     // exposition only
        chrono::month       m_;     // exposition only
        chrono::weekday_indexed wdi_;  // exposition only

public:
    year_month_weekday() = default;
    constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
        const chrono::weekday_indexed& wdi) noexcept;
    constexpr year_month_weekday(const sys_days& dp) noexcept;
    constexpr explicit year_month_weekday(const local_days& dp) noexcept;
    constexpr year_month_weekday& operator+=(const months& m) noexcept;
    constexpr year_month_weekday& operator-=(const months& m) noexcept;
    constexpr year_month_weekday& operator+=(const years& y) noexcept;
    constexpr year_month_weekday& operator-=(const years& y) noexcept;
    constexpr chrono::year year() const noexcept;
    constexpr chrono::month month() const noexcept;
    constexpr chrono::weekday weekday() const noexcept;
    constexpr unsigned index() const noexcept;
    constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
    constexpr operator sys_days() const noexcept;
    constexpr explicit operator local_days() const noexcept;
    constexpr bool ok() const noexcept;
};
}

year_month_weekday represents a specific year, month, and nth weekday of the month. year_month_weekday
is a field-based time point with a resolution of days.

[Note 1: year_month_weekday supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]
year_month_weekday meets the Cpp17EqualityComparable (Table 29) requirements.

year_month_weekday is a trivially copyable and standard-layout class type.

### 29.8.16.2 Member functions

#### [time.cal.ymwd.members]

```cpp
constexpr year_month_weekday(const chrono::year& y, const chrono::month& m,
                             const chrono::weekday_indexed& wdi) noexcept;
```

- **Effects**: Initializes y_ with y, m_ with m, and wdi_ with wdi.

```cpp
constexpr year_month_weekday(const sys_days& dp) noexcept;
```

- **Effects**: Constructs an object of type year_month_weekday which corresponds to the date represented by dp.

- **Remarks**: For any value ymwd of type year_month_weekday for which ymwd.ok() is true, ymwd == year_month_weekday{sys_days{ymwd}} is true.

```cpp
constexpr explicit year_month_weekday(const local_days& dp) noexcept;
```

- **Effects**: Equivalent to constructing with sys_days{dp.time_since_epoch()}.

```cpp
constexpr year_month_weekday& operator+=(const months& m) noexcept;
```

- **Constraints**: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

- **Effects**: *this = *this + m.

```cpp
constexpr year_month_weekday& operator-=(const months& m) noexcept;
```

- **Constraints**: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

- **Effects**: *this = *this - m.

```cpp
constexpr year_month_weekday& operator+=(const years& y) noexcept;
```

- **Effects**: *this = *this + y.

```cpp
constexpr year_month_weekday& operator-=(const years& y) noexcept;
```

- **Effects**: *this = *this - y.

```cpp
constexpr chrono::year year() const noexcept;
```

- **Returns**: y_.

```cpp
constexpr chrono::month month() const noexcept;
```

- **Returns**: m_.

```cpp
constexpr chrono::weekday weekday() const noexcept;
```

- **Returns**: wdi_.weekday().

```cpp
constexpr unsigned index() const noexcept;
```

- **Returns**: wdi_.index().

```cpp
constexpr chrono::weekday_indexed weekday_indexed() const noexcept;
```

- **Returns**: wdi_.

```cpp
constexpr operator sys_days() const noexcept;
```

- **Returns**: If y_.ok() && m_.ok() && wdi_.weekday().ok(), returns a sys_days that represents the date (index() - 1) * 7 days after the first weekday() of year()/month(). If index() is 0
the returned \texttt{sys\_days} represents the date 7 days prior to the first \texttt{weekday()} of \texttt{year()/month()}.
Otherwise the returned value is unspecified.

\begin{Verbatim}
constexpr explicit operator local\_days() const noexcept;
\end{Verbatim}
\textbf{Returns:} \texttt{local\_days(sys\_days{*this}.time\_since\_epoch()).}

\begin{Verbatim}
constexpr bool ok() const noexcept;
\end{Verbatim}
\textbf{Returns:} If any of \texttt{y_.ok()}, \texttt{m_.ok()}, or \texttt{wdi_.ok()} is false, returns false. Otherwise, if \texttt{*this} represents a valid date, returns true. Otherwise, returns false.

29.8.16.3 Non-member functions

\begin{Verbatim}
constexpr bool operator==(const year\_month\_weekday& x, const year\_month\_weekday& y) noexcept;
\end{Verbatim}
\textbf{Returns:} \texttt{x.year() == y.year() && x.month() == y.month() && x.weekday\_indexed() == y.weekday\_indexed()}

\begin{Verbatim}
constexpr year\_month\_weekday operator+(const year\_month\_weekday& ymwd, const months& dm) noexcept;
\end{Verbatim}
\textbf{Constraints:} If the argument supplied by the caller for the \texttt{months} parameter is convertible to \texttt{years}, its
implicit conversion sequence to \texttt{years} is worse than its implicit conversion sequence to \texttt{months} (12.2.4.3).
\textbf{Returns:} \texttt{(ymwd.year() / ymwd.month() + dm) / ymwd.weekday\_indexed()).}

\begin{Verbatim}
constexpr year\_month\_weekday operator-(const year\_month\_weekday& ymwd, const months& dm) noexcept;
\end{Verbatim}
\textbf{Constraints:} If the argument supplied by the caller for the \texttt{months} parameter is convertible to \texttt{years}, its
implicit conversion sequence to \texttt{years} is worse than its implicit conversion sequence to \texttt{months} (12.2.4.3).
\textbf{Returns:} \texttt{ymwd + (-dm).}

29.8.17 Class \texttt{year\_month\_weekday\_last}

\begin{Verbatim}
template<class charT, class traits>
\texttt{basic\_ostream<charT, traits>&}
\texttt{operator<}(\texttt{basic\_ostream<charT, traits>& os, const year\_month\_weekday\_last& ymwd});
\end{Verbatim}
\textbf{Effects:} Equivalent to:
\begin{Verbatim}
return os << format(os.getloc(), STATICALLY\_WIDEN\texttt{<charT>}("{/}/::\_L/\_{::\_L}")),
ymwd.year(), ymwd.month(), ymwd.weekday\_indexed());
\end{Verbatim}

29.8.17.1 Overview
 constexpr year_month_weekday_last& operator+=(const months& m) noexcept;
constexpr year_month_weekday_last& operator-=(const months& m) noexcept;
constexpr year_month_weekday_last& operator+=(const years& y) noexcept;
constexpr year_month_weekday_last& operator-=(const years& y) noexcept;

constexpr chrono::year year() const noexcept;
constexpr chrono::month month() const noexcept;
constexpr chrono::weekday weekday() const noexcept;
constexpr chrono::weekday_last weekday_last() const noexcept;
constexpr operator sys_days() const noexcept;
constexpr explicit operator local_days() const noexcept;
constexpr bool ok() const noexcept;

}  
year_month_weekday_last represents a specific year, month, and last weekday of the month. year_month_weekday_last is a field-based time point with a resolution of days, except that it is restricted to pointing to the last weekday of a year and month.

[Note 1: year_month_weekday_last supports years- and months-oriented arithmetic, but not days-oriented arithmetic. For the latter, there is a conversion to sys_days, which efficiently supports days-oriented arithmetic. — end note]

year_month_weekday_last meets the Cpp17EqualityComparable (Table 29) requirements.

2 year_month_weekday_last is a trivially copyable and standard-layout class type.

29.8.17.2 Member functions

constexpr year_month_weekday_last(const chrono::year& y, const chrono::month& m,
   const chrono::weekday_last& wdl) noexcept;

  Effects: Initializes y_ with y, m_ with m, and wdl_ with wdl.

constexpr year_month_weekday_last& operator+=(const months& m) noexcept;

  Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

  Effects: *this = *this + m.

  Returns: *this.

constexpr year_month_weekday_last& operator-=(const months& m) noexcept;

  Constraints: If the argument supplied by the caller for the months parameter is convertible to years, its implicit conversion sequence to years is worse than its implicit conversion sequence to months (12.2.4.3).

  Effects: *this = *this - m.

  Returns: *this.

constexpr year_month_weekday_last& operator+=(const years& y) noexcept;

  Effects: *this = *this + y.

  Returns: *this.

constexpr year_month_weekday_last& operator-=(const years& y) noexcept;

  Effects: *this = *this - y.

  Returns: *this.

constexpr chrono::year year() const noexcept;

  Returns: y_.

constexpr chrono::month month() const noexcept;

  Returns: m_.

constexpr chrono::weekday weekday() const noexcept;

  Returns: wdl_.weekday().
constexpr chrono::weekday_last weekday_last() const noexcept;

Returns: wdl_.

constexpr operator sys_days() const noexcept;

Returns: If ok() == true, returns a sys_days that represents the last weekday() of year()/month(). Otherwise the returned value is unspecified.

constexpr explicit operator local_days() const noexcept;

Returns: local_days(sys_days(*this).time_since_epoch()).

constexpr bool ok() const noexcept;

Returns: y_.ok() && m_.ok() && wdl_.ok().
29.8.18 Conventional syntax operators

A set of overloaded operator/ functions provides a conventional syntax for the creation of civil calendar dates.

[Note 1: The year, month, and day are accepted in any of the following 3 orders:

year/month/day
month/day/year
day/month/year

Anywhere a day is required, any of the following can also be specified:

last
weekday[i]
weekday[last]
—end note]

[Note 2: Partial-date types such as year_month and month_day can be created by not applying the second division operator for any of the three orders. For example:

year_month ym = 2015y/April;
month_day md1 = April/4;
month_day md2 = 4d/April;
—end note]

[Example 1:

auto a = 2015/4/4;  // a == int(125)
auto b = 2015y/4/4;  // b == year_month_day{year(2015), month(4), day(4)}
auto c = 2015y/4d/April;  // error: no viable operator/ for first /
auto d = 2015/April/4;  // error: no viable operator/ for first /
—end example]

constexpr year_month
operator/(const year& y, const month& m) noexcept;
Returns: {y, m}.

constexpr year_month
operator/(const year& y, int m) noexcept;
Returns: y / month(m).

constexpr month_day
operator/(const month& m, const day& d) noexcept;
Returns: {m, d}.

constexpr month_day
operator/(const month& m, int d) noexcept;
Returns: m / day(d).

constexpr month_day
operator/(int m, const day& d) noexcept;
Returns: month(m) / d.

constexpr month_day
operator/(const day& d, const month& m) noexcept;
Returns: m / d.

constexpr month_day
operator/(const day& d, int m) noexcept;
Returns: month(m) / d.

constexpr month_day_last
operator/(const month& m, last_spec) noexcept;
Returns: month_day_last(m).
constexpr month_day_last
operator/(int m, last_spec) noexcept;

Returns: month(m) / last.

constexpr month_day_last
operator/(last_spec, const month& m) noexcept;

Returns: m / last.

constexpr month_day_last
operator/(last_spec, int m) noexcept;

Returns: month(m) / last.

constexpr month_weekday
operator/(const month& m, const weekday_indexed& wdi) noexcept;

Returns: {m, wdi}.

constexpr month_weekday
operator/(int m, const weekday_indexed& wdi) noexcept;

Returns: month(m) / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, const month& m) noexcept;

Returns: m / wdi.

constexpr month_weekday
operator/(const weekday_indexed& wdi, int m) noexcept;

Returns: month(m) / wdi.

constexpr month_weekday_last
operator/(const month& m, const weekday_last& wdl) noexcept;

Returns: {m, wdl}.

constexpr month_weekday_last
operator/(int m, const weekday_last& wdl) noexcept;

Returns: month(m) / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, const month& m) noexcept;

Returns: m / wdl.

constexpr month_weekday_last
operator/(const weekday_last& wdl, int m) noexcept;

Returns: month(m) / wdl.

constexpr year_month_day
operator/(const year_month& ym, const day& d) noexcept;

Returns: {ym.year(), ym.month(), d}.

constexpr year_month_day
operator/(const year_month& ym, int d) noexcept;

Returns: ym / day(d).

constexpr year_month_day
operator/(const year& y, const month_day& md) noexcept;

Returns: y / md.month() / md.day().

constexpr year_month_day
operator/(int y, const month_day& md) noexcept;

Returns: year(y) / md.
constexpr year_month_day
    operator/(const month_day& md, const year& y) noexcept;
Returns: y / md.

constexpr year_month_day
    operator/(const month_day& md, int y) noexcept;
Returns: year(y) / md.

constexpr year_month_day_last
    operator/(const year_month& ym, last_spec) noexcept;
Returns: {ym.year(), month_day_last(ym.month())}.

constexpr year_month_day_last
    operator/(const year& y, const month_day_last& mdl) noexcept;
Returns: {y, mdl}.

constexpr year_month_day_last
    operator/(int y, const month_day_last& mdl) noexcept;
Returns: year(y) / mdl.

constexpr year_month_day_last
    operator/(const month_day_last& mdl, const year& y) noexcept;
Returns: y / mdl.

constexpr year_month_day_last
    operator/(const month_day_last& mdl, int y) noexcept;
Returns: year(y) / mdl.

constexpr year_month_weekday
    operator/(const year_month& ym, const weekday_indexed& wdi) noexcept;
Returns: {ym.year(), ym.month(), wdi}.

constexpr year_month_weekday
    operator/(const year& y, const month_weekday& mwd) noexcept;
Returns: {y, mwd.month(), mwd.weekday_indexed()}.

constexpr year_month_weekday
    operator/(int y, const month_weekday& mwd) noexcept;
Returns: year(y) / mwd.

constexpr year_month_weekday
    operator/(const month_weekday& mwd, const year& y) noexcept;
Returns: y / mwd.

constexpr year_month_weekday
    operator/(const month_weekday& mwd, int y) noexcept;
Returns: year(y) / mwd.

constexpr year_month_weekday_last
    operator/(const year_month& ym, const weekday_last& wdl) noexcept;
Returns: {ym.year(), ym.month(), wdl}.

constexpr year_month_weekday_last
    operator/(const year& y, const month_weekday_last& mwdl) noexcept;
Returns: {y, mwdl.month(), mwdl.weekday_last()}.

constexpr year_month_weekday_last
    operator/(int y, const month_weekday_last& mwdl) noexcept;
Returns: year(y) / mwdl.

§ 29.8.18
1522
constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, const year& y) noexcept;

Returns: y / mwdl.

constexpr year_month_weekday_last
operator/(const month_weekday_last& mwdl, int y) noexcept;

Returns: year(y) / mwdl.

29.9 Class template hh_mm_ss

29.9.1 Overview

namespace std::chrono {
    template<class Duration> class hh_mm_ss {
        public:
            static constexpr unsigned fractional_width = see below;
            using precision = see below;

            constexpr hh_mm_ss() noexcept : hh_mm_ss(Duration::zero()) {}  
            constexpr explicit hh_mm_ss(Duration d);

            constexpr bool is_negative() const noexcept;
            constexpr chrono::hours hours() const noexcept;
            constexpr chrono::minutes minutes() const noexcept;
            constexpr chrono::seconds seconds() const noexcept;
            constexpr precision subseconds() const noexcept;
            constexpr explicit operator precision() const noexcept;
            constexpr precision to_duration() const noexcept;

        private:
            bool is_neg;  // exposition only
            chrono::hours h;  // exposition only
            chrono::minutes m;  // exposition only
            chrono::seconds s;  // exposition only
            precision ss;  // exposition only
    };
}

The hh_mm_ss class template splits a duration into a multi-field time structure hours:minutes:seconds and possibly subseconds, where subseconds will be a duration unit based on a non-positive power of 10. The Duration template parameter dictates the precision to which the time is split. A hh_mm_ss models negative durations with a distinct is_negative getter that returns true when the input duration is negative. The individual duration fields always return non-negative durations even when is_negative() indicates the structure is representing a negative duration.

If Duration is not a specialization of duration, the program is ill-formed.

29.9.2 Members

static constexpr unsigned fractional_width = see below;

fractional_width is the number of fractional decimal digits represented by precision. fractional_width has the value of the smallest possible integer in the range [0, 18] such that precision will exactly represent all values of Duration. If no such value of fractional_width exists, then fractional_width is 6.

[Example 1: See Table 101 for some durations, the resulting fractional_width, and the formatted fractional second output of Duration{1}.]

<table>
<thead>
<tr>
<th>Duration</th>
<th>fractional_width</th>
<th>Formatted fractional second output</th>
</tr>
</thead>
<tbody>
<tr>
<td>hours, minutes, and seconds</td>
<td>0</td>
<td></td>
</tr>

<tr>
<td>duration&lt;int, ratio&lt;756, 625&gt;&gt;</td>
<td>4</td>
<td>0.2096</td>
</tr>
</tbody>
</table>

using precision = see below;

```cpp
2 precision is
duration<common_type_t<Duration::rep, seconds::rep>, ratio<1, 10>>
```

constexpr explicit hh_mm_ss(Duration d);

3 Effects: Constructs an object of type `hh_mm_ss` which represents the `Duration` `d` with precision `precision`.

(3.1) — Initializes `is_neg` with `d < Duration::zero()`.

(3.2) — Initializes `h` with `duration_cast<chrono::hours>(abs(d))`.

(3.3) — Initializes `m` with `duration_cast<chrono::minutes>(abs(d) - hours())`.

(3.4) — Initializes `s` with `duration_cast<chrono::seconds>(abs(d) - hours() - minutes())`.

(3.5) — If `treat_as_floating_point_v<precision::rep>` is `true`, initializes `ss` with `abs(d) - hours() - minutes() - seconds()`. Otherwise, initializes `ss` with `duration_cast<precision>(abs(d) - hours() - minutes() - seconds())`.

[Note 1: When `precision::rep` is integral and `precision::period` is `ratio<1>`, `subseconds()` always returns a value equal to 0s. — end note]

4 Postconditions: If `treat_as_floating_point_v<precision::rep>` is `true`, `to_duration()` returns `d`, otherwise `to_duration()` returns `duration_cast<precision>(d)`.

constexpr bool is_negative() const noexcept;

5 Returns: `is_neg`.

constexpr chrono::hours hours() const noexcept;

6 Returns: `h`.

constexpr chrono::minutes minutes() const noexcept;

7 Returns: `m`.

constexpr chrono::seconds seconds() const noexcept;

8 Returns: `s`.

constexpr precision subseconds() const noexcept;

9 Returns: `ss`.

constexpr precision to_duration() const noexcept;

10 Returns: If `is_neg`, returns `- (h + m + s + ss)`, otherwise returns `h + m + s + ss`.

constexpr explicit operator precision() const noexcept;

11 Returns: `to_duration()`.
29.9.3 Non-members

```cpp
template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const hh_mm_ss<Duration>& hms);
```

Effects: Equivalent to:

```
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%T}"), hms);
```

Example 1:

```
for (auto ms : {-4083007ms, 4083007ms, 65745123ms}) {
    hh_mm_ss hms{ms};
    cout << hms << '
';
}
```

Produces the output (assuming the 'C' locale):

```
-01:08:03.007
01:08:03.007
18:15:45.123
18:15:45
```

—end example—

29.10 12/24 hours functions

These functions aid in translating between a 12h format time of day and a 24h format time of day.

```cpp
constexpr bool is_am(const hours& h) noexcept;
Returns: 0h <= h && h <= 11h.
```

```cpp
constexpr bool is_pm(const hours& h) noexcept;
Returns: 12h <= h && h <= 23h.
```

```cpp
constexpr hours make12(const hours& h) noexcept;
Returns: The 12-hour equivalent of h in the range [1h, 12h]. If h is not in the range [0h, 23h], the value
returned is unspecified.
```

```cpp
constexpr hours make24(const hours& h, bool is_pm) noexcept;
Returns: If is_pm is false, returns the 24-hour equivalent of h in the range [0h, 11h], assuming h
represents an ante meridiem hour. Otherwise, returns the 24-hour equivalent of h in the range [12h, 23h],
assuming h represents a post meridiem hour. If h is not in the range [1h, 12h], the value returned is
unspecified.
```

29.11 Time zones

29.11.1 In general

29.11 describes an interface for accessing the IANA Time Zone Database that interoperates with `sys_time`
and `local_time`. This interface provides time zone support to both the civil calendar types (29.8) and to
user-defined calendars.

29.11.2 Time zone database

```cpp
namespace std::chrono {
    struct tzdb {
        string version;
        vector<time_zone> zones;
        vector<time_zone_link> links;
        vector<leap_second> leap_seconds;

        const time_zone* locate_zone(string_view tz_name) const;
        const time_zone* current_zone() const;
    };
}
```
Each vector in a tzdb object is sorted to enable fast lookup.

    const time_zone* locate_zone(string_view tz_name) const;

Returns:

(2.1) If zones contains an element tz for which tz.name() == tz_name, a pointer to tz;
(2.2) otherwise, if links contains an element tz_l for which tz_l.name() == tz_name, then a pointer
to the element tz of zones for which tz.name() == tz_l.target().

[Note 1: A time_zone_link specifies an alternative name for a time_zone. — end note]

Throws: If a const time_zone* cannot be found as described in the Returns: element, throws a
runtime_error.

[Note 2: On non-exceptional return, the return value is always a pointer to a valid time_zone. — end note]

const time_zone* current_zone() const;

Returns: A pointer to the time zone which the computer has set as its local time zone.

29.11.2.2 Class tzdb_list

namespace std::chrono {
    class tzdb_list {
        public:
            tzdb_list(const tzdb_list&) = delete;
            tzdb_list& operator=(const tzdb_list&) = delete;

            // unspecified additional constructors

            class const_iterator;

            const tzdb& front() const noexcept;

            const_iterator erase_after(const_iterator p);

            const_iterator begin() const noexcept;
            const_iterator end() const noexcept;
            const_iterator cbegin() const noexcept;
            const_iterator cend() const noexcept;
        };
    }

The tzdb_list database is a singleton; the unique object of type tzdb_list can be accessed via the
get_tzdb_list() function.

[Note 1: This access is only needed for those applications that need to have long uptimes and have a need to update
the time zone database while running. Other applications can implicitly access the front() of this list via the
read-only namespace scope functions get_tzdb(), locate_zone(), and current_zone(). — end note]

The tzdb_list object contains a list of tzdb objects.

tzdb_list::const_iterator is a constant iterator which meets the Cpp17ForwardIterator requirements
and has a value type of tzdb.

const tzdb& front() const noexcept;

Synchronization: This operation is thread-safe with respect to reload_tzdb().

[Note 2: reload_tzdb() pushes a new tzdb onto the front of this container. — end note]

Returns: A reference to the first tzdb in the container.

cost_iterator erase_after(const_iterator p);

Preconditions: The iterator following p is dereferenceable.

Effects: Erases the tzdb referred to by the iterator following p.

Postconditions: No pointers, references, or iterators are invalidated except those referring to the erased
 tzdb.
[Note 3: It is not possible to erase the tzdb referred to by begin(). — end note]

Returns: An iterator pointing to the element following the one that was erased, or end() if no such element exists.

Throws: Nothing.

const_iterator begin() const noexcept;

Returns: An iterator referring to the first tzdb in the container.

const_iterator end() const noexcept;

Returns: An iterator referring to the position one past the last tzdb in the container.

const_iterator cbegin() const noexcept;

Returns: begin().

const_iterator cend() const noexcept;

Returns: end().

### 29.11.2.3 Time zone database access

Get tzdb list:

tzdb_list& get_tzdb_list();

Effects: If this is the first access to the time zone database, initializes the database. If this call initializes the database, the resulting database will be a tzdb_list holding a single initialized tzdb.

Synchronization: It is safe to call this function from multiple threads at one time.

Returns: A reference to the database.

Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb_list containing one or more valid tzdbs.

const tzdb& get_tzdb();

Returns: get_tzdb_list().front().

const time_zone* locate_zone(string_view tz_name);

Returns: get_tzdb().locate_zone(tz_name).

[Note 1: The time zone database will be initialized if this is the first reference to the database. — end note]

const time_zone* current_zone();

Returns: get_tzdb().current_zone().

### 29.11.2.4 Remote time zone database support

The local time zone database is that supplied by the implementation when the program first accesses the database, for example via current_zone(). While the program is running, the implementation may choose to update the time zone database. This update shall not impact the program in any way unless the program calls the functions in this subclause. This potentially updated time zone database is referred to as the remote time zone database.

const tzdb& reload_tzdb();

Effects: This function first checks the version of the remote time zone database. If the versions of the local and remote databases are the same, there are no effects. Otherwise the remote database is pushed to the front of the tzdb_list accessed by get_tzdb_list().

Synchronization: This function is thread-safe with respect to get_tzdb_list().front() and get_tzdb_list().erase_after().

Postconditions: No pointers, references, or iterators are invalidated.

Returns: get_tzdb_list().front().

Throws: runtime_error if for any reason a reference cannot be returned to a valid tzdb.
string remote_version();

Returns: The latest remote database version.

[Note 1: This can be compared with get_tzdb().version to discover if the local and remote databases are equivalent. — end note]

29.11.3 Exception classes [time.zone.exception]

29.11.3.1 Class nonexistent_local_time [time.zone.exception.nonexist]

namespace std::chrono {
    class nonexistent_local_time : public runtime_error {
public:
    template<class Duration>
    nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}

nonexistent_local_time is thrown when an attempt is made to convert a non-existent local_time to a sys_time without specifying choose::earliest or choose::latest.

template<class Duration>
nonexistent_local_time(const local_time<Duration>& tp, const local_info& i);

Preconditions: i.result == local_info::nonexistent is true.

Effects: Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

```cpp
ostringstream os;
os << tp << " is in a gap between\n" << local_seconds{i.first.end.time_since_epoch()} + i.first.offset << " " << i.first.abbrev << " and\n" << local_seconds{i.second.begin.time_since_epoch()} + i.second.offset << " " << i.second.abbrev << " which are both equivalent to\n" << i.first.end << " UTC";
```

[Example 1:]

```cpp
#include <chrono>
#include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
                               local_days{Sunday[2]/March/2016} + 2h + 30min);
    } catch (const nonexistent_local_time& e) {
        std::cout << e.what() << "\n";
    }
}
```

Produces the output:

2016-03-13 02:30:00 is in a gap between
2016-03-13 02:00:00 EST and
2016-03-13 03:00:00 EDT which are both equivalent to
2016-03-13 07:00:00 UTC

— end example]

29.11.3.2 Class ambiguous_local_time [time.zone.exception.ambig]

namespace std::chrono {
    class ambiguous_local_time : public runtime_error {
public:
    template<class Duration>
    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);
    };
}

§ 29.11.3.2
ambiguous_local_time is thrown when an attempt is made to convert an ambiguous local_time to a sys_time without specifying choose::earliest or choose::latest.

    template<class Duration>
    ambiguous_local_time(const local_time<Duration>& tp, const local_info& i);

Preconditions: i.result == local_info::ambiguous is true.

Effects: Initializes the base class with a sequence of char equivalent to that produced by os.str() initialized as shown below:

    ostringstream os;
    os << tp << " is ambiguous. It could be
    " << tp << tp - i.first.offset << " UTC or
    " << tp - i.second.offset << " UTC";

[Example 1):

# include <chrono>
# include <iostream>

int main() {
    using namespace std::chrono;
    try {
        auto zt = zoned_time("America/New_York",
                        local_days{Sunday[1]/November/2016} + 1h + 30min);
    } catch (const ambiguous_local_time& e) {
        std::cout << e.what() << '\n';
    }
}

Produces the output:

2016-11-06 01:30:00 is ambiguous. It could be
2016-11-06 01:30:00 EDT == 2016-11-06 05:30:00 UTC or
2016-11-06 01:30:00 EST == 2016-11-06 06:30:00 UTC

—end example]

29.11.4  Information classes

29.11.4.1  Class sys_info

A sys_info object can be obtained from the combination of a time_zone and either a sys_time or local_time. It can also be obtained from a zoned_time, which is effectively a pair of a time_zone and sys_time.

[Note 1: This type provides a low-level interface to time zone information. Typical conversions from sys_time to local_time will use this class implicitly, not explicitly. — end note]

The begin and end data members indicate that, for the associated time_zone and time_point, the offset and abbrev are in effect in the range [begin,end). This information can be used to efficiently iterate the transitions of a time_zone.

The offset data member indicates the UTC offset in effect for the associated time_zone and time_point. The relationship between local_time and sys_time is:

    offset = local_time - sys_time

The save data member is extra information not normally needed for conversion between local_time and sys_time. If save != 0min, this sys_info is said to be on “daylight saving” time, and offset - save
suggests what offset this `time_zone` might use if it were off daylight saving time. However, this information should not be taken as authoritative. The only sure way to get such information is to query the `time_zone` with a `time_point` that returns a `sys_info` where `save == 0min`. There is no guarantee what `time_point` might return such a `sys_info` except that it is guaranteed not to be in the range `[begin, end)` (if `save != 0min` for this `sys_info`).

The `abbrev` data member indicates the current abbreviation used for the associated `time_zone` and `time_point`. Abbreviations are not unique among the `time_zones`, and so one cannot reliably map abbreviations back to a `time_zone` and UTC offset.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_info& r);
```

Effects: Streams out the `sys_info` object `r` in an unspecified format.

Returns: `os`.

### 29.11.4.2 Class `local_info` [time.zone.info.local]

```
namespace std::chrono {
    struct local_info {
        static constexpr int unique = 0;
        static constexpr int nonexistent = 1;
        static constexpr int ambiguous = 2;

        int result;
        sys_info first;
        sys_info second;
    };
}
```

[Note 1: This type provides a low-level interface to time zone information. Typical conversions from `local_time` to `sys_time` will use this class implicitly, not explicitly. — end note]

Describes the result of converting a `local_time` to a `sys_time` as follows:

- (2.1) When a `local_time` to `sys_time` conversion is unique, `result == unique`, `first` will be filled out with the correct `sys_info`, and `second` will be zero-initialized.
- (2.2) If the conversion stems from a nonexistent `local_time` then `result == nonexistent`, `first` will be filled out with the `sys_info` that ends just prior to the `local_time`, and `second` will be filled out with the `sys_info` that begins just after the `local_time`.
- (2.3) If the conversion stems from an ambiguous `local_time`, then `result == ambiguous`, `first` will be filled out with the `sys_info` that ends just after the `local_time`, and `second` will be filled out with the `sys_info` that starts just before the `local_time`.

```
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const local_info& r);
```

Effects: Streams out the `local_info` object `r` in an unspecified format.

Returns: `os`.

### 29.11.5 Class `time_zone` [time.zone.timezone]

### 29.11.5.1 Overview [time.zone.overview]

```
namespace std::chrono {
    class time_zone {
        public:
            time_zone(time_zone&&) = default;
            time_zone& operator=(time_zone&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;
        }
    }
```
A time_zone represents all time zone transitions for a specific geographic area. time_zone construction is unspecified, and performed as part of database initialization.

[Note 1: const time_zone objects can be accessed via functions such as locate_zone. — end note]

29.11.5.2 Member functions

string_view name() const noexcept;

Returns: The name of the time_zone.

[Example 1: "America/New_York". — end example]

template<class Duration>
    sys_info get_info(const sys_time<Duration>& st) const;

Returns: A sys_info for which st is in the range [i.begin, i.end).

template<class Duration>
    local_info get_info(const local_time<Duration>& tp) const;

Returns: A local_info for tp.

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp) const;

Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone. Throws: If the conversion from tp to a sys_time is ambiguous, throws ambiguous_local_time. If the tp represents a non-existent time between two UTC time_points, throws nonexistent_local_time.

template<class Duration>
    sys_time<common_type_t<Duration, seconds>>
        to_sys(const local_time<Duration>& tp, choose z) const;

Returns: A sys_time that is at least as fine as seconds, and will be finer if the argument tp has finer precision. This sys_time is the UTC equivalent of tp according to the rules of this time_zone. If the conversion from tp to a sys_time is ambiguous, returns the earlier sys_time if z == choose::earliest, and returns the later sys_time if z == choose::latest. If the tp represents a non-existent time between two UTC time_points, then the two UTC time_points will be the same, and that UTC time_point will be returned.

template<class Duration>
    local_time<common_type_t<Duration, seconds>>
        to_local(const sys_time<Duration>& tp) const;

Returns: The local_time associated with tp and this time_zone.
29.11.5.3 Non-member functions

bool operator==(const time_zone& x, const time_zone& y) noexcept;
1
Returns: x.name() == y.name().

strong_ordering operator<=>(const time_zone& x, const time_zone& y) noexcept;
2
Returns: x.name() <=> y.name().

29.11.6 Class template zoned_traits

namespace std::chrono {
    template<class T> struct zoned_traits {
    }
}
1
zoned_traits provides a means for customizing the behavior of zoned_time<Duration, TimeZonePtr> for the zoned_time default constructor, and constructors taking string_view. A specialization for const time_zone* is provided by the implementation:

namespace std::chrono {
    template<> struct zoned_traits<const time_zone*> {
        static const time_zone* default_zone();
        static const time_zone* locate_zone(string_view name);
    };
}
2
static const time_zone* default_zone();
Returns: std::chrono::locate_zone("UTC").

static const time_zone* locate_zone(string_view name);
3
Returns: std::chrono::locate_zone(name).

29.11.7 Class template zoned_time

29.11.7.1 Overview

namespace std::chrono {
    template<class Duration, class TimeZonePtr = const time_zone*> class zoned_time {
        public:
            using duration = common_type_t<Duration, seconds>;

        private:
            TimeZonePtr zone_; // exposition only
            sys_time<duration> tp_; // exposition only

            using traits = zoned_traits<TimeZonePtr>; // exposition only

        public:
            zoned_time();
            zoned_time(const zoned_time&) = default;
            zoned_time& operator=(const zoned_time&); = default;

            zoned_time(const sys_time<Duration>& st);
            explicit zoned_time(TimeZonePtr z);
            explicit zoned_time(string_view name);

            template<class Duration2>
                zoned_time(const zoned_time<Duration2, TimeZonePtr>& zt);

            zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
            zoned_time(string_view name, const sys_time<Duration>& st);

            zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
            zoned_time(string_view name, const local_time<Duration>& tp);
            zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
            zoned_time(string_view name, const local_time<Duration>& tp, choose c);

§ 29.11.7.1
template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt);
template<class Duration2, class TimeZonePtr2>
    zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& zt, choose);

template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& zt);
template<class Duration2, class TimeZonePtr2>
    zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& zt, choose);

zoned_time& operator=(const sys_time<Duration>& st);
zoned_time& operator=(const local_time<Duration>& ut);

operator sys_time<duration>() const;
explicit operator local_time<duration>() const;

TimeZonePtr get_time_zone() const;
local_time<duration> get_local_time() const;
sys_time<duration> get_sys_time() const;
sys_info get_info() const;
};

zoned_time() -> zoned_time<seconds>;

template<class Duration>
    zoned_time(sys_time<Duration>)
    -> zoned_time<common_type_t<Duration, seconds>>;

template<class TimeZonePtrOrName>
using time-zone-representation = // exposition only
    conditional_t<is_convertible_v<TimeZonePtrOrName, string_view>,
        const time_zone*,
        remove_cvref_t<TimeZonePtrOrName>>;

template<class TimeZonePtrOrName, class Duration>
    zoned_time(TimeZonePtrOrName&&, sys_time<Duration>,
        choose = choose::earliest)
    -> zoned_time<common_type_t<Duration, seconds>,
        time-zone-representation<TimeZonePtrOrName>>;

1 zoned_time represents a logical pairing of a time_zone and a time_point with precision Duration. zoned_time<Duration> maintains the invariant that it always refers to a valid time zone and represents a point in time that exists and is not ambiguous in that time zone.

2 If Duration is not a specialization of chrono::duration, the program is ill-formed.

3 Every constructor of zoned_time that accepts a string_view as its first parameter does not participate in class template argument deduction (12.2.2.9).
29.11.7.2 Constructors

```cpp
zoned_time();
Constraints: traits::default_zone() is a well-formed expression.
Effects: Initializes zone_ with traits::default_zone() and default constructs tp_.
```

```cpp
zoned_time(const sys_time<Duration>& st);
Constraints: traits::default_zone() is a well-formed expression.
Effects: Initializes zone_ with traits::default_zone() and tp_ with st.
```

```cpp
explicit zoned_time(TimeZonePtr z);
Preconditions: z refers to a time zone.
Effects: Initializes zone_ with std::move(z) and default constructs tp_.
```

```cpp
explicit zoned_time(string_view name);
Constraints: traits::locate_zone(string_view{}) is a well-formed expression and zoned_time is constructible from the return type of traits::locate_zone(string_view{}).
Effects: Initializes zone_ with traits::locate_zone(name) and default constructs tp_.
```

```cpp
template<class Duration2>
zoned_time(const zoned_time<Duration2, TimeZonePtr>& y);
Constraints: is_convertible_v<sys_time<Duration2>, sys_time<Duration>> is true.
Effects: Initializes zone_ with y.zone_ and tp_ with y.tp_.
```

```cpp
zoned_time(TimeZonePtr z, const sys_time<Duration>& st);
Preconditions: z refers to a time zone.
Effects: Initializes zone_ with std::move(z) and tp_ with st.
```

```cpp
zoned_time(string_view name, const sys_time<Duration>& st);
Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and st.
Effects: Equivalent to construction with {traits::locate_zone(name), st}.
```

```cpp
zoned_time(TimeZonePtr z, const local_time<Duration>& tp);
Constraints:
is_convertible_v<
decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{}, choose::earliest)),
sys_time<duration>>
is true.
Preconditions: z refers to a time zone.
Effects: Initializes zone_ with std::move(z) and tp_ with zone_->to_sys(tp).
```

```cpp
zoned_time(string_view name, const local_time<Duration>& tp);
Constraints: zoned_time is constructible from the return type of traits::locate_zone(name) and tp.
Effects: Equivalent to construction with {traits::locate_zone(name), tp}.
```

```cpp
zoned_time(TimeZonePtr z, const local_time<Duration>& tp, choose c);
Constraints:
is_convertible_v<
decltype(declval<TimeZonePtr&>()->to_sys(local_time<Duration>{}, choose::earliest)),
sys_time<duration>>
is true.
Preconditions: z refers to a time zone.
```
Effects: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

Contraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name), local_time<Duration>`, and `choose`.

Effects: Equivalent to construction with `{traits::locate_zone(name), tp, c}`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const local_time<Duration>& tp, choose c);
```

Effects: Initializes `zone_` with `std::move(z)` and `tp_` with `zone_->to_sys(tp, c)`.

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name), local_time<Duration>`, and `choose`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Constraints: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

Preconditions: `z` refers to a valid time zone.

Effects: Equivalent to construction with `{z, y}`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

Constraints: `is_convertible_v<sys_time<Duration2>, sys_time<Duration>>` is true.

Preconditions: `z` refers to a valid time zone.

Effects: Equivalent to construction with `{z, y}`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

Effects: Equivalent to construction with `{traits::locate_zone(name), y}`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(string_view name, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

Effects: Equivalent to construction with `{traits::locate_zone(name), y, c}`.

Note 1: The `choose` parameter has no effect. — end note

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y);
```

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

Effects: Equivalent to construction with `{traits::locate_zone(name), y}`.

```
template<class Duration2, class TimeZonePtr2>
zoned_time(TimeZonePtr z, const zoned_time<Duration2, TimeZonePtr2>& y, choose);
```

Constraints: `zoned_time` is constructible from the return type of `traits::locate_zone(name)` and the type `zoned_time<Duration2, TimeZonePtr2>`.

Effects: Equivalent to construction with `{traits::locate_zone(name), y, c}`.

Note 2: The `choose` parameter has no effect. — end note

### 29.11.7.3 Member functions

```
zoned_time& operator=(const sys_time<Duration>& st);
```

Effects: After assignment, `get_sys_time() == st`. This assignment has no effect on the return value of `get_time_zone()`.

Returns: *this.

```
zoned_time& operator=(const local_time<Duration>& lt);
```

Effects: After assignment, `get_local_time() == lt`. This assignment has no effect on the return value of `get_time_zone()`.

Returns: *this.

```
operator sys_time<duration>() const;
```

Returns: `get_sys_time()`.

```
explicit operator local_time<duration>() const;
```

Returns: `get_local_time()`.

```
TimeZonePtr get_time_zone() const;
```

Returns: `zone_`.

```
local_time<duration> get_local_time() const;
```

Returns: `zone_->to_local(tp_)`.  

§ 29.11.7.3
sys_time<duration> get_sys_time() const;

Returns: tp_.

sys_info get_info() const;

Returns: zone_->get_info(tp_).

29.11.7.4 Non-member functions

template<class Duration1, class Duration2, class TimeZonePtr>
bool operator==(const zoned_time<Duration1, TimeZonePtr>& x,
const zoned_time<Duration2, TimeZonePtr>& y);

Returns: x.zone_ == y.zone_ && x.tp_ == y.tp_.

template<class charT, class traits, class Duration, class TimeZonePtr>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
const zoned_time<Duration, TimeZonePtr>& t);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN("{:L%F %T %Z}"), t);

29.11.8 Class leap_second

29.11.8.1 Overview

namespace std::chrono {
    class leap_second {
    public:
        leap_second(const leap_second&) = default;
        leap_second& operator=(const leap_second&) = default;
        // unspecified additional constructors

        constexpr sys_seconds date() const noexcept;
        constexpr seconds value() const noexcept;
    };
}

Objects of type leap_second representing the date and value of the leap second insertions are constructed and stored in the time zone database when initialized.

[Example 1]:

for (auto& l : get_tzdb().leap_seconds)
    if (l <= 2018y/March/17d)
        cout << l.date() << " ": " << l.value() << "n";

Produces the output:

1972-07-01 00:00:00: 1s
1973-01-01 00:00:00: 1s
1974-01-01 00:00:00: 1s
1975-01-01 00:00:00: 1s
1976-01-01 00:00:00: 1s
1977-01-01 00:00:00: 1s
1978-01-01 00:00:00: 1s
1979-01-01 00:00:00: 1s
1980-01-01 00:00:00: 1s
1981-07-01 00:00:00: 1s
1982-07-01 00:00:00: 1s
1983-07-01 00:00:00: 1s
1985-07-01 00:00:00: 1s
1988-01-01 00:00:00: 1s
1990-01-01 00:00:00: 1s
1991-01-01 00:00:00: 1s
1992-07-01 00:00:00: 1s
1993-07-01 00:00:00: 1s
29.11.8.2 Member functions

```cpp
constexpr sys_seconds date() const noexcept;
```

*Returns:* The date and time at which the leap second was inserted.

```cpp
constexpr seconds value() const noexcept;
```

*Returns:* +1s to indicate a positive leap second or -1s to indicate a negative leap second.

*[Note 1: All leap seconds inserted up through 2019 were positive leap seconds. — end note]*

29.11.8.3 Non-member functions

```cpp
constexpr bool operator==(const leap_second& x, const leap_second& y) noexcept;
```

*Returns:* `x.date() == y.date()`.

```cpp
constexpr strong_ordering operator<=>(const leap_second& x, const leap_second& y) noexcept;
```

*Returns:* `x.date() <=> y.date()`.

```cpp
template<class Duration>
constexpr bool operator==(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* `x.date() == y`.

```cpp
template<class Duration>
constexpr bool operator<(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* `x.date() < y`.

```cpp
template<class Duration>
constexpr bool operator>(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* `y < x`.

```cpp
template<class Duration>
constexpr bool operator<=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* `!(y < x)`.

```cpp
template<class Duration>
constexpr bool operator>=(const leap_second& x, const sys_time<Duration>& y) noexcept;
```

*Returns:* `!(x < y)`.

§ 29.11.8.3
template<
class Duration>
    constexpr bool operator>=(const sys_time<Duration>& x, const leap_second& y) noexcept;

Returns: !(x < y).

template<
class Duration>
    requires three_way_comparable_with<sys_seconds, sys_time<Duration>>
    auto operator<=>(const leap_second& x, const sys_time<Duration>& y) noexcept;

Returns: x.date() <=> y.

29.11.9 Class time_zone_link

29.11.9.1 Overview

namespace std::chrono {
    class time_zone_link {
        public:
            time_zone_link(time_zone_link&&) = default;
            time_zone_link& operator=(time_zone_link&&) = default;

            // unspecified additional constructors

            string_view name() const noexcept;
            string_view target() const noexcept;
        };
    }

A time_zone_link specifies an alternative name for a time_zone. time_zone_links are constructed when
the time zone database is initialized.

29.11.9.2 Member functions

string_view name() const noexcept;

Returns: The alternative name for the time zone.

string_view target() const noexcept;

Returns: The name of the time_zone for which this time_zone_link provides an alternative name.

29.11.9.3 Non-member functions

bool operator==(const time_zone_link& x, const time_zone_link& y) noexcept;

Returns: x.name() == y.name().

strong_ordering operator<=>(const time_zone_link& x, const time_zone_link& y) noexcept;

Returns: x.name() <=> y.name().

29.12 Formatting

Each formatter (22.14.6) specialization in the chrono library (29.2) meets the Formatter requirements
(22.14.6.1). The parse member functions of these formatters interpret the format specification as a chrono-
format-spec according to the following syntax:

chrono-format-spec:
    fill-and-align opt width opt precision opt L opt chrono-specs opt

chrono-specs:
    conversion-spec
    chrono-specs conversion-spec
    chrono-specs literal-char

literal-char:
    any character other than {, }, or %

conversion-spec:
    % modifier opt type

modifier:
    one of
    E 0
type: one of
    A B C D E F G H I j m M n
    p q r RS t U V W X Y Z %

The productions `fill-and-align`, `width`, and `precision` are described in 22.14.2. Giving a `precision` specification in the `chrono-format-spec` is valid only for `std::chrono::duration` types where the representation type `Rep` is a floating-point type. For all other `Rep` types, an exception of type `format_error` is thrown if the `chrono-format-spec` contains a `precision` specification. All ordinary multibyte characters represented by `literal-char` are copied unchanged to the output.

A formatting locale is an instance of `locale` used by a formatting function, defined as

1. the "C" locale if the `L` option is not present in `chrono-format-spec`, otherwise
2. the locale passed to the formatting function if any, otherwise
3. the global locale.

Each conversion specifier `conversion-spec` is replaced by appropriate characters as described in Table 102; the formats specified in ISO 8601:2004 shall be used where so described. Some of the conversion specifiers depend on the formatting locale. If the string literal encoding is a Unicode encoding form and the locale is among an implementation-defined set of locales, each replacement that depends on the locale is performed as if the replacement character sequence is converted to the string literal encoding. If the formatted object does not contain the information the conversion specifier refers to, an exception of type `format_error` is thrown.

The result of formatting a `std::chrono::duration` instance holding a negative value, or an `hh_mm_ss` object `h` for which `h.is_negative()` is true, is equivalent to the output of the corresponding positive value, with a `STATICALLY-WIDEN<charT>("-")` character sequence placed before the replacement of the initial conversion specifier.

Example 1:

```cpp
    cout << format("{:%T}", -10'000s);    // prints: -02:46:40
    cout << format("{:%H:%M:%S}" , -10'000s); // prints: -02:46:40
    cout << format("minutes {:%M, hours %H, seconds %S}" , -10'000s);
                  // prints: minutes -46, hours 02, seconds 40
```

—end example

Example 2: A `duration` does not contain enough information to format as a `weekday`. —end example

However, if a flag refers to a "time of day" (e.g. `%H`, `%I`, `%p`, etc.), then a specialization of `duration` is interpreted as the time of day elapsed since midnight.

Table 102: Meaning of conversion specifiers

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>%a</code></td>
<td>The locale’s abbreviated weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td><code>%A</code></td>
<td>The locale’s full weekday name. If the value does not contain a valid weekday, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td><code>%b</code></td>
<td>The locale’s abbreviated month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td><code>%B</code></td>
<td>The locale’s full month name. If the value does not contain a valid month, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td><code>%c</code></td>
<td>The locale’s date and time representation. The modified command <code>%Ec</code> produces the locale’s alternate date and time representation.</td>
</tr>
</tbody>
</table>
Table 102: Meaning of conversion specifiers (continued)

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%C</td>
<td>The year divided by 100 using floored division. If the result is a single decimal digit, it is prefixed with 0. The modified command %EC produces the locale’s alternative representation of the century.</td>
</tr>
<tr>
<td>%d</td>
<td>The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with 0. The modified command %Od produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%D</td>
<td>Equivalent to %m/%d/%y.</td>
</tr>
<tr>
<td>%e</td>
<td>The day of month as a decimal number. If the result is a single decimal digit, it is prefixed with a space. The modified command %Oe produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%F</td>
<td>Equivalent to %Y-%m-%d.</td>
</tr>
<tr>
<td>%g</td>
<td>The last two decimal digits of the ISO week-based year. If the result is a single digit it is prefixed by 0.</td>
</tr>
<tr>
<td>%G</td>
<td>The ISO week-based year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits.</td>
</tr>
<tr>
<td>%h</td>
<td>Equivalent to %b.</td>
</tr>
<tr>
<td>%H</td>
<td>The hour (24-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OH produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%I</td>
<td>The hour (12-hour clock) as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OI produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%j</td>
<td>If the type being formatted is a specialization of duration, the decimal number of days without padding. Otherwise, the day of the year as a decimal number. Jan 1 is 001. If the result is less than three digits, it is left-padded with 0 to three digits.</td>
</tr>
<tr>
<td>%m</td>
<td>The month as a decimal number. Jan is 01. If the result is a single digit, it is prefixed with 0. The modified command %Om produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%M</td>
<td>The minute as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OM produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%n</td>
<td>A new-line character.</td>
</tr>
<tr>
<td>%p</td>
<td>The locale’s equivalent of the AM/PM designations associated with a 12-hour clock.</td>
</tr>
<tr>
<td>%q</td>
<td>The duration’s unit suffix as specified in 29.5.11.</td>
</tr>
<tr>
<td>%Q</td>
<td>The duration’s numeric value (as if extracted via .count()).</td>
</tr>
<tr>
<td>%r</td>
<td>The locale’s 12-hour clock time.</td>
</tr>
<tr>
<td>%R</td>
<td>Equivalent to %H:%M.</td>
</tr>
<tr>
<td>%s</td>
<td>Seconds as a decimal number. If the number of seconds is less than 10, the result is prefixed with 0. If the precision of the input cannot be exactly represented with seconds, then the format is a decimal floating-point number with a fixed format and a precision matching that of the precision of the input (or to a microseconds precision if the conversion to floating-point decimal seconds cannot be made within 18 fractional digits). The character for the decimal point is localized according to the locale. The modified command %Os produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%t</td>
<td>A horizontal-tab character.</td>
</tr>
<tr>
<td>%T</td>
<td>Equivalent to %H:%M:%S.</td>
</tr>
<tr>
<td>%u</td>
<td>The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command %Ou produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%U</td>
<td>The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OU produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%V</td>
<td>The ISO week-based week number as a decimal number. If the result is a single digit, it is prefixed with 0. The modified command %OV produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%w</td>
<td>The weekday as a decimal number (0-6), where Sunday is 0. The modified command %Ow produces the locale’s alternative representation.</td>
</tr>
</tbody>
</table>
### Table 102: Meaning of conversion specifiers (continued)

<table>
<thead>
<tr>
<th>Specifier</th>
<th>Replacement</th>
</tr>
</thead>
<tbody>
<tr>
<td>%W</td>
<td>The week number of the year as a decimal number. The first Monday of the year is the first day of week 01. Days of the same year prior to that are in week 00. If the result is a single digit, it is prefixed with 0. The modified command %OW produces the locale’s alternative representation.</td>
</tr>
<tr>
<td>%x</td>
<td>The locale’s date representation. The modified command %Ex produces the locale’s alternate date representation.</td>
</tr>
<tr>
<td>%X</td>
<td>The locale’s time representation. The modified command %EX produces the locale’s alternate time representation.</td>
</tr>
<tr>
<td>%y</td>
<td>The last two decimal digits of the year. If the result is a single digit it is prefixed by 0. The modified command %Oy produces the locale’s alternative representation. The modified command %Ey produces the locale’s alternative representation of offset from %EC (year only).</td>
</tr>
<tr>
<td>%Y</td>
<td>The year as a decimal number. If the result is less than four digits it is left-padded with 0 to four digits. The modified command %EY produces the locale’s alternative full year representation.</td>
</tr>
<tr>
<td>%z</td>
<td>The offset from UTC in the ISO 8601:2004 format. For example -0430 refers to 4 hours 30 minutes behind UTC. If the offset is zero, +0000 is used. The modified commands %Ez and %Oz insert a : between the hours and minutes: -04:30. If the offset information is not available, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%Z</td>
<td>The time zone abbreviation. If the time zone abbreviation is not available, an exception of type <code>format_error</code> is thrown.</td>
</tr>
<tr>
<td>%%</td>
<td>A % character.</td>
</tr>
</tbody>
</table>

7 If the `chrono-specs` is omitted, the chrono object is formatted as if by streaming it to `std::ostringstream` `os` with the formatting locale imbued and copying `os.str()` through the output iterator of the context with additional padding and adjustments as specified by the format specifiers.

[Example 3:
```cpp
string s = format("{0:=>8}", 42ms); // value of s is "====42ms"
```
— end example]

```cpp
template<class Duration, class charT>
struct formatter<chrono::sys_time<Duration>, charT>;
```

8 Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>`("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted.

```cpp
template<class Duration, class charT>
struct formatter<chrono::utc_time<Duration>, charT>;
```

9 Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>`("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. If the argument represents a time during a positive leap second insertion, and if a seconds field is formatted, the integral portion of that format is `STATICALLY-WIDEN<charT>"60"`.

```cpp
template<class Duration, class charT>
struct formatter<chrono::tai_time<Duration>, charT>;
```

10 Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>`("TAI"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

```cpp
sys_time<Duration>{tp.time_since_epoch()} -
(sys_days{1970y/January/1} - sys_days{1958y/January/1})
```

```cpp
template<class Duration, class charT>
struct formatter<chrono::gps_time<Duration>, charT>;
```

11 Remarks: If %Z is used, it is replaced with `STATICALLY-WIDEN<charT>`("GPS"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a `sys_time` initialized with

§ 29.12 1541
sys_time<Duration>{tp.time_since_epoch()} +
(sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1})

Remarks: If %Z is used, it is replaced with STATICALLY-WIDEN<charT>("UTC"). If %z (or a modified variant of %z) is used, an offset of 0min is formatted. The date and time formatted are equivalent to those formatted by a sys_time initialized with clock_cast<system_clock>(t), or by a utc_time initialized with clock_cast<utc_clock>(t), where t is the first argument to format.

template<class Duration, class charT>
struct formatter<chrono::file_time<Duration>, charT>;

template<class Duration> struct local-time-format-t {
    // exposition only
    local_time<Duration> time;
    // exposition only
    const string* abbrev;
    // exposition only
    const seconds* offset_sec;
};

template<class Duration, class TimeZonePtr, class charT>
struct formatter<chrono::zoned_time<Duration, TimeZonePtr>, charT>:
    formatter<chrono::local-time-format-t<Duration>, charT> {
        template<class FormatContext>
        typename FormatContext::iterator
        format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);
    };

template<class FormatContext>
typename FormatContext::iterator
format(const chrono::zoned_time<Duration, TimeZonePtr>& tp, FormatContext& ctx);

Effects: Equivalent to:
sys_info info = tp.get_info();
return formatter<chrono::local-time-format-t<Duration>, charT>::
    format((tp.get_local_time(), &info.abbrev, &info.offset), ctx);

29.13 Parsing [time.parse]

Each parse overload specified in this subclause calls from_stream unqualified, so as to enable argument dependent lookup (6.5.4). In the following paragraphs, let is denote an object of type basic_istream<charT, traits> and let I be basic_istream<charT, traits>&, where charT and traits are template parameters in that context.

Recommended practice: Implementations should make it difficult to accidentally store or use a manipulator that may contain a dangling reference to a format string, for example by making the manipulators produced by parse immovable and preventing stream extraction into an lvalue of such a manipulator type.

§ 29.13
template<class charT, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp);

3 Let $F$ be $fmt$ for the first overload and $fmt\.c\.str()$ for the second overload. Let $traits$ be $char\_traits\langle\text{charT}\rangle$ for the first overload.

4 Constraints: The expression
(from_stream(declval<basic_istream<charT, traits>&>()(), $F$, tp)

is well-formed when treated as an unevaluated operand (7.2.3).

5 Returns: A manipulator such that the expression $\text{is} >> \text{parse}(fmt, tp)$ has type $I$, has value $\text{is}$, and calls $\text{from\_stream}(\text{is}, F, tp)$.

template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp);

6 Let $F$ be $fmt$ for the first overload and $fmt\.c\.str()$ for the second overload.

7 Constraints: The expression
(from_stream(declval<basic_istream<charT, traits>&>()(), $F$, tp, addressof(abbrev))

is well-formed when treated as an unevaluated operand (7.2.3).

8 Returns: A manipulator such that the expression $\text{is} >> \text{parse}(fmt, tp, abbrev)$ has type $I$, has value $\text{is}$, and calls $\text{from\_stream}(\text{is}, F, tp, addressof(abbrev))$.

template<class charT, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp, minutes& offset);

9 Let $F$ be $fmt$ for the first overload and $fmt\.c\.str()$ for the second overload. Let $traits$ be $char\_traits\langle\text{charT}\rangle$ and $\text{Alloc}$ be $\text{allocator}\langle\text{charT}\rangle$ for the first overload.

10 Constraints: The expression
(from_stream(declval<basic_istream<charT, traits>&>()(), $F$, tp,
declval<basic_string<charT, traits, Alloc>>& abbrev)

is well-formed when treated as an unevaluated operand (7.2.3).

11 Returns: A manipulator such that the expression $\text{is} >> \text{parse}(fmt, tp, offset)$ has type $I$, has value $\text{is}$, and calls:
(from_stream(\text{is},
$F$, tp,
static\_cast<basic\_string<charT, traits, Alloc>&*>(nullptr),
&offset)

template<class charT, class traits, class Alloc, class Parsable>
unspecified
parse(const charT* fmt, Parsable& tp,
basic_string<charT, traits, Alloc>& abbrev, minutes& offset);

§ 29.13 1543

1543
template<class charT, class traits, class Alloc, class Parsable>

parse(const basic_string<charT, traits, Alloc>& fmt, Parsable& tp,
        basic_string<charT, traits, Alloc>& abbrev, minutes& offset);

Let $F$ be $fmt$ for the first overload and $fmt.c_str()$ for the second overload.

Constraints: The expression

$\texttt{from\_stream(declval<basic\_istream<charT, traits>&>(),}$

$F$, $\text{tp, addressof(abbrev), } &\text{offset})$

is well-formed when treated as an unevaluated operand (7.2.3).

Returns: A manipulator such that the expression

$\texttt{is >> parse(fmt, tp, abbrev, offset)}$

has type $I$, has value $\text{is}$, and calls $\texttt{from\_stream(is, F, tp, addressof(abbrev), koffset)}$.

All $\texttt{from\_stream}$ overloads behave as unformatted input functions, except that they have an unspecified effect on the value returned by subsequent calls to $\texttt{basic\_istream<>::gcount()}$. Each overload takes a format string containing ordinary characters and flags which have special meaning. Each flag begins with a `%". Some flags can be modified by E or O. During parsing each flag interprets characters as parts of date and time types according to Table 103. Some flags can be modified by a width parameter given as a positive decimal integer called out as $N$ below which governs how many characters are parsed from the stream in interpreting the flag. All characters in the format string that are not represented in Table 103, except for whitespace, are parsed unchanged from the stream. A whitespace character matches zero or more whitespace characters in the input stream.

If the type being parsed cannot represent the information that the format flag refers to, $\texttt{is.setstate(ios\_-base::failbit)}$ is called.

[Example 1: A duration cannot represent a weekday. — end example]

However, if a flag refers to a “time of day” (e.g. $%H$, $%I$, $%p$, etc.), then a specialization of duration is parsed as the time of day elapsed since midnight.

If the $\texttt{from\_stream}$ overload fails to parse everything specified by the format string, or if insufficient information is parsed to specify a complete duration, time point, or calendrical data structure, $\texttt{setstate(ios\_-base::failbit)}$ is called on the $\texttt{basic\_istream}$. 

Table 103: Meaning of $parse$ flags

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td>$%a$</td>
<td>The locale’s full or abbreviated case-insensitive weekday name.</td>
</tr>
<tr>
<td>$%A$</td>
<td>Equivalent to $%a$.</td>
</tr>
<tr>
<td>$%b$</td>
<td>The locale’s full or abbreviated case-insensitive month name.</td>
</tr>
<tr>
<td>$%B$</td>
<td>Equivalent to $%b$.</td>
</tr>
<tr>
<td>$%c$</td>
<td>The locale’s date and time representation. The modified command $%Ec$ interprets the locale’s alternate date and time representation.</td>
</tr>
<tr>
<td>$%C$</td>
<td>The century as a decimal number. The modified command $%NC$ specifies the maximum number of characters to read. If $N$ is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command $%EC$ interprets the locale’s alternative representation of the century.</td>
</tr>
<tr>
<td>$%d$</td>
<td>The day of the month as a decimal number. The modified command $%Nd$ specifies the maximum number of characters to read. If $N$ is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command $%Od$ interprets the locale’s alternative representation of the day of the month.</td>
</tr>
<tr>
<td>$%D$</td>
<td>Equivalent to $%m/%d/%y$.</td>
</tr>
<tr>
<td>$%e$</td>
<td>Equivalent to $%d$ and can be modified like $%d$.</td>
</tr>
<tr>
<td>$%F$</td>
<td>Equivalent to $%Y-%m-%d$. If modified with a width $N$, the width is applied to only $%Y$.</td>
</tr>
<tr>
<td>$%g$</td>
<td>The last two decimal digits of the ISO week-based year. The modified command $%Ng$ specifies the maximum number of characters to read. If $N$ is not specified, the default is 2. Leading zeroes are permitted but not required.</td>
</tr>
<tr>
<td>$%g$</td>
<td>The ISO week-based year as a decimal number. The modified command $%Ng$ specifies the maximum number of characters to read. If $N$ is not specified, the default is 4. Leading zeroes are permitted but not required.</td>
</tr>
</tbody>
</table>
Table 103: Meaning of parse flags (continued)

<table>
<thead>
<tr>
<th>Flag</th>
<th>Parsed value</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>%h</code></td>
<td>Equivalent to <code>%b</code>.</td>
</tr>
<tr>
<td><code>%H</code></td>
<td>The hour (24-hour clock) as a decimal number. The modified command <code>%NH</code> specifies the maximum number of characters to read. If <code>N</code> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OH</code> interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td><code>%I</code></td>
<td>The hour (12-hour clock) as a decimal number. The modified command <code>%NI</code> specifies the maximum number of characters to read. If <code>N</code> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OI</code> interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td><code>%j</code></td>
<td>If the type being parsed is a specialization of duration, a decimal number of days. Otherwise, the day of the year as a decimal number. Jan 1 is 1. In either case, the modified command <code>%NJ</code> specifies the maximum number of characters to read. If <code>N</code> is not specified, the default is 3. Leading zeroes are permitted but not required. The modified command <code>%OJ</code> interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td><code>%m</code></td>
<td>The month as a decimal number. Jan is 1. The modified command <code>%NM</code> specifies the maximum number of characters to read. If <code>N</code> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OM</code> interprets the locale’s alternative representation.</td>
</tr>
<tr>
<td><code>%M</code></td>
<td>The minutes as a decimal number. The modified command <code>%NM</code> specifies the maximum number of characters to read. If <code>N</code> is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command <code>%OM</code> interprets the locale’s alternative representation.</td>
</tr>
</tbody>
</table>
| `%n` | Matches one whitespace character.  
[Note 1: `%n`, `%t`, and a space can be combined to match a wide range of whitespace patterns. For example, "%n " matches one or more whitespace characters, and "%n%t%t" matches one to three whitespace characters. — end note] |
| `%p` | The locale’s equivalent of the AM/PM designations associated with a 12-hour clock. |
| `%r` | The locale’s 12-hour clock time. |
| `%r` | Equivalent to `%H:%M`. |
| `%S` | The seconds as a decimal number. The modified command `%NS` specifies the maximum number of characters to read. If `N` is not specified, the default is 2 if the input time has a precision convertible to seconds. Otherwise the default width is determined by the decimal precision of the input and the field is interpreted as a long double in a fixed format. If encountered, the locale determines the decimal point character. Leading zeroes are permitted but not required. The modified command `%OS` interprets the locale’s alternative representation. |
| `%T` | Equivalent to `%H:%M:%S`. |
| `%u` | The ISO weekday as a decimal number (1-7), where Monday is 1. The modified command `%NU` specifies the maximum number of characters to read. If `N` is not specified, the default is 1. Leading zeroes are permitted but not required. |
| `%U` | The week number of the year as a decimal number. The first Sunday of the year is the first day of week 01. Days of the same year prior to that are in week 00. The modified command `%NU` specifies the maximum number of characters to read. If `N` is not specified, the default is 2. Leading zeroes are permitted but not required. The modified command `%OU` interprets the locale’s alternative representation. |
| `%V` | The ISO week-based week number as a decimal number. The modified command `%NV` specifies the maximum number of characters to read. If `N` is not specified, the default is 2. Leading zeroes are permitted but not required. |
| `%w` | The weekday as a decimal number (0-6), where Sunday is 0. The modified command `%NW` specifies the maximum number of characters to read. If `N` is not specified, the default is 1. Leading zeroes are permitted but not required. The modified command `%OW` interprets the locale’s alternative representation. |

    using clock_t = see below;
    using time_t = see below;

    struct timespec;
    struct tm;

    clock_t clock();
    double difftime(time_t time1, time_t time0);
    time_t mktime(tm* timeptr);
    time_t time(time_t* timer);
    int timespec_get(timespec* ts, int base);
    char* asctime(const tm* timeptr);
    char* ctime(const time_t* timer);
    tm* gmtime(const time_t* timer);
    tm* localtime(const time_t* timer);
    size_t strftime(char* s, size_t maxsize, const char* format, const tm* timeptr);
}
```

1 The contents of the header <ctime> are the same as the C standard library header <time.h>.

244 strftime supports the C conversion specifiers C, D, E, F, G, h, r, x, r, x, x, and z, and the modifiers E and O.
The functions `asctime`, `ctime`, `gmtime`, and `localtime` are not required to avoid data races (16.4.6.10).

30 Localization library [localization]

30.1 General [localization.general]

1 This Clause describes components that C++ programs may use to encapsulate (and therefore be more portable when confronting) cultural differences. The locale facility includes internationalization support for character classification and string collation, numeric, monetary, and date/time formatting and parsing, and message retrieval.

2 The following subclauses describe components for locales themselves, the standard facets, and facilities from the ISO C library, as summarized in Table 104.

<table>

</tbody>
</table>

30.2 Header <locale> synopsis [locale.syn]

```cpp
namespace std {
    // 30.3.1, locale
    class locale;
    template<class Facet> const Facet& use_facet(const locale&);
    template<class Facet> bool has_facet(const locale&) noexcept;

    // 30.3.3, convenience interfaces
    template<class charT> bool isspace (charT c, const locale& loc);
    template<class charT> bool isprint (charT c, const locale& loc);
    template<class charT> bool iscntrl (charT c, const locale& loc);
    template<class charT> bool isupper (charT c, const locale& loc);
    template<class charT> bool islower (charT c, const locale& loc);
    template<class charT> bool isalpha (charT c, const locale& loc);
    template<class charT> bool isdigit (charT c, const locale& loc);
    template<class charT> bool ispunct (charT c, const locale& loc);
    template<class charT> bool isxdigit(charT c, const locale& loc);
    template<class charT> bool isalnum (charT c, const locale& loc);
    template<class charT> bool isgraph (charT c, const locale& loc);
    template<class charT> bool isblank (charT c, const locale& loc);
    template<class charT> charT toupper(charT c, const locale& loc);
    template<class charT> charT tolower(charT c, const locale& loc);

    // 30.4.2, ctype
    class ctype_base;
    template<class charT> class ctype;
    template<> class ctype<char>;
    // specialization
    template<class charT> class ctype_byname;
    class codecvt_base;
    template<class internT, class externT, class stateT> class codecvt;
    template<class internT, class externT, class stateT> class codecvt_byname;

    // 30.4.3, numeric
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get;
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put;
    template<class charT>
    class numpunct;

template<class charT> class messages;
template<class charT> class messages_byname;
}

1 The header <locale> defines classes and declares functions that encapsulate and manipulate the information peculiar to a locale.245

30.3 Locales
30.3.1 Class locale
30.3.1.1 General

namespace std {
    class locale {
    public:
        // types
        class facet;
        class id;
        using category = int;
        static const category // values assigned here are for exposition only
            none = 0,
            collate = 0x010, ctype = 0x020,
            monetary = 0x040, numeric = 0x080,
            time = 0x100, messages = 0x200,
            all = collate | ctype | monetary | numeric | time | messages;

        // construct/copy/destroy
        locale() noexcept;
        locale(const locale& other) noexcept;
        explicit locale(const char* std_name);
        explicit locale(const string& std_name);
        locale(const locale& other, const char* std_name, category);

245) In this subclause, the type name tm is an incomplete type that is defined in <ctime> (29.14).
locale(const locale& other, const string& std_name, category);
template<class Facet> locale(const locale& other, Facet* f);
locale(const locale& other, const locale& one, category);
~locale(); // not virtual
const locale& operator=(const locale& other) noexcept;
template<class Facet> locale combine(const locale& other) const;

// locale operations
string name() const;
bool operator==(const locale& other) const;
template<class charT, class traits, class Allocator>
  bool operator()(const basic_string<charT, traits, Allocator>& s1,
                  const basic_string<charT, traits, Allocator>& s2) const;

// global locale objects
static locale global(const locale&);
static const locale& classic();

Class locale implements a type-safe polymorphic set of facets, indexed by facet type. In other words, a facet
has a dual role: in one sense, it’s just a class interface; at the same time, it’s an index into a locale’s set of
facets.

Access to the facets of a locale is via two function templates, use_facet<> and has_facet<>.

[Example 1: An iostream operator<< can be implemented as.]

template<class charT, class traits>
  basic_ostream<charT, traits>&
  operator<<(basic_ostream<charT, traits>&& s, Date d) {
    typename basic_ostream<charT, traits>::sentry cerberos(s);
    if (cerberos) {
      tm tmbuf; d.extract(tmbuf);
      bool failed =
        use_facet<time_put<charT, ostreambuf_iterator<charT, traits>>>(s.getloc()).put(s, tmbuf, 'x').failed();
      if (failed)
        s.setstate(s.badbit); // can throw
    }
    return s;
  }
— end example]

In the call to use_facet<Facet>(loc), the type argument chooses a facet, making available all members
of the named type. If Facet is not present in a locale, it throws the standard exception bad_cast. A C++
program can check if a locale implements a particular facet with the function template has_facet<Facet>().
User-defined facets may be installed in a locale, and used identically as may standard facets.

[Note 1: All locale semantics are accessed via use_facet<> and has_facet<>], except that:

(5.1) — A member operator template

  operator()(const basic_string<C, T, A>&, const basic_string<C, T, A>&)

  is provided so that a locale can be used as a predicate argument to the standard collections, to collate strings.

(5.2) — Convenient global interfaces are provided for traditional ctype functions such as isdigit() and isspace(),
so that given a locale object loc a C++ program can call isspace(c, loc). (This eases upgrading existing
extractors (31.7.5.3).)
— end note]

Once a facet reference is obtained from a locale object by calling use_facet<>, that reference remains usable,
and the results from member functions of it may be cached and re-used, as long as some locale object refers
to that facet.

246) Note that in the call to put, the stream is implicitly converted to an ostreambuf_iterator<charT, traits>.
In successive calls to a locale facet member function on a facet object installed in the same locale, the returned result shall be identical.

A `locale` constructed from a name string (such as "POSIX"), or from parts of two named locales, has a name; all others do not. Named locales may be compared for equality; an unnamed locale is equal only to (copies of) itself. For an unnamed locale, `locale::name()` returns the string "*".

Whether there is one global locale object for the entire program or one global locale object per thread is implementation-defined. Implementations should provide one global locale object per thread. If there is a single global locale object for the entire program, implementations are not required to avoid data races on it (16.4.6.10).

### 30.3.1.2 Types

#### 30.3.1.2.1 Type `locale::category`

```cpp
using category = int;
```

1 Valid category values include the `locale` member bitmask elements `collate`, `ctype`, `monetary`, `numeric`, `time`, and `messages`, each of which represents a single locale category. In addition, `locale` member bitmask constant `none` is defined as zero and represents no category. And `locale` member bitmask constant `all` is defined such that the expression

\[(\text{collate} \mid \text{ctype} \mid \text{monetary} \mid \text{numeric} \mid \text{time} \mid \text{messages} \mid \text{all}) == \text{all}\]

is `true`, and represents the union of all categories. Further, the expression \((X \mid Y)\), where \(X\) and \(Y\) each represent a single category, represents the union of the two categories.

2 `locale` member functions expecting a `category` argument require one of the `category` values defined above, or the union of two or more such values. Such a `category` value identifies a set of locale categories. Each locale category, in turn, identifies a set of locale facets, including at least those shown in Table 105.

<table>

</tr>
<tr>
<td></td>
<td><code>time_put&lt;char&gt;, time_put&lt;wchar_t&gt;</code></td>
</tr>
<tr>
<td><code>messages</code></td>
<td><code>messages&lt;char&gt;, messages&lt;wchar_t&gt;</code></td>
</tr>
</tbody>
</table>

3 For any locale `loc` either constructed, or returned by `locale::classic()`, and any facet `Facet` shown in Table 105, `has_facet<Facet>(loc)` is `true`. Each `locale` member function which takes a `locale::category` argument operates on the corresponding set of facets.

4 An implementation is required to provide those specializations for facet templates identified as members of a category, and for those shown in Table 106.

5 The provided implementation of members of facets `num_get<char>` and `num_put<char>` calls `use_facet<F>(1)` only for facet `F` of types `numpunct<char>` and `ctype<char>`, and for locale `l` the value obtained by calling member `getloc()` on the `ios_base&` argument to these functions.

6 In declarations of facets, a template parameter with name `InputIterator` or `OutputIterator` indicates the set of all possible specializations on parameters that meet the `Cpp17InputIterator` requirements or

</tr>
</tbody>
</table>

### Cpp17OutputIterator requirements, respectively (25.3). A template parameter with name `C` represents the set of types containing `char`, `wchar_t`, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated. A template parameter with name `International` represents the set of all possible specializations on a bool parameter.

#### 30.3.1.2.2 Class `locale::facet`  

```cpp
namespace std {
    class locale::facet {
    protected:
        explicit facet(size_t refs = 0);
        virtual ~facet();
        facet(const facet&) = delete;
        void operator=(const facet&) = delete;
    };
}
```

1. Class `facet` is the base class for locale feature sets. A class is a `facet` if it is publicly derived from another `facet`, or if it is a class derived from `locale::facet` and contains a publicly accessible declaration as follows:

```cpp
    static ::std::locale::id id;
```

2. Template parameters in this Clause which are required to be facets are those named `Facet` in declarations. A program that passes a type that is not a `facet`, or a type that refers to a volatile-qualified `facet`, as an (explicit or deduced) template parameter to a locale function expecting a `Facet` template parameter, is ill-formed. A const-qualified `facet` is a valid template argument to any locale function that expects a `Facet` template parameter.

3. The `refs` argument to the constructor is used for lifetime management. For `refs == 0`, the implementation performs `delete static_cast<locale::facet*>(f)` (where `f` is a pointer to the facet) when the last `locale` object containing the facet is destroyed; for `refs == 1`, the implementation never destroys the facet.

4. Constructors of all facets defined in this Clause take such an argument and pass it along to their `facet` base class constructor. All one-argument constructors defined in this Clause are `explicit`, preventing their participation in implicit conversions.

---

247) This is a complete list of requirements; there are no other requirements. Thus, a facet class need not have a public copy constructor, assignment, default constructor, destructor, etc.
For some standard facets a standard “..._byname” class, derived from it, implements the virtual function semantics equivalent to that facet of the locale constructed by `locale(const char*)` with the same name. Each such facet provides a constructor that takes a `const char*` argument, which names the locale, and a `refs` argument, which is passed to the base class constructor. Each such facet also provides a constructor that takes a `string` argument `str` and a `refs` argument, which has the same effect as calling the first constructor with the two arguments `str.c_str()` and `refs`. If there is no “..._byname” version of a facet, the base class implements named locale semantics itself by reference to other facets.

30.3.1.2.3 Class `locale::id` [locale.id]

```cpp
namespace std {
    class locale::id {
        public:
            id();
            void operator=(const id&) = delete;
            id(id const&) = delete;
    };
}
```

The class `locale::id` provides identification of a locale facet interface, used as an index for lookup and to encapsulate initialization.

[Note 1: Because facets are used by iostreams, potentially while static constructors are running, their initialization cannot depend on programmed static initialization. One initialization strategy is for `locale` to initialize each facet’s `id` member the first time an instance of the facet is installed into a locale. This depends only on static storage being zero before constructors run (6.9.3.2). — end note]

30.3.1.3 Constructors and destructor [locale.cons]

```cpp
locale() noexcept;
```

Effects: Constructs a copy of the argument last passed to `locale::global(locale&)`, if it has been called; else, the resulting facets have virtual function semantics identical to those of `locale::classic()`.

[Note 1: This constructor yields a copy of the current global locale. It is commonly used as a default argument for function parameters of type `const locale&`. — end note]

```cpp
explicit locale(const char* std_name);
```

Effects: Constructs a locale using standard C locale names, e.g., "POSIX". The resulting locale implements semantics defined to be associated with that name.

Throws: `runtime_error` if the argument is not valid, or is null.

Remarks: The set of valid string argument values is "C", ",", and any implementation-defined values.

```cpp
explicit locale(const string& std_name);
```

Effects: The same as `locale(std_name.c_str())`.

```cpp
locale(const locale& other, const char* std_name, category);
```

Effects: Constructs a locale as a copy of `other` except for the facets identified by the `category` argument, which instead implement the same semantics as `locale(std_name)`.

Throws: `runtime_error` if the argument is not valid, or is null.

Remarks: The locale has a name if and only if `other` has a name.

```cpp
locale(const locale& other, const string& std_name, category cat);
```

Effects: The same as `locale(other, std_name.c_str(), cat)`.

```cpp
template<class Facet> locale(const locale& other, Facet* f);
```

Effects: Constructs a locale incorporating all facets from the first argument except that of type `Facet`, and installs the second argument as the remaining facet. If `f` is null, the resulting object is a copy of `other`.

Remarks: The resulting locale has no name.
locale(const locale& other, const locale& one, category cats);

Effects: Constructs a locale incorporating all facets from the first argument except those that implement cats, which are instead incorporated from the second argument.

Remarks: The resulting locale has a name if and only if the first two arguments have names.

const locale& operator=(const locale& other) noexcept;

Effects: Creates a copy of other, replacing the current value.

Returns: *this.

30.3.1.4 Members

template<class Facet> locale combine(const locale& other) const;

Effects: Constructs a locale incorporating all facets from *this except for that one facet of other that is identified by Facet.

Returns: The newly created locale.

Throws: runtime_error if has_facet<Facet>(other) is false.

Remarks: The resulting locale has no name.

string name() const;

Returns: The name of *this, if it has one; otherwise, the string "*".

30.3.1.5 Operators

bool operator==(const locale& other) const;

Returns: true if both arguments are the same locale, or one is a copy of the other, or each has a name and the names are identical; false otherwise.

template<class charT, class traits, class Allocator>
bool operator()(const basic_string<charT, traits, Allocator>& s1,
const basic_string<charT, traits, Allocator>& s2) const;

Effects: Compares two strings according to the collate<charT> facet.

Returns:
use_facet<collate<charT>>(*this).compare(s1.data(), s1.data() + s1.size(),
s2.data(), s2.data() + s2.size()) < 0

Remarks: This member operator template (and therefore locale itself) meets the requirements for a comparator predicate template argument (Clause 27) applied to strings.

[Example 1: A vector of strings v can be collated according to collation rules in locale loc simply by (27.8.2,
24.3.11):
    std::sort(v.begin(), v.end(), loc);
—end example]

30.3.1.6 Static members

static locale global(const locale& loc);

Effects: Sets the global locale to its argument. Causes future calls to the constructor locale() to return a copy of the argument. If the argument has a name, does
setlocale(LC_ALL, loc.name().c_str());
otherwise, the effect on the C locale, if any, is implementation-defined.

Returns: The previous value of locale().

Remarks: No library function other than locale::global() affects the value returned by locale().

[Note 1: See 30.5 for data race considerations when setlocale is invoked. — end note]
static const locale& classic();

The "C" locale.

Returns: A locale that implements the classic "C" locale semantics, equivalent to the value locale("C").

Remarks: This locale, its facets, and their member functions, do not change with time.

30.3.2 locale globals

template<class Facet> const Facet& use_facet(const locale& loc);

Mandates: Facet is a facet class whose definition contains the public static member id as defined in 30.3.1.2.2.

Returns: A reference to the corresponding facet of loc, if present.

Throws: bad_cast if has_facet<Facet>(loc) is false.

Remarks: The reference returned remains valid at least as long as any copy of loc exists.

template<class Facet> bool has_facet(const locale& loc) noexcept;

Returns: true if the facet requested is present in loc; otherwise false.

30.3.3 Convenience interfaces

30.3.3.1 Character classification

template<class charT> bool isspace (charT c, const locale& loc);

template<class charT> bool isprint (charT c, const locale& loc);

template<class charT> bool iscntrl (charT c, const locale& loc);

template<class charT> bool isupper (charT c, const locale& loc);

template<class charT> bool islower (charT c, const locale& loc);

template<class charT> bool isalpha (charT c, const locale& loc);

template<class charT> bool isdigit (charT c, const locale& loc);

template<class charT> bool ispunct (charT c, const locale& loc);

template<class charT> bool isxdigit(charT c, const locale& loc);

template<class charT> bool isalnum (charT c, const locale& loc);

template<class charT> bool isgraph (charT c, const locale& loc);

Each of these functions isF returns the result of the expression:

   use_facet<ctype<charT>>(loc).is(ctype_base::F, c)

where F is the ctype_base::mask value corresponding to that function (30.4.2).248

30.3.3.2 Character conversions

template<class charT> charT toupper(charT c, const locale& loc);

Returns: use_facet<ctype<charT>>(loc).toupper(c).

template<class charT> charT tolower(charT c, const locale& loc);

Returns: use_facet<ctype<charT>>(loc).tolower(c).

30.4 Standard locale categories

30.4.1 General

Each of the standard categories includes a family of facets. Some of these implement formatting or parsing of a datum, for use by standard or users' iostream operators << and >>, as members put() and get(), respectively. Each such member function takes an ios_base& argument whose members flags(), precision(), and width(), specify the format of the corresponding datum (31.5.2). Those functions which need to use other facets call its member getloc() to retrieve the locale imbued there. Formatting facets use the character argument fill to fill out the specified width where necessary.

The put() members make no provision for error reporting. (Any failures of the OutputIterator argument can be extracted from the returned iterator.) The get() members take an ios_base::iostate& argument whose value they ignore, but set to ios_base::failbit in case of a parse error.

248) When used in a loop, it is faster to cache the ctype<> facet and use it directly, or use the vector form of ctype<>::is.
Within subclause 30.4 it is unspecified whether one virtual function calls another virtual function.

### 30.4.2 The `ctype` category

#### 30.4.2.1 General

```cpp
class ctype_base {
public:
  using mask = see below;

  // numeric values are for exposition only.
  static const mask space = 1 << 0;
  static const mask print = 1 << 1;
  static const mask cntrl = 1 << 2;
  static const mask upper = 1 << 3;
  static const mask lower = 1 << 4;
  static const mask alpha = 1 << 5;
  static const mask digit = 1 << 6;
  static const mask punct = 1 << 7;
  static const mask xdigit = 1 << 8;
  static const mask blank = 1 << 9;
  static const mask alnum = alpha | digit;
  static const mask graph = alnum | punct;
};
```

The type `mask` is a bitmask type (16.3.3.3.4).

#### 30.4.2.2 Class template `ctype`

```cpp
namespace std {
  template<class charT>
  class ctype : public locale::facet, public ctype_base {
    public:
      using char_type = charT;

      explicit ctype(size_t refs = 0);

      bool is(mask m, charT c) const;
      const charT* is(const charT* low, const charT* high, mask* vec) const;
      const charT* scan_is(mask m, const charT* low, const charT* high) const;
      const charT* scan_not(mask m, const charT* low, const charT* high) const;
      charT toupper(charT c) const;
      const charT* toupper(charT* low, const charT* high) const;
      charT tolower(charT c) const;
      const charT* tolower(charT* low, const charT* high) const;
      charT widen(char c) const;
      const char* widen(const char* low, const char* high, charT* to) const;
      char narrow(charT c, char dfault) const;
      const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

    protected:
      ~ctype();
      virtual bool do_is(mask m, charT c) const;
      virtual const charT* do_is(const charT* low, const charT* high, mask* vec) const;
      virtual const charT* do_scan_is(mask m, const charT* low, const charT* high) const;
      virtual const charT* do_scan_not(mask m, const charT* low, const charT* high) const;
      virtual charT do_toupper(charT) const;
      virtual const charT* do_toupper(charT* low, const charT* high) const;
      virtual charT do_tolower(charT) const;
      virtual const charT* do_tolower(charT* low, const charT* high) const;

  };  // class ctype
};  // namespace std
```
virtual charT do_widen(char) const;
virtual const char* do_widen(const char* low, const char* high, charT* dest) const;
virtual char do_narrow(charT, char dfault) const;
virtual const charT* do_narrow(const charT* low, const charT* high,
    char dfault, char* dest) const;
};

Class ctype encapsulates the C library <cctype> features. istream members are required to use ctype<> for character classing during input parsing.

The specializations required in Table 105 (30.3.1.2.1), namely ctype<char> and ctype<wchar_t>, implement character classing appropriate to the implementation’s native character set.

30.4.2.2.2 ctype members [locale.ctype.members]

bool is(mask m, charT c) const;
const charT* is(const charT* low, const charT* high, mask* vec) const;

1 Returns: do_is(m, c) or do_is(low, high, vec).

const charT* scan_is(mask m, const charT* low, const charT* high) const;

2 Returns: do_scan_is(m, low, high).

const charT* scan_not(mask m, const charT* low, const charT* high) const;

3 Returns: do_scan_not(m, low, high).

charT toupper(charT) const;
const charT* toupper(charT* low, const charT* high) const;

4 Returns: do_toupper(c) or do_toupper(low, high).

charT tolower(charT c) const;
const charT* tolower(charT* low, const charT* high) const;

5 Returns: do_tolower(c) or do_tolower(low, high).

charT widen(char c) const;
const charT* widen(const charT* low, const charT* high, charT* to) const;

6 Returns: do_widen(c) or do_widen(low, high, to).

char narrow(charT c, char dfault) const;
const charT* narrow(const charT* low, const charT* high, char dfault, char* to) const;

7 Returns: do_narrow(c, dfault) or do_narrow(low, high, dfault, to).

30.4.2.2.3 ctype virtual functions [locale.ctype.virtuals]

bool do_is(mask m, charT c) const;
const charT* do_is(const charT* low, const charT* high, mask* vec) const;

1 Effects: Classifies a character or sequence of characters. For each argument character, identifies a value M of type ctype_base::mask. The second form identifies a value M for each *p where (low <= p && p < high), and places it into vec[p - low].

2 Returns: The first form returns the result of the expression (M & m) != 0; i.e., true if the character has the characteristics specified. The second form returns high.

const charT* do_scan_is(mask m, const charT* low, const charT* high) const;

3 Effects: Locates a character in a buffer that conforms to a classification m.

4 Returns: The smallest pointer p in the range [low,high] such that is(m, *p) would return true; otherwise, returns high.

const charT* do_scan_not(mask m, const charT* low, const charT* high) const;

5 Effects: Locates a character in a buffer that fails to conform to a classification m.

6 Returns: The smallest pointer p, if any, in the range [low,high] such that is(m, *p) would return false; otherwise, returns high.

§ 30.4.2.2.3 1557
charT do_toupper(charT c) const;
const charT* do_toupper(charT* low, const charT* high) const;

Effects: Converts a character or characters to upper case. The second form replaces each character *p in the range [low,high] for which a corresponding upper-case character exists, with that character.

Returns: The first form returns the corresponding upper-case character if it is known to exist, or its argument if not. The second form returns high.

charT do_tolower(charT c) const;
const charT* do_tolower(charT* low, const charT* high) const;

Effects: Converts a character or characters to lower case. The second form replaces each character *p in the range [low,high] and for which a corresponding lower-case character exists, with that character.

Returns: The first form returns the corresponding lower-case character if it is known to exist, or its argument if not. The second form returns high.

charT do_widen(char c) const;
const char* do_widen(const char* low, const char* high, charT* dest) const;

Effects: Applies the simplest reasonable transformation from a char value or sequence of char values to the corresponding charT value or values. The only characters for which unique transformations are required are those in the basic character set (5.3).

For any named ctype category with a ctype<charT> facet ctc and valid ctype_base::mask value M, (ctc.is(M, c) || !is(M, do_widen(c)) ) is true.

The second form transforms each character *p in the range [low,high], placing the result in dest[p - low].

Returns: The first form returns the transformed value. The second form returns high.

char do_narrow(charT c, char dfault) const;
const charT* do_narrow(const charT* low, const charT* high, char dfault, char* dest) const;

Effects: Applies the simplest reasonable transformation from a charT value or sequence of charT values to the corresponding char value or values. For any character c in the basic character set (5.3) the transformation is such that

do_widen(do_narrow(c, 0)) == c

For any named ctype category with a ctype<char> facet ctc however, and ctype_base::mask value M,

(is(M, c) || !ctc.is(M, do_narrow(c, dfault)) )

is true (unless do_narrow returns dfault). In addition, for any digit character c, the expression (do_narrow(c, dfault) - '0') evaluates to the digit value of the character. The second form transforms each character *p in the range [low,high], placing the result (or dfault if no simple transformation is readily available) in dest[p - low].

Returns: The first form returns the transformed value; or dfault if no mapping is readily available. The second form returns high.

30.4.2.3 Class template ctye_byname

namespace std {
    template<class charT>
    class ctye_byname : public ctye<charT> {
    public:
        using mask = typename ctye<charT>::mask;
        explicit ctye_byname(const char*, size_t refs = 0);
        explicit ctye_byname(const string&, size_t refs = 0);

    protected:
        ~ctye_byname();

    } [locale.ctyebyname]

} 249) The parameter c of do_widen is intended to accept values derived from character-literals for conversion to the locale’s encoding.
250) In other words, the transformed character is not a member of any character classification that c is not also a member of.
30.4.2.4.4.2 Destructor

~ctype();

1 Effects: If the constructor's first argument was nonzero, and its second argument was true, does delete [] table().

251) Only the char (not unsigned char and signed char) form is provided. The specialization is specified in the standard, and not left as an implementation detail, because it affects the derivation interface for ctype<char>.
30.4.2.4.3 Members

In the following member descriptions, for unsigned char values v where v >= table_size, table()[v] is assumed to have an implementation-specific value (possibly different for each such value v) without performing the array lookup.

explicit ctype(const mask* tbl = nullptr, bool del = false, size_t refs = 0);

Preconditions: Either tbl == nullptr is true or [tbl, tbl+table_size) is a valid range.

Effects: Passes its refs argument to its base class constructor.

bool is(mask m, char c) const;
const char* is(const char* low, const char* high, mask* vec) const;

Effects: The second form, for all *p in the range [low, high), assigns into vec[p - low] the value table()[(unsigned char)*p].

Returns: The first form returns table()[(unsigned char)c] & m; the second form returns high.

const char* scan_is(mask m, const char* low, const char* high) const;

Returns: The smallest p in the range [low, high) such that table()[(unsigned char) *p] & m is true.

const char* scan_not(mask m, const char* low, const char* high) const;

Returns: The smallest p in the range [low, high) such that table()[(unsigned char) *p] & m is false.

char toupper(char c) const;
const char* toupper(char* low, const char* high) const;

Returns: do_toupper(c) or do_toupper(low, high), respectively.

char tolower(char c) const;
const char* tolower(char* low, const char* high) const;

Returns: do_tolower(c) or do_tolower(low, high), respectively.

char widen(char c) const;
const char* widen(const char* low, const char* high, char* to) const;

Returns: do_widen(c) or do_widen(low, high, to), respectively.

char narrow(char c, char dfault) const;
const char* narrow(const char* low, const char* high, char dfault, char* to) const;

Returns: do_narrow(c, dfault) or do_narrow(low, high, dfault, to), respectively.

const mask* table() const noexcept;

Returns: The first constructor argument, if it was nonzero, otherwise classic_table().

30.4.2.4.4 Static members

static const mask* classic_table() noexcept;

Returns: A pointer to the initial element of an array of size table_size which represents the classifications of characters in the "C" locale.

30.4.2.4.5 Virtual functions
virtual char  do_widen(char c) const;
virtual const char* do_widen(const char* low, const char* high, char* to) const;
virtual char  do_narrow(char c, char dfa) const;
virtual const char* do_narrow(const char* low, const char* high, char dfa, char* to) const;

1 These functions are described identically as those members of the same name in the ctype class template (30.4.2.2.2).

30.4.2.5  Class template codecvt

30.4.2.5.1 General

namespace std {
    class codecvt_base {
        public:
            enum result { ok, partial, error, noconv }; 
    };

    template<class internT, class externT, class stateT>
    class codecvt : public locale::facet, public codecvt_base {
        public:
            using intern_type = internT;
            using extern_type = externT;
            using state_type = stateT;

            explicit codecvt(size_t refs = 0);

            result out(
                stateT& state, 
                const internT* from, const internT* from_end, const internT*& from_next, 
                externT* to, externT* to_end, externT*& to_next) const;

            result unshift(
                stateT& state,

                internT* to, internT* to_end, internT*& to_next) const;
            virtual result do_unshift(
                stateT& state, 
                externT* to, externT* to_end, externT*& to_next) const;
            virtual int do_encoding() const noexcept;
            virtual bool do_always_noconv() const noexcept;
            virtual int do_length(stateT&, const externT* from, const externT* end, size_t max) const;

§ 30.4.2.5.1  1561
The class `codecvt<internT, externT, stateT>` is for use when converting from one character encoding to another, such as from wide characters to multibyte characters or between wide character encodings such as UTF-32 and EUC.

The `stateT` argument selects the pair of character encodings being mapped between.

The specializations required in Table 105 (30.3.1.2.1) convert the implementation-defined native character set. `codecvt<char, char, mbstate_t>` implements a degenerate conversion; it does not convert at all. The specialization `codecvt<char16_t, char8_t, mbstate_t>` converts between the UTF-16 and UTF-8 encoding forms, and the specialization `codecvt<char32_t, char8_t, mbstate_t>` converts between the UTF-32 and UTF-8 encoding forms. `codecvt<wchar_t, char, mbstate_t>` converts between the native character sets for ordinary and wide characters. Specializations on `mbstate_t` perform conversion between encodings known to the library implementer. Other encodings can be converted by specializing on a program-defined `stateT` type. Objects of type `stateT` can contain any state that is useful to communicate to or from the specialized `do_in` or `do_out` members.

### 30.4.2.5.2 Members

#### 30.4.2.5.2 Members [locale.codecvt.members]

result out(  
stateT& state,  
const internT* from, const internT* from_end, const internT*& from_next,  
externT* to, externT* to_end, externT*& to_next) const;

1 Returns: `do_out(state, from, from_end, from_next, to, to_end, to_next)` const;

result unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

2 Returns: `do_unshift(state, to, to_end, to_next)` const;

result in(  
stateT& state,  
const externT* from, const externT* from_end, const externT*& from_next,  
internT* to, internT* to_end, internT*& to_next) const;

3 Returns: `do_in(state, from, from_end, from_next, to, to_end, to_next)` const;

int encoding() const noexcept;

4 Returns: `do_encoding()`.

bool always_noconv() const noexcept;

5 Returns: `do_always_noconv()`.

int length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

6 Returns: `do_length(state, from, from_end, max)`.

int max_length() const noexcept;

7 Returns: `do_max_length()`.

### 30.4.2.5.3 Virtual functions [locale.codecvt.virtuals]

result do_out(  
stateT& state,  
const internT* from, const internT* from_end, const internT*& from_next,  
externT* to, externT* to_end, externT*& to_next) const;

result do_in(  
stateT& state,  
const externT* from, const externT* from_end, const externT*& from_next,  
internT* to, internT* to_end, internT*& to_next) const;

1 Preconditions: `(from <= from_end && &k to <= to_end)` is well-defined and `true`; `state` is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.
Effects: Translates characters in the source range $[\text{from}, \text{from\_end})$, placing the results in sequential positions starting at destination $\text{to}$. Converts no more than $(\text{from\_end} - \text{from})$ source elements, and stores no more than $(\text{to\_end} - \text{to})$ destination elements.

Stops if it encounters a character it cannot convert. It always leaves the $\text{from\_next}$ and $\text{to\_next}$ pointers pointing one beyond the last element successfully converted. If returns $\text{noconv}$, $\text{internT}$ and $\text{externT}$ are the same type and the converted sequence is identical to the input sequence $[\text{from}, \text{from\_next})$. $\text{to\_next}$ is set equal to $\text{to}$, the value of $\text{state}$ is unchanged, and there are no changes to the values in $[\text{to}, \text{to\_end})$.

A codecvt facet that is used by $\text{basic\_filebuf}$ (31.10) shall have the property that if

\[
do\_out(\text{state}, \text{from}, \text{from\_end}, \text{from\_next}, \text{to}, \text{to\_end}, \text{to\_next})
\]

would return ok, where $\text{from} \neq \text{from\_end}$, then

\[
do\_out(\text{state}, \text{from}, \text{from} + 1, \text{from\_next}, \text{to}, \text{to\_end}, \text{to\_next})
\]

shall also return ok, and that if

\[
do\_in(\text{state}, \text{from}, \text{from\_end}, \text{from\_next}, \text{to}, \text{to\_end}, \text{to\_next})
\]

would return ok, where $\text{to} \neq \text{to\_end}$, then

\[
do\_in(\text{state}, \text{from}, \text{from\_end}, \text{from\_next}, \text{to}, \text{to} + 1, \text{to\_next})
\]

shall also return ok.\(^\text{252}\)

\[\text{Note 1: As a result of operations on } \text{state}, \text{it can return } \text{ok} \text{ or } \text{partial} \text{ and set } \text{from\_next} = \text{from} \text{ and } \text{to\_next} = \text{to}. \quad \text{—end note}\]

Returns: An enumeration value, as summarized in Table 107.

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the conversion</td>
</tr>
<tr>
<td>partial</td>
<td>not all source characters converted</td>
</tr>
<tr>
<td>error</td>
<td>encountered a character in $[\text{from}, \text{from_end})$ that cannot be converted</td>
</tr>
<tr>
<td>noconv</td>
<td>$\text{internT}$ and $\text{externT}$ are the same type, and input sequence is identical to converted sequence</td>
</tr>
</tbody>
</table>

A return value of $\text{partial}$, if $(\text{from\_next} = \text{from\_end})$, indicates that either the destination sequence has not absorbed all the available destination elements, or that additional source elements are needed before another destination element can be produced.

Remarks: Its operations on $\text{state}$ are unspecified.

\[\text{Note 2: This argument can be used, for example, to maintain shift state, to specify conversion options (such as count only), or to identify a cache of seek offsets}. \quad \text{—end note}\]

result do_unshift(stateT& state, externT* to, externT* to_end, externT*& to_next) const;

Preconditions: $(\text{to} \leq \text{to\_end})$ is well-defined and true; $\text{state}$ is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

Effects: Places characters starting at $\text{to}$ that should be appended to terminate a sequence when the current stateT is given by $\text{state}$.\(^\text{253}\) Stores no more than $(\text{to\_end} - \text{to})$ destination elements, and leaves the $\text{to\_next}$ pointer pointing one beyond the last element successfully stored.

Returns: An enumeration value, as summarized in Table 108.

---

\(\text{252}\) Informally, this means that $\text{basic\_filebuf}$ assumes that the mappings from internal to external characters is 1 to N: that a codecvt facet that is used by $\text{basic\_filebuf}$ can translate characters one internal character at a time.

\(\text{253}\) Typically these will be characters to return the state to $\text{stateT()}$.  

\(\text{§ 30.4.2.5.3}\)
## Table 108: do_unshift result values

<table>
<thead>
<tr>
<th>Value</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>ok</td>
<td>completed the sequence</td>
</tr>
<tr>
<td>partial</td>
<td>space for more than <code>to_end - to</code> destination elements was needed to terminate a sequence given the value of state</td>
</tr>
<tr>
<td>error</td>
<td>an unspecified error has occurred</td>
</tr>
<tr>
<td>noconv</td>
<td>no termination is needed for this state_type</td>
</tr>
</tbody>
</table>

```cpp
int do_encoding() const noexcept;

Returns: -1 if the encoding of the externT sequence is state-dependent; else the constant number of externT characters needed to produce an internal character; or 0 if this number is not a constant.\(^{254}\)
```

```cpp
bool do_always_noconv() const noexcept;

Returns: true if do_in() and do_out() return noconv for all valid argument values. codecvt<char, char, mbstate_t> returns true.
```

```cpp
int do_length(stateT& state, const externT* from, const externT* from_end, size_t max) const;

Preconditions: (from <= from_end) is well-defined and true; state is initialized, if at the beginning of a sequence, or else is equal to the result of converting the preceding characters in the sequence.

Effects: The effect on the state argument is as if it called do_in(state, from, from_end, from, to, to+max, to) for to pointing to a buffer of at least max elements.

