If any exception is thrown, the result of the expression this->has_value() remains unchanged. If an exception is thrown during the call to T's move constructor, the state of *rhs.val is determined by the exception safety guarantee of T's move constructor. If an exception is thrown during the call to T's move assignment, the state of *val and *rhs.val is determined by the exception safety guarantee of T's move assignment. If is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T> && is_trivially_destructible_v<T> is true, this assignment operator is trivial.

template<class U = T> constexpr optional<T>& operator=(U&& v);

Constraints: is_same_v<remove_cvref_t<U>, optional> is false, conjunction_v<is_scalar<T>, is_same<T, decay_t<U>>> is false, is_constructible_v<T, U> is true, and is_assignable_v<T&, U> is true.

Effects: If *this contains a value, assigns std::forward<U>(v) to the contained value; otherwise direct-non-list-initializes the contained value with std::forward<U>(v).

Postconditions: *this contains a value.

Returns: *this.

Remarks: If any exception is thrown, the result of the expression this->has_value() remains unchanged. If an exception is thrown during the call to T's constructor, the state of v is determined by the exception safety guarantee of T's constructor. If an exception is thrown during the call to T's assignment, the state of *val and v is determined by the exception safety guarantee of T's assignment.

template<class U> constexpr optional<T>& operator=(const optional<U>& rhs);

Constraints:

(19.1) is_constructible_v<T, const U&> is true,
(19.2) isAssignable_v<T&, const U&> is true,
(19.3) is_constructible_v<T, optional<U>&> is false,
(19.4) is_constructible_v<T, optional<U>&&> is false,
(19.5) is_constructible_v<T, const optional<U>&> is false,
(19.6) is_constructible_v<T, const optional<U>&&> is false,
(19.7) is_convertible_v<optional<U>&, T> is false,
(19.8) is_convertible_v<optional<U>&&, T> is false,
(19.9) is_convertible_v<optional<U>&, T> is false,
(19.10) is_convertible_v<optional<U>&&, T> is false,

\[ (19.11) \text{is\_assignable\_v}\langle T, \text{optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (19.12) \text{is\_assignable\_v}\langle T, \text{optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (19.13) \text{is\_assignable\_v}\langle T, \text{const optional}\langle U\rangle\rangle \text{ is false, and} \]
\[ (19.14) \text{is\_assignable\_v}\langle T, \text{const optional}\langle U\rangle\rangle \text{ is false}. \]

\textbf{Effects:} See Table 61.

\end{table}

\[ \text{Postconditions: } \text{\textit{rhs}.has\_value()} == \text{\textit{this}->has\_value()}. \]
\[ \text{Returns: *this.} \]

\textbf{Remarks:} If any exception is thrown, the result of the expression \textit{this->has\_value()} remains unchanged. If an exception is thrown during the call to \textit{T}'s constructor, the state of \*\textit{rhs.val} is determined by the exception safety guarantee of \textit{T}'s constructor. If an exception is thrown during the call to \textit{T}'s assignment, the state of \*\textit{val} and \*\textit{rhs.val} is determined by the exception safety guarantee of \textit{T}'s assignment.

\template{class U} constexpr \textit{optional\langle T\rangle} & \textit{operator=(\text{optional}\langle U\rangle&& rhs);} \;

\textbf{Constraints:}
\[ (24.1) \text{is\_constructible\_v}\langle T, U\rangle \text{ is true}, \]
\[ (24.2) \text{is\_assignable\_v}\langle T, U\rangle \text{ is true}, \]
\[ (24.3) \text{is\_constructible\_v}\langle T, \text{optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (24.4) \text{is\_constructible\_v}\langle T, \text{optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (24.5) \text{is\_constructible\_v}\langle T, \text{const optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (24.6) \text{is\_constructible\_v}\langle T, \text{const optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (24.7) \text{is\_convertible\_v}\langle \text{optional}\langle U\rangle, T\rangle \text{ is false}, \]
\[ (24.8) \text{is\_convertible\_v}\langle \text{optional}\langle U\rangle, T\rangle \text{ is false}, \]
\[ (24.9) \text{is\_convertible\_v}\langle \text{const optional}\langle U\rangle, T\rangle \text{ is false}, \]
\[ (24.10) \text{is\_convertible\_v}\langle \text{const optional}\langle U\rangle, T\rangle \text{ is false}, \]
\[ (24.11) \text{is\_assignable\_v}\langle T, \text{optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (24.12) \text{is\_assignable\_v}\langle T, \text{optional}\langle U\rangle\rangle \text{ is false}, \]
\[ (24.13) \text{is\_assignable\_v}\langle T, \text{const optional}\langle U\rangle\rangle \text{ is false, and} \]
\[ (24.14) \text{is\_assignable\_v}\langle T, \text{const optional}\langle U\rangle\rangle \text{ is false}. \]

\textbf{Effects:} See Table 62. The result of the expression \textit{rhs.has\_value()} remains unchanged.

\textbf{Postconditions:} \textit{rhs.has\_value()} == \textit{this->has\_value()}. \]
\textbf{Returns: *this.}

\textbf{Remarks:} If any exception is thrown, the result of the expression \textit{this->has\_value()} remains unchanged. If an exception is thrown during the call to \textit{T}'s constructor, the state of \*\textit{rhs.val} is determined by the exception safety guarantee of \textit{T}'s constructor. If an exception is thrown during the call to \textit{T}'s assignment, the state of \*\textit{val} and \*\textit{rhs.val} is determined by the exception safety guarantee of \textit{T}'s assignment.
Table 62: `optional::operator=(optional<U>&&)` effects

<table>
<thead>
<tr>
<th>*this contains a value</th>
<th>*this does not contain a value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rhs contains a value</strong></td>
<td>assigns <code>std::move(*rhs)</code> to the contained value</td>
</tr>
<tr>
<td><strong>rhs does not contain a value</strong></td>
<td>destroys the contained value by calling <code>val-&gt;T::~T()</code></td>
</tr>
</tbody>
</table>

```cpp
template<class... Args> constexpr T& emplace(Args&&... args);
```

**Mandates:** `is_constructible_v<T, Args...>` is true.

**Effects:** Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `std::forward<Args>(args)`.

**Postconditions:** `*this` contains a value.

**Returns:** A reference to the new contained value.

**Throws:** Any exception thrown by the selected constructor of `T`.

**Remarks:** If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

```cpp
template<class U, class... Args> constexpr T& emplace(initializer_list<U> il, Args&&... args);
```

**Constraints:** `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

**Effects:** Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `il, std::forward<Args>(args)`.

**Postconditions:** `*this` contains a value.

**Returns:** A reference to the new contained value.

**Throws:** Any exception thrown by the selected constructor of `T`.

**Remarks:** If an exception is thrown during the call to `T`'s constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

### 22.5.3.5 Swap

```cpp
constexpr void swap(optional& rhs) noexcept(see below);
```

**Mandates:** `is_move_constructible_v<T>` is true.

**Preconditions:** Lvalues of type `T` are swappable.

**Effects:** See Table 63.

**Throws:** Any exceptions thrown by the operations in the relevant part of Table 63.

**Remarks:** The exception specification is equivalent to:

```cpp
is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T>
```

If any exception is thrown, the results of the expressions `*this->has_value()` and `rhs.has_value()` remain unchanged. If an exception is thrown during the call to function `swap`, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `swap` for lvalues of `T`. If an exception is thrown during the call to `T`'s move constructor, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of `T`'s move constructor.

### 22.5.3.6 Observers

```cpp
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

**Preconditions:** `*this` contains a value.

**Returns:** `val`.

§ 22.5.3.6
### Table 63: `optional::swap(optional&)` effects

<table>
<thead>
<tr>
<th>*this contains a value</th>
<th>*this does not contain a value</th>
</tr>
</thead>
<tbody>
<tr>
<td>rhs contains a value</td>
<td>calls <code>swap(*(*this), *rhs)</code></td>
</tr>
<tr>
<td>rhs does not contain a value</td>
<td>direct-non-list-initializes the contained value of rhs with <code>std::move(**(*this))</code>, followed by <code>val-&gt;T::~T()</code>; postcondition is that *this does not contain a value and rhs contains a value</td>
</tr>
</tbody>
</table>

3 **Remarks:** These functions are `constexpr` functions.

```cpp
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

4 **Preconditions:** *this contains a value.

5 **Returns:** *val.

6 **Remarks:** These functions are `constexpr` functions.

```cpp
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

7 **Preconditions:** *this contains a value.

8 **Effects:** Equivalent to: `return std::move(*val);`

9 **Returns:** true if and only if *this contains a value.

10 **Remarks:** This function is a `constexpr` function.

```cpp
constexpr bool has_value() const noexcept;
```

11 **Returns:** true if and only if *this contains a value.

12 **Remarks:** This function is a `constexpr` function.

```cpp
constexpr const T& value() const &;
constexpr T& value() &;
```

13 **Effects:** Equivalent to:

```cpp
return has_value() ? *val : throw bad_optional_access();
```

14 **Effects:** Equivalent to:

```cpp
return has_value() ? std::move(*val) : throw bad_optional_access();
```

15 **Mandates:** `is_copy_constructible_v<T> && is_convertible_v<U&&, T>` is true.

16 **Effects:** Equivalent to:

```cpp
return has_value() ? **this : static_cast<T>(std::forward<U>(v));
```
template<class U> constexpr T value_or(U&& v) &&;

Mandates: is_move_constructible_v<T> && is_convertible_v<U&&, T> is true.

Effects: Equivalent to:

\[ \text{return has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v));} \]

22.5.3.7 Monadic operations

[optional.monadic]

template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;

1. Let U be invoke_result_t<F, decltype(value())>.
2. Mandates: remove_cvref_t<U> is a specialization of optional.
3. Effects: Equivalent to:

   if (*this) {
       return invoke(std::forward<F>(f), value());
   } else {
       return remove_cvref_t<U>();
   }

4. template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;

7. Let U be remove_cv_t<invoke_result_t<F, decltype(value())>>.
8. Mandates: U is a non-array object type other than in_place_t or nullopt_t. The declaration
   U u(invoke(std::forward<F>(f), value()));
   is well-formed for some invented variable u.
   [Note 1: There is no requirement that U is movable (9.4.1). — end note]
9. Returns: If *this contains a value, an optional<U> object whose contained value is direct-non-list-
   initialized with invoke(std::forward<F>(f), value()); otherwise, optional<U>().

10. template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &&;

14. Mandates: is_same_v<remove_cvref_t<invoke_result_t<F>>, optional> is true.
15. Effects: Equivalent to:
if (*this) {
    return *this;
} else {
    return std::forward<F>(f)();
}

template<class F> constexpr optional or_else(F&& f) &&;

Constraints: F models invocable<> and T models move_constructible.

Mandates: is_same_v<remove_cvref_t<invoke_result_t<F>>, optional> is true.

Effects: Equivalent to:
if (*this) {
    return std::move(*this);
} else {
    return std::forward<F>(f)();
}

22.5.3.8 Modifiers

constexpr void reset() noexcept;

Effects: If *this contains a value, calls val->T::~T() to destroy the contained value; otherwise no effect.

Postconditions: *this does not contain a value.

22.5.4 No-value state indicator

struct nullopt_t{see below};
inline constexpr nullopt_t nullopt(unspecified);

The struct nullopt_t is an empty class type used as a unique type to indicate the state of not containing a value for optional objects. In particular, optional<T> has a constructor with nullopt_t as a single argument; this indicates that an optional object not containing a value shall be constructed.

Type nullopt_t shall not have a default constructor or an initializer-list constructor, and shall not be an aggregate.

22.5.5 Class bad_optional_access

namespace std {
    class bad_optional_access : public exception {
        // see 17.10.3 for the specification of the special member functions
        const char* what() const noexcept override;
    };
}

The class bad_optional_access defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an optional object that does not contain a value.

const char* what() const noexcept override;

Returns: An implementation-defined NTBS.

22.5.6 Relational operators

template<class T, class U> constexpr bool operator==(const optional<T>& x, const optional<U>& y);

Mandates: The expression *x == *y is well-formed and its result is convertible to bool.

[Note 1: T need not be Cpp17EqualityComparable. — end note]

Returns: If x.has_value() != y.has_value(), false; otherwise if x.has_value() == false, true; otherwise *x == *y.

Remarks: Specializations of this function template for which *x == *y is a core constant expression are constexpr functions.
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const optional<U>& y);

Mandates: The expression \(*x \neq *y\) is well-formed and its result is convertible to bool.

Returns: If x.has_value() \(!=\) y.has_value(), true; otherwise, if x.has_value() \(==\) false, false; otherwise \(*x \neq *y\).

Remarks: Specializations of this function template for which \(*x \neq *y\) is a core constant expression are constexpr functions.

template<class T, class U> constexpr bool operator<(const optional<T>& x, const optional<U>& y);

Mandates: \(*x < *y\) is well-formed and its result is convertible to bool.

Returns: If \(!y\), false; otherwise, if \(!x, true; otherwise \(*x < *y\).

Remarks: Specializations of this function template for which \(*x < *y\) is a core constant expression are constexpr functions.

template<class T, class U> constexpr bool operator>(const optional<T>& x, const optional<U>& y);

Mandates: The expression \(*x > *y\) is well-formed and its result is convertible to bool.

Returns: If \(!x\), false; otherwise, if \(!y, true; otherwise \(*x > *y\).

Remarks: Specializations of this function template for which \(*x > *y\) is a core constant expression are constexpr functions.

template<class T, class U> constexpr bool operator<=(const optional<T>& x, const optional<U>& y);

Mandates: The expression \(*x \leq *y\) is well-formed and its result is convertible to bool.

Returns: If \(!x\), true; otherwise, if \(!y\), false; otherwise \(*x \leq *y\).

Remarks: Specializations of this function template for which \(*x \leq *y\) is a core constant expression are constexpr functions.

template<class T, class U> constexpr bool operator>=(const optional<T>& x, const optional<U>& y);

Mandates: The expression \(*x \geq *y\) is well-formed and its result is convertible to bool.

Returns: If \(!y\), true; otherwise, if \(!x\), false; otherwise \(*x \geq *y\).

Remarks: Specializations of this function template for which \(*x \geq *y\) is a core constant expression are constexpr functions.

template<class T, three_way_comparable_with<T> U>
constexpr compare_three_way_result_t<T, U> operator<=>(const optional<T>& x, const optional<U>& y);

Returns: If x \&\& y, \(*x <=> *y\); otherwise x.has_value() <=> y.has_value().

Remarks: Specializations of this function template for which \(*x <=> *y\) is a core constant expression are constexpr functions.

22.5.7 Comparison with nullopt

template<class T> constexpr bool operator==(const optional<T>& x, nullopt_t) noexcept;

Returns: \(!x\).

template<class T> constexpr strong_ordering operator<=>(const optional<T>& x, nullopt_t) noexcept;

Returns: x.has_value() <=> false.

22.5.8 Comparison with T

template<class T, class U> constexpr bool operator==(const optional<T>& x, const U& v);

Mandates: The expression \(*x == v\) is well-formed and its result is convertible to bool.

[Note 1: T need not be Cpp17EqualityComparable. — end note]

Effects: Equivalent to: return x.has_value() ? \(*x == v : false;\)
template<class T, class U> constexpr bool operator==(const T& v, const optional<U>& x);

Mandates: The expression v == *x is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? v == *x : false;

template<class T, class U> constexpr bool operator!=(const optional<T>& x, const U& v);

Mandates: The expression *x != v is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? *x != v : true;

template<class T, class U> constexpr bool operator!=(const T& v, const optional<U>& x);

Mandates: The expression v != *x is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? v != *x : true;

template<class T, class U> constexpr bool operator<(const optional<T>& x, const U& v);

Mandates: The expression *x < v is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? *x < v : true;

template<class T, class U> constexpr bool operator<(const T& v, const optional<U>& x);

Mandates: The expression v < *x is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? v < *x : false;

template<class T, class U> constexpr bool operator<=(const optional<T>& x, const U& v);

Mandates: The expression *x <= v is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? *x <= v : true;

template<class T, class U> constexpr bool operator<=(const T& v, const optional<U>& x);

Mandates: The expression v <= *x is well-formed and its result is convertible to bool.
Effects: Equivalent to: return x.has_value() ? v <= *x : false;

template<class T, class U> requires (!is-optional<U>) && three_way_comparable_with<T, U>
constexpr compare_three_way_result_t<T, U> operator<=>(const optional<T>& x, const U& v);

Effects: Equivalent to: return x.has_value() ? *x <=> v : strong_ordering::less;

22.5.9 Specialized algorithms

[optional.specalg]

template<class T>
constexpr void swap(optional<T>& x, optional<T>& y) noexcept(noexcept(x.swap(y)));

Constraints: is_move_constructible_v<T> is true and is_swappable_v<T> is true.

§ 22.5.9
template<class T> constexpr optional<decay_t<T>> make_optional(T&& v);

Returns:
optional<decay_t<T>>(std::forward<T>(v)).

Effects:
Equivalent to:

```cpp
template<class T, class... Args>
constexpr optional<T> make_optional(Args&&... args);
```

Effects:
Equivalent to:

```cpp
template<class T, class U, class... Args>
constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);
```

22.5.10 Hash support

```cpp
template<class T> struct hash<optional<T>>;
```

The specialization hash<optional<T>> is enabled (22.10.19) if and only if hash<remove_const_t<T>> is enabled. When enabled, for an object o of type optional<T>, if o.has_value() == true, then hash<optional<T>>()()() evaluates to the same value as hash<remove_const_t<T>>()()()(); otherwise it evaluates to an unspecified value. The member functions are not guaranteed to be noexcept.

22.6 Variants

22.6.1 In general

A variant object holds and manages the lifetime of a value. If the variant holds a value, that value’s type has to be one of the template argument types given to variant. These template arguments are called alternatives.

22.6.2 Header <variant> synopsis

```cpp
#include <compare>  // see 17.12.1

namespace std {
  // 22.6.3, class template variant
  template<class... Types>
  class variant;

  // 22.6.4, variant helper classes
  template<class T> struct variant_size;
  template<class T> struct variant_size<const T>;
  template<class T>
  inline constexpr size_t variant_size_v = variant_size<T>::value;

  template<class... Types>
  struct variant_size<variant<Types...>>;

  template<size_t I, class... Types>
  struct variant_alternative;

  template<size_t I, class... Types>
  using variant_alternative_t = typename variant_alternative<I, Types...>::type;

  inline constexpr size_t variant_npos = -1;

  // 22.6.5, value access
  template<class T, class... Types>
  constexpr bool holds_alternative(const variant<Types...>&) noexcept;

  template<class T, class... Types>
  constexpr variant_alternative_t<I, variant<Types...>> get(variant<Types...>&);
```
template<
    size_t I,
    class... Types>
constexpr variant_alternative_t<I, variant<Types...>> get(variant<Types...>&&);

template<
    size_t I,
    class... Types>
constexpr const variant_alternative_t<I, variant<Types...>>& get(const variant<Types...>&);

template<
    size_t I,
    class... Types>
constexpr const variant_alternative_t<I, variant<Types...>>&& get(const variant<Types...>&&);

template<class T,
    class... Types>
constexpr T& get(variant<Types...>&);

template<class T,
    class... Types>
constexpr T&& get(variant<Types...>&&);

template<class T,
    class... Types>
constexpr const T& get(const variant<Types...>&);

template<class T,
    class... Types>
constexpr const T&& get(const variant<Types...>&&);

template<size_t I,
    class... Types>
constexpr add_pointer_t<
    variant_alternative_t<I, variant<Types...>>>
get_if(variant<Types...>*) noexcept;

template<size_t I,
    class... Types>
constexpr add_pointer_t<const variant_alternative_t<I, variant<Types...>>>
get_if(const variant<Types...>*) noexcept;

template<class T,
    class... Types>
constexpr add_pointer_t<T>
get_if(variant<Types...>*) noexcept;

template<class T,
    class... Types>
constexpr add_pointer_t<const T>
get_if(const variant<Types...>*) noexcept;

// 22.6.6, relational operators

template<class... Types>

22.6.3 Class template variant

22.6.3.1 General

```cpp
namespace std {
  template<class... Types>
  class variant {
  public:
    // 22.6.3.2, constructors
    constexpr variant() noexcept;
    constexpr variant(const variant&);
    constexpr variant(variant&&) noexcept;
    template<class T>
    constexpr variant(T&&) noexcept;
    template<class T, class... Args>
    constexpr explicit variant(in_place_type_t<T>, Args&&...);
    template<class T, class U, class... Args>
    constexpr explicit variant(in_place_type_t<T>, initializer_list<U>, Args&&...);
    template<size_t I, class... Args>
    constexpr explicit variant(in_place_index_t<I>, Args&&...);
    template<size_t I, class U, class... Args>
    constexpr explicit variant(in_place_index_t<I>, initializer_list<U>, Args&&...);

    // 22.6.3.3, destructor
    constexpr ~variant();

    // 22.6.3.4, assignment
    constexpr variant& operator=(const variant&);
    constexpr variant& operator=(variant&&) noexcept;
    template<class T> constexpr variant& operator=(T&&) noexcept;

    // 22.6.3.5, modifiers
    template<class T, class... Args>
    constexpr T& emplace(Args&&...);
    template<class T, class U, class... Args>
    constexpr T& emplace(initializer_list<U>, Args&&...);
    template<size_t I, class... Args>
    constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&...);
    template<size_t I, class U, class... Args>
    constexpr variant_alternative_t<I, variant<Types...>>&
    emplace(initializer_list<U>, Args&&...);

    // 22.6.3.6, value status
    constexpr bool valueless_by_exception() const noexcept;
    constexpr size_t index() const noexcept;

    // 22.6.3.7, swap
    constexpr void swap(variant&) noexcept;
  }
}
```

1 Any instance of `variant` at any given time either holds a value of one of its alternative types or holds no value. When an instance of `variant` holds a value of alternative type `T`, it means that a value of type `T`,

§ 22.6.3.1 714
referred to as the `variant` object's contained value, is allocated within the storage of the `variant` object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the contained value.

All types in `Types` shall meet the `Cpp17Destructible` requirements (Table 36).

A program that instantiates the definition of `variant` with no template arguments is ill-formed.

### 22.6.3.2 Constructors

In the descriptions that follow, let \( i \) be in the range \([0, \text{sizeof}...(\text{Types}))\), and \( T_i \) be the \( i^{th} \) type in `Types`.

```cpp
constexpr variant() noexcept;
```

**Constraints:** `is_default_constructible_v<T_0>` is true.

**Effects:** Constructs a `variant` holding a value-initialized value of type \( T_0 \).

**Postconditions:** `valueless_by_exception()` is false and `index()` is 0.

**Throws:** Any exception thrown by the value-initialization of \( T_0 \).

**Remarks:** This function is `constexpr` if and only if the value-initialization of the alternative type \( T_0 \) would satisfy the requirements for a `constexpr` function. The exception specification is equivalent to `is_nothrow_default_constructible_v<T_0>`.

**[Note 1:]** See also class `monostate`. — end note

```cpp
constexpr variant(const variant& w);
```

**Effects:** If \( w \) holds a value, initializes the `variant` to hold the same alternative as \( w \) and direct-initializes the contained value with `get<j>(w)` where \( j \) is `w.index()`.

**Constraints:** `is_default_constructible_v<T_0>` is true.

**Remarks:** This constructor is defined as deleted unless `is_copy_constructible_v<T_i>` is true for all \( i \). If `is_trivially_copy_constructible_v<T_i>` is true for all \( i \), this constructor is trivial.

```cpp
constexpr variant(variant&& w) noexcept;
```

**Constraints:** `is_move_constructible_v<T_0>` is true for all \( i \).

**Effects:** If \( w \) holds a value, initializes the `variant` to hold the same alternative as \( w \) and direct-initializes the contained value with `get<j>(\text{std::move}(w))`, where \( j \) is `w.index()`.

**Remarks:** The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<T_i>` for all \( i \). If `is_trivially_move_constructible_v<T_i>` is true for all \( i \), this constructor is trivial.

```cpp
template<class T> constexpr variant(T&& t) noexcept;
```

Let \( T_j \) be a type that is determined as follows: build an imaginary function `FUN(T_j)` for each alternative type \( T_i \) for which \( T_i \ x[] = \{\text{std::forward}<T>(t)\}; \) is well-formed for some invented variable \( x \). The overload `FUN(T_j)` selected by overload resolution for the expression `FUN(\text{std::forward}<T>(t))` defines the alternative \( T_j \) which is the type of the contained value after construction.

**Constraints:**

1. `sizeof...(\text{Types})` is nonzero,
2. `is_same_v<\text{remove_cvref_t}<T>, \text{variant}>` is false,
3. `remove_cvref_t<T>` is neither a specialization of `in_place_type_t` nor a specialization of `in_place_index_t`,
4. `is_constructible_v<T_j, T>` is true, and
5. the expression `FUN(\text{std::forward}<T>(t))` (with `FUN` being the above-mentioned set of imaginary functions) is well-formed.

**[Note 2:]**

```cpp
variant<string, string> v("abc");
```
is ill-formed, as both alternative types have an equally viable constructor for the argument. — end note]

Effects: Initializes *this to hold the alternative type Tj and direct-non-list-initializes the contained value with std::forward<T>(t).

Postconditions: holds_alternative<Tj>(*this) is true.

Throws: Any exception thrown by the initialization of the selected alternative Tj.

Remarks: The exception specification is equivalent to is_nothrow_constructible_v<Tj, T>. If Tj’s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

template<class T, class... Args> constexpr explicit variant(in_place_type_t<T>, Args&&... args);

Constraints:
— There is exactly one occurrence of T in Types... and
— is_constructible_v<T, Args...> is true.

Effects: Direct-non-list-initializes the contained value of type T with std::forward<Args>(args)....

Postconditions: holds_alternative<T>(*this) is true.

Throws: Any exception thrown by calling the selected constructor of T.

Remarks: If T’s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

template<class T, class U, class... Args>
constexpr explicit variant(in_place_type_t<T>, initializer_list<U> il, Args&&... args);

Constraints:
— There is exactly one occurrence of T in Types... and
— is_constructible_v<T, initializer_list<U>&, Args...> is true.

Effects: Direct-non-list-initializes the contained value of type T with il, std::forward<Args>(args)....

Postconditions: holds_alternative<T>(*this) is true.

Throws: Any exception thrown by calling the selected constructor of T.

Remarks: If T’s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

template<size_t I, class... Args>
constexpr explicit variant(in_place_index_t<I>, Args&&... args);

Constraints:
— I is less than sizeof...(Types) and
— is_constructible_v<T, Args...> is true.

Effects: Direct-non-list-initializes the contained value of type TI with std::forward<Args>(args)....

Postconditions: index() is I.

Throws: Any exception thrown by calling the selected constructor of TI.

Remarks: If TI’s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

template<size_t I, class U, class... Args>
constexpr explicit variant(in_place_index_t<I>, initializer_list<U> il, Args&&... args);

Constraints:
— I is less than sizeof...(Types) and
— is_constructible_v<T, initializer_list<U>&, Args...> is true.

Effects: Direct-non-list-initializes the contained value of type TI with il, std::forward<Args>(args)....

Postconditions: index() is I.
Remarks: If \( T_i \)'s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

22.6.3.3 Destructor

```cpp
constexpr ~variant();
```

Effects: If valueless_by_exception() is false, destroys the currently contained value.

Remarks: If is_trivially_destructible_v\( <T_i> \) is true for all \( T_i \), then this destructor is trivial.

22.6.3.4 Assignment

```cpp
constexpr variant& operator=(const variant& rhs);
```

Effects:
1. If neither *this nor rhs holds a value, there is no effect.
2. Otherwise, if *this holds a value but rhs does not, destroys the value contained in *this and sets *this to not hold a value.
3. Otherwise, if index() == j, assigns the value contained in rhs to the value contained in *this.
4. Otherwise, if either is_nothrow_copy_constructible_v\( <T_j> \) is true or is_nothrow_move_constructible_v\( <T_j> \) is false, equivalent to emplace\( <j>(get\( <j>(rhs))\).
5. Otherwise, equivalent to operator=(variant(rhs)).

Postconditions: index() == rhs.index().

Returns: *this.

Remarks: This operator is defined as deleted unless is_copy_constructible_v\( <T_i> \) && is_copy_assignable_v\( <T_i> \) is true for all i. If is_trivially_copy_constructible_v\( <T_i> \) && is_trivially_copy_assignable_v\( <T_i> \) is true for all i, this assignment operator is trivial.

```cpp
constexpr variant& operator=(variant&& rhs) noexcept;
```

Effects:
1. Let j be rhs.index().
2. Possible effects:
   1. If neither *this nor rhs holds a value, there is no effect.
   2. Otherwise, if *this holds a value but rhs does not, destroys the value contained in *this and sets *this to not hold a value.
   3. Otherwise, if index() == j, assigns the value contained in rhs to the value contained in *this.
   4. Otherwise, if either is_nothrow_copy_constructible_v\( <T_j> \) is true or is_nothrow_move_constructible_v\( <T_j> \) is false, equivalent to emplace\( <j>(get\( <j>(std::move(rhs))\).
   5. Otherwise, equivalent to operator=(variant(rhs)).

Postconditions: index() == rhs.index().

Returns: *this.

Remarks: If is_trivially_move_constructible_v\( <T_i> \) && is_trivially_move_assignable_v\( <T_i> \) is true for all i, this assignment operator is trivial. The exception specification is equivalent to is_nothrow_move_constructible_v\( <T_i> \) && is_nothrow_move_assignable_v\( <T_i> \) for all i.

```cpp
template<class T> constexpr variant& operator=(T&& t) noexcept;
```

Effects:
1. Let T_j be a type that is determined as follows: build an imaginary function \( FUN(T_j) \) for each alternative type T_i for which T_i x[] = {std::forward<T>(t)} is well-formed for some invented variable x. The overload \( FUN(T_j) \) selected by overload resolution for the expression \( FUN(std::forward<T>(t)) \) defines the alternative T_j which is the type of the contained value after assignment.

§ 22.6.3.4
Constraints:

- is_same_v<remove_cvref_t<T>, variant> is false,
- is_assignable_v<T, &T> && is_constructible_v<T, T> is true, and
- the expression \( \text{FUN}(\text{std::forward<T>(t)}) \) (with \( \text{FUN} \) being the above-mentioned set of imaginary functions) is well-formed.

[Note 1:

\[
\text{variant}<\text{string, string}> v; \\
v = "abc";
\]

is ill-formed, as both alternative types have an equally viable constructor for the argument. — end note]

Effects:

- If \(*\text{this} \) holds a \( T_j \), assigns \( \text{std::forward<T>(t)} \) to the value contained in \(*\text{this}\).
- Otherwise, if is_nothrow_constructible_v<T_j, T> is true, equivalent to \( \text{emplace}<j>(\text{std::forward<T>(t)}) \).
- Otherwise, equivalent to \( \text{emplace}<j>(T_j)(\text{std::forward<T>(t)}) \).

Postconditions: holds_alternative<T_j>(*this) is true, with \( T_j \) selected by the imaginary function overload resolution described above.

Returns: \*this.

Remarks: The exception specification is equivalent to:

- is_nothrow_assignable_v<T, &T> && is_nothrow_constructible_v<T, T> is true, and \( T \) occurs exactly once in Types.
- If an exception is thrown during the assignment of \( \text{std::forward<T>(t)} \) to the value contained in \(*\text{this}\), the state of the contained value and \( t \) are as defined by the exception safety guarantee of the assignment expression; \( \text{valueless_by_exception}() \) will be false.
- If an exception is thrown during the initialization of the contained value, the \text{variant} object is permitted to not hold a value.

22.6.3.5 Modifiers

\[
\begin{align*}
\text{template<class T, class... Args>& emplace(Args&&... args);} \\
\text{Constraints: is_constructible_v<T, Args...> is true, and T occurs exactly once in Types.} \\
\text{Effects: Equivalent to:} \\
\quad \text{return emplace<}(\text{std::forward<Args>(args)}...)\text{);} \\
\quad \text{where I is the zero-based index of T in Types.}
\end{align*}
\]

\[
\begin{align*}
\text{template<class T, class U, class... Args> constexpr T& emplace(initializer_list<U> il, Args&&... args);} \\
\text{Constraints: is_constructible_v<T, initializer_list<U>&, Args...> is true, and T occurs exactly once in Types.} \\
\text{Effects: Equivalent to:} \\
\quad \text{return emplace<}(il, \text{std::forward<Args>(args)}...)\text{);} \\
\quad \text{where I is the zero-based index of T in Types.}
\end{align*}
\]

\[
\begin{align*}
\text{template<\text{size_t} I, class... Args> constexpr \text{variant_alternative_t}<I, \text{variant<Types...>>& emplace(Args&&... args);} \\
\text{Mandates: I < sizeof...(Types).} \\
\text{Constraints: is_constructible_v<T_I, Args...> is true.} \\
\text{Effects: Destroys the currently contained value if \text{valueless_by_exception}() is false. Then direct-} \\
\text{non-list-initializes the contained value of type T_I with the arguments \text{std::forward<Args>(args)}...}. \\
\text{Postconditions: index()} is I. \\
\text{Returns: A reference to the new contained value.} \\
\text{Throws: Any exception thrown during the initialization of the contained value.}
\end{align*}
\]
Remarks: If an exception is thrown during the initialization of the contained value, the variant is permitted to not hold a value.

```
template<size_t I, class U, class... Args>
constexpr variant_alternative_t<I, variant<Types...>> &
emplace(initializer_list<U> il, Args&&... args);
```

Mandates: $I < \text{sizeof}\ldots\text{(Types)}$.

Constraints: is_constructible_v<T_I, initializer_list<U> &>, Args... is true.

Effects: Destroys the currently contained value if valueless_by_exception() is false. Then non-list-initializes the contained value of type T_I with il, std::forward<Args>(args)....

Postconditions: index() is I.

Returns: A reference to the new contained value.

Remarks: If an exception is thrown during the initialization of the contained value, the variant is permitted to not hold a value.

### 22.6.3.6 Value status

```
constexpr bool valueless_by_exception() const noexcept;
```

Effects: Returns false if and only if the variant holds a value.

[Note 1: It is possible for a variant to hold no value if an exception is thrown during a type-changing assignment or emplacement. The latter means that even a variant<float, int> can become valueless_by_exception(), for instance by

```c
struct S { operator int() { throw 42; };
variant<float, int> v(12.f);
vemplace<1>(S());
```

—end note]

```
constexpr size_t index() const noexcept;
```

Effects: If valueless_by_exception() is true, returns variant_npos. Otherwise, returns the zero-based index of the alternative of the contained value.

### 22.6.3.7 Swap

```
constexpr void swap(variant& rhs) noexcept(see below);
```

Mandates: is_move_constructible_v<T_i> is true for all $i$.

Preconditions: Lvalues of type $T_i$ are swappable (16.4.4.3).

Effects:

1. If valueless_by_exception() && rhs.valueless_by_exception() no effect.
2. Otherwise, if index() == rhs.index(), calls swap(get<i>(*this), get<i>(rhs)) where $i$ is index().
3. Otherwise, exchanges values of rhs and *this.

Throws: If index() == rhs.index(), any exception thrown by swap(get<i>(*this), get<i>(rhs)) with $i$ being index(). Otherwise, any exception thrown by the move constructor of $T_i$ or $T_j$ with $i$ being index() and $j$ being rhs.index().

Remarks: If an exception is thrown during the call to function swap(get<i>(*this), get<i>(rhs)), the states of the contained values of *this and of rhs are determined by the exception safety guarantee of swap for lvalues of $T_i$ with $i$ being index(). If an exception is thrown during the exchange of the values of *this and rhs, the states of the values of *this and of rhs are determined by the exception safety guarantee of variant’s move constructor. The exception specification is equivalent to the logical and of is_nothrow_move_constructible_v<T_i> && is_nothrow_swappable_v<T_i> for all $i$. 

§ 22.6.3.7 719
22.6.4 variant helper classes

```cpp
template<class T> struct variant_size;
```

All specializations of `variant_size` meet the `Cpp17UnaryTypeTrait` requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some N.

```cpp
template<class T> struct variant_size< const T >;
```

Let VS denote `variant_size<T>` of the cv-unqualified type T. Then each specialization of the template meets the `Cpp17UnaryTypeTrait` requirements (21.3.2) with a base characteristic of `integral_constant<size_t, VS::value>`.

```cpp
template<class... Types>
struct variant_size<variant<Types...>> : integral_constant<size_t, sizeof...(Types)> { };
```

Let VA denote `variant_alternative<I, T>` of the cv-unqualified type T. Then each specialization of the template meets the `Cpp17TransformationTrait` requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<VA::type>`.

```cpp
variant_alternative<I, variant<Types...>>::type
```

**Mandates:** I < sizeof...(Types).

**Type:** The type Ti.

22.6.5 Value access

```cpp
template<class T, class... Types>
constexpr bool holds_alternative(const variant<Types...>& v) noexcept;
```

**Mandates:** The type T occurs exactly once in Types.

**Returns:** true if `index()` is equal to the zero-based index of T in Types.

```cpp
template<size_t I, class... Types>
constexpr variant_alternative_t<I, variant<Types...>>& get(variant<Types...>& v);
```

```cpp
template<size_t I, class... Types>
constexpr variant_alternative_t<I, variant<Types...>>&& get(variant<Types...>&& v);
```

```cpp
template<size_t I, class... Types>
constexpr const variant_alternative_t<I, variant<Types...>>& get(const variant<Types...>& v);
```

```cpp
template<size_t I, class... Types>
constexpr const variant_alternative_t<I, variant<Types...>>&& get(const variant<Types...>&& v);
```

**Mandates:** I < sizeof...(Types).

**Effects:** If `v.index()` is I, returns a reference to the object stored in the variant. Otherwise, throws an exception of type `bad_variant_access`.

```cpp
template<class T, class... Types>
constexpr T& get(variant<Types...>& v);
```

```cpp
template<class T, class... Types>
constexpr T&& get(variant<Types...>&& v);
```

```cpp
template<class T, class... Types>
constexpr const T& get(const variant<Types...>& v);
```

```cpp
template<class T, class... Types>
constexpr const T&& get(const variant<Types...>&& v);
```

**Mandates:** The type T occurs exactly once in Types.

**Effects:** If v holds a value of type T, returns a reference to that value. Otherwise, throws an exception of type `bad_variant_access`.

```cpp
template<size_t I, class... Types>
constexpr add_pointer_t<variant_alternative_t<I, variant<Types...>>>
get_if(variant<Types...>* v) noexcept;
```

```cpp
template<size_t I, class... Types>
constexpr add_pointer_t<const variant_alternative_t<I, variant<Types...>>>
get_if(const variant<Types...>* v) noexcept;
```

**Mandates:** I < sizeof...(Types).

**Returns:** A pointer to the value stored in the variant, if v != nullptr and v->index() == I. Otherwise, returns nullptr.

§ 22.6.5 720
template<class T, class... Types>
    constexpr add_pointer_t<T>
    get_if(variant<Types...>* v) noexcept;

template<class T, class... Types>
    constexpr add_pointer_t<const T>
    get_if(const variant<Types...>* v) noexcept;

Mandates: The type T occurs exactly once in Types.

Effects: Equivalent to: return get_if<i>(v); with i being the zero-based index of T in Types.

22.6.6 Relational operators

template<class... Types>
    constexpr bool operator==(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) == get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.index() != w.index(), false; otherwise if v.valueless_by_exception(), true; otherwise get<i>(v) == get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator!=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) != get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.index() != w.index(), true; otherwise if v.valueless_by_exception(), false; otherwise get<i>(v) != get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator<(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) < get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If w.valueless_by_exception(), false; otherwise if v.valueless_by_exception(), true; otherwise, if v.index() < w.index(), true; otherwise if v.index() > w.index(), false; otherwise get<i>(v) < get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator>(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) > get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.valueless_by_exception(), false; otherwise if w.valueless_by_exception(), true; otherwise, if v.index() > w.index(), true; otherwise if v.index() < w.index(), false; otherwise get<i>(v) > get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator<=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) <= get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.valueless_by_exception(), true; otherwise if w.valueless_by_exception(), false; otherwise, if v.index() < w.index(), true; otherwise if v.index() > w.index(), false; otherwise get<i>(v) <= get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator>=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) >= get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If w.valueless_by_exception(), true; otherwise if v.valueless_by_exception(), false; otherwise, if v.index() > w.index(), true; otherwise if v.index() < w.index(), false; otherwise get<i>(v) >= get<i>(w) with i being v.index().

template<class... Types> requires (three_way_comparable<Types> && ...)
    constexpr common_comparison_category_t<
        compare_three_way_result_t<Types>...>
    operator<=>(const variant<Types...>& v, const variant<Types...>& w);

Effects: Equivalent to:
    if (v.valueless_by_exception() && w.valueless_by_exception())
        return strong_ordering::equal;
if (v.valueless_by_exception()) return strong_ordering::less;
if (w.valueless_by_exception()) return strong_ordering::greater;
if (auto c = v.index() <=> w.index(); c != 0) return c;
return get<i>(v) <=> get<i>(w);

with i being v.index().

### 22.6.7 Visitation

#### [variant.visit]

```cpp
template<class Visitor, class... Variants>
constexpr see below visit(Visitor&& vis, Variants&&... vars);
```

```cpp
template<class R, class Visitor, class... Variants>
constexpr R visit(Visitor&& vis, Variants&&... vars);
```

1. Let `as-variant` denote the following exposition-only function templates:

   ```cpp
template<class... Ts>
   auto&& as-variant(variant<Ts...>& var) { return var; }
template<class... Ts>
   auto&& as-variant(const variant<Ts...>& var) { return var; }
template<class... Ts>
   auto&& as-variant(variant<Ts...>&& var) { return std::move(var); }
template<class... Ts>
   auto&& as-variant(const variant<Ts...>&& var) { return std::move(var); }
```

Let `n` be `sizeof...(Variants)`. For each `0 ≤ i < n`, let `V_i` denote the type `decltype(as-variant(std::forward<Variants_i>(vars_i)))`.

2. **Constraints:** `V_i` is a valid type for all `0 ≤ i < n`.

3. Let `V` denote the pack of types `V_i`.

4. Let `m` be a pack of `n` values of type `size_t`. Such a pack is valid if

   ```cpp
   0 ≤ m_i < variant_size_v<remove_reference_t<V_i>>
   ```

   for all `0 ≤ i < n`. For each valid pack `m`, let `e(m)` denote the expression:

   ```cpp
   INVOKE(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4
   ```

   for the first form and

   ```cpp
   INVOKE<R>(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4
   ```

   for the second form.

5. **Mandates:** For each valid pack `m`, `e(m)` is a valid expression. All such expressions are of the same type and value category.

6. **Returns:** `e(m)`, where `m` is the pack for which `m_i` is `as-variant(vars_i).index()` for all `0 ≤ i < n`. The return type is `decltype(e(m))` for the first form.

7. **Throws:** `bad_variant_access` if `(as-variant(vars).valueless_by_exception() || ...)` is true.

8. **Complexity:** For `n ≤ 1`, the invocation of the callable object is implemented in constant time, i.e., for `n = 1`, it does not depend on the number of alternative types of `V_0`. For `n > 1`, the invocation of the callable object has no complexity requirements.

### 22.6.8 Class monostate

#### [variant.monostate]

```cpp
struct monostate{};
```

The class `monostate` can serve as a first alternative type for a `variant` to make the `variant` type default constructible.

### 22.6.9 monostate relational operators

#### [variant.monostate.relops]

```cpp
constexpr bool operator==(monostate, monostate) noexcept { return true; }
constexpr strong_ordering operator<=>(monostate, monostate) noexcept
{ return strong_ordering::equal; }
```

1. **[Note 1]**: `monostate` objects have only a single state; they thus always compare equal. — end note
22.6.10 Specialized algorithms

\[\text{template<class... Types>}\]

\[\text{constexpr void swap(variant<Types...>& v, variant<Types...>& w) noexcept(see below);}\]

1. Constraints: is_move_constructible_v\(<T_i>\) && is_swappable_v\(<T_i>\) is true for all \(i\).
2. Effects: Equivalent to \(v\).swap\((w)\).
3. Remarks: The exception specification is equivalent to noexcept\((v\).swap\((w)\)).

22.6.11 Class bad_variant_access

\[\text{namespace std {}\]

\[\text{class bad_variant_access : public exception {}\]

\[\text{public:\}

\[\text{// see 17.10.3 for the specification of the special member functions}\]

\[\text{const char* what() const noexcept override;}\]

\[\text{};}\]

\[}\]

1. Objects of type \text{bad_variant_access} are thrown to report invalid accesses to the value of a \text{variant} object.
2. Returns: An implementation-defined \text{ntbs}.

22.6.12 Hash support

\[\text{template<class... Types> struct hash<variant<Types...>>;}\]

1. The specialization \text{hash<variant<Types...>>} is enabled (22.10.19) if and only if every specialization in \text{hash<remove_const_t<Types>>...} is enabled. The member functions are not guaranteed to be noexcept.

\[\text{template<> struct hash<monostate>;}\]

2. The specialization is enabled (22.10.19).

22.7 Storage for any type

22.7.1 General

1. Subclause 22.7 describes components that C++ programs may use to perform operations on objects of a discriminated type.
2. [Note 1: The discriminated type can contain values of different types but does not attempt conversion between them, i.e., 5 is held strictly as an \text{int} and is not implicitly convertible either to "5" or to 5.0. This indifference to interpretation but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions. — end note]

22.7.2 Header \text{<any>} synopsis

\[\text{namespace std {}\]

\[\text{// 22.7.3, class bad_any_cast}\]

\[\text{class bad_any_cast;}\]

\[\text{// 22.7.4, class any}\]

\[\text{class any;}\]

\[\text{// 22.7.5, non-member functions}\]

\[\text{void swap(any& x, any& y) noexcept;}\]

\[\text{template<class T, class... Args>}\]

\[\text{any make_any(Args&&... args);}\]

\[\text{template<class T, class U, class... Args>}\]

\[\text{any make_any(initializer_list<U> il, Args&&... args);}\]
template<class T>
T any_cast(const any& operand);

template<class T>
T any_cast(any& operand);

template<class T>
T any_cast(any&& operand);

template<class T>
const T* any_cast(const any* operand) noexcept;

template<class T>
T* any_cast(any* operand) noexcept;
}

22.7.3 Class bad_any_cast

namespace std {

    class bad_any_cast : public bad_cast {
        public:
            // see 17.10.3 for the specification of the special member functions
            const char* what() const noexcept override;
    };
}

1 Objects of type bad_any_cast are thrown by a failed any_cast (22.7.5).

const char* what() const noexcept override;

2 Returns: An implementation-defined ntbs.

22.7.4 Class any

22.7.4.1 General

namespace std {

    class any {
        public:
            // 22.7.4.2, construction and destruction
            constexpr any() noexcept;

            any(const any& other);

            any(any&& other) noexcept;

            template<class T>
            any(T&& value);

            template<class T, class... Args>
            explicit any(in_place_type_t<T>, Args&&...);

            template<class T, class U, class... Args>
            explicit any(in_place_type_t<T>, initializer_list<U>, Args&&...);

            ~any();

            // 22.7.4.3, assignments
            any& operator=(const any& rhs);

            any& operator=(any&& rhs) noexcept;

            template<class T>
            any& operator=(T&& rhs);

            // 22.7.4.4, modifiers
            template<class T, class... Args>
            decay_t<T>& emplace(Args&&...);

            template<class T, class U, class... Args>
            decay_t<T>& emplace(initializer_list<U>, Args&&...);

            void reset() noexcept;

            void swap(any& rhs) noexcept;

§ 22.7.4.1
An object of class any stores an instance of any type that meets the constructor requirements or it has no value, and this is referred to as the state of the class any object. The stored instance is called the contained value. Two states are equivalent if either they both have no value, or they both have a value and the contained values are equivalent.

The non-member any_cast functions provide type-safe access to the contained value.

Implementations should avoid the use of dynamically allocated memory for a small contained value. However, any such small-object optimization shall only be applied to types T for which is_nothrow_move_constructible_v<T> is true.

[Example 1: A contained value of type int could be stored in an internal buffer, not in separately-allocated memory. —end example]

### 22.7.4.2 Construction and destruction

`constexpr any() noexcept;`

**Postconditions:** has_value() is false.

`any(const any& other);`

**Effects:** If other.has_value() is false, constructs an object that has no value. Otherwise, equivalent to any(in_place_type<T>, any_cast<const T&>(other)) where T is the type of the contained value.

**Throws:** Any exceptions arising from calling the selected constructor for the contained value.

`any(any&& other) noexcept;`

**Effects:** If other.has_value() is false, constructs an object that has no value. Otherwise, constructs an object of type any that contains either the contained value of other, or contains an object of the same type constructed from the contained value of other considering that contained value as an rvalue.

```cpp
template<class T>
any(T&& value);
```

**Constraints:** VT is not the same type as any, VT is not a specialization of in_place_type_t, and is_copy_constructible_v<VT> is true.

**Preconditions:** VT meets the Cpp17CopyConstructible requirements.

**Effects:** Constructs an object of type any that contains an object of type VT direct-initialized with std::forward<T>(value).

**Throws:** Any exception thrown by the selected constructor of VT.

```cpp
template<class T, class... Args>
explicit any(in_place_type_t<T>, Args&&... args);
```

**Constraints:** is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.

**Preconditions:** VT meets the Cpp17CopyConstructible requirements.

**Effects:** Direct-non-list-initializes the contained value of type VT with std::forward<Args>(args)....

**Postconditions:** *this contains a value of type VT.

**Throws:** Any exception thrown by the selected constructor of VT.

```cpp
template<class T, class U, class... Args>
explicit any(in_place_type_t<T>, initializer_list<U> il, Args&&... args);
```

**Constraints:** is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.

**Preconditions:** VT meets the Cpp17CopyConstructible requirements.

**Effects:** Direct-non-list-initializes the contained value of type VT with std::forward<Args>(args)....

**Postconditions:** *this contains a value of type VT.

**Throws:** Any exception thrown by the selected constructor of VT.
Constraints: \( \text{is\_copy\_constructible\_v<VT> is true and is\_constructible\_v<VT, initializer\_list<U>&, Args...> is true.} \)

Preconditions: VT meets the \texttt{Cpp17CopyConstructible} requirements.

Effects: Direct-non-list-initializes the contained value of type VT with il, \texttt{std::forward<Args>(args)....}

Postconditions: \*this contains a value.

Throws: Any exception thrown by the selected constructor of VT.

\(~\text{any();}\

Effects: As if by \texttt{reset().}

### 22.7.4.3 Assignment

\texttt{any\& operator=(const any\& rhs);}  
\hspace{1cm} Effects: As if by \texttt{any(rhs).swap(*this)}. No effects if an exception is thrown.  
\hspace{1cm} Returns: \*this.  
\hspace{1cm} Throws: Any exceptions arising from the copy constructor for the contained value.

\texttt{any\& operator=(any\&\& rhs) noexcept;}  
\hspace{1cm} Effects: As if by \texttt{any(std::move(rhs)).swap(*this)}.  
\hspace{1cm} Postconditions: The state of \*this is equivalent to the original state of rhs.  
\hspace{1cm} Returns: \*this.

\texttt{template<class T> any\& operator=(T\&\& rhs);}  
\hspace{1cm} Let VT be \texttt{decay\_t<T>}.  
\hspace{1cm} Constraints: VT is not the same type as any and \texttt{is\_copy\_constructible\_v<VT> is true.}  
\hspace{1cm} Preconditions: VT meets the \texttt{Cpp17CopyConstructible} requirements.  
\hspace{1cm} Effects: Constructs an object tmp of type any that contains an object of type VT direct-initialized with \texttt{std::forward<T>(rhs)}, and tmp.swap(*this). No effects if an exception is thrown.  
\hspace{1cm} Returns: \*this.  
\hspace{1cm} Throws: Any exception thrown by the selected constructor of VT.

### 22.7.4.4 Modifiers

\texttt{template<class T, class... Args>}  
\hspace{1cm} \texttt{decay\_t<T\&\& emplace(Args\&\&... args);}  
\hspace{1cm} Let VT be \texttt{decay\_t<T>}.  
\hspace{1cm} Constraints: \texttt{is\_copy\_constructible\_v<VT> is true and is\_constructible\_v<VT, Args...> is true.}  
\hspace{1cm} Preconditions: VT meets the \texttt{Cpp17CopyConstructible} requirements.  
\hspace{1cm} Effects: Calls \texttt{reset()}. Then direct-non-list-initializes the contained value of type VT with \texttt{std::forward<Args>(args)....}  
\hspace{1cm} Postconditions: \*this contains a value.  
\hspace{1cm} Returns: A reference to the new contained value.  
\hspace{1cm} Throws: Any exception thrown by the selected constructor of VT.  
\hspace{1cm} Remarks: If an exception is thrown during the call to VT's constructor, \*this does not contain a value, and any previously contained value has been destroyed.

\texttt{template<class T, class U, class... Args>}  
\hspace{1cm} \texttt{decay\_t<T\&\& emplace(initializer\_list<U> il, Args\&\&... args);}  
\hspace{1cm} Let VT be \texttt{decay\_t<T>}.  

\§ 22.7.4.4
Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, initializer_list<U> &, Args...> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.

Effects: Calls reset(). Then direct-non-list-initializes the contained value of type VT with il, std::forward<Args>(args)....

Postconditions: *this contains a value.

Returns: A reference to the new contained value.

Remarks: If an exception is thrown during the call to VT’s constructor, *this does not contain a value, and any previously contained value has been destroyed.

void reset() noexcept;

Effects: If has_value() is true, destroys the contained value.

Postconditions: has_value() is false.

void swap(any& rhs) noexcept;

Effects: Exchanges the states of *this and rhs.

22.7.4.5 Observers

bool has_value() const noexcept;

Returns: true if *this contains an object, otherwise false.

cast type_info& type() const noexcept;

Returns: typeid(T) if *this has a contained value of type T, otherwise typeid(void).

[Note 1: Useful for querying against types known either at compile time or only at runtime. — end note]

22.7.5 Non-member functions

void swap(any& x, any& y) noexcept;

Effects: Equivalent to x.swap(y).

template<class T, class... Args>
any make_any(Args&&... args);

Effects: Equivalent to: return any(in_place_type<T>, std::forward<Args>(args)...);

template<class T, class U, class... Args>
any make_any(initializer_list<U> il, Args&&... args);

Effects: Equivalent to: return any(in_place_type<T>, il, std::forward<Args>(args)...);

template<class T>
T any_cast(const any& operand);

template<class T>
T any_cast(any& operand);

template<class T>
T any_cast(any&& operand);

Let U be the type remove_cvref_t<T>.

Mandates: For the first overload, is_constructible_v<T, const U&> is true. For the second overload, is_constructible_v<T, U&> is true. For the third overload, is_constructible_v<T, U> is true.

Returns: For the first and second overload, static_cast<T>(*any_cast<U>(koperand)). For the third overload, static_cast<T>(std::move(*any_cast<U>(koperand))).

Throws: bad_any_cast if operand.type() != typeid(remove_reference_t<T>).

[Example 1:
any x(5);
assert(any_cast<int>(x) == 5); // cast to value
any_cast<int&>(x) = 10; // cast to reference]
assert(any_cast<int>(x) == 10);

x = "Meow";    // x holds const char*
assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
any_cast<const char*>(x) = "Harry";
assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

x = string("Meow");    // x holds string
string s, s2("Jane");
s = move(any_cast<string&>(x));    // move from any
assert(s == "Meow");
any_cast<string&>(x) = move(s2);    // move to any
assert(any_cast<const string&>(x) == "Jane");

string cat("Meow");
const any y(cat);    // const y holds string
assert(any_cast<const string&>(y) == cat);

any_cast<string&>(y);    // error: cannot any_cast away const

— end example]

template<class T>
const T* any_cast(const any* operand) noexcept;

template<class T>
T* any_cast(any* operand) noexcept;

9 Returns: If operand != nullptr && operand->type() == typeid(T), a pointer to the object contained by operand; otherwise, nullptr.

10 [Example 2:

bool is_string(const any& operand) {
    return any_cast<string&>(&operand) != nullptr;
}

— end example]

22.8 Expected objects [expected]

22.8.1 In general [expected.general]

Subclause 22.8 describes the class template expected that represents expected objects. An expected<T, E> object holds an object of type T or an object of type unexpected<E> and manages the lifetime of the contained objects.

22.8.2 Header <expected> synopsis [expected.syn]

namespace std {
    // 22.8.3, class template unexpected
template<class E> class unexpected;

    // 22.8.4, class template bad_expected_access
template<class E> class bad_expected_access;

    // 22.8.5, specialization for void
template<> class bad_expected_access<void>;

    // in-place construction of unexpected values
struct unexpect_t {
    explicit unexpect_t() = default;
};
inline constexpr unexpect_t unexpect{};

    // 22.8.6, class template expected
template<class T, class E> class expected;

§ 22.8.2 728
22.8.3 Class template unexpected

22.8.3.1 General

Subclause 22.8.3 describes the class template unexpected that represents unexpected objects stored in expected objects.