Returns: (from_next-from) where from_next is the largest value in the range [from, from_end) such that the sequence of values in the range [from, from_next) represents max or fewer valid complete characters of type internT. The specialization codecvt<char, char, mbstate_t>::do_length() returns the lesser of max and (from_end-from).
```

```cpp
int do_max_length() const noexcept;

Returns: The maximum value that do_length(state, from, from_end, 1) can return for any valid range [from, from_end) and stateT value state. The specialization codecvt<char, char, mbstate_t>::do_max_length() returns 1.
```

### 30.4.2.6 Class template codecvtbyname

```
namespace std {
    template<class internT, class externT, class stateT>
    class codecvtbyname : public codecvt<internT, externT, stateT> {
        public:
            explicit codecvtbyname(const char*, size_t refs = 0);
            explicit codecvtbyname(const string&, size_t refs = 0);
        protected:
            ~codecvtbyname();
        }
}
```

### 30.4.3 The numeric category

#### 30.4.3.1 General

The classes num_get<> and num_put<> handle numeric formatting and parsing. Virtual functions are provided for several numeric types. Implementations may (but are not required to) delegate extraction of smaller types to extractors for larger types.\(^{255}\)

---

\(^{254}\) If encoding() yields -1, then more than max_length() externT elements can be consumed when producing a single internT character, and additional externT elements can appear at the end of a sequence after those that yield the final internT character.

\(^{255}\) Parsing "-1" correctly into, e.g., an unsigned short requires that the corresponding member get() at least extract the sign before delegating.
All specifications of member functions for `num_put` and `num_get` in the subclauses of 30.4.3 only apply to the specializations required in Tables 105 and 106 (30.3.1.2.1), namely `num_get<char>`, `num_get<wchar_t>`, `num_get<C, InputIterator>`, `num_put<char>`, `num_put<wchar_t>`, and `num_put<C, OutputIterator>`. These specializations refer to the `ios_base&` argument for formatting specifications (30.4), and to its imbued locale for the `numpunct<>` facet to identify all numeric punctuation preferences, and also for the `ctype<>` facet to perform character classification.

Extractor and inserter members of the standard iostreams use `num_get<>` and `num_put<>` member functions for formatting and parsing numeric values (31.7.5.3.1, 31.7.6.3.1).

30.4.3.2 Class template `num_get` [locale.num.get]
30.4.3.2.1 General [locale.num.get.general]

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class num_get : public locale::facet {
        using char_type = charT;
        using iter_type = InputIterator;
        explicit num_get(size_t refs = 0);
        iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, bool& v) const;
        iter_type get(iter_type in, iter_type end, ios_base&,
            ios_base::iostate& err, long& v) const;

   ios_base::iostate& err, double& val) const;
iter_type get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, void*& val) const;

Returns: do_get(in, end, str, err, val).

30.4.3.2.3 Virtual functions

iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, unsigned short& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, unsigned int& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, unsigned long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, unsigned long long& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, float& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, double& val) const;
iter_type do_get(iter_type in, iter_type end, ios_base& str, 
   ios_base::iostate& err, void*& val) const;

Effects: Reads characters from in, interpreting them according to str.flags(), use_facet<ctype<
   charT>>(loc), and use_facet<numpunct<charT>>(loc), where loc is str.getloc().

The details of this operation occur in three stages
Stage 1: Determine a conversion specifier

Stage 2: Extract characters from `in` and determine a corresponding `char` value for the format expected by the conversion specification determined in stage 1.

Stage 3: Store results

The details of the stages are presented below.

Stage 1: The function initializes local variables via

```c
fmtflags flags = str.flags();
fmtflags basefield = (flags & ios_base::basefield);
fmtflags uppercase = (flags & ios_base::uppercase);
fmtflags boolalpha = (flags & ios_base::boolalpha);
```

For conversion to an integral type, the function determines the integral conversion specifier as indicated in Table 109. The table is ordered. That is, the first line whose condition is true applies.

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>basefield == oct</td>
<td>%o</td>
</tr>
<tr>
<td>basefield == hex</td>
<td>%X</td>
</tr>
<tr>
<td>basefield == 0</td>
<td>%i</td>
</tr>
<tr>
<td>signed integral type</td>
<td>%d</td>
</tr>
<tr>
<td>unsigned integral type</td>
<td>%u</td>
</tr>
</tbody>
</table>

For conversions to a floating-point type the specifier is `%g`.

For conversions to `void*` the specifier is `%p`.

A length modifier is added to the conversion specification, if needed, as indicated in Table 110.

Table 110: Length modifier

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>short</td>
<td>h</td>
</tr>
<tr>
<td>unsigned short</td>
<td>h</td>
</tr>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>double</td>
<td>l</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
</tbody>
</table>

Stage 2: If `in == end` then stage 2 terminates. Otherwise a `charT` is taken from `in` and local variables are initialized as if by

```c
char_type ct = *in;
char c = src[find(atoms, atoms + sizeof(src) - 1, ct) - atoms];
if (ct == use_facet<numpunct<charT>>(loc).decimal_point())
  c = '.';
bool discard =
  ct == use_facet<numpunct<charT>>(loc).thousands_sep()
  && use_facet<numpunct<charT>>(loc).grouping().length() != 0;
```

where the values `src` and `atoms` are defined as if by:

- `static const char src[] = "0123456789abcdefpxABCDEFPX+-";`
- `char_type atoms[sizeof(src)];`
- `use_facet<ctype<charT>>(loc).widen(src, src + sizeof(src), atoms);`

for this value of `loc`.

If `discard` is `true`, then if '.' has not yet been accumulated, then the position of the character is remembered, but the character is otherwise ignored. Otherwise, if '.' has already been accumulated, the character is discarded and Stage 2 terminates. If it is not discarded, then a
check is made to determine if c is allowed as the next character of an input field of the conversion specifier returned by Stage 1. If so, it is accumulated.

If the character is either discarded or accumulated then in is advanced by ++in and processing returns to the beginning of stage 2.

[Example 1: Given an input sequence of "0x1a.bp+07p", if the conversion specifier returned by Stage 1 is %d, "0" is accumulated; if the conversion specifier returned by Stage 1 is %i, "0x1a" are accumulated; if the conversion specifier returned by Stage 1 is %g, "0x1a.bp+07" are accumulated. In all cases, the remainder is left in the input. — end example]

Stage 3: The sequence of chars accumulated in stage 2 (the field) is converted to a numeric value by the rules of one of the functions declared in the header <cstdlib>:

— For a signed integer value, the function strtol.
— For an unsigned integer value, the function strtoull.
— For a float value, the function strtof.
— For a double value, the function strtod.
— For a long double value, the function strtold.

The numeric value to be stored can be one of:

— zero, if the conversion function does not convert the entire field.
— the most positive (or negative) representable value, if the field to be converted to a signed integer type represents a value too large positive (or negative) to be represented in val.
— the most positive representable value, if the field to be converted to an unsigned integer type represents a value that cannot be represented in val.
— the converted value, otherwise.

The resultant numeric value is stored in val. If the conversion function does not convert the entire field, or if the field represents a value outside the range of representable values, ios_base::failbit is assigned to err.

Digit grouping is checked. That is, the positions of discarded separators are examined for consistency with use_facet<numpunct<charT>>(loc).grouping(). If they are not consistent then ios_base::failbit is assigned to err.

In any case, if stage 2 processing was terminated by the test for in == end then err |= ios_base::eofbit is performed.

iter_type do_get(iter_type in, iter_type end, ios_base& str, ios_base::iostate& err, bool& val) const;

Effects: If (str.flags()&ios_base::boolalpha) == 0 then input proceeds as it would for a long except that if a value is being stored into val, the value is determined according to the following: If the value to be stored is 0 then false is stored. If the value is 1 then true is stored. Otherwise true is stored and ios_base::failbit is assigned to err.

Otherwise target sequences are determined “as if” by calling the members false_name() and true_name() of the facet obtained by use_facet<numpunct<charT>>(str.getloc()). Successive characters in the range [in,end] (see 24.2.4) are obtained and matched against corresponding positions in the target sequences only as necessary to identify a unique match. The input iterator in is compared to end only when necessary to obtain a character. If a target sequence is uniquely matched, val is set to the corresponding value. Otherwise false is stored and ios_base::failbit is assigned to err.

The in iterator is always left pointing one position beyond the last character successfully matched. If val is set, then err is set to str::goodbit; or to str::eofbit if, when seeking another character to match, it is found that (in == end). If val is not set, then err is set to str::failbit; or to (str::failbit|str::eofbit) if the reason for the failure was that (in == end).

[Example 2: For targets true: "a" and false: "abb", the input sequence "a" yields val == true and err == str::eofbit; the input sequence "abc" yields err == str::failbit, with in ending at the ‘c’ element. For targets true: "1" and false: "0", the input sequence "1" yields val == true and err == str::goodbit. For empty targets (""), any input sequence yields err == str::failbit. — end example]

Returns: in.
30.4.3.3 Class template num_put

30.4.3.3.1 General

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class num_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            explicit num_put(size_t refs = 0);
            iter_type put(iter_type s, ios_base& f, char_type fill, bool v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, unsigned long long v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, long double v) const;
            iter_type put(iter_type s, ios_base& f, char_type fill, const void* v) const;
        protected:
            ~num_put();
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, bool v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, unsigned long long v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, long double v) const;
            virtual iter_type do_put(iter_type, ios_base&, char_type fill, const void* v) const;
        }
    };

The facet num_put is used to format numeric values to a character sequence such as an ostream.

30.4.3.3.2 Members

iter_type put(iter_type out, ios_base& str, char_type fill, bool val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type put(iter_type out, ios_base& str, char_type fill, const void* val) const;

Returns: do_put(out, str, fill, val).

30.4.3.3.3 Virtual functions

iter_type do_put(iter_type out, ios_base& str, char_type fill, long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, unsigned long long val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, long double val) const;
iter_type do_put(iter_type out, ios_base& str, char_type fill, const void* val) const;

Effects: Writes characters to the sequence out, formatting val as desired. In the following description,
loc names a local variable initialized as

locale loc = str.getloc();

The details of this operation occur in several stages:
Stage 1: The first action of stage 1 is to determine a conversion specifier. The tables that describe this determination use the following local variables:

```c
fmtflags flags = str.flags();
fmtflags basefield = (flags & (ios_base::basefield));
fmtflags uppercase = (flags & (ios_base::uppercase));
fmtflags floatfield = (flags & (ios_base::floatfield));
fmtflags showpos = (flags & (ios_base::showpos));
fmtflags showbase = (flags & (ios_base::showbase));
fmtflags showpoint = (flags & (ios_base::showpoint));
```

All tables used in describing stage 1 are ordered. That is, the first line whose condition is true applies. A line without a condition is the default behavior when none of the earlier lines apply.

For conversion from an integral type other than a character type, the function determines the integral conversion specifier as indicated in Table 111.

**Table 111: Integer conversions**

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>basefield == ios_base::oct</code></td>
<td><code>%o</code></td>
</tr>
<tr>
<td><code>(basefield == ios_base::hex) &amp;&amp; !uppercase</code></td>
<td><code>%x</code></td>
</tr>
<tr>
<td><code>(basefield == ios_base::hex)</code></td>
<td><code>%X</code></td>
</tr>
<tr>
<td>for a signed integral type</td>
<td><code>%d</code></td>
</tr>
<tr>
<td>for an unsigned integral type</td>
<td><code>%u</code></td>
</tr>
</tbody>
</table>

For conversion from a floating-point type, the function determines the floating-point conversion specifier as indicated in Table 112.

**Table 112: Floating-point conversions**

<table>
<thead>
<tr>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>floatfield == ios_base::fixed</code></td>
<td><code>%f</code></td>
</tr>
<tr>
<td><code>floatfield == ios_base::scientific &amp;&amp; !uppercase</code></td>
<td><code>%e</code></td>
</tr>
<tr>
<td><code>floatfield == ios_base::scientific</code></td>
<td><code>%E</code></td>
</tr>
<tr>
<td>`floatfield == (ios_base::fixed</td>
<td>ios_base::scientific) &amp;&amp; !uppercase`</td>
</tr>
<tr>
<td>`floatfield == (ios_base::fixed</td>
<td>ios_base::scientific)`</td>
</tr>
<tr>
<td><code>!uppercase</code></td>
<td><code>%g</code></td>
</tr>
<tr>
<td>otherwise</td>
<td><code>%G</code></td>
</tr>
</tbody>
</table>

For conversions from an integral or floating-point type a length modifier is added to the conversion specifier as indicated in Table 113.

The conversion specifier has the following optional additional qualifiers prepended as indicated in Table 114.

For conversion from a floating-point type, if `floatfield != (ios_base::fixed | ios_base::scientific)`, `str.precision()` is specified as precision in the conversion specification. Otherwise, no precision is specified.
Table 113: Length modifier [tab:facet.num.put.length]

<table>
<thead>
<tr>
<th>Type</th>
<th>Length modifier</th>
</tr>
</thead>
<tbody>
<tr>
<td>long</td>
<td>l</td>
</tr>
<tr>
<td>long long</td>
<td>ll</td>
</tr>
<tr>
<td>unsigned long</td>
<td>l</td>
</tr>
<tr>
<td>unsigned long long</td>
<td>ll</td>
</tr>
<tr>
<td>long double</td>
<td>L</td>
</tr>
<tr>
<td>otherwise</td>
<td>none</td>
</tr>
</tbody>
</table>

Table 114: Numeric conversions [tab:facet.num.put.conv]

<table>
<thead>
<tr>
<th>Type(s)</th>
<th>State</th>
<th>stdio equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>an integral type</td>
<td>showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showbase</td>
<td>#</td>
</tr>
<tr>
<td>a floating-point type</td>
<td>showpos</td>
<td>+</td>
</tr>
<tr>
<td></td>
<td>showpoint</td>
<td>#</td>
</tr>
</tbody>
</table>

For conversion from void* the specifier is %p.

The representations at the end of stage 1 consists of the char’s that would be printed by a call of printf(s, val) where a is the conversion specifier determined above.

Stage 2: Any character c other than a decimal point(.) is converted to a charT via

use_facet<ctype<charT>>(loc).widen(c)

A local variable punct is initialized via

const numpunct<charT>& punct = use_facet<numpunct<charT>>(loc);

For arithmetic types, punct.thousands_sep() characters are inserted into the sequence as determined by the value returned by punct.do_grouping() using the method described in 30.4.4.1.3.

Decimal point characters(.) are replaced by punct.decimal_point().

Stage 3: A local variable is initialized as

fmtflags adjustfield = (flags & (ios_base::adjustfield));

The location of any padding256 is determined according to Table 115.

Table 115: Fill padding [tab:facet.num.put.fill]

<table>
<thead>
<tr>
<th>State</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield == ios_base::left</td>
<td>pad after</td>
</tr>
<tr>
<td>adjustfield == ios_base::right</td>
<td>pad before</td>
</tr>
<tr>
<td>adjustfield == internal and a sign occurs in the representation</td>
<td>pad after the sign</td>
</tr>
<tr>
<td>adjustfield == internal and representation after stage 1 began with 0x or 0X</td>
<td>pad after x or X</td>
</tr>
<tr>
<td>otherwise</td>
<td>pad before</td>
</tr>
</tbody>
</table>

If str.width() is nonzero and the number of charT’s in the sequence after stage 2 is less than str.width(), then enough fill characters are added to the sequence at the position indicated for padding to bring the length of the sequence to str.width().

str.width(0) is called.

Stage 4: The sequence of charT’s at the end of stage 3 are output via

*out++ = c

256 The conversion specification #o generates a leading 0 which is not a padding character.
iter_type do_put(iter_type out, ios_base& str, char_type fill, bool val) const;

Returns: If (str.flags() & ios_base::boolalpha) == 0 returns do_put(out, str, fill, (int)val), otherwise obtains a string s as if by

    string_type s =
    val ? use_facet<numpunct<charT>>(loc).truename()
    : use_facet<numpunct<charT>>(loc).falsename();

and then inserts each character c of s into out via *out++ = c and returns out.

        ~numpunct();                      // virtual
        virtual char_type do_decimal_point() const;
        virtual char_type do_thousands_sep() const;
        virtual string do_grouping() const;
        virtual string_type do_truename() const;   // for bool
        virtual string_type do_falsename() const;  // for bool
    
    };
}

1 numpunct<> specifies numeric punctuation. The specializations required in Table 105 (30.3.1.2.1), namely numpunct<wchar_t> and numpunct<char>, provide classic "C" numeric formats, i.e., they contain information equivalent to that contained in the "C" locale or their wide character counterparts as if obtained by a call to widen.

2 The syntax for number formats is as follows, where digit represents the radix set specified by the fmtflags argument value, and thousands-sep and decimal-point are the results of corresponding numpunct<charT> members. Integer values have the format:

    intval:
        sign_opt units
        sign:
            +
            -
        units:
            digits
            digits thousands-sep units
        digits:
            digit digits_opt

and floating-point values have:

    floatval:
        sign_opt units fractional_opt exponent_opt
        sign_opt decimal-point digits exponent_opt
fractional:
  decimal-point digits\_opt
exponent:
  e sign\_opt digits
e:
e
E

where the number of digits between thousands-seps is as specified by do\_grouping(). For parsing, if the
digits portion contains no thousands-separators, no grouping constraint is applied.

30.4.4.1.2 Members

char\_type decimal\_point() const;

1 Returns: do\_decimal\_point().

cchar\_type thousands\_sep() const;

2 Returns: do\_thousands\_sep().

string grouping() const;

3 Returns: do\_grouping().

string\_type truename() const;

4 Returns: do\_truename() or do\_false\_name(), respectively.

30.4.4.1.3 Virtual functions

char\_type do\_decimal\_point() const;

1 Returns: A character for use as the decimal radix separator. The required specializations return "." or
L"."

cchar\_type do\_thousands\_sep() const;

2 Returns: A character for use as the digit group separator. The required specializations return "," or
L",".

string do\_grouping() const;

3 Returns: A string vec used as a vector of integer values, in which each element vec[i] represents
the number of digits\textsuperscript{257} in the group at position i, starting with position 0 as the rightmost group. If
vec.size() \leq i, the number is the same as group \((i - 1); if (i < 0 || vec[i] <= 0 || vec[i] == CHAR\_MAX), the size of the digit group is unlimited.

4 The required specializations return the empty string, indicating no grouping.

string\_type do\_truename() const;

string\_type do\_false\_name() const;

5 Returns: A string representing the name of the boolean value \texttt{true} or \texttt{false}, respectively.

6 In the base class implementation these names are \texttt{"true"} and \texttt{"false"}, or \texttt{L"true"} and \texttt{L"false"}.

30.4.4.2 Class template numpunct\_byname

namespace std {

  template<class charT>
  class numpunct\_byname : public numpunct<charT> {

    // this class is specialized for char and wchar\_t.

    public:
      using char\_type = charT;
      using string\_type = basic\_string<charT>;

\[257\] Thus, the string \"\003\" specifies groups of 3 digits each, and \"3\" probably indicates groups of 51 (!) digits each, because 51
is the ASCII value of \"3\".

§ 30.4.4.2 1573
explicit numpunct_byname(const char*, size_t refs = 0);
explicit numpunct_byname(const string&, size_t refs = 0);

protected:
- numpunct_byname();
};
}

§ 30.4.5 The collate category
30.4.5.1 Class template collate
30.4.5.1.1 General

namespace std {
  template<class charT>
  class collate : public locale::facet {
    public:
      using char_type = charT;
      using string_type = basic_string<charT>;

      explicit collate(size_t refs = 0);

      int compare(const charT* low1, const charT* high1,
                  const charT* low2, const charT* high2) const;
      string_type transform(const charT* low, const charT* high) const;
      long hash(const charT* low, const charT* high) const;

      static locale::id id;
    protected:
      ~collate();
      virtual int do_compare(const charT* low1, const charT* high1,
                             const charT* low2, const charT* high2) const;
      virtual string_type do_transform(const charT* low, const charT* high) const;
      virtual long do_hash (const charT* low, const charT* high) const;
    }
  }
}

The class collate< charT > provides features for use in the collation (comparison) and hashing of strings. A locale member function template, operator (), uses the collate facet to allow a locale to act directly as the predicate argument for standard algorithms (Clause 27) and containers operating on strings. The specializations required in Table 105 (30.3.1.2.1), namely collate< char > and collate< wchar_t >, apply lexicographical ordering (27.8.11).

Each function compares a string of characters *p in the range [low,high).

30.4.5.1.2 Members

int compare(const charT* low1, const charT* high1,
            const charT* low2, const charT* high2) const;
1 Returns: do_compare(low1, high1, low2, high2).

string_type transform(const charT* low, const charT* high) const;
2 Returns: do_transform(low, high).

long hash(const charT* low, const charT* high) const;
3 Returns: do_hash(low, high).

30.4.5.1.3 Virtual functions

int do_compare(const charT* low1, const charT* high1,
               const charT* low2, const charT* high2) const;
1 Returns: 1 if the first string is greater than the second, -1 if less, zero otherwise. The specializations required in Table 105 (30.3.1.2.1), namely collate< char > and collate< wchar_t >, implement a lexicographical comparison (27.8.11).
string_type do_transform(const charT* low, const charT* high) const;

Returns: A basic_string<charT> value that, compared lexicographically with the result of calling transform() on another string, yields the same result as calling do_compare() on the same two strings.

long do_hash(const charT* low, const charT* high) const;

Returns: An integer value equal to the result of calling hash() on any other string for which do_compare() returns 0 (equal) when passed the two strings.

Recommended practice: The probability that the result equals that for another string which does not compare equal should be very small, approaching \((1.0/\text{numeric\_limits}\langle\text{unsigned long}\rangle::\text{max}())\).

30.4.5.2 Class template collate_byname

namespace std {

    template<class charT>
    class collate_byname : public collate<charT> {
    public:
        using string_type = basic_string<charT>;
        explicit collate_byname(const char*, size_t refs = 0);
        explicit collate_byname(const string&, size_t refs = 0);
    protected:
        ~collate_byname();
    }
}

30.4.6 The time category

30.4.6.1 General

Templates time_get<charT, InputIterator> and time_put<charT, OutputIterator> provide date and time formatting and parsing. All specifications of member functions for time_put and time_get in the subclauses of 30.4.6 only apply to the specializations required in Tables 105 and 106 (30.3.1.2.1). Their members use their ios_base&, ios_base::iostate&, and fill arguments as described in 30.4, and the ctype<> facet, to determine formatting details.

30.4.6.2 Class template time_get

namespace std {

    class time_base {
    public:
        enum dateorder { no_order, dmy, mdy, ymd, ydm };
    
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_get : public locale::facet, public time_base {
    public:
        using char_type = charT;
        using iter_type = InputIterator;
        explicit time_get(size_t refs = 0);
        dateorder date_order() const { return do_date_order(); }
        iter_type get_time(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
        iter_type get_date(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
        iter_type get_weekday(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
        iter_type get_monthname(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err, tm* t) const;
    }
}

258) This function is useful when one string is being compared to many other strings.
time_get is used to parse a character sequence, extracting components of a time or date into a \texttt{tm} object. Each \texttt{get} member parses a format as produced by a corresponding format specifier to \texttt{time_put<>::put}. If the sequence being parsed matches the correct format, the corresponding members of the \texttt{tm} argument are set to the values used to produce the sequence; otherwise either an error is reported or unspecified values are assigned.\footnote{In other words, user confirmation is required for reliable parsing of user-entered dates and times, but machine-generated formats can be parsed reliably. This allows parsers to be aggressive about interpreting user variations on standard formats.}

If the end iterator is reached during parsing by any of the \texttt{get()} member functions, the member sets \texttt{ios_base::eofbit} in \texttt{err}.

30.4.6.2.2 Members

\begin{itemize}
\item \texttt{dateorder date_order()}\footnote{\texttt{Returns: do_date_order().}} \texttt{const};
\item \texttt{iter_type get_time(iter_type s, iter_type end, ios_base& str,}
\texttt{ios_base::iostate& err, tm* t) const;}
\item \texttt{Returns: do_get_time(s, end, str, err, t).}
\item \texttt{iter_type get_date(iter_type s, iter_type end, ios_base& str,}
\texttt{ios_base::iostate& err, tm* t) const;}
\item \texttt{Returns: do_get_date(s, end, str, err, t).}
\item \texttt{iter_type get_weekday(iter_type s, iter_type end, ios_base& str,}
\texttt{ios_base::iostate& err, tm* t) const;}
\item \texttt{iter_type get_mondayname(iter_type s, iter_type end, ios_base& str,}
\texttt{ios_base::iostate& err, tm* t) const;}
\item \texttt{Returns: do_get_weekday(s, end, str, err, t) or do_get_mondayname(s, end, str, err, t).}
\item \texttt{iter_type get_year(iter_type s, iter_type end, ios_base& str,}
\texttt{ios_base::iostate& err, tm* t) const;}
\item \texttt{Returns: do_get_year(s, end, str, err, t).}
\end{itemize}
iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
    tm* t, char format, char modifier = 0) const;

    Returns: do_get(s, end, f, err, t, format, modifier).

iter_type get(iter_type s, iter_type end, ios_base& f, ios_base::iostate& err,
    tm* t, const char_type* fmt, const char_type* fmtend) const;

    Preconditions: [fmt,fmtend) is a valid range.

    Effects: The function starts by evaluating err = ios_base::goodbit. It then enters a loop, reading
    zero or more characters from s at each iteration. Unless otherwise specified below, the loop terminates
    when the first of the following conditions holds:

    (8.1) The expression fmt == fmtend evaluates to true.

    (8.2) The expression err == ios_base::goodbit evaluates to false.

    (8.3) The expression s == end evaluates to true, in which case the function evaluates err = ios_base::eofbit | ios_base::failbit.

    (8.4) The next element of fmt is equal to '%', optionally followed by a modifier character, followed by
    a conversion specifier character, format, together forming a conversion specification valid for the
    POSIX function strftime. If the number of elements in the range [fmt,fmtend) is not sufficient
    to unambiguously determine whether the conversion specification is complete and valid, the
    function evaluates err = ios_base::failbit. Otherwise, the function evaluates s = do_get(s, end, f, err, t, format, modifier), where the value of modifier is '\0' when the optional
    modifier is absent from the conversion specification. If err == ios_base::goodbit holds after
    the evaluation of the expression, the function increments fmt to point just past the end of the conversion
    specification and continues looping.

    (8.5) The expression isspace(*fmt, f.getloc()) evaluates to true, in which case the function first
    increments fmt until fmt == fmtend || !isspace(*fmt, f.getloc()) evaluates to true, then
    advances s until s == end || !isspace(*s, f.getloc()) is true, and finally resumes looping.

    (8.6) The next character read from s matches the element pointed to by fmt in a case-insensitive
    comparison, in which case the function evaluates ++fmt, ++s and continues looping. Otherwise,
    the function evaluates err = ios_base::failbit.

    [Note 1: The function uses the ctype facet installed in f's locale to determine valid whitespace
    characters. It is unspecified by what means the function performs case-insensitive comparison or whether
    multi-character sequences are considered while doing so. — end note]

    Returns: s.

30.4.6.2.3 Virtual functions

dateorder do_date_order() const;

    Returns: An enumeration value indicating the preferred order of components for those date formats
    that are composed of day, month, and year. Returns no_order if the date format specified by 'x'
    contains other variable components (e.g., Julian day, week number, week day).

iter_type do_get_time(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;

    Effects: Reads characters starting at s until it has extracted those tm members, and remaining format
    characters, used by time_put<>::put to produce the format specified by "%H:%M:%S", or until it
    encounters an error or end of sequence.

    Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a
    valid time.

iter_type do_get_date(iter_type s, iter_type end, ios_base& str,
    ios_base::iostate& err, tm* t) const;

    Effects: Reads characters starting at s until it has extracted those tm members and remaining format
    characters used by time_put<>::put to produce one of the following formats, or until it encounters an
    error. The format depends on the value returned by date_order() as shown in Table 116.

260) This function is intended as a convenience only, for common formats, and can return no_order in valid locales.

§ 30.4.6.2.3 1577
Table 116: do_get_date effects

<table>
<thead>
<tr>
<th>date_order()</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>no_order</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>dmy</td>
<td>&quot;%d%m%y&quot;</td>
</tr>
<tr>
<td>ndy</td>
<td>&quot;%m%d%y&quot;</td>
</tr>
<tr>
<td>ymd</td>
<td>&quot;%y%m%d&quot;</td>
</tr>
<tr>
<td>ydm</td>
<td>&quot;%y%d%m&quot;</td>
</tr>
</tbody>
</table>

An implementation may also accept additional implementation-defined formats.

Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid date.

iter_type do_get_weekday(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;
iter_type do_get_monthname(iter_type s, iter_type end, ios_base& str,
                        ios_base::iostate& err, tm* t) const;

Effects: Reads characters starting at s until it has extracted the (perhaps abbreviated) name of a weekday or month. If it finds an abbreviation that is followed by characters that can match a full name, it continues reading until it matches the full name or fails. It sets the appropriate tm member accordingly.

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid name.

iter_type do_get_year(iter_type s, iter_type end, ios_base& str,
                      ios_base::iostate& err, tm* t) const;

Effects: Reads characters starting at s until it has extracted an unambiguous year identifier. It is implementation-defined whether two-digit year numbers are accepted, and (if so) what century they are assumed to lie in. Sets the t->tm_year member accordingly.

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid year identifier.

iter_type do_get(iter_type s, iter_type end, ios_base& f,
                 ios_base::iostate& err, tm* t, char format, char modifier) const;

Preconditions: t points to an object.

Effects: The function starts by evaluating err = ios_base::goodbit. It then reads characters starting at s until it encounters an error, or until it has extracted and assigned those tm members, and any remaining format characters, corresponding to a conversion specification appropriate for the POSIX function strptime, formed by concatenating '%', the modifier character, when non-NUL, and the format character. When the concatenation fails to yield a complete valid directive the function leaves the object pointed to by t unchanged and evaluates err |= ios_base::failbit. When s == end evaluates to true after reading a character the function evaluates err |= ios_base::eofbit.

For complex conversion specifications such as %c, %x, or %X, or conversion specifications that involve the optional modifiers E or O, when the function is unable to unambiguously determine some or all tm members from the input sequence [s, end), it evaluates err |= ios_base::eofbit. In such cases the values of those tm members are unspecified and may be outside their valid range.

Returns: An iterator pointing immediately beyond the last character recognized as possibly part of a valid input sequence for the given format and modifier.

Remarks: It is unspecified whether multiple calls to do_get() with the address of the same tm object will update the current contents of the object or simply overwrite its members. Portable programs should zero out the object before invoking the function.

30.4.6.3 Class template time_getbyname

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class time_getbyname : public time_get<charT, InputIterator> {

§ 30.4.6.3 1578
public:
    using dateorder = time_base::dateorder;
    using iter_type = InputIterator;

    explicit time_getbyname(const char*, size_t refs = 0);
    explicit time_getbyname(const string&, size_t refs = 0);

protected:
    ~time_getbyname();
};

30.4.6.4 Class template time_put

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put : public locale::facet {
    public:
        using char_type = charT;
        using iter_type = OutputIterator;

        explicit time_put(size_t refs = 0);
        // the following is implemented in terms of other member functions,
        iter_type put(iter_type s, ios_base& f, char_type fill, const tm* tmb,
                      const charT* pattern, const charT* pat_end) const;
        iter_type put(iter_type s, ios_base& f, char_type fill,
                      const tm* tmb, char format, char modifier = 0) const;

        static locale::id id;

    protected:
        ~time_put();
        virtual iter_type do_put(iter_type s, ios_base&, char_type, const tm* t,
                                  char format, char modifier) const;
    };
}

30.4.6.4.1 Members

iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              const charT* pattern, const charT* pat_end) const;
iter_type put(iter_type s, ios_base& str, char_type fill, const tm* t,
              char format, char modifier = 0) const;

Effects: The first form steps through the sequence from pattern to pat_end, identifying characters that are part of a format sequence. Each character that is not part of a format sequence is written to s immediately, and each format sequence, as it is identified, results in a call to do_put; thus, format elements and other characters are interleaved in the output in the order in which they appear in the pattern. Format sequences are identified by converting each character c to a char value as if by ct.narrow(c, 0), where ct is a reference to ctype<charT> obtained from str.getloc(). The first character of each sequence is equal to ‘%’, followed by an optional modifier character mod and a format specifier character spec as defined for the function strftime. If no modifier character is present, mod is zero. For each valid format sequence identified, calls do_put(s, str, fill, t, spec, mod).

The second form calls do_put(s, str, fill, t, format, modifier).

[Note 1: The fill argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — end note]

Returns: An iterator pointing immediately after the last character produced.

261) Although the C programming language defines no modifiers, most vendors do.
30.4.6.4.2 Virtual functions

iter_type do_put(iter_type s, ios_base&, char_type fill, const tm* t,
    char format, char modifier) const;

Effects: Formats the contents of the parameter t into characters placed on the output sequence s. Formatting is controlled by the parameters format and modifier, interpreted identically as the format specifiers in the string argument to the standard library function strftime(), except that the sequence of characters produced for those specifiers that are described as depending on the C locale are instead implementation-defined.

[Note 1: Interpretation of the modifier argument is implementation-defined. — end note]

Returns: An iterator pointing immediately after the last character produced.

[Note 2: The fill argument can be used in the implementation-defined formats or by derivations. A space character is a reasonable default for this argument. — end note]

Recommended practice: Interpretation of the modifier should follow POSIX conventions. Implementations should refer to other standards such as POSIX for a specification of the character sequences produced for those specifiers described as depending on the C locale.

30.4.6.5 Class template time_put_byname

namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class time_put_byname : public time_put<charT, OutputIterator> {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            explicit time_put_byname(const char*, size_t refs = 0);
            explicit time_put_byname(const string&, size_t refs = 0);

        protected:
            ~time_put_byname();
        }
    }

30.4.7 The monetary category

30.4.7.1 General

These templates handle monetary formats. A template parameter indicates whether local or international monetary formats are to be used.

All specifications of member functions for money_put and money_get in the subclauses of 30.4.7 only apply to the specializations required in Tables 105 and 106 (30.3.1.2.1). Their members use their ios_base&, ios_base::iostate&, and fill arguments as described in 30.4, and the moneypunct<> and ctype<> facets, to determine formatting details.

30.4.7.2 Class template money_get

namespace std {
    template<class charT, class InputIterator = istreambuf_iterator<charT>>
    class money_get : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = InputIterator;
            using string_type = basic_string<charT>;
            explicit money_get(size_t refs = 0);

            iter_type get(iter_type s, iter_type end, bool intl,
                ios_base& f, ios_base::iostate& err,
                long double& units) const;
            iter_type get(iter_type s, iter_type end, bool intl,
                ios_base& f, ios_base::iostate& err,
                string_type& digits) const;
    }
static locale::id id;

protected:

Returns: do_get(s, end, intl, f, err, quant).

30.4.7.2.2 Virtual functions

iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
  ios_base::iostate& err, long double& units) const;
iter_type do_get(iter_type s, iter_type end, bool intl, ios_base& str,
  ios_base::iostate& err, string_type& digits) const;

Effects: Reads characters from s to parse and construct a monetary value according to the format specified by a moneypunct<CharT, Intl> facet reference mp and the character mapping specified by a ctype<CharT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags(). If a valid sequence is recognized, does not change err; otherwise, sets err to (err|str.failbit), or (err|str.failbit|str.eofbit) if no more characters are available, and does not change units or digits. Uses the pattern returned by mp.neg_format() to parse all values. The result is returned as an integral value stored in units or as a sequence of digits possibly preceded by a minus sign (as produced by ct.widen(c) where c is '-' or in the range from '0' through '9' (inclusive)) stored in digits.

[Example 1: The sequence $1,056.23 in a common United States locale would yield, for units, 105623, or, for digits, "105623". — end example]

If mp.grouping() indicates that no thousands separators are permitted, any such characters are not read, and parsing is terminated at the point where they first appear. Otherwise, thousands separators are optional; if present, they are checked for correct placement only after all format components have been read.

Where money_base::space or money_base::none appears as the last element in the format pattern, no whitespace is consumed. Otherwise, where money_base::space appears in any of the initial elements of the format pattern, at least one whitespace character is required. Where money_base::none appears in any of the initial elements of the format pattern, whitespace is allowed but not required. If (str.flags() & str.showbase) is false, the currency symbol is optional and is consumed only if other characters are needed to complete the format; otherwise, the currency symbol is required.

3 If the first character (if any) in the string pos returned by mp.positive_sign() or the string neg returned by mp.negative_sign() is recognized in the position indicated by sign in the format pattern, it is consumed and any remaining characters in the string are required after all the other format components.

[Example 2: If showbase is off, then for a neg value of "(" and a currency symbol of "L", in "(100 L)" the "L" is consumed; but if neg is ",", the "L" in "100 - L" is not consumed. — end example]

If pos or neg is empty, the sign component is optional, and if no sign is detected, the result is given the sign that corresponds to the source of the empty string. Otherwise, the character in the indicated position must match the first character of pos or neg, and the result is given the corresponding sign. If the first character of pos is equal to the first character of neg, or if both strings are empty, the result is given a positive sign.
Digits in the numeric monetary component are extracted and placed in digits, or into a character buffer buf1 for conversion to produce a value for units, in the order in which they appear, preceded by a minus sign if and only if the result is negative. The value units is produced as if by

```c
for (int i = 0; i < n; ++i)
    buf2[i] = src[find(atoms, atoms+sizeof(src), buf1[i]) - atoms];
buf2[n] = 0;
sscanf(buf2, "%Lf", &units);
```

where n is the number of characters placed in buf1, buf2 is a character buffer, and the values src and atoms are defined as if by

```c
static const char src[] = "0123456789-";
charT atoms[sizeof(src)];
ct.widen(src, src + sizeof(src) - 1, atoms);
```

5  

Returns: An iterator pointing immediately beyond the last character recognized as part of a valid monetary quantity.

30.4.7.3 Class template money_put

```c
namespace std {
    template<class charT, class OutputIterator = ostreambuf_iterator<charT>>
    class money_put : public locale::facet {
        public:
            using char_type = charT;
            using iter_type = OutputIterator;
            using string_type = basic_string<charT>;
            explicit money_put(size_t refs = 0);
            iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double units) const;
            iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& digits) const;
        }
    } // namespace std
```

30.4.7.3.1 Members

```c
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, long double quant) const;
iter_type put(iter_type s, bool intl, ios_base& f, char_type fill, const string_type& quant) const;
```

1  

Returns: do_put(s, intl, f, loc, quant).

30.4.7.3.2 Virtual functions

```c
iter_type do_put(iter_type s, bool intl, ios_base& str,
    char_type fill, long double units) const;
iter_type do_put(iter_type s, bool intl, ios_base& str,
    char_type fill, const string_type& digits) const;
```

1  

Effects: Writes characters to s according to the format specified by a moneypunct<charT, Intl> facet reference mp and the character mapping specified by a ctype<charT> facet reference ct obtained from the locale returned by str.getloc(), and str.flags(). The argument units is transformed into a sequence of wide characters as if by

```c
c:t.widen(buf1, buf1 + sprintf(buf1, "%.0Lf", units), buf2)
```
for character buffers `buf1` and `buf2`. If the first character in `digits` or `buf2` is equal to `ct.widen('-')`, then the pattern used for formatting is the result of `mp.neg_format()`; otherwise the pattern is the result of `mp.pos_format()`. Digit characters are written, interspersed with any thousands separators and decimal point specified by the format, in the order they appear (after the optional leading minus sign) in `digits` or `buf2`. In `digits`, only the optional leading minus sign and the immediately subsequent digit characters (as classified according to `ct`) are used; any trailing characters (including digits appearing after a non-digit character) are ignored. Calls `str.width(0)`.

**Returns:** An iterator pointing immediately after the last character produced.

**Remarks:** The currency symbol is generated if and only if `(str.flags() & str.showbase)` is nonzero. If the number of characters generated for the specified format is less than the value returned by `str.width()` on entry to the function, then copies of `fill` are inserted as necessary to pad to the specified width. For the value `af` equal to `(str.flags() & str.adjustfield)`, if `(af == str.internal)` is true, the fill characters are placed where `none` or `space` appears in the formatting pattern; otherwise if `(af == str.left)` is true, they are placed after the other characters; otherwise, they are placed before the other characters.

*Note 1: It is possible, with some combinations of format patterns and flag values, to produce output that cannot be parsed using `num_get<>::get. — end note*

30.4.7.4 Class template `moneypunct`  
30.4.7.4.1 General

```cpp
namespace std {
    class money_base {
    public:
        enum part { none, space, symbol, sign, value }
        struct pattern { char field[4]; }
    }

    template<class charT, bool International = false>
    class moneypunct : public locale::facet, public money_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;
        explicit moneypunct(size_t refs = 0);
        charT decimal_point() const;
        charT thousands_sep() const;
        string grouping() const;
        string_type curr_symbol() const;
        string_type positive_sign() const;
        string_type negative_sign() const;
        int frac_digits() const;
        pattern pos_format() const;
        pattern neg_format() const;

        static locale::id id;
        static const bool intl = International;

    protected:
        moneypunct();
        virtual charT do_decimal_point() const;
        virtual charT do_thousands_sep() const;
        virtual string do_grouping() const;
        virtual string_type do_curr_symbol() const;
        virtual string_type do_positive_sign() const;
        virtual string_type do_negative_sign() const;
        virtual int do_frac_digits() const;
        virtual pattern do_pos_format() const;
        virtual pattern do_neg_format() const;
    }
}
```
The `moneypunct<>` facet defines monetary formatting parameters used by `money_get<>` and `money_put<>`. A monetary format is a sequence of four components, specified by a `pattern` value `p`, such that the `part` value `static_cast<part>(p.field[i])` determines the `i`th component of the format. In the `field` member of a `pattern` object, each value `symbol`, `sign`, `value`, and either `space` or `none` appears exactly once. The value `none`, if present, is not first; the value `space`, if present, is neither first nor last.

Where `none` or `space` appears, whitespace is permitted in the format, except where `none` appears at the end, in which case no whitespace is permitted. The value `space` indicates that at least one space is required at that position. Where `symbol` appears, the sequence of characters returned by `curr_symbol()` is permitted, and can be required. Where `sign` appears, the first (if any) of the sequence of characters returned by `positive_sign()` or `negative_sign()` (respectively as the monetary value is non-negative or negative) is required. Any remaining characters of the sign sequence are required after all other format components. Where `value` appears, the absolute numeric monetary value is required.

The format of the numeric monetary value is a decimal number:

```
value:
  units fractional_opt
  decimal-point digits
fractional:
  decimal-point digits_opt
```

If `frac_digits()` returns a positive value, or

```
value:
  units
```
otherwise. The symbol `decimal-point` indicates the character returned by `decimal_point()`. The other symbols are defined as follows:

```
units:
  digits
  digits thousands-sep units
digits:
  adigit digits_opt
```

In the syntax specification, the symbol `adigit` is any of the values `ct.widen(c)` for `c` in the range `'0'` through `'9'` (inclusive) and `ct` is a reference of type `const ctype<charT>&` obtained as described in the definitions of `money_get<>` and `money_put<>`. The symbol `thousands-sep` is the character returned by `thousands_sep()`. The space character used is the value `ct.widen(' ')`. Whitespace characters are those characters `c` for which `ci.is(space, c)` returns `true`. The number of digits required after the decimal point (if any) is exactly the value returned by `frac_digits()`.

The placement of thousands-separator characters (if any) is determined by the value returned by `grouping()`, defined identically as the member `moneypunct<>::do_grouping()`.

### 30.4.7.4.2 Members

#### [locale.moneypunct.members]

- `charT decimal_point() const;`
- `charT thousands_sep() const;`
- `string grouping() const;`
- `string_type curr_symbol() const;`  
- `string_type positive_sign() const;`  
- `string_type negative_sign() const;`  
- `int frac_digits() const;`
- `pattern pos_format() const;`
- `pattern neg_format() const;`

Each of these functions `F` returns the result of calling the corresponding virtual member function `do_F()`.

### 30.4.7.4.3 Virtual functions

#### [locale.moneypunct.virtuals]

- `charT do_decimal_point() const;`

Returns: The radix separator to use in case `do_frac_digits()` is greater than zero.
charT do_thousands_sep() const;

Returns: The digit group separator to use in case do_grouping() specifies a digit grouping pattern.\(^\text{265}\)

string do_grouping() const;

Returns: A pattern defined identically as, but not necessarily equal to, the result of mumpunct<charT>::
do_grouping().\(^\text{266}\)

string_type do_curr_symbol() const;

Returns: A string to use as the currency identifier symbol.

[Note 1: For specializations where the second template parameter is \texttt{true}, this is typically four characters long: a three-letter code as specified by ISO 4217 followed by a space. — end note]\(^\text{267}\)

string_type do_positive_sign() const;
string_type do_negative_sign() const;

Returns: do_positive_sign() returns the string to use to indicate a positive monetary value;\(^\text{268}\)
do_negative_sign() returns the string to use to indicate a negative value.

int do_frac_digits() const;

Returns: The number of digits after the decimal radix separator, if any.\(^\text{269}\)

pattern do_pos_format() const;
pattern do_neg_format() const;

Returns: The specializations required in Table 106 (30.3.1.2.1), namely

(7.1) \hspace{1cm} \text{moneypunct<char>},
(7.2) \hspace{1cm} \text{moneypunct<wchar_t>},
(7.3) \hspace{1cm} \text{moneypunct<char, true>}, and
(7.4) \hspace{1cm} \text{moneypunct<wchar_t, true>},

return an object of type \texttt{pattern} initialized to \{ \texttt{symbol, sign, none, value} \}.\(^\text{270}\)

### 30.4.7.5 Class template \texttt{moneypunct\_byname} \[locale.moneypunct\_byname\]

namespace std {

template<class charT, bool Intl = false>

class moneypunct\_byname : public moneypunct<charT, Intl> {

public:

\hspace{1cm} \text{using \texttt{pattern} = money_base::pattern;}
\hspace{1cm} \text{using \texttt{string\_type} = basic\_string<charT>;}

\hspace{1cm} \text{explicit moneypunct\_byname(const char*, size\_t refs = 0);}
\hspace{1cm} \text{explicit moneypunct\_byname(const string&, size\_t refs = 0);}

\hspace{1cm} protected:

\hspace{1cm} \text{~moneypunct\_byname();}

};

}

### 30.4.8 The message retrieval category \[category.messages\]

#### 30.4.8.1 General \[category.messages.general\]

Class \texttt{messages<charT>} implements retrieval of strings from message catalogs.

\(^{265}\) In common U.S. locales this is \',\'.
\(^{266}\) To specify grouping by 3s, the value is \texttt{"\003"} \textit{not} \texttt{"3"}.
\(^{267}\) This is usually the empty string.
\(^{268}\) In common U.S. locales, this is \texttt{2}.
\(^{269}\) Note that the international symbol returned by \texttt{do\_curr\_symbol()} usually contains a space, itself; for example, \texttt{"USD ".}
30.4.8.2 Class template messages

30.4.8.2.1 General

namespace std {
    class messages_base {
    public:
        using catalog = unspecified signed integer type;
    };

    template<class charT>
    class messages : public locale::facet, public messages_base {
    public:
        using char_type = charT;
        using string_type = basic_string<charT>;
        explicit messages(size_t refs = 0);
        catalog open(const string& fn, const locale&) const;
        string_type get(catalog c, int set, int msgid,
                        const string_type& dfault) const;
        void close(catalog c) const;
        static locale::id id;
    protected:
        ~messages();
        virtual catalog do_open(const string&, const locale&) const;
        virtual string_type do_get(catalog, int set, int msgid,
                                    const string_type& dfault) const;
        virtual void do_close(catalog) const;
    };
}

1 Values of type messages_base::catalog usable as arguments to members get and close can be obtained only by calling member open.

30.4.8.2.2 Members

catalog open(const string& name, const locale& loc) const;
1 Returns: do_open(name, loc).

string_type get(catalog cat, int set, int msgid, const string_type& dfault) const;
2 Returns: do_get(cat, set, msgid, dfault).

void close(catalog cat) const;
3 Effects: Calls do_close(cat).

30.4.8.2.3 Virtual functions

catalog do_open(const string& name, const locale& loc) const;
1 Returns: A value that may be passed to get() to retrieve a message from the message catalog identified by the string name according to an implementation-defined mapping. The result can be used until it is passed to close().
2 Returns a value less than 0 if no such catalog can be opened.
3 Remarks: The locale argument loc is used for character set code conversion when retrieving messages, if needed.

string_type do_get(catalog cat, int set, int msgid, const string_type& dfault) const;
4 Preconditions: cat is a catalog obtained from open() and not yet closed.
5 Returns: A message identified by arguments set, msgid, and dfault, according to an implementation-defined mapping. If no such message can be found, returns dfault.
void do_close(catalog cat) const;

6  **Preconditions**: cat is a catalog obtained from open() and not yet closed.

7  **Effects**: Releases unspecified resources associated with cat.

8  **Remarks**: The limit on such resources, if any, is implementation-defined.

30.4.8.3 Class template messages_byname

namespace std {
  template<class charT>
  class messages_byname : public messages<charT> {
    public:
    using catalog = messages_base::catalog;
    using string_type = basic_string<charT>;

    explicit messages_byname(const char*, size_t refs = 0);
    explicit messages_byname(const string&, size_t refs = 0);

    protected:
    ~messages_byname();
  };
}

30.5 C library locales

30.5.1 Header <locale> synopsis

namespace std {
  struct lconv;
  char* setlocale(int category, const char* locale);
  lconv* localeconv();
}

#define NULL
see 17.2.3
#define LC_ALL

31 Input/output library

31.1 General

This Clause describes components that C++ programs may use to perform input/output operations.

The following subclauses describe requirements for stream parameters, and components for forward declarations of iostreams, predefined iostream objects, base iostream classes, stream buffering, stream formatting and manipulators, string streams, and file streams, as summarized in Table 118.

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header</th>
</tr>

<td>&lt;sstream&gt;</td>
</tr>
<tr>
<td>31.7 Formatting and manipulators</td>
<td>&lt;iomanip&gt;</td>
</tr>
<tr>
<td>31.8 String streams</td>
<td>&lt;fstream&gt;</td>
</tr>
<tr>
<td>31.9 Span-based streams</td>
<td>&lt;spanstream&gt;</td>
</tr>
<tr>
<td>31.10 File streams</td>
<td>&lt;filesystem&gt;</td>
</tr>
<tr>
<td>31.11 Synchronized output streams</td>
<td>&lt;syncstream&gt;</td>
</tr>
<tr>
<td>31.12 File systems</td>
<td>&lt;cstdio&gt;, &lt;cinttypes&gt;</td>
</tr>
</tbody>
</table>

31.2 Iostreams requirements

31.2.1 Imbue limitations

No function described in Clause 31 except for ios_base::imbue and basic_filebuf::pubimbue causes any instance of basic_ios::imbue or basic_streambuf::imbue to be called. If any user function called from a function declared in Clause 31 or as an overriding virtual function of any class declared in Clause 31 calls imbue, the behavior is undefined.

31.2.2 Types

using streamoff = implementation-defined;

The type streamoff is a synonym for one of the signed basic integral types of sufficient size to represent the maximum possible file size for the operating system.

using streamsize = implementation-defined;

The type streamsize is a synonym for one of the signed basic integral types. It is used to represent the number of characters transferred in an I/O operation, or the size of I/O buffers.

31.2.3 Positioning type limitations

The classes of Clause 31 with template arguments charT and traits behave as described if traits::pos_type and traits::off_type are streampos and streamoff respectively. Except as noted explicitly below, their behavior when traits::pos_type and traits::off_type are other types is implementation-defined.

[Note: For each of the specializations of char_traits defined in 23.2.4, state_type denotes mbstate_t, pos_type denotes fpos<mbstate_t>, and off_type denotes streamoff. — end note]

In the classes of Clause 31, a template parameter with name charT represents a member of the set of types containing char, wchar_t, and any other implementation-defined character types that meet the requirements for a character on which any of the iostream components can be instantiated.

270) Typically long long.
271) Most places where streamsize is used would use size_t in ISO C, or ssize_t in POSIX.
31.2.4 Thread safety

Concurrent access to a stream object (31.8, 31.10), stream buffer object (31.6), or C Library stream (31.13) by multiple threads may result in a data race (6.9.2) unless otherwise specified (31.4).

[Note 1: Data races result in undefined behavior (6.9.2). — end note]

If one thread makes a library call \( a \) that writes a value to a stream and, as a result, another thread reads this value from the stream through a library call \( b \) such that this does not result in a data race, then \( a \)'s write synchronizes with \( b \)'s read.

31.3 Forward declarations

31.3.1 Header <iosfwd> synopsis

```cpp
namespace std {
    template<class charT> struct char_traits;
    template<> struct char_traits<char>;
    template<> struct char_traits<char8_t>;

template<class state> class fpos;
using streampos = fpos<char_traits<char>::state_type>;
using wstreampos = fpos<char_traits<wchar_t>::state_type>;

§ 31.3.1
using u8streampos = fpos<char_traits<char8_t>::state_type>;
using u16streampos = fpos<char_traits<char16_t>::state_type>;
using u32streampos = fpos<char_traits<char32_t>::state_type>;
}

1 Default template arguments are described as appearing both in `<iosfwd>` and in the synopsis of other headers but it is well-formed to include both `<iosfwd>` and one or more of the other headers.272

### 31.3.2 Overview

The class template specialization `basic_ios<charT, traits>` serves as a virtual base class for the class templates `basic_istream`, `basic_ostream`, and class templates derived from them. `basic_iosstream` is a class template derived from both `basic_istream<charT, traits>` and `basic_ostream<charT, traits>`.

2 The class template specialization `basic_streambuf<charT, traits>` serves as a base class for class templates `basic_streambuf`, `basic_filebuf`, and `basic_syncbuf`.

3 The class template specialization `basic_istream<charT, traits>` serves as a base class for class templates `basic_istringstream` and `basic_ifstream`.

4 The class template specialization `basic_ostream<charT, traits>` serves as a base class for class templates `basic_osstreamstream`, `basic_ofstream`, and `basic_osyncstream`.

5 The class template specialization `basic_iosstream<charT, traits>` serves as a base class for class templates `basic_stringstream` and `basic_fstream`.

6 [Note 1: For each of the class templates above, the program is ill-formed if `traits::char_type` is not the same type as `charT` (23.2). — end note]

7 Other typedef-names define instances of class templates specialized for `char` or `wchar_t` types.

8 Specializations of the class template `fpos` are used for specifying file position information.

[Example 1: The types `streampos` and `wstreampos` are used for positioning streams specialized on `char` and `wchar_t` respectively. — end example]

9 [Note 2: This synopsis suggests a circularity between `streampos` and `char_traits<char>`. An implementation can avoid this circularity by substituting equivalent types. — end note]

### 31.4 Standard iostream objects

#### 31.4.1 Header `<iostream>` synopsis

```cpp
#include <ios>   // see 31.5.1
#include <streambuf> // see 31.6.1
#include <iostream> // see 31.7.1
#include <ostream> // see 31.7.2

namespace std {
  extern istream cin;
  extern ostream cout;
  extern ostream cerr;
  extern ostream clog;

  extern wistream wcin;
  extern wostream wcout;
  extern wostream wcerr;
  extern wostream wclog;
}
```

#### 31.4.2 Overview

In this Clause, the type name FILE refers to the type FILE declared in `<cstdio>` (31.13.1).

2 The header `<iostream>` declares objects that associate objects with the standard C streams provided for by the functions declared in `<cstdio>`, and includes all the headers necessary to use these objects.

---

272) It is the implementation’s responsibility to implement headers so that including `<iosfwd>` and other headers does not violate the rules about multiple occurrences of default arguments.
The objects are constructed and the associations are established at some time prior to or during the first time an object of class `ios_base::Init` is constructed, and in any case before the body of `main` (6.9.3.1) begins execution. The objects are not destroyed during program execution.\(^{273}\)

Recommended practice: If it is possible for them to do so, implementations should initialize the objects earlier than required.

The results of including `<iostream>` in a translation unit shall be as if `<iostream>` defined an instance of `ios_base::Init` with static storage duration.

Mixing operations on corresponding wide- and narrow-character streams follows the same semantics as mixing such operations on FILEs, as specified in the C standard library.

Concurrent access to a synchronized (31.5.2.5) standard iostream object’s formatted and unformatted input (31.7.5.2) and output (31.7.6.2) functions or a standard C stream by multiple threads does not result in a data race (6.9.2).

[Note 1: Unsynchronized concurrent use of these objects and streams by multiple threads can result in interleaved characters. — end note]

See also: ISO C 7.21.2

### 31.4.3 Narrow stream objects

```cpp
istream cin;
```

The object `cin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

After the object `cin` is initialized, `cin.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

```cpp
ostream cout;
```

The object `cout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

```cpp
ostream cerr;
```

The object `cerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

After the object `cerr` is initialized, `cerr.flags() & unitbuf` is nonzero and `cerr.tie()` returns `&cout`. Its state is otherwise the same as required for `basic_ios<char>::init` (31.5.4.2).

```cpp
ostream clog;
```

The object `clog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.4.4 Wide stream objects

```cpp
wistream wcin;
```

The object `wcin` controls input from a stream buffer associated with the object `stdin`, declared in `<cstdio>` (31.13.1).

After the object `wcin` is initialized, `wcin.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init` (31.5.4.2).

```cpp
wostream wcout;
```

The object `wcout` controls output to a stream buffer associated with the object `stdout`, declared in `<cstdio>` (31.13.1).

```cpp
wostream wcerr;
```

The object `wcerr` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

\(^{273}\) Constructors and destructors for objects with static storage duration can access these objects to read input from `stdin` or write output to `stdout` or `stderr`.
After the object `wcerr` is initialized, `wcerr.flags() & unitbuf` is nonzero and `wcerr.tie()` returns `&wcout`. Its state is otherwise the same as required for `basic_ios<wchar_t>::init (31.5.4.2)`.

```cpp
wostream wclog;
```

The object `wclog` controls output to a stream buffer associated with the object `stderr`, declared in `<cstdio>` (31.13.1).

### 31.5 Iostreams base classes

#### 31.5.1 Header `<ios>` synopsis

```cpp
#include <iosfwd>  // see 31.3.1

namespace std {
    using streamoff = implementation-defined;
    using streamsize = implementation-defined;
    template<class stateT> class fpos;
    class ios_base;
    template<class charT, class traits = char_traits<charT>>
    class basic_ios;

    // 31.5.5, manipulators
    ios_base& boolalpha (ios_base& str);
    ios_base& noboolalpha(ios_base& str);
    ios_base& showbase (ios_base& str);
    ios_base& noshowbase (ios_base& str);
    ios_base& showpoint (ios_base& str);
    ios_base& noshowpoint(ios_base& str);
    ios_base& shoupos (ios_base& str);
    ios_base& noshoupos (ios_base& str);
    ios_base& skipws (ios_base& str);
    ios_base& noskipws (ios_base& str);
    ios_base& uppercase (ios_base& str);
    ios_base& nouppercase(ios_base& str);
    ios_base& unitbuf (ios_base& str);
    ios_base& nounitbuf (ios_base& str);

    // 31.5.5.2, adjustfield
    ios_base& internal (ios_base& str);
    ios_base& left (ios_base& str);
    ios_base& right (ios_base& str);

    // 31.5.5.3, basefield
    ios_base& dec (ios_base& str);
    ios_base& hex (ios_base& str);
    ios_base& oct (ios_base& str);

    // 31.5.5.4, floatfield
    ios_base& fixed (ios_base& str);
    ios_base& scientific (ios_base& str);
    ios_base& hexfloat (ios_base& str);
    ios_base& defaultfloat(ios_base& str);

    // 31.5.6, error reporting
    enum class io_errc {
        stream = 1
    };
}
```
template<> struct is_error_code_enum<io_errc> : public true_type { }
error_code make_error_code(io_errc e) noexcept;
error_condition make_error_condition(io_errc e) noexcept;
const error_category& iostream_category() noexcept;
}

31.5.2 Class ios_base
31.5.2.1 General

namespace std {
  class ios_base {
  public:
    class failure;  // see below

    // 31.5.2.2, fmtflags
    using fmtflags = T1;
    static constexpr fmtflags boolalpha = unspecified;
    static constexpr fmtflags dec = unspecified;
    static constexpr fmtflags fixed = unspecified;
    static constexpr fmtflags hex = unspecified;
    static constexpr fmtflags internal = unspecified;
    static constexpr fmtflags left = unspecified;
    static constexpr fmtflags oct = unspecified;
    static constexpr fmtflags right = unspecified;
    static constexpr fmtflags scientific = unspecified;
    static constexpr fmtflags showbase = unspecified;
    static constexpr fmtflags showpoint = unspecified;
    static constexpr fmtflags showpos = unspecified;
    static constexpr fmtflags skipws = unspecified;
    static constexpr fmtflags unitbuf = unspecified;
    static constexpr fmtflags uppercase = unspecified;
    static constexpr fmtflags adjustfield = see below;
    static constexpr fmtflags basefield = see below;
    static constexpr fmtflags floatfield = see below;

    // 31.5.2.3, iostate
    using iostate = T2;
    static constexpr iostate badbit = unspecified;
    static constexpr iostate eofbit = unspecified;
    static constexpr iostate failbit = unspecified;
    static constexpr iostate goodbit = unspecified;

    // 31.5.2.4, openmode
    using openmode = T3;
    static constexpr openmode app = unspecified;
    static constexpr openmode ate = unspecified;
    static constexpr openmode binary = unspecified;
    static constexpr openmode in = unspecified;
    static constexpr openmode noreplace = unspecified;
    static constexpr openmode out = unspecified;
    static constexpr openmode trunc = unspecified;

    // 31.5.2.5, seekdir
    using seekdir = T4;
    static constexpr seekdir beg = unspecified;
    static constexpr seekdir cur = unspecified;
    static constexpr seekdir end = unspecified;

    class Init;

    // 31.5.2.5, fmtflags state
    fmtflags flags() const;
    fmtflags flags(fmtflags fmtfl);
    fmtflags setf(fmtflags fmtfl);

§ 31.5.2.1
fmtflags setf(fmtflags fmtfl, fmtflags mask);
void unsetf(fmtflags mask);

streamsize precision() const;
streamsize precision(streamsize prec);
streamsize width() const;
streamsize width(streamsize wide);

// 31.5.2.4, locales
locale imbue(const locale& loc);
locale getloc() const;

// 31.5.2.6, storage
static int xalloc();
long& iword(int idx);
void*& pword(int idx);

// destructor
virtual ~ios_base();

// 31.5.2.7, callbacks
enum event { erase_event, imbue_event, copyfmt_event };
using event_callback = void (*)(event, ios_base&, int idx);
void register_callback(event_callback fn, int idx);

ios_base(const ios_base&) = delete;
ios_base& operator=(const ios_base&) = delete;
static bool sync_with_stdio(bool sync = true);

protected:
ios_base();

private:
static int index; // exposition only
long* iarray; // exposition only
void** parray; // exposition only
};

1 ios_base defines several member types:

(1.1) — a type failure, defined as either a class derived from system_error or a synonym for a class derived from system_error;

(1.2) — a class Init;

(1.3) — three bitmask types, fmtflags, iostate, and openmode;

(1.4) — an enumerated type, seekdir.

2 It maintains several kinds of data:

(2.1) — state information that reflects the integrity of the stream buffer;

(2.2) — control information that influences how to interpret (format) input sequences and how to generate (format) output sequences;

(2.3) — additional information that is stored by the program for its private use.

[Note 1: For the sake of exposition, the maintained data is presented here as:

(3.1) — static int index, specifies the next available unique index for the integer or pointer arrays maintained for the private use of the program, initialized to an unspecified value;

(3.2) — long* iarray, points to the first element of an arbitrary-length long array maintained for the private use of the program;

(3.3) — void** parray, points to the first element of an arbitrary-length pointer array maintained for the private use of the program.

§ 31.5.2.1
31.5.2.2 Types
31.5.2.2.1 Class `ios_base::failure`

namespace std {
    class ios_base::failure : public system_error {
        public:
            explicit failure(const string& msg, const error_code& ec = io_errc::stream);
            explicit failure(const char* msg, const error_code& ec = io_errc::stream);
    }
}

An implementation is permitted to define `ios_base::failure` as a synonym for a class with equivalent functionality to class `ios_base::failure` shown in this subclause.

[Note 1: When `ios_base::failure` is a synonym for another type, that type is required to provide a nested type `failure` to emulate the injected-class-name. — end note]

The class `failure` defines the base class for the types of all objects thrown as exceptions, by functions in the iostreams library, to report errors detected during stream buffer operations.

When throwing `ios_base::failure` exceptions, implementations should provide values of `ec` that identify the specific reason for the failure.

[Note 2: Errors arising from the operating system would typically be reported as `system_category()` errors with an error value of the error number reported by the operating system. Errors arising from within the stream library would typically be reported as `error_code(io_errc::stream, iostream_category())`. — end note]

explicit failure(const string& msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with `msg` and `ec`.

explicit failure(const char* msg, const error_code& ec = io_errc::stream);

Effects: Constructs the base class with `msg` and `ec`.

31.5.2.2.2 Type `ios_base::fmtflags`

using fmtflags = T1;

The type `fmtflags` is a bitmask type (16.3.3.3.4). Setting its elements has the effects indicated in Table 119.

Table 119: `fmtflags` effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>boolalpha</code></td>
<td>insert and extract bool type in alphabetic format</td>
</tr>
<tr>
<td><code>dec</code></td>
<td>converts integer input or generates integer output in decimal base</td>
</tr>
<tr>
<td><code>fixed</code></td>
<td>generate floating-point output in fixed-point notation</td>
</tr>
<tr>
<td><code>hex</code></td>
<td>converts integer input or generates integer output in hexadecimal base</td>
</tr>
<tr>
<td><code>internal</code></td>
<td>adds fill characters at a designated internal point in certain generated output, or identical to <code>right</code> if no such point is designated</td>
</tr>
<tr>
<td><code>left</code></td>
<td>adds fill characters on the right (final positions) of certain generated output</td>
</tr>
<tr>
<td><code>oct</code></td>
<td>converts integer input or generates integer output in octal base</td>
</tr>
<tr>
<td><code>right</code></td>
<td>adds fill characters on the left (initial positions) of certain generated output</td>
</tr>
<tr>
<td><code>scientific</code></td>
<td>generates floating-point output in scientific notation</td>
</tr>
<tr>
<td><code>showbase</code></td>
<td>generates a prefix indicating the numeric base of generated integer output</td>
</tr>
<tr>
<td><code>showpoint</code></td>
<td>generates a decimal-point character unconditionally in generated floating-point output</td>
</tr>
<tr>
<td><code>shoupos</code></td>
<td>generates a + sign in non-negative generated numeric output</td>
</tr>
<tr>
<td><code>skipws</code></td>
<td>skips leading whitespace before certain input operations</td>
</tr>
<tr>
<td><code>unitbuf</code></td>
<td>flushes output after each output operation</td>
</tr>
<tr>
<td><code>uppercase</code></td>
<td>replaces certain lowercase letters with their uppercase equivalents in generated output</td>
</tr>
</tbody>
</table>

Type `fmtflags` also defines the constants indicated in Table 120.
Table 120: \texttt{fmtflags} constants [tab:ios.fmtflags.const]

<table>
<thead>
<tr>
<th>Constant</th>
<th>Allowable values</th>
</tr>
</thead>
<tbody>
<tr>
<td>adjustfield</td>
<td>left</td>
</tr>
<tr>
<td>basefield</td>
<td>dec</td>
</tr>
<tr>
<td>floatfield</td>
<td>scientific</td>
</tr>
</tbody>
</table>

31.5.2.2.3 Type \texttt{ios::iosstate} [ios.iostate]

```cpp
using iostate = T2;
```

The type \texttt{iostate} is a bitmask type (16.3.3.4) that contains the elements indicated in Table 121.

Table 121: \texttt{iostate} effects [tab:ios.iostate]

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>badbit</td>
<td>indicates a loss of integrity in an input or output sequence (such as an irrecoverable read error from a file);</td>
</tr>
<tr>
<td>eofbit</td>
<td>indicates that an input operation reached the end of an input sequence;</td>
</tr>
<tr>
<td>failbit</td>
<td>indicates that an input operation failed to read the expected characters, or that an output operation failed to generate the desired characters.</td>
</tr>
</tbody>
</table>

Type \texttt{iostate} also defines the constant:

(2.1) \texttt{goodbit}, the value zero.

31.5.2.2.4 Type \texttt{ios::openmode} [ios.openmode]

```cpp
using openmode = T3;
```

The type \texttt{openmode} is a bitmask type (16.3.3.4). It contains the elements indicated in Table 122.

Table 122: \texttt{openmode} effects [tab:ios.openmode]

<table>
<thead>
<tr>
<th>Element</th>
<th>Effect(s) if set</th>
</tr>
</thead>
<tbody>
<tr>
<td>app</td>
<td>seek to end before each write</td>
</tr>
<tr>
<td>ate</td>
<td>open and seek to end immediately after opening</td>
</tr>
<tr>
<td>binary</td>
<td>perform input and output in binary mode (as opposed to text mode)</td>
</tr>
<tr>
<td>in</td>
<td>open for input</td>
</tr>
<tr>
<td>noreplace</td>
<td>open in exclusive mode</td>
</tr>
<tr>
<td>out</td>
<td>open for output</td>
</tr>
<tr>
<td>trunc</td>
<td>truncate an existing stream when opening</td>
</tr>
</tbody>
</table>

31.5.2.2.5 Type \texttt{ios::seekdir} [ios.seekdir]

```cpp
using seekdir = T4;
```

The type \texttt{seekdir} is an enumerated type (16.3.3.3.3) that contains the elements indicated in Table 123.

Table 123: \texttt{seekdir} effects [tab:ios.seekdir]

<table>
<thead>
<tr>
<th>Element</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>beg</td>
<td>request a seek (for subsequent input or output) relative to the beginning of the stream</td>
</tr>
<tr>
<td>cur</td>
<td>request a seek relative to the current position within the sequence</td>
</tr>
<tr>
<td>end</td>
<td>request a seek relative to the current end of the sequence</td>
</tr>
</tbody>
</table>
31.5.2.2.6 Class `ios_base::Init`  

```cpp
namespace std {
    class ios_base::Init {
        public:
            Init();
            Init(const Init&) = default;
            ~Init();
            Init& operator=(const Init&) = default;
        private:
            static int init_cnt; // exposition only
    };
}
```

1. The class `Init` describes an object whose construction ensures the construction of the eight objects declared in `<iostream>` (31.4) that associate file stream buffers with the standard C streams provided for by the functions declared in `<cstdio>` (31.13.1).

2. For the sake of exposition, the maintained data is presented here as:

```
static int init_cnt, counts the number of constructor and destructor calls for class Init, initialized to zero.
```

3. `Init();`  
   **Effects:** Constructs and initializes the objects `cin`, `cout`, `cerr`, `clog`, `wcin`, `wcout`, `wcerr`, and `wclog` if they have not already been constructed and initialized.

4. `~Init();`  
   **Effects:** If there are no other instances of the class still in existence, calls `cout.flush()`, `cerr.flush()`, `clog.flush()`, `wcout.flush()`, `wcerr.flush()`, and `wclog.flush()`.

31.5.2.3 State functions

```cpp
fmtflags flags() const;
```

1. **Returns:** The format control information for both input and output.

```cpp
fmtflags flags(fmtflags fmtfl);
```

2. **Postconditions:** `fmtfl == flags()`.

```cpp
Returns: The previous value of `flags()`.
```

```cpp
fmtflags setf(fmtflags fmtfl);
```

4. **Effects:** Sets `fmtfl` in `flags()`.

```cpp
Returns: The previous value of `flags()`.
```

```cpp
fmtflags setf(fmtflags fmtfl, fmtflags mask);
```

6. **Effects:** Clears `mask` in `flags()`, sets `fmtfl & mask` in `flags()`.

```cpp
Returns: The previous value of `flags()`.
```

```cpp
void unsetf(fmtflags mask);
```

8. **Effects:** Clears `mask` in `flags()`.

```cpp
streamsize precision() const;
```

9. **Returns:** The precision to generate on certain output conversions.

```cpp
streamsize precision(streamsize prec);
```

10. **Postconditions:** `prec == precision()`.

```cpp
Returns: The previous value of `precision()`.
```

```cpp
streamsize width() const;
```

12. **Returns:** The minimum field width (number of characters) to generate on certain output conversions.
streamsize width(streamsize wide);

Postconditions: wide == width().

Returns: The previous value of width().

### 31.5.2.4 Functions

locale imbue(const locale& loc);

Effects: Calls each registered callback pair (fn, idx) (31.5.2.7) as (*fn)(imbue_event, *this, idx) at such a time that a call to iostream::getloc() from within fn returns the new locale value loc.

Postconditions: loc == getloc().

Returns: The previous value of getloc().

locale getloc() const;

Returns: If no locale has been imbued, a copy of the global C++ locale, locale(), in effect at the time of construction. Otherwise, returns the imbued locale, to be used to perform locale-dependent input and output operations.

### 31.5.2.5 Static members

static bool sync_with_stdio(bool sync = true);

Effects: If any input or output operation has occurred using the standard streams prior to the call, the effect is implementation-defined. Otherwise, called with a false argument, it allows the standard streams to operate independently of the standard C streams.

Returns: true if the previous state of the standard iostream objects (31.4) was synchronized and otherwise returns false. The first time it is called, the function returns true.

Remarks: When a standard iostream object str is synchronized with a standard stdio stream f, the effect of inserting a character c by

\[ \text{fputc}(f, c); \]

is the same as the effect of

\[ \text{str.rdbuf()->sputc}(c); \]

for any sequences of characters; the effect of extracting a character c by

\[ c = \text{fgetc}(f); \]

is the same as the effect of

\[ c = \text{str.rdbuf()->sbumpc}(); \]

for any sequences of characters; and the effect of pushing back a character c by

\[ \text{ungetc}(c, f); \]

is the same as the effect of

\[ \text{str.rdbuf()->sputbackc}(c); \]

for any sequence of characters.\(^{274}\)

### 31.5.2.6 Storage functions

static int xalloc();

Returns: index ++.

Remarks: Concurrent access to this function by multiple threads does not result in a data race (6.9.2).

long& iword(int idx);

Preconditions: idx is a value obtained by a call to xalloc.

Effects: If iarray is a null pointer, allocates an array of long of unspecified size and stores a pointer to its first element in iarray. The function then extends the array pointed at by iarray as necessary to

---

\(^{274}\) This implies that operations on a standard iostream object can be mixed arbitrarily with operations on the corresponding stdio stream. In practical terms, synchronization usually means that a standard iostream object and a standard stdio object share a buffer.
include the element \texttt{iarray[idx]}. Each newly allocated element of the array is initialized to zero. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{iword} with the same index yields another reference to the same value. If the function fails and \texttt{*this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\textit{Returns:} On success \texttt{iarray[idx]}. On failure, a valid \texttt{long&} initialized to 0.

\begin{verbatim}
void* & pword(int idx);
\end{verbatim}

\textit{Preconditions:} \texttt{idx} is a value obtained by a call to \texttt{xalloc}.

\textit{Effects:} If \texttt{parray} is a null pointer, allocates an array of pointers to \texttt{void} of unspecified size and stores a pointer to its first element in \texttt{parray}. The function then extends the array pointed at by \texttt{parray} as necessary to include the element \texttt{parray[idx]}. Each newly allocated element of the array is initialized to a null pointer. The reference returned is invalid after any other operation on the object. However, the value of the storage referred to is retained, so that until the next call to \texttt{copyfmt}, calling \texttt{pword} with the same index yields another reference to the same value. If the function fails and \texttt{*this} is a base class subobject of a \texttt{basic_ios<>} object or subobject, the effect is equivalent to calling \texttt{basic_ios<>::setstate(badbit)} on the derived object (which may throw \texttt{failure}).

\textit{Returns:} On success \texttt{parray[idx]}. On failure a valid \texttt{void* &} initialized to 0.

\textit{Remarks:} After a subsequent call to \texttt{pword(int)} for the same object, the earlier return value may no longer be valid.

31.5.2.7 Callbacks

\begin{verbatim}
void register_callback(event_callback fn, int idx);
\end{verbatim}

\textit{Preconditions:} The function \texttt{fn} does not throw exceptions.

\textit{Effects:} Registers the pair \texttt{(fn, idx)} such that during calls to \texttt{imbue()} (31.5.2.4), \texttt{copyfmt()}, or \texttt{~ios_base()} (31.5.2.8), the function \texttt{fn} is called with argument \texttt{idx}. Functions registered are called when an event occurs, in opposite order of registration. Functions registered while a callback function is active are not called until the next event.

\textit{Remarks:} Identical pairs are not merged. A function registered twice will be called twice.

31.5.2.8 Constructors and destructor

\begin{verbatim}
ios_base();
\end{verbatim}

\textit{Effects:} Each \texttt{ios_base} member has an indeterminate value after construction. The object’s members shall be initialized by calling \texttt{basic_ios::init} before the object’s first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

\begin{verbatim}
~ios_base();
\end{verbatim}

\textit{Effects:} Calls each registered callback pair \texttt{(fn, idx)} (31.5.2.7) as \texttt{(*fn)(erase_event, *this, idx)} at such time that any \texttt{ios_base} member function called from within \texttt{fn} has well-defined results. Then, any memory obtained is deallocated.

31.5.3 Class template \texttt{fpos}

\begin{verbatim}
namespace std {
    template<class stateT> class fpos {
public:
    // 31.5.3.1, members
    stateT state() const;
    void state(stateT);
private:
    stateT st; // exposition only

\end{verbatim}

275) An implementation is free to implement both the integer array pointed at by \texttt{iarray} and the pointer array pointed at by \texttt{parray} as sparse data structures, possibly with a one-element cache for each.

276) For example, because it cannot allocate space.

277) For example, because it cannot allocate space.
31.5.3.1 Members

```cpp
void state(stateT s);
```

1. **Effects**: Assigns `s` to `st`.

```cpp
stateT state() const;
```

2. **Returns**: Current value of `st`.

31.5.3.2 Requirements

1. An `fpos` type specifies file position information. It holds a state object whose type is equal to the template parameter `stateT`. Type `stateT` shall meet the Cpp17DefaultConstructible (Table 31), Cpp17CopyConstructible (Table 33), Cpp17CopyAssignable (Table 35), and Cpp17Destructible (Table 36) requirements. If `is_trivially_copy_constructible_v<stateT>` is true, then `fpos<stateT>` has a trivial copy constructor. If `is_trivially_copyAssignable_v<stateT>` is true, then `fpos<stateT>` has a trivial copy assignment operator. If `is_trivially_destructible_v<stateT>` is true, then `fpos<stateT>` has a trivial destructor. All specializations of `fpos` meet the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, Cpp17Destructible, and Cpp17EqualityComparable (Table 29) requirements. In addition, the expressions shown in Table 124 are valid and have the indicated semantics. In that table,

1. `P` refers to a specialization of `fpos`,
2. `p` and `q` refer to values of type `P` or `const P`,
3. `pl` and `ql` refer to modifiable lvalues of type `P`,
4. `o` refers to type `streamoff`, and
5. `o` refers to a value of type `streamoff` or `const streamoff`.

</tr>
</tbody>
</table>

2. Stream operations that return a value of type `traits::pos_type` return `P(O(-1))` as an invalid value to signal an error. If this value is used as an argument to any `istream`, `ostream`, or `streambuf` member that accepts a value of type `traits::pos_type` then the behavior of that function is undefined.

        };
    }
}
31.5.4.2 Constructors

```cpp
explicit basic_ios(basic_streambuf<charT, traits>* sb);
```

*Effects:* Assigns initial values to its member objects by calling `init(sb)`.

```cpp
basic_ios();
```

*Effects:* Leaves its member objects uninitialized. The object shall be initialized by calling `basic_ios::init` before its first use or before it is destroyed, whichever comes first; otherwise the behavior is undefined.

```cpp
~basic_ios();
```

*Remarks:* The destructor does not destroy `rdbuf()`.

```cpp
void init(basic_streambuf<charT, traits>* sb);
```

*Postconditions:* The postconditions of this function are indicated in Table 125.

Table 125: `basic_ios::init()` effects

31.5.4.3 Member functions

```cpp
basic_ostream<charT, traits>* tie() const;
```

*Returns:* An output sequence that is tied to (synchronized with) the sequence controlled by the stream buffer.

```cpp
basic_ostream<charT, traits>* tie(basic_ostream<charT, traits>* tiestr);
```

*Preconditions:* If `tiestr` is not null, `tiestr` is not reachable by traversing the linked list of tied stream objects starting from `tiestr->tie()`.

*Postconditions:* `tiestr == tie()`.

*Returns:* The previous value of `tie()`.

```cpp
basic_streambuf<charT, traits>* rdbuf() const;
```

*Effects:* Calls `clear()`.

*Postconditions:* `sb == rdbuf()`.

*Returns:* The previous value of `rdbuf()`.

```cpp
locale imbue(const locale& loc);
```

*Effects:* Calls `ios_base::imbue(loc)` (31.5.2.4) and if `rdbuf()` != `0` then `rdbuf()->pubimbue(loc)` (31.6.3.3.1).

*Returns:* The prior value of `ios_base::imbue()`.
char narrow(char_type c, char dfault) const;

Returns: use_facet<ctype<char_type>>(getloc()).narrow(c, dfault)

char_type widen(char c) const;

Returns: use_facet<ctype<char_type>>(getloc()).widen(c)

char_type fill() const;

Returns: The character used to pad (fill) an output conversion to the specified field width.

char_type fill(char_type fillch);

Postconditions: traits::eq(fillch, fill()).

Returns: The previous value of fill().

basic_ios& copyfmt(const basic_ios& rhs);

Effects: If (this == addressof(rhs)) is true does nothing. Otherwise assigns to the member objects of *this the corresponding member objects of rhs as follows:

(16.1) calls each registered callback pair (fn, idx) as (*fn)(erase_event, *this, idx);

(16.2) then, assigns to the member objects of *this the corresponding member objects of rhs except that

(16.2.1) rdstate(), rdbuf(), and exceptions() are left unchanged;

(16.2.2) the contents of arrays pointed at by pword and iword are copied, not the pointers themselves; and

(16.2.3) if any newly stored pointer values in *this point at objects stored outside the object rhs and those objects are destroyed when rhs is destroyed, the newly stored pointer values are altered to point at newly constructed copies of the objects;

(16.3) then, calls each callback pair that was copied from rhs as (*fn)(copyfmt_event, *this, idx);

(16.4) then, calls exceptions(rhs.exceptions()).

[Note 1: The second pass through the callback pairs permits a copied pword value to be zeroed, or to have its referent deep copied or reference counted, or to have other special action taken. — end note]

Postconditions: The postconditions of this function are indicated in Table 126.

Table 126: basic_ios::copyfmt() effects

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>rdbuf()</td>
<td>unchanged</td>
</tr>
<tr>
<td>tie()</td>
<td>rhs.tie()</td>
</tr>
<tr>
<td>rdstate()</td>
<td>unchanged</td>
</tr>
<tr>
<td>exceptions()</td>
<td>rhs.exceptions()</td>
</tr>
<tr>
<td>flags()</td>
<td>rhs.flags()</td>
</tr>
<tr>
<td>width()</td>
<td>rhs.width()</td>
</tr>
<tr>
<td>precision()</td>
<td>rhs.precision()</td>
</tr>
<tr>
<td>fill()</td>
<td>rhs.fill()</td>
</tr>
<tr>
<td>getloc()</td>
<td>rhs.getloc()</td>
</tr>
</tbody>
</table>

Returns: *this.

void move(basic_ios& rhs);
void move(basic_ios&& rhs);

Postconditions: *this has the state that rhs had before the function call, except that rdbuf() returns nullptr. rhs is in a valid but unspecified state, except that rhs.rdbuf() returns the same value as it returned before the function call, and rhs.tie() returns nullptr.
void swap(basic_ios& rhs) noexcept;  
   Effects: The states of *this and rhs are exchanged, except that rdbuf() returns the same value as it
   returned before the function call, and rhs.rdbuf() returns the same value as it returned before the
   function call.

void set_rdbuf(basic_streambuf<charT, traits>* sb);  
   Preconditions: sb != nullptr is true.  
   Effects: Associates the basic_streambuf object pointed to by sb with this stream without calling
   clear().  
   Postconditions: rdbuf() == sb is true.  
   Throws: Nothing.

31.5.4.4 Flags functions [iostate.flags]

   explicit operator bool() const;  
      Returns: !fail().

   bool operator!() const;  
      Returns: fail().

   iostate rdstate() const;  
      Returns: The error state of the stream buffer.

   void clear(iostate state = goodbit);  
      Effects: If ((state | (rdbuf() ? goodbit : badbit)) & exceptions()) == 0, returns. Other-
      wise, the function throws an object of class ios_base::failure (31.5.2.2.1), constructed with
      implementation-defined argument values.

   Postconditions: If rdbuf() != 0 then state == rdstate(); otherwise rdstate() == (state | 
      ios_base::badbit).

   void setstate(iostate state);  
      Effects: Calls clear(rdstate() | state) (which may throw ios_base::failure (31.5.2.2.1)).

   bool good() const;  
      Returns: rdstate() == 0.

   bool eof() const;  
      Returns: true if eofbit is set in rdstate().

   bool fail() const;  
      Returns: true if failbit or badbit is set in rdstate().279

   bool bad() const;  
      Returns: true if badbit is set in rdstate().

   iostate exceptions() const;  
      Returns: A mask that determines what elements set in rdstate() cause exceptions to be thrown.

   void exceptions(iostate except);  
      Effects: Calls clear(rdstate()).  
      Postconditions: except == exceptions().

31.5.5 ios_base manipulators [std_ios.manip]

31.5.5.1 fmtflags manipulators [fmtflags.manip]

1 Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

279) Checking badbit also for fail() is historical practice.
ios_base& boolalpha(ios_base& str);
    Effects: Calls str.setf(ios_base::boolalpha).
    Returns: str.

ios_base& noboolalpha(ios_base& str);
    Effects: Calls str.unsetf(ios_base::boolalpha).
    Returns: str.

ios_base& showbase(ios_base& str);
    Effects: Calls str.setf(ios_base::showbase).
    Returns: str.

ios_base& noshowbase(ios_base& str);
    Effects: Calls str.unsetf(ios_base::showbase).
    Returns: str.

ios_base& showpoint(ios_base& str);
    Effects: Calls str.setf(ios_base::showpoint).
    Returns: str.

ios_base& noshowpoint(ios_base& str);
    Effects: Calls str.unsetf(ios_base::showpoint).
    Returns: str.

ios_base& showpos(ios_base& str);
    Effects: Calls str.setf(ios_base::showpos).
    Returns: str.

ios_base& noshowpos(ios_base& str);
    Effects: Calls str.unsetf(ios_base::showpos).
    Returns: str.

ios_base& skipws(ios_base& str);
    Effects: Calls str.setf(ios_base::skipws).
    Returns: str.

ios_base& noskipws(ios_base& str);
    Effects: Calls str.unsetf(ios_base::skipws).
    Returns: str.

ios_base& uppercase(ios_base& str);
    Effects: Calls str.setf(ios_base::uppercase).
    Returns: str.

ios_base& nouppercase(ios_base& str);
    Effects: Calls str.unsetf(ios_base::uppercase).
    Returns: str.

ios_base& unitbuf(ios_base& str);
    Effects: Calls str.setf(ios_base::unitbuf).
    Returns: str.

ios_base& nounitbuf(ios_base& str);
    Effects: Calls str.unsetf(ios_base::unitbuf).

§ 31.5.5.1
Returns: str.

31.5.5.2 adjustfield manipulators

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& internal(ios_base& str);

   Effects: Calls str.setf(ios_base::internal, ios_base::adjustfield).
   Returns: str.

ios_base& left(ios_base& str);

   Effects: Calls str.setf(ios_base::left, ios_base::adjustfield).
   Returns: str.

ios_base& right(ios_base& str);

   Effects: Calls str.setf(ios_base::right, ios_base::adjustfield).
   Returns: str.

31.5.5.3 basefield manipulators

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& dec(ios_base& str);

   Effects: Calls str.setf(ios_base::dec, ios_base::basefield).
   Returns: str.

ios_base& hex(ios_base& str);

   Effects: Calls str.setf(ios_base::hex, ios_base::basefield).
   Returns: str.

ios_base& oct(ios_base& str);

   Effects: Calls str.setf(ios_base::oct, ios_base::basefield).
   Returns: str.

31.5.5.4 floatfield manipulators

Each function specified in this subclause is a designated addressable function (16.4.5.2.1).

ios_base& fixed(ios_base& str);

   Effects: Calls str.setf(ios_base::fixed, ios_base::floatfield).
   Returns: str.

ios_base& scientific(ios_base& str);

   Effects: Calls str.setf(ios_base::scientific, ios_base::floatfield).
   Returns: str.

ios_base& hexfloat(ios_base& str);

   Effects: Calls str.setf(ios_base::fixed | ios_base::scientific, ios_base::floatfield).
   Returns: str.

   [Note 1: ios_base::hex cannot be used to specify a hexadecimal floating-point format, because it is not part of ios_base::floatfield (Table 120). — end note]

ios_base& defaultfloat(ios_base& str);

   Effects: Calls str.unsetf(ios_base::floatfield).
   Returns: str.

---

280) The function signature dec(ios_base&) can be called by the function signature basic_ostream& stream::operator<<(ios_base&) to permit expressions of the form cout << dec to change the format flags stored in cout.
31.5.6 Error reporting

```cpp
error_code make_error_code(io_errc e) noexcept;
1
Returns: error_code(static_cast<int>(e), iostream_category()).
```

```cpp
error_condition make_error_condition(io_errc e) noexcept;
2
Returns: error_condition(static_cast<int>(e), iostream_category()).
```

```cpp
const error_category& iostream_category() noexcept;
3
Returns: A reference to an object of a type derived from class error_category.
```

4 The object’s default_error_condition and equivalent virtual functions shall behave as specified for the class error_category. The object’s name virtual function shall return a pointer to the string "iostream".

31.6 Stream buffers

31.6.1 Header <streambuf> synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf;
    using streambuf = basic_streambuf<char>;
    using wstreambuf = basic_streambuf<wchar_t>;
}
```

1 The header <streambuf> defines types that control input from and output to character sequences.

31.6.2 Stream buffer requirements

1 Stream buffers can impose various constraints on the sequences they control. Some constraints are:

1.1 — The controlled input sequence can be not readable.

1.2 — The controlled output sequence can be not writable.

1.3 — The controlled sequences can be associated with the contents of other representations for character sequences, such as external files.

1.4 — The controlled sequences can support operations directly to or from associated sequences.

1.5 — The controlled sequences can impose limitations on how the program can read characters from a sequence, write characters to a sequence, put characters back into an input sequence, or alter the stream position.

2 Each sequence is characterized by three pointers which, if non-null, all point into the same charT array object. The array object represents, at any moment, a (sub)sequence of characters from the sequence. Operations performed on a sequence alter the values stored in these pointers, perform reads and writes directly to or from associated sequences, and alter “the stream position” and conversion state as needed to maintain this subsequence relationship. The three pointers are:

2.1 — the beginning pointer, or lowest element address in the array (called xbeg here);

2.2 — the next pointer, or next element address that is a current candidate for reading or writing (called xnext here);

2.3 — the end pointer, or first element address beyond the end of the array (called xend here).

3 The following semantic constraints shall always apply for any set of three pointers for a sequence, using the pointer names given immediately above:

3.1 — If xnext is not a null pointer, then xbeg and xend shall also be non-null pointers into the same charT array, as described above; otherwise, xbeg and xend shall also be null.

3.2 — If xnext is not a null pointer and xnext < xend for an output sequence, then a write position is available. In this case, *xnext shall be assignable as the next element to write (to put, or to store a character value, into the sequence).

3.3 — If xnext is not a null pointer and xbeg < xnext for an input sequence, then a putback position is available. In this case, xnext[-1] shall have a defined value and is the next (preceding) element to store a character that is put back into the input sequence.
If \( x_{\text{next}} \) is not a null pointer and \( x_{\text{next}} < x_{\text{end}} \) for an input sequence, then a read position is available. In this case, \(*x_{\text{next}}*\) shall have a defined value and is the next element to read (to get, or to obtain a character value, from the sequence).

### 31.6.3 Class template `basic_streambuf`

#### 31.6.3.1 General

```cpp
namespace std {

    template<class charT, class traits = char_traits<charT>>
    class basic_streambuf {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        virtual ~basic_streambuf();

        // locales
        locale pubimbue(const locale& loc);
        locale getloc() const;

        // buffer and positioning
        basic_streambuf* pubsetbuf(char_type* s, streamsize n);
        pos_type pubseekoff(off_type off, ios_base::seekdir way,
                             ios_base::openmode which
                             = ios_base::in | ios_base::out);
        pos_type pubseekpos(pos_type sp,
                             ios_base::openmode which
                             = ios_base::in | ios_base::out);
        int pubsync();

        // get and put areas
        streamsize in_avail();
        int_type snextc();
        int_type sbumpc();
        int_type sgetc();
        streamsize sgetn(char_type* s, streamsize n);

        // putback
        int_type sputbackc(char_type c);
        int_type sungetc();

        // put area
        int_type sputc(char_type c);
        streamsize sputn(const char_type* s, streamsize n);

    protected:
        basic_streambuf();
        basic_streambuf(const basic_streambuf& rhs);
        basic_streambuf& operator=(const basic_streambuf& rhs);

        void swap(basic_streambuf& rhs);

        // get area access
        char_type* eback() const;
        char_type* gptr() const;
        char_type* egptr() const;
        void gbump(int n);
        void setg(char_type* gbeg, char_type* gnext, char_type* gend);
    }
}
```
The class template `basic_streambuf` serves as an abstract base class for deriving various stream buffers whose objects each control two character sequences:

1. a character input sequence;
2. a character output sequence.

### 31.6.3.2 Constructors

```cpp
basic_streambuf();
```

**Effects:** Initializes:

1. all pointer member objects to null pointers,
2. the `getloc()` member to a copy of the global locale, `locale()`, at the time of construction.

**Remarks:** Once the `getloc()` member is initialized, results of calling locale member functions, and of members of facets so obtained, can safely be cached until the next time the member `imbue` is called.

```cpp
basic_streambuf(const basic_streambuf& rhs);
```

**Postconditions:**

1. `eback() == rhs.eback()`
2. `gptr() == rhs.gptr()`
3. `egptr() == rhs.egptr()`
4. `pbase() == rhs.pbase()`

---

281) The default constructor is protected for class `basic_streambuf` to assure that only objects for classes derived from this class can be constructed.
31.6.3.3 Public member functions

31.6.3.3.1 Locales
locale pubimbue(const locale& loc);

Effects: Calls imbue(loc).
Postconditions: loc == getloc().
Returns: Previous value of getloc().

locale getloc() const;
Returns: If pubimbue() has ever been called, then the last value of loc supplied, otherwise the current global locale, locale(), in effect at the time of construction. If called after pubimbue() has been called but before pubimbue has returned (i.e., from within the call of imbue()) then it returns the previous value.

31.6.3.3.2 Buffer management and positioning
basic_streambuf* pubsetbuf(char_type* s, streamsize n);
Returns: setbuf(s, n).

pos_type pubseekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out);
Returns: seekoff(off, way, which).

pos_type pubseekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out);
Returns: seekpos(sp, which).

int pubsync();
Returns: sync().

31.6.3.3.3 Get area
streamsize in_avail();
Returns: If a read position is available, returns egptr() - gptr(). Otherwise returns showmanyc() (31.6.3.5.3).

int_type snextc();
Effects: Calls sbumpc().
Returns: If that function returns traits::eof(), returns traits::eof(). Otherwise, returns sgetc().

int_type sbumpc();
Effects: If the input sequence read position is not available, returns uflow(). Otherwise, returns traits::to_int_type(*gptr()) and increments the next pointer for the input sequence.

int_type sgetc();
Returns: If the input sequence read position is not available, returns underflow(). Otherwise, returns traits::to_int_type(*gptr()).
streamsize sgetn(char_type* s, streamsize n);

Returns: xsgetn(s, n).

31.6.3.3.4 Putback [streambuf.pub.pback]

int_type sputbackc(char_type c);

Effects: If the input sequence putback position is not available, or if traits::eq(c, gptr()[-1]) is false, returns pbackfail(traits::to_int_type(c)). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

int_type sungetc();

Effects: If the input sequence putback position is not available, returns pbackfail(). Otherwise, decrements the next pointer for the input sequence and returns traits::to_int_type(*gptr()).

31.6.3.3.5 Put area [streambuf.pub.put]

int_type sputc(char_type c);

Effects: If the output sequence write position is not available, returns overflow(traits::to_int_type(c)). Otherwise, stores c at the next pointer for the output sequence, increments the pointer, and returns traits::to_int_type(c).

streamsize sputn(const char_type* s, streamsize n);

Returns: xsputn(s, n).

31.6.3.4 Protected member functions [streambuf.protected]

31.6.3.4.1 Assignment [streambuf.assign]

basic_streambuf& operator=(const basic_streambuf& rhs);

Postconditions:
(1.1) — eback() == rhs.eback()
(1.2) — gptr() == rhs.gptr()
(1.3) — egptr() == rhs.egptr()
(1.4) — pbase() == rhs.pbase()
(1.5) — pptr() == rhs.pptr()
(1.6) — eptr() == rhs.eptr()
(1.7) — getloc() == rhs.getloc()

Returns: *this.

void swap(basic_streambuf& rhs);

Effects: Swaps the data members of rhs and *this.

31.6.3.4.2 Get area access [streambuf.get.area]

char_type* eback() const;

Returns: The beginning pointer for the input sequence.

char_type* gptr() const;

Returns: The next pointer for the input sequence.

char_type* egptr() const;

Returns: The end pointer for the input sequence.

void gbump(int n);

Effects: Adds n to the next pointer for the input sequence.

void setg(char_type* gbeg, char_type* gnext, char_type* gend);

Postconditions: gbeg == eback(), gnext == gptr(), and gend == egptr() are all true.
31.6.3.4.3 Put area access

char_type* pbase() const;

Returns: The beginning pointer for the output sequence.

char_type* pptr() const;

Returns: The next pointer for the output sequence.

char_type* epptr() const;

Returns: The end pointer for the output sequence.

void pbump(int n);

Effects: Adds n to the next pointer for the output sequence.

void setp(char_type* pbeg, char_type* pend);

Postconditions: pbeg == pbase(), pbeg == pptr(), and pend == epptr() are all true.

31.6.3.5 Virtual functions

31.6.3.5.1 Locales

void imbue(const locale&);

Effects: Change any translations based on locale.

Remarks: Allows the derived class to be informed of changes in locale at the time they occur. Between invocations of this function a class derived from streambuf can safely cache results of calls to locale functions and to members of facets so obtained.

Default behavior: Does nothing.

31.6.3.5.2 Buffer management and positioning

basic_streambuf* setbuf(char_type* s, streamsize n);

Effects: Influences stream buffering in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2.5, 31.10.2.5).

Default behavior: Does nothing. Returns this.

pos_type seekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2.5, 31.10.2.5).

Default behavior: Returns pos_type(off_type(-1)).

pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Alters the stream positions within one or more of the controlled sequences in a way that is defined separately for each class derived from basic_streambuf in this Clause (31.8.2, 31.10.2).

Default behavior: Returns pos_type(off_type(-1)).

int sync();

Effects: Synchronizes the controlled sequences with the arrays. That is, if pbase() is non-null the characters between pbase() and pptr() are written to the controlled sequence. The pointers may then be reset as appropriate.

Returns: -1 on failure. What constitutes failure is determined by each derived class (31.10.2.5).

Default behavior: Returns zero.
31.6.3.5.3 Get area

streamsize showmanyc();  \[282\]

\[\begin{align*}
\text{Returns:} & \quad \text{An estimate of the number of characters available in the sequence, or } -1. \text{ If it returns a positive value, then successive calls to } \text{underflow()} \text{ will not return traits::eof() until at least that number of characters have been extracted from the stream. If } \text{showmanyc()} \text{ returns } -1, \text{ then calls to } \text{underflow()} \text{ or } \text{uflow()} \text{ will fail.} \quad \[283\] \\
\text{Default behavior:} & \quad \text{Returns zero.} \\
\text{Remarks:} & \quad \text{Uses traits::eof().}
\end{align*}\]

streamsize xsgetn(char_type* s, streamsize n);  

\[\begin{align*}
\text{Effects:} & \quad \text{Assigns up to } n \text{ characters to successive elements of the array whose first element is designated by } s. \text{ The characters assigned are read from the input sequence as if by repeated calls to } \text{sbumpc(). Assigning stops when either } n \text{ characters have been assigned or a call to } \text{sbumpc()} \text{ would return traits::eof().} \\
\text{Returns:} & \quad \text{The number of characters assigned.} \quad \[284\] \\
\text{Remarks:} & \quad \text{Uses traits::eof().}
\end{align*}\]

int_type underflow();  

\[\begin{align*}
\text{The pending sequence of characters is defined as the concatenation of} \\
& \quad \text{— the empty sequence if } gptr() \text{ is null, otherwise the characters in } [gptr(), egptr()), \text{ followed by} \\
& \quad \text{— some (possibly empty) sequence of characters read from the input sequence.} \\
\text{The result character} & \quad \text{is the first character of the pending sequence if it is non-empty, otherwise the next} \\
\text{character that would be read from the input sequence.} \\
\text{The backup sequence} & \quad \text{is the empty sequence if } eback() \text{ is null, otherwise the characters in } [eback(), \\
\text{Effects:} & \quad \text{The function sets up the } gptr() \text{ and } egptr() \text{ such that if the pending sequence is non-empty, then } \\
& \quad \text{egptr()} \text{ is non-null and the characters in } [gptr(), egptr()) \text{ are the characters in the pending} \\
& \quad \text{sequence, otherwise either } gptr() \text{ is null or } gptr() == egptr(). \\
\text{If } eback() \text{ and } gptr() & \quad \text{are non-null then the function is not constrained as to their contents, but the} \\
& \quad \text{“usual backup condition” is that either} \\
& \quad \text{— the backup sequence contains at least } gptr() - eback() \text{ characters, in which case the characters} \\
& \quad \text{in } [eback(), gptr()) \text{ agree with the last } gptr() - eback() \text{ characters of the backup sequence, or} \\
& \quad \text{— the characters in } [gptr() - n, gptr()) \text{ agree with the backup sequence (where } n \text{ is the length of} \\
\text{the backup sequence).} \\
\text{Returns:} & \quad \text{traits::to_int_type(c), where } c \text{ is the first character of the pending sequence, without} \\
\text{moving the input sequence position past it. If the pending sequence is null then the function returns} \\
\text{traits::eof()} \text{ to indicate failure.} \\
\text{Default behavior:} & \quad \text{Returns traits::eof().} \\
\text{Remarks:} & \quad \text{The public members of basic_streambuf call this virtual function only if } gptr() \text{ is null or} \\
\text{gptr()} > egptr().
\end{align*}\]

int_type uflow();  

\[\begin{align*}
\text{Preconditions:} & \quad \text{The constraints are the same as for underflow(), except that the result character is} \\
& \quad \text{transferred from the pending sequence to the backup sequence, and the pending sequence is not empty} \\
& \quad \text{before the transfer.}
\end{align*}\]

---

282) The morphemes of showmanyc are “es-how-many-see”, not “show-manic”.

283) underflow or uflow can fail by throwing an exception prematurely. The intention is not only that the calls will not return eof() but that they will return “immediately”.

284) Classes derived from basic_streambuf can provide more efficient ways to implement xsgetn() and xsputn() by overriding these definitions from the base class.
Default behavior: Calls `underflow()`. If `underflow()` returns `traits::eof()`, returns `traits::eof()`. Otherwise, returns the value of `traits::to_int_type(*gptr())` and increments the value of the next pointer for the input sequence.

Returns: `traits::eof()` to indicate failure.

31.6.3.5.4 Putback

```cpp
type pbackfail(int_type c = traits::eof());
```

1. The pending sequence is defined as for `underflow()`, with the modifications that
   1.1. If `traits::eq_int_type(c, traits::eof())` returns true, then the input sequence is backed up one character before the pending sequence is determined.
   1.2. If `traits::eq_int_type(c, traits::eof())` returns false, then `c` is prepended. Whether the input sequence is backed up or modified in any other way is unspecified.

Postconditions: On return, the constraints of `gptr()`, `eback()`, and `pptr()` are the same as for `underflow()`.

Returns: `traits::eof()` to indicate failure. Failure may occur because the input sequence could not be backed up, or if for some other reason the pointers cannot be set consistent with the constraints. `pbackfail()` is called only when put back has really failed.

4. Returns some value other than `traits::eof()` to indicate success.

Default behavior: Returns `traits::eof()`.

Remarks: The public functions of `basic_streambuf` call this virtual function only when `gptr()` is null, `gptr() == eback()`, or `traits::eq(traits::to_char_type(c), gptr()[−1])` returns false. Other calls shall also satisfy that constraint.

31.6.3.5.5 Put area

```cpp
streamsize xsputn(const char_type* s, streamsize n);
```

1. Effects: Writes up to `n` characters to the output sequence as if by repeated calls to `sputc(c)`. The characters written are obtained from successive elements of the array whose first element is designated by `s`. Writing stops when either `n` characters have been written or a call to `sputc(c)` would return `traits::eof()`. It is unspecified whether the function calls `overflow()` when `pptr() == epptr()` becomes true or whether it achieves the same effects by other means.

2. Returns: The number of characters written.

```cpp
int_type overflow(int_type c = traits::eof());
```

3. Effects: Consumes some initial subsequence of the characters of the pending sequence. The pending sequence is defined as the concatenation of
   3.1. the empty sequence if `pbase()` is null, otherwise the `pptr() - pbase()` characters beginning at `pbase()`, followed by
   3.2. the empty sequence if `traits::eq_int_type(c, traits::eof())` returns true, otherwise the sequence consisting of `c`.

4. Preconditions: Every overriding definition of this virtual function obeys the following constraints:
   4.1. The effect of consuming a character on the associated output sequence is specified.\footnote{That is, for each class derived from a specialization of `basic_streambuf` in this Clause (31.8.2, 31.10.2), a specification of how consuming a character effects the associated output sequence is given. There is no requirement on a program-defined class.}
   4.2. Let `r` be the number of characters in the pending sequence not consumed. If `r` is nonzero then `pbase()` and `pptr()` are set so that: `pptr() - pbase() == r` and the `r` characters starting at `pbase()` are the associated output stream. In case `r` is zero (all characters of the pending sequence have been consumed) then either `pbase()` is set to `nullptr`, or `pbase()` and `pptr()` are both set to the same non-null value.
   4.3. The function may fail if either appending some character to the associated output stream fails or if it is unable to establish `pbase()` and `pptr()` according to the above rules.
Returns: \( \text{traits::eof()} \) or throws an exception if the function fails. Otherwise, returns some value other than \( \text{traits::eof()} \) to indicate success.\(^{286}\)

Default behavior: Returns \( \text{traits::eof()} \).

Remarks: The member functions \( \text{sputc()} \) and \( \text{sputn()} \) call this function in case that no room can be found in the put buffer enough to accommodate the argument character sequence.

### 31.7 Formatting and manipulators

#### 31.7.1 Header `<istream>` synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream;

    using istream = basic_istream<char>;
    using wistream = basic_istream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_iostream;

    using iostream = basic_iostream<char>;
    using wiostream = basic_iostream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

    template<class Istream, class T>
    Istream&& operator>>(Istream&& is, T&& x);
}
```

#### 31.7.2 Header `<ostream>` synopsis

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream;

    using ostream = basic_ostream<char>;
    using wostream = basic_ostream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);

    template<class charT, class traits = char_traits<charT>>
    basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);

    template<class charT, class traits = char_traits<charT>>
    basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);

    template<class charT, class traits = char_traits<charT>>
    basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);

    template<class charT, class traits = char_traits<charT>>
    basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);

    template<class charT, class traits = char_traits<charT>>
    basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);

    template<class Ostream, class T>
    Ostream&& operator<<(Ostream&& os, const T& x);

    // 31.7.6.3.5, print functions
    template<class... Args>
    static void print(ostream& os, format_string<Args...> fmt, Args&&... args);
    template<class... Args>
    static void println(ostream& os, format_string<Args...> fmt, Args&&... args);
}
```

\(^{286}\) Typically, \texttt{overflow} returns \texttt{c} to indicate success, except when \( \text{traits::eq_int_type(c, traits::eof())} \) returns \texttt{true}, in which case it returns \( \text{traits::not_eof(c)} \).
void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
31.7.5.2 Class template basic_istream

31.7.5.2.1 General

When a function is specified with a type placeholder of `extended-floating-point-type`, the implementation provides overloads for all cv-unqualified extended floating-point types (6.8.2) in lieu of `extended-floating-point-type`.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_istream : virtual public basic_ios<charT, traits> {
        public:
            // types (inherited from basic_ios (31.5.4))
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.7.5.2.2, constructor/destructor
            explicit basic_istream(basic_streambuf<charT, traits>* sb);
            virtual ~basic_istream();

            // 31.7.5.2.4, prefix/suffix
            class sentry;

            // 31.7.5.3, formatted input
            basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));
            basic_istream& operator>>(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&&));
            basic_istream& operator>>(ios_base& (*pf)(ios_base&));
            basic_istream& operator>>(bool& n);
            basic_istream& operator>>(short& n);
            basic_istream& operator>>(unsigned short& n);
            basic_istream& operator>>(int& n);
            basic_istream& operator>>(unsigned int& n);
            basic_istream& operator>>(long& n);
            basic_istream& operator>>(unsigned long& n);
            basic_istream& operator>>(long long& n);
            basic_istream& operator>>(unsigned long long& n);
            basic_istream& operator>>(float& f);
            basic_istream& operator>>(double& f);
            basic_istream& operator>>(long double& f);
            basic_istream& operator>>(extended-floating-point-type& f);
            basic_istream& operator>>(void*& p);
            basic_istream& operator>>(basic_streambuf<char_type, traits>* sb);

            // 31.7.5.4, unformatted input
            streamsize gcount() const;
            int_type get();
            basic_istream& get(char_type& c);
            basic_istream& get(char_type* s, streamsize n);
            basic_istream& get(char_type* s, streamsize n, char_type delim);
            basic_istream& get(basic_streambuf<char_type, traits>& sb);
            basic_istream& get(basic_streambuf<char_type, traits>& sb, char_type delim);
            basic_istream& getline(char_type* s, streamsize n);
            basic_istream& getline(char_type* s, streamsize n, char_type delim);
            basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
            int_type peek();
            basic_istream& read (char_type* s, streamsize n);
            streamsize readsome(char_type* s, streamsize n);
        }
    }
}
```
The class template \texttt{basic\_istream} defines a number of member function signatures that assist in reading and interpreting input from sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the \textit{formatted input functions} (or \textit{extractors}) and the \textit{unformatted input functions}. Both groups of input functions are described as if they obtain (or \textit{extract}) input \texttt{characters} by calling \texttt{rdbuf\()->sbumpc()} or \texttt{rdbuf\()->sgetc()}. They may use other public members of \texttt{istream}.

If \texttt{rdbuf\()->sbumpc()} or \texttt{rdbuf\()->sgetc()} returns \texttt{traits::eof()}, then the input function, except as explicitly noted otherwise, completes its actions and does \texttt{setstate(eofbit)}, which may throw \texttt{ios\_base::failure} (31.5.4.4), before returning.

If one of these called functions throws an exception, then unless explicitly noted otherwise, the input function sets \texttt{badbit} in the error state. If \texttt{badbit} is set in \texttt{exceptions()}, the input function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

### 31.7.5.2.2 Constructors

#### [istream.cons]

\begin{verbatim}
explicit basic_istream(basic_streambuf<charT, traits>\* sb);
\end{verbatim}

1. \textit{Effects}: Initializes the base class subobject with \texttt{basic\_ios::init(sb)} (31.5.4.2).
2. \textit{Postconditions}: \texttt{gcount()} == 0.

\begin{verbatim}
basic_istream(basic_istream&& rhs);
\end{verbatim}

3. \textit{Effects}: Default constructs the base class, copies the \texttt{gcount()} from \texttt{rhs}, calls \texttt{basic\_ios<charT, traits>::move(rhs)} to initialize the base class, and sets the \texttt{gcount()} for \texttt{rhs} to 0.
4. \textit{Remarks}: Does not perform any operations of \texttt{rdbuf()}.

</table>

\[§ 31.7.5.2.2\]
31.7.5.2.3 Assignment and swap

basic_istream& operator=(basic_istream& rhs);  

Effects: Equivalent to: swap(rhs).

Returns: *this.

void swap(basic_istream& rhs);

Effects: Calls basic_ios<ch,Traits>::swap(rhs). Exchanges the values returned by gcount() and rhs.gcount().

31.7.5.2.4 Class basic_istream::sentry

namespace std {
  template<class charT, class traits>
  class basic_istream<charT, traits>::sentry {
    bool ok_;  // exposition only
  public:
    explicit sentry(basic_istream& is, bool noskipws = false);
    ~sentry();
    explicit operator bool() const { return ok_; }
    sentry(const sentry&) = delete;
    sentry& operator=(const sentry&) = delete;
  }
};

The class sentry defines a class that is responsible for doing exception safe prefix and suffix operations.

explicit sentry(basic_istream& is, bool noskipws = false);

Effects: If is.good() is false, calls is.setstate(failbit). Otherwise, prepares for formatted or unformatted input. First, if is.tie() is not a null pointer, the function calls is.tie()->flush() to synchronize the output sequence with any associated external C stream. Except that this call can be suppressed if the put area of is.tie() is empty. Further an implementation is allowed to defer the call to flush until a call of is.rdbuf()->underflow() occurs. If no such call occurs before the sentry object is destroyed, the call to flush may be eliminated entirely.287 If noskipws is zero and is.flags() & ios_base::skipws is nonzero, the function extracts and discards each character as long as the next available input character c is a whitespace character. If is.rdbuf()->sbumpc() or is.rdbuf()->sgetc() returns traits::eof(), the function calls setstate(failbit | eofbit) (which may throw ios_base::failure).

Remarks: The constructor

  explicit sentry(basic_istream& is, bool noskipws = false)
uses the currently imbued locale in is, to determine whether the next input character is whitespace or not.

To decide if the character c is a whitespace character, the constructor performs as if it executes the following code fragment:

  const ctype<charT>& ctype = use_facet<ctype<charT>>(is.getloc());
  if (ctype.is(ctype.space, c) != 0)  // c is a whitespace character.

If, after any preparation is completed, is.good() is true, ok_ != false otherwise, ok_ == false. During preparation, the constructor may call setstate(failbit) (which may throw ios_base::failure (31.5.4.4)).288

~sentry();

Effects: None.

explicit operator bool() const;

Returns: ok_.

287) This will be possible only in functions that are part of the library. The semantics of the constructor used in user code is as specified.
288) The sentry constructor and destructor can also perform additional implementation-dependent operations.
31.7.5.3 Formatted input functions

31.7.5.3.1 Common requirements

Each formatted input function begins execution by constructing an object of class `sentry` with the `noskipws` (second) argument `false`. If the `sentry` object returns `true`, when converted to a value of type `bool`, the function endeavors to obtain the requested input. If an exception is thrown during input then `ios_base::badbit` is turned on in `*this`'s error state. If `(exceptions()&badbit) != 0` then the exception is rethrown. In any case, the formatted input function destroys the `sentry` object. If no exception has been thrown, it returns `*this`.

31.7.5.3.2 Arithmetic extractors

As in the case of the inserters, these extractors depend on the locale’s `num_get<>` (30.4.3.2) object to perform parsing the input stream data. These extractors behave as formatted input functions (as described in 31.7.5.3.1). After a `sentry` object is constructed, the conversion occurs as if performed by the following code fragment:

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;

iostate err = iostate::goodbit;
use_facet<numget>(loc).get(*this, 0, *this, err, val);
setstate(err);
```

In the above fragment, `loc` stands for the private member of the `basic_ios` class.

[Note 1: The first argument provides an object of the `istreambuf_iterator` class which is an iterator pointed to an input stream. It bypasses istreams and uses streambufs directly. — end note]

Class `locale` relies on this type as its interface to `istream`, so that it does not need to depend directly on `istream`.

```
basic_istream& operator>>(short& val);
```

As in the case of the inserters, the conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;

iostate err = iostate::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
  err |= ios_base::failbit;
  val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
  err |= ios_base::failbit;
  val = numeric_limits<short>::max();
} else
  val = static_cast<short>(lval);
setstate(err);
```

```
basic_istream& operator>>(int& val);
```

The conversion occurs as if performed by the following code fragment (using the same notation as for the preceding code fragment):

```cpp
using numget = num_get<charT, istreambuf_iterator<charT, traits>>;

iostate err = iostate::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<short>::min()) {
  err |= ios_base::failbit;
  val = numeric_limits<short>::min();
} else if (numeric_limits<short>::max() < lval) {
  err |= ios_base::failbit;
  val = numeric_limits<short>::max();
} else
  val = static_cast<short>(lval);
setstate(err);
```

```
basic_istream& operator>>(void*& val);
```

289) This is done without causing an `ios_base::failure` to be thrown.
iostate err = ios_base::goodbit;
long lval;
use_facet<numget>(loc).get(*this, 0, *this, err, lval);
if (lval < numeric_limits<int>::min()) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::min();
} else if (numeric_limits<int>::max() < lval) {
    err |= ios_base::failbit;
    val = numeric_limits<int>::max();
} else
    val = static_cast<int>(lval);
setstate(err);

basic_istream& operator>>(extended-floating-point-type& val);

If the floating-point conversion rank of extended-floating-point-type is not less than or equal
to that of long double, then an invocation of the operator function is conditionally supported with
implementation-defined semantics.

Otherwise, let FP be a standard floating-point type:

(5.1) — if the floating-point conversion rank of extended-floating-point-type is less than or equal to
that of float, then FP is float,

(5.2) — otherwise, if the floating-point conversion rank of extended-floating-point-type is less than
or equal to that of double, then FP is double,

(5.3) — otherwise, FP is long double.

The conversion occurs as if performed by the following code fragment (using the same notation as for
the preceding code fragment):

using numget = num_get<charT, istreambuf_iterator<charT, traits>>;
iostate err = ios_base::goodbit;
FP fval;
use_facet<numget>(loc).get(*this, 0, *this, err, fval);
if (fval < -numeric_limits<extended-floating-point-type>::max()) {
    err |= ios_base::failbit;
    val = -numeric_limits<extended-floating-point-type>::max();
} else if (numeric_limits<extended-floating-point-type>::max() < fval) {
    err |= ios_base::failbit;
    val = numeric_limits<extended-floating-point-type>::max();
} else {
    val = static_cast<extended-floating-point-type>(fval);
}
setstate(err);

[Note 2: When the extended floating-point type has a floating-point conversion rank that is not equal to
the rank of any standard floating-point type, then double rounding during the conversion can result in inaccurate
results. from_chars can be used in situations where maximum accuracy is important. — end note]

31.7.5.3.3 basic_istream::operator>>(basic_istream& (*pf)(basic_istream&)); [istream.extractors]

basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));

Effects: None. This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

Returns: pf(*this).

basic_istream& operator>>(basic_istream& (*pf)(basic_istream&));

Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described
in 31.7.5.3.1).

Returns: *this.

290) See, for example, the function signature ws(basic_istream&) (31.7.5.5).
basic_istream& operator>>(ios_base& (*pf)(ios_base&));

Effects: Calls pf(*this). This extractor does not behave as a formatted input function (as described in 31.7.5.3.1).

Returns: *this.

template<class charT, class traits, size_t N>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT (&s)[N]);
template<class traits, size_t N>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char (&s)[N]);
template<class traits, size_t N>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char (&s)[N]);

Effects: Behaves like a formatted input member (as described in 31.7.5.3.1) of in. After a sentry object is constructed, operator>> extracts characters and stores them into s. If width() is greater than zero, n is min(size_t(width()), N). Otherwise n is N. n is the maximum number of characters stored.

Characters are extracted and stored until any of the following occurs:

1. n-1 characters are stored;
2. end of file occurs on the input sequence;
3. letting ct be use_facet<ctype<charT>>(in.getloc()), ct.is(ct.space, c) is true.

operator>> then stores a null byte (charT()) in the next position, which may be the first position if no characters were extracted. operator>> then calls width(0).

If the function extracted no characters, it calls setstate(failbit), which may throw ios_base::failure (31.5.4.4).

Returns: in.

template<class charT, class traits>
  basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& in, charT& c);
template<class traits>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, unsigned char& c);
template<class traits>
  basic_istream<char, traits>& operator>>(basic_istream<char, traits>& in, signed char& c);

Effects: Behaves like a formatted input member (as described in 31.7.5.3.1) of in. After a sentry object is constructed a character is extracted from in, if one is available, and stored in c. Otherwise, the function calls in.setstate(failbit).

Returns: in.

basic_istream& operator>>(basic_streambuf<charT, traits>* sb);

Effects: Behaves as an unformatted input function (31.7.5.4). If sb is null, calls setstate(failbit), which may throw ios_base::failure (31.5.4.4). After a sentry object is constructed, extracts characters from *this and inserts them in the output sequence controlled by sb. Characters are extracted and inserted until any of the following occurs:

1. end-of-file occurs on the input sequence;
2. inserting in the output sequence fails (in which case the character to be inserted is not extracted);
3. an exception occurs (in which case the exception is caught).

If the function inserts no characters, it calls setstate(failbit), which may throw ios_base::failure (31.5.4.4). If it inserted no characters because it caught an exception thrown while extracting characters from *this and failbit is set in exceptions() (31.5.4.4), then the caught exception is rethrown.

Returns: *this.

31.7.5.4 Unformatted input functions

Each unformatted input function begins execution by constructing an object of class sentry with the default argument noskipws (second) argument true. If the sentry object returns true, when converted to a value 291) See, for example, the function signature dec(ios_base&) (31.5.5.3).
of type \texttt{bool}, the function endeavors to obtain the requested input. Otherwise, if the \texttt{sentry} constructor exits by throwing an exception or if the \texttt{sentry} object returns \texttt{false}, when converted to a value of type \texttt{bool}, the function returns without attempting to obtain any input. In either case the number of extracted characters is set to 0; unformatted input functions taking a character array of nonzero size as an argument shall also store a null character (using \texttt{charT()}) in the first location of the array. If an exception is thrown during input then \texttt{ios_base::badbit} is turned on\(^{292}\) in \texttt{*this}'s error state. (Exceptions thrown from \texttt{basic_ios<>::clear()} are not caught or rethrown.) If \((\texttt{exceptions()}\&\texttt{badbit}) \neq 0\) then the exception is rethrown. It also counts the number of characters extracted. If no exception has been thrown it ends by storing the count in a member object and returning the value specified. In any event the \texttt{sentry} object is destroyed before leaving the unformatted input function.

### streamsize \texttt{gcount()} const;

2 Effects: None. This member function does not behave as an unformatted input function (as described above).

3 Returns: The number of characters extracted by the last unformatted input member function called for the object. If the number cannot be represented, returns \texttt{numeric_limits<streamsize>::max()}.

### int\_type \texttt{get();}

4 Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts a character \(c\), if one is available. Otherwise, the function calls \texttt{setstate(failbit)}, which may throw \texttt{ios_base::failure} (31.5.4.4).

5 Returns: \(c\) if available, otherwise \texttt{traits::eof()}.

### basic\_istream& \texttt{get(char\_type& c);}

6 Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts a character, if one is available, and assigns it to \(c\).\(^{293}\) Otherwise, the function calls \texttt{setstate(failbit)} (which may throw \texttt{ios_base::failure} (31.5.4.4)).

7 Returns: \texttt{*this}.

### basic\_istream& \texttt{get(char\_type* s, streamsize n, char\_type delim);}

8 Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts characters and stores them into successive locations of an array whose first element is designated by \(s\).\(^{294}\) Characters are extracted and stored until any of the following occurs:

- \texttt{s} is less than one or \(n - 1\) characters are stored;
- end-of-file occurs on the input sequence (in which case the function calls \texttt{setstate(eofbit)});
- \texttt{traits::eq(c, delim)} for the next available input character \(c\) (in which case \(c\) is not extracted).

9 If the function stores no characters, it calls \texttt{setstate(failbit)} (which may throw \texttt{ios_base::failure} (31.5.4.4)). In any case, if \(n\) is greater than zero it then stores a null character into the next successive location of the array.

10 Returns: \texttt{*this}.

### basic\_istream& \texttt{get(char\_type* s, streamsize n);}  

11 Effects: Calls \texttt{get(s, n, widen(\'\n\')}}.

12 Returns: Value returned by the call.

### basic\_istream& \texttt{get(basic\_streambuf<\texttt{char\_type}, \texttt{traits}\& sb, char\_type delim);}

13 Effects: Behaves as an unformatted input function (as described above). After constructing a \texttt{sentry} object, extracts characters and inserts them in the output sequence controlled by \(sb\). Characters are extracted and inserted until any of the following occurs:

- end-of-file occurs on the input sequence;
- inserting in the output sequence fails (in which case the character to be inserted is not extracted);

\(^{292}\) This is done without causing an \texttt{ios_base::failure} to be thrown.

\(^{293}\) Note that this function is not overloaded on types \texttt{signed char} and \texttt{unsigned char}.

\(^{294}\) Note that this function is not overloaded on types \texttt{signed char} and \texttt{unsigned char}.
— traits::eq(c, delim) for the next available input character c (in which case c is not extracted);
— an exception occurs (in which case, the exception is caught but not rethrown).

If the function inserts no characters, it calls `setstate(failbit)`, which may throw `ios_base::failure` (31.5.4.4).

Returns: *this.

`basic_istream& get(basic_streambuf<char_type, traits>& sb);`

Effects: Calls `get(sb, widen('n'))`.

Returns: Value returned by the call.

`basic_istream& getline(char_type* s, streamsize n, char_type delim);`

Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and stores them into successive locations of an array whose first element is designated by s. 295 Characters are extracted and stored until one of the following occurs:

1. end-of-file occurs on the input sequence (in which case the function calls `setstate(eofbit)`);
2. traits::eq(c, delim) for the next available input character c (in which case the input character is extracted but not stored); 296
3. n is less than one or n - 1 characters are stored (in which case the function calls `setstate(failbit)`).

These conditions are tested in the order shown. 297

If the function extracts no characters, it calls `setstate(failbit)` (which may throw `ios_base::failure` (31.5.4.4)) 298

In any case, if n is greater than zero, it then stores a null character (using `charT()`) into the next successive location of the array.

Returns: *this.

[Example 1:

```cpp
#include <iostream>

int main() {
    using namespace std;
    const int line_buffer_size = 100;

    char buffer[line_buffer_size];
    int line_number = 0;
    while ((cin.getline(buffer, line_buffer_size, '\n') || cin.gcount()) {
        int count = cin.gcount();
        if (cin.eof())
            cout << "Partial final line";  // cin.fail() is false
        else if (cin.fail()) {
            cout << "Partial long line";
            cin.clear(cin.rdstate() & ~ios_base::failbit);
        } else {
            count--;
            // Don't include newline in count
            cout << "Line " << ++line_number;
        }
        cout << " (" << count << " chars): " << buffer << endl;
    }
}
```
—end example]

295) Note that this function is not overloaded on types `signed char` and `unsigned char`.
296) Since the final input character is “extracted”, it is counted in the `gcount()`, even though it is not stored.
297) This allows an input line which exactly fills the buffer, without setting `failbit`. This is different behavior than the historical AT&T implementation.
298) This implies an empty input line will not cause `failbit` to be set.
basic_istream& getline(char_type* s, streamsize n);
24
Returns: getline(s, n, widen('n'))

basic_istream& ignore(streamsize n = 1, int_type delim = traits::eof());
25
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, extracts characters and discards them. Characters are extracted until any of the following occurs:

(25.1) n != numeric_limits<streamsize>::max() (17.3.5) and n characters have been extracted so far
(25.2) end-of-file occurs on the input sequence (in which case the function calls setstate(eofbit), which may throw ios_base::failure (31.5.4.4));
(25.3) traits::eq_int_type(traits::to_int_type(c), delim) for the next available input character c (in which case c is extracted).

[Note 1: The last condition will never occur if traits::eq_int_type(delim, traits::eof()). — end note]
Returns: *this.

int_type peek();
27
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, reads but does not extract the current input character.
Returns: traits::eof() if good() is false. Otherwise, returns rdbuf()->sgetc().

basic_istream& read(char_type* s, streamsize n);
29
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. Characters are extracted and stored until either of the following occurs:

(29.1) n characters are stored;
(29.2) end-of-file occurs on the input sequence (in which case the function calls setstate(failbit | eofbit), which may throw ios_base::failure (31.5.4.4)).
Returns: *this.

streamsize readsome(char_type* s, streamsize n);
31
Effects: Behaves as an unformatted input function (as described above). After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. Otherwise extracts characters and stores them into successive locations of an array whose first element is designated by s. If rdbuf()->in_avail() == -1, calls setstate(eofbit) (which may throw ios_base::failure (31.5.4.4)), and extracts no characters;
(31.1) If rdbuf()->in_avail() == 0, extracts no characters
(31.2) If rdbuf()->in_avail() > 0, extracts min(rdbuf()->in_avail(), n)).
Returns: The number of characters extracted.

basic_istream& putback(char_type c);
33
Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sputc(c). If rdbuf() is null, or if sputc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

[Note 2: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]
Returns: *this.

299) Note that this function is not overloaded on types signed char and unsigned char.
basic_istream& unget();

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit. After constructing a sentry object, if !good() calls setstate(failbit) which may throw an exception, and return. If rdbuf() is not null, calls rdbuf()->sungetc(). If rdbuf() is null, or if sungetc returns traits::eof(), calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).

[Note 3: This function extracts no characters, so the value returned by the next call to gcount() is 0. — end note]

Returns: *this.

int sync();

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if rdbuf() is a null pointer, returns -1. Otherwise, calls rdbuf()->pubsync() and, if that function returns -1 calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4), and returns -1. Otherwise, returns zero.

pos_type tellg();

Effects: Behaves as an unformatted input function (as described above), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to gcount().

Returns: After constructing a sentry object, if fail() != false, returns pos_type(-1) to indicate failure. Otherwise, returns rdbuf()->pubseekoff(0, cur, in).

basic_istream& seekg(pos_type pos);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if fail() != true, executes rdbuf()->pubseekpos(pos, ios_base::in). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

basic_istream& seekg(off_type off, ios_base::seekdir dir);

Effects: Behaves as an unformatted input function (as described above), except that the function first clears eofbit, it does not count the number of characters extracted, and it does not affect the value returned by subsequent calls to gcount(). After constructing a sentry object, if fail() != true, executes rdbuf()->pubseekoff(off, dir, ios_base::in). In case of failure, the function calls setstate(failbit) (which may throw ios_base::failure).

Returns: *this.

31.7.5.5 Standard basic_istream manipulators [istream.manip]

Each instantiation of the function template specified in this subclause is a designated addressable function (16.4.5.2.1).

template<class charT, class traits>
basic_istream<charT, traits>& ws(basic_istream<charT, traits>& is);

Effects: Behaves as an unformatted input function (31.7.5.4), except that it does not count the number of characters extracted and does not affect the value returned by subsequent calls to is.gcount(). After constructing a sentry object extracts characters as long as the next available character is whitespace or until there are no more characters in the sequence. Whitespace characters are distinguished with the same criterion as used by sentry::sentry (31.7.5.2.4). If ws stops extracting characters because there are no more available it sets eofbit, but not failbit.

Returns: is.
31.7.5.6 Rvalue stream extraction

```c++
template<class Istream, class T>
Istream&& operator>>(Istream&& is, T&& x);
```

1 **Constraints**: The expression is >> std::forward<T>(x) is well-formed when treated as an unevaluated operand (7.2.3) and Istream is publicly and unambiguously derived from ios_base.

2 **Effects**: Equivalent to:
   
is >> std::forward<T>(x);
   return std::move(is);

31.7.5.7 Class template basic_iostream

31.7.5.7.1 General

```c++
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_iostream
        : public basic_istream<charT, traits>,
          public basic_ostream<charT, traits> {
public:
    using char_type = charT;
    using int_type = typename traits::int_type;
    using pos_type = typename traits::pos_type;
    using off_type = typename traits::off_type;
    using traits_type = traits;

    // 31.7.5.7.2, constructor
    explicit basic_iostream(basic_streambuf<charT, traits>* sb);

    // 31.7.5.7.3, destructor
    virtual ~basic_iostream();

protected:
    // 31.7.5.7.2, constructor
    basic_iostream(const basic_iostream&) = delete;
    basic_iostream(basic_iostream&& rhs);

    // 31.7.5.7.4, assignment and swap
    basic_iostream& operator=(const basic_iostream&) = delete;
    basic_iostream& operator=(basic_iostream&& rhs);
    void swap(basic_iostream& rhs);
};
}
```

1 The class template basic_iostream inherits a number of functions that allow reading input and writing output to sequences controlled by a stream buffer.

31.7.5.7.2 Constructors

```c++
explicit basic_iostream(basic_streambuf<charT, traits>* sb);
```

1 **Effects**: Initializes the base class subobjects with basic_istream<charT, traits>(sb) (31.7.5.2) and basic_ostream<charT, traits>(sb) (31.7.6.2).

2 **Postconditions**: rdbuf() == sb and gcount() == 0.

3 **Effects**: Move constructs from the rvalue rhs by constructing the basic_istream base class with move(rhs).

31.7.5.7.3 Destructor

```c++
virtual ~basic_iostream();
```

1 **Remarks**: Does not perform any operations on rdbuf().
31.7.5.7.4 Assignment and swap

basic_ios& operator=(basic_ios& rhs);

Effects: Equivalent to: swap(rhs).

void swap(basic_ios& rhs);

Effects: Calls basic_istream<charT, traits>::swap(rhs).

31.7.6 Output streams

31.7.6.1 General

The header <ostream> defines a class template and several function templates that control output to a
stream buffer, along with a function template that inserts into stream rvalues.

31.7.6.2 Class template basic_ostream

31.7.6.2.1 General

When a function has a parameter type extended-floating-point-type, the implementation provides
overloads for all cv-unqualified extended floating-point types (6.8.2).

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ostream : virtual public basic_ios<charT, traits> {
    public:
        // types (inherited from basic_ios (31.5.4))
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.7.6.2.2, constructor/destructor
        explicit basic_ostream(basic_streambuf<char_type, traits>* sb);
        virtual ~basic_ostream();

        // 31.7.6.2.4, prefix/suffix
        class sentry;

        // 31.7.6.3, formatted output
        basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
        basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
        basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
        basic_ostream& operator<<(bool n);
        basic_ostream& operator<<(short n);
        basic_ostream& operator<<(unsigned short n);
        basic_ostream& operator<<(int n);
        basic_ostream& operator<<(unsigned int n);
        basic_ostream& operator<<(long n);
        basic_ostream& operator<<(unsigned long n);
        basic_ostream& operator<<(long long n);
        basic_ostream& operator<<(unsigned long long n);
        basic_ostream& operator<<(float f);
        basic_ostream& operator<<(double f);
        basic_ostream& operator<<(long double f);
        basic_ostream& operator<<(extended-floating-point-type f);

        basic_ostream& operator<<(const void* p);
        basic_ostream& operator<<(const volatile void* p);
        basic_ostream& operator<<(nullptr_t);
        basic_ostream& operator<<(basic_streambuf<char_type, traits>* sb);

        // 31.7.6.4, unformatted output
        basic_ostream& put(char_type c);
        basic_ostream& write(const char_type* s, streamsize n);
    }
basic_ostream& flush();

// 31.7.6.2.5, seeks
pos_type tellp();
basic_ostream& seekp(pos_type);
basic_ostream& seekp(off_type, ios_base::seekdir);

protected:
// 31.7.6.2.2, copy/move constructor
basic_ostream(const basic_ostream&) = delete;
basic_ostream(basic_ostream&& rhs);

// 31.7.6.2.3, assignment and swap
basic_ostream& operator=(const basic_ostream&) = delete;
basic_ostream& operator=(basic_ostream&& rhs);
void swap(basic_ostream& rhs);
};

// 31.7.6.3.4, character inserters
template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, charT);

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>&, char);

template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, char);

template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, signed char);

template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, unsigned char);

template<class traits>
basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>&, const charT*);
The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

Two groups of member function signatures share common properties: the formatted output functions (or *inserters*) and the unformatted output functions. Both groups of output functions generate (or *insert*) output characters by actions equivalent to calling `rdbuf()->sputc(int_type)`. They may use other public members of `basic_ostream` except that they shall not invoke any virtual members of `rdbuf()` except `overflow()`, `xsputn()`, and `sync()`.

If one of these called functions throws an exception, then unless explicitly noted otherwise the output function sets `badbit` in the error state. If `badbit` is set in `exceptions()`, the output function rethrows the exception without completing its actions, otherwise it does not throw anything and proceeds as if the called function had returned a failure indication.

[Note 1: The deleted overloads of `operator<<` prevent formatting characters as integers and strings as pointers. —end note]

### 31.7.6.2.2 Constructors

```cpp
template<class traits>
    basic_ostream<char, traits>&
    operator<<(basic_ostream<char, traits>&, const char8_t*) = delete;
```

The class template `basic_ostream` defines a number of member function signatures that assist in formatting and writing output to output sequences controlled by a stream buffer.

### 31.7.6.2.3 Assignment and swap

```cpp
    basic_ostream& operator=(basic_ostream&& rhs);
    virtual ~basic_ostream();
```

### 31.7.6.2.4 Class `basic_ostream::sentry`

```cpp
namespace std {
    template<class charT, class traits>
    class basic_ostream<charT, traits>::sentry {
```
bool ok_;     // exposition only
public:
  explicit sentry(basic_ostream& os);
  ~sentry();
  explicit operator bool() const { return ok_; }
  sentry(const sentry&) = delete;
  sentry& operator=(const sentry&) = delete;
};

The class `sentry` defines a class that is responsible for doing exception safe prefix and suffix operations.

```cpp
explicit sentry(basic_ostream& os);
```

If `os.good()` is nonzero, prepares for formatted or unformatted output. If `os.tie()` is not a null pointer, calls `os.tie()->flush()`.

```cpp
~sentry();
```

If, after any preparation is completed, `os.good()` is `true`, `ok_ == true` otherwise, `ok_ == false`. During preparation, the constructor may call `setstate(failbit)` (which may throw `ios_base::failure`).

```cpp
explicit operator bool() const;
```

Effects: Returns `ok_`.

### 31.7.6.2.5 Seek members

Each seek member function begins execution by constructing an object of class `sentry`. It returns by destroying the `sentry` object.

```cpp
pos_type tellp();
```

Returns: If `fail() != false`, returns `pos_type(-1)` to indicate failure. Otherwise, returns `rdbuf()->pubseekoff(0, cur, out)`.

```cpp
basic_ostream& seekp(pos_type pos);
```

Effects: If `fail() != true`, executes `rdbuf()->pubseekpos(pos, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

Returns: `*this`.

```cpp
basic_ostream& seekp(off_type off, ios_base::seekdir dir);
```

Effects: If `fail() != true`, executes `rdbuf()->pubseekoff(off, dir, ios_base::out)`. In case of failure, the function calls `setstate(failbit)` (which may throw `ios_base::failure`).

Returns: `*this`.

### 31.7.6.3 Formatted output functions

#### 31.7.6.3.1 Common requirements

Each formatted output function begins execution by constructing an object of class `sentry`. If that object returns `true` when converted to a value of type `bool`, the function endeavors to generate the requested output. If the generation fails, then the formatted output function does `setstate(ios_base::failbit)`, which can throw an exception. If an exception is thrown during output, then `ios_base::badbit` is turned on in `*this`'s error state. If `(exceptions()&badbit) != 0` then the exception is rethrown. Whether or not an exception is thrown, the `sentry` object is destroyed before leaving the formatted output function. If no exception is thrown, the result of the formatted output function is `*this`.

---

300) The call `os.tie()->flush()` does not necessarily occur if the function can determine that no synchronization is necessary.

301) The `sentry` constructor and destructor can also perform additional implementation-dependent operations.

302) This is done without causing an `ios_base::failure` to be thrown.
2 The descriptions of the individual formatted output functions describe how they perform output and do not mention the sentry object.

3 If a formatted output function of a stream \texttt{os} determines padding, it does so as follows. Given a \texttt{charT} character sequence \texttt{seq} where \texttt{charT} is the character type of the stream, if the length of \texttt{seq} is less than \texttt{os.width()}, then enough copies of \texttt{os.fill()} are added to this sequence as necessary to pad to a width of \texttt{os.width()} characters. If \((\texttt{os.flags()} \& \texttt{ios::adjustfield}) == \texttt{ios::left}) is true, the fill characters are placed after the character sequence; otherwise, they are placed before the character sequence.

31.7.6.3.2 Arithmetic inserter

\begin{verbatim}
basic_ostream& operator<<(bool val);
basic_ostream& operator<<(short val);
basic_ostream& operator<<(unsigned short val);
basic_ostream& operator<<(int val);
basic_ostream& operator<<(unsigned int val);
basic_ostream& operator<<(long val);
basic_ostream& operator<<(unsigned long val);
basic_ostream& operator<<(long long val);
basic_ostream& operator<<(unsigned long long val);
basic_ostream& operator<<(float val);
basic_ostream& operator<<(double val);
basic_ostream& operator<<(long double val);
basic_ostream& operator<<(const void* val);
\end{verbatim}

\textbf{Effects:} The classes \texttt{num_get<}} and \texttt{num_put<} handle locale-dependent numeric formatting and parsing. These inserter functions use the imbued \texttt{locale} value to perform numeric formatting. When \texttt{val} is of type \texttt{bool}, \texttt{long}, \texttt{unsigned long}, \texttt{long long}, \texttt{unsigned long long}, \texttt{double}, \texttt{long double}, or \texttt{const void*}, the formatting conversion occurs as if it performed the following code fragment:

\begin{verbatim}
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(getloc()).put(*this, *this, fill(), val).failed();
\end{verbatim}

When \texttt{val} is of type \texttt{short} the formatting conversion occurs as if it performed the following code fragment:

\begin{verbatim}
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
            ? static_cast<long>(static_cast<unsigned short>(val))
            : static_cast<long>(val)).failed();
\end{verbatim}

When \texttt{val} is of type \texttt{int} the formatting conversion occurs as if it performed the following code fragment:

\begin{verbatim}
ios_base::fmtflags baseflags = ios_base::flags() & ios_base::basefield;
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(getloc()).put(*this, *this, fill(),
        baseflags == ios_base::oct || baseflags == ios_base::hex
            ? static_cast<long>(static_cast<unsigned int>(val))
            : static_cast<long>(val)).failed();
\end{verbatim}

When \texttt{val} is of type \texttt{unsigned short} or \texttt{unsigned int} the formatting conversion occurs as if it performed the following code fragment:

\begin{verbatim}
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(getloc()).put(*this, *this, fill(),
        static_cast<unsigned long>(val)).failed();
\end{verbatim}

When \texttt{val} is of type \texttt{float} the formatting conversion occurs as if it performed the following code fragment:

\begin{verbatim}
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>(getloc()).put(*this, *this, fill(),
        static_cast<long double>(val)).failed();
\end{verbatim}

\textbf{§ 31.7.6.3.2 1633}
The first argument provides an object of the `ostreambuf_iterator<>` class which is an iterator for class `basic_ostream<`. It bypasses `ostream` and uses `streambufs` directly. Class `locale` relies on these types as its interface to iostreams, since for flexibility it has been abstracted away from direct dependence on `ostream`. The second parameter is a reference to the base class subobject of type `ios_base`. It provides formatting specifications such as field width, and a locale from which to obtain other facets. If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

Returns: `*this`.

```cpp
basic_ostream& operator<<(const volatile void* p);
```

Effects: Equivalent to: `return operator<<(const_cast<const void*>(p));`

```cpp
basic_ostream& operator<<(extended-floating-point-type val);
```

Effects: If the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `double`, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
    static_cast<double>(val)).failed();
```

Otherwise, if the floating-point conversion rank of `extended-floating-point-type` is less than or equal to that of `long double`, the formatting conversion occurs as if it performed the following code fragment:

```cpp
bool failed = use_facet<
    num_put<charT, ostreambuf_iterator<charT, traits>>
    >(getloc()).put(*this, *this, fill(),
    static_cast<long double>(val)).failed();
```

Otherwise, an invocation of the operator function is conditionally supported with implementation-defined semantics.

If `failed` is `true` then does `setstate(badbit)`, which may throw an exception, and returns.

Returns: `*this`.

### 31.7.6.3.3 basic_ostream::operator<< [ostream.inserters]

```cpp
basic_ostream& operator<<(basic_ostream& (*pf)(basic_ostream&));
```

Effects: None. Does not behave as a formatted output function (as described in 31.7.6.3.1).

Returns: `pf(*this)`.

```cpp
basic_ostream& operator<<(basic_ios<charT, traits>& (*pf)(basic_ios<charT, traits>&));
```

Effects: Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

Returns: `*this`.

```cpp
basic_ostream& operator<<(ios_base& (*pf)(ios_base&));
```

Effects: Calls `pf(*this)`. This inserter does not behave as a formatted output function (as described in 31.7.6.3.1).

Returns: `*this`.

```cpp
basic_ostream& operator<<(basic_streambuf<charT, traits>* sb);
```

Effects: Behaves as an unformatted output function (31.7.6.4). After the `sentry` object is constructed, if `sb` is null calls `setstate(badbit)` (which may throw `ios_base::failure`).

Gets characters from `sb` and inserts them in `*this`. Characters are read from `sb` and inserted until any of the following occurs:

---

303) See, for example, the function signature `endl(basic_ostream&)` (31.7.6.5).
304) See, for example, the function signature `dec(ios_base&)` (31.5.5.3).
— end-of-file occurs on the input sequence;
— inserting in the output sequence fails (in which case the character to be inserted is not extracted);
— an exception occurs while getting a character from \( sb \).

If the function inserts no characters, it calls \texttt{setstate(failbit)} (which may throw \texttt{ios\_base::failure}} (31.5.4.4)). If an exception was thrown while extracting a character, the function sets \texttt{failbit} in the error state, and if \texttt{failbit} is set in \texttt{exceptions()} the caught exception is rethrown.

\textbf{Returns: *this.}

\begin{verbatim}
basic_ostream& operator<<(nullptr_t);
\end{verbatim}

\textbf{Effects:} Equivalent to:

\begin{verbatim}
return *this << s;
\end{verbatim}

where \texttt{s} is an implementation-defined NTCTS (3.37).

\section{Character inserter function templates}  

\begin{verbatim}
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, charT c);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, char c);
    // specialization
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, char c);
    // signed and unsigned
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, signed char c);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const unsigned char* s);
\end{verbatim}

\textbf{Effects:} Behaves as a formatted output function (31.7.6.3.1) of \texttt{out}. Constructs a character sequence \texttt{seq}. If \texttt{c} has type \texttt{char} and the character type of the stream is not \texttt{char}, then \texttt{seq} consists of \texttt{out.widen(c)}; otherwise \texttt{seq} consists of \texttt{c}. Determines padding for \texttt{seq} as described in 31.7.6.3.1. Inserts \texttt{seq} into \texttt{out}. Calls \texttt{os.width(0)}.

\textbf{Returns:} \texttt{out}.

\begin{verbatim}
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const charT* s);
template<class charT, class traits>
    basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& out, const char* s);
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const char* s);
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const signed char* s);
    template<class traits>
    basic_ostream<char, traits>& operator<<(basic_ostream<char, traits>& out, const unsigned char* s);
\end{verbatim}

\textbf{Preconditions:} \texttt{s} is not a null pointer.

\textbf{Effects:} Behaves like a formatted inserter (as described in 31.7.6.3.1) of \texttt{out}. Creates a character sequence \texttt{seq} of \texttt{n} characters starting at \texttt{s}, each widened using \texttt{out.widen()} (31.5.4.3), where \texttt{n} is the number that would be computed as if by:

\begin{itemize}
  \item \texttt{traits::length(s)} for the overload where the first argument is of type \texttt{basic_ostream<charT, traits>&} and the second is of type \texttt{const charT*}, and also for the overload where the first argument is of type \texttt{basic_ostream<char, traits>&} and the second is of type \texttt{const char*},
  \item \texttt{char_traits<char>::length(s)} for the overload where the first argument is of type \texttt{basic_ostream<charT, traits>&} and the second is of type \texttt{const char*},
  \item \texttt{traits::length(reinterpret_cast<const char*>(s))} for the other two overloads.
\end{itemize}

Determines padding for \texttt{seq} as described in 31.7.6.3.1. Inserts \texttt{seq} into \texttt{out}. Calls \texttt{width(0)}.

\textbf{Returns:} \texttt{out}.
31.7.6.3.5 Print

```
template<class... Args>
void print(ostream& os, format_string<Args...> fmt, Args&&... args);
```

1. **Effects:** If the ordinary literal encoding (5.3) is UTF-8, equivalent to:
   
   \[ \text{vprint_unicode(os, fmt.str, make_format_args(std::forward<Args>(args))...);} \]

   Otherwise, equivalent to:
   
   \[ \text{vprint_nonunicode(os, fmt.str, make_format_args(std::forward<Args>(args))...);} \]

```
template<class... Args>
void println(ostream& os, format_string<Args...> fmt, Args&&... args);
```

2. **Effects:**Equivalent to:

   \[ \text{print(os, "{}\n", format(fmt, std::forward<Args>(args))...);} \]

```
void vprint_unicode(ostream& os, string_view fmt, format_args args);
void vprint_nonunicode(ostream& os, string_view fmt, format_args args);
```

3. **Effects:** Behaves as a formatted output function (31.7.6.3.1) of os, except that:

   - failure to generate output is reported as specified below, and
   - any exception thrown by the call to vformat is propagated without regard to the value of os.exceptions() and without turning on ios_base::badbit in the error state of os.

After constructing a sentry object, the function initializes an automatic variable via

\[ \text{string out = vformat(os.getloc(), fmt, args);} \]

If the function is vprint_unicode and os is a stream that refers to a terminal capable of displaying Unicode which is determined in an implementation-defined manner, writes out to the terminal using the native Unicode API; if out contains invalid code units, the behavior is undefined and implementations are encouraged to diagnose it. Otherwise (if os is not such a stream or the function is vprint_nonunicode), inserts the character sequence [out.begin(), out.end()) into os. If writing to the terminal or inserting into os fails, calls os.setstate(ios_base::badbit) (which may throw ios_base::failure).

```
Recommended practice: For vprint_unicode, if invoking the native Unicode API requires transcoding, implementations should substitute invalid code units with U+FFFD REPLACEMENT CHARACTER per The Unicode Standard Version 14.0 - Core Specification, Chapter 3.9.
```

31.7.6.4 Unformatted output functions

```
basic_ostream& put(char_type c);
```

2. **Effects:** Behaves as an unformatted output function (as described above). After constructing a sentry object, inserts the character c, if possible.

```
Otherwise, calls setstate(badbit) (which may throw ios_base::failure (31.5.4.4)).
```

4. **Returns:** *this.

```
basic_ostream& write(const char_type* s, streamsize n);
```

5. **Effects:** Behaves as an unformatted output function (as described above). After constructing a sentry object, obtains characters to insert from successive locations of an array whose first element is designated by s. Characters are inserted until either of the following occurs:

   - n characters are inserted;

---

305 This is done without causing an ios_base::failure to be thrown.
306 Note that this function is not overloaded on types signed char and unsigned char.
307 Note that this function is not overloaded on types signed char and unsigned char.
— inserting in the output sequence fails (in which case the function calls `setstate(badbit)`), which may throw `ios_base::failure (31.5.4.4)`).

6

Returns: `*this`.

```cpp
basic_ostream& flush();
```

Effects: Behaves as an unformatted output function (as described above). If `rdbuf()` is not a null pointer, constructs a `sentry` object. If that object returns `true` when converted to a value of type `bool` the function calls `rdbuf()->pubsync()`. If that function returns `-1` calls `setstate(badbit)` (which may throw `ios_base::failure (31.5.4.4)`). Otherwise, if the `sentry` object returns `false`, does nothing.

8

Returns: `*this`.

31.7.6.5 Standard manipulators

Each instantiation of any of the function templates specified in this subclause is a designated addressable function (16.4.5.2.1).

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& endl(basic_ostream<charT, traits>& os);
```

2

Effects: Calls `os.put(os.widen(\'\n\'))`, then `os.flush()`.

3

Returns: `os`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& ends(basic_ostream<charT, traits>& os);
```

4

Effects: Inserts a null character into the output sequence: calls `os.put(charT())`.

5

Returns: `os`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& flush(basic_ostream<charT, traits>& os);
```

6

Effects: Calls `os.flush()`.

7

Returns: `os`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& emit_on_flush(basic_ostream<charT, traits>& os);
```

8

Effects: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(true)`. Otherwise this manipulator has no effect.

[Note 1: To work around the issue that the `Allocator` template argument cannot be deduced, implementations can introduce an intermediate base class to `basic_syncbuf` that manages its `emit_on_sync` flag. — end note]

9

Returns: `os`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& noemit_on_flush(basic_ostream<charT, traits>& os);
```

10

Effects: If `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, calls `buf->set_emit_on_sync(false)`. Otherwise this manipulator has no effect.

11

Returns: `os`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>& flush_emit(basic_ostream<charT, traits>& os);
```

12

Effects: Calls `os.flush()`. Then, if `os.rdbuf()` is a `basic_syncbuf<charT, traits, Allocator>*`, called `buf` for the purpose of exposition, behaves as an unformatted output function (31.7.6.4) of `os`. After constructing a `sentry` object, calls `buf->emit()`. If that call returns `false`, calls `os.setstate(ios_base::badbit)`.

13

Returns: `os`.

31.7.6.6 Rvalue stream insertion

```cpp
template<class Ostream, class T>
§ 31.7.6.6 1637
1. The header `<iomanip>` defines several functions that support extractors and inserters that alter information maintained by class `ios_base` and its derived classes.

```
unspecified resetiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << resetiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> resetiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:
```

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
    // reset specified flags
    str.setf(ios_base::fmtflags(0), mask);
}
```

The expression `out << resetiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> resetiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setiosflags(ios_base::fmtflags mask);

Returns: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setiosflags(mask)` behaves as if it called `f(out, mask)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setiosflags(mask)` behaves as if it called `f(in, mask)`, where the function `f` is defined as:
```

```cpp
void f(ios_base& str, ios_base::fmtflags mask) {
    // set specified flags
    str.setf(mask);
}
```

The expression `out << setiosflags(mask)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setiosflags(mask)` has type `basic_istream<charT, traits>&` and value `in`.

```
unspecified setbase(int base);

Returns: An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression `out << setbase(base)` behaves as if it called `f(out, base)`, or if `in` is an object of type `basic_istream<charT, traits>` then the expression `in >> setbase(base)` behaves as if it called `f(in, base)`, where the function `f` is defined as:
```

```cpp
void f(ios_base& str, int base) {
    // set basefield
    str.setf(base == 8 ? ios_base::oct :
               base == 10 ? ios_base::dec :
               base == 16 ? ios_base::hex :
               ios_base::fmtflags(0), ios_base::basefield);
}
```

The expression `out << setbase(base)` has type `basic_ostream<charT, traits>&` and value `out`. The expression `in >> setbase(base)` has type `basic_istream<charT, traits>&` and value `in`.

---

Note: The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).

---

308) The expression `cin >> resetiosflags(ios_base::skipws)` clears `ios_base::skipws` in the format flags stored in the `basic_istream<charT, traits>` object `cin` (the same as `cin >> noskipws`), and the expression `cout << resetiosflags(ios_base::showbase)` clears `ios_base::showbase` in the format flags stored in the `basic_ostream<charT, traits>` object `cout` (the same as `cout << noshowbase`).
unspecified setfill(char_type c);
5
    Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> and c has type charT then the expression out << setfill(c) behaves as if it called f(out, c), where the function f is defined as:
    template<class charT, class traits>
    void f(basic_ios<charT, traits>& str, charT c) {
        // set fill character
        str.fill(c);
    }
    The expression out << setfill(c) has type basic_ostream<charT, traits>& and value out.

unspecified setprecision(int n);
6
    Returns: An object of unspecified type such that if out is an object of type basic_ostream<charT, traits> then the expression out << setprecision(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setprecision(n) behaves as if it called f(in, n), where the function f is defined as:
    void f(ios_base& str, int n) {
        // set precision
        str.precision(n);
    }
    The expression out << setprecision(n) has type basic_ostream<charT, traits>& and value out. The expression in >> setprecision(n) has type basic_istream<charT, traits>& and value in.

unspecified setw(int n);
7
    Returns: An object of unspecified type such that if out is an instance of basic_ostream<charT, traits> then the expression out << setw(n) behaves as if it called f(out, n), or if in is an object of type basic_istream<charT, traits> then the expression in >> setw(n) behaves as if it called f(in, n), where the function f is defined as:
    void f(ios_base& str, int n) {
        // set width
        str.width(n);
    }
    The expression out << setw(n) has type basic_ostream<charT, traits>& and value out. The expression in >> setw(n) has type basic_istream<charT, traits>& and value in.

31.7.8 Extended manipulators [ext.manip]

The header <iomanip> defines several functions that support extractors and inserters that allow for the parsing and formatting of sequences and values for money and time.

template<class moneyT> unspecified get_money(moneyT& mon, bool intl = false);
2
    Mandates: The type moneyT is either long double or a specialization of the basic_string template (Clause 23).

    Effects: The expression in >> get_money(mon, intl) described below behaves as a formatted input function (31.7.5.3.1).

    Returns: An object of unspecified type such that if in is an object of type basic_istream<charT, traits> then the expression in >> get_money(mon, intl) behaves as if it called f(in, mon, intl), where the function f is defined as:
    template<class charT, class traits, class moneyT>
    void f(basic_ios<charT, traits>& str, moneyT& mon, bool intl) {
        using Iter = istreambuf_iterator<charT, traits>;
        using MoneyGet = money_get<charT, Iter>
        ios_base::iostate err = ios_base::goodbit;
        const MoneyGet& mg = use_facet<MoneyGet>(str.getloc());
        mon = mg.get(Iter(str.rdbuf()), Iter(), intl, str, err, mon);
if (ios_base::goodbit != err)
    str.setstate(err);
}

The expression `in >> get_money(mon, intl)` has type `basic_istream<charT, traits>&` and value in.

template<class moneyT> unspecified put_money(const moneyT& mon, bool Intl = false);

*Mandates:* The type `moneyT` is either `long double` or a specialization of the `basic_string` template (Clause 23).

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression output `<< put_money(mon, Intl)` behaves as a formatted output function (31.7.6.3.1) that calls `f(out, mon, Intl)`, where the function `f` is defined as:

```cpp
template<class charT, class traits, class moneyT>
void f(basic_ios<charT, traits>& str, const moneyT& mon, bool Intl) {
    using Iter = ostreambuf_iterator<charT, traits>;
    using MoneyPut = money_put<charT, Iter>;
    const MoneyPut& mp = use_facet<MoneyPut>(str.getloc());
    const Iter end = mp.put(Iter(str.rdbuf()), Intl, str, str.fill(), mon);
    if (end.failed())
        str.setstate(ios_base::badbit);
}
```

The expression `out << put_money(mon, Intl)` has type `basic_ostream<charT, traits>&` and value in.

template<class charT> unspecified get_time(tm* tmb, const charT* fmt);

*Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt))` is a valid range.

*Returns:* An object of unspecified type such that if `in` is an object of type `basic_istream<charT, traits>` then the expression input `>> get_time(tmb, fmt)` behaves as if it called `f(in, tmb, fmt)`, where the function `f` is defined as:

```cpp
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, tm* tmb, const charT* fmt) {
    using Iter = istreambuf_iterator<charT, traits>;
    using TimeGet = time_get<charT, Iter>;
    ios_base::iostate err = ios_base::goodbit;
    const TimeGet& tg = use_facet<TimeGet>(str.getloc());
    tg.get(Iter(str.rdbuf()), Iter(), str, err, tmb, fmt, fmt + traits::length(fmt));
    if (err != ios_base::goodbit)
        str.setstate(err);
}
```

The expression `in >> get_time(tmb, fmt)` has type `basic_istream<charT, traits>&` and value in.

template<class charT> unspecified put_time(const tm* tmb, const charT* fmt);

*Preconditions:* The argument `tmb` is a valid pointer to an object of type `tm`, and `[fmt, fmt + char_traits<charT>::length(fmt))` is a valid range.

*Returns:* An object of unspecified type such that if `out` is an object of type `basic_ostream<charT, traits>` then the expression output `<< put_time(tmb, fmt)` behaves as if it called `f(out, tmb, fmt)`, where the function `f` is defined as:

```cpp
template<class charT, class traits>
void f(basic_ios<charT, traits>& str, const tm* tmb, const charT* fmt) {
    using Iter = ostreambuf_iterator<charT, traits>;
```
using TimePut = time_put<charT, Iter>;
const TimePut& tp = use_facet<TimePut>(str.getloc());
const Iter end = tp.put(Iter(str.rdbuf()), str, str.fill(), tmb,
    fmt, fmt + traits::length(fmt));
if (end.failed())
    str.setstate(ios_base::badbit);
}

The expression `out << put_time(tmb, fmt)` has type `basic_ostream<charT, traits>&` and value `out`.

### 31.7.9 Quoted manipulators

[Note 1: Quoted manipulators provide string insertion and extraction of quoted strings (for example, XML and CSV formats). Quoted manipulators are useful in ensuring that the content of a string with embedded spaces remains unchanged if inserted and then extracted via stream I/O. — end note]

```cpp
template<class charT>
unspecified quoted(const charT* s, charT delim = charT('"'), charT escape = charT('\\'));
```

Returns: An object of unspecified type such that if `out` is an instance of `basic_ostream` with member type `char_type` the same as `charT` and with member type `traits_type`, which in the second and third forms is the same as `traits`, then the expression `out << quoted(s, delim, escape)` behaves as a formatted output function (31.7.6.3.1) of `out`. This forms a character sequence `seq`, initially consisting of the following elements:

1. `<delim>`.
2. Each character in `s`. If the character to be output is equal to `escape` or `delim`, as determined by `traits_type::eq`, first output `escape`.
3. `<delim>`.

Let `x` be the number of elements initially in `seq`. Then padding is determined for `seq` as described in 31.7.6.3.1, `seq` is inserted as if by calling `out.rdbuf()->sputn(seq, n)`, where `n` is the larger of `out.width()` and `x`, and `out.width(0)` is called. The expression `out << quoted(s, delim, escape)` has type `basic_ostream<charT, traits>&` and value `out`.

```cpp
template<class charT, class traits, class Allocator>
unspecified quoted(const basic_string<charT, traits, Allocator>& s,
    charT delim = charT('"'), charT escape = charT('\\'));
```

```cpp
template<class charT, class traits>
unspecified quoted(basic_string_view<charT, traits> s,
    charT delim = charT('"'), charT escape = charT('\\'));
```

Returns: An object of unspecified type such that:

1. If `in` is an instance of `basic_istream` with member types `char_type` and `traits_type` the same as `charT` and `traits`, respectively, then the expression `in >> quoted(s, delim, escape)` behaves as if it extracts the following characters from `in` using `operator>>(basic_istream<charT, traits>&, charT&)` (31.7.5.3.3) which may throw `ios_base::failure` (31.5.2.2.1):
2. If the first character extracted is equal to `delim`, as determined by `traits_type::eq`, then:
3. Turn off the `skipws` flag.
4. `s.clear()`.
5. Until an unescaped `delim` character is reached or `!in`, extract characters from `in` and append them to `s`, except that if an `escape` is reached, ignore it and append the next character to `s`.
6. Discard the final `delim` character.
7. Restore the `skipws` flag to its original value.
N4917

© ISO/IEC
— Otherwise, in >> s.

(3.1.2)
(3.2)

— If out is an instance of basic_ostream with member types char_type and traits_type the
same as charT and traits, respectively, then the expression out << quoted(s, delim, escape)
behaves as specified for the const basic_string<charT, traits, Allocator>& overload of the
quoted function.

(3.3)

— The expression in >> quoted(s, delim, escape) has type basic_istream<charT, traits>&
and value in.

(3.4)

— The expression out << quoted(s, delim, escape) has type basic_ostream<charT, traits>&
and value out.

31.7.10

Print functions

[print.fun]

template<class... Args>
void print(format_string<Args...> fmt, Args&&... args);
1

Effects: Equivalent to:
print(stdout, fmt, std::forward<Args>(args)...);
template<class... Args>
void print(FILE* stream, format_string<Args...> fmt, Args&&... args);

2

Effects: If the ordinary literal encoding (5.3) is UTF-8, equivalent to:
vprint_unicode(stream, fmt.str , make_format_args(std::forward<Args>(args)...));

Otherwise, equivalent to:
vprint_nonunicode(stream, fmt.str , make_format_args(std::forward<Args>(args)...));
template<class... Args>
void println(format_string<Args...> fmt, Args&&... args);
3

Effects: Equivalent to:
println(stdout, fmt, std::forward<Args>(args)...);
template<class... Args>
void println(FILE* stream, format_string<Args...> fmt, Args&&... args);

4

Effects: Equivalent to:
print(stream, "{}\n", format(fmt, std::forward<Args>(args)...));
void vprint_unicode(string_view fmt, format_args args);

5

Effects: Equivalent to:
vprint_unicode(stdout, fmt, args);
void vprint_unicode(FILE* stream, string_view fmt, format_args args);

6

Preconditions: stream is a valid pointer to an output C stream.

7

Effects: The function initializes an automatic variable via
string out = vformat(fmt, args);

If stream refers to a terminal capable of displaying Unicode, writes out to the terminal using the
native Unicode API; if out contains invalid code units, the behavior is undefined and implementations
are encouraged to diagnose it. Otherwise writes out to stream unchanged.
[Note 1 : On POSIX and Windows, stream referring to a terminal means that, respectively, isatty(fileno(
stream)) and GetConsoleMode(_get_osfhandle(_fileno(stream)), ...) return nonzero. — end note]
[Note 2 : On Windows, the native Unicode API is WriteConsoleW. — end note]
8

Throws: Any exception thrown by the call to vformat (22.14.3). system_error if writing to the
terminal or stream fails. May throw bad_alloc.

9

Recommended practice: If invoking the native Unicode API requires transcoding, implementations
should substitute invalid code units with u+fffd replacement character per The Unicode Standard

§ 31.7.10

1642


void vprint_nonunicode(string_view fmt, format_args args);

Effects: Equivalent to:

vprint_nonunicode(stdout, fmt, args);

void vprint_nonunicode(FILE* stream, string_view fmt, format_args args);

Preconditions: stream is a valid pointer to an output C stream.

Effects: Writes the result of vformat(fmt, args) to stream.

Throws: Any exception thrown by the call to vformat (22.14.3). system_error if writing to stream fails. May throw bad_alloc.

31.8 String-based streams

31.8.1 Header <sstream> synopsis

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_stringbuf;

template<class charT, class traits, class Allocator>
    void swap(basic_stringbuf<charT, traits, Allocator>& x,
              basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

    }
}

§ 31.8.2.1 1644
protected:
  // 31.8.2.5, overridden virtual functions
  int_type underflow() override;
  int_type pbackfail(int_type c = traits::eof()) override;
  int_type overflow(int_type c = traits::eof()) override;
  basic_streambuf<charT, traits>* setbuf(charT*, streamsize) override;
  pos_type seekoff(off_type off, ios_base::seekdir way,
                   ios_base::openmode which = ios_base::in | ios_base::out) override;
  pos_type seekpos(pos_type sp,
                   ios_base::openmode which = ios_base::in | ios_base::out) override;

private:
  ios_base::openmode mode;
  // exposition only
  basic_string<charT, traits, Allocator> buf;
  // exposition only
  void init_buf_ptrs();
  // exposition only
};

The class basic_stringbuf is derived from basic_streambuf to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence can be initialized from, or made available as, an object of class basic_string.

For the sake of exposition, the maintained data and internal pointer initialization is presented here as:

(2.1) — ios_base::openmode mode, has in set if the input sequence can be read, and out set if the output sequence can be written.

(2.2) — basic_string<charT, traits, Allocator> buf contains the underlying character sequence.

(2.3) — init_buf_ptrs() sets the base class’ get area (31.6.3.4.2) and put area (31.6.3.4.3) pointers after initializing, moving from, or assigning to buf accordingly.

31.8.2.2 Constructors

explicit basic_stringbuf(ios_base::openmode which);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), and mode with which. It is implementation-defined whether the sequence pointers (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) are initialized to null pointers.

Postconditions: str().empty() is true.

explicit basic_stringbuf(  
  const basic_string<charT, traits, Allocator>& s,
  ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with s, then calls init_buf_ptrs().

basic_stringbuf(ios_base::openmode which, const Allocator &a);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with a, then calls init_buf_ptrs().

Postconditions: str().empty() is true.

explicit basic_stringbuf(  
  basic_string<charT, traits, Allocator>&& s,
  ios_base::openmode which = ios_base::in | ios_base::out);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with std::move(s), then calls init_buf_ptrs().

template<class SAlloc>
basic_stringbuf(  
  const basic_string<charT, traits, SAlloc>& s,
  basic_stringbuf<charT, traits, SAlloc>&& s,
ios_base::openmode which, const Allocator &a);

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with {s,a}, then calls init_buf_ptrs().

template<class SAlloc>
external basic_stringbuf(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in | ios_base::out);

Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Initializes the base class with basic_streambuf() (31.6.3.2), mode with which, and buf with s, then calls init_buf_ptrs().

basic_stringbuf(basic_stringbuf&& rhs);

Effects: Copy constructs the base class from rhs and initializes mode with rhs.mode. In the first form buf is initialized from std::move(rhs).str(). In the second form buf is initialized from {std::move(rhs).str(), a}. It is implementation-defined whether the sequence pointers in *this (eback(), gptr(), egptr(), pbase(), pptr(), epptr()) obtain the values which rhs had.

Postconditions: Let rhs_p refer to the state of rhs just prior to this construction and let rhs_a refer to the state of rhs just after this construction.

(11.1) — str() == rhs_p.str()
(11.2) — gptr() - eback() == rhs_p.gptr() - rhs_p.eback()
(11.3) — egptr() - eback() == rhs_p.egptr() - rhs_p.eback()
(11.4) — pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()
(11.5) — epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()
(11.6) — if (eback()) eback() != rhs_a.eback()
(11.7) — if (gptr()) gptr() != rhs_a.gptr()
(11.8) — if (egptr()) egptr() != rhs_a.egptr()
(11.9) — if (pbase()) pbase() != rhs_a.pbase()
(11.10) — if (pptr()) pptr() != rhs_a.pptr()
(11.11) — if (epptr()) epptr() != rhs_a.epptr()
(11.12) — getloc() == rhs_p.getloc()
(11.13) — rhs is empty but usable, as if std::move(rhs).str() was called.

31.8.2.3 Assignment and swap

basic_stringbuf& operator=(basic_stringbuf&& rhs);

Effects: After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.8.2.2).

Returns: *this.

void swap(basic_stringbuf& rhs) noexcept(see below);

Preconditions: allocator_traits<Allocator>::propagate_on_container_swap::value is true or get_allocator() == rhs.get_allocator() is true.

Effects: Exchanges the state of *this and rhs.

Remarks: The exception specification is equivalent to:

allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value.

template<class charT, class traits, class Allocator> void swap(basic_stringbuf<charT, traits, Allocator>& x, basic_stringbuf<charT, traits, Allocator>& y) noexcept(noexcept(x.swap(y)));

Effects: Equivalent to: x.swap(y).
## 31.8.2.4 Member functions

The member functions getting the underlying character sequence all refer to a **high_mark** value, where **high_mark** represents the position one past the highest initialized character in the buffer. Characters can be initialized by writing to the stream, by constructing the basic_stringbuf passing a basic_string argument, or by calling one of the str member functions passing a basic_string as an argument. In the latter case, all characters initialized prior to the call are now considered uninitialized (except for those characters re-initialized by the new basic_string).

```cpp
void init_buf_ptrs(); // exposition only
```

**Effects:** Initializes the input and output sequences from buf according to mode.

### Postconditions:

1. If ios_base::out is set in mode, pbase() points to buf.front() and eptr() >= pbase() + buf.size() is true;
2. in addition, if ios_base::ate is set in mode, pptr() == pbase() + buf.size() is true;
3. otherwise pptr() == pbase() is true.

### Note 1:
For efficiency reasons, stream buffer operations can violate invariants of buf while it is held encapsulated in the basic_stringbuf, e.g., by writing to characters in the range [buf.data() + buf.size(), buf.data() + buf.capacity()). All operations retrieving a basic_string from buf ensure that the basic_string invariants hold on the returned value. —end note

```cpp
allocator_type get_allocator() const noexcept;
```

**Returns:** buf.get_allocator().

```cpp
basic_string<charT, traits, Allocator> str() const &;
```

**Effects:** Equivalent to:

```
return basic_string<charT, traits, Allocator>(view(), get_allocator());
```

### Template:

```cpp
template<class SAlloc>
basic_string<charT, traits, SAlloc> str(const SAlloc& sa) const;
```

**Constraints:** SAlloc is a type that qualifies as an allocator (24.2.2.1).

**Effects:** Equivalent to:

```
return basic_string<charT, traits, SAlloc>(view(), sa);
```

```cpp
basic_string_view<charT, traits, Allocator> view() const noexcept;
```

**Returns:** A basic_string_view<charT, traits, Allocator> object move constructed from the basic_stringbuf's underlying character sequence in buf. This can be achieved by first adjusting buf to have the same content as view().

### Note 2:
Using the returned sv object after destruction or invalidation of the character sequence underlying *this is undefined behavior, unless sv.empty() is true. —end note

```cpp
void str(const basic_string<charT, traits, Allocator>& s);
```

**Effects:** Equivalent to:
buf = s;
init_buf_ptrs();

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

15 Constraints: is_same_v<SAlloc, Allocator> is false.

Effects: Equivalent to:
buf = s;
init_buf_ptrs();

void str(basic_string<charT, traits, Allocator>&& s);

17 Effects: Equivalent to:
buf = std::move(s);
init_buf_ptrs();

31.8.2.5 Overridden virtual functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>int_type underflow()</code></td>
<td>Returns: If the input sequence has a read position available, returns <code>traits::to_int_type(*gptr())</code>. Otherwise, returns <code>traits::eof()</code>. Any character in the underlying buffer which has been initialized is considered to be part of the input sequence.</td>
</tr>
<tr>
<td><code>int_type pbackfail(int_type c = traits::eof()) override;</code></td>
<td>Effects: Puts back the character designated by c to the input sequence, if possible, in one of three ways:</td>
</tr>
</tbody>
</table>
| | (2.1) If `traits::eq_int_type(c, traits::eof())` returns false and if the input sequence has a putback position available, and if `traits::eq(to_char_type(c), gptr()[-1])` returns true, assigns `gptr() - 1` to `gptr()`.
| | Returns: c. |
| | (2.2) If `traits::eq_int_type(c, traits::eof())` returns false and if the input sequence has a putback position available, and if `mode & ios_base::out` is nonzero, assigns c to `*--gptr()`.
| | Returns: c. |
| | (2.3) If `traits::eq_int_type(c, traits::eof())` returns true and if the input sequence has a putback position available, assigns `gptr() - 1` to `gptr()`.
| | Returns: `traits::not_eof(c)`. |
| `int_type overflow(int_type c = traits::eof()) override;` | Effects: Appends the character designated by c to the output sequence, if possible, in one of two ways: |
| | (5.1) If `traits::eq_int_type(c, traits::eof())` returns false and if either the output sequence has a write position available or the function makes a write position available (as described below), the function calls `sputc(c)`.
| | Signals success by returning c. |
| | (5.2) If `traits::eq_int_type(c, traits::eof())` returns true, there is no character to append. |
| | Signals success by returning a value other than `traits::eof()`. |
| `Remarks:` | As specified above, or `traits::eof()` to indicate failure. |
| `Remarks:` | If the function can succeed in more than one of these ways, it is unspecified which way is chosen. |

§ 31.8.2.5
pos_type seekoff(off_type off, ios_base::seekdir way,
    ios_base::openmode which = ios_base::in | ios_base::out) override;

Effects: Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 127.

Table 127: seekoff positioning

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>ios_base::in is set in which</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>ios_base::out is set in which</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>both ios_base::in and ios_base::out</td>
<td>positions both the input and the output sequences</td>
</tr>
<tr>
<td>are set in which and either</td>
<td></td>
</tr>
<tr>
<td>way == ios_base::beg or</td>
<td></td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td></td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, the function determines newoff as indicated in Table 128. If the sequence’s next pointer (either gptr() or pptr()) is a null pointer and newoff is nonzero, the positioning operation fails.

Table 128: newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios_base::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios_base::cur</td>
<td>the next pointer minus the begin-</td>
</tr>
<tr>
<td></td>
<td>ning pointer (xnext - xbeg).</td>
</tr>
<tr>
<td>way == ios_base::end</td>
<td>the high mark pointer minus the</td>
</tr>
<tr>
<td></td>
<td>beginning pointer (high_mark - xbeg).</td>
</tr>
</tbody>
</table>

If (newoff + off) < 0, or if newoff + off refers to an uninitialized character (31.8.2.4), the positioning operation fails. Otherwise, the function assigns xbeg + newoff + off to the next pointer xnext.

Returns: pos_type(newoff), constructed from the resultant offset newoff (of type off_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is pos_type(off_type(-1)).

pos_type seekpos(pos_type sp,
    ios_base::openmode which = ios_base::in | ios_base::out) override;

Effects: Equivalent to seekoff(off_type(sp), ios_base::beg, which).

Returns: sp to indicate success, or pos_type(off_type(-1)) to indicate failure.

basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;

Effects: implementation-defined, except that setbuf(0, 0) has no effect.

Returns: this.

31.8.3 Class template basic_istringstream

31.8.3.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>,
        class Allocator = allocator<charT>>
    class basic_istringstream : public basic_istream<charT, traits> {
        public:
            using char_type = charT;

basic_istringstream(basic_istringstream&& rhs);
basic_istringstream& operator=(const basic_istringstream&) = delete;
basic_istringstream& operator=(basic_istringstream&& rhs);

// 31.8.3.3, swap
void swap(basic_istringstream& rhs);

// 31.8.3.4, members
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
basic_string<charT, traits, Allocator> str() const &;
template<class SAlloc>
basic_string<charT, traits, SAlloc> str() const &;
basic_string<charT, traits, Allocator> str() &&;
basic_string_view<charT, traits> view() const noexcept;
void str(const basic_string<charT, traits, Allocator>& s);
template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);
void str(basic_string<charT, traits, Allocator>&& s);

private:
basic_stringbuf<charT, traits, Allocator> sb;  // exposition only
};

1 The class basic_istringstream<charT, traits, Allocator> supports reading objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) sb, the stringbuf object.
31.8.3.2 Constructors

```cpp
explicit basic_istringstream(ios_base::openmode which);

Effects: Initializes the base class with basic_istream<char, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<char, traits, Allocator>(which | ios_base::in) (31.8.2.2).
```

```cpp
explicit basic_istringstream(
    const basic_string<char, traits, Allocator>& s,
    ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<char, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<char, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).
```

```cpp
basic_istringstream(ios_base::openmode which, const Allocator& a);

Effects: Initializes the base class with basic_istream<char, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<char, traits, Allocator>(which | ios_base::in, a) (31.8.2.2).
```

```cpp
explicit basic_istringstream(
    basic_string<char, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<char, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<char, traits, Allocator>(std::move(s), which | ios_base::in) (31.8.2.2).
```

```cpp
template<class SAlloc>
basic_istringstream(
    const basic_string<char, traits, SAlloc>& s,
    ios_base::openmode which, const Allocator& a);

Effects: Initializes the base class with basic_istream<char, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<char, traits, Allocator>(s, which | ios_base::in, a) (31.8.2.2).
```

```cpp
template<class SAlloc>
explicit basic_istringstream(
    const basic_string<char, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::in);

Effects: Initializes the base class with basic_istream<char, traits>(addressof(sb)) (31.7.5.2) and sb with basic_stringbuf<char, traits, Allocator>(s, which | ios_base::in) (31.8.2.2).
```

```cpp
basic_istringstream(basic_istringstream&& rhs);

Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the base class, and the contained basic_stringbuf. Then calls basic_istream<char, traits>::set_rdbuf(addressof(sb)) to install the contained basic_stringbuf.
```

31.8.3.3 Swap

```cpp
void swap(basic_istringstream& rhs);

Effects: Equivalent to:
    basic_istream<char, traits>::swap(rhs);
    sb.swap(rhs.sb);
```

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_istringstream<charT, traits, Allocator>& x,
    basic_istringstream<charT, traits, Allocator>& y);

Effects: Equivalent to: x.swap(y).
```

31.8.3.4 Member functions

```cpp
basic_stringbuf<char, traits, Allocator>* rdbuf() const;

Returns: const_cast<basic_stringbuf<char, traits, Allocator>*>(addressof(sb)).
```
basic_string<
charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<
charT, traits, SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<
charT, traits, Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<
charT, traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<
charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<
charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<
charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

31.8.4 Class template basic_ostringstream

31.8.4.1 General

namespace std {

template<class charT, class traits = char_traits<charT>,
class Allocator = allocator<charT>>
class basic_ostringstream : public basic_ostream<charT, traits> {

public:
using char_type = charT;
using int_type = typename traits::int_type;
using pos_type = typename traits::pos_type;

void str(basic_string<charT, traits, Allocator>&& s);

private:

basic_stringbuf<charT, traits, Allocator> sb; // exposition only
};

The class basic_ostringstream<charT, traits, Allocator> supports writing objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf object to control the associated storage. For the sake of exposition, the maintained data is presented here as:

(1.1) — sb, the stringbuf object.

§ 31.8.4.2  Constructors

explicit basic_ostringstream(ios_base::openmode which);

1 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out) (31.8.2.2).

explicit basic_ostringstream(const basic_string<charT, traits, Allocator>& s,

ios_base::openmode which = ios_base::out);

2 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

basic_ostringstream(ios_base::openmode which, const Allocator& a);

3 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(which | ios_base::out, a) (31.8.2.2).

explicit basic_ostringstream(

basic_string<charT, traits, Allocator>&& s,

ios_base::openmode which = ios_base::out);

4 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(std::move(s), which | ios_base::out) (31.8.2.2).

template<class SAlloc>

basic_ostringstream(SAlloc*

basic_ostringstream(SAlloc* s,

ios_base::openmode which, const Allocator& a);

5 Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2) and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out, a) (31.8.2.2).
template<class SAlloc>
  explicit basic_ostringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out);

  Constraints: is_same_v<SAlloc, Allocator> is false.

  Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) (31.7.6.2)
  and sb with basic_stringbuf<charT, traits, Allocator>(s, which | ios_base::out) (31.8.2.2).

  basic_ostringstream(basic_ostringstream&& rhs);

  Effects: Move constructs from the rvalue rhs. This is accomplished by move constructing the
  base class, and the contained basic_stringbuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb))
  to install the contained basic_stringbuf.

31.8.4.3 Swap

  void swap(basic_ostringstream& rhs);

  Effects: Equivalent to:
  basic_ostream<charT, traits>::swap(rhs);
  sb.swap(rhs.sb);

  template<class charT, class traits, class Allocator>
  void swap(basic_ostringstream<charT, traits, Allocator>& x,
            basic_ostringstream<charT, traits, Allocator>& y);

  Effects: Equivalent to: x.swap(y).

31.8.4.4 Member functions

  basic_stringbuf<charT, traits, Allocator>* rdbuf() const;

  Returns: const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb)).

  basic_string<charT, traits, Allocator> str() const &;

  Effects: Equivalent to: return rdbuf()->str();

  template<class SAlloc>
  basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;

  Effects: Equivalent to: return rdbuf()->str(sa);

  basic_string<charT,traits,Allocator> str() &&;

  Effects: Equivalent to: return std::move(*rdbuf()).str();

  basic_string_view<charT, traits> view() const noexcept;

  Effects: Equivalent to: return rdbuf()->view();

  void str(const basic_string<charT, traits, Allocator>& s);

  Effects: Equivalent to: rdbuf()->str(s);

  template<class SAlloc>
  void str(const basic_string<charT, traits, SAlloc>& s);

  Effects: Equivalent to: rdbuf()->str(s);

  void str(basic_string<charT, traits, Allocator>&& s);

  Effects: Equivalent to: rdbuf()->str(std::move(s));

31.8.5 Class template basic_stringstream

31.8.5.1 General

  namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>

  § 31.8.5.1 1654
class basic_stringstream : public basic_iostream<charT, traits> {
public:
using char_type = charT;
using int_type = typename traits::int_type;
using pos_type = typename traits::pos_type;
using off_type = typename traits::off_type;
using traits_type = traits;

void str(const basic_string<charT, traits, Allocator>& s);  
    template<class SAlloc>
        void str(const basic_string<charT, traits, SAlloc>& s);  
    void str(basic_string<charT, traits, Allocator>&& s);  

private:
    basic_stringbuf<charT, traits> sb; // exposition only
};  

1 The class template basic_stringstream<charT, traits> supports reading and writing from objects of class basic_string<charT, traits, Allocator>. It uses a basic_stringbuf<charT, traits, Allocator> object to control the associated sequence. For the sake of exposition, the maintained data is presented here as

---

1.1 — sb, the stringbuf object.
31.8.5.2 Constructors

```cpp
explicit basic_stringstream(ios_base::openmode which);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which)`.

```cpp
explicit basic_stringstream(
    const basic_string<charT, traits, Allocator>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which)`.

```cpp
basic_stringstream(ios_base::openmode which, const Allocator& a);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(which, a)` (31.8.2.2).

```cpp
explicit basic_stringstream(
    basic_string<charT, traits, Allocator>&& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(std::move(s), which)` (31.8.2.2).

```cpp
template<class SAlloc>
basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2).

```cpp
template<class SAlloc>
explicit basic_stringstream(
    const basic_string<charT, traits, SAlloc>& s,
    ios_base::openmode which = ios_base::out | ios_base::in);
```

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` (31.7.5.7.2) and `sb` with `basic_stringbuf<charT, traits, Allocator>(s, which, a)` (31.8.2.2).

```cpp
basic_stringstream(basic_stringstream&& rhs);
```

*Effects:* Move constructs from the rvalue `rhs`. This is accomplished by move constructing the base class, and the contained `basic_stringbuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_stringbuf`.

31.8.5.3 Swap

```cpp
void swap(basic_stringstream& rhs);
```

*Effects:* Equivalent to:

```cpp
    basic_iostream<charT, traits>::swap(rhs);
    sb.swap(rhs.sb);
```

```cpp
template<class charT, class traits, class Allocator>
void swap(basic_stringstream<charT, traits, Allocator>& x,
    basic_stringstream<charT, traits, Allocator>& y);
```

*Effects:* Equivalent to: `x.swap(y)`.

31.8.5.4 Member functions

```cpp
basic_stringbuf<charT, traits, Allocator>* rdbuf() const;
```

*Returns:* `const_cast<basic_stringbuf<charT, traits, Allocator>*>(addressof(sb))`.
basic_string<charT, traits, Allocator> str() const &;

Effects: Equivalent to: return rdbuf()->str();

template<class SAlloc>
basic_string<charT,traits,SAlloc> str(const SAlloc& sa) const;

Effects: Equivalent to: return rdbuf()->str(sa);

basic_string<charT,traits,Allocator> str() &&;

Effects: Equivalent to: return std::move(*rdbuf()).str();

basic_string_view<charT, traits> view() const noexcept;

Effects: Equivalent to: return rdbuf()->view();

void str(const basic_string<charT, traits, Allocator>& s);

Effects: Equivalent to: rdbuf()->str(s);

template<class SAlloc>
void str(const basic_string<charT, traits, SAlloc>& s);

Effects: Equivalent to: rdbuf()->str(s);

void str(basic_string<charT, traits, Allocator>&& s);

Effects: Equivalent to: rdbuf()->str(std::move(s));

31.9 Span-based streams

31.9.1 Overview

The header <spanstream> defines class templates and types that associate stream buffers with objects whose types are specializations of span as described in 24.7.3.

[Note 1: A user of these classes is responsible for ensuring that the character sequence represented by the given span outlives the use of objects by the classes in subclause 31.9. Using multiple basic_spanbuf objects referring to overlapping underlying sequences from different threads, where at least one basic_spanbuf object is used for writing to the sequence, results in a data race. —end note]

31.9.2 Header <spanstream> synopsis

namespace std {
  template<class charT, class traits = char_traits<charT>>
    class basic_spanbuf;

  template<class charT, class traits>
    void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);

  using spanbuf = basic_spanbuf<char>;
  using wspanbuf = basic_spanbuf<wchar_t>;

  template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream;

  template<class charT, class traits>
    void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);

  using ispanstream = basic_ispanstream<char>;
  using wispanstream = basic_ispanstream<wchar_t>;

  template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream;

  template<class charT, class traits>
    void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

  using ospanstream = basic_ospanstream<char>;
  using wospanstream = basic_ospanstream<wchar_t>;

§ 31.9.2 1657
The class template `basic_spanbuf` is derived from `basic_streambuf` to associate possibly the input sequence and possibly the output sequence with a sequence of arbitrary characters. The sequence is provided by an object of class `span<charT>`.

For the sake of exposition, the maintained data is presented here as:

1. `ios_base::openmode mode`, has `in` set if the input sequence can be read, and `out` set if the output sequence can be written.
2. `std::span<charT> buf` is the view to the underlying character sequence.
31.9.3.2 Constructors
[spanbuf.cons]

```cpp
explicit basic_spanbuf(std::span<charT> s, 
    ios_base::openmode which = ios_base::in | ios_base::out);
```

**Effects:** Initializes the base class with `basic_streambuf()` (31.6.3.2), and `mode` with which. Initializes the internal pointers as if calling `span(s)`.

```cpp
basic_spanbuf(basic_spanbuf&& rhs);
```

**Effects:** Initializes the base class with `std::move(rhs)` and `mode` with `std::move(rhs.mode)` and `buf` with `std::move(rhs.buf)`. The sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. It is implementation-defined whether `rhs.buf.empty()` returns `true` after the move.

**Postconditions:** Let `rhs.p` refer to the state of `rhs` just prior to this construction.

1. `span().data() == rhs.p.span().data()`
2. `span().size() == rhs.p.span().size()`
3. `eback() == rhs.p.eback()`
4. `gptr() == rhs.p.gptr()`
5. `egptr() == rhs.p.egptr()`
6. `pbase() == rhs.p.pbase()`
7. `pptr() == rhs.p.pptr()`
8. `epptr() == rhs.p.epptr()`
9. `getloc() == rhs.p.getloc()`

31.9.3.3 Assignment and swap
[spanbuf.assign]

```cpp
basic_spanbuf& operator=(basic_spanbuf&& rhs);
```

**Effects:** Equivalent to:

```cpp
basic_spanbuf tmp{std::move(rhs)};
this->swap(tmp);
return *this;
```

```cpp
void swap(basic_spanbuf& rhs);
```

**Effects:** Equivalent to:

```cpp
basic_streambuf<charT, traits>::swap(rhs);
std::swap(mode, rhs.mode);
std::swap(buf, rhs.buf);
```

```cpp
template<class charT, class traits>
void swap(basic_spanbuf<charT, traits>& x, basic_spanbuf<charT, traits>& y);
```

**Effects:** Equivalent to `x.swap(y)`.

31.9.3.4 Member functions
[spanbuf.members]

```cpp
std::span<charT> span() const noexcept;
```

**Returns:** If `ios_base::out` is set in `mode`, returns `std::span<charT>(pbase(), pptr())`, otherwise returns `buf`.

[Note 1: In contrast to `basic_stringbuf`, the underlying sequence never grows and is not owned. An owning copy can be obtained by converting the result to `basic_string<charT>`.

--- end note]}

```cpp
void span(std::span<charT> s) noexcept;
```

**Effects:** `buf = s`. Initializes the input and output sequences according to `mode`.

**Postconditions:**

1. If `ios_base::out` is set in `mode`, `pbase() == s.data() & eptr() == pbase() + s.size()` is true;
2. In addition, if `ios_base::ate` is set in `mode`, `pptr() == pbase() + s.size()` is true,
— otherwise \(pptr() == pbase()\) is true.

If \(ios\_base::in\) is set in \(mode\), \(eback() == s\_data() && gptr() == eback() && egptr() == eback() + s\_size()\) is true.

### 31.9.3.5 Overridden virtual functions

1 [Note 1: Because the underlying buffer is of fixed size, neither overflow, underflow, nor \(pbackfail\) can provide useful behavior. —end note]

```cpp
pos_type seekoff(off_type off, ios_base::seekdir way, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects:** Alters the stream position within one or both of the controlled sequences, if possible, as follows:

1. If \(ios\_base::in\) is set in \(which\), positions the input sequence; \(x\_next\) is \(gptr()\), \(x\_beg\) is \(eback()\).
2. If \(ios\_base::out\) is set in \(which\), positions the output sequence; \(x\_next\) is \(pptr()\), \(x\_beg\) is \(pbase()\).

If both \(ios\_base::in\) and \(ios\_base::out\) are set in \(which\) and \(way\) is \(ios\_base::cur\), the positioning operation fails.

For a sequence to be positioned, if its next pointer \(x\_next\) (either \(gptr()\) or \(pptr()\)) is a null pointer and the new offset \(new\_off\) as computed below is nonzero, the positioning operation fails. Otherwise, the function determines \(base\_off\) as a value of type \(off\_type\) as follows:

1. \(0\) when \(way\) is \(ios\_base::beg\);
2. \((pptr() - pbase())\) for the output sequence, or \((gp\_ptr() - e\_back())\) for the input sequence when \(way\) is \(ios\_base::cur\);
3. when \(way\) is \(ios\_base::end\):
   1. \((pptr() - pbase())\) if \(ios\_base::out\) is set in \(mode\) and \(ios\_base::in\) is not set in \(mode\),
   2. \(buf\_size()\) otherwise.
4. If \(base\_off + off\) would overflow, or if \(base\_off + off\) is less than zero, or if \(base\_off + off\) is greater than \(buf\_size()\), the positioning operation fails. Otherwise, the function computes
   \(off\_type new\_off = base\_off + off;\)
   and assigns \(x\_beg + new\_off\) to the next pointer \(x\_next\).

5. **Returns:** \(pos\_type(off\_type(-1))\) if the positioning operation fails; \(pos\_type(new\_off)\) otherwise.

```cpp
pos_type seekpos(pos_type sp, ios_base::openmode which = ios_base::in | ios_base::out) override;
```

**Effects:** Equivalent to:

```
return seekoff(off_type(sp), ios_base::beg, which);
```

```cpp
basic_streambuf<charT, traits>* setbuf(charT* s, streamsize n) override;
```

**Effects:** Equivalent to:

```
this->span(std::span<charT>(s, n));
return this;
```

### 31.9.4 Class template basic_ispanstream

#### 31.9.4.1 General

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ispanstream :
        public basic_istream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
```
// 31.9.4.2, constructors
explicit basic_ispanstream(std::span<charT> s,
    ios_base::openmode which = ios_base::in);
basic_ispanstream(const basic_ispanstream&) = delete;
basic_ispanstream(basic_ispanstream&& rhs);
template<class ROS> explicit basic_ispanstream(ROS&& s);
basic_ispanstream& operator=(const basic_ispanstream&) = delete;
basic_ispanstream& operator=(basic_ispanstream&& rhs);

// 31.9.4.3, swap
void swap(basic_ispanstream& rhs);

// 31.9.4.4, member functions
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
std::span<const charT> span() const noexcept;
void span(std::span<charT> s) noexcept;
template<class ROS> void span(ROS&& s) noexcept;

private:
    basic_spanbuf<charT, traits> sb;    // exposition only
};

[Note 1: Constructing an ispanstream from a string-literal includes the termination character '\0' in the underlying spanbuf. — end note]

### 31.9.4.2 Constructors

**explicit basic_ispanstream(std::span<charT> s, ios_base::openmode which = ios_base::in);**

**Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which | ios_base::in)` (31.9.3.2).

**basic_ispanstream(basic_ispanstream&& rhs);**

**Effects:** Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

**template<class ROS> explicit basic_ispanstream(ROS&& s);**

**Constraints:** `ROS` models `ranges::borrowed_range`, `!convertible_to<ROS, std::span<charT>>` and `convertible_to<ROS, std::span<charT const>>` is true.

**Effects:** Let `sp` be `std::span<const charT>((std::forward<ROS>(s)).span(s).const_cast<charT*>(sp.data()), sp.size())`. Equivalent to `basic_ispanstream(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))`

### 31.9.4.3 Swap

**void swap(basic_ispanstream& rhs);**

**Effects:** Equivalent to:

- `basic_istream<charT, traits>::swap(rhs);`
- `sb.swap(rhs.sb);`

**template<class charT, class traits>
void swap(basic_ispanstream<charT, traits>& x, basic_ispanstream<charT, traits>& y);**

**Effects:** Equivalent to `x.swap(y)`.  

### 31.9.4.4 Member functions

**basic_spanbuf<charT, traits>* rdbuf() const noexcept;**

**Effects:** Equivalent to:

- `return const_cast.basic_spanbuf<charT, traits>*(addressof(sb));`
std::span<const charT> span() const noexcept;

Effects: Equivalent to: return rdbuf()->span();

void span(std::span<charT> s) noexcept;

Effects: Equivalent to rdbuf()->span(s).

template<class ROS> void span(ROS&& s) noexcept;

Constraints: ROS models ranges::borrowed_range. (!convertible_to<ROS, std::span<charT>> && & convert_to<ROS, std::span<const charT>> is true.

Effects: Let sp be std::span<const charT>(std::forward<ROS>(s)). Equivalent to:
this->span(std::span<charT>(const_cast<charT*>(sp.data()), sp.size()))

31.9.5 Class template basic_ospanstream

31.9.5.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ospanstream :
        public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.9.5.2, constructors
            explicit basic_ospanstream(std::span<charT> s,
                ios_base::openmode which = ios_base::out);
            basic_ospanstream(const basic_ospanstream&) = delete;
            basic_ospanstream(basic_ospanstream&& rhs);
            basic_ospanstream& operator=(const basic_ospanstream&) = delete;
            basic_ospanstream& operator=(basic_ospanstream&& rhs);

            // 31.9.5.3, swap
            void swap(basic_ospanstream& rhs);

            // 31.9.5.4, member functions
            basic_spanbuf<charT, traits>* rdbuf() const noexcept;
            std::span<charT> span() const noexcept;
            void span(std::span<charT> s) noexcept;
            private:
                basic_spanbuf<charT, traits> sb; // exposition only
        };
    }

31.9.5.2 Constructors

explicit basic_ospanstream(std::span<charT> s,
    ios_base::openmode which = ios_base::out);

Effects: Initializes the base class with basic_ostream<charT, traits>(addressof(sb)) and sb with
basic_spanbuf<charT, traits>(s, which | ios_base::out) (31.9.3.2).

basic_ospanstream(basic_ospanstream&& rhs) noexcept;

Effects: Initializes the base class with std::move(rhs) and sb with std::move(rhs.sb). Next, basic_os
_ostream<charT, traits>::set_rdbuf(addressof(sb)) is called to install the contained basic_os
spanbuf.
31.9.5.3 Swap

void swap(basic_ospanstream& rhs);

*Effects*: Equivalent to:

```cpp
basic_ostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

template<class charT, class traits>
void swap(basic_ospanstream<charT, traits>& x, basic_ospanstream<charT, traits>& y);

*Effects*: Equivalent to `x.swap(y).

31.9.5.4 Member functions

basic_spanbuf<charT, traits>* rdbuf() const noexcept;

*Effects*: Equivalent to:

```cpp
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

std::span<charT> span() const noexcept;

*Effects*: Equivalent to: return rdbuf()->span();

void span(std::span<charT> s) noexcept;

*Effects*: Equivalent to rdbuf()->span(s).

31.9.6 Class template basic_spanstream

31.9.6.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_spanstream :
        public basic_iostream<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;

        // 31.9.6.2, constructors
        explicit basic_spanstream(std::span<charT> s,
            ios_base::openmode which = ios_base::out | ios_base::in);
        basic_spanstream(const basic_spanstream&) = delete;
        basic_spanstream(basic_spanstream&& rhs);
        basic_spanstream& operator=(const basic_spanstream&) = delete;
        basic_spanstream& operator=(basic_spanstream&& rhs);

        // 31.9.6.3, swap
        void swap(basic_spanstream& rhs);

        // 31.9.6.4, members
        basic_spanbuf<charT, traits>* rdbuf() const noexcept;
        std::span<charT> span() const noexcept;
        void span(std::span<charT> s) noexcept;
    private:
        basic_spanbuf<charT, traits> sb;    // exposition only
    };
}
31.9.6.2 Constructors

```
explicit basic_spanstream(std::span<charT> s,
   ios_base::openmode which = ios_base::out | ios_base::in);
```

1 **Effects**: Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))` and `sb` with `basic_spanbuf<charT, traits>(s, which)` (31.9.3.2).

```
basic_spanstream(basic_spanstream&& rhs);
```

2 **Effects**: Initializes the base class with `std::move(rhs)` and `sb` with `std::move(rhs.sb)`. Next, `basic_iostream<charT, traits>::set_rdbuf(addressof(sb))` is called to install the contained `basic_spanbuf`.

31.9.6.3 Swap

```
void swap(basic_spanstream& rhs);
```

1 **Effects**: Equivalent to:

```
basic_iostream<charT, traits>::swap(rhs);
sb.swap(rhs.sb);
```

```
template<class charT, class traits>
void swap(basic_spanstream<charT, traits>& x, basic_spanstream<charT, traits>& y);
```

2 **Effects**: Equivalent to `x.swap(y)`.

31.9.6.4 Member functions

```
basic_spanbuf<charT, traits>* rdbuf() const noexcept;
```

1 **Effects**: Equivalent to:

```
return const_cast<basic_spanbuf<charT, traits>*>(addressof(sb));
```

```
std::span<charT> span() const noexcept;
```

2 **Effects**: Equivalent to: `return rdbuf()->span();`

```
void span(std::span<charT> s) noexcept;
```

3 **Effects**: Equivalent to `rdbuf()->span(s)`.

31.10 File-based streams

31.10.1 Header <fstream> synopsis

```
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf;

    template<class charT, class traits>
    void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);

    using filebuf = basic_filebuf<char>;
    using wfilebuf = basic_filebuf<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ifstream;

    template<class charT, class traits>
    void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

    using ifstream = basic_ifstream<char>;
    using wifstream = basic_ifstream<wchar_t>;

    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream;

    template<class charT, class traits>
    void swap(basic_ofstream<charT, traits>& x, basic_ofstream<charT, traits>& y);
```

§ 31.10.1 1664
using ofstream = basic_ofstream<char>;
using wofstream = basic_ofstream<wchar_t>;

template<class charT, class traits = char_traits<charT>>
class basic_fstream;

template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x, basic_fstream<charT, traits>& y);

using fstream = basic_fstream<char>;
using wfstream = basic_fstream<wchar_t>;

1 The header <fstream> defines four class templates and eight types that associate stream buffers with files and assist reading and writing files.

2 [Note 1: The class template basic_filebuf treats a file as a source or sink of bytes. In an environment that uses a large character set, the file typically holds multibyte character sequences and the basic_filebuf object converts those multibyte sequences into wide character sequences. — end note]

3 In subclause 31.10, member functions taking arguments of const filesystem::path::value_type* are only provided on systems where filesystem::path::value_type (31.12.6) is not char.

[Note 2: These functions enable class path support for systems with a wide native path character type, such as wchar_t. — end note]

31.10.2 Class template basic_filebuf

31.10.2.1 General

namespace std {

    template<class charT, class traits = char_traits<charT>>
    class basic_filebuf : public basic_streambuf<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

            // 31.10.2.2, constructors/destructor
            basic_filebuf();
            basic_filebuf(const basic_filebuf&) = delete;
            basic_filebuf(basic_filebuf&& rhs);
            virtual ~basic_filebuf();

            // 31.10.2.3, assignment and swap
            basic_filebuf& operator=(const basic_filebuf&) = delete;
            basic_filebuf& operator=(basic_filebuf&& rhs);
            void swap(basic_filebuf& rhs);

            // 31.10.2.4, members
            bool is_open() const;
            basic_filebuf* open(const char* s, ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path::value_type* s,
                                 ios_base::openmode mode); // wide systems only; see 31.10.1
            basic_filebuf* open(const string& s,
                                 ios_base::openmode mode);
            basic_filebuf* open(const filesystem::path& s,
                                 ios_base::openmode mode);
            basic_filebuf* close();

            protected:
            // 31.10.2.5, overridden virtual functions
            streamsize showmanyc() override;
            int_type underflow() override;
            int_type uflow() override;
    }
}
The class `basic_filebuf<charT, traits>` associates both the input sequence and the output sequence with a file.

The restrictions on reading and writing a sequence controlled by an object of class `basic_filebuf<charT, traits>` are the same as for reading and writing with the C standard library `FILE`s.

In particular:

1. If the file is not open for reading the input sequence cannot be read.
2. If the file is not open for writing the output sequence cannot be written.
3. A joint file position is maintained for both the input sequence and the output sequence.

An instance of `basic_filebuf` behaves as described in 31.10.2 provided `traits::pos_type` is `fpos<traits::state_type>`. Otherwise the behavior is undefined.

In order to support file I/O and multibyte/wide character conversion, conversions are performed using members of a facet, referred to as `a_codecvt` in following subclauses, obtained as if by

```c++
const codecvt<charT, char, typename traits::state_type>& a_codecvt = use_facet<codecvt<charT, char, typename traits::state_type>>(getloc());
```

### 31.10.2.2 Constructors

**basic_filebuf();**

1. **Effects**: Initializes the base class with `basic_streambuf<charT, traits>()` (31.6.3.2).
2. **Postconditions**: `is_open() == false`.

**basic_filebuf(basic_filebuf&& rhs);**

3. **Effects**: It is implementation-defined whether the sequence pointers in `*this` (`eback()`, `gptr()`, `egptr()`, `pbase()`, `pptr()`, `epptr()`) obtain the values which `rhs` had. Whether they do or not, `*this` and `rhs` reference separate buffers (if any at all) after the construction. Additionally `*this` references the file which `rhs` did before the construction, and `rhs` references no file after the construction. The `openmode`, `locale` and any other state of `rhs` is also copied.
4. **Postconditions**: Let `rhs_p` refer to the state of `rhs` just prior to this construction and let `rhs_a` refer to the state of `rhs` just after this construction.

- `is_open() == rhs_p.is_open()`
- `rhs_a.is_open() == false`
- `gptr() - eback() == rhs_p.gptr() - rhs_p.eback()`
- `egptr() - eback() == rhs_p.egptr() - rhs_p.eback()`
- `pptr() - pbase() == rhs_p.pptr() - rhs_p.pbase()`
- `epptr() - pbase() == rhs_p.epptr() - rhs_p.pbase()`
- `if (eback()) eback() != rhs_a.eback()`
- `if (gptr()) gptr() != rhs_a.gptr()`
- `if (egptr()) egptr() != rhs_a.egptr()`
virtual ~basic_filebuf();
5
Effects: Calls close(). If an exception occurs during the destruction of the object, including the call to close(), the exception is caught but not rethrown (see 16.4.6.13).

### 31.10.2.3 Assignment and swap

basic_filebuf& operator=(basic_filebuf&& rhs);
1
Effects: Calls close() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (see 31.10.2.2).
2
Returns: *this.

void swap(basic_filebuf& rhs);
3
Effects: Exchanges the state of *this and rhs.

template<class charT, class traits>
void swap(basic_filebuf<charT, traits>& x, basic_filebuf<charT, traits>& y);
4
Effects: Equivalent to: x.swap(y).

### 31.10.2.4 Member functions

bool is_open() const;
1
Returns: true if a previous call to open succeeded (returned a non-null value) and there has been no intervening call to close.

basic_filebuf* open(const char* s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path::value_type* s, ios_base::openmode mode); // wide systems only; see 31.10.1
2
Preconditions: s points to a NTCTS (3.37).
3
Effects: If is_open() != false, returns a null pointer. Otherwise, initializes the filebuf as required. It then opens the file to which s resolves, if possible, as if by a call to fopen with the second argument determined from mode & ~ios_base::ate as indicated in Table 129. If mode is not some combination of flags shown in the table then the open fails.
4
If the open operation succeeds and ios_base::ate is set in mode, positions the file to the end (as if by calling fseek(file, 0, SEEK_END), where file is the pointer returned by calling fopen).
5
If the repositioning operation fails, calls close() and returns a null pointer to indicate failure.
6
Returns: this if successful, a null pointer otherwise.

basic_filebuf* open(const string& s, ios_base::openmode mode);
basic_filebuf* open(const filesystem::path& s, ios_base::openmode mode);
7
Returns: open(s.c_str(), mode);

basic_filebuf* close();
8
Effects: If is_open() == false, returns a null pointer. If a put area exists, calls overflow(traits::eof()) to flush characters. If the last virtual member function called on *this (between underflow, overflow, seekoff, and seekpos) was overflow then calls a_codecvt.unshift (possibly several times) to determine a termination sequence, inserts those characters and calls overflow(traits::eof()) again. Finally, regardless of whether any of the preceding calls fails or throws an exception, the function closes the file (as if by calling fclose(file)). If any of the calls made by the function, including fclose, fails, close fails by returning a null pointer. If one of these calls throws an exception, the exception is caught and rethrown after closing the file.