```cpp
namespace std {
    template<class E>
    class unexpected {
        public:
            constexpr unexpected(const unexpected&) = default;
            constexpr unexpected(unexpected&&) = default;
            template<class Err = E>
                constexpr explicit unexpected(Err&&);
            template<class... Args>
                constexpr explicit unexpected(in_place_t, Args&&...);
            template<class U, class... Args>
                constexpr explicit unexpected(in_place_t, initializer_list<U>, Args&&...);
            constexpr unexpected& operator=(const unexpected&) = default;
            constexpr unexpected& operator=(unexpected&&) = default;
            constexpr const E& error() const & noexcept;
            constexpr E& error() & noexcept;
            constexpr const E&& error() const && noexcept;
            constexpr E&& error() && noexcept;
            constexpr void swap(unexpected& other) noexcept;
            template<class E2>
                friend constexpr bool operator==(const unexpected&, const unexpected&E2&);
        private:
            E unex;               // exposition only
        }
    template<class E> unexpected(E) -> unexpected<E>;
}
```

2 A program that instantiates the definition of unexpected for a non-object type, an array type, a specialization of unexpected, or a cv-qualified type is ill-formed.

22.8.3.2 Constructors

```cpp
template<class Err = E>
    constexpr explicit unexpected(Err&& e);
```

1 Constraints:

(1.1) is_same_v<remove_cvref_t<Err>, unexpected> is false; and
(1.2) is_same_v<remove_cvref_t<Err>, in_place_t> is false; and
(1.3) is_constructible_v<E, Err> is true.

2 Effects: Direct-non-list-initializes `unex` with std::forward<Err>(e).

3 Throws: Any exception thrown by the initialization of `unex`.

```cpp
template<class... Args>
    constexpr explicit unexpected(in_place_t, Args&&... args);
```

4 Constraints: is_constructible_v<E, Args...> is true.
Effects: Direct-non-list-initializes `unexpected` with `std::forward<Args>(args)`.

Throws: Any exception thrown by the initialization of `unexpected`.

```
template<class U, class... Args>
constexpr explicit unexpected(in_place_t, initializer_list<U> il, Args&&... args);
```

Constraints: `is_constructible_v<E, initializer_list<U>&, Args...>` is true.

Effects: Direct-non-list-initializes `unexpected` with `il`, `std::forward<Args>(args)`.

Throws: Any exception thrown by the initialization of `unexpected`.

22.8.3.3 Observers

```
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

Returns: `unexpected`.

```
constexpr E&& error() && noexcept;
```

Returns: `std::move(unexpected)`.

22.8.3.4 Swap

```
constexpr void swap(unexpected& other) noexcept(is_nothrow_swappable_v<E>);
```

Mandates: `is_swappable_v<E>` is true.

Effects: Equivalent to: using `std::swap`; `swap(unexpected, other.unexpected)`.

```
friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));
```

Constraints: `is_swappable_v<E>` is true.

Effects: Equivalent to `x.swap(y)`.

22.8.3.5 Equality operator

```
template<class E2>
friend constexpr bool operator==(const unexpected& x, const unexpected<E2>& y);
```

Mandates: The expression `x.error() == y.error()` is well-formed and its result is convertible to `bool`.

Returns: `x.error() == y.error()`.

22.8.4 Class template `bad_expected_access`

```
namespace std {
    template<class E>
    class bad_expected_access : public bad_expected_access<void> {
        public:
            explicit bad_expected_access(E);
            const char* what() const noexcept override;
            E& error() & noexcept;
            const E& error() const & noexcept;
            E&& error() && noexcept;
            const E&& error() const && noexcept;
        private:
            E unexpected; // exposition only
    }
}
```

The class template `bad_expected_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an `expected<T, E>` object for which `has_value()` is false.

```
explicit bad_expected_access(E e);
```

Effects: Initializes `unexpected` with `std::move(e)`.
const E& error() const & noexcept;
E& error() & noexcept;

Returns: unex.

E&& error() && noexcept;
const E&& error() const && noexcept;

Returns: std::move(unex).

const char* what() const noexcept override;

Returns: An implementation-defined ntbs.

22.8.5  Class template specialization bad_expected_access<void>  [expected.bad(void]

namespace std {
  template<class E>
  class bad_expected_access<void> : public exception {
    protected:
      bad_expected_access() noexcept;
      bad_expected_access(const bad_expected_access&);
      bad_expected_access(bad_expected_access&&);
      bad_expected_access& operator=(const bad_expected_access&);
      bad_expected_access& operator=(bad_expected_access&&);
    public:
      const char* what() const noexcept override;
  };
}

const char* what() const noexcept override;

Returns: An implementation-defined ntbs.

22.8.6  Class template expected  [expected.expected]

22.8.6.1  General  [expected.object.general]

namespace std {
  template<class T, class E>
  class expected {
    public:
      using value_type = T;
      using error_type = E;
      using unexpected_type = unexpected<E>;

      template<class U>
      using rebind = expected<U, error_type>;

      // 22.8.6.2, constructors
      constexpr expected();
      constexpr expected(const expected&);
      constexpr expected(expected&&) noexcept(see below);
      template<class U, class G>
      constexpr explicit(see below) expected(const expected<U, G>&);
      template<class U, class G>
      constexpr explicit(see below) expected(expected<U, G>&&);

      template<class U = T>
      constexpr explicit(see below) expected(U&& v);

      template<class G>
      constexpr expected(const unexpected<G>&);
      template<class G>
      constexpr expected(unexpected<G>&&);

§ 22.8.6.1  731
```cpp
template<class... Args>
constexpr explicit expected(in_place_t, Args&&...);
template<class U, class... Args>
constexpr explicit expected(in_place_t, initializer_list<U>, Args&&...);
template<class... Args>
constexpr explicit expected(unexpect_t, Args&&...);
template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U>, Args&&...);

// 22.8.6.3, destructor
consexpr ~expected();

// 22.8.6.4, assignment
consexpr expected& operator=(const expected&);
consexpr expected& operator=(expected&) noexcept;
template<class U = T> consexpr expected& operator=(U&);
template<class G>
constexpr expected& operator=(const unexpected<G>&);
template<class G>
constexpr expected& operator=(unexpected<G>&&);
template<class... Args>
constexpr T& emplace(Args&&...) noexcept;
template<class U, class... Args>
constexpr T& emplace(initializer_list<U>, Args&&...) noexcept;

// 22.8.6.5, swap
consexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

// 22.8.6.6, observers

consexpr E& error() & noexcept;
consexpr const E&& error() const && noexcept;
consexpr E&& error() && noexcept;
template<class U> consexpr T value_or(U&&) const &
template<class U> consexpr T value_or(U&&) &&

// 22.8.6.7, equality operators
template<class T2, class E2> requires (!is_void_v<T2>)
friend consexpr bool operator==(const expected&, const expected<T2, E2>& y);
template<class T2>
friend consexpr bool operator==(const expected&, const T2&);
template<class E2>
friend consexpr bool operator==(const expected&, const unexpected<E2>&);

private:
bool has_val; // exposition only
union {
  T val; // exposition only
  E unex; // exposition only
};
```

© ISO/IEC

N4917

§ 22.8.6.1
Any object of type `expected<T, E>` either contains a value of type `T` or a value of type `E` within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type `T` or the object of type `E`. Member `has_val` indicates whether the `expected<T, E>` object contains an object of type `T`.

A program that instantiates the definition of template `expected<T, E>` for a reference type, a function type, or for possibly cv-qualified types `in_place_t`, `unexpect_t`, or a specialization of `unexpected` for the `T` parameter is ill-formed. A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.

When `T` is not `cv void`, it shall meet the `Cpp17Destructible` requirements (Table 36). `E` shall meet the `Cpp17Destructible` requirements.

### 22.8.6.2 Constructors [expected.object ctor]

#### constexpr `expected()`;

1. **Constraints**: `is_default_constructible_v<T>` is true.
2. **Effects**: Value-initializes `val`.
3. **Postconditions**: `has_value()` is true.
4. **Throws**: Any exception thrown by the initialization of `val`.

#### constexpr `expected(const expected& rhs)`;

5. **Effects**: If `rhs.has_value()` is true, direct-non-list-initializes `val` with `*rhs`. Otherwise, direct-non-list-initializes `unex` with `rhs.error()`.
6. **Postconditions**: `rhs.has_value()` == `this->has_value()`.
7. **Throws**: Any exception thrown by the initialization of `val` or `unex`.
8. **Remarks**: This constructor is defined as deleted unless
   - (8.1) `is_copy_constructible_v<T>` is true and
   - (8.2) `is_copy_constructible_v<E>` is true.
9. This constructor is trivial if
   - (9.1) `is_trivially_copy_constructible_v<T>` is true and
   - (9.2) `is_trivially_copy_constructible_v<E>` is true.

#### constexpr `expected(expected&& rhs) noexcept(see below)`;

10. **Constraints**: 
    - (10.1) `is_move_constructible_v<T>` is true and
    - (10.2) `is_move_constructible_v<E>` is true.
11. **Effects**: If `rhs.has_value()` is true, direct-non-list-initializes `val` with `std::move(*rhs)`. Otherwise, direct-non-list-initializes `unex` with `std::move(rhs.error())`.
12. **Postconditions**: `rhs.has_value()` is unchanged; `rhs.has_value()` == `this->has_value()` is true.
13. **Throws**: Any exception thrown by the initialization of `val` or `unex`.
14. **Remarks**: The exception specification is equivalent to `is_nothrow_move_constructible_v<T> && is_nothrow_move_constructible_v<E>`.
15. This constructor is trivial if
    - (15.1) `is_trivially_move_constructible_v<T>` is true and
    - (15.2) `is_trivially_move_constructible_v<E>` is true.

#### template<class U, class G> constexpr explicit(see below) `expected(const expected<U, G>& rhs)`;

**§ 22.8.6.2**

733
template<class U, class G>
constexpr explicit(see below) expected(expected<U, G>&& rhs);

Let:
16.1 UF be const U& for the first overload and U for the second overload.
16.2 GF be const G& for the first overload and G for the second overload.

Constraints:
17.1 is_constructible_v<T, UF> is true; and
17.2 is_constructible_v<E, GF> is true; and
17.3 is_constructible_v<T, expected<U, G>&> is false; and
17.4 is_constructible_v<T, expected<U, G>> is false; and
17.5 is_constructible_v<T, const expected<U, G>&> is false; and
17.6 is_constructible_v<T, const expected<U, G>> is false; and
17.7 is_convertible_v<expected<U, G>&, T> is false; and
17.8 is_convertible_v<expected<U, G>&&, T> is false; and
17.9 is_convertible_v<const expected<U, G>&, T> is false; and
17.10 is_convertible_v<const expected<U, G>&&, T> is false; and
17.11 is_constructible_v<unexpected<E>, expected<U, G>&> is false; and
17.12 is_constructible_v<unexpected<E>, expected<U, G>> is false; and
17.13 is_constructible_v<unexpected<E>, const expected<U, G>&> is false; and
17.14 is_constructible_v<unexpected<E>, const expected<U, G>> is false.

Effects: If rhs.has_value(), direct-non-list-initializes val with std::forward<UF>(*rhs). Otherwise, direct-non-list-initializes unex with std::forward<GF>(rhs.error()).

Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.

Throws: Any exception thrown by the initialization of val or unex.

Remarks: The expression inside explicit is equivalent to !is_convertible_v<UF, T> || !is_convertible_v<GF, E>.

template<class U = T>
constexpr explicit(!is_convertible_v<U, T>) expected(U&& v);

Constraints:
22.1 is_same_v<remove_cvref_t<U>, in_place_t> is false; and
22.2 is_same_v<expected, remove_cvref_t<U>> is false; and
22.3 remove_cvref_t<U> is not a specialization of unexpected; and
22.4 is_constructible_v<T, U> is true.

Effects: Direct-non-list-initializes val with std::forward<U>(v).

Postconditions: has_value() is true.

Throws: Any exception thrown by the initialization of val.

template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>&& e);

template<class G>
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);

Let GF be const G& for the first overload and G for the second overload.

Constraints: is_constructible_v<E, GF> is true.

Effects: Direct-non-list-initializes unex with std::forward<GF>(e.error()).

Postconditions: has_value() is false.

Throws: Any exception thrown by the initialization of unex.
template<class... Args>
constexpr explicit expected(in_place_t, Args&&... args);

Constraints: is_constructible_v<T, Args...> is true.
Effects: Direct-non-list-initializes val with std::forward<Args>(args)....
Postconditions: has_value() is true.
Throws: Any exception thrown by the initialization of val.

template<class U, class... Args>
constexpr explicit expected(in_place_t, initializer_list<U> il, Args&&... args);

Constraints: is_constructible_v<T, initializer_list<U>&, Args...> is true.
Effects: Direct-non-list-initializes val with il, std::forward<Args>(args)....
Postconditions: has_value() is true.
Throws: Any exception thrown by the initialization of val.

template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);

Constraints: is_constructible_v<E, Args...> is true.
Effects: Direct-non-list-initializes unex with std::forward<Args>(args)....
Postconditions: has_value() is false.
Throws: Any exception thrown by the initialization of unex.

template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);

Constraints: is_constructible_v<E, initializer_list<U>&, Args...> is true.
Effects: Direct-non-list-initializes unex with il, std::forward<Args>(args)....
Postconditions: has_value() is false.
Throws: Any exception thrown by the initialization of unex.

22.8.6.3 Destructor [expected.object.dtor]
constexpr ~expected();

Effects: If has_value() is true, destroys val, otherwise destroys unex.
Remarks: If is_trivially_destructible_v<T> is true, and is_trivially_destructible_v<E> is true, then this destructor is a trivial destructor.

22.8.6.4 Assignment [expected.object.assign]

This subclause makes use of the following exposition-only function:

template<class T, class U, class... Args>
constexpr void reinit-expected(T& newval, U& oldval, Args&&... args) { // exposition only
    if constexpr (is_nothrow_constructible_v<T, Args...>) {
        destroy_at(addressof(oldval));
        construct_at(addressof(newval), std::forward<Args>(args)...);
    } else if constexpr (is_nothrow_move_constructible_v<T>) {
        T tmp(std::forward<Args>(args)...);
        destroy_at(addressof(oldval));
        construct_at(addressof(newval), std::move(tmp));
    } else {
        U tmp(std::move(oldval));
        destroy_at(addressof(oldval));
        try {
            construct_at(addressof(newval), std::forward<Args>(args)...);
        } catch (...) {
            construct_at(addressof(oldval), std::move(oldval));
            throw;
        }
    }
}
constexpr expected& operator=(const expected& rhs);

Effects:
(2.1) If this->has_value() && rhs.has_value() is true, equivalent to val = *rhs.
(2.2) Otherwise, if this->has_value() is true, equivalent to:
    reinit-expected(unex, val, rhs.error())
(2.3) Otherwise, if rhs.has_value() is true, equivalent to:
    reinit-expected(val, unex, *rhs)
(2.4) Otherwise, equivalent to unex = rhs.error().

Then, if no exception was thrown, equivalent to: has_val = rhs.has_value(); return *this;

Returns: *this.

Remarks: This operator is defined as deleted unless:
(4.1) is_copy_assignable_v<T> is true and
(4.2) is_copy_constructible_v<T> is true and
(4.3) is_copy_assignable_v<E> is true and
(4.4) is_copy_constructible_v<E> is true and
(4.5) is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

constexpr expected& operator=(expected&& rhs) noexcept(

Constraints:
(5.1) is_move_constructible_v<T> is true and
(5.2) is_move_assignable_v<T> is true and
(5.3) is_move_constructible_v<E> is true and
(5.4) is_move_assignable_v<E> is true and
(5.5) is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

Effects:
(6.1) If this->has_value() && rhs.has_value() is true, equivalent to val = std::move(*rhs).
(6.2) Otherwise, if this->has_value() is true, equivalent to:
    reinit-expected(unex, val, std::move(rhs.error()))
(6.3) Otherwise, if rhs.has_value() is true, equivalent to:
    reinit-expected(val, unex, std::move(*rhs))
(6.4) Otherwise, equivalent to unex = std::move(rhs.error()).

Then, if no exception was thrown, equivalent to: has_val = rhs.has_value(); return *this;

Returns: *this.

Remarks: The exception specification is equivalent to:

 template<class U = T>
 constexpr expected& operator=(expected&& rhs) noexcept(see below);

Constraints:
(9.1) is_same_v<expected, remove_cvref_t<U>> is false; and
(9.2) remove_cvref_t<U> is not a specialization of unexpected; and
(9.3) is_constructible_v<T, U> is true; and
(9.4) is_assignable_v<T, U> is true; and

§ 22.8.6.4
Effects:

— If `has_value()` is true, equivalent to: `val = std::forward<U>(v);`

— Otherwise, equivalent to:
  ```
  reinit-expected(val, unex, std::forward<U>(v));
  has_val = true;
  ```

Returns: `*this`.

```template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);
```

Let `GF` be `const G&` for the first overload and `G` for the second overload.

Constraints:

— `is_constructible_v<E, GF> is true`; and

— `is_assignable_v<E&, GF> is true`; and

— `is_nothrow_constructible_v<T> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true`.

Effects:

— If `has_value()` is true, equivalent to:
  ```
  reinit-expected(unex, val, std::forward<GF>(e.error()));
  has_val = false;
  ```

— Otherwise, equivalent to: `unex = std::forward<GF>(e.error());`

Returns: `*this`.

```template<class... Args>
constexpr T& emplace(Args&&... args) noexcept;
template<class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args) noexcept;
```

Constraints: `is_nothrow_constructible_v<T, Args...> is true`.

Effects: Equivalent to:

```if (has_value()) {
  destroy_at(addressof(val));
} else {
  destroy_at(addressof(unex));
  has_val = true;
}
return *construct_at(addressof(val), std::forward<Args>(args)...);
```

```template<class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args) noexcept;
```

Constraints: `is_nothrow_constructible_v<T, initializer_list<U>&, Args...> is true`.

Effects: Equivalent to:

```if (has_value()) {
  destroy_at(addressof(val));
} else {
  destroy_at(addressof(unex));
  has_val = true;
}
return *construct_at(addressof(val), il, std::forward<Args>(args)...);
```

### 22.8.6.5 Swap

```
constexpr void swap(expected& rhs) noexcept(see below);
```

Constraints:

§ 22.8.6.5
is_swappable_v<T> is true and
— is_swappable_v<E> is true and
— is_move_constructible_v<T> && is_move_constructible_v<E> is true, and
— is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

Effects: See Table 64.

Table 64: swap(expected&) effects

<table>
<thead>
<tr>
<th>this-&gt;has_value()</th>
<th>!this-&gt;has_value()</th>
</tr>
</thead>
<tbody>
<tr>
<td>rhs.has_value() equivalent to: using std::swap; swap(val, rhs.val);</td>
<td>calls rhs.swap(*this)</td>
</tr>
<tr>
<td>!rhs.has_value() see below</td>
<td>equivalent to: using std::swap; swap(unex, rhs.unex);</td>
</tr>
</tbody>
</table>

For the case where rhs.value() is false and this->has_value() is true, equivalent to:

```cpp
if constexpr (is_nothrow_move_constructible_v<E>) {
    E tmp(std::move(rhs.unex));
    destroy_at(addressof(rhs.unex));
    try {
        construct_at(addressof(rhs.val), std::move(val));
        destroy_at(addressof(val));
        construct_at(addressof(unex), std::move(tmp));
    } catch(...) {
        construct_at(addressof(rhs.unex), std::move(tmp));
        throw;
    }
} else {
    T tmp(std::move(val));
    destroy_at(addressof(val));
    try {
        construct_at(addressof(unex), std::move(rhs.unex));
        destroy_at(addressof(rhs.unex));
        construct_at(addressof(rhs.val), std::move(tmp));
    } catch (...) {
        construct_at(addressof(val), std::move(tmp));
        throw;
    }
}
has_val = false;
rhs.has_val = true;
```

Throws: Any exception thrown by the expressions in the Effects.

Remarks: The exception specification is equivalent to:

```cpp
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

Effects: Equivalent to x.swap(y).

22.8.6.6 Observers

```cpp
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

Preconditions: has_value() is true.

Returns: addressof(val).

```cpp
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

Preconditions: has_value() is true.
4. **Returns:** `val`.

```cpp
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;
```

5. **Preconditions:** `has_value()` is true.

6. **Returns:** `std::move(val)`.

```cpp
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

7. **Returns:** `has_val`.

```cpp
constexpr const T& value() const &;
constexpr T& value() &;
```

8. **Returns:** `val`, if `has_value()` is true.

```cpp
constexpr T&& value() &&;
constexpr const T&& value() const &&;
```

9. **Throws:** `bad_expected_access(error())` if `has_value()` is false.

```cpp
template<class U> constexpr T value_or(U&& v) const &;
```

10. **Mandates:** `is_copy_constructible_v<T>` is true and `is_convertible_v<U, T>` is true.

```cpp
template<class U> constexpr T value_or(U&& v) &&;
```

11. **Mandates:** `is_move_constructible_v<T>` is true and `is_convertible_v<U, T>` is true.

```cpp
template<class U> friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

12. **Mandates:** `is_copy_constructible_v<T2> requires (!is_void_v<T2>)`.

```cpp
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

13. **Mandates:** The expressions `*x == *y` and `x.error() == y.error()` are well-formed and their results are convertible to `bool`.

```cpp
Mandates: The expression `*x == v` is well-formed and its result is convertible to `bool`.
```

14. **Returns:** `x.has_value() && static_cast<bool>(*x == v)`.

```cpp
template<class T2> friend constexpr bool operator==(const expected& x, const T2& v);
```

15. **Mandates:** `is_move_constructible_v<T2>`.

```cpp
Mandates: The expression `x.has_value() && static_cast<bool>(*x == v)`.
```

16. **Mandates:** `is_move_constructible_v<T2>`.

```cpp
Mandates: The expression `x.error() == y.error()`.
```

17. **Returns:** `x.has_value() ? **this : static_cast<T>(std::forward<U>(v))`.

```cpp
Returns: If `x.has_value()` does not equal `y.has_value()`, `false`; otherwise if `x.has_value()` is true, `*x == *y`; otherwise `x.error() == y.error()`.
```

18. **Returns:** `x.has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v))`.

```cpp
template<class U> constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

19. **Mandates:** `is_move_constructible_v<T2>`.

```cpp
Mandates: The expression `x.error() == e.error()`.
```

22.8.6.7 Equality operators

```cpp
§ 22.8.6.7
```
6 Returns: \( !x.\text{has\_value()} \&\& \text{static\_cast<bool>}(x.\text{error()} == e.\text{error()}). \)

22.8.7 Partial specialization of expected for void types

22.8.7.1 General

template<class T, class E> requires is_void_v<T>
class expected<T, E> {
public:
  using value_type = T;
  using error_type = E;
  using unexpected_type = unexpected<E>;

  template<class U>
  using rebind = expected<U, error_type>;

  // 22.8.7.2, constructors
  constexpr expected() noexcept;
  constexpr expected(const expected&);
  constexpr expected(expected&&) noexcept;
  template<class U, class G>
  constexpr explicit(expected<U, G>&);
  template<class U, class G>
  constexpr explicit(expected<U, G>&&);
  template<class G>
  constexpr explicit(unexpected<G>&);
  template<class G>
  constexpr explicit(unexpected<G>&&);
  constexpr explicit(in_place_t) noexcept;
  template<class... Args>
  constexpr explicit(unexpect_t, Args&&...);
  template<class U, class... Args>
  constexpr explicit(unexpect_t, initializer_list<U>, Args&&...);

  // 22.8.7.3, destructor
  constexpr ~expected();

  // 22.8.7.4, assignment
  constexpr expected& operator=(const expected&);
  constexpr expected& operator=(expected&&) noexcept;
  template<class G>
  constexpr expected& operator=(const unexpected<G>&);
  template<class G>
  constexpr expected& operator=(unexpected<G>&&);
  constexpr void emplace() noexcept;

  // 22.8.7.5, swap
  constexpr void swap(expected&) noexcept;
  friend constexpr void swap(expected& x, expected& y) noexcept;

  // 22.8.7.6, observers
  constexpr explicit operator bool() const noexcept;
  constexpr bool has_value() const noexcept;
  constexpr void operator*() const noexcept;
  constexpr void value() const &;
  constexpr void value() &&;
  constexpr bool const E& has_value() const & noexcept;
  constexpr E& has_value() & noexcept;
  constexpr E& error() & noexcept;
  constexpr E& error() && noexcept;
// 22.8.7.7 equality operators
template<class T2, class E2> requires is_void_v<T2>
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);

private:
  bool has_val;        // exposition only
  union {
    E unex;           // exposition only
  };

Any object of type `expected<T, E>` either represents a value of type `T`, or contains a value of type `E` within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type `E`. Member `has_val` indicates whether the `expected<T, E>` object represents a value of type `T`.

A program that instantiates the definition of the template `expected<T, E>` with a type for the `E` parameter that is not a valid template argument for `unexpected` is ill-formed.

E shall meet the requirements of `Cpp17Destructible` (Table 36).

22.8.7.2 Constructors

```cpp
constexpr expected() noexcept;
Postconditions: has_value() is true.
```

```cpp
constexpr expected(const expected& rhs);
Effects: If rhs.has_value() is false, direct-non-list-initializes `unex` with rhs.error().
Postconditions: rhs.has_value() == this->has_value().
Throws: Any exception thrown by the initialization of `unex`.
Remarks: This constructor is defined as deleted unless `is_copy_constructible_v<E>` is true.

This constructor is trivial if `is_trivially_copy_constructible_v<E>` is true.
```

```cpp
constexpr expected(expected&& rhs) noexcept(is_nothrow_move_constructible_v<E>);
Constraints: `is_move_constructible_v<E>` is true.
Effects: If rhs.has_value() is false, direct-non-list-initializes `unex` with std::move(rhs.error()).
Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.
Throws: Any exception thrown by the initialization of `unex`.
Remarks: This constructor is trivial if `is_trivially_move_constructible_v<E>` is true.
```

```cpp
template<class U, class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const expected<U, G>& rhs);
template<class U, class G>
constexpr explicit(!is_convertible_v<G, E>) expected(expected<U, G>&& rhs);
Let GF be const G& for the first overload and G for the second overload.
Constraints:
- `is_void_v<U>` is true; and
- `is_constructible_v<E, GF>` is true; and
- `is_constructible_v<unexpected<E>, expected<U, G>>&` is false; and
- `is_constructible_v<unexpected<E>, expected<U, G>>` is false; and
- `is_constructible_v<unexpected<E>, const expected<U, G>>&` is false; and
- `is_constructible_v<unexpected<E>, const expected<U, G>>` is false.
Effects: If rhs.has_value() is false, direct-non-list-initializes `unex` with std::forward<GF>(rhs.error()).
```
Postconditions: \( \text{rhs.has\_value()} \) is unchanged; \( \text{rhs.has\_value()} == \text{this->has\_value()} \) is true.

Throws: Any exception thrown by the initialization of \( \text{unex} \).

```cpp
template<class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);
template<class G>
constexpr explicit(!is_convertible_v<G, E>) expected(unexpected<G>&& e);
```

Let \( \text{GF} \) be \( \text{const G} \) for the first overload and \( \text{G} \) for the second overload.

Constraints: \( \text{is\_constructible\_v<E, GF> is true.} \)

Effects: Direct-non-list-initializes \( \text{unex} \) with \( \text{std::forward<GF>(e.error())} \).

Postconditions: \( \text{has\_value()} \) is false.

Throws: Any exception thrown by the initialization of \( \text{unex} \).

```cpp
constexpr explicit expected(in_place_t) noexcept;
```

```cpp
constexpr expected& operator=(const expected& rhs);
```

Effects:

1.1 If \( \text{this->has\_value()} \) \&\& \( \text{rhs.has\_value()} \) is true, no effects.

1.2 Otherwise, if \( \text{this->has\_value()} \) is true, equivalent to: construct at(\( \text{addressesof(unex)}, \newline \text{rhs.unex} \)); \( \text{has\_val} = \text{false}; \)

1.3 Otherwise, if \( \text{rhs.has\_value()} \) is true, destroys \( \text{unex} \) and sets \( \text{has\_val} \) to true.

1.4 Otherwise, equivalent to \( \text{unex = rhs.error()} \).

Returns: \( \text{*this} \).

Remarks: This operator is defined as deleted unless \( \text{is\_copy\_assignable\_v<E> is true and is\_copy\_-\newline\text{constructible\_v<E> is true.} \)

```cpp
constexpr expected& operator=(expected&& rhs) noexcept(see below);
```

Effects:

4.1 If \( \text{this->has\_value()} \) \&\& \( \text{rhs.has\_value()} \) is true, no effects.
Otherwise, if `this->has_value()` is true, equivalent to:

```cpp
construct_at(addressof(unex), std::move(rhs.unex));
has_val = false;
```

Otherwise, if `rhs.has_value()` is true, destroys `unex` and sets `has_val` to true.

Otherwise, equivalent to `unex = std::move(rhs.error());`.

Returns: *this.

Remarks: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> && is_nothrow_move_assignable_v<E>`.

This operator is defined as deleted unless `is_move_constructible_v<E>` is true and `is_move_assignable_v<E>` is true.

```cpp
template<class G>
constexpr expected& operator=(const unexpected<G>& e);
template<class G>
constexpr expected& operator=(unexpected<G>&& e);
```

Let `GF` be `const G&` for the first overload and `G` for the second overload.

Constraints: `is_constructible_v<E, GF>` is true and `is_assignable_v<E&, GF>` is true.

Effects:

1. If `has_value()` is true, equivalent to:

```cpp
construct_at(addressof(unex), std::forward<GF>(e.error()));
has_val = false;
```

2. Otherwise, equivalent to: `unex = std::forward<GF>(e.error());`

Returns: *this.

```cpp
constexpr void emplace() noexcept;
```

Effects: If `has_value()` is false, destroys `unex` and sets `has_val` to true.

### 22.8.7.5 Swap

```cpp
constexpr void swap(expected& rhs) noexcept;
```

Constraints: `is_swappable_v<E>` is true and `is_move_constructible_v<E>` is true.

Effects: See Table 65.

Table 65: swap(expected&) effects

<table>
<thead>
<tr>
<th><code>this-&gt;has_value()</code></th>
<th><code>!this-&gt;has_value()</code></th>
</tr>
</thead>
<tbody>
<tr>
<td>rhs.has_value()</td>
<td>no effects</td>
</tr>
<tr>
<td>!rhs.has_value()</td>
<td>see below</td>
</tr>
</tbody>
</table>

For the case where `rhs.value()` is `false` and `this->has_value()` is true, equivalent to:

```cpp
construct_at(addressof(unex), std::move(rhs.unex));
destroy_at(addressof(rhs.unex));
has_val = false;
rhs.has_val = true;
```

Throws: Any exception thrown by the expressions in the Effects.

Remarks: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>`.

```cpp
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

Effects: Equivalent to `x.swap(y)`.

§ 22.8.7.5
22.8.7.6 Observers

constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;

Returns: has_val.

constexpr void operator*() const noexcept;

Preconditions: has_value() is true.

constexpr void value() const &;

Throws: bad_expected_access(error()) if has_value() is false.

constexpr void value() &&;

Throws: bad_expected_access(std::move(error())) if has_value() is false.

constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;

Preconditions: has_value() is false.

Returns: unez.

22.8.7.7 Equality operators

template<class T2, class E2> requires is_void_v<T2>
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);

Mandates: The expression x.error() == y.error() is well-formed and its result is convertible to bool.

Returns: If x.has_value() does not equal y.has_value(), false; otherwise x.has_value() ||
static_cast<bool>(x.error() == y.error()).

template<class E2>
friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);

Mandates: The expression x.error() == e.error() is well-formed and its result is convertible to bool.

Returns: !x.has_value() && static_cast<bool>(x.error() == e.error()).

22.9 Bitsets

22.9.1 Header <bitset> synopsis

The header <bitset> defines a class template and several related functions for representing and manipulating fixed-size sequences of bits.

#include <string>  // see 23.4.2
#include <iosfwd>  // for istream (31.7.1), ostream (31.7.2), see 31.3.1

namespace std {

   template<

   // 22.9.4, bitset operators
   template<
   template<
   }
template<class charT, class traits, size_t N>
    basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, bitset<N>& x);

template<class charT, class traits, size_t N>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);

22.9.2 Class template bitset

22.9.2.1 General

namespace std {
    template<size_t N> class bitset {
    public:
    // bit reference
    class reference {
        friend class bitset;
        constexpr reference() noexcept;
        constexpr reference(const reference&) = default;
        constexpr ~reference();
        constexpr reference& operator=(bool x) noexcept;
        constexpr reference& operator=(const reference&) noexcept;
        constexpr bool operator~() const noexcept;
        constexpr operator bool() const noexcept;
        constexpr reference& flip() noexcept;
    public:
        constexpr bitset() noexcept;
        constexpr bitset(unsigned long long val) noexcept;
        template<class charT, class traits, class Allocator>
        constexpr explicit bitset(
            const basic_string<charT, traits, Allocator>& str,
            typename basic_string<charT, traits, Allocator>::size_type pos = 0,
            typename basic_string<charT, traits, Allocator>::size_type n = basic_string<charT, traits, Allocator>::npos,
            charT zero = charT('0'),
            charT one = charT('1'));
        template<class charT>
        constexpr explicit bitset(
            const charT* str,
            typename basic_string<charT>::size_type n = basic_string<charT>::npos,
            charT zero = charT('0'),
            charT one = charT('1'));
    public:
        constexpr bitset& operator&=(const bitset& rhs) noexcept;
        constexpr bitset& operator|=(const bitset& rhs) noexcept;
        constexpr bitset& operator^=(const bitset& rhs) noexcept;
        constexpr bitset& operator<<=(size_t pos) noexcept;
        constexpr bitset& operator>>=(size_t pos) noexcept;
        constexpr bitset& set() noexcept;
        constexpr bitset& set(size_t pos, bool val = true);
        constexpr bitset& reset() noexcept;
        constexpr bitset& reset(size_t pos);
        constexpr bitset operator~() const noexcept;
        constexpr bitset& flip() noexcept;
        constexpr bitset& flip(size_t pos);
    // element access
    constexpr bool operator[](size_t pos) const; // for b[i];
    constexpr reference operator[](size_t pos); // for b[i];
    
    // 22.9.2.2, constructors
    constexpr bitset() noexcept;
    constexpr bitset(unsigned long long val) noexcept;
    template<class charT, class traits, class Allocator>
    constexpr explicit bitset(
        const basic_string<charT, traits, Allocator>& str,
        typename basic_string<charT, traits, Allocator>::size_type pos = 0,
        typename basic_string<charT, traits, Allocator>::size_type n = basic_string<charT, traits, Allocator>::npos,
        charT zero = charT('0'),
        charT one = charT('1'));
    template<class charT>
    constexpr explicit bitset(
        const charT* str,
        typename basic_string<charT>::size_type n = basic_string<charT>::npos,
        charT zero = charT('0'),
        charT one = charT('1'));

    // 22.9.2.3, bitset operations
    constexpr bitset& operator=(const bitset& rhs) noexcept;
    constexpr bitset& operator=(const bitset& rhs) noexcept;
    constexpr bitset& operator=(const bitset& rhs) noexcept;
    constexpr bitset& operator<<(size_t pos) noexcept;
    constexpr bitset& operator>>(size_t pos) noexcept;
    constexpr bitset& set() noexcept;
    constexpr bitset& set(size_t pos, bool val = true);
    constexpr bitset& reset() noexcept;
    constexpr bitset& reset(size_t pos);
    constexpr bitset operator~() const noexcept;
    constexpr bitset& flip() noexcept;
    constexpr bitset& flip(size_t pos);

    // element access
    constexpr bool operator[](size_t pos) const; // for b[i];
    constexpr reference operator[](size_t pos); // for b[i];

§ 22.9.2.1 745
The class template `bitset<N>` describes an object that can store a sequence consisting of a fixed number of bits, N.

Each bit represents either the value zero (reset) or one (set). To **toggle** a bit is to change the value zero to one, or the value one to zero. Each bit has a non-negative position `pos`. When converting between an object of class `bitset<N>` and a value of some integral type, bit position `pos` corresponds to the bit value `1 << pos`.

The integral value corresponding to two or more bits is the sum of their bit values.

The functions described in 22.9.2 can report three kinds of errors, each associated with a distinct exception:

1. **Invalid-argument** error is associated with exceptions of type `invalid_argument` (19.2.5);
2. **Out-of-range** error is associated with exceptions of type `out_of_range` (19.2.7);
3. **Overflow** error is associated with exceptions of type `overflow_error` (19.2.10).

### 22.9.2.2 Constructors

```cpp
constexpr bitset() noexcept;

Effects: Initializes all bits in *this to zero.
```

```cpp
constexpr bitset(unsigned long long val) noexcept;
```

**Effects:** Initializes the first M bit positions to the corresponding bit values in val. M is the smaller of N and the number of bits in the value representation (6.8.1) of `unsigned long long`. If M < N, the remaining bit positions are initialized to zero.

```cpp
template<class charT, class traits, class Allocator>
constexpr explicit bitset(
    const basic_string<charT, traits, Allocator>& str,
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,
    typename basic_string<charT, traits, Allocator>::size_type n = basic_string<charT, traits, Allocator>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
```

**Effects:** Determines the effective length `rlen` of the initializing string as the smaller of `n` and `str.size()` - `pos`. Initializes the first M bit positions to values determined from the corresponding characters in the string `str`. M is the smaller of N and `rlen`.

An element of the constructed object has value zero if the corresponding character in `str`, beginning at position `pos`, is `zero`. Otherwise, the element has the value one. Character position `pos + M - 1` corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions.
If \( M < N \), remaining bit positions are initialized to zero.

The function uses `traits::eq` to compare the character values.

Throws: `out_of_range` if \( pos > str.size() \) or `invalid_argument` if any of the `rlen` characters in `str` beginning at position `pos` is other than zero or one.

```cpp
template<class charT>
constexpr explicit bitset(
    const charT* str,
    typename basic_string<charT>::size_type n = basic_string<charT>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
```

Effects: As if by:

```cpp
bitset(n == basic_string<charT>::npos
    ? basic_string<charT>(str)
    : basic_string<charT>(str, n),
  0, n, zero, one)
```

### § 22.9.2.3 Members

- **bitset\& operator\&=(const bitset& rhs) noexcept;**
  
  **Effects:** Clears each bit in \(*this\) for which the corresponding bit in `rhs` is clear, and leaves all other bits unchanged.

  **Returns:** \(*this\).

- **bitset\& operator\|==(const bitset& rhs) noexcept;**
  
  **Effects:** Sets each bit in \(*this\) for which the corresponding bit in `rhs` is set, and leaves all other bits unchanged.

  **Returns:** \(*this\).

- **bitset\& operator\^=(const bitset& rhs) noexcept;**
  
  **Effects:** Toggles each bit in \(*this\) for which the corresponding bit in `rhs` is set, and leaves all other bits unchanged.

  **Returns:** \(*this\).

- **bitset\& operator\<<=(size_t pos) noexcept;**
  
  **Effects:** Replaces each bit at position \( I \) in \(*this\) with a value determined as follows:

  (7.1) If \( I < pos \), the new value is zero;

  (7.2) If \( I >= pos \), the new value is the previous value of the bit at position \( I - pos \).

  **Returns:** \(*this\).

- **bitset\& operator\>>=(size_t pos) noexcept;**
  
  **Effects:** Replaces each bit at position \( I \) in \(*this\) with a value determined as follows:

  (9.1) If \( pos >= N - I \), the new value is zero;

  (9.2) If \( pos < N - I \), the new value is the previous value of the bit at position \( I + pos \).

  **Returns:** \(*this\).

- **bitset\& set() noexcept;**
  
  **Effects:** Sets all bits in \(*this\).

  **Returns:** \(*this\).

- **bitset\& set(size_t pos, bool val = true);**
  
  **Effects:** Stores a new value in the bit at position `pos` in \(*this\). If `val` is `true`, the stored value is one, otherwise it is zero.

  **Returns:** \(*this\).
15 Throws: out_of_range if pos does not correspond to a valid bit position.

castexpr bitset& reset() noexcept;

16 Effects: Resets all bits in *this.

17 Returns: *this.

castexpr bitset& reset(size_t pos);

18 Effects: Resets the bit at position pos in *this.

19 Returns: *this.

20 Throws: out_of_range if pos does not correspond to a valid bit position.

21 Returns: *this.

22 constexpr bitset operator~() const noexcept;

23 Effects: Constructs an object x of class bitset and initializes it with *this.

24 Returns: x.flip().

castexpr bitset& flip() noexcept;

25 Effects: Toggles all bits in *this.

26 Returns: *this.

27 constexpr bitset& flip(size_t pos);

28 Effects: Toggles the bit at position pos in *this.

29 Returns: *this.

30 Throws: out_of_range if pos does not correspond to a valid bit position.

31 Returns: *this.

32 constexpr unsigned long to_ulong() const;

33 Returns: x.

34 Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long.

35 constexpr unsigned long long to_ullong() const;

36 Returns: x.

37 Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long long.

38 template<class charT = char, 

39 class traits = char_traits<charT>,

40 class Allocator = allocator<charT>>

41 constexpr basic_string<charT, traits, Allocator> to_string(charT zero = charT('0'), charT one = charT('1')) const;

42 Effects: Constructs a string object of the appropriate type and initializes it to a string of length N characters. Each character is determined by the value of its corresponding bit position in *this. Character position N - 1 corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions. Bit value zero becomes the character zero, bit value one becomes the character one.

43 Returns: The created object.

castexpr size_t count() const noexcept;

44 Returns: A count of the number of bits set in *this.

castexpr size_t size() const noexcept;

45 Returns: N.

46 constexpr bool operator==(const bitset& rhs) const noexcept;

47 Returns: true if the value of each bit in *this equals the value of the corresponding bit in rhs.

\[\S 22.9.2.3\]
constexpr bool test(size_t pos) const;

Returns: true if the bit at position pos in *this has the value one.
Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bool all() const noexcept;
Returns: count() == size().

constexpr bool any() const noexcept;
Returns: count() != 0.

constexpr bool none() const noexcept;
Returns: count() == 0.

constexpr bitset operator<<(size_t pos) const noexcept;
Returns: bitset(*this) <<= pos.

constexpr bitset operator>>(size_t pos) const noexcept;
Returns: bitset(*this) >>= pos.

constexpr bool operator[](size_t pos) const;
Preconditions: pos is valid.
Returns: true if the bit at position pos in *this has the value one, otherwise false.
Throws: Nothing.

constexpr bitset::reference operator[](size_t pos);
Preconditions: pos is valid.
Returns: An object of type bitset::reference such that (*this)[pos] == this->test(pos), and such that (*this)[pos] = val is equivalent to this->set(pos, val).
Throws: Nothing.
Remarks: For the purpose of determining the presence of a data race (6.9.2), any access or update through the resulting reference potentially accesses or modifies, respectively, the entire underlying bitset.

22.9.3 bitset hash support
[bitset.hash]

template<
size_t N>
struct hash<bitset<N>>;

The specialization is enabled (22.10.19).

22.9.4 bitset operators
[bitset.operators]

template<
size_t N>
constexpr bitset<N> operator&(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
Returns: bitset<N>(lhs) & rhs.

template<
size_t N>
constexpr bitset<N> operator|(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
Returns: bitset<N>(lhs) |= rhs.

template<
size_t N>
constexpr bitset<N> operator^(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;
Returns: bitset<N>(lhs) ^= rhs.

template<class charT, class traits, size_t N>
basic_istream<charT, traits>& operator>>(
    basic_istream<charT, traits>& is,
    bitset<N>& x);
A formatted input function (31.7.5.3).
Effects: Extracts up to \(N\) characters from \(is\). Stores these characters in a temporary object \(str\) of type 
\[\text{basic_string<charT, traits>}\), then evaluates the expression \(x = \text{bitset<N>}(str)\). Characters are 
extracted and stored until any of the following occurs:

(5.1) \(N\) characters have been extracted and stored;
(5.2) end-of-file occurs on the input sequence;
(5.3) the next input character is neither \(\text{is.widen(‘0’)}\) nor \(\text{is.widen(‘1’)}\) (in which case the input 
character is not extracted).

If \(N > 0\) and no characters are stored in \(str\), calls \(\text{is.setstate(ios_base::failbit)}\) (which may 
throw \(\text{ios_base::failure}\) (31.5.4.4)).

Returns: \(is\).

```cpp
template<class charT, class traits, size_t N>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);
```

Returns:
\[
os << x.template to_string<charT, traits, allocator<charT>>(
use_facet<ctype<charT>>(os.getloc()).widen(‘0’),
use_facet<ctype<charT>>(os.getloc()).widen(‘1’))
\]

(see 31.7.6.3).

22.10 Function objects [function.objects]

22.10.1 General [function.objects.general]

A function object type is an object type (6.8.1) that can be the type of the postfix-expression in a function 
call (7.6.1.3, 12.2.2.2).\(^\text{208}\) A function object is an object of a function object type. In the places where one 
would expect to pass a pointer to a function to an algorithmic template (Clause 27), the interface is specified 
to accept a function object. This not only makes algorithmic templates work with pointers to functions, but 
also enables them to work with arbitrary function objects.

22.10.2 Header <functional> synopsis [functional.syn]

```cpp
namespace std {
    // 22.10.5, invoke
    template<class F, class... Args>
    constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args) 
    noexcept(is_nothrow_invocable_v<F, Args...>); // freestanding

    template<class R, class F, class... Args>
    constexpr R invoke_r(F&& f, Args&&... args)
    noexcept(is_nothrow_invocable_r_v<R, F, Args...>); // freestanding

    // 22.10.6, reference_wrapper
    template<class T> class reference_wrapper;
    template<class T> constexpr reference_wrapper<T> ref(T&);
    template<class T> constexpr reference_wrapper<T> cref(const T&);
    template<class T> void ref(const T&) = delete;
    template<class T> void cref(const T&) = delete;

    template<class T>
    constexpr reference_wrapper<T> ref(reference_wrapper<T>) noexcept; // freestanding
    template<class T>
    constexpr reference_wrapper<T> cref(reference_wrapper<T>) noexcept; // freestanding

    // 22.10.7, arithmetic operations
    template<class T = void> struct plus;
    template<class T = void> struct minus;
    template<class T = void> struct multiplies;
}
```

\(^{208}\) Such a type is a function pointer or a class type which has a member \texttt{operator()}\) or a class type which has a conversion to 
a pointer to function.

\[\text{§ 22.10.2} \quad 750\]

struct greater_equal;
// freestanding
struct less_equal;
// freestanding
}

[Example 1: If a C++ program wants to have a by-element addition of two vectors a and b containing double and put the result into a, it can do:
transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>());
—end example]

[Example 2: To negate every element of a:
transform(a.begin(), a.end(), a.begin(), negate<double>());
—end example]
```

### 22.10.3 Definitions

1. The following definitions apply to this Clause:

2. A **call signature** is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.

3. A **callable type** is a function object type (22.10) or a pointer to member.

4. A **callable object** is an object of a callable type.

5. A **call wrapper type** is a type that holds a callable object and supports a call operation that forwards to that object.

6. A **call wrapper** is an object of a call wrapper type.

7. A **target object** is the callable object held by a call wrapper.

8. A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as **bound argument entities**.

9. The target object and bound argument entities of the call wrapper are collectively referred to as **state entities**.

### 22.10.4 Requirements

1. Define `INVOKE(f, t₁, t₂, ..., tₙ)` as follows:

   (1.1) — `(t₁.*f)(t₂, ..., tₙ)` when `f` is a pointer to a member function of a class `T` and `is_base_of_v<T, remove_reference_t<decltype(t₁)>>` is true;

   (1.2) — `(t₁.get().*f)(t₂, ..., tₙ)` when `f` is a pointer to a member function of a class `T` and `remove_cvref_t<decltype(t₁)>>` is a specialization of `reference_wrapper`;

   (1.3) — `(*t₁).*f(t₂, ..., tₙ)` when `f` is a pointer to a member function of a class `T` and `t₁` does not satisfy the previous two items;

   (1.4) — `t₁.*f` when `N == 1` and `f` is a pointer to data member of a class `T` and `is_base_of_v<T, remove_reference_t<decltype(t₁)>>` is true;

   (1.5) — `t₁.get().*f` when `N == 1` and `f` is a pointer to data member of a class `T` and `remove_cvref_t<decltype(t₁)>>` is a specialization of `reference_wrapper`;

   (1.6) — `(*t₁).*f` when `N == 1` and `f` is a pointer to data member of a class `T` and `t₁` does not satisfy the previous two items;

   (1.7) — `f(t₁, t₂, ..., tₙ)` in all other cases.

2. Define `INVOKE<R>(f, t₁, t₂, ..., tₙ)` as `static_cast<void>(INVOKE(f, t₁, t₂, ..., tₙ))` if `R` is `cv void`, otherwise `INVOKE(f, t₁, t₂, ..., tₙ)` implicitly converted to `R`. If `reference_converts_from_temporary_v<R, decltype(INVOKE(f, t₁, t₂, ..., tₙ))>` is `true`, `INVOKE<R>(f, t₁, t₂, ..., tₙ)` is ill-formed.

3. Every call wrapper (22.10.3) meets the `Cpp17MoveConstructible` and `Cpp17Destructible` requirements. An **argument forwarding call wrapper** is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the target object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.
[Note 1: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form]

```cpp
template<class... UnBoundArgs>
    constexpr R operator()(UnBoundArgs&&... unbound_args) cv-qual;
```

—end note

4 A **perfect forwarding call wrapper** is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type T as cv T& when the call is performed on an lvalue of the call wrapper type and as cv T&& otherwise, where cv represents the cv-qualifiers of the call wrapper and where cv shall be neither volatile nor const volatile.

5 A **call pattern** defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.21) to an expression e determined from its call pattern cp by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.

6 A **simple call wrapper** is a perfect forwarding call wrapper that meets the Cpp17CopyConstructible and Cpp17CopyAssignable requirements and whose copy constructor, move constructor, and assignment operators are constexpr functions that do not throw exceptions.

7 The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).

[Note 2: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as constexpr if the corresponding implicit definition would be considered to be constexpr. —end note]

8 Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

### 22.10.5 invoke functions

```cpp
template<class F, class... Args>
    constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
        noexcept(is_nothrow_invocable_v<F, Args...>);
```

1 **Constraints:** is_invocable_v<F, Args...> is true.

2 **Returns:** INVOKE(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4).

```cpp
template<class R, class F, class... Args>
    constexpr R invoke_r(F&& f, Args&&... args)
        noexcept(is_nothrow_invocable_r_v<R, F, Args...>);
```

3 **Constraints:** is_invocable_r_v<R, F, Args...> is true.

4 **Returns:** INVOKE<R>(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4).

### 22.10.6 Class template reference_wrapper

#### 22.10.6.1 General

```cpp
namespace std {
    template<class T> class reference_wrapper {
        public:
            // types
            using type = T;

            // 22.10.6.2, constructors
            template<class U>
                constexpr reference_wrapper(U&&) noexcept(see below);
            constexpr reference_wrapper(const reference_wrapper& x) noexcept;

            // 22.10.6.3, assignment
            constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

            // 22.10.6.4, access
            constexpr operator T& () const noexcept;
            constexpr T& get() const noexcept;
```
// 22.10.6.5, invocation

template<class... ArgTypes>
constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const;
};

template<class T>
reference_wrapper(T&) -> reference_wrapper<T>;
}

1 reference_wrapper<T> is a Cpp17CopyConstructible and Cpp17CopyAssignable wrapper around a reference to an object or function of type T.

2 reference_wrapper<T> is a trivially copyable type (6.8.1).

3 The template parameter T of reference_wrapper may be an incomplete type.

22.10.6.2 Constructors

template<class U>
constexpr reference_wrapper(U&& u) noexcept;

1 Let FUN denote the exposition-only functions
   void FUN(T&) noexcept;
   void FUN(T&&) = delete;

2 Constraints: The expression FUN(declval<U>()) is well-formed and is_same_v<remove_cvref_t<U>,
   reference_wrapper> is false.

3 Effects: Creates a variable r as if by T& r = std::forward<U>(u), then constructs a reference_
   wrapper object that stores a reference to r.

4 Remarks: The exception specification is equivalent to noexcept(FUN(declval<U>())).

constexpr reference_wrapper(const reference_wrapper& x) noexcept;

1 Effects: Constructs a reference_wrapper object that stores a reference to x.get().

22.10.6.3 Assignment

constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

1 Postconditions: *this stores a reference to x.get().

22.10.6.4 Access

constexpr operator T& () const noexcept;

1 Returns: The stored reference.

constexpr T& get() const noexcept;

2 Returns: The stored reference.

22.10.6.5 Invocation

template<class... ArgTypes>
constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&... args) const;

1 Mandates: T is a complete type.

2 Returns: INVOKE(get(), std::forward<ArgTypes>(args)...). (22.10.4)

22.10.6.6 Helper functions

1 The template parameter T of the following ref and cref function templates may be an incomplete type.

template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;

2 Returns: reference_wrapper<T>(t).

template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;

3 Returns: t.
template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;

template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;

22.10.7 Arithmetic operations

22.10.7.1 General

The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

22.10.7.2 Class template plus

template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x + y.

.template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) + std::forward<U>(u));
    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) + std::forward<U>(u));

Returns: std::forward<T>(t) + std::forward<U>(u).

22.10.7.3 Class template minus

template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x - y.

.template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) - std::forward<U>(u));
    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
-> decltype(std::forward<T>(t) - std::forward<U>(u));

Returns: std::forward<T>(t) - std::forward<U>(u).

22.10.7.4 Class template multiplies

template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x * y.
template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) * std::forward<U>(u));

22.10.7.5 Class template divides

template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x / y.

template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) / std::forward<U>(u));

2 Returns: std::forward<T>(t) / std::forward<U>(u).

22.10.7.6 Class template modulus

template<class T = void> struct modulus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x % y.

template<> struct modulus<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(-std::forward<T>(t));

    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(-std::forward<T>(t));

2 template<class T> constexpr auto operator()(T&& t) const
    -> decltype(-std::forward<T>(t));

22.10.7.7 Class template negate

template<class T = void> struct negate {
    constexpr T operator()(const T& x) const;
};

constexpr T operator()(const T& x) const;

1 Returns: -x.

template<> struct negate<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(-std::forward<T>(t));

§ 22.10.7.7 757
using is_transparent = unspecified;
};
template<class T> constexpr auto operator()(T&& t) const
  -> decltype(-std::forward<T>(t));
2
Returns: -std::forward<T>(t).

22.10.8 Comparisons

22.10.8.1 General

The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).

For templates less, greater, less_equal, and greater_equal, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.27).

[Note 1: If a < b is well-defined for pointers a and b of type P, then (a < b) == less<P>()(a, b), (a > b) ==
greater<P>()(a, b), and so forth. —end note]

For template specializations less<void>, greater<void>, less_equal<void>, and greater_equal<void>, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

22.10.8.2 Class template equal_to

template<class T = void> struct equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1
Returns: x == y.

template<> struct equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) == std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) == std::forward<U>(u));
2
Returns: std::forward<T>(t) == std::forward<U>(u).

22.10.8.3 Class template not_equal_to

template<class T = void> struct not_equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1
Returns: x != y.

template<> struct not_equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) != std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) != std::forward<U>(u));
2
Returns: std::forward<T>(t) != std::forward<U>(u).
22.10.8.4 Class template `greater`

```cpp
template<class T = void> struct greater {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

1. `Returns:` \( x > y \).

```cpp
template<>
struct greater<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) > std::forward<U>(u));
};
```

2. `Returns:` \( \text{std::forward}(t) > \text{std::forward}(u) \).

22.10.8.5 Class template `less`

```cpp
template<class T = void> struct less {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

1. `Returns:` \( x < y \).

```cpp
template<>
struct less<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) < std::forward<U>(u));
};
```

2. `Returns:` \( \text{std::forward}(t) < \text{std::forward}(u) \).

22.10.8.6 Class template `greater_equal`

```cpp
template<class T = void> struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

1. `Returns:` \( x \geq y \).

```cpp
template<>
struct greater_equal<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) \geq \text{std::forward}(u));
};
```

2. `Returns:` \( \text{std::forward}(t) \geq \text{std::forward}(u) \).

22.10.8.7 Class template `less_equal`

```cpp
template<class T = void> struct less_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};
```

`§ 22.10.8.7 759`
constexpr bool operator()(const T& x, const T& y) const;
1 Returns: \( x \leq y \).

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
\rightarrow decltype(std::forward<T>(t) <= std::forward<U>(u));

using is_transparent = unspecified;
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
\rightarrow decltype(std::forward<T>(t) <= std::forward<U>(u));
2 Returns: \( \text{std::forward}(t) \leq \text{std::forward}(u) \).
```

22.10.8.8 Class compare_three_way

```cpp
namespace std {
    struct compare_three_way {
        template<class T, class U>
        constexpr auto operator()(T&& t, U&& u) const;
        using is_transparent = unspecified;
    };
}
```

```cpp
template<class T, class U>
constexpr auto operator()(T&& t, U&& u) const;
1 Constraints: \( T \) and \( U \) satisfy three_way_comparable_with.

2 Preconditions: If the expression \( \text{std::forward}(t)(t) <-> \text{std::forward}(u)(u) \) results in a call to a built-in operator \( <-> \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2); otherwise, \( T \) and \( U \) model three_way_comparable_with.

3 Effects:
   (3.1) — If the expression \( \text{std::forward}(t)(t) <-> \text{std::forward}(u)(u) \) results in a call to a built-in operator \( <-> \) comparing pointers of type \( P \), returns \( \text{strong_ordering::less} \) if (the converted value of) \( t \) precedes \( u \) in the implementation-defined strict total order over pointers (3.27), \( \text{strong_ordering::greater} \) if \( u \) precedes \( t \), and otherwise \( \text{strong_ordering::equal} \).
   (3.2) — Otherwise, equivalent to: return \( \text{std::forward}(t)(t) <-> \text{std::forward}(u)(u) \);
```

22.10.9 Concept-constrained comparisons

```cpp
struct ranges::equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
1 Constraints: \( T \) and \( U \) satisfy equality_comparable_with.

2 Preconditions: If the expression \( \text{std::forward}(t)(t) == \text{std::forward}(u)(u) \) results in a call to a built-in operator \( == \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2); otherwise, \( T \) and \( U \) model equality_comparable_with.

3 Effects:
   (3.1) — If the expression \( \text{std::forward}(t)(t) == \text{std::forward}(u)(u) \) results in a call to a built-in operator \( == \) comparing pointers: returns \( \text{false} \) if either (the converted value of) \( t \) precedes \( u \) or \( u \) precedes \( t \) in the implementation-defined strict total order over pointers (3.27) and otherwise \( \text{true} \).
```
(3.2) Otherwise, equivalent to: return std::forward<T>(t) == std::forward<U>(u);

struct ranges::not_equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

4 Constraints: T and U satisfy equality_comparable_with.
5 Effects: Equivalent to:
       return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::greater {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

6 Constraints: T and U satisfy totally_ordered_with.
7 Effects: Equivalent to:
       return ranges::less{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::less {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

8 Constraints: T and U satisfy totally_ordered_with.
9 Preconditions: If the expression std::forward<T>(t) < std::forward<U>(u) results in a call to a built-in operator < comparing pointers of type P, the conversion sequences from both T and U to P are equality-preserving (18.2); otherwise, T and U model totally_ordered_with. For any expressions ET and EU such that decltype((ET)) is T and decltype((EU)) is U, exactly one of ranges::less{}(ET, EU), ranges::less{}(EU, ET), or ranges::equal_to{}(ET, EU) is true.
10 Effects:
     — If the expression std::forward<T>(t) < std::forward<U>(u) results in a call to a built-in operator < comparing pointers: returns true if (the converted value of) t precedes u in the implementation-defined strict total order over pointers (3.27) and otherwise false.
     — Otherwise, equivalent to: return std::forward<T>(t) < std::forward<U>(u);

struct ranges::greater_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

11 Constraints: T and U satisfy totally_ordered_with.
12 Effects: Equivalent to:
return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::less_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.
Effects: Equivalent to:
    return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));

22.10.10 Logical operations
    [logical.operations]
22.10.10.1 General
        [logical.operations.general]
1 The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).

22.10.10.2 Class template logical_and
        [logical.operations.and]
    template<class T = void> struct logical_and {
        constexpr bool operator()(const T& x, const T& y) const;
    };
    constexpr bool operator()(const T& x, const T& y) const;

1 Returns: x && y.

template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) && std::forward<U>(u));
    using is_transparent = unspecified;
};

2 Returns: std::forward<T>(t) && std::forward<U>(u).

22.10.10.3 Class template logical_or
        [logical.operations.or]
    template<class T = void> struct logical_or {
        constexpr bool operator()(const T& x, const T& y) const;
    };
    constexpr bool operator()(const T& x, const T& y) const;

1 Returns: x || y.

template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) || std::forward<U>(u));
    using is_transparent = unspecified;
};

2 Returns: std::forward<T>(t) || std::forward<U>(u).
22.10.10.4 Class template logical_not

```
template<class T = void> struct logical_not {
  constexpr bool operator()(const T& x) const;
};
```

`constexpr bool operator()(const T& x) const;`<br>

1 Returns: !x.

```
template<> struct logical_not<void> {
  template<class T> constexpr auto operator()(T&& t) const
  -> decltype(!std::forward<T>(t));
};
```

2 Returns: !std::forward<T>(t).

22.10.11 Bitwise operations

22.10.11.1 General

The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

22.10.11.2 Class template bit_and

```
template<class T = void> struct bit_and {
  constexpr T operator()(const T& x, const T& y) const;
};
```

`constexpr T operator()(const T& x, const T& y) const;`<br>

1 Returns: x & y.

```
template<> struct bit_and<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) & std::forward<U>(u));
};
```

2 Returns: std::forward<T>(t) & std::forward<U>(u).

22.10.11.3 Class template bit_or

```
template<class T = void> struct bit_or {
  constexpr T operator()(const T& x, const T& y) const;
};
```

`constexpr T operator()(const T& x, const T& y) const;`<br>

1 Returns: x | y.

```
template<> struct bit_or<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) | std::forward<U>(u));
};
```

§ 22.10.11.3
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

2

Returns: std::forward<T>(t) ^ std::forward<U>(u).

22.10.11.4 Class template bit_xor

```cpp
template<class T = void> struct bit_xor {
    constexpr T operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr T operator()(const T& x, const T& y) const;
```

1

Returns: x ^ y.

```cpp
template<> struct bit_xor<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
```

2

Returns: std::forward<T>(t) ^ std::forward<U>(u).

22.10.11.5 Class template bit_not

```cpp
template<class T = void> struct bit_not {
    constexpr T operator()(const T& x) const;
};
```

```cpp
constexpr T operator()(const T& x) const;
```

1

Returns: -x.

```cpp
template<> struct bit_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(~std::forward<T>(t));

    using is_transparent = unspecified;
};
```

```cpp
template<class T> constexpr auto operator()(T&&) const
    -> decltype(~std::forward<T>(t));
```

2

Returns: ~std::forward<T>(t).

22.10.12 Class identity

```cpp
struct identity {
    template<class T>
        constexpr T&& operator()(T&& t) const noexcept;

    using is_transparent = unspecified;
};
```

```cpp
template<class T>
    constexpr T&& operator()(T&& t) const noexcept;
```

1

Effects: Equivalent to: return std::forward<T>(t);

22.10.13 Function template not_fn

```cpp
template<class F> constexpr unspecified not_fn(F&& f);
```

1

In the text that follows:

(1.1) — g is a value of the result of a not_fn invocation,
— FD is the type `decay_t<F>`,
— fd is the target object of `g` (22.10.3) of type FD, direct-non-list-initialized with `std::forward<F>(f)`,
— call_args is an argument pack used in a function call expression (7.6.1.3) of `g`.

Mandates: `is_constructible_v<FD, F> && is_move_constructible_v<FD>` is true.

Preconditions: FD meets the Cpp17MoveConstructible requirements.

Returns: A perfect forwarding call wrapper (22.10.4) `g` with call pattern `!invoke(fd, call_args...)`.

Throws: Any exception thrown by the initialization of `fd`.

### 22.10.14 Function templates bind_front and bind_back

```
template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);
```

Within this subclause:

— g is a value of the result of a `bind_front` or `bind_back` invocation,
— FD is the type `decay_t<F>`,
— fd is the target object of `g` (22.10.3) of type FD, direct-non-list-initialized with `std::forward<F>(f)`,
— BoundArgs is a pack that denotes `decay_t<Args>...`,
— bound_args is a pack of bound argument entities of `g` (22.10.3) of types BoundArgs..., direct-
non-list-initialized with `std::forward<Args>(args)...`, respectively, and
— call_args is an argument pack used in a function call expression (7.6.1.3) of `g`.

Mandates:

```
(is_constructible_v<BoundArgs, Args> && ...) &&
(is_move_constructible_v<BoundArgs> && ...)
```

is true.

Preconditions: FD meets the Cpp17MoveConstructible requirements. For each Ti in BoundArgs, if Ti is
an object type, Ti meets the Cpp17MoveConstructible requirements.

Returns: A perfect forwarding call wrapper (22.10.4) `g` with call pattern:

— `!invoke(fd, bound_args..., call_args...)` for a `bind_front` invocation, or
— `!invoke(fd, call_args..., bound_args...)` for a `bind_back` invocation.

Throws: Any exception thrown by the initialization of the state entities of `g` (22.10.3).

### 22.10.15 Function object binders

Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

#### 22.10.15.1 General

The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.

Specializations of the `is_bind_expression` template shall meet the Cpp17UnaryTypeTrait requirements (21.3.2). The implementation provides a definition that has a base characteristic of `true_type` if T is a type returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this template for a program-defined type T to have a base characteristic of `true_type` to indicate that T should be treated as a subexpression in a `bind` call.
22.10.15.3 Class template is_placeholder

```cpp
namespace std {
  template<class T> struct is_placeholder; // see below
}
```

1. The class template `is_placeholder` can be used to detect the standard placeholders `_1, _2, and so on. The function template `bind` uses `is_placeholder` to detect placeholders.

2. Specializations of the `is_placeholder` template shall meet the Cpp17UnaryTypeTrait requirements (21.3.2). The implementation provides a definition that has the base characteristic of `integral_constant<int, J>` if T is the type of `std::placeholders::J`, otherwise it has a base characteristic of `integral_constant<int, 0>`. A program may specialize this template for a program-defined type T to have a base characteristic of `integral_constant<int, N>` with N > 0 to indicate that T should be treated as a placeholder type.

22.10.15.4 Function template bind

```cpp
template<class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

1. In the text that follows:
   (1.1) — g is a value of the result of a bind invocation,
   (1.2) — FD is the type `decay_t<F>`,
   (1.3) — fd is an lvalue that is a target object of g (22.10.3) of type FD direct-non-list-initialized with `std::forward<F>(f)`,
   (1.4) — T_i is the i_th type in the template parameter pack BoundArgs,
   (1.5) — TD_i is the type `decay_t<T_i>`,
   (1.6) — t_i is the i_th argument in the function parameter pack bound_args,
   (1.7) — td_i is a bound argument entity of g (22.10.3) of type TD_i direct-non-list-initialized with `std::forward<T_i>(t_i)`,
   (1.8) — U_j is the j_th deduced type of the UnBoundArgs&&... parameter of the argument forwarding call wrapper, and
   (1.9) — u_j is the j_th argument associated with U_j.

```

2. **Mandates:** is_constructible_v<FD, F> is true. For each T_i in BoundArgs, is_constructible_v<TD_i, T_i> is true.

3. **Preconditions:** FD and each TD_i meet the Cpp17MoveConstructible and Cpp17Destructible requirements. INVOKE(fd, w_1, w_2, ..., w_N) (22.10.4) is a valid expression for some values w_1, w_2, ..., w_N, where N has the value sizeof...(bound_args).

4. **Returns:** An argument forwarding call wrapper g (22.10.4). A program that attempts to invoke a volatile-qualified g is ill-formed. When g is not volatile-qualified, invocation of g(u_1, w_2, ..., u_M) is expression-equivalent (3.21) to
   ```
   INVOKE(static_cast<V_1>(v_1)),
   static_cast<V_2>(v_2), ..., static_cast<V_N>(v_N)
   ```
   for the first overload, and
   ```
   INVOKE2(static_cast<V_1>(v_1)),
   static_cast<V_2>(v_2), ..., static_cast<V_N>(v_N)
   ```
   for the second overload, where the values and types of the target argument v_fd and of the bound arguments v_1, v_2, ..., v_N are determined as specified below.

5. **Throws:** Any exception thrown by the initialization of the state entities of g.

6. [Note 1: If all of FD and TD_i meet the requirements of Cpp17CopyConstructible, then the return type meets the requirements of Cpp17CopyConstructible. — end note]

7. The values of the bound arguments v_1, v_2, ..., v_N and their corresponding types V_1, V_2, ..., V_N depend on the types TD_i derived from the call to bind and the cv-qualifiers cv of the call wrapper g as follows:
   (7.1) — if TD_i is reference_wrapper<T>, the argument is td_i.get() and its type V_i is TD_i;

§ 22.10.15.4
— if the value of is_bind_expression_v<TD_i> is true, the argument is
\[
\text{static\_cast<cv TD_i&>(td_i)(std::forward<U_j>(u_j)...)}
\]
and its type \(V_i\) is invoke_result_t<cv TD_i&, U_j...>&&;

— if the value \(j\) of is_placeholder_v<TD_i> is not zero, the argument is \(\text{std::forward<U_j>(u_j)}\) and its
type \(V_i\) is \(U_j&&\);

— otherwise, the value is \(\text{td}_i\) and its type \(V_i\) is \(cv\ TD_i&\).

8 The value of the target argument \(v_{td}\) is \(fd\) and its corresponding type \(V_{td}\) is \(cv\ FD&\).

---

22.10.15.5 Placeholders

namespace std::placeholders {
  // M is the implementation-defined number of placeholders
  see below _1;
  see below _2;
  ...
  see below _M;
}

1 All placeholder types meet the Cpp17DefaultConstructible and Cpp17CopyConstructible requirements, and
their default constructors and copy/move constructors are constexpr functions that do not throw exceptions.
It is implementation-defined whether placeholder types meet the Cpp17CopyAssignable requirements, but if
so, their copy assignment operators are constexpr functions that do not throw exceptions.

2 Placeholders should be defined as:

```cpp
inline constexpr unspecified _1{};
```
If they are not, they are declared as:

```cpp
extern unspecified _1;
```

3 Placeholders are freestanding entities (16.3.3.6).

22.10.16 Function template mem_fn

```cpp
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

1 Returns: A simple call wrapper (22.10.4) \(fn\) with call pattern \(\text{invoke(pmd, call_args...)}\), where
\(pmd\) is the target object of \(fn\) of type \(R\ T::*\) direct-non-list-initialized with \(pm\), and \(call_args\) is an
argument pack used in a function call expression (7.6.1.3) of \(fn\).

22.10.17 Polymorphic function wrappers

22.10.17.1 General

1 Subclause 22.10.17 describes polymorphic wrapper classes that encapsulate arbitrary callable objects.

22.10.17.2 Class bad_function_call

1 An exception of type bad_function_call is thrown by function::operator() (22.10.17.3.5) when the
function wrapper object has no target.

```cpp
namespace std {
  class bad_function_call : public exception {
    public:
      // see 17.10.3 for the specification of the special member functions
      const char* what() const noexcept override;
  };
}
```

2 Returns: An implementation-defined NTBS.
22.10.17.3 Class template function

22.10.17.3.1 General

```cpp
namespace std {
    template<class> class function; // not defined

    template<class R, class... ArgTypes>
    class function<R(ArgTypes...)> {
        public:
            using result_type = R;

            // 22.10.17.3.2, construct/copy/destroy
            function() noexcept;
            function(nullptr_t) noexcept;
            function(const function&);
            function(function&&) noexcept;
            template<class F> function(F&&);
            function& operator=(const function&);
            function& operator=(function&&);
            function& operator=(nullptr_t) noexcept;
            template<class F> function& operator=(F&&);
            template<class F> function& operator=(reference_wrapper<F>) noexcept;
            ~function();

            // 22.10.17.3.3, function modifiers
            void swap(function&) noexcept;

            // 22.10.17.3.4, function capacity
            explicit operator bool() const noexcept;

            // 22.10.17.3.5, function invocation
            R operator()(ArgTypes...) const;

            // 22.10.17.3.6, function target access
            const type_info& target_type() const noexcept;
            template<class T> T* target() noexcept;
            template<class T> const T* target() const noexcept;
    }
}
```

1. The `function` class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (22.10.3), given a call signature (22.10.3).

2. A callable type (22.10.3) `F` is `Lvalue-Callable` for argument types `ArgTypes` and return type `R` if the expression `INVOKE<R>(declval<F&>(), declval<ArgTypes>()...)`, considered as an unevaluated operand (7.2.3), is well-formed (22.10.4).

3. The `function` class template is a call wrapper (22.10.3) whose call signature (22.10.3) is `R(ArgTypes...)`.

4. [Note 1: The types deduced by the deduction guides for `function` might change in future revisions of C++. — end note]

22.10.17.3.2 Constructors and destructor

```cpp
function() noexcept;
    Postconditions: !*this.

function(nullptr_t) noexcept;
    Postconditions: !*this.
```
function(const function& f);

Postconditions: !\*this if !f; otherwise, the target object of \*this is a copy of f.target().

Throws: Nothing if f's target is a specialization of reference_wrapper or a function pointer. Otherwise, may throw bad_alloc or any exception thrown by the copy constructor of the stored callable object.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer.

function(function&& f) noexcept;

Postconditions: If !f, \*this has no target; otherwise, the target of \*this is equivalent to the target of f before the construction, and f is in a valid state with an unspecified value.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f's target is an object holding only a pointer or reference to an object and a member function pointer.

template<class F> function(F&& f);

Let FD be decay_t<F>.

Constraints:

(9.1) is_same_v<remove_cvref_t<F>, function> is false, and
(9.2) FD is Lvalue-Callable (22.10.17.3) for argument types ArgTypes... and return type R.

Mandates:

(10.1) is_copy_constructible_v_v<FD> is true, and
(10.2) is_constructible_v_v<FD, F> is true.

Preconditions: FD meets the Cpp17CopyConstructible requirements.

Postconditions: !\*this is true if any of the following hold:

(12.1) f is a null function pointer value.
(12.2) f is a null member pointer value.
(12.3) remove_cvref_t<F> is a specialization of the function class template, and !f is true.

Otherwise, \*this has a target object of type FD direct-non-list-initialized with std::forward<F>(f).

Throws: Nothing if FD has a specialization of reference_wrapper or a function pointer type. Otherwise, may throw bad_alloc or any exception thrown by the initialization of the target object.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f refers to an object holding only a pointer or reference to an object and a member function pointer.

template<class F> function(F) -> function<see below>;

Constraints: &F::operator() is well-formed when treated as an unevaluated operand and either

(16.1) F::operator() is a non-static member function and decltype(&F::operator()) is either of the form R(G::*)(A...) cv k_opt noexcept_opt or of the form R(*)(G, A...) noexcept_opt for a type G, or
(16.2) F::operator() is a static member function and decltype(&F::operator()) is of the form R(*)(A...) noexcept_opt.

Remarks: The deduced type is function<R(A...)>.

[Example 1:]

```cpp
void f() {
    int i(5);
    function g = [&](double) { return i; }; // deduces function<int(double)>
}
```

—end example]
function& operator=(const function& f);
   \textit{Effects}: As if by function(f).swap(*this);
   \textit{Returns}: *this.

function& operator=(function&& f);
   \textit{Effects}: Replaces the target of *this with the target of f.
   \textit{Returns}: *this.

function& operator=(nullptr_t) noexcept;
   \textit{Effects}: If *this != nullptr, destroys the target of this.
   \textit{Postconditions}: !(*this).
   \textit{Returns}: *this.

\begin{verbatim}

function operator=(F&& f);
   Constraints: decay_t<F> is Lvalue-Callable (22.10.17.3) for argument types ArgTypes... and return
type R.
   \textit{Effects}: As if by: function(std::forward<F>(f)).swap(*this);
   \textit{Returns}: *this.

template<class F> function& operator=(reference_wrapper<F> f) noexcept;
   \textit{Effects}: As if by: function(f).swap(*this);
   \textit{Returns}: *this.

\end{verbatim}

\textit{~function();}
   \textit{Effects}: If *this != nullptr, destroys the target of this.

22.10.17.3.3 \textbf{Modifiers} \hfill [\texttt{func.wrap.func.mod}]

\begin{verbatim}

void swap(function& other) noexcept;
   \textit{Effects}: Interchanges the target objects of *this and other.

\end{verbatim}

22.10.17.3.4 \textbf{Capacity} \hfill [\texttt{func.wrap.func.cap}]

\begin{verbatim}

explicit operator bool() const noexcept;
   \textit{Returns}: true if *this has a target, otherwise false.

\end{verbatim}

22.10.17.3.5 \textbf{Invocation} \hfill [\texttt{func.wrap.func.inv}]

\begin{verbatim}

R operator()(ArgTypes... args) const;
   \textit{Returns}: \texttt{INVOKE}\langle R\rangle(f, \texttt{std::forward}\langle\texttt{ArgTypes}\rangle(args)\ldots) (22.10.4), where f is the target object
   (22.10.3) of *this.
   \textit{throws}: bad_function_call if !*this; otherwise, any exception thrown by the target object.

\end{verbatim}

22.10.17.3.6 \textbf{Target access} \hfill [\texttt{func.wrap.func.targ}]

\begin{verbatim}

const type_info& target_type() const noexcept;
   \textit{Returns}: If *this has a target of type T, typeid(T); otherwise, typeid(void).

template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;
   \textit{Returns}: If target_type() == typeid(T) a pointer to the stored function target; otherwise a null
   pointer.

\end{verbatim}

22.10.17.3.7 \textbf{Null pointer comparison operator functions} \hfill [\texttt{func.wrap.func.nullptr}]

\begin{verbatim}

template<class R, class... ArgTypes>
   bool operator==(const function<R(ArgTypes...)>& f, nullptr_t) noexcept;
   \textit{Returns}: !f.

\end{verbatim}
22.10.17.3.8 Specialized algorithms

```cpp
template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)>& f1, function<R(ArgTypes...)>& f2) noexcept;
```

**Effects:** As if by: f1.swap(f2);

22.10.17.4 Move only wrapper

22.10.17.4.1 General

The header provides partial specializations of move_only_function for each combination of the possible replacements of the placeholders `cv`, `ref`, and `noex` where

1. `cv` is either `const` or empty,
2. `ref` is either `&`, `&&`, or empty, and
3. `noex` is either `true` or `false`.

For each of the possible combinations of the placeholders mentioned above, there is a placeholder `inv-quals` defined as follows:

1. If `ref` is empty, let `inv-quals` be `cv&`,
2. otherwise, let `inv-quals` be `cv ref`.

22.10.17.4.2 Class template `move_only_function`

```cpp
namespace std {
    template<class... S> class move_only_function; // not defined

    template<class R, class... ArgTypes>
class move_only_function<R(ArgTypes...) cv ref noexcept(noex)> {
    public:
        using result_type = R;

        move_only_function() noexcept;
        move_only_function(nullptr_t) noexcept;
        move_only_function(move_only_function&&) noexcept;
        template<class F> move_only_function(F&&);
        template<class T, class... Args>
            explicit move_only_function(in_place_type_t<T>, Args&&...);
        template<class T, class U, class... Args>
            explicit move_only_function(in_place_type_t<T>, initializer_list<U>, Args&&...);

        move_only_function& operator=(move_only_function&&);
        move_only_function& operator=(nullptr_t) noexcept;
        template<class F> move_only_function& operator=(F&&);

        ~move_only_function();

    // 22.10.17.4.4, invocation
    explicit operator bool() const noexcept;
    R operator()(ArgTypes...) cv ref noexcept(noex);

    // 22.10.17.4.5, utility
    void swap(move_only_function&) noexcept;
    friend void swap(move_only_function&, move_only_function&) noexcept;
    friend bool operator==(const move_only_function&, nullptr_t) noexcept;

    private:
        template<class VT>
            static constexpr bool is-callable-from = see below; // exposition only
    }
}
```
The `move_only_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for a small contained value.

[Note 1: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is true. — end note]

### 22.10.17.4.3 Constructors, assignment, and destructor

```cpp
template<class VT>
static constexpr bool is-callable-from = see below;

if noex is true, is-callable-from<VT> is equal to:
is_nothrow_invocable_r_v<R, VT cv ref, ArgTypes...> &&
is_nothrow_invocable_r_v<R, VT inv-quals, ArgTypes...>
Otherwise, is-callable-from<VT> is equal to:
is_invocable_r_v<R, VT cv ref, ArgTypes...> &&
is_invocable_r_v<R, VT inv-quals, ArgTypes...>
```

move_only_function() noexcept;
move_only_function(nullptr_t) noexcept;

Postconditions: *this has no target object.

move_only_function(move_only_function&& f) noexcept;

Postconditions: The target object of *this is the target object f had before construction, and f is in a valid state with an unspecified value.

```cpp
template<class F> move_only_function(F&& f);
Let VT be decay_t<F>.
Constraints:
(5.1) remove_cvref_t<F> is not the same type as move_only_function, and
(5.2) remove_cvref_t<F> is not a specialization of in_place_type_t, and
(5.3) is-callable-from<VT> is true.
Mandates: is_constructible_v<VT, F> is true.
Preconditions: VT meets the Cpp17Destructible requirements, and if is_move_constructible_v<VT> is true, VT meets the Cpp17MoveConstructible requirements.
Postconditions: *this has no target object if any of the following hold:
(8.1) f is a null function pointer value, or
(8.2) f is a null member pointer value, or
(8.3) remove_cvref_t<F> is a specialization of the move_only_function class template, and f has no target object.
Otherwise, *this has a target object of type VT direct-non-list-initialized with std::forward<F>(f).
Throws: Any exception thrown by the initialization of the target object. May throw bad_alloc unless VT is a function pointer or a specialization of reference_wrapper.

```cpp
template<class T, class... Args>
explicit move_only_function(in_place_type_t<T>, Args&&... args);
Let VT be decay_t<T>.
Constraints:
(11.1) is_constructible_v<VT, Args...> is true, and
(11.2) is-callable-from<VT> is true.
```
Mandates: VT is the same type as T.

Preconditions: VT meets the Cpp17Destructible requirements, and if is_move_constructible_v<VT> is true, VT meets the Cpp17MoveConstructible requirements.

Postconditions: *this has a target object of type VT direct-non-list-initialized with std::forward<Args>(args)....

Throws: Any exception thrown by the initialization of the target object. May throw bad_alloc unless VT is a function pointer or a specialization of reference_wrapper.

\[

& \text{where f is an lvalue designating the target object of *this and F is the type of f.}
\end{align*}
\]

22.10.17.4.5 Utility

\[
\text{void swap(move_only_function& other) noexcept;} \\
\text{Effects: Exchanges the target objects of *this and other.}
\]
friend void swap(move_only_function& f1, move_only_function& f2) noexcept;

Effects: Equivalent to f1.swap(f2).

friend bool operator==(const move_only_function& f, nullptr_t) noexcept;

Returns: true if f has no target object, otherwise false.

22.10.18 Searchers [func.search]

22.10.18.1 General [func.search.general]

Subclause 22.10.18 provides function object types (22.10) for operations that search for a sequence \([\text{pat\_first}, \text{pat\_last}]\) in another sequence \([\text{first}, \text{last}]\) that is provided to the object’s function call operator. The first sequence (the pattern to be searched for) is provided to the object’s constructor, and the second (the sequence to be searched) is provided to the function call operator.

Each specialization of a class template specified in 22.10.18 shall meet the Cpp17CopyConstructible and Cpp17CopyAssignable requirements. Template parameters named

(2.1) — ForwardIterator,
(2.2) — ForwardIterator1,
(2.3) — ForwardIterator2,
(2.4) — RandomAccessIterator,
(2.5) — RandomAccessIterator1,
(2.6) — RandomAccessIterator2, and
(2.7) — BinaryPredicate

of templates specified in 22.10.18 shall meet the same requirements and semantics as specified in 27.1. Template parameters named Hash shall meet the Cpp17Hash requirements (Table 38).

The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

22.10.18.2 Class template default_searcher [func.search.default]

namespace std {

  template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
  class default_searcher {
  public:
    constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                              BinaryPredicate pred = BinaryPredicate());

    template<class ForwardIterator2>
    constexpr pair<ForwardIterator2, ForwardIterator2>
    operator()(ForwardIterator2 first, ForwardIterator2 last) const;
  
    private:
    ForwardIterator1 pat_first_;  // exposition only
    ForwardIterator1 pat_last_;   // exposition only
    BinaryPredicate pred_;       // exposition only
  
  };

  constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                              BinaryPredicate pred = BinaryPredicate());

  Effects: Constructs a default_searcher object, initializing \(\text{pat\_first_}\) with \(\text{pat\_first}\), \(\text{pat\_last}\) with \(\text{pat\_last}\), and \(\text{pred}_\) with \(\text{pred}\).

  Throws: Any exception thrown by the copy constructor of BinaryPredicate or ForwardIterator1.

  template<class ForwardIterator2>
  constexpr pair<ForwardIterator2, ForwardIterator2>
  operator()(ForwardIterator2 first, ForwardIterator2 last) const;

  Effects: Returns a pair of iterators \(i\) and \(j\) such that

§ 22.10.18.2 774
i == search(first, last, pat_first_, pat_last_, pred_), and

if i == last, then j == last, otherwise j == next(i, distance(pat_first_, pat_last_)).

22.10.18.3 Class template boyer_moore_searcher

namespace std {

    template<class RandomAccessIterator1, 
             class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>, 
             class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher {
        public:
            boyer_moore_searcher(RandomAccessIterator1 pat_first, 
                                 RandomAccessIterator1 pat_last, 
                                 Hash hf = Hash(), 
                                 BinaryPredicate pred = BinaryPredicate());

    template<class RandomAccessIterator2>
    pair<RandomAccessIterator2, RandomAccessIterator2> 
    operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

    private:
        RandomAccessIterator1 pat_first_; // exposition only
        RandomAccessIterator1 pat_last_; // exposition only
        Hash hash_;                     // exposition only
        BinaryPredicate pred_;          // exposition only
    }
}

boyer_moore_searcher(RandomAccessIterator1 pat_first, 
                      RandomAccessIterator1 pat_last, 
                      Hash hf = Hash(), 
                      BinaryPredicate pred = BinaryPredicate());

Preconditions: The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible, the Cpp17CopyConstructible, and the Cpp17CopyAssignable requirements.

Let V be iterator_traits<RandomAccessIterator1>::value_type. For any two values A and B of type V, if pred(A, B) == true, then hf(A) == hf(B) is true.

Effects: Initializes pat_first_ with pat_first, pat_last_ with pat_last, hash_ with hf, and pred_ with pred.

Throws: Any exception thrown by the copy constructor of RandomAccessIterator1, or by the default constructor, copy constructor, or the copy assignment operator of the value type of RandomAccessIterator1, or the copy constructor or operator() of BinaryPredicate or Hash. May throw bad_alloc if additional memory needed for internal data structures cannot be allocated.

template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2> 
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

Mandates: RandomAccessIterator1 and RandomAccessIterator2 have the same value type.

Effects: Finds a subsequence of equal values in a sequence.

Returns: A pair of iterators i and j such that

(7.1) i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds: pred(*(i + n), *(pat_first_ + n)) != false, and

(7.2) j == next(i, distance(pat_first_, pat_last_)).

Returns make_pair(first, first) if [pat_first_, pat_last_) is empty, otherwise returns make_pair(last, last) if no such iterator is found.

Complexity: At most (last - first) * (pat_last_ - pat_first_) applications of the predicate.
22.10.18.4 Class template boyer_moore_horspool_searcher

namespace std {
    template<class RandomAccessIterator1,
             class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
             class BinaryPredicate = equal_to<>>
    class boyer_moore_horspool_searcher {
        public:
            boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                                           RandomAccessIterator1 pat_last,
                                           Hash hf = Hash(),
                                           BinaryPredicate pred = BinaryPredicate());
        
            template<class RandomAccessIterator2>
            pair<RandomAccessIterator2, RandomAccessIterator2>
            operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
        
            private:
                RandomAccessIterator1 pat_first_; // exposition only
                RandomAccessIterator1 pat_last_; // exposition only
                Hash hash_; // exposition only
                BinaryPredicate pred_; // exposition only
    };
}

boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                               RandomAccessIterator1 pat_last,
                               Hash hf = Hash(),
                               BinaryPredicate pred = BinaryPredicate());

1 Preconditions: The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible,
                 Cpp17CopyConstructible, and Cpp17CopyAssignable requirements.

2 Let V be iterator_traits<RandomAccessIterator1>::value_type. For any two values A and B of
   type V, if pred(A, B) == true, then hf(A) == hf(B) is true.

3 Effects: Initializes pat_first_ with pat_first, pat_last_ with pat_last, hash_ with hf, and
           pred_ with pred.

4 Throws: Any exception thrown by the copy constructor of RandomAccessIterator1, or by the default
          constructor, copy constructor, or the copy assignment operator of the value type of
          RandomAccessIterator1, or the copy constructor or operator() of BinaryPredicate or Hash. May throw bad_alloc
          if additional memory needed for internal data structures cannot be allocated.

5 template<class RandomAccessIterator2>
     pair<RandomAccessIterator2, RandomAccessIterator2>
     operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

6 Mandates: RandomAccessIterator1 and RandomAccessIterator2 have the same value type.

7 Effects: Finds a subsequence of equal values in a sequence.

8 Returns: A pair of iterators i and j such that
            (7.1) i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for
                 every non-negative integer n less than pat_last_ - pat_first_ the following condition holds:
                 pred(*(i + n), *(pat_first_ + n)) != false, and
            (7.2) j == next(i, distance(pat_first_, pat_last_)).

8 Returns make_pair(first, first) if [pat_first_, pat_last_) is empty, otherwise returns make_pair(
8     last, last) if no such iterator is found.

8 Complexity: At most (last - first) * (pat_last_ - pat_first_) applications of the predicate.

22.10.19 Class template hash

1 The unordered associative containers defined in 24.5 use specializations of the class template hash (22.10.2)
   as the default hash function.

2 Each specialization of hash is either enabled or disabled, as described below.
Each header that declares the template `hash` provides enabled specializations of `hash` for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template `hash`, `hash<Key>` is disabled.

If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are `noexcept` except as noted otherwise.

If `H` is a disabled specialization of `hash`, these values are false: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copy_assignable_v<H>`, and `is_move_assignable_v<H>`. Disabled specializations of `hash` are not function object types (22.10).

An enabled specialization `hash<Key>` will:

1. meet the `Cpp17Hash` requirements (Table 38), with `Key` as the function call argument type, the `Cpp17DefaultConstructible` requirements (Table 31), the `Cpp17CopyAssignable` requirements (Table 35),
2. be swappable (16.4.4.3) for lvalues,
3. meet the requirement that if `k1 == k2` is `true`, `h(k1) == h(k2)` is also `true`, where `h` is an object of type `hash<Key>` and `k1` and `k2` are objects of type `Key`;
4. meet the requirement that the expression `h(k)`, where `h` is an object of type `hash<Key>` and `k` is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization.

The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (24.4) and in unordered associative containers (24.5).
22.11.3 type_index members

```cpp
type_index(const type_info& rhs) noexcept;
```

- **Effects:** Constructs a `type_index` object, the equivalent of `target = &rhs`.

```cpp
bool operator==(const type_index& rhs) const noexcept;
```

- **Returns:** `*target == *rhs.target`.

```cpp
bool operator<(const type_index& rhs) const noexcept;
```

- **Returns:** `target->before(*rhs.target)`.

```cpp
bool operator<=(const type_index& rhs) const noexcept;
```

- **Returns:** `!rhs.target->before(*target)`.

```cpp
bool operator>=(const type_index& rhs) const noexcept;
```

- **Returns:** `!target->before(*rhs.target)`.

```cpp
strong_ordering operator<=>(const type_index& rhs) const noexcept;
```

- **Effects:** Equivalent to:
  ```cpp
  if (*target == *rhs.target) return strong_ordering::equal;
  if (target->before(*rhs.target)) return strong_ordering::less;
  return strong_ordering::greater;
  ```

```cpp
size_t hash_code() const noexcept;
```

- **Returns:** `target->hash_code()`.

```cpp
const char* name() const noexcept;
```

- **Returns:** `target->name()`.

22.11.4 Hash support

```cpp
template<> struct hash<type_index>;
```

- For an object `index` of type `type_index`, `hash<type_index>()(index)` shall evaluate to the same result as `index.hash_code()`.

22.12 Execution policies

22.12.1 In general

- Subclause 22.12 describes classes that are `execution policy` types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions.

  **Example 1:**
  ```cpp
  using namespace std;
  vector<int> v = /* ... */;

  // standard sequential sort
  sort(v.begin(), v.end());

  // explicitly sequential sort
  sort(execution::seq, v.begin(), v.end());

  // permitting parallel execution
  sort(execution::par, v.begin(), v.end());

  // permitting vectorization as well
  sort(execution::par_unseq, v.begin(), v.end());
  ```

— end example]

[Note 1: Implementations can provide additional execution policies to those described in this standard as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution. — end note]

### 22.12.2 Header `<execution>` synopsis

```cpp
namespace std {
    // 22.12.3, execution policy type trait
template<class T> struct is_execution_policy;
template<class T> inline constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}
namespace std::execution {
    // 22.12.4, sequenced execution policy
class sequenced_policy;
    // 22.12.5, parallel execution policy
class parallel_policy;
    // 22.12.6, parallel and unsequenced execution policy
class parallel_unsequenced_policy;
    // 22.12.7, unsequenced execution policy
class unsequenced_policy;
    // 22.12.8, execution policy objects
inline constexpr sequenced_policy seq{ unspecified};
inline constexpr parallel_policy par{ unspecified};
inline constexpr parallel_unsequenced_policy par_unseq{ unspecified};
inline constexpr unsequenced_policy unseq{ unspecified};
}
```

### 22.12.3 Execution policy type trait

```
template<class T> struct is_execution_policy { see below };  
1 is_execution_policy can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.
2 is_execution_policy<T> is a Cpp17UnaryTypeTrait with a base characteristic of true_type if T is the type of a standard or implementation-defined execution policy, otherwise false_type.
[Note 1: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — end note]
3 The behavior of a program that adds specializations for is_execution_policy is undefined.
```

### 22.12.4 Sequenced execution policy

```
class execution::sequenced_policy { unspecified };  
1 The class execution::sequenced_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.
2 During the execution of a parallel algorithm with the execution::sequenced_policy policy, if the invocation of an element access function exits via an exception, terminate is invoked (14.6.2).
```

### 22.12.5 Parallel execution policy

```
class execution::parallel_policy { unspecified };  
1 The class execution::parallel_policy is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.
2 During the execution of a parallel algorithm with the execution::parallel_policy policy, if the invocation of an element access function exits via an exception, terminate is invoked (14.6.2).
```
22.12.6 Parallel and unsequenced execution policy

The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized.

During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.7 Unsequenced execution policy

The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items.

During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

22.12.8 Execution policy objects

The header `<execution>` declares global objects associated with each type of execution policy.

22.13 Primitive numeric conversions

When a function is specified with a type placeholder of `integer-type`, the implementation provides overloads for all cv-unqualified signed and unsigned integer types and `char` in lieu of `integer-type`. When a function is specified with a type placeholder of `floating-point-type`, the implementation provides overloads for all cv-unqualified floating-point types (6.8.2) in lieu of `floating-point-type`.

```cpp
namespace std {
    // floating-point format for primitive numerical conversion
    enum class chars_format {
        scientific = unspecified,
        fixed = unspecified,
        hex = unspecified,
        general = fixed | scientific
    };

    // 22.13.2, primitive numerical output conversion
    struct to_chars_result {
        char* ptr;
        errc ec;
        friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
    }

    constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
    to_chars_result to_chars(char* first, char* last, bool value, int base = 10) = delete;
    to_chars_result to_chars(char* first, char* last, floating-point-type value);
    to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt, int precision);

    // 22.13.3, primitive numerical input conversion
    struct from_chars_result {
        const char* ptr;
```

§ 22.13.1
```c
errc ec;
friend bool operator==(const from_chars_result&, const from_chars_result&) = default;

constexpr from_chars_result from_chars(const char* first, const char* last, integer-type value, int base = 10);
from_chars_result from_chars(const char* first, const char* last, floating-point-type value, chars_format fmt = chars_format::general);
```

2 The type `chars_format` is a bitmask type (16.3.3.3.4) with elements `scientific`, `fixed`, and `hex`.

3 The types `to_chars_result` and `from_chars_result` have the data members and special members specified above. They have no base classes or members other than those specified.

### 22.13.2 Primitive numeric output conversion

1 All functions named `to_chars` convert `value` into a character string by successively filling the range `[first, last)`, where `[first, last)` is required to be a valid range. If the member `ec` of the return value is such that the value is equal to the value of a value-initialized `errc`, the conversion was successful and the member `ptr` is the one-past-the-end pointer of the characters written. Otherwise, the member `ec` has the value `errc::value_too_large`, the member `ptr` has the value `last`, and the contents of the range `[first, last)` are unspecified.

[Note 1: This guarantee applies only if `to_chars` and `from_chars` are executed on the same implementation. — end note]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to `round_to_nearest` (17.3.4.1).

3 The functions taking a `chars_format` parameter determine the conversion specifier for `printf` as follows:

- The conversion specifier is `f` if `fmt` is `chars_format::fixed`, `e` if `fmt` is `chars_format::scientific`, `a` (without leading "0x" in the result) if `fmt` is `chars_format::hex`, and `g` if `fmt` is `chars_format::general`.

```c
constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
```

4 **Preconditions:** `base` has a value between 2 and 36 (inclusive).

5 **Effects:** The value of `value` is converted to a string of digits in the given base (with no redundant leading zeroes). Digits in the range 10..35 (inclusive) are represented as lowercase characters `a`..`z`. If `value` is less than zero, the representation starts with `-`.

6 **Throws:** Nothing.

```c
to_chars_result to_chars(char* first, char* last, floating-point-type value);
```

7 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale. The conversion specifier is `f` or `e`, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of `f`.

8 **Throws:** Nothing.

```c
to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
```

9 **Preconditions:** `fmt` has the value of one of the enumerators of `chars_format`.

10 **Effects:** `value` is converted to a string in the style of `printf` in the "C" locale.

11 **Throws:** Nothing.

```c
to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt, int precision);
```

12 **Preconditions:** `fmt` has the value of one of the enumerators of `chars_format`.

§ 22.13.2
Effects: value is converted to a string in the style of printf in the "C" locale with the given precision.

Throws: Nothing.

See also: ISO C 7.21.6.1

22.13.3 Primitive numeric input conversion \[charconv.from.chars\]

All functions named from_chars analyze the string [first,last) for a pattern, where [first,last) is required to be a valid range. If no characters match the pattern, value is unmodified, the member ptr of the return value is first and the member ec is equal to errc::invalid_argument.

[Note 1: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. — end note]

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of value. The member ptr of the return value points to the first character not matching the pattern, or has the value last if all characters match. If the parsed value is not in the range representable by the type of value, value is unmodified and the member ec of the return value is equal to errc::result_out_of_range. Otherwise, value is set to the parsed value, after rounding according to round_to_nearest (17.3.4.1), and the member ec is value-initialized.

```cpp
constexpr from_chars_result from_chars(const char* first, const char* last, integer-type& value, int base = 10);
```

Preconditions: base has a value between 2 and 36 (inclusive).

Effects: The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for strtol, except that no "0x" or "0X" prefix shall appear if the value of base is 16, and except that ' - ' is the only sign that may appear, and only if value has a signed type.

Throws: Nothing.