309) The macro SEEK_END is defined, and the function signatures fopen(const char*, const char*) and fseek(FILE*, long, int) are declared, in <cstdio> (31.13.1).

</tbody>
</table>

9 Postconditions: is_open() == false.

10 Returns: this on success, a null pointer otherwise.

31.10.2.5 Overridden virtual functions

streamsize showmanyc() override;

1 Effects: Behaves the same as basic_streambuf::showmanyc() (31.6.3.5).

2 Remarks: An implementation may provide an overriding definition for this function signature if it can determine whether more characters can be read from the input sequence.

int_type underflow() override;

3 Effects: Behaves according to the description of basic_streambuf<charT, traits>::underflow(), with the specialization that a sequence of characters is read from the input sequence as if by reading from the associated file into an internal buffer (externBuf) and then as if by doing:

```cpp
char extern_buf[XSIZE];
char* extern_end;
charT intern_buf[ISIZE];
charT* intern_end;
codecvt_base::result r = a_codecvt.in(state, extern_buf, extern_buf+XSIZE, extern_end,
                                       intern_buf, intern_buf+ISIZE, intern_end);
```

This shall be done in such a way that the class can recover the position (fpos_t) corresponding to each character between intern_buf and intern_end. If the value of r indicates that a_codecvt.in() ran out of space in intern_buf, retry with a larger intern_buf.
int_type uflow() override;

**Effects:** Behaves according to the description of `basic_streambuf<charT, traits>::uflow()`, with the specialization that a sequence of characters is read from the input with the same method as used by `underflow`.

int_type pbackfail(int_type c = traits::eof()) override;

**Effects:** Puts back the character designated by `c` to the input sequence, if possible, in one of three ways:

1. If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if `traits::eq(to_char_type(c), gptr()[-1])` returns `true`, decrements the next pointer for the input sequence, `gptr()`.
   Returns: `c`.

2. If `traits::eq_int_type(c, traits::eof())` returns `false` and if the function makes a putback position available and if the function is permitted to assign to the putback position, decrements the next pointer for the input sequence, and stores `c` there.
   Returns: `c`.

3. If `traits::eq_int_type(c, traits::eof())` returns `true`, and if either the input sequence has a putback position available or the function makes a putback position available, decrements the next pointer for the input sequence, `gptr()`.
   Returns: `traits::not_eof(c)`.

**Returns:** As specified above, or `traits::eof()` to indicate failure.

**Remarks:** If `is_open() == false`, the function always fails.

The function does not put back a character directly to the input sequence.

If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

int_type overflow(int_type c = traits::eof()) override;

**Effects:** Behaves according to the description of `basic_streambuf<charT, traits>::overflow(c)`, except that the behavior of “consuming characters” is performed by first converting as if by:

```c
charT* b = pbase();
charT* p = pptr();
charT* end;
char xbuf[XSIZE];
char* xbuf_end;
codecvt_base::result r =
    a_codecvt.out(state, b, p, end, xbuf, xbuf+XSIZE, xbuf_end);
```

and then

1. If `r == codecvt_base::error` then fail.
2. If `r == codecvt_base::noconv` then output characters from `b` up to (and not including) `p`.
3. Otherwise output to the file characters from `xbuf` up to `xbuf_end`, and repeat using characters from `end` to `p`. If output fails, fail (without repeating).
4. Otherwise output from `xbuf` to `xbuf_end`, and fail if output fails. At this point if `b != p` and `b == end (xbuf isn’t large enough)` then increase `XSIZE` and repeat from the beginning.

**Returns:** `traits::not_eof(c)` to indicate success, and `traits::eof()` to indicate failure. If `is_open() == false`, the function always fails.

`basic_streambuf* setbuf(char_type* s, streamsize n) override;

**Effects:** If `setbuf(0, 0)` is called on a stream before any I/O has occurred on that stream, the stream becomes unbuffered. Otherwise the results are implementation-defined. “Unbuffered” means that `pbase()` and `pptr()` always return null and output to the file should appear as soon as possible.
Effects: Let \(\text{width}\) denote \(\text{a\_codecvt\_encoding()}\). If \(\text{is\_open()} == \text{false}\), or \(\text{off} \neq 0 \&\& \text{width} \leq 0\), then the positioning operation fails. Otherwise, if \(\text{way} \neq \text{basic\_ios\_cur}\) or \(\text{off} \neq 0\), and if the last operation was output, then update the output sequence and write any unshift sequence. Next, seek to the new position: if \(\text{width} > 0\), call \(\text{fseek(file, width * off, whence)}\), otherwise call \(\text{fseek(file, 0, whence)}\).

Returns: A newly constructed \texttt{pos\_type} object that stores the resultant stream position, if possible. If the positioning operation fails, or if the object cannot represent the resultant stream position, returns \texttt{pos\_type(off\_type(-1))}.

Remarks: “The last operation was output” means either the last virtual operation was overflow or the put buffer is non-empty. “Write any unshift sequence” means, if \(\text{width}\) if less than zero then call \(\text{a\_codecvt\_unshift(state, xbuf, xbuf+XSIZE, xbuf\_end)}\) and output the resulting unshift sequence. The function determines one of three values for the argument \texttt{whence}, of type \texttt{int}, as indicated in Table 130.

Table 130: \texttt{seekoff} effects  

<table>
<thead>
<tr>
<th>\texttt{way}</th>
<th>Value</th>
<th>\texttt{stdio} Equivalent</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{basic_ios_beg}</td>
<td>SEEK_SET</td>
<td></td>
</tr>
<tr>
<td>\texttt{basic_ios_cur}</td>
<td>SEEK_CUR</td>
<td></td>
</tr>
<tr>
<td>\texttt{basic_ios_end}</td>
<td>SEEK_END</td>
<td></td>
</tr>
</tbody>
</table>

\texttt{pos\_type seekpos(pos\_type \texttt{sp},}

\begin{verbatim}
    ios\_base\_openmode \texttt{which}
    = \texttt{ios\_base\_in \&\& ios\_base\_out}) override;
\end{verbatim}

Alters the file position, if possible, to correspond to the position stored in \texttt{sp} (as described below). Altering the file position performs as follows:

1. if \((\text{om} \& \text{ios\_base\_out}) \neq 0\), then update the output sequence and write any unshift sequence;
2. set the file position to \texttt{sp} as if by a call to \texttt{fsetpos};
3. if \((\text{om} \& \text{ios\_base\_in}) \neq 0\), then update the input sequence;

where \texttt{om} is the open mode passed to the last call to \texttt{open()}. The operation fails if \texttt{is\_open()} returns \texttt{false}.

If \texttt{sp} is an invalid stream position, or if the function positions neither sequence, the positioning operation fails. If \texttt{sp} has not been obtained by a previous successful call to one of the positioning functions (\texttt{seekoff} or \texttt{seekpos}) on the same file the effects are undefined.

Returns: \texttt{sp} on success. Otherwise returns \texttt{pos\_type(off\_type(-1))}.

\texttt{int sync()} override;

Effects: If a put area exists, calls \texttt{filebuf\_overflow} to write the characters to the file, then flushes the file as if by calling \texttt{fflush(file)}. If a get area exists, the effect is implementation-defined.

\texttt{void imbue(const locale& loc) override;}

Preconditions: If the file is not positioned at its beginning and the encoding of the current locale as determined by \texttt{a\_codecvt\_encoding()} is state-dependent (30.4.2.5.3) then that facet is the same as the corresponding facet of \texttt{loc}.

Effects: Causes characters inserted or extracted after this call to be converted according to \texttt{loc} until another call of \texttt{imbue}.

Remarks: This may require reconversion of previously converted characters. This in turn may require the implementation to be able to reconstruct the original contents of the file.

31.10.3 Class template \texttt{basic\_ifstream}  

31.10.3.1 General  

namespace std {
template<class charT, class traits = char_traits<charT>>
class basic_ifstream : public basic_istream<charT, traits> {
public:
  using char_type = charT;
  using int_type = typename traits::int_type;
  using pos_type = typename traits::pos_type;
  using off_type = typename traits::off_type;
  using traits_type = traits;

  // 31.10.3.2, constructors
  basic_ifstream();
  explicit basic_ifstream(const char* s,
                          ios_base::openmode mode = ios_base::in);
  explicit basic_ifstream(const filesystem::path::value_type* s,
                          ios_base::openmode mode = ios_base::in);
  // wide systems only; see 31.10.1
  explicit basic_ifstream(const string& s,
                          ios_base::openmode mode = ios_base::in);
  template<class T>
    explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);
  basic_ifstream(const basic_ifstream&) = delete;
  basic_ifstream(basic_ifstream&& rhs);
  basic_ifstream& operator=(const basic_ifstream&) = delete;
  basic_ifstream& operator=(basic_ifstream&& rhs);

  // 31.10.3.3, swap
  void swap(basic_ifstream& rhs);

  // 31.10.3.4, members
  basic_filebuf<charT, traits>* rdbuf() const;

  bool is_open() const;
  void open(const char* s, ios_base::openmode mode = ios_base::in);
  void open(const filesystem::path::value_type* s,
            ios_base::openmode mode = ios_base::in);
  // wide systems only; see 31.10.1
  void open(const string& s, ios_base::openmode mode = ios_base::in);
  void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);
  void close();

private:
  basic_filebuf<charT, traits> sb; // exposition only
};

1 The class `basic_ifstream<charT, traits>` supports reading from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

— `sb`, the filebuf object.

31.10.3.2 Constructors

1 basic_ifstream();

**Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2).

2 explicit basic_ifstream(const char* s,
                          ios_base::openmode mode = ios_base::in);

**Effects:** Initializes the base class with `basic_istream<charT, traits>(addressof(sb))` (31.7.5.2.2) and `sb` with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls `rdbuf()->open(s, mode | ios_base::in)`. If that function returns a null pointer, calls `setstate(failbit)`.

§ 31.10.3.2 1671
explicit basic_ifstream(const string& s,
    ios_base::openmode mode = ios_base::in);

Effects: Equivalent to: basic_ifstream(s.c_str(), mode).

template<class T>
explicit basic_ifstream(const T& s, ios_base::openmode mode = ios_base::in);

Constraints: is_same_v<T, filesystem::path> is true.

Effects: Equivalent to: basic_ifstream(s.c_str(), mode).

basic_ifstream(basic_ifstream&& rhs);

Effects: Move constructs the base class, and the contained basic_filebuf. Then calls basic_istream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

31.10.3.3 Swap

void swap(basic_ifstream& rhs);

Effects: Exchanges the state of *this and rhs by calling basic_istream<charT, traits>::swap(rhs) and sb.swap(rhs.sb).

template<class charT, class traits>
void swap(basic_ifstream<charT, traits>& x, basic_ifstream<charT, traits>& y);

Effects: Equivalent to: x.swap(y).

31.10.3.4 Member functions

basic_filebuf<charT, traits>* rdbuf() const;

Returns: const_cast<basic_filebuf<charT, traits>*>(addressof(sb)).

bool is_open() const;

Returns: rdbuf()->is_open().

void open(const char* s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in); // wide systems only; see 31.10.1

Effects: Calls rdbuf()->open(s, mode | ios_base::in). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

void open(const string& s, ios_base::openmode mode = ios_base::in);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::in);

Effects: Calls open(s.c_str(), mode).

void close();

Effects: Calls rdbuf()->close() and, if that function returns a null pointer, calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

31.10.4 Class template basic_ofstream

31.10.4.1 General

namespace std {
    template<class charT, class traits = char_traits<charT>>
    class basic_ofstream : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;

§ 31.10.4.1 1672
The class `basic_ofstream<charT, traits>` supports writing to named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequence. For the sake of exposition, the maintained data is presented here as:

---

(1.1) \(sb\), the `filebuf` object.

### 31.10.4.2 Constructors

#### [ofstream.cons]

---

**basic_ofstream();**

*Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and \(sb\) with `basic_filebuf<charT, traits>()` (31.10.2.2).

**explicit basic_ofstream(const char* s,****

```
ios_base::openmode mode = ios_base::out);
```

*Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and \(sb\) with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls \(rdbuf()->open(s, mode | ios_base::out)\). If that function returns a null pointer, calls \(setstate(failbit)\).

**explicit basic_ofstream(const filesystem::path::value_type* s,****

```
// wide systems only; see 31.10.1
ios_base::openmode mode = ios_base::out);
```

*Effects*: Initializes the base class with `basic_ostream<charT, traits>(addressof(sb))` (31.7.6.2.2) and \(sb\) with `basic_filebuf<charT, traits>()` (31.10.2.2), then calls \(rdbuf()->open(s, mode | ios_base::out)\). If that function returns a null pointer, calls `setstate(failbit)`.

**explicit basic_ofstream(const string& s,****

```
ios_base::openmode mode = ios_base::out);
```

*Effects*: Equivalent to: `basic_ofstream(s.c_str(), mode)`.

**template<class T>****

```
explicit basic_ofstream(const T& s, ios_base::openmode mode = ios_base::out);
```

*Constraints*: `is_same_v<T, filesystem::path>` is true.

*Effects*: Equivalent to: `basic_ofstream(s.c_str(), mode)`.
basic_ofstream(basic_ofstream&& rhs);

**Effects**: Move constructs the base class, and the contained basic_filebuf. Then calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)) to install the contained basic_filebuf.

### 31.10.4.3 Swap

```cpp
template<class charT, class traits>
void swap(basic_ofstream& x, basic_ofstream& y);
```

**Effects**: Equivalent to: x.swap(y).

### 31.10.4.4 Member functions

```cpp
basic_filebuf<charT, traits>* rdbuf() const;
```

**Returns**: \(\text{const\_cast\(basic\_filebuf\<\text{charT, traits}\>\star\)(addressof(sb))}\).

```cpp
bool is_open() const;
```

**Returns**: \(rdbuf()->\text{is\_open()}\).

```cpp
void open(const char* s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path::value_type* s, 
          ios_base::openmode mode = ios_base::out);
```

**Effects**: Calls rdbuf()->open(s, mode \| ios_base::out). If that function does not return a null pointer calls clear(), otherwise calls setstate(failbit) (which may throw ios_base::failure) (31.5.4.4).

```cpp
void close();
```

**Effects**: Calls rdbuf()->close() and, if that function fails (returns a null pointer), calls setstate( failbit) (which may throw ios_base::failure) (31.5.4.4).

```cpp
void open(const string& s, ios_base::openmode mode = ios_base::out);
void open(const filesystem::path& s, ios_base::openmode mode = ios_base::out);
```

**Effects**: Calls open(s.c_str(), mode).

### 31.10.5 Class template basic_fstream

#### [fstream]

#### 31.10.5.1 General

```cpp
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class basic_fstream : public basic_iostream<charT, traits> {
    public:
      using char_type = charT;
      using int_type = typename traits::int_type;
      using pos_type = typename traits::pos_type;
      using off_type = typename traits::off_type;
      using traits_type = traits;

      // 31.10.5.2, constructors
      basic_fstream();
      explicit basic_fstream(
          const char* s,
          ios_base::openmode mode = ios_base::in | ios_base::out);
      explicit basic_fstream(
          const filesystem::path::value_type* s,
          ios_base::openmode mode = ios_base::in|ios_base::out);
  }
}
```
The class template `basic_fstream<charT, traits>` supports reading and writing from named files. It uses a `basic_filebuf<charT, traits>` object to control the associated sequences. For the sake of exposition, the maintained data is presented here as:

\[ \text{sb}, \text{the basic_filebuf object.} \]

### 31.10.5.2 Constructors

#### [fstream.cons]

**basic_fstream();**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))(31.7.5.7.2)` and `sb` with `basic_filebuf<charT, traits>()`.

**explicit basic_fstream(const char* s, ios_base::openmode mode = ios_base::in | ios_base::out);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))(31.7.5.7.2)` and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

**explicit basic_fstream(const filesystem::path::value_type* s, ios_base::openmode mode = ios_base::in | ios_base::out);**

*Effects:* Initializes the base class with `basic_iostream<charT, traits>(addressof(sb))(31.7.5.7.2)` and `sb` with `basic_filebuf<charT, traits>()`. Then calls `rdbuf()->open(s, mode)`. If that function returns a null pointer, calls `setstate(failbit)`.

**explicit basic_fstream(const string& s, ios_base::openmode mode = ios_base::in | ios_base::out);**

*Effects:* Equivalent to: `basic_fstream(s.c_str(), mode)`.

**template<class T> explicit basic_fstream(const T& s, ios_base::openmode mode = ios_base::in | ios_base::out);**

*Constraints:* `is_same_v<T, filesystem::path>` is true.
Effects: Equivalent to: `basic_fstream(s.c_str(), mode)`.

`basic_fstream(basic_fstream&& rhs)`;

Effects: Move constructs the base class, and the contained `basic_filebuf`. Then calls `basic_istream<charT, traits>::set_rdbuf(addressof(sb))` to install the contained `basic_filebuf`.

### 31.10.5.3 Swap

```cpp
void swap(basic_fstream& rhs);
```

Effects: Exchanges the state of `*this` and `rhs` by calling `basic_iostream<charT, traits>::swap(rhs)` and `sb.swap(rhs.sb)`.

```cpp
template<class charT, class traits>
void swap(basic_fstream<charT, traits>& x,
          basic_fstream<charT, traits>& y);
```

Effects: Equivalent to: `x.swap(y)`.

### 31.10.5.4 Member functions

```cpp
basic_filebuf<charT, traits>* rdbuf() const;
```

Returns: `const_cast<basic_filebuf<charT, traits>*>(addressof(sb))`.

```cpp
bool is_open() const;
```

Returns: `rdbuf()->is_open()`.

```cpp
void open(
    const char* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

Effects: Calls `rdbuf()->open(s, mode)`. If that function does not return a null pointer calls `clear()`, otherwise calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

```cpp
void open(
    const filesystem::path::value_type* s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

// wide systems only; see 31.10.1

```cpp
void open(
    const string& s,
    ios_base::openmode mode = ios_base::in | ios_base::out);
```

Effects: Calls `open(s.c_str(), mode)`.

```cpp
void close();
```

Effects: Calls `rdbuf()->close()` and, if that function returns a null pointer, calls `setstate(failbit)` (which may throw `ios_base::failure`) (31.5.4.4).

### 31.11 Synchronized output streams

#### 31.11.1 Header `<syncstream>` synopsis

```cpp
#include <ostream>  // see 31.7.2
```

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_syncbuf;

    // 31.11.2.6, specialized algorithms
    template<class charT, class traits, class Allocator>
    void swap(basic_syncbuf<charT, traits, Allocator>& x,
              basic_syncbuf<charT, traits, Allocator>& y);

    using syncbuf = basic_syncbuf<char>;
    using wsyncbuf = basic_syncbuf<wchar_t>;
}
```
template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
class basic_osyncstream;

using osyncstream = basic_osyncstream<char>;
using wosyncstream = basic_osyncstream<wchar_t>;

The header <syncstream> provides a mechanism to synchronize execution agents writing to the same stream.

31.11.2 Class template basic_syncbuf

31.11.2.1 Overview

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
class basic_syncbuf : public basic_streambuf<charT, traits> {
    public:
        using char_type = charT;
        using int_type = typename traits::int_type;
        using pos_type = typename traits::pos_type;
        using off_type = typename traits::off_type;
        using traits_type = traits;
        using allocator_type = Allocator;
        using streambuf_type = basic_streambuf<charT, traits>;

    // 31.11.2.2, construction and destruction
    basic_syncbuf() : basic_syncbuf(nullptr) {}  
    explicit basic_syncbuf(streambuf_type* obuf) : basic_syncbuf(obuf, Allocator()) {}  
    basic_syncbuf(streambuf_type*, const Allocator&);  
    basic_syncbuf(basic_syncbuf&&);  
    ~basic_syncbuf();  

    // 31.11.2.3, assignment and swap
    basic_syncbuf& operator=(basic_syncbuf&&);  
    void swap(basic_syncbuf&);  

    // 31.11.2.4, member functions
    bool emit();  
    streambuf_type* get_wrapped() const noexcept;  
    allocator_type get_allocator() const noexcept;  
    void set_emit_on_sync(bool) noexcept;

    protected:
    // 31.11.2.5, overridden virtual functions
    int sync() override;

    private:
    streambuf_type* wrapped;  // exposition only
    bool emit_on_sync{};  // exposition only
    }
}

1 Class template basic_syncbuf stores character data written to it, known as the associated output, into
internal buffers allocated using the object’s allocator. The associated output is transferred to the wrapped
stream buffer object *wrapped when emit() is called or when the basic_syncbuf object is destroyed. Such
transfers are atomic with respect to transfers by other basic_syncbuf objects with the same wrapped stream
buffer object.

31.11.2.2 Construction and destruction

basic_syncbuf(streambuf_type* obuf, const Allocator& allocator);

1 Effects: Sets wrapped to obuf.
Postconditions: get_wrapped() == obuf and get_allocator() == allocator are true.

Throws: Nothing unless an exception is thrown by the construction of a mutex or by memory allocation.

Remarks: A copy of allocator is used to allocate memory for internal buffers holding the associated output.

basic_syncbuf(basic_syncbuf& other);

Postconditions: The value returned by this->get_wrapped() is the value returned by other.get_wrapped() prior to calling this constructor. Output stored in other prior to calling this constructor will be stored in *this afterwards. other.pbase() == other.pptr() and other.get_wrapped() == nullptr are true.

Remarks: This constructor disassociates other from its wrapped stream buffer, ensuring destruction of other produces no output.

~basic_syncbuf();

Effects: Calls emit().

Throws: Nothing. If an exception is thrown from emit(), the destructor catches and ignores that exception.

31.11.2.3 Assignment and swap

basic_syncbuf& operator=(basic_syncbuf& rhs);

Effects: Calls emit() then move assigns from rhs. After the move assignment *this has the observable state it would have had if it had been move constructed from rhs (31.11.2.2).

Postconditions:

(2.1) rhs.get_wrapped() == nullptr is true.

(2.2) this->get_allocator() == rhs.get_allocator() is true when

allocator_traits<Allocator>::propagate_on_container_move_assignment::value is true; otherwise, the allocator is unchanged.

Returns: *this.

Remarks: This assignment operator disassociates rhs from its wrapped stream buffer, ensuring destruction of rhs produces no output.

void swap(basic_syncbuf& other);

Preconditions: Either allocator_traits<Allocator>::propagate_on_container_swap::value is true or this->get_allocator() == other.get_allocator() is true.

Effects: Exchanges the state of *this and other.

31.11.2.4 Member functions

bool emit();

Effects: Atomically transfers the associated output of *this to the stream buffer *wrapped, so that it appears in the output stream as a contiguous sequence of characters. wrapped->pubsync() is called if and only if a call was made to sync() since the most recent call to emit(), if any.

Synchronization: All emit() calls transferring characters to the same stream buffer object appear to execute in a total order consistent with the “happens before” relation (6.9.2.2), where each emit() call synchronizes with subsequent emit() calls in that total order.

Postconditions: On success, the associated output is empty.

Returns: true if all of the following conditions hold; otherwise false:

(4.1) wrapped == nullptr is false.

(4.2) All of the characters in the associated output were successfully transferred.

(4.3) The call to wrapped->pubsync() (if any) succeeded.

Remarks: May call member functions of wrapped while holding a lock uniquely associated with wrapped.
streambuf_type* get_wrapped() const noexcept;

Returns: wrapped.

allocator_type get_allocator() const noexcept;

Returns: A copy of the allocator that was set in the constructor or assignment operator.

void set_emit_on_sync(bool b) noexcept;

Effects: emit_on_sync = b.

31.11.2.5 Overridden virtual functions

int sync() override;

Effects: Records that the wrapped stream buffer is to be flushed. Then, if emit_on_sync is true, calls emit().

[Note 1: If emit_on_sync is false, the actual flush is delayed until a call to emit(). — end note]

Returns: If emit() was called and returned false, returns -1; otherwise 0.

31.11.2.6 Specialized algorithms

template<class charT, class traits, class Allocator>
void swap(basic_syncbuf<charT, traits, Allocator>& a, basic_syncbuf<charT, traits, Allocator>& b);

Effects: Equivalent to a.swap(b).

31.11.3 Class template basic_osyncstream

31.11.3.1 Overview

namespace std {
    template<class charT, class traits = char_traits<charT>, class Allocator = allocator<charT>>
    class basic_osyncstream : public basic_ostream<charT, traits> {
        public:
            using char_type = charT;
            using int_type = typename traits::int_type;
            using pos_type = typename traits::pos_type;
            using off_type = typename traits::off_type;
            using traits_type = traits;
            using allocator_type = Allocator;
            using streambuf_type = basic_streambuf<charT, traits>;
            using syncbuf_type = basic_syncbuf<charT, traits, Allocator>;

            basic_osyncstream(streambuf_type*, const Allocator&);
            explicit basic_osyncstream(streambuf_type* obuf) :
                basic_osyncstream(obuf, Allocator()) {}
            basic_osyncstream(basic_ostream<charT, traits>& os, const Allocator& allocator) :
                basic_osyncstream(os.rdbuf(), allocator) {}
            explicit basic_osyncstream(basic_ostream<charT, traits>&& os) :
                basic_osyncstream(os, Allocator()) {}
            basic_osyncstream(basic_osyncstream&&) noexcept;
        ~basic_osyncstream();

        basic_osyncstream& operator=(basic_osyncstream&&) noexcept;

        // 31.11.3.3, member functions
        void emit();
        streambuf_type* get_wrapped() const noexcept;
        syncbuf_type* rdbuf() const noexcept { return const_cast<syncbuf_type*>(addressof(sb)); } }
private:
    syncbuf_type sb; // exposition only
};

Allocator shall meet the Cpp17Allocator requirements (16.4.4.6.1).

[Example 1: A named variable can be used within a block statement for streaming.]

```cpp
osyncstream bout(cout);
bout << "Hello, ";
bout << "World!";
bout << endl; // flush is noted
bout << "and more!\n";
// characters are transferred and cout is flushed
```

— end example

[Example 2: A temporary object can be used for streaming within a single statement.]

```cpp
osyncstream(cout) << "Hello, " << "World!" << '\n';
```

In this example, cout is not flushed. — end example]

### 31.11.3.2 Construction and destruction

**basic_osyncstream(streambuf_type* buf, const Allocator& allocator);**

1 Effects: Initializes sb from buf and allocator. Initializes the base class with basic_ostream<charT, traits>(addressof(sb)).

2 [Note 1: The member functions of the provided stream buffer can be called from emit() while a lock is held, which might result in a deadlock if used incautiously. — end note]

3 **Postconditions:** get_wrapped() == buf is true.

**basic_osyncstream(basic_osyncstream&& other) noexcept;**

4 Effects: Move constructs the base class and sb from the corresponding subobjects of other, and calls basic_ostream<charT, traits>::set_rdbuf(addressof(sb)).

5 **Postconditions:** The value returned by get_wrapped() is the value returned by other.get_wrapped() prior to calling this constructor. nullptr == other.get_wrapped() is true.

### 31.11.3.3 Member functions

**void emit();**

1 Effects: Behaves as an unformatted output function (31.7.6.4). After constructing a sentry object, calls sb.emit(). If that call returns false, calls setstate(ios_base::badbit).

2 [Example 1: A flush on a basic_osyncstream does not flush immediately:

```cpp
osyncstream bout(cout);
bout << "Hello," << '\n'; // no flush
bout.emit(); // characters transferred; cout not flushed
bout << "World!" << endl; // flush noted; cout not flushed
bout.emit(); // characters transferred; cout flushed
bout << "Greetings." << '\n'; // no flush
// characters transferred; cout not flushed
```

— end example

3 [Example 2: The function emit() can be used to handle exceptions from operations on the underlying stream.

```cpp
osyncstream bout(cout);
bout << "Hello, " << "World!" << '\n';
try {
bout.emit();
```
streambuf_type* get_wrapped() const noexcept;

Returns: sb.get_wrapped().

[Example 3: Obtaining the wrapped stream buffer with get_wrapped() allows wrapping it again with an osyncstream. For example,

```cpp
    osyncstream bout1(cout);
bout1 << "Hello, ";
    {
        osyncstream(bout1.get_wrapped()) << "Goodbye, " << "Planet!" << '\n';
    }
bout1 << "World!" << '\n';
```]

produces the uninterleaved output

Goodbye, Planet!
Hello, World!

—end example]

31.12 File systems [filesystems]

31.12.1 General [fs.general]

1 Subclause 31.12 describes operations on file systems and their components, such as paths, regular files, and directories.

2 A file system is a collection of files and their attributes.

3 A file is an object within a file system that holds user or system data. Files can be written to, or read from, or both. A file has certain attributes, including type. File types include regular files and directories. Other types of files, such as symbolic links, may be supported by the implementation.

4 A directory is a file within a file system that acts as a container of directory entries that contain information about other files, possibly including other directory files. The parent directory of a directory is the directory that both contains a directory entry for the given directory and is represented by the dot-dot filename (31.12.6.2) in the given directory. The parent directory of other types of files is a directory containing a directory entry for the file under discussion.

5 A link is an object that associates a filename with a file. Several links can associate names with the same file. A hard link is a link to an existing file. Some file systems support multiple hard links to a file. If the last hard link to a file is removed, the file itself is removed.

[Note 1: A hard link can be thought of as a shared-ownership smart pointer to a file. — end note]

A symbolic link is a type of file with the property that when the file is encountered during pathname resolution (31.12.6), a string stored by the file is used to modify the pathname resolution.

[Note 2: Symbolic links are often called symlinks. A symbolic link can be thought of as a raw pointer to a file. If the file pointed to does not exist, the symbolic link is said to be a “dangling” symbolic link. — end note]

31.12.2 Conformance [fs.conformance]

31.12.2.1 General [fs.conformance.general]

1 Conformance is specified in terms of behavior. Ideal behavior is not always implementable, so the conformance subclauses take that into account.

31.12.2.2 POSIX conformance [fs.conform.9945]

1 Some behavior is specified by reference to POSIX. How such behavior is actually implemented is unspecified.

[Note 1: This constitutes an “as if” rule allowing implementations to call native operating system or other APIs. — end note]
Implementations should provide such behavior as it is defined by POSIX. Implementations shall document any behavior that differs from the behavior defined by POSIX. Implementations that do not support exact POSIX behavior should provide behavior as close to POSIX behavior as is reasonable given the limitations of actual operating systems and file systems. If an implementation cannot provide any reasonable behavior, the implementation shall report an error as specified in 31.12.5.

[Note 2: This allows users to rely on an exception being thrown or an error code being set when an implementation cannot provide any reasonable behavior. —end note]

Implementations are not required to provide behavior that is not supported by a particular file system.

[Example 1: The FAT file system used by some memory cards, camera memory, and floppy disks does not support hard links, symlinks, and many other features of more capable file systems, so implementations are not required to support those features on the FAT file system but instead are required to report an error as described above. —end example]

### 31.12.2.3 Operating system dependent behavior conformance

1. Behavior that is specified as being operating system dependent is dependent upon the behavior and characteristics of an operating system. The operating system an implementation is dependent upon is implementation-defined.

2. It is permissible for an implementation to be dependent upon an operating system emulator rather than the actual underlying operating system.

### 31.12.2.4 File system race behavior

1. A file system race is the condition that occurs when multiple threads, processes, or computers interleave access and modification of the same object within a file system. Behavior is undefined if calls to functions provided by subclause 31.12 introduce a file system race.

2. If the possibility of a file system race would make it unreliable for a program to test for a precondition before calling a function described herein, Preconditions: is not specified for the function.

[Note 1: As a design practice, preconditions are not specified when it is unreasonable for a program to detect them prior to calling the function. —end note]

### 31.12.3 Requirements

1. Throughout subclause 31.12, char, wchar_t, char8_t, char16_t, and char32_t are collectively called encoded character types.

2. Functions with template parameters named EcharT shall not participate in overload resolution unless EcharT is one of the encoded character types.

3. Template parameters named InputIterator shall meet the Cpp17InputIterator requirements (25.3.5.3) and shall have a value type that is one of the encoded character types.

4. [Note 1: Use of an encoded character type implies an associated character set and encoding. Since signed char and unsigned char have no implied character set and encoding, they are not included as permitted types. —end note]

5. Template parameters named Allocator shall meet the Cpp17Allocator requirements (16.4.4.6.1).

### 31.12.4 Header <filesystem> synopsis

```cpp
#include <compare>  // see 17.12.1

namespace std::filesystem {
  // 31.12.6, paths
  class path;

  // 31.12.6.8, path non-member functions

path temp_directory_path();
path temp_directory_path(error_code& ec);

path weakly_canonical(const path& p);
path weakly_canonical(const path& p, error_code& ec);

} // 31.12.6.9, hash support
namespace std {
    template<class T> struct hash;
    template<> struct hash<filesystem::path>;
}

namespace std::ranges {
    template<>
    inline constexpr bool enable_borrowed_range<filesystem::directory_iterator> = true;
}
template<>
inline constexpr bool enable_borrowed_range<filesystem::recursive_directory_iterator> = true;

template<>
inline constexpr bool enable_view<filesystem::directory_iterator> = true;

template<>
inline constexpr bool enable_view<filesystem::recursive_directory_iterator> = true;

1 Implementations should ensure that the resolution and range of file_time_type reflect the operating system dependent resolution and range of file time values.

31.12.5 Error reporting

Filesystem library functions often provide two overloads, one that throws an exception to report file system errors, and another that sets an error_code.

[Note 1: This supports two common use cases:

(1.1) — Uses where file system errors are truly exceptional and indicate a serious failure. Throwing an exception is an appropriate response.

(1.2) — Uses where file system errors are routine and do not necessarily represent failure. Returning an error code is the most appropriate response. This allows application specific error handling, including simply ignoring the error.

— end note]

2 Functions not having an argument of type error_code& handle errors as follows, unless otherwise specified:

(2.1) — When a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, an exception of type filesystem_error shall be thrown. For functions with a single path argument, that argument shall be passed to the filesystem_error constructor with a single path argument. For functions with two path arguments, the first of these arguments shall be passed to the filesystem_error constructor as the path1 argument, and the second shall be passed as the path2 argument. The filesystem_error constructor’s error_code argument is set as appropriate for the specific operating system dependent error.

(2.2) — Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

(2.3) — Destructors throw nothing.

3 Functions having an argument of type error_code& handle errors as follows, unless otherwise specified:

(3.1) — If a call by the implementation to an operating system or other underlying API results in an error that prevents the function from meeting its specifications, the error_code& argument is set as appropriate for the specific operating system dependent error. Otherwise, clear() is called on the error_code& argument.

31.12.6 Class path

31.12.6.1 General

1 An object of class path represents a path and contains a pathname. Such an object is concerned only with the lexical and syntactic aspects of a path. The path does not necessarily exist in external storage, and the pathname is not necessarily valid for the current operating system or for a particular file system.

[Note 1: Class path is used to support the differences between the string types used by different operating systems to represent pathnames, and to perform conversions between encodings when necessary. — end note]

2 A path is a sequence of elements that identify the location of a file within a filesystem. The elements are the root-name_opt, root-directory_opt, and an optional sequence of filenames (31.12.6.2). The maximum number of elements in the sequence is operating system dependent (31.12.2.3).

3 An absolute path is a path that unambiguously identifies the location of a file without reference to an additional starting location. The elements of a path that determine if it is absolute are operating system dependent. A relative path is a path that is not absolute, and as such, only unambiguously identifies the location of a file when resolved relative to an implied starting location. The elements of a path that determine if it is relative are operating system dependent.

[Note 2: Pathnames "." and ".." are relative paths. — end note]
A **pathname** is a character string that represents the name of a path. Pathnames are formatted according to the generic pathname format grammar (31.12.6.2) or according to an operating system dependent native pathname format accepted by the host operating system.

**Pathname resolution** is the operating system dependent mechanism for resolving a pathname to a particular file in a file hierarchy. There may be multiple pathnames that resolve to the same file.

[Example 1: POSIX specifies the mechanism in section 4.12, Pathname resolution. — end example]

```cpp
namespace std::filesystem {
    class path {
        public:
            using value_type = see below;
            using string_type = basic_string<value_type>;
            static constexpr value_type preferred_separator = see below;

            // 31.12.8.1, enumeration format
            enum format;

            // 31.12.6.5.1, constructors and destructor
            path() noexcept;
            path(const path& p);
            path(path&& p) noexcept;
            path(string_type&& source, format fmt = auto_format);
            template<class Source>
                path(const Source& source, format fmt = auto_format);
            template<class InputIterator>
                path(InputIterator first, InputIterator last, format fmt = auto_format);
            template<class Source>
                path(const Source& source, const locale& loc, format fmt = auto_format);
            template<class InputIterator>
                path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);
            path();

            // 31.12.6.5.2, assignments
            path& operator=(const path& p);
            path& operator=(path&& p) noexcept;
            path& assign(string_type&& source);
            template<class Source>
                path& assign(const Source& source);
            template<class InputIterator>
                path& assign(InputIterator first, InputIterator last);

            // 31.12.6.5.3, appends
            path& operator/=(const path& p);
            template<class Source>
                path& operator/=(const Source& source);
            template<class InputIterator>
                path& append(InputIterator first, InputIterator last);

            // 31.12.6.5.4, concatenation
            path& operator+=(const path& x);
            path& operator+=(const string_type& x);
            path& operator+=(basic_string_view<value_type> x);
            path& operator+=(const value_type* x);
            path& operator+=(value_type x);
            template<class Source>
                path& operator+=(const Source& x);
            template<class EcharT>
                path& operator+=(EcharT x);
```
template<class Source>
    path& concat(const Source& x);

operator>>(basic_istream<charT, traits>& is, path& p);

value_type is a typedef for the operating system dependent encoded character type used to represent pathnames.

The value of the preferred_separator member is the operating system dependent preferred-separator character (31.12.6.2).

[Example 2: For POSIX-based operating systems, value_type is char and preferred_separator is the slash character (‘/’). For Windows-based operating systems, value_type is wchar_t and preferred_separator is the backslash character (L‘\’). — end example]

31.12.6.2 Generic pathname format

pathname:
  root-name_opt root-directory_opt relative-path

root-name:
  operating system dependent sequences of characters
  implementation-defined sequences of characters

root-directory:
  directory-separator

relative-path:
  filename
  filename directory-separator relative-path
  an empty path

filename:
  non-empty sequence of characters other than directory-separator characters

directory-separator:
  preferred-separator directory-separator_opt
  fallback-separator directory-separator_opt

preferred-separator:
  operating system dependent directory separator character
A filename is the name of a file. The dot and dot-dot filenames, consisting solely of one and two period characters respectively, have special meaning. The following characteristics of filenames are operating system dependent:

1. The permitted characters.

   [Example 1: Some operating systems prohibit the ASCII control characters (0x00 – 0x1F) in filenames. — end example]

   [Note 1: Wider portability can be achieved by limiting filename characters to the POSIX Portable Filename Character Set: 
   \[\text{A B C D E F G H I J K L M N O P Q R S T U V W X Y Z}
   \text{a b c d e f g h i j k l m n o p q r s t u v w x y z 0 1 2 3 4 5 6 7 8 9 . _ -} \] — end note]

2. The maximum permitted length.

3. Filenames that are not permitted.

4. Filenames that have special meaning.

5. Case awareness and sensitivity during path resolution.

6. Special rules that may apply to file types other than regular files, such as directories.

Except in a root-name, multiple successive directory-separator characters are considered to be the same as one directory-separator character.

The dot filename is treated as a reference to the current directory. The dot-dot filename is treated as a reference to the parent directory. What the dot-dot filename refers to relative to root-directory is implementation-defined. Specific filenames may have special meanings for a particular operating system.

A root-name identifies the starting location for pathname resolution (31.12.6). If there are no operating system dependent root-names, at least one implementation-defined root-name is required.

[Note 2: Many operating systems define a name beginning with two directory-separator characters as a root-name that identifies network or other resource locations. Some operating systems define a single letter followed by a colon as a drive specifier — a root-name identifying a specific device such as a disk drive. — end note]

If a root-name is otherwise ambiguous, the possibility with the longest sequence of characters is chosen.

[Note 3: On a POSIX-like operating system, it is impossible to have a root-name and a relative-path without an intervening root-directory element. — end note]

Normalization of a generic format pathname means:

1. If the path is empty, stop.
2. Replace each slash character in the root-name with a preferred-separator.
3. Replace each directory-separator with a preferred-separator.
   [Note 4: The generic pathname grammar defines directory-separator as one or more slashes and preferred-separators. — end note]
4. Remove each dot filename and any immediately following directory-separator.
5. As long as any appear, remove a non-dot-dot filename immediately followed by a directory-separator and a dot-dot filename, along with any immediately following directory-separator.
6. If there is a root-directory, remove all dot-dot filenames and any directory-separators immediately following them.
   [Note 5: These dot-dot filenames attempt to refer to nonexistent parent directories. — end note]
7. If the last filename is dot-dot, remove any trailing directory-separator.
8. If the path is empty, add a dot.

The result of normalization is a path in normal form, which is said to be normalized.
31.12.6.3 Conversions

31.12.6.3.1 Argument format conversions

[fs.path.cvt]
[fs.path.fmt.cvt]

[Note 1: The format conversions described in this subclause are not applied on POSIX-based operating systems because on these systems:

(1.1) — The generic format is acceptable as a native path.
(1.2) — There is no need to distinguish between native format and generic format in function arguments.
(1.3) — Paths for regular files and paths for directories share the same syntax.
— end note]

Several functions are defined to accept detected-format arguments, which are character sequences. A detected-format argument represents a path using either a pathname in the generic format (31.12.6.2) or a pathname in the native format (31.12.6). Such an argument is taken to be in the generic format if and only if it matches the generic format and is not acceptable to the operating system as a native path.

[Note 2: Some operating systems have no unambiguous way to distinguish between native format and generic format arguments. This is by design as it simplifies use for operating systems that do not require disambiguation. An implementation for an operating system where disambiguation is required is permitted to distinguish between the formats. — end note]

Pathnames are converted as needed between the generic and native formats in an operating-system-dependent manner. Let $G(n)$ and $N(g)$ in a mathematical sense be the implementation’s functions that convert native-to-generic and generic-to-native formats respectively. If $g = G(n)$ for some $n$, then $G(N(g)) = g$; if $n = N(g)$ for some $g$, then $N(G(n)) = n$.

[Note 3: Neither $G$ nor $N$ need be invertible. — end note]

If the native format requires paths for regular files to be formatted differently from paths for directories, the path shall be treated as a directory path if its last element is a directory-separator, otherwise it shall be treated as a path to a regular file.

[Note 4: A path stores a native format pathname (31.12.6.5.6) and acts as if it also stores a generic format pathname, related as given below. The implementation can generate the generic format pathname based on the native format pathname (and possibly other information) when requested. — end note]

When a path is constructed from or is assigned a single representation separate from any path, the other representation is selected by the appropriate conversion function ($G$ or $N$).

When the (new) value $p$ of one representation of a path is derived from the representation of that or another path, a value $q$ is chosen for the other representation. The value $q$ converts to $p$ (by $G$ or $N$ as appropriate) if any such value does so; $q$ is otherwise unspecified.

[Note 5: If $q$ is the result of converting any path at all, it is the result of converting $p$. — end note]

31.12.6.3.2 Type and encoding conversions

[fs.path.type.cvt]

The native encoding of an ordinary character string is the operating system dependent current encoding for pathnames (31.12.6). The native encoding for wide character strings is the implementation-defined execution-wide-character set encoding (16.3.3.3.5).

For member function arguments that take character sequences representing paths and for member functions returning strings, value type and encoding conversion is performed if the value type of the argument or return value differs from path::value_type. For the argument or return value, the method of conversion and the encoding to be converted to is determined by its value type:

(2.1) — char: The encoding is the native ordinary encoding. The method of conversion, if any, is operating system dependent.

[Note 1: For POSIX-based operating systems path::value_type is char so no conversion from char value type arguments or to char value type return values is performed. For Windows-based operating systems, the native ordinary encoding is determined by calling a Windows API function. — end note]

[Note 2: This results in behavior identical to other C and C++ standard library functions that perform file operations using ordinary character strings to identify paths. Changing this behavior would be surprising and error prone. — end note]

(2.2) — wchar_t: The encoding is the native wide encoding. The method of conversion is unspecified.

[Note 3: For Windows-based operating systems path::value_type is wchar_t so no conversion from wchar_t value type arguments or to wchar_t value type return values is performed. — end note]
— char8_t: The encoding is UTF-8. The method of conversion is unspecified.
— char16_t: The encoding is UTF-16. The method of conversion is unspecified.
— char32_t: The encoding is UTF-32. The method of conversion is unspecified.

3 If the encoding being converted to has no representation for source characters, the resulting converted characters, if any, are unspecified. Implementations should not modify member function arguments if already of type path::value_type.

31.12.6.4 Requirements

1 In addition to the requirements (31.12.3), function template parameters named Source shall be one of:

(1.1) — basic_string<EcharT, traits, Allocator>. A function argument const Source& source shall have an effective range [source.begin(), source.end()).
(1.2) — basic_string_view<EcharT, traits>. A function argument const Source& source shall have an effective range [source.begin(), source.end()).
(1.3) — A type meeting the Cpp17InputIterator requirements that iterates over a NTCTS. The value type shall be an encoded character type. A function argument const Source& source shall have an effective range [source.end) where end is the first iterator value with an element value equal to iterator_traits<Source>::value_type().
(1.4) — A character array that after array-to-pointer decay results in a pointer to the start of a NTCTS. The value type shall be an encoded character type. A function argument const Source& source shall have an effective range [source, end) where end is the first iterator value with an element value equal to iterator_traits<decay_t<Source>>::value_type().

2 Functions taking template parameters named Source shall not participate in overload resolution unless Source denotes a type other than path, and either

(2.1) — Source is a specialization of basic_string or basic_string_view, or
(2.2) — the qualified-id iterator_traits<decay_t<Source>::value_type is valid and denotes a possibly const encoded character type (13.10.3).

3 [Note 1: See path conversions (31.12.6.3) for how the value types above and their encodings convert to path::value_type and its encoding. — end note]

4 Arguments of type Source shall not be null pointers.

31.12.6.5 Members

31.12.6.5.1 Constructors

path() noexcept;

Postconditions: empty() == true.

path(const path& p);
path(path&& p) noexcept;

Effects: Constructs an object of class path having the same pathname in the native and generic formats, respectively, as the original value of p. In the second form, p is left in a valid but unspecified state.

path(string_type&& source, format fmt = auto_format);

Effects: Constructs an object of class path for which the pathname in the detected-format of source has the original value of source (31.12.6.3.1), converting format if required (31.12.6.3.1). source is left in a valid but unspecified state.

template<class Source>
path(const Source& source, format fmt = auto_format);
template<class InputIterator>
path(InputIterator first, InputIterator last, format fmt = auto_format);

Effects: Let s be the effective range of source (31.12.6.4) or the range [first, last), with the encoding converted if required (31.12.6.3). Finds the detected-format of s (31.12.6.3.1) and constructs an object of class path for which the pathname in that format is s.
template<class Source>
    path(const Source& source, const locale& loc, format fmt = auto_format);

template<class InputIterator>
    path(InputIterator first, InputIterator last, const locale& loc, format fmt = auto_format);

Mandates: The value type of Source and InputIterator is char.

Effects: Let s be the effective range of source or the range [first, last), after converting the encoding as follows:

(6.1) — If value_type is wchar_t, converts to the native wide encoding (31.12.6.3.2) using the codecvt<wchar_t, char, mbstate_t> facet of loc.

(6.2) — Otherwise a conversion is performed using the codecvt<wchar_t, char, mbstate_t> facet of loc, and then a second conversion to the current ordinary encoding.

Finds the detected-format of s (31.12.6.3.1) and constructs an object of class path for which the pathname in that format is s.

[Example 1: A string is to be read from a database that is encoded in ISO/IEC 8859-1, and used to create a directory:

```cpp
namespace fs = std::filesystem;
std::string latin1_string = read_latin1_data();
codecvt_8859_1<wchar_t> latin1_facet;
std::locale latin1_locale(std::locale(), latin1_facet);
fs::create_directory(fs::path(latin1_string, latin1_locale));
```

For POSIX-based operating systems, the path is constructed by first using latin1_facet to convert ISO/IEC 8859-1 encoded latin1_string to a wide character string in the native wide encoding (31.12.6.3.2). The resulting wide string is then converted to an ordinary character pathname string in the current native ordinary encoding. If the native wide encoding is UTF-16 or UTF-32, and the current native ordinary encoding is UTF-8, all of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation, but for other native ordinary encodings some characters may have no representation.

For Windows-based operating systems, the path is constructed by using latin1_facet to convert ISO/IEC 8859-1 encoded latin1_string to a UTF-16 encoded wide character pathname string. All of the characters in the ISO/IEC 8859-1 character set will be converted to their Unicode representation. — end example]

31.12.6.5.2 Assignments

```cpp
path& operator=(const path& p);
```

Effects: If *this and p are the same object, has no effect. Otherwise, sets both respective pathnames of *this to the respective pathnames of p.

Returns: *this.

```cpp
path& operator=(path&& p) noexcept;
```

Effects: If *this and p are the same object, has no effect. Otherwise, sets both respective pathnames of *this to the respective pathnames of p. p is left in a valid but unspecified state.

[Note 1: A valid implementation is swap(p). — end note]

Returns: *this.

```cpp
path& operator=(string_type&& source);
path assign(string_type&& source);
```

Effects: Sets the pathname in the detected-format of source to the original value of source. source is left in a valid but unspecified state.

Returns: *this.

```cpp
template<class Source>
    path& operator=(const Source& source);
```
template<class InputIterator>
    path& assign(InputIterator first, InputIterator last);

Effects: Let s be the effective range of source (31.12.6.4) or the range [first, last), with the encoding converted if required (31.12.6.3). Finds the detected-format of s (31.12.6.3.1) and sets the pathname in that format to s.

Returns: *this.

31.12.6.5.3 Appends

The append operations use operator/= to denote their semantic effect of appending preferred-separator when needed.

path& operator/=(const path& p);

Effects: If p.is_absolute() || (p.has_root_name() && p.root_name() != root_name()), then operator=(p).

Otherwise, modifies *this as if by these steps:

(3.1) — If p.has_root_directory(), then removes any root directory and relative path from the generic format pathname. Otherwise, if !has_root_directory() && is_absolute() is true or if has_filename() is true, then appends path::preferred_separator to the generic format pathname.

(3.2) — Then appends the native format pathname of p, omitting any root-name from its generic format pathname, to the native format pathname.

[Example 1: Even if //host is interpreted as a root-name, both of the paths path("//host")/"foo" and path("//host/")/"foo" equal "/host/foo" (although the former might use backslash as the preferred separator).

Expression examples:

// On POSIX,
path("foo") /= path("""); // yields path("foo")
path("foo") /= path("/bar"); // yields path("/bar")

// On Windows,
path("foo") /= path("""); // yields path("foo\")
path("foo") /= path("/bar"); // yields path("/bar")
path("foo") /= path("c:/bar"); // yields path("c:/bar")
path("foo") /= path("c:"); // yields path("c:")
path("c:\") /= path("""); // yields path("c:\")
path("c:foo") /= path("/bar"); // yields path("c:/bar")
path("c:foo") /= path("c:\bar"); // yields path("c:foo\bar")

—end example]

Returns: *this.

31.12.6.5.4 Concatenation

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);

Effects: Equivalent to: return operator/=(path(source));

31.12.6.5.4 Concatenation

path& operator+=(const path& x);
path& operator+=(const string_type& x);
path& operator+=(basic_string_view<value_type> x);
path& operator+=(const value_type* x);
template<class Source>
path& concat(const Source& x);

Effects: Appends `path(x).native()` to the pathname in the native format.
[Note 1: This directly manipulates the value of `native()`, which is not necessarily portable between operating systems. — end note]

Returns: *this.

path& operator+=(value_type x);

Effects: Equivalent to: `return *this += basic_string_view(&x, 1);`

template<class InputIterator>
path& concat(InputIterator first, InputIterator last);

Effects: Equivalent to: `return *this += path(first, last);`

31.12.6.5.5 Modifiers

void clear() noexcept;

Postconditions: `empty() == true`.

path& make_preferred();

Effects: Each directory-separator of the pathname in the generic format is converted to preferred-separator.

Returns: *this.

[Example 1:
path p("foo/bar");
std::cout << p << '\n';
p.make_preferred();
std::cout << p << '\n';

On an operating system where preferred-separator is a slash, the output is:
"foo/bar"
"foo/bar"

On an operating system where preferred-separator is a backslash, the output is:
"foo/bar"
"foo\bar"
— end example]

path& remove_filename();

Effects: Remove the generic format pathname of filename() from the generic format pathname.

Postconditions: `!has_filename()`.

Returns: *this.

[Example 2:
path("foo/bar").remove_filename(); // yields "foo/"
path("foo/").remove_filename(); // yields "foo/"
path("/foo").remove_filename(); // yields "/
path("/").remove_filename(); // yields "/
— end example]

path& replace_filename(const path& replacement);

Effects: Equivalent to:
remove_filename();
operator/=(replacement);

Returns: *this.

[Example 3:
path("/foo").replace_filename("bar"); // yields "/bar" on POSIX
path("/").replace_filename("bar"); // yields "/bar" on POSIX
— end example

path& replace_extension(const path& replacement = path());

Effects:

— Any existing extension() (31.12.5.9) is removed from the pathname in the generic format, then
— If replacement is not empty and does not begin with a dot character, a dot character is appended to the pathname in the generic format, then
— operator+=(replacement);

Returns: *this.

void swap(path& rhs) noexcept;

Effects: Swaps the contents (in all formats) of the two paths.

Complexity: Constant time.

31.12.6.5.6 Native format observers [fs.path.native.obs]

The string returned by all native format observers is in the native pathname format (31.12.6).

const string_type& native() const noexcept;

Returns: The pathname in the native format.

const value_type* c_str() const noexcept;

Effects: Equivalent to: return native().c_str();

operator string_type() const;

Returns: native().

template<class EcharT, class traits = char_traits<EcharT>,
class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
string(const Allocator& a = Allocator()) const;

Returns: native().

Remarks: All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

std::string string() const;
std::wstring wstring() const;
std::u8string u8string() const;
std::u16string u16string() const;
std::u32string u32string() const;

Returns: native().

Remarks: Conversion, if any, is performed as specified by 31.12.6.3.

31.12.6.5.7 Generic format observers [fs.path.generic.obs]

Generic format observer functions return strings formatted according to the generic pathname format (31.12.6.2). A single slash (/) character is used as the directory-separator.

[Example 1: On an operating system that uses backslash as its preferred-separator,

path("foo\\bar").generic_string()
returns "foo/bar". — end example]

template<class EcharT, class traits = char_traits<EcharT>,
class Allocator = allocator<EcharT>>
basic_string<EcharT, traits, Allocator>
generic_string(const Allocator& a = Allocator()) const;

Returns: The pathname in the generic format.
4 "Remarks": All memory allocation, including for the return value, shall be performed by a. Conversion, if any, is specified by 31.12.6.3.

std::string generic_string() const;
std::wstring generic_wstring() const;
std::u8string generic_u8string() const;
std::u16string generic_u16string() const;
std::u32string generic_u32string() const;

5 Returns: The pathname in the generic format.

6 "Remarks": Conversion, if any, is specified by 31.12.6.3.

31.12.6.5.8 Compare [fs.path.compare]

int compare(const path& p) const noexcept;

1 "Returns":

1.1 — Let rootNameComparison be the result of this->root_name().native().compare(p.root_name().native()). If rootNameComparison is not 0, rootNameComparison.

1.2 — Otherwise, if !this->has_root_directory() and p.has_root_directory(), a value less than 0.

1.3 — Otherwise, if this->has_root_directory() and !p.has_root_directory(), a value greater than 0.

1.4 — Otherwise, if native() for the elements of this->relative_path() are lexicographically less than native() for the elements of p.relative_path(), a value less than 0.

1.5 — Otherwise, if native() for the elements of this->relative_path() are lexicographically greater than native() for the elements of p.relative_path(), a value greater than 0.

1.6 — Otherwise, 0.

int compare(const string_type& s) const;
int compare(basic_string_view<value_type> s) const;
int compare(const value_type* s) const;

2 "Effects": Equivalent to: return compare(path(s));

31.12.6.5.9 Decomposition [fs.path.decompose]

path root_name() const;
1 "Returns": root-name, if the pathname in the generic format includes root-name, otherwise path().

path root_directory() const;
2 "Returns": root-directory, if the pathname in the generic format includes root-directory, otherwise path().

path root_path() const;
3 "Returns": root_name() / root_directory().

path relative_path() const;
4 "Returns": A path composed from the pathname in the generic format, if empty() is false, beginning with the first filename after root_path(). Otherwise, path().

path parent_path() const;
5 "Returns": *this if has_relative_path() is false, otherwise a path whose generic format pathname is the longest prefix of the generic format pathname of *this that produces one fewer element in its iteration.

path filename() const;
6 "Returns": relative_path().empty() ? path() : *--end().

7 [Example 1:
path("/foo/bar.txt").filename(); // yields "bar.txt"
path("/foo/bar").filename(); // yields "bar"

§ 31.12.6.5.9
N4917

© ISO/IEC

path("/foo/bar/").filename();
path("/").filename();
path("//host").filename();
path(".").filename();
path("..").filename();

//
//
//
//
//

yields
yields
yields
yields
yields

""
""
""
"."
".."

— end example]
path stem() const;
8

(8.1)
(8.2)
9

Returns: Let f be the generic format pathname of filename(). Returns a path whose pathname in
the generic format is
— f, if it contains no periods other than a leading period or consists solely of one or two periods;
— otherwise, the prefix of f ending before its last period.
[Example 2 :
std::cout << path("/foo/bar.txt").stem();
path p = "foo.bar.baz.tar";
for (; !p.extension().empty(); p = p.stem())
std::cout << p.extension() << '\n';
// outputs: .tar
// .baz
// .bar

// outputs "bar"

— end example]
path extension() const;
10

Returns: A path whose pathname in the generic format is the suffix of filename() not included in
stem().

11

[Example 3 :
path("/foo/bar.txt").extension();
path("/foo/bar").extension();
path("/foo/.profile").extension();
path(".bar").extension();
path("..bar").extension();

//
//
//
//
//

yields
yields
yields
yields
yields

".txt"
"" and
"" and
"" and
".bar"

and stem() is "bar"
stem() is "bar"
stem() is ".profile"
stem() is ".bar"
and stem() is "."

— end example]
12

[Note 1 : The period is included in the return value so that it is possible to distinguish between no extension
and an empty extension. — end note]

13

[Note 2 : On non-POSIX operating systems, for a path p, it is possible that p.stem() + p.extension() ==
p.filename() is false, even though the generic format pathnames are the same. — end note]

31.12.6.5.10

Query

[fs.path.query]

[[nodiscard]] bool empty() const noexcept;
1

Returns: true if the pathname in the generic format is empty, otherwise false.
bool has_root_path() const;

2

Returns: !root_path().empty().
bool has_root_name() const;

3

Returns: !root_name().empty().
bool has_root_directory() const;

4

Returns: !root_directory().empty().
bool has_relative_path() const;

5

Returns: !relative_path().empty().
bool has_parent_path() const;

6

Returns: !parent_path().empty().

§ 31.12.6.5.10

1698


bool has_filename() const;
    Returns: !filename().empty().

bool has_stem() const;
    Returns: !stem().empty().

bool has_extension() const;
    Returns: !extension().empty().

bool is_absolute() const;
    Returns: true if the pathname in the native format contains an absolute path (31.12.6), otherwise false.
    [Example 1: path("/").is_absolute() is true for POSIX-based operating systems, and false for Windows-based operating systems. — end example]

bool is_relative() const;
    Returns: !is_absolute().

31.12.6.5.11 Generation

path lexically_normal() const;
    Returns: A path whose pathname in the generic format is the normal form (31.12.6.2) of the pathname in the generic format of *this.
    [Example 1:
        assert(path("foo/./bar/..").lexically_normal() == "foo/");
        assert(path("foo////bar/../").lexically_normal() == "foo/");
    ]
The above assertions will succeed. On Windows, the returned path's directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example]

path lexically_relative(const path& base) const;
    Effects: If:
        (3.1) root_name() != base.root_name() is true, or
        (3.2) is_absolute() != base.is_absolute() is true, or
        (3.3) !has_root_directory() && base.has_root_directory() is true, or
        (3.4) any filename in relative_path() or base.relative_path() can be interpreted as a root-name, returns path().
        [Note 1: On a POSIX implementation, no filename in a relative-path is acceptable as a root-name. — end note] Determines the first mismatched element of *this and base as if by:
        auto [a, b] = mismatch(begin(), end(), base.begin(), base.end());
    Then,
        (3.5) if a == end() and b == base.end(), returns path("."); otherwise
        (3.6) let n be the number of filename elements in [b, base.end()) that are not dot or dot-dot or empty, minus the number that are dot-dot. If n<0, returns path(); otherwise
        (3.7) if n == 0 and (a == end() || a->empty()), returns path("."); otherwise
        (3.8) returns an object of class path that is default-constructed, followed by
            — application of operator/(path(".")) n times, and then
            — application of operator/= for each element in [a, end()).
    Returns: *this made relative to base. Does not resolve (31.12.6) symlinks. Does not first normalize (31.12.6.2) *this or base.
    [Example 2:
        assert(path("/a/d").lexically_relative("/a/b/c") == ".../d");
        assert(path("/a/b/c").lexically_relative("/a/d") == ".//b/c");
assert(path("a/b/c").lexically_relative("a") == "b/c");
assert(path("a/b/c").lexically_relative("a/b/c/x/y") == "./.../..");
assert(path("a/b/c").lexically_relative("a/b/c") == ".");
assert(path("a/b").lexically_relative("c/d") == "./.../a/b");

The above assertions will succeed. On Windows, the returned path’s directory-separator characters will be backslashes rather than slashes, but that does not affect path equality. — end example

[Note 2: If symlink following semantics are desired, use the operational function relative(). — end note]

[Note 3: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply lexically_normal() to *this, base, or both. — end note]

path lexically_proximate(const path& base) const;

Returns: If the value of lexically_relative(base) is not an empty path, return it. Otherwise return *this.

[Note 4: If symlink following semantics are desired, use the operational function proximate(). — end note]

[Note 5: If normalization (31.12.6.2) is needed to ensure consistent matching of elements, apply lexically_normal() to *this, base, or both. — end note]

31.12.6.6 Iterators [fs.path.itr]

Path iterators iterate over the elements of the pathname in the generic format (31.12.6.2).

A path::iterator is a constant iterator meeting all the requirements of a bidirectional iterator (25.3.5.6) except that, for dereferenceable iterators a and b of type path::iterator with a == b, there is no requirement that *a and *b are bound to the same object. Its value_type is path.

Calling any non-const member function of a path object invalidates all iterators referring to elements of that object.

For the elements of the pathname in the generic format, the forward traversal order is as follows:

(4.1) — The root-name element, if present.
(4.2) — The root-directory element, if present.
[Note 1: The generic format is required to ensure lexicographical comparison works correctly. — end note]
(4.3) — Each successive filename element, if present.
(4.4) — An empty element, if a trailing non-root directory-separator is present.

The backward traversal order is the reverse of forward traversal.

iterator begin() const;

Returns: An iterator for the first present element in the traversal list above. If no elements are present, the end iterator.

iterator end() const;

Returns: The end iterator.

31.12.6.7 Inserter and extractor [fs.path.io]

template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const path& p);

Effects: Equivalent to os << quoted(p.string<charT, traits>().)
[Note 1: The quoted function is described in 31.7.9. — end note]

Returns: os.

template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, path& p);

Effects: Equivalent to:

basic_string<charT, traits> tmp;
is >> quoted(tmp);
p = tmp;

§ 31.12.6.7 1700
31.12.6.8 Non-member functions

```cpp
void swap(path& lhs, path& rhs) noexcept;
```

**Effects:** Equivalent to `lhs.swap(rhs)`.

```cpp
size_t hash_value(const path& p) noexcept;
```

**Returns:** A hash value for the path `p`. If for two paths, `p1 == p2` then `hash_value(p1) == hash_value(p2)`.

```cpp
friend bool operator==(const path& lhs, const path& rhs) noexcept;
```

**Returns:** `lhs.compare(rhs) == 0`.

```
friend strong_ordering operator<=>(const path& lhs, const path& rhs) noexcept;
```

**Returns:** `lhs.compare(rhs) <=> 0`.

```cpp
friend path operator/(const path& lhs, const path& rhs);
```

**Effects:** Equivalent to: `return path(lhs) /= rhs`.

31.12.6.9 Hash support

```cpp
template<> struct hash<filesystem::path>;
```

For an object `p` of type `filesystem::path`, `hash<filesystem::path>()(p)` evaluates to the same result as `filesystem::hash_value(p)`.

31.12.7 Class filesystem_error

### 31.12.7.1 General

The class `filesystem_error` defines the type of objects thrown as exceptions to report file system errors from functions described in subclause 31.12.

```
namespace std::filesystem {
    class filesystem_error : public system_error {
        public:
            filesystem_error(const string& what_arg, error_code ec);
            filesystem_error(const string& what_arg, const path& p1, error_code ec);
            filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);
            const path& path1() const noexcept;
            const path& path2() const noexcept;
            const char* what() const noexcept override;
    };
}
```

Constructors are provided that store zero, one, or two paths associated with an error.

```cpp
filesystem_error(const string& what_arg, error_code ec);
```

**Postconditions:**
filesystem_error(const string& what_arg, const path& p1, error_code ec);

Postconditions:

— code() == ec,
— path1().empty() == true,
— path2().empty() == true, and
— string_view(what()).find(what_arg.c_str()) != string_view::npos.

filesystem_error(const string& what_arg, const path& p1, const path& p2, error_code ec);

Postconditions:

— code() == ec,
— path1() returns a reference to the stored copy of p1,
— path2() returns a reference to the stored copy of p2, and
— string_view(what()).find(what_arg.c_str()) != string_view::npos.

const path& path1() const noexcept;

Returns: A reference to the copy of p1 stored by the constructor, or, if none, an empty path.

const path& path2() const noexcept;

Returns: A reference to the copy of p2 stored by the constructor, or, if none, an empty path.

const char* what() const noexcept override;

Returns: An nttbs that incorporates the what_arg argument supplied to the constructor. The exact format is unspecified. Implementations should include the system_error::what() string and the pathnames of path1 and path2 in the native format in the returned string.

### 31.12.8 Enumerations

#### 31.12.8.1 Enum path::format

This enum specifies constants used to identify the format of the character sequence, with the meanings listed in Table 131.

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>native_format</td>
<td>The native pathname format.</td>
</tr>
<tr>
<td>generic_format</td>
<td>The generic pathname format.</td>
</tr>
<tr>
<td>auto_format</td>
<td>The interpretation of the format of the character sequence is implementation-defined. The implementation may inspect the content of the character sequence to determine the format. Recommended practice: For POSIX-based systems, native and generic formats are equivalent and the character sequence should always be interpreted in the same way.</td>
</tr>
</tbody>
</table>

#### 31.12.8.2 Enum class file_type

This enum class specifies constants used to identify file types, with the meanings listed in Table 132. The values of the constants are distinct.
### Table 132: Enum class file_type [tab:fs.enum.file.type]

<table>
<thead>
<tr>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>The type of the file has not been determined or an error occurred while trying to determine the type.</td>
</tr>
<tr>
<td>not_found</td>
<td>Pseudo-type indicating the file was not found.</td>
</tr>
<tr>
<td>[Note 1]</td>
<td>The file not being found is not considered an error while determining the type of a file. — end note</td>
</tr>
<tr>
<td>regular</td>
<td>Regular file</td>
</tr>
<tr>
<td>directory</td>
<td>Directory file</td>
</tr>
<tr>
<td>symlink</td>
<td>Symbolic link file</td>
</tr>
<tr>
<td>block</td>
<td>Block special file</td>
</tr>
<tr>
<td>character</td>
<td>Character special file</td>
</tr>
<tr>
<td>fifo</td>
<td>FIFO or pipe file</td>
</tr>
<tr>
<td>socket</td>
<td>Socket file</td>
</tr>
<tr>
<td>implementation-defined</td>
<td>Implementations that support file systems having file types in addition to the above file_type types shall supply implementation-defined file_type constants to separately identify each of those additional file types</td>
</tr>
<tr>
<td>unknown</td>
<td>The file exists but the type cannot be determined</td>
</tr>
</tbody>
</table>

### 31.12.8.3 Enum class copy_options [fs.enum.copy.opts]

The `enum class` type `copy_options` is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to control the semantics of copy operations. The constants are specified in option groups with the meanings listed in Table 133. The constant `none` represents the empty bitmask, and is shown in each option group for purposes of exposition; implementations shall provide only a single definition. Every other constant in the table represents a distinct bitmask element.

#### Table 133: Enum class copy_options [tab:fs.enum.copy.opts]

<table>
<thead>
<tr>
<th>Option group controlling copy_file function effects for existing target files</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Error; file already exists.</td>
<td></td>
</tr>
<tr>
<td>skip_existing</td>
<td>Do not overwrite existing file, do not report an error.</td>
<td></td>
</tr>
<tr>
<td>overwrite_existing</td>
<td>Overwrite the existing file.</td>
<td></td>
</tr>
<tr>
<td>update_existing</td>
<td>Overwrite the existing file if it is older than the replacement file.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option group controlling copy function effects for sub-directories</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Do not copy sub-directories.</td>
<td></td>
</tr>
<tr>
<td>recursive</td>
<td>Recursively copy sub-directories and their contents.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option group controlling copy function effects for symbolic links</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Follow symbolic links.</td>
<td></td>
</tr>
<tr>
<td>copy_symlinks</td>
<td>Copy symbolic links as symbolic links rather than copying the files that they point to.</td>
<td></td>
</tr>
<tr>
<td>skip_symlinks</td>
<td>Ignore symbolic links.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Option group controlling copy function effects for choosing the form of copying</th>
<th>Constant</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none</td>
<td>(Default) Copy content.</td>
<td></td>
</tr>
<tr>
<td>directories_only</td>
<td>Copy directory structure only, do not copy non-directory files.</td>
<td></td>
</tr>
<tr>
<td>create_symlinks</td>
<td>Make symbolic links instead of copies of files. The source path shall be an absolute path unless the destination path is in the current directory.</td>
<td></td>
</tr>
<tr>
<td>create_hard_links</td>
<td>Make hard links instead of copies of files.</td>
<td></td>
</tr>
</tbody>
</table>

§ 31.12.8.3 1703
31.12.8.4 Enum class perms

The enum class type perms is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to identify file permissions, with the meanings listed in Table 134.

Table 134: Enum class perms

<table>
<thead>
<tr>
<th>Name</th>
<th>Value (octal)</th>
<th>POSIX macro</th>
<th>Definition or notes</th>
</tr>
</thead>
<tbody>
<tr>

31.12.8.5 Enum class perm_options

The enum class type perm_options is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to control the semantics of permissions operations, with the meanings listed in Table 135. The bitmask constants are bitmask elements. In Table 135 perm denotes a value of type perms passed to permissions.

Table 135: Enum class perm_options

<table>
<thead>
<tr>
<th>Name</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>replace permissions</td>
<td>shall replace the file’s permission bits with perm</td>
</tr>
<tr>
<td>add permissions</td>
<td>shall replace the file’s permission bits with the bitwise OR of perm and the file’s current permission bits.</td>
</tr>
<tr>
<td>remove permissions</td>
<td>shall replace the file’s permission bits with the bitwise AND of the complement of perm and the file’s current permission bits.</td>
</tr>
<tr>
<td>nofollow permissions</td>
<td>shall change the permissions of a symbolic link itself rather than the permissions of the file the link resolves to.</td>
</tr>
</tbody>
</table>

31.12.8.6 Enum class directory_options

The enum class type directory_options is a bitmask type (16.3.3.3.4) that specifies bitmask constants used to identify directory traversal options, with the meanings listed in Table 136. The constant none represents the empty bitmask; every other constant in the table represents a distinct bitmask element.

31.12.9 Class file_status

31.12.9.1 General

namespace std::filesystem {
    class file_status {
        public:
            // 31.12.9.2, constructors and destructor
            file_status() noexcept : file_status(file_type::none) {}  
            explicit file_status(file_type ft,              
                perms prms = perms::unknown) noexcept;  
            file_status(const file_status&) noexcept = default;  
            file_status(file_status&&) noexcept = default;  
            ~file_status();
            
            // assignments
            file_status& operator=(const file_status&) noexcept = default;  
            file_status& operator=(file_status&&) noexcept = default;  
            
            // 31.12.9.4, modifiers
            void type(file_type ft) noexcept;  
            void permissions(perms prms) noexcept;  
            
            // 31.12.9.3, observers
            file_type type() const noexcept;  
            perms permissions() const noexcept;
            
            friend bool operator==(const file_status& lhs, const file_status& rhs) noexcept  
            { return lhs.type() == rhs.type() && lhs.permissions() == rhs.permissions(); }
    };
}

An object of type file_status stores information about the type and permissions of a file.

31.12.9.2 Constructors

    explicit file_status(file_type ft, perms prms = perms::unknown) noexcept;

Postconditions: type() == ft and permissions() == prms.

31.12.9.3 Observers

    file_type type() const noexcept;

Returns: The value of type() specified by the postconditions of the most recent call to a constructor, operator=, or type(file_type) function.

    perms permissions() const noexcept;

Returns: The value of permissions() specified by the postconditions of the most recent call to a constructor, operator=, or permissions(perms) function.

31.12.9.4 Modifiers

    void type(file_type ft) noexcept;

Postconditions: type() == ft.
void permissions(perms prms) noexcept;

Postconditions: permissions() == prms.

31.12.10 Class directory_entry [fs.class.directory.entry]

31.12.10.1 General [fs.class.directory.entry.general]

namespace std::filesystem {
    class directory_entry {
public:
    // 31.12.10.2, constructors and destructor
    directory_entry() noexcept = default;
    directory_entry(const directory_entry&) = default;
    directory_entry(directory_entry&&) noexcept = default;
    explicit directory_entry(const filesystem::path& p);
    directory_entry(const filesystem::path& p, error_code& ec);
    ~directory_entry();

    // assignments
    directory_entry& operator=(const directory_entry&) = default;
    directory_entry& operator=(directory_entry&&) noexcept = default;

    // 31.12.10.3, modifiers
    void assign(const filesystem::path& p);
    void assign(const filesystem::path& p, error_code& ec);
    void replace_filename(const filesystem::path& p);
    void replace_filename(const filesystem::path& p, error_code& ec);
    void refresh();
    void refresh(error_code& ec) noexcept;

    // 31.12.10.4, observers
    const filesystem::path& path() const noexcept;
    operator const filesystem::path&() const noexcept;
    bool exists() const;
    bool exists(error_code& ec) const noexcept;
    bool is_block_file() const;
    bool is_block_file(error_code& ec) const noexcept;

    uintmax_t file_size() const;
    uintmax_t file_size(error_code& ec) const noexcept;
    uintmax_t hard_link_count() const;
    uintmax_t hard_link_count(error_code& ec) const noexcept;
    file_time_type last_write_time() const;
    file_time_type last_write_time(error_code& ec) const noexcepcion;
    file_status status() const;
    file_status status(error_code& ec) const noexcepcion;
    file_status symlink_status() const;
    file_status symlink_status(error_code& ec) const noexcepcion;

    bool operator==(const directory_entry& rhs) const noexcept;
    strong_ordering operator<=>(const directory_entry& rhs) const noexcepcion;

§ 31.12.10.1 1706
A `directory_entry` object stores a `path` object and may store additional objects for file attributes such as hard link count, status, symlink status, file size, and last write time.

Implementations should store such additional file attributes during directory iteration if their values are available and storing the values would allow the implementation to eliminate file system accesses by `directory_entry` observer functions (31.12.13). Such stored file attribute values are said to be cached.

[Note 1: For purposes of exposition, class `directory_iterator` (31.12.11) is shown above as a friend of class `directory_entry`. Friendship allows the `directory_iterator` implementation to cache already available attribute values directly into a `directory_entry` object without the cost of an unneeded call to `refresh()`. —end note]

**Example 1:**

```cpp
using namespace std::filesystem;

// use possibly cached last write time to minimize disk accesses
for (auto& x : directory_iterator("."))
{
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}

// call refresh() to refresh a stale cache
for (auto& x : directory_iterator("."))
{
    lengthy_function(x.path()); // cache becomes stale
    x.refresh();
    std::cout << x.path() << " " << x.last_write_time() << std::endl;
}
```

On implementations that do not cache the last write time, both loops will result in a potentially expensive call to the `std::filesystem::last_write_time` function. On implementations that do cache the last write time, the first loop will use the cached value and so will not result in a potentially expensive call to the `std::filesystem::last_write_time` function. The code is portable to any implementation, regardless of whether or not it employs caching. —end example]

### 31.12.10.2 Constructors

```cpp
explicit directory_entry(const filesystem::path& p);
directory_entry(const filesystem::path& p, error_code& ec);
```

**Effects:** Calls `refresh()` or `refresh(ec)`, respectively.

**Postconditions:** `path() == p` if no error occurs, otherwise `path() == filesystem::path()`.

**Throws:** As specified in 31.12.5.

### 31.12.10.3 Modifiers

```cpp
void assign(const filesystem::path& p);
void assign(const filesystem::path& p, error_code& ec);
```

**Effects:** Equivalent to `pathobject = p`, then `refresh()` or `refresh(ec)`, respectively. If an error occurs, the values of any cached attributes are unspecified.

**Throws:** As specified in 31.12.5.

```cpp
void replace_filename(const filesystem::path& p);
```
void replace_filename(const filesystem::path& p, error_code& ec);

Effects: Equivalent to pathobject.replace_filename(p), then refresh() or refresh(ec), respectively. If an error occurs, the values of any cached attributes are unspecified.

Throws: As specified in 31.12.5.

void refresh();
void refresh(error_code& ec) noexcept;

Effects: Stores the current values of any cached attributes of the file p resolves to. If an error occurs, an error is reported (31.12.5) and the values of any cached attributes are unspecified.

Throws: As specified in 31.12.5.

[Note 1: Implementations of directory_iterator (31.12.11) are prohibited from directly or indirectly calling the refresh function as described in 31.12.11.1. — end note]

31.12.10.4 Observers [fs.dir.entry.obs]

Unqualified function names in the Returns: elements of the directory_entry observers described below refer to members of the std::filesystem namespace.

const filesystem::path& path() const noexcept;
operator const filesystem::path&() const noexcept;

Returns: pathobject.

bool exists() const;
bool exists(error_code& ec) const noexcept;

Returns: exists(this->status()) or exists(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_block_file() const;
bool is_block_file(error_code& ec) const noexcept;

Returns: is_block_file(this->status()) or is_block_file(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_character_file() const;
bool is_character_file(error_code& ec) const noexcept;

Returns: is_character_file(this->status()) or is_character_file(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_directory() const;
bool is_directory(error_code& ec) const noexcept;

Returns: is_directory(this->status()) or is_directory(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_fifo() const;
bool is_fifo(error_code& ec) const noexcept;

Returns: is_fifo(this->status()) or is_fifo(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_other() const;
bool is_other(error_code& ec) const noexcept;

Returns: is_other(this->status()) or is_other(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_regular_file() const;
bool is_regular_file(error_code& ec) const noexcept;

Returns: is_regular_file(this->status()) or is_regular_file(this->status(ec)), respectively.

§ 31.12.10.4
Throws: As specified in 31.12.5.

bool is_socket() const;
bool is_socket(error_code& ec) const noexcept;

Returns: is_socket(this->status()) or is_socket(this->status(ec)), respectively.

Throws: As specified in 31.12.5.

bool is_symlink() const;
bool is_symlink(error_code& ec) const noexcept;

Returns: is_symlink(this->symlink_status()) or is_symlink(this->symlink_status(ec)), respectively.

Throws: As specified in 31.12.5.

uintmax_t file_size() const;
uintmax_t file_size(error_code& ec) const noexcept;

Returns: If cached, the file size attribute value. Otherwise, file_size(path()) or file_size(path(), ec), respectively.

Throws: As specified in 31.12.5.

uintmax_t hard_link_count() const;
uintmax_t hard_link_count(error_code& ec) const noexcept;

Returns: If cached, the hard link count attribute value. Otherwise, hard_link_count(path()) or hard_link_count(path(), ec), respectively.

Throws: As specified in 31.12.5.

file_time_type last_write_time() const;
file_time_type last_write_time(error_code& ec) const noexcept;

Returns: If cached, the last write time attribute value. Otherwise, last_write_time(path()) or last_write_time(path(), ec), respectively.

Throws: As specified in 31.12.5.

file_status status() const;
file_status status(error_code& ec) const noexcept;

Returns: If cached, the status attribute value. Otherwise, status(path()) or status(path(), ec), respectively.

Throws: As specified in 31.12.5.

file_status symlink_status() const;
file_status symlink_status(error_code& ec) const noexcept;

Returns: If cached, the symlink status attribute value. Otherwise, symlink_status(path()) or symlink_status(path(), ec), respectively.

Throws: As specified in 31.12.5.

bool operator==(const directory_entry& rhs) const noexcept;

Returns: pathobject == rhs.pathobject.

strong_ordering operator<=>(const directory_entry& rhs) const noexcept;

Returns: pathobject <=> rhs.pathobject.

31.12.10.5 Inserter

template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const directory_entry& d);

Effects: Equivalent to: return os << d.path();
31.12.11 Class directory_iterator

1 An object of type directory_iterator provides an iterator for a sequence of directory_entry elements representing the path and any cached attribute values (31.12.10) for each file in a directory or in an implementation-defined directory-like file type.

[Note 1: For iteration into sub-directories, see class recursive_directory_iterator (31.12.12). — end note]

namespace std::filesystem {
  class directory_iterator {
    public:
      using iterator_category = input_iterator_tag;
      using value_type = directory_entry;
      using difference_type = ptrdiff_t;
      using pointer = const directory_entry*;
      using reference = const directory_entry&;

      directory_iterator() noexcept;
      explicit directory_iterator(const path& p);
      directory_iterator(const path& p, directory_options options);
      directory_iterator(const path& p, error_code& ec);
      directory_iterator(const path& p, directory_options options,
                         error_code& ec);
      directory_iterator(const directory_iterator& rhs);
      directory_iterator(directory_iterator&& rhs) noexcept;
      ~directory_iterator();
      directory_iterator& operator=(const directory_iterator& rhs);
      directory_iterator& operator=(directory_iterator&& rhs) noexcept;
      const directory_entry& operator*() const;
      const directory_entry* operator->() const;
      directory_iterator& operator++();
      directory_iterator& increment(error_code& ec);

      bool operator==(default_sentinel_t) const noexcept {
        return *this == directory_iterator();
      }
  } // other members as required by 25.3.5.3, input iterators
};

2 directory_iterator meets the Cpp17InputIterator requirements (25.3.5.3).

3 If an iterator of type directory_iterator reports an error or is advanced past the last directory element, that iterator shall become equal to the end iterator value. The directory_iterator default constructor shall create an iterator equal to the end iterator value, and this shall be the only valid iterator for the end condition.

4 The end iterator is not dereferenceable.

5 Two end iterators are always equal. An end iterator shall not be equal to a non-end iterator.

6 The result of calling the path() member of the directory_entry object obtained by dereferencing a directory_iterator is a reference to a path object composed of the directory argument from which the iterator was constructed with the filename of the directory entry appended as if by operator/=

7 Directory iteration shall not yield directory entries for the current (dot) and parent (dot-dot) directories.

8 The order of directory entries obtained by dereferencing successive increments of a directory_iterator is unspecified.

9 Constructors and non-const directory_iterator member functions store the values of any cached attributes (31.12.10) in the directory_entry element returned by operator*(). directory_iterator member functions shall not directly or indirectly call any directory_entry refresh function.
[Note 2: The exact mechanism for storing cached attribute values is not exposed to users. For exposition, class directory_iterator is shown in 31.12.10 as a friend of class directory_entry. — end note]

[Note 3: A path obtained by dereferencing a directory iterator might not actually exist; it could be a symbolic link to a non-existent file. Recursively walking directory trees for purposes of removing and renaming entries might invalidate symbolic links that are being followed. — end note]

[Note 4: If a file is removed from or added to a directory after the construction of a directory_iterator for the directory, it is unspecified whether or not subsequently incrementing the iterator will ever result in an iterator referencing the removed or added directory entry. See POSIX readdir. — end note]

### 31.12.11.2 Members

**directory_iterator() noexcept;**

*Effects*: Constructs the end iterator.

**explicit directory_iterator(const path& p);**

**directory_iterator(const path& p, directory_options options);**

**directory_iterator(const path& p, error_code& ec);**

**directory_iterator(const path& p, directory_options options, error_code& ec);**

*Effects*: For the directory that \( p \) resolves to, constructs an iterator for the first element in a sequence of directory_entry elements representing the files in the directory, if any; otherwise the end iterator. However, if

\[
(options & directory_options::skip_permission_denied) != directory_options::none
\]

and construction encounters an error indicating that permission to access \( p \) is denied, constructs the end iterator and does not report an error.

**Throws**: As specified in 31.12.5.

[Note 1: To iterate over the current directory, use directory_iterator("." ) rather than directory_iterator(" "). — end note]

**directory_iterator(const directory_iterator& rhs);**

**directory_iterator(directory_iterator&& rhs) noexcept;**

*Postconditions*: \*this has the original value of rhs.

**directory_iterator& operator=(const directory_iterator& rhs);**

**directory_iterator& operator=(directory_iterator&& rhs) noexcept;**

*Effects*: If \*this and rhs are the same object, the member has no effect.

*Postconditions*: \*this has the original value of rhs.

*Returns*: \*this.

**directory_iterator& operator++();**

**directory_iterator& increment(error_code& ec);**

*Effects*: As specified for the prefix increment operation of Input iterators (25.3.5.3).

*Returns*: \*this.

**Throws**: As specified in 31.12.5.

### 31.12.11.3 Non-member functions

These functions enable range access for directory_iterator.

**directory_iterator begin(directory_iterator iter) noexcept;**

*Returns*: iter.

**directory_iterator end(directory_iterator) noexcept;**

*Returns*: directory_iterator().
An object of type `recursive_directory_iterator` provides an iterator for a sequence of `directory_entry` elements representing the files in a directory or in an implementation-defined directory-like file type, and its sub-directories.

```cpp
namespace std::filesystem {
  class recursive_directory_iterator {
    public:
      using iterator_category = input_iterator_tag;
      using value_type = directory_entry;
      using difference_type = ptrdiff_t;
      using pointer = const directory_entry*;
      using reference = const directory_entry&;

      // 31.12.12.2, constructors and destructor
      recursive_directory_iterator() noexcept;
      explicit recursive_directory_iterator(const path& p);
      recursive_directory_iterator(const path& p, directory_options options);
      recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
      recursive_directory_iterator(const path& p, error_code& ec);
      recursive_directory_iterator(const recursive_directory_iterator& rhs);
      recursive_directory_iterator(recursive_directory_iterator&& rhs) noexcept;
      ~recursive_directory_iterator();

      // 31.12.12.2, observers
      directory_options options() const;
      int depth() const;
      bool recursion_pending() const;
      const directory_entry& operator*() const;
      const directory_entry* operator->() const;

      // 31.12.12.2, modifiers
      recursive_directory_iterator&
        operator=(const recursive_directory_iterator& rhs);
      recursive_directory_iterator&
        operator=(recursive_directory_iterator&& rhs) noexcept;
      recursive_directory_iterator& operator++();
      recursive_directory_iterator& increment(error_code& ec);
      void pop();
      void pop(error_code& ec);
      void disable_recursion_pending();

      bool operator==(default_sentinel_t) const noexcept {
        return *this == recursive_directory_iterator();
      }
  }
}
```

2 Calling `options`, `depth`, `recursion_pending`, `pop` or `disable_recursion_pending` on an iterator that is not dereferenceable results in undefined behavior.

3 The behavior of a `recursive_directory_iterator` is the same as a `directory_iterator` unless otherwise specified.

4 [Note 1: If the directory structure being iterated over contains cycles then it is possible that the end iterator is unreachable. — end note]
31.12.12.2 Members

recursive_directory_iterator() noexcept;

Effects: Constructs the end iterator.

explicit recursive_directory_iterator(const path& p);
recursive_directory_iterator(const path& p, directory_options options);
recursive_directory_iterator(const path& p, directory_options options, error_code& ec);
recursive_directory_iterator(const path& p, error_code& ec);

Effects: Constructs an iterator representing the first entry in the directory to which p resolves, if any; otherwise, the end iterator. However, if
(options & directory_options::skip_permission_denied) != directory_options::none
and construction encounters an error indicating that permission to access p is denied, constructs the end iterator and does not report an error.

Postconditions: options() == options for the signatures with a directory_options argument, otherwise options() == directory_options::none.

Throws: As specified in 31.12.5.

[Note 1: Use recursive_directory_iterator(“.”) rather than recursive_directory_iterator(“”) to iterate over the current directory. —end note]

recursive_directory_iterator(const recursive_directory_iterator& rhs);

Postconditions:
(7.1) — options() == rhs.options()
(7.2) — depth() == rhs.depth()
(7.3) — recursion_pending() == rhs.recursion_pending()

recursive_directory_iterator(const recursive_directory_iterator& rhs) noexcept;

Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

recursive_directory_iterator& operator=(const recursive_directory_iterator& rhs);

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions:
(10.1) — options() == rhs.options()
(10.2) — depth() == rhs.depth()
(10.3) — recursion_pending() == rhs.recursion_pending()

Returns: *this.

recursive_directory_iterator& operator=(recursive_directory_iterator& rhs) noexcept;

Effects: If *this and rhs are the same object, the member has no effect.

Postconditions: options(), depth(), and recursion_pending() have the values that rhs.options(), rhs.depth(), and rhs.recursion_pending(), respectively, had before the function call.

Returns: *this.

directory_options options() const;

Returns: The value of the argument passed to the constructor for the options parameter, if present, otherwise directory_options::none.

Throws: Nothing.

int depth() const;

Returns: The current depth of the directory tree being traversed.
Note 3: The initial directory is depth 0, its immediate subdirectories are depth 1, and so forth. — end note

bool recursion_pending() const;

Returns: true if disable_recursion_pending() has not been called subsequent to the prior construction or increment operation, otherwise false.

Throws: Nothing.

recursive_directory_iterator& operator++();

recursive_directory_iterator& increment(error_code& ec);

Effects: As specified for the prefix increment operation of Input iterators (25.3.5.3), except that:

- If there are no more entries at the current depth, then if depth() != 0 iteration over the parent directory resumes; otherwise *this = recursive_directory_iterator().

- Otherwise if

  recursion_pending() && is_directory(*this)->status()) && (!is_symlink(*this)->symlink_status()) ||
  (options() & directory_options::follow_directory_symlink) != directory_options::none

  then either directory (*this)->path() is recursively iterated into or, if

  (options() & directory_options::skip_permission_denied) != directory_options::none

  and an error occurs indicating that permission to access directory (*this)->path() is denied, then directory (*this)->path() is treated as an empty directory and no error is reported.

Returns: *this.

Throws: As specified in 31.12.5.

void pop();

void pop(error_code& ec);

Effects: If depth() == 0, set *this to recursive_directory_iterator(). Otherwise, cease iteration of the directory currently being iterated over, and continue iteration over the parent directory.

Throws: As specified in 31.12.5.

Remarks: Any copies of the previous value of *this are no longer required to be dereferenceable nor to be in the domain of ==.

void disable_recursion_pending();

Postconditions: recursion_pending() == false.

[Note 4: disable_recursion_pending() is used to prevent unwanted recursion into a directory. — end note]

31.12.12.3 Non-member functions [fs.rec.dir.itr.nonmembers]

These functions enable use of recursive_directory_iterator with range-based for statements.

recursive_directory_iterator begin(recursive_directory_iterator iter) noexcept;

Returns: iter.

recursive_directory_iterator end(recursive_directory_iterator) noexcept;

Returns: recursive_directory_iterator().

31.12.13 Filesystem operation functions [fs.op.funcs]

31.12.13.1 General [fs.op.funcs.general]

Filesystem operation functions query or modify files, including directories, in external storage.

[Note 1: Because hardware failures, network failures, file system races (31.12.2.4), and many other kinds of errors occur frequently in file system operations, any filesystem operation function, no matter how apparently innocuous, can encounter an error; see 31.12.5. — end note]
path filesystem::absolute(const path& p, error_code& ec);

*Effects:* Composes an absolute path referencing the same file system location as p according to the operating system (31.12.2.3).

*Returns:* The composed path. The signature with argument ec returns path() if an error occurs.

*[Note 1:* For the returned path, rp, rp.is_absolute() is true unless an error occurs. — *end note]*

*Throws:* As specified in 31.12.5.

*[Note 2:* To resolve symlinks or perform other sanitization that can involve queries to secondary storage, such as hard disks, consider canonical (31.12.13.3). — *end note]*

*[Note 3:* Implementations are strongly encouraged to not query secondary storage, and not consider !exists(p) an error. — *end note]*

*[Example 1:* For POSIX-based operating systems, absolute(p) is simply current_path() / p. For Windows-based operating systems, absolute might have the same semantics as GetFullPathNameW. — *end example]*

### 31.12.13.3 Canonical

path filesystem::canonical(const path& p);
path filesystem::canonical(const path& p, error_code& ec);

*Effects:* Converts p to an absolute path that has no symbolic link, dot, or dot-dot elements in its pathname in the generic format.

*Returns:* A path that refers to the same file system object as absolute(p). The signature with argument ec returns path() if an error occurs.

*Throws:* As specified in 31.12.5.

*Remarks:* !exists(p) is an error.

### 31.12.13.4 Copy

void filesystem::copy(const path& from, const path& to);

*Effects:* Equivalent to copy(from, to, copy_options::none).

void filesystem::copy(const path& from, const path& to, error_code& ec);

*Effects:* Equivalent to copy(from, to, copy_options::none, ec).

void filesystem::copy(const path& from, const path& to, copy_options options);
void filesystem::copy(const path& from, const path& to, copy_options options, error_code& ec);  

*Preconditions:* At most one element from each option group (31.12.8.3) is set in options.

*Effects:* Before the first use of f and t:

1. If  
   
   (options & copy_options::create_symlinks) != copy_options::none ||  
   (options & copy_options::skip_symlinks) != copy_options::none

   then auto f = symlink_status(from) and if needed auto t = symlink_status(to).

2. Otherwise, if

   (options & copy_options::copy_symlinks) != copy_options::none

   then auto f = symlink_status(from) and if needed auto t = status(to).

3. Otherwise, auto f = status(from) and if needed auto t = status(to).

Effects are then as follows:

1. If f.type() or t.type() is an implementation-defined file type (31.12.8.2), then the effects are implementation-defined.

2. Otherwise, an error is reported as specified in 31.12.5 if:

3.1. exists(f) is false, or

3.2. equivalent(from, to) is true, or

3.3. is_other(f) || is_other(t) is true, or

§ 31.12.13.4 1715
is_directory(f) \&\& is_regular_file(t) is true.

Otherwise, if is_symlink(f), then:

- If (options & copy_options::skip_symlinks) != copy_options::none then return.
- Otherwise if !exists(t) \&\& (options & copy_options::copy_symlinks) != copy_options::none then copy_symlink(from, to).

Otherwise report an error as specified in 31.12.

Otherwise, if is_regular_file(f), then:

- If (options & copy_options::directories_only) != copy_options::none, then return.
- Otherwise, if (options & copy_options::create_symlinks) != copy_options::none, then create a symbolic link to the source file.
- Otherwise, if (options & copy_options::create_hard_links) != copy_options::none, then create a hard link to the source file.
- Otherwise, if is_directory(t), then copy_file(from, to/from.filename(), options).
- Otherwise, copy_file(from, to, options).

Otherwise, if

is_directory(f) \&\& (options & copy_options::create_symlinks) != copy_options::none
then report an error with an error_code argument equal to make_error_code(errc::is_a_directory).

Otherwise, if

is_directory(f) \&\& (options & copy_options::recursive) != copy_options::none || options == copy_options::none
then:

- If exists(t) is false, then create_directory(to, from).
- Then, iterate over the files in from, as if by

for (const directory_entry& x : directory_iterator(from))
  copy(x.path(), to/x.path().filename(),
       options | copy_options::in-recursive-copy);

where in-recursive-copy is a bitmask element of copy_options that is not one of the elements in 31.12.8.3.

Otherwise, for the signature with argument ec, ec.clear().

Otherwise, no effects.

Throws: As specified in 31.12.

Remarks: For the signature with argument ec, any library functions called by the implementation shall have an error_code argument if applicable.

Example 1: Given this directory structure:

```
/dir1
  file1
  file2
dir2
  file3
```

Calling copy("/dir1", "/dir3") would result in:

```
/dir1
  file1
  file2
  dir2
  file3
/dir3
```
Alternatively, calling `copy("/dir1", "/dir3", copy_options::recursive) would result in:

```
/dir1
 file1
 file2
 dir2
   file3
/dir3
 file1
 file2
 dir2
   file3
```

— end example]

### 31.12.13.5 Copy file

bool filesystem::copy_file(const path& from, const path& to);
bool filesystem::copy_file(const path& from, const path& to, error_code& ec);

1

**Returns:** `copy_file(from, to, copy_options::none)` or
`copy_file(from, to, copy_options::none, ec)`, respectively.

2

**Throws:** As specified in 31.12.5.

bool filesystem::copy_file(const path& from, const path& to, copy_options options);
bool filesystem::copy_file(const path& from, const path& to, copy_options options, error_code& ec);

3

**Preconditions:** At most one element from each option group (31.12.8.3) is set in `options`.

4

**Effects:** As follows:

1. Report an error as specified in 31.12.5 if:
   1. `is_regular_file(from)` is false, or
   2. `exists(to)` is true and `is_regular_file(to)` is false, or
   3. `exists(to)` is true and `equivalent(from, to)` is true, or
   4. `exists(to)` is true and
      ```
      (options & (copy_options::skip_existing |
                  copy_options::overwrite_existing |
                  copy_options::update_existing)) == copy_options::none
      ```

2. Otherwise, copy the contents and attributes of the file `from` resolves to, to the file `to` resolves to, if:
   1. `exists(to)` is false, or
   2. `(options & copy_options::overwrite_existing)` != `copy_options::none`, or
   3. `(options & copy_options::update_existing)` != `copy_options::none` and `from` is more recent than `to`, determined as if by use of the `last_write_time` function (31.12.13.26).

3. Otherwise, no effects.

4. **Returns:** `true` if the `from` file was copied, otherwise `false`. The signature with argument `ec` returns `false` if an error occurs.

5

**Throws:** As specified in 31.12.5.

6

**Complexity:** At most one direct or indirect invocation of `status(to)`.

### 31.12.13.6 Copy symlink

void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink);

§ 31.12.13.6 1717
void filesystem::copy_symlink(const path& existing_symlink, const path& new_symlink, error_code& ec) noexcept;

Effects: Equivalent to function(read_symlink(existing_symlink), new_symlink) or function(read_symlink(existing_symlink, ec), new_symlink, ec), respectively, where in each case function is create_symlink or create_directory_symlink as appropriate.

Throws: As specified in 31.12.5.

31.12.13.7 Create directories

bool filesystem::create_directories(const path& p);
bool filesystem::create_directories(const path& p, error_code& ec);

Effects: Calls create_directory() for each element of p that does not exist.

Returns: true if a new directory was created for the directory p resolves to, otherwise false.

Throws: As specified in 31.12.5.

Complexity: $O(n)$ where $n$ is the number of elements of p.

31.12.13.8 Create directory

bool filesystem::create_directory(const path& p);
bool filesystem::create_directory(const path& p, error_code& ec) noexcept;

Effects: Creates the directory p resolves to, as if by POSIX mkdir with a second argument of static_cast<int>(perms::all). If mkdir fails because p resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

Returns: true if a new directory was created, otherwise false.

Throws: As specified in 31.12.5.

bool filesystem::create_directory(const path& p, const path& existing_p);
bool filesystem::create_directory(const path& p, const path& existing_p, error_code& ec) noexcept;

Effects: Creates the directory p resolves to, with attributes copied from directory existing_p. The set of attributes copied is operating system dependent. If mkdir fails because p resolves to an existing directory, no error is reported. Otherwise on failure an error is reported.

[Note 1: For POSIX-based operating systems, the attributes are those copied by native API stat(existing_p.c_str(), &attributes_stat) followed by mkdir(p.c_str(), attributes_stat.st_mode). For Windows-based operating systems, the attributes are those copied by native API CreateDirectoryExW(existing_p.c_str(), p.c_str(), 0). —end note]

Returns: true if a new directory was created with attributes copied from directory existing_p, otherwise false.

Throws: As specified in 31.12.5.

31.12.13.9 Create directory symlink

void filesystem::create_directory_symlink(const path& to, const path& new_symlink);
void filesystem::create_directory_symlink(const path& to, const path& new_symlink, error_code& ec) noexcept;

Effects: Establishes the postcondition, as if by POSIX symlink().

Postconditions: new_symlink resolves to a symbolic link file that contains an unspecified representation of to.

Throws: As specified in 31.12.5.

[Note 1: Some operating systems require symlink creation to identify that the link is to a directory. Thus, create_symlink() (instead of create_directory_symlink()) cannot be used reliably to create directory symlinks. —end note]

[Note 2: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. —end note]
31.12.13.10  Create hard link

```cpp
void filesystem::create_hard_link(const path& to, const path& new_hard_link);
void filesystem::create_hard_link(const path& to, const path& new_hard_link,
    error_code& ec) noexcept;
```

### Effects
Establishes the postcondition, as if by POSIX `link()`.

### Postconditions
1. `exists(to)` && `exists(new_hard_link)` && `equivalent(to, new_hard_link)`
2. The contents of the file or directory `to` resolves to are unchanged.

### Throws
As specified in 31.12.5.

[Note 1: Some operating systems do not support hard links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support hard links regardless of the operating system. Some file systems limit the number of links per file. — end note]

31.12.13.11  Create symlink

```cpp
void filesystem::create_symlink(const path& to, const path& new_symlink);
void filesystem::create_symlink(const path& to, const path& new_symlink,
    error_code& ec) noexcept;
```

### Effects
Establishes the postcondition, as if by POSIX `symlink()`.

### Postconditions
`new_symlink` resolves to a symbolic link file that contains an unspecified representation of `to`.

### Throws
As specified in 31.12.5.

[Note 1: Some operating systems do not support symbolic links at all or support them only for regular files. Some file systems (such as the FAT file system) do not support symbolic links regardless of the operating system. — end note]

31.12.13.12  Current path

```cpp
path filesystem::current_path();
path filesystem::current_path(error_code& ec);
```

### Returns
The absolute path of the current working directory, whose pathname in the native format is obtained as if by POSIX `getcwd()` . The signature with argument `ec` returns `path()` if an error occurs.

### Throws
As specified in 31.12.5.

### Remarks
The current working directory is the directory, associated with the process, that is used as the starting location in pathname resolution for relative paths.

[Note 1: The `current_path()` name was chosen to emphasize that the returned value is a path, not just a single directory name. — end note]

[Note 2: The current path as returned by many operating systems is a dangerous global variable and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

```cpp
void filesystem::current_path(const path& p);
void filesystem::current_path(const path& p, error_code& ec) noexcept;
```

### Effects
Establishes the postcondition, as if by POSIX `chdir()`.

### Postconditions
`equivalent(p, current_path())`.

### Throws
As specified in 31.12.5.

[Note 3: The current path for many operating systems is a dangerous global state and can be changed unexpectedly by third-party or system library functions, or by another thread. — end note]

31.12.13.13  Equivalent

```cpp
bool filesystem::equivalent(const path& p1, const path& p2);
bool filesystem::equivalent(const path& p1, const path& p2, error_code& ec) noexcept;
```

Two paths are considered to resolve to the same file system entity if two candidate entities reside on the same device at the same location.
[Note 1: On POSIX platforms, this is determined as if by the values of the POSIX stat class, obtained as if by stat() for the two paths, having equal st_dev values and equal st_ino values. — end note]

2 Returns: true, if p1 and p2 resolve to the same file system entity, otherwise false. The signature with argument ec returns false if an error occurs.

3 Throws: As specified in 31.12.5.

4 Remarks: !exists(p1) || !exists(p2) is an error.

31.12.13.14 Exists

bool filesystem::exists(file_status s) noexcept;

1 Returns: status_known(s) && s.type() != file_type::not_found.

bool filesystem::exists(const path& p);

bool filesystem::exists(const path& p, error_code& ec) noexcept;

2 Let s be a file_status, determined as if by status(p) or status(p, ec), respectively.

3 Effects: The signature with argument ec calls ec.clear() if status_known(s).

4 Returns: exists(s).

5 Throws: As specified in 31.12.5.

31.12.13.15 File size

uintmax_t filesystem::file_size(const path& p);

uintmax_t filesystem::file_size(const path& p, error_code& ec) noexcept;

1 Effects: If exists(p) is false, an error is reported (31.12.5).

2 Returns:

(2.1) — If is_regular_file(p), the size in bytes of the file p resolves to, determined as if by the value of the POSIX stat class member st_size obtained as if by POSIX stat().

(2.2) — Otherwise, the result is implementation-defined.

The signature with argument ec returns static_cast<uintmax_t>(-1) if an error occurs.

3 Throws: As specified in 31.12.5.

31.12.13.16 Hard link count

uintmax_t filesystem::hard_link_count(const path& p);

uintmax_t filesystem::hard_link_count(const path& p, error_code& ec) noexcept;

1 Returns: The number of hard links for p. The signature with argument ec returns static_cast<uintmax_t>(-1) if an error occurs.

2 Throws: As specified in 31.12.5.

31.12.13.17 Is block file

bool filesystem::is_block_file(file_status s) noexcept;

1 Returns: s.type() == file_type::block.

bool filesystem::is_block_file(const path& p);

bool filesystem::is_block_file(const path& p, error_code& ec) noexcept;

2 Returns: is_block_file(status(p)) or is_block_file(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

3 Throws: As specified in 31.12.5.

31.12.13.18 Is character file

bool filesystem::is_character_file(file_status s) noexcept;

1 Returns: s.type() == file_type::character.
bool filesystem::is_character_file(const path& p);
bool filesystem::is_character_file(const path& p, error_code& ec) noexcept;

Returns: is_character_file(status(p)) or is_character_file(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.19 Is directory [fs.op.is.directory]

bool filesystem::is_directory(file_status s) noexcept;

Returns: s.type() == file_type::directory.

bool filesystem::is_directory(const path& p);
bool filesystem::is_directory(const path& p, error_code& ec) noexcept;

Returns: is_directory(status(p)) or is_directory(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.20 Is empty [fs.op.is.empty]

bool filesystem::is_empty(const path& p);
bool filesystem::is_empty(const path& p, error_code& ec);

Effects:

(1.1) — Determine file_status s, as if by status(p) or status(p, ec), respectively.
(1.2) — For the signature with argument ec, return false if an error occurred.
(1.3) — Otherwise, if is_directory(s):
(1.3.1) — Create a variable itr, as if by directory_iterator itr(p) or directory_iterator itr(p, ec), respectively.
(1.3.2) — For the signature with argument ec, return false if an error occurred.
(1.3.3) — Otherwise, return itr == directory_iterator().
(1.4) — Otherwise:
(1.4.1) — Determine uintmax_t sz, as if by file_size(p) or file_size(p, ec), respectively.
(1.4.2) — For the signature with argument ec, return false if an error occurred.
(1.4.3) — Otherwise, return sz == 0.

Throws: As specified in 31.12.5.

31.12.13.21 Is fifo [fs.op.is.fifo]

bool filesystem::is_fifo(file_status s) noexcept;

Returns: s.type() == file_type::fifo.

bool filesystem::is_fifo(const path& p);
bool filesystem::is_fifo(const path& p, error_code& ec) noexcept;

Returns: is_fifo(status(p)) or is_fifo(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.

Throws: As specified in 31.12.5.

31.12.13.22 Is other [fs.op.is.other]

bool filesystem::is_other(file_status s) noexcept;

Returns: exists(s) && !is_regular_file(s) && !is_directory(s) && !is_symlink(s).

bool filesystem::is_other(const path& p);
bool filesystem::is_other(const path& p, error_code& ec) noexcept;

Returns: is_other(status(p)) or is_other(status(p, ec)), respectively. The signature with argument ec returns false if an error occurs.
3. **Throws**: As specified in 31.12.5.

### 31.12.13.23 Is regular file

**bool filesystem::is_regular_file(file_status s)** noexcept;

*Returns*: \(s\.type() == file\.type\.\:\\text{\textasciitilde{\text{\textvisiblespace}}}\text{regular}.\)

**bool filesystem::is_regular_file(const path\& p)**;

*Returns*: \(\text{is\_regular\_file}(\text{status}(p)).\)

*Throws*: filesystem\_error if status(p) would throw filesystem\_error.

**bool filesystem::is_regular_file(const path\& p, error\_code\& ec)** noexcept;

*Effects*: Sets \(ec\) as if by status(p, ec).

\[\text{Note 1: file\_type::\text{none}, file\_type::\text{not\_found} and file\_type::\text{unknown} cases set ec to error values. To distinguish between cases, call the status function directly. —end note}\]

*Returns*: \(\text{is\_regular\_file}(\text{status}(p, ec)).\) Returns false if an error occurs.

### 31.12.13.24 Is socket

**bool filesystem::is_socket(file_status s)** noexcept;

*Returns*: \(s\.type() == file\.type\.\:\\text{\textasciitilde{\text{\textvisiblespace}}}\text{socket}.\)

**bool filesystem::is_socket(const path\& p)**;

**bool filesystem::is_socket(const path\& p, error\_code\& ec)** noexcept;

*Returns*: \(\text{is\_socket}(\text{status}(p))\) or \(\text{is\_socket}(\text{status}(p, ec))\), respectively. The signature with argument \(ec\) returns false if an error occurs.

*Throws*: As specified in 31.12.5.

### 31.12.13.25 Is symlink

**bool filesystem::is_symlink(file_status s)** noexcept;

*Returns*: \(s\.type() == file\.type\.\:\\text{\textasciitilde{\text{\textvisiblespace}}}\text{symlink}.\)

**bool filesystem::is_symlink(const path\& p)**;

**bool filesystem::is_symlink(const path\& p, error\_code\& ec)** noexcept;

*Returns*: \(\text{is\_symlink}(\text{symlink\_status}(p))\) or \(\text{is\_symlink}(\text{symlink\_status}(p, ec))\), respectively. The signature with argument \(ec\) returns false if an error occurs.

*Throws*: As specified in 31.12.5.

### 31.12.13.26 Last write time

**file\_time\_type filesystem::last\_write\_time(const path\& p)**;

**file\_time\_type filesystem::last\_write\_time(const path\& p, error\_code\& ec)** noexcept;

*Returns*: The time of last data modification of \(p\), determined as if by the value of the POSIX stat class member \(st\_mtime\) obtained as if by POSIX \(\text{stat}\). The signature with argument \(ec\) returns \(file\_time\_type::\text{min}()\) if an error occurs.

*Throws*: As specified in 31.12.5.

**void filesystem::last\_write\_time(const path\& p, file\_time\_type new\_time)**;

**void filesystem::last\_write\_time(const path\& p, file\_time\_type new\_time, error\_code\& ec)** noexcept;

*Effects*: Sets the time of last data modification of the file resolved to by \(p\) to \(new\_time\), as if by POSIX \(\text{futimens}\).

*Throws*: As specified in 31.12.5.

\[\text{Note 1: A postcondition of last\_write\_time(p) == new\_time is not specified because it does not necessarily hold for file systems with coarse time granularity. —end note}\]
31.12.13.27 Permissions

void filesystem::permissions(const path& p, perms prms, perm_options opts=perm_options::replace);
void filesystem::permissions(const path& p, perms prms, error_code& ec) noexcept;
void filesystem::permissions(const path& p, perms prms, perm_options opts, error_code& ec);

Preconditions: Exactly one of the perm_options constants replace, add, or remove is present in opts.

Effects: Applies the action specified by opts to the file p resolves to, or to file p itself if p is a symbolic link and perm_options::nofollow is set in opts. The action is applied as if by POSIX fchmodat().

[Note 1: Conceptually permissions are viewed as bits, but the actual implementation can use some other mechanism. — end note]

Throws: As specified in 31.12.5.

Remarks: The second signature behaves as if it had an additional parameter perm_options opts with an argument of perm_options::replace.

31.12.13.28 Proximate

path filesystem::proximate(const path& p, error_code& ec);
Returns: proximate(p, current_path(), ec).

Throws: As specified in 31.12.5.

path filesystem::proximate(const path& p, const path& base = current_path());
path filesystem::proximate(const path& p, const path& base, error_code& ec);

Returns: For the first form:
weakly_canonical(p).lexically_proximate(weakly_canonical(base));
For the second form:
weakly_canonical(p, ec).lexically_proximate(weakly_canonical(base, ec));
or path() at the first error occurrence, if any.

Throws: As specified in 31.12.5.

31.12.13.29 Read symlink

path filesystem::read_symlink(const path& p);
path filesystem::read_symlink(const path& p, error_code& ec);

Returns: If p resolves to a symbolic link, a path object containing the contents of that symbolic link. The signature with argument ec returns path() if an error occurs.

Throws: As specified in 31.12.5.

[Note 1: It is an error if p does not resolve to a symbolic link. — end note]

31.12.13.30 Relative

path filesystem::relative(const path& p, error_code& ec);
Returns: relative(p, current_path(), ec).

Throws: As specified in 31.12.5.

path filesystem::relative(const path& p, const path& base = current_path());
path filesystem::relative(const path& p, const path& base, error_code& ec);

Returns: For the first form:
weakly_canonical(p).lexically_relative(weakly_canonical(base));
For the second form:
weakly_canonical(p, ec).lexically_relative(weakly_canonical(base, ec));
or path() at the first error occurrence, if any.

Throws: As specified in 31.12.5.
31.12.13.31 Remove

```cpp
bool filesystem::remove(const path& p);
bool filesystem::remove(const path& p, error_code& ec) noexcept;
```

**Effects:** If `exists(symlink_status(p, ec))`, the file `p` is removed as if by POSIX `remove()`.

*Note 1:* A symbolic link is itself removed, rather than the file it resolves to.  — *end note*

**Postconditions:** `exists(symlink_status(p))` is false.

**Returns:** `false` if `p` did not exist, otherwise `true`. The signature with argument `ec` returns `false` if an error occurs.

**Throws:** As specified in 31.12.5.

31.12.13.32 Remove all

```cpp
uintmax_t filesystem::remove_all(const path& p);
uintmax_t filesystem::remove_all(const path& p, error_code& ec);
```

**Effects:** Recursively deletes the contents of `p` if it exists, then deletes file `p` itself, as if by POSIX `remove()`.

*Note 1:* A symbolic link is itself removed, rather than the file it resolves to.  — *end note*

**Postconditions:** `exists(symlink_status(p))` is false.

**Returns:** The number of files removed. The signature with argument `ec` returns `static_cast<uintmax_t>(-1)` if an error occurs.

**Throws:** As specified in 31.12.5.

31.12.13.33 Rename

```cpp
void filesystem::rename(const path& old_p, const path& new_p);
void filesystem::rename(const path& old_p, const path& new_p, error_code& ec) noexcept;
```

**Effects:** Renames `old_p` to `new_p`, as if by POSIX `rename()`.

*Note 1:

1. If `old_p` and `new_p` resolve to the same existing file, no action is taken.
2. Otherwise, the rename can include the following effects:
   1. if `new_p` resolves to an existing non-directory file, `new_p` is removed; otherwise,
   2. if `new_p` resolves to an existing directory, `new_p` is removed if empty on POSIX compliant operating systems but might be an error on other operating systems. A symbolic link is itself renamed, rather than the file it resolves to.  — *end note*

**Throws:** As specified in 31.12.5.

31.12.13.34 Resize file

```cpp
void filesystem::resize_file(const path& p, uintmax_t new_size);
void filesystem::resize_file(const path& p, uintmax_t new_size, error_code& ec) noexcept;
```

**Effects:** Causes the size that would be returned by `file_size(p)` to be equal to `new_size`, as if by POSIX `truncate()`.

**Throws:** As specified in 31.12.5.

31.12.13.35 Space

```cpp
space_info filesystem::space(const path& p);
space_info filesystem::space(const path& p, error_code& ec) noexcept;
```

**Returns:** An object of type `space_info`. The value of the `space_info` object is determined as if by using POSIX `statvfs` to obtain a POSIX `struct statvfs`, and then multiplying its `f_blocks`, `f_bfree`, and `f_bavail` members by its `f_frsize` member, and assigning the results to the `capacity`, `free`, and `available` members respectively. Any members for which the value cannot be determined shall be set to `static_cast<uintmax_t>(-1)`. For the signature with argument `ec`, all members are set to `static_cast<uintmax_t>(-1)` if an error occurs.

§ 31.12.13.35 1724
**Throws:** As specified in 31.12.5.

**Remarks:** The value of member `space_info::available` is operating system dependent.

[Note 1: `available` might be less than `free`. — end note]

### §31.12.13.36 Status

```cpp
file_status filesystem::status(const path& p);
```

**Effects:** As if:

```cpp
error_code ec;
file_status result = status(p, ec);
if (result.type() == file_type::none)
    throw filesystem_error(implementation-supplied-message, p, ec);
return result;
```

**Returns:** See above.

**Throws:** `filesystem_error`.

[Note 1: `result` values of `file_status(file_type::not_found)` and `file_status(file_type::unknown)` are not considered failures and do not cause an exception to be thrown. — end note]

```cpp
file_status filesystem::status(const path& p, error_code& ec) noexcept;
```

**Effects:** If possible, determines the attributes of the file `p` resolves to, as if by using POSIX `stat()` to obtain a POSIX `struct stat`. If, during attribute determination, the underlying file system API reports an error, sets `ec` to indicate the specific error reported. Otherwise, `ec.clear()`.

[Note 2: This allows users to inspect the specifics of underlying API errors even when the value returned by `status()` is not `file_status(file_type::none)`. — end note]

Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

**Returns:**

(6.1) — If `ec != error_code()`:

(6.1.1) — If the specific error indicates that `p` cannot be resolved because some element of the path does not exist, returns `file_status(file_type::not_found)`.

(6.1.2) — Otherwise, if the specific error indicates that `p` can be resolved but the attributes cannot be determined, returns `file_status(file_type::unknown)`.

(6.1.3) — Otherwise, returns `file_status(file_type::none)`.

[Note 3: These semantics distinguish between `p` being known not to exist, `p` existing but not being able to determine its attributes, and there being an error that prevents even knowing if `p` exists. These distinctions are important to some use cases. — end note]

(6.2) — Otherwise,

(6.2.1) — If the attributes indicate a regular file, as if by POSIX `S_ISREG`, returns `file_status(file_type::regular, prms)`.

[Note 4: `file_type::regular` implies appropriate `<fstream>` operations would succeed, assuming no hardware, permission, access, or file system race errors. Lack of `file_type::regular` does not necessarily imply `<fstream>` operations would fail on a directory. — end note]

(6.2.2) — Otherwise, if the attributes indicate a directory, as if by POSIX `S_ISDIR`, returns `file_status(file_type::directory, prms)`.

[Note 5: `file_type::directory` implies that calling `directory_iterator(p)` would succeed. — end note]

(6.2.3) — Otherwise, if the attributes indicate a block special file, as if by POSIX `S_ISBLK`, returns `file_status(file_type::block, prms)`.

(6.2.4) — Otherwise, if the attributes indicate a character special file, as if by POSIX `S_ISCHR`, returns `file_status(file_type::character, prms)`.

(6.2.5) — Otherwise, if the attributes indicate a fifo or pipe file, as if by POSIX `S_ISFIFO`, returns `file_status(file_type::fifo, prms)`.
Otherwise, if the attributes indicate a socket, as if by POSIX `S_ISSOCK`, returns `file_status(file_type::socket, prms)`.

Otherwise, if the attributes indicate an implementation-defined file type (31.12.8.2), returns `file_status(file_type::A, prms)`, where `A` is the constant for the implementation-defined file type.

Otherwise, returns `file_status(file_type::unknown, prms)`.

Remarks: If a symbolic link is encountered during pathname resolution, pathname resolution continues using the contents of the symbolic link.

31.12.13.37 Status known

`bool filesystem::status_known(file_status s) noexcept;`

Returns: `s.type() != file_type::none`.

31.12.13.38 Symlink status

`file_status filesystem::symlink_status(const path& p);`

Effects: Same as `status()`, above, except that the attributes of `p` are determined as if by using POSIX `lstat()` to obtain a POSIX `struct stat`.

Let `prms` denote the result of `(m & perms::mask)`, where `m` is determined as if by converting the `st_mode` member of the obtained `struct stat` to the type `perms`.

Returns: Same as `status()`, above, except that if the attributes indicate a symbolic link, as if by POSIX `S_ISLNK`, returns `file_status(file_type::symlink, prms)`.

The signature with argument `ec` returns `file_status(file_type::none)` if an error occurs.

Throws: As specified in 31.12.5.

Remarks: Pathname resolution terminates if `p` names a symbolic link.

31.12.13.39 Temporary directory path

`path filesystem::temp_directory_path();`

Effects: If `exists(p)` is `false` or `is_directory(p)` is `false`, an error is reported (31.12.5).

Returns: The path `p`. The signature with argument `ec` returns `path()` if an error occurs.

Throws: As specified in 31.12.5.

[Example 1: For POSIX-based operating systems, an implementation might return the path supplied by the first environment variable found in the list TMPDIR, TMP, TEMP, TEMPDIR, or if none of these are found, "/tmp". For Windows-based operating systems, an implementation might return the path reported by the Windows GetTempPath API function. — end example]

31.12.13.40 Weakly canonical

`path filesystem::weakly_canonical(const path& p);`

Effects: Using `status(p) or status(p, ec)`, respectively, to determine existence, return a path composed by `operator/=` from the result of calling `canonical()` with a path argument composed of the leading elements of `p` that exist, if any, followed by the elements of `p` that do not exist, if any.

For the first form, `canonical()` is called without an `error_code` argument. For the second form, `canonical()` is called with `ec` as an `error_code` argument, and `path()` is returned at the first error occurrence, if any.

Postconditions: The returned path is in normal form (31.12.6.2).

Returns: `p` with symlinks resolved and the result normalized (31.12.6.2).

Throws: As specified in 31.12.5.
Remarks: Implementations should avoid unnecessary normalization such as when canonical has already been called on the entirety of p.

1 The contents and meaning of the header `<cinttypes>` are the same as the C standard library header `<inttypes.h>`, with the following changes:

(1.1) — The header `<cinttypes>` includes the header `<cstdint>` (17.4.2) instead of `<stdint.h>`, and

(1.2) — if and only if the type `<intmax_t>` designates an extended integer type (6.8.2), the following function signatures are added:

```c
intmax_t abs(intmax_t);
imaxdiv_t div(intmax_t, intmax_t);
```

which shall have the same semantics as the function signatures `<intmax_t> imaxabs(intmax_t)` and `<imaxdiv_t> imaxdiv(intmax_t, intmax_t)`, respectively.

See also: ISO C 7.8

2 Each of the PRI macros listed in this subclause is defined if and only if the implementation defines the corresponding typedef-name in 17.4.2. Each of the SCN macros listed in this subclause is defined if and only if the implementation defines the corresponding typedef-name in 17.4.2 and has a suitable `fscanf` length modifier for the type.
32 Regular expressions library [re]

32.1 General [re.general]
1 This Clause describes components that C++ programs may use to perform operations involving regular expression matching and searching.
2 The following subclauses describe a basic regular expression class template and its traits that can handle char-like (23.1) template arguments, two specializations of this class template that handle sequences of char and wchar_t, a class template that holds the result of a regular expression match, a series of algorithms that allow a character sequence to be operated upon by a regular expression, and two iterator types for enumerating regular expression matches, as summarized in Table 137.

Table 137: Regular expressions library summary [tab:re.summary]

32.2 Requirements [re.req]
1 This subclause defines requirements on classes representing regular expression traits.
[Note 1: The class template regex_traits, defined in 32.6, meets these requirements. — end note]
2 The class template basic_regex, defined in 32.7, needs a set of related types and functions to complete the definition of its semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by the basic_regex class template. This subclause defines the semantics of these members.
3 To specialize class template basic_regex for a character container CharT and its related regular expression traits class Traits, use basic_regex<CharT, Traits>.
4 In the following requirements,
   (4.1) — X denotes a traits class defining types and functions for the character container type charT;
   (4.2) — u is an object of type X;
   (4.3) — v is an object of type const X;
   (4.4) — p is a value of type const charT*;
   (4.5) — I1 and I2 are input iterators (25.3.5.3);
   (4.6) — F1 and F2 are forward iterators (25.3.5.5);
   (4.7) — c is a value of type const charT;
   (4.8) — s is an object of type X::string_type;
   (4.9) — cs is an object of type const X::string_type;
   (4.10) — b is a value of type bool;
   (4.11) — I is a value of type int;
   (4.12) — cl is an object of type X::char_class_type; and
— `loc` is an object of type `X::locale_type`.

A traits class `X` meets the regular expression traits requirements if the following types and expressions are well-formed and have the specified semantics.

```cpp
typename X::char_type
Result: `charT`, the character container type used in the implementation of class template `basic_regex`.
```

```cpp
typename X::string_type
Result: `basic_string<charT>`
```

```cpp
typename X::locale_type
Result: A copy constructible type that represents the locale used by the traits class.
```

```cpp
typename X::char_class_type
Result: A bitmask type (16.3.3.3.4) representing a particular character classification.
```

```cpp
X::length(p)
Result: `size_t`
Returns: The smallest `i` such that `p[i] == 0`.
Complexity: Linear in `i`.
```

```cpp
v.translate(c)
Result: `X::char_type`
Returns: A character such that for any character `d` that is to be considered equivalent to `c` then `v.translate(c) == v.translate(d)`.
```

```cpp
v.translate_nocase(c)
Result: `X::char_type`
Returns: For all characters `C` that are to be considered equivalent to `c` when comparisons are to be performed without regard to case, then `v.translate_nocase(c) == v.translate_nocase(C)`.
```

```cpp
v.transform(F1, F2)
Result: `X::string_type`
Returns: A sort key for the character sequence designated by the iterator range `[F1, F2)` such that if the character sequence `[G1, G2)` sorts before the character sequence `[H1, H2)` then `v.transform(G1, G2) < v.transform(H1, H2)`.
```

```cpp
v.transform_primary(F1, F2)
Result: `X::string_type`
Returns: A sort key for the character sequence designated by the iterator range `[F1, F2)` such that if the character sequence `[G1, G2)` sorts before the character sequence `[H1, H2)` when character case is not considered then `v.transform_primary(G1, G2) < v.transform_primary(H1, H2)`.
```

```cpp
v.lookup_collatename(F1, F2)
Result: `X::string_type`
Returns: A sequence of characters that represents the collating element consisting of the character sequence designated by the iterator range `[F1, F2)`. Returns an empty string if the character sequence is not a valid collating element.
```

```cpp
v.lookup_classname(F1, F2, b)
Result: `X::char_class_type`
Returns: Converts the character sequence designated by the iterator range `[F1, F2)` into a value of a bitmask type that can subsequently be passed to `isctype`. Values returned from `lookup_classname` can be bitwise OR’ed together; the resulting value represents membership in either of the corresponding character classes. If `b` is `true`, the returned bitmask is suitable for matching characters without regard

§ 32.2
to their case. Returns 0 if the character sequence is not the name of a character class recognized by X. The value returned shall be independent of the case of the characters in the sequence.

v.isctype(c, cl)

**Result**: bool

**Returns**: Returns true if character c is a member of one of the character classes designated by cl, false otherwise.

v.value(c, I)

**Result**: int

**Returns**: Returns the value represented by the digit c in base I if the character c is a valid digit in base I; otherwise returns -1.

**[Note 2]: The value of I will only be 8, 10, or 16. — end note**

u.imbue(loc)

**Result**: X::locale_type

**Effects**: Imbues u with the locale loc and returns the previous locale used by u if any.

v.getloc()

**Result**: X::locale_type

**Returns**: Returns the current locale used by v, if any.

**[Note 3]: Class template regex_traits meets the requirements for a regular expression traits class when it is specialized for char or wchar_t. This class template is described in the header <regex>, and is described in 32.6. — end note**

### 32.3 Header <regex> synopsis

```
#include <compare>        // see 17.12.1
#include <initializer_list>  // see 17.11.2

namespace std {
    // 32.4, regex constants
    namespace regex_constants {
        using syntax_option_type = T1;
        using match_flag_type = T2;

    using wcmatch = match_results<const wchar_t*>;
    using smatch = match_results<string::const_iterator>;
    using wsmatch = match_results<wstring::const_iterator>;
}

32.4 Namespace std::regex_constants
32.4.1 General

1 The namespace std::regex_constants holds symbolic constants used by the regular expression library. This namespace provides three types, syntax_option_type, match_flag_type, and error_type, along with several constants of these types.

32.4.2 Bitmask type syntax_option_type

namespace std::regex_constants {
    using syntax_option_type = T1;
    inline constexpr syntax_option_type icase = unspecified;
    inline constexpr syntax_option_type nosubs = unspecified;
    inline constexpr syntax_option_type optimize = unspecified;
    inline constexpr syntax_option_type collate = unspecified;
    inline constexpr syntax_option_type ECMAScript = unspecified;
    inline constexpr syntax_option_type basic = unspecified;
    inline constexpr syntax_option_type extended = unspecified;
    inline constexpr syntax_option_type awk = unspecified;
    inline constexpr syntax_option_type grep = unspecified;
    inline constexpr syntax_option_type egrep = unspecified;
    inline constexpr syntax_option_type multiline = unspecified;
}

1 The type syntax_option_type is an implementation-defined bitmask type (16.3.3.3.4). Setting its elements has the effects listed in Table 138. A valid value of type syntax_option_type shall have at most one of the grammar elements ECMAScript, basic, extended, awk, grep, egrep, set. If no grammar element is set, the default grammar is ECMAScript.

32.4.3 Bitmask type match_flag_type

namespace std::regex_constants {
    using match_flag_type = T2;
    inline constexpr match_flag_type match_default = {};
    inline constexpr match_flag_type match_not_bol = unspecified;
    inline constexpr match_flag_type match_not_eol = unspecified;
    inline constexpr match_flag_type match_not_bow = unspecified;
    inline constexpr match_flag_type match_not_eow = unspecified;
    inline constexpr match_flag_type match_any = unspecified;
    inline constexpr match_flag_type match_not_null = unspecified;
    inline constexpr match_flag_type match_continuous = unspecified;
    inline constexpr match_flag_type match_prev_avail = unspecified;
    inline constexpr match_flag_type match_format_default = {};
    inline constexpr match_flag_type match_format_sed = unspecified;
    inline constexpr match_flag_type match_format_no_copy = unspecified;
    inline constexpr match_flag_type match_format_first_only = unspecified;
}

1 The type match_flag_type is an implementation-defined bitmask type (16.3.3.3.4). The constants of that type, except for match_default and format_default, are bitmask elements. The match_default and format_default constants are empty bitmasks. Matching a regular expression against a sequence of characters [first, last) proceeds according to the rules of the grammar specified for the regular expression object, modified according to the effects listed in Table 139 for any bitmask elements set.

</thead>
<tbody>
<tr>
<td>format_sed</td>
<td>When a regular expression match is to be replaced by a new string, the new string shall be constructed using the rules used by the sed utility in POSIX.</td>
</tr>
<tr>
<td>format_no_copy</td>
<td>During a search and replace operation, sections of the character container sequence being searched that do not match the regular expression shall not be copied to the output string.</td>
</tr>
<tr>
<td>format_first_only</td>
<td>When specified during a search and replace operation, only the first occurrence of the regular expression shall be replaced.</td>
</tr>
</tbody>
</table>

32.4.4 Implementation-defined error_type

namespace std::regex_constants {
    using error_type = T3;
    inline constexpr error_type error_collate = unspecified;
    inline constexpr error_type error_ctype = unspecified;
    inline constexpr error_type error_escape = unspecified;
    inline constexpr error_type error_backref = unspecified;
    inline constexpr error_type error_brack = unspecified;
    inline constexpr error_type error_paren = unspecified;
    inline constexpr error_type error_brace = unspecified;
    inline constexpr error_type error_badbrace = unspecified;
    inline constexpr error_type error_range = unspecified;
    inline constexpr error_type error_space = unspecified;
    inline constexpr error_type error_badrepeat = unspecified;
    inline constexpr error_type error_complexity = unspecified;
    inline constexpr error_type error_stack = unspecified;
}

1 The type error_type is an implementation-defined enumerated type (16.3.3.3.3). Values of type error_type represent the error conditions described in Table 140:

Table 140: error_type values in the C locale [tab:re.err]

<table>
<thead>
<tr>
<th>Value</th>
<th>Error condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>error_collate</td>
<td>The expression contains an invalid collating element name.</td>
</tr>
<tr>
<td>error_ctype</td>
<td>The expression contains an invalid character class name.</td>
</tr>
<tr>
<td>error_escape</td>
<td>The expression contains an invalid escaped character, or a trailing escape.</td>
</tr>
<tr>
<td>error_backref</td>
<td>The expression contains an invalid back reference.</td>
</tr>
<tr>
<td>error_brack</td>
<td>The expression contains mismatched [ and ].</td>
</tr>
<tr>
<td>error_paren</td>
<td>The expression contains mismatched ( and ).</td>
</tr>
<tr>
<td>error_brace</td>
<td>The expression contains mismatched { and }.</td>
</tr>
<tr>
<td>error_badbrace</td>
<td>The expression contains an invalid range in a { expression.</td>
</tr>
<tr>
<td>error_range</td>
<td>The expression contains an invalid character range, such as [b-a] in most encodings.</td>
</tr>
<tr>
<td>error_space</td>
<td>There is insufficient memory to convert the expression into a finite state machine.</td>
</tr>
<tr>
<td>error_badrepeat</td>
<td>One of *?+{ is not preceded by a valid regular expression.</td>
</tr>
<tr>
<td>error_complexity</td>
<td>The complexity of an attempted match against a regular expression exceeds a pre-set level.</td>
</tr>
<tr>
<td>error_stack</td>
<td>There is insufficient memory to determine whether the regular expression matches the specified character sequence.</td>
</tr>
</tbody>
</table>

32.5 Class regex_error

namespace std {
    class regex_error : public runtime_error {
        public:
            explicit regex_error(regex_constants::error_type ecode);
            regex_constants::error_type code() const;
    }
The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.

```cpp
regex_error(regex_constants::error_type ecode);
```

**Postconditions:** `ecode == code()`.

```cpp
regex_constants::error_type code() const;
```

**Returns:** The error code that was passed to the constructor.

### 32.6 Class template `regex_traits`

```cpp
namespace std {
    template<class charT>
    struct regex_traits {
        using char_type = charT;
        using string_type = basic_string<char_type>;
        using locale_type = locale;
        using char_class_type = bitmask_type;

        regex_traits();
        static size_t length(const char_type* p);
        charT translate(charT c) const;
        charT translate_nocase(charT c) const;
        template<class ForwardIterator>
        string_type transform(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type transform_primary(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;
        template<class ForwardIterator>
        char_class_type lookup_classname(ForwardIterator first, ForwardIterator last, bool icase = false) const;
        bool isctype(charT c, char_class_type f) const;
        int value(charT ch, int radix) const;
        locale_type imbue(locale_type l);
        locale_type getloc() const;
    };
}
```

The specializations `regex_traits<char>` and `regex_traits<wchar_t>` meet the requirements for a regular expression traits class (32.2).

```cpp
using char_class_type = bitmask_type;
```

The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.

```cpp
static size_t length(const char_type* p);
```

**Returns:** `char_traits<charT>::length(p)`.

```cpp
charT translate(charT c) const;
```

**Returns:** `c`.

```cpp
charT translate_nocase(charT c) const;
```

**Returns:** `use_facet<ctype<charT>>(getloc()).tolower(c)`.

```cpp
template<class ForwardIterator>
string_type transform(ForwardIterator first, ForwardIterator last) const;
```

**Effects:** As if by:

---

1. The class `regex_error` defines the type of objects thrown as exceptions to report errors from the regular expression library.
2. `regex_error(regex_constants::error_type ecode);`
3. `regex_constants::error_type code() const;`
4. `using char_class_type = bitmask_type;`
5. The type `char_class_type` is used to represent a character classification and is capable of holding an implementation specific set returned by `lookup_classname`.
6. `static size_t length(const char_type* p);`
7. `charT translate(charT c) const;`
8. `charT translate_nocase(charT c) const;`
9. `template<class ForwardIterator> string_type transform(ForwardIterator first, ForwardIterator last) const;`
string_type str(first, last);
return use_facet<collate<charT>>(
    getloc()).transform(str.data(), str.data() + str.length());

template<class ForwardIterator>
string_type transform_primary(ForwardIterator first, ForwardIterator last) const;

Effects: If
    typeid(use_facet<collate<charT>>) == typeid(collate_byname<charT>)
and the form of the sort key returned by collate_byname<charT>::transform(first, last)

and the form of the sort key returned by collate_byname<charT>::transform(first, last)
is known and can be converted into a primary sort key then returns that key, otherwise returns an empty

string_type lookup_collatename(ForwardIterator first, ForwardIterator last) const;

Returns: A sequence of one or more characters that represents the collating element consisting of the
character sequence designated by the iterator range [first, last). Returns an empty string if the
character sequence is not a valid collating element.

template<class ForwardIterator>
char_class_type lookup_classname(
    ForwardIterator first, ForwardIterator last, bool icase = false) const;

Returns: An unspecified value that represents the character classification named by the character
sequence designated by the iterator range [first, last). If the parameter icase is true then the
returned mask identifies the character classification without regard to the case of the characters being
matched, otherwise it does honor the case of the characters being matched.\footnote{For example, if the parameter icase is true then $[[:lower:]]$ is the same as $[[:alpha:]]$.}
The value returned shall
be independent of the case of the characters in the character sequence. If the name is not recognized
then returns char_class_type().

Remarks: For regex_traits<char>, at least the narrow character names in Table 141 shall be
recognized. For regex_traits<wchar_t>, at least the wide character names in Table 141 shall be
recognized.

bool isctype(charT c, char_class_type f) const;

Effects: Determines if the character c is a member of the character classification represented by f.

Returns: Given the following function declaration:
    // for exposition only
    template<class C>
    ctype_base::mask convert(typename regex_traits<C>::char_class_type f);

that returns a value in which each ctype_base::mask value corresponding to a value in f named in
Table 141 is set, then the result is determined as if by:

    ctype_base::mask m = convert<charT>(f);
    const ctype<charT>& ct = use_facet<ctype<charT>>(getloc());
    if (ct.is(m, c)) {
        return true;
    } else if (c == ct.widen('_')) {
        charT w[1] = { ct.widen('w') };
        char_class_type x = lookup_classname(w, w+1);
        return (f&x) == x;
    } else {
        return false;
    }

[Example 1:
regex_traits<char> t;
string d("d");
string u("upper");
regex_traits<char>::char_class_type f;
f = t.lookup_classname(d.begin(), d.end());

\footnote{For example, if the parameter icase is true then $[[:lower:]]$ is the same as $[[:alpha:]]$.}
f |= t.lookup_classname(u.begin(), u.end());
ctype_base::mask m = convert<char>(f); // m == ctype_base::digit|ctype_base::upper
— end example]
[Example 2:
  regex_traits<char> t;
  string w("w");
  regex_traits<char>::char_class_type f;
  f = t.lookup_classname(w.begin(), w.end());
  t.isctype('A', f); // returns true
  t.isctype('0', f); // returns true
  t.isctype(' ', f); // returns false
— end example]

int value(charT ch, int radix) const;

Preconditions: The value of radix is 8, 10, or 16.

Returns: The value represented by the digit ch in base radix if the character ch is a valid digit in base radix; otherwise returns -1.

locale_type imbue(locale_type loc);

Effects: Imbues this with a copy of the locale loc.

[Note 1: Calling imbue with a different locale than the one currently in use invalidates all cached data held by *this. — end note]

Postconditions: getloc() == loc.

Returns: If no locale has been previously imbued then a copy of the global locale in effect at the time of construction of *this, otherwise a copy of the last argument passed to imbue.

locale_type getloc() const;

Returns: If no locale has been imbued then a copy of the global locale in effect at the time of construction of *this, otherwise a copy of the last argument passed to imbue.

32.7 Class template basic_regex

32.7.1 General

For a char-like type charT, specializations of class template basic_regex represent regular expressions constructed from character sequences of charT characters. In the rest of 32.7, charT denotes a given char-like type. Storage for a regular expression is allocated and freed as necessary by the member functions of class basic_regex.

§ 32.7.1
Objects of type specialization of `basic_regex` are responsible for converting the sequence of `charT` objects to an internal representation. It is not specified what form this representation takes, nor how it is accessed by algorithms that operate on regular expressions.

[Note 1: Implementations will typically declare some function templates as friends of `basic_regex` to achieve this. — end note]

The functions described in 32.7 report errors by throwing exceptions of type `regex_error`.

```cpp
namespace std {
    template<class charT, class traits = regex_traits<charT>>
    class basic_regex {
    public:
        // types
        using value_type = charT;
        using traits_type = traits;
        using string_type = typename traits::string_type;
        using flag_type = regex_constants::syntax_option_type;
        using locale_type = typename traits::locale_type;

        // 32.4.2, constants
        static constexpr flag_type icase = regex_constants::icase;
        static constexpr flag_type nosubs = regex_constants::nosubs;
        static constexpr flag_type optimize = regex_constants::optimize;
        static constexpr flag_type collate = regex_constants::collate;
        static constexpr flag_type ECMAScript = regex_constants::ECMAScript;
        static constexpr flag_type basic = regex_constants::basic;
        static constexpr flag_type extended = regex_constants::extended;
        static constexpr flag_type awk = regex_constants::awk;
        static constexpr flag_type grep = regex_constants::grep;
        static constexpr flag_type egrep = regex_constants::egrep;
        static constexpr flag_type multiline = regex_constants::multiline;

        // 32.7.2, construct/copy/destroy
        basic_regex();
        explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
        basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
        basic_regex(const basic_regex&);
        basic_regex(basic_regex&&) noexcept;
        template<class ST, class SA>
        explicit basic_regex(const basic_string<charT, ST, SA>& s, flag_type f = regex_constants::ECMAScript);
        template<class ForwardIterator>
        basic_regex(ForwardIterator first, ForwardIterator last, flag_type f = regex_constants::ECMAScript);
        basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);
        ~basic_regex();

        // 32.7.3, assign
        basic_regex& operator=(const basic_regex& e);
        basic_regex& operator=(basic_regex&& e) noexcept;
        basic_regex& operator=(const charT* p);
        basic_regex& operator=(initializer_list<charT> il);
        template<class ST, class SA>
        basic_regex& operator=(const basic_string<charT, ST, SA>& s);

        basic_regex& assign(const basic_regex& e);
        basic_regex& assign(basic_regex&& e) noexcept;
        basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);
        basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
        template<class ST, class SA>
        basic_regex& assign(const basic_string<charT, ST, SA>& s, flag_type f = regex_constants::ECMAScript);
    }
```
template<class InputIterator>
    basic_regex& assign(InputIterator first, InputIterator last,
        flag_type f = regex_constants::ECMAScript);
    basic_regex& assign(initializer_list<charT>,
        flag_type f = regex_constants::ECMAScript);

// 32.7.4, const operations
unsigned mark_count() const;
flag_type flags() const;

// 32.7.5, locale
locale_type imbue(locale_type loc);
locale_type getloc() const;

// 32.7.6, swap
    void swap(basic_regex&);
};

template<class ForwardIterator>
    basic_regex(ForwardIterator, ForwardIterator,
        regex_constants::syntax_option_type = regex_constants::ECMAScript)
        -> basic_regex<typename iterator_traits<ForwardIterator>::value_type>;

32.7.2 Constructors

basic_regex();
    Postconditions: *this does not match any character sequence.

explicit basic_regex(const charT* p, flag_type f = regex_constants::ECMAScript);
    Preconditions: [p, p + char_traits<charT>::length(p)) is a valid range.
    Effects: The object’s internal finite state machine is constructed from the regular expression contained
    in the sequence of characters [p, p + char_traits<charT>::length(p)), and interpreted according to
    the flags f.
    Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
    within the expression.
    Throws: regex_error if [p, p + char_traits<charT>::length(p)) is not a valid regular expression.

basic_regex(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);
    Preconditions: [p, p + len) is a valid range.
    Effects: The object’s internal finite state machine is constructed from the regular expression contained
    in the sequence of characters [p, p + len), and interpreted according to the flags specified in f.
    Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions
    within the expression.
    Throws: regex_error if [p, p + len) is not a valid regular expression.

basic_regex(const basic_regex& e);
    Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex(basic_regex&& e) noexcept;
    Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(),
    respectively, had before construction.

template<class ST, class SA>
    explicit basic_regex(const basic_string<charT, ST, SA>& s,
        flag_type f = regex_constants::ECMAScript);
    Effects: The object’s internal finite state machine is constructed from the regular expression contained
    in the string s, and interpreted according to the flags specified in f.
Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if s is not a valid regular expression.

template<class ForwardIterator>
basic_regex(ForwardIterator first, ForwardIterator last,
    flag_type f = regex_constants::ECMAScript);

Effects: The object’s internal finite state machine is constructed from the regular expression contained in the sequence of characters [first,last], and interpreted according to the flags specified in f.

Postconditions: flags() returns f. mark_count() returns the number of marked sub-expressions within the expression.

Throws: regex_error if the sequence [first,last) is not a valid regular expression.

basic_regex(initializer_list<charT> il, flag_type f = regex_constants::ECMAScript);

Effects: Same as basic_regex(il.begin(), il.end(), f).

32.7.3 Assignment

basic_regex& operator=(const basic_regex& e);

Postconditions: flags() and mark_count() return e.flags() and e.mark_count(), respectively.

basic_regex& operator=(basic_regex&& e) noexcept;

Postconditions: flags() and mark_count() return the values that e.flags() and e.mark_count(), respectively, had before assignment. e is in a valid state with unspecified value.

basic_regex& operator=(const charT* p);

Effects: Equivalent to: return assign(p);

basic_regex& operator=(initializer_list<charT> il);

Effects: Equivalent to: return assign(il.begin(), il.end());

template<class ST, class SA>
basic_regex& operator=(const basic_string<charT, ST, SA>& s);

Effects: Equivalent to: return assign(s);

basic_regex& assign(const basic_regex& e);

Effects: Equivalent to: return *this = e;

basic_regex& assign(basic_regex&& e) noexcept;

Effects: Equivalent to: return *this = std::move(e);

basic_regex& assign(const charT* p, flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(p), f);

basic_regex& assign(const charT* p, size_t len, flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(p, len), f);

template<class ST, class SA>
basic_regex& assign(const basic_string<charT, ST, SA>& s,
    flag_type f = regex_constants::ECMAScript);

Effects: Assigns the regular expression contained in the string s, interpreted according the flags specified in f. If an exception is thrown, *this is unchanged.

Postconditions: If no exception is thrown, flags() returns f and mark_count() returns the number of marked sub-expressions within the expression.

Returns: *this.

Throws: regex_error if s is not a valid regular expression.
template<class InputIterator>
  basic_regex& assign(InputIterator first, InputIterator last,  
  flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(string_type(first, last), f);

basic_regex& assign(initializer_list<charT> il, 
  flag_type f = regex_constants::ECMAScript);

Effects: Equivalent to: return assign(il.begin(), il.end(), f);

32.7.4 Constant operations

unsigned mark_count() const;

Effects: Returns the number of marked sub-expressions within the regular expression.

flag_type flags() const;

Effects: Returns a copy of the regular expression syntax flags that were passed to the object’s constructor or to the last call to assign.

32.7.5 Locale

locale_type imbue(locale_type loc);

Effects: Returns the result of traits_inst.imbue(loc) where traits_inst is a (default-initialized) instance of the template type argument traits stored within the object. After a call to imbue the basic_regex object does not match any character sequence.

locale_type getloc() const;

Effects: Returns the result of traits_inst.getloc() where traits_inst is a (default-initialized) instance of the template parameter traits stored within the object.

32.7.6 Swap

void swap(basic_regex& e);

Effects: Swaps the contents of the two regular expressions.

Postconditions: *this contains the regular expression that was in e, e contains the regular expression that was in *this.

Complexity: Constant time.

32.7.7 Non-member functions

template<class charT, class traits>
  void swap(basic_regex<charT, traits>& lhs, basic_regex<charT, traits>& rhs);

Effects: Calls lhs.swap(rhs).

32.8 Class template sub_match

32.8.1 General

Class template sub_match denotes the sequence of characters matched by a particular marked sub-expression.

namespace std {
  template<class BidirectionalIterator>
  class sub_match : public pair<BidirectionalIterator, BidirectionalIterator> { 
  public:
    using value_type = 
      typename iterator_traits<BidirectionalIterator>::value_type;
    using difference_type = 
      typename iterator_traits<BidirectionalIterator>::difference_type;
    using iterator = BidirectionalIterator;
    using string_type = basic_string<value_type>;

    bool matched;
32.8.2 Members

```cpp
constexpr sub_match();

difference_type length() const;
operator string_type() const;
string_type str() const;

int compare(const sub_match& s) const;
int compare(const string_type& s) const;
int compare(const value_type* s) const;
};
```

32.8.3 Non-member operators

```cpp
§ 32.8.3 1746
```
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(rhs.data(), rhs.size())
    <=> 0
  )
)

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
const typename iterator_traits<BiIter>::value_type* rhs);
6
Returns: lhs.compare(rhs) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
const typename iterator_traits<BiIter>::value_type* rhs);
7
Returns: static_cast<SM-CAT(BiIter)>(lhs.compare(rhs) <=> 0).

template<class BiIter>
bool operator==(const sub_match<BiIter>& lhs,
const typename iterator_traits<BiIter>::value_type& rhs);
8
Returns: lhs.compare(typename sub_match<BiIter>::string_type(1, rhs)) == 0.

template<class BiIter>
auto operator<=>(const sub_match<BiIter>& lhs,
const typename iterator_traits<BiIter>::value_type& rhs);
9
Returns:
static_cast<SM-CAT(BiIter)>(lhs.compare(
    typename sub_match<BiIter>::string_type(1, rhs))
    <=> 0
  )
)

template<class charT, class ST, class BiIter>
basic_ostream<charT, ST>& operator<<(basic_ostream<charT, ST>& os, const sub_match<BiIter>& m);
10
Returns: os << m.str().

32.9 Class template match_results

32.9.1 General

Class template match_results denotes a collection of character sequences representing the result of a regular expression match. Storage for the collection is allocated and freed as necessary by the member functions of class template match_results.

The class template match_results meets the requirements of an allocator-aware container and of a sequence container (24.2.2.1, 24.2.4) except that only copy assignment, move assignment, and operations defined for const-qualified sequence containers are supported and that the semantics of the comparison operator functions are different from those required for a container.

A default-constructed match_results object has no fully established result state. A match result is ready when, as a consequence of a completed regular expression match modifying such an object, its result state becomes fully established. The effects of calling most member functions from a match_results object that is not ready are undefined.

The sub_match object stored at index 0 represents sub-expression 0, i.e., the whole match. In this case the sub_match member matched is always true. The sub_match object stored at index n denotes what matched the marked sub-expression n within the matched expression. If the sub-expression n participated in a regular expression match then the sub_match member matched evaluates to true, and members first and second denote the range of characters [first, second) which formed that match. Otherwise matched is false, and members first and second point to the end of the sequence that was searched.

[Note 1: The sub_match objects representing different sub-expressions that did not participate in a regular expression match need not be distinct. — end note]
namespace std {

    template<class BidirectionalIterator,
            class Allocator = allocator<sub_match<BidirectionalIterator>>>  

    class match_results {  
public:
    using value_type = sub_match<BidirectionalIterator>;
    using const_reference = const value_type&;
    using reference = value_type&;
    using const_iterator = implementation-defined;
    using iterator = const_iterator;
    using difference_type  
                        = 
                        typename iterator_traits<BidirectionalIterator>::difference_type;
    using size_type = typeof allocator_traits<Allocator>::size_type;
    using allocator_type = Allocator;
    using char_type =  
                        typename iterator_traits<BidirectionalIterator>::value_type;
    using string_type = basic_string<char_type>;

    // 32.9.1, construct/copy/destroy
    match_results() : match_results(Allocator()) {} 
    explicit match_results(const Allocator&);  
    match_results(const match_results& m);  
    match_results(match_results&& m) noexcept;  
    match_results& operator=(const match_results& m);  
    ~match_results(); 

    // 32.9.2, state
    bool ready() const;

    // 32.9.3, size
    size_type size() const;
    size_type max_size() const;
    [[nodiscard]] bool empty() const;

    // 32.9.4, element access
    difference_type length(size_type sub = 0) const;
    difference_type position(size_type sub = 0) const;
    string_type str(size_type sub = 0) const;
    const_reference operator[](size_type n) const;
    const_reference prefix() const;
    const_reference suffix() const;
    const_iterator begin() const;
    const_iterator end() const;
    const_iterator cbegin() const;
    const_iterator cend() const;

    // 32.9.5, format
    template<class OutputIter,  
             class ST, class SA>  
    OutputIter format(OutputIter out,
                        const char_type* fmt_first, const char_type* fmt_last,
                        regex_constants::match_flag_type flags = regex_constants::format_default) const;

    template<class OutputIter, class ST, class SA>  
    OutputIter format(OutputIter out,
                        const basic_string<char_type, ST, SA>& fmt,
                        regex_constants::match_flag_type flags = regex_constants::format_default) const;

    template<class ST, class SA>  
    basic_string<char_type, ST, SA>  
    format(const basic_string<char_type, ST, SA>& fmt,
            regex_constants::match_flag_type flags = regex_constants::format_default) const;

    }  
}
32.9.2 Constructors

Table 142 lists the postconditions of `match_results` copy/move constructors and copy/move assignment operators. For move operations, the results of the expressions depending on the parameter m denote the values they had before the respective function calls.

```cpp
explicit match_results(const Allocator& a);  
Postconditions: ready() returns false. size() returns 0.

match_results(const match_results& m);  
Postconditions: As specified in Table 142.

match_results(match_results&& m) noexcept;  
Effects: The stored Allocator value is move constructed from m.get_allocator().  
Postconditions: As specified in Table 142.

match_results& operator=(const match_results& m);  
Postconditions: As specified in Table 142.

match_results& operator=(match_results&& m);  
Postconditions: As specified in Table 142.
```

Table 142: `match_results` copy/move operation postconditions

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>ready()</td>
<td>m.ready()</td>
</tr>
<tr>
<td>size()</td>
<td>m.size()</td>

<td>m.position(n) for all non-negative integers n &lt; m.size()</td>
</tr>
</tbody>
</table>

32.9.3 State

```cpp
bool ready() const;  
Returns: true if this has a fully established result state, otherwise false.
```

32.9.4 Size

```cpp
size_type size() const;  
Returns: One plus the number of marked sub-expressions in the regular expression that was matched if this represents the result of a successful match. Otherwise returns 0.
```
size_type max_size() const;

    Returns: The maximum number of sub_match elements that can be stored in *this.

[nodiscard] bool empty() const;

    Returns: size() == 0.

32.9.5 Element access

difference_type length(size_type sub = 0) const;

    Preconditions: ready() == true.

    Returns: (*this)[sub].length().

difference_type position(size_type sub = 0) const;

    Preconditions: ready() == true.

    Returns: The distance from the start of the target sequence to (*this)[sub].first.

string_type str(size_type sub = 0) const;

    Preconditions: ready() == true.

    Returns: string_type(*this)[sub]).

const_reference operator[](size_type n) const;

    Preconditions: ready() == true.

    Returns: A reference to the sub_match object representing the character sequence that matched marked sub-expression n. If n == 0 then returns a reference to a sub_match object representing the character sequence that matched the whole regular expression. If n >= size() then returns a sub_match object representing an unmatched sub-expression.

const_reference prefix() const;

    Preconditions: ready() == true.

    Returns: A reference to the sub_match object representing the character sequence from the start of the string being matched/searched to the start of the match found.

const_reference suffix() const;

    Preconditions: ready() == true.

    Returns: A reference to the sub_match object representing the character sequence from the end of the match found to the end of the string being matched/searched.

const_iterator begin() const;
const_iterator cbegin() const;

    Returns: A starting iterator that enumerates over all the sub-expressions stored in *this.

const_iterator end() const;
const_iterator cend() const;

    Returns: A terminating iterator that enumerates over all the sub-expressions stored in *this.

32.9.6 Formatting

template<class OutputIter>
OutputIter format(
    OutputIter out,
    const char_type* fmt_first, const char_type* fmt_last,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;

    Preconditions: ready() == true and OutputIter meets the requirements for a Cpp17OutputIterator (25.3.5.4).
Effects: Copies the character sequence \([\text{fmt}\_\text{first}, \text{fmt}\_\text{last})\] to OutputIter out. Replaces each format specifier or escape sequence in the copied range with either the character(s) it represents or the sequence of characters within *this to which it refers. The bitmasks specified in flags determine which format specifiers and escape sequences are recognized.

Returns: out.

```cpp
template<class OutputIter, class ST, class SA>
OutputIter format(
    OutputIter out,
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

Effects: Equivalent to:

```
return format(out, fmt.data(), fmt.data() + fmt.size(), flags);
```

```cpp
template<class ST, class SA>
basic_string<char_type, ST, SA> format(
    const basic_string<char_type, ST, SA>& fmt,
    regex_constants::match_flag_type flags = regex_constants::format_default) const;
```

32.9.7 Allocator [re.results.all]

```cpp
allocator_type get_allocator() const;
```

Returns: A copy of the Allocator that was passed to the object’s constructor or, if that allocator has been replaced, a copy of the most recent replacement.

32.9.8 Swap [re.results.swap]

```cpp
void swap(match_results& that);
```

Effects: Swaps the contents of the two sequences.

Postconditions: *this contains the sequence of matched sub-expressions that were in that, that contains the sequence of matched sub-expressions that were in *this.

Complexity: Constant time.

```cpp
template<class BidirectionalIterator, class Allocator>
void swap(match_results<BidirectionalIterator, Allocator>& m1,
        match_results<BidirectionalIterator, Allocator>& m2);
```

Effects: As if by m1.swap(m2).

32.9.9 Non-member functions [re.results.nonmember]

```cpp
template<class BidirectionalIterator, class Allocator>
bool operator==(const match_results<BidirectionalIterator, Allocator>& m1,
                const match_results<BidirectionalIterator, Allocator>& m2);  
```

Returns: true if neither match result is ready, false if one match result is ready and the other is not. If both match results are ready, returns true only if:
(1.1) \( m_1.\text{empty}() \land m_2.\text{empty}() \), or
(1.2) \( \neg m_1.\text{empty}() \land \neg m_2.\text{empty}() \), and the following conditions are satisfied:
(1.2.1) \( m_1.\text{prefix}() = m_2.\text{prefix}() \),
(1.2.2) \( m_1.\text{size}() = m_2.\text{size}() \land \text{equal}(m_1.\text{begin}(), m_1.\text{end}(), m_2.\text{begin}()) \), and
(1.2.3) \( m_1.\text{suffix}() = m_2.\text{suffix}() \).

[Note 1: The algorithm \texttt{equal} is defined in Clause 27. — end note]

32.10 Regular expression algorithms

32.10.1 Exceptions

1 The algorithms described in subclause 32.10 may throw an exception of type \texttt{regex_error}. If such an exception \( e \) is thrown, \( e.\text{code}() \) shall return either \texttt{regex_constants::error_complexity} or \texttt{regex_constants::error_stack}.

32.10.2 \texttt{regex_match}

template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool \texttt{regex_match}(BidirectionalIterator first, BidirectionalIterator last,
match_results<BidirectionalIterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);

1 \textbf{Preconditions:} \texttt{BidirectionalIterator} models \texttt{bidirectional_iterator} (25.3.4.12).

2 \textbf{Effects:} Determines whether there is a match between the regular expression \( e \), and all of the character sequence \((\text{first, last})\). The parameter \( \text{flags} \) is used to control how the expression is matched against the character sequence. When determining if there is a match, only potential matches that match the entire character sequence are considered. Returns \texttt{true} if such a match exists, \texttt{false} otherwise.

\begin{itemize}
\item \textbf{Example 1:}
\begin{verbatim}
std::regex re("Get|GetValue");
std::cmatch m;
regex_search("GetValue", m, re); // returns true, and \texttt{m[0]} contains "Get"
regex_match("GetValue", m, re);  // returns true, and \texttt{m[0]} contains "GetValue"
regex_search("GetValues", m, re); // returns true, and \texttt{m[0]} contains "Get"
regex_match("GetValues", m, re);  // returns false
\end{verbatim}
\end{itemize}

3 \textbf{Postconditions:} \( \text{m.ready()} == \text{true} \) in all cases. If the function returns \texttt{false}, then the effect on parameter \( \text{m} \) is unspecified except that \( \text{m.size()} \) returns 0 and \( \text{m.empty()} \) returns \texttt{true}. Otherwise the effects on parameter \( \text{m} \) are given in Table 143.

\begin{table}[ht]
\centering
\caption{Effects of \texttt{regex_match} algorithm}

Table 143: Effects of `regex_match` algorithm (continued)

<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>m[n].second</td>
<td>For all integers (0 &lt; n &lt; \text{m.size()}), the end of the sequence that matched sub-expression (n). Alternatively, if sub-expression (n) did not participate in the match, then \text{last}.</td>
</tr>
<tr>
<td>m[n].matched</td>
<td>For all integers (0 &lt; n &lt; \text{m.size()}), true if sub-expression (n) participated in the match, false otherwise.</td>
</tr>
</tbody>
</table>

```cpp
template<class BidirectionalIterator, class charT, class traits>
bool regex_match(BidirectionalIterator first, BidirectionalIterator last,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Effects:** Behaves “as if” by constructing an instance of `match_results<BidirectionalIterator>` `what`, and then returning the result of `regex_match(first, last, what, e, flags)`.

```cpp
template<class charT, class Allocator, class traits>
bool regex_match(const charT* str, match_results<const charT*, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(str, str + char_traits<charT>::length(str), m, e, flags)`.

```cpp
template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s, match_results<typename basic_string<charT, ST, SA>::const_iterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(s.begin(), s.end(), m, e, flags)`.

```cpp
template<class charT, class traits>
bool regex_match(const charT* str, const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(str, str + char_traits<charT>::length(str), e, flags)`.

```cpp
template<class ST, class SA, class charT, class traits>
bool regex_match(const basic_string<charT, ST, SA>& s, const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Returns:** `regex_match(s.begin(), s.end(), e, flags)`.

### 32.10.3 `regex_search` [re.alg.search]

```cpp
template<class BidirectionalIterator, class Allocator, class charT, class traits>
bool regex_search(BidirectionalIterator first, BidirectionalIterator last,
match_results<BidirectionalIterator, Allocator>& m,
const basic_regex<charT, traits>& e,
regex_constants::match_flag_type flags = regex_constants::match_default);
```

**Preconditions:** `BidirectionalIterator` models `bidirectional_iterator` (25.3.4.12).

**Effects:** Determines whether there is some sub-sequence within `[first, last)` that matches the regular expression `e`. The parameter `flags` is used to control how the expression is matched against the character sequence. Returns `true` if such a sequence exists, `false` otherwise.

**Postconditions:** `m.ready()` == `true` in all cases. If the function returns `false`, then the effect on parameter `m` is unspecified except that `m.size()` returns `0` and `m.empty()` returns `true`. Otherwise the effects on parameter `m` are given in Table 144.
Table 144: Effects of `regex_search` algorithm

<table>

</tr>
<tr>
<td>m[n].matched</td>
<td>For all integers 0 &lt; n &lt; m.size(), true if sub-expression n participated in the match, false otherwise.</td>
</tr>
</tbody>
</table>

template<class charT, class Allocator, class traits>
bool regex_search(const charT* str, match_results<const charT*, Allocator>& m, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: `regex_search(str, str + char_traits<charT>::length(str), m, e, flags)`.

template<class ST, class SA, class Allocator, class charT, class traits>
bool regex_search(const basic_string<charT, ST, SA>& s, match_results<typename basic_string<charT, ST, SA>::const_iterator, Allocator>& m, const basic_regex<charT, traits>& e, regex_constants::match_flag_type flags = regex_constants::match_default);

Returns: `regex_search(s.begin(), s.end(), m, e, flags)`.

Effects: Behaves “as if” by constructing an object what of type `match_results<BidirectionalIterator>` and returning `regex_search(first, last, what, e, flags)`.

§ 32.10.3
32.10.4 regex_replace

```
template<class OutputIterator, class BidirectionalIterator, 
    class traits, class charT, class ST, class SA>
OutputIterator
regex_replace(OutputIterator out, 
    BidirectionalIterator first, BidirectionalIterator last, 
    const basic_regex<charT, traits>& e, 
    const basic_string<charT, ST, SA>& fmt, 
    regex_constants::match_flag_type flags = regex_constants::match_default);
```

```
Effects: Constructs a regex_iterator object \(i\) as if by
\[
\text{regex_iterator<BidirectionalIterator, charT, traits> i(first, last, e, flags)}
\]
and uses \(i\) to enumerate through all of the matches \(m\) of type match_results<BidirectionalIterator>
that occur within the sequence \([\text{first, last})\]. If no such matches are found and \(!\text{(flags & regex_constants::format_no_copy)}\), then calls
\[
\text{out = copy(first, last, out)}
\]
If any matches are found then, for each such match:

1. If \(!\text{(flags & regex_constants::format_no_copy)}\), calls
   \[
   \text{out = copy(m.prefix().first, m.prefix().second, out)}
   \]
   Then calls
   \[
   \text{out = m.format(out, fmt, flags)}
   \]
   for the first form of the function and
   \[
   \text{out = m.format(out, fmt, fmt + char_traits<charT>::length(fmt), flags)}
   \]
   for the second.

Finally, if such a match is found and \(!\text{(flags & regex_constants::format_no_copy)}\), calls
\[
\text{out = copy(last_m.suffix().first, last_m.suffix().second, out)}
\]
where \(last_m\) is a copy of the last match found. If \text{flags & regex_constants::format_first_only}
is nonzero, then only the first match found is replaced.

```
template<class traits, class charT, class ST, class SA, class FST, class FSA>
basic_string<charT, ST, SA>
regex_replace(const basic_string<charT, ST, SA>& s, 
    const basic_regex<charT, traits>& e, 
    const basic_string<charT, FST, FSA>& fmt, 
    regex_constants::match_flag_type flags = regex_constants::match_default);
```

```
Effects: Constructs an empty string result of type basic_string<charT, ST, SA> and calls:
\[
\text{regex_replace(back_inserter(result), s.begin(), s.end(), e, fmt, flags)}
\]
```

```
Returns: result.
```

---

Note: The text is a direct excerpt from the ISO/IEC N4917 standard, which provides specifications for the C++ standard library. The excerpt focuses on the `regex_replace` function, which is used to replace substrings within a string based on regex patterns and formats.
const basic_regex<charT, traits>& e,
const basic_string<charT, ST, SA>& fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

template<class traits, class charT>
basic_string<charT>
regex_replace(const charT* s,
const basic_regex<charT, traits>& e,
const charT* fmt,
regex_constants::match_flag_type flags = regex_constants::match_default);

Effects: Constructs an empty string result of type basic_string<charT> and calls:
regex_replace(back_inserter(result), s, s + char_traits<charT>::length(s), e, fmt, flags);

Returns: result.

32.11 Regular expression iterators

32.11.1 Class template regex_iterator

The class template regex_iterator is an iterator adaptor. It represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence. A regex_iterator uses regex_search to find successive regular expression matches within the sequence from which it was constructed. After the iterator is constructed, and every time operator++ is used, the iterator finds and stores a value of match_results<BidirectionalIterator>. If the end of the sequence is reached (regex_search returns false), the iterator becomes equal to the end-of-sequence iterator value. The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-sequence iterator is not defined. For any other iterator value a const match_results<BidirectionalIterator>& is returned. The result of operator-> on an end-of-sequence iterator is not defined. For any other iterator value a const match_results<BidirectionalIterator>* is returned. It is impossible to store things into regex_iterators. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

namespace std {
    template<class BidirectionalIterator,
             class charT = typename iterator_traits<BidirectionalIterator>::value_type,
             class traits = regex_traits<charT>>
    class regex_iterator {
        public:
            using regex_type = basic_regex<charT, traits>;
            using iterator_category = forward_iterator_tag;
            using value_type = match_results<BidirectionalIterator>;
            using difference_type = ptrdiff_t;
            using pointer = const value_type*;
            using reference = const value_type&;

            regex_iterator();
            regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
                           const regex_type& re,
                           regex_constants::match_flag_type m = regex_constants::match_default);
            regex_iterator(BidirectionalIterator, BidirectionalIterator,
                           const regex_type&,
                           regex_constants::match_flag_type = regex_constants::match_default) = delete;
            regex_iterator(const regex_iterator&);
            regex_iterator& operator=(const regex_iterator&);
            bool operator==(const regex_iterator&) const;
            bool operator==(default_sentinel_t) const { return *this == regex_iterator(); }
            const value_type* operator() const;
            const value_type* operator->() const;
            regex_iterator& operator++();
            regex_iterator operator++(int);

        private:
            BidirectionalIterator begin;  // exposition only

        § 32.11.1.1 1756
2 An object of type `regex_iterator` that is not an end-of-sequence iterator holds a *zero-length match* if `match[0].matched == true` and `match[0].first == match[0].second`.

[Note 1: For example, this can occur when the part of the regular expression that matched consists only of an assertion (such as `'^'`, `'\$'`, `'\b'`, `'\B'`). — end note]

### 32.11.1.2 Constructors

```
regex_iterator();
```
1

**Effects:** Constructs an end-of-sequence iterator.

```
regex_iterator(BidirectionalIterator a, BidirectionalIterator b,
               const regex_type& re,
               regex_constants::match_flag_type m = regex_constants::match_default);
```
2

**Effects:** Initializes `begin` and `end` to `a` and `b`, respectively, sets `pregex` to `addressof(re)`, sets `flags` to `m`, then calls `regex_search(begin, end, match, *pregex, flags)`. If this call returns `false` the constructor sets `*this` to the end-of-sequence iterator.

### 32.11.1.3 Comparisons

```
bool operator==(const regex_iterator& right) const;
```
1

**Returns:** `true` if `*this` and `right` are both end-of-sequence iterators or if the following conditions all hold:

1. `begin == right.begin`,
2. `end == right.end`,
3. `pregex == right.pregex`,
4. `flags == right.flags`, and
5. `match[0] == right.match[0]`

otherwise `false`.

### 32.11.1.4 Indirection

```
const value_type& operator*() const;
```
1

**Returns:** `match`.

```
const value_type* operator->() const;
```
2

**Returns:** `addressof(match)`.

### 32.11.1.5 Increment

```
regex_iterator& operator++();
```
1

**Effects:** Constructs a local variable `start` of type `BidirectionalIterator` and initializes it with the value of `match[0].second`.

2 If the iterator holds a zero-length match and `start == end` the operator sets `*this` to the end-of-sequence iterator and returns `*this`.

3 Otherwise, if the iterator holds a zero-length match, the operator calls:

```
regex_search(start, end, match, *pregex,
             flags | regex_constants::match_not_null | regex_constants::match_continuous)
```

If the call returns `true` the operator returns `*this`. Otherwise the operator increments `start` and continues as if the most recent match was not a zero-length match.
If the most recent match was not a zero-length match, the operator sets flags to flags | regex_constants::match_prev_avail and calls regex_search(start, end, match, *pregex, flags). If the call returns false the iterator sets *this to the end-of-sequence iterator. The iterator then returns *this.

In all cases in which the call to regex_search returns true, match.prefix().first shall be equal to the previous value of match[0].second, and for each index i in the half-open range [0, match.size()) for which match[i].matched is true, match.position(i) shall return distance(begin, match[i].first).

[Note 1: This means that match.position(i) gives the offset from the beginning of the target sequence, which is often not the same as the offset from the sequence passed in the call to regex_search. — end note]

It is unspecified how the implementation makes these adjustments.

[Note 2: This means that an implementation can call an implementation-specific search function, in which case a program-defined specialization of regex_search will not be called. — end note]

regex_iterator operator++(int);

Effects: As if by:

regex_iterator tmp = *this;
++(*this);
return tmp;

32.11.2 Class template regex_token_iterator [re.tokiter]
32.11.2.1 General [re.tokiter.general]

The class template regex_token_iterator is an iterator adaptor; that is to say it represents a new view of an existing iterator sequence, by enumerating all the occurrences of a regular expression within that sequence, and presenting one or more sub-expressions for each match found. Each position enumerated by the iterator is a sub_match class template instance that represents what matched a particular sub-expression within the regular expression.

When class regex_token_iterator is used to enumerate a single sub-expression with index −1 the iterator performs field splitting: that is to say it enumerates one sub-expression for each section of the character container sequence that does not match the regular expression specified.

After it is constructed, the iterator finds and stores a value regex_iterator<BidirectionalIterator> position and sets the internal count N to zero. It also maintains a sequence subs which contains a list of the sub-expressions which will be enumerated. Every time operator++ is used the count N is incremented; if N exceeds or equals subs.size(), then the iterator increments member position and sets count N to zero.

If the end of sequence is reached (position is equal to the end of sequence iterator), the iterator becomes equal to the end-of-sequence iterator value, unless the sub-expression being enumerated has index −1, in which case the iterator enumerates one last sub-expression that contains all the characters from the end of the last regular expression match to the end of the input sequence being enumerated, provided that this would not be an empty sub-expression.

The default constructor constructs an end-of-sequence iterator object, which is the only legitimate iterator to be used for the end condition. The result of operator* on an end-of-sequence iterator is not defined. For any other iterator value a const sub_match<BidirectionalIterator>& is returned. The result of operator-> on an end-of-sequence iterator is not defined. For any other iterator value a const sub_match<BidirectionalIterator>* is returned.

It is impossible to store things into regex_token_iterator. Two end-of-sequence iterators are always equal. An end-of-sequence iterator is not equal to a non-end-of-sequence iterator. Two non-end-of-sequence iterators are equal when they are constructed from the same arguments.

namespace std {
  template<Class BidirectionalIterator, 
    class charT = typename iterator_traits<BidirectionalIterator>::value_type, 
    class traits = regex_traits<charT>>
  class regex_token_iterator {
    public:
      using regex_type = basic_regex<charT, traits>;
      using iterator_category = forward_iterator_tag;
      using value_type = sub_match<BidirectionalIterator>;
  }
using difference_type = ptrdiff_t;
using pointer = const value_type*;
using reference = const value_type&;

regex_token_iterator();
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    int submatch = 0,
    regex_constants::match_flag_type m =
    regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    const vector<int>& submatches,
    regex_constants::match_flag_type m =
    regex_constants::match_default);

regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    initializer_list<int> submatches,
    regex_constants::match_flag_type m =
    regex_constants::match_default);

template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
    const regex_type& re,
    const int (&submatches)[N],
    regex_constants::match_flag_type m =
    regex_constants::match_default) = delete;

regex_token_iterator(const regex_token_iterator&);
regex_token_iterator& operator=(const regex_token_iterator&);

bool operator==(const regex_token_iterator&) const;
bool operator==(default_sentinel_t) const { return *this == regex_token_iterator(); } 

const value_type& operator*() const;
const value_type* operator->() const;
regex_token_iterator& operator++();
regex_token_iterator operator++(int);

private:

using position_iterator =
    regex_iterator<BidirectionalIterator, charT, traits>; // exposition only

position_iterator position;
    // exposition only
const value_type* result; // exposition only
value_type suffix; // exposition only
size_t N; // exposition only
vector<int> subs; // exposition only
A *suffix iterator* is a `regex_token_iterator` object that points to a final sequence of characters at the end of the target sequence. In a suffix iterator the member `result` holds a pointer to the data member `suffix`, the value of the member `suffix.match` is `true`, `suffix.first` points to the beginning of the final sequence, and `suffix.second` points to the end of the final sequence.

[Note 1: For a suffix iterator, data member `suffix.first` is the same as the end of the last match found, and `suffix.second` is the same as the end of the target sequence. — end note]

The *current match* is `(*position).prefix()` if `subs[N] == -1`, or `(*position)[subs[N]]` for any other value of `subs[N]`.

### 32.11.2.2 Constructors

```cpp
regex_token_iterator();
```

*Effects:* Constructs the end-of-sequence iterator.

```cpp
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
              const regex_type& re,
              int submatch = 0,
              regex_constants::match_flag_type m = regex_constants::match_default);
```

```cpp
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
              const regex_type& re,
              const vector<int>& submatches,
              regex_constants::match_flag_type m = regex_constants::match_default);
```

```cpp
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
              const regex_type& re,
              initializer_list<int> submatches,
              regex_constants::match_flag_type m = regex_constants::match_default);
```

```cpp
template<size_t N>
regex_token_iterator(BidirectionalIterator a, BidirectionalIterator b,
              const regex_type& re,
              const int (&submatches)[N],
              regex_constants::match_flag_type m = regex_constants::match_default);
```

*Preconditions:* Each of the initialization values of `submatches` is `>= -1`.

*Effects:* The first constructor initializes the member `subs` to hold the single value `submatch`. The second, third, and fourth constructors initialize the member `subs` to hold a copy of the sequence of integer values pointed to by the iterator range `[begin(submatches), end(submatches))].`

Each constructor then sets `N` to 0, and `position` to `position_iterator(a, b, re, m)`. If `position` is not an end-of-sequence iterator the constructor sets `result` to the address of the current match. Otherwise if any of the values stored in `subs` is equal to `-1` the constructor sets `*this` to a suffix iterator that points to the range `[a, b)`, otherwise the constructor sets `*this` to an end-of-sequence iterator.

### 32.11.2.3 Comparisons

```cpp
bool operator==(const regex_token_iterator& right) const;
```

*Returns:* `true` if `*this` and `right` are both end-of-sequence iterators, or if `*this` and `right` are both suffix iterators and `suffix == right.suffix`; otherwise returns `false` if `*this` or `right` is an end-of-sequence iterator or a suffix iterator. Otherwise returns `true` if `position == right.position`, `N == right.N`, and `subs == right.subs`. Otherwise returns `false`.

### 32.11.2.4 Indirection

```cpp
const value_type& operator*() const;
```

*Returns:* `*result`. 

§ 32.11.2.4
32.11.2.5 Increment

regex_token_iterator& operator++();

Effects: Constructs a local variable prev of type position_iterator, initialized with the value of position.

1. If *this is a suffix iterator, sets *this to an end-of-sequence iterator.
2. Otherwise, if N + 1 < subs.size(), increments N and sets result to the address of the current match.
3. Otherwise, sets N to 0 and increments position. If position is not an end-of-sequence iterator the operator sets result to the address of the current match.
4. Otherwise, if any of the values stored in subs is equal to −1 and prev->suffix().length() is not 0 the operator sets *this to a suffix iterator that points to the range [prev->suffix().first, prev->suffix().second).
5. Otherwise, sets *this to an end-of-sequence iterator.

Returns: *this

regex_token_iterator& operator++(int);

Effects: Constructs a copy tmp of *this, then calls ++(*this).

Returns: tmp.

32.12 Modified ECMAScript regular expression grammar

The regular expression grammar recognized by basic_regex objects constructed with the ECMAScript flag is that specified by ECMA-262, except as specified below.

Objects of type specialization of basic_regex store within themselves a default-constructed instance of their traits template parameter, henceforth referred to as traits_inst. This traits_inst object is used to support localization of the regular expression; basic_regex member functions shall not call any locale dependent C or C++ API, including the formatted string input functions. Instead they shall call the appropriate traits member function to achieve the required effect.

The following productions within the ECMAScript grammar are modified as follows:

ClassAtom ::=

- ClassAtomNoDash
  ClassAtomExClass
  ClassAtomCollatingElement
  ClassAtomEquivalence

IdentityEscape ::=

SourceCharacter but not c

The following new productions are then added:

ClassAtomExClass ::=

[ : ClassName : ]

ClassAtomCollatingElement ::

[ . ClassName . ]

ClassAtomEquivalence ::

[ = ClassName = ]

ClassName ::

ClassNameCharacter
  ClassNameCharacter ClassName

ClassNameCharacter ::

SourceCharacter but not one of . or = or :

The productions ClassAtomExClass, ClassAtomCollatingElement and ClassAtomEquivalence provide functionality equivalent to that of the same features in regular expressions in POSIX.
The regular expression grammar may be modified by any `regex_constants::syntax_option_type` flags specified when constructing an object of type specialization of `basic_regex` according to the rules in Table 138.

A `ClassName` production, when used in `ClassAtomExClass`, is not valid if `traits_inst.lookup_classname` returns zero for that name. The names recognized as valid `ClassName` are determined by the type of the traits class, but at least the following names shall be recognized: alnum, alpha, blank, cntrl, digit, graph, lower, print, punct, space, upper, xdigit, d, s, w. In addition the following expressions shall be equivalent:

\d and `[:digit:]`
\D and `[^[:digit:]]`
\s and `[:space:]`
\S and `[^[:space:]]`
\w and `[_[:alnum:]]`
\W and `[^[_[:alnum:]]`

A `ClassName` production when used in a `ClassAtomCollatingElement` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string.

The results from multiple calls to `traits_inst.lookup_classname` can be bitwise OR-ed together and subsequently passed to `traits_inst.isctype`.

A `ClassName` production when used in a `ClassAtomEquivalence` production is not valid if the value returned by `traits_inst.lookup_collatename` for that name is an empty string or if the value returned by `traits_inst.transform_primary` for the result of the call to `traits_inst.lookup_collatename` is an empty string.

When the sequence of characters being transformed to a finite state machine contains an invalid class name the translator shall throw an exception object of type `regex_error`.

If the `CV` of a `UnicodeEscapeSequence` is greater than the largest value that can be held in an object of type `charT` the translator shall throw an exception object of type `regex_error`.

[Note 1: This means that values of the form “uxxxx” that do not fit in a character are invalid. — end note]

Where the regular expression grammar requires the conversion of a sequence of characters to an integral value, this is accomplished by calling `traits_inst.value`.

The behavior of the internal finite state machine representation when used to match a sequence of characters is as described in ECMA-262. The behavior is modified according to any `match_flag_type` flags (32.4.3) specified when using the regular expression object in one of the regular expression algorithms (32.10). The behavior is also localized by interaction with the traits class template parameter as follows:

(14.1) During matching of a regular expression finite state machine against a sequence of characters, two characters c and d are compared using the following rules:

(14.1.1) if `(flags() & regex_constants::icase)` the two characters are equal if `traits_inst.translate_nocase(c) == traits_inst.translate_nocase(d)`;

(14.1.2) otherwise, if `(flags() & regex_constants::collate)` the two characters are equal if `traits_inst.translate(c) == traits_inst.translate(d)`;

(14.1.3) otherwise, the two characters are equal if `c == d`.

(14.2) During matching of a regular expression finite state machine against a sequence of characters, comparison of a collating element range c1-c2 against a character c is conducted as follows: if `flags() & regex_constants::collate` is false then the character c is matched if `c1 <= c && c <= c2`, otherwise c is matched in accordance with the following algorithm:

```c++
string_type str1 = string_type(1,
    flags() & icase ?
        traits_inst.translate_nocase(c1) : traits_inst.translate(c1));
```
string_type str2 = string_type(1, flags() & icase ?
    traits_inst.translate_nocase(c2) : traits_inst.translate(c2));
string_type str = string_type(1, flags() & icase ?
    traits_inst.translate_nocase(c) : traits_inst.translate(c));
return traits_inst.transform(str1.begin(), str1.end())
    <= traits_inst.transform(str.begin(), str.end())
    && traits_inst.transform(str.begin(), str.end())
    <= traits_inst.transform(str2.begin(), str2.end());

(14.3) — During matching of a regular expression finite state machine against a sequence of characters, testing
whether a collating element is a member of a primary equivalence class is conducted by first converting
the collating element and the equivalence class to sort keys using traits::transform_primary, and
then comparing the sort keys for equality.

(14.4) — During matching of a regular expression finite state machine against a sequence of characters, a
character c is a member of a character class designated by an iterator range [first, last) if traits_-
inst.isctype(c, traits_inst.lookup_classname(first, last, flags() & icase)) is true.

33.2 Requirements [thread.req]

33.2.1 Template parameter names [thread.req.paramname]

Throughout this Clause, the names of template parameters are used to express type requirements. If a template parameter is named `Predicate`, `operator()` applied to the template argument shall return a value that is convertible to `bool`. If a template parameter is named `Clock`, the corresponding template argument shall be a type `C` that meets the `Cpp17Clock` requirements (29.3); the program is ill-formed if `is_clock_v<C>` is false.

33.2.2 Exceptions [thread.req.exception]

Some functions described in this Clause are specified to throw exceptions of type `system_error` (19.5.8). Such exceptions are thrown if any of the function’s error conditions is detected or a call to an operating system or other underlying API results in an error that prevents the library function from meeting its specifications. Failure to allocate storage is reported as described in 16.4.6.13.

[Example 1: Consider a function in this Clause that is specified to throw exceptions of type `system_error` and specifies error conditions that include `operation_not_permitted` for a thread that does not have the privilege to perform the operation. Assume that, during the execution of this function, an `errno` of `EPERM` is reported by a POSIX API call used by the implementation. Since POSIX specifies an `errno` of `EPERM` when “the caller does not have the privilege to perform the operation”, the implementation maps `EPERM` to an `error_condition` of `operation_not_permitted` (19.5) and an exception of type `system_error` is thrown. — end example]

2 The `error_code` reported by such an exception’s `code()` member function compares equal to one of the conditions specified in the function’s error condition element.

33.2.3 Native handles [thread.req.native]

Several classes described in this Clause have members `native_handle_type` and `native_handle`. The presence of these members and their semantics is implementation-defined.

[Note 1: These members allow implementations to provide access to implementation details. Their names are specified to facilitate portable compile-time detection. Actual use of these members is inherently non-portable. — end note]

33.2.4 Timing specifications [thread.req.timing]

Several functions described in this Clause take an argument to specify a timeout. These timeouts are specified as either a `duration` or a `time_point` type as specified in Clause 29.

2 Implementations necessarily have some delay in returning from a timeout. Any overhead in interrupt response, function return, and scheduling induces a “quality of implementation” delay, expressed as duration $D_i$. Ideally,
this delay would be zero. Further, any contention for processor and memory resources induces a “quality of management” delay, expressed as duration $D_m$. The delay durations may vary from timeout to timeout, but in all cases shorter is better.

3 The functions whose names end in _for take an argument that specifies a duration. These functions produce relative timeouts. Implementations should use a steady clock to measure time for these functions.\(^{311}\) Given a duration argument $D_t$, the real-time duration of the timeout is $D_t + D_i + D_m$.

4 The functions whose names end in _until take an argument that specifies a time point. These functions produce absolute timeouts. Implementations should use the clock specified in the time point to measure time for these functions. Given a clock time point argument $C_t$, the clock time point of the return from timeout should be $C_t + D_i + D_m$ when the clock is not adjusted during the timeout. If the clock is adjusted to the time $C_a$ during the timeout, the behavior should be as follows:

\((4.1)\) — If $C_a > C_t$, the waiting function should wake as soon as possible, i.e., $C_a + D_i + D_m$, since the timeout is already satisfied. This specification may result in the total duration of the wait decreasing when measured against a steady clock.

\((4.2)\) — If $C_a \leq C_t$, the waiting function should not time out until \texttt{Clock::now()} returns a time $C_n \geq C_t$, i.e., waking at $C_t + D_i + D_m$.

[Note 1: When the clock is adjusted backwards, this specification can result in the total duration of the wait increasing when measured against a steady clock. When the clock is adjusted forwards, this specification can result in the total duration of the wait decreasing when measured against a steady clock. — end note]

An implementation returns from such a timeout at any point from the time specified above to the time it would return from a steady-clock relative timeout on the difference between $C_t$ and the time point of the call to the _until function.

Recommended practice: Implementations should decrease the duration of the wait when the clock is adjusted forwards.

5 [Note 2: If the clock is not synchronized with a steady clock, e.g., a CPU time clock, these timeouts can fail to provide useful functionality. — end note]

6 The resolution of timing provided by an implementation depends on both operating system and hardware. The finest resolution provided by an implementation is called the native resolution.

7 Implementation-provided clocks that are used for these functions meet the Cpp17TrivialClock requirements (29.3).

8 A function that takes an argument which specifies a timeout will throw if, during its execution, a clock, time point, or time duration throws an exception. Such exceptions are referred to as timeout-related exceptions.

[Note 3: Instantiations of clock, time point and duration types supplied by the implementation as specified in 29.7 do not throw exceptions. — end note]

### 33.2.5 Requirements for Cpp17Lockable types

#### 33.2.5.1 In general

An execution agent is an entity such as a thread that may perform work in parallel with other execution agents.

[Note 1: Implementations or users can introduce other kinds of agents such as processes or thread-pool tasks. — end note]

The calling agent is determined by context, e.g., the calling thread that contains the call, and so on.

2 [Note 2: Some lockable objects are “agent oblivious” in that they work for any execution agent model because they do not determine or store the agent’s ID (e.g., an ordinary spin lock). — end note]

3 The standard library templates unique_lock (33.6.5.4), shared_lock (33.6.5.5), scoped_lock (33.6.5.3), lock_guard (33.6.5.2), lock, try_lock (33.6.6), and condition_variable_any (33.7.5) all operate on user-supplied lockable objects. The Cpp17BasicLockable requirements, the Cpp17Lockable requirements, the Cpp17TimedLockable requirements, the Cpp17SharedLockable requirements, and the Cpp17SharedTimedLockable requirements list the requirements imposed by these library types in order to acquire or release ownership of a lock by a given execution agent.

---

311) Implementations for which standard time units are meaningful will typically have a steady clock within their hardware implementation.
Note 3: The nature of any lock ownership and any synchronization it entails are not part of these requirements. —end note

A lock on an object m is said to be

(4.1) a non-shared lock if it is acquired by a call to lock, try_lock, try_lock_for, or try_lock_until on m, or

(4.2) a shared lock if it is acquired by a call to lock_shared, try_lock_shared, try_lock_shared_for, or try_lock_shared_until on m.

Note 4: Only the method of lock acquisition is considered; the nature of any lock ownership is not part of these definitions. —end note

33.2.5.2 Cpp17BasicLockable requirements [thread.req.lockable.basic]

A type L meets the Cpp17BasicLockable requirements if the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

m.lock()  Effects: Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

m.unlock()  Preconditions: The current execution agent holds a non-shared lock on m.  Effects: Releases a non-shared lock on m held by the current execution agent.

Throws: Nothing.

33.2.5.3 Cpp17Lockable requirements [thread.req.lockable.req]

A type L meets the Cpp17Lockable requirements if it meets the Cpp17BasicLockable requirements and the following expressions are well-formed and have the specified semantics (m denotes a value of type L).

m.try_lock()  Effects: Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

Returns: true if the lock was acquired, otherwise false.

33.2.5.4 Cpp17TimedLockable requirements [thread.req.lockable.timed]

A type L meets the Cpp17TimedLockable requirements if it meets the Cpp17Lockable requirements and the following expressions are well-formed and have the specified semantics (m denotes a value of type L, rel_time denotes a value of an instantiation of duration (29.5), and abs_time denotes a value of an instantiation of time_point (29.6)).

m.try_lock_for(rel_time)  Effects: Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by rel_time. The function will not return within the timeout specified by rel_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns: true if the lock was acquired, otherwise false.

m.try_lock_until(abs_time)  Effects: Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by abs_time. The function will not return before the timeout specified by abs_time unless it has obtained a lock on m for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

Returns: true if the lock was acquired, otherwise false.
33.2.5.5 **Cpp17SharedLockable requirements**

A type `L` meets the **Cpp17SharedLockable** requirements if the following expressions are well-formed, have the specified semantics, and the expression `m.try_lock_shared()` has type `bool` (m denotes a value of type L):

- `m.lock_shared()`

  **Effects:** Blocks until a lock can be acquired for the current execution agent. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

- `m.try_lock_shared()`

  **Effects:** Attempts to acquire a lock for the current execution agent without blocking. If an exception is thrown then a lock shall not have been acquired for the current execution agent.

  **Returns:** `true` if the lock was acquired, `false` otherwise.

- `m.unlock_shared()`

  **Preconditions:** The current execution agent holds a shared lock on `m`.

  **Effects:** Releases a shared lock on `m` held by the current execution agent.

  **Throws:** Nothing.

33.2.5.6 **Cpp17SharedTimedLockable requirements**

A type `L` meets the **Cpp17SharedTimedLockable** requirements if it meets the **Cpp17SharedLockable** requirements, and the following expressions are well-formed, have type `bool`, and have the specified semantics (m denotes a value of type L, `rel_time` denotes a value of a specialization of `chrono::duration`, and `abs_time` denotes a value of a specialization of `chrono::time_point`).

- `m.try_lock_shared_for(rel_time)`

  **Effects:** Attempts to acquire a lock for the current execution agent within the relative timeout (33.2.4) specified by `rel_time`. The function will not return within the timeout specified by `rel_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

  **Returns:** `true` if the lock was acquired, `false` otherwise.

- `m.try_lock_shared_until(abs_time)`

  **Effects:** Attempts to acquire a lock for the current execution agent before the absolute timeout (33.2.4) specified by `abs_time`. The function will not return before the timeout specified by `abs_time` unless it has obtained a lock on `m` for the current execution agent. If an exception is thrown then a lock has not been acquired for the current execution agent.

  **Returns:** `true` if the lock was acquired, `false` otherwise.

33.3 **Stop tokens**

33.3.1 **Introduction**

Subclause 33.3 describes components that can be used to asynchronously request that an operation stops execution in a timely manner, typically because the result is no longer required. Such a request is called a **stop request**.

**stop_source**, **stop_token**, and **stop_callback** implement semantics of shared ownership of a **stop state**. Any **stop_source**, **stop_token**, or **stop_callback** that shares ownership of the same stop state is an associated **stop_source**, **stop_token**, or **stop_callback**, respectively. The last remaining owner of the stop state automatically releases the resources associated with the stop state.

**stop_token** can be passed to an operation which can either

- (3.1) actively poll the token to check if there has been a stop request, or
- (3.2) register a callback using the **stop_callback** class template which will be called in the event that a stop request is made.

A stop request made via a **stop_source** will be visible to all associated **stop_token** and **stop_source** objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).
Callbacks registered via a stop_callback object are called when a stop request is first made by any associated stop_source object.

Calls to the functions request_stop, stop_requested, and stop_possible do not introduce data races. A call to request_stop that returns true synchronizes with a call to stop_requested on an associated stop_token or stop_source object that returns true. Registration of a callback synchronizes with the invocation of that callback.

33.3.2 Header <stop_token> synopsis

namespace std {

// 33.3.3, class stop_token
class stop_token;

// 33.3.4, class stop_source
class stop_source;

// no-shared-stop-state indicator
struct nostopstate_t {
    explicit nostopstate_t() = default;
};
inline constexpr nostopstate_t nostopstate{};

// 33.3.5, class stop_callback
template<class Callback>
class stop_callback;
}

33.3.3 Class stop_token

33.3.3.1 General

The class stop_token provides an interface for querying whether a stop request has been made (stop_requested) or can ever be made (stop_possible) using an associated stop_source object (33.3.4). A stop_token can also be passed to a stop_callback (33.3.5) constructor to register a callback to be called when a stop request has been made from an associated stop_source.

namespace std {

class stop_token {

public:

    // 33.3.3.2, constructors, copy, and assignment
    stop_token() noexcept;
    stop_token(const stop_token&) noexcept;
    stop_token(stop_token&&) noexcept;
    stop_token& operator=(const stop_token&) noexcept;
    stop_token& operator=(stop_token&&) noexcept;
    ~stop_token();
    void swap(stop_token&) noexcept;

    // 33.3.3.3, stop handling
    [[nodiscard]] bool stop_requested() const noexcept;
    [[nodiscard]] bool stop_possible() const noexcept;

    [[nodiscard]] friend bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;
    friend void swap(stop_token& lhs, stop_token& rhs) noexcept;
};
}

33.3.3.2 Constructors, copy, and assignment

postconditions: stop_possible() is false and stop_requested() is false.

[Note 1: Because the created stop_token object can never receive a stop request, no resources are allocated for a stop state. — end note]
stop_token(const stop_token& rhs) noexcept;

Postconditions: \( \ast \text{this} == \text{rhs} \) is true.

\[ \text{Note 2: \( \ast \text{this} \) and \( \text{rhs} \) share the ownership of the same stop state, if any. — end note} \]

stop_token(stop_token&& rhs) noexcept;

Postconditions: \( \ast \text{this} \) contains the value of \( \text{rhs} \) prior to the start of construction and \( \text{rhs}.\text{stop_possible()} \) is false.

\( \sim \text{stop_token}() \);

Effects: Releases ownership of the stop state, if any.

stop_token& operator=(const stop_token& rhs) noexcept;

Effects: Equivalent to: stop_token(rhs).swap(*this).

Returns: *this.

stop_token& operator=(stop_token&& rhs) noexcept;

Effects: Equivalent to: stop_token(std::move(rhs)).swap(*this).

Returns: *this.

void swap(stop_token& rhs) noexcept;

Effects: Exchanges the values of \( \ast \text{this} \) and \( \text{rhs} \).

33.3.3.3 Members

[[nodiscard]] bool stop_requested() const noexcept;

Returns: true if \( \ast \text{this} \) has ownership of a stop state that has received a stop request; otherwise, false.

[[nodiscard]] bool stop_possible() const noexcept;

Returns: false if:

(2.1) \( \ast \text{this} \) does not have ownership of a stop state, or

(2.2) a stop request was not made and there are no associated \text{stop_source} objects; otherwise, true.

33.3.3.4 Non-member functions

[[nodiscard]] bool operator==(const stop_token& lhs, const stop_token& rhs) noexcept;

Returns: true if \( \text{lhs} \) and \( \text{rhs} \) have ownership of the same stop state or if both \( \text{lhs} \) and \( \text{rhs} \) do not have ownership of a stop state; otherwise false.

friend void swap(stop_token& x, stop_token& y) noexcept;

Effects: Equivalent to: x.swap(y).

33.3.4 Class \text{stop_source}

33.3.4.1 General

The class \text{stop_source} implements the semantics of making a stop request. A stop request made on a \text{stop_source} object is visible to all associated \text{stop_source} and \text{stop_token} (33.3.3) objects. Once a stop request has been made it cannot be withdrawn (a subsequent stop request has no effect).

namespace std {
    // no-shared-stop-state indicator
    struct nostopstate_t {
        explicit nostopstate_t() = default;
    };
    inline constexpr nostopstate_t nostopstate{};
}
class stop_source {
public:
// 33.3.4.2, constructors, copy, and assignment
    stop_source();
    explicit stop_source(nostopstate_t) noexcept;
    stop_source(const stop_source&) noexcept;
    stop_source(stop_source&&) noexcept;
    stop_source& operator=(const stop_source&) noexcept;
    stop_source& operator=(stop_source&&) noexcept;
    ~stop_source();
    void swap(stop_source&) noexcept;

// 33.3.4.3, stop handling
    [[nodiscard]] stop_token get_token() const noexcept;
    [[nodiscard]] bool stop_possible() const noexcept;
    [[nodiscard]] bool stop_requested() const noexcept;
    bool request_stop() noexcept;
    [[nodiscard]] friend bool operator==(const stop_source& lhs, const stop_source& rhs) noexcept;
    friend void swap(stop_source& lhs, stop_source& rhs) noexcept;
};

33.3.4.2  Constructors, copy, and assignment
[stopsource.cons]

stop_source();
1  Effects: Initialises *this to have ownership of a new stop state.
2  Postconditions: stop_possible() is true and stop_requested() is false.
3  Throws: bad_alloc if memory cannot be allocated for the stop state.

explicit stop_source(nostopstate_t) noexcept;
4  Postconditions: stop_possible() is false and stop_requested() is false.
[Note 1: No resources are allocated for the state. — end note]

stop_source(const stop_source& rhs) noexcept;
5  Postconditions: *this == rhs is true.
[Note 2: *this and rhs share the ownership of the same stop state, if any. — end note]

stop_source(stop_source&& rhs) noexcept;
6  Postconditions: *this contains the value of rhs prior to the start of construction and rhs.stop_possible() is false.

~stop_source();
7  Effects: Releases ownership of the stop state, if any.

stop_source& operator=(const stop_source& rhs) noexcept;
8  Effects: Equivalent to: stop_source(rhs).swap(*this).
9  Returns: *this.

stop_source& operator=(stop_source&& rhs) noexcept;
10  Effects: Equivalent to: stop_source(std::move(rhs)).swap(*this).
11  Returns: *this.

void swap(stop_source& rhs) noexcept;
12  Effects: Exchanges the values of *this and rhs.
33.3.4.3 Members

[[nodiscard]] stop_token get_token() const noexcept;

1 Returns: stop_token() if stop_possible() is false; otherwise a new associated stop_token object.

[[nodiscard]] bool stop_possible() const noexcept;

2 Returns: true if *this has ownership of a stop state; otherwise, false.

[[nodiscard]] bool stop_requested() const noexcept;

3 Returns: true if *this has ownership of a stop state that has received a stop request; otherwise, false.

bool request_stop() noexcept;

4 Effects: If *this does not have ownership of a stop state, returns false. Otherwise, atomically determines whether the owned stop state has received a stop request, and if not, makes a stop request. The determination and making of the stop request are an atomic read-modify-write operation (6.9.2.2). If the request was made, the callbacks registered by associated stop_callback objects are synchronously called. If an invocation of a callback exits via an exception then terminate is invoked (14.6.2).

[Note 1: A stop request includes notifying all condition variables of type condition_variable_any temporarily registered during an interruptible wait (33.7.5.3). —end note]

Postconditions: stop_possible() is false or stop_requested() is true.

Returns: true if this call made a stop request; otherwise false.

33.3.4.4 Non-member functions

[[nodiscard]] friend bool operator==(const stop_source& lhs, const stop_source& rhs) noexcept;

1 Returns: true if lhs and rhs have ownership of the same stop state or if both lhs and rhs do not have ownership of a stop state; otherwise false.

friend void swap(stop_source& x, stop_source& y) noexcept;

2 Effects: Equivalent to: x.swap(y).

33.3.5 Class template stop_callback

33.3.5.1 General

namespace std {

    template<class Callback>
    class stop_callback {
        public:
            using callback_type = Callback;

            // 33.3.5.2, constructors and destructor
            template<class C>
                explicit stop_callback(const stop_token& st, C&& cb)
                    noexcept(is_nothrow_constructible_v<Callback, C>);
            template<class C>
                explicit stop_callback(stop_token&& st, C&& cb)
                    noexcept(is_nothrow_constructible_v<Callback, C>);
            ~stop_callback();

            stop_callback(const stop_callback&) = delete;
            stop_callback(stop_callback&&) = delete;
            stop_callback& operator=(const stop_callback&) = delete;
            stop_callback& operator=(stop_callback&&) = delete;

        private:
            Callback callback;  // exposition only
        };

§ 33.3.5.1
template<class Callback>
    stop_callback(stop_token, Callback) -> stop_callback<Callback>;
}

2 Mandates: stop_callback is instantiated with an argument for the template parameter Callback that satisfies both invocable and destructible.

3 Preconditions: stop_callback is instantiated with an argument for the template parameter Callback that models both invocable and destructible.

33.3.5.2 Constructors and destructor [stopcallback.cons]

template<class C>
explicit stop_callback(const stop_token& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);

template<class C>
explicit stop_callback(stop_token&& st, C&& cb)
    noexcept(is_nothrow_constructible_v<Callback, C>);

1 Constraints: Callback and C satisfy constructible_from<Callback, C>.

2 Preconditions: Callback and C model constructible_from<Callback, C>.

3 Effects: Initializes callback with std::forward<C>(cb). If st.stop_requested() is true, then std::forward<Callback>(callback)() is evaluated in the current thread before the constructor returns. Otherwise, if st has ownership of a stop state, acquires shared ownership of that stop state and registers the callback with that stop state such that std::forward<Callback>(callback)() is evaluated by the first call to request_stop() on an associated stop_source.

4 Throws: Any exception thrown by the initialization of callback.

5 Remarks: If evaluating std::forward<Callback>(callback)() exits via an exception, then terminate is invoked (14.6.2).

~stop_callback();

6 Effects: Unregisters the callback from the owned stop state, if any. The destructor does not block waiting for the execution of another callback registered by an associated stop_callback. If callback is concurrently executing on another thread, then the return from the invocation of callback strongly happens before (6.9.2.2) callback is destroyed. If callback is executing on the current thread, then the destructor does not block (3.7) waiting for the return from the invocation of callback. Releases ownership of the stop state, if any.

33.4 Threads [thread.threads]

33.4.1 General [thread.threads.general]

1 33.4 describes components that can be used to create and manage threads.

[Note 1: These threads are intended to map one-to-one with operating system threads. — end note]

33.4.2 Header <thread> synopsis [thread.syn]

#include <compare> // see 17.12.1

namespace std {
    // 33.4.3, class thread
    class thread;

    void swap(thread& x, thread& y) noexcept;

    // 33.4.4, class jthread
    class jthread;

    // 33.4.5, namespace this_thread
    namespace this_thread {
        thread::id get_id() noexcept;
    }

§ 33.4.2 1772
33.4.3 Class thread

33.4.3.1 General

The class `thread` provides a mechanism to create a new thread of execution, to join with a thread (i.e., wait for a thread to complete), and to perform other operations that manage and query the state of a thread. A `thread` object uniquely represents a particular thread of execution. That representation may be transferred to other `thread` objects in such a way that no two `thread` objects simultaneously represent the same thread of execution. A thread of execution is detached when no `thread` object represents that thread. Objects of class `thread` can be in a state that does not represent a thread of execution.

[Note 1: A `thread` object does not represent a thread of execution after default construction, after being moved from, or after a successful call to `detach` or `join`. — end note]

```cpp
namespace std {
    class thread {
public:
    // 33.4.3.2, class thread::id
class id;
using native_handle_type = implementation-defined; // see 33.2.3

    // construct/copy/destroy
    thread() noexcept;
    template<class F, class... Args> explicit thread(F&& f, Args&&... args);
    ~thread();
    thread(const thread&) = delete;
    thread(thread&&) noexcept;
    thread& operator=(const thread&) = delete;
    thread& operator=(thread&&) noexcept;

    // 33.4.3.6, members
    void swap(thread&) noexcept;
    bool joinable() const noexcept;
    void join();
    void detach();
    id get_id() const noexcept;
    native_handle_type native_handle(); // see 33.2.3

    // static members
    static unsigned int hardware_concurrency() noexcept;
};
}
```

33.4.3.2 Class thread::id

```cpp
namespace std {
    class thread::id {
public:
    id() noexcept;
};

bool operator==(thread::id x, thread::id y) noexcept;
strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

template<class charT, class traits>
basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& out, thread::id id);
```
// hash support
template<class T> struct hash;
template<> struct hash<thread::id>;
}

An object of type thread::id provides a unique identifier for each thread of execution and a single distinct value for all thread objects that do not represent a thread of execution (33.4.3). Each thread of execution has an associated thread::id object that is not equal to the thread::id object of any other thread of execution and that is not equal to the thread::id object of any thread object that does not represent threads of execution.

thread::id is a trivially copyable class (11.2). The library may reuse the value of a thread::id of a terminated thread that can no longer be joined.

[Note 1: Relational operators allow thread::id objects to be used as keys in associative containers. — end note]

id() noexcept;

Postconditions: The constructed object does not represent a thread of execution.

bool operator==(thread::id x, thread::id y) noexcept;

Returns: true only if x and y represent the same thread of execution or neither x nor y represents a thread of execution.

strong_ordering operator<=>(thread::id x, thread::id y) noexcept;

Let P(x,y) be an unspecified total ordering over thread::id as described in 27.8.

Returns: strong_ordering::less if P(x,y) is true. Otherwise, strong_ordering::greater if P(y,x) is true. Otherwise, strong_ordering::equal.

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& out, thread::id id);

Effects: Inserts an unspecified text representation of id into out. For two objects of type thread::id x and y, if x == y the thread::id objects have the same text representation and if x != y the thread::id objects have distinct text representations.

Returns: out.

The specialization is enabled (22.10.19).

### 33.4.3.3 Constructors

thread() noexcept;

Effects: The object does not represent a thread of execution.

Postconditions: get_id() == id().

template<class F, class... Args> explicit thread(F&& f, Args&&... args);

Constraints: remove_cvref_t<F> is not the same type as thread.

Mandates: The following are all true:

(4.1) — is_constructible_v<decay_t<F>, F>,
(4.2) — (is_constructible_v<decay_t<Args>, Args> && ...), and
(4.3) — is_invocable_v<decay_t<F>, decay_t<Args>...>.

Effects: The new thread of execution executes

invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)

with the values produced by auto being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[Note 1: This implies that any exceptions not thrown from the invocation of the copy of f will be thrown in the constructing thread, not the new thread. — end note]
If the invocation of `invoke` terminates with an uncaught exception, `terminate` is invoked (14.6.2).

**Synchronization**: The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of `f`.

**Postconditions**: `get_id()` != `id()`. `*this` represents the newly started thread.

**Throws**: `system_error` if unable to start the new thread.

**Error conditions**:
- `resource_unavailable_try_again` — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.