```cpp
from_chars_result from_chars(const char* first, const char* last, floating-point-type& value, chars_format fmt = chars_format::general);
```

Preconditions: fmt has the value of one of the enumerators of chars_format.

Effects: The pattern is the expected form of the subject sequence in the "C" locale, as described for strtod, except that

- the sign '+ ' may only appear in the exponent part;
- if fmt has chars_format::scientific set but not chars_format::fixed, the otherwise optional exponent part shall appear;
- if fmt has chars_format::fixed set but not chars_format::scientific, the optional exponent part shall not appear; and
- if fmt is chars_format::hex, the prefix "0x" or "0X" is assumed.

[Example 1: The string 0x123 is parsed to have the value 0 with remaining characters x123. — end example]

In any case, the resulting value is one of at most two floating-point values closest to the value of the string matching the pattern.

Throws: Nothing.

The class template format_to_n_result has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

22.14.2 Format string

22.14.2.1 In general

A format string for arguments `args` is a (possibly empty) sequence of replacement fields, escape sequences, and characters other than `{` and `}`. Let `charT` be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of `{` or `}`. It is replaced with `{` or `}`, respectively, in the output. The syntax of replacement fields is as follows:

replacement-field:
  {, arg-id_opt, format-specifier_opt }

arg-id:
  0
  positive-integer

positive-integer:
  nonzero-digit
  positive-integer digit

nonnegative-integer:
  digit
  nonnegative-integer digit

nonzero-digit: one of
  1 2 3 4 5 6 7 8 9

digit: one of
  0 1 2 3 4 5 6 7 8 9

format-specifier:
  : format-spec

format-spec:
  as specified by the formatter specialization for the argument type

The `arg-id` field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index `arg-id` in `args`, the string is not a format string for `args`. The optional `format-specifier` field explicitly specifies a format for the replacement value.

[Example 1:]

```cpp
string s = format("{0}--{1}, 8");  // value of s is "8--"  
```

---

[1] The class template `format_to_n_result` has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

[2] The `arg-id` field specifies the index of the argument in `args` whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index `arg-id` in `args`, the string is not a format string for `args`. The optional `format-specifier` field explicitly specifies a format for the replacement value.

[3] [Example 1:]

```cpp
string s = format("{0}--{1}, 8");  // value of s is "8--"
```

---

§ 22.14.2.1 785
If all arg-ids in a format string are omitted (including those in the format-spec, as interpreted by the corresponding formatter specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some arg-ids are omitted and some are present, the string is not a format string.

[Note 1: A format string cannot contain a mixture of automatic and manual indexing. — end note]

[Example 2:

```c
string s0 = format("{} to {}", "a", "b"); // OK, automatic indexing
string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
string s2 = format("{0} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing), // ill-formed
string s3 = format("{} to {1}", "a", "b"); // not a format string (mixing automatic and manual indexing), // ill-formed
```

— end example]

The format-spec field contains format specifications that define how the value should be presented. Each type can define its own interpretation of the format-spec field. If format-spec does not conform to the format specifications for the argument type referred to by arg-id, the string is not a format string for args.

[Example 3:

(5.1) — For arithmetic, pointer, and string types the format-spec is interpreted as a std-format-spec as described in (22.14.2.2).
(5.2) — For chrono types the format-spec is interpreted as a chrono-format-spec as described in (29.12).
(5.3) — For user-defined formatter specializations, the behavior of the parse member function determines how the format-spec is interpreted.

— end example]

**22.14.2.2 Standard format specifiers**

Each formatter specializations described in 22.14.6.3 for fundamental and string types interprets format-spec as a std-format-spec.

[Note 1: The format specification can be used to specify such details as field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — end note]

The syntax of format specifications is as follows:

```
std-format-spec:
  fill-and-align_opt sign_opt #opt 0_opt width_opt precision_opt Lopt type_opt
fill-and-align:
  fill_opt align
fill:
  any character other than \{ or \}
align: one of
  < > ^
sign: one of
  + - space
width:
  positive-integer
  { arg-id_opt }
precision:
  . nonnegative-integer
  . { arg-id_opt }
type: one of
  a A b B c d e E f F g G o p s x X ?
```

[Note 2: The fill character can be any character other than \{ or \}. The presence of a fill character is signaled by the character following it, which must be one of the alignment options. If the second character of std-format-spec is not a valid alignment option, then it is assumed that both the fill character and the alignment option are absent. — end note]

The align specifier applies to all argument types. The meaning of the various alignment options is as specified in Table 66.

[Example 1:
char c = 120;
string s0 = format("{:6}", 42); // value of s0 is " 42"
string s1 = format("{:6}", 'x'); // value of s1 is "x"
string s2 = format("{:<6}", 'x'); // value of s2 is "x*****"
string s3 = format("{:>6}", 'x'); // value of s3 is "*****x"
string s4 = format("{:*<6}", 'x'); // value of s4 is "x*****"
string s5 = format("{:*>6}", c); // value of s5 is "*****x"
string s6 = format("{:*^6}", true); // value of s6 is "true"

—end example

[Note 3: Unless a minimum field width is defined, the field width is determined by the size of the content and the alignment option has no effect. —end note]

Table 66: Meaning of align options [tab:format.align]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>Forces the field to be aligned to the start of the available space. This is the default for non-arithmetic non-pointer types, charT, and bool, unless an integer presentation type is specified.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Forces the field to be aligned to the end of the available space. This is the default for arithmetic types other than charT and bool, pointer types, or when an integer presentation type is specified.</td>
</tr>
<tr>
<td>-</td>
<td>Forces the field to be centered within the available space by inserting ⌊\frac{n}{2}⌋ characters before and ⌈\frac{n}{2}⌉ characters after the value, where n is the total number of fill characters to insert.</td>
</tr>
</tbody>
</table>

4 The sign option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. The meaning of the various options is as specified in Table 67.

Table 67: Meaning of sign options [tab:format.sign]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>+</td>
<td>Indicates that a sign should be used for both non-negative and negative numbers. The + sign is inserted before the output of to_chars for non-negative numbers other than negative zero. [Note 4: For negative numbers and negative zero the output of to_chars will already contain the sign so no additional transformation is performed. —end note]</td>
</tr>
<tr>
<td>-</td>
<td>Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior).</td>
</tr>
<tr>
<td>space</td>
<td>Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero.</td>
</tr>
</tbody>
</table>

5 The sign option applies to floating-point infinity and NaN. [Example 2:]

```cpp
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:}, {0:+}, {0:-}, {0: }", 1); // value of s0 is "1, +1, 1, 1"
string s1 = format("{0:}, {0:+}, {0:-}, {0: }", -1); // value of s1 is "-1, -1, -1, -1"
string s2 = format("{0:}, {0:+}, {0:-}, {0: }", inf); // value of s2 is "inf, +inf, inf, inf"
string s3 = format("{0:}, {0:+}, {0:-}, {0: }", nan); // value of s3 is "nan, +nan, nan, nan"
—end example]
```

6 The # option causes the alternate form to be used for the conversion. This option is valid for arithmetic types other than charT and bool or when an integer presentation type is specified, and not otherwise. For integral types, the alternate form inserts the base prefix (if any) specified in Table 69 into the output after the sign character (possibly space) if there is one, or before the output of to_chars otherwise. For floating-point types, the alternate form causes the result of the conversion of finite values to always contain a decimal-point character, even if no digits follow it. Normally, a decimal-point character appears in the result of these
conversions only if a digit follows it. In addition, for g and G conversions, trailing zeros are not removed from the result.

A zero (0) character preceding the width field pads the field with leading zeros (following any indication of sign or base) to the field width, except when applied to an infinity or NaN. This option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. If the 0 character and an align option both appear, the 0 character is ignored.

Example 3:

```cpp
char c = 120;
string s1 = format("{:+06d}" , c); // value of s1 is "+00120"
string s2 = format("{:#06x}" , 0xa); // value of s2 is "0x000a"
string s3 = format("{:<06}" , -42); // value of s3 is "-42 " (0 is ignored because of < alignment)
```

If `{ arg-id opt }` is used in a width or precision, the value of the corresponding formatting argument is used in its place. If the corresponding formatting argument is not of integral type, or its value is negative, an exception of type format_error is thrown.

The positive-integer in width is a decimal integer defining the minimum field width. If width is not specified, there is no minimum field width, and the field width is determined based on the content of the field.

The width of a string is defined as the estimated number of column positions appropriate for displaying it in a terminal.

Note 5: This is similar to the semantics of the POSIX wcswidth function. — end note

For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use a Unicode encoding on platforms capable of displaying Unicode text in a terminal.

Note 6: This is the case for Windows®-based and many POSIX-based operating systems. — end note

For a string in a Unicode encoding, implementations should estimate the width of a string as the sum of estimated widths of the first code points in its extended grapheme clusters. The extended grapheme clusters of a string are defined by UAX #29. The estimated width of the following code points is 2:

- (12.1)  \( \text{U+1100} - \text{U+115F} \)
- (12.2)  \( \text{U+12329} - \text{U+1232A} \)
- (12.3)  \( \text{U+2E80} - \text{U+303E} \)
- (12.4)  \( \text{U+3040} - \text{U+A4CF} \)
- (12.5)  \( \text{U+AC00} - \text{U+D7A3} \)
- (12.6)  \( \text{U+F900} - \text{U+FAFF} \)
- (12.7)  \( \text{U+FE10} - \text{U+FE19} \)
- (12.8)  \( \text{U+FE30} - \text{U+FE6F} \)
- (12.9)  \( \text{U+FF00} - \text{U+FF60} \)
- (12.10) \( \text{U+FFE0} - \text{U+FFE6} \)
- (12.11) \( \text{U+1F300} - \text{U+1F64F} \)
- (12.12) \( \text{U+1F900} - \text{U+1F9FF} \)
- (12.13) \( \text{U+20000} - \text{U+2FFF} \)
- (12.14) \( \text{U+30000} - \text{U+3FFFD} \)

The estimated width of other code points is 1.

For a string in a non-Unicode encoding, the width of a string is unspecified.

The nonnegative-integer in precision is a decimal integer defining the precision or maximum field size. It can only be used with floating-point and string types. For floating-point types this field specifies the formatting precision. For string types, this field provides an upper bound for the estimated width of the prefix of the input string that is copied into the output. For a string in a Unicode encoding, the formatter copies to the

---

209) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.
output the longest prefix of whole extended grapheme clusters whose estimated width is no greater than the precision.

When the L option is used, the form used for the conversion is called the \textit{locale-specific form}. The L option is only valid for arithmetic types, and its effect depends upon the type.

\begin{enumerate}[(15.1)]
\item For integral types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group separator characters.
\item For floating-point types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group and radix separator characters.
\end{enumerate}

For the textual representation of \texttt{bool}, the locale-specific form causes the context’s locale to be used to insert the appropriate string as if obtained with \texttt{numpunct::truename} or \texttt{numpunct::falsename}.

The \textit{type} determines how the data should be presented.

The available string presentation types are specified in Table 68.

\begin{table}[h]
\centering
\caption{Meaning of \textit{type} options for strings}  
\begin{tabular}{ll}
\textbf{Type} & \textbf{Meaning} \\
none, \texttt{s} & Copies the string to the output. \\
? & Copies the escaped string (22.14.6.4) to the output. \\
\end{tabular}
\label{tab:format.type.string}
\end{table}

The meaning of some non-string presentation types is defined in terms of a call to \texttt{to_chars}. In such cases, let \texttt{[first, last)} be a range large enough to hold the \texttt{to_chars} output and \texttt{value} be the formatting argument value. Formatting is done as if by calling \texttt{to_chars} as specified and copying the output through the output iterator of the format context.

\begin{note}
Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. \textit{— end note}
\end{note}

The available integer presentation types for integral types other than \texttt{bool} and \texttt{charT} are specified in Table 69.

\begin{table}[h]
\centering
\caption{Meaning of \textit{type} options for integer types}  
\begin{tabular}{ll}
\textbf{Type} & \textbf{Meaning} \\
\texttt{b} & \texttt{to_chars(first, last, value, 2)}; the base prefix is \texttt{0b}. \\
\texttt{B} & The same as \texttt{b}, except that the base prefix is \texttt{0B}. \\
\texttt{c} & Copies the character \texttt{static_cast<charT>(value)} to the output. Throws \texttt{format_error} if \texttt{value} is not in the range of representable values for \texttt{charT}. \\
\texttt{d} & \texttt{to_chars(first, last, value)}. \\
\texttt{o} & \texttt{to_chars(first, last, value, 8)}; the base prefix is \texttt{0} if \texttt{value} is nonzero and is empty otherwise. \\
\texttt{x} & \texttt{to_chars(first, last, value, 16)}; the base prefix is \texttt{0x}. \\
\texttt{X} & The same as \texttt{x}, except that it uses uppercase letters for digits above 9 and the base prefix is \texttt{0X}. \\
\texttt{none} & The same as \texttt{d}.  \\
\end{tabular}
\label{tab:format.type.int}
\end{table}

The available \texttt{charT} presentation types are specified in Table 70.

The available \texttt{bool} presentation types are specified in Table 71.
The available floating-point presentation types and their meanings for values other than infinity and NaN are specified in Table 72. For lower-case presentation types, infinity and NaN are formatted as \texttt{inf} and \texttt{nan}, respectively. For upper-case presentation types, infinity and NaN are formatted as \texttt{INF} and \texttt{NAN}, respectively.

\[\text{Note 9: In either case, a sign is included if indicated by the \texttt{sign} option. — end note}\]

The available pointer presentation types and their mapping to \texttt{to_chars} are specified in Table 73.

\[\text{Note 10: Pointer presentation types also apply to \texttt{nullptr_t}. — end note}\]
22.14.3 Error reporting

Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

### Class template basic_format_string

```cpp
namespace std {
    template<class charT, class... Args>
    struct basic_format_string {
        private:
            basic_string_view<charT> str; // exposition only

        public:
            template<class T> consteval basic_format_string(const T& s);
            constexpr basic_string_view<charT> get() const noexcept { return str; }
    }
}
```

- **Constraints**: `const T&` models convertible_to<basic_string_view<charT>>.
- **Effects**: `Direct-non-list-initializes str` with `s`.
- **Remarks**: A call to this function is not a core constant expression (7.7) unless there exist `args` of types `Args` such that `str` is a format string for `args`.

22.14.5 Formatting functions

```cpp
template<class... Args>
string format(format_string<Args...> fmt, Args&&... args);
```

- **Effects**: Equivalent to:
  ```cpp
  return vformat(fmt.str, make_format_args(args...));
  ```

```cpp
template<class... Args>
wstring format(wformat_string<Args...> fmt, Args&&... args);
```

- **Effects**: Equivalent to:
  ```cpp
  return vformat(fmt.str, make_wformat_args(args...));
  ```

```cpp
template<class... Args>
string format(const locale& loc, format_string<Args...> fmt, Args&&... args);
```

- **Effects**: Equivalent to:
  ```cpp
  return vformat(loc, fmt.str, make_format_args(args...));
  ```

```cpp
template<class... Args>
wstring format(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

- **Effects**: Equivalent to:
  ```cpp
  return vformat(loc, fmt.str, make_wformat_args(args...));
  ```

- **Returns**: A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.
- **Throws**: As specified in 22.14.3.
template<class Out, class... Args>
Out format_to(Out out, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), fmt.str, make_format_args(args...));

template<class Out, class... Args>
Out format_to(Out out, wformat_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), fmt.str, make_wformat_args(args...));

template<class Out, class... Args>
Out format_to(Out out, const locale& loc, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));

template<class Out, class... Args>
Out format_to(Out out, const locale& loc, wformat_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), loc, fmt.str, make_wformat_args(args...));

template<class Out>
Out vformat_to(Out out, string_view fmt, format_args args);

template<class Out>
Out vformat_to(Out out, wstring_view fmt, wformat_args args);

template<class Out>
Out vformat_to(Out out, const locale& loc, string_view fmt, format_args args);

template<class Out>
Out vformat_to(Out out, const locale& loc, wstring_view fmt, wformat_args args);

Let
charT be decltype(fmt)::value_type.

Constraints: Out satisfies output_iterator<const charT&>.

Preconditions: Out models output_iterator<const charT&>.

Effects: Places the character representation of formatting the arguments provided by args, formatted
according to the specifications given in fmt, into the range [out, out + N), where N is the number of
characters in that character representation. If present, loc is used for locale-specific formatting.

Returns: out + N.

Throws: As specified in 22.14.3.

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n, format_string<Args...> fmt, Args&&... args);

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n, wformat_string<Args...> fmt, Args&&... args);

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n, const locale& loc, format_string<Args...> fmt, Args&&... args);

template<class Out, class... Args>
format_to_n_result<Out> format_to_n(Out out, iter_difference_t<Out> n, const locale& loc, wformat_string<Args...> fmt, Args&&... args);

Let
— charT be decltype(fmt.str)::value_type,
— N be formatted_size(fmt, args...) for the functions without a loc parameter and formatted_size(loc, fmt, args...) for the functions with a loc parameter, and
— N be clamp(n, 0, N).
Constraints: Out satisfies output_iterator<const charT&>.

 Preconditions: Out models output_iterator<const charT&>, and formatter<remove_cvref_t<T>, charT> meets the BasicFormatter requirements (22.14.6.1) for each Ti in Args.

 Effects: Places the first M characters of the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + M). If present, loc is used for locale-specific formatting.

 Returns: {out + M, N}.

 Throws: As specified in 22.14.3.

 template<class... Args>
 size_t formatted_size(format_string<Args...> fmt, Args&&... args);
 template<class... Args>
 size_t formatted_size(wformat_string<Args...> fmt, Args&&... args);
 template<class... Args>
 size_t formatted_size(const locale& loc, format_string<Args...> fmt, Args&&... args);
 template<class... Args>
 size_t formatted_size(const locale& loc, wformat_string<Args...> fmt, Args&&... args);

 Let charT be decltype(fmt.str)::value_type.

 Preconditions: formatter<remove_cvref_t<Ti>, charT> meets the BasicFormatter requirements (22.14.6.1) for each Ti in Args.

 Returns: The number of characters in the character representation of formatting arguments args formatted according to specifications given in fmt. If present, loc is used for locale-specific formatting.

 Throws: As specified in 22.14.3.

 22.14.6 Formatter

 22.14.6.1 Formatter requirements

 A type F meets the BasicFormatter requirements if:

 (1.1) — it meets the

 (1.1.1) — Cpp17DefaultConstructible (Table 31),
 (1.1.2) — Cpp17CopyConstructible (Table 33),
 (1.1.3) — Cpp17CopyAssignable (Table 35), and
 (1.1.4) — Cpp17Destructible (Table 36)

 requirements,

 (1.2) — it is swappable (16.4.4.3) for lvalues, and
 (1.3) — the expressions shown in Table 74 are valid and have the indicated semantics.

 A type F meets the Formatter requirements if it meets the BasicFormatter requirements and the expressions shown in Table 75 are valid and have the indicated semantics.

 Given character type charT, output iterator type Out, and formatting argument type T, in Table 74 and Table 75:

 (3.1) — f is a value of type F,
 (3.2) — u is an lvalue of type T,
 (3.3) — t is a value of a type convertible to (possibly const) T,
 (3.4) — PC is basic_format_parse_context<charT>,
 (3.5) — FC is basic_format_context<Out, charT>,
 (3.6) — pc is an lvalue of type PC, and
 (3.7) — fc is an lvalue of type FC.

 pc.begin() points to the beginning of the format-spec (22.14.2) of the replacement field being formatted in the format string. If format-spec is empty then either pc.begin() == pc.end() or *pc.begin() == '}'.

 § 22.14.6.1 793
Table 74: BasicFormatter requirements  [tab:formatter.basic]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>f.parse(pc)</td>
<td>PC::iterator</td>
<td>Parses format-spec (22.14.2) for type T in the range [pc.begin(), pc.end()) until the first unmatched character. Throws format_error unless the whole range is parsed or the unmatched character is }. [Note 1: This allows formatters to emit meaningful error messages. — end note] Stores the parsed format specifiers in *this and returns an iterator past the end of the parsed range.</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>Formats u according to the specifiers stored in *this, writes the output to fc.out(), and returns an iterator past the end of the output range. The output shall only depend on u, fc.locale(), fc.arg(n) for any value n of type size_t, and the range [pc.begin(), pc.end()) from the last call to f.parse(pc).</td>
</tr>
</tbody>
</table>

Table 75: Formatter requirements  [tab:formatter]

<table>
<thead>

<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>f.format(t, fc)</td>
<td>FC::iterator</td>
<td>Formats t according to the specifiers stored in *this, writes the output to fc.out(), and returns an iterator past the end of the output range. The output shall only depend on t, fc.locale(), fc.arg(n) for any value n of type size_t, and the range [pc.begin(), pc.end()) from the last call to f.parse(pc).</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>As above, but does not modify u.</td>
</tr>
</tbody>
</table>

22.14.6.2 Concept formattable  [format.formattable]

1 Let fmt-iter-for<charT> be an unspecified type that models output_iterator<const charT&> (25.3.4.10).

    template<class T, class charT>
    concept formattable =
        semiregular<formatter<remove_cvref_t<T>, charT>> &&
        requires(formatter<remove_cvref_t<T>, charT> f,
            const formatter<remove_cvref_t<T>, charT> cf,
            T t,
            basic_format_context<fmt-iter-for<charT>, charT> fc,
            basic_format_parse_context<charT> pc) {
            { f.parse(pc) }  -> same_as<basic_format_parse_context<charT>::iterator>;
            { cf.format(t, fc) }  -> same_as<fmt-iter-for<charT>>;
        };

2 A type T and a character type charT model formattable if formatter<remove_cvref_t<T>, charT> meets the BasicFormatter requirements (22.14.6.1) and, if remove_reference_t<T> is const-qualified, the Formatter requirements.

22.14.6.3 Formatter specializations  [format.formatter.spec]

1 The functions defined in 22.14.5 use specializations of the class template formatter to format individual arguments.

2 Let charT be either char or wchar_t. Each specialization of formatter is either enabled or disabled, as described below. A debug-enabled specialization of formatter additionally provides a public, constexpr, non-static member function set_debug_format() which modifies the state of the formatter to be as if the
type of the std-format-spec parsed by the last call to parse were ? Each header that declares the template formatter provides the following enabled specializations:

(2.1) — The debug-enabled specializations

    template<> struct formatter<char, char>;
    template<> struct formatter<char, wchar_t>;
    template<> struct formatter<wchar_t, wchar_t>;

(2.2) — For each charT, the debug-enabled string type specializations

    template<> struct formatter<charT*, charT>;
    template<> struct formatter<const charT*, charT>;
    template<size_t N> struct formatter<charT[N], charT>;
    template<size_t N> struct formatter<const charT[N], charT>;
    template<class traits, class Allocator>
    struct formatter<basic_string<charT, traits, Allocator>*, charT>;
    template<class traits>
    struct formatter<basic_string_view<charT, traits>, charT>;

(2.3) — For each charT, for each cv-unqualified arithmetic type ArithmeticT other than char, wchar_t, char8_t, char16_t, or char32_t, a specialization

    template<> struct formatter<ArithmeticT, charT>;

(2.4) — For each charT, the pointer type specializations

    template<> struct formatter<nullptr_t, charT>;
    template<> struct formatter<void*, charT>;
    template<> struct formatter<const void*, charT>;

The parse member functions of these formatters interpret the format specification as a std-format-spec as described in 22.14.2.2.

[Note 1: Specializations such as formatter<wchar_t, char> and formatter<const char*, wchar_t> that would require implicit multibyte / wide string or character conversion are disabled. —end note]

3 For any types T and charT for which neither the library nor the user provides an explicit or partial specialization of the class template formatter, formatter<T, charT> is disabled.

4 If the library provides an explicit or partial specialization of formatter<T, charT>, that specialization is enabled and meets the Formatter requirements except as noted otherwise.

5 If F is a disabled specialization of formatter, these values are false:

(5.1) — is_default_constructible_v<F>,
(5.2) — is_copy_constructible_v<F>,
(5.3) — is_move_constructible_v<F>,
(5.4) — is_copy_assignable_v<F>, and
(5.5) — is_move_assignable_v<F>.

6 An enabled specialization formatter<T, charT> meets the BasicFormatter requirements (22.14.6.1).

[Example 1:
#include <format>

    enum color { red, green, blue };    
    const char* color_names[] = { "red", "green", "blue" };    

    template<> struct std::formatter<color> : std::formatter<const char*> {
        auto format(color c, format_context& ctx) {
            return formatter<const char*>::format(color_names[c], ctx);    
        }
    };

    struct err {};

    std::string s0 = std::format("{}", 42);    // OK, library-provided formatter
    std::string s1 = std::format("{}", L"foo");    // error: disabled formatter
    std::string s2 = std::format("{}", red);    // OK, user-provided formatter

§ 22.14.6.3 795
std::string s3 = std::format("{}", err{});  // error: disabled formatter
— end example]

22.14.6.4 Formatting escaped characters and strings

A character or string can be formatted as *escaped* to make it more suitable for debugging or for logging.

The escaped string $E$ representation of a string $S$ is constructed by encoding a sequence of characters as follows. The associated character encoding $CE$ for charT (Table 13) is used to both interpret $S$ and construct $E$.

1. $U+0022$ QUOTATION MARK (") is appended to $E$.
2. For each code unit sequence $X$ in $S$ that either encodes a single character, is a shift sequence, or is a sequence of ill-formed code units, processing is in order as follows:
   1. If $X$ encodes a single character $C$, then:
      1. If $C$ is one of the characters in Table 76, then the two characters shown as the corresponding escape sequence are appended to $E$.
      2. Otherwise, if $C$ is not $U+0020$ SPACE and
         1. $CE$ is a Unicode encoding and $C$ corresponds to either a UCS scalar value whose Unicode property General_Category has a value in the groups Separator (Z) or Other (C) or to a UCS scalar value which has the Unicode property Grapheme_Extend=Yes, as described by table 12 of UAX #44, or
         2. $CE$ is not a Unicode encoding and $C$ is one of an implementation-defined set of separator or non-printable characters
            then the sequence $\backslash u\{\text{hex-digit-sequence}\}$ is appended to $E$, where $\text{hex-digit-sequence}$ is the shortest hexadecimal representation of $C$ using lower-case hexadecimal digits.
      3. Otherwise, $C$ is appended to $E$.
   2. Otherwise, if $X$ is a shift sequence, the effect on $E$ and further decoding of $S$ is unspecified.

   Recommended practice: A shift sequence should be represented in $E$ such that the original code unit sequence of $S$ can be reconstructed.
   1. Otherwise ($X$ is a sequence of ill-formed code units), each code unit $U$ is appended to $E$ in order as the sequence $\backslash x\{\text{hex-digit-sequence}\}$, where $\text{hex-digit-sequence}$ is the shortest hexadecimal representation of $U$ using lower-case hexadecimal digits.

   Finally, $U+0022$ QUOTATION MARK (") is appended to $E$.

   Table 76: Mapping of characters to escape sequences

<table>
<thead>
<tr>
<th>Character</th>
<th>Escape sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+0009 CHARACTER TABULATION</td>
<td>\t</td>
</tr>
<tr>
<td>U+000A LINE FEED</td>
<td>\n</td>
</tr>
<tr>
<td>U+000D CARRIAGE RETURN</td>
<td>\r</td>
</tr>
<tr>
<td>U+0022 QUOTATION MARK</td>
<td>&quot;</td>
</tr>
<tr>
<td>U+005C REVERSE SOLIDUS</td>
<td>\</td>
</tr>
</tbody>
</table>

The escaped string representation of a character $C$ is equivalent to the escaped string representation of a string of $C$, except that:

1. the result starts and ends with $U+0027$ APOSTROPHE (’) instead of $U+0022$ QUOTATION MARK ("), and
2. if $C$ is $U+0027$ APOSTROPHE, the two characters \’ are appended to $E$, and
3. if $C$ is $U+0022$ QUOTATION MARK, then $C$ is appended unchanged.

Example 1:

```c++
string s0 = format("[{}]", "h\tlllo"); // s0 has value: [h lllo]
string s1 = format("[?{}]", "h\tlllo"); // s1 has value: ["h\tlllo"]
string s3 = format("[?:, ?{}]", \', \"'); // s3 has value: [\', \"]
```
The following examples assume use of the UTF-8 encoding:

```cpp
string s4 = format("[{:?}]", string("\0 \n \t \x02 \x1b", 9));
// s4 has value: ["\u{0} \n \t \u{2} \u{1b}"
```

```cpp
string s5 = format("[{:?}]", "\xc3\x28");
// invalid UTF-8
```

```cpp
// s5 has value: ["\xc3\x28"]
```

--- end example

### 22.14.6.5 Class template `basic_format_parse_context`

```cpp
namespace std {
    template<class charT>
    class basic_format_parse_context {  // format.parse.ctx
        public:
            using char_type = charT;
            using const_iterator = typename basic_string_view<charT>::const_iterator;
            using iterator = const_iterator;

            private:
                iterator begin_;  // exposition only
                iterator end_;  // exposition only
                enum indexing { unknown, manual, automatic };  // exposition only
                indexing indexing_;  // exposition only
                size_t next_arg_id_;  // exposition only
                size_t num_args_;  // exposition only

            public:
                constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
                    size_t num_args = 0) noexcept;
                basic_format_parse_context(const basic_format_parse_context&); // delete;
                basic_format_parse_context& operator=(const basic_format_parse_context&); // delete;

                constexpr const_iterator begin() const noexcept;
                constexpr const_iterator end() const noexcept;
                constexpr void advance_to(const_iterator it);
                constexpr size_t next_arg_id();
                constexpr void check_arg_id(size_t id);
            }
}
```

1. An instance of `basic_format_parse_context` holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

```cpp
constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt,
    size_t num_args = 0) noexcept;
```

2. **Effects**: Initializes `begin_` with `fmt.begin()`, `end_` with `fmt.end()`, `indexing_` with `unknown`, `next_arg_id_` with 0, and `num_args_` with `num_args`.

```cpp
constexpr const_iterator begin() const noexcept;
```

3. **Returns**: `begin_`.

```cpp
constexpr const_iterator end() const noexcept;
```

4. **Returns**: `end_`.

```cpp
constexpr void advance_to(const_iterator it);
```

5. **Preconditions**: `end()` is reachable from `it`.

```cpp
constexpr size_t next_arg_id();
```

6. **Effects**: Equivalent to: `begin_ = it;`

```cpp
constexpr void check_arg_id(size_t id);
```

7. **Effects**: If `indexing_` != `manual`, equivalent to:
   - if (`indexing_` == `unknown`)
     - `indexing_` = `automatic`
return next_arg_id_++;

Throws: format_error if indexing_ == manual which indicates mixing of automatic and manual argument indexing.

constexpr void check_arg_id(size_t id);

Effects: If indexing_ != automatic, equivalent to:
if (indexing_ == unknown)
    indexing_ = manual;

Throws: format_error if indexing_ == automatic which indicates mixing of automatic and manual argument indexing.

Remarks: Call expressions where id >= num_args_ are not core constant expressions (7.7).

22.14.6.6 Class template basic_format_context

namespace std {
    template<class Out, class charT>
    class basic_format_context {
    private:
        basic_format_args<basic_format_context> args_; // exposition only
        Out out_; // exposition only
    public:
        using iterator = Out;
        using char_type = charT;
        template<class T> using formatter_type = formatter<T, charT>;
        basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
        std::locale locale();
        iterator out();
        void advance_to(iterator it);
    };

1 An instance of basic_format_context holds formatting state consisting of the formatting arguments and the output iterator.

2 Out shall model output_iterator<const charT&>.

3 format_context is an alias for a specialization of basic_format_context with an output iterator that appends to string, such as back_insert_iterator<string>. Similarly, wformat_context is an alias for a specialization of basic_format_context with an output iterator that appends to wstring.

4 Recommended practice: For a given type charT, implementations should provide a single instantiation of basic_format_context for appending to basic_string<charT>, vector<charT>, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a span<charT>) and polymorphic reallocation.

    basic_format_arg<basic_format_context> arg(size_t id) const noexcept;

5 Returns: args_.get(id).

    std::locale locale();

6 Returns: The locale passed to the formatting function if the latter takes one, and std::locale() otherwise.

    iterator out();

7 Effects: Equivalent to: return std::move(out_);

    void advance_to(iterator it);

8 Effects: Equivalent to: out_ = std::move(it);

[Example 1:

    struct S { int value; };
template<> struct std::formatter<S> {
    size_t width_arg_id = 0;

    // Parses a width argument id in the format { digit }.
    constexpr auto parse(format_parse_context& ctx) {
        auto iter = ctx.begin();
        auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; }; 
        if (get_char() != '{')
            return iter;
        ++iter;
        char c = get_char();
        if (!isdigit(c) || (++iter, get_char()) != '}
            throw format_error("invalid format");
        width_arg_id = c - '0';
        ctx.check_arg_id(width_arg_id);
        return ++iter;
    }

    // Formats an S with width given by the argument width_arg_id.
    auto format(S s, format_context& ctx) {
        int width = visit_format_arg([=](auto value) -> int {
            if constexpr (!is_integral_v<decltype(value)>)
                throw format_error("width is not integral");
            else if (value < 0 || value > numeric_limits<int>::max())
                throw format_error("invalid width");
            else
                return value;
        }, ctx.arg(width_arg_id));
        return format_to(ctx.out(), "{0:x<{1}}", s.value, width);
    }

    std::string s = std::format("{0:{1}}", S{42}, 10); // value of s is "xxxxxxxx42"
};

22.14.7 Formatting of ranges

22.14.7.1 Variable template format_kind

template<ranges::input_range R>
requires same_as<R, remove_cvref_t<R>>
    constexpr range_format format_kind<R> = see below;

A program that instantiates the primary template of format_kind is ill-formed.

For a type R, format_kind<R> is defined as follows:

(2.1) If same_as<remove_cvref_t<ranges::range_reference_t<R>>, R> is true, format_kind<R> is range_format::disabled.

[Note 1: This prevents constraint recursion for ranges whose reference type is the same range type. For example, std::filesystem::path is a range of std::filesystem::path. — end note]

(2.2) Otherwise, if the qualified-id R::key_type is valid and denotes a type:

(2.2.1) If the qualified-id R::mapped_type is valid and denotes a type, let U be remove_cvref_t<ranges::range_reference_t<R>>. If either U is a specialization of pair or U is a specialization of tuple and tuple_size_v<U> == 2, format_kind<R> is range_format::map.

(2.2.2) Otherwise, format_kind<R> is range_format::set.

(2.3) Otherwise, format_kind<R> is range_format::sequence.

Remarks: Pursuant to 16.4.5.2.1, users may specialize format_kind for cv-unqualified program-defined types that model ranges::input_range. Such specializations shall be usable in constant expressions (7.7) and have type const range_format.

22.14.7.2 Class template range_formatter

```cpp
namespace std {
    template<class T, class charT = char>
    requires same_as<remove_cvref_t<T>, T> && formattable<T, charT>
class range_formatter {
    formatter<T, charT> underlying_; // exposition only
    basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(" "); // exposition only
    basic_string_view<charT> opening_bracket_ = STATICALLY-WIDEN<charT>("["); // exposition only
    basic_string_view<charT> closing_bracket_ = STATICALLY-WIDEN<charT>("]"); // exposition only

    public:
    constexpr void set_separator(basic_string_view<charT> sep);
    constexpr void set_brackets(basic_string_view<charT> opening,
                               basic_string_view<charT> closing);
    constexpr formatter<T, charT>& underlying() { return underlying_; }
    constexpr const formatter<T, charT>& underlying() const { return underlying_; }

    template<class ParseContext>
    constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);

    template<ranges::input_range R, class FormatContext>
    requires formattable<ranges::range_reference_t<R>, charT> &&
    same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
    typename FormatContext::iterator
    format(R&& r, FormatContext& ctx) const;
}
```

1 The class template range_formatter is a utility for implementing formatter specializations for range types.

2 range_formatter interprets format-spec as a range-format-spec. The syntax of format specifications is as follows:

```plaintext
range-format-spec:
    range-fill-and-align_opt width_opt n_opt range-type_opt range-underlying-spec_opt

range-fill-and-align:
    range-fill_opt align

range-fill:
    any character other than { or } or :

group-type:
    m
    s
    ?s

range-underlying-spec:
    : format-spec
```

3 For range_formatter<T, charT>, the format-spec in a range-underlying-spec, if any, is interpreted by formatter<T, charT>.

4 The range-fill-and-align is interpreted the same way as a fill-and-align (22.14.2.2). The productions align and width are described in 22.14.2.

5 The n option causes the range to be formatted without the opening and closing brackets.

   [Note 1: This is equivalent to invoking set_brackets({}, {}). — end note]

6 The range-type specifier changes the way a range is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 77.

   If the range-type is s or ?s, then there shall be no n option and no range-underlying-spec.

```cpp
constexpr void set_separator(basic_string_view<charT> sep);
```

7 Effects: Equivalent to: separator_ = sep;
Table 77: Meaning of range-type options [tab:formatter.range.type]

<table>
<thead>
<tr>
<th>Option</th>
<th>Requirements</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>m T</td>
<td>T shall be either a specialization of pair or a specialization of tuple such that tuple_size_v&lt;T&gt; is 2.</td>
<td>Indicates that the opening bracket should be &quot;{&quot;, the closing bracket should be &quot;}&quot;*, the separator should be &quot;,&quot;, and each range element should be formatted as if m were specified for its tuple-type. [Note 2: If the n option is provided in addition to the m option, both the opening and closing brackets are still empty. — end note]</td>
</tr>
<tr>
<td>s T</td>
<td>T shall be charT.</td>
<td>Indicates that the range should be formatted as a string.</td>
</tr>
<tr>
<td>?s T</td>
<td>T shall be charT.</td>
<td>Indicates that the range should be formatted as an escaped string (22.14.6.4).</td>
</tr>
</tbody>
</table>

```cpp
constexpr void set_brackets(basic_string_view<charT> opening, basic_string_view<charT> closing);
```

**Effects:** Equivalent to:

```cpp
opening_bracket_ = opening;
closing_bracket_ = closing;
```

```cpp
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

**Effects:** Parses the format specifier as a range-format-spec and stores the parsed specifiers in *this. The values of opening_bracket_, closing_bracket_, and separator_ are modified if and only if required by the range-type or the n option, if present. If:

1. the range-type is neither s nor ?s,
2. underlying_.set_debug_format() is a valid expression, and
3. there is no range-underlying-spec,

then calls underlying_.set_debug_format().

**Returns:** An iterator past the end of the range-format-spec.

```cpp
template<ranges::input_range R, class FormatContext>
requires formattable<ranges::range_reference_t<R>, charT> &&
same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
typename FormatContext::iterator
format(R&& r, FormatContext& ctx) const;
```

**Effects:** Writes the following into ctx.out(), adjusted according to the range-format-spec:

1. If the range-type was s, then as if by formatting basic_string<charT>(from_range, r).
2. Otherwise, if the range-type was ?s, then as if by formatting basic_string<charT>(from_range, r) as an escaped string (22.14.6.4).
3. Otherwise,
   1. opening_bracket_,
   2. for each element e of the range r:
      1. the result of writing e via underlying_ and
      2. separator_, unless e is the last element of r, and
   3. closing_bracket_.

**Returns:** An iterator past the end of the output range.
22.14.7.3 Class template range-default-formatter

namespace std {
    template<ranges::input_range R, class charT>
    struct range-default-formatter<range_format::sequence, R, charT> { // exposition only
        private:
            using maybe-const-r = fmt-maybe-const<R, charT>; // exposition only
            range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-r>>, charT> underlying_; // exposition only

        public:
            constexpr void set_separator(basic_string_view<charT> sep);
            constexpr void set_brackets(basic_string_view<charT> opening, basic_string_view<charT> closing);

            template<class ParseContext>
                constexpr typename ParseContext::iterator parse(ParseContext& ctx);

            template<class FormatContext>
                typename FormatContext::iterator format(maybe-const-r& elems, FormatContext& ctx) const;
    };
}

constexpr void set_separator(basic_string_view<charT> sep);
Effects: Equivalent to: underlying_.set_separator(sep);

constexpr void set_brackets(basic_string_view<charT> opening, basic_string_view<charT> closing);
Effects: Equivalent to: underlying_.set_brackets(opening, closing);

template<class ParseContext>
constexpr typename ParseContext::iterator parse(ParseContext& ctx);
Effects: Equivalent to: return underlying_.parse(ctx);

template<class FormatContext>
typename FormatContext::iterator format(maybe-const-r& elems, FormatContext& ctx) const;
Effects: Equivalent to: return underlying_.format(elems, ctx);

22.14.7.4 Specialization of range-default-formatter for maps

namespace std {
    template<ranges::input_range R, class charT>
    struct range-default-formatter<range_format::map, R, charT> { // exposition only
        private:
            using maybe-const-map = fmt-maybe-const<R, charT>; // exposition only
            using element-type = remove_cvref_t<ranges::range_reference_t<maybe-const-map>>; // exposition only
            range_formatter<element-type, charT> underlying_; // exposition only

        public:
            constexpr range-default-formatter();

            template<class ParseContext>
                constexpr typename ParseContext::iterator parse(ParseContext& ctx);

            template<class FormatContext>
                typename FormatContext::iterator format(maybe-const-map& r, FormatContext& ctx) const;
    };
}
constexpr range-default-formatter();

1  

Mandates: Either:

(1.1)  — *element-type* is a specialization of `pair`, or

(1.2)  — *element-type* is a specialization of `tuple` and `tuple_size_v<T> == 2`.

2  

Effects: Equivalent to:

```
underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
underlying_.underlying().set_brackets({}, {});
underlying_.underlying().set_separator(STATICALLY-WIDEN<charT>(" : "));
```

```cpp
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

3  

Effects: Equivalent to: return underlying_.parse(ctx);

```cpp
template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-set& r, FormatContext& ctx) const;
```

4  

Effects: Equivalent to: return underlying_.format(r, ctx);

### 22.14.7.5 Specialization of range-default-formatter for sets

```cpp
namespace std {
template<ranges::input_range R, class charT>
struct range-default-formatter<range_format::set, R, charT> {
private:
  using maybe-const-set = fmt-maybe-const<R, charT>;
  range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-set>>, charT> underlying_;  // exposition only

public:
  constexpr range-default-formatter();

  template<class ParseContext>
  constexpr typename ParseContext::iterator
  parse(ParseContext& ctx);

  template<class FormatContext>
  typename FormatContext::iterator
  format(maybe-const-set& r, FormatContext& ctx) const;
};
}
```

```cpp
constexpr range-default-formatter();
```

1  

Effects: Equivalent to:

```
underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"), STATICALLY-WIDEN<charT>("}"));
```

```cpp
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

2  

Effects: Equivalent to: return underlying_.parse(ctx);

```cpp
template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-set& r, FormatContext& ctx) const;
```

3  

Effects: Equivalent to: return underlying_.format(r, ctx);

### 22.14.7.6 Specialization of range-default-formatter for strings

```cpp
namespace std {
template<range_format K, ranges::input_range R, class charT>
requires (K == range_format::string || K == range_format::debug_string)
```
struct range-default-formatter<K, R, charT> {
    private:
        formatter<basic_string<charT>, charT> underlying_;  // exposition only

    public:
        template<class ParseContext>
            constexpr typename ParseContext::iterator parse(ParseContext& ctx);
        template<class FormatContext>
            typename FormatContext::iterator format(see below& str, FormatContext& ctx) const;
    }

   1 Mandates: same_as<remove_cvref_t<range_reference_t<R>>, charT> is true.

   template<class ParseContext>
       constexpr typename ParseContext::iterator parse(ParseContext& ctx);

   2 Effects: Equivalent to:
       auto i = underlying_.parse(ctx);
       if constexpr (K == range_format::debug_string) {
           underlying_.set_debug_format();
       }
       return i;

   template<class FormatContext>
       typename FormatContext::iterator format(see below& r, FormatContext& ctx) const;

   3 The type of r is const R& if ranges::input_range<const R> is true and R& otherwise.

   4 Effects: Let s be a basic_string<charT> such that ranges::equal(s, r) is true. Equivalent to:
       return underlying_.format(s, ctx);

22.14.8 Arguments [format.arguments]

22.14.8.1 Class template basic_format_arg [format.arg]

namespace std {
    template<class Context>
        class basic_format_arg {
            public:
                class handle;

            private:
                using char_type = typename Context::char_type;  // exposition only

                variant<monostate, bool, char_type,
                    int, unsigned int, long long int,
                    float, double, long double,
                    const char_type*, basic_string_view<char_type>,
                    const void*, handle> value;  // exposition only

            template<class T> explicit basic_format_arg(T&& v) noexcept;  // exposition only
            explicit basic_format_arg(float n) noexcept;  // exposition only
            explicit basic_format_arg(double n) noexcept;  // exposition only
            explicit basic_format_arg(long double n) noexcept;  // exposition only
            explicit basic_format_arg(const char_type* s);  // exposition only

            template<class traits>
                explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;  // exposition only

        }  // class basic_format_arg
     }  // namespace std
An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.

The behavior of a program that adds specializations of `basic_format_arg` is undefined.

```
explicit basic_format_arg() noexcept;
```

Postconditions: ![this).

```
template<class T> explicit basic_format_arg(T v) noexcept;
Constraints: The template specialization
typename Context::template formatter_type<remove_cvref_t<T>>
meets the BasicFormatter requirements (22.14.6.1). The extent to which an implementation determines
that the specialization meets the BasicFormatter requirements is unspecified, except that as a minimum
the expression
typename Context::template formatter_type<remove_cvref_t<T>>()
.format(declval<T>(), declval<Context&>())
shall be well-formed when treated as an unevaluated operand (7.2.3).
```

Effects:

1. If T is `bool` or `char_type`, initializes value with v;
2. Otherwise, if T is `char` and `char_type` is `wchar_t`, initializes value with `static_cast<wchar_t>(v)`;
3. Otherwise, if T is a signed integer type (6.8.2) and `sizeof(T) <= sizeof(int)`, initializes value with `static_cast<int>(v)`;
4. Otherwise, if T is an unsigned integer type and `sizeof(T) <= sizeof(unsigned int)`, initializes value with `static_cast<unsigned int>(v)`;
5. Otherwise, if T is a signed integer type and `sizeof(T) <= sizeof(long long int)`, initializes value with `static_cast<long long int>(v)`;
6. Otherwise, if T is an unsigned integer type and `sizeof(T) <= sizeof(unsigned long long int)`, initializes value with `static_cast<unsigned long long int>(v)`;
7. Otherwise, initializes value with handle(v).

```
explicit basic_format_arg(float n) noexcept;
explicit basic_format_arg(double n) noexcept;
explicit basic_format_arg(long double n) noexcept;
Effects: Initializes value with n.
```

```
explicit basic_format_arg(const char_type* s);
Preconditions: s points to a NTCTS (3.37).
Effects: Initializes value with s.
```
template<class traits>
explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;

Effects: Initializes value with basic_string_view<char_type>(s.data(), s.size()).

template<class traits, class Allocator>
explicit basic_format_arg(const basic_string<char_type, traits, Allocator>& s) noexcept;

Effects: Initializes value with basic_string_view<char_type>(s.data(), s.size()).

explicit basic_format_arg(nullptr_t) noexcept;

Effects: Initializes value with static_cast<const void*>(nullptr).

template<class T> explicit basic_format_arg(T* p) noexcept;

Constraints: is_void_v<T> is true.

Effects: Initializes value with p.

[Note 1: Constructing basic_format_arg from a pointer to a member is ill-formed unless the user provides an enabled specialization of formatter for that pointer to member type. — end note]

explicit operator bool() const noexcept;

Returns: !holds_alternative<monostate>(value).

The class handle allows formatting an object of a user-defined type.

namespace std {
    template<class Context>
    class basic_format_arg<Context>::handle {
        const void* ptr_; // exposition only
        void (*format_)(basic_format_parse_context<char_type>&, Context&, const void*); // exposition only
    private:
        friend class basic_format_arg<Context>;
    public:
        void format(basic_format_parse_context<char_type>&, Context& ctx) const;
    }
}

template<class T> explicit handle(T&& val) noexcept;

Let

(17.1) TD be remove_cvref_t<T>.
(17.2) const-formattable be true if typename Context::template formatter_type<TD>() .format(declval<const TD&>(), declval<Context&>()) is well-formed, otherwise false,
(17.3) TQ be const TD if const-formattable is true and TD otherwise.

Mandates: const-formattable || !is_const_v<remove_reference_t<T>> is true.

Effects: Initializes ptr_ with addressof(val) and format_ with

[](basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx, const void* ptr) {
    typename Context::template formatter_type<TD> f;
    parse_ctx.advance_to(f.parse(parse_ctx));
    format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr))),
        format_ctx);
}

void format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;

Effects: Equivalent to: format_(parse_ctx, format_ctx, ptr_);
template<class Visitor, class Context>
decltype(auto) visit_format_arg(Visitor&& vis, basic_format_arg<Context> arg);

Effects: Equivalent to: return visit(forward<Visitor>(vis), arg.value);

22.14.8.2 Class template format-arg-store

namespace std {
    template<class Context, class... Args>
    class format-arg-store {
        array<basic_format_arg<Context>, sizeof...(Args)> args;  // exposition only
    };
}

An instance of format-arg-store stores formatting arguments.

template<class Context = format_context, class... Args>
format-arg-store<Context, Args...> make_format_args(Args&&... fmt_args);

Preconditions: The type typename Context::template formatter_type<T_i> meets the BasicFormatter requirements (22.14.6.1) for each T_i in Args.

Returns: An object of type format-arg-store<Context, Args...> whose args data member is initialized with {basic_format_arg<Context>(fmt_args)...}.

template<class... Args>
format-arg-store<wformat_context, Args...> make_wformat_args(Args&&... args);

Effects: Equivalent to: return make_format_args<wformat_context>(args...);

22.14.8.3 Class template basic_format_args

namespace std {
    template<class Context>
    class basic_format_args {
        size_t size_;  // exposition only
        const basic_format_arg<Context>* data_;  // exposition only

        public:
            basic_format_args() noexcept;

            template<class... Args>
            basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

            basic_format_arg<Context> get(size_t i) const noexcept;
    };
}

An instance of basic_format_args provides access to formatting arguments. Implementations should optimize the representation of basic_format_args for a small number of formatting arguments.

[Note 1: For example, by storing indices of type alternatives separately from values and packing the former. — end note]

basic_format_args() noexcept;

Effects: Initializes size_ with 0.

template<class... Args>
basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;

Effects: Initializes size_ with sizeof...(Args) and data_ with store.args.data().

basic_format_arg<Context> get(size_t i) const noexcept;

Returns: i < size_ ? data_[i] : basic_format_arg<Context>();

22.14.9 Tuple formatter

For each of pair and tuple, the library provides the following formatter specialization where pair-or-tuple is the name of the template:
namespace std {
    template<class charT, formattable<charT>... Ts>
    struct formatter<pair-or-tuple<Ts...>, charT> {
        private:
            tuple<formatter<remove_cvref_t<Ts>, charT>...> underlying_; // exposition only
            basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(" "); // exposition only
            basic_string_view<charT> opening_bracket_ = STATICALLY-WIDEN<charT>("("); // exposition only
            basic_string_view<charT> closing_bracket_ = STATICALLY-WIDEN<charT>(")"); // exposition only
        public:
            constexpr void set_separator(basic_string_view<charT> sep);
            constexpr void set_brackets(basic_string_view<charT> opening,
                                            basic_string_view<charT> closing);

            template<class ParseContext>
            constexpr typename ParseContext::iterator parse(ParseContext& ctx);

            template<class FormatContext>
            typename FormatContext::iterator format(see below& elems, FormatContext& ctx) const;
    }
}

The parse member functions of these formatters interpret the format specification as a tuple-format-spec according to the following syntax:

tuple-format-spec:
  tuple-fill-and-align opt width opt tuple-type opt

tuple-fill-and-align:
  tuple-fill opt align

tuple-fill:
  any character other than { or } or :

tuple-type:
  \( m \)
  \( n \)

The tuple-fill-and-align is interpreted the same way as a fill-and-align (22.14.2.2). The productions align and width are described in 22.14.2.

The tuple-type specifier changes the way a pair or tuple is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 78.

Table 78: Meaning of tuple-type options [tab:formatter.tuple.type]

<table>
<thead>
<tr>
<th>Option</th>
<th>Requirements</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| \( m \) | sizeof...(Ts) == 2 | Equivalent to:
| &nbsp; | &nbsp; | set_separator(STATICALLY-WIDEN<charT>(" : ");
| &nbsp; | &nbsp; | set_brackets({}, {});
| \( n \) | none | Equivalent to: set_brackets({}, {}); |
| none | none | No effects |

constexpr void set_separator(basic_string_view<charT> sep);

Effects: Equivalent to: separator_ = sep;

constexpr void set_brackets(basic_string_view<charT> opening, basic_string_view<charT> closing);

Effects: Equivalent to:

opening_bracket_ = opening;
closing_bracket_ = closing;
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

Effects: Parses the format specifier as a tuple-format-spec and stores the parsed specifiers in this. The values of opening-bracket_, closing-bracket_, and separator_ are modified if and only if required by the tuple-type, if present. For each element e in underlying_, if e.set_debug_format() is a valid expression, calls e.set_debug_format().

Returns: An iterator past the end of the tuple-format-spec.

template<class FormatContext>
typename FormatContext::iterator
format(see below& elems, FormatContext& ctx) const;

The type of elems is:
(9.1) If (formattable<const Ts, charT> && ...) is true, const pair-or-tuple<Ts...>&.
(9.2) Otherwise pair-or-tuple<Ts...>&.

Effects: Writes the following into ctx.out(), adjusted according to the tuple-format-spec:
(10.1) opening-bracket_,
(10.2) for each index I in the [0, sizeof...(Ts)):
(10.2.1) if I != 0, separator_,
(10.2.2) the result of writing get<I>(elems) via get<I>(underlying_), and
(10.3) closing-bracket_.

Returns: An iterator past the end of the output range.

22.14.10 Class format_error

namespace std {
    class format_error : public runtime_error {
    public:
        explicit format_error(const string& what_arg);
        explicit format_error(const char* what_arg);
    }
};

The class format_error defines the type of objects thrown as exceptions to report errors from the formatting library.

format_error(const string& what_arg);

Postconditions: strcmp(what(), what_arg.c_str()) == 0.

format_error(const char* what_arg);

Postconditions: strcmp(what(), what_arg) == 0.

22.15 Bit manipulation

22.15.1 General

The header <bit> provides components to access, manipulate and process both individual bits and bit sequences.

22.15.2 Header <bit> synopsis

// all freestanding
namespace std {
// 22.15.3, bit_cast
template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;

// 22.15.4, byteswap
template<class T>
constexpr T byteswap(T value) noexcept;

§ 22.15.2
// 22.15.5, integral powers of 2
template<class T>
    constexpr bool has_single_bit(T x) noexcept;

template<class T>
    constexpr T bit_ceil(T x);

template<class T>
    constexpr T bit_floor(T x) noexcept;

template<class T>
    constexpr int bit_width(T x) noexcept;

// 22.15.6, rotating
template<class T>
    [[nodiscard]] constexpr T rotl(T x, int s) noexcept;

template<class T>
    [[nodiscard]] constexpr T rotr(T x, int s) noexcept;

// 22.15.7, counting
template<class T>
    constexpr int countl_zero(T x) noexcept;

template<class T>
    constexpr int countl_one(T x) noexcept;

template<class T>
    constexpr int countr_zero(T x) noexcept;

template<class T>
    constexpr int countr_one(T x) noexcept;

template<class T>
    constexpr int popcount(T x) noexcept;

// 22.15.8, endian
enum class endian {
    little = see below,
    big = see below,
    native = see below
};

22.15.3 Function template bit_cast

template<class To, class From>
    constexpr To bit_cast(const From& from) noexcept;

Constraints:

(1.1) sizeof(To) == sizeof(From) is true;
(1.2) is_trivially_copyable_v<To> is true; and
(1.3) is_trivially_copyable_v<From> is true.

Returns: An object of type To. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of from. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object’s type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified. A bit in the value representation of the result is indeterminate if it does not correspond to a bit in the value representation of from or corresponds to a bit of an object that is not within its lifetime or has an indeterminate value (6.7.4). For each bit in the value representation of the result that is indeterminate, the smallest object containing that bit has an indeterminate value; the behavior is undefined unless that object is of unsigned ordinary character type or std::byte type. The result does not otherwise contain any indeterminate values.

Remarks: This function is constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:

(3.1) is_union_v<T> is false;
(3.2) is_pointer_v<T> is false;
— `is_member_pointer_v<T>` is false;
— `is_volatile_v<T>` is false; and
— T has no non-static data members of reference type.

### 22.15.4 `byteswap` [bit.byteswap]
```cpp
template<class T>
constexpr T byteswap(T value) noexcept;
```

1. **Constraints:** T models integral.
2. **Mandates:** T does not have padding bits (6.8.1).
3. Let the sequence R comprise the bytes of the object representation of value in reverse order.
4. **Returns:** An object v of type T such that each byte in the object representation of v is equal to the byte in the corresponding position in R.

### 22.15.5 Integral powers of 2 [bit.pow.two]
```cpp
template<class T>
constexpr bool has_single_bit(T x) noexcept;
```

1. **Constraints:** T is an unsigned integer type (6.8.2).
2. **Returns:** true if x is an integral power of two; false otherwise.

```cpp
template<class T>
constexpr T bit_ceil(T x);
```

3. Let N be the smallest power of 2 greater than or equal to x.
4. **Constraints:** T is an unsigned integer type (6.8.2).
5. **Preconditions:** N is representable as a value of type T.
6. **Returns:** N.
7. **Throws:** Nothing.
8. **Remarks:** A function call expression that violates the precondition in the Preconditions: element is not a core constant expression (7.7).

```cpp
template<class T>
constexpr T bit_floor(T x) noexcept;
```

9. **Constraints:** T is an unsigned integer type (6.8.2).
10. **Returns:** If x == 0, 0; otherwise the maximal value y such that has_single_bit(y) is true and y <= x.

```cpp
template<class T>
constexpr int bit_width(T x) noexcept;
```

11. **Constraints:** T is an unsigned integer type (6.8.2).
12. **Returns:** If x == 0, 0; otherwise one plus the base-2 logarithm of x, with any fractional part discarded.

### 22.15.6 Rotating [bit.rotate]
1. In the following descriptions, let N denote numeric_limits<T>::digits.

```cpp
template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;
```

2. **Constraints:** T is an unsigned integer type (6.8.2).
3. Let r be s % N.
4. **Returns:** If r is 0, x; if r is positive, (x << r) | (x >> (N - r)); if r is negative, rotr(x, -r).

```cpp
template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;
```

5. **Constraints:** T is an unsigned integer type (6.8.2).
Let \( r \) be \( s \% N \).

Returns: If \( r \) is 0, \( x \); if \( r \) is positive, \((x >> r) | (x << (N - r))\); if \( r \) is negative, \( \text{rotl}(x, -r) \).

### 22.15.7 Counting

In the following descriptions, let \( N \) denote \texttt{numeric_limits<T>::digits}.

```cpp
template<class T>
constexpr int countl_zero(T x) noexcept;
```

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 0 bits in the value of \( x \), starting from the most significant bit.

[Note 1: Returns \( N \) if \( x == 0 \). — end note]

```cpp
template<class T>
constexpr int countl_one(T x) noexcept;
```

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 1 bits in the value of \( x \), starting from the most significant bit.

[Note 2: Returns \( N \) if \( x == \text{numeric_limits<T>::max()} \). — end note]

```cpp
template<class T>
constexpr int countr_zero(T x) noexcept;
```

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 0 bits in the value of \( x \), starting from the least significant bit.

[Note 3: Returns \( N \) if \( x == 0 \). — end note]

```cpp
template<class T>
constexpr int countr_one(T x) noexcept;
```

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 1 bits in the value of \( x \), starting from the least significant bit.

[Note 4: Returns \( N \) if \( x == \text{numeric_limits<T>::max()} \). — end note]

```cpp
template<class T>
constexpr int popcount(T x) noexcept;
```

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of 1 bits in the value of \( x \).

### 22.15.8 Endian

Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```cpp
class endian {
    little = see below,
    big = see below,
    native = see below
};
```

If all scalar types have size 1 byte, then all of \texttt{endian::little}, \texttt{endian::big}, and \texttt{endian::native} have the same value. Otherwise, \texttt{endian::little} is not equal to \texttt{endian::big}. If all scalar types are big-endian, \texttt{endian::native} is equal to \texttt{endian::big}. If all scalar types are little-endian, \texttt{endian::native} is equal to \texttt{endian::little}. Otherwise, \texttt{endian::native} is not equal to either \texttt{endian::big} or \texttt{endian::little}.
23 Strings library

23.1 General

1 This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8.1) type. Such types are called char-like types, and objects of char-like types are called char-like objects or simply characters.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 79.

Table 79: Strings library summary

23.2 Character traits

23.2.1 General

1 Subclause 23.2 defines requirements on classes representing character traits, and defines a class template char_traits<charT>, along with five specializations, char_traits<char>, char_traits<char8_t>, char_traits<char16_t>, char_traits<char32_t>, and char_traits<wchar_t>, that meet those requirements.

2 Most classes specified in 23.4, 23.3, and Clause 31 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by each such template. Subclause 23.2 defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) C, that and its related character traits class X are passed as a pair of parameters to the string, string view, or iostream template as parameters charT and traits. If X::char_type is not the same type as C, the program is ill-formed.