```
thread(thread&& x) noexcept;
```

**Postconditions**: `x.get_id()` == `id()` and `get_id()` returns the value of `x.get_id()` prior to the start of construction.

### 33.4.3.4 Destructor

```
~thread();
```

**Effects**: If `joinable()`, invokes `terminate` (14.6.2). Otherwise, has no effects.

[Note 1: Either implicitly detaching or joining a `joinable()` thread in its destructor can result in difficult to debug correctness (for detach) or performance (for join) bugs encountered only when an exception is thrown. These bugs can be avoided by ensuring that the destructor is never executed while the thread is still joinable. —end note]

### 33.4.3.5 Assignment

```
thread& operator=(thread&& x) noexcept;
```

**Effects**: If `joinable()`, invokes `terminate` (14.6.2). Otherwise, assigns the state of `x` to `*this` and sets `x` to a default constructed state.

**Postconditions**: `x.get_id()` == `id()` and `get_id()` returns the value of `x.get_id()` prior to the assignment.

**Returns**: `*this`.

### 33.4.3.6 Members

```
void swap(thread& x) noexcept;
```

**Effects**: Swaps the state of `*this` and `x`.

```
bool joinable() const noexcept;
```

**Returns**: `get_id()` != `id()`.

```
void join();
```

**Effects**: Blocks until the thread represented by `*this` has completed.

**Synchronization**: The completion of the thread represented by `*this` synchronizes with (6.9.2) the corresponding successful `join()` return.

[Note 1: Operations on `*this` are not synchronized. —end note]

**Postconditions**: The thread represented by `*this` has completed. `get_id()` == `id()`.

**Throws**: `system_error` when an exception is required (33.2.2).

**Error conditions**:
- `resource_deadlock_would_occur` — if deadlock is detected or `get_id()` == `this_thread::get_id()`.
- `no_such_process` — if the thread is not valid.
- `invalid_argument` — if the thread is not joinable.
void detach();

Effects: The thread represented by \*this continues execution without the calling thread blocking. When detach() returns, \*this no longer represents the possibly continuing thread of execution. When the thread previously represented by \*this ends execution, the implementation releases any owned resources.

Postconditions: get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:
(11.1) no_such_process — if the thread is not valid.
(11.2) invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if \*this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by \*this.

33.4.3.7 Static members

unsigned hardware_concurrency() noexcept;

Returns: The number of hardware thread contexts.

[Note 1: This value should only be considered to be a hint. — end note]

If this value is not computable or well-defined, an implementation should return 0.

33.4.3.8 Specialized algorithms

void swap(thread& x, thread& y) noexcept;

Effects: As if by x.swap(y).

33.4.4 Class jthread

33.4.4.1 General

The class jthread provides a mechanism to create a new thread of execution. The functionality is the same as for class thread (33.4.3) with the additional abilities to provide a stop_token (33.3) to the new thread of execution, make stop requests, and automatically join.

namespace std {
    class jthread {
        public:
            // types
            using id = thread::id;
            using native_handle_type = thread::native_handle_type;

            // 33.4.4.2, constructors, move, and assignment
            jthread() noexcept;
            template<class F, class... Args> explicit jthread(F&& f, Args&&... args);
            ~jthread();
            jthread(const jthread&) = delete;
            jthread(jthread&&) noexcept;
            jthread& operator=(const jthread&); = delete;
            jthread& operator=(jthread&&) noexcept;

            // 33.4.4.3, members
            void swap(jthread&) noexcept;
            [[nodiscard]] bool joinable() const noexcept;
            void join();
            void detach();
            [[nodiscard]] id get_id() const noexcept;
            [[nodiscard]] native_handle_type native_handle(); // see 33.2.3

§ 33.4.4.1 1776
33.4.4.2 Constructors, move, and assignment

\section*{33.4.4.2  Constructors, move, and assignment} \index{constructors!jthread} \index{move!jthread} \index{assignment!jthread}

\subsection*{33.4.4.2.1 jthread() noexcept;}

\textbf{Effects:} Constructs a \texttt{jthread} object that does not represent a thread of execution.

\textbf{Postconditions:} \texttt{get\_id()} == \texttt{id()} is true and \texttt{ssource\_stop\_possible()} is false.

\textbf{Constraints:} \texttt{remove\_cvref\_t<\texttt{F}>} is not the same type as \texttt{jthread}.

\subsection*{33.4.4.2.2 template<class F, class... Args> explicit jthread(F&& f, Args&&... args);}

\textbf{Mandates:} The following are all true:

\begin{itemize}
  \item (4.1) \texttt{is\_constructible\_v<\texttt{decay\_t<F>, F>}},
  \item (4.2) \texttt{(is\_constructible\_v<\texttt{decay\_t<Args>, Args> \&\& ...}, and},
  \item (4.3) \texttt{is\_invocable\_v<\texttt{decay\_t<F>, decay\_t<Args>\ldots>} ||
    \texttt{is\_invocable\_v<\texttt{decay\_t<F>, stop\_token, decay\_t<Args>\ldots>}}.
\end{itemize}

\textbf{Effects:} Initializes \texttt{ssource}. The new thread of execution executes

\begin{verbatim}
invoke(auto(std::forward<F>(f)), get_stop_token(),
        auto(std::forward<Args>(args))...)
\end{verbatim}

if that expression is well-formed, otherwise

\begin{verbatim}
invoke(auto(std::forward<F>(f)), auto(std::forward<Args>(args))...)
\end{verbatim}

with the values produced by \texttt{auto} being materialized (7.3.5) in the constructing thread. Any return value from this invocation is ignored.

[\textit{Note 1:} This implies that any exceptions not thrown from the invocation of the copy of \texttt{f} will be thrown in the constructing thread, not the new thread. \textit{—end note}]

If the \texttt{invoke} expression exits via an exception, \texttt{terminate} is called.

\textbf{Synchronization:} The completion of the invocation of the constructor synchronizes with the beginning of the invocation of the copy of \texttt{f}.

\textbf{Postconditions:} \texttt{get\_id()} != \texttt{id()} is true and \texttt{ssource\_stop\_possible()} is true and \texttt{*this} represents the newly started thread.

[\textit{Note 2:} The calling thread can make a stop request only once, because it cannot replace this stop token. \textit{—end note}]

\textbf{Throws:} \texttt{system\_error} if unable to start the new thread.

\textbf{Error conditions:}

\begin{itemize}
  \item (9.1) \texttt{resource\_unavailable\_try\_again} — the system lacked the necessary resources to create another thread, or the system-imposed limit on the number of threads in a process would be exceeded.
\end{itemize}

\subsection*{33.4.4.2.3 jthread(jthread&& x) noexcept;}

\textbf{Postconditions:} \texttt{x.get\_id()} == \texttt{id()} and \texttt{get\_id()} returns the value of \texttt{x.get\_id()} prior to the start of construction. \texttt{ssource} has the value of \texttt{x.ssource} prior to the start of construction and \texttt{x.ssource\_stop\_possible()} is false.
~jthread();

Effects: If joinable() is true, calls request_stop() and then join().
[Note 3: Operations on *this are not synchronized. — end note]

jthread& operator=(jthread&& x) noexcept;

Effects: If joinable() is true, calls request_stop() and then join(). Assigns the state of x to *this and sets x to a default constructed state.

Postconditions: x.get_id() == id() and get_id() returns the value of x.get_id() prior to the assignment. ssourc has the value of x.ssourc prior to the assignment and x.ssourc.stop_possible() is false.

Returns: *this.

33.4.4.3 Members

void swap(jthread& x) noexcept;

Effects: Exchanges the values of *this and x.

[[nodiscard]] bool joinable() const noexcept;

Returns: get_id() != id().

join();

Effects: Blocks until the thread represented by *this has completed.

Synchronization: The completion of the thread represented by *this synchronizes with (6.9.2) the corresponding successful join() return.
[Note 1: Operations on *this are not synchronized. — end note]

Postconditions: The thread represented by *this has completed. get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

(7.1) — resource_deadlock_would_occur — if deadlock is detected or get_id() == this_thread::get_id().

(7.2) — no_such_process — if the thread is not valid.

(7.3) — invalid_argument — if the thread is not joinable.

detach();

Effects: The thread represented by *this continues execution without the calling thread blocking. When detach() returns, *this no longer represents the possibly continuing thread of execution. When the thread previously represented by *this ends execution, the implementation releases any owned resources.

Postconditions: get_id() == id().

Throws: system_error when an exception is required (33.2.2).

Error conditions:

(11.1) — no_such_process — if the thread is not valid.

(11.2) — invalid_argument — if the thread is not joinable.

id get_id() const noexcept;

Returns: A default constructed id object if *this does not represent a thread, otherwise this_thread::get_id() for the thread of execution represented by *this.

33.4.4.4 Stop token handling

[[nodiscard]] stop_source get_stop_source() noexcept;

Effects: Equivalent to: return ssourc;
stop_token get_stop_token() const noexcept;
Effects: Equivalent to: return ssource.get_token();

bool request_stop() noexcept;
Effects: Equivalent to: return ssource.request_stop();

33.4.4.5 Specialized algorithms
friend void swap(jthread& x, jthread& y) noexcept;
Effects: Equivalent to: x.swap(y).

33.4.4.6 Static members
static unsigned int hardware_concurrency() noexcept;
Returns: thread::hardware_concurrency().

33.4.5 Namespace this_thread
namespace std::this_thread {
    thread::id get_id() noexcept;
    void yield() noexcept;
    template<class Clock, class Duration>
        void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
    template<class Rep, class Period>
        void sleep_for(const chrono::duration<Rep, Period>& rel_time);
}

thread::id this_thread::get_id() noexcept;
Returns: An object of type thread::id that uniquely identifies the current thread of execution. No other thread of execution has this id and this thread of execution always has this id. The object returned does not compare equal to a default constructed thread::id.

void this_thread::yield() noexcept;
Effects: Offers the implementation the opportunity to reschedule.
Synchronization: None.

template<class Clock, class Duration>
void sleep_until(const chrono::time_point<Clock, Duration>& abs_time);
Effects: Blocks the calling thread for the absolute timeout (33.2.4) specified by abs_time.
Synchronization: None.
Throws: Timeout-related exceptions (33.2.4).

template<class Rep, class Period>
void sleep_for(const chrono::duration<Rep, Period>& rel_time);
Effects: Blocks the calling thread for the relative timeout (33.2.4) specified by rel_time.
Synchronization: None.
Throws: Timeout-related exceptions (33.2.4).

33.5 Atomic operations
33.5.1 General
Subclause 33.5 describes components for fine-grained atomic access. This access is provided via operations on atomic objects.

33.5.2 Header <atomic> synopsis
namespace std {
    // 33.5.4, order and consistency
    enum class memory_order : unspecified;                     // freestanding

# 33.5.3 Type aliases [atomics.alias]

The type aliases `atomic_intN_t`, `atomic_uintN_t`, `atomicintptr_t`, and `atomicuintptr_t` are defined if and only if `intN_t`, `uintN_t`, `intptr_t`, and `uintptr_t` are defined, respectively.

The type aliases `atomic_signed_lock_free` and `atomic_unsigned_lock_free` name specializations of `atomic` whose template arguments are integral types, respectively signed and unsigned, and whose `is_always_lock_free` property is true.

[Note 1: These aliases are optional in freestanding implementations (16.4.2.5). — end note]

Implementations should choose for these aliases the integral specializations of `atomic` for which the atomic waiting and notifying operations (33.5.6) are most efficient.

# 33.5.4 Order and consistency [atomics.order]

```c++
namespace std {
    enum class memory_order : unspecified {
        relaxed, consume, acquire, release, acq_rel, seq_cst
    };
}
```

The enumeration `memory_order` specifies the detailed regular (non-atomic) memory synchronization order as defined in 6.9.2 and may provide for operation ordering. Its enumerated values and their meanings are as follows:

1. `memory_order::relaxed`: no operation orders memory.
2. `memory_order::release`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a store operation performs a release operation on the affected memory location.
3. `memory_order::consume`: a load operation performs a consume operation on the affected memory location.

[Note 1: Prefer `memory_order::acquire`, which provides stronger guarantees than `memory_order::consume`. Implementations have found it infeasible to provide performance better than that of `memory_order::acquire`. Specification revisions are under consideration. — end note]
4. `memory_order::acquire`, `memory_order::acq_rel`, and `memory_order::seq_cst`: a load operation performs an acquire operation on the affected memory location.

[Note 2: Atomic operations specifying `memory_order::relaxed` are relaxed with respect to memory ordering. Implementations must still guarantee that any given atomic access to a particular atomic object be indivisible with respect to all other atomic accesses to that object. — end note]
An atomic operation $A$ that performs a release operation on an atomic object $M$ synchronizes with an atomic operation $B$ that performs an acquire operation on $M$ and takes its value from any side effect in the release sequence headed by $A$.

An atomic operation $A$ on some atomic object $M$ is coherence-ordered before another atomic operation $B$ on $M$ if

1. $A$ is a modification, and $B$ reads the value stored by $A$, or
2. $A$ precedes $B$ in the modification order of $M$, or
3. $A$ and $B$ are not the same atomic read-modify-write operation, and there exists an atomic modification $X$ of $M$ such that $A$ reads the value stored by $X$ and $X$ precedes $B$ in the modification order of $M$, or
4. there exists an atomic modification $X$ of $M$ such that $A$ is coherence-ordered before $X$ and $X$ is coherence-ordered before $B$.

There is a single total order $S$ on all `memory_order::seq_cst` operations, including fences, that satisfies the following constraints. First, if $A$ and $B$ are `memory_order::seq_cst` operations and $A$ strongly happens before $B$, then $A$ precedes $B$ in $S$. Second, for every pair of atomic operations $A$ and $B$ on an object $M$, where $A$ is coherence-ordered before $B$, the following four conditions are required to be satisfied by $S$:

1. if $A$ and $B$ are both `memory_order::seq_cst` operations, then $A$ precedes $B$ in $S$; and
2. if $A$ is a `memory_order::seq_cst` operation and $B$ happens before a `memory_order::seq_cst` fence $Y$, then $A$ precedes $Y$ in $S$; and
3. if a `memory_order::seq_cst` fence $X$ happens before $A$ and $B$ is a `memory_order::seq_cst` operation, then $X$ precedes $B$ in $S$; and
4. if a `memory_order::seq_cst` fence $X$ happens before $A$ and $B$ happens before a `memory_order::seq_cst` fence $Y$, then $X$ precedes $Y$ in $S$.

[Note 3: This definition ensures that $S$ is consistent with the modification order of any atomic object $M$. It also ensures that a `memory_order::seq_cst` load of $A$ of $M$ gets its value either from the last modification of $M$ that precedes $A$ in $S$ or from some non-`memory_order::seq_cst` modification of $M$ that does not happen before any modification of $M$ that precedes $A$ in $S$. — end note]

[Note 4: We do not require that $S$ be consistent with “happens before” (6.9.2.2). This allows more efficient implementation of `memory_order::acquire` and `memory_order::release` on some machine architectures. It can produce surprising results when these are mixed with `memory_order::seq_cst` accesses. — end note]

[Note 5: `memory_order::seq_cst` ensures sequential consistency only for a program that is free of data races and uses exclusively `memory_order::seq_cst` atomic operations. Any use of weaker ordering will invalidate this guarantee unless extreme care is used. In many cases, `memory_order::seq_cst` atomic operations are reorderable with respect to other atomic operations performed by the same thread. — end note]

Implementations should ensure that no “out-of-thin-air” values are computed that circularly depend on their own computation.

[Note 6: For example, with $x$ and $y$ initially zero,

```c
// Thread 1:
    r1 = y.load(memory_order::relaxed);
    x.store(r1, memory_order::relaxed);
// Thread 2:
    r2 = x.load(memory_order::relaxed);
    y.store(r2, memory_order::relaxed);
```

this recommendation discourages producing $r1 == r2 == 42$, since the store of 42 to $y$ is only possible if the store to $x$ stores 42, which circularly depends on the store to $y$ storing 42. Note that without this restriction, such an execution is possible. — end note]

[Note 7: The recommendation similarly disallows $r1 == r2 == 42$ in the following example, with $x$ and $y$ again initially zero:

```c
// Thread 1:
    r1 = x.load(memory_order::relaxed);
    if (r1 == 42) y.store(42, memory_order::relaxed);
// Thread 2:
    r2 = y.load(memory_order::relaxed);
    if (r2 == 42) x.store(42, memory_order::relaxed);
```
Atomic read-modify-write operations shall always read the last value (in the modification order) written before the write associated with the read-modify-write operation.

Implementations should make atomic stores visible to atomic loads within a reasonable amount of time.

```cpp
template<class T>
T kill_dependency(T y) noexcept;
```

**Effects:** The argument does not carry a dependency to the return value (6.9.2).

**Returns:** y.

### 33.5.5 Lock-free property

The `ATOMIC_..._LOCK_FREE` macros indicate the lock-free property of the corresponding atomic types, with the signed and unsigned variants grouped together. The properties also apply to the corresponding (partial) specializations of the `atomic` template. A value of 0 indicates that the types are never lock-free. A value of 1 indicates that the types are sometimes lock-free. A value of 2 indicates that the types are always lock-free.

On a hosted implementation (16.4.2.5), at least one signed integral specialization of the `atomic` template, along with the specialization for the corresponding unsigned type (6.8.2), is always lock-free.

The functions `atomic<T>::is_lock_free` and `atomic_is_lock_free` (33.5.8.2) indicate whether the object is lock-free. In any given program execution, the result of the lock-free query is the same for all atomic objects of the same type.

Atomic operations that are not lock-free are considered to potentially block (6.9.2.3).

**Recommended practice:** Operations that are lock-free should also be address-free. The implementation of these operations should not depend on any per-process state.

[Note 1: This restriction enables communication by memory that is mapped into a process more than once and by memory that is shared between two processes. — end note]

### 33.5.6 Waiting and notifying

**Atomic waiting operations** and **atomic notifying operations** provide a mechanism to wait for the value of an atomic object to change more efficiently than can be achieved with polling. An atomic waiting operation may block until it is unblocked by an atomic notifying operation, according to each function’s effects.

[Note 1: Programs are not guaranteed to observe transient atomic values, an issue known as the A-B-A problem, resulting in continued blocking if a condition is only temporarily met. — end note]

[Note 2: The following functions are atomic waiting operations:

(2.1) — `atomic<T>::wait`,
(2.2) — `atomic_flag::wait`,
(2.3) — `atomic_wait` and `atomic_wait_explicit`,
(2.4) — `atomic_flag_wait` and `atomic_flag_wait_explicit`, and
(2.5) — `atomic_ref<T>::wait`. — end note]

[Note 3: The following functions are atomic notifying operations:

(3.1) — `atomic<T>::notify_one` and `atomic<T>::notify_all`.]

312) That is, atomic operations on the same memory location via two different addresses will communicate atomically.
A call to an atomic waiting operation on an atomic object \(M\) is eligible to be unblocked by a call to an atomic notifying operation on \(M\) if there exist side effects \(X\) and \(Y\) on \(M\) such that:

1. the atomic waiting operation has blocked after observing the result of \(X\),
2. \(X\) precedes \(Y\) in the modification order of \(M\), and
3. \(Y\) happens before the call to the atomic notifying operation.

### 33.5.7 Class template atomic_ref

#### 33.5.7.1 General

```cpp
namespace std {
    template<class T>
    struct atomic_ref {
        private:
            T* ptr;  // exposition only
        public:
            using value_type = T;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(T, memory_order = memory_order::seq_cst) const noexcept;
            T operator=(T) const noexcept;
            T load(memory_order = memory_order::seq_cst) const noexcept;
            operator T() const noexcept;
            T exchange(T, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T&, T,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T&, T,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T&, T,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T&, T,
                memory_order = memory_order::seq_cst) const noexcept;
            void wait(T, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
}
```

1. An `atomic_ref` object applies atomic operations (33.5.1) to the object referenced by `*ptr` such that, for the lifetime (6.7.3) of the `atomic_ref` object, the object referenced by `*ptr` is an atomic object (6.9.2.2).
2. The program is ill-formed if `is_trivially_copyable_v<T>` is false.
3. The lifetime (6.7.3) of an object referenced by `*ptr` shall exceed the lifetime of all `atomic_ref`s that reference the object. While any `atomic_ref` instances exist that reference the `*ptr` object, all accesses to that object shall exclusively occur through those `atomic_ref` instances. No subobject of the object referenced by `atomic_ref` shall be concurrently referenced by any other `atomic_ref` object.
4. Atomic operations applied to an object through a referencing `atomic_ref` are atomic with respect to atomic operations applied through any other `atomic_ref` referencing the same object.
33.5.7.2 Operations

static constexpr size_t required_alignment;
1 The alignment required for an object to be referenced by an atomic reference, which is at least
2 alignof(T).

[Note 1: Hardware could require an object referenced by an atomic_ref to have stricter alignment (6.7.6)
3 than other objects of type T. Further, whether operations on an atomic_ref are lock-free could depend
4 on the alignment of the referenced object. For example, lock-free operations on std::complex<double>
5 could be supported only if aligned to 2*alignof(double). — end note]

static constexpr bool is_always_lock_free;
3 The static data member is_always_lock_free is true if the atomic_ref type's operations are always
4 lock-free, and false otherwise.

bool is_lock_free() const noexcept;
4 Returns: true if operations on all objects of the type atomic_ref<T> are lock-free, false otherwise.

atomic_ref(T& obj);
5 Preconditions: The referenced object is aligned to required_alignment.
6 Postconditions: *this references obj.
7 Throws: Nothing.

atomic_ref(const atomic_ref& ref) noexcept;
8 Postconditions: *this references the object referenced by ref.

void store(T desired, memory_order order = memory_order::seq_cst) const noexcept;
9 Preconditions: The order argument is neither memory_order::consume, memory_order::acquire,
10 nor memory_order::acq_rel.
11 Effects: Atomically replaces the value referenced by *ptr with the value of desired. Memory is affected
12 according to the value of order.

T operator=(T desired) const noexcept;
13 Effects: Equivalent to:
14 store(desired);
15 return desired;

T load(memory_order order = memory_order::seq_cst) const noexcept;
12 Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.
13 Effects: Memory is affected according to the value of order.
14 Returns: Atomically returns the value referenced by *ptr.

operator T() const noexcept;
15 Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) const noexcept;
16 Effects: Atomically replaces the value referenced by *ptr with desired. Memory is affected according
to the value of order. This operation is an atomic read-modify-write operation (6.9.2).
17 Returns: Atomically returns the value referenced by *ptr immediately before the effects.

bool compare_exchange_weak(T& expected, T desired,
16 memory_order success, memory_order failure) const noexcept;

bool compare_exchange_strong(T& expected, T desired,
16 memory_order success, memory_order failure) const noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order order = memory_order::seq_cst) const noexcept;

bool compare_exchange_strong(T& expected, T desired,
    memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: The failure argument is neither memory_order::release nor memory_order::acq-rel.

Effects: Retrieves the value in expected. It then atomically compares the value referenced by *ptr for equality with that previously retrieved from expected, and if true, replaces the value referenced by *ptr with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value read from the value referenced by *ptr. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and ptr are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 2: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. — end note]

void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq-rel.

Effects: Repeatedly performs the following steps, in order:

(23.1) — Evaluates load(order) and compares its value representation for equality against that of old.
(23.2) — If they compare unequal, returns.
(23.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: This function is an atomic waiting operation (33.5.6) on atomic object *ptr.

void notify_one() const noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation on *ptr that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6) on atomic object *ptr.

void notify_all() const noexcept;

Effects: Unblocks the execution of all atomic waiting operations on *ptr that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6) on atomic object *ptr.

33.5.7.3 Specializations for integral types

There are specializations of the atomic_ref class template for the integral types char, signed char, unsigned char, short, unsigned short, int, unsigned int, long, unsigned long, long long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header <cstdint> (17.4.2). For each such type integral, the specialization atomic_ref<integral> provides additional atomic operations appropriate to integral types.

[Note 1: The specialization atomic_ref<bool> uses the primary template (33.5.7). — end note]
namespace std {
    template<> struct atomic_ref<integral> {
        private:
            integral* ptr; // exposition only
        public:
            using value_type = integral;
            using difference_type = value_type;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(integral&);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(integral, memory_order = memory_order::seq_cst) const noexcept;
            integral load(memory_order = memory_order::seq_cst) const noexcept;
            operator integral() const noexcept;
            integral exchange(integral,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(integral&, integral,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(integral&, integral,
                memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(integral&, integral,
                memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(integral&, integral,
                memory_order = memory_order::seq_cst) const noexcept;
            integral fetch_add(integral,
                memory_order = memory_order::seq_cst) const noexcept;
            integral fetch_sub(integral,
                memory_order = memory_order::seq_cst) const noexcept;
            integral fetch_and(integral,
                memory_order = memory_order::seq_cst) const noexcept;
            integral fetch_or(integral,
                memory_order = memory_order::seq_cst) const noexcept;
            integral fetch_xor(integral,
                memory_order = memory_order::seq_cst) const noexcept;
            integral operator++(int) const noexcept;
            integral operator--(int) const noexcept;
            integral operator++() const noexcept;
            integral operator--() const noexcept;
            integral operator+=(integral) const noexcept;
            integral operator-=(integral) const noexcept;
            integral operator|=(integral) const noexcept;
            integral operator^=(integral) const noexcept;
            void wait(integral, memory_order = memory_order::seq_cst) const noexcept;
            void notify_one() const noexcept;
            void notify_all() const noexcept;
    };
}

2 Descriptions are provided below only for members that differ from the primary template.
3 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 146.
integral fetch_key(integral operand, memory_order order = memory_order::seq_cst) const noexcept;

Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.2).

Returns: Atomically, the value referenced by *ptr immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. — end note]

integral operator op=(integral operand) const noexcept;

Effects: Equivalent to: return fetch_key(operand) op operand;

§ 33.5.7.4 Specializations for floating-point types

There are specializations of the atomic_ref class template for all cv-unqualified floating-point types. For each such type floating-point, the specialization atomic_ref<floating-point> provides additional atomic operations appropriate to floating-point types.

namespace std {
  template<> struct atomic_ref<floating-point> { 
  private:
    floating-point* ptr; // exposition only
  public:
    using value_type = floating-point;
    using difference_type = value_type;
    static constexpr size_t required_alignment = implementation-defined;
    static constexpr bool is_always_lock_free = implementation-defined;
    bool is_lock_free() const noexcept;
    explicit atomic_ref(floating-point&);
    atomic_ref(const atomic_ref&) noexcept;
    atomic_ref& operator=(const atomic_ref&) = delete;
    void store(floating-point, memory_order = memory_order::seq_cst) const noexcept;
    floating-point operator=(floating-point) const noexcept;
    floating-point load(memory_order = memory_order::seq_cst) const noexcept;
    operator floating-point() const noexcept;
    floating-point exchange(floating-point,
      memory_order = memory_order::seq_cst) const noexcept;
    bool compare_exchange_weak(floating-point&, floating-point,
      memory_order, memory_order) const noexcept;
    bool compare_exchange_strong(floating-point&, floating-point,
      memory_order, memory_order) const noexcept;
    bool compare_exchange_weak(floating-point&, floating-point,
      memory_order = memory_order::seq_cst) const noexcept;
    bool compare_exchange_strong(floating-point&, floating-point,
      memory_order = memory_order::seq_cst) const noexcept;
    floating-point fetch_add(floating-point,
      memory_order = memory_order::seq_cst) const noexcept;
    floating-point fetch_sub(floating-point,
      memory_order = memory_order::seq_cst) const noexcept;
    floating-point operator+=(floating-point) const noexcept;
    floating-point operator-=(floating-point) const noexcept;
    void wait(floating-point, memory_order = memory_order::seq_cst) const noexcept;
    void notify_one() const noexcept;
    void notify_all() const noexcept;
  }
}
Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 146.

`floating-point fetch_key(floating-point operand, memory_order order = memory_order::seq_cst) const noexcept;`

**Effects**: Atomically replaces the value referenced by `*ptr` with the result of the computation applied to the value referenced by `*ptr` and the given operand. Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2.2).

**Returns**: Atomically, the value referenced by `*ptr` immediately before the effects.

**Remarks**: If the result is not a representable value for its type (7.1), the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on `floating-point` should conform to the `std::numeric_limits<floating-point>` traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on `floating-point` may be different than the calling thread’s floating-point environment.

`floating-point operator op=(floating-point operand) const noexcept;`

**Effects**: Equivalent to: `return fetch_key(operand) op operand;`

### 33.5.7.5 Partial specialization for pointers

```cpp
namespace std {
    template<class T> struct atomic_ref<T*> {
        private:
            T** ptr; // exposition only
        public:
            using value_type = T*;
            using difference_type = ptrdiff_t;
            static constexpr size_t required_alignment = implementation-defined;
            static constexpr bool is_always_lock_free = implementation-defined;
            bool is_lock_free() const noexcept;
            explicit atomic_ref(T*);
            atomic_ref(const atomic_ref&) noexcept;
            atomic_ref& operator=(const atomic_ref&) = delete;
            void store(T*, memory_order = memory_order::seq_cst) const noexcept;
            T* operator=(T*) const noexcept;
            T* load(memory_order = memory_order::seq_cst) const noexcept;
            operator T*() const noexcept;
            T* exchange(T*, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_weak(T*&, T*, memory_order, memory_order) const noexcept;
            bool compare_exchange_strong(T*&, T*, memory_order, memory_order) const noexcept;
            bool compare_exchange_weak(T*&, T*, memory_order = memory_order::seq_cst) const noexcept;
            bool compare_exchange_strong(T*&, T*, memory_order = memory_order::seq_cst) const noexcept;
            T* fetch_add(difference_type, memory_order = memory_order::seq_cst) const noexcept;
            T* fetch_sub(difference_type, memory_order = memory_order::seq_cst) const noexcept;
            T* operator++(int) const noexcept;
            T* operator--(int) const noexcept;
            T* operator++() const noexcept;
            T* operator--() const noexcept;
            T* operator+=(difference_type) const noexcept;
```
T* operator-=(difference_type) const noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() const noexcept;
void notify_all() const noexcept;
};
}

1 Descriptions are provided below only for members that differ from the primary template.

2 The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 147.

T* fetch_key(difference_type operand, memory_order order = memory_order::seq_cst) const noexcept;

3 Mandates: T is a complete object type.

4 Effects: Atomically replaces the value referenced by *ptr with the result of the computation applied to the value referenced by *ptr and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2.2).

5 Returns: Atomically, the value referenced by *ptr immediately before the effects.

6 Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.

T* operator op=(difference_type operand) const noexcept;

7 Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.7.6 Member operators common to integers and pointers to objects [atomics.ref.memop]

value_type operator++(int) const noexcept;

1 Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) const noexcept;

2 Effects: Equivalent to: return fetch_sub(1);

value_type operator++() const noexcept;

3 Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() const noexcept;

4 Effects: Equivalent to: return fetch_sub(1) - 1;

33.5.8 Class template atomic [atomics.types.generic]

33.5.8.1 General [atomics.types.generic.general]

namespace std {
    template<class T> struct atomic {
        using value_type = T;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        // 33.5.8.2, operations on atomic types
        constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>);
        constexpr atomic(T) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        T load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T load(memory_order = memory_order::seq_cst) const noexcept;
        operator T() const volatile noexcept;
        operator T() const noexcept;
        void store(T, memory_order = memory_order::seq_cst) volatile noexcept;
    };
};
void store(T, memory_order = memory_order::seq_cst) noexcept;
T operator=(T) volatile noexcept;
T operator=(T) noexcept;

T exchange(T, memory_order = memory_order::seq_cst) volatile noexcept;
T exchange(T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order, memory_order) noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T&, T, memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T&, T, memory_order = memory_order::seq_cst) noexcept;

void wait(T, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
}

The template argument for T shall meet the Cpp17CopyConstructible and Cpp17CopyAssignable requirements.

The program is ill-formed if any of

1. is_trivially_copyable_v<T>,
2. is_copy_constructible_v<T>,
3. is_move_constructible_v<T>,
4. is_copy_assignable_v<T>, or
5. is_move_assignable_v<T>

is false.
[Note 1: Type arguments that are not also statically initializable can be difficult to use. — end note]

The specialization atomic<bool> is a standard-layout struct.
[Note 2: The representation of an atomic specialization need not have the same size and alignment requirement as its corresponding argument type. — end note]

### 33.5.8.2 Operations on atomic types

```cpp
constexpr atomic() noexcept(is_nothrow_default_constructible_v<T>));
```

**Mandates:** is_default_constructible_v<T> is true.

**Effects:** Initializes the atomic object with the value of T(). Initialization is not an atomic operation (6.9.2).

```cpp
constexpr atomic(T desired) noexcept;
```

**Effects:** Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

**[Note 1:]** It is possible to have an access to an atomic object A race with its construction, for example by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

```cpp
static constexpr bool is_always_lock_free = implementation-defined;
```

The static data member is_always_lock_free is true if the atomic type’s operations are always lock-free, and false otherwise.

**[Note 2:]** The value of is_always_lock_free is consistent with the value of the corresponding ATOMIC_...-_LOCK_FREE macro, if defined. — end note]
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;

5 Returns: true if the object’s operations are lock-free, false otherwise.

[Note 3: The return value of the is_lock_free member function is consistent with the value of is_always_lock_free for the same type. —end note]

void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
void store(T desired, memory_order order = memory_order::seq_cst) noexcept;

6 Constraints: For the volatile overload of this function, is_always_lock_free is true.

7 Preconditions: The order argument is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

8 Effects: Atomically replaces the value pointed to by this with the value of desired. Memory is affected according to the value of order.

T operator=(T desired) volatile noexcept;
T operator=(T desired) noexcept;

9 Constraints: For the volatile overload of this function, is_always_lock_free is true.

10 Effects: Equivalent to store(desired).

11 Returns: desired.

T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const noexcept;

12 Constraints: For the volatile overload of this function, is_always_lock_free is true.

13 Preconditions: The order argument is neither memory_order::release nor memory_order::acq_rel.

14 Effects: Memory is affected according to the value of order.

15 Returns: Atomically returns the value pointed to by this.

operator T() const volatile noexcept;
operator T() const noexcept;

16 Constraints: For the volatile overload of this function, is_always_lock_free is true.

17 Effects: Equivalent to: return load();

T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) noexcept;

18 Constraints: For the volatile overload of this function, is_always_lock_free is true.

19 Effects: Atomically replaces the value pointed to by this with desired. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

20 Returns: Atomically returns the value pointed to by this immediately before the effects.

bool compare_exchange_weak(T& expected, T desired,
memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order success, memory_order failure) noexcept;
bool compare_exchange_weak(T& expected, T desired,
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
memory_order order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
memory_order order = memory_order::seq_cst) noexcept;

21 Constraints: For the volatile overload of this function, is_always_lock_free is true.

§ 33.5.8.2
Preconditions: The failure argument is neither memory_order::release nor memory_order::acq_rel.

Effects: Retrieves the value in expected. It then atomically compares the value representation of the value pointed to by this for equality with that previously retrieved from expected, and if true, replaces the value pointed to by this with that in desired. If and only if the comparison is true, memory is affected according to the value of success, and if the comparison is false, memory is affected according to the value of failure. When only one memory_order argument is supplied, the value of success is order, and the value of failure is order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed. If and only if the comparison is false then, after the atomic operation, the value in expected is replaced by the value pointed to by this during the atomic comparison. If the operation returns true, these operations are atomic read-modify-write operations (6.9.2) on the memory pointed to by this. Otherwise, these operations are atomic load operations on that memory.

Returns: The result of the comparison.

[Note 4: For example, the effect of compare_exchange_strong on objects without padding bits (6.8.1) is]

```c
if (memcmp(this, &expected, sizeof(*this)) == 0)
    memcpy(this, &desired, sizeof(*this));
else
    memcpy(&expected, this, sizeof(*this));
—end note]
```

[Example 1: The expected use of the compare-and-exchange operations is as follows. The compare-and-exchange operations will update expected when another iteration of the loop is needed.]

```c
expected = current.load();
do {
    desired = function(expected);
} while (!current.compare_exchange_weak(expected, desired));
—end example]
```

[Example 2: Because the expected value is updated only on failure, code releasing the memory containing the expected value on success will work. For example, list head insertion will act atomically and would not introduce a data race in the following code:]

```c
do {
    p->next = head; // make new list node point to the current head
} while (!head.compare_exchange_weak(p->next, p)); // try to insert
—end example]
```

Implementations should ensure that weak compare-and-exchange operations do not consistently return false unless either the atomic object has value different from expected or there are concurrent modifications to the atomic object.

Remarks: A weak compare-and-exchange operation may fail spuriously. That is, even when the contents of memory referred to by expected and this are equal, it may return false and store back to expected the same memory contents that were originally there.

[Note 5: This spurious failure enables implementation of compare-and-exchange on a broader class of machines, e.g., load-locked store-conditional machines. A consequence of spurious failure is that nearly all uses of weak compare-and-exchange will be in a loop. When a compare-and-exchange is in a loop, the weak version will yield better performance on some platforms. When a weak compare-and-exchange would require a loop and a strong one would not, the strong one is preferable. —end note]

[Note 6: Under cases where the memcpy and memcmp semantics of the compare-and-exchange operations apply, the comparisons can fail for values that compare equal with operator== if the value representation has trap bits or alternate representations of the same value. Notably, on implementations conforming to ISO/IEC/IEEE 60559, floating-point -0.0 and +0.0 will not compare equal with memcmp but will compare equal with operator==, and NaNs with the same payload will compare equal with memcmp but will not compare equal with operator==. —end note]

[Note 7: Because compare-and-exchange acts on an object’s value representation, padding bits that never participate in the object’s value representation are ignored. As a consequence, the following code is guaranteed to avoid spurious failure:]

§ 33.5.8.2
struct padded {
    char clank = 0x42;
    // Padding here.
    unsigned biff = 0xCODEFEFE;
};
atomic<padded> pad = {};

bool zap() {
    padded expected, desired{0, 0};
    return pad.compare_exchange_strong(expected, desired);
}

— end note]

[Note 8: For a union with bits that participate in the value representation of some members but not others, compare-and-exchange might always fail. This is because such padding bits have an indeterminate value when they do not participate in the value representation of the active member. As a consequence, the following code is not guaranteed to ever succeed:

    union pony {
        double celestia = 0.;
        short luna;    // padded
    };
    atomic<pony> princesses = {};

    bool party(pony desired) {
        pony expected;
        return princesses.compare_exchange_strong(expected, desired);
    }

— end note]

void wait(T old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void wait(T old, memory_order order = memory_order::seq_cst) const noexcept;

29 Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

30 Effects: Repeatedly performs the following steps, in order:
(30.1) — Evaluates load(order) and compares its value representation for equality against that of old.
(30.2) — If they compare unequal, returns.
(30.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

31 Remarks: This function is an atomic waiting operation (33.5.6).

void notify_one() volatile noexcept;
void notify_one() noexcept;

32 Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

33 Remarks: This function is an atomic notifying operation (33.5.6).

void notify_all() volatile noexcept;
void notify_all() noexcept;

34 Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

35 Remarks: This function is an atomic notifying operation (33.5.6).

33.5.8.3 Specializations for integers [atomics.types.int]

1 There are specializations of the atomic class template for the integral types char, signed char, unsigned char, short, unsigned short, int, unsigned int, long, unsigned long, long long, unsigned long long, char8_t, char16_t, char32_t, wchar_t, and any other types needed by the typedefs in the header <cstdint> (17.4.2). For each such type integral, the specialization atomic<integral> provides additional atomic operations appropriate to integral types.

[Note 1: The specialization atomic<bool> uses the primary template (33.5.8). — end note]
namespace std {
    template<> struct atomic<integral> {
        using value_type = integral;
        using difference_type = value_type;

        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;

        constexpr atomic() noexcept;
        constexpr atomic(integral) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;

        void store(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(integral, memory_order = memory_order::seq_cst) noexcept;
        integral operator=(integral) volatile noexcept;
        integral operator=(integral) noexcept;
        integral load(memory_order = memory_order::seq_cst) const volatile noexcept;
        integral load(memory_order = memory_order::seq_cst) const noexcept;
        operator integral() const volatile noexcept;
        operator integral() const noexcept;

        integral exchange(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral exchange(integral, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(integral&, integral,
                                     memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(integral&, integral,
                                     memory_order, memory_order) noexcept;
        bool compare_exchange_strong(integral&, integral,
                                      memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(integral&, integral,
                                      memory_order, memory_order) noexcept;

        integral fetch_add(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_add(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_sub(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_sub(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_and(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_and(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_or(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_or(integral, memory_order = memory_order::seq_cst) noexcept;
        integral fetch_xor(integral, memory_order = memory_order::seq_cst) volatile noexcept;
        integral fetch_xor(integral, memory_order = memory_order::seq_cst) noexcept;

        integral operator++(int) volatile noexcept;
        integral operator++(int) noexcept;
        integral operator--(int) volatile noexcept;
        integral operator--(int) noexcept;
        integral operator++() volatile noexcept;
        integral operator++() noexcept;
        integral operator--() volatile noexcept;
        integral operator--() noexcept;
        integral operator+=(integral) volatile noexcept;
        integral operator+=(integral) noexcept;
    }
};

§ 33.5.8.3
The atomic integral specializations are standard-layout structs. They each have a trivial destructor.

Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic computations. The correspondence among key, operator, and computation is specified in Table 146.

Table 146: Atomic arithmetic computations

<table>

T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value pointed to by this immediately before the effects.

Remarks: For signed integer types, the result is as if the object value and parameters were converted to their corresponding unsigned types, the computation performed on those types, and the result converted back to the signed type.

[Note 2: There are no undefined results arising from the computation. —end note]

T operator op=(T operand) volatile noexcept;
T operator op=(T operand) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.8.4 Specializations for floating-point types

There are specializations of the atomic class template for all cv-unqualified floating-point types. For each such type floating-point, the specialization atomic<floating-point> provides additional atomic operations appropriate to floating-point types.

namespace std {
    template<> struct atomic<float> {  
        using value_type = float;
        using difference_type = value_type;
    };
}

§ 33.5.8.4
static constexpr bool is_always_lock_free = implementation-defined;
bool is_lock_free() const volatile noexcept;
bool is_lock_free() const noexcept;

constexpr atomic() noexcept;
constexpr atomic(floating-point) noexcept;

void store(floating-point, memory_order = memory_order::seq_cst) noexcept;
floating-point operator=(floating-point) volatile noexcept;
floating-point operator=(floating-point) noexcept;
floating-point load(memory_order = memory_order::seq_cst) volatile noexcept;
floating-point load(memory_order = memory_order::seq_cst) noexcept;
operator floating-point() volatile noexcept;
operator floating-point() noexcept;

floating-point exchange(floating-point,
    memory_order = memory_order::seq_cst) volatile noexcept;
floating-point exchange(floating-point,
    memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order, memory_order) volatile noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order, memory_order) noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order, memory_order) volatile noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order, memory_order) noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(floating-point&, floating-point,
    memory_order = memory_order::seq_cst) noexcept;
floating-point fetch_add(floating-point,
    memory_order = memory_order::seq_cst) volatile noexcept;
floating-point fetch_add(floating-point,
    memory_order = memory_order::seq_cst) noexcept;
floating-point fetch_sub(floating-point,
    memory_order = memory_order::seq_cst) volatile noexcept;
floating-point fetch_sub(floating-point,
    memory_order = memory_order::seq_cst) noexcept;

floating-point operator+=(floating-point) volatile noexcept;
floating-point operator+=(floating-point) noexcept;
floating-point operator-=(floating-point) volatile noexcept;
floating-point operator-=(floating-point) noexcept;

void wait(floating-point, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(floating-point, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_all() volatile noexcept;
void notify_all() noexcept;
};

2 The atomic floating-point specializations are standard-layout structs. They each have a trivial destructor.
Descriptions are provided below only for members that differ from the primary template.

The following operations perform arithmetic addition and subtraction computations. The correspondence among key, operator, and computation is specified in Table 146.

\[
T \text{ fetch\_key}(T \text{ operand}, \text{ memory\_order order} = \text{ memory\_order::seq\_cst}) \text{ volatile noexcept};
\]

\[
T \text{ fetch\_key}(T \text{ operand}, \text{ memory\_order order} = \text{ memory\_order::seq\_cst}) \text{ noexcept};
\]

**Constraints**: For the volatile overload of this function, is\_always\_lock\_free is true.

**Effects**: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

**Returns**: Atomically, the value pointed to by this immediately before the effects.

**Remarks**: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric\_limits\<\text{floating-point}\> traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point may be different than the calling thread’s floating-point environment.

\[
T \text{ operator op}=(T \text{ operand}) \text{ volatile noexcept};
\]

\[
T \text{ operator op}=(T \text{ operand}) \text{ noexcept};
\]

**Constraints**: For the volatile overload of this function, is\_always\_lock\_free is true.

**Effects**: Equivalent to: return fetch\_key(operand) \text{ op operand};

**Remarks**: If the result is not a representable value for its type (7.1) the result is unspecified, but the operations otherwise have no undefined behavior. Atomic arithmetic operations on floating-point should conform to the std::numeric\_limits\<\text{floating-point}\> traits associated with the floating-point type (17.3.3). The floating-point environment (28.3) for atomic arithmetic operations on floating-point may be different than the calling thread’s floating-point environment.

### 33.5.8.5 Partial specialization for pointers

```cpp
namespace std {
    template<class T> struct atomic<T*> {
        using value_type = T*;
        using difference_type = ptrdiff_t;
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const volatile noexcept;
        bool is_lock_free() const noexcept;
        constexpr atomic() noexcept;
        constexpr atomic(T*) noexcept;
        atomic(const atomic&) = delete;
        atomic& operator=(const atomic&) = delete;
        atomic& operator=(const atomic&) volatile = delete;
        void store(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        void store(T*, memory_order = memory_order::seq_cst) noexcept;
        T* operator=(T*) volatile noexcept;
        T* operator=(T*) noexcept;
        T* load(memory_order = memory_order::seq_cst) const volatile noexcept;
        T* load(memory_order = memory_order::seq_cst) const noexcept;
        operator T*() const volatile noexcept;
        operator T*() const noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) volatile noexcept;
        T* exchange(T*, memory_order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(T*&, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_weak(T*&, T*, memory_order, memory_order) noexcept;
        bool compare_exchange_strong(T*&, T*, memory_order, memory_order) volatile noexcept;
        bool compare_exchange_strong(T*&, T*, memory_order, memory_order) noexcept;
    }
}
```
true compare_exchange_weak(T*&, T*,
memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T*&, T*,
memory_order = memory_order::seq_cst) noexcept;
bool compare_exchange_strong(T*&, T*,
memory_order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T*&, T*,
memory_order = memory_order::seq_cst) noexcept;

T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_add(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) volatile noexcept;
T* fetch_sub(ptrdiff_t, memory_order = memory_order::seq_cst) noexcept;

T* operator++(int) volatile noexcept;
T* operator++(int) noexcept;
T* operator--(int) volatile noexcept;
T* operator--(int) noexcept;
T* operator++() volatile noexcept;
T* operator++() noexcept;
T* operator--() volatile noexcept;
T* operator--() noexcept;
T* operator+=(ptrdiff_t) volatile noexcept;
T* operator+=(ptrdiff_t) noexcept;
T* operator-=(ptrdiff_t) volatile noexcept;
T* operator-=(ptrdiff_t) noexcept;

void wait(T*, memory_order = memory_order::seq_cst) const volatile noexcept;
void wait(T*, memory_order = memory_order::seq_cst) const noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;
void notify_one() volatile noexcept;
void notify_one() noexcept;

There is a partial specialization of the atomic class template for pointers. Specializations of this partial specialization are standard-layout structs. They each have a trivial destructor.

Descriptions are provided below only for members that differ from the primary template.

The following operations perform pointer arithmetic. The correspondence among key, operator, and computation is specified in Table 147.

Table 147: Atomic pointer computations  [tab:atomic.types.pointer.comp]

<table>
<thead>
<tr>
<th>key</th>
<th>Op</th>
<th>Computation</th>
</tr>
</thead>
<tbody>
<tr>
<td>add</td>
<td>+</td>
<td>addition</td>
</tr>
<tr>
<td>sub</td>
<td>-</td>
<td>subtraction</td>
</tr>
</tbody>
</table>

T* fetch_key(ptrdiff_t operand, memory_order_order = memory_order::seq_cst) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order_order = memory_order::seq_cst) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.

Mandates: T is a complete object type.

[Note 1: Pointer arithmetic on void* or function pointers is ill-formed. — end note]

Effects: Atomically replaces the value pointed to by this with the result of the computation applied to the value pointed to by this and the given operand. Memory is affected according to the value of order. These operations are atomic read-modify-write operations (6.9.2).

Returns: Atomically, the value pointed to by this immediately before the effects.

Remarks: The result may be an undefined address, but the operations otherwise have no undefined behavior.
T* operator op=(ptrdiff_t operand) volatile noexcept;
T* operator op=(ptrdiff_t operand) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_key(operand) op operand;

33.5.8.6 Member operators common to integers and pointers to objects [atomics.types.memop]

value_type operator++(int) volatile noexcept;
value_type operator++(int) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_add(1);

value_type operator--(int) volatile noexcept;
value_type operator--(int) noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_sub(1);

value_type operator++() volatile noexcept;
value_type operator++() noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_add(1) + 1;

value_type operator--() volatile noexcept;
value_type operator--() noexcept;

Constraints: For the volatile overload of this function, is_always_lock_free is true.
Effects: Equivalent to: return fetch_sub(1) - 1;

33.5.8.7 Partial specializations for smart pointers [util.smartptr.atomic]

33.5.8.7.1 General [util.smartptr.atomic.general]

1 The library provides partial specializations of the atomic template for shared-ownership smart pointers (20.3.2).

[Note 1: The partial specializations are declared in header <memory> (20.2.2). — end note]

The behavior of all operations is as specified in 33.5.8, unless specified otherwise. The template parameter T of these partial specializations may be an incomplete type.

2 All changes to an atomic smart pointer in 33.5.8.7, and all associated use_count increments, are guaranteed to be performed atomically. Associated use_count decrements are sequenced after the atomic operation, but are not required to be part of it. Any associated deletion and deallocation are sequenced after the atomic update step and are not part of the atomic operation.

[Note 2: If the atomic operation uses locks, locks acquired by the implementation will be held when any use_count adjustments are performed, and will not be held when any destruction or deallocation resulting from this is performed. — end note]

[Example 1:]

```cpp
template< typename T > class atomic_list {
    struct node {
        T t;
        shared_ptr< node > next;
    };
    atomic< shared_ptr< node > > head;

    public:
        auto find(T t) const {
            auto p = head.load();
            while (p && p->t != t)
                p = p->next;
            return shared_ptr< node >(move(p));
        }
};
```

§ 33.5.8.7.1
void push_front(T t) {
    auto p = make_shared<node>();
    p->t = t;
    p->next = head;
    while (!head.compare_exchange_weak(p->next, p)) {} // end example
}

33.5.8.7.2 Partial specialization for shared_ptr

namespace std {
    template<class T> struct atomic<shared_ptr<T>> {
        using value_type = shared_ptr<T>
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;
        constexpr atomic() noexcept;
        constexpr atomic(nullptr_t) noexcept : atomic() {} // exposition only
        atomic(shared_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;
        shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator shared_ptr<T>() const noexcept;
        void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(shared_ptr<T> desired) noexcept;
        shared_ptr<T> exchange(shared_ptr<T> desired,
            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired,
            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired,
            memory_order order = memory_order::seq_cst) noexcept;
        void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;
    }
    private:
        shared_ptr<T> p; // exposition only
    };

constexpr atomic() noexcept;

atomic(shared_ptr<T> desired) noexcept;

Effects: Initializes p().

atomic(shared_ptr<T> desired) noexcept;

Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

void store(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Preconditions: order is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.
Effects: Atomically replaces the value pointed to by this with the value of desired as if by p.swap(desired). Memory is affected according to the value of order.

```cpp
void operator=(shared_ptr<T> desired) noexcept;
```

Effects: Equivalent to store(desired).

```cpp
shared_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
```

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns p.

```cpp
operator shared_ptr<T>() const noexcept;
```

Effects: Equivalent to: return load();

```cpp
shared_ptr<T> exchange(shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.2).

Returns: Atomically returns the value of p immediately before the effects.

```cpp
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired, memory_order success, memory_order failure) noexcept;
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired, memory_order success, memory_order failure) noexcept;
```

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

```cpp
bool compare_exchange_weak(shared_ptr<T>& expected, shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

Effects: Equivalent to:

```cpp
return compare_exchange_weak(expected, desired, order, fail_order);
```

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

```cpp
bool compare_exchange_strong(shared_ptr<T>& expected, shared_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
```

Effects: Equivalent to:

```cpp
return compare_exchange_strong(expected, desired, order, fail_order);
```

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

```cpp
void wait(shared_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
```

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.
Effects: Repeatedly performs the following steps, in order:

- Evaluates `load(order)` and compares it to `old`.
- If the two are not equivalent, returns.
- Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two `shared_ptr` objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

```cpp
void notify_one() noexcept;
```

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

```cpp
void notify_all() noexcept;
```

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

### 33.5.8.7.3 Partial specialization for `weak_ptr`

```cpp
namespace std {
    template<class T> struct atomic<weak_ptr<T>> {
        using value_type = weak_ptr<T>
        static constexpr bool is_always_lock_free = implementation-defined;
        bool is_lock_free() const noexcept;
        atomic() noexcept;
        atomic(weak_ptr<T> desired) noexcept;
        atomic(const atomic&) = delete;
        void operator=(const atomic&) = delete;
        weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;
        operator weak_ptr<T>() const noexcept;
        void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;
        void operator=(weak_ptr<T> desired) noexcept;
        weak_ptr<T> exchange(weak_ptr<T> desired,
                            memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                    memory_order success, memory_order failure) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                      memory_order success, memory_order failure) noexcept;
        bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired,
                                    memory_order order = memory_order::seq_cst) noexcept;
        bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired,
                                      memory_order order = memory_order::seq_cst) noexcept;
        void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;
        void notify_one() noexcept;
        void notify_all() noexcept;
    };

    constexpr atomic() noexcept;
}
```

atomic(weak_ptr<T> desired) noexcept;

Effects: Initializes the object with the value desired. Initialization is not an atomic operation (6.9.2).

[Note 1: It is possible to have an access to an atomic object A race with its construction, for example, by communicating the address of the just-constructed object A to another thread via memory_order::relaxed operations on a suitable atomic pointer variable, and then immediately accessing A in the receiving thread. This results in undefined behavior. — end note]

void store(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Preconditions: order is neither memory_order::consume, memory_order::acquire, nor memory_order::acq_rel.

Effects: Atomically replaces the value pointed to by this with the value of desired as if by p.swap(desired). Memory is affected according to the value of order.

void operator=(weak_ptr<T> desired) noexcept;

Effects: Equivalent to store(desired).

weak_ptr<T> load(memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Memory is affected according to the value of order.

Returns: Atomically returns p.

operator weak_ptr<T>() const noexcept;

Effects: Equivalent to return load();

weak_ptr<T> exchange(weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Atomically replaces p with desired as if by p.swap(desired). Memory is affected according to the value of order. This is an atomic read-modify-write operation (6.9.2.2).

Returns: Atomically returns the value of p immediately before the effects.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order success, memory_order failure) noexcept;

bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order success, memory_order failure) noexcept;

Preconditions: failure is neither memory_order::release nor memory_order::acq_rel.

Effects: If p is equivalent to expected, assigns desired to p and has synchronization semantics corresponding to the value of success, otherwise assigns p to expected and has synchronization semantics corresponding to the value of failure.

Returns: true if p was equivalent to expected, false otherwise.

Remarks: Two weak_ptr objects are equivalent if they store the same pointer value and either share ownership or are both empty. The weak form may fail spuriously. See 33.5.8.2.

If the operation returns true, expected is not accessed after the atomic update and the operation is an atomic read-modify-write operation (6.9.2) on the memory pointed to by this. Otherwise, the operation is an atomic load operation on that memory, and expected is updated with the existing value read from the atomic object in the attempted atomic update. The use_count update corresponding to the write to expected is part of the atomic operation. The write to expected itself is not required to be part of the atomic operation.

bool compare_exchange_weak(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_weak(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.
bool compare_exchange_strong(weak_ptr<T>& expected, weak_ptr<T> desired, memory_order order = memory_order::seq_cst) noexcept;

Effects: Equivalent to:

return compare_exchange_strong(expected, desired, order, fail_order);

where fail_order is the same as order except that a value of memory_order::acq_rel shall be replaced by the value memory_order::acquire and a value of memory_order::release shall be replaced by the value memory_order::relaxed.

void wait(weak_ptr<T> old, memory_order order = memory_order::seq_cst) const noexcept;

Preconditions: order is neither memory_order::release nor memory_order::acq_rel.

Effects: Repeatedly performs the following steps, in order:

(20.1) — Evaluates load(order) and compares it to old.
(20.2) — If the two are not equivalent, returns.
(20.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: Two weak_ptr objects are equivalent if they store the same pointer and either share ownership or are both empty. This function is an atomic waiting operation (33.5.6).

void notify_one() noexcept;

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

void notify_all() noexcept;

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

### 33.5.9 Non-member functions

A non-member function template whose name matches the pattern atomic_f or the pattern atomic_f-_explicit invokes the member function f, with the value of the first parameter as the object expression and the values of the remaining parameters (if any) as the arguments of the member function call, in order. An argument for a parameter of type atomic<T>::value_type* is dereferenced when passed to the member function call. If no such member function exists, the program is ill-formed.

[Note 1: The non-member functions enable programmers to write code that can be compiled as either C or C++, for example in a shared header file. — end note]

### 33.5.10 Flag type and operations

namespace std {

struct atomic_flag {
    constexpr atomic_flag() noexcept;
    atomic_flag(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) = delete;
    atomic_flag& operator=(const atomic_flag&) volatile = delete;

    bool test(memory_order order = memory_order::seq_cst) const volatile noexcept;
    bool test(memory_order order = memory_order::seq_cst) const noexcept;
    bool test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
    bool test_and_set(memory_order order = memory_order::seq_cst) noexcept;
    void clear(memory_order order = memory_order::seq_cst) volatile noexcept;
    void clear(memory_order order = memory_order::seq_cst) noexcept;

    void wait(bool, memory_order order = memory_order::seq_cst) const volatile noexcept;
    void wait(bool, memory_order order = memory_order::seq_cst) const noexcept;
    void notify_one() volatile noexcept;
    void notify_one() noexcept;
    void notify_all() volatile noexcept;
}
The `atomic_flag` type provides the classic test-and-set functionality. It has two states, set and clear. Operations on an object of type `atomic_flag` shall be lock-free. The operations should also be address-free. The `atomic_flag` type is a standard-layout struct. It has a trivial destructor.

```cpp
constexpr atomic_flag::atomic_flag() noexcept;
```

**Effects**: Initializes *this to the clear state.

```cpp
bool atomic_flag_test(const volatile atomic_flag* object) noexcept;
bool atomic_flag_test(const atomic_flag* object) noexcept;
bool atomic_flag_test_explicit(const volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_explicit(const atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const volatile noexcept;
bool atomic_flag::test(memory_order order = memory_order::seq_cst) const noexcept;
```

**Preconditions**: `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

**Effects**: Memory is affected according to the value of `order`. These operations are atomic read-modify-write operations (6.9.2).

```cpp
bool atomic_flag_test_and_set(volatile atomic_flag* object) noexcept;
bool atomic_flag_test_and_set(atomic_flag* object) noexcept;
bool atomic_flag_test_and_set_explicit(volatile atomic_flag* object, memory_order order) noexcept;
bool atomic_flag_test_and_set_explicit(atomic_flag* object, memory_order order) noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) volatile noexcept;
bool atomic_flag::test_and_set(memory_order order = memory_order::seq_cst) noexcept;
```

**Effects**: Atomically sets the value pointed to by `object` or by `this` to `true`. Memory is affected according to the value of `order`.

```cpp
void atomic_flag_clear(volatile atomic_flag* object) noexcept;
void atomic_flag_clear(atomic_flag* object) noexcept;
void atomic_flag_clear_explicit(volatile atomic_flag* object, memory_order order) noexcept;
void atomic_flag_clear_explicit(atomic_flag* object, memory_order order) noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) volatile noexcept;
void atomic_flag::clear(memory_order order = memory_order::seq_cst) noexcept;
```

**Preconditions**: The `order` argument is neither `memory_order::consume`, `memory_order::acquire`, nor `memory_order::acq_rel`.

**Effects**: Atomically sets the value pointed to by `object` or by `this` to `false`. Memory is affected according to the value of `order`.

```cpp
void atomic_flag_wait(const volatile atomic_flag* object, bool old) noexcept;
void atomic_flag_wait(const atomic_flag* object, bool old) noexcept;
void atomic_flag_wait_explicit(const volatile atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag_wait_explicit(const atomic_flag* object, bool old, memory_order order) noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const volatile noexcept;
void atomic_flag::wait(bool old, memory_order order = memory_order::seq_cst) const noexcept;
```

**Preconditions**: `order` is neither `memory_order::release` nor `memory_order::acq_rel`.

For `atomic_flag_wait`, let `order` be `memory_order::seq_cst`. Let `flag` be `object` for the non-member functions and `this` for the member functions.
Effects: Repeatedly performs the following steps, in order:

(15.1) — Evaluates `flag->test(order) != old`.
(15.2) — If the result of that evaluation is `true`, returns.
(15.3) — Blocks until it is unblocked by an atomic notifying operation or is unblocked spuriously.

Remarks: This function is an atomic waiting operation (33.5.6).

```c
void atomic_flag_notify_one(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_one(atomic_flag* object) noexcept;
void atomic_flag::notify_one() volatile noexcept;
void atomic_flag::notify_one() noexcept;
```

Effects: Unblocks the execution of at least one atomic waiting operation that is eligible to be unblocked (33.5.6) by this call, if any such atomic waiting operations exist.

Remarks: This function is an atomic notifying operation (33.5.6).

```c
void atomic_flag_notify_all(volatile atomic_flag* object) noexcept;
void atomic_flag_notify_all(atomic_flag* object) noexcept;
void atomic_flag::notify_all() volatile noexcept;
void atomic_flag::notify_all() noexcept;
```

Effects: Unblocks the execution of all atomic waiting operations that are eligible to be unblocked (33.5.6) by this call.

Remarks: This function is an atomic notifying operation (33.5.6).

#define ATOMIC_FLAG_INIT see below

Remarks: The macro `ATOMIC_FLAG_INIT` is defined in such a way that it can be used to initialize an object of type `atomic_flag` to the clear state. The macro can be used in the form:

```
atomic_flag guard = ATOMIC_FLAG_INIT;
```

It is unspecified whether the macro can be used in other initialization contexts. For a complete static-duration object, that initialization shall be static.

### 33.5.11 Fences

This subclause introduces synchronization primitives called fences. Fences can have acquire semantics, release semantics, or both. A fence with acquire semantics is called an acquire fence. A fence with release semantics is called a release fence.

A release fence `A` synchronizes with an acquire fence `B` if there exist atomic operations `X` and `Y`, both operating on some atomic object `M`, such that `A` is sequenced before `X`, `X` modifies `M`, `Y` is sequenced before `B`, and `Y` reads the value written by `X` or a value written by any side effect in the hypothetical release sequence `X` would head if it were a release operation.

A release fence `A` synchronizes with an atomic operation `B` that performs an acquire operation on an atomic object `M` if there exists some atomic operation `X` such that `A` is sequenced before `X`, `X` modifies `M`, and `B` reads the value written by `X` or a value written by any side effect in the hypothetical release sequence `X` would head if it were a release operation.

An atomic operation `A` that is a release operation on an atomic object `M` synchronizes with an acquire fence `B` if there exists some atomic operation `X` on `M` such that `X` is sequenced before `B` and reads the value written by `A` or a value written by any side effect in the release sequence headed by `A`.

```c
extern "C" void atomic_thread_fence(memory_order order) noexcept;
```

Effects: Depending on the value of `order`, this operation:

(5.1) — has no effects, if `order == memory_order::relaxed`;
(5.2) — is an acquire fence, if `order == memory_order::acquire` or `order == memory_order::consume`;
(5.3) — is a release fence, if `order == memory_order::release`;
(5.4) — is both an acquire fence and a release fence, if `order == memory_order::acq_rel`;
(5.5) — is a sequentially consistent acquire and release fence, if `order == memory_order::seq_cst`.
extern "C" void atomic_signal_fence(memory_order order) noexcept;

Effects: Equivalent to atomic_thread_fence(order), except that the resulting ordering constraints are established only between a thread and a signal handler executed in the same thread.

[Note 1: atomic_signal_fence can be used to specify the order in which actions performed by the thread become visible to the signal handler. Compiler optimizations and reorderings of loads and stores are inhibited in the same way as with atomic_thread_fence, but the hardware fence instructions that atomic_thread_fence would have inserted are not emitted. — end note]

33.5.12 C compatibility

The header <stdatomic.h> provides the following definitions:

```c
template<class T>
  using std::atomic = std::atomic<T>; // exposition only

#define _Atomic(T) std-atomic<T>

1 Each using-declaration for some name A in the synopsis above makes available the same entity as std::A declared in <atomic> (33.5.2). Each macro listed above other than _Atomic(T) is defined as in <atomic>. It is unspecified whether <stdatomic.h> makes available any declarations in namespace std.

2 Each of the using-declarations for intN_t, uintN_t, intptr_t, and uintptr_t listed above is defined if and only if the implementation defines the corresponding typedef-name in 33.5.2.

3 Neither the _Atomic macro, nor any of the non-macro global namespace declarations, are provided by any C++ standard library header other than <stdatomic.h>.

4 Recommended practice: Implementations should ensure that C and C++ representations of atomic objects are compatible, so that the same object can be accessed as both an _Atomic(T) from C code and an atomic<T> from C++ code. The representations should be the same, and the mechanisms used to ensure atomicity and memory ordering should be compatible.
33.6 Mutual exclusion  

33.6.1 General  

Subclause 33.6 provides mechanisms for mutual exclusion: mutexes, locks, and call once. These mechanisms ease the production of race-free programs (6.9.2).

33.6.2 Header <mutex> synopsis  

```
namespace std {
    // 33.6.4.2.2, class mutex
    class mutex;
    // 33.6.4.2.3, class recursive_mutex
    class recursive_mutex;
    // 33.6.4.3.2 class timed_mutex
    class timed_mutex;
    // 33.6.4.3.3, class recursive_timed_mutex
    class recursive_timed_mutex;

    struct defer_lock_t { explicit defer_lock_t() = default; ;
    struct try_to_lock_t { explicit try_to_lock_t() = default; ;
    struct adopt_lock_t { explicit adopt_lock_t() = default; ;

    inline constexpr defer_lock_t defer_lock { ;
    inline constexpr try_to_lock_t try_to_lock { ;
    inline constexpr adopt_lock_t adopt_lock { ;

    // 33.6.5, locks
    template<class Mutex> class lock_guard;
    template<class... MutexTypes> class scoped_lock;
    template<class Mutex> class unique_lock;

    template<class Mutex>
    void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

    // 33.6.6, generic locking algorithms
    template<class L1, class L2, class... L3> int try_lock(L1&, L2&, L3&...);
    template<class L1, class L2, class... L3> void lock(L1&, L2&, L3&...);

    struct once_flag;
    template<class Callable, class... Args>
    void call_once(once_flag& flag, Callable& func, Args&... args);
}
```

33.6.3 Header <shared_mutex> synopsis  

```
namespace std {
    // 33.6.4.4.2, class shared_mutex
    class shared_mutex;
    // 33.6.4.5.2, class shared_timed_mutex
    class shared_timed_mutex;
    // 33.6.5.5, class template shared_lock
    template<class Mutex> class shared_lock;
    template<class Mutex>
    void swap(shared_lock<Mutex>& x, shared_lock<Mutex>& y) noexcept;
}
```

33.6.4 Mutex requirements  

33.6.4.1 In general  

A mutex object facilitates protection against data races and allows safe synchronization of data between execution agents (33.2.5). An execution agent owns a mutex from the time it successfully calls one of the lock functions until it calls unlock. Mutexes can be either recursive or non-recursive, and can grant simultaneous ownership to one or many execution agents. Both recursive and non-recursive mutexes are supplied.
33.6.4.2 Mutex types

The mutex types are the standard library types `mutex`, `recursive_mutex`, `timed_mutex`, `recursive_timed_mutex`, `shared_mutex`, and `shared_timed_mutex`. They meet the requirements set out in 33.6.4.2. In this description, `m` denotes an object of a mutex type.

1 The mutex types meet the Cpp17Lockable requirements (33.2.5.3). —end note

2 The mutex types meet Cpp17DefaultConstructible and Cpp17Destructible. If initialization of an object of a mutex type fails, an exception of type `system_error` is thrown. The mutex types are neither copyable nor movable.

3 The error conditions for error codes, if any, reported by member functions of the mutex types are as follows:

- `resource_unavailable_try_again` — if any native handle type manipulated is not available.
- `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
- `invalid_argument` — if any native handle type manipulated as part of mutex construction is incorrect.

4 The implementation provides lock and unlock operations, as described below. For purposes of determining the existence of a data race, these behave as atomic operations (6.9.2). The lock and unlock operations on a single mutex appear to occur in a single total order.

- `lock()` is well-formed and has the following semantics:

  Preconditions: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.
  Effects: Blocks the calling thread until ownership of the mutex can be obtained for the calling thread.
  Synchronization: Prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
  Postconditions: The calling thread owns the mutex.
  Return type: `void`.
  Throws: `system_error` when an exception is required (33.2.2).
  Error conditions:
  - `operation_not_permitted` — if the thread does not have the privilege to perform the operation.
  - `resource_deadlock_would_occur` — if the implementation detects that a deadlock would occur.

- `try_lock()` is well-formed and has the following semantics:

  Preconditions: If `m` is of type `mutex`, `timed_mutex`, `shared_mutex`, or `shared_timed_mutex`, the calling thread does not own the mutex.
  Effects: Attempts to obtain ownership of the mutex for the calling thread without blocking. If ownership is not obtained, there is no effect and `try_lock()` immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.
  Synchronization: If `try_lock()` returns `true`, prior `unlock()` operations on the same object synchronize with (6.9.2) this operation.
  Postconditions: The calling thread owns the mutex.
  Return type: `bool`.
  Returns: `true` if ownership was obtained, otherwise `false`.
  Throws: Nothing.
The expression \texttt{m.unlock()} is well-formed and has the following semantics:

1. **Preconditions:** The calling thread owns the mutex.
2. **Effects:** Releases the calling thread’s ownership of the mutex.
3. **Return type:** \texttt{void}.
4. **Synchronization:** This operation synchronizes with (6.9.2) subsequent lock operations that obtain ownership on the same object.
5. **Throws:** Nothing.

### 33.6.4.2.2 Class mutex

```cpp
class mutex {
public:
    constexpr mutex() noexcept;
    ~mutex();
    mutex(const mutex&) = delete;
    mutex& operator=(const mutex&) = delete;
    void lock();
    bool try_lock();
    void unlock();

    using native_handle_type = implementation-defined; // see 33.2.3
    native_handle_type native_handle(); // see 33.2.3
};
```

1. The class \texttt{mutex} provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a mutex object, attempts by another thread to acquire ownership of that object will fail (for \texttt{try_lock()}) or block (for \texttt{lock()}) until the owning thread has released ownership with a call to \texttt{unlock()}.

2. **Note 1:** After a thread \texttt{A} has called \texttt{unlock()}, releasing a mutex, it is possible for another thread \texttt{B} to lock the same mutex, observe that it is no longer in use, unlock it, and destroy it, before thread \texttt{A} appears to have returned from its unlock call. Implementations are required to handle such scenarios correctly, as long as thread \texttt{A} doesn’t access the mutex after the unlock call returns. These cases typically occur when a reference-counted object contains a mutex that is used to protect the reference count. —end note

3. The class \texttt{mutex} meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).

4. **Note 2:** A program can deadlock if the thread that owns a \texttt{mutex} object calls \texttt{lock()} on that object. If the implementation can detect the deadlock, a \texttt{resource_deadlock_would_occur} error condition might be observed. —end note

5. The behavior of a program is undefined if it destroys a \texttt{mutex} object owned by any thread or a thread terminates while owning a \texttt{mutex} object.

### 33.6.4.2.3 Class recursive_mutex

```cpp
class recursive_mutex {
public:
    recursive_mutex();
    ~recursive_mutex();
    recursive_mutex(const recursive_mutex&) = delete;
    recursive_mutex& operator=(const recursive_mutex&) = delete;
    void lock();
    bool try_lock() noexcept;
    void unlock();

    using native_handle_type = implementation-defined; // see 33.2.3
    native_handle_type native_handle(); // see 33.2.3
};
```

§ 33.6.4.2.3
The class \texttt{recursive_mutex} provides a recursive mutex with exclusive ownership semantics. If one thread owns a \texttt{recursive_mutex} object, attempts by another thread to acquire ownership of that object will fail (for \texttt{try_lock()}) or block (for \texttt{lock()}) until the first thread has completely released ownership.

The class \texttt{recursive_mutex} meets all of the mutex requirements (33.6.4). It is a standard-layout class (11.2).

A thread that owns a \texttt{recursive_mutex} object may acquire additional levels of ownership by calling \texttt{lock()} or \texttt{try_lock()} on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a \texttt{recursive_mutex} object, additional calls to \texttt{try_lock()} fail, and additional calls to \texttt{lock()} throw an exception of type \texttt{system_error}. A thread shall call \texttt{unlock()} once for each level of ownership acquired by calls to \texttt{lock()} and \texttt{try_lock()}. Only when all levels of ownership have been released may ownership be acquired by another thread.

The behavior of a program is undefined if:

1. it destroys a \texttt{recursive_mutex} object owned by any thread or
2. a thread terminates while owning a \texttt{recursive_mutex} object.

33.6.4.3 Timed mutex types

The \texttt{timed mutex types} are the standard library types \texttt{timed_mutex}, \texttt{recursive_timed_mutex}, and \texttt{shared_timed_mutex}. They meet the requirements set out below. In this description, \texttt{m} denotes an object of a mutex type, \texttt{rel_time} denotes an object of an instantiation of \texttt{duration} (29.5), and \texttt{abs_time} denotes an object of an instantiation of \texttt{time_point} (29.6).

[Note 1: The timed mutex types meet the \texttt{Cpp17TimedLockable} requirements (33.2.5.4). — end note]

The expression \texttt{m.\texttt{try_lock_for}(rel_time)} is well-formed and has the following semantics:

1. **Preconditions:** If \texttt{m} is of type \texttt{timed_mutex} or \texttt{shared_timed_mutex}, the calling thread does not own the mutex.
2. **Effects:** The function attempts to obtain ownership of the mutex within the relative timeout (33.2.4) specified by \texttt{rel_time}. If the time specified by \texttt{rel_time} is less than or equal to \texttt{rel_time.zero()}, the function attempts to obtain ownership without blocking (as if by calling \texttt{try_lock()}). The function returns within the timeout specified by \texttt{rel_time} only if it has obtained ownership of the mutex object.
3. **Synchronization:** If \texttt{try_lock_for()} returns \texttt{true}, prior \texttt{unlock()} operations on the same object synchronize with (6.9.2) this operation.
4. **Return type:** \texttt{bool}.
5. **Returns:** \texttt{true} if ownership was obtained, otherwise \texttt{false}.
6. **Throws:** Timeout-related exceptions (33.2.4).

The expression \texttt{m.\texttt{try_lock_until}(abs_time)} is well-formed and has the following semantics:

1. **Preconditions:** If \texttt{m} is of type \texttt{timed_mutex} or \texttt{shared_timed_mutex}, the calling thread does not own the mutex.
2. **Effects:** The function attempts to obtain ownership of the mutex. If \texttt{abs_time} has already passed, the function attempts to obtain ownership without blocking (as if by calling \texttt{try_lock()}). The function returns before the absolute timeout (33.2.4) specified by \texttt{abs_time} only if it has obtained ownership of the mutex object.
3. **Synchronization:** If \texttt{try_lock_until()} returns \texttt{true}, prior \texttt{unlock()} operations on the same object synchronize with (6.9.2) this operation.
4. **Return type:** \texttt{bool}.
5. **Returns:** \texttt{true} if ownership was obtained, otherwise \texttt{false}.
6. **Throws:** Timeout-related exceptions (33.2.4).
### 33.6.4.3.2 Class `timed_mutex`

```cpp
namespace std {
    class timed_mutex {
        public:
            timed_mutex();
            ~timed_mutex();
            
            timed_mutex(const timed_mutex&) = delete;
            timed_mutex& operator=(const timed_mutex&) = delete;
            
            void lock(); // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();
            
            using native_handle_type = implementation-defined; // see 33.2.3
            native_handle_type native_handle(); // see 33.2.3
    };
}
```

1 The class `timed_mutex` provides a non-recursive mutex with exclusive ownership semantics. If one thread owns a `timed_mutex` object, attempts by another thread to acquire ownership of that object will fail (for `try_lock()`) or block (for `lock()`, `try_lock_for()`, and `try_lock_until()`) until the owning thread has released ownership with a call to `unlock()` or the call to `try_lock_for()` or `try_lock_until()` times out (having failed to obtain ownership).

2 The class `timed_mutex` meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

3 The behavior of a program is undefined if:

- it destroys a `timed_mutex` object owned by any thread,
- a thread that owns a `timed_mutex` object calls `lock()`, `try_lock()`, `try_lock_for()`, or `try_lock_until()` on that object, or
- a thread terminates while owning a `timed_mutex` object.

### 33.6.4.3.3 Class `recursive_timed_mutex`

```cpp
namespace std {
    class recursive_timed_mutex {
        public:
            recursive_timed_mutex();
            ~recursive_timed_mutex();
            
            recursive_timed_mutex(const recursive_timed_mutex&) = delete;
            recursive_timed_mutex& operator=(const recursive_timed_mutex&) = delete;
            
            void lock(); // blocking
            bool try_lock() noexcept;
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();
            
            using native_handle_type = implementation-defined; // see 33.2.3
            native_handle_type native_handle(); // see 33.2.3
    };
}
```

1 The class `recursive_timed_mutex` provides a recursive mutex with exclusive ownership semantics. If one thread owns a `recursive_timed_mutex` object, attempts by another thread to acquire ownership of that
object will fail (for try_lock()) or block (for lock(), try_lock_for(), and try_lock_until()) until the owning thread has completely released ownership or the call to try_lock_for() or try_lock_until() times out (having failed to obtain ownership).

2 The class recursive_timed_mutex meets all of the timed mutex requirements (33.6.4.3). It is a standard-layout class (11.2).

3 A thread that owns a recursive_timed_mutex object may acquire additional levels of ownership by calling lock(), try_lock(), try_lock_for(), or try_lock_until() on that object. It is unspecified how many levels of ownership may be acquired by a single thread. If a thread has already acquired the maximum level of ownership for a recursive_timed_mutex object, additional calls to try_lock(), try_lock_for(), or try_lock_until() fail, and additional calls to lock() throw an exception of type system_error. A thread shall call unlock() once for each level of ownership acquired by calls to lock(), try_lock(), try_lock_for(), and try_lock_until(). Only when all levels of ownership have been released may ownership of the object be acquired by another thread.

4 The behavior of a program is undefined if:

(4.1) — it destroys a recursive_timed_mutex object owned by any thread, or

(4.2) — a thread terminates while owning a recursive_timed_mutex object.

33.6.4.4 Shared mutex types

33.6.4.4.1 General

The standard library types shared_mutex and shared_timed_mutex are shared mutex types. Shared mutex types meet the requirements of mutex types (33.6.4.2) and additionally meet the requirements set out below. In this description, m denotes an object of a shared mutex type.

[Note 1: The shared mutex types meet the Cpp17SharedLockable requirements (33.2.5.5). — end note]

In addition to the exclusive lock ownership mode specified in 33.6.4.2, shared mutex types provide a shared lock ownership mode. Multiple execution agents can simultaneously hold a shared lock ownership of a shared mutex type. But no execution agent holds a shared lock while another execution agent holds an exclusive lock on the same shared mutex type, and vice-versa. The maximum number of execution agents which can share a shared lock on a single shared mutex type is unspecified, but is at least 10000. If more than the maximum number of execution agents attempt to obtain a shared lock, the excess execution agents block until the number of shared locks are reduced below the maximum amount by other execution agents releasing their shared lock.

The expression m.lock_shared() is well-formed and has the following semantics:

4 Preconditions: The calling thread has no ownership of the mutex.

5 Effects: Blocks the calling thread until shared ownership of the mutex can be obtained for the calling thread. If an exception is thrown then a shared lock has not been acquired for the current thread.

6 Synchronization: Prior unlock() operations on the same object synchronize with (6.9.2) this operation.

7 Postconditions: The calling thread has a shared lock on the mutex.

8 Return type: void.

9 Throws: system_error when an exception is required (33.2.2).

10 Error conditions:

(10.1) — operation_not_permitted — if the thread does not have the privilege to perform the operation.

(10.2) — resource_deadlock_would_occur — if the implementation detects that a deadlock would occur.

The expression m.unlock_shared() is well-formed and has the following semantics:

11 Preconditions: The calling thread holds a shared lock on the mutex.

12 Effects: Releases a shared lock on the mutex held by the calling thread.

13 Return type: void.

14 Synchronization: This operation synchronizes with (6.9.2) subsequent lock() operations that obtain ownership on the same object.

15 Throws: Nothing.
The expression \texttt{m.try\_lock\_shared()} is well-formed and has the following semantics:

**Preconditions:** The calling thread has no ownership of the mutex.

**Effects:** Attempts to obtain shared ownership of the mutex for the calling thread without blocking. If shared ownership is not obtained, there is no effect and \texttt{try\_lock\_shared()} immediately returns. An implementation may fail to obtain the lock even if it is not held by any other thread.

**Synchronization:** If \texttt{try\_lock\_shared()} returns \texttt{true}, prior \texttt{unlock()} operations on the same object synchronize with (6.9.2) this operation.

**Return type:** \texttt{bool}.

**Returns:** \texttt{true} if the shared lock was acquired, otherwise \texttt{false}.

**Throws:** Nothing.

### 33.6.4.4.2 Class \texttt{shared\_mutex}

```cpp
namespace std {
    class shared_mutex {
        public:
            shared_mutex();
            ~shared_mutex();
            shared_mutex(const shared_mutex&) = delete;
            shared_mutex& operator=(const shared_mutex&) = delete;

            // exclusive ownership
            void lock(); // blocking
            bool try_lock();
            void unlock();

            // shared ownership
            void lock_shared(); // blocking
            bool try_lock_shared();
            void unlock_shared();

            using native_handle_type = implementation-defined; // see 33.2.3
            native_handle_type native_handle(); // see 33.2.3
    };
}
```

1. The class \texttt{shared\_mutex} provides a non-recursive mutex with shared ownership semantics.

2. The class \texttt{shared\_mutex} meets all of the shared mutex requirements (33.6.4.4). It is a standard-layout class (11.2).

3. The behavior of a program is undefined if:
   (3.1) it destroys a \texttt{shared\_mutex} object owned by any thread,
   (3.2) a thread attempts to recursively gain any ownership of a \texttt{shared\_mutex}, or
   (3.3) a thread terminates while possessing any ownership of a \texttt{shared\_mutex}.

4. \texttt{shared\_mutex} may be a synonym for \texttt{shared\_timed\_mutex}.

### 33.6.4.5 Shared timed mutex types

**33.6.4.5.1 General**

The standard library type \texttt{shared\_timed\_mutex} is a *shared timed mutex type*. Shared timed mutex types meet the requirements of timed mutex types (33.6.4.3), shared mutex types (33.6.4.4), and additionally meet the requirements set out below. In this description, \texttt{m} denotes an object of a shared timed mutex type, \texttt{rel\_time} denotes an object of an instantiation of \texttt{duration} (29.5), and \texttt{abs\_time} denotes an object of an instantiation of \texttt{time\_point} (29.6).

[Note 1: The shared timed mutex types meet the \texttt{Cpp17SharedTimedLockable} requirements (33.2.5.6). — end note]

2. The expression \texttt{m.try\_lock\_shared\_for(rel\_time)} is well-formed and has the following semantics:

**Preconditions:** The calling thread has no ownership of the mutex.
Effects: Attempts to obtain shared lock ownership for the calling thread within the relative timeout (33.2.4) specified by \texttt{rel\_time}. If the time specified by \texttt{rel\_time} is less than or equal to \texttt{rel\_time.zero()}, the function attempts to obtain ownership without blocking (as if by calling \texttt{try\_lock\_shared()}). The function returns within the timeout specified by \texttt{rel\_time} only if it has obtained shared ownership of the mutex object.

\[\text{Note 2: As with \texttt{try\_lock()}, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note}\]

If an exception is thrown then a shared lock has not been acquired for the current thread.

Synchronization: If \texttt{try\_lock\_shared\_for()} returns \texttt{true}, prior \texttt{unlock()} operations on the same object synchronize with (6.9.2) this operation.

Return type: \texttt{bool}.

Returns: \texttt{true} if the shared lock was acquired, otherwise \texttt{false}.

Throws: Timeout-related exceptions (33.2.4).

The expression \texttt{m.try\_lock\_shared\_until(abs\_time)} is well-formed and has the following semantics:

Preconditions: The calling thread has no ownership of the mutex.

Effects: The function attempts to obtain shared ownership of the mutex. If \texttt{abs\_time} has already passed, the function attempts to obtain shared ownership without blocking (as if by calling \texttt{try\_lock\_shared()}). The function returns before the absolute timeout (33.2.4) specified by \texttt{abs\_time} only if it has obtained shared ownership of the mutex object.

\[\text{Note 3: As with \texttt{try\_lock()}, there is no guarantee that ownership will be obtained if the lock is available, but implementations are expected to make a strong effort to do so. — end note}\]

If an exception is thrown then a shared lock has not been acquired for the current thread.

Synchronization: If \texttt{try\_lock\_shared\_until()} returns \texttt{true}, prior \texttt{unlock()} operations on the same object synchronize with (6.9.2) this operation.

Return type: \texttt{bool}.

Returns: \texttt{true} if the shared lock was acquired, otherwise \texttt{false}.

Throws: Timeout-related exceptions (33.2.4).

### 33.6.4.5.2 Class \texttt{shared\_timed\_mutex}  

```
namespace std {
    class shared_timed_mutex {
        public:
            shared_timed_mutex();
            ~shared_timed_mutex();
            shared_timed_mutex(const shared_timed_mutex&) = delete;
            shared_timed_mutex& operator=(const shared_timed_mutex&) = delete;

            // exclusive ownership
            void lock(); // blocking
            bool try_lock();
            template<class Rep, class Period>
                bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock();

            // shared ownership
            void lock_shared(); // blocking
            bool try_lock_shared();
            template<class Rep, class Period>
                bool try_lock_shared_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_lock_shared_until(const chrono::time_point<Clock, Duration>& abs_time);
            void unlock_shared();

§ 33.6.4.5.2 1820
```
The class `shared_timed_mutex` provides a non-recursive mutex with shared ownership semantics.

The class `shared_timed_mutex` meets all of the shared timed mutex requirements (33.6.4.5). It is a standard-layout class (11.2).

The behavior of a program is undefined if:

1. it destroys a `shared_timed_mutex` object owned by any thread,
2. a thread attempts to recursively gain any ownership of a `shared_timed_mutex`, or
3. a thread terminates while possessing any ownership of a `shared_timed_mutex`.

### 33.6.5 Locks [thread.lock]

#### 33.6.5.1 General [thread.lock.general]

A **lock** is an object that holds a reference to a lockable object and may unlock the lockable object during the lock’s destruction (such as when leaving block scope). An execution agent may use a lock to aid in managing ownership of a lockable object in an exception safe manner. A lock is said to **own** a lockable object if it is currently managing the ownership of that lockable object for an execution agent. A lock does not manage the lifetime of the lockable object it references.

[Note 1: Locks are intended to ease the burden of unlocking the lockable object under both normal and exceptional circumstances. — end note]

Some lock constructors take tag types which describe what should be done with the lockable object during the lock’s construction.

```cpp
namespace std {
    struct defer_lock_t { }; // do not acquire ownership of the mutex
    struct try_to_lock_t { }; // try to acquire ownership of the mutex
    struct adopt_lock_t { }; // assume the calling thread has already
    // obtained mutex ownership and manage it

    inline constexpr defer_lock_t defer_lock { };
    inline constexpr try_to_lock_t try_to_lock { };
    inline constexpr adopt_lock_t adopt_lock { };
}
```

#### 33.6.5.2 Class template `lock_guard` [thread.lock.guard]

```cpp
namespace std {
    template<class Mutex>
    class lock_guard {
    public:
        using mutex_type = Mutex;

        explicit lock_guard(mutex_type& m);
        lock_guard(mutex_type& m, adopt_lock_t);
        ~lock_guard();

        lock_guard(const lock_guard&) = delete;
        lock_guard& operator=(const lock_guard&) = delete;

    private:
        mutex_type& pm; // exposition only
    };
}
```

An object of type `lock_guard` controls the ownership of a lockable object within a scope. A `lock_guard` object maintains ownership of a lockable object throughout the `lock_guard` object’s lifetime (6.7.3). The behavior of a program is undefined if the lockable object referenced by `pm` does not exist for the entire lifetime of the `lock_guard` object. The supplied `Mutex` type shall meet the Cpp17BasicLockable requirements (33.2.5.2).
explicit lock_guard(mutex_type& m);

Effects: Initializes pm with m. Calls m.lock().

lock_guard(mutex_type& m, adopt_lock_t);

Preconditions: The calling thread holds a non-shared lock on m.
Effects: Initializes pm with m.

Throws: Nothing.

~lock_guard();

Effects: Equivalent to: pm.unlock()

33.6.5.3 Class template scoped_lock

namespace std {
    template<class... MutexTypes>
    class scoped_lock {
        public:
            using mutex_type = see below;  // Only if sizeof...(MutexTypes) == 1 is true

            explicit scoped_lock(MutexTypes&... m);
            explicit scoped_lock(adopt_lock_t, MutexTypes&... m);
            ~scoped_lock();

            scoped_lock(const scoped_lock&) = delete;
            scoped_lock& operator=(const scoped_lock&) = delete;

        private:
            tuple<MutexTypes&...> pm;  // exposition only
        }
    }

An object of type scoped_lock controls the ownership of lockable objects within a scope. A scoped_lock object maintains ownership of lockable objects throughout the scoped_lock object's lifetime (6.7.3). The behavior of a program is undefined if the lockable objects referenced by pm do not exist for the entire lifetime of the scoped_lock object.

(1.1) — If sizeof...(MutexTypes) is one, let Mutex denote the sole type constituting the pack MutexTypes. Mutex shall meet the Cpp17BasicLockable requirements (33.2.5.2). The member typedef-name mutex_type denotes the same type as Mutex.

(1.2) — Otherwise, all types in the template parameter pack MutexTypes shall meet the Cpp17Lockable requirements (33.2.5.3) and there is no member mutex_type.

explicit scoped_lock(MutexTypes&... m);

Effects: Initializes pm with tie(m...). Then if sizeof...(MutexTypes) is 0, no effects. Otherwise if sizeof...(MutexTypes) is 1, then m.lock(). Otherwise, lock(m...).

explicit scoped_lock(adopt_lock_t, MutexTypes&... m);

Preconditions: The calling thread holds a non-shared lock on each element of m.
Effects: Initializes pm with tie(m...).

Throws: Nothing.

~scoped_lock();

Effects: For all i in [0, sizeof...(MutexTypes)), get<i>(pm).unlock().

33.6.5.4 Class template unique_lock

33.6.5.4.1 General
using mutex_type = Mutex;

// 33.6.5.4.2, construct/copy/destroy
unique_lock() noexcept;
explicit unique_lock(mutex_type& m);
unique_lock(mutex_type& m, defer_lock_t) noexcept;
unique_lock(mutex_type& m, try_to_lock_t);
unique_lock(mutex_type& m, adopt_lock_t);
template<class Clock, class Duration>
  unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
template<class Rep, class Period>
  unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
~unique_lock();

unique_lock(const unique_lock&) = delete;
unique_lock& operator=(const unique_lock&) = delete;

unique_lock(unique_lock&& u) noexcept;
unique_lock& operator=(unique_lock&& u);

// 33.6.5.4.3, locking
void lock();
bool try_lock();

template<class Rep, class Period>
  bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);
template<class Clock, class Duration>
  bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

void unlock();

// 33.6.5.4.4, modifiers
void swap(unique_lock& u) noexcept;
mutex_type* release() noexcept;

// 33.6.5.4.5, observers
bool owns_lock() const noexcept;
explicit operator bool () const noexcept;
mutex_type* mutex() const noexcept;

};

1 An object of type unique_lock controls the ownership of a lockable object within a scope. Ownership of
the lockable object may be acquired at construction or after construction, and may be transferred, after
acquisition, to another unique_lock object. Objects of type unique_lock are not copyable but are movable.
The behavior of a program is undefined if the contained pointer pm is not null and the lockable object pointed
to by pm does not exist for the entire remaining lifetime (6.7.3) of the unique_lock object. The supplied
Mutex type shall meet the Cpp17BasicLockable requirements (33.2.5.2).

2 [Note 1: unique_lock<Mutex> meets the Cpp17BasicLockable requirements. If Mutex meets the Cpp17Lockable
requirements (33.2.5.3), unique_lock<Mutex> also meets the Cpp17Lockable requirements; if Mutex meets the
Cpp17TimedLockable requirements (33.2.5.4), unique_lock<Mutex> also meets the Cpp17TimedLockable requirements.
—end note]

33.6.5.4.2 Constructors, destructor, and assignment

unique_lock() noexcept;

1 Postconditions: pm == nullptr and owns == false.
explicit unique_lock(mutex_type& m);

Effects: Calls m.lock().
Postconditions: pm == addressof(m) and owns == true.

unique_lock(mutex_type& m, defer_lock_t) noexcept;

Postconditions: pm == addressof(m) and owns == false.

unique_lock(mutex_type& m, try_to_lock_t);

Preconditions: The supplied Mutex type meets the Cpp17Lockable requirements (33.2.5.3).
Effects: Calls m.try_lock().
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock().

unique_lock(mutex_type& m, adopt_lock_t);

Preconditions: The calling thread holds a non-shared lock on m.
Postconditions: pm == addressof(m) and owns == true.
Throws: Nothing.

template<class Clock, class Duration>
unique_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).
Effects: Calls m.try_lock_until(abs_time).
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_until(abs_time).

template<class Rep, class Period>
unique_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).
Effects: Calls m.try_lock_for(rel_time).
Postconditions: pm == addressof(m) and owns == res, where res is the value returned by the call to m.try_lock_for(rel_time).

unique_lock(unique_lock&& u) noexcept;

Postconditions: pm == u_p.pm and owns == u_p.owns (where u_p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.

unique_lock& operator=(unique_lock&& u);

Effects: If owns calls pm->unlock().
Postconditions: pm == u_p.pm and owns == u_p.owns (where u_p is the state of u just prior to this construction), u.pm == 0 and u.owns == false.

[Note 1: With a recursive mutex it is possible for both *this and u to own the same mutex before the assignment. In this case, *this will own the mutex after the assignment and u will not. — end note]

Throws: Nothing.

~unique_lock();

Effects: If owns calls pm->unlock().

33.6.5.4.3 Locking [thread.lock.unique.locking]

void lock();

Effects: As if by pm->lock().
Postconditions: owns == true.
Throws: Any exception thrown by pm->lock(). system_error when an exception is required (33.2.2).
Error conditions:
bool try_lock();

Preconditions: The supplied Mutex meets the Cpp17Lockable requirements (33.2.5.3).
Effects: As if by pm->try_lock().
Postconditions: owns == res, where res is the value returned by pm->try_lock().
Returns: The value returned by pm->try_lock().
Throws: Any exception thrown by pm->try_lock(). system_error when an exception is required (33.2.2).

Error conditions:

— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).
Effects: As if by pm->try_lock_until(abs_time).
Postconditions: owns == res, where res is the value returned by pm->try_lock_until(abs_time).
Returns: The value returned by pm->try_lock_until(abs_time).
Throws: Any exception thrown by pm->try_lock_until(abstime). system_error when an exception is required (33.2.2).

Error conditions:

— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

Preconditions: The supplied Mutex type meets the Cpp17TimedLockable requirements (33.2.5.4).
Effects: As if by pm->try_lock_for(rel_time).
Postconditions: owns == res, where res is the value returned by pm->try_lock_for(rel_time).
Returns: The value returned by pm->try_lock_for(rel_time).
Throws: Any exception thrown by pm->try_lock_for(rel_time). system_error when an exception is required (33.2.2).

Error conditions:

— operation_not_permitted — if pm is nullptr.
— resource_deadlock_would_occur — if on entry owns is true.

void unlock();

Effects: As if by pm->unlock().
Postconditions: owns == false.
Throws: system_error when an exception is required (33.2.2).
Error conditions:

— operation_not_permitted — if on entry owns is false.

33.6.5.4.4 Modifiers
thread.lock.unique.mod

void swap(unique_lock& u) noexcept;

Effects: Swaps the data members of *this and u.
mutex_type* release() noexcept;

*Postconditions:* pm == 0 and owns == false.

Returns: The previous value of pm.

template<class Mutex>
void swap(unique_lock<Mutex>& x, unique_lock<Mutex>& y) noexcept;

*Effects:* As if by x.swap(y).

33.6.5.4.5 Observers

bool owns_lock() const noexcept;

*Returns:* owns.

explicit operator bool() const noexcept;

*Returns:* owns.

mutex_type* mutex() const noexcept;

*Returns:* pm.

33.6.5.5 Class template shared_lock

33.6.5.5.1 General

namespace std {
    template<class Mutex>
    class shared_lock {
    public:
        using mutex_type = Mutex;

        // 33.6.5.5.2, construct/copy/destroy
        shared_lock() noexcept;
        explicit shared_lock(mutex_type& m); // blocking
        shared_lock(mutex_type& m, defer_lock_t) noexcept;
        shared_lock(mutex_type& m, try_to_lock_t);
        shared_lock(mutex_type& m, adopt_lock_t);
        template<class Clock, class Duration>
        shared_lock(mutex_type& m, const chrono::time_point<Clock, Duration>& abs_time);
        template<class Rep, class Period>
        shared_lock(mutex_type& m, const chrono::duration<Rep, Period>& rel_time);
        ~shared_lock();

        shared_lock(const shared_lock&) = delete;
        shared_lock& operator=(const shared_lock&) = delete;
        shared_lock(shared_lock&& u) noexcept;
        shared_lock& operator=(shared_lock&& u) noexcept;

        // 33.6.5.5.3, locking
        void lock(); // blocking
        bool try_lock();
        template<class Rep, class Period>
        bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

        mutex_type* mutex() const noexcept;

§ 33.6.5.5.1

1826
private:
    mutex_type* pm;    // exposition only
    bool owns;         // exposition only
};

An object of type `shared_lock` controls the shared ownership of a lockable object within a scope. Shared ownership of the lockable object may be acquired at construction or after construction, and may be transferred, after acquisition, to another `shared_lock` object. Objects of type `shared_lock` are not copyable but are movable. The behavior of a program is undefined if the contained pointer `pm` is not null and the lockable object pointed to by `pm` does not exist for the entire remaining lifetime (6.7.3) of the `shared_lock` object. The supplied `Mutex` type shall meet the `Cpp17SharedLockable` requirements (33.2.5.5).

[Note 1: `shared_lock<Mutex>` meets the `Cpp17Lockable` requirements (33.2.5.3). If `Mutex` meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6), `shared_lock<Mutex>` also meets the `Cpp17TimedLockable` requirements (33.2.5.4). — end note]

### 33.6.5.5.2 Constructors, destructor, and assignment

`shared_lock()` noexcept;

Postconditions: `pm` == nullptr and `owns` == false.

explicit `shared_lock(mutex_type& m)`;

Effects: Calls `m.lock_shared()`.

Postconditions: `pm` == addressof(`m`) and `owns` == true.

`shared_lock(mutex_type& m, defer_lock_t)` noexcept;

Postconditions: `pm` == addressof(`m`) and `owns` == false.

Effects: Calls `m.lock_shared()`.

`shared_lock(mutex_type& m, try_to_lock_t);`

Postconditions: `pm` == addressof(`m`) and `owns` == `res` where `res` is the value returned by the call to `m.try_lock_shared()`.

Effects: Calls `m.try_lock_shared()`.