23.2.2 Character traits requirements

1 In Table 80, X denotes a traits class defining types and functions for the character container type C; c and d denote values of type C; p and q denote values of type const C*; s denotes a value of type C*; n, i and j denote values of type size_t; e and f denote values of type X::int_type; pos denotes a value of type X::pos_type; and r denotes an lvalue of type C. No expression which is part of the character traits requirements specified in this subclause 23.2.2 shall exit via an exception.

</table>

2 The class template

```
template<class charT> struct char_traits;
```

is provided in the header `<string>` as a basis for explicit specializations.

### 23.2.3 Traits typedefs

using int_type = see below;

1 Preconditions: int_type shall be able to represent all of the valid characters converted from the corresponding char_type values, as well as an end-of-file value, eof().

using state_type = see below;

2 Preconditions: state_type meets the Cpp17Destructible (Table 36), Cpp17CopyAssignable (Table 35), Cpp17CopyConstructible (Table 33), and Cpp17DefaultConstructible (Table 31) requirements.

### 23.2.4 char_traits specializations

#### 23.2.4.1 General

```c
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
```

1 The header `<string>` defines five specializations of the class template char_traits: char_traits<char>, char_traits<char8_t>, char_traits<char16_t>, char_traits<char32_t>, and char_traits<wchar_t>.

#### 23.2.4.2 struct char_traits<char>

```c
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
```

210) If eof() can be held in char_type then some iostreams operations can give surprising results.
The type `mbstate_t` is defined in `<cwchar>` and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

The two-argument member `assign` is defined identically to the built-in operator `=`. The two-argument members `eq` and `lt` are defined identically to the built-in operators `==` and `<` for type `unsigned char`.

The member `eof()` returns `EOF`.

### 23.2.4.3 struct char_traits<char8_t> [char.traits.specializations.char8.t]

```cpp
namespace std {
  template<> struct char_traits<char8_t> {
    using char_type = char8_t;
    using int_type = unsigned int;
    using off_type = streamoff;
    using pos_type = u8streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;
    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  }
}
```

The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<` respectively.

The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

### 23.2.4.4 struct char_traits<char16_t> [char.traits.specializations.char16.t]

```cpp
namespace std {
  template<> struct char_traits<char16_t> {
    using char_type = char16_t;
    using int_type = uint_least16_t;
    using off_type = streamoff;
    using pos_type = u16streampos;
    using state_type = mbstate_t;
    using comparison_category = strong_ordering;

    static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
    static constexpr bool eq(char_type c1, char_type c2) noexcept;
    static constexpr bool lt(char_type c1, char_type c2) noexcept;
    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
    static constexpr size_t length(const char_type* s);
    static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
    static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    static constexpr int_type not_eof(int_type c) noexcept;
    static constexpr char_type to_char_type(int_type c) noexcept;
    static constexpr int_type to_int_type(char_type c) noexcept;
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
    static constexpr int_type eof() noexcept;
  }
}
```
The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

23.2.4.5 `struct char_traits<char32_t>`

```cpp
namespace std {
    template<> struct char_traits<char32_t> {
        using char_type = char32_t;
        using int_type = uint_least32_t;
        using off_type = streamoff;
        using pos_type = u32streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                               const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    }
};
```

The two-argument members `assign`, `eq`, and `lt` are defined identically to the built-in operators `=`, `==`, and `<`, respectively.

The member `eof()` returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

23.2.4.6 `struct char_traits<wchar_t>`

```cpp
namespace std {
    template<> struct char_traits<wchar_t> {
        using char_type = wchar_t;
        using int_type = wint_t;
        using off_type = streamoff;
        using pos_type = wstreampos;
        using state_type = mbstate_t;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                               const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    }
};
```
using comparison_category = strong_ordering;

static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
static constexpr bool eq(char_type c1, char_type c2) noexcept;
static constexpr bool lt(char_type c1, char_type c2) noexcept;
static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
static constexpr size_t length(const char_type* s);
static constexpr const char_type* find(const char_type* s, size_t n,
const char_type& a);
static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* assign(char_type* s, size_t n, char_type a);
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.

2 The member eof() returns WEOF.

23.3 String view classes

23.3.1 General

1 The class template basic_string_view describes an object that can refer to a constant contiguous sequence of char-like (23.1) objects with the first element of the sequence at position zero. In the rest of 23.3, the type of the char-like objects held in a basic_string_view object is designated by charT.

2 [Note 1: The library provides implicit conversions from const charT* and std::basic_string<charT, ...> to std::basic_string_view<charT, ...> so that user code can accept just std::basic_string_view<charT> as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to std::basic_string_view<charT> in order to interoperate with these functions. — end note]

23.3.2 Header <string_view> synopsis

#include <compare> // see § 17.12.1

namespace std {
  // 23.3.3, class template basic_string_view
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view;

  template<class charT, class traits>
  inline constexpr bool ranges::enable_view<basic_string_view<charT, traits>> = true;
  template<class charT, class traits>
  inline constexpr bool ranges::enable_borrowed_range<basic_string_view<charT, traits>> = true;

  // 23.3.4, non-member comparison functions
  template<class charT, class traits>
  constexpr bool operator==(basic_string_view<charT, traits> x,
      basic_string_view<charT, traits> y) noexcept;

  template<class charT, class traits>
  constexpr see below operator<(basic_string_view<charT, traits> x,
      basic_string_view<charT, traits> y) noexcept;

  // see § 23.3.4, sufficient additional overloads of comparison functions

§ 23.3.2
template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os,
               basic_string_view<charT, traits> str);

using string_view = basic_string_view<char>;
using u8string_view = basic_string_view<char8_t>;
using u16string_view = basic_string_view<char16_t>;
using u32string_view = basic_string_view<char32_t>;
using wstring_view = basic_string_view<wchar_t>;

template<class T> struct hash;
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;

namespace literals {
    namespace string_view_literals {
        constexpr string_view operator"sv(const char* str, size_t len) noexcept;
        constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;
        constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;
        constexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;
        constexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;
    }
}

The function templates defined in 22.2.2 and 25.7 are available when <string_view> is included.

23.3.3 Class template basic_string_view

23.3.3.1 General

namespace std {
    template<class charT, class traits = char_traits<charT> >
    class basic_string_view {
    public:
        using traits_type = traits;
        using value_type = charT;
        using pointer = value_type*;
        using const_pointer = const value_type*;
        using reference = value_type&;
        using const_reference = const value_type&;
        using const_iterator = implementation-defined; // see 23.3.3.4
        using iterator = const_iterator;
        using const_reverse_iterator = reverse_iterator<const_iterator>;
        using reverse_iterator = const_reverse_iterator;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        static constexpr size_type npos = size_type(-1);

        constexpr basic_string_view() noexcept;
        constexpr basic_string_view(const basic_string_view&) noexcept = default;
        constexpr basic_string_view& operator=(const basic_string_view&) noexcept = default;
        constexpr basic_string_view(const charT* str);
        basic_string_view(nullptr_t) = delete;

        constexpr basic_string_view(string_view s) noexcept;
        constexpr basic_string_view(u8string_view s) noexcept;

constexpr size_type find_first_not_of(basic_string_view s, size_type pos = 0) const noexcept;
constexpr size_type find_first_not_of(charT c, size_type pos = 0) const noexcept;
constexpr size_type find_first_not_of(const charT* s, size_type pos, size_type n) const;
constexpr size_type find_first_not_of(const charT* s, size_type pos = 0) const;

private:
  const_pointer data_;  // exposition only
  size_type size_;      // exposition only
};

// 23.3.3.3, deduction guides
template<class It, class End>
  basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
template<class R>
  basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;

1 In every specialization basic_string_view<charT, traits>, the type traits shall meet the character
traits requirements (23.2).

[Note 1: The program is ill-formed if traits::char_type is not the same type as charT. — end note]

2 For a basic_string_view str, any operation that invalidates a pointer in the range
   [str.data(), str.data() + str.size())
invalidates pointers, iterators, and references returned from str's member functions.

3 The complexity of basic_string_view member functions is O(1) unless otherwise specified.

4 basic_string_view<charT, traits> is a trivially copyable type (6.8.1).

23.3.3.2 Construction and assignment

constexpr basic_string_view() noexcept;

  Postconditions: size_ == 0 and data_ == nullptr.

constexpr basic_string_view(const charT* str);

  Preconditions: [str, str + traits::length(str)) is a valid range.

  Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with
traits::length(str).

  Complexity: O(traits::length(str)).

constexpr basic_string_view(const charT* str, size_type len);

  Preconditions: [str, str + len) is a valid range.

  Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.
template<class It, class End>
constexpr basic_string_view(It begin, End end);

Constraints:
(7.1) It satisfies contiguous_iterator.
(7.2) End satisfies sized_sentinel_for<It>.
(7.3) is_same_v<iter_value_t<It>, charT> is true.
(7.4) is_convertible_v<End, size_type> is false.

 Preconditions:
(8.1) [begin, end) is a valid range.
(8.2) It models contiguous_iterator.
(8.3) End models sized_sentinel_for<It>.

Effects: Initializes data_ with to_address(begin) and initializes size_ with end - begin.
Throws: When and what end - begin throws.

template<class R>
constexpr explicit basic_string_view(R&& r);

Let d be an lvalue of type remove_cvref_t<R>.

Constraints:
(12.1) remove_cvref_t<R> is not the same type as basic_string_view,
(12.2) R models ranges::contiguous_range and ranges::sized_range,
(12.3) is_same_v<ranges::range_value_t<R>, charT> is true,
(12.4) is_convertible_v<R, const charT*> is false,
(12.5) d.operator ::std::basic_string_view<charT, traits>() is not a valid expression, and
(12.6) if the qualified-id remove_reference_t<R>::traits_type is valid and denotes a type, is_same_v<remove_reference_t<R>::traits_type, traits> is true.

Effects: Initializes data_ with ranges::data(r) and size_ with ranges::size(r).
Throws: Any exception thrown by ranges::data(r) and ranges::size(r).

23.3.3.3 Deduction guides
[string.view.deduct]

template<class It, class End>
basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;

Constraints:
(1.1) It satisfies contiguous_iterator.
(1.2) End satisfies sized_sentinel_for<It>.

template<class R>
basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;

Constraints: R satisfies ranges::contiguous_range.

23.3.3.4 Iterator support
[string.view.iterators]

using const_iterator = implementation-defined;

A type that meets the requirements of a constant Cpp17RandomAccessIterator (25.3.5.7), models contiguous_iterator (25.3.4.14), and meets the constexpr iterator requirements (25.3.1), whose value_type is the template parameter charT.

All requirements on container iterators (24.2) apply to basic_string_view::const_iterator as well.

constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

Returns: An iterator such that
— if !empty(), addressof(*begin()) == data_,
— otherwise, an unspecified value such that [begin(),end()) is a valid range.

constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

4 Returns: begin() + size().

constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

5 Returns: const_reverse_iterator(end()).

constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

6 Returns: const_reverse_iterator(begin()).

23.3.3.5 Capacity

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

1 Returns: size_.

constexpr size_type max_size() const noexcept;

2 Returns: The largest possible number of char-like objects that can be referred to by a basic_string_view.

[[nodiscard]] constexpr bool empty() const noexcept;

3 Returns: size_ == 0.

23.3.3.6 Element access

constexpr const_reference operator[](size_type pos) const;

1 Preconditions: pos < size().
2 Returns: data_[pos].
3 Throws: Nothing.
4 [Note 1: Unlike basic_string::operator[], basic_string_view::operator[](size()) has undefined behavior instead of returning charT. — end note]

constexpr const_reference at(size_type pos) const;

5 Returns: data_[pos].
6 Throws: out_of_range if pos >= size().

constexpr const_reference front() const;

7 Preconditions: !empty().
8 Returns: data_[0].
9 Throws: Nothing.

constexpr const_reference back() const;

10 Preconditions: !empty().
11 Returns: data_[size() - 1].
12 Throws: Nothing.

constexpr const_pointer data() const noexcept;

13 Returns: data_.
14 [Note 2: Unlike basic_string::data() and string_literals, data() can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a function that takes just a const charT* and expects a null-terminated string. — end note]

§ 23.3.3.6
23.3.3.7 Modifiers

```cpp
constexpr void remove_prefix(size_type n);

Preconditions: n <= size().

Effects: Equivalent to: data_ += n; size_ -= n;
```

```cpp
constexpr void remove_suffix(size_type n);

Preconditions: n <= size().

Effects: Equivalent to: size_ -= n;
```

```cpp
constexpr void swap(basic_string_view& s) noexcept;

Effects: Exchanges the values of *this and s.
```

23.3.3.8 String operations

```cpp
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;

Let rlen be the smaller of n and size() - pos.

Preconditions: [s, s + rlen) is a valid range.

Effects: Equivalent to traits::copy(s, data() + pos, rlen).

Returns: rlen.

Throws: out_of_range if pos > size().

Complexity: \(\Theta(rlen)\).
```

```cpp
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;

Let rlen be the smaller of n and size() - pos.

Effects: Determines rlen, the effective length of the string to reference.

Returns: basic_string_view(data() + pos, rlen).

Throws: out_of_range if pos > size().
```

```cpp
constexpr int compare(basic_string_view str) const noexcept;

Let rlen be the smaller of size() and str.size().

Effects: Determines rlen, the effective length of the strings to compare. The function then compares the two strings by calling traits::compare(data(), str.data(), rlen).

Returns: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as indicated in Table 81.
```

Table 81: compare() results

<table>
<thead>
<tr>
<th>Condition</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>size() &lt; str.size()</td>
<td>&lt; 0</td>
</tr>
<tr>
<td>size() == str.size()</td>
<td>0</td>
</tr>
<tr>
<td>size() &gt; str.size()</td>
<td>&gt; 0</td>
</tr>
</tbody>
</table>

Complexity: \(\Theta(rlen)\).

```cpp
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;

Effects: Equivalent to: return substr(pos1, n1).compare(str);
```

```cpp
constexpr int compare(size_type pos1, size_type n1, basic_string_view str, size_type pos2, size_type n2) const;

Effects: Equivalent to: return substr(pos1, n1).compare(str.substr(pos2, n2));
```

```cpp
constexpr int compare(const charT* s) const;

Effects: Equivalent to: return compare(basic_string_view(s));
```

§ 23.3.3.8
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;
18 Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s));
constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;
19 Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s, n2));
constexpr bool starts_with(basic_string_view x) const noexcept;
20 Effects: Equivalent to: return substr(0, x.size()) == x;
constexpr bool starts_with(charT x) const noexcept;
21 Effects: Equivalent to: return !empty() && traits::eq(front(), x);
constexpr bool starts_with(const charT* x) const;
22 Effects: Equivalent to: return starts_with(basic_string_view(x));
constexpr bool ends_with(basic_string_view x) const noexcept;
23 Effects: Equivalent to:
    return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;
constexpr bool ends_with(charT x) const noexcept;
24 Effects: Equivalent to: return !empty() && traits::eq(back(), x);
constexpr bool ends_with(const charT* x) const;
25 Effects: Equivalent to: return ends_with(basic_string_view(x));
constexpr bool contains(basic_string_view x) const noexcept;
26 Effects: Equivalent to: return find(x) != npos;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;

23.3.3.9 Searching [string.view.find]
1 Member functions in this subclause have complexity \(O(size() \cdot str.size())\) at worst, although implementations should do better.

2 Let \(F\) be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

(2.1) — Each member function of the form
    constexpr return-type F(const charT* s, size_type pos) const;
    has effects equivalent to: return F(basic_string_view(s), pos);
(2.2) — Each member function of the form
    constexpr return-type F(const charT* s, size_type pos, size_type n) const;
    has effects equivalent to: return F(basic_string_view(s, n), pos);
(2.3) — Each member function of the form
    constexpr return-type F(charT c, size_type pos) const noexcept;
    has effects equivalent to: return F(basic_string_view(addressof(c), 1), pos);
    constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;

3 Let \(xpos\) be the lowest position, if possible, such that the following conditions hold:

(3.1) — pos <= xpos
(3.2) — xpos + str.size() <= size()
(3.3) — traits::eq(at(xpos + I), str.at(I)) for all elements \(I\) of the string referenced by \(str\).

Effects: Determines \(xpos\).

Returns: \(xpos\) if the function can determine such a value for \(xpos\). Otherwise, returns \(npos\).
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

(6.1) \( \text{xpos} \leq \text{pos} \)
(6.2) \( \text{xpos} + \text{str.size()} \leq \text{size()} \)
(6.3) \( \text{traits::eq(at(xpos + I), str.at(I))} \) for all elements I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;

Let xpos be the lowest position, if possible, such that the following conditions hold:

(9.1) \( \text{pos} \leq \text{xpos} \)
(9.2) \( \text{xpos} < \text{size()} \)
(9.3) \( \text{traits::eq(at(xpos), str.at(I))} \) for some element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

(12.1) \( \text{xpos} \leq \text{pos} \)
(12.2) \( \text{xpos} < \text{size()} \)
(12.3) \( \text{traits::eq(at(xpos), str.at(I))} \) for some element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;

Let xpos be the lowest position, if possible, such that the following conditions hold:

(15.1) \( \text{pos} \leq \text{xpos} \)
(15.2) \( \text{xpos} < \text{size()} \)
(15.3) \( \text{traits::eq(at(xpos), str.at(I))} \) for no element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

(18.1) \( \text{xpos} \leq \text{pos} \)
(18.2) \( \text{xpos} < \text{size()} \)
(18.3) \( \text{traits::eq(at(xpos), str.at(I))} \) for no element I of the string referenced by str.

**Effects:** Determines xpos.

**Returns:** xpos if the function can determine such a value for xpos. Otherwise, returns npos.

### 23.3.4 Non-member comparison functions

Let S be basic_string_view<charT, traits>, and sv be an instance of S. Implementations shall provide sufficient additional overloads marked `constexpr` and `noexcept` so that an object t with an implicit conversion to S can be compared according to Table 82.

**Example 1:** A sample conforming implementation for `operator==` would be:

```cpp
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs, basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
```
Table 82: Additional `basic_string_view` comparison overloads  

<table>
<thead>
<tr>
<th>Expression</th>
<th>Equivalent to</th>
</tr>
</thead>
<tbody>
<tr>
<td>t == sv</td>
<td>S(t) == sv</td>
</tr>
<tr>
<td>sv == t</td>
<td>sv == S(t)</td>
</tr>
<tr>
<td>t != sv</td>
<td>S(t) != sv</td>
</tr>
<tr>
<td>sv != t</td>
<td>sv != S(t)</td>
</tr>
<tr>
<td>t &lt; sv</td>
<td>S(t) &lt; sv</td>
</tr>
<tr>
<td>sv &lt; t</td>
<td>sv &lt; S(t)</td>
</tr>
<tr>
<td>t &gt; sv</td>
<td>S(t) &gt; sv</td>
</tr>
<tr>
<td>sv &gt; t</td>
<td>sv &gt; S(t)</td>
</tr>
<tr>
<td>t &lt;= sv</td>
<td>S(t) &lt;= sv</td>
</tr>
<tr>
<td>sv &lt;= t</td>
<td>sv &lt;= S(t)</td>
</tr>
<tr>

<td>S(t) &lt;=&gt; sv</td>
</tr>
<tr>
<td>sv &lt;=&gt; t</td>
<td>sv &lt;=&gt; S(t)</td>
</tr>
</tbody>
</table>

```cpp
} template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> lhs,
        type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
        return lhs.compare(rhs) == 0;
    }

    template<class charT, class traits>
    constexpr bool operator==(basic_string_view<charT, traits> lhs,
        basic_string_view<charT, traits> rhs) noexcept;

    template<class charT, class traits>
    constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
        basic_string_view<charT, traits> rhs) noexcept;

    // Let R denote the type traits::comparison_category if that qualified-id is valid and denotes a
type (13.10.3), otherwise R is weak_ordering.
    template<class charT, class traits>
    constexpr static_cast<R>(lhs.compare(rhs) <=> 0);

23.3.5  Inserters and extractors  

```cpp
    template<class charT, class traits>
    basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);

    template<> struct hash<string_view>;
    template<> struct hash<u8string_view>;
    template<> struct hash<u16string_view>;
    template<> struct hash<u32string_view>;
    template<> struct hash<wstring_view>;

1 The specialization is enabled (22.10.19).
[Note 1: The hash value of a string view object is equal to the hash value of the corresponding string object (23.4.6). — end note]

23.3.7 Suffix for basic_string_view literals

constexpr string_view operator"sv(const char* str, size_t len) noexcept;

Returns: string_view{str, len}.

constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;

Returns: u8string_view{str, len}.

constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;

Returns: u16string_view{str, len}.

constexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;

Returns: u32string_view{str, len}.

constexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;

Returns: wstring_view{str, len}.

23.4 String classes

23.4.1 General

The header <string> defines the basic_string class template for manipulating varying-length sequences of char-like objects and five typedef-names, string, u8string, u16string, u32string, and wstring, that name the specializations basic_string<char>, basic_string<char8_t>, basic_string<char16_t>, basic_string<char32_t>, and basic_string<wchar_t>, respectively.

23.4.2 Header <string> synopsis

#include <compare>  // see 17.12.1
#include <initializer_list>  // see 17.11.2

23.4.3 Class template basic_string

23.4.3.1 General

The class template basic_string describes objects that can store a sequence consisting of a varying number
of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also
called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of 23.4.3,
the type of the char-like objects held in a basic_string object is designated by charT.

A specialization of basic_string is a contiguous container (24.2.2.1).

In all cases, [data().data() + size()] is a valid range, data() + size() points at an object with value
charT() (a “null terminator”), and size() <= capacity() is true.

namespace std {
    template<class charT, class traits = char_traits<charT>,
             class Allocator = allocator<charT>>
    class basic_string {
        public:
            // types
            using traits_type = traits;
            using value_type = charT;
            using allocator_type = Allocator;

class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;

template<class charT,
class traits,
class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,
              typename see below::size_type, typename see below::size_type,
              const Allocator& = Allocator())
-> basic_string<charT, traits, Allocator>;

4 A size_type parameter type in a basic_string deduction guide refers to the size_type member type of
   the type deduced by the deduction guide.
5 The types iterator and const_iterator meet the constexpr iterator requirements (25.3.1).

23.4.3.2 General requirements

1 If any operation would cause size() to exceed max_size(), that operation throws an exception object of
   type length_error.
2 If any member function or operator of basic_string throws an exception, that function or operator has no
   other effect on the basic_string object.
3 In every specialization basic_string<charT, traits, Allocator>, the type allocator_traits<Alloc-
   ator>::value_type shall name the same type as charT. Every object of type basic_string<charT,
   traits, Allocator> uses an object of type Allocator to allocate and free storage for the contained
   charT objects as needed. The Allocator object used is obtained as described in 24.2.2.1. In every spe-
   cialization basic_string<charT, traits, Allocator>, the type traits shall meet the character traits
   requirements (23.2).
4 References, pointers, and iterators referring to the elements of a basic_string sequence may be invalidated by the following uses of that basic_string object:

(4.1) — Passing as an argument to any standard library function taking a reference to non-const basic_string as an argument.\footnote{For example, as an argument to non-member functions swap() (23.4.4.3), operator>>() (23.4.4.4), and getline() (23.4.4.4), or as an argument to basic_string::swap().}

(4.2) — Calling non-const member functions, except operator[], at, data, front, back, begin, rbegin, end, and rend.

23.4.3.3 Constructors and assignment operators

constexpr explicit basic_string(const Allocator& a) noexcept;

Postconditions: size() is equal to 0.

constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;

Effects: Constructs an object whose value is that of str prior to this call.

Remarks: In the second form, str is left in a valid but unspecified state.

constexpr basic_string(const basic_string& str, size_type pos, size_type n, const Allocator& a = Allocator());

Effects: Constructs an object whose initial value is the range \([s.data() + pos, s.data() + rlen)\).

Throws: out_of_range if \(pos > s.size()\).

Remarks: For the overloads with a basic_string&& parameter, str is left in a valid but unspecified state.

Recommended practice: For the overloads with a basic_string&& parameter, implementations should avoid allocation if \(s.get_allocator() == a\) is true.

\[
\text{template<class T>}
\]

constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());

Constraints: is_convertible_v<const T&, basic_string_view<charT, traits>> is true.

Effects: Creates a variable, sv, as if by basic_string_view<charT, traits> sv = t; and then behaves the same as:

\[
\text{basic_string(sv.substr(pos, n), a);}
\]

\[
\text{template<class T>}
\]

constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());

Constraints:

(11.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(11.2) — is_convertible_v<const T&, const charT*> is false.
Effects: Creates a variable, sv, as if by
\[
\text{basic_string_view<charT, traits> } sv = t;
\]
and then behaves the same as \text{basic_string(sv.data(), sv.size(), a)}.

constexpr \text{basic_string(const charT* s, size_type n, const Allocator& a = Allocator());}

Preconditions: \([s, s + n)\) is a valid range.

Effects: Constructs an object whose initial value is the range \([s, s + n)\).

Postconditions: size() is equal to n, and \text{traits::compare(data(), s, n)} is equal to 0.

constexpr \text{basic_string(const charT* s, const Allocator& a = Allocator());}

Constraints: Allocator is a type that qualifies as an allocator (24.2.2.1).

[Note 1: This affects class template argument deduction. — end note]

Effects: Equivalent to: \text{basic_string(s, traits::length(s), a)}.

constexpr \text{basic_string(size_type n, charT c, const Allocator& a = Allocator());}

Constraints: Allocator is a type that qualifies as an allocator (24.2.2.1).

[Note 2: This affects class template argument deduction. — end note]

Effects: Constructs an object whose value consists of n copies of c.

template<class InputIterator>
constexpr \text{basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());}

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).

Effects: Constructs a string from the values in the range \([begin, end)\), as specified in 24.2.4.

template<container-compatible-range<charT> R>
constexpr \text{basic_string(from_range_t, R&& rg, const Allocator& = Allocator());}

Effects: Constructs a string from the values in the range \(rg\), as specified in 24.2.4.

constexpr \text{basic_string(initializer_list<charT> il, const Allocator& a = Allocator());}

Effects: Equivalent to \text{basic_string(il.begin(), il.end(), a)}.

constexpr \text{basic_string(const basic_string& str, const Allocator& alloc);}

constexpr \text{basic_string(basic_string&& str, const Allocator& alloc);}

Effects: Constructs an object whose value is that of \text{str} prior to this call. The stored allocator is
constructed from alloc. In the second form, \text{str} is left in a valid but unspecified state.

Throws: The second form throws nothing if alloc == str.get_allocator().

template<class InputIterator,
class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
\text{basic_string(InputIterator, InputIterator, Allocator = Allocator());}

-> \text{basic_string<typename iterator_traits<InputIterator>::value_type,
char_traits<typename iterator_traits<InputIterator>::value_type>,
Allocator>};

Constraints: InputIterator is a type that qualifies as an input iterator, and Allocator is a type
that qualifies as an allocator (24.2.2.1).

template<class charT,
class traits,
class Allocator = allocator<charT>>
\text{explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator());}

-> \text{basic_string<charT, traits, Allocator>};

template<class charT,
class traits,
class Allocator = allocator<charT>>
\text{basic_string(basic_string_view<charT, traits>,
typename see below::size_type, typename see below::size_type,
const Allocator& = Allocator());}

§ 23.4.3.3
27
Constraints: Allocator is a type that qualifies as an allocator (24.2.2.1).

constexpr basic_string& operator=(const basic_string& str);

Effects: If *this and str are the same object, has no effect. Otherwise, replaces the value of *this with a copy of str.

Returns: *this.

castexpr basic_string& operator=(basic_string&& str)
    noexcept(algorithm_traits<Allocator>::propagate_on_container_move_assignment::value ||
              algorithm_traits<Allocator>::is_always_equal::value);

Effects: Move assigns as a sequence container (24.2), except that iterators, pointers and references may be invalidated.

Returns: *this.

template<class T>
    constexpr basic_string& operator=(const T& t);

Constraints:
(32.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(32.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> sv = t;
    return assign(sv);

castexpr basic_string& operator=(const charT* s);

Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(s);

castexpr basic_string& operator=(charT c);

Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(addressof(c), 1);

castexpr basic_string& operator=(initializer_list<charT> il);

Effects: Equivalent to:
    return *this = basic_string_view<charT, traits>(il.begin(), il.size());

23.4.3.4 Iterator support [string.iterators]

constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr const_iterator cbegin() const noexcept;

Returns: An iterator referring to the first character in the string.

constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

Returns: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(end()).

constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

Returns: An iterator which is semantically equivalent to reverse_iterator(begin()).
23.4.3.5 Capacity

```cpp
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;
```

>Returns: A count of the number of char-like objects currently in the string.

>Complexity: Constant time.

```cpp
constexpr size_type max_size() const noexcept;
```

>Returns: The largest possible number of char-like objects that can be stored in a basic_string.

>Complexity: Constant time.

```cpp
constexpr void resize(size_type n, charT c);
```

>Effects: Alters the value of *this as follows:

(5.1) If \( n \leq \) size(), erases the last \( \text{size()} - n \) elements.

(5.2) If \( n > \) size(), appends \( n - \text{size()} \) copies of \( c \).

```cpp
constexpr void resize(size_type n);
```

>Effects: Equivalent to `resize(n, charT())`.

```cpp
template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);
```

>Let

(7.1) \( o = \text{size()} \) before the call to `resize_and_overwrite`.

(7.2) \( k = \min(o, n) \).

(7.3) \( p \) be a charT*, such that the range \([p, p+n]\) is valid and `this->compare(0, k, p, k) == 0` is true before the call. The values in the range \([p+k, p+n]\) may be indeterminate (6.7.4).

(7.4) \( OP \) be the expression `std::move(op)(p, n)`.

(7.5) \( r = OP \).

>Mandates: `OP` has an integer-like type (25.3.4.4).

>Preconditions:

(9.1) \( OP \) does not throw an exception or modify \( p \) or \( n \).

(9.2) \( r \geq 0 \).

(9.3) \( r \leq n \).

(9.4) After evaluating `OP` there are no indeterminate values in the range \([p, p+r]\).

>Effects: Evaluates `OP`, replaces the contents of *this with \([p, p+r]\), and invalidates all pointers and references to the range \([p, p+n]\).

>Recommended practice: Implementations should avoid unnecessary copies and allocations by, for example, making \( p \) a pointer into internal storage and by restoring *(p + r) to charT() after evaluating `OP`.

```cpp
constexpr size_type capacity() const noexcept;
```

>Returns: The size of the allocated storage in the string.

>Complexity: Constant time.

```cpp
constexpr void reserve(size_type res_arg);
```

>Effects: A directive that informs a basic_string of a planned change in size, so that the storage allocation can be managed accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`.

>Throws: length_error if `res_arg > max_size()` or any exceptions thrown by allocator_traits <ALLOCATOR>::allocate.
constexpr void shrink_to_fit();

Effects: shrink_to_fit is a non-binding request to reduce capacity() to size().

[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase capacity(), but may reduce capacity() by causing reallocation.

Complexity: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 2: If no reallocation happens, they remain valid. — end note]

constexpr void clear() noexcept;

Effects: Equivalent to: erase(begin(), end());

[[nodiscard]] constexpr bool empty() const noexcept;

Effects: Equivalent to: return size() == 0;

### 23.4.3.6 Element access

```cpp
constexpr const_reference operator[](size_type pos) const;
constexpr reference operator[](size_type pos);
```

Preconditions: pos <= size().

Returns: *(begin() + pos) if pos < size(). Otherwise, returns a reference to an object of type charT with value charT(), where modifying the object to any value other than charT() leads to undefined behavior.

Throws: Nothing.

Complexity: Constant time.

```cpp
constexpr const_reference at(size_type pos) const;
constexpr reference at(size_type pos);
```

Preconditions: !empty().

Returns: operator[](pos).

Throws: out_of_range if pos >= size().

```cpp
constexpr const charT& front() const;
constexpr charT& front();
```

Preconditions: !empty().

Effects: Equivalent to: return operator[](0);

```cpp
constexpr const charT& back() const;
constexpr charT& back();
```

Preconditions: !empty().

Effects: Equivalent to: return operator[](size() - 1);

### 23.4.3.7 Modifiers

#### 23.4.3.7.1 basic_string::operator+=

```cpp
constexpr basic_string& operator+=(const basic_string& str);
```

Effects: Equivalent to: return append(str);

```cpp
template<class T>
constexpr basic_string& operator+=(const T& t);
```

Constraints:

1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
2. is_convertible_v<const T&, const charT*> is false.
Effects: Equivalent to:
```cpp
t basic_string_view<CharT, traits> sv = t;
return append(sv);
```

constexpr basic_string& operator+=(const charT* s);
Effects: Equivalent to: return append(s);

constexpr basic_string& operator+=(CharT c);
Effects: Equivalent to: return append(size_type{1}, c);

constexpr basic_string& operator+=(initializer_list<CharT> il);
Effects: Equivalent to: return append(il);

23.4.3.7.2 base_string::append [string.append]

constexpr base_string& append(const base_string& str);
Effects: Equivalent to: return append(str.data(), str.size());

constexpr base_string& append(const base_string& str, size_type pos, size_type n = npos);
Effects: Equivalent to:
```cpp
return append(basic_string_view<CharT, traits>(str).substr(pos, n));
```

template<class T>
customexpr basic_string& append(const T& t);
Constraints:
(3.1) is_convertible_v<const T&, basic_string_view<CharT, traits>> is true and
(3.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
```cpp
basic_string_view<CharT, traits> sv = t;
return append(sv.data(), sv.size());
```

template<class T>
customexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
Constraints:
(5.1) is_convertible_v<const T&, basic_string_view<CharT, traits>> is true and
(5.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
```cpp
basic_string_view<CharT, traits> sv = t;
return append(sv.substr(pos, n));
```

constexpr basic_string& append(const charT* s, size_type n);
Preconditions: [s, s + n) is a valid range.
Effects: Appends a copy of the range [s, s + n) to the string.
Returns:*this.

constexpr basic_string& append(const charT* s);
Effects: Equivalent to: return append(s, traits::length(s));

constexpr basic_string& append(size_type n, charT c);
Effects: Appends n copies of c to the string.
Returns: *this.

template<class InputIterator>
customexpr basic_string& append(InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).
Effects: Equivalent to:
\[
\text{return append(basic_string(first, last, get_allocator()));}
\]

```cpp
template<container-compatible-range<charT> R>
constexpr basic_string& append_range(R&& rg);
```

Effects: Equivalent to:
\[
\text{return append(basic_string(from_range, std::forward<R>(rg), get_allocator()));}
\]

```cpp
constexpr basic_string& append(initializer_list<charT> il);
```

Effects: Equivalent to:
\[
\text{return append(il.begin(), il.size());}
\]

```cpp
constexpr void push_back(charT c);
```

Effects: Equivalent to:
\[
\text{append(size_type\{1\}, c).}
\]

### 23.4.3.7.3 basic_string::assign

```cpp
constexpr basic_string& assign(const basic_string& str);
```

Effects: Equivalent to:
\[
\text{return *this = str;}
\]

```cpp
constexpr basic_string& assign(basic_string&& str)
noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
allocator_traits<Allocator>::is_always_equal::value);
```

Effects: Equivalent to:
\[
\text{return *this = std::move(str);}
\]

```cpp
constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);
```

Effects: Equivalent to:
\[
\text{return assign(basic_string_view<charT, traits>(str).substr(pos, n));}
\]

```cpp
template<class T>
constexpr basic_string& assign(const T& t);
```

**Constraints:**

1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
2. is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
\[
\text{basic_string_view<charT, traits> sv = t;}
\text{return assign(sv.data(), sv.size());}
\]

```cpp
template<class T>
constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);
```

**Constraints:**

1. is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
2. is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
\[
\text{basic_string_view<charT, traits> sv = t;}
\text{return assign(sv.substr(pos, n));}
\]

```cpp
constexpr basic_string& assign(const charT* s, size_type n);
```

**Preconditions:** \([s, s + n]\) is a valid range.

Effects: Replaces the string controlled by *this with a copy of the range \([s, s + n]\).

Returns: *this.

```cpp
constexpr basic_string& assign(const charT* s);
```

Effects: Equivalent to:
\[
\text{return assign(s, traits::length(s));}
\]

```cpp
constexpr basic_string& assign(initializer_list<charT> il);
```

Effects: Equivalent to:
\[
\text{return assign(il.begin(), il.size());}
\]
constexpr basic_string& assign(size_type n, charT c);

**Effects:** Equivalent to:

```cpp
clear();
resize(n, c);
return *this;
```

```cpp
template<class InputIterator>
constexpr basic_string& assign(InputIterator first, InputIterator last);
```

**Constraints:** `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).

**Effects:** Equivalent to:

```cpp
return assign(basic_string(first, last, get_allocator()));
```

```cpp
template<container-compatible-range<charT> R>
constexpr basic_string& assign_range(R&& rg);
```

**Effects:** Equivalent to:

```cpp
return assign(basic_string(from_range, std::forward<R>(rg), get_allocator()));
```

### 23.4.3.7.4 basic_string::insert

```cpp
constexpr basic_string& insert(size_type pos, const basic_string& str);
```

**Effects:** Equivalent to:

```cpp
return insert(pos, str.data(), str.size());
```

```cpp
constexpr basic_string& insert(size_type pos1, const basic_string& str, size_type pos2, size_type n = npos);
```

**Effects:** Equivalent to:

```cpp
return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);
```

```cpp
template<class T>
constexpr basic_string& insert(size_type pos, const T& t);
```

**Constraints:**

(1.1) `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(1.2) `is_convertible_v<const T&, const charT*>` is false.

**Effects:** Equivalent to:

```cpp
basic_string_view<charT, traits> sv = t;
return insert(pos, sv.data(), sv.size());
```

```cpp
template<class T>
constexpr basic_string& insert(size_type pos1, const T& t, size_type pos2, size_type n = npos);
```

**Constraints:**

(5.1) `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(5.2) `is_convertible_v<const T&, const charT*>` is false.

**Effects:** Equivalent to:

```cpp
basic_string_view<charT, traits> sv = t;
return insert(pos1, sv.substr(pos2, n));
```

```cpp
constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

**Preconditions:** `[s, s + n)` is a valid range.

**Effects:** Inserts a copy of the range `[s, s + n)` immediately before the character at position `pos` if `pos < size()`, or otherwise at the end of the string.

**Returns:** *this.

**Throws:**

(10.1) `out_of_range` if `pos > size()`,

(10.2) `length_error` if `n > max_size() - size()`, or

(10.3) any exceptions thrown by `allocator_traits<Allocator>::allocate.`
constexpr basic_string& insert(size_type pos, const charT* s);
Effects: Equivalent to: return insert(pos, s, traits::length(s));

constexpr basic_string& insert(size_type pos, size_type n, charT c);
Effects: Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the end of the string.
Returns: *this
Throws:
- out_of_range if pos > size(),
- length_error if n > max_size() - size(), or
- any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr iterator insert(const_iterator p, charT c);
 Preconditions: p is a valid iterator on *this.
Effects: Inserts a copy of c at the position p.
Returns: An iterator which refers to the inserted character.

constexpr iterator insert(const_iterator p, size_type n, charT c);
 Preconditions: p is a valid iterator on *this.
Effects: Inserts n copies of c at the position p.
Returns: An iterator which refers to the first inserted character, or p if n == 0.

template<class InputIterator>
constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);
Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).
 Preconditions: p is a valid iterator on *this.
Effects: Equivalent to insert(p - begin(), basic_string(first, last, get_allocator())).
Returns: An iterator which refers to the first inserted character, or p if first == last.

template<container-compatible-range<charT> R>
constexpr iterator insert_range(const_iterator p, R&& rg);
 Preconditions: p is a valid iterator on *this.
Effects: Equivalent to insert(p - begin(), basic_string(from_range, std::forward<R>(rg),
get_allocator())).
Returns: An iterator which refers to the first inserted character, or p if rg is empty.

constexpr iterator insert(const_iterator p, initializer_list<charT> il);
Effects: Equivalent to: return insert(p, il.begin(), il.end());

23.4.3.7.5 basic_string::erase

constexpr basic_string& erase(size_type pos = 0, size_type n = npos);
Effects: Determines the effective length xlen of the string to be removed as the smaller of n and size() - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen).
Returns: *this.
Throws: out_of_range if pos > size().

constexpr iterator erase(const_iterator p);
 Preconditions: p is a valid dereferenceable iterator on *this.
Effects: Removes the character referred to by p.
Returns: An iterator which points to the element immediately following p prior to the element being erased. If no such element exists, end() is returned.
**Throws:** Nothing.

```cpp
constexpr iterator erase(const_iterator first, const_iterator last);
```

**Preconditions:** `first` and `last` are valid iterators on `*this`. `[first,last)` is a valid range.

**Effects:** Removes the characters in the range `[first, last)`. Returns: An iterator which points to the element pointed to by `last` prior to the other elements being erased. If no such element exists, `end()` is returned.

**Throws:** Nothing.

```cpp
constexpr void pop_back();
```

**Preconditions:** `!empty()`.

**Effects:** Equivalent to `erase(end() - 1)`.

**Throws:** Nothing.

### 23.4.3.7.6 basic_string::replace

**[string.replace]**

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);
```

**Effects:** Equivalent to: `return replace(pos1, n1, str.data(), str.size());`

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
                                size_type pos2, size_type n2 = npos);
```

**Effects:** Equivalent to:

```cpp
    return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));
```

```cpp
template<class T>
    constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);
```

**Constraints:**

- (3.1) `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
- (3.2) `is_convertible_v<const T&, const charT*>` is false.

**Effects:** Equivalent to:

```cpp
    basic_string_view<charT, traits> sv = t;
    return replace(pos1, n1, sv.data(), sv.size());
```

```cpp
template<class T>
    constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
                                      size_type pos2, size_type n2 = npos);
```

**Constraints:**

- (5.1) `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
- (5.2) `is_convertible_v<const T&, const charT*>` is false.

**Effects:** Equivalent to:

```cpp
    basic_string_view<charT, traits> sv = t;
    return replace(pos1, n1, sv.substr(pos2, n2));
```

```cpp
constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);
```

**Preconditions:** `[s, s + n2)` is a valid range.

**Effects:** Determines the effective length `xlen` of the string to be removed as the smaller of `n1` and `size() - pos1`. If `size() - xlen >= max_size() - n2` throws `length_error`. Otherwise, the function replaces the characters in the range `[begin() + pos1, begin() + pos1 + xlen)` with a copy of the range `[s, s + n2)`.

**Returns:** `*this`.

**Throws:**

- (10.1) `out_of_range` if `pos1 > size()`,
- (10.2) `length_error` if the length of the resulting string would exceed `max_size()`. or

§ 23.4.3.7.6
(10.3) any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr basic_string& replace(size_type pos, size_type n, const charT* s);

Effects: Equivalent to: return replace(pos, n, s, traits::length(s));

constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);

Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range [begin() + pos1, begin() + pos1 + xlen) with n2 copies of c.

Returns: *this.

Throws:
  (14.1) — out_of_range if pos1 > size(),
  (14.2) — length_error if the length of the resulting string would exceed max_size(), or
  (14.3) — any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);

Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(str));

template<class T>
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);

Constraints:
  (16.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
  (16.2) is_convertible_v<const T&, const charT*> is false.

Preconditions: [begin(), i1) and [i1, i2) are valid ranges.

Effects: Equivalent to:
  basic_string_view<charT, traits> sv = t;
  return replace(i1 - begin(), i2 - i1, sv.data(), sv.size());

constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);

Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s, n));

constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);

Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s));

constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);

Effects: Equivalent to: return replace(i1, i2, basic_string_view<charT, traits>(s, n));

constexpr basic_string& replace(const_iterator i1, const_iterator i2, size_type n, charT c);

Preconditions: [begin(), i1) and [i1, i2) are valid ranges.

Effects: Equivalent to: return replace(i1 - begin(), i2 - i1, n, c);

template<class InputIterator>
constexpr basic_string& replace(const_iterator i1, const_iterator i2, InputIterator j1, InputIterator j2);

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).

Effects: Equivalent to: return replace(i1, i2, basic_string(j1, j2, get_allocator()));

template<container-compatible-range<charT> R>
constexpr basic_string& replace_with_range(const_iterator i1, const_iterator i2, R&& rg);

Effects: Equivalent to:
  return replace(i1, i2, basic_string(from_range, std::forward<R>(rg), get_allocator()));
constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);

Effects: Equivalent to: return replace(i1, i2, il.begin(), il.size());
23.4.3.7.7 basic_string::copy

constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;

Effects: Equivalent to: return basic_string_view<charT, traits>(*this).copy(s, n, pos);
[Note 1: This does not terminate s with a null object. —end note]

23.4.3.7.8 basic_string::swap

constexpr void swap(basic_string& s)

Preconditions: allocation_traits<Allocator>::propagate_on_container_swap::value is true or
get_allocator() == s.get_allocator().
Postconditions: *this contains the same sequence of characters that was in s, s contains the same
sequence of characters that was in *this.
Throws: Nothing.
Complexity: Constant time.

23.4.3.8 String operations

23.4.3.8.1 Accessors

constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;

Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].
Complexity: Constant time.
Remarks: The program shall not modify any of the values stored in the character array; otherwise, the
behavior is undefined.

constexpr charT* data() noexcept;

Returns: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].
Complexity: Constant time.
Remarks: The program shall not modify the value stored at p + size() to any value other than
charT(); otherwise, the behavior is undefined.

constexpr operator basic_string_view<charT, traits>() const noexcept;

Effects: Equivalent to: return basic_string_view<charT, traits>(data(), size());

constexpr allocator_type get_allocator() const noexcept;

Returns: A copy of the Allocator object used to construct the string or, if that allocator has been
replaced, a copy of the most recent replacement.

23.4.3.8.2 Searching

Let F be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.
(1.1) — Each member function of the form

constexpr size_type F(const basic_string& str, size_type pos) const noexcept;

has effects equivalent to: return F(basic_string_view<charT, traits>(str), pos);

(1.2) — Each member function of the form

constexpr size_type F(const charT* s, size_type pos) const;

has effects equivalent to: return F(basic_string_view<charT, traits>(s), pos);

(1.3) — Each member function of the form

constexpr size_type F(const charT* s, size_type pos, size_type n) const;

has effects equivalent to: return F(basic_string_view<charT, traits>(s, n), pos);

§ 23.4.3.8.2
(1.4) — Each member function of the form

```cpp
constexpr size_type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to:

```cpp
return F(basic_string_view<charT, traits>(&c), 1), pos);
```

```cpp
template<class T>
constexpr size_type find(const T& t, size_type pos = 0) const noexcept;
```

```cpp
template<class T>
constexpr size_type rfind(const T& t, size_type pos = npos) const noexcept;
```

```cpp
template<class T>
constexpr size_type find_first_of(const T& t, size_type pos = 0) const noexcept;
```

```cpp
template<class T>
constexpr size_type find_last_of(const T& t, size_type pos = npos) const noexcept;
```

```cpp
template<class T>
constexpr size_type find_first_not_of(const T& t, size_type pos = 0) const noexcept;
```

```cpp
template<class T>
constexpr size_type find_last_not_of(const T& t, size_type pos = npos) const noexcept;
```

2 Constraints:

(2.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(2.2) — is_convertible_v<const T&, const charT*> is false.

3 Effects: Let G be the name of the function. Equivalent to:

```cpp
basic_string_view<charT, traits> s = *this, sv = t;
return s.G(sv, pos);
```

4 Remarks: The exception specification is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

### 23.4.3.8.3 basic_string::substr

```cpp
constexpr basic_string substr(size_type pos = 0, size_type n = npos) const &;
```

1 Effects: Equivalent to: return basic_string(*this, pos, n);

```cpp
constexpr basic_string substr(size_type pos = 0, size_type n = npos) &&;
```

2 Effects: Equivalent to: return basic_string(std::move(*this), pos, n);

### 23.4.3.8.4 basic_string::compare

```cpp
template<class T>
constexpr int compare(const T& t) const noexcept;
```

1 Constraints:

(1.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(1.2) — is_convertible_v<const T&, const charT*> is false.

2 Effects: Equivalent to: return basic_string_view<charT, traits>(*this).compare(t);

3 Remarks: The exception specification is equivalent to is_nothrow_convertible_v<const T&, basic_string_view<charT, traits>>.

```cpp
template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t) const;
```

4 Constraints:

(4.1) — is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(4.2) — is_convertible_v<const T&, const charT*> is false.

5 Effects: Equivalent to:

```cpp
return basic_string_view<charT, traits>(*this).substr(pos1, n1).compare(t);
```
template<class T>
constexpr int compare(size_type pos1, size_type n1, const T& t,
    size_type pos2, size_type n2 = npos) const;

Constraints:
— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
    basic_string_view<charT, traits> s = *this, sv = t;
    return s.substr(pos1, n1).compare(sv.substr(pos2, n2));

constexpr int compare(const basic_string& str) const noexcept;

Effects: Equivalent to:
    return compare(basic_string_view<charT, traits>(str));

constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;

Effects: Equivalent to:
    return compare(pos1, n1, basic_string_view<charT, traits>(str));

constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
    size_type pos2, size_type n2 = npos) const;

Effects: Equivalent to:
    return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);

constexpr int compare(const charT* s) const;

Effects: Equivalent to:
    return compare(basic_string_view<charT, traits>(s));

constexpr int compare(size_type pos, size_type n1, const charT* s) const;

Effects: Equivalent to:
    return compare(pos, n1, basic_string_view<charT, traits>(s));

constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;

Effects: Equivalent to:
    return compare(pos, n1, basic_string_view<charT, traits>(s, n2));

23.4.3.8.5 basic_string::starts_with

constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;

Effects: Equivalent to:
    return basic_string_view<charT, traits>(data(), size()).starts_with(x);

23.4.3.8.6 basic_string::ends_with

constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;

Effects: Equivalent to:
    return basic_string_view<charT, traits>(data(), size()).ends_with(x);

23.4.3.8.7 basic_string::contains

constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;

Effects: Equivalent to:
    return basic_string_view<charT, traits>(data(), size()).contains(x);
23.4.4 Non-member functions

23.4.4.1 operator+

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
          const basic_string<charT, traits, Allocator>& rhs);
```

**Effects:** Equivalent to:

```cpp
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

**Effects:** Equivalent to:

```cpp
basic_string<charT, traits, Allocator> r = lhs;
r.append(rhs);
return r;
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, const basic_string<charT, traits, Allocator>& rhs);
```

**Effects:** Equivalent to:

```cpp
lhs.append(rhs);
return std::move(lhs);
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, basic_string<charT, traits, Allocator>&& rhs);
```

**Effects:** Equivalent to:

```cpp
lhs.append(rhs);
return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states.

[Note 1: If `lhs` and `rhs` have equal allocators, the implementation can move from either. — end note]

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);
```

**Effects:** Equivalent to:

```cpp
rhs.insert(0, lhs);
return std::move(rhs);
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, const basic_string<charT, traits, Allocator>& rhs);
```

**Effects:** Equivalent to:

```cpp
basic_string<charT, traits, Allocator> r = rhs;
r.insert(0, lhs);
return r;
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);
```

**Effects:** Equivalent to:

§ 23.4.4.1 851
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);

Effects: Equivalent to:

basic_string<charT, traits, Allocator> r = lhs;
r.push_back(rhs);
return std::move(lhs);

23.4.4.2 Non-member comparison operator functions

template<class charT, class traits, class Allocator>
constexpr bool
operator==(const basic_string<charT, traits, Allocator>& lhs,
const basic_string<charT, traits, Allocator>& rhs) noexcept;

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
const charT* rhs);

Effects: Let op be the operator. Equivalent to:

return basic_string_view<charT, traits>(lhs) op basic_string_view<charT, traits>(rhs);

23.4.4.3 swap

template<class charT, class traits, class Allocator>
constexpr void
swap(basic_string<charT, traits, Allocator>& lhs,
basic_string<charT, traits, Allocator>& rhs) noexcept(noexcept(lhs.swap(rhs)));

Effects: Equivalent to lhs.swap(rhs).

23.4.4.4 Inserters and extractors

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);

Effects: Behaves as a formatted input function (31.7.5.3.1). After constructing a sentry object, if the sentry object returns true when converted to a value of type bool, calls str.erase() and then
extracts characters from is and appends them to str as if by calling str.append(1, c). If is.width() is greater than zero, the maximum number n of characters appended is is.width(); otherwise n is str.max_size(). Characters are extracted and appended until any of the following occurs:

1. n characters are stored;
2. end-of-file occurs on the input sequence;
3. isspace(c, is.getloc()) is true for the next available input character c.

After the last character (if any) is extracted, is.width(0) is called and the sentry object is destroyed.

If the function extracts no characters, it calls is.setstate(ios_base::failbit), which may throw ios_base::failure (31.5.4.4).

Returns: is.

```cpp
template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, 
const basic_string<charT, traits, Allocator>& str);
```

Effects: Equivalent to: return os << basic_string_view<charT, traits>(str);

```cpp
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
getline(basic_istream<charT, traits>& is, 
basic_string<charT, traits, Allocator>& str, charT delim);
```

Effects: Behaves as an unformatted input function (31.7.5.4), except that it does not affect the value returned by subsequent calls to basic_istream::gcount(). After constructing a sentry object, if the sentry object returns true when converted to a value of type bool, calls str.erase() and then extracts characters from is and appends them to str as if by calling str.append(1, c) until any of the following occurs:

1. end-of-file occurs on the input sequence (in which case, the getline function calls is.setstate( ios_base::eofbit)).
2. traits::eq(c, delim) for the next available input character c (in which case, c is extracted but not appended) (31.5.4.4)
3. str.max_size() characters are stored (in which case, the function calls is.setstate(ios_base::failbit)) (31.5.4.4)

The conditions are tested in the order shown. In any case, after the last character is extracted, the sentry object is destroyed.

If the function extracts no characters, it calls is.setstate(ios_base::failbit) which may throw ios_base::failure (31.5.4.4).

Returns: is.

```cpp
template<class charT, class traits, class Allocator>
basic_istream<charT, traits>&
gline(basic_istream<charT, traits>& is, 
basic_string<charT, traits, Allocator>& str);
```

Returns: getline(is, str, is.widen(\n')).