`shared_lock(mutex_type& m, adopt_lock_t);`

Postconditions: `pm` == addressof(`m`) and `owns` == true.

template<class Clock, class Duration>
`shared_lock(mutex_type& m,` const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: `Mutex` meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).

Effects: Calls `m.try_lock_shared_until(abs_time)`.

Postconditions: `pm` == addressof(`m`) and `owns` == `res` where `res` is the value returned by the call to `m.try_lock_shared_until(abs_time)`.

template<class Rep, class Period>
`shared_lock(mutex_type& m,` const chrono::duration<Rep, Period>& rel_time);

Preconditions: `Mutex` meets the `Cpp17SharedTimedLockable` requirements (33.2.5.6).

Effects: Calls `m.try_lock_shared_for(rel_time)`.

Postconditions: `pm` == addressof(`m`) and `owns` == `res` where `res` is the value returned by the call to `m.try_lock_shared_for(rel_time)`.

~`shared_lock();`

Effects: If `owns` calls `pm->unlock_shared()`.
shared_lock(shared_lock&& sl) noexcept;

Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to this construction), sl.pm == nullptr and sl.owns == false.

shared_lock& operator=(shared_lock&& sl) noexcept;

Effects: If owns calls pm->unlock_shared().

Postconditions: pm == sl_p.pm and owns == sl_p.owns (where sl_p is the state of sl just prior to this assignment), sl.pm == nullptr and sl.owns == false.

33.6.5.5.3 Locking

void lock();

Effects: As if by pm->lock_shared().

Postconditions: owns == true.

Throws: Any exception thrown by pm->lock_shared(). system_error when an exception is required (33.2.2).

Error conditions:

— operation_not_permitted — if pm is nullptr.

— resource_deadlock_would_occur — if on entry owns is true.

bool try_lock();

Effects: As if by pm->try_lock_shared().

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared().

Returns: The value returned by the call to pm->try_lock_shared().

Throws: Any exception thrown by pm->try_lock_shared(). system_error when an exception is required (33.2.2).

Error conditions:

— operation_not_permitted — if pm is nullptr.

— resource_deadlock_would_occur — if on entry owns is true.

template<class Clock, class Duration>
bool try_lock_until(const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: As if by pm->try_lock_shared_until(abs_time).

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared_until(abs_time).

Returns: The value returned by the call to pm->try_lock_shared_until(abs_time).

Throws: Any exception thrown by pm->try_lock_shared_until(abs_time). system_error when an exception is required (33.2.2).

Error conditions:

— operation_not_permitted — if pm is nullptr.

— resource_deadlock_would_occur — if on entry owns is true.

template<class Rep, class Period>
bool try_lock_for(const chrono::duration<Rep, Period>& rel_time);

Preconditions: Mutex meets the Cpp17SharedTimedLockable requirements (33.2.5.6).

Effects: As if by pm->try_lock_shared_for(rel_time).

Postconditions: owns == res, where res is the value returned by the call to pm->try_lock_shared_for(rel_time).

Returns: The value returned by the call to pm->try_lock_shared_for(rel_time).
Throws: Any exception thrown by \( \text{pm} \rightarrow \text{try\_lock\_shared\_for(rel\_time)} \). system\_error when an exception is required (33.2.2).

Error conditions:

- operation\_not\_permitted — if \( \text{pm} \) is nullptr.
- resource\_deadlock\_would\_occur — if on entry owns is true.

void unlock();

Effects: As if by \( \text{pm} \rightarrow \text{unlock\_shared()} \).

Postconditions: owns == false.

Throws: system\_error when an exception is required (33.2.2).

Error conditions:

- operation\_not\_permitted — if on entry owns is false.

33.6.5.5.4 Modifiers

void swap(shared\_lock& sl) noexcept;

Effects: Swaps the data members of *this and sl.

mutex\_type* release() noexcept;

Postconditions: pm == nullptr and owns == false.

Returns: The previous value of pm.

template<class Mutex>

void swap(shared\_lock<Mutex>& x, shared\_lock<Mutex>& y) noexcept;

Effects: As if by x.swap(y).

33.6.5.5.5 Observers

bool owns\_lock() const noexcept;

Returns: owns.

explicit operator bool() const noexcept;

Returns: owns.

mutex\_type* mutex() const noexcept;

Returns: pm.

33.6.6 Generic locking algorithms

template<class L1, class L2, class... L3> int try\_lock(L1& l1, L2& l2, L3&...);

Preconditions: Each template parameter type meets the Cpp17\_Lockable requirements.

[Note 1: The unique\_lock class template meets these requirements when suitably instantiated. — end note]

Effects: Calls try\_lock() for each argument in order beginning with the first until all arguments have been processed or a call to try\_lock() fails, either by returning false or by throwing an exception. If a call to try\_lock() fails, unlock() is called for all prior arguments with no further calls to try\_lock().

Returns: -1 if all calls to try\_lock() returned true, otherwise a zero-based index value that indicates the argument for which try\_lock() returned false.

template<class L1, class L2, class... L3> void lock(L1& l1, L2& l2, L3&...);

Preconditions: Each template parameter type meets the Cpp17\_Lockable requirements.

[Note 2: The unique\_lock class template meets these requirements when suitably instantiated. — end note]

Effects: All arguments are locked via a sequence of calls to lock(), try\_lock(), or unlock() on each argument. The sequence of calls does not result in deadlock, but is otherwise unspecified.

[Note 3: A deadlock avoidance algorithm such as try-and-back-off can be used, but the specific algorithm is not specified to avoid over-constraining implementations. — end note]
If a call to \texttt{lock()} or \texttt{try\_lock()} throws an exception, \texttt{unlock()} is called for any argument that had been locked by a call to \texttt{lock()} or \texttt{try\_lock()}.

### 33.6.7 Call once

#### 33.6.7.1 Struct \texttt{once\_flag}

```c
namespace std {
  struct once_flag {
    constexpr once_flag() noexcept;
    once_flag(const once_flag&) = delete;
    once_flag& operator=(const once_flag&) = delete;
  };
}
```

1. The class \texttt{once\_flag} is an opaque data structure that \texttt{call\_once} uses to initialize data without causing a data race or deadlock.

```c
constexpr once_flag() noexcept;
```

2. \textit{Synchronization}: The construction of a \texttt{once\_flag} object is not synchronized.

3. \textit{Postconditions}: The object’s internal state is set to indicate to an invocation of \texttt{call\_once} with the object as its initial argument that no function has been called.

#### 33.6.7.2 Function \texttt{call\_once}

```c
template<class Callable, class... Args>
void call_once(once_flag& flag, Callable&& func, Args&&... args);
```

1. \textit{Mandates}: \texttt{is\_invocable\_v<Callable, Args...> is true}.

2. \textit{Effects}: An execution of \texttt{call\_once} that does not call its \texttt{func} is a \textit{passive} execution. An execution of \texttt{call\_once} that calls its \texttt{func} is an \textit{active} execution. An active execution calls \texttt{INVOKE( std::forward<Callable>(func), std::forward<Args>(args)...)}. If such a call to \texttt{func} throws an exception the execution is \textit{exceptional}, otherwise it is \textit{returning}. An exceptional execution propagates the exception to the caller of \texttt{call\_once}. Among all executions of \texttt{call\_once} for any given \texttt{once\_flag}: at most one is a returning execution; if there is a returning execution, it is the last active execution; and there are passive executions only if there is a returning execution.

   [Note 1: Passive executions allow other threads to reliably observe the results produced by the earlier returning execution. — end note]

3. \textit{Synchronization}: For any given \texttt{once\_flag}: all active executions occur in a total order; completion of an active execution synchronizes with (6.9.2) the start of the next one in this total order; and the returning execution synchronizes with the return from all passive executions.

4. \textit{Throws}: \texttt{system\_error} when an exception is required (33.2.2), or any exception thrown by \texttt{func}.

[Example 1:

```c
// global flag, regular function
void init();
std::once_flag flag;

void f() {
  std::call_once(flag, init);
}

// function static flag, function object
struct initializer {
  void operator()(){};
};

void g() {
  static std::once_flag flag2;
  std::call_once(flag2, initializer());
}
```
33.7 Condition variables

33.7.1 General

Condition variables provide synchronization primitives used to block a thread until notified by some other thread that some condition is met or until a system time is reached. Class `condition_variable` provides a condition variable that can only wait on an object of type `unique_lock<mutex>`, allowing the implementation to be more efficient. Class `condition_variable_any` provides a general condition variable that can wait on objects of user-supplied lock types.

Condition variables permit concurrent invocation of the `wait`, `wait_for`, `wait_until`, `notify_one` and `notify_all` member functions.

The executions of `notify_one` and `notify_all` are atomic. The executions of `wait`, `wait_for`, and `wait_until` are performed in three atomic parts:

1. the release of the mutex and entry into the waiting state;
2. the unblocking of the wait; and
3. the reacquisition of the lock.

The implementation behaves as if all executions of `notify_one`, `notify_all`, and each part of the `wait`, `wait_for`, and `wait_until` executions are executed in a single unspecified total order consistent with the “happens before” order.

Condition variable construction and destruction need not be synchronized.

33.7.2 Header `<condition_variable>` synopsis

```cpp
namespace std {
  // 33.7.4, class condition_variable
  class condition_variable;
  // 33.7.5, class condition_variable_any
  class condition_variable_any;
  // 33.7.3, non-member functions
  void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);

  enum class cv_status { no_timeout, timeout };
}
```

33.7.3 Non-member functions

```cpp
void notify_all_at_thread_exit(condition_variable& cond, unique_lock<mutex> lk);
```

**Preconditions:** `lk` is locked by the calling thread and either

1. no other thread is waiting on `cond`, or
2. `lk.mutex()` returns the same value for each of the lock arguments supplied by all concurrently waiting (via `wait`, `wait_for`, or `wait_until`) threads.

**Effects:** Transfers ownership of the lock associated with `lk` into internal storage and schedules `cond` to be notified when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed. This notification is equivalent to:

```cpp
lk.unlock();
cond.notify_all();
```

**Synchronization:** The implied `lk.unlock()` call is sequenced after the destruction of all objects with thread storage duration associated with the current thread.
4  [Note 1: The supplied lock is held until the thread exits, which might cause deadlock due to lock ordering issues. — end note]

5  [Note 2: It is the user’s responsibility to ensure that waiting threads do not erroneously assume that the thread has finished if they experience spurious wakeups. This typically requires that the condition being waited for is satisfied while holding the lock on lk, and that this lock is not released and reacquired prior to calling notify_all_at_thread_exit. — end note]

33.7.4 Class condition_variable

namespace std {
    class condition_variable {
    public:
        condition_variable();
        ~condition_variable();

        condition_variable(const condition_variable&) = delete;
        condition_variable& operator=(const condition_variable&) = delete;

        void notify_one() noexcept;
        void notify_all() noexcept;
        void wait(unique_lock<mutex>& lock);
        template<class Predicate>
            void wait(unique_lock<mutex>& lock, Predicate pred);
        template<class Clock, class Duration>
            cv_status wait_until(unique_lock<mutex>& lock,
                const chrono::time_point<Clock, Duration>& abs_time);
        template<class Clock, class Duration, class Predicate>
            bool wait_until(unique_lock<mutex>& lock,
                const chrono::time_point<Clock, Duration>& abs_time,
                Predicate pred);
        template<class Rep, class Period>
            cv_status wait_for(unique_lock<mutex>& lock,
                const chrono::duration<Rep, Period>& rel_time);
        template<class Rep, class Period, class Predicate>
            bool wait_for(unique_lock<mutex>& lock,
                const chrono::duration<Rep, Period>& rel_time,
                Predicate pred);

        using native_handle_type = implementation-defined;  // see 33.2.3
        native_handle_type native_handle();  // see 33.2.3
    };
}

1  The class condition_variable is a standard-layout class (11.2).

    condition_variable();

    Throws: system_error when an exception is required (33.2.2).

3  Error conditions:

   (3.1)  — resource_unavailable_try_again — if some non-memory resource limitation prevents initial-

        ization.

    ~condition_variable();

    Preconditions: There is no thread blocked on *this.

    [Note 1: That is, all threads have been notified; they can subsequently block on the lock specified in the wait.

       This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the
       notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread
       waits on *this once the destructor has been started, especially when the waiting threads are calling the wait
       functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. — end note]

    void notify_one() noexcept;

5  Effects: If any threads are blocked waiting for *this, unblocks one of those threads.
void notify_all() noexcept;

Effects: Unblocks all threads that are blocked waiting for *this.

void wait(unique_lock<mutex>& lock);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(7.1) no other thread is waiting on this condition_variable object or
(7.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects:
(8.1) Atomically calls lock.unlock() and blocks on *this.
(8.2) When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.
(8.3) The function will unblock when signaled by a call to notify_one() or a call to notify_all(), or
spuriously.

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Throws: Nothing.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Predicate>
void wait(unique_lock<mutex>& lock, Predicate pred);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(12.1) no other thread is waiting on this condition_variable object or
(12.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects: Equivalent to:

while (!pred())
    wait(lock);

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Throws: Any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate() is invoked (14.6.2).
[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Clock, class Duration>
cv_status wait_until(unique_lock<mutex>& lock,
                const chrono::time_point<Clock, Duration>& abs_time);

Preconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread, and either
(17.1) no other thread is waiting on this condition_variable object or
(17.2) lock.mutex() returns the same value for each of the lock arguments supplied by all concurrently
waiting (via wait, wait_for, or wait_until) threads.

Effects:
(18.1) Atomically calls lock.unlock() and blocks on *this.
(18.2) When unblocked, calls lock.lock() (possibly blocking on the lock), then returns.
(18.3) The function will unblock when signaled by a call to notify_one(), a call to notify_all(),
expiration of the absolute timeout (33.2.4) specified by abs_time, or spuriously.
(18.4) If the function exits via an exception, lock.lock() is called prior to exiting the function.

Postconditions: lock.owns_lock() is true and lock.mutex() is locked by the calling thread.

Returns: cv_status::timeout if the absolute timeout (33.2.4) specified by abs_time expired, otherwise
cv_status::no_timeout.

Throws: Timeout-related exceptions (33.2.4).
Remarks: If the function fails to meet the postcondition, \texttt{terminate()} is invoked (14.6.2).

[Note 4: This can happen if the re-locking of the mutex throws an exception. — end note]

\begin{verbatim}
template<class Rep, class Period>
  cv_status wait_for(unique_lock<mutex>& lock,
    const chrono::duration<Rep, Period>& rel_time);
\end{verbatim}

\textbf{Preconditions}: \texttt{lock.owns_lock()} is true and \texttt{lock.mutex()} is locked by the calling thread, and either
\begin{enumerate}
  \item no other thread is waiting on this \texttt{condition_variable} object or
  \item \texttt{lock.mutex()} returns the same value for each of the \texttt{lock} arguments supplied by all concurrently waiting (via \texttt{wait}, \texttt{wait_for}, or \texttt{wait_until}) threads.
\end{enumerate}

\textbf{Effects}: Equivalent to:
\begin{verbatim}
return wait_until(lock, chrono::steady_clock::now() + rel_time);
\end{verbatim}

\textbf{Postconditions}: \texttt{lock.owns_lock()} is true and \texttt{lock.mutex()} is locked by the calling thread.

\textbf{Returns}: \texttt{cv_status::timeout} if the relative timeout (33.2.4) specified by \texttt{rel_time} expired, otherwise \texttt{cv_status::no_timeout}.

\textbf{Throws}: Timeout-related exceptions (33.2.4).

\textbf{Remarks}: If the function fails to meet the postcondition, \texttt{terminate()} is invoked (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

\begin{verbatim}
template<class Clock, class Duration, class Predicate>
  bool wait_until(unique_lock<mutex>& lock,
    const chrono::time_point<Clock, Duration>& abs_time,
    Predicate pred);
\end{verbatim}

\textbf{Preconditions}: \texttt{lock.owns_lock()} is true and \texttt{lock.mutex()} is locked by the calling thread, and either
\begin{enumerate}
  \item no other thread is waiting on this \texttt{condition_variable} object or
  \item \texttt{lock.mutex()} returns the same value for each of the \texttt{lock} arguments supplied by all concurrently waiting (via \texttt{wait}, \texttt{wait_for}, or \texttt{wait_until}) threads.
\end{enumerate}

\textbf{Effects}: Equivalent to:
\begin{verbatim}
while (!pred())
  if (wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
return true;
\end{verbatim}

\textbf{Postconditions}: \texttt{lock.owns_lock()} is true and \texttt{lock.mutex()} is locked by the calling thread.

\textbf{Note 6:} The returned value indicates whether the predicate evaluated to \texttt{true} regardless of whether the timeout was triggered. — end note]

\textbf{Throws}: Timeout-related exceptions (33.2.4) or any exception thrown by \texttt{pred}.

\textbf{Remarks}: If the function fails to meet the postcondition, \texttt{terminate()} is invoked (14.6.2).

[Note 7: This can happen if the re-locking of the mutex throws an exception. — end note]

\begin{verbatim}
template<class Rep, class Period, class Predicate>
  bool wait_for(unique_lock<mutex>& lock,
    const chrono::duration<Rep, Period>& rel_time,
    Predicate pred);
\end{verbatim}

\textbf{Preconditions}: \texttt{lock.owns_lock()} is true and \texttt{lock.mutex()} is locked by the calling thread, and either
\begin{enumerate}
  \item no other thread is waiting on this \texttt{condition_variable} object or
  \item \texttt{lock.mutex()} returns the same value for each of the \texttt{lock} arguments supplied by all concurrently waiting (via \texttt{wait}, \texttt{wait_for}, or \texttt{wait_until}) threads.
\end{enumerate}

\textbf{Effects}: Equivalent to:
\begin{verbatim}
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
\end{verbatim}

\textbf{Postconditions}: \texttt{lock.owns_lock()} is true and \texttt{lock.mutex()} is locked by the calling thread.

\textbf{Note 8:} There is no blocking if \texttt{pred()} is initially \texttt{true}, even if the timeout has already expired. — end note]
39  [Note 9: The returned value indicates whether the predicate evaluates to \texttt{true} regardless of whether the timeout was triggered. — end note]

40  \textit{ Throws:} Timeout-related exceptions (33.2.4) or any exception thrown by \texttt{pred}.

41  \textit{Remarks:} If the function fails to meet the postcondition, \texttt{terminate()} is invoked (14.6.2).

42  [Note 10: This can happen if the re-locking of the mutex throws an exception. — end note]

33.7.5 Class \texttt{condition\_variable\_any} 

33.7.5.1 General

In this subclause 33.7.5, template arguments for template parameters named \texttt{Lock} shall meet the \textit{Cpp17BasicLockable} requirements (33.2.5.2).

[Note 1: All of the standard mutex types meet this requirement. If a type other than one of the standard mutex types or a \texttt{unique\_lock} wrapper for a standard mutex type is used with \texttt{condition\_variable\_any}, any necessary synchronization is assumed to be in place with respect to the predicate associated with the \texttt{condition\_variable\_any} instance. — end note]

namespace std {

  class condition_variable_any {

    public:
      condition_variable_any();
      ~condition_variable_any();
      condition_variable_any(const condition_variable_any&) = delete;
      condition_variable_any& operator=(const condition_variable_any&) = delete;

      void notify_one() noexcept;
      void notify_all() noexcept;

    // 33.7.5.2, noninterruptible waits
    template<class Lock>
      void wait(Lock& lock);
    template<class Lock, class Predicate>
      void wait(Lock& lock, Predicate pred);

    template<class Lock, class Clock, class Duration>
      cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
    template<class Lock, class Clock, class Duration, class Predicate>
      bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time,
                      Predicate pred);
    template<class Lock, class Rep, class Period>
      cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
    template<class Lock, class Rep, class Period, class Predicate>
      bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);

    // 33.7.5.3, interruptible waits
    template<class Lock, class Predicate>
      bool wait(Lock& lock, stop_token stoken, Predicate pred);
    template<class Lock, class Clock, class Duration, class Predicate>
      bool wait_until(Lock& lock, stop_token stoken,
                      const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
    template<class Lock, class Rep, class Period, class Predicate>
      bool wait_for(Lock& lock, stop_token stoken,
                   const chrono::duration<Rep, Period>& rel_time, Predicate pred);
  };

  condition_variable_any();

2  \textit{Throws:} \texttt{bad\_alloc} or \texttt{system\_error} when an exception is required (33.2.2).

3  \textit{Error conditions:}

(3.1) \texttt{resource\_unavailable\_try\_again} — if some non-memory resource limitation prevents initialization.
— operation_not_permitted — if the thread does not have the privilege to perform the operation.

```cpp
~condition_variable_any();
```

**Preconditions:** There is no thread blocked on *this.

*[Note 2: That is, all threads have been notified; they can subsequently block on the lock specified in the wait. This relaxes the usual rules, which would have required all wait calls to happen before destruction. Only the notification to unblock the wait needs to happen before destruction. Undefined behavior ensues if a thread waits on *this once the destructor has been started, especially when the waiting threads are calling the wait functions in a loop or using the overloads of wait, wait_for, or wait_until that take a predicate. — end note]*

```cpp
void notify_one() noexcept;
```

**Effects:** If any threads are blocked waiting for *this, unblocks one of those threads.

```cpp
void notify_all() noexcept;
```

**Effects:** Unblocks all threads that are blocked waiting for *this.

### 33.7.5.2 Noninterruptible waits

**template<class Lock>**

```cpp
void wait(Lock& lock);
```

**Effects:**

1. Atomically calls lock.unlock() and blocks on *this.
2. When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.
3. The function will unblock when signaled by a call to notify_one(), a call to notify_all(), or spuriously.

**Postconditions:** lock is locked by the calling thread.

**Throws:** Nothing.

**Remarks:** If the function fails to meet the postcondition, terminate() is invoked (14.6.2).

*[Note 1: This can happen if the re-locking of the mutex throws an exception. — end note]*

```cpp
template<class Lock, class Predicate>
void wait(Lock& lock, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
while (!pred())
    wait(lock);
```

```cpp
template<class Lock, class Clock, class Duration>
cv_status wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time);
```

**Effects:**

1. Atomically calls lock.unlock() and blocks on *this.
2. When unblocked, calls lock.lock() (possibly blocking on the lock) and returns.
3. The function will unblock when signaled by a call to notify_one(), a call to notify_all(), expiration of the absolute timeout (33.2.4) specified by abs_time, or spuriously.
4. If the function exits via an exception, lock.lock() is called prior to exiting the function.

**Postconditions:** lock is locked by the calling thread.

**Returns:** cv_status::timeout if the absolute timeout (33.2.4) specified by abs_time expired, otherwise cv_status::no_timeout.

**Throws:** Timeout-related exceptions (33.2.4).

**Remarks:** If the function fails to meet the postcondition, terminate() is invoked (14.6.2).

*[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]*

```cpp
template<class Lock, class Rep, class Period>
cv_status wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time);
```

**Effects:** Equivalent to:
```cpp
return wait_until(lock, chrono::steady_clock::now() + rel_time);
```

**Postconditions:** lock is locked by the calling thread.

**Returns:** cv_status::timeout if the relative timeout (33.2.4) specified by rel_time expired, otherwise cv_status::no_timeout.

**Throws:** Timeout-related exceptions (33.2.4).

**Remarks:** If the function fails to meet the postcondition, terminate is invoked (14.6.2).

*[Note 3: This can happen if the re-locking of the mutex throws an exception. — end note]*

```cpp
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
while (!pred())
    if (wait_until(lock, abs_time) == cv_status::timeout)
        return pred();
    return true;
```

*[Note 4: There is no blocking if pred() is initially true, or if the timeout has already expired. — end note]*

*[Note 5: The returned value indicates whether the predicate evaluates to true regardless of whether the timeout was triggered. — end note]*

```cpp
template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, const chrono::duration<Rep, Period>& rel_time, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
return wait_until(lock, chrono::steady_clock::now() + rel_time, std::move(pred));
```

### 33.7.5.3 Interruptible waits

[thread.condvarany.intwait]

The following wait functions will be notified when there is a stop request on the passed stop_token. In that case the functions return immediately, returning false if the predicate evaluates to false.

```cpp
template<class Lock, class Predicate>
bool wait(Lock& lock, stop_token stoken, Predicate pred);
```

**Effects:** Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

```cpp
while (!stoken.stop_requested()) {
    if (pred())
        return true;
    wait(lock);
}
return pred();
```

*[Note 1: The returned value indicates whether the predicate evaluated to true regardless of whether there was a stop request. — end note]*

**Postconditions:** lock is locked by the calling thread.

**Throws:** Any exception thrown by pred.

**Remarks:** If the function fails to meet the postcondition, terminate is called (14.6.2).

*[Note 2: This can happen if the re-locking of the mutex throws an exception. — end note]*

```cpp
template<class Lock, class Clock, class Duration, class Predicate>
bool wait_until(Lock& lock, stop_token stoken,
                const chrono::time_point<Clock, Duration>& abs_time, Predicate pred);
```

**Effects:** Registers for the duration of this call *this to get notified on a stop request on stoken during this call and then equivalent to:

```cpp
while (!stoken.stop_requested()) {
    if (pred())
        return true;
```
if (wait_until(lock, abs_time) == cv_status::timeout)
    return pred();
}
return pred();

[Note 3: There is no blocking if pred() is initially true, stoken.stop_requested() was already true or the timeout has already expired. — end note]

[Note 4: The returned value indicates whether the predicate evaluated to true regardless of whether the timeout was triggered or a stop request was made. — end note]

Postconditions: lock is locked by the calling thread.

Throws: Timeout-related exceptions (33.2.4), or any exception thrown by pred.

Remarks: If the function fails to meet the postcondition, terminate is called (14.6.2).

[Note 5: This can happen if the re-locking of the mutex throws an exception. — end note]

template<class Lock, class Rep, class Period, class Predicate>
bool wait_for(Lock& lock, stop_token stoken,
    const chrono::duration<Rep, Period>& rel_time, Predicate pred);

Effects: Equivalent to:

    return wait_until(lock, std::move(stoken), chrono::steady_clock::now() + rel_time,
    std::move(pred));

### 33.8 Semaphore

#### 33.8.1 General

Semaphores are lightweight synchronization primitives used to constrain concurrent access to a shared resource. They are widely used to implement other synchronization primitives and, whenever both are applicable, can be more efficient than condition variables.

A counting semaphore is a semaphore object that models a non-negative resource count. A binary semaphore is a semaphore object that has only two states. A binary semaphore should be more efficient than the default implementation of a counting semaphore with a unit resource count.

#### 33.8.2 Header <semaphore> synopsis

```cpp
namespace std {
    // 33.8.3, class template counting_semaphore
    template<ptrdiff_t least_max_value = implementation-defined>
    class counting_semaphore;

    using binary_semaphore = counting_semaphore<1>;
}
```

#### 33.8.3 Class template counting_semaphore

```cpp
namespace std {
    template<ptrdiff_t least_max_value = implementation-defined>
    class counting_semaphore {
        public:
            static constexpr ptrdiff_t max() noexcept;
            constexpr explicit counting_semaphore(ptrdiff_t desired);
            ~counting_semaphore();
            void release(ptrdiff_t update = 1);
            void acquire();
            bool try_acquire() noexcept;
            template<class Rep, class Period>
                bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
            template<class Clock, class Duration>
                bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
    }
```

§ 33.8.3
private:
    ptrdiff_t counter;  // exposition only
};

Class template `counting_semaphore` maintains an internal counter that is initialized when the semaphore is created. The counter is decremented when a thread acquires the semaphore, and is incremented when a thread releases the semaphore. If a thread tries to acquire the semaphore when the counter is zero, the thread will block until another thread increments the counter by releasing the semaphore.

`least_max_value` shall be non-negative; otherwise the program is ill-formed.

Concurrent invocations of the member functions of `counting_semaphore`, other than its destructor, do not introduce data races.

```cpp
static constexpr ptrdiff_t max() noexcept;
```

Returns: The maximum value of `counter`. This value is greater than or equal to `least_max_value`.

```cpp
constexpr explicit counting_semaphore(ptrdiff_t desired);
```

**Preconditions:** `desired >= 0` is true, and `desired <= max()` is true.

**Effects:** Initializes `counter` with `desired`.

**Throws:** Nothing.

```cpp
void release(ptrdiff_t update = 1);
```

**Preconditions:** `update >= 0` is true, and `update <= max() - counter` is true.

**Effects:** Atomically execute `counter += update`. Then, unblocks any threads that are waiting for `counter` to be greater than zero.

**Synchronization:** Strongly happens before invocations of `try_acquire` that observe the result of the effects.

**Throws:** `system_error` when an exception is required (33.2.2).

**Error conditions:** Any of the error conditions allowed for mutex types (33.6.4.2).

```cpp
bool try_acquire() noexcept;
```

**Effects:** Attempts to atomically decrement `counter` if it is positive, without blocking. If `counter` is not decremented, there is no effect and `try_acquire` immediately returns. An implementation may fail to decrement `counter` even if it is positive.

[Note 1: This spurious failure is normally uncommon, but allows interesting implementations based on a simple compare and exchange (33.5). — end note]

An implementation should ensure that `try_acquire` does not consistently return `false` in the absence of contending semaphore operations.

**Returns:** `true` if `counter` was decremented, otherwise `false`.

```cpp
void acquire();
```

**Effects:** Repeatedly performs the following steps, in order:

1. Evaluates `try_acquire()`. If the result is `true`, returns.
2. Blocks on `*this` until `counter` is greater than zero.

**Throws:** `system_error` when an exception is required (33.2.2).

**Error conditions:** Any of the error conditions allowed for mutex types (33.6.4.2).

```cpp
template<class Rep, class Period>
bool try_acquire_for(const chrono::duration<Rep, Period>& rel_time);
```

```cpp
template<class Clock, class Duration>
bool try_acquire_until(const chrono::time_point<Clock, Duration>& abs_time);
```

**Effects:** Repeatedly performs the following steps, in order:

1. Evaluates `try_acquire()`. If the result is `true`, returns `true`. 

§ 33.8.3
Blocks on *this until `counter` is greater than zero or until the timeout expires. If it is unblocked by the timeout expiring, returns `false`.

The timeout expires (33.2.4) when the current time is after `abs_time` (for `try_acquire_until`) or when at least `rel_time` has passed from the start of the function (for `try_acquire_for`).

*Throws:* Timeout-related exceptions (33.2.4), or `system_error` when a non-timeout-related exception is required (33.2.2).

*Error conditions:* Any of the error conditions allowed for mutex types (33.6.4.2).

### 33.9 Coordination types

#### 33.9.1 General

Subclause 33.9 describes various concepts related to thread coordination, and defines the coordination types `latch` and `barrier`. These types facilitate concurrent computation performed by a number of threads.

#### 33.9.2 Latches

A latch is a thread coordination mechanism that allows any number of threads to block until an expected number of threads arrive at the latch (via the `count_down` function). The expected count is set when the latch is created. An individual latch is a single-use object; once the expected count has been reached, the latch cannot be reused.

#### 33.9.2.2 Header `<latch>` synopsis

```cpp
namespace std {
    class latch;
}
```

#### 33.9.2.3 Class `latch`

```cpp
namespace std {
    class latch {
        public:
            static constexpr ptrdiff_t max() noexcept;
            constexpr explicit latch(ptrdiff_t expected);
            ~latch();
            latch(const latch&); // exposition only
            latch& operator=(const latch&); // exposition only
            void count_down(ptrdiff_t update = 1);
            bool try_wait() const noexcept;
            void wait() const;
            void arrive_and_wait(ptrdiff_t update = 1);

            private:
                ptrdiff_t counter; // exposition only
    };
}
```

A `latch` maintains an internal counter that is initialized when the latch is created. Threads can block on the latch object, waiting for counter to be decremented to zero.

Concurrent invocations of the member functions of `latch`, other than its destructor, do not introduce data races.

```cpp
static constexpr ptrdiff_t max() noexcept;
```

*Returns:* The maximum value of `counter` that the implementation supports.

```cpp
constexpr explicit latch(ptrdiff_t expected);
```

*Preconditions:* `expected >= 0` is true and `expected <= max()` is true.

*Effects:* Initializes `counter` with `expected`.  

§ 33.9.2.3
void count_down(ptrdiff_t update = 1);

Preconditions: update >= 0 is true, and update <= counter is true.

Effects: Atomically decrements counter by update. If counter is equal to zero, unblocks all threads
blocked on *this.

Synchronization: Strongly happens before the returns from all calls that are unblocked.

Throws: Nothing.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

bool try_wait() const noexcept;

Returns: With very low probability false. Otherwise counter == 0.

void wait() const;

Effects: If counter equals zero, returns immediately. Otherwise, blocks on *this until a call to
count_down that decrements counter to zero.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

void arrive_and_wait(ptrdiff_t update = 1);

Effects: Equivalent to:

count_down(update);
wait();

33.9.3 Barriers

33.9.3.1 General

A barrier is a thread coordination mechanism whose lifetime consists of a sequence of barrier phases, where
each phase allows at most an expected number of threads to block until the expected number of threads
arrive at the barrier.

[Note 1: A barrier is useful for managing repeated tasks that are handled by multiple threads. — end note]

33.9.3.2 Header <barrier> synopsis

namespace std {
    template<class CompletionFunction = see below>
    class barrier;
}

33.9.3.3 Class template barrier

namespace std {
    template<class CompletionFunction = see below>
    class barrier {
    public:
        using arrival_token = see below;

        static constexpr ptrdiff_t max() noexcept;
        constexpr explicit barrier(ptrdiff_t expected,
            CompletionFunction f = CompletionFunction());
        ~barrier();

        barrier(const barrier&) = delete;
        barrier& operator=(const barrier&) = delete;

        [[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
        void wait(arrival_token& arrival) const;
        void arrive_and_wait();
        void arrive_and_drop();
Each barrier phase consists of the following steps:

1. The expected count is decremented by each call to `arrive` or `arrive_and_drop`.
2. When the expected count reaches zero, the phase completion step is run. For the specialization with the default value of the `CompletionFunction` template parameter, the completion step is run as part of the call to `arrive` or `arrive_and_drop` that caused the expected count to reach zero. For other specializations, the completion step is run on one of the threads that arrived at the barrier during the phase.
3. When the completion step finishes, the expected count is reset to what was specified by the `expected` argument to the constructor, possibly adjusted by calls to `arrive_and_drop`, and the next phase starts.

Each phase defines a phase synchronization point. Threads that arrive at the barrier during the phase can block on the phase synchronization point by calling `wait`, and will remain blocked until the phase completion step is run.

The phase completion step that is executed at the end of each phase has the following effects:

1. Invokes the completion function, equivalent to `completion()`.
2. Unblocks all threads that are blocked on the phase synchronization point. The end of the completion step strongly happens before the returns from all calls that were unblocked by the completion step. For specializations that do not have the default value of the `CompletionFunction` template parameter, the behavior is undefined if any of the barrier object’s member functions other than `wait` are called while the completion step is in progress.

Concurrent invocations of the member functions of `barrier`, other than its destructor, do not introduce data races. The member functions `arrive` and `arrive_and_drop` execute atomically.

`CompletionFunction` shall meet the `Cpp17MoveConstructible` (Table 32) and `Cpp17Destructible` (Table 36) requirements. `is_nothrow_invocable_v<CompletionFunction&>` shall be true.

The default value of the `CompletionFunction` template parameter is an unspecified type, such that, in addition to satisfying the requirements of `CompletionFunction`, it meets the `Cpp17DefaultConstructible` requirements (Table 31) and `completion()` has no effects.

`barrier::arrival_token` is an unspecified type, such that it meets the `Cpp17MoveConstructible` (Table 32), `Cpp17MoveAssignable` (Table 34), and `Cpp17Destructible` (Table 36) requirements.

```cpp
static constexpr ptrdiff_t max() noexcept;
```

Returns: The maximum expected count that the implementation supports.

```cpp
constexpr explicit barrier(ptrdiff_t expected, CompletionFunction f = CompletionFunction());
```

Preconditions: `expected` >= 0 is true and `expected` <= `max()` is true.

Effects: Sets both the initial expected count for each barrier phase and the current expected count for the first phase to `expected`. Initializes `completion` with `std::move(f)`. Starts the first phase.

[Note 1: If `expected` is 0 this object can only be destroyed. — end note]

Throws: Any exception thrown by `CompletionFunction`'s move constructor.

```cpp
[[nodiscard]] arrival_token arrive(ptrdiff_t update = 1);
```

Preconditions: `update` > 0 is true, and `update` is less than or equal to the expected count for the current barrier phase.

Effects: Constructs an object of type `arrival_token` that is associated with the phase synchronization point for the current phase. Then, decrements the expected count by `update`.

Synchronization: The call to `arrive` strongly happens before the start of the phase completion step for the current phase.

Returns: The constructed `arrival_token` object.
void wait(arrival_token&& arrival) const;

Preconditions: arrival is associated with the phase synchronization point for the current phase or the immediately preceding phase of the same barrier object.

Effects: Blocks at the synchronization point associated with std::move(arrival) until the phase completion step of the synchronization point's phase is run.

[Note 3: If arrival is associated with the synchronization point for a previous phase, the call returns immediately. — end note]

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

void arrive_and_wait();

Effects: Equivalent to: wait(arrive()).

void arrive_and_drop();

Preconditions: The expected count for the current barrier phase is greater than zero.

Effects: Decrement the initial expected count for all subsequent phases by one. Then decrements the expected count for the current phase by one.

Synchronization: The call to arrive_and_drop strongly happens before the start of the phase completion step for the current phase.

Throws: system_error when an exception is required (33.2.2).

Error conditions: Any of the error conditions allowed for mutex types (33.6.4.2).

[Note 4: This call can cause the completion step for the current phase to start. — end note]

33.10 Futures

33.10.1 Overview

33.10 describes components that a C++ program can use to retrieve in one thread the result (value or exception) from a function that has run in the same thread or another thread.

[Note 1: These components are not restricted to multi-threaded programs but can be useful in single-threaded programs as well. — end note]

33.10.2 Header <future> synopsis

namespace std {
    enum class future_errc {
        broken_promise = implementation-defined,
        future_already_retrieved = implementation-defined,
        promise_already_satisfied = implementation-defined,
        no_state = implementation-defined
    }
    enum class launch : unspecified {
        async = unspecified,
        deferred = unspecified,
        implementation-defined
    }
    enum class future_status {
        ready,
        timeout,
        deferred
    }
};
// 33.10.3, error handling
template<> struct is_error_code_enum<future_errc> : public true_type { };
error_code make_error_code(future_errc e) noexcept;
error_condition make_error_condition(future_errc e) noexcept;

const error_category& future_category() noexcept;

// 33.10.4, class future_error
class future_error;

// 33.10.6, class template promise
template<class R> class promise;
template<class R> class promise<R&>;
template<> class promise<void>;

template<class R>
void swap(promise<R>& x, promise<R>& y) noexcept;

template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc>;

// 33.10.7, class template future
template<class R> class future;
template<class R> class future<R&>;
template<> class future<void>;

// 33.10.8, class template shared_future
template<class R> class shared_future;
template<class R> class shared_future<R&>;
template<> class shared_future<void>;

// 33.10.10, class template packaged_task
template<class R, class... ArgTypes>
class packaged_task<R(ArgTypes...)>
{

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>&, packaged_task<R(ArgTypes...)>&) noexcept;

// 33.10.9, function template async
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(F&& f, Args&&... args);
template<class F, class... Args>
[[nodiscard]] future<invoke_result_t<decay_t<F>, decay_t<Args>...>>
async(launch policy, F&& f, Args&&... args);

1 The enum type launch is a bitmask type (16.3.3.3.4) with elements launch::async and launch::deferred.

[Note 1: Implementations can provide bitmasks to specify restrictions on task interaction by functions launched by
async() applicable to a corresponding subset of available launch policies. Implementations can extend the behavior
of the first overload of async() by adding their extensions to the launch policy under the “as if” rule. — end note]  

2 The enum values of future_errc are distinct and not zero.

33.10.3 Error handling

const error_category& future_category() noexcept;

Returns: A reference to an object of a type derived from class error_category.

The object’s default_error_condition and equivalent virtual functions shall behave as specified for the
class error_category. The object’s name virtual function returns a pointer to the string "future".

§ 33.10.3
error_code make_error_code(future_errc e) noexcept;
3
Returns: error_code(static_cast<int>(e), future_category()).

error_condition make_error_condition(future_errc e) noexcept;
4
Returns: error_condition(static_cast<int>(e), future_category()).

33.10.4 Class future_error [futures.future.error]
namespace std {
    class future_error : public logic_error {
        public:
            explicit future_error(future_errc e);

            const error_code& code() const noexcept;
            const char* what() const noexcept;

        private:
            error_code ec_;         // exposition only
        };
    }

explicit future_error(future_errc e);
1
Effects: Initializes ec_ with make_error_code(e).

const error_code& code() const noexcept;
2
Returns: ec_.

const char* what() const noexcept;
3
Returns: An NTBS incorporating code().message().

33.10.5 Shared state [futures.state]
Many of the classes introduced in subclause 33.10 use some state to communicate results. This shared state consists of some state information and some (possibly not yet evaluated) result, which can be a (possibly void) value or an exception.

[Note 1: Futures, promises, and tasks defined in this Clause reference such shared state. — end note]

[Note 2: The result can be any kind of object including a function to compute that result, as used by async when policy is launch::deferred. — end note]

An asynchronous return object is an object that reads results from a shared state. A waiting function of an asynchronous return object is one that potentially blocks to wait for the shared state to be made ready. If a waiting function can return before the state is made ready because of a timeout (33.2.5), then it is a timed waiting function, otherwise it is a non-timed waiting function.

An asynchronous provider is an object that provides a result to a shared state. The result of a shared state is set by respective functions on the asynchronous provider.

[Note 3: Such as promises or tasks. — end note]

The means of setting the result of a shared state is specified in the description of those classes and functions that create such a state object.

When an asynchronous return object or an asynchronous provider is said to release its shared state, it means:

(5.1) — if the return object or provider holds the last reference to its shared state, the shared state is destroyed; and

(5.2) — the return object or provider gives up its reference to its shared state; and

(5.3) — these actions will not block for the shared state to become ready, except that it may block if all of the following are true: the shared state was created by a call to std::async, the shared state is not yet ready, and this was the last reference to the shared state.

When an asynchronous provider is said to make its shared state ready, it means:

(6.1) — first, the provider marks its shared state as ready; and

(6.2) — second, the provider unblocks any execution agents waiting for its shared state to become ready.

§ 33.10.5 1845
When an asynchronous provider is said to abandon its shared state, it means:

1. first, if that state is not ready, the provider
   - stores an exception object of type `future_error` with an error condition of `broken_promise` within its shared state; and then
2. makes its shared state ready;

---

A shared state is *ready* only if it holds a value or an exception ready for retrieval. Waiting for a shared state to become ready may invoke code to compute the result on the waiting thread if so specified in the description of the class or function that creates the state object.

Calls to functions that successfully set the stored result of a shared state synchronize with (6.9.2) calls to functions successfully detecting the ready state resulting from that setting. The storage of the result (whether normal or exceptional) into the shared state synchronizes with (6.9.2) the successful return from a call to a waiting function on the shared state.

Some functions (e.g., `promise::set_value_at_thread_exit`) delay making the shared state ready until the calling thread exits. The destruction of each of that thread’s objects with thread storage duration (6.7.5.3) is sequenced before making that shared state ready.

Access to the result of the same shared state may conflict (6.9.2).

[Note 4: This explicitly specifies that the result of the shared state is visible in the objects that reference this state in the sense of data race avoidance (16.4.6.10). For example, concurrent accesses through references returned by `shared_future::get()` (33.10.8) must either use read-only operations or provide additional synchronization. — end note]

### 33.10.6 Class template promise

```cpp
namespace std {
    template<class R>
    class promise {
    public:
        promise();
        template<class Allocator>
        promise(allocator_arg_t, const Allocator& a);
        promise(promise&&) noexcept;
        promise(const promise&) = delete;
        ~promise();

        // assignment
        promise& operator=(promise&& rhs) noexcept;
        promise& operator=(const promise&) = delete;
        void swap(promise& other) noexcept;

        // retrieving the result
        future<R> get_future();

        // setting the result
        void set_value(see below);
        void set_exception(exception_ptr p);

        // setting the result with deferred notification
        void set_value_at_thread_exit(see below);
        void set_exception_at_thread_exit(exception_ptr p);
    };

    template<class R, class Alloc>
    struct uses_allocator<promise<R>, Alloc> {
        
    }
}
```

For the primary template, R shall be an object type that meets the `Cpp17Destructible` requirements.
The implementation provides the template promise and two specializations, promise<R&> and promise<void>. These differ only in the argument type of the member functions set_value and set_value_at_thread_exit, as set out in their descriptions, below.

The set_value, set_exception, set_value_at_thread_exit, and set_exception_at_thread_exit member functions behave as though they acquire a single mutex associated with the promise object while updating the promise object.

```cpp
template<class R, class Alloc>
struct uses_allocator<promise<R>, Alloc> : true_type { };
```

Preconditions: Alloc meets the Cpp17Allocator requirements (16.4.4.6.1).

promise();
template<class Allocator>
    promise(allocator_arg_t, const Allocator& a);
Effects: Creates a shared state. The second constructor uses the allocator a to allocate memory for the shared state.

promise(promise&& rhs) noexcept;
Effects: Transfers ownership of the shared state of rhs (if any) to the newly-constructed object.
Postconditions: rhs has no shared state.

~promise();
Effects: Abandons any shared state (33.10.5).
promise& operator=(promise&& rhs) noexcept;
Effects: Abandons any shared state (33.10.5) and then as if promise(std::move(rhs)).swap(*this).
Returns: *this.

void swap(promise& other) noexcept;
Effects: Exchanges the shared state of *this and other.
Postconditions: *this has the shared state (if any) that other had prior to the call to swap. other has the shared state (if any) that *this had prior to the call to swap.

future<R> get_future();
Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to set_value, set_exception, set_value_at_thread_exit, or set_exception_at_thread_exit.
[Note 1: Such calls need not synchronize with each other. — end note]
Returns: A future<R> object with the same shared state as *this.
Threws: future_error if *this has no shared state or if get_future has already been called on a promise with the same shared state as *this.

Error conditions:
(16.1) future_already_retrieved if get_future has already been called on a promise with the same shared state as *this.
(16.2) no_state if *this has no shared state.

void promise::set_value(const R& r);
void promise::set_value(R&& r);
void promise<R&>::set_value(R& r);
void promise<void>::set_value();
Effects: Atomically stores the value r in the shared state and makes that state ready (33.10.5).
Throws:
(18.1) future_error if its shared state already has a stored value or exception, or
(18.2) for the first version, any exception thrown by the constructor selected to copy an object of R, or
void set_exception(exception_ptr p);
Preconditions: p is not null.

Effects: Atomically stores the exception pointer p in the shared state and makes that state ready (33.10.5).

Throws: future_error if its shared state already has a stored value or exception.

Error conditions:
(23.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(23.2) — no_state if *this has no shared state.

Effects: Stores the value r in the shared state without making that state ready immediately. Schedules that state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

Throws:
(25.1) — future_error if its shared state already has a stored value or exception, or
(25.2) — for the first version, any exception thrown by the constructor selected to copy an object of R, or
(25.3) — for the second version, any exception thrown by the constructor selected to move an object of R.

Error conditions:
(26.1) — promise_already_satisfied if its shared state already has a stored value or exception.
(26.2) — no_state if *this has no shared state.

Effects: As if by x.swap(y).

33.10.7 Class template future
[ futures.unique.future ]

The class template future defines a type for asynchronous return objects which do not share their shared state with other asynchronous return objects. A default-constructed future object has no shared state. A future object with shared state can be created by functions on asynchronous providers (33.10.5) or by the move constructor and shares its shared state with the original asynchronous provider. The result (value or exception) of a future object can be set by calling a respective function on an object that shares the same shared state.
2 [Note 1: Member functions of `future` do not synchronize with themselves or with member functions of `shared_future`.]
   —end note]

3 The effect of calling any member function other than the destructor, the move-assignment operator, `share`, or `valid` on a `future` object for which `valid() == false` is undefined.

   [Note 2: It is valid to move from a future object for which `valid() == false`. —end note]

   Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```cpp
namespace std {
    template<class R>
    class future {
        public:
            future() noexcept;
            future(future&&) noexcept;
            future(const future&) = delete;
            future& operator=(const future&) = delete;
            future& operator=(future&&) noexcept;
            shared_future<R> share() noexcept;

            // retrieving the value
            see below get();

            // functions to check state
            bool valid() const noexcept;

            void wait() const;
            template<class Rep, class Period>
                future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
            template<class Clock, class Duration>
                future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    }
}
```

4 For the primary template, `R` shall be an object type that meets the `Cpp17Destructible` requirements.

5 The implementation provides the template `future` and two specializations, `future<R&>` and `future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

   `future()` noexcept;

   Effects: The object does not refer to a shared state.

   Postconditions: `valid() == false`.

   `future(future&& rhs)` noexcept;

   Effects: Move constructs a `future` object that refers to the shared state that was originally referred to by `rhs` (if any).

   Postconditions:
   9(1) — `valid()` returns the same value as `rhs.valid()` prior to the constructor invocation.
   9(2) — `rhs.valid() == false`.

   `~future()`;

   Effects:
   10(1) — Releases any shared state (33.10.5);
   10(2) — destroys *this.

   `future& operator=(future&& rhs)` noexcept;

   Effects:
   11(1) — Releases any shared state (33.10.5).
move assigns the contents of rhs to *this.

Postconditions:

- valid() returns the same value as rhs.valid() prior to the assignment.
- rhs.valid() == false.

12

shared_future<R> share() noexcept;

Postconditions: valid() == false.

Returns: shared_future<R>(std::move(*this)).

13

R future::get();
R& future<R&>::get();
void future<void>::get();

[Note 3: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

Effects:

- wait()s until the shared state is ready, then retrieves the value stored in the shared state;
- releases any shared state (33.10.5).

Postconditions: valid() == false.

Returns:

- future::get() returns the value v stored in the object’s shared state as std::move(v).
- future<R&>::get() returns the reference stored as value in the object’s shared state.
- future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

19

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.

Returns:

- future_status::deferred if the shared state contains a deferred function.
- future_status::ready if the shared state is ready.
- future_status::timeout if the function is returning because the relative timeout (33.2.4) specified by rel_time has expired.

Throws: timeout-related exceptions (33.2.4).

24

template<class Clock, class Duration>
future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by abs_time has expired.

Returns:

- future_status::deferred if the shared state contains a deferred function.
- future_status::ready if the shared state is ready.
- future_status::timeout if the function is returning because the absolute timeout (33.2.4) specified by abs_time has expired.

Throws: timeout-related exceptions (33.2.4).
The class template `shared_future` defines a type for asynchronous return objects which may share their shared state with other asynchronous return objects. A default-constructed `shared_future` object has no shared state. A `shared_future` object with shared state can be created by conversion from a `future` object and shares its shared state with the original asynchronous provider (33.10.5) of the shared state. The result (value or exception) of a `shared_future` object can be set by calling a respective function on an object that shares the same shared state.

[Note 1: Member functions of `shared_future` do not synchronize with themselves, but they synchronize with the shared state. — end note]

The effect of calling any member function other than the destructor, the move-assignment operator, the copy-assignment operator, or `valid()` on a `shared_future` object for which `valid() == false` is undefined. [Note 2: It is valid to copy or move from a `shared_future` object for which `valid()` is false. — end note]

Recommended practice: Implementations should detect this case and throw an object of type `future_error` with an error condition of `future_errc::no_state`.

```
namespace std {
    template<class R>
    class shared_future {
    public:
        shared_future() noexcept;
        shared_future(const shared_future& rhs) noexcept;
        shared_future(future<R>&& rhs) noexcept;
        shared_future(shared_future&& rhs) noexcept;
        ~shared_future();
        shared_future& operator=(const shared_future& rhs) noexcept;
        shared_future& operator=(shared_future&& rhs) noexcept;

        // retrieving the value
        see below get() const;

        // functions to check state
        bool valid() const noexcept;

        void wait() const;
        template<class Rep, class Period>
        future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;
        template<class Clock, class Duration>
        future_status wait_until(const chrono::time_point<Clock, Duration>& abs_time) const;
    };
}
```

For the primary template, `R` shall be an object type that meets the `Cpp17Destructible` requirements.

The implementation provides the template `shared_future` and two specializations, `shared_future<R&>` and `shared_future<void>`. These differ only in the return type and return value of the member function `get`, as set out in its description, below.

```
shared_future() noexcept;
  Effects: The object does not refer to a shared state.
Postconditions: valid() == false.

shared_future(const shared_future& rhs) noexcept;
  Effects: The object refers to the same shared state as rhs (if any).
Postconditions: valid() returns the same value as rhs.valid().

shared_future(future<R>&& rhs) noexcept;
shared_future(shared_future& rhs) noexcept;
  Effects: Move constructs a shared_future object that refers to the shared state that was originally referred to by rhs (if any).
Postconditions:
```

§ 33.10.8  1851
(11.1) — valid() returns the same value as rhs.valid() returned prior to the constructor invocation.
(11.2) — rhs.valid() == false.

~shared_future();

Effects:
(12.1) — Releases any shared state (33.10.5);
(12.2) — destroys *this.

shared_future& operator=(shared_future&& rhs) noexcept;

Effects:
(13.1) — Releases any shared state (33.10.5);
(13.2) — move assigns the contents of rhs to *this.

Postconditions:
(14.1) — valid() returns the same value as rhs.valid() returned prior to the assignment.
(14.2) — rhs.valid() == false.

shared_future& operator=(const shared_future& rhs) noexcept;

Effects:
(15.1) — Releases any shared state (33.10.5);
(15.2) — assigns the contents of rhs to *this.

[Note 3: As a result, *this refers to the same shared state as rhs (if any). — end note]

Postconditions: valid() == rhs.valid().

const R& shared_future::get() const;
R& shared_future<R&>::get() const;
void shared_future<void>::get() const;

[Note 4: As described above, the template and its two required specializations differ only in the return type and return value of the member function get. — end note]

[Note 5: Access to a value object stored in the shared state is unsynchronized, so operations on R might introduce a data race (6.9.2). — end note]

Effects: wait()s until the shared state is ready, then retrieves the value stored in the shared state.

Returns:
(20.1) — shared_future::get() returns a const reference to the value stored in the object’s shared state.

[Note 6: Access through that reference after the shared state has been destroyed produces undefined behavior; this can be avoided by not storing the reference in any storage with a greater lifetime than the shared_future object that returned the reference. — end note]

(20.2) — shared_future<R&>::get() returns the reference stored as value in the object’s shared state.

(20.3) — shared_future<void>::get() returns nothing.

Throws: The stored exception, if an exception was stored in the shared state.

bool valid() const noexcept;

Returns: true only if *this refers to a shared state.

void wait() const;

Effects: Blocks until the shared state is ready.

template<class Rep, class Period>
future_status wait_for(const chrono::duration<Rep, Period>& rel_time) const;

Effects: None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the relative timeout (33.2.4) specified by rel_time has expired.

Returns:
(25.1) — future_status::deferred if the shared state contains a deferred function.
— \texttt{future\_status::ready} if the shared state is ready.

— \texttt{future\_status::timeout} if the function is returning because the relative timeout (33.2.4) specified by \texttt{rel\_time} has expired.

\textit{Throws:} timeout-related exceptions (33.2.4).

\begin{Verbatim}
\texttt{template<class Clock, class Duration>
  future\_status wait\_until(const \texttt{chrono:}\texttt{\_time\_point<Clock, Duration>\& abs\_time}) \texttt{const;}
}\end{Verbatim}

\textit{Effects:} None if the shared state contains a deferred function (33.10.9), otherwise blocks until the shared state is ready or until the absolute timeout (33.2.4) specified by \texttt{abs\_time} has expired.

\textit{Returns:}

— \texttt{future\_status::deferred} if the shared state contains a deferred function.

— \texttt{future\_status::ready} if the shared state is ready.

— \texttt{future\_status::timeout} if the function is returning because the absolute timeout (33.2.4) specified by \texttt{abs\_time} has expired.

\textit{Throws:} timeout-related exceptions (33.2.4).

33.10.9 Function template \texttt{async} \[\text{[futures.async]}\]

The function template \texttt{async} provides a mechanism to launch a function potentially in a new thread and provides the result of the function in a \texttt{future} object with which it shares a shared state.

\begin{Verbatim}
\texttt{template<class F, class... Args>
  [[\text{ndispatch}]] future<\text{invoke\_result\_t<decay\_t<F>, decay\_t<Args>...>>>\text{async}(F\&\& f, Arg\&\&... args);
}
\end{Verbatim}

\textit{Mandates:} The following are all true:

— \texttt{is\_constructible\_v<decay\_t<F>, F>},

— \texttt{(is\_constructible\_v<decay\_t<Args>, Args \&\& ...),} and

— \texttt{is\_invocable\_v<decay\_t<F>, decay\_t<Args>...>}.

\textit{Effects:} The first function behaves the same as a call to the second function with a \texttt{policy} argument of \texttt{launch::async | launch::deferred} and the same arguments for \texttt{F} and \texttt{Args}. The second function creates a shared state that is associated with the returned \texttt{future} object. The further behavior of the second function depends on the \texttt{policy} argument as follows (if more than one of these conditions applies, the implementation may choose any of the corresponding policies):

— If \texttt{launch::async} is set in \texttt{policy}, calls \texttt{invoke(auto(std::forward\_t<F>(f)), auto(std::forward\_t<Args>(args)))...} (22.10.4, 33.4.3.3) as if in a new thread of execution represented by a \texttt{thread} object with the values produced by \texttt{auto} being materialized (7.3.5) in the thread that called \texttt{async}. Any return value is stored as the result in the shared state. Any exception propagated from the execution of \texttt{invoke(auto(std::forward\_t<F>(f)), auto(std::forward\_t<Args>(args)))...} is stored as the exceptional result in the shared state. The \texttt{thread} object is stored in the shared state and affects the behavior of any asynchronous return objects that reference that state.

— If \texttt{launch::deferred} is set in \texttt{policy}, stores \texttt{auto(std::forward\_t<F>(f))} and \texttt{auto(std::forward\_t<Args>(args))...} in the shared state. These copies of \texttt{f} and \texttt{args} constitute a \textit{deferred function}. Invocation of the deferred function evaluates \texttt{invoke(std::move(g), std::move(xyz))} where \texttt{g} is the stored value of \texttt{auto(std::forward\_t<F>(f))} and \texttt{xyz} is the stored copy of \texttt{auto(std::forward\_t<Args>(args))...} Any return value is stored as the result in the shared state. Any exception propagated from the execution of the deferred function is stored as the exceptional result in the shared state. The shared state is not made ready until the function has completed. The first call to a non-timed waiting function (33.10.5) on an asynchronous return object referring to this shared state invokes the deferred function in the thread that called the waiting function. Once evaluation of \texttt{invoke(std::move(g), std::move(xyz))} begins, the function is no longer considered deferred.
Recommended practice: If this policy is specified together with other policies, such as when using a policy value of launch::async | launch::deferred, implementations should defer invocation or the selection of the policy when no more concurrency can be effectively exploited.

If no value is set in the launch policy, or a value is set that is neither specified in this document nor by the implementation, the behavior is undefined.

Synchronization: The invocation of async synchronizes with the invocation of f. The completion of the function f is sequenced before the shared state is made ready.

[Note 1: These apply regardless of the provided policy argument, and even if the corresponding future object is moved to another thread. However, it is possible for f not to be called at all, in which case its completion never happens. —end note]

If the implementation chooses the launch::async policy,

— a call to a waiting function on an asynchronous return object that shares the shared state created by this async call shall block until the associated thread has completed, as if joined, or else time out (33.4.3.6);

— the associated thread completion synchronizes with (6.9.2) the return from the first function that successfully detects the ready status of the shared state or with the return from the last function that releases the shared state, whichever happens first.

Returns: An object of type future<invoke_result_t<decay_t<F>, decay_t<Args>...>> that refers to the shared state created by this call to async.

[Note 2: If a future obtained from async is moved outside the local scope, the future’s destructor can block for the shared state to become ready. —end note]

Throws: system_error if policy == launch::async and the implementation is unable to start a new thread, or std::bad_alloc if memory for the internal data structures cannot be allocated.

Error conditions:

— resource_unavailable_try_again — if policy == launch::async and the system is unable to start a new thread.

[Example 1:

```cpp
int work1(int value);
int work2(int value);
int work(int value) {
    auto handle = std::async([]{ return work2(value); });
    int tmp = work1(value);
    return tmp + handle.get(); // #1
}
```

[Note 3: Line #1 might not result in concurrency because the async call uses the default policy, which might use launch::deferred, in which case the lambda might not be invoked until the get() call; in that case, work1 and work2 are called on the same thread and there is no concurrency. —end note]

— end example]

33.10.10 Class template packaged_task

33.10.10.1 General

The class template packaged_task defines a type for wrapping a function or callable object so that the return value of the function or callable object is stored in a future when it is invoked.

When the packaged_task object is invoked, its stored task is invoked and the result (whether normal or exceptional) stored in the shared state. Any futures that share the shared state will then be able to access the stored result.

```cpp
namespace std {
    template<class> class packaged_task; // not defined

    template<class R, class... ArgTypes>
    class packaged_task<R(ArgTypes...)>
    {
        public:
            // construction and destruction
            packaged_task() noexcept;

    } // packaged_task

} // namespace std
```
template<class F>
    explicit packaged_task(F&& f);

    packaged_task();

    // no copy
    packaged_task(const packaged_task&) = delete;
    packaged_task& operator=(const packaged_task&) = delete;

    // move support
    packaged_task(packaged_task&& rhs) noexcept;
    packaged_task& operator=(packaged_task&& other) noexcept;

    bool valid() const noexcept;

    // result retrieval
    future<R> get_future();

    // execution
    void operator()(ArgTypes...);
    void make_ready_at_thread_exit(ArgTypes...);
    void reset();

    template<class R, class... ArgTypes>
        packaged_task(R (*)(ArgTypes...)) -> packaged_task<R(ArgTypes...)>

    template<class F> packaged_task(F) -> packaged_task<R(ArgTypes...)>

33.10.10.2 Member functions

packaged_task() noexcept;

    Effects: The object has no shared state and no stored task.

template<class F>
    packaged_task(F&& f);

    Constraints: remove_cvref_t<F> is not the same type as packaged_task<R(ArgTypes...)>

    Mandates: is_invocable_r_v<R, F&, ArgTypes...> is true.

    Preconditions: Invoking a copy of f behaves the same as invoking f.

    Effects: Constructs a new packaged_task object with a shared state and initializes the object’s stored task with std::forward<F>(f).

    Throws: Any exceptions thrown by the copy or move constructor of f, or bad_alloc if memory for the internal data structures cannot be allocated.

template<class F> packaged_task(F) -> packaged_task<R(ArgTypes...)>

    Constraints: kF::operator() is well-formed when treated as an unevaluated operand (7.2.3) and either

    (7.1) — F::operator() is a non-static member function and decltype(&F::operator()) is either of the form R(G::*)(A...) cv kopt noexceptopt or of the form R(*)(G, A...) noexceptopt for a type G, or

    (7.2) — F::operator() is a static member function and decltype(&F::operator()) is of the form

    R(*)(A...) noexceptopt.

    Remarks: The deduced type is packaged_task<R(A...)>

    packaged_task(packaged_task&& rhs) noexcept;

    Effects: Transfers ownership of rhs’s shared state to *this, leaving rhs with no shared state. Moves the stored task from rhs to *this.

    Postconditions: rhs has no shared state.
```cpp
packaged_task& operator=(packaged_task&& rhs) noexcept;
11

Effects:
(11.1) — Releases any shared state (33.10.5);
(11.2) — calls packaged_task(std::move(rhs)).swap(*this).

~packaged_task();
12

Effects: Abandons any shared state (33.10.5).

void swap(packaged_task& other) noexcept;
13

Effects: Exchanges the shared states and stored tasks of *this and other.

Postconditions: *this has the same shared state and stored task (if any) as other prior to the call to swap. other has the same shared state and stored task (if any) as *this prior to the call to swap.

bool valid() const noexcept;
15

Returns: true only if *this has a shared state.

future<R> get_future();
16

Synchronization: Calls to this function do not introduce data races (6.9.2) with calls to operator() or make_ready_at_thread_exit.

[Note 1: Such calls need not synchronize with each other. — end note]

Returns: A future object that shares the same shared state as *this.

Throws: A future_error object if an error occurs.

Error conditions:
(19.1) — future_already_retrieved if get_future has already been called on a packaged_task object with the same shared state as *this.
(19.2) — no_state if *this has no shared state.

void operator()(ArgTypes... args);
20

Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (22.10.4), where f is the stored task of *this and t1, t2, ..., tN are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. The shared state of *this is made ready, and any threads blocked in a function waiting for the shared state of *this to become ready are unblocked.

Throws: A future_error exception object if there is no shared state or the stored task has already been invoked.

Error conditions:
(22.1) — promise_already_satisfied if the stored task has already been invoked.
(22.2) — no_state if *this has no shared state.

void make_ready_at_thread_exit(ArgTypes... args);
23

Effects: As if by INVOKE<R>(f, t1, t2, ..., tN) (22.10.4), where f is the stored task and t1, t2, ..., tN are the values in args.... If the task returns normally, the return value is stored as the asynchronous result in the shared state of *this, otherwise the exception thrown by the task is stored. In either case, this is done without making that state ready (33.10.5) immediately. Schedules the shared state to be made ready when the current thread exits, after all objects of thread storage duration associated with the current thread have been destroyed.

Throws: future_error if an error condition occurs.

Error conditions:
(25.1) — promise_already_satisfied if the stored task has already been invoked.
(25.2) — no_state if *this has no shared state.
```
void reset();

26  Effects: As if *this = packaged_task(std::move(f)), where f is the task stored in *this.

[Note 2: This constructs a new shared state for *this. The old state is abandoned (33.10.5). — end note]

27  Throws:

(27.1) — bad_alloc if memory for the new shared state cannot be allocated.
(27.2) — any exception thrown by the move constructor of the task stored in the shared state.
(27.3) — future_error with an error condition of no_state if *this has no shared state.

33.10.10.3 Globals [futures.task.nonmembers]

template<class R, class... ArgTypes>
void swap(packaged_task<R(ArgTypes...)>& x, packaged_task<R(ArgTypes...)>& y) noexcept;

1  Effects: As if by x.swap(y).
Annex A  (informative)
Grammar summary

A.1 General

This summary of C++ grammar is intended to be an aid to comprehension. It is not an exact statement of the language. In particular, the grammar described here accepts a superset of valid C++ constructs. Disambiguation rules (8.9, 9.2, 6.5.2) are applied to distinguish expressions from declarations. Further, access control, ambiguity, and type rules are used to weed out syntactically valid but meaningless constructs.

A.2 Keywords

New context-dependent keywords are introduced into a program by typedef (9.2.4), namespace (9.8.2), class (Clause 11), enumeration (9.7.1), and template (Clause 13) declarations.

typedef-name:
  identifier
  simple-template-id

namespace-name:
  identifier
  namespace-alias

namespace-alias:
  identifier

class-name:
  identifier
  simple-template-id

enum-name:
  identifier

template-name:
  identifier

A.3 Lexical conventions

n-char: one of
  A B C D E F G H I J K L M N O P Q R S T U V W X Y Z
  0 1 2 3 4 5 6 7 8 9
  U+002D HYPHEN-MINUS
  U+0020 SPACE

n-char-sequence:

Annex B  (normative)
Implementation quantities  [implimits]

1 Because computers are finite, C++ implementations are inevitably limited in the size of the programs they can successfully process. Every implementation shall document those limitations where known. This documentation may cite fixed limits where they exist, say how to compute variable limits as a function of available resources, or say that fixed limits do not exist or are unknown.

2 The limits may constrain quantities that include those described below or others. The bracketed number following each quantity is recommended as the minimum for that quantity. However, these quantities are only guidelines and do not determine compliance.

(2.1) — Nesting levels of compound statements (8.4), iteration control structures (8.6), and selection control structures (8.5) [256].
(2.2) — Nesting levels of conditional inclusion (15.2) [256].
(2.3) — Pointer (9.3.4.2), array (9.3.4.5), and function (9.3.4.6) declarators (in any combination) modifying a class, arithmetic, or incomplete type in a declaration [256].
(2.4) — Nesting levels of parenthesized expressions (7.5.3) within a full-expression [256].
(2.5) — Number of characters in an internal identifier (5.10) or macro name (15.6) [1024].
(2.6) — Number of characters in an external identifier (5.10, 6.6) [1024].
(2.7) — External identifiers (6.6) in one translation unit [65536].
(2.8) — Identifiers with block scope declared in one block (6.4.3) [1024].
(2.9) — Structured bindings (9.6) introduced in one declaration [256].
(2.10) — Macro identifiers (15.6) simultaneously defined in one translation unit [65536].
(2.11) — Parameters in one function definition (9.5.1) [256].
(2.12) — Arguments in one function call (7.6.1.3) [256].
(2.13) — Parameters in one macro definition (15.6) [256].
(2.14) — Arguments in one macro invocation (15.6) [256].
(2.15) — Characters in one logical source line (5.2) [65536].
(2.16) — Characters in a string-literal (5.13.5) (after concatenation (5.2)) [65536].
(2.17) — Size of an object (6.7.2) [262144].
(2.18) — Nesting levels for #include files (15.3) [256].
(2.19) — Case labels for a switch statement (8.5.3) (excluding those for any nested switch statements) [16384].
(2.20) — Non-static data members (including inherited ones) in a single class (11.4) [16384].
(2.21) — Lambda-captures in one lambda-expression (7.5.5.3) [256].
(2.22) — Enumeration constants in a single enumeration (9.7.1) [4096].
(2.23) — Levels of nested class definitions (11.4.12) in a single member-specification [256].
(2.24) — Functions registered by atexit() (17.6) [32].
(2.25) — Functions registered by at_quick_exit() (17.6) [32].
(2.26) — Direct and indirect base classes (11.7) [16384].
(2.27) — Direct base classes for a single class (11.7) [1024].
(2.28) — Class members declared in a single member-specification (including member functions) (11.4) [4096].
(2.29) — Final overriding virtual functions in a class, accessible or not (11.7.3) [16384].
(2.30) — Direct and indirect virtual bases of a class (11.7.2) [1024].
(2.31) — Static data members of a class (11.4.9.3) [1024].
(2.32) — Friend declarations in a class (11.8.4) [4096].
(2.33) — Access control declarations in a class (11.8.2) [4096].
(2.34) — Member initializers in a constructor definition (11.9.3) [6144].
(2.35) — initializer-clauses in one braced-init-list (9.4) [16384].
(2.36) — Scope qualifications of one identifier (7.5.4.3) [256].
(2.37) — Nested linkage-specifications (9.11) [1024].
(2.38) — Recursive constexpr function invocations (9.2.6) [512].
(2.39) — Full-expressions evaluated within a core constant expression (7.7) [1 048 576].
(2.40) — Template parameters in a template declaration (13.2) [1024].
(2.41) — Recursively nested template instantiations (13.9.2), including substitution during template argument deduction (13.10.3) [1024].
(2.42) — Handlers per try block (14.4) [256].
(2.43) — Number of placeholders (22.10.15.5) [10].
Annex C  (informative)
Compatibility

C.1  C++ and ISO C++ 2020

C.1.1  General

Subclause C.1 lists the differences between C++ and ISO C++ 2020 (ISO/IEC 14882:2020, Programming Languages — C++), by the chapters of this document.

C.1.2  Clause 5: lexical conventions

1  Affected subclause: 5.10
Change: Previously valid identifiers containing characters not present in UAX #44 properties XID_Start or XID_Continue, or not in Normalization Form C, are now rejected.
Rationale: Prevent confusing characters in identifiers. Requiring normalization of names ensures consistent linker behavior.
Effect on original feature: Some identifiers are no longer well-formed.

2  Affected subclause: 5.13.5
Change: Concatenated string-literals can no longer have conflicting encoding-prefixes.
Rationale: Removal of unimplemented conditionally-supported feature.
Effect on original feature: Concatenation of string-literals with different encoding-prefixes is now ill-formed.
For example:
```cpp
auto c = L"a" U"b";  // was conditionally-supported; now ill-formed
```

C.1.3  Clause 7: expressions

1  Affected subclause: 7.5.4.2
Change: Change move-eligible id-expressions from lvalues to xvalues.
Rationale: Simplify the rules for implicit move.
Effect on original feature: Valid C++ 2020 code that relies on a returned id-expression’s being an lvalue may change behavior or fail to compile. For example:
```cpp
decatype(auto) f(int&& x) { return (x); }  // returns int&&; previously returned int&
int g(int&& x) { return x; }  // ill-formed; previously well-formed
```

2  Affected subclause: 7.6.1.2
Change: Change the meaning of comma in subscript expressions.
Rationale: Enable repurposing a deprecated syntax to support multidimensional indexing.
Effect on original feature: Valid C++ 2020 code that uses a comma expression within a subscript expression may fail to compile. For example:
```cpp
arr[1, 2]  // was equivalent to arr[(1, 2)],
// now equivalent to arr.operator[](1, 2) or ill-formed
```

C.1.4  Clause 9: declarations

1  Affected subclause: 9.4.3
Change: UTF-8 string literals may initialize arrays of char or unsigned char.
Rationale: Compatibility with previously written code that conformed to previous versions of this document.
Effect on original feature: Arrays of char or unsigned char may now be initialized with a UTF-8 string literal. This can affect initialization that includes arrays that are directly initialized within class types, typically aggregates. For example:
```cpp
struct A {
    char8_t s[10];
};
struct B {
    char s[10];
};
```
void f(A);
void f(B);

int main()
{
    f(u8""); // ambiguous
}

C.1.5 Clause 13: templates [diff.cpp20.temp]

Affected subclause: 13.10.3.6

Change: Deducing template arguments from exception specifications.

Rationale: Facilitate generic handling of throwing and non-throwing functions.

Effect on original feature: Valid ISO C++ 2020 code may be ill-formed in this revision of C++. For example:

```cpp
template<bool> struct A { }
template<bool B> void f(void (*)(A<B>) noexcept(B));
void g(A<false>) noexcept;
void h()
{
    f(g);
    // ill-formed; previously well-formed
}
```

C.1.6 Clause 16: library introduction [diff.cpp20.library]

Affected subclause: 16.4.2.3

Change: New headers.

Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<expected>` (22.8.2), `<stdatomic.h>` (33.5.12), `<spanstream>` (31.9.2), and `<stacktrace>` (19.6.2). Valid C++ 2020 code that `#include`s headers with these names may be invalid in this revision of C++.

C.1.7 Clause 18: concepts library [diff.cpp20.concepts]

Affected subclauses: 17.12.4, 18.5.4, and 18.5.5

Change: Replace `common_reference_with` in `three_way_comparable_with`, `equality_comparable_with`, and `totally_ordered_with` with an exposition-only concept.

Rationale: Allow uncopyable, but movable, types to model these concepts.

Effect on original feature: Valid C++ 2020 code relying on subsumption with `common_reference_with` may fail to compile in this revision of C++. For example:

```cpp
template<class T, class U>
    requires equality_comparable_with<T, U>
    bool attempted_equals(const T&, const U& u); // previously selected overload

template<class T, class U>
    requires common_reference_with<remove_reference_t<T>&, remove_reference_t<U>&>
    bool attempted_equals(const T& t, const U& u); // ambiguous overload; previously rejected by partial ordering

bool test(shared_ptr<int> p) {
    return attempted_equals(p, nullptr); // ill-formed; previously well-formed
}
```

C.1.8 Clause 22: general utilities library [diff.cpp20.utilities]

Affected subclause: 22.14

Change: Signature changes: `format`, `format_to`, `vformat_to`, `format_to_n`, `formatted_size`. Removal of `format_args_t`.

Rationale: Improve safety via compile-time format string checks, avoid unnecessary template instantiations.

Effect on original feature: Valid C++ 2020 code that contained errors in format strings or relied on previous format string signatures or `format_args_t` may become ill-formed. For example:

```cpp
class S
{
    void f() {
        auto s = std::format("\"{}\"", "I am not a number"); // ill-formed,
        // previously threw format_error
    }
};
```
Effect on original feature: Valid C++ 2020 code that passes bit fields to formatting functions may become ill-formed. For example:

```cpp
struct tiny {
  int bit: 1;
};

auto t = tiny();
std::format("{}", t.bit);  // ill-formed, previously returned "0"
```

C.1.9 Clause 23: strings library

Affected subclause: 23.4

Change: Additional rvalue overload for the `substr` member function and the corresponding constructor.

Rationale: Improve efficiency of operations on rvalues.

Effect on original feature: Valid C++ 2020 code that created a substring by calling `substr` (or the corresponding constructor) on an xvalue expression with type `S` that is a specialization of `basic_string` may change meaning in this revision of C++. For example:

```cpp
std::string s1 = "some long string that forces allocation", s2 = s1;
std::move(s1).substr(10, 5);
assert(s1 == s2);  // unspecified, previously guaranteed to be true
std::string s3(std::move(s2), 10, 5);
assert(s1 == s2);  // unspecified, previously guaranteed to be true
```

C.1.10 Clause 24: containers library

Affected subclauses: 24.2.7 and 24.2.8

Change: Heterogeneous `extract` and `erase` overloads for associative containers.

Rationale: Improve efficiency of erasing elements from associative containers.

Effect on original feature: Valid C++ 2020 code may fail to compile in this revision of C++. For example:

```cpp
struct B {
  auto operator<=>(const B&) const = default;
};

struct D : private B {
  void f(std::set<B, std::less<>>& s) {
    s.erase(*this);  // ill formed; previously well-formed
  }
};
```

C.2 C++ and ISO C++ 2017

C.2.1 General

Subclause C.2 lists the differences between C++ and ISO C++ 2017 (ISO/IEC 14882:2017, Programming Languages — C++), by the chapters of this document.

C.2.2 Clause 5: lexical conventions

Affected subclauses: 5.4, 10.1, 10.3, 15.1, 15.4, and 15.5

Change: New identifiers with special meaning.

Rationale: Required for new features.

Effect on original feature: Logical lines beginning with `module` or `import` may be interpreted differently in this revision of C++. For example:

```cpp
class module {};
module m1;  // was variable declaration; now module-declaration
module *m2;  // variable declaration

class import {};
import j1;  // was variable declaration; now module-import-declaration
::import j2;  // variable declaration
```

Affected subclause: 5.8

Change: `header-name` tokens are formed in more contexts.
Rationale: Required for new features.

Effect on original feature: When the identifier import is followed by a < character, a header-name token may be formed. For example:

```cpp
#include<typename>

import<int> f(); // ill-formed; previously well-formed
::import<int> g(); // OK
```

3 Affected subclause: 5.11
Change: New keywords.
Rationale: Required for new features.

- The char8_t keyword is added to differentiate the types of ordinary and UTF-8 literals (5.13.5).
- The concept keyword is added to enable the definition of concepts (13.7.9).
- The consteval keyword is added to declare immediate functions (9.2.6).
- The constinit keyword is added to prevent unintended dynamic initialization (9.2.7).
- The co_await, co_yield, and co_return keywords are added to enable the definition of coroutines (9.5.4).
- The requires keyword is added to introduce constraints through a requires-clause (13.1) or a requires-expression (7.5.7).

Effect on original feature: Valid C++ 2017 code using char8_t, concept, consteval, constinit, co_await, co_yield, co_return, or requires as an identifier is not valid in this revision of C++.

4 Affected subclause: 5.12
Change: New operator <=>
Rationale: Necessary for new functionality.

Effect on original feature: Valid C++ 2017 code that contains a <= token immediately followed by a > token may be ill-formed or have different semantics in this revision of C++. For example:

```cpp
namespace N {
    struct X {
    
        bool operator<=(X, X);
        template<bool(X, X)> struct Y {}
        Y operator<=> y; // ill-formed; previously well-formed
    }
}
```

5 Affected subclause: 5.13
Change: Type of UTF-8 string and character literals.
Rationale: Required for new features. The changed types enable function overloading, template specialization, and type deduction to distinguish ordinary and UTF-8 string and character literals.

Effect on original feature: Valid C++ 2017 code that depends on UTF-8 string literals having type “array of const char” and UTF-8 character literals having type “char” is not valid in this revision of C++. For example:

```cpp
const auto *u8s = u8"text"; // u8s previously deduced as const char*; now deduced as const char8_t*
const char *ps = u8s; // ill-formed; previously well-formed

auto u8c = u8'c'; // u8c previously deduced as char; now deduced as char8_t
char *pc = &u8c; // ill-formed; previously well-formed

std::string s = u8"text"; // ill-formed; previously well-formed

void f(const char *s);
f(u8"text"); // ill-formed; previously well-formed

template<typename> struct ct;
template<> struct ct<char> {
    using type = char;
};
t<decltype(u8'c')>::type x; // ill-formed; previously well-formed.

§ C.2.2 1885
C.2.3 Clause 6: basics

1

Affected subclause: 6.7.3
Change: A pseudo-destructor call ends the lifetime of the object to which it is applied.
Rationale: Increase consistency of the language model.
Effect on original feature: Valid ISO C++ 2017 code may be ill-formed or have undefined behavior in this revision of C++. For example:

```cpp
int f() {
    int a = 123;
    using T = int;
    a.-T();
    return a;       // undefined behavior; previously returned 123
}
```

2

Affected subclause: 6.9.2.2
Change: Except for the initial release operation, a release sequence consists solely of atomic read-modify-write operations.
Rationale: Removal of rarely used and confusing feature.
Effect on original feature: If a `memory_order_release` atomic store is followed by a `memory_order_-relaxed` store to the same variable by the same thread, then reading the latter value with a `memory_order_-acquire` load no longer provides any “happens before” guarantees, even in the absence of intervening stores by another thread.

C.2.4 Clause 7: expressions

1

Affected subclause: 7.5.5.3
Change: Implicit lambda capture may capture additional entities.
Rationale: Rule simplification, necessary to resolve interactions with constexpr if.
Effect on original feature: Lambdas with a `capture-default` may capture local entities that were not captured in C++ 2017 if those entities are only referenced in contexts that do not result in an odr-use.

C.2.5 Clause 9: declarations

1

Affected subclause: 9.2.4
Change: Unnamed classes with a typedef name for linkage purposes can contain only C-compatible constructs.
Rationale: Necessary for implementability.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++. For example:

```cpp
typedef struct {
    void f() {}
} S;
```

2

Affected subclause: 9.3.4.7
Change: A function cannot have different default arguments in different translation units.
Rationale: Required for modules support.
Effect on original feature: Valid C++ 2017 code may be ill-formed in this revision of C++, with no diagnostic required. For example:

```cpp
// Translation unit 1
int f(int a = 42);
int g() { return f(); }  

// Translation unit 2
int f(int a = 76) { return a; }           // ill-formed, no diagnostic required; previously well-formed
int g();
int main() { return g(); }               // used to return 42
```

3

Affected subclause: 9.4.2
Change: A class that has user-declared constructors is never an aggregate.
Rationale: Remove potentially error-prone aggregate initialization which may apply notwithstanding the declared constructors of a class.
Effect on original feature: Valid C++ 2017 code that aggregate-initializes a type with a user-declared constructor may be ill-formed or have different semantics in this revision of C++. For example:
struct A {                                // not an aggregate; previously an aggregate
    A() = delete;
};

struct B {                                // not an aggregate; previously an aggregate
    B() = default;
    int i = 0;
};

struct C {                                // not an aggregate; previously an aggregate
    C(C&&) = default;
    int a, b;
};

A a{};                                    // ill-formed; previously well-formed
B b = {1};                                 // ill-formed; previously well-formed
auto* c = new C{2, 3};                    // ill-formed; previously well-formed

struct Y;

struct X {
    operator Y();
};

struct Y {                                // not an aggregate; previously an aggregate
    Y(const Y&) = default;
    X x;
};

Y y{};                                    // copy constructor call; previously aggregate-initialization

4 Affected subclause: 9.4.5
Change: Boolean conversion from a pointer or pointer-to-member type is now a narrowing conversion.
Rationale: Catches bugs.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
bool y[] = { "bc" };                  // ill-formed; previously well-formed
```

C.2.6 Clause 11: classes [diff.cpp17.class]

1 Affected subclauses: 11.4.5 and 11.4.8.3
Change: The class name can no longer be used parenthesized immediately after an explicit decl-specifier in a constructor declaration. The conversion-function-id can no longer be used parenthesized immediately after an explicit decl-specifier in a conversion function declaration.
Rationale: Necessary for new functionality.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
struct S {
    explicit (S)(const S&);                    // ill-formed; previously well-formed
    explicit (operator int)();                // ill-formed; previously well-formed
    explicit(true) (S)(int);                  // OK
};
```

2 Affected subclauses: 11.4.5 and 11.4.7
Change: A simple-template-id is no longer valid as the declarator-id of a constructor or destructor.
Rationale: Remove potentially error-prone option for redundancy.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:

```cpp
template<class T>
struct A {
    A<T>();                                // error: simple-template-id not allowed for constructor
    A<int>();                               // OK, injected-class-name used
    "A<T>();                                 // error: simple-template-id not allowed for destructor
};
```

3 Affected subclause: 11.9.6
Change: A function returning an implicitly movable entity may invoke a constructor taking an rvalue
reference to a type different from that of the returned expression. Function and catch-clause parameters can be thrown using move constructors.

**Rationale:** Side effect of making it easier to write more efficient code that takes advantage of moves.

**Effect on original feature:** Valid C++ 2017 code may fail to compile or have different semantics in this revision of C++. For example:

```cpp
struct base {
    base();
    base(base const &);  // error: base(base &&) is private
    base(base &&);        // error: base(base &&) is private
private:
    base(base &&);
};

struct derived : base {};

base f(base b) {
    throw b;
    derived d;
    return d;            // error: base(base &&) is private
}

struct S {
    S(const char *s) : m(s) { }
    S(const S&) = default;
    S(S&& other) : m(other.m) { other.m = nullptr; }
    const char * m;
};

S consume(S&& s) { return s; }

void g() {
    S s("text");
    consume(static_cast<S&&>(s));
    char c = *s.m;          // undefined behavior; previously ok
}
```

### C.2.7 Clause 12: overloading

**Affected subclause:** 12.2.2.3

**Change:** Equality and inequality expressions can now find reversed and rewritten candidates.

**Rationale:** Improve consistency of equality with three-way comparison and make it easier to write the full complement of equality operations.

**Effect on original feature:** For certain pairs of types where one is convertible to the other, equality or inequality expressions between an object of one type and an object of the other type invoke a different operator. Also, for certain types, equality or inequality expressions between two objects of that type become ambiguous. For example:

```cpp
struct A {
    operator int() const;
};

bool operator==(A, int);       // #1
// #2 is built-in candidate: bool operator==(int, int);
// #3 is built-in candidate: bool operator!=(int, int);

int check(A x, A y) {
    return (x == y) +           // ill-formed; previously well-formed
        (10 == x) +           // calls #1, previously selected #2
        (10 != x);           // calls #1, previously selected #3
}
```

### C.2.8 Clause 13: templates

**Affected subclause:** 13.3

**Change:** An *unqualified-id* that is followed by a `<` and for which name lookup finds nothing or finds a
function will be treated as a template-name in order to potentially cause argument dependent lookup to be performed.

**Rationale:** It was problematic to call a function template with an explicit template argument list via argument dependent lookup because of the need to have a template with the same name visible via normal lookup.

**Effect on original feature:** Previously valid code that uses a function name as the left operand of a < operator would become ill-formed. For example:

```cpp
struct A {};
bool operator<(void (*fp)(), A);
void f() {}
int main() {
    A a;
    f < a;  // ill-formed; previously well-formed
    (f) < a;  // still well formed
}
```

C.2.9 Clause 14: exception handling

Affected subclause: 14.5
Change: Remove throw() exception specification.
**Rationale:** Removal of obsolete feature that has been replaced by noexcept.
**Effect on original feature:** A valid C++ 2017 function declaration, member function declaration, function pointer declaration, or function reference declaration that uses throw() for its exception specification will be rejected as ill-formed in this revision of C++ 2017. It should simply be replaced with noexcept for no change of meaning since C++ 2017.

[Note 1: There is no way to write a function declaration that is non-throwing in this revision of C++ and is also non-throwing in C++ 2003 except by using the preprocessor to generate a different token sequence in each case. — end note]

C.2.10 Clause 16: library introduction

Affected subclause: 16.4.2.3
Change: New headers.
**Rationale:** New functionality.
**Effect on original feature:** The following C++ headers are new: <barrier> (33.9.3.2), <bit> (22.15.2), <charconv> (22.13.1), <compare> (17.12.1), <concepts> (18.3), <coroutine> (17.13.2), <format> (22.14.1), <latch> (33.9.2.2), <numbers> (28.8.1), <ranges> (26.2), <semaphore> (33.8.2), <source_location> (17.9.1), <span> (24.7.2), <stop_token> (33.3.2), <syncstream> (31.11.1), and <version> (17.3.1). Valid C++ 2017 code that #include:s headers with these names may be invalid in this revision of C++.

2 Affected subclause: 16.4.2.3
Change: Remove vacuous C++ header files.
**Rationale:** The empty headers implied a false requirement to achieve C compatibility with the C++ headers.
**Effect on original feature:** A valid C++ 2017 program that #includes any of the following headers may fail to compile: <complex>, <ciso646>, <cstlalign>, <cstddef>, and <ctgmath>. To retain the same behavior:

1. a #include of <complex> can be replaced by a #include of <complex>
2. a #include of <ctgmath> can be replaced by a #include of <cmath> and a #include of <complex>, and
3. a #include of <ciso646>, <cstlalign>, or <cstddef> can simply be removed.

C.2.11 Clause 24: containers library

Affected subclauses: 24.3.9 and 24.3.10
Change: Return types of remove, remove_if, and unique changed from void to container::size_type.
**Rationale:** Improve efficiency and convenience of finding number of removed elements.
**Effect on original feature:** Code that depends on the return types might have different semantics in this revision of C++. Translation units compiled against this version of C++ may be incompatible with translation units compiled against C++ 2017, either failing to link or having undefined behavior.
C.2.12 Clause 25: iterators library

Affected subclause: 25.3.2.3
Change: The specialization of `iterator_traits` for `void*` and for function pointer types no longer contains any nested typedefs.
Rationale: Corrects an issue misidentifying pointer types that are not incrementable as iterator types.
Effect on original feature: A valid C++ 2017 program that relies on the presence of the typedefs may fail to compile, or have different behavior.

C.2.13 Clause 27: algorithms library

Affected subclause: 27.2
Change: The number and order of deducible template parameters for algorithm declarations is now unspecified, instead of being as-declared.
Rationale: Increase implementor freedom and allow some function templates to be implemented as function objects with templated call operators.
Effect on original feature: A valid C++ 2017 program that passes explicit template arguments to algorithms not explicitly specified to allow such in this version of C++ may fail to compile or have undefined behavior.

C.2.14 Clause 31: input/output library

Affected subclause: 31.7.5.3.3
Change: Character array extraction only takes array types.
Rationale: Increase safety via preventing buffer overflow at compile time.
Effect on original feature: Valid C++ 2017 code may fail to compile in this revision of C++. For example:
```cpp
auto p = new char[100];
char q[100];
std::cin >> std::setw(20) >> p;       // ill-formed; previously well-formed
std::cin >> std::setw(20) >> q;       // OK
```

Affected subclause: 31.7.6.3.4
Change: Overload resolution for ostream inserters used with UTF-8 literals.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2017 code that passes UTF-8 literals to `basic_ostream<char, ...>::operator<<` is now ill-formed. For example:
```cpp
std::cout << u8"text";         // previously called operator<<(const char*) and printed a string;
// now ill-formed
std::cout << u8'X';           // previously called operator<<(char) and printed a character;
// now ill-formed
```

Affected subclause: 31.7.6.3.4
Change: Overload resolution for ostream inserters used with `wchar_t`, `char16_t`, or `char32_t` types.
Rationale: Removal of surprising behavior.
Effect on original feature: Valid C++ 2017 code that passes `wchar_t`, `char16_t`, or `char32_t` characters or strings to `basic_ostream<char, ...>::operator<<` or that passes `char16_t` or `char32_t` characters or strings to `basic_ostream<wchar_t, ...>::operator<<` is now ill-formed. For example:
```cpp
std::cout << u"text";         // previously formatted the string as a pointer value;
// now ill-formed
std::cout << u'X';            // previously formatted the character as an integer value;
// now ill-formed
```

Affected subclause: 31.12.6
Change: Return type of filesystem path format observer member functions.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2017 code that depends on the `u8string()` and `generic_u8string()` member functions of `std::filesystem::path` returning `std::string` is not valid in this revision of C++. For example:
```cpp
std::filesystem::path p;
std::string s1 = p.u8string();       // ill-formed; previously well-formed
std::string s2 = p.generic_u8string(); // ill-formed; previously well-formed
```
C.2.15 Annex D: compatibility features

1 Change: Remove uncaught_exception.
Rationale: The function did not have a clear specification when multiple exceptions were active, and has been superseded by uncaught_exceptions.
Effect on original feature: A valid C++ 2017 program that calls std::uncaught_exception may fail to compile. It can be revised to use std::uncaught_exceptions instead, for clear and portable semantics.

2 Change: Remove support for adaptable function API.
Rationale: The deprecated support relied on a limited convention that could not be extended to support the general case or new language features. It has been superseded by direct language support with decltype, and by the std::bind and std::not_fn function templates.
Effect on original feature: A valid C++ 2017 program that relies on the presence of result_type, argument_type, first_argument_type, or second_argument_type in a standard library class may fail to compile. A valid C++ 2017 program that calls not1 or not2, or uses the class templates unary_negate or binary_negate, may fail to compile.

3 Change: Remove redundant members from std::allocator.
Rationale: std::allocator was overspecified, encouraging direct usage in user containers rather than relying on std::allocator_traits, leading to poor containers.
Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

4 Change: Remove raw_storage_iterator.
Rationale: The iterator encouraged use of potentially-throwing algorithms, but did not return the number of elements successfully constructed, as would be necessary to destroy them.
Effect on original feature: A valid C++ 2017 program that uses this iterator class may fail to compile.

5 Change: Remove temporary buffers API.
Rationale: The temporary buffer facility was intended to provide an efficient optimization for small memory requests, but there is little evidence this was achieved in practice, while requiring the user to provide their own exception-safe wrappers to guard use of the facility in many cases.
Effect on original feature: A valid C++ 2017 program that calls get_temporary_buffer or return_temporary_buffer may fail to compile.

6 Change: Remove shared_ptr::unique.
Rationale: The result of a call to this member function is not reliable in the presence of multiple threads and weak pointers. The member function use_count is similarly unreliable, but has a clearer contract in such cases, and remains available for well defined use in single-threaded cases.
Effect on original feature: A valid C++ 2017 program that calls unique on a shared_ptr object may fail to compile.

7 Affected subclause: D.15
Change: Remove deprecated type traits.
Rationale: The traits had unreliable or awkward interfaces. The is_literal_type trait provided no way to detect which subset of constructors and member functions of a type were declared constexpr. The result_of trait had a surprising syntax that did not directly support function types. It has been superseded by the invoke_result trait.
Effect on original feature: A valid C++ 2017 program that relies on the is_literal_type or result_of type traits, on the is_literal_type_v variable template, or on the result_of_t alias template may fail to compile.

C.3 C++ and ISO C++ 2014

C.3.1 General

1 Subclause C.3 lists the differences between C++ and ISO C++ 2014 (ISO/IEC 14882:2014, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.3.2 Clause 5: lexical conventions

1 Affected subclause: 5.2
Change: Removal of trigraph support as a required feature.
Rationale: Prevents accidental uses of trigraphs in non-raw string literals and comments.
Effect on original feature: Valid C++ 2014 code that uses trigraphs may not be valid or may have different semantics in this revision of C++. Implementations may choose to translate trigraphs as specified in C++ 2014 if they appear outside of a raw string literal, as part of the implementation-defined mapping from input source file characters to the translation character set.

2 Affected subclause: 5.9
Change: pp-number can contain p sign and P sign.
Rationale: Necessary to enable hexadecimal-floating-point-literals.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. Specifically, character sequences like 0p+0 and 0e1_p+0 are three separate tokens each in C++ 2014, but one single token in this revision of C++. For example:

```
#define F(a) b ## a
int b0p = F(0p+0);
// ill-formed; equivalent to “int b0p = b0p + 0;” in C++ 2014
```

C.3.3 Clause 7: expressions [diff.cpp14.expr]

1 Affected subclauses: 7.6.1.6 and 7.6.2.3
Change: Remove increment operator with bool operand.
Rationale: Obsolete feature with occasionally surprising semantics.
Effect on original feature: A valid C++ 2014 expression utilizing the increment operator on a bool lvalue is ill-formed in this revision of C++.

2 Affected subclauses: 7.6.2.8 and 7.6.2.9
Change: Dynamic allocation mechanism for over-aligned types.
Rationale: Simplify use of over-aligned types.
Effect on original feature: In C++ 2014 code that uses a new-expression to allocate an object with an over-aligned class type, where that class has no allocation functions of its own, ::operator new(std::size_t) is used to allocate the memory. In this revision of C++, ::operator new(std::size_t, std::align_val_t) is used instead.

C.3.4 Clause 9: declarations [diff.cpp14.dcl.dcl]

1 Affected subclause: 9.2.2
Change: Removal of register storage-class-specifier.
Rationale: Enable repurposing of deprecated keyword in future revisions of C++.
Effect on original feature: A valid C++ 2014 declaration utilizing the register storage-class-specifier is ill-formed in this revision of C++. The specifier can simply be removed to retain the original meaning.