§ 23.4.4.4
23.4.4.5 Erasure

```cpp
template<class charT, class traits, class Allocator, class U>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase(basic_string<charT, traits, Allocator>& c, const U& value);
```

**Effects:** Equivalent to:
- `auto it = remove(c.begin(), c.end(), value);`
- `auto r = distance(it, c.end());`
- `c.erase(it, c.end());`
- `return r;`

```cpp
template<class charT, class traits, class Allocator, class Predicate>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);
```

**Effects:** Equivalent to:
- `auto it = remove_if(c.begin(), c.end(), pred);`
- `auto r = distance(it, c.end());`
- `c.erase(it, c.end());`
- `return r;`

23.4.5 Numeric conversions

```cpp
int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);
```

**Effects:** The first two functions call `strtol(str.c_str(), ptr, base)`, and the last three functions call `strtoul(str.c_str(), ptr, base)`, `strtoll(str.c_str(), ptr, base)`, and `strtoull(str.c_str(), ptr, base)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

**Returns:** The converted result.

**Throws:** `invalid_argument` if `strtol`, `strtoul`, `strtoll`, or `strtoull` reports that no conversion can be performed. Throws `out_of_range` if `strtol`, `strtoul`, `strtoll`, or `strtoull` sets `errno` to `ERANGE`, or if the converted value is outside the range of representable values for the return type.

```cpp
float stof(const string& str, size_t* idx = nullptr);
double stod(const string& str, size_t* idx = nullptr);
l long double stold(const string& str, size_t* idx = nullptr);
```

**Effects:** These functions call `strtof(str.c_str(), ptr)`, `strtod(str.c_str(), ptr)`, and `strtold(str.c_str(), ptr)`, respectively. Each function returns the converted result, if any. The argument `ptr` designates a pointer to an object internal to the function that is used to determine what to store at `*idx`. If the function does not throw an exception and `idx != nullptr`, the function stores in `*idx` the index of the first unconverted element of `str`.

**Returns:** The converted result.

**Throws:** `invalid_argument` if `strtof`, `strtod`, or `strtold` reports that no conversion can be performed. Throws `out_of_range` if `strtof`, `strtod`, or `strtold` sets `errno` to `ERANGE` or if the converted value is outside the range of representable values for the return type.

```cpp
string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
```
string to_string(long double val);

>Returns: Each function returns a string object holding the character representation of the value of its argument that would be generated by calling sprintf(buf, fmt, val) with a format specifier of "%d", "%u", "%ld", "%lu", "%lld", "%llu", "%f", or "%Lf", respectively, where buf designates an internal character buffer of sufficient size.

int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);

>Effects: The first two functions call wcstol(str.c_str(), ptr, base), and the last three functions call wcstoul(str.c_str(), ptr, base), wcstoll(str.c_str(), ptr, base), and wcstoull(str.c_str(), ptr, base), respectively. Each function returns the converted result, if any. The argument ptr designates a pointer to an object internal to the function that is used to determine what to store at *idx. If the function does not throw an exception and idx != nullptr, the function stores in *idx the index of the first unconverted element of str.

>Returns: The converted result.

Throws: invalid_argument if wcstol, wcstoul, wcstoll, or wcstoull reports that no conversion can be performed. Throws out_of_range if the converted value is outside the range of representable values for the return type.

float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);

>Effects: These functions call wcstof(str.c_str(), ptr), wcstod(str.c_str(), ptr), and wcstold(str.c_str(), ptr), respectively. Each function returns the converted result, if any. The argument ptr designates a pointer to an object internal to the function that is used to determine what to store at *idx. If the function does not throw an exception and idx != nullptr, the function stores in *idx the index of the first unconverted element of str.

>Returns: The converted result.

Throws: invalid_argument if wcstof, wcstod, or wcstold reports that no conversion can be performed. Throws out_of_range if wcstof, wcstod, or wcstold sets errno to ERANGE.

wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(unsigned long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);

>Returns: Each function returns a wstring object holding the character representation of the value of its argument that would be generated by calling swprintf(buf, buffsz, fmt, val) with a format specifier of L"%d", L"%u", L"%ld", L"%lu", L"%lld", L"%llu", L"%f", L"%Lf", or L"%Lf", respectively, where buf designates an internal character buffer of sufficient size buffsz.

23.4.6 Hash support

template<class A> struct hash<basic_string<char, char_traits<char>, A>>;
template<class A> struct hash<basic_string<char8_t, char_traits<char8_t>, A>>;
template<class A> struct hash<basic_string<char16_t, char_traits<char16_t>, A>>;
template<class A> struct hash<basic_string<char32_t, char_traits<char32_t>, A>>;
template<class A> struct hash<basic_string<wchar_t, char_traits<wchar_t>, A>>;

If S is one of these string types, SV is the corresponding string view type, and s is an object of type S, then hash<S>()(s) == hash<SV>()(SV(s)).
23.4.7 Suffix for basic_string literals

```cpp
constexpr string operator"s(const char* str, size_t len);

Returns: string{str, len}.
```

```cpp
constexpr u8string operator"s(const char8_t* str, size_t len);

Returns: u8string{str, len}.
```

```cpp
constexpr u16string operator"s(const char16_t* str, size_t len);

Returns: u16string{str, len}.
```

```cpp
constexpr u32string operator"s(const char32_t* str, size_t len);

Returns: u32string{str, len}.
```

```cpp
constexpr wstring operator"s(const wchar_t* str, size_t len);

Returns: wstring{str, len}.
```

[Note 1: The same suffix s is used for `chrono::duration` literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

23.5 Null-terminated sequence utilities

23.5.1 Header `<cassert>` synopsis

```cpp
namespace std {
    int isalnum(int c);
    int isalpha(int c);
    int isblank(int c);
    int iscntrl(int c);
    int isdigit(int c);
    int isgraph(int c);
    int islower(int c);
    int isprint(int c);
    int ispunct(int c);
    int isspace(int c);
    int isupper(int c);
    int isxdigit(int c);
    int tolower(int c);
    int toupper(int c);
}
```

[1] The contents and meaning of the header `<cassert>` are the same as the C standard library header `<ctype.h>`.

See also: ISO C 7.4

23.5.2 Header `<cwctype>` synopsis

```cpp
namespace std {
    using wint_t = see below;
    using wctrans_t = see below;
    using wctype_t = see below;

    int iswalnum(wint_t wc);
    int iswalpha(wint_t wc);
    int iswblank(wint_t wc);
    int iswcntrl(wint_t wc);
    int iswdigit(wint_t wc);
    int iswgraph(wint_t wc);
    int iswlower(wint_t wc);
    int iswprint(wint_t wc);
    int iswpunct(wint_t wc);
    int iswspace(wint_t wc);
    int iswupper(wint_t wc);
    int iswctype(wint_t wc, wctype_t desc);
    wctype_t wctype(const char* property);
}
wint_t towlower(wint_t wc);
wint_t toupper(wint_t wc);
wint_t towctrans(wint_t wc, wctrans_t desc);
wctrans_t wcctrans(const char* property);
}

#define WEOF see below

1 The contents and meaning of the header `<cwctype>` are the same as the C standard library header `<wctype.h>`.

See also: ISO C 7.30

23.5.3 Header `<cstring>` synopsis

```cpp
namespace std {
    using size_t = see 17.2.4;
    void* memcpy(void* s1, const void* s2, size_t n);
    void* memmove(void* s1, const void* s2, size_t n);
    char* strncpy(char* s1, const char* s2, size_t n);
    char* strncat(char* s1, const char* s2);
    char* strnstr(const char* s1, const char* s2);
    int memmove(const void* s1, const void* s2, size_t n);
    int memcmp(const void* s1, const void* s2, size_t n);
    int strcmp(const char* s1, const char* s2);
    int strcoll(const char* s1, const char* s2);
    int strncmp(const char* s1, const char* s2, size_t n);
    size_t strxfrm(char* s1, const char* s2, size_t n);
    const void* memchr(const void* s, int c, size_t n);
    void* memchr(void* s, int c, size_t n);
    const char* strchr(const char* s, int c);
    char* strchr(char* s, int c);
    size_t strcspn(const char* s1, const char* s2);
    const char* strpbrk(const char* s1, const char* s2);
    const char* strrrchr(const char* s, int c);
    char* strrrchr(char* s, int c);
    size_t strspn(const char* s1, const char* s2);
    const char* strnstr(const char* s1, const char* s2);
    char* strtok(char* s1, const char* s2);
    int strcmp(int errnum);
    size_t strlen(const char* s);
}
```

#define NULL see 17.2.3

1 The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`.

2 The functions `strerror` and `strtok` are not required to avoid data races (16.4.6.10).

3 The functions `memcpy` and `memmove` are signal-safe (17.14.5). Both functions implicitly create objects (6.7.2) in the destination region of storage immediately prior to copying the sequence of characters to the destination.

4 [Note 1: The functions `strchr`, `strpbrk`, `strrchr`, `strrstr`, and `memchr`, have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — end note]

See also: ISO C 7.24

23.5.4 Header `<cwchar>` synopsis

```cpp
namespace std {
    using size_t = see 17.2.4;
    using mbstate_t = see below;
    using wint_t = see below;
    struct tm;
```
int _fwprintf(FILE* stream, const wchar_t* format, ...);
int _fwscanf(FILE* stream, const wchar_t* format, ...);
int _swprintf(wchar_t* s, size_t n, const wchar_t* format, ...);
int _swscanf(const wchar_t* s, const wchar_t* format, ...);

int _fputwc(wchar_t c, FILE* stream);
int _fputws(const wchar_t* s, FILE* stream);
int _fwscanf(const wchar_t* format, ...);
itn_t _getwc(FILE* stream, int mode);
wchar_t* wcscpy(wchar_t* s1, const wchar_t* s2);
wchar_t* wcsncpy(wchar_t* s1, const wchar_t* s2, size_t n);
wchar_t* wmemcpy(wchar_t* s1, const wchar_t* s2, size_t n);
wchar_t* wmemmove(wchar_t* s1, const wchar_t* s2, size_t n);
wchar_t* wcscat(wchar_t* s1, const wchar_t* s2);
wchar_t* wcsncat(wchar_t* s1, const wchar_t* s2, size_t n);
int wcscmp(const wchar_t* s1, const wchar_t* s2);
int wcscoll(const wchar_t* s1, const wchar_t* s2);
int wcsncmp(const wchar_t* s1, const wchar_t* s2, size_t n);
size_t wcsxfrm(wchar_t* s1, const wchar_t* s2, size_t n);
int wmemcmp(const wchar_t* s1, const wchar_t* s2, size_t n);
const wchar_t* wcschr(const wchar_t* s, wchar_t c);
const wchar_t* wcschr(wchar_t* s, wchar_t c); // see 16.2
size_t wcscspn(const wchar_t* s1, const wchar_t* s2);
const wchar_t* wcspbrk(const wchar_t* s1, const wchar_t* s2); // see 16.2
size_t wcscspn(const wchar_t* s1, const wchar_t* s2);
const wchar_t* wcspbrk(const wchar_t* s1, const wchar_t* s2); // see 16.2
const wchar_t* wcscsrchr(const wchar_t* s1, const wchar_t* s2); // see 16.2
size_t wcscspn(const wchar_t* s1, const wchar_t* s2);
const wchar_t* wcscstr(const wchar_t* s1, const wchar_t* s2); // see 16.2
wchar_t* wcscstr(wchar_t* s1, const wchar_t* s2); // see 16.2
wchar_t* wcscstr(wchar_t* s1, const wchar_t* s2);
const wchar_t* wcstok(wchar_t* s1, const wchar_t* s2, wchar_t** ptr);
const wchar_t* wcswrchr(const wchar_t* s, wchar_t c, size_t n); // see 16.2
size_t wcslen(const wchar_t* s);
wchar_t* wmemset(wchar_t* s, wchar_t c, size_t n);
size_t wcsftime(wchar_t* s, size_t maxsize, const wchar_t* format, const tm* timeptr);
int _btowc(int c);
int _wctob(wint_t c);

§ 23.5.4

// 23.5.6, multibyte / wide string and character conversion functions
int mbinit(const mbstate_t* ps);
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbtowc(const wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);

858
The contents and meaning of the header `<cwchar>` are the same as the C standard library header `<wchar.h>`, except that it does not declare a type `wchar_t`.

[Note 1: The functions `wcschr`, `wcspbrk`, `wcsrchr`, `wcsstr`, and `wmemchr` have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — end note]

23.5.5 Header `<cuchar>` synopsis

```cpp
namespace std {
    using mbstate_t = see below;
    using size_t = see 17.2.4;
    
    size_t mbtowc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
    size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
    size_t mbtowc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
    size_t c16rtomb(char* s, char16_t c16, mbstate_t* ps);
    size_t mbtowc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
    size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
}
```

The contents and meaning of the header `<cuchar>` are the same as the C standard library header `<uchar.h>`, except that it declares the additional `mbtowc8` and `c8rtomb` functions and does not declare types `char16_t` nor `char32_t`.

See also: ISO C 7.28

23.5.6 Multibyte / wide string and character conversion functions

```cpp
int mbsinit(const mbstate_t* ps);
int mblen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);
```

Effects: These functions have the semantics specified in the C standard library.

See also: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

```cpp
int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);
```

Effects: These functions have the semantics specified in the C standard library.

Remarks: Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

See also: ISO C 7.22.7

```cpp
size_t mbrlen(const char* s, size_t n, mbstate_t* ps);
size_t mbstowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcstombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);
```

Effects: These functions have the semantics specified in the C standard library.

Remarks: Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.

§ 23.5.6
See also: ISO C 7.29.6.3

size_t mbtoca8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to mbtoca8(nullptr, "", 1, ps). Otherwise, the function
inspects at most n bytes beginning with the byte pointed to by s to determine the number of bytes
needed to complete the next multibyte character (including any shift sequences). If the function
determines that the next multibyte character is complete and valid, it determines the values of the
corresponding UTF-8 code units and then, if pc8 is not a null pointer, stores the value of the first (or
only) such code unit in the object pointed to by pc8. Subsequent calls will store successive UTF-8
code units without consuming any additional input until all the code units have been stored. If the
 corresponding Unicode character is U+0000 NULL, the resulting state described is the initial conversion
state.

Returns: The first of the following that applies (given the current conversion state):

- 0, if the next n or fewer bytes complete the multibyte character that corresponds to the U+0000
  NULL Unicode character (which is the value stored).
- between 1 and n (inclusive), if the next n or fewer bytes complete a valid multibyte character
  (whose first (or only) code unit is stored); the value returned is the number of bytes that complete
  the multibyte character.
- (size_t)(-3), if the next code unit resulting from a previous call has been stored (no bytes from
  the input have been consumed by this call).
- (size_t)(-2), if the next n bytes contribute to an incomplete (but potentially valid) multibyte
  character, and all n bytes have been processed (no value is stored).
- (size_t)(-1), if an encoding error occurs, in which case the next n or fewer bytes do not contribute
  to a complete and valid multibyte character (no value is stored); the value of the macro EILSEQ is
  stored in errno, and the conversion state is unspecified.

size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to c8rtomb(buf, u8'\0', ps) where buf is an internal buffer.
Otherwise, if c8 completes a sequence of valid UTF-8 code units, determines the number of bytes
 needed to represent the multibyte character (including any shift sequences), and stores the multibyte
character representation in the array whose first element is pointed to by s. At most MB_CUR_MAX bytes
are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift
sequence needed to restore the initial shift state; the resulting state described is the initial conversion
state.

Returns: The number of bytes stored in the array object (including any shift sequences). If c8 does
not contribute to a sequence of char8_t corresponding to a valid multibyte character, the value of the
macro EILSEQ is stored in errno, (size_t) (-1) is returned, and the conversion state is unspecified.

Remarks: Calls to c8rtomb with a null pointer argument for s may introduce a data race (16.4.6.10)
with other calls to c8rtomb with a null pointer argument for s.
24 Containers library

24.1 General

1 This Clause describes components that C++ programs may use to organize collections of information.

2 The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 83.

### Table 83: Containers library summary

<table>
<thead>
<tr>
<th>Subclause</th>

<td>Unordered associative containers</td>
</tr>
<tr>
<td>24.6</td>
<td>Container adaptors</td>
</tr>
<tr>
<td>24.7</td>
<td>Views</td>
</tr>
</tbody>
</table>

24.2 Requirements

24.2.1 Preamble

1 Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

2 All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

[Example 1: The copy constructor of type `vector<vector<int>>` has linear complexity, even though the complexity of copying each contained `vector<int>` is itself linear. — end example]

3 Allocator-aware containers (24.2.2.5) other than `basic_string` construct elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::construct` and destroy elements using the function `allocator_traits<allocator_type>::rebind_traits<U>::destroy (20.2.9.3)`, where U is either `allocator_type::value_type` or an internal type used by the container. These functions are called only for the container’s element type, not for internal types used by the container.

[Note 1: This means, for example, that a node-based container would need to construct nodes containing aligned buffers and call `construct` to place the element into the buffer. — end note]

24.2.2 General containers

24.2.2.1 General

1 In subclause 24.2.2,

   (1.1) — `X` denotes a container class containing objects of type `T`,
   (1.2) — `a` and `b` denote values of type `X`,
   (1.3) — `i` and `j` denote values of type (possibly const) `X::iterator`,
   (1.4) — `u` denotes an identifier,
   (1.5) — `r` denotes a non-const value of type `X`, and
   (1.6) — `rv` denotes a non-const rvalue of type `X`.

24.2.2.2 Containers

1 A type `X` meets the `container` requirements if the following types, statements, and expressions are well-formed and have the specified semantics.

   ```cpp
typename X::value_type
```

2 Result: `T`
Preconditions: \( T \) is Cpp17Erasable from \( X \) (see §24.2.2.5, below).

\[
\text{typedef X::reference} \\
\text{Result: } T& \\
\text{typedef X::const_reference} \\
\text{Result: } \text{const } T& \\
\text{typedef X::iterator} \\
\text{Result: A type that meets the forward iterator requirements (25.3.5.5) with value type } T. \text{ The type } X::\text{iterator} \text{ is convertible to } X::\text{const} \text{\_iterator}. \\
\text{typedef X::const_iterator} \\
\text{Result: A type that meets the requirements of a constant iterator and those of a forward iterator with value type } T. \\
\text{typedef X::difference\_type} \\
\text{Result: A signed integer type, identical to the difference type of } X::\text{iterator} \text{ and } X::\text{const} \text{\_iterator}. \\
\text{typedef X::size\_type} \\
\text{Result: An unsigned integer type that can represent any non-negative value of } X::\text{difference}\_type. \\
\]

\( X \ u; \)
\( X \ u = X(); \)

\text{Postconditions: } u.\text{empty}() \\
\text{Complexity: Constant.}

\( X \ u(a); \)
\( X \ u = a; \)

Preconditions: \( T \) is Cpp17CopyInsertable into \( X \) (see below).

\text{Postconditions: } u == a \\
\text{Complexity: Linear.}

\( X \ u(rv); \)
\( X \ u = rv; \)

\text{Postconditions: } u \text{ is equal to the value that } rv \text{ had before this construction.} \\
\text{Complexity: Linear for array and constant for all other standard containers.}

\( a = rv \)

\text{Result: } X&. \\
\text{Effects: All existing elements of } a \text{ are either move assigned to or destroyed.} \\
\text{Postconditions: If } a \text{ and } rv \text{ do not refer to the same object, } a \text{ is equal to the value that } rv \text{ had before this assignment.} \\
\text{Complexity: Linear.}

\( a.\text{~}(\) \\
\text{Result: void} \\
\text{Effects: Destroys every element of } a; \text{ any memory obtained is deallocated.} \\
\text{Complexity: Linear.}

\( a.\text{begin}(\) \\
\text{Result: iterator; const_iterator for constant } a. \\
\text{Returns: An iterator referring to the first element in the container.} \\
\text{Complexity: Constant.}
a.end()

Result: iterator; const_iterator for constant a.
Retruns: An iterator which is the past-the-end value for the container.
Complexity: Constant.

a.cbegin()

Result: const_iterator.
Returns: const_cast<X const&>(a).begin()
Complexity: Constant.

a.cend()

Result: const_iterator.
Returns: const_cast<X const&>(a).end()
Complexity: Constant.

i <=> j

Result: strong_ordering.
Constraints: X::iterator meets the random access iterator requirements.
Complexity: Constant.

a == b

Preconditions: T meets the Cpp17EqualityComparable requirements.
Result: Convertible to bool.
Returns: equal(a.begin(), a.end(), b.begin(), b.end())
[Note 1: The algorithm equal is defined in 27.6.13. — end note]
Complexity: Constant if a.size() != b.size(), linear otherwise.
Remarks: == is an equivalence relation.

a != b

Effects: Equivalent to !(a == b).

a.swap(b)

Result: void
Effects: Exchanges the contents of a and b.
Complexity: Linear for array and constant for all other standard containers.

swap(a, b)

Effects: Equivalent to a.swap(b).

r = a

Result: X&.
Postconditions: r == a.
Complexity: Linear.

a.size()

Result: size_type.
Returns: distance(a.begin(), a.end()), i.e. the number of elements in the container.
Complexity: Constant.
Remarks: The number of elements is defined by the rules of constructors, inserts, and erases.
a.max_size()

Result: size_type.

Returns: distance(begin(), end()) for the largest possible container.

Complexity: Constant.

a.empty()

Result: Convertible to bool.

Returns: a.begin() == a.end()

Complexity: Constant.

Remarks: If the container is empty, then a.empty() is true.

In the expressions

i == j
i != j
i < j
i <= j
i >= j
i > j
i <=> j
i - j

where i and j denote objects of a container’s iterator type, either or both may be replaced by an object of the container’s const_iterator type referring to the same element with no change in semantics.

Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see 16.4.4.6).

[Note 2: In particular, containers and iterators do not store references to allocated elements other than through the allocator’s pointer type, i.e., as objects of type P or pointer_traits<P>::template rebind<unspecified>, where P is allocator_traits<allocator_type>::pointer. — end note]

Copy constructors for these container types obtain an allocator by calling allocator_traits<allocator_type>::select_on_container_copy_construction on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a const allocator_type& argument.

[Note 3: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. — end note]

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or swap(). Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if

(64.1) allocator_traits<allocator_type>::propagate_on_container_copy_assignment::value,

(64.2) allocator_traits<allocator_type>::propagate_on_container_move_assignment::value, or

(64.3) allocator_traits<allocator_type>::propagate_on_container_swap::value

is true within the implementation of the corresponding container operation. In all container types defined in this Clause, the member get_allocator() returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

The expression a.swap(b), for containers a and b of a standard container type other than array, shall exchange the values of a and b without invoking any move, copy, or swap operations on the individual container elements. Lvalues of any Compare, Pred, or Hash types belonging to a and b shall be swappable and shall be exchanged by calling swap as described in 16.4.4.3. If allocator_traits<allocator_type>::propagate_on_container_swap::value is true, then lvalues of type allocator_type shall be swappable and the allocators of a and b shall also be exchanged by calling swap as described in 16.4.4.3. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless a.get_allocator() == b.get_allocator(). Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value a.end() before the swap will have value b.end() after the swap.
24.2.2.3 Reversible container requirements

A type \( X \) meets the *reversible container* requirements if \( X \) meets the container requirements, the iterator type of \( X \) belongs to the bidirectional or random access iterator categories (25.3), and the following types and expressions are well-formed and have the specified semantics.

\[
typename \ X::reverse_iterator
\]

**Result:** The type \( reverse_iterator<X::iterator> \), an iterator type whose value type is \( T \).

\[
typename \ X::const_reverse_iterator
\]

**Result:** The type \( reverse_iterator<X::const_iterator> \), a constant iterator type whose value type is \( T \).

\[a.rbegin()\]

**Result:** \( reverse_iterator; const_reverse_iterator \) for constant \( a \).

**Returns:** \( reverse_iterator(end()) \)

**Complexity:** Constant.

\[a.rend()\]

**Result:** \( reverse_iterator; const_reverse_iterator \) for constant \( a \).

**Returns:** \( reverse_iterator(begin()) \)

**Complexity:** Constant.

\[a.crbegin()\]

**Result:** \( const_reverse_iterator \).

**Returns:** \( const_cast<X \ const&>(a).rbegin() \)

**Complexity:** Constant.

\[a.crend()\]

**Result:** \( const_reverse_iterator \).

**Returns:** \( const_cast<X \ const&>(a).rend() \)

**Complexity:** Constant.

Unless otherwise specified (see 24.2.7.2, 24.2.8.2, 24.3.8.4, and 24.3.11.5) all container types defined in this Clause meet the following additional requirements:

1. If an exception is thrown by an `insert()` or `emplace()` function while inserting a single element, that function has no effects.
2. If an exception is thrown by a `push_back()`, `push_front()`, `emplace_back()`, or `emplace_front()` function, that function has no effects.
3. No `erase()`, `clear()`, `pop_back()` or `pop_front()` function throws an exception.
4. No copy constructor or assignment operator of a returned iterator throws an exception.
5. No `swap()` function throws an exception.
6. No `swap()` function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

[Note 1: The `end()` iterator does not refer to any element, so it can be invalidated. — end note]

Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

A *contiguous container* is a container whose member types `iterator` and `const_iterator` meet the `Cpp17RandomAccessIterator` requirements (25.3.5.7) and model `contiguous_iterator` (25.3.4.14).

24.2.2.4 Optional container requirements

The following operations are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics as described unless otherwise stated. If the
iterators passed to \texttt{lexicographical\_compare\_three\_way} meet the constexpr iterator requirements (25.3.1) then the operations described below are implemented by constexpr functions.

\begin{verbatim}
a <=> b
\end{verbatim}

\textit{Result:} \texttt{synth-three-way-result<X::value\_type>}

\textit{Preconditions:} Either \texttt{<=>} is defined for values of type (possibly const) \texttt{T}, or \texttt{<} is defined for values of type (possibly const) \texttt{T} and \texttt{<} is a total ordering relationship.

\textit{Returns:} \texttt{lexicographical\_compare\_three\_way(a.begin(), a.end(), b.begin(), b.end(), synth-three-way)}

[\textit{Note 1:} The algorithm \texttt{lexicographical\_compare\_three\_way} is defined in Clause 27. — end note]

\textit{Complexity:} Linear.

\subsection*{24.2.2.5 Allocator-aware containers} [container.alloc.reqmts]

All of the containers defined in Clause 24 and in 23.4.3 except \texttt{array} meet the additional requirements of an \texttt{allocator-aware container}, as described below.

Given an allocator type \texttt{A} and given a container type \texttt{X} having a \texttt{value\_type} identical to \texttt{T} and an \texttt{allocator\_type} identical to \texttt{allocator\_traits<A>::rebind\_alloc<T>} and given an lvalue \texttt{m} of type \texttt{A}, a pointer \texttt{p} of type \texttt{T*}, an expression \texttt{v} of type (possibly const) \texttt{T}, and an rvalue \texttt{rv} of type \texttt{T}, the following terms are defined. If \texttt{X} is not allocator-aware or is a specialization of \texttt{basic\_string}, the terms below are defined as if \texttt{A} were \texttt{allocator<T>} — no allocator object needs to be created and user specializations of \texttt{allocator<T>} are not instantiated:

\begin{enumerate}
\item \[T\text{ is }\texttt{Cpp17DefaultInsertable into } X\text{ means that the following expression is well-formed:}\]
\[\texttt{allocator\_traits<A>::construct}(m, p)\]
\item \[T\text{ is }\texttt{Cpp17MoveInsertable into } X\text{ means that the following expression is well-formed:}\]
\[\texttt{allocator\_traits<A>::construct}(m, p, \texttt{rv})\]
\item \[T\text{ is }\texttt{Cpp17CopyInsertable into } X\text{ means that, in addition to } T\text{ being }\texttt{Cpp17MoveInsertable into } X,\text{ the following expression is well-formed:}\]
\[\texttt{allocator\_traits<A>::construct}(m, p, \texttt{v})\]
\item \[T\text{ is }\texttt{Cpp17EmplaceConstructible into } X\text{ from } \texttt{args},\text{ for zero or more arguments } \texttt{args},\text{ means that the following expression is well-formed:}\]
\[\texttt{allocator\_traits<A>::construct}(m, p, \texttt{args})\]
\item \[T\text{ is }\texttt{Cpp17Erasable from } X\text{ means that the following expression is well-formed:}\]
\[\texttt{allocator\_traits<A>::destroy}(m, p)\]
\end{enumerate}

[\textit{Note 2:} A container calls \texttt{allocator\_traits<A>::construct}(m, p, \texttt{args}) to construct an element at \texttt{p} using \texttt{args}, with \texttt{m == get\_allocator()}. The default \texttt{construct} in \texttt{allocator} will call \texttt{::new((\texttt{void}*)p) T(args)}, but specialized allocators can choose a different definition. — end note]

The following exposition-only concept is used in the definition of containers:

\begin{verbatim}
\template<class R, class T>
concept container-compatible-range = // exposition only
 ranges::input\_range<R> \&\& convertible\_to\_ranges::<range\_reference\_t<R>, T>;
\end{verbatim}

In this subclause,

\begin{enumerate}
\item \[X\text{ denotes an allocator-aware container class with a }\texttt{value\_type}\text{ of } T\text{ using an allocator of type } A,\]
\end{enumerate}
(4.2) — \( u \) denotes a variable,
(4.3) — \( a \) and \( b \) denote non-const lvalues of type \( X \),
(4.4) — \( c \) denotes an lvalue of type \( \text{const } X \),
(4.5) — \( t \) denotes an lvalue or a const rvalue of type \( X \),
(4.6) — \( \text{rv} \) denotes a non-const rvalue of type \( X \), and
(4.7) — \( m \) is a value of type \( A \).

A type \( X \) meets the allocator-aware container requirements if \( X \) meets the container requirements and the following types, statements, and expressions are well-formed and have the specified semantics.

typename \( X::\text{allocator\_type} \)

\[ \text{Result: } A \]

**Preconditions:** \( \text{allocator\_type::value\_type} \) is the same as \( X::\text{value\_type} \).

c\text{.get\_allocator()}

\[ \text{Result: } A \]

**Complexity:** Constant.

\( X \ u; \)
\( X \ u = X(); \)

**Preconditions:** \( A \) meets the \text{Cpp17DefaultConstructible} requirements.

\[ \text{Postconditions: } u\text{.empty()} \text{ returns } \text{true}, u\text{.get\_allocator()} == A(); \]

**Complexity:** Constant.

\( X \ u(m); \)

**Postconditions:** \( u\text{.empty()} \text{ returns } \text{true}, u\text{.get\_allocator()} == m. \)

**Complexity:** Constant.

\( X \ u(t, m); \)

**Preconditions:** \( T \) is \text{Cpp17CopyInsertable} into \( X \).

**Postconditions:** \( u == t, u\text{.get\_allocator()} == m \)

**Complexity:** Linear.

\( X \ u(\text{rv}); \)

**Postconditions:** \( u \) has the same elements as \( \text{rv} \) had before this construction; the value of \( u\text{.get\_-\_allocator()} \) is the same as the value of \( \text{rv\text{.get\_-\_allocator()}} \) before this construction.

**Complexity:** Constant.

\( X \ u(\text{rv}, m); \)

**Preconditions:** \( T \) is \text{Cpp17MoveInsertable} into \( X \).

**Postconditions:** \( u \) has the same elements, or copies of the elements, that \( \text{rv} \) had before this construction, \( u\text{.get\_allocator()} == m. \)

**Complexity:** Constant if \( m == \text{rv\text{.get\_-\_allocator()}} \), otherwise linear.

\( a = t \)

\[ \text{Result: } X\&. \]

**Preconditions:** \( T \) is \text{Cpp17CopyInsertable} into \( X \) and \text{Cpp17CopyAssignble}.

**Postconditions:** \( a == t \text{ is true.} \)

**Complexity:** Linear.

\( a = \text{rv} \)

\[ \text{Result: } X\&. \]

§ 24.2.2.5
Preconditions: If `allocator_traits<allocator_type>::propagate_on_container_move_assignment::value` is false, `T` is Cpp17MoveInsertable into `X` and Cpp17MoveAssignable.

Effects: All existing elements of `a` are either move assigned to or destroyed.

Postconditions: If `a` and `rv` do not refer to the same object, `a` is equal to the value that `rv` had before this assignment.

Complexity: Linear.

```
a.swap(b)
```

Result: void

Effects: Exchanges the contents of `a` and `b`.

Complexity: Constant.

The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type `A` shall not qualify as an allocator unless it meets both of the following conditions:

(34.1) — The qualified-id `A::value_type` is valid and denotes a type (13.10.3).

(34.2) — The expression `declval<A&>().allocate(size_t{})` is well-formed when treated as an unevaluated operand.

### 24.2.3 Container data races

For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be const: `begin`, `end`, `rbegin`, `rend`, `front`, `back`, `data`, `find`, `lower_bound`, `upper_bound`, `equal_range`, `at` and, except in associative or unordered associative containers, `operator[]`.

Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting `vector<bool>`, are modified concurrently.

[Note 1: For a `vector<int>` `x` with a size greater than one, `x[1] = 5` and `*x.begin() = 10` can be executed concurrently without a data race, but `x[0] = 5` and `*x.begin() = 10` executed concurrently can result in a data race. As an exception to the general rule, for a `vector<bool>` `y`, `y[0] = true` can race with `y[1] = true`. — end note]

### 24.2.4 Sequence containers

A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: `vector`, `forward_list`, `list`, and `deque`. In addition, `array` is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as `stacks`, `queues`, `flat_maps`, `flat_multimaps`, `flat_sets`, or `flat_multisets`, out of the basic sequence container kinds (or out of other program-defined sequence containers).

[Note 1: The sequence containers offer the programmer different complexity trade-offs. `vector` is appropriate in most circumstances. `array` has a fixed size known during translation. `list` or `forward_list` support frequent insertions and deletions from the middle of the sequence. `deque` supports efficient insertions and deletions taking place at the beginning or at the end of the sequence. When choosing a container, remember `vector` is best; leave a comment to explain if you choose from the rest! — end note]

In this subclause,

(3.1) — `X` denotes a sequence container class,

(3.2) — `a` denotes a value of type `X` containing elements of type `T`,

(3.3) — `u` denotes the name of a variable being declared,

(3.4) — `A` denotes `X::allocator_type` if the qualified-id `X::allocator_type` is valid and denotes a type (13.10.3) and `allocator<T>` if it doesn’t,

(3.5) — `i` and `j` denote iterators that meet the Cpp17InputIterator requirements and refer to elements implicitly convertible to `value_type`,

(3.6) — `[i, j)` denotes a valid range,
rg denotes a value of a type \( R \) that models container-compatible-range\(<T>\),
il designates an object of type initializer_list\(\text{value_type}\),
n denotes a value of type \( X::\text{size_type} \),
p denotes a valid constant iterator to \( a \),
q denotes a valid dereferenceable constant iterator to \( a \),
\([q_1, q_2) \) denotes a valid range of constant iterators in \( a \),
t denotes an lvalue or a const rvalue of \( X::\text{value_type} \), and
rv denotes a non-const rvalue of \( X::\text{value_type} \).

(3.7) 
(3.8) 
(3.9) 
(3.10) 
(3.11) 
(3.12) 
(3.13) 
(3.14) 
(3.15) 
(3.16)

The complexities of the expressions are sequence dependent.
A type \( X \) meets the sequence container requirements if \( X \) meets the container requirements and the following statements and expressions are well-formed and have the specified semantics.

\[ \text{X u}(n, t); \] 
Preconditions: \( T \) is \text{Cpp17CopyInsertable} into \( X \).
Effects: Constructs a sequence container with \( n \) copies of \( t \).
Postconditions: \( \text{distance(u.begin(), u.end()) == n} \) is true.

\[ \text{X u}(i, j); \] 
Preconditions: \( T \) is \text{Cpp17EmplaceConstructible} into \( X \) from \( \ast i \). For \text{vector}, if the iterator does not meet the \text{Cpp17ForwardIterator} requirements (25.3.5.5), \( T \) is also \text{Cpp17MoveInsertable} into \( X \).
Effects: Constructs a sequence container equal to the range \([i, j)\). Each iterator in the range \([i, j)\) is dereferenced exactly once.
Postconditions: \( \text{distance(u.begin(), u.end()) == distance(i, j)} \) is true.

\[ \text{X(from_range, rg)} \] 
Preconditions: \( T \) is \text{Cpp17EmplaceConstructible} into \( X \) from \( \ast \text{ranges::begin(rg)} \). For \text{vector}, if \( R \) models neither \text{ranges::sized_range} nor \text{ranges::forward_range}, \( T \) is also \text{Cpp17MoveInsertable} into \( X \).
Effects: Constructs a sequence container equal to the range \( \text{rg} \). Each iterator in the range \( \text{rg} \) is dereferenced exactly once.
Postconditions: \( \text{distance(begin(), end()) == ranges::distance(rg)} \) is true.

\[ \text{X(il)} \] 
Effects: Equivalent to \( \text{X(il.begin(), il.end())} \).
a = il
Result: \( X\& \).
Preconditions: \( T \) is \text{Cpp17CopyInsertable} into \( X \) and \text{Cpp17CopyAssignable}.
Effects: Assigns the range \([il.begin(), il.end())\) into \( a \). All existing elements of \( a \) are either assigned to or destroyed.
Returns: \( \ast \text{this} \).
a.emplace(p, args)
Result: iterator.
Preconditions: \( T \) is \text{Cpp17EmplaceConstructible} into \( X \) from \( \text{args} \). For \text{vector} and \text{deque}, \( T \) is also \text{Cpp17MoveInsertable} into \( X \) and \text{Cpp17MoveAssignable}.
Effects: Inserts an object of type \( T \) constructed with \text{std::forward<Args>(args)}\ldots before \( p \).
[Note 2: \( \text{args} \) can directly or indirectly refer to a value in \( a \). — end note]
Returns: An iterator that points to the new element constructed from \texttt{args} into \texttt{a}.

\texttt{a.insert(p, t)}

Result: iterator.

Preconditions: \texttt{T} is \texttt{Cpp17CopyInsertable} into \texttt{X}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17CopyAssignable}.

Effects: Inserts a copy of \texttt{t} before \texttt{p}.

Returns: An iterator that points to the copy of \texttt{t} inserted into \texttt{a}.

\texttt{a.insert(p, rv)}

Result: iterator.

Preconditions: \texttt{T} is \texttt{Cpp17MoveInsertable} into \texttt{X}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17MoveAssignable}.

Effects: Inserts a copy of \texttt{rv} before \texttt{p}.

Returns: An iterator that points to the copy of \texttt{rv} inserted into \texttt{a}.

\texttt{a.insert(p, n, t)}

Result: iterator.

Preconditions: \texttt{T} is \texttt{Cpp17CopyInsertable} into \texttt{X} and \texttt{Cpp17CopyAssignable}.

Effects: Inserts \texttt{n} copies of \texttt{t} before \texttt{p}.

Returns: An iterator that points to the copy of the first element inserted into \texttt{a}, or \texttt{p} if \texttt{n == 0}.

\texttt{a.insert(p, i, j)}

Result: iterator.

Preconditions: \texttt{T} is \texttt{Cpp17EmplaceConstructible} into \texttt{X} from \texttt{*i}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17MoveInsertable} into \texttt{X}, \texttt{Cpp17MoveConstructible}, \texttt{Cpp17MoveAssignable}, and swappable (16.4.4.3). Neither \texttt{i} nor \texttt{j} are iterators into \texttt{a}.

Effects: Inserts copies of elements in \texttt{[i, j)} before \texttt{p}. Each iterator in the range \texttt{[i, j)} shall be dereferenced exactly once.

Returns: An iterator that points to the copy of the first element inserted into \texttt{a}, or \texttt{p} if \texttt{i == j}.

\texttt{a.insert_range(p, rg)}

Result: iterator.

Preconditions: \texttt{T} is \texttt{Cpp17EmplaceConstructible} into \texttt{X} from \texttt{*ranges::begin(rg)}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17MoveInsertable} into \texttt{X}, \texttt{Cpp17MoveConstructible}, \texttt{Cpp17MoveAssignable}, and swappable (16.4.4.3). \texttt{rg} and \texttt{a} do not overlap.

Effects: Inserts copies of elements in \texttt{rg} before \texttt{p}. Each iterator in the range \texttt{rg} is dereferenced exactly once.

Returns: An iterator that points to the copy of the first element inserted into \texttt{a}, or \texttt{p} if \texttt{rg} is empty.

\texttt{a.insert(p, il)}

Effects: Equivalent to \texttt{a.insert(p, il.begin(), il.end())}.

\texttt{a.erase(q)}

Result: iterator.

Preconditions: For \texttt{vector} and \texttt{deque}, \texttt{T} is \texttt{Cpp17MoveAssignable}.

Effects: Erases the element pointed to by \texttt{q}.

Returns: An iterator that points to the element immediately following \texttt{q} prior to the element being erased. If no such element exists, \texttt{a.end()} is returned.

\texttt{a.erase(q1, q2)}

Result: iterator.

Preconditions: For \texttt{vector} and \texttt{deque}, \texttt{T} is \texttt{Cpp17MoveAssignable}.
Effects: Erases the elements in the range \([q_1, q_2)\).

Returns: An iterator that points to the element pointed to by \(q_2\) prior to any elements being erased. If no such element exists, \(a\).end() is returned.

\[ a\).clear() \]

Result: void

Effects: Destroys all elements in \(a\). Invalidates all references, pointers, and iterators referring to the elements of \(a\) and may invalidate the past-the-end iterator.

Postconditions: \(a\).empty() is true.

Complexity: Linear.

\[ a\).assign(i, j) \]

Result: void

Preconditions: \(T\) is \(\text{Cpp17EmplaceConstructible}\) into \(X\) from \(*i\) and assignable from \(*i\). For \(\text{vector}\), if the iterator does not meet the forward iterator requirements (25.3.5.5), \(T\) is also \(\text{Cpp17MoveInsertable}\) into \(X\). Neither \(i\) nor \(j\) are iterators into \(a\).

Effects: Replaces elements in \(a\) with a copy of \([i, j)\). Invalidates all references, pointers and iterators referring to the elements of \(a\). For \(\text{vector}\) and \(\text{deque}\), also invalidates the past-the-end iterator. Each iterator in the range \([i, j)\) is dereferenced exactly once.

\[ a\).assign_range(rg) \]

Result: void

Mandates: assignable_from\(<T&, \text{ranges::range_reference_t}<R>>\) is modeled.

Preconditions: \(T\) is \(\text{Cpp17EmplaceConstructible}\) into \(X\) from \(*\text{ranges::begin}(rg)\). For \(\text{vector}\), if \(R\) models neither \(\text{ranges::sized_range}\) nor \(\text{ranges::forward_range}\), \(T\) is also \(\text{Cpp17MoveInsertable}\) into \(X\). \(rg\) and \(a\) do not overlap.

Effects: Replaces elements in \(a\) with a copy of each element in \(rg\). Invalidates all references, pointers, and iterators referring to the elements of \(a\). For \(\text{vector}\) and \(\text{deque}\), also invalidates the past-the-end iterator. Each iterator in the range \(rg\) is dereferenced exactly once.

\[ a\).assign(il) \]

Effects: Equivalent to \(a\).assign(il.begin(), il.end()).

\[ a\).assign(n, t) \]

Result: void

Preconditions: \(T\) is \(\text{Cpp17CopyInsertable}\) into \(X\) and \(\text{Cpp17CopyAssignable}\). \(t\) is not a reference into \(a\).

Effects: Replaces elements in \(a\) with \(n\) copies of \(t\). Invalidates all references, pointers and iterators referring to the elements of \(a\). For \(\text{vector}\) and \(\text{deque}\), also invalidates the past-the-end iterator.

For every sequence container defined in this Clause and in Clause 23:

(68.1) If the constructor

\[
\text{template<\text{class InputIterator}>}
X(\text{InputIterator first, InputIterator last,}
\text{\text{const allocator_type } alloc = allocator_type()});
\]

is called with a type \(\text{InputIterator}\) that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(68.2) If the member functions of the forms:

\[
\text{template<\text{class InputIterator}>}
\text{return-type } F(\text{const_iterator } p, 
\text{\text{InputIterator first, InputIterator last}); } \quad // \text{such as insert}
\]

\[
\text{template<\text{class InputIterator}>}
\text{return-type } F(\text{InputIterator first, InputIterator last}); \quad // \text{such as append, assign}
\]
template<class InputIterator>
    return-type F(const_iterator i1, const_iterator i2, 
    InputIterator first, InputIterator last);    // such as replace

(68.3) A deduction guide for a sequence container shall not participate in overload resolution if it has a 
InputIterator template parameter and a type that does not qualify as an input iterator is deduced 
for that parameter, or if it has an Allocator template parameter and a type that does not qualify as an 
allocator is deduced for that parameter.

The following operations are provided for some types of sequence containers but not others. An implementation 
shall implement them so as to take amortized constant time.

a.front()
  Result: reference; const_reference for constant a.
  Returns: *a.begin()
  Remarks: Required for basic_string, array, deque, forward_list, list, and vector.

a.back()
  Result: reference; const_reference for constant a.
  Effects: Equivalent to:
  auto tmp = a.end();
  --tmp;
  return *tmp;
  Remarks: Required for basic_string, array, deque, list, and vector.

aemplace_front(args)
  Result: reference
  Preconditions: T is Cpp17EmplaceConstructible into X from args.
  Effects: Prepends an object of type T constructed with std::forward<Args>(args)....
  Returns: a.front().
  Remarks: Required for deque, forward_list, and list.

aemplace_back(args)
  Result: reference
  Preconditions: T is Cpp17EmplaceConstructible into X from args. For vector, T is also Cpp17MoveIn-
sertable into X.
  Effects: Appends an object of type T constructed with std::forward<Args>(args)....
  Returns: a.back().
  Remarks: Required for deque, list, and vector.

a.push_front(t)
  Result: void
  Preconditions: T is Cpp17CopyInsertable into X.
  Effects: Prepends a copy of t.
  Remarks: Required for deque, forward_list, and list.

a.push_front(rv)
  Result: void
  Preconditions: T is Cpp17MoveInsertable into X.
  Effects: Prepends a copy of rv.
  Remarks: Required for deque, forward_list, and list.
a.prepend_range(rg)

Result: void

Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg).

Effects: Inserts copies of elements in rg before begin(). Each iterator in the range rg is dereferenced exactly once.

[Note 3: The order of elements in rg is not reversed. — end note]

Remarks: Required for deque, forward_list, and list.

a.push_back(t)

Result: void

Preconditions: T is Cpp17CopyInsertable into X.

Effects: Appends a copy of t.

Remarks: Required for basic_string, deque, list, and vector.

a.push_back(rv)

Result: void

Preconditions: T is Cpp17MoveInsertable into X.

Effects: Appends a copy of rv.

Remarks: Required for basic_string, deque, list, and vector.

a.append_range(rg)

Result: void

Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For vector, T is also Cpp17MoveInsertable into X.

Effects: Inserts copies of elements in rg before end(). Each iterator in the range rg is dereferenced exactly once.

Remarks: Required for deque, list, and vector.

a.pop_front()

Result: void

Preconditions: a.empty() is false.

Effects: Destroys the first element.

Remarks: Required for deque, forward_list, and list.

a.pop_back()

Result: void

Preconditions: a.empty() is false.

Effects: Destroys the last element.

Remarks: Required for basic_string, deque, list, and vector.

a[n]

Result: reference; const_reference for constant a

Returns: *(a.begin() + n)

Remarks: Required for basic_string, array, deque, and vector.

a.at(n)

Result: reference; const_reference for constant a

Returns: *(a.begin() + n)

Throws: out_of_range if n >= a.size().

Remarks: Required for basic_string, array, deque, and vector.
24.2.5 Node handles

24.2.5.1 Overview

A node handle is an object that accepts ownership of a single element from an associative container (24.2.7) or an unordered associative container (24.2.8). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 84.

Table 84: Container types with compatible nodes

<table>
<thead>
<tr>
<th>Container Type</th>
<th>Container Type</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>map&lt;K, T, C1, A&gt;</code></td>
<td><code>map&lt;K, T, C2, A&gt;</code></td>
</tr>

</tbody>
</table>

2 If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

3 Class node-handle is for exposition only.

4 If a user-defined specialization of pair exists for `pair<const Key, T>` or `pair<Key, T>`, where Key is the container’s key_type and T is the container’s mapped_type, the behavior of operations involving node handles is undefined.

```cpp
template<unspecified>
class node-handle {
public:
  // These type declarations are described in 24.2.7 and 24.2.8.
  using value_type = see below; // not present for map containers
  using key_type = see below; // not present for set containers
  using mapped_type = see below; // not present for set containers
  using allocator_type = see below;

private:
  using container_node_type = unspecified; // exposition only
  using ator_traits = allocator_traits<allocator_type>; // exposition only

  typename ator_traits::template rebind_traits<container_node_type>::pointer ptr_; // exposition only
  optional<allocator_type> alloc_; // exposition only

public:
  // 24.2.5.2, constructors, copy, and assignment
  constexpr node-handle() noexcept : ptr_(), alloc_() {}
  node-handle(node-handle&&) noexcept;
  node-handle& operator=(node-handle&&);

  // 24.2.5.3, destructor
  ~node-handle();

  allocator_type get_allocator() const;
  explicit operator bool() const noexcept;
  [[nodiscard]] bool empty() const noexcept;
};
```

§ 24.2.5.1
24.2.5.5, modifiers

```c++
void swap(node-handle&);
```

```cpp
friend void swap(node-handle x, node-handle y) noexcept(noexcept(x.swap(y))) {
   x.swap(y);
}
```

24.2.5.2 Constructors, copy, and assignment

```cpp
node-handle(node-handle&& nh) noexcept;
```  
**Effects:** Constructs a `node-handle` object initializing `ptr_` with `nh.ptr_`. Move constructs `alloc_` with `nh.alloc_`. Assigns `nullptr` to `nh.ptr_` and assigns `nullopt` to `nh.alloc_`.

```cpp
node-handle& operator=(node-handle&& nh);
```  
**Preconditions:** Either `!alloc_`, or `ator_traits::propagate_on_container_move_assignment::value` is `true`, or `alloc_ == nh.alloc_`.

**Effects:**

1. If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::template rebind_traits<container_node_type>::deallocate`.

2. Assigns `nh.ptr_` to `ptr_`.

3. If `!alloc_` or `ator_traits::propagate_on_container_move_assignment::value` is `true`, move assigns `nh.alloc_` to `alloc_`.

4. Returns: `*this`.

5. Throws: Nothing.

24.2.5.3 Destructor

```cpp
~node-handle();
```  
**Effects:** If `ptr_ != nullptr`, destroys the `value_type` subobject in the `container_node_type` object pointed to by `ptr_` by calling `ator_traits::destroy`, then deallocates `ptr_` by calling `ator_traits::template rebind_traits<container_node_type>::deallocate`.

24.2.5.4 Observers

```cpp
value_type& value() const;
```  
**Preconditions:** `empty() == false`.

**Returns:** A reference to the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

**Throws:** Nothing.

```cpp
key_type& key() const;
```  
**Preconditions:** `empty() == false`.

**Returns:** A non-const reference to the `key_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.

**Throws:** Nothing.

**Remarks:** Modifying the key through the returned reference is permitted.