2 Affected subclause: 9.2.9.6
Change: auto deduction from braced-init-list.
Rationale: More intuitive deduction behavior.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```
auto x1{1}; // was std::initializer_list<int>, now int
auto x2{1, 2}; // was std::initializer_list<int>, now ill-formed
```

3 Affected subclause: 9.3.4.6
Change: Make exception specifications be part of the type system.
Rationale: Improve type-safety.
Effect on original feature: Valid C++ 2014 code may fail to compile or change meaning in this revision of C++. For example:

```
void g1() noexcept;
void g2();
template<class T> int f(T *, T *);
int x = f(g1, g2); // ill-formed; previously well-formed
```

4 Affected subclause: 9.4.2
Change: Definition of an aggregate is extended to apply to user-defined types with base classes.
Rationale: To increase convenience of aggregate initialization.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++; initialization from an empty initializer list will perform aggregate initialization instead of invoking a default constructor for the affected types. For example:

```
struct derived;
```
struct base {
    friend struct derived;
private:
    base();
};
struct derived : base {}

derived d1{}; // error; the code was well-formed in C++ 2014
derived d2;  // still OK

C.3.5 Clause 11: classes

Affected subclause: 11.9.4
Change: Inheriting a constructor no longer injects a constructor into the derived class.
Rationale: Better interaction with other language features.
Effect on original feature: Valid C++ 2014 code that uses inheriting constructors may not be valid or may have different semantics. A using-declaration that names a constructor now makes the corresponding base class constructors visible to initializations of the derived class rather than declaring additional derived class constructors. For example:

```cpp
struct A {
    template<typename T> A(T, typename T::type = 0);
    A(int);
};
struct B : A {
    using A::A;
    B(int);
};
B b(42L); // now calls B(int), used to call B<long>(long), // which called A(int) due to substitution failure // in A<long>(long).
```

C.3.6 Clause 13: templates

Affected subclause: 13.10.3.6
Change: Allowance to deduce from the type of a non-type template argument.
Rationale: In combination with the ability to declare non-type template arguments with placeholder types, allows partial specializations to decompose from the type deduced for the non-type template argument.
Effect on original feature: Valid C++ 2014 code may fail to compile or produce different results in this revision of C++. For example:

```cpp
template <int N> struct A;
template <typename T, T N> int foo(A<N> *) = delete;
void foo(void *);
void bar(A<0> *p) {
    foo(p); // ill-formed; previously well-formed
}
```

C.3.7 Clause 14: exception handling

Affected subclause: 14.5
Change: Remove dynamic exception specifications.
Rationale: Dynamic exception specifications were a deprecated feature that was complex and brittle in use. They interacted badly with the type system, which became a more significant issue in this revision of C++ where (non-dynamic) exception specifications are part of the function type.
Effect on original feature: A valid C++ 2014 function declaration, member function declaration, function pointer declaration, or function reference declaration, if it has a potentially throwing dynamic exception specification, is rejected as ill-formed in this revision of C++. Violating a non-throwing dynamic exception specification calls terminate rather than unexpected, and it is unspecified whether stack unwinding is performed prior to such a call.

C.3.8 Clause 16: library introduction

Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.

Effect on original feature: The following C++ headers are new: `<any>` (22.7.2), `<charconv>` (22.13.1), `<execution>` (22.12.2), `<filesystem>` (31.12.4), `<memory_resource>` (20.4.1), `<optional>` (22.5.2), `<string_view>` (23.3.2), and `<variant>` (22.6.2). Valid C++ 2014 code that includes headers with these names may be invalid in this revision of C++.

2 Affected subclause: 16.4.5.2.3
Change: New reserved namespaces.
Rationale: Reserve namespaces for future revisions of the standard library that might otherwise be incompatible with existing programs.
Effect on original feature: The global namespaces `std` followed by an arbitrary sequence of digits (5.10) are reserved for future standardization. Valid C++ 2014 code that uses such a top-level namespace, e.g., `std2`, may be invalid in this revision of C++.

C.3.9 Clause 22: general utilities library

1 Affected subclause: 22.10.17
Change: Constructors taking allocators removed.
Rationale: No implementation consensus.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. Specifically, constructing a `std::function` with an allocator is ill-formed and uses-allocator construction will not pass an allocator to `std::function` constructors in this revision of C++.

2 Affected subclause: 20.3.2.2
Change: Different constraint on conversions from `unique_ptr`.
Rationale: Adding array support to `shared_ptr`, via the syntax `shared_ptr<T[]>` and `shared_ptr<T[N]>`.
Effect on original feature: Valid C++ 2014 code may fail to compile or may change meaning in this revision of C++. For example:

```cpp
#include <memory>
std::unique_ptr<int[]> arr(new int[1]);
std::shared_ptr<int> ptr(std::move(arr)); // error: int(*)[] is not compatible with int*
```

C.3.10 Clause 23: strings library

1 Affected subclause: 23.4.3
Change: Non-const `.data()` member added.
Rationale: The lack of a non-const `.data()` differed from the similar member of `std::vector`. This change regularizes behavior.
Effect on original feature: Overloaded functions which have differing code paths for `char*` and `const char*` arguments will execute differently when called with a non-const string’s `.data()` member in this revision of C++. For example:

```cpp
int f(char *) = delete;
int f(const char *);
string s;
int x = f(s.data()); // ill-formed; previously well-formed
```

C.3.11 Clause 24: containers library

1 Affected subclause: 24.2.7
Change: Requirements change:
Rationale: Increase portability, clarification of associative container requirements.
Effect on original feature: Valid C++ 2014 code that attempts to use associative containers having a comparison object with non-const function call operator may fail to compile in this revision of C++. For example:

```cpp
#include <set>

struct compare
{
    bool operator()(int a, int b)
    {
        return a < b;
    }
};
```
int main() {
    const std::set<int, compare> s;
    s.find(0);
}

C.3.12 Annex D: compatibility features

1 Change: The class templates auto_ptr, unary_function, and binary_function, the function templates random_shuffle, and the function templates (and their return types) ptr_fun, mem_fun, mem_fun_ref, bind1st, and bind2nd are not defined.
Rationale: Superseded by new features.
Effect on original feature: Valid C++ 2014 code that uses these class templates and function templates may fail to compile in this revision of C++.

2 Change: Remove old iostreams members [depr.ios.members].
Rationale: Redundant feature for compatibility with pre-standard code has served its time.
Effect on original feature: A valid C++ 2014 program using these identifiers may be ill-formed in this revision of C++.

C.4 C++ and ISO C++ 2011

C.4.1 General

1 Subclause C.4 lists the differences between C++ and ISO C++ 2011 (ISO/IEC 14882:2011, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.4.2 Clause 5: lexical conventions

1 Affected subclause: 5.9
Change: pp-number can contain one or more single quotes.
Rationale: Necessary to enable single quotes as digit separators.
Effect on original feature: Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example, the following code is valid both in C++ 2011 and in this revision of C++, but the macro invocation produces different outcomes because the single quotes delimit a character-literal in C++ 2011, whereas they are digit separators in this revision of C++. For example:

```cpp
#define M(x, ...) __VA_ARGS__
                            // int x[2] = { 3'4, 5 }; — this revision of C++
```

C.4.3 Clause 6: basics

1 Affected subclause: 6.7.5.5.3
Change: New usual (non-placement) deallocator.
Rationale: Required for sized deallocation.
Effect on original feature: Valid C++ 2011 code can declare a global placement allocation function and deallocation function as follows:

```cpp
void* operator new(std::size_t, std::size_t);
void operator delete(void*, std::size_t) noexcept;
```
In this revision of C++, however, the declaration of operator delete might match a predefined usual (non-placement) operator delete (6.7.5.5). If so, the program is ill-formed, as it was for class member allocation functions and deallocation functions (7.6.2.8).

C.4.4 Clause 7: expressions

1 Affected subclause: 7.6.16
Change: A conditional expression with a throw expression as its second or third operand keeps the type and value category of the other operand.
Rationale: Formerly mandated conversions (lvalue-to-rvalue (7.3.2), array-to-pointer (7.3.3), and function-to-pointer (7.3.4) standard conversions), especially the creation of the temporary due to lvalue-to-rvalue conversion, were considered gratuitous and surprising.
Effect on original feature: Valid C++ 2011 code that relies on the conversions may behave differently in this revision of C++. For example:
In C++ 2011, \( f(\text{true}) \) returns 1. In this revision of C++, it returns 2.

\[
\text{sizeof(} \text{true ? "" : throw 0)}
\]

In C++ 2011, the expression yields \( \text{sizeof(const char*)} \). In this revision of C++, it yields \( \text{sizeof(const char[1])} \).

### C.4.5 Clause 9: declarations

**Affected subclause:** 9.2.6

**Change:** constexpr non-static member functions are not implicitly const member functions.

**Rationale:** Necessary to allow constexpr member functions to mutate the object.

**Effect on original feature:** Valid C++ 2011 code may fail to compile in this revision of C++. For example:

```cpp
struct S {
    constexpr const int &f();
    int &f();
};
```

This code is valid in C++ 2011 but invalid in this revision of C++ because it declares the same member function twice with different return types.

**Affected subclause:** 9.4.2

**Change:** Classes with default member initializers can be aggregates.

**Rationale:** Necessary to allow default member initializers to be used by aggregate initialization.

**Effect on original feature:** Valid C++ 2011 code may fail to compile or may change meaning in this revision of C++. For example:

```cpp
struct S {
    // Aggregate in C++ 2014 onwards.
};
struct X {
    operator int();
    operator S();
};
X a{};
S b{a};
```

// uses copy constructor in C++ 2011,
// performs aggregate initialization in this revision of C++

### C.4.6 Clause 16: library introduction

**Affected subclause:** 16.4.2.3

**Change:** New header.

**Rationale:** New functionality.

**Effect on original feature:** The C++ header `<shared_mutex>` (33.6.3) is new. Valid C++ 2011 code that includes a header with that name may be invalid in this revision of C++.

### C.4.7 Clause 31: input/output library

**Affected subclause:** 31.13

**Change:** `gets` is not defined.

**Rationale:** Use of `gets` is considered dangerous.

**Effect on original feature:** Valid C++ 2011 code that uses the `gets` function may fail to compile in this revision of C++.
C.5 C++ and ISO C++ 2003

C.5.1 General

Subclause C.5 lists the differences between C++ and ISO C++ 2003 (ISO/IEC 14882:2003, Programming Languages — C++), in addition to those listed above, by the chapters of this document.

C.5.2 Clause 5: lexical conventions

<table>
<thead>
<tr>
<th>Affected subclause:</th>
<th>5.4</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change:</td>
<td>New kinds of string-literals.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Required for new features.</td>
</tr>
<tr>
<td>Effect on original feature:</td>
<td>Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. Specifically, macros named R, u8, u8R, u, uR, U, UR, or LR will not be expanded when adjacent to a string-literal but will be interpreted as part of the string-literal. For example:</td>
</tr>
<tr>
<td>Documentation:</td>
<td>#define u8 &quot;abc&quot;</td>
</tr>
<tr>
<td>Documentation:</td>
<td>const char* s = u8&quot;def&quot;; // Previously &quot;abcdef&quot;, now &quot;def&quot;</td>

<tbody>
<tr>
<td>Change:</td>
<td>Type of integer literals.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>C99 compatibility.</td>
</tr>
<tr>
<td>Effect on original feature:</td>
<td>Certain integer literals larger than can be represented by long could change from an unsigned integer type to signed long long.</td>
</tr>
</tbody>
</table>

C.5.3 Clause 7: expressions

<table>
<thead>
<tr>
<th>Affected subclause:</th>
<th>7.3.12</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change:</td>
<td>Only literals are integer null pointer constants.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Removing surprising interactions with templates and constant expressions.</td>
</tr>
<tr>
<td>Effect on original feature:</td>
<td>Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:</td>
</tr>
<tr>

<tr>
<td>Documentation:</td>
<td>template&lt;int N&gt; void g() {</td>
</tr>
<tr>
<td>Documentation:</td>
<td>f(0*N); // calls #2; used to call #1</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Affected subclause:</td>
<td>7.6.5</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----</td>
</tr>
<tr>
<td>Change:</td>
<td>Specify rounding for results of integer / and %.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Increase portability, C99 compatibility.</td>
</tr>
<tr>
<td>Effect on original feature:</td>
<td>Valid C++ 2003 code that uses integer division rounds the result toward 0 or toward negative infinity, whereas this revision of C++ always rounds the result toward 0.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Affected subclause:</th>
<th>7.6.14</th>
</tr>
</thead>
<tbody>
<tr>
<td>Change:</td>
<td>&amp;&amp; is valid in a type-name.</td>
</tr>
<tr>
<td>Rationale:</td>
<td>Required for new features.</td>
</tr>
</tbody>
</table>
Effect on original feature: Valid C++ 2003 code may fail to compile or produce different results in this revision of C++. For example:

```cpp
bool b1 = new int && false; // previously false, now ill-formed
struct S { operator int(); };
bool b2 = &S::operator int && false; // previously false, now ill-formed
```

### C.5.4 Clause 9: declarations

1. **Affected subclause:** 9.2  
   **Change:** Remove auto as a storage class specifier.  
   **Rationale:** New feature.  
   **Effect on original feature:** Valid C++ 2003 code that uses the keyword auto as a storage class specifier may be invalid in this revision of C++. In this revision of C++, auto indicates that the type of a variable is to be deduced from its initializer expression.

2. **Affected subclause:** 9.4.5  
   **Change:** Narrowing restrictions in aggregate initializers.  
   **Rationale:** Catches bugs.  
   **Effect on original feature:** Valid C++ 2003 code may fail to compile in this revision of C++. For example:

```cpp
int x[] = { 2.0 };  
```

This code is valid in C++ 2003 but invalid in this revision of C++ because double to int is a narrowing conversion.

### C.5.5 Clause 11: classes

1. **Affected subclauses:** 11.4.5.2, 11.4.7, 11.4.5.3, and 11.4.6  
   **Change:** Implicitly-declared special member functions are defined as deleted when the implicit definition would have been ill-formed.  
   **Rationale:** Improves template argument deduction failure.  
   **Effect on original feature:** A valid C++ 2003 program that uses one of these special member functions in a context where the definition is not required (e.g., in an expression that is not potentially evaluated) becomes ill-formed.

2. **Affected subclause:** 11.4.7  
   **Change:** User-declared destructors have an implicit exception specification.  
   **Rationale:** Clarification of destructor requirements.  
   **Effect on original feature:** Valid C++ 2003 code may execute differently in this revision of C++. In particular, destructors that throw exceptions will call std::terminate (without calling std::unexpected) if their exception specification is non-throwing.

### C.5.6 Clause 13: templates

1. **Affected subclause:** 13.2  
   **Change:** Repurpose export for modules (Clause 10, 15.4, 15.5).  
   **Rationale:** No implementation consensus for the C++ 2003 meaning of export.  
   **Effect on original feature:** A valid C++ 2003 program containing export is ill-formed in this revision of C++.

2. **Affected subclause:** 13.4  
   **Change:** Remove whitespace requirement for nested closing template right angle brackets.  
   **Rationale:** Considered a persistent but minor annoyance. Template aliases representing non-class types would exacerbate whitespace issues.  
   **Effect on original feature:** Change to semantics of well-defined expression. A valid C++ 2003 expression containing a right angle bracket (“>”) followed immediately by another right angle bracket may now be treated as closing two templates. For example:

```cpp
template <class T> struct X { };  
template <int N> struct Y { };  
X< Y< 1 >> 2 >> x;  
```

This code is valid in C++ 2003 because “>>” is a right-shift operator, but invalid in this revision of C++ because “>>>” closes two templates.

3. **Affected subclause:** 13.8.4.2  
   **Change:** Allow dependent calls of functions with internal linkage.
Rationale: Overly constrained, simplify overload resolution rules.
Effect on original feature: A valid C++ 2003 program can get a different result in this revision of C++.

C.5.7 Clause 16: library introduction

1 Affected: Clause 16 – Clause 33
Change: New reserved identifiers.
Rationale: Required by new features.
Effect on original feature: Valid C++ 2003 code that uses any identifiers added to the C++ standard library by later revisions of C++ may fail to compile or produce different results in this revision of C++.
A comprehensive list of identifiers used by the C++ standard library can be found in the Index of Library Names in this document.

2 Affected subclause: 16.4.2.3
Change: New headers.
Rationale: New functionality.
Effect on original feature: The following C++ headers are new: `<array>` (24.3.2), `<atomic>` (33.5.2), `<chrono>` (29.2), `<codecvt>` (D.22.2), `<condition_variable>` (33.7.2), `<forward_list>` (24.3.4), `<future>` (33.10.2), `<initializer_list>` (17.12.2), `<mutex>` (33.6.2), `<random>` (28.5.2), `<ratio>` (21.4.2), `<regex>` (32.3), `<scoped_allocator>` (20.5.1), `<system_error>` (19.5.2), `<thread>` (33.4.2), `<tuple>` (22.4.2), `<type-index>` (22.11.1), `<type_traits>` (22.3.3), `<unordered_map>` (24.5.2), and `<unordered_set>` (24.5.3). In addition the following C compatibility headers are new: `<cfenv>` (28.3.1), `<cinttypes>` (31.13.2), `<cstdint>` (17.4.2), and `<cuchar>` (23.5.5). Valid C++ 2003 code that `#include`s headers with these names may be invalid in this revision of C++.

3 Affected subclause: 16.4.5.2.2
Change: Additional restrictions on macro names.
Rationale: Avoid hard to diagnose or non-portable constructs.
Effect on original feature: Names of attribute identifiers may not be used as macro names. Valid C++ 2003 code that defines `override`, `final`, `carries_dependency`, or `noreturn` as macros is invalid in this revision of C++.

C.5.8 Clause 17: language support library

1 Affected subclause: 17.7.3.2
Change: `operator new` may throw exceptions other than `std::bad_alloc`.
Rationale: Consistent application of `noexcept`.
Effect on original feature: Valid C++ 2003 code that assumes that global `operator new` only throws `std::bad_alloc` may execute differently in this revision of C++. Valid C++ 2003 code that replaces the global replaceable `operator new` is ill-formed in this revision of C++, because the exception specification of `throw(std::bad_alloc)` was removed.

C.5.9 Clause 19: diagnostics library

1 Affected subclause: 19.4
Change: Thread-local error numbers.
Rationale: Support for new thread facilities.
Effect on original feature: Valid but implementation-specific C++ 2003 code that relies on `errno` being the same across threads may change behavior in this revision of C++.
C.5.10 Clause 22: general utilities library

Affected subclauses: 22.10.6, 22.10.7, 22.10.8, 22.10.10, and 22.10.11

Change: Standard function object types no longer derived from `std::unary_function` or `std::binary_function`.

Rationale: Superseded by new feature; `unary_function` and `binary_function` are no longer defined.

Effect on original feature: Valid C++ 2003 code that depends on function object types being derived from `unary_function` or `binary_function` may fail to compile in this revision of C++.

C.5.11 Clause 23: strings library

Affected subclause: 23.4

Change: `basic_string` requirements no longer allow reference-counted strings.

Rationale: Invalidation is subtly different with reference-counted strings. This change regularizes behavior.

Effect on original feature: Valid C++ 2003 code may execute differently in this revision of C++.

C.5.12 Clause 24: containers library

Affected subclause: 24.2

Change: Complexity of `size()` member functions now constant.

Rationale: Lack of specification of complexity of `size()` resulted in divergent implementations with inconsistent performance characteristics.

Effect on original feature: Some container implementations that conform to C++ 2003 may not conform to the specified `size()` requirements in this revision of C++. Adjusting containers such as `std::list` to the stricter requirements may require incompatible changes.

2 Affected subclause: 24.2

Change: Requirements change: relaxation.

Rationale: Clarification.

Effect on original feature: Valid C++ 2003 code that attempts to meet the specified container requirements may now be over-specified. Code that attempted to be portable across containers may need to be adjusted as follows:

1. not all containers provide `size()`; use `empty()` instead of `size() == 0`;
2. not all containers are empty after construction (`array`);
3. not all containers have constant complexity for `swap()` (`array`).

3 Affected subclause: 24.2

Change: Requirements change: default constructible.

Rationale: Clarification of container requirements.

Effect on original feature: Valid C++ 2003 code that attempts to explicitly instantiate a container using a user-defined type with no default constructor may fail to compile.

4 Affected subclauses: 24.2.4 and 24.2.7

Change: Signature changes: from `void` return types.

Rationale: Old signature threw away useful information that may be expensive to recalculate.

Effect on original feature: The following member functions have changed:

1. `erase(iter)` for `set`, `multiset`, `map`, `multimap`
2. `erase(begin, end)` for `set`, `multiset`, `map`, `multimap`
3. `insert(pos, num, val)` for `vector`, `deque`, `list`, `forward_list`
4. `insert(pos, beg, end)` for `vector`, `deque`, `list`, `forward_list`

Valid C++ 2003 code that relies on these functions returning `void` (e.g., code that creates a pointer to member function that points to one of these functions) will fail to compile with this revision of C++.

5 Affected subclauses: 24.2.4 and 24.2.7

Change: Signature changes: from `iterator` to `const_iterator` parameters.
Rationale: Overspecification.

Effect on original feature: The signatures of the following member functions changed from taking an iterator to taking a const_iterator:

- insert(iter, val) for vector, deque, list, set, multiset, map, multimap
- insert(pos, beg, end) for vector, deque, list, forward_list
- erase(begin, end) for set, multiset, map, multimap
- all forms of list::splice
- all forms of list::merge

Valid C++ 2003 code that uses these functions may fail to compile with this revision of C++.

Affected subclauses: 24.2.4 and 24.2.7

Change: Signature changes: resize.

Rationale: Performance, compatibility with move semantics.

Effect on original feature: For vector, deque, and list the fill value passed to resize is now passed by reference instead of by value, and an additional overload of resize has been added. Valid C++ 2003 code that uses this function may fail to compile with this revision of C++.

C.5.13 Clause 27: algorithms library

Change: Result state of inputs after application of some algorithms.

Rationale: Required by new feature.

Effect on original feature: A valid C++ 2003 program may detect that an object with a valid but unspecified state has a different valid but unspecified state with this revision of C++. For example, std::remove and std::remove_if may leave the tail of the input sequence with a different set of values than previously.

C.5.14 Clause 28: numerics library

Change: Specified representation of complex numbers.

Rationale: Compatibility with C99.

Effect on original feature: Valid C++ 2003 code that uses implementation-specific knowledge about the binary representation of the required template specializations of std::complex may not be compatible with this revision of C++.

C.5.15 Clause 30: localization library

Change: The num_get facet recognizes hexadecimal floating point values.

Rationale: Required by new feature.

Effect on original feature: Valid C++ 2003 code may have different behavior in this revision of C++.

C.5.16 Clause 31: input/output library

Change: Specify use of explicit in existing boolean conversion functions.

Rationale: Clarify intentions, avoid workarounds.

Effect on original feature: Valid C++ 2003 code that relies on implicit boolean conversions will fail to compile with this revision of C++. Such conversions occur in the following conditions:

- passing a value to a function that takes an argument of type bool;
- using operator== to compare to false or true;
- returning a value from a function with a return type of bool;
- initializing members of type bool via aggregate initialization;
- initializing a const bool& which would bind to a temporary object.

Affected subclauses: 31.5.2.2.1

Change: Change base class of std::ios_base::failure.

Rationale: More detailed error messages.

Effect on original feature: std::ios_base::failure is no longer derived directly from std::exception,
but is now derived from `std::system_error`, which in turn is derived from `std::runtime_error`. Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may execute differently in this revision of C++.

3 Affected subclause: 31.5.2
Change: Flag types in `std::ios_base` are now bitmasks with values defined as constexpr static members.
Rationale: Required for new features.
Effect on original feature: Valid C++ 2003 code that assumes that `std::ios_base::failure` is derived directly from `std::exception` may fail to compile with this revision of C++. For example:

```
#include <iostream>

int main() {
    int flag = std::ios_base::hex;
    std::cout.setf(flag);          // error: setf does not take argument of type int
}
```

C.6 C++ and ISO C

C.6.1 General

Subclause C.6 lists the differences between C++ and ISO C, in addition to those listed above, by the chapters of this document.

C.6.2 Clause 5: lexical conventions

1 Affected subclause: 5.11
Change: New Keywords
New keywords are added to C++; see 5.11.
Rationale: These keywords were added in order to implement the new semantics of C++.
Effect on original feature: Change to semantics of well-defined feature. Any ISO C programs that used any of these keywords as identifiers are not valid C++ programs.
Difficulty of converting: Syntactic transformation. Converting one specific program is easy. Converting a large collection of related programs takes more work.
How widely used: Common.

2 Affected subclause: 5.13.3
Change: Type of `character-literal` is changed from `int` to `char`.
Rationale: This is needed for improved overloaded function argument type matching. For example:

```
int function( int i );
int function( char c );
```

It is preferable that this call match the second version of function rather than the first.
Effect on original feature: Change to semantics of well-defined feature. ISO C programs which depend on `sizeof('x') == sizeof(int)` will not work the same as C++ programs.
Difficulty of converting: Simple.
How widely used: Programs which depend upon `sizeof('x')` are probably rare.

3 Affected subclause: 5.13.5
Change: Concatenated `string-literals` can no longer have conflicting `encoding-prefixes`.
Rationale: Removal of non-portable feature.
Effect on original feature: Concatenation of `string-literals` with different `encoding-prefixes` is now ill-formed.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

4 Affected subclause: 5.13.5
Change: String literals made const.
The type of a `string-literal` is changed from “array of `char`” to “array of `const char`”. The type of a UTF-8 string literal is changed from “array of `char`” to “array of `const char8_t`”. The type of a UTF-16 string literal is changed from “array of `some-integer-type`” to “array of `const char16_t`”. The type of a UTF-32 string literal is changed from “array of `some-integer-type`” to “array of `const char32_t`”. The type of a wide string literal is changed from “array of `wchar_t`” to “array of `const wchar_t`”.

§ C.6.2
Rationale: This avoids calling an inappropriate overloaded function, which might expect to be able to modify its argument.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Syntactic transformation. The fix is to add a cast:

```c
char* p = "abc";
void f(char*) {
    char* p = (char*)"abc";
    f(p);
    f((char*)"def");
}
```

How widely used: Programs that have a legitimate reason to treat string literal objects as potentially modifiable memory are probably rare.

C.6.3 Clause 6: basics

Affected subclause: 6.2

Change: C++ does not have “tentative definitions” as in C. E.g., at file scope,

```c
int i;
int i;
```

is valid in C, invalid in C++. This makes it impossible to define mutually referential file-local objects with static storage duration, if initializers are restricted to the syntactic forms of C. For example,

```c
struct X { int i; struct X* next; };

static struct X a;
static struct X b = { 0, &a };
static struct X a = { 0, &b };
```

Rationale: This avoids having different initialization rules for fundamental types and user-defined types.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. In C++, the initializer for one of a set of mutually-referential file-local objects with static storage duration must invoke a function call to achieve the initialization.

How widely used: Seldom.

Affected subclause: 6.4

Change: A struct is a scope in C++, not in C. For example,

```c
struct X {
    struct Y { int a; } b;
};
struct Y c;
```

is valid in C but not in C++, which would require `X::Y c;`.

Rationale: Class scope is crucial to C++, and a struct is a class.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: C programs use struct extremely frequently, but the change is only noticeable when struct, enumeration, or enumerator names are referred to outside the struct. The latter is probably rare.

Affected subclause: 6.6 [also 9.2.9]

Change: A name of file scope that is explicitly declared const, and not explicitly declared extern, has internal linkage, while in C it would have external linkage.

Rationale: Because const objects may be used as values during translation in C++, this feature urges programmers to provide an explicit initializer for each const object. This feature allows the user to put const objects in source files that are included in more than one translation unit.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

Affected subclause: 6.9.3.1

Change: The main function cannot be called recursively and cannot have its address taken.

Rationale: The main function may require special actions.

Effect on original feature: Deletion of semantically well-defined feature.

§ C.6.3
Difficulty of converting: Trivial: create an intermediary function such as mymain(argc, argv).
How widely used: Seldom.

Affected subclause: 6.8
Change: C allows “compatible types” in several places, C++ does not. For example, otherwise-identical struct types with different tag names are “compatible” in C but are distinctly different types in C++.
Rationale: Stricter type checking is essential for C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The “typesafe linkage” mechanism will find many, but not all, of such problems. Those problems not found by typesafe linkage will continue to function properly, according to the “layout compatibility rules” of this document.
How widely used: Common.

C.6.4 Clause 7: expressions

Affected subclause: 7.3.12
Change: Converting void* to a pointer-to-object type requires casting.

```c
char a[10];
void* b = a;
void foo() {
    char* c = b;
}
```

ISO C accepts this usage of pointer to void being assigned to a pointer to object type. C++ does not.
Rationale: C++ tries harder than C to enforce compile-time type safety.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Can be automated. Violations will be diagnosed by the C++ translator. The fix is to add a cast. For example:

```c
char* c = (char*) b;
```

How widely used: This is fairly widely used but it is good programming practice to add the cast when assigning pointer-to-void to pointer-to-object. Some ISO C translators will give a warning if the cast is not used.

Affected subclauses: 7.6.1.6 and 7.6.2.3
Change: Decrement operator is not allowed with bool operand.
Rationale: Feature with surprising semantics.
Effect on original feature: A valid ISO C expression utilizing the decrement operator on a bool lvalue (for instance, via the C typedef in <stdbool.h> (17.15.5)) is ill-formed in C++.

Affected subclauses: 7.6.2.5 and 7.6.3
Change: In C++, types can only be defined in declarations, not in expressions. In C, a sizeof expression or cast expression may define a new type. For example,

```c
p = (void*)(struct x {int i;})*0;
```

defines a new type, struct x.
Rationale: This prohibition helps to clarify the location of definitions in the source code.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

Affected subclauses: 7.6.16, 7.6.19, and 7.6.20
Change: The result of a conditional expression, an assignment expression, or a comma expression may be an lvalue.
Rationale: C++ is an object-oriented language, placing relatively more emphasis on lvalues. For example, function calls may yield lvalues.
Effect on original feature: Change to semantics of well-defined feature. Some C expressions that implicitly rely on lvalue-to-rvalue conversions will yield different results. For example,

```c
char arr[100];
sizeof(0, arr)
```
yields 100 in C++ and sizeof(char*) in C.

Difficulty of converting: Programs must add explicit casts to the appropriate rvalue.

How widely used: Rare.

C.6.5 Clause 8: statements

Affected subclauses: 8.5.3 and 8.7.6

Change: It is now invalid to jump past a declaration with explicit or implicit initializer (except across entire block not entered).

Rationale: Constructors used in initializers may allocate resources which need to be de-allocated upon leaving the block. Allowing jump past initializers would require complicated runtime determination of allocation. Furthermore, many operations on such an uninitialized object have undefined behavior. With this simple compile-time rule, C++ assures that if an initialized variable is in scope, then it has assuredly been initialized.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation.

How widely used: Seldom.

C.6.6 Clause 9: declarations

Affected subclause: 9.2.2

Change: In C++, the static or extern specifiers can only be applied to names of objects or functions. Using these specifiers with type declarations is illegal in C++. In C, these specifiers are ignored when used on type declarations.

Example:

```cpp
static struct S {
    int i;
};
```

Rationale: Storage class specifiers don’t have any meaning when associated with a type. In C++, class members can be declared with the static storage class specifier. Storage class specifiers on type declarations can be confusing for users.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

Affected subclause: 9.2.2

Change: In C++, register is not a storage class specifier.

Rationale: The storage class specifier had no effect in C++.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Syntactic transformation.

How widely used: Common.

Affected subclause: 9.2.4

Change: A C++ typedef-name must be different from any class type name declared in the same scope (except if the typedef is a synonym of the class name with the same name). In C, a typedef-name and a struct tag name declared in the same scope can have the same name (because they have different name spaces).

Example:
typedef struct name1 { /* ... */ } name1; // valid C and C++
struct name { /* ... */ }; // valid C, invalid C++
typedef int name; // valid C, invalid C++

typedef struct name1 { /* ... */ } name1; // valid C and C++
struct name { /* ... */ }; // valid C, invalid C++
typedef int name; // valid C, invalid C++

Rationale: For ease of use, C++ doesn’t require that a type name be prefixed with the keywords class, struct or union when used in object declarations or type casts.

Example:

```c
class name { /* ... */ };  // has type name
name i;  // i has type class name
```

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. One of the 2 types has to be renamed.

How widely used: Seldom.

4 Affected subclause: 9.2.9 [see also 6.6]
Change: Const objects must be initialized in C++ but can be left uninitialized in C.
Rationale: A const object cannot be assigned to so it must be initialized to hold a useful value.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom.

5 Affected subclause: 9.2.9.6
Change: The keyword auto cannot be used as a storage class specifier.

Example:

```c
void f() {
    auto int x;  // valid C, invalid C++
}
```

Rationale: Allowing the use of auto to deduce the type of a variable from its initializer results in undesired interpretations of auto as a storage class specifier in certain contexts.

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Rare.

6 Affected subclause: 9.3.4.6
Change: In C++, a function declared with an empty parameter list takes no arguments. In C, an empty parameter list means that the number and type of the function arguments are unknown.

Example:

```c
int f();  // means int f(void) in C++
// int f( unknown ) in C
```

Rationale: This is to avoid erroneous function calls (i.e., function calls with the wrong number or type of arguments).

Effect on original feature: Change to semantics of well-defined feature. This feature was marked as “obsolete” in C.

Difficulty of converting: Syntactic transformation. The function declarations using C incomplete declaration style must be updated further if different calls to the same (non-prototype) function have different numbers of arguments.

How widely used: Common.

7 Affected subclause: 9.3.4.6 [see 7.6.2.5]
Change: In C++, types may not be defined in return or parameter types. In C, these type definitions are allowed.

Example:

```c
void f( struct S { int a; } arg ) {};  // valid C, invalid C++
enum E { A, B, C } f();  // valid C, invalid C++
```

Rationale: When comparing types in different translation units, C++ relies on name equivalence when C relies on structural equivalence. Regarding parameter types: since the type defined in a parameter list would be in the scope of the function, the only legal calls in C++ would be from within the function itself.

Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The type definitions must be moved to file scope, or in header files.

How widely used: Seldom. This style of type definition is seen as poor coding style.

8 Affected subclause: 9.5
Change: In C++, the syntax for function definition excludes the “old-style” C function. In C, “old-style” syntax is allowed, but deprecated as “obsolescent”.
Rationale: Prototypes are essential to type safety.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Common in old programs, but already known to be obsolescent.

9 Affected subclause: 9.4.2
Change: In C++, designated initialization support is restricted compared to the corresponding functionality in C. In C++, designators for non-static data members must be specified in declaration order, designators for array elements and nested designators are not supported, and designated and non-designated initializers cannot be mixed in the same initializer list.

Example:
```c
struct A { int x, y; };
struct B { struct A a; };
struct A a = {.y = 1, .x = 2};  // valid C, invalid C++
int arr[3] = {{1} = 5};        // valid C, invalid C++
struct B b = {.a.x = 0};       // valid C, invalid C++
struct A c = {.x = 1, 2};      // valid C, invalid C++
```

Rationale: In C++, members are destroyed in reverse construction order and the elements of an initializer list are evaluated in lexical order, so field initializers must be specified in order. Array designators conflict with lambda-expression syntax. Nested designators are seldom used.
Effect on original feature: Deletion of feature that is incompatible with C++.
Difficulty of converting: Syntactic transformation.
How widely used: Out-of-order initializers are common. The other features are seldom used.

10 Affected subclause: 9.4.3
Change: In C++, when initializing an array of character with a string, the number of characters in the string (including the terminating ‘\0’) must not exceed the number of elements in the array. In C, an array can be initialized with a string even if the array is not large enough to contain the string-terminating ‘\0’.

Example:
```c
char array[4] = "abcd";  // valid C, invalid C++
```

Rationale: When these non-terminated arrays are manipulated by standard string functions, there is potential for major catastrophe.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Semantic transformation. The arrays must be declared one element bigger to contain the string-terminating ‘\0’.
How widely used: Seldom. This style of array initialization is seen as poor coding style.

11 Affected subclause: 9.7.1
Change: C++ objects of enumeration type can only be assigned values of the same enumeration type. In C, objects of enumeration type can be assigned values of any integral type.

Example:
```c
enum color { red, blue, green };
enum color c = 1;          // valid C, invalid C++
```

Rationale: The type-safe nature of C++.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation. (The type error produced by the assignment can be automatically corrected by applying an explicit cast.)
How widely used: Common.

12 Affected subclause: 9.7.1
Change: In C++, the type of an enumerator is its enumeration. In C, the type of an enumerator is int.

Example:
enum e { A };
sizeof(A) == sizeof(int)  // in C
sizeof(A) == sizeof(e)    // in C++
/* and sizeof(int) is not necessarily equal to sizeof(e) */

Rationale: In C++, an enumeration is a distinct type.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Seldom. The only time this affects existing C code is when the size of an enumerator is
taken. Taking the size of an enumerator is not a common C coding practice.

Affected subclause: 9.12.2
Change: In C++, an alignment-specifier is an attribute-specifier. In C, an alignment-specifier is a declaration-
specifier.

Example:
#include <stdalign.h>
unsigned alignas(8) int x;    // valid C, invalid C++
unsigned int y alignas(8);    // valid C++, invalid C

Rationale: C++ requires unambiguous placement of the alignment-specifier.
Effect on original feature: Deletion of semantically well-defined feature.
Difficulty of converting: Syntactic transformation.
How widely used: Seldom.

C.6.7 Clause 11: classes [diff.class]

Affected subclause: 11.3 [see also 9.2.4]
Change: In C++, a class declaration introduces the class name into the scope where it is declared and hides
any object, function or other declaration of that name in an enclosing scope. In C, an inner scope declaration
of a struct tag name never hides the name of an object or function in an outer scope.

Example:
int x[99];
void f() {
    struct x { int a; };
    sizeof(x); /* size of the array in C */
    /* size of the struct in C++ */
}

Rationale: This is one of the few incompatibilities between C and C++ that can be attributed to the new
C++ name space definition where a name can be declared as a type and as a non-type in a single scope
causing the non-type name to hide the type name and requiring that the keywords class, struct, union
or enum be used to refer to the type name. This new name space definition provides important notational
conveniences to C++ programmers and helps making the use of the user-defined types as similar as possible
to the use of fundamental types. The advantages of the new name space definition were judged to outweigh
by far the incompatibility with C described above.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation. If the hidden name that needs to be accessed is at
global scope, the :: C++ operator can be used. If the hidden name is at block scope, either the type or the
struct tag has to be renamed.
How widely used: Seldom.

Affected subclause: 11.4.5.3
Change: Copying volatile objects.
The implicitly-declared copy constructor and implicitly-declared copy assignment operator cannot make a
copy of a volatile lvalue. For example, the following is valid in ISO C:

struct X { int i; };
volatile struct X x1 = {0};
struct X x2 = x1;       // invalid C++
struct X x3;
x3 = x1;                 // also invalid C++

Rationale: Several alternatives were debated at length. Changing the parameter to volatile const X&
would greatly complicate the generation of efficient code for class objects. Discussion of providing two
alternative signatures for these implicitly-defined operations raised unanswered concerns about creating
ambiguities and complicating the rules that specify the formation of these operators according to the bases
and members.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. If volatile semantics are required for the copy, a
user-declared constructor or assignment must be provided. If non-volatile semantics are required, an explicit
\texttt{const\_cast} can be used.

How widely used: Seldom.

3 Affected subclause: 11.4.10

Change: Bit-fields of type plain \texttt{int} are signed.

Rationale: The signedness needs to be consistent among template specializations. For consistency, the
implementation freedom was eliminated for non-dependent types, too.

Effect on original feature: The choice is implementation-defined in C, but not so in C++.

Difficulty of converting: Syntactic transformation.

How widely used: Seldom.

4 Affected subclause: 11.4.12

Change: In C++, the name of a nested class is local to its enclosing class. In C the name of the nested class
belongs to the same scope as the name of the outermost enclosing class.

Example:

\begin{verbatim}
struct X {
    struct Y { /* ... */ } y;
};
struct Y yy;  // valid C, invalid C++
\end{verbatim}

Rationale: C++ classes have member functions which require that classes establish scopes. The C rule would
leave classes as an incomplete scope mechanism which would prevent C++ programmers from maintaining
locality within a class. A coherent set of scope rules for C++ based on the C rule would be very complicated
and C++ programmers would be unable to predict reliably the meanings of nontrivial examples involving
nested or local functions.

Effect on original feature: Change to semantics of well-defined feature.

Difficulty of converting: Semantic transformation. To make the struct type name visible in the scope of
the enclosing struct, the struct tag can be declared in the scope of the enclosing struct, before the enclosing
struct is defined. Example:

\begin{verbatim}
struct Y;  // struct Y and struct X are at the same scope
struct X {
    struct Y { /* ... */ } y;
};
\end{verbatim}

All the definitions of C struct types enclosed in other struct definitions and accessed outside the scope of
the enclosing struct can be exported to the scope of the enclosing struct. Note: this is a consequence of the
difference in scope rules, which is documented in 6.4.

How widely used: Seldom.

5 Affected subclause: 6.5.2

Change: In C++, a \texttt{typedef-name} may not be redeclared in a class definition after being used in that
definition.

Example:

\begin{verbatim}
typedef int I;
struct S {
    int i;
    int I;  // valid C, invalid C++
};
\end{verbatim}

Rationale: When classes become complicated, allowing such a redefinition after the type has been used can
create confusion for C++ programmers as to what the meaning of \texttt{I} really is.

Effect on original feature: Deletion of semantically well-defined feature.

Difficulty of converting: Semantic transformation. Either the type or the struct member has to be
renamed.

How widely used: Seldom.
C.6.8 Clause 15: preprocessing directives

1 Affected subclause: 15.11
Change: Whether _STDC_ is defined and if so, what its value is, are implementation-defined.
Rationale: C++ is not identical to ISO C. Mandating that _STDC_ be defined would require that translators make an incorrect claim.
Effect on original feature: Change to semantics of well-defined feature.
Difficulty of converting: Semantic transformation.
How widely used: Programs and headers that reference _STDC_ are quite common.

C.7 C standard library

C.7.1 General

Subclause C.7 summarizes the explicit changes in headers, definitions, declarations, or behavior between the C standard library in the C standard and the parts of the C++ standard library that were included from the C standard library.

C.7.2 Modifications to headers

1 For compatibility with the C standard library, the C++ standard library provides the C headers enumerated in 17.15.
2 There are no C++ headers for the C standard library’s headers <stdnoreturn.h> and <threads.h>, nor are these headers from the C standard library headers themselves part of C++.
3 The C headers <complex.h> and <tgmath.h> do not contain any of the content from the C standard library and instead merely include other headers from the C++ standard library.

C.7.3 Modifications to definitions

C.7.3.1 Types char16_t and char32_t

The types char16_t and char32_t are distinct types rather than typedefs to existing integral types. The tokens char16_t and char32_t are keywords in C++ (5.11). They do not appear as macro or type names defined in <uchar> (23.5.5).

C.7.3.2 Type wchar_t

The type wchar_t is a distinct type rather than a typedef to an existing integral type. The token wchar_t is a keyword in C++ (5.11). It does not appear as a macro or type name defined in any of <cassert> (19.3.2), <cstdio> (31.13.1), <cstdlib> (17.2.2), or <cwchar> (23.5.4).

C.7.3.3 Header <assert.h>

The token static_assert is a keyword in C++. It does not appear as a macro name defined in <cassert> (19.3.2).

C.7.3.4 Header <iso646.h>

The tokens and, and_eq, bitand, bitor, compl, not, not_eq, or, or_eq, xor, and xor_eq are keywords in C++ (5.11), and are not introduced as macros by <iso646.h> (17.15.3).

C.7.3.5 Header <stdalign.h>

The token alignas is a keyword in C++ (5.11), and is not introduced as a macro by <stdalign.h> (17.15.4).

C.7.3.6 Header <stdbool.h>

The tokens bool, true, and false are keywords in C++ (5.11), and are not introduced as macros by <stdbool.h> (17.15.5).

C.7.3.7 Macro NULL

The macro NULL, defined in any of <locale> (30.5.1), <cstddef> (17.2.1), <stdio> (31.13.1), <stdlib> (17.2.2), <cstring> (23.5.3), <ctime> (29.14), or <cwchar> (23.5.4), is an implementation-defined null pointer constant in C++ (17.2).
C.7.4 Modifications to declarations

Header `<cstring>` (23.5.3): The following functions have different declarations:

1. `strchr`
2. `strpbrk`
3. `strrchr`
4. `strstr`
5. `memchr`

Subclause 23.5.3 describes the changes.

Header `<cwchar>` (23.5.4): The following functions have different declarations:

1. `wcschr`
2. `wcspbrk`
3. `wcsrchr`
4. `wcsstr`
5. `wmemchr`

Subclause 23.5.4 describes the changes.

Header `<cstdlib>` (17.2.2): The following functions have different behavior:

1. `atexit`
2. `exit`
3. `abort`

Subclause 17.6 describes the changes.

Header `<csetjmp>` (17.14.3): The following functions have different behavior:

1. `longjmp`

Subclause 17.14.3 describes the changes.

C.7.5.2 Macro `offsetof(type, member-designator)`

The macro `offsetof`, defined in `<cstddef>` (17.2.1), accepts a restricted set of `type` arguments in C++. Subclause 17.2.4 describes the change.

C.7.5.3 Memory allocation functions

The functions `aligned_alloc`, `calloc`, `malloc`, and `realloc` are restricted in C++. Subclause 20.2.12 describes the changes.
Annex D  (normative)

Compatibility features

D.1 General

1 This Annex describes features of the C++ Standard that are specified for compatibility with existing implementations.

2 These are deprecated features, where deprecated is defined as: Normative for the current revision of C++, but having been identified as a candidate for removal from future revisions. An implementation may declare library names and entities described in this Clause with the deprecated attribute (9.12.5).

D.2 Arithmetic conversion on enumerations

1 The ability to apply the usual arithmetic conversions (7.4) on operands where one is of enumeration type and the other is of a different enumeration type or a floating-point type is deprecated.

[Example 1:]
```cpp
class E1 { e; }
class E2 { f; }
bool b = e <= 3.7; // deprecated
int k = f - e;    // deprecated
auto cmp = e <-> f; // error
```

D.3 Implicit capture of *this by reference

1 For compatibility with prior revisions of C++, a lambda-expression with capture-default = (7.5.5.3) may implicitly capture *this by reference.

[Example 1:]
```cpp
class X {
    int x;
    void foo(int n) {
        auto f = [=] () { x = n; }; // deprecated: x means this->x, not a copy thereof
        auto g = [=, this] () { x = n; }; // recommended replacement
    }
}
```

D.4 Array comparisons

1 Equality and relational comparisons (7.6.10, 7.6.9) between two operands of array type are deprecated.

[Note 1: Three-way comparisons (7.6.8) between such operands are ill-formed. — end note]

[Example 1:]
```cpp
int arr1[5];
int arr2[5];
bool same = arr1 == arr2; // deprecated, same as &arr1[0] == &arr2[0],
// does not compare array contents
auto cmp = arr1 <=> arr2; // error
```

D.5 Deprecated volatile types

1 Postfix ++ and -- expressions (7.6.1.6) and prefix ++ and -- expressions (7.6.2.3) of volatile-qualified arithmetic and pointer types are deprecated.

[Example 1:]
```cpp
§ D.5 1912
```
volatile int velociraptor;
++velociraptor;  // deprecated
— end example

2 Certain assignments where the left operand is a volatile-qualified non-class type are deprecated; see 7.6.19.

[Example 2]

```c
int neck, tail;
volatile int brachiosaur;
brachiosaur = neck;  // OK
tail = brachiosaur;  // OK
tail = brachiosaur = neck;  // deprecated
brachiosaur += neck;  // deprecated
brachiosaur = brachiosaur + neck;  // OK
brachiosaur |= neck;  // OK, bitwise compound expression
— end example
```

3 A function type (9.3.4.6) with a parameter with volatile-qualified type or with a volatile-qualified return type is deprecated.

[Example 3]

```c
volatile struct amber jurassic();  // deprecated
void trex(volatile short left_arm, volatile short right_arm);  // deprecated
void fly(volatile struct pterosaur* pteranodon);  // OK
— end example
```

4 A structured binding (9.6) of a volatile-qualified type is deprecated.

[Example 4]

```c
struct linhenykus { short forelimb; }
void park(linhenykus alvarezsauroid) {
    volatile auto [what_is_this] = alvarezsauroid;  // deprecated
    // ...
}
— end example
```

D.6 Redeclaration of static constexpr data members [depr.static.constexpr]

1 For compatibility with prior revisions of C++, a constexpr static data member may be redundantly redeclared outside the class with no initializer. This usage is deprecated.

[Example 1]

```c
struct A {
    static constexpr int n = 5;  // definition (declaration in C++ 2014)
};

constexpr int A::n;  // redundant declaration (definition in C++ 2014)
— end example
```

D.7 Non-local use of TU-local entities [depr.local]

1 A declaration of a non-TU-local entity that is an exposure (6.6) is deprecated.

[Note 1: Such a declaration in an importable module unit is ill-formed. — end note]

[Example 1]

```c
namespace {
    struct A {
        void f() {}
    };
}
A h();  // deprecated: not internal linkage
inline void g() {A().f();}  // deprecated: inline and not internal linkage
— end example
```
D.8 Implicit declaration of copy functions

The implicit definition of a copy constructor (11.4.5.3) as defaulted is deprecated if the class has a user-declared copy assignment operator or a user-declared destructor (11.4.7). The implicit definition of a copy assignment operator (11.4.6) as defaulted is deprecated if the class has a user-declared copy constructor or a user-declared destructor. It is possible that future versions of C++ will specify that these implicit definitions are deleted (9.5.3).

D.9 template keyword before qualified names

The use of the keyword template before the qualified name of a class or alias template without a template argument list is deprecated.

D.10 Requires paragraph

In addition to the elements specified in 16.3.2.4, descriptions of function semantics may also contain a Requires: element to denote the preconditions for calling a function.

Violation of any preconditions specified in a function’s Requires: element results in undefined behavior unless the function’s Throws: element specifies throwing an exception when the precondition is violated.

D.11 Relational operators

The header <utility> (22.2.1) has the following additions:

```cpp
namespace std::rel_ops {
    template<class T> bool operator!=(const T&, const T&);
    template<class T> bool operator> (const T&, const T&);
    template<class T> bool operator<=(const T&, const T&);
    template<class T> bool operator>=(const T&, const T&);
}
```

To avoid redundant definitions of `operator!=` out of `operator==` and operators `>`, `<=`, and `>=` out of `operator<`, the library provides the following:

```cpp
template<class T> bool operator!=(const T& x, const T& y);

// Requires: Type T is Cpp17EqualityComparable (Table 29).
// Returns: !(x == y).

template<class T> bool operator> (const T& x, const T& y);

// Requires: Type T is Cpp17LessThanComparable (Table 30).
// Returns: y < x.

template<class T> bool operator<=(const T& x, const T& y);

// Requires: Type T is Cpp17LessThanComparable (Table 30).
// Returns: !(y < x).

template<class T> bool operator>=(const T& x, const T& y);

// Requires: Type T is Cpp17LessThanComparable (Table 30).
// Returns: !(x < y).
```

D.12 char* streams

D.12.1 Header <strstream> synopsis

The header <strstream> defines types that associate stream buffers with character array objects and assist reading and writing such objects.

```cpp
namespace std {
    class strstreambuf;
    class istrstream;
    class ostrstream;
    class strstream;
}
```
D.12.2 Class 

D.12.2.1 General

namespace std {

class strstreambuf : public basic_streambuf<char> {

public:

strstreambuf() : strstreambuf(0) {}

explicit strstreambuf(streamsize alsize_arg);

strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));

strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);

strstreambuf(const char* gnext_arg, streamsize n);

strstreambuf(signed char* gnext_arg, streamsize n,
signed char* pbeg_arg = nullptr);

strstreambuf(const signed char* gnext_arg, streamsize n,
signed char* pbeg_arg = nullptr);

strstreambuf(const unsigned char* gnext_arg, streamsize n);

strstreambuf(const unsigned char* gnext_arg, streamsize n);

virtual ~strstreambuf();

void freeze(bool freezefl = true);

char* str();

int pcount();

protected:

int_type overflow (int_type c = EOF) override;

int_type pbackfail(int_type c = EOF) override;

int_type underflow() override;

pos_type seekoff(off_type off, ios_base::seekdir way,
ios_base::openmode which = ios_base::in | ios_base::out) override;

pos_type seekpos(pos_type sp,
ios_base::openmode which = ios_base::in | ios_base::out) override;

streambuf* setbuf(char* s, streamsize n) override;

private:

using strstate = T1; // exposition only

static const strstate allocated; // exposition only

static const strstate constant; // exposition only

static const strstate dynamic; // exposition only

static const strstate frozen; // exposition only

strstate strmode; // exposition only

streamsize alsize;

void* (*palloc)(size_t); // exposition only

void (*pfree)(void*); // exposition only

};

The class strstreambuf associates the input sequence, and possibly the output sequence, with an object of some character array type, whose elements store arbitrary values. The array object has several attributes.

[Note 1: For the sake of exposition, these are represented as elements of a bitmask type (indicated here as T1) called strstate. The elements are:

(2.1) — allocated, set when a dynamic array object has been allocated, and hence will be freed by the destructor for the strstreambuf object;

(2.2) — constant, set when the array object has const elements, so the output sequence cannot be written;

(2.3) — dynamic, set when the array object is allocated (or reallocated) as necessary to hold a character sequence that can change in length;

(2.4) — frozen, set when the program has requested that the array object not be altered, reallocated, or freed.

— end note]

[Note 2: For the sake of exposition, the maintained data is presented here as:

(3.1) — strstate strmode, the attributes of the array object associated with the strstreambuf object;]
— int alsize, the suggested minimum size for a dynamic array object;
— void* (*palloc)(size_t), points to the function to call to allocate a dynamic array object;
— void (*pfree)(void*), points to the function to call to free a dynamic array object.

— end note]

Each object of class strstreambuf has a seekable area, delimited by the pointers seeklow and seekhigh. If gnext is a null pointer, the seekable area is undefined. Otherwise, seeklow equals gbeg and seekhigh is either pend, if pend is not a null pointer, or gend.

**D.12.2.2 strstreambuf constructors**

explicit strstreambuf(streamsize alsize_arg);

**Effects:** Initializes the base class with streambuf(). The postconditions of this function are indicated in Table 148.

Table 148: strstreambuf(streamsize) effects  
<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsize</td>
<td>alsize_arg</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

strstreambuf(void* (*palloc_arg)(size_t), void (*pfree_arg)(void*));

**Effects:** Initializes the base class with streambuf(). The postconditions of this function are indicated in Table 149.

Table 149: strstreambuf(void* (*)(size_t), void (*)(void*)) effects  
<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>dynamic</td>
</tr>
<tr>
<td>alsize</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>palloc_arg</td>
</tr>
<tr>
<td>pfree</td>
<td>pfree_arg</td>
</tr>
</tbody>
</table>

strstreambuf(char* gnext_arg, streamsize n, char* pbeg_arg = nullptr);
strstreambuf(signed char* gnext_arg, streamsize n,  
  signed char* pbeg_arg = nullptr);
strstreambuf(unsigned char* gnext_arg, streamsize n,  
  unsigned char* pbeg_arg = nullptr);

**Effects:** Initializes the base class with streambuf(). The postconditions of this function are indicated in Table 150.

Table 150: strstreambuf(charT*, streamsize, charT*) effects  
<table>
<thead>
<tr>
<th>Element</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>strmode</td>
<td>0</td>
</tr>
<tr>
<td>alsize</td>
<td>an unspecified value</td>
</tr>
<tr>
<td>palloc</td>
<td>a null pointer</td>
</tr>
<tr>
<td>pfree</td>
<td>a null pointer</td>
</tr>
</tbody>
</table>

**gnext_arg** shall point to the first element of an array object whose number of elements N is determined as follows:

— If \( n > 0 \), \( N = n \).
(4.2) If \( n == 0 \), \( N \) is \( \text{std::strlen}(\text{gnext}_{-}\text{arg}) \).

(4.3) If \( n < 0 \), \( N \) is \( \text{INT}_{-}\text{MAX} \).\(^{313}\)

If \( \text{pbeg}_{-}\text{arg} \) is a null pointer, the function executes:

\[
\text{setg}(\text{gnext}_{-}\text{arg}, \text{gnext}_{-}\text{arg}, \text{gnext}_{-}\text{arg} + N);
\]

Otherwise, the function executes:

\[
\text{setg}(\text{gnext}_{-}\text{arg}, \text{gnext}_{-}\text{arg}, \text{pbeg}_{-}\text{arg});
\]

\[
\text{setp}(\text{pbeg}_{-}\text{arg}, \text{pbeg}_{-}\text{arg} + N);
\]

\[
\text{strstreambuf}(\text{const char* gnext}_{-}\text{arg}, \text{streamsize n});
\]

\[
\text{strstreambuf}(\text{const signed char* gnext}_{-}\text{arg}, \text{streamsize n});
\]

\[
\text{strstreambuf}(\text{const unsigned char* gnext}_{-}\text{arg}, \text{streamsize n});
\]

**Effects:** Behaves the same as \( \text{strstreambuf}((\text{char*})\text{gnext}_{-}\text{arg}, \text{n}) \), except that the constructor also sets \( \text{constant} \) in \( \text{strmode} \).

virtual ~strstreambuf();

**Effects:** Destroys an object of class \( \text{strstreambuf} \). The function frees the dynamically allocated array object only if \((\text{strmode} \& \text{allocated}) != 0 \) and \((\text{strmode} \& \text{frozen}) == 0 \). (D.12.2.4 describes how a dynamically allocated array object is freed.)

D.12.2.3 Member functions

void freeze(bool freeze1 = true);

**Effects:** If \( \text{strmode} \& \text{dynamic} \) is nonzero, alters the freeze status of the dynamic array object as follows:

(1.1) If \( \text{freeze1} \) is \( \text{true} \), the function sets \( \text{frozen} \) in \( \text{strmode} \).

(1.2) Otherwise, it clears \( \text{frozen} \) in \( \text{strmode} \).

char* str();

**Effects:** Calls \( \text{freeze()} \), then returns the beginning pointer for the input sequence, \( \text{gbeg} \).

**Remarks:** The return value can be a null pointer.

int pcount() const;

**Effects:** If the next pointer for the output sequence, \( \text{pnext} \), is a null pointer, returns zero. Otherwise, returns the current effective length of the array object as the next pointer minus the beginning pointer for the output sequence, \( \text{pnext} - \text{pbeg} \).

D.12.2.4 strstreambuf overridden virtual functions

int_type overflow(int_type c = EOF) override;

**Effects:** Appends the character designated by \( c \) to the output sequence, if possible, in one of two ways:

(1.1) If \( c != EOF \) and if either the output sequence has a write position available or the function makes a write position available (as described below), assigns \( c \) to \(*\text{pnext}++\).

Returns \((\text{unsigned char})c\).

(1.2) If \( c == EOF \), there is no character to append.

Returns a value other than \( EOF \).

Returns \( EOF \) to indicate failure.

**Remarks:** The function can alter the number of write positions available as a result of any call.

To make a write position available, the function reallocates (or initially allocates) an array object with a sufficient number of elements \( n \) to hold the current array object (if any), plus at least one additional write position. How many additional write positions are made available is otherwise unspecified. If \( \text{palloc} \) is not a null pointer, the function calls \((\text{*palloc})(n)\) to allocate the new dynamic array object.

\(^{313}\) The function signature \( \text{strlen(const char*)} \) is declared in \( \langle \text{cstring} \rangle \) (23.5.3). The macro \( \text{INT}_{-}\text{MAX} \) is defined in \( \langle \text{climits} \rangle \) (17.3.6).
Otherwise, it evaluates the expression new charT[n]. In either case, if the allocation fails, the function returns EOF. Otherwise, it sets allocated in strmode.

To free a previously existing dynamic array object whose first element address is p: If pfree is not a null pointer, the function calls (*pfree)(p). Otherwise, it evaluates the expression delete[] p.

If (strmode & dynamic) == 0, or if (strmode & frozen) != 0, the function cannot extend the array (reallocating it with greater length) to make a write position available.

**Recommended practice:** An implementation should consider alsize in making the decision how many additional write positions to make available.

```cpp
int_type pbackfail(int_type c = EOF) override;
```

Puts back the character designated by c to the input sequence, if possible, in one of three ways:

(8.1) If c != EOF, if the input sequence has a putback position available, and if (char)c == gnext[-1], assigns gnext - 1 to gnext.

Returns c.

(8.2) If c != EOF, if the input sequence has a putback position available, and if strmode & constant is zero, assigns c to *--gnext.

Returns c.

(8.3) If c == EOF and if the input sequence has a putback position available, assigns gnext - 1 to gnext.

Returns a value other than EOF.

Returns EOF to indicate failure.

**Remarks:** If the function can succeed in more than one of these ways, it is unspecified which way is chosen. The function can alter the number of putback positions available as a result of any call.

```cpp
int_type underflow() override;
```

**Effects:** Reads a character from the input sequence, if possible, without moving the stream position past it, as follows:

(11.1) If the input sequence has a read position available, the function signals success by returning (unsigned char)*gnext.

(11.2) Otherwise, if the current write next pointer pnext is not a null pointer and is greater than the current read end pointer gend, makes a read position available by assigning to gend a value greater than gnext and no greater than pnext.

Returns (unsigned char)*gnext.

Returns EOF to indicate failure.

**Remarks:** The function can alter the number of read positions available as a result of any call.

```cpp
pos_type seekoff(off_type off, seekdir way, openmode which = in | out) override;
```

**Effects:** Alters the stream position within one of the controlled sequences, if possible, as indicated in Table 151.

**Table 151: seekoff positioning**

<table>
<thead>
<tr>
<th>Conditions</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>which &amp; ios::in != 0</td>
<td>positions the input sequence</td>
</tr>
<tr>
<td>which &amp; ios::out != 0</td>
<td>positions the output sequence</td>
</tr>
<tr>
<td>(which &amp; (ios::in</td>
<td>ios::out)) == (ios::in</td>
</tr>
<tr>
<td>Otherwise</td>
<td>the positioning operation fails.</td>
</tr>
</tbody>
</table>

For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines newoff as indicated in Table 152.
Table 152: newoff values

<table>
<thead>
<tr>
<th>Condition</th>
<th>newoff Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>way == ios::beg</td>
<td>0</td>
</tr>
<tr>
<td>way == ios::cur</td>
<td>the next pointer minus the beginning</td>
</tr>
<tr>
<td></td>
<td>pointer ((xnext - xbeg)).</td>
</tr>
<tr>
<td>way == ios::end</td>
<td>seekhigh minus the beginning</td>
</tr>
<tr>
<td></td>
<td>pointer ((seekhigh - xbeg)).</td>
</tr>
</tbody>
</table>

16 If \((\text{newoff} + \text{off}) < (\text{seeklow} - \text{xbeg})\) or \((\text{seekhigh} - \text{xbeg}) < (\text{newoff} + \text{off})\), the positioning operation fails. Otherwise, the function assigns \(\text{xbeg} + \text{newoff} + \text{off}\) to the next pointer \(\text{xnext}\).

17 Returns: \pos\_type(newoff), constructed from the resultant offset newoff (of type \off\_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \pos\_type(off\_type(-1)).

\pos\_type seekpos(pos\_type sp, ios\_base::openmode which = ios\_base::in | ios\_base::out) override;

18 Effects: Alters the stream position within one of the controlled sequences, if possible, to correspond to the stream position stored in \(\text{sp}\) (as described below).

18.1 If \((\text{which} & \text{ios}::\text{in}) \neq 0\), positions the input sequence.
18.2 If \((\text{which} & \text{ios}::\text{out}) \neq 0\), positions the output sequence.
18.3 If the function positions neither sequence, the positioning operation fails.

19 For a sequence to be positioned, if its next pointer is a null pointer, the positioning operation fails. Otherwise, the function determines newoff from \(\text{sp}.\text{offset()}\):

19.1 If \text{newoff} is an invalid stream position, has a negative value, or has a value greater than \((\text{seekhigh} - \text{seeklow})\), the positioning operation fails
19.2 Otherwise, the function adds \text{newoff} to the beginning pointer \text{xbeg} and stores the result in the next pointer \text{xnext}.

20 Returns: \pos\_type(newoff), constructed from the resultant offset newoff (of type \off\_type), that stores the resultant stream position, if possible. If the positioning operation fails, or if the constructed object cannot represent the resultant stream position, the return value is \pos\_type(off\_type(-1)).

streambuf<
char> setbuf(char* s, streamsize n) override;

21 Effects: Behavior is implementation-defined, except that setbuf(0, 0) has no effect.

D.12.3 Class istrstream

D.12.3.1 General

namespace std {
  class istrstream : public basic_istream<char> {
  public:
    explicit istrstream(const char* s);
    explicit istrstream(char* s);
    istrstream(const char* s, streamsize n);
    istrstream(char* s, streamsize n);
    virtual ~istrstream();

    strstreambuf* rdbuf() const;
    char* str();
  private:
    strstreambuf sb; // exposition only  
  };
}
D.12.3.2 **istrstream constructors**

```cpp
explicit istrstream(const char* s);
explicit istrstream(char* s);
```

1. **Effects**: Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, 0)`. `s` shall designate the first element of an `ntbs`.

```cpp
istrstream(const char* s, streamsize n);
istrstream(char* s, streamsize n);
```

2. **Effects**: Initializes the base class with `istream(&sb)` and `sb` with `strstreambuf(s, n)`. `s` shall designate the first element of an array whose length is `n` elements, and `n` shall be greater than zero.

D.12.3.3 **Member functions**

```cpp
strstreambuf* rdbuf() const;
```

1. **Returns**: `const_cast<strstreambuf*>(&sb)`.

```cpp
char* str();
```

2. **Returns**: `rdbuf()->str()`.

D.12.4 **Class ostrstream**

D.12.4.1 **General**

```cpp
namespace std {
    class ostrstream : public basic_ostream<char> {
        public:
            ostrstream();
            ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
            virtual ~ostrstream();

            strstreambuf* rdbuf() const;
            void freeze(bool freezefl = true);
            char* str();
            int pcount() const;

            private:
                strstreambuf sb; // exposition only
    };
}
```

1. The class `ostrstream` supports the writing of objects of class `strstreambuf`. It supplies a `strstreambuf` object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

   — `sb`, the `strstreambuf` object.

D.12.4.2 **ostrstream constructors**

```cpp
ostrstream();
```

1. **Effects**: Initializes the base class with `ostream(&sb)` and `sb` with `strstreambuf()`.

```cpp
ostrstream(char* s, int n, ios_base::openmode mode = ios_base::out);
```

2. **Effects**: Initializes the base class with `ostream(&sb)`, and `sb` with one of two constructors:

   (2.1) — If `(mode & app) == 0`, then `s` shall designate the first element of an array of `n` elements.
   
   The constructor is `strstreambuf(s, n, s)`.

   (2.2) — If `(mode & app) != 0`, then `s` shall designate the first element of an array of `n` elements that contains an `ntbs` whose first element is designated by `s`. The constructor is `strstreambuf(s, n, s + std::strlen(s))`.\(^{314}\)

\(^{314}\) The function signature `strlen(const char*)` is declared in `<cstring>` (23.5.3).
D.12.4.3 Member functions

strstreambuf* rdbuf() const;

1 Returns: (strstreambuf*)&sb.

void freeze(bool freezefl = true);

2 Effects: Calls rdbuf()->freeze(freezefl).

char* str();

3 Returns: rdbuf()->str().

int pcount() const;

4 Returns: rdbuf()->pcount().

D.12.5 Class strstream

D.12.5.1 General

namespace std {
    class strstream : public basic_iostream<char> {
        public:
            // types
            using char_type = char;
            using int_type = char_traits<char>::int_type;
            using pos_type = char_traits<char>::pos_type;
            using off_type = char_traits<char>::off_type;

            // constructors/destructor
            strstream();
            strstream(char* s, int n,
                    ios_base::openmode mode = ios_base::in|ios_base::out);
            virtual ~strstream();

            // members
            strstreambuf* rdbuf() const;
            void freeze(bool freezefl = true);
            int pcount() const;
            char* str();

        private:
            strstreambuf sb; // exposition only
    };
}

1 The class strstream supports reading and writing from objects of class strstreambuf. It supplies a strstreambuf object to control the associated array object. For the sake of exposition, the maintained data is presented here as:

    — sb, the strstreambuf object.

D.12.5.2 strstream constructors

strstream();

1 Effects: Initializes the base class with iostream(&sb).

strstream(char* s, int n,
        ios_base::openmode mode = ios_base::in|ios_base::out);

2 Effects: Initializes the base class with iostream(&sb), and sb with one of the two constructors:

    — If (mode & app) == 0, then s shall designate the first element of an array of n elements. The constructor is strstreambuf(s,n,s).

    — If (mode & app) != 0, then s shall designate the first element of an array of n elements that contains an NTBS whose first element is designated by s. The constructor is strstreambuf(s,n,s + std::strlen(s)).
D.12.5.3 **strstream destructor** [ depr.strstream.dest]

virtual ~strstream();

*Effects:* Destroys an object of class `strstream`.

D.12.5.4 **strstream operations** [ depr.strstream.oper]

strstreambuf* rdbuf() const;

*Returns:* `const_cast<strstreambuf*>(&sb)`.

void freeze(bool freezefl = true);

*Effects:* Calls `rdbuf()->freeze(freezefl)`.

char* str();

*Returns:* `rdbuf()->str()`.

int pcount() const;

*Returns:* `rdbuf()->pcount()`.

D.13 **The default allocator** [ depr.default.allocator]

The following member is defined in addition to those specified in 20.2.10:

```cpp
namespace std {
    template<class T> class allocator {
        public:
            using is_always_equal = true_type;
    };
}
```

D.14 **Deprecated polymorphic_allocator member function** [ depr.mem.poly.allocator.mem]

The following member is declared in addition to those members specified in 20.4.3.3:

```cpp
namespace std::pmr {
    template<class Tp = byte>
    class polymorphic_allocator {
        public:
            template <class T>
            void destroy(T* p);
    };
}
```

```cpp
template<class T>
void destroy(T* p);
```

*Effects:* As if by `p->T()`.

D.15 **Deprecated type traits** [ depr.meta.types]

The header `<type_traits>` (21.3.3) has the following addition:

```cpp
namespace std {
    template<class T> struct is_pod;
    template<class T> inline constexpr bool is_pod_v = is_pod<T>::value;
    template<size_t Len, size_t Align = default-alignment> // see below
    struct aligned_storage;
    template<size_t Len, size_t Align = default-alignment> // see below
        using aligned_storage_t = typename aligned_storage<Len, Align>::type;
    template<size_t Len, class... Types>
        using aligned_union_t = typename aligned_union<Len, Types...>::type;
}
```
The behavior of a program that adds specializations for any of the templates defined in this subclause is undefined, unless explicitly permitted by the specification of the corresponding template.

```cpp
template<class T> struct is_pod;
```

*Requires:* `remove_all_extents_t<T>` shall be a complete type or `cv void`.

`is_pod<T>` is a `Cpp17UnaryTypeTrait` (21.3.2) with a base characteristic of `true_type` if `T` is a POD type, and `false_type` otherwise. A POD class is a class that is both a trivial class and a standard-layout class, and has no non-static data members of type non-POD class (or array thereof). A POD type is a scalar type, a POD class, an array of such a type, or a cv-qualified version of one of these types.

[Note 1: It is unspecified whether a closure type (7.5.5.2) is a POD type. — end note]

```cpp
template<size_t Len, size_t Align = default-alignment>
struct aligned_storage;
```

The value of `default-alignment` is the most stringent alignment requirement for any object type whose size is no greater than `Len` (6.8).

*Mandates:* `Len` is not zero. `Align` is equal to `alignof(T)` for some type `T` or to `default-alignment`.

The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose size is at most `Len` and whose alignment is a divisor of `Align`.

[Note 2: Uses of `aligned_storage<Len, Align>::type` can be replaced by an array `std::byte[Len]` declared with `alignas(Align)`.

—end note]

[Note 3: A typical implementation would define `aligned_storage` as:
```cpp
template<size_t Len, Size Alignment>
struct aligned_storage {
    typedef struct {
        alignas(Alignment) unsigned char __data[Len];
    } type;
};
```

—end note]

```cpp
template<size_t Len, class... Types>
struct aligned_union;
```

*Mandates:* At least one type is provided. Each type in the template parameter pack `Types` is a complete object type.

The member typedef `type` denotes a trivial standard-layout type suitable for use as uninitialized storage for any object whose type is listed in `Types`; its size shall be at least `Len`. The static member `alignment_value` is an integral constant of type `size_t` whose value is the strictest alignment of all types listed in `Types`.

### D.16 Tuple [depr.tuple]

The header `<tuple>` (22.4.2) has the following additions:

```cpp
namespace std {
    template<class T> struct tuple_size<volatile T>;
    template<class T> struct tuple_size<const volatile T>;

    template<size_t I, class T> struct tuple_element<I, volatile T>;
    template<size_t I, class T> struct tuple_element<I, const volatile T>;
}
```

```cpp
template<class T> struct tuple_size<volatile T>;
template<class T> struct tuple_size<const volatile T>;
```

Let `TS` denote `tuple_size<T>` of the cv-unqualified type `T`. If the expression `TS::value` is well-formed when treated as an unevaluated operand (7.2.3), then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a base characteristic of `integral_constant<size_t, TS::value>`. Otherwise, they have no member `value`.

Access checking is performed as if in a context unrelated to `TS` and `T`. Only the validity of the immediate context of the expression is considered.
In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

```
template<size_t I, class T> struct tuple_element<I, volatile T>;
template<size_t I, class T> struct tuple_element<I, const volatile T>;
```

Let \( TE \) denote `tuple_element_t<I, T>` of the cv-unqualified type \( T \). Then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a member typedef `type` that names the following type:

\[(5.1) \quad \text{— for the first specialization, } add\_volatile\_t<TE> , \text{ and} \]

\[(5.2) \quad \text{— for the second specialization, } add\_cv\_t<TE>. \]

In addition to being available via inclusion of the `<tuple>` (22.4.2) header, the two templates are available when any of the headers `<array>` (24.3.2), `<ranges>` (26.2), or `<utility>` (22.2.1) are included.

**D.17 Variant**

The header `<variant>` (22.6.2) has the following additions:

```
namespace std {
    template<class T> struct variant_size<volatile T>;
    template<class T> struct variant_size<const volatile T>;
    template<size_t I, class T> struct variant_alternative<I, volatile T>;
    template<size_t I, class T> struct variant_alternative<I, const volatile T>;
}
```

Let \( VS \) denote `variant_size<T>` of the cv-unqualified type \( T \). Then specializations of each of the two templates meet the `Cpp17UnaryTypeTrait` requirements with a base characteristic of `integral_constant<size_t, VS::value>`.

```
template<size_t I, class T> struct variant_alternative<I, volatile T>;
template<size_t I, class T> struct variant_alternative<I, const volatile T>;
```

Let \( VA \) denote `variant_alternative<I, T>` of the cv-unqualified type \( T \). Then specializations of each of the two templates meet the `Cpp17TransformationTrait` requirements with a member typedef `type` that names the following type:

\[(3.1) \quad \text{— for the first specialization, } add\_volatile\_t<VA::type> , \text{ and} \]

\[(3.2) \quad \text{— for the second specialization, } add\_cv\_t<VA::type>. \]

**D.18 Deprecated iterator class template**

The header `<iterator>` (25.2) has the following addition:

```
namespace std {
    template<class Category, class T, class Distance = ptrdiff_t, class Pointer = T*, class Reference = T&>
    struct iterator {
        using iterator_category = Category;
        using value_type = T;
        using difference_type = Distance;
        using pointer = Pointer;
        using reference = Reference;
    };
}
```

The `iterator` template may be used as a base class to ease the definition of required types for new iterators.

\[\text{[Note 1: If the new iterator type is a class template, then these aliases will not be visible from within the iterator class's template definition, but only to callers of that class. — end note]}\]

\[\text{[Example 1: If a C++ program wants to define a bidirectional iterator for some data structure containing double and such that it works on a large memory model of the implementation, it can do so with:}\]
class MyIterator : 
  public iterator<bidirectional_iterator_tag, double, long, T*, T&> { 
    // code implementing ++, etc. 
  }; 
  
—end example

D.19 Deprecated move_iterator access [depr.move.iter.elem]

The following member is declared in addition to those members specified in 25.5.4.6:

namespace std {
  template<class Iterator>
  class move_iterator { 
  public:
    constexpr pointer operator->() const;
  }
}

constexpr pointer operator->() const;

Returns: current.

D.20 Deprecated shared_ptr atomic access [depr.util.smartptr.shared.atomic]

The header <memory> (20.2.2) has the following additions:

namespace std {
  template<class T>
  bool atomic_is_lock_free(const shared_ptr<T>* p);

  template<class T>
  shared_ptr<T> atomic_load(const shared_ptr<T>* p);
  template<class T>
  shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

  template<class T>
  void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);
  template<class T>
  void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

  template<class T>
  shared_ptr<T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);
  template<class T>
  shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

  template<class T>
  bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
  template<class T>
  bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);
  template<class T>
  bool atomic_compare_exchange_weak_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);
  template<class T>
  bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);
}

Concurrent access to a shared_ptr object from multiple threads does not introduce a data race if the access is done exclusively via the functions in this subclause and the instance is passed as their first argument.

The meaning of the arguments of type memory_order is explained in 33.5.4.

template<class T> bool atomic_is_lock_free(const shared_ptr<T>* p);

Requires: p shall not be null.

Returns: true if atomic access to *p is lock-free, false otherwise.
template<class T> shared_ptr<T> atomic_load(const shared_ptr<T>* p);

Requires: p shall not be null.

Returns: atomic_load_explicit(p, memory_order::seq_cst).

Throws: Nothing.

template<class T> shared_ptr<T> atomic_load_explicit(const shared_ptr<T>* p, memory_order mo);

Requires: p shall not be null.

Requires: mo shall not be memory_order::release or memory_order::acq_rel.

Returns: *p.

Throws: Nothing.

template<class T> void atomic_store(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.

Effects: As if by atomic_store_explicit(p, r, memory_order::seq_cst).

Throws: Nothing.

template<class T> void atomic_store_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.

Requires: mo shall not be memory_order::acquire or memory_order::acq_rel.

Effects: As if by p->swap(r).

Throws: Nothing.

template<class T> atomic_exchange(shared_ptr<T>* p, shared_ptr<T> r);

Requires: p shall not be null.

Returns: atomic_exchange_explicit(p, r, memory_order::seq_cst).

Throws: Nothing.

template<class T> shared_ptr<T> atomic_exchange_explicit(shared_ptr<T>* p, shared_ptr<T> r, memory_order mo);

Requires: p shall not be null.

Effects: As if by p->swap(r).

Returns: The previous value of *p.

Throws: Nothing.

template<class T>
bool atomic_compare_exchange_weak(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Requires: p shall not be null and v shall not be null.

Returns:
    atomic_compare_exchange_weak_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)

Throws: Nothing.

template<class T>
bool atomic_compare_exchange_strong(shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w);

Returns:
    atomic_compare_exchange_strong_explicit(p, v, w, memory_order::seq_cst, memory_order::seq_cst)

template<class T>
bool atomic_compare_exchange_weak_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);
template<class T>
bool atomic_compare_exchange_strong_explicit(
    shared_ptr<T>* p, shared_ptr<T>* v, shared_ptr<T> w,
    memory_order success, memory_order failure);

Requires: p shall not be null and v shall not be null. The failure argument shall not be memory_order::release nor memory_order::acq_rel.

Effects: If *p is equivalent to *v, assigns w to *p and has synchronization semantics corresponding to the value of success, otherwise assigns *p to *v and has synchronization semantics corresponding to the value of failure.

Returns: true if *p was equivalent to *v, false otherwise.

Throws: Nothing.

Remarks: Two shared_ptr objects are equivalent if they store the same pointer value and share ownership. The weak form may fail spuriously. See 33.5.8.2.

D.21 Deprecated basic_string capacity

The following member is declared in addition to those members specified in 23.4.3.5:

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
        public:
            void reserve();
    };
}
```

void reserve();

Effects: After this call, capacity() has an unspecified value greater than or equal to size().

[Note 1: This is a non-binding shrink to fit request. — end note]

D.22 Deprecated standard code conversion facets

D.22.1 General

The header <codecvt> provides code conversion facets for various character encodings.

D.22.2 Header <codecvt> synopsis

```cpp
namespace std {
    enum codecvt_mode {
        consume_header = 4,
        generate_header = 2,
        little_endian = 1
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8 : public codecvt<Elem, char, mbstate_t> {
        public:
            explicit codecvt_utf8(size_t refs = 0);
            ~codecvt_utf8();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf16 : public codecvt<Elem, char, mbstate_t> {
        public:
            explicit codecvt_utf16(size_t refs = 0);
            ~codecvt_utf16();
    };

    template<class Elem, unsigned long Maxcode = 0x10ffff, codecvt_mode Mode = (codecvt_mode)0>
    class codecvt_utf8_utf16 : public codecvt<Elem, char, mbstate_t> {
        public:
            explicit codecvt_utf8_utf16(size_t refs = 0);
    };
```
D.22.3 Requirements ~codecvt_utf8_utf16();

D.22.3.3 Requirements [depr.locale.stdcvt.req]

For each of the three code conversion facets `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

1 For each of the three code conversion facets, `codecvt_utf8`, `codecvt_utf16`, and `codecvt_utf8_utf16`:

   (1.1) `Elem` is the wide-character type, such as `wchar_t`, `char16_t`, or `char32_t`.

   (1.2) `Maxcode` is the largest wide-character code that the facet will read or write without reporting a conversion error.

   (1.3) If `(Mode & consume_header)`, the facet shall consume an initial header sequence, if present, when reading a multibyte sequence to determine the endianness of the subsequent multibyte sequence to be read.

   (1.4) If `(Mode & generate_header)`, the facet shall generate an initial header sequence when writing a multibyte sequence to advertise the endianness of the subsequent multibyte sequence to be written.

   (1.5) If `(Mode & little_endian)`, the facet shall generate a multibyte sequence in little-endian order, as opposed to the default big-endian order.

2 For the facet `codecvt_utf8`:

   (2.1) The facet shall convert between UTF-8 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.

   (2.2) Endianness shall not affect how multibyte sequences are read or written.

   (2.3) The multibyte sequences may be written as either a text or a binary file.

3 For the facet `codecvt_utf16`:

   (3.1) The facet shall convert between UTF-16 multibyte sequences and UCS-2 or UTF-32 (depending on the size of `Elem`) within the program.

   (3.2) Multibyte sequences shall be read or written according to the `Mode` flag, as set out above.

   (3.3) The multibyte sequences may be written only as a binary file. Attempting to write to a text file produces undefined behavior.

4 For the facet `codecvt_utf8_utf16`:

   (4.1) The facet shall convert between UTF-8 multibyte sequences and UTF-16 (one or two 16-bit codes) within the program.

   (4.2) Endianness shall not affect how multibyte sequences are read or written.

   (4.3) The multibyte sequences may be written as either a text or a binary file.

5 The encoding forms UTF-8, UTF-16, and UTF-32 are specified in ISO/IEC 10646. The encoding form UCS-2 is specified in ISO/IEC 10646:2003.315

D.23 Deprecated convenience conversion interfaces [depr.conversions]

D.23.1 General [depr.conversions.general]

1 The header `<locale>` has the following additions:

```cpp
namespace std {
    template<class Codecvt, class Elem = wchar_t,
             class WideAlloc = allocator<Elem>,
             class ByteAlloc = allocator<char>>
    class wstring_convert;

    template<class Codecvt, class Elem = wchar_t,
             class Tr = char_traits<Elem>>
    class wbuffer_convert;
}
```

D.23.2 Class template wstring_convert

Class template `wstring_convert` performs conversions between a wide string and a byte string. It lets you specify a code conversion facet (like class template `codecvt`) to perform the conversions, without affecting any streams or locales.

[Example 1: If you want to use the code conversion facet `codecvt_utf8` to output to `cout` a UTF-8 multibyte sequence corresponding to a wide string, but you don’t want to alter the locale for `cout`, you can write something like:

```cpp
wstring_convert<std::codecvt_utf8<wchar_t>> myconv;
std::string mbstring = myconv.to_bytes(L"Hello\n");
std::cout << mbstring;
```

—end example]

namespace std {

template<class Codecvt, class Elem = wchar_t,
        class WideAlloc = allocator<Elem>,
        class ByteAlloc = allocator<char>>

class wstring_convert {

  public:
  using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;
  using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;
  using state_type = typename Codecvt::state_type;
  using int_type = typename wide_string::traits_type::int_type;

  wstring_convert() : wstring_convert(new Codecvt) {}  
  explicit wstring_convert(Codecvt* pcvt);
  wstring_convert(Codecvt* pcvt, state_type state);
  explicit wstring_convert(const byte_string& byte_err, 
                          const wide_string& wide_err = wide_string());
  ~wstring_convert();

  wstring_convert(const wstring_convert&) = delete;
  wstring_convert& operator=(const wstring_convert&) = delete;

  wide_string from_bytes(char byte);
  wide_string from_bytes(const char* ptr);
  wide_string from_bytes(const byte_string& str);
  wide_string from_bytes(const Elem* first, const Elem* last);

  byte_string to_bytes(Elem wchar);
  byte_string to_bytes(const Elem* wptr);
  byte_string to_bytes(const wide_string& wstr);
  byte_string to_bytes(const Elem* first, const Elem* last);

  size_t converted() const noexcept;
  state_type state() const;

  private:
  byte_string byte_err_string;  // exposition only
  wide_string wide_err_string;  // exposition only
  Codecvt* cvtptr;              // exposition only
  state_type cvtstate;          // exposition only
  size_t cvtcount;              // exposition only

};

} // namespace std

The class template describes an object that controls conversions between wide string objects of class `basic_string<Elem, char_traits<Elem>, WideAlloc>` and byte string objects of class `basic_string<char, char_traits<char>, ByteAlloc>`. The class template defines the types `wide_string` and `byte_string` as synonyms for these two types. Conversion between a sequence of `Elem` values (stored in a `wide_string` object) and multibyte sequences (stored in a `byte_string` object) is performed by an object of class `Codecvt`, which meets the requirements of the standard code-conversion facet `codecvt<Elem, char, mbstate_t>`. An object of this class template stores:

(3.1) — `byte_err_string` — a byte string to display on errors

§ D.23.2 1929
— wide_err_string — a wide string to display on errors
— cvtptr — a pointer to the allocated conversion object (which is freed when the wstring_convert object is destroyed)
— cvtstate — a conversion state object
— cvtcount — a conversion count

using byte_string = basic_string<char, char_traits<char>, ByteAlloc>;

4 The type shall be a synonym for basic_string<char, char_traits<char>, ByteAlloc>.

size_t converted() const noexcept;
5 Returns: cvtcount.

wide_string from_bytes(char byte);
wide_string from_bytes(const char* ptr);
wide_string from_bytes(const byte_string& str);
wide_string from_bytes(const char* first, const char* last);

6 Effects: The first member function shall convert the single-element sequence byte to a wide string. The second member function shall convert the null-terminated sequence beginning at ptr to a wide string. The third member function shall convert the sequence stored in str to a wide string. The fourth member function shall convert the sequence defined by the range [first, last) to a wide string.

7 In all cases:
(7.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
(7.2) — The number of input elements successfully converted shall be stored in cvtcount.

8 Returns: If no conversion error occurs, the member function shall return the converted wide string. Otherwise, if the object was constructed with a wide-error string, the member function shall return the wide-error string. Otherwise, the member function throws an object of class range_error.

using int_type = typename wide_string::traits_type::int_type;

9 The type shall be a synonym for wide_string::traits_type::int_type.

state_type state() const;
10 Returns: cvtstate.

using state_type = typename Codecvt::state_type;
11 The type shall be a synonym for Codecvt::state_type.

byte_string to_bytes(Elem wchar);
byte_string to_bytes(const Elem* wptr);
byte_string to_bytes(const wide_string& wstr);
byte_string to_bytes(const Elem* first, const Elem* last);

12 Effects: The first member function shall convert the single-element sequence wchar to a byte string. The second member function shall convert the null-terminated sequence beginning at wptr to a byte string. The third member function shall convert the sequence stored in wstr to a byte string. The fourth member function shall convert the sequence defined by the range [first, last) to a byte string.

13 In all cases:
(13.1) — If the cvtstate object was not constructed with an explicit value, it shall be set to its default value (the initial conversion state) before the conversion begins. Otherwise it shall be left unchanged.
(13.2) — The number of input elements successfully converted shall be stored in cvtcount.

14 Returns: If no conversion error occurs, the member function shall return the converted byte string. Otherwise, if the object was constructed with a byte-error string, the member function shall return the byte-error string. Otherwise, the member function shall throw an object of class range_error.

using wide_string = basic_string<Elem, char_traits<Elem>, WideAlloc>;

15 The type shall be a synonym for basic_string<Elem, char_traits<Elem>, WideAlloc>.
explicit wstring_convert(Codecvt* pcvt);
wstring_convert(Codecvt* pcvt, state_type state);
explicit wstring_convert(const byte_string& byte_err,
    const wide_string& wide_err = wide_string());

Requires: For the first and second constructors, pcvt != nullptr.

Effects: The first constructor shall store pcvt in cvtptr and default values in cvtstate, byte_err_string, and wide_err_string. The second constructor shall store pcvt in cvtptr, state in cvtstate, and default values in byte_err_string and wide_err_string; moreover the stored state shall be retained between calls to from_bytes and to_bytes. The third constructor shall store new Codecvt in cvtptr, state_type() in cvtstate, byte_err in byte_err_string, and wide_err in wide_err_string.

~wstring_convert();

Effects: The destructor shall delete cvtptr.

D.23.3 Class template wbuffer_convert [depr.conversions.buffer]

1 Class template wbuffer_convert looks like a wide stream buffer, but performs all its I/O through an underlying byte stream buffer that you specify when you construct it. Like class template wstring_convert, it lets you specify a code conversion facet to perform the conversions, without affecting any streams or locales.

namespace std {
    template<class Codecvt, class Elem = wchar_t, class Tr = char_traits<Elem>>
    class wbuffer_convert : public basic_streambuf<Elem, Tr> {
    public:
        using state_type = typename Codecvt::state_type;

        wbuffer_convert() : wbuffer_convert(nullptr) {}
    explicit wbuffer_convert(streambuf* bytebuf,
            Codecvt* pcvt = new Codecvt,
            state_type state = state_type());

    ~wbuffer_convert();

    wbuffer_convert(const wbuffer_convert&) = delete;
    wbuffer_convert& operator=(const wbuffer_convert&) = delete;

    streambuf* rdbuf() const;
    streambuf* rdbuf(streambuf* bytebuf);

    state_type state() const;

    private:
        streambuf* bufptr; // exposition only
        Codecvt* cvtptr; // exposition only
        state_type cvtstate; // exposition only
    };
}

2 The class template describes a stream buffer that controls the transmission of elements of type Elem, whose character traits are described by the class Tr, to and from a byte stream buffer of type streambuf. Conversion between a sequence of Elem values and multibyte sequences is performed by an object of class Codecvt, which shall meet the requirements of the standard code-conversion facet codecvt<Elem, char, mbstate_t>.

3 An object of this class template stores:

(3.1) — bufptr — a pointer to its underlying byte stream buffer
(3.2) — cvtptr — a pointer to the allocated conversion object (which is freed when the wbuffer_convert object is destroyed)
(3.3) — cvtstate — a conversion state object

state_type state() const;

4 Returns: cvtstate.
streambuf* rdbuf() const;
Returns: bufptr.

streambuf* rdbuf(streambuf* bytebuf);
Effects: Stores bytebuf in bufptr.
Returns: The previous value of bufptr.

using state_type = typename Codecvt::state_type;
The type shall be a synonym for Codecvt::state_type.

explicit wbuffer_convert(
    streambuf* bytebuf,
    Codecvt* pcvt = new Codecvt,
    state_type state = state_type());
Requires: pcvt != nullptr.
Effects: The constructor constructs a stream buffer object, initializes bufptr to bytebuf, initializes cvtpt to pcvt, and initializes cvtstate to state.

~wbuffer_convert();
Effects: The destructor shall delete cvtptr.

D.24 Deprecated locale category facets

The ctype locale category includes the following facets as if they were specified in table Table 105 of 30.3.1.2.1.

codecvt<char16_t, char, mbstate_t>
codecvt<char32_t, char, mbstate_t>

The ctype locale category includes the following facets as if they were specified in table Table 106 of 30.3.1.2.1.

codecvt_byname<char16_t, char, mbstate_t>
codecvt_byname<char32_t, char, mbstate_t>

The following class template specializations are required in addition to those specified in 30.4.2.5. The specialization codecvt<char16_t, char, mbstate_t> converts between the UTF-16 and UTF-8 encoding forms, and the specialization codecvt<char32_t, char, mbstate_t> converts between the UTF-32 and UTF-8 encoding forms.

D.25 Deprecated filesystem path factory functions

template<class Source>
path u8path(const Source& source);
template<class InputIterator>
path u8path(InputIterator first, InputIterator last);
Requires: The source and [first, last) sequences are UTF-8 encoded. The value type of Source and InputIterator is char or char8_t. Source meets the requirements specified in 31.12.6.4.

Returns:
(2.1) — If value_type is char and the current native narrow encoding (31.12.6.3.2) is UTF-8, return path(source) or path(first, last); otherwise,
(2.2) — if value_type is wchar_t and the native wide encoding is UTF-16, or if value_type is char16_t or char32_t, convert source or [first, last) to a temporary, tmp, of type string_type and return path(tmp); otherwise,
(2.3) — convert source or [first, last) to a temporary, tmp, of type u32string and return path(tmp).
Remarks: Argument format conversion (31.12.6.3.1) applies to the arguments for these functions. How Unicode encoding conversions are performed is unspecified.

[Example 1: A string is to be read from a database that is encoded in UTF-8, and used to create a directory using the native encoding for filenames:
namespace fs = std::filesystem;
std::string utf8_string = read_utf8_data();
fs::create_directory(fs::u8path(utf8_string));]
For POSIX-based operating systems with the native narrow encoding set to UTF-8, no encoding or type conversion occurs.

For POSIX-based operating systems with the native narrow encoding not set to UTF-8, a conversion to UTF-32 occurs, followed by a conversion to the current native narrow encoding. Some Unicode characters may have no native character set representation.

For Windows-based operating systems a conversion from UTF-8 to UTF-16 occurs.

*Note 1:* The example above is representative of a historical use of `filesystem::u8path`. To indicate a UTF-8 encoding, passing a `std::u8string` to `path`’s constructor is preferred as it is consistent with `path`’s handling of other encodings. — *end note*

### D.26 Deprecated atomic operations

#### [depr.atomics]

#### D.26.1 General

[depr.atomics.general]

The header `<atomic>` (33.5.2) has the following additions.

```cpp
namespace std {
    template<class T>
    void atomic_init(volatile atomic<T>*, typename atomic<T>::value_type) noexcept;
    template<class T>
    void atomic_init(atomic<T>*, typename atomic<T>::value_type) noexcept;

    #define ATOMIC_VAR_INIT(value) see below
}
```

#### D.26.2 Volatile access

[depr.atomics.volatile]

If an atomic specialization has one of the following overloads, then that overload participates in overload resolution even if `atomic<T>::is_always_lock_free` is false:

```cpp
void store(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator=(T desired) volatile noexcept;
T load(memory_order order = memory_order::seq_cst) const volatile noexcept;
operator T() const volatile noexcept;
T exchange(T desired, memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order success, memory_order failure) volatile noexcept;
bool compare_exchange_weak(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
bool compare_exchange_strong(T& expected, T desired,
    memory_order order = memory_order::seq_cst) volatile noexcept;
T fetch_key(T operand, memory_order order = memory_order::seq_cst) volatile noexcept;
T operator op=(T operand) volatile noexcept;
T* fetch_key(ptrdiff_t operand, memory_order order = memory_order::seq_cst) volatile noexcept;
```

#### D.26.3 Non-member functions

[depr.atomics.nonmembers]

```cpp
template<class T>
void atomic_init(volatile atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
template<class T>
void atomic_init(atomic<T>* object, typename atomic<T>::value_type desired) noexcept;
```

*Effects:* Equivalent to: `atomic_store_explicit(object, desired, memory_order::relaxed);

#### D.26.4 Operations on atomic types

[depr.atomics.types.operations]

```cpp
#define ATOMIC_VAR_INIT(value) see below
```

The macro expands to a token sequence suitable for constant initialization of an atomic variable of static storage duration of a type that is initialization-compatible with `value`.

*Note 1:* This operation possibly needs to initialize locks. — *end note*

Concurrent access to the variable being initialized, even via an atomic operation, constitutes a data race.

*Example 1:*
atomic<int> v = ATOMIC_VAR_INIT(5);
— end example]
Annex E  (informative)
Conformance with UAX #31 [uaxid]

E.1 General [uaxid.general]
1 This Annex describes the choices made in application of UAX #31 ("Unicode Identifier and Pattern Syntax") to C++ in terms of the requirements from UAX #31 and how they do or do not apply to C++. In terms of UAX #31, C++ conforms by meeting the requirements R1 "Default Identifiers" and R4 "Equivalent Normalized Identifiers". The other requirements, also listed below, are either alternatives not taken or do not apply to C++.

E.2 R1 Default identifiers [uaxid.def]
E.2.1 General [uaxid.def.general]
1 UAX #31 specifies a default syntax for identifiers based on properties from the Unicode Character Database, UAX #44. The general syntax is

\[
\text{<Identifier>} := \text{<Start>} \text{<Continue>}* (\text{<Medial>} \text{<Continue>}+)*
\]

where \text{<Start>} has the XID_Start property, \text{<Continue>} has the XID_Continue property, and \text{<Medial>} is a list of characters permitted between continue characters. For C++ we add the character \text{U+005F LOW LINE}, or \text{_}, to the set of permitted \text{<Start>} characters, the \text{<Medial>} set is empty, and the \text{<Continue>} characters are unmodified. In the grammar used in UAX #31, this is

\[
\text{<Identifier>} := \text{<Start>} \text{<Continue>}*
\]

\[
\text{<Start>} := \text{XID_Start} + \text{U+005F}
\]

\[
\text{<Continue>} := \text{<Start>} + \text{XID_Continue}
\]

2 This is described in the C++ grammar in 5.10, where identifier is formed from identifier-start or identifier followed by identifier-continue.

E.2.2 R1a Restricted format characters [uaxid.def.rfmt]
1 If an implementation of UAX #31 wishes to allow format characters such as ZERO WIDTH JOINER or ZERO WIDTH NON-JOINER it must define a profile allowing them, or describe precisely which combinations are permitted.

2 C++ does not allow format characters in identifiers, so this does not apply.

E.2.3 R1b Stable identifiers [uaxid.def.stable]
1 An implementation may choose to guarantee that identifiers are stable across versions of the Unicode Standard. Once a string qualifies as an identifier it does so in all future versions.

2 C++ does not make this guarantee, except to the extent that UAX #31 guarantees the stability of the XID_Start and XID_Continue properties.

E.3 R2 Immutable identifiers [uaxid.immutable]
1 An implementation may choose to guarantee that the set of identifiers will never change by fixing the set of code points allowed in identifiers forever.

2 C++ does not choose to make this guarantee. As scripts are added to Unicode, additional characters in those scripts may become available for use in identifiers.

E.4 R3 Pattern_White_Space and Pattern_Syntax characters [uaxid.pattern]
1 UAX #31 describes how languages that use or interpret patterns of characters, such as regular expressions or number formats, may describe that syntax with Unicode properties.

2 C++ does not do this as part of the language, deferring to library components for such usage of patterns. This requirement does not apply to C++.
E.5  R4 Equivalent normalized identifiers

1 UAX #31 requires that implementations describe how identifiers are compared and considered equivalent.
2 C++ requires that identifiers be in Normalization Form C and therefore identifiers that compare the same under NFC are equivalent. This is described in 5.10.

E.6  R5 Equivalent case-insensitive identifiers

1 C++ considers case to be significant in identifier comparison, and does not do any case folding. This requirement does not apply to C++.

E.7  R6 Filtered normalized identifiers

1 If any characters are excluded from normalization, UAX #31 requires a precise specification of those exclusions.
2 C++ does not make any such exclusions.

E.8  R7 Filtered case-insensitive identifiers

1 C++ identifiers are case sensitive, and therefore this requirement does not apply.

E.9  R8 Hashtag identifiers

1 There are no hashtags in C++, so this requirement does not apply.
Bibliography

— ISO 4217:2015, Codes for the representation of currencies
— IANA Time Zone Database. Available from: https://www.iana.org/time-zones

The arithmetic specification described in ISO/IEC 10967-1:2012 is called LIA-1 in this document.

Index of grammar productions

The first bold page number for each entry is the page in the general text where the grammar production is defined. The second bold page number is the corresponding page in the Grammar summary (Annex A). Other page numbers refer to pages where the grammar production is mentioned in the general text.

Index of implementation-defined behavior

The entries in this index are rough descriptions; exact specifications are at the indicated page in the general text.

#pragma, 468
additional execution policies supported by parallel algorithms, 779, 1254
additional file_type enumerators for file systems supporting additional types of file, 1703
additional formats for time_get::do_get_date, 1578
additional supported forms of preprocessing directive, 456
algorithms for producing the standard random number distributions, 1403
alignment, 70
alignment additional values, 71
alignment of bit-fields within a class object, 286
allocation of bit-fields within a class object, 286
any use of an invalid pointer other than to perform indirection or deallocate, 67
argument values to construct ios_base::failure, 1605
assignability of placeholder objects, 767
behavior of iostream classes when traits::pos_type is not streampos or when traits::off_type is not streamoff, 1588
behavior of non-standard attributes, 245
behavior of strstreambuf::setbuf, 1919
bits in a byte, 61
choice of larger or smaller value of floating-point-literal, 27
code unit sequence for conditional-escape-sequence, 30
code unit sequence for non-representable string-literal, 29
column value of source_location::current, 530
conversions between pointers and integers, 131
converting function pointer to object pointer and vice versa, 131
default configuration of a pool, 637
default next_buffer_size for a monotonic_buffer_resource, 638
default number of buckets in unordered_map, 952, 953
default number of buckets in unordered_multiset, 969
default number of buckets in unordered_set, 964
default value for least_max_value template parameter of counting_semaphore, 1838
defining main in freestanding environment, 89
definition and meaning of __STDC__, 470, 1910
definition and meaning of __STDC_VERSION__, 470
definition of NULL, 504, 1910
derived type for typeid, 128
determination of kind of input file, 13
diagnostic message, 4
dynamic initialization of static inline variables before main, 92
dynamic initialization of static variables before main, 91, 92
dynamic initialization of thread-local variables before entry, 92
effect of calling associated Laguerre polynomials with n \geq 128 or m \geq 128, 1451
effect of calling associated Legendre polynomials with l \geq 128, 1451
effect of calling basic_filebuf::setbuf with nonzero arguments, 1669
effect of calling basic_filebuf::sync when a get area exists, 1670
effect of calling basic_streambuf::setbuf with nonzero arguments, 1649
effect of calling cylindrical Bessel functions of the first kind with nu \geq 128, 1452
effect of calling cylindrical Neumann functions with nu \geq 128, 1453
effect of calling Hermite polynomials with n \geq 128, 1454
effect of calling ios_base::sync_with_stdio after any input or output operation on standard streams, 1599
effect of calling irregular modified cylindrical Bessel functions with nu \geq 128, 1453
effect of calling Laguerre polynomials with n \geq 128, 1454
effect of calling Legendre polynomials with l \geq 128, 1454
effect of calling regular modified cylindrical Bessel functions with nu \geq 128, 1452
effect of calling spherical associated Legendre functions with l \geq 128, 1455
effect of calling spherical Bessel functions with n \geq 128, 1455
effect of calling spherical Neumann functions with n >= 128, 1456

manner of search for included source file, 459

mapping from name to catalog when calling messages::do_open, 1586

maximum depth of recursive template instantiations, 418

maximum size of an allocated object, 138, 526

meaning of '., \, /*, or // in a q-char-sequence or an h-char-sequence, 20

meaning of asm declaration, 242

meaning of attribute declaration, 172

meaning of dot-dot in root-directory, 1690

nesting limit for #include directives, 460

NTCTS in basic_ostream<charT, traits>& operator<<(nullptr_t), 1635

number of placeholders for bind expressions, 752, 767

number of threads in a program under a freestanding implementation, 84

operating system on which implementation depends, 1682

operator<< for large extended floating-point types, 1634

operator>> for large extended floating-point types, 1622

ordinary and wide literal encodings, 16

parameters to main, 89

passing argument of class type through ellipsis, 124

presence and meaning of native_handle_type and native_handle, 1764

rank of extended signed integer type, 81

representation of floating-point types, 78

required alignment for atomic_ref type’s operations, 1787, 1790–1792

resource limits on a message catalog, 1587

result of filesystem::file_size, 1720

result of inexact floating-point conversion, 101, 130

resuming a coroutine on a different execution agent, 546

return type of cartesian_product_view::size, 1240

return value of bad_alloc::what, 526

return value of bad_any_cast::what, 724

return value of bad_array_new_length::what, 526

type of \texttt{unordered\_multimap::iterator}, 955

type of \texttt{unordered\_multimap::local\_iterator}, 955

type of \texttt{unordered\_multimap::size\_type}, 955

type of \texttt{unordered\_multiset::const\_local\_iterator}, 965

type of \texttt{unordered\_multiset::const\_local\_difference\_type}, 965

type of \texttt{unordered\_multiset::iterator}, 965

type of \texttt{unordered\_multiset::local\_iterator}, 965

type of \texttt{unordered\_multiset::size\_type}, 965

type of \texttt{unordered\_set::const\_local\_iterator}, 960

type of \texttt{unordered\_set::const\_local\_difference\_type}, 960

type of \texttt{unordered\_set::iterator}, 960

type of \texttt{unordered\_set::local\_iterator}, 960

type of \texttt{unordered\_set::size\_type}, 960

type of \texttt{vector::const\_iterator}, 919

type of \texttt{vector::difference\_type}, 919

type of \texttt{vector::iterator}, 919

type of \texttt{vector::size\_type}, 919

type of \texttt{vector<\texttt{bool}>::const\_iterator}, 924

type of \texttt{vector<\texttt{bool}>::const\_pointer}, 923

type of \texttt{vector<\texttt{bool}>::difference\_type}, 924

type of \texttt{vector<\texttt{bool}>::iterator}, 924

type of \texttt{vector<\texttt{bool}>::pointer}, 923

underlying type of \texttt{bool}, 77

underlying type of \texttt{char}, 77

underlying type of \texttt{wchar\_t}, 77

unit suffix when \texttt{Period::type} is micro, 1479

value of bit-field that cannot represent assigned value, 153

incremented value, 126

initializer, 210

value of conditional-escape-sequence, 26

value of \texttt{ctype<char>::table\_size}, 1559

value of \texttt{future\_errc::broken\_promise}, 1843

value of \texttt{future\_errc::future\_already\_retrieved}, 1843

value of \texttt{future\_errc::no\_state}, 1843

value of \texttt{future\_errc::promise\_already\_satisfied}, 1843

value of \texttt{has\_attribute\_expression} for non-standard attributes, 458

value of non-encodable character literal or multicharacter literal, 25

value of \texttt{pow(0,0)}, 1381

value of result of inexact integer to floating-point conversion, 101

value representation of pointer types, 80

values of a trivially copyable type, 75

values of various \texttt{ATOMIC\_\_\_LOCK\_FREE} macros, 1786

whether \texttt{<cfenv>} functions can be used to manage floating-point status, 1375

whether a given \texttt{atomic} type’s operations are always lock free, 1793, 1794, 1798, 1800, 1801, 1804, 1806

whether a given \texttt{atomic\_ref} type’s operations are always lock free, 1787, 1790–1792

whether \texttt{basic\_spanbuf}\texttt{’}s move source is empty after a move, 1659

whether functions from Annex K of the C standard library are declared when C++ headers are included, 482

whether locale object is global or per-thread, 1551

whether pragma \texttt{FENV\_ACCESS} is supported, 1375

whether \texttt{rand} may introduce a data race, 1424

whether sequence pointers are copied by \texttt{basic\_filebuf} move constructor, 1666

whether sequence pointers are copied by \texttt{basic\_stringbuf} move constructor, 1646

whether sequence pointers are initialized to null pointers, 1645

whether source file inclusion of importable header is replaced with \texttt{import} directive, 460

whether source of translation units must be available to locate template definitions, 14

whether stack is unwound before invoking the function \texttt{std::terminate} when a \texttt{noexcept} specification is violated, 454

whether the implementation is hosted or freestanding, 483

whether the lifetime of a parameter ends when the callee returns or at the end of the enclosing full-expression, 123
whether the sources for module units and header units on which the current translation unit has an interface dependency are required to be available during translation, 14

whether the thread that executes `main` and the threads created by `std::thread` or `std::jthread` provide concurrent forward progress guarantees, 88

whether `time_get::do_get_year` accepts two-digit year numbers, 1578

whether values are rounded or truncated to the required precision when converting between `time_t` values and `time_point` objects, 1483

which functions in the C++ standard library may be recursively reentered, 500

which non-standard-layout objects containing no data are considered empty, 63

which scalar types have unique object representations, 659

width of integral type, 77