```cpp
mapped_type& mapped() const;
```  
**Preconditions:** `empty() == false`.

**Returns:** A reference to the `mapped_type` member of the `value_type` subobject in the `container_node_type` object pointed to by `ptr_`.
Throws: Nothing.

allocator_type get_allocator() const;

Preconditions: empty() == false.

Returns: *alloc_.

Throws: Nothing.

explicit operator bool() const noexcept;

Returns: ptr_ != nullptr.

[[nodiscard]] bool empty() const noexcept;

Returns: ptr_ == nullptr.

24.2.5.5 Modifiers

void swap(node-handle& nh)

nothrow(ator_traits::propagate_on_container_swap::value ||

ator_traits::is_always_equal::value);

Preconditions: !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value

is true, or alloc_ == nh.alloc_.

Effects: Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value is true calls swap(alloc_, nh.alloc_).

24.2.6 Insert return type

The associative containers with unique keys and the unordered containers with unique keys have a member function insert that returns a nested type insert_return_type. That return type is a specialization of the template specified in this subclause.

template<class Iterator, class NodeType>

struct insert-return-type

{

Iterator position;

bool inserted;

NodeType node;

};

The name insert-return-type is exposition only. insert-return-type has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

24.2.7 Associative containers

24.2.7.1 General

Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: set, multiset, map and multimap. The library also provides container adaptors that make it easy to construct abstract data types, such as flat_maps, flat_multimaps, flat_sets, or flat_multisets, out of the basic sequence container kinds (or out of other program-defined sequence containers).

Each associative container is parameterized on Key and an ordering relation Compare that induces a strict weak ordering (27.8) on elements of Key. In addition, map and multimap associate an arbitrary mapped type T with the Key. The object of type Compare is called the comparison object of a container.

The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys k1 and k2 are considered to be equivalent if for the comparison object comp, comp(k1, k2) == false & & comp(k2, k1) == false.

[Note 1: This is not necessarily the same as the result of k1 == k2. — end note]

For any two keys k1 and k2 in the same container, calling comp(k1, k2) shall always return the same value.

An associative container supports unique keys if it may contain at most one element for each key. Otherwise, it supports equivalent keys. The set and map classes support unique keys; the multiset and multimap
classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

5 For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<`const` Key, `T`>.

6 `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[Note 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. —end note]

7 In this subclause,

(7.1) — `X` denotes an associative container class,

(7.2) — `a` denotes a value of type `X`,

(7.3) — `a2` denotes a value of a type with nodes compatible with type `X` (Table 84),

(7.4) — `b` denotes a possibly `const` value of type `X`,

(7.5) — `u` denotes the name of a variable being declared,

(7.6) — `a_uniq` denotes a value of type `X` when `X` supports unique keys,

(7.7) — `a_eq` denotes a value of type `X` when `X` supports multiple keys,

(7.8) — `a_tran` denotes a possibly `const` value of type `X` when the qualified-id `X::key_compare::is_transparent` is valid and denotes a type (13.10.3),

(7.9) — `i` and `j` meet the `Cpp17InputIterator` requirements and refer to elements implicitly convertible to `value_type`,

(7.10) — `[i, j)` denotes a valid range,

(7.11) — `rg` denotes a value of a type `R` that models `container-compatible-range`<value_type>,

(7.12) — `p` denotes a valid constant iterator to `a`,

(7.13) — `q` denotes a valid dereferenceable constant iterator to `a`,

(7.14) — `r` denotes a valid dereferenceable iterator to `a`,

(7.15) — `[q1, q2)` denotes a valid range of constant iterators in `a`,

(7.16) — `il` designates an object of type `initializer_list<value_type>`,

(7.17) — `t` denotes a value of type `X::value_type`,

(7.18) — `k` denotes a value of type `X::key_type`, and

(7.19) — `c` denotes a possibly `const` value of type `X::key_compare`;

(7.20) — `kl` is a value such that `a` is partitioned (27.8) with respect to `c(x, kl)`, with `x` the key value of `e` and `e` in `a`;

(7.21) — `ku` is a value such that `a` is partitioned with respect to `!c(ku, x)`, with `x` the key value of `e` and `e` in `a`;

(7.22) — `ke` is a value such that `a` is partitioned with respect to `c(x, ke)` and `!c(ke, x)`, with `c(x, ke)` implying `!c(ke, x)` and with `x` the key value of `e` and `e` in `a`;

(7.23) — `kx` is a value such that

(7.23.1) — `a` is partitioned with respect to `c(x, kx)` and `!c(kx, x)`, with `c(x, kx)` implying `!c(kx, x)` and with `x` the key value of `e` and `e` in `a`, and

(7.23.2) — `kx` is not convertible to either `iterator` or `const_iterator`; and

(7.24) — `A` denotes the storage allocator used by `X`, if any, or `allocator<X::value_type>` otherwise,

(7.25) — `m` denotes an allocator of a type convertible to `A`, and `nh` denotes a non-const rvalue of type `X::node_type`.

8 A type `X` meets the `associative_container` requirements if `X` meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the

§ 24.2.7.1
specified semantics, except that for \texttt{map} and \texttt{multimap}, the requirements placed on \texttt{value\_type} in \ref{item:24.2.5} apply instead to \texttt{key\_type} and \texttt{mapped\_type}.

\[\text{Note 3: For example, in some cases \texttt{key\_type} and \texttt{mapped\_type} are required to be Cpp17CopyAssign\_\texttt{Assignable} even though the associated \texttt{value\_type}, \texttt{pair<const\ key\_type,\ mapped\_type>}, is not Cpp17CopyAssign\_\texttt{Assignable}. — end note}\]

\begin{verbatim}
typename X::key\_type
  Result: Key.
typename X::mapped\_type
  Result: T.
  Remarks: For \texttt{map} and \texttt{multimap} only.
typename X::value\_type
  Result: Key for \texttt{set} and \texttt{multiset} only; \texttt{pair<const\ Key,\ T>} for \texttt{map} and \texttt{multimap} only.
  Preconditions: \texttt{X::value\_type} is Cpp17Eras\_\texttt{able} from \texttt{X}.
typename X::key\_compare
  Result: Compare.
  Preconditions: \texttt{key\_compare} is Cpp17CopyConstructible.
typename X::value\_compare
  Result: A binary predicate type. It is the same as \texttt{key\_compare} for \texttt{set} and \texttt{multiset}; is an ordering relation on pairs induced by the first component (i.e., Key) for \texttt{map} and \texttt{multimap}.
typename X::node\_type
  Result: A specialization of the \texttt{node\_handle} class template (\ref{item:24.2.5}), such that the public nested types are the same types as the corresponding types in \texttt{X}.
X(c)
  Effects: Constructs an empty container. Uses a copy of \texttt{c} as a comparison object.
  Complexity: Constant.
X u = X();
X u;
  Preconditions: \texttt{key\_compare} meets the Cpp17DefaultConstructible requirements.
  Effects: Constructs an empty container. Uses \texttt{Compare()} as a comparison object.
  Complexity: Constant.
X(i, j, c)
  Preconditions: \texttt{value\_type} is Cpp17EmplaceConstructible into \texttt{X} from \texttt{*i}.
  Effects: Constructs an empty container and inserts elements from the range \texttt{[i, j]} into it; uses \texttt{c} as a comparison object.
  Complexity: \(N\log N\) in general, where \(N\) has the value \texttt{distance(i, j)}; linear if \texttt{[i, j]} is sorted with respect to \texttt{value\_comp()}.
X(i, j)
  Preconditions: \texttt{key\_compare} meets the Cpp17DefaultConstructible requirements. \texttt{value\_type} is Cpp17EmplaceConstructible into \texttt{X} from \texttt{*i}.
  Effects: Constructs an empty container and inserts elements from the range \texttt{[i, j]} into it; uses \texttt{Compare()} as a comparison object.
  Complexity: \(N\log N\) in general, where \(N\) has the value \texttt{distance(i, j)}; linear if \texttt{[i, j]} is sorted with respect to \texttt{value\_comp()}.
X(from_range, rg, c)
  Preconditions: \texttt{value\_type} is Cpp17EmplaceConstructible into \texttt{X} from \texttt{\*range::begin(rg)}.
\end{verbatim}
Effects: Constructs an empty container and inserts each element from \( \text{rg} \) into it. Uses \( c \) as the comparison object.

Complexity: \( N \log N \) in general, where \( N \) has the value \( \text{ranges}::\text{distance}(\text{rg}) \); linear if \( \text{rg} \) is sorted with respect to \( \text{value\_comp()} \).

\( X(\text{from\_range}, \text{rg}) \)

Preconditions: \( \text{key\_compare} \) meets the \( \text{Cpp17DefaultConstructible} \) requirements. \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \text{ranges}::\text{begin}(\text{rg}) \).

Effects: Constructs an empty container and inserts each element from \( \text{rg} \) into it. Uses \( \text{Compare()} \) as the comparison object.

Complexity: Same as \( X(\text{from\_range}, \text{rg}, c) \).

\( X(\text{il}, c) \)

Effects: Equivalent to \( X(\text{il}\cdot\text{begin}(), \text{il}\cdot\text{end}(), c) \).

\( X(\text{il}) \)

Effects: Equivalent to \( X(\text{il}\cdot\text{begin}(), \text{il}\cdot\text{end}()) \).

\( a = \text{il} \)

Result: \( X \& \)

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17CopyInsertable} \) into \( X \) and \( \text{Cpp17CopyAssignable} \).

Effects: Assigns the range \( [\text{il}\cdot\text{begin}(), \text{il}\cdot\text{end}()) \) into \( a \). All existing elements of \( a \) are either assigned or destroyed.

Complexity: \( N \log N \) in general, where \( N \) has the value \( \text{il}\cdot\text{size}() + a\cdot\text{size}() \); linear if \( [\text{il}\cdot\text{begin}(), \text{il}\cdot\text{end}()) \) is sorted with respect to \( \text{value\_comp()} \).

\( b\cdot\text{key\_comp}() \)

Result: \( X\cdot\text{key\_compare} \)

Returns: The comparison object out of which \( b \) was constructed.

Complexity: Constant.

\( b\cdot\text{value\_comp}() \)

Result: \( X\cdot\text{value\_compare} \)

Returns: An object of \( \text{value\_compare} \) constructed out of the comparison object.

Complexity: Constant.

\( a\_\text{uniq}\cdot\text{emplace}(\text{args}) \)

Result: \( \text{pair<iterator, bool>} \)

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \text{args} \).

Effects: Inserts a \( \text{value\_type} \) object \( t \) constructed with \( \text{std}\::\text{forward}<\text{Args}>(\text{args})... \) if and only if there is no element in the container with key equivalent to the key of \( t \).

Returns: The \( \text{bool} \) component of the returned pair is \text{true} if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of \( t \).

Complexity: Logarithmic.

\( a\_\text{eq}\cdot\text{emplace}(\text{args}) \)

Result: \( \text{iterator} \)

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \text{args} \).

Effects: Inserts a \( \text{value\_type} \) object \( t \) constructed with \( \text{std}\::\text{forward}<\text{Args}>(\text{args})... \) . If a range containing elements equivalent to \( t \) exists in \( a\_\text{eq} \), \( t \) is inserted at the end of that range.

Returns: An iterator pointing to the newly inserted element.

Complexity: Logarithmic.
\texttt{a.emplace\_hint(p, \textbf{args})}

\textit{Result: iterator}

\textit{Effects}: Equivalent to \texttt{a.emplace(std::forward<Args>(\textbf{args})...)}, except that the element is inserted as close as possible to the position just prior to \texttt{p}.

\textit{Returns}: An iterator pointing to the element with the key equivalent to the newly inserted element.

\textit{Complexity}: Logarithmic in general, but amortized constant if the element is inserted right before \texttt{p}.

\texttt{a\_uniq.insert(\textbf{t})}

\textit{Result: pair<iterator, \textbf{bool}>}

\textit{Preconditions}: If \textbf{t} is a non-const rvalue, \textit{value\_type} is \textit{Cpp17MoveInsertable} into \textit{X}; otherwise, \textit{value\_type} is \textit{Cpp17CopyInsertable} into \textit{X}.

\textit{Effects}: Inserts \textbf{t} if and only if there is no element in the container with key equivalent to the key of \textbf{t}.

\textit{Returns}: The \textbf{bool} component of the returned pair is \textbf{true} if and only if the insertion takes place, and the \textit{iterator} component of the pair points to the element with key equivalent to the key of \textbf{t}.

\textit{Complexity}: Logarithmic.

\texttt{a\_eq.insert(\textbf{t})}

\textit{Result: iterator}

\textit{Preconditions}: If \textbf{t} is a non-const rvalue, \textit{value\_type} is \textit{Cpp17MoveInsertable} into \textit{X}; otherwise, \textit{value\_type} is \textit{Cpp17CopyInsertable} into \textit{X}.

\textit{Effects}: Inserts \textbf{t} and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to \textbf{t} exists in \texttt{a\_eq}, \textbf{t} is inserted at the end of that range.

\textit{Complexity}: Logarithmic.

\texttt{a.insert(p, \textbf{t})}

\textit{Result: iterator}

\textit{Preconditions}: If \textbf{t} is a non-const rvalue, \textit{value\_type} is \textit{Cpp17MoveInsertable} into \textit{X}; otherwise, \textit{value\_type} is \textit{Cpp17CopyInsertable} into \textit{X}.

\textit{Effects}: Inserts \textbf{t} if and only if there is no element with key equivalent to the key of \textbf{t} in containers with unique keys; always inserts \textbf{t} in containers with equivalent keys. \textbf{t} is inserted as close as possible to the position just prior to \texttt{p}.

\textit{Returns}: An iterator pointing to the element with key equivalent to the key of \textbf{t}.

\textit{Complexity}: Logarithmic in general, but amortized constant if \textbf{t} is inserted right before \texttt{p}.

\texttt{a.insert(i, \textbf{j})}

\textit{Result: void}

\textit{Preconditions}: \textit{value\_type} is \textit{Cpp17EmplaceConstructible} into \textit{X} from *\textbf{i}. Neither \textbf{i} nor \textbf{j} are iterators into \texttt{a}.

\textit{Effects}: Inserts each element from the range [\textbf{i}, \textbf{j}) if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

\textit{Complexity}: $N\log(a.size() + N)$, where \textit{N} has the value \textit{distance}(\textbf{i}, \textbf{j})

\texttt{a.insert\_range(\textbf{rg})}

\textit{Result: void}

\textit{Preconditions}: \textit{value\_type} is \textit{Cpp17EmplaceConstructible} into \textit{X} from *\texttt{ranges::begin(\textbf{rg})}. \textbf{rg} and \texttt{a} do not overlap.

\textit{Effects}: Inserts each element from \textbf{rg} if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

\textit{Complexity}: $N\log(a.size() + N)$, where \textit{N} has the value \texttt{ranges::distance(\textbf{rg})}.

\section{24.2.7.1}

\textbf{N4917}
a.insert(il)

   Effects: Equivalent to a.insert(il.begin(), il.end()).

a_uniq.insert(nh)

   Result: insert_return_type
   Preconditions: nh is empty or a_uniq.get_allocator() == nh.get_allocator() is true.
   Effects: If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to nh.key().
   Returns: If nh is empty, inserted is false, position is end(), and node is empty. Otherwise if the insertion took place, inserted is true, position points to the inserted element, and node is empty; if the insertion failed, inserted is false, node has the previous value of nh, and position points to an element with a key equivalent to nh.key().
   Complexity: Logarithmic.

a_eq.insert(nh)

   Result: iterator
   Preconditions: nh is empty or a_eq.get_allocator() == nh.get_allocator() is true.
   Effects: If nh is empty, has no effect and returns a_eq.end(). Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to nh.key() exists in a_eq, the element is inserted at the end of that range.
   Postconditions: nh is empty.
   Complexity: Logarithmic.

a.insert(p, nh)

   Result: iterator
   Preconditions: nh is empty or a.get_allocator() == nh.get_allocator() is true.
   Effects: If nh is empty, has no effect and returns a.end(). Otherwise, inserts the element owned by nh if and only if there is no element with key equivalent to nh.key() in containers with unique keys; always inserts the element owned by nh in containers with equivalent keys. The element is inserted as close as possible to the position just prior to p.
   Postconditions: nh is empty if insertion succeeds, unchanged if insertion fails.
   Returns: An iterator pointing to the element with key equivalent to nh.key().
   Complexity: Logarithmic in general, but amortized constant if the element is inserted right before p.

a.extract(k)

   Result: node_type
   Effects: Removes the first element in the container with key equivalent to k.
   Returns: A node_type owning the element if found, otherwise an empty node_type.
   Complexity: log(a.size())

a_tran.extract(kx)

   Result: node_type
   Effects: Removes the first element in the container with key r such that !c(r, kx) && !c(kx, r) is true.
   Returns: A node_type owning the element if found, otherwise an empty node_type.
   Complexity: log(a_tran.size())

a.extract(q)

   Result: node_type
   Effects: Removes the element pointed to by q.
   Returns: A node_type owning that element.
Complexity: Amortized constant.

a.merge(a2)

Result: void

Preconditions: a.get_allocator() == a2.get_allocator().

Effects: Attempts to extract each element in a2 and insert it into a using the comparison object of a. In containers with unique keys, if there is an element in a with key equivalent to the key of an element from a2, then that element is not extracted from a2.

Postconditions: Pointers and references to the transferred elements of a2 refer to those same elements but as members of a. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into a, not into a2.

Throws: Nothing unless the comparison object throws.

Complexity: \( N \log(a.size() + N) \), where \( N \) has the value a2.size().

a.erase(k)

Result: size_type

Effects: Erases all elements in the container with key equivalent to k.

Returns: The number of erased elements.

Complexity: \( \log(a.size()) + a.count(k) \)

a_tran.erase(kx)

Result: size_type

Effects: Erases all elements in the container with key r such that \( !c(r, kx) \) && \( !c(kx, r) \) is true.

Returns: The number of erased elements.

Complexity: \( \log(a_tran.size()) + a_tran.count(kx) \)

a.erase(q)

Result: iterator

Effects: Erases the element pointed to by q.

Returns: An iterator pointing to the element immediately following q prior to the element being erased. If no such element exists, returns a.end().

Complexity: Amortized constant.

a.erase(r)

Result: iterator

Effects: Erases the element pointed to by r.

Returns: An iterator pointing to the element immediately following r prior to the element being erased. If no such element exists, returns a.end().

Complexity: Amortized constant.

a.erase(q1, q2)

Result: iterator

Effects: Erases all the elements in the range [q1, q2).

Returns: An iterator pointing to the element pointed to by q2 prior to any elements being erased. If no such element exists, a.end() is returned.

Complexity: \( \log(a.size()) + N \), where \( N \) has the value distance(q1, q2).

a.clear()

Effects: Equivalent to a.erase(a.begin(), a.end()).

Postconditions: a.empty() is true.

Complexity: Linear in a.size().

§ 24.2.7.1
b.find(k)

Result: iterator; const_iterator for constant b.

Returns: An iterator pointing to an element with the key equivalent to k, or b.end() if such an element is not found.

Complexity: Logarithmic.

a_trans.find(ke)

Result: iterator; const_iterator for constant a_trans.

Returns: An iterator pointing to an element with key r such that !c(r, ke) && !c(ke, r) is true, or a_trans.end() if such an element is not found.

Complexity: Logarithmic.

b.count(k)

Result: size_type

Returns: The number of elements with key equivalent to k.

Complexity: log(b.size()) + b.count(k)

a_trans.count(ke)

Result: size_type

Returns: The number of elements with key r such that !c(r, ke) && !c(ke, r).

Complexity: log(a_trans.size()) + a_trans.count(ke)

b.contains(k)

Result: bool

Effects: Equivalent to: return b.find(k) != b.end();

a_trans.contains(ke)

Result: bool

Effects: Equivalent to: return a_trans.find(ke) != a_trans.end();

b.lower_bound(k)

Result: iterator; const_iterator for constant b.

Returns: An iterator pointing to the first element with key not less than k, or b.end() if such an element is not found.

Complexity: Logarithmic.

a_trans.lower_bound(kl)

Result: iterator; const_iterator for constant a_trans.

Returns: An iterator pointing to the first element with key r such that !c(r, kl), or a_trans.end() if such an element is not found.

Complexity: Logarithmic.

b.upper_bound(k)

Result: iterator; const_iterator for constant b.

Returns: An iterator pointing to the first element with key greater than k, or b.end() if such an element is not found.

Complexity: Logarithmic.

a_trans.upper_bound(ku)

Result: iterator; const_iterator for constant a_trans.

Returns: An iterator pointing to the first element with key r such that c(ku, r), or a_trans.end() if such an element is not found.
Complexity: Logarithmic.

b.equal_range(k)

Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant b.

Effects: Equivalent to: return make_pair(b.lower_bound(k), b.upper_bound(k));

Complexity: Logarithmic.

a_tran.equal_range(ke)

Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant a_tran.

Effects: Equivalent to: return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));

Complexity: Logarithmic.

The insert, insert_range, and emplace members shall not affect the validity of iterators and references to the container, and the erase members shall invalidate only iterators and references to the erased elements.

The extract members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a node_type is undefined behavior. References and pointers to an element obtained while it is owned by a node_type are invalidated if the element is successfully inserted.

The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators \( i \) and \( j \) such that distance from \( i \) to \( j \) is positive, the following condition holds:

\[
value\_comp(*j, *i) == false
\]

For associative containers with unique keys the stronger condition holds:

\[
value\_comp(*i, *j) != false
\]

When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

The member function templates find, count, contains, lower_bound, upper_bound, equal_range, erase, and extract shall not participate in overload resolution unless the qualified-id Compare::is_transparent is valid and denotes a type (13.10.3). Additionally, the member function templates extract and erase shall not participate in overload resolution if is_convertible_v<K&&, iterator> || is_convertible_v<K&&, const_iterator> is true, where K is the type substituted as the first template argument.

A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

1. It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
2. It has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.
3. It has a Compare template parameter and a type that qualifies as an allocator is deduced for that parameter.

24.2.7.2 Exception safety guarantees

For associative containers, no clear() function throws an exception. erase(k) does not throw an exception unless that exception is thrown by the container’s Compare object (if any).

For associative containers, if an exception is thrown by any operation from within an insert or emplace function inserting a single element, the insertion has no effect.

For associative containers, no swap function throws an exception unless that exception is thrown by the swap of the container’s Compare object (if any).
24.2.8 Unordered associative containers

24.2.8.1 General

Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: unordered_set, unordered_map, unordered_multiset, and unordered_multimap.

Unordered associative containers conform to the requirements for Containers (24.2), except that the expressions a == b and a != b have different semantics than for the other container types.

Each unordered associative container is parameterized by Key, by a function object type Hash that meets the Cpp17Hash requirements (16.4.4.5) and acts as a hash function for argument values of type Key, and by a binary predicate Pred that induces an equivalence relation on values of type Key. Additionally, unordered_map and unordered_multimap associate an arbitrary mapped type T with the Key.

The container’s object of type Hash — denoted by hash — is called the hash function of the container. The container’s object of type Pred — denoted by pred — is called the key equality predicate of the container.

Two values k1 and k2 are considered equivalent if the container’s key equality predicate pred(k1, k2) is valid and returns true when passed those values. If k1 and k2 are equivalent, the container’s hash function shall return the same value for both.

[Note 1: Thus, when an unordered associative container is instantiated with a non-default Pred parameter it usually needs a non-default Hash parameter as well. — end note]

For any two keys k1 and k2 in the same container, calling pred(k1, k2) shall always return the same value. For any key k in a container, calling hash(k) shall always return the same value.

An unordered associative container supports unique keys if it may contain at most one element for each key. Otherwise, it supports equivalent keys. unordered_set and unordered_map support unique keys. unordered_multiset and unordered_multimap support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into equivalent-key groups such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

For unordered_set and unordered_multiset the value type is the same as the key type. For unordered_map and unordered_multimap it is pair<const Key, T>.

For unordered containers where the value type is the same as the key type, both iterator and const_iterator are constant iterators. It is unspecified whether or not iterator and const_iterator are the same type.

[Note 2: iterator and const_iterator have identical semantics in this case, and iterator is convertible to const_iterator. Users can avoid violating the one-definition rule by always using const_iterator in their function parameter lists. — end note]

The elements of an unordered associative container are organized into buckets. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For unordered_multiset and unordered_multimap, rehashing preserves the relative ordering of equivalent elements.

In this subclause,

(10.1) X denotes an unordered associative container class,
(10.2) a denotes a value of type X,
(10.3) a2 denotes a value of a type with nodes compatible with type X (Table 84),
(10.4) b denotes a possibly const value of type X,
(10.5) a_uniq denotes a value of type X when X supports unique keys,
(10.6) a_eq denotes a value of type X when X supports equivalent keys,
(10.7) a_tran denotes a possibly const value of type X when the qualified-ids X::key_equal::is_transparent and X::hasher::is_transparent are both valid and denote types (13.10.3),
— i and j denote input iterators that refer to value_type,
— [i, j) denotes a valid range,
— rg denotes a value of a type R that models \texttt{container-compatible-range
<\textit{value_type}>},
— p and q2 denote valid constant iterators to a,
— q and q1 denote valid dereferenceable constant iterators to a,
— r denotes a valid dereferenceable iterator to a,
— [q1, q2) denotes a valid range in a,
— il denotes a value of type \texttt{initializer_list<value_type>},
— t denotes a value of type X::value_type,
— k denotes a value of type key_type,
— hf denotes a possibly const value of type hasher,
— eq denotes a possibly const value of type key_equal,
— ke is a value such that
  — eq(r1, ke) == eq(ke, r1),
  — hf(r1) == hf(ke) if eq(r1, ke) is true, and
  — (eq(r1, ke) && eq(r1, r2)) == eq(r2, ke),
where r1 and r2 are keys of elements in a_tran,
— kx is a value such that
  — eq(r1, kx) == eq(kx, r1),
  — hf(r1) == hf(kx) if eq(r1, kx) is true,
  — (eq(r1, kx) && eq(r1, r2)) == eq(r2, kx), and
  — kx is not convertible to either iterator or const_iterator,
where r1 and r2 are keys of elements in a_tran,
— n denotes a value of type size_type,
— z denotes a value of type float, and
— nh denotes a non-const rvalue of type X::node_type.

A type X meets the unordered associative container requirements if X meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for unordered_map and unordered_multimap, the requirements placed on value_type in 24.2.2.5 apply instead to key_type and mapped_type.

[Note 3: For example, key_type and mapped_type are sometimes required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. — end note]

typename X::key_type
Result: Key.
typename X::mapped_type
Result: T.
Remarks: For unordered_map and unordered_multimap only.
typename X::value_type
Result: Key for unordered_set and unordered_multiset only; pair<const Key, T> for unordered_map and unordered_multimap only.
Preconditions: value_type is Cpp17Erasable from X.
typename X::hasher
Result: Hash.
Preconditions: Hash is a unary function object type such that the expression hf(k) has type size_t.
typedef X::key_equal

    Result: Pred.

Preconditions: Pred meets the Cpp17CopyConstructible requirements. Pred is a binary predicate that takes two arguments of type Key. Pred is an equivalence relation.

typedef X::local_iterator

    Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::iterator's.

    [Note 4: A local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typedef X::const_local_iterator

    Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::const_iterator's.

    [Note 5: A const_local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typedef X::node_type

    Result: A specialization of a node-handle class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(n, hf, eq)

    Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate.

    Complexity: $\Theta(n)$

X(n, hf)

    Preconditions: key_equal meets the Cpp17DefaultConstructible requirements.

    Effects: Constructs an empty container with at least n buckets, using hf as the hash function and key_equal() as the key equality predicate.

    Complexity: $\Theta(n)$

X(n)

    Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

    Effects: Constructs an empty container with at least n buckets, using hasher() as the hash function and key_equal() as the key equality predicate.

    Complexity: $\Theta(n)$

X a = X();
X a;

    Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

    Effects: Constructs an empty container with an unspecified number of buckets, using hasher() as the hash function and key_equal() as the key equality predicate.

    Complexity: Constant.

X(i, j, n, hf, eq)

    Preconditions: value_type is Cpp17EmplaceConstructible into X from *i.

    Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate, and inserts elements from [i, j) into it.

    Complexity: Average case $\Theta(N)$ (N is distance(i, j)), worst case $\Theta(N^2)$.

X(i, j, n, hf)

    Preconditions: key_equal meets the Cpp17DefaultConstructible requirements. value_type is Cpp17-EmplaceConstructible into X from *i.

§ 24.2.8.1
Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \([i, j]\) into it.

Complexity: Average case \( \Theta(N) \) (\( N \) is \( \text{distance}(i, j) \)), worst case \( \Theta(N^2) \).

\[
X(i, j, n)
\]

Preconditions: \( \text{hasher} \) and \( \text{key\_equal}() \) meet the \( \text{Cpp17DefaultConstructible} \) requirements. \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \star i \).

Effects: Constructs an empty container with at least \( n \) buckets, using \( \text{hasher}() \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \([i, j]\) into it.

Complexity: Average case \( \Theta(N) \) (\( N \) is \( \text{distance}(i, j) \)), worst case \( \Theta(N^2) \).

\[
X(i, j)
\]

Preconditions: \( \text{hasher} \) and \( \text{key\_equal}() \) meet the \( \text{Cpp17DefaultConstructible} \) requirements. \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \star i \).

Effects: Constructs an empty container with an unspecified number of buckets, using \( \text{hasher}() \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \([i, j]\) into it.

Complexity: Average case \( \Theta(N) \) (\( N \) is \( \text{distance}(i, j) \)), worst case \( \Theta(N^2) \).

\[
X(\text{from\_range}, \text{rg}, n, \text{hf}, \text{eq})
\]

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \star \text{ranges}::\text{begin}(\text{rg}) \).

Effects: Constructs an empty container with at least \( n \) buckets, using \( \text{hf} \) as the hash function and \( \text{eq} \) as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) (\( N \) is \( \text{ranges}::\text{distance}(\text{rg}) \)), worst case \( \Theta(N^2) \).

\[
X(\text{from\_range}, \text{rg}, n, \text{hf})
\]

Preconditions: \( \text{key\_equal}() \) meets the \( \text{Cpp17DefaultConstructible} \) requirements. \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \star \text{ranges}::\text{begin}(\text{rg}) \).

Effects: Constructs an empty container with at least \( n \) buckets, using \( \text{hf} \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) (\( N \) is \( \text{ranges}::\text{distance}(\text{rg}) \)), worst case \( \Theta(N^2) \).

\[
X(\text{from\_range}, \text{rg})
\]

Preconditions: \( \text{hasher} \) and \( \text{key\_equal}() \) meet the \( \text{Cpp17DefaultConstructible} \) requirements. \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \star \text{ranges}::\text{begin}(\text{rg}) \).

Effects: Constructs an empty container with a unspecified number of buckets, using \( \text{hasher}() \) as the hash function and \( \text{key\_equal}() \) as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) (\( N \) is \( \text{ranges}::\text{distance}(\text{rg}) \)), worst case \( \Theta(N^2) \).

\[
X(\text{il})
\]

Effects: Equivalent to \( X(\text{il}\.\text{begin}(), \text{il}\.\text{end}()) \).

\[
X(\text{il}, n)
\]

Effects: Equivalent to \( X(\text{il}\.\text{begin}(), \text{il}\.\text{end}(), n) \).

\[
X(\text{il}, n, hf)
\]

Effects: Equivalent to \( X(\text{il}\.\text{begin}(), \text{il}\.\text{end}(), n, hf) \).

§ 24.2.8.1 888
X(il, n, hf, eq)

| Effects: Equivalent to X(il.begin(), il.end(), n, hf, eq). |

X(b)

| Effects: In addition to the container requirements (24.2.2.1), copies the hash function, predicate, and maximum load factor. |

| Complexity: Average case linear in b.size(), worst case quadratic. |

a = b

| Result: X& |

| Effects: In addition to the container requirements, copies the hash function, predicate, and maximum load factor. |

| Complexity: Average case linear in b.size(), worst case quadratic. |

a = il

| Result: X& |

| Preconditions: value_type is Cpp17CopyInsertable into X and Cpp17CopyAssignable. |

| Effects: Assigns the range [il.begin(), il.end()) into a. All existing elements of a are either assigned to or destroyed. |

| Complexity: Average case linear in il.size(), worst case quadratic. |

b.hash_function()

| Result: hasher |

| Returns: b’s hash function. |

| Complexity: Constant. |

b.key_eq()

| Result: key_equal |

| Returns: b’s key equality predicate. |

| Complexity: Constant. |

a_uniq.emplace(args)

| Result: pair<iterator, bool> |

| Preconditions: value_type is Cpp17EmplaceConstructible into X from args. |

| Effects: Inserts a value_type object t constructed with std::forward<Args>(args)... if and only if there is no element in the container with key equivalent to the key of t. |

| Returns: The bool component of the returned pair is true if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of t. |

| Complexity: Average case Θ(1), worst case Θ(a_uniq.size()). |

a_eq.emplace(args)

| Result: iterator |

| Preconditions: value_type is Cpp17EmplaceConstructible into X from args. |

| Effects: Inserts a value_type object t constructed with std::forward<Args>(args)... and |

| Returns: An iterator pointing to the newly inserted element. |

| Complexity: Average case Θ(1), worst case Θ(a_eq.size()). |

a.emplace_hint(p, args)

| Result: iterator |

| Preconditions: value_type is Cpp17EmplaceConstructible into X from args. |

| Effects: Equivalent to a.emplace(std::forward<Args>(args)...). |
Returns: An iterator pointing to the element with the key equivalent to the newly inserted element. The
\texttt{const\_iterator} \texttt{p} is a hint pointing to where the search should start. Implementations are permitted
to ignore the hint.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.\text{size}())$.

\texttt{a\_uniq.insert}(t)

\texttt{Result: pair<iterator, bool>}

\texttt{Preconditions:} If \texttt{t} is a non-const rvalue, \texttt{value\_type} is \texttt{Cpp17MoveInsertable} into \texttt{X}; otherwise, \texttt{value\_type} is \texttt{Cpp17CopyInsertable} into \texttt{X}.

\texttt{Effects:} Inserts \texttt{t} if and only if there is no element in the container with key equivalent to the key of \texttt{t}.

\texttt{Returns:} The \texttt{bool} component of the returned pair indicates whether the insertion takes place, and the
\texttt{iterator} component points to the element with key equivalent to the key of \texttt{t}.

Complexity: Average case $\Theta(1)$, worst case $\Theta(\text{a.size}())$.

\texttt{a\_eq.insert}(t)

\texttt{Result: iterator}

\texttt{Preconditions:} If \texttt{t} is a non-const rvalue, \texttt{value\_type} is \texttt{Cpp17MoveInsertable} into \texttt{X}; otherwise, \texttt{value\_type} is \texttt{Cpp17CopyInsertable} into \texttt{X}.

\texttt{Effects:} Inserts \texttt{t}.

\texttt{Returns:} An iterator pointing to the newly inserted element.

Complexity: Average case $\Theta(1)$, worst case $\Theta(\text{a.size}())$.

\texttt{a.insert(p, t)}

\texttt{Result: iterator}

\texttt{Preconditions:} If \texttt{t} is a non-const rvalue, \texttt{value\_type} is \texttt{Cpp17MoveInsertable} into \texttt{X}; otherwise, \texttt{value\_type} is \texttt{Cpp17CopyInsertable} into \texttt{X}.

\texttt{Effects:} Equivalent to \texttt{a.insert(t)}. The iterator \texttt{p} is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

\texttt{Returns:} An iterator pointing to the element with the key equivalent to that of \texttt{t}.

Complexity: Average case $\Theta(1)$, worst case $\Theta(\text{a.size}())$.

\texttt{a.insert(i, j)}

\texttt{Result: void}

\texttt{Preconditions:} \texttt{value\_type} is \texttt{Cpp17EmplaceConstructible} into \texttt{X} from \texttt{*i}. Neither \texttt{i} nor \texttt{j} are iterators into \texttt{a}.

\texttt{Effects:} Equivalent to \texttt{a.insert(t)} for each element in \texttt{[i,j)}.

\texttt{Complexity:} Average case $\Theta(N)$, where \texttt{N} is \texttt{distance(i, j)}, worst case $\Theta(N(\text{a.size}()+1))$.

\texttt{a.insert\_range}(rg)

\texttt{Result: void}

\texttt{Preconditions:} \texttt{value\_type} is \texttt{Cpp17EmplaceConstructible} into \texttt{X} from \texttt{*ranges::begin(rg)}. \texttt{rg} and \texttt{a} do not overlap.

\texttt{Effects:} Equivalent to \texttt{a.insert(t)} for each element \texttt{t} in \texttt{rg}.

\texttt{Complexity:} Average case $\Theta(N)$, where \texttt{N} is \texttt{ranges::distance(rg)}, worst case $\Theta(N(\text{a.size}()+1))$.

\texttt{a.insert(il)}

\texttt{Effects:} Equivalent to \texttt{a.insert(il.begin(), il.end())}.

\texttt{a\_uniq.insert}(nh)

\texttt{Result: insert\_return\_type}

\texttt{Preconditions:} \texttt{nh} is empty or \texttt{a\_uniq.get\_allocator() == nh.get\_allocator()} is true.
Effects: If \( \text{nh} \) is empty, has no effect. Otherwise, inserts the element owned by \( \text{nh} \) if and only if there is no element in the container with a key equivalent to \( \text{nh.key()} \).

Postconditions: If \( \text{nh} \) is empty, inserted is false, position is end(), and node is empty. Otherwise if the insertion took place, inserted is true, position points to the inserted element, and node is empty; if the insertion failed, inserted is false, node has the previous value of \( \text{nh} \), and position points to an element with a key equivalent to \( \text{nh.key()} \).

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.uniq.size()}) \).

\[
\text{a_eq.insert(nh)}
\]

Result: iterator

Preconditions: \( \text{nh} \) is empty or \( \text{a_eq.get_allocator()} == \text{nh.get_allocator()} \) is true.

Effects: If \( \text{nh} \) is empty, has no effect and returns \( \text{a_eq.end()} \). Otherwise, inserts the element owned by \( \text{nh} \) and returns an iterator pointing to the newly inserted element.

Postconditions: \( \text{nh} \) is empty.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.eq.size()}) \).

\[
\text{a.insert(q, nh)}
\]

Preconditions: \( \text{nh} \) is empty or \( \text{a.get_allocator()} == \text{nh.get_allocator()} \) is true.

Effects: If \( \text{nh} \) is empty, has no effect and returns \( \text{a.end()} \). Otherwise, inserts the element owned by \( \text{nh} \) if and only if there is no element with key equivalent to \( \text{nh.key()} \) in containers with unique keys; always inserts the element owned by \( \text{nh} \) in containers with equivalent keys. The iterator \( \text{q} \) is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Postconditions: \( \text{nh} \) is empty if insertion succeeds, unchanged if insertion fails.

Returns: An iterator pointing to the element with key equivalent to \( \text{nh.key()} \).

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.size()}) \).

\[
\text{a.extract(k)}
\]

Result: node_type

Effects: Removes an element in the container with key equivalent to \( \text{k} \).

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.size()}) \).

\[
\text{a_tran.extract(kx)}
\]

Result: node_type

Effects: Removes an element in the container with key equivalent to \( \text{kx} \).

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a_tran.size()}) \).

\[
\text{a.extract(q)}
\]

Result: node_type

Effects: Removes the element pointed to by \( \text{q} \).

Returns: A node_type owning that element.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(\text{a.size()}) \).

\[
\text{a.merge(a2)}
\]

Result: void

Preconditions: \( \text{a.get_allocator()==a2.get_allocator()} \).

Effects: Attempts to extract each element in \( \text{a2} \) and insert it into \( \text{a} \) using the hash function and key equality predicate of \( \text{a} \). In containers with unique keys, if there is an element in \( \text{a} \) with key equivalent to the key of an element from \( \text{a2} \), then that element is not extracted from \( \text{a2} \).
**Postconditions:** Pointers and references to the transferred elements of `a2` refer to those same elements but as members of `a`. Iterators referring to the transferred elements and all iterators referring to `a` will be invalided, but iterators to elements remaining in `a2` will remain valid.

**Complexity:** Average case $\Theta(N)$, where $N$ is `a2.size()`, worst case $\Theta(N\cdot a.size() + N)$.

```
a.erase(k)
```

**Result:** `size_type`

**Effects:** Erases all elements with key equivalent to `k`.

**Returns:** The number of elements erased.

**Complexity:** Average case $\Theta(a.count(k))$, worst case $\Theta(a.size())$.

```
a_tran.erase(kx)
```

**Result:** `size_type`

**Effects:** Erases all elements with key equivalent to `kx`.

**Returns:** The number of elements erased.

**Complexity:** Average case $\Theta(a_tran.count(kx))$, worst case $\Theta(a_tran.size())$.

```
a.erase(q)
```

**Result:** `iterator`

**Effects:** Erases the element pointed to by `q`.

**Returns:** The iterator immediately following `q` prior to the erasure.

**Complexity:** Average case $\Theta(1)$, worst case $\Theta(a.size())$.

```
a.erase(r)
```

**Result:** `iterator`

**Effects:** Erases the element pointed to by `r`.

**Returns:** The iterator immediately following `r` prior to the erasure.

**Complexity:** Average case $\Theta(1)$, worst case $\Theta(a.size())$.

```
a.erase(q1, q2)
```

**Result:** `iterator`

**Effects:** Erases all elements in the range `[q1, q2)`.

**Returns:** The iterator immediately following the erased elements prior to the erasure.

**Complexity:** Average case linear in $\text{distance}(q1, q2)$, worst case $\Theta(a.size())$.

```
a.clear()
```

**Result:** `void`

**Effects:** Erases all elements in the container.

**Postconditions:** `a.empty()` is `true`.

**Complexity:** Linear in `a.size()`.

```
b.find(k)
```

**Result:** `iterator; const_iterator` for constant `b`.

**Returns:** An iterator pointing to an element with key equivalent to `k`, or `b.end()` if no such element exists.

**Complexity:** Average case $\Theta(1)$, worst case $\Theta(b.size())$.

```
a_tran.find(ke)
```

**Result:** `iterator; const_iterator` for constant `a_tran`.

**Returns:** An iterator pointing to an element with key equivalent to `ke`, or `a_tran.end()` if no such element exists.

§ 24.2.8.1
Complexity: Average case $\Theta(1)$, worst case $\Theta(a_{\text{tran}.\text{size}})$. 

\texttt{b.count(k)}

\textbf{Result:} \texttt{size_type}

\textbf{Returns:} The number of elements with key equivalent to \texttt{k}.

\textbf{Complexity:} Average case $\Theta(\texttt{b.count(k)})$, worst case $\Theta(\texttt{b.size})$.

\texttt{a_{\text{tran}.\text{count}(ke)}

\textbf{Result:} \texttt{size_type}

\textbf{Returns:} The number of elements with key equivalent to \texttt{ke}.

\textbf{Complexity:} Average case $\Theta(\texttt{a_{\text{tran}.\text{count}(ke)})$, worst case $\Theta(\texttt{a_{\text{tran}.\text{size}}})$.

\texttt{b.contains(k)}

\textbf{Effects:} Equivalent to \texttt{b.find(k) != b.end()}. 

\texttt{a_{\text{tran}.\text{contains}(ke)}

\textbf{Effects:} Equivalent to \texttt{a_{\text{tran}.\text{find}(ke) != a_{\text{tran}.\text{end}}()}. 

\texttt{b.equal_range(k)}

\textbf{Result:} \texttt{pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant \texttt{b}.}

\textbf{Returns:} A range containing all elements with keys equivalent to \texttt{k}. Returns \texttt{make_pair(b.end(), b.end())} if no such elements exist.

\textbf{Complexity:} Average case $\Theta(\texttt{b.count(k)})$, worst case $\Theta(\texttt{b.size})$.

\texttt{a_{\text{tran}.\text{equal_range}(ke)}

\textbf{Result:} \texttt{pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant \texttt{a_{\text{tran}}}.}

\textbf{Returns:} A range containing all elements with keys equivalent to \texttt{ke}. Returns \texttt{make_pair(a_{\text{tran}.\text{end}}, a_{\text{tran}.\text{end})} if no such elements exist.

\textbf{Complexity:} Average case $\Theta(\texttt{a_{\text{tran}.\text{count}(ke)})$, worst case $\Theta(\texttt{a_{\text{tran}.\text{size}}})$.

\texttt{b.bucket_count()}

\textbf{Returns:} The number of buckets that \texttt{b} contains.

\textbf{Complexity:} Constant.

\texttt{b.max_bucket_count()}

\textbf{Returns:} An upper bound on the number of buckets that \texttt{b} can ever contain.

\textbf{Complexity:} Constant.

\texttt{b.bucket(k)}

\textbf{Result:} \texttt{size_type}

\textbf{Preconditions:} \texttt{b.bucket_count()} $> 0$.

\textbf{Returns:} The index of the bucket in which elements with keys equivalent to \texttt{k} would be found, if any such element existed. The return value is in the range $[0, \texttt{b.bucket_count})$.

\textbf{Complexity:} Constant.

\texttt{b.bucket_size(n)}

\textbf{Result:} \texttt{size_type}

\textbf{Preconditions:} \texttt{n} shall be in the range $[0, \texttt{b.bucket_count})$.

\textbf{Returns:} The number of elements in the \texttt{n}th bucket.

\textbf{Complexity:} $\Theta(\texttt{b.bucket_size(n})$
\textbf{b.begin(n)}

\textit{Result:} local\_iterator; const\_local\_iterator for constant b.

\textit{Preconditions:} n is in the range \([0, \text{b.bucket\_count()}]\).

\textit{Returns:} An iterator referring to the first element in the bucket. If the bucket is empty, then b.begin(n) == b.end(n).

\textit{Complexity:} Constant.

\textbf{b.end(n)}

\textit{Result:} local\_iterator; const\_local\_iterator for constant b.

\textit{Preconditions:} n is in the range \([0, \text{b.bucket\_count()}]\).

\textit{Returns:} An iterator which is the past-the-end value for the bucket.

\textit{Complexity:} Constant.

\textbf{b.cbegin(n)}

\textit{Result:} const\_local\_iterator

\textit{Preconditions:} n shall be in the range \([0, \text{b.bucket\_count()}]\).

\textit{Returns:} An iterator referring to the first element in the bucket. If the bucket is empty, then b.cbegin(n) == b.cend(n).

\textit{Complexity:} Constant.

\textbf{b.cend(n)}

\textit{Result:} const\_local\_iterator

\textit{Preconditions:} n is in the range \([0, \text{b.bucket\_count()}]\).

\textit{Returns:} An iterator which is the past-the-end value for the bucket.

\textit{Complexity:} Constant.

\textbf{b.load_factor()}

\textit{Result:} float

\textit{Returns:} The average number of elements per bucket.

\textit{Complexity:} Constant.

\textbf{b.max_load_factor()}

\textit{Result:} float

\textit{Returns:} A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.

\textit{Complexity:} Constant.

\textbf{a.max_load_factor(z)}

\textit{Result:} void

\textit{Preconditions:} z is positive. May change the container's maximum load factor, using z as a hint.

\textit{Complexity:} Constant.

\textbf{a.rehash(n)}

\textit{Result:} void

\textit{Postconditions:} a.bucket\_count() >= a.size() / a.max\_load\_factor() and a.bucket\_count() >= n.

\textit{Complexity:} Average case linear in a.size(), worst case quadratic.

\textbf{a.reserve(n)}

\textit{Effects:} Equivalent to a.rehash(ceil(n / a.max\_load\_factor()))

\\
Two unordered containers \(a\) and \(b\) compare equal if \(a\.size() == b\.size()\) and, for every equivalent-key group \([Ea1, Ea2]\) obtained from \(a\.equal_range(Ea1)\), there exists an equivalent-key group \([Eb1, Eb2]\) obtained from \(b\.equal_range(Ea1)\), such that \(is_permutation(Ea1, Ea2, Eb1, Eb2)\) returns \(true\). For \(unordered_set\) and \(unordered_map\), the complexity of \(operator==\) (i.e., the number of calls to the == operator of the value_type, to the predicate returned by \(key_eq()\), and to the hasher returned by \(hash\_function()\)) is proportional to \(N\) in the average case and to \(N^2\) in the worst case, where \(N\) is \(a\.size()\). For \(unordered_multiset\) and \(unordered_multimap\), the complexity of \(operator==\) is proportional to \(\sum E_i^2\) in the average case and to \(N^2\) in the worst case, where \(N\) is \(a\.size()\), and \(E_i\) is the size of the \(i^{th}\) equivalent-key group in \(a\). However, if the respective elements of each corresponding pair of equivalent-key groups \(Eu_i\) and \(Eb_i\) are arranged in the same order (as is commonly the case, e.g., if \(a\) and \(b\) are unmodified copies of the same container), then the average-case complexity for \(unordered_multiset\) and \(unordered_multimap\) becomes proportional to \(N\) (but worst-case complexity remains \(O(N^2)\), e.g., for a pathologically bad hash function). The behavior of a program that uses \(operator==\) or \(operator!=\) on unordered containers is undefined unless the \(Pred\) function object has the same behavior for both containers and the equality comparison function for \(Key\) is a refinement\(^{213}\) of the partition into equivalent-key groups produced by \(Pred\).

The iterator types \(iterator\) and \(const\_iterator\) of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both \(iterator\) and \(const\_iterator\) are constant iterators.

The \(insert\), \(insert\_range\), and \(emplace\) members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The \(erase\) members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

The \(insert\), \(insert\_range\), and \(emplace\) members shall not affect the validity of iterators if \((N+n) <= z * B\), where \(N\) is the number of elements in the container prior to the insert operation, \(n\) is the number of elements inserted, \(B\) is the container’s bucket count, and \(z\) is the container’s maximum load factor.

The \(extract\) members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a \(node\_type\) is undefined behavior. References and pointers to an element obtained while it is owned by a \(node\_type\) are invalidated if the element is successfully inserted.

The member function templates \(find\), \(count\), \(equal\_range\), \(contains\), \(extract\), and \(erase\) shall not participate in overload resolution unless the \(qualified\_ids\) \(Pred::is\_transparent\) and \(Hash::is\_transparent\) are both valid and denote types \((13.10.3)\). Additionally, the member function templates \(extract\) and \(erase\) shall not participate in overload resolution if \(is\_convertible\_v<K&&, iterator> || is\_convertible\_v<K&&, const\_iterator>\) is \(true\), where \(K\) is the type substituted as the first template argument.

A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

\[
\begin{align*}
\text{(243.1)} & \quad \text{It has a } Input\_Iterator \text{ template parameter and a type that does not qualify as an input iterator is deduced for that parameter.} \\
\text{(243.2)} & \quad \text{It has an } Allocator \text{ template parameter and a type that does not qualify as an allocator is deduced for that parameter.} \\
\text{(243.3)} & \quad \text{It has a } Hash \text{ template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.} \\
\text{(243.4)} & \quad \text{It has a } Pred \text{ template parameter and a type that qualifies as an allocator is deduced for that parameter.}
\end{align*}
\]

\[
\text{24.2.8.2 Exception safety guarantees} \quad \text{[unord.req.except]}
\]

For unordered associative containers, no \(clear()\) function throws an exception. \(erase(k)\) does not throw an exception unless that exception is thrown by the container’s \(Hash\) or \(Pred\) object (if any).

For unordered associative containers, if an exception is thrown by any operation other than the container’s hash function from within an \(insert\) or \(emplace\) function inserting a single element, the insertion has no effect.

For unordered associative containers, no \(swap\) function throws an exception unless that exception is thrown by the swap of the container’s \(Hash\) or \(Pred\) object (if any).

\(^{213}\) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.
For unordered associative containers, if an exception is thrown from within a \texttt{rehash()} function other than by the container's hash function or comparison function, the \texttt{rehash()} function has no effect.

24.3 Sequence containers

24.3.1 In general

The headers \texttt{<array> (24.3.2), <deque> (24.3.3), <forward_list> (24.3.4), <list> (24.3.5), and <vector> (24.3.6)} define class templates that meet the requirements for sequence containers.

The following exposition-only alias template may appear in deduction guides for sequence containers:

\begin{verbatim}
template<class InputIterator>
using iter_value_type = typename iterator_traits<InputIterator>::value_type; // exposition only
\end{verbatim}

24.3.2 Header \texttt{<array>} synopsis

```
#include <compare> // see 17.12.1
#include <initializer_list> // see 17.11.2
namespace std {
    // 24.3.7, class template array
    template<class T, size_t N> struct array;
    template<class T, size_t N> constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
    template<class T, size_t N> constexpr synth_three_way_result<T> operator<=>(const array<T, N>& x, const array<T, N>& y);
    // 24.3.7.4, specialized algorithms
    template<class T, size_t N> constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));
    // 24.3.7.6, array creation functions
    template<class T, size_t N> constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
    template<class T, size_t N> constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
    // 24.3.7.7, tuple interface
    template<class T> struct tuple_size;
    template<size_t I, class T> struct tuple_element;
    template<size_t I, class T, size_t N> constexpr T& get(array<T, N>&) noexcept;
    template<size_t I, class T, size_t N> constexpr T&& get(array<T, N>&&) noexcept;
    template<size_t I, class T, size_t N> constexpr const T& get(const array<T, N>&) noexcept;
    template<size_t I, class T, size_t N> constexpr const T&& get(const array<T, N>&&) noexcept;
}
```

24.3.3 Header \texttt{<deque>} synopsis

```
#include <compare> // see 17.12.1
#include <initializer_list> // see 17.11.2
namespace std {
    // 24.3.8, class template deque
    template<class T, class Allocator = allocator<T>> class deque;
}
```
template<class T, class Allocator>
    bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);

template<class T, class Allocator>
synth-three-way-result<T> operator<=>(const deque<T, Allocator>& x, const deque<T, Allocator>& y);

template<class T, class Allocator>
void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));

// 24.3.8.5, erasure
template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
    erase(deque<T, Allocator>& c, const U& value);

template<class T, class Allocator, class Predicate>
typename deque<T, Allocator>::size_type
    erase_if(deque<T, Allocator>& c, Predicate pred);

namespace pmr {
    template<class T>
    using deque = std::deque<T, polymorphic_allocator<T>>;
}

24.3.4 Header <forward_list> synopsis

#include <compare> // see 17.12.1
#include <initializer_list> // see 17.11.2
namespace std {

struct formatter<T, charT>;
}

24.3.7 Class template array

24.3.7.1 Overview

1 The header <array> defines a class template for storing fixed-size sequences of objects. An array is a contiguous container (24.2.2.1). An instance of array<T, N> stores N elements of type T, so that size() == N is an invariant.

2 An array is an aggregate (9.4.2) that can be list-initialized with up to N elements whose types are convertible to T.

3 An array meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), except that a default constructed array object is not empty if N > 0. An array meets some of the requirements of a sequence container (24.2.4). Descriptions are provided here only for operations on array that are not described in one of these tables and for operations where there is additional semantic information.

4 array<T, N> is a structural type (13.2) if T is a structural type. Two values a1 and a2 of type array<T, N> are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in a1 and a2 are template-argument-equivalent.

5 The types iterator and const_iterator meet the constexpr iterator requirements (25.3.1).

namespace std {
  template<class T, size_t N>
  struct array {
    // types
    using value_type = T;
    using pointer = T*;
    using const_pointer = const T*;
    using reference = T&;
    using const_reference = const T&;
    using size_type = size_t;
    using difference_type = ptrdiff_t;
    using iterator = implementation-defined; // see 24.2
    using const_iterator = implementation-defined; // see 24.2
    using reverse_iterator = std::reverse_iterator<iterator>;
    using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // no explicit construct/copy/destroy for aggregate type
    constexpr void fill(const T& u);
    constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);

    // iterators
    constexpr iterator begin() noexcept;
    constexpr const_iterator begin() const noexcept;
    constexpr iterator end() noexcept;
    constexpr const_iterator end() const noexcept;
    constexpr reverse_iterator rbegin() noexcept;
    constexpr const_reverse_iterator rbegin() const noexcept;
    constexpr reverse_iterator rend() noexcept;
    constexpr const_reverse_iterator rend() const noexcept;
    constexpr const_iterator cbegin() const noexcept;
    constexpr const_iterator cend() const noexcept;
    constexpr const_reverse_iterator crbegin() const noexcept;
    constexpr const_reverse_iterator crend() const noexcept;
  } array
}

§ 24.3.7.1 899
// capacity
[nodiscard] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr reference at(size_type n);
constexpr const_reference at(size_type n) const;
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

};

template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;

24.3.7.2 Constructors, copy, and assignment [array.cons]

The conditions for an aggregate (9.4.2) shall be met. Class array relies on the implicitly-declared special
member functions (11.4.5.2, 11.4.7, 11.4.5.3) to conform to the container requirements table in 24.2. In
addition to the requirements specified in the container requirements table, the implicit move constructor and
move assignment operator for array require that T be Cpp17MoveConstructible or Cpp17MoveAssignable,
respectively.

template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;

Mandates: (is_same_v<T, U> && ...) is true.

24.3.7.3 Member functions [array.members]

constexpr size_type size() const noexcept;

Returns: N.

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

Returns: A pointer such that [data(), data() + size()] is a valid range. For a non-empty array,
data() == addressof(front()).

constexpr void fill(const T& u);

Effects: As if by fill_n(begin(), N, u).

constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);

Effects: Equivalent to swap_ranges(begin(), end(), y.begin()).

[Note 1: Unlike the swap function for other containers, array::swap takes linear time, can exit via an exception,
and does not cause iterators to become associated with the other container. — end note]

24.3.7.4 Specialized algorithms [array.special]

template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

Constraints: N == 0 or is_swappable_v<T> is true.

Effects: As if by x.swap(y).

Complexity: Linear in N.
24.3.7.5 Zero-sized arrays

array shall provide support for the special case $N == 0$.

In the case that $N == 0$, `begin() == end() ==` unique value. The return value of `data()` is unspecified.

The effect of calling `front()` or `back()` for a zero-sized array is undefined.

Member function `swap()` shall have a non-throwing exception specification.

24.3.7.6 Array creation functions

```cpp
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```

**Mandates:** `is_array_v<T>` is false and `is_constructible_v<T, T&>` is true.

**Preconditions:** T meets the Cpp17CopyConstructible requirements.

**Returns:** `{ { a[0], ..., a[N - 1] } }`.

```cpp
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```

**Mandates:** `is_array_v<T>` is false and `is_move_constructible_v<T>` is true.

**Preconditions:** T meets the Cpp17MoveConstructible requirements.

**Returns:** `{ { std::move(a[0]), ..., std::move(a[N - 1]) } }`.

24.3.7.7 Tuple interface

```cpp
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };    
```

```cpp
template<size_t I, class T, size_t N>
struct tuple_element<I, array<T, N>> {
  using type = T;
};
```

**Mandates:** $I < N$ is true.

```cpp
template<size_t I, class T, size_t N>
constexpr T& get(array<T, N>& a) noexcept;
```

**Mandates:** $I < N$ is true.

**Returns:** A reference to the $I$th element of `a`, where indexing is zero-based.

24.3.8 Class template deque

24.3.8.1 Overview

A `deque` is a sequence container that supports random access iterators (25.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.

A `deque` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on `deque` that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class deque {
        public:
            // types
        }
    }
```
using value_type = T;
using allocator_type = Allocator;
using pointer = typename allocator_traits<Allocator>::pointer;
using const_pointer = typename allocator_traits<Allocator>::const_pointer;
using reference = value_type&;
using const_reference = const value_type&;
using size_type = implementation-defined; // see 24.2
using difference_type = implementation-defined; // see 24.2
using iterator = implementation-defined; // see 24.2
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// 24.3.8.2, construct/copy/destroy
deque() : deque(Allocator()) {} 
explicit deque(const Allocator&);
deque(size_type n, const Allocator& = Allocator());
template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<container-compatible-range<R>>
deque(from_range_t,R&& rg, const Allocator& = Allocator());
deque(const deque& x);
deque(deque&);
deque(const deque&, const type_identity_t<Allocator>&);
deque(deque&, const type_identity_t<Allocator>&);
deque(initializer_list<T>, const Allocator& = Allocator());
~deque();
deque& operator=(const deque& x);
deque& operator=(deque&& x) noexcept(algorithm_traits<Allocator>::is_always_equal::value);
deque& operator=(initializer_list<T>);
template<class InputIterator>
void assign(InputIterator first, InputIterator last);
template<container-compatible-range<R>>
void assign_range(R&& rg);
void assign(size_type n, const T& t);
void assign(initializer_list<T>);

iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&) noexcept(allocator_traits<Allocator>::is_always_equal::value);
void clear() noexcept;

// 24.3.8.2 Constructors, copy, and assignment [deque.cons]

explicit deque(const Allocator&);
1 Effects: Constructs an empty deque, using the specified allocator.
2 Complexity: Constant.

explicit deque(size_type n, const Allocator& = Allocator());
3 Preconditions: T is Cpp17DefaultInsertable into *this.
4 Effects: Constructs a deque with n default-inserted elements using the specified allocator.
5 Complexity: Linear in n.

§ 24.3.8.2
deque(size_type n, const T& value, const Allocator& = Allocator());

**Preconditions:** T is Cpp17CopyInsertable into *this.

**Effects:** Constructs a deque with n copies of value, using the specified allocator.

**Complexity:** Linear in n.

```cpp
template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

**Effects:** Constructs a deque equal to the range [first, last), using the specified allocator.

**Complexity:** Linear in distance(first, last).

```cpp
template<container-compatible-range<T> R>
deque(from_range_t, R&& rg, const Allocator& = Allocator());
```

**Effects:** Constructs a deque with the elements of the range rg, using the specified allocator.

**Complexity:** Linear in ranges::distance(rg).

### 24.3.8.3 Capacity

void resize(size_type sz);

**Preconditions:** T is Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.

**Effects:** If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

void resize(size_type sz, const T& c);

**Preconditions:** T is Cpp17CopyInsertable into *this.

**Effects:** If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

void shrink_to_fit();

**Preconditions:** T is Cpp17MoveInsertable into *this.

**Effects:** shrink_to_fit is a non-binding request to reduce memory use but does not change the size of the sequence.

**[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]**

If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T, then there are no effects.

**Complexity:** If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

**Remarks:** If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

### 24.3.8.4 Modifiers

iterator insert(const_iterator position, const T& x);

iterator insert(const_iterator position, T&& x);

iterator insert(const_iterator position, size_type n, const T& x);

```cpp
template<class InputIterator>
iterator insert(const_iterator position,
    InputIterator first, InputIterator last);
```

**Complexity:** Linear in distance(first, last).

```cpp
template<container-compatible-range<T> R>
iterator insert_range(const_iterator position, R&& rg);
```

**Complexity:** Linear in ranges::distance(rg).

iterator insert(const_iterator position, initializer_list<T>);

```cpp
template<class... Args> reference emplace_front(Args&&... args);
```

```cpp
template<class... Args> reference emplace_back(Args&&... args);
```

```cpp
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
```

```cpp
void push_front(const T& x);
```

```cpp
void push_front(T&& x);
```

§ 24.3.8.4
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);

template<container-compatible-range<T> R>
void append_range(R&& rg);

Effects: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

Complexity: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

Remarks: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();

Effects: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[Note 1: pop_front and pop_back are erase operations. — end note]

Throws: Nothing unless an exception is thrown by the assignment operator of T.

Complexity: The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

24.3.8.5 Erasure

template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
erase(deque<T, Allocator>& c, const U& value);

Effects: Equivalent to:

auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<class T, class Allocator, class Predicate>
typename deque<T, Allocator>::size_type
erase_if(deque<T, Allocator>& c, Predicate pred);

Effects: Equivalent to:

auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

24.3.9 Class template forward_list

24.3.9.1 Overview

A forward_list is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.
A forward_list meets all of the requirements of a container (24.2.2.2), except that the size() member function is not provided and operator== has linear complexity. A forward_list also meets all of the requirements for an allocator-aware container (24.2.2.5). In addition, a forward_list provides the assign member functions and several of the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on forward_list that are not described in that table or for operations where there is additional semantic information.

[Note 2: Modifying any list requires access to the element preceding the first element of interest, but in a forward_list there is no constant-time way to access a preceding element. For this reason, erase_after and splice_after take fully-open ranges, not semi-open ranges. — end note]

namespace std {
    template<class T, class Allocator = allocator<T>>
    class forward_list {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;

© ISO/IEC

4 An incomplete type \( T \) may be used when instantiating \texttt{forward\_list} if the allocator meets the allocator completeness requirements (16.4.4.6.2). \( T \) shall be complete before any member of the resulting specialization of \texttt{forward\_list} is referenced.

24.3.9.2 Constructors, copy, and assignment

\begin{verbatim}
explicit forward_list(const Allocator&);
Effects: Constructs an empty \texttt{forward\_list} object using the specified allocator.
Complexity: Constant.

explicit forward_list(size_type n, const Allocator& = Allocator());
Preconditions: \( T \) is \texttt{Cpp17DefaultInsertable} into \*this.
Effects: Constructs a \texttt{forward\_list} object with \( n \) default-inserted elements using the specified allocator.
Complexity: Linear in \( n \).

forward_list(size_type n, const \texttt{T} & value, const Allocator& = Allocator());
Preconditions: \( T \) is \texttt{Cpp17CopyInsertable} into \*this.
Effects: Constructs a \texttt{forward\_list} object with \( n \) copies of \texttt{value} using the specified allocator.
Complexity: Linear in \( n \).

template<class InputIterator>
forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
Effects: Constructs a \texttt{forward\_list} object equal to the range \([\texttt{first},\texttt{last})\).
Complexity: Linear in distance(\texttt{first}, \texttt{last}).

template<container-compatible-range<T> R>
forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
Effects: Constructs a \texttt{forward\_list} object with the elements of the range \texttt{rg}.
Complexity: Linear in ranges::distance(\texttt{rg}).
\end{verbatim}

24.3.9.3 Iterators

\begin{verbatim}
iterator before_begin() noexcept;
const_iterator before_begin() const noexcept;
const_iterator cbefore_begin() const noexcept;
Effects: \texttt{cbefore\_begin()} is equivalent to \texttt{const\_cast<forward\_list const&>(*this).before\_begin()}.
Returns: A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by \texttt{begin()}.
Remarks: before\_begin() == end() shall equal false.
\end{verbatim}

24.3.9.4 Element access

\begin{verbatim}
reference front();
const_reference front() const;
Returns: *begin()
\end{verbatim}
24.3.9.5 Modifiers

None of the overloads of `insert_after` shall affect the validity of iterators and references, and `erase_after` shall invalidate only iterators and references to the erased elements. If an exception is thrown during `insert_after` there shall be no effect. Inserting \( n \) elements into a `forward_list` is linear in \( n \), and the number of calls to the copy or move constructor of \( T \) is exactly equal to \( n \). Erasing \( n \) elements from a `forward_list` is linear in \( n \) and the number of calls to the destructor of type \( T \) is exactly equal to \( n \).

```cpp
template<class... Args> reference emplace_front(Args&&... args);
```

*Effects:* Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...)` at the beginning of the list.

```cpp
void push_front(const T& x);
void push_front(T&& x);
```

*Effects:* Inserts a copy of \( x \) at the beginning of the list.

```cpp
template<container-compatible-range<T> R> void prepend_range(R&& rg);
```

*Effects:* Inserts a copy of each element of \( rg \) at the beginning of the list.

*[Note 1: The order of elements is not reversed. — end note]*

```cpp
void pop_front();
```

*Effects:* As if by `erase_after(before_begin())`.

```cpp
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
```

*Preconditions:* `position` is `before_begin()` or is a dereferenceable iterator in the range \([begin(), end())\).

*Effects:* Inserts a copy of \( x \) after `position`.

*Returns:* An iterator pointing to the copy of \( x \).

```cpp
iterator insert_after(const_iterator position, size_type n, const T& x);
```

*Preconditions:* `position` is `before_begin()` or is a dereferenceable iterator in the range \([begin(), end())\).

*Effects:* Inserts \( n \) copies of \( x \) after `position`.

*Returns:* An iterator pointing to the last inserted copy of \( x \) or `position` if \( n == 0 \).

```cpp
template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
```

*Preconditions:* `position` is `before_begin()` or is a dereferenceable iterator in the range \([begin(), end())\). Neither `first` nor `last` are iterators in \*this.

*Effects:* Inserts copies of elements in \([first, last)\) after `position`.

*Returns:* An iterator pointing to the last inserted element or `position` if `first == last`.

```cpp
template<container-compatible-range<T> R> iterator insert_range_after(const_iterator position, R&& rg);
```

*Preconditions:* `position` is `before_begin()` or is a dereferenceable iterator in the range \([begin(), end())\). \( rg \) and \*this do not overlap.

*Effects:* Inserts copies of elements in the range \( rg \) after `position`.

*Returns:* An iterator pointing to the last inserted element, or `position` if `rg` is empty.

```cpp
iterator insert_after(const_iterator position, initializer_list<T> il);
```

*Effects:* `insert_after(position, il.begin(), il.end())`.

*Returns:* An iterator pointing to the last inserted element or `position` if `il` is empty.
template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()).

Effects: Inserts an object of type value_type constructed with value_type(std::forward<Args>(args)...)
after position.

Returns: An iterator pointing to the new object.

iterator erase_after(const_iterator position);

Preconditions: The iterator following position is dereferenceable.

Effects: Erases the element pointed to by the iterator following position.

Returns: An iterator pointing to the element following the one that was erased, or end() if no such
element exists.

Throws: Nothing.

iterator erase_after(const_iterator position, const_iterator last);

Preconditions: All iterators in the range (position, last) are dereferenceable.

Effects: Erases the elements in the range (position, last).

Returns: last.

Throws: Nothing.

void resize(size_type sz);

Preconditions: T is Cpp17DefaultInsertable into *this.

Effects: If sz < distance(begin(), end()), erases the last
distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end())
default-inserted elements at the end of the list.

void resize(size_type sz, const value_type& c);

Preconditions: T is Cpp17CopyInsertable into *this.

Effects: If sz < distance(begin(), end()), erases the last
distance(begin(), end()) - sz elements from the list. Otherwise, inserts sz - distance(begin(), end())
copies of c at the end of the list.

void clear() noexcept;

Effects: Erases all elements in the range [begin(), end()).

Remarks: Does not invalidate past-the-end iterators.

24.3.9.6 Operations

In this subclause, arguments for a template parameter named Predicate or BinaryPredicate shall meet
the corresponding requirements in 27.2. The semantics of i + n, where i is an iterator into the list and n is
an integer, are the same as those of next(i, n). The expression i - n, where i is an iterator into the list
and n is an integer, means an iterator j such that j + n == i is true. For merge and sort, the definitions
and requirements in 27.8 apply.

void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(),
end()). get_allocator() == x.get_allocator() is true. addressof(x) != this is true.

Effects: Inserts the contents of x after position, and x becomes empty. Pointers and references to the
moved elements of x now refer to those same elements but as members of *this. Iterators referring
to the moved elements will continue to refer to their elements, but they now behave as iterators into
*this, not into x.

Throws: Nothing.
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);

Preconditions: position is before_begin() or is a dereferenceable iterator in the range [begin(), end()). The iterator following i is a dereferenceable iterator in x. get_allocator() == x.get_allocator() is true.

Effects: Inserts the element following i into *this, following position, and removes it from x. The result is unchanged if position == i or position == ++i. Pointers and references to *i++ continue to refer to the same element but as a member of *this. Iterators to *i++ continue to refer to the same element, but now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: $\Theta(1)$

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

Effects: Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value (for remove()), pred(*i) is true (for remove_if()). Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the equality comparison or the predicate.

Complexity: Exactly distance(begin(), end()) applications of the corresponding predicate.

Remarks: Stable (16.4.6.8).

Let binary_pred be equal_to<> for the first overload.

Preconditions: binary_pred is an equivalence relation.

Effects: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator i in the range [begin() + 1, end()) for which binary_pred(*i, *(i - 1)) is true. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the predicate.

Complexity: If empty() is false, exactly distance(begin(), end()) - 1 applications of the corresponding predicate, otherwise no applications of the predicate.
template<class Compare> void merge(forward_list&& x, Compare comp);

Let \( \text{comp} \) be \text{less<>} for the first two overloads.

**Preconditions:** \( *\text{this} \) and \( x \) are both sorted with respect to the comparator \( \text{comp} \), and \( \text{get_allocator()} == x.\text{get_allocator()} \) is true.

**Effects:** If \( \text{addressof}(x) == \text{this} \), there are no effects. Otherwise, merges the two sorted ranges \([\text{begin()}, \text{end()})\) and \([x.\text{begin()}, x.\text{end()})\). The result is a range that is sorted with respect to the comparator \( \text{comp} \). Pointers and references to the moved elements of \( x \) now refer to those same elements but as members of \( *\text{this} \). Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into \( *\text{this} \), not into \( x \).

**Complexity:** At most \( \text{distance}(\text{begin()}, \text{end()}) + \text{distance}(x.\text{begin()}, x.\text{end()}) - 1 \) comparisons if \( \text{addressof}(x) != \text{this} \); otherwise, no comparisons are performed.

**Remarks:** Stable (16.4.6.8). If \( \text{addressof}(x) != \text{this} \), \( x \) is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

```cpp
void sort();
```

```cpp
template<class Compare> void sort(Compare comp);
```

**Effects:** Sorts the list according to the \text{operator<} or the \( \text{comp} \) function object. If an exception is thrown, the order of the elements in \( *\text{this} \) is unspecified. Does not affect the validity of iterators and references.

**Complexity:** Approximately \( N \log N \) comparisons, where \( N \) is \( \text{distance}(\text{begin()}, \text{end()}). \)

**Remarks:** Stable (16.4.6.8).

```cpp
void reverse() noexcept;
```

**Effects:** Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

**Complexity:** Linear time.

### 24.3.9.7 Erasure

```cpp
template<class T, class Allocator, class U>
typename forward_list<T, Allocator>::size_type
erase(forward_list<T, Allocator>& c, const U& value);
```

**Effects:** Equivalent to:

\[
\text{return erase_if}(c, [\&](\text{auto}\& \text{elem}) \{ \text{return elem == value; \});
\]

```cpp
template<class T, class Allocator, class Predicate>
typename forward_list<T, Allocator>::size_type
erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

**Effects:** Equivalent to:

\[
\text{return c.remove_if}(\text{pred});
\]

### 24.3.10 Class template list

#### 24.3.10.1 Overview

A **list** is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (24.3.11) and deques (24.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

A **list** meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including most of the optional sequence container requirements (24.2.4). The exceptions are the **operator[]** and **at** member functions, which are not provided.\(^{214}\) Descriptions are provided here only for operations on **list** that are not described in one of these tables or for operations where there is additional semantic information.

\(^{214}\) These member functions are only provided by containers whose iterators are random access iterators.
namespace std {
    template<class T, class Allocator = allocator<T>>
    class list {
    public:
        // types
        using value_type = T;

void reverse() noexcept;
An incomplete type T may be used when instantiating `list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of `list` is referenced.

### 24.3.10.2 Constructors, copy, and assignment

```cpp
explicit list(const Allocator&);
```

*Effects*: Constructs an empty list, using the specified allocator.

*Complexity*: Constant.

```cpp
explicit list(size_type n, const Allocator& = Allocator());
```

*Preconditions*: T is `Cpp17DefaultInsertable` into *this.

*Effects*: Constructs a list with n default-inserted elements using the specified allocator.

*Complexity*: Linear in n.

```cpp
list(size_type n, const T& value, const Allocator& = Allocator());
```

*Preconditions*: T is `Cpp17CopyInsertable` into *this.

*Effects*: Constructs a list with n copies of value, using the specified allocator.

*Complexity*: Linear in n.

```cpp
template<class InputIterator>
list(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

*Effects*: Constructs a list equal to the range `[first, last)`.

*Complexity*: Linear in distance(first, last).

```cpp
template<container-compatible-range<T> R>
list(from_range_t, R&& rg, const Allocator& = Allocator());
```

*Effects*: Constructs a list object with the elements of the range rg.

*Complexity*: Linear in ranges::distance(rg).

### 24.3.10.3 Capacity

```cpp
void resize(size_type sz);
```

*Preconditions*: T is `Cpp17DefaultInsertable` into *this.

*Effects*: If size() < sz, appends sz - size() default-inserted elements to the sequence. If sz <= size(), equivalent to:

```cpp
list<T>::iterator it = begin();
advance(it, sz);
erase(it, end());
```

```cpp
void resize(size_type sz, const T& c);
```

*Preconditions*: T is `Cpp17CopyInsertable` into *this.

*Effects*: As if by:

```cpp
if (sz > size())
    insert(end(), sz-size(), c);
else if (sz < size()) {
    iterator i = begin();
    advance(i, sz);
```
erase(i, end());
}
else
    // do nothing

24.3.10.4 Modifiers

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first,
          InputIterator last);
template<
    container-compatible-range<T> R>
    iterator insert_range(const_iterator position, R&& rg);
    iterator insert_range(const_iterator position, initializer_list<T>);
template<class... Args>
    reference emplace_front(Args&&... args);
template<class... Args>
    reference emplace_back(Args&&... args);
template<class... Args>
    iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<
    container-compatible-range<T> R>
    void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<
    container-compatible-range<T> R>
    void append_range(R&& rg);

Complexity: Insertion of a single element into a list takes constant time and exactly one call to a
constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted,
and the number of calls to the copy constructor or move constructor of T is exactly equal to the number
of elements inserted.

Remarks: Does not affect the validity of iterators and references. If an exception is thrown there are no
effects.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();
void clear() noexcept;

Effects: Invalidates only the iterators and references to the erased elements.

Throws: Nothing.

Complexity: Erasing a single element is a constant time operation with a single call to the destructor
of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the
destructor of type T is exactly equal to the size of the range.

24.3.10.5 Operations

Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically
for them. In this subclause, arguments for a template parameter named Predicate or BinaryPredicate
shall meet the corresponding requirements in 27.2. The semantics of i + n and i - n, where i is an iterator
into the list and n is an integer, are the same as those of next(i, n) and prev(i, n), respectively. For
merge and sort, the definitions and requirements in 27.8 apply.

list provides three splice operations that destructively move elements from one list to another. The behavior
of splice operations is undefined if get_allocator() != x.get_allocator().

void splice(const_iterator position, list& x);

215) As specified in 16.4.4.6, the requirements in this Clause apply only to lists whose allocators compare equal.
void splice(const_iterator position, list&& x);

**Preconditions**: addressof(x) != this is true.

**Effects**: Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

**Throws**: Nothing.

**Complexity**: Constant time.

void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);

**Preconditions**: i is a valid dereferenceable iterator of x.

**Effects**: Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if position == i or position == ++i. Pointers and references to *i continue to refer to this same element but as a member of *this. Iterators to *i (including i itself) continue to refer to the same element, but now behave as iterators into *this, not into x.

**Throws**: Nothing.

**Complexity**: Constant time.

void splice(const_iterator position, list& x, const_iterator first, const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first, const_iterator last);

**Preconditions**: [first, last) is a valid range in x. position is not an iterator in the range [first, last).

**Effects**: Inserts elements in the range [first, last) before position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

**Throws**: Nothing.

**Complexity**: Constant time if addressof(x) == this; otherwise, linear time.

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

**Effects**: Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value, pred(*i) != false. Invalidates only the iterators and references to the erased elements.

**Returns**: The number of elements erased.

**Throws**: Nothing unless an exception is thrown by *i == value or pred(*i) != false.

**Complexity**: Exactly size() applications of the corresponding predicate.

**Remarks**: Stable (16.4.6.8).

size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

Let binary_pred be equal_to<>{} for the first overload.

**Preconditions**: binary_pred is an equivalence relation.

**Effects**: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator i in the range [begin() + 1, end()) for which binary_pred(*i, *(i - 1)) is true. Invalidates only the iterators and references to the erased elements.

**Returns**: The number of elements erased.

**Throws**: Nothing unless an exception is thrown by the predicate.
Complexity: If `empty()` is `false`, exactly `size()-1` applications of the corresponding predicate, otherwise no applications of the predicate.

```cpp
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

Let `comp` be `less<` for the first two overloads.

**Preconditions:** `*this` and `x` are both sorted with respect to the comparator `comp`, and `get_allocator()` `== x.get_allocator()` `is` `true`.

**Effects:** If `addressof(x) == this`, there are no effects. Otherwise, merges the two sorted ranges `begin().end()` and `x.begin().x.end()`). The result is a range that is sorted with respect to the comparator `comp`. Pointers and references to the moved elements of `x` now refer to those same elements but as members of `*this`. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into `*this`, not into `x`.

**Complexity:** At most `size() + x.size() - 1` comparisons if `addressof(x) != this`; otherwise, no comparisons are performed.

**Remarks:** Stable (16.4.6.8). If `addressof(x) != this`, `x` is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison there are no effects.

```cpp
void reverse() noexcept;
```

**Effects:** Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

**Complexity:** Linear time.

```cpp
void sort();
template<class Compare> void sort(Compare comp);
```

**Effects:** Sorts the list according to the `operator<` or a `Compare` function object. If an exception is thrown, the order of the elements in `*this` is unspecified. Does not affect the validity of iterators and references.

**Complexity:** Approximately `N log N` comparisons, where `N == size()`.

**Remarks:** Stable (16.4.6.8).

### 24.3.11 Class template vector

**24.3.11.1 Overview**

A `vector` is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.

A `vector` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of a sequence container, including most of the optional sequence container requirements (24.2.4), and, for an element type other than `bool`, of a contiguous container (24.2.2.1). The exceptions are the `push_front`, `prepend_range`, `pop_front`, and `emplace_front` member functions, which are not provided. Descriptions are provided here only for operations on `vector` that are not described in one of these tables or for operations where there is additional semantic information.
The types `iterator` and `const_iterator` meet the constexpr iterator requirements (25.3.1).

namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 24.2
        using difference_type = implementation-defined; // see 24.2
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

        // 24.3.11.2, construct/copy/destroy
        constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { } 
        constexpr explicit vector(const Allocator&) noexcept;

constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<container-compatible-range T R> constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&);
constexpr void clear() noexcept;

4 An incomplete type T may be used when instantiating vector if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of vector is referenced.

§ 24.3.11.1 920
### 24.3.11.2 Constructors

```cpp
constexpr explicit vector(const Allocator&) noexcept;
```

**Effects:** Constructs an empty `vector`, using the specified allocator.

**Complexity:** Constant.

```cpp
constexpr explicit vector(size_type n, const Allocator& = Allocator());
```

**Preconditions:** `T` is Cpp17DefaultInsertable into `*this`.

**Effects:** Constructs a `vector` with `n` default-inserted elements using the specified allocator.

**Complexity:** Linear in `n`.

```cpp
constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
```

**Preconditions:** `T` is Cpp17CopyInsertable into `*this`.

**Effects:** Constructs a `vector` with `n` copies of `value`, using the specified allocator.

**Complexity:** Linear in `n`.

```cpp
template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

**Effects:** Constructs a `vector` equal to the range `[first, last)`, using the specified allocator.

**Complexity:** Makes only `N` calls to the copy constructor of `T` (where `N` is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order `N` calls to the copy constructor of `T` and order \( \log N \) reallocations if they are just input iterators.

```cpp
template<container-compatible-range<T> R>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
```

**Effects:** Constructs a `vector` object with the elements of the range `rg`, using the specified allocator.

**Complexity:** Initializes exactly `N` elements from the results of dereferencing successive iterators of `rg`, where `N` is `ranges::distance(rg)`. Performs no reallocations if `R` models `ranges::forward_range` or `ranges::sized_range`; otherwise, performs order \( \log N \) reallocations and order `N` calls to the copy or move constructor of `T`.

### 24.3.11.3 Capacity

```cpp
constexpr size_type capacity() const noexcept;
```

**Returns:** The total number of elements that the vector can hold without requiring reallocation.

**Complexity:** Constant time.

```cpp
constexpr void reserve(size_type n);
```

**Preconditions:** `T` is Cpp17MoveInsertable into `*this`.

**Effects:** A directive that informs a `vector` of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable type, there are no effects.

**Throws:** `length_error` if `n > max_size()`.

**Complexity:** It does not change the size of the sequence and takes at most linear time in the size of the sequence.

**Remarks:** Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 1: If no reallocation happens, they remain valid. — end note]

---

216) `reserve()` uses `Allocator::allocate()` which can throw an appropriate exception.
No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```cpp
constexpr void shrink_to_fit();
```

**Preconditions:** `T` is `Cpp17MoveInsertable` into `*this`.

**Effects:** `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[Note 2: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` `T` there are no effects.

**Complexity:** If reallocation happens, linear in the size of the sequence.

**Remarks:** Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

[Note 3: If no reallocation happens, they remain valid. — end note]

```cpp
constexpr void swap(vector& x) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value || allocator_traits<Allocator>::is_always_equal::value);
```

**Effects:** Exchanges the contents and `capacity()` of `*this` with that of `x`.

**Complexity:** Constant time.

```cpp
constexpr void resize(size_type sz);
```

**Preconditions:** `T` is `Cpp17MoveInsertable` and `Cpp17DefaultInsertable` into `*this`.

**Effects:** If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

**Remarks:** If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` `T` there are no effects.

```cpp
constexpr void resize(size_type sz, const T& c);
```

**Preconditions:** `T` is `Cpp17CopyInsertable` into `*this`.

**Effects:** If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

**Remarks:** If an exception is thrown there are no effects.

### 24.3.11.4 Data

```cpp
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

**Returns:** A pointer such that `[data(), data() + size()]` is a valid range. For a non-empty vector, `data() == addressof(front())`.

**Complexity:** Constant time.

### 24.3.11.5 Modifiers

```cpp
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T>);
template<class... Args> constexpr reference emplace_back(Args&&... args);
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
```
template<container-compatible-range<T> R>
constexpr void append_range(R&& rg);

Complexity: If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

Remarks: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T or by any inputIterator operation there are no effects. If an exception is thrown while inserting a single element at the end and T is Cpp17CopyInsertable or is_nothrow_move_constructible_v<T> is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();

Effects: Invalidates iterators and references at or after the point of the erase.

Throws: Nothing unless an exception is thrown by the assignment operator or move assignment operator of T.

Complexity: The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.

24.3.11.6 Erasure

template<class T, class Allocator, class U>
constexpr typename vector<T, Allocator>::size_type
erase(vector<T, Allocator>& c, const U& value);

Effects: Equivalent to:
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<class T, class Allocator, class Predicate>
constexpr typename vector<T, Allocator>::size_type
erase_if(vector<T, Allocator>& c, Predicate pred);

Effects: Equivalent to:
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

24.3.12 Specialization of vector for bool

24.3.12.1 Partial class template specialization vector<bool, Allocator>

To optimize space allocation, a partial specialization of vector for bool elements is provided:

namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
        public:
            // types
            using value_type = bool;
            using allocator_type = Allocator;
            using pointer = implementation-defined;
            using const_pointer = implementation-defined;
            using const_reference = bool;
            using size_type = implementation-defined; // see 24.2
using difference_type = implementation-defined; // see 24.2
using iterator = implementation-defined; // see 24.2
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// bit reference
class reference {
friend class vector;
constexpr reference() noexcept;
public:
constexpr reference(const reference&) = default;
constexpr ~reference();
constexpr operator bool() const noexcept;
constexpr reference& operator=(bool x) noexcept;
constexpr reference& operator=(const reference& x) noexcept;
constexpr const reference& operator=(bool x) const noexcept;
constexpr void flip() noexcept; // flips the bit
};

// construct/copy/destroy
constexpr vector() : vector(Allocator()) {} 
constexpr explicit vector(const Allocator&);
constexpr explicit vector(size_type n, const Allocator& = Allocator());
constexpr vector(size_type n, const bool& value, const Allocator& = Allocator());
template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<class InputIterator>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
constexpr vector(const vector& x);
constexpr vector(vector&& x);
constexpr vector(const vector&, const type_identity_t<Allocator>&);
constexpr vector(vector&&, const type_identity_t<Allocator>&);
constexpr vector(initializer_list<bool>, const Allocator& = Allocator());
constexpr ~vector();
constexpr vector& operator=(const vector& x);
constexpr vector& operator=(vector&& x);
constexpr vector& operator=(initializer_list<bool>);
constexpr allocator_type get_allocator() const noexcept;

// iterators
constexpr iterator begin() noexcept;
constexpr const_iterator begin() const noexcept;
constexpr iterator end() noexcept;
constexpr const_iterator end() const noexcept;
constexpr reverse_iterator rbegin() noexcept;
constexpr const_reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() noexcept;
constexpr const_reverse_iterator rend() const noexcept;
constexpr const_iterator cbegin() const noexcept;
constexpr const_iterator cend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

// capacity
[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;

§ 24.3.12.1 924
constexpr size_type max_size() const noexcept;
constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz, bool c = false);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr const_reference at(size_type n) const;
constexpr reference at(size_type n);
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const bool& x);
template<container-compatible-range<br> R>
constexpr void append_range(R&& rg);
constexpr void pop_back();
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const bool& x);
constexpr iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<br> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<bool> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&);
constexpr static void swap(reference x, reference y) noexcept;
constexpr void flip() noexcept; // flips all bits
constexpr void clear() noexcept;
}

2 Unless described below, all operations have the same requirements and semantics as the primary vector template, except that operations dealing with the bool value type map to bit values in the container storage and allocator_traits::construct (20.2.9.3) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of bool values. A space-optimized representation of bits is recommended instead.

4 reference is a class that simulates the behavior of references of a single bit in vector<bool>. The conversion function returns true when the bit is set, and false otherwise. The assignment operators set the bit when the argument is (convertible to) true and clear it otherwise. flip reverses the state of the bit.

constexpr void flip() noexcept;

5 Effects: Replaces each element in the container with its complement.

constexpr static void swap(reference x, reference y) noexcept;

6 Effects: Exchanges the contents of x and y as if by:
bool b = x;
x = y;
y = b;

template<class Allocator> struct hash<vector<bool, Allocator>>;

7 The specialization is enabled (22.10.19).
template<class T>
inline constexpr bool is-vector-bool-reference = see below;

The expression `is-vector-bool-reference<T>` is true if `T` denotes the type `vector<bool, Alloc>::reference` for some type `Alloc` and `vector<bool, Alloc>` is not a program-defined specialization.

24.3.12.2 Formatter specialization for `vector<bool>`

```cpp
namespace std {
    template<class T, class charT>
    requires is-vector-bool-reference<T>
    struct formatter<T, charT> {
        private:
            formatter<bool, charT> underlying_; // exposition only
        public:
            template<class ParseContext>
            constexpr typename ParseContext::iterator
            parse(ParseContext& ctx);
            template<class FormatContext>
            typename FormatContext::iterator
            format(const T& ref, FormatContext& ctx) const;
    };
}
```

```cpp
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

```cpp
template<class FormatContext>
typename FormatContext::iterator
format(const T& ref, FormatContext& ctx) const;
```

24.4 Associative containers

24.4.1 In general

The header `<map>` defines the class templates `map` and `multimap`; the header `<set>` defines the class templates `set` and `multiset`.

The following exposition-only alias templates may appear in deduction guides for associative containers:

```cpp
template<class InputIterator>
using iter-value-type =
    typename iterator_traits<InputIterator>::value_type; // exposition only
```

```cpp
template<class InputIterator>
using iter-key-type = remove_const_t<tuple_element_t<0, iter-value-type<InputIterator>>>;
```

```cpp
template<class InputIterator>
using iter-mapped-type =
    tuple_element_t<1, iter-value-type<InputIterator>>; // exposition only
```

```cpp
template<class InputIterator>
using iter-to-alloc-type =
    pair<add_const_t<tuple_element_t<0, iter-value-type<InputIterator>>>,
         tuple_element_t<1, iter-value-type<InputIterator>>>; // exposition only
```

```cpp
template<ranges::input_range Range>
using range-key-type =
    remove_const_t<typename ranges::range_value_t<Range>::first_type>; // exposition only
```

```cpp
template<ranges::input_range Range>
using range-mapped-type =
    typename ranges::range_value_t<Range>::second_type; // exposition only
```

```cpp
template<ranges::input_range Range>
using range-to-alloc-type =
    pair<add_const_t<typename ranges::range_value_t<Range>::first_type>,
         typename ranges::range_value_t<Range>::second_type>; // exposition only
```
24.4.2 Header <map> synopsis

```cpp
#include <compare>    // see 17.12.1
#include <initializer_list>  // see 17.11.2

namespace std {

    // 24.4.4, class template map
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>> class map;

    template<class Key, class T, class Compare, class Allocator>
    bool operator==(const map<Key, T, Compare, Allocator>& x,
                    const map<Key, T, Compare, Allocator>& y);

    template<class Key, class T, class Compare, class Allocator>
    synth-three-way-result<
        pair<const Key, T>> operator<=>(const map<Key, T, Compare, Allocator>& x,
                                           const map<Key, T, Compare, Allocator>& y);

    template<class Key, class T, class Compare, class Allocator>
    void swap(map<Key, T, Compare, Allocator>& x,
              map<Key, T, Compare, Allocator>& y)
              noexcept(noexcept(x.swap(y)));

    // 24.4.4.5, erasure for map
    template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename map<Key, T, Compare, Allocator>::size_type
    erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

    // 24.4.5, class template multimap
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>> class multimap;

    template<class Key, class T, class Compare, class Allocator>
    bool operator==(const multimap<Key, T, Compare, Allocator>& x,
                    const multimap<Key, T, Compare, Allocator>& y);

    template<class Key, class T, class Compare, class Allocator>
    synth-three-way-result<
        pair<const Key, T>> operator<=>(const multimap<Key, T, Compare, Allocator>& x,
                                          const multimap<Key, T, Compare, Allocator>& y);

    template<class Key, class T, class Compare, class Allocator>
    void swap(multimap<Key, T, Compare, Allocator>& x,
              multimap<Key, T, Compare, Allocator>& y)
              noexcept(noexcept(x.swap(y)));

    // 24.4.5.4, erasure for multimap
    template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename multimap<Key, T, Compare, Allocator>::size_type
    erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);

namespace pmr {
    template<class Key, class T, class Compare = less<Key>>
    using map = std::map<Key, T, Compare,
                          polymorphic_allocator<pair<const Key, T>>>;

    template<class Key, class T, class Compare = less<Key>>
    using multimap = std::multimap<Key, T, Compare,
                                   polymorphic_allocator<pair<const Key, T>>>;
}
}

§ 24.4.2
24.4.3 Header <set> synopsis

```cpp
#include <compare>  // see 17.12.1
#include <initializer_list>  // see 17.11.2

namespace std {
  // 24.4.6, class template set
  template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
    class set;

  template<class Key, class Compare, class Allocator>
    bool operator==(const set<Key, Compare, Allocator>& x, const set<Key, Compare, Allocator>& y);
  // 24.4.6.3, erasure for set
  template<class Key, class Compare, class Allocator, class Predicate>
    typename set<Key, Compare, Allocator>::size_type
      erase_if(set<Key, Compare, Allocator>& c, Predicate pred);

  template<class Key, class Compare, class Allocator>
    void swap(set<Key, Compare, Allocator>& x, set<Key, Compare, Allocator>& y)
      noexcept(noexcept(x.swap(y)));

  // 24.4.7, class template multiset
  template<class Key, class Compare = less<Key>, class Allocator = allocator<Key>>
    class multiset;

  template<class Key, class Compare, class Allocator>
    bool operator==(const multiset<Key, Compare, Allocator>& x, const multiset<Key, Compare, Allocator>& y);
  // 24.4.7.3, erasure for multiset
  template<class Key, class Compare, class Allocator, class Predicate>
    typename multiset<Key, Compare, Allocator>::size_type
      erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

  namespace pmr {
    template<class Key, class Compare = less<Key>>
      using set = std::set<Key, Compare, polymorphic_allocator<Key>>;
    template<class Key, class Compare = less<Key>>
      using multiset = std::multiset<Key, Compare, polymorphic_allocator<Key>>;
  }
}

24.4.4 Class template map

24.4.4.1 Overview

A map is an associative container that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. The map class supports bidirectional iterators.

§ 24.4.4.1
A map meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A map also provides most operations described in 24.2.7 for unique keys. This means that a map supports the `a_uniq` operations in 24.2.7 but not the `a_eq` operations. For a map<Key,T> the key_type is Key and the value_type is `pair<const Key,T>`. Descriptions are provided here only for operations on map that are not described in one of those tables or for operations where there is additional semantic information.

namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class map {
    public:
        // types
        using key_type = Key;
        using mapped_type = T;
        using value_type = pair<const Key, T>;
        using key_compare = Compare;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 24.2
        using difference_type = implementation-defined; // see 24.2
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        using node_type = unspecified;
        using insert_return_type = insert-return-type<iterator, node_type>;

        class value_compare {
            friend class map;
            protected:
                Compare comp;
            value_compare(Compare c) : comp(c) {}
        public:
            bool operator()(const value_type& x, const value_type& y) const {
                return comp(x.first, y.first);
            }
        };

        // 24.4.4.2, construct/copy/destroy
        map() : map(Compare()) {} 
        explicit map(const Compare& comp, const Allocator& = Allocator());
        template<class InputIterator>

    pair<iterator, iterator> equal_range(const K& x);
    template<class K>
    pair<const_iterator, const_iterator> equal_range(const K& x) const;
24.4.4.2 Constructors, copy, and assignment

```cpp
explicit map(const Compare& comp, const Allocator& = Allocator());
```

**Effects:** Constructs an empty `map` using the specified comparison object and allocator.

**Complexity:** Constant.

```cpp
template<class InputIterator>
map(InputIterator first, InputIterator last, 
    const Compare& comp = Compare(), const Allocator& = Allocator());
```

**Effects:** Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `[first, last)`.

**Complexity:** Linear in \(N\) if the range `[first, last)` is already sorted with respect to `comp` and otherwise \(N \log N\), where \(N = last - first\).

```cpp
template<container-compatible-range<value_type> R>
map(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());
```

**Effects:** Constructs an empty `map` using the specified comparison object and allocator, and inserts elements from the range `rg`.

**Complexity:** Linear in \(N\) if `rg` is already sorted with respect to `comp` and otherwise \(N \log N\), where \(N\) is `ranges::distance(rg)`.

### 24.4.4.3 Element access

```cpp
mapped_type& operator[](const key_type& x);
```

**Effects:** Equivalent to: `return try_emplace(x).first->second;`

```cpp
mapped_type& operator[](key_type&& x);
```

**Effects:** Equivalent to: `return try_emplace(std::move(x)).first->second;`
mapped_type& at(const key_type& x);
const mapped_type& at(const key_type& x) const;

Returns: A reference to the mapped_type corresponding to x in *this.
Throws: An exception object of type out_of_range if no such element is present.
Complexity: Logarithmic.

24.4.4.4 Modifiers

template<class P>
pair<iterator, bool> insert(P&& x);
template<class P>
iterator insert(const_iterator position, P&& x);

Constraints: is_constructible_v<value_type, P&&> is true.
Effects: The first form is equivalent to return emplace(std::forward<P>(x)). The second form is equivalent to return emplace_hint(position, std::forward<P>(x)).

template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);

Preconditions: value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).
Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).
Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.
Complexity: The same as emplace and emplace_hint, respectively.

template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

Preconditions: value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).
Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).
Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.
Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);

Mandates: is_assignable_v<mapped_type&, M&&> is true.
Preconditions: value_type is Cpp17EmplaceConstructible into map from k, std::forward<M>(obj).
Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with k, std::forward<M>(obj).
Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.
Complexity: The same as emplace and emplace_hint, respectively.
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);

template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

Mandates: is_assignable_v<mapped_type&, M&&> is true.

Preconditions: value_type is Cpp17EmplaceConstructible into map from std::move(k), std::forward<M>(obj).

Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with std::move(k), std::forward<M>(obj).

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

Complexity: The same as emplace and emplace_hint, respectively.

24.4.4.5 Erasure

template<class Key, class T, class Compare, class Allocator, class Predicate>
typename map<Key, T, Compare, Allocator>::size_type
erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();

24.4.5 Class template multimap

24.4.5.1 Overview

A multimap is an associative container that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type T based on the keys. The multimap class supports bidirectional iterators.

A multimap meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A multimap also provides most operations described in 24.2.7 for equal keys. This means that a multimap supports the a_eq operations in 24.2.7 but not the a_uniq operations. For a multimap<Key,T> the key_type is Key and the value_type is pair<const Key,T>. Descriptions are provided here only for operations on multimap that are not described in one of those tables or for operations where there is additional semantic information.

namespace std {
  template<class Key, class T, class Compare = less<Key>,
           class Allocator = allocator<pair<const Key, T>>>

24.4.5.2 Constructors

explicit multimap(const Compare& comp, const Allocator& = Allocator());

1 Effects: Constructs an empty multimap using the specified comparison object and allocator.

2 Complexity: Constant.

template<class InputIterator>
multimap(InputIterator first, InputIterator last,
const Compare& comp = Compare(),
const Allocator& = Allocator());

3 Effects: Constructs an empty multimap using the specified comparison object and allocator, and inserts elements from the range [first, last).

4 Complexity: Linear in N if the range [first, last) is already sorted with respect to comp and otherwise N log N, where N is last - first.
template<container-compatible-range<value_type> R>
  multimap(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty multimap using the specified comparison object and allocator, and inserts
elements from the range rg.

Complexity: Linear in N if rg is already sorted with respect to comp and otherwise N log N, where N
is ranges::distance(rg).

24.4.5.3 Modifiers

template<class P> iterator insert(P&& x);
template<class P> iterator insert(const_iterator position, P&& x);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: The first form is equivalent to return emplace(std::forward<P>(x)). The second form is
equivalent to return emplace_hint(position, std::forward<P>(x)).

24.4.5.4 Erasure

template<class Key, class T, class Compare, class Allocator, class Predicate>
  typename multimap<Key, T, Compare, Allocator>::size_type
  erase_if(multimap<Key, T, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:
  auto original_size = c.size();
  for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
      i = c.erase(i);
    } else {
      ++i;
    }
  }
  return original_size - c.size();

24.4.6 Class template set

24.4.6.1 Overview

A set is an associative container that supports unique keys (i.e., contains at most one of each key value) and
provides for fast retrieval of the keys themselves. The set class supports bidirectional iterators.

A set meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an
allocator-aware container (24.2.2.5). and of an associative container (24.2.7). A set also provides most
operations described in 24.2.7 for unique keys. This means that a set supports the a_uniq operations in 24.2.7
but not the a_eq operations. For a set<Key> both the key_type and value_type are Key. Descriptions are
provided here only for operations on set that are not described in one of these tables and for operations
where there is additional semantic information.

```cpp
namespace std {
  template<class Key, class Compare = less<Key>,
    class Allocator = allocator<Key>>
  class set {
    public:
      // types
      using key_type = Key;
      using key_compare = Compare;
      using value_type = Key;
      using value_compare = Compare;
      using allocator_type = Allocator;
      using pointer = typename allocator_traits<Allocator>::pointer;
      using const_pointer = typename allocator_traits<Allocator>::const_pointer;
      using reference = value_type&;
      using const_reference = const value_type&;
      using size_type = implementation-defined; // see 24.2
      using difference_type = implementation-defined; // see 24.2
      using iterator = implementation-defined; // see 24.2
  }
}
```
using const_iterator = implementation-defined; // see 24.2

24.4.6.2 Constructors, copy, and assignment

explicit set(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator.

Complexity: Constant.

template<class InputIterator>
    set<InputIterator first, InputIterator last,
     const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range [first, last).

Complexity: Linear in N if the range [first, last) is already sorted with respect to comp and otherwise N log N, where N is last - first.

template<container-compatible-range<value_type> R>
    set(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range rg.

Complexity: Linear in N if rg is already sorted with respect to comp and otherwise N log N, where N is ranges::distance(rg).

24.4.6.3 Erasure

template<class Key, class Compare, class Allocator, class Predicate>
typename set<Key, Compare, Allocator>::size_type
    erase_if(set<Key, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

24.4.7 Class template multiset

24.4.7.1 Overview

A multiset is an associative container that supports equivalent keys (i.e., possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The multiset class supports bidirectional iterators.

A multiset meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of an associative container (24.2.7). multiset also provides most operations described in 24.2.7 for duplicate keys. This means that a multiset supports the a_eq operations in 24.2.7 but not the a_uniq operations. For a multiset<Key> both the key_type and value_type are Key. Descriptions are provided here only for operations on multiset that are not described in one of these tables and for operations where there is additional semantic information.

-> multiset<ranges::range_value_t<R>, less<ranges::range_value_t<R>>, Allocator>;

template<class Key, class Allocator>
multiset(initializer_list<Key>, Allocator) -> multiset<Key, less<Key>, Allocator>;

24.4.7.2 Constructors

explicit multiset(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator.

Complexity: Constant.

template<class InputIterator>
multiset(InputIterator first, InputIterator last,
    const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range [first,last).

Complexity: Linear in N if the range [first,last) is already sorted with respect to comp and otherwise N log N, where N is last - first.

template<container-compatible-range<value_type> R>
multiset(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range rg.

Complexity: Linear in N if rg is already sorted with respect to comp and otherwise N log N, where N is ranges::distance(rg).

24.4.7.3 Erasure

template<class Key, class Compare, class Allocator, class Predicate>
typename multiset<Key, Compare, Allocator>::size_type
erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:

auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
} return original_size - c.size();

24.5 Unordered associative containers

24.5.1 In general

The header <unordered_map> defines the class templates unordered_map and unordered_multimap; the header <unordered_set> defines the class templates unordered_set and unordered_multiset.

The exposition-only alias templates iter-value-type, iter-key-type, iter-mapped-type, and iter-to-alloc-type defined in 24.4.1 may appear in deduction guides for unordered containers.

24.5.2 Header <unordered_map> synopsis

#include <compare>    // see 17.12.1
#include <initializer_list> // see 17.11.2
namespace std {
    // 24.5.4, class template unordered_map
    template<class Key,
             class T,
             class Hash = hash<Key>,
             class Pred = equal_to<Key>,
             class Alloc = allocator<pair<const Key, T>>>
    class unordered_map;

    // 24.5.5, class template unordered_multimap
    template<class Key,

}  // namespace pmr
```
24.5.4 Class template unordered_map

24.5.4.1 Overview

1 An unordered_map is an unordered associative container that supports unique keys (an unordered_map contains at most one of each key value) and that associates values of another type mapped_type with the keys. The unordered_map class supports forward iterators.

2 An unordered_map meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_map supports the a uniq operations in that table, not the a_eq operations. For an unordered_map<Key, T> the key_type is Key, the mapped_type is T, and the value_type is pair<const Key, T>.

3 Subclause 24.5.4 only describes operations on unordered_map that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key,
             class T,
             class Hash = hash<Key>,
             class Pred = equal_to<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class unordered_map {
        public:
            // types
            using key_type = Key;
            using mapped_type = T;
            using value_type = pair<const Key, T>;
            using hasher = Hash;
            using key_equal = Pred;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;

unordered_map(initializer_list<pair<Key, T>>, typename see below::size_type, Hash,
  Allocator)
  -> unordered_map<Key, T, Hash, equal_to<Key>, Allocator>;

A size_type parameter type in an unordered_map deduction guide refers to the size_type
member type of the type deduced by the deduction guide.

24.5.4.2 Constructors [unord.map.cnstr]

unordered_map() : unordered_map(size_type(see below)) { }
explicit unordered_map(size_type n,
  const hasher& hf = hasher(),
  const key_equal& eql = key_equal(),
  const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate,
and allocator, and using at least n buckets. For the default constructor, the number of buckets
is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.

template<class InputIterator f, InputIterator l,
  size_type n = see below,
  const hasher& hf = hasher(),
  const key_equal& eql = key_equal(),
  const allocator_type& a = allocator_type());

template<container-compatible-range<value_type> R>
unordered_map(from_range_t, R&& rg,
  size_type n = see below,
  const hasher& hf = hasher(),
  const key_equal& eql = key_equal(),
  const allocator_type& a = allocator_type());
unordered_map(initializer_list<value_type> il,  
      size_type n = see below,  
      const hasher& hf = hasher(),  
      const key_equal& eql = key_equal(),  
      const allocator_type& a = allocator_type());  

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l), [rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.4.3 Element access  

mapped_type& operator[](const key_type& k);  
Effects: Equivalent to: return try_emplace(k).first->second;

mapped_type& operator[](key_type&& k);  
Effects: Equivalent to: return try_emplace(std::move(k)).first->second;

mapped_type& at(const key_type& k);  
const mapped_type& at(const key_type& k) const;  
Returns: A reference to x.second, where x is the (unique) element whose key is equivalent to k.  
Throws: An exception object of type out_of_range if no such element is present.

24.5.4.4 Modifiers  

template<class P>  
  pair<iterator, bool> insert(P&& obj);  
  Constraints: is_constructible_v<value_type, P&&> is true.  
  Effects: Equivalent to: return emplace(std::forward<P>(obj));

template<class P>  
  iterator insert(const_iterator hint, P&& obj);  
  Constraints: is_constructible_v<value_type, P&&> is true.  
  Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

template<class... Args>  
  pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);  
  template<class... Args>  
  iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);  
  Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).
  Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).
  Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.
  Complexity: The same as emplace and emplace_hint, respectively.

template<class... Args>  
  pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);  
  template<class... Args>  
  iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);  
  Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).
10 Effects: If the map already contains an element whose key is equivalent to \( k \), there is no effect. Otherwise inserts an object of type value_type constructed with `piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...)`.

11 Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```cpp
template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
```

12 Mandates: is_assignable_v<mapped_type&, M&&> is true.

13 Preconditions: value_type is `Cpp17EmplaceConstructible` into unordered_map from \( k \), std::forward<M>(obj).

14 Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns std::forward<M>(obj) to \( e.second \). Otherwise inserts an object of type value_type constructed with \( k \), std::forward<M>(obj).

15 Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```cpp
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
```

16 Mandates: is_assignable_v<mapped_type&, M&&> is true.

17 Preconditions: value_type is `Cpp17EmplaceConstructible` into unordered_map from std::move(k), std::forward<M>(obj).

18 Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns std::forward<M>(obj) to \( e.second \). Otherwise inserts an object of type value_type constructed with std::move(k), std::forward<M>(obj).

19 Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

24.5.4.5 Erasure

```cpp
template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_map<K, T, H, P, A>::size_type
erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

1 Effects: Equivalent to:

```cpp
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.5.5 Class template unordered_multimap

24.5.5.1 Overview

An unordered_multimap is an unordered associative container that supports equivalent keys (an instance of unordered_multimap may contain multiple copies of each key value) and that associates values of another type mapped_type with the keys. The unordered_multimap class supports forward iterators.
An unordered_multimap meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multimap supports the \texttt{a\_eq} operations in that table, not the \texttt{a\_uniq} operations. For an unordered_multimap<Key, T> the key_type is Key, the \texttt{mapped_type} is T, and the value_type is pair<const Key, T>.

Subclause 24.5.5 only describes operations on unordered_multimap that are not described in one of the requirement tables, or for which there is additional semantic information.

```cpp
namespace std {
    template<class Key, 
             class T, 
             class Hash = hash<Key>, 
             class Pred = equal_to<Key>, 
             class Allocator = allocator<pair<const Key, T>>>
    class unordered_multimap {
        public:
            // types
            using key_type = Key;
            using mapped_type = T;
            using value_type = pair<const Key, T>;
            using hasher = Hash;
            using key_equal = Pred;
            using allocator_type = Allocator;
            using pointer = typename allocator_traits<Allocator>::pointer;
            using const_pointer = typename allocator_traits<Allocator>::const_pointer;
            using reference = value_type&;
            using const_reference = const value_type&;
            using size_type = implementation-defined; // see 24.2
            using difference_type = implementation-defined; // see 24.2

    Hash, equal_to<iter-key-type<InputIterator>>, Allocator>;

template<ranges::input_range R, class Allocator>
unordered_multimap(from_range_t, R&&, typename see below::size_type, Allocator)
-> unordered_multimap<range-key-type<R>, range-mapped-type<R>, hash<range-key-type<R>>,
    equal_to<range-key-type<R>>, Allocator>;

template<ranges::input_range R, class Hash, class Allocator>
unordered_multimap(from_range_t, R&&, typename see below::size_type, Hash, Allocator)
-> unordered_multimap<range-key-type<R>, range-mapped-type<R>, Hash,
    equal_to<range-key-type<R>>, Allocator>;}
template<class Key, class T, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, typename
                    see below::size_type,
                    Allocator)
    -> unordered_multimap<Key, T, hash<Key>, equal_to<Key>, Allocator>;

template<class Key, class T, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, Allocator)
    -> unordered_multimap<Key, T, hash<Key>, equal_to<Key>, Allocator>;

template<class Key, class T, class Hash, class Allocator>
    unordered_multimap(initializer_list<pair<Key, T>>, typename
                       see below::size_type,
                       Hash, Allocator)
    -> unordered_multimap<Key, T, Hash, equal_to<Key>, Allocator>;

4 A size_type parameter type in an unordered_multimap deduction guide refers to the size_type member type of the type deduced by the deduction guide.

24.5.5.2 Constructors [unord.multimap.cnstr]

unordered_multimap() : unordered_multimap(size_type(see below)) { }
explicit unordered_multimap(size_type n,
                                    const hasher& hf = hasher(),
                                    const key_equal& eql = key_equal(),
                                    const allocator_type& a = allocator_type());

1 Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

2 Complexity: Constant.

template<class InputIterator>
    unordered_multimap(InputIterator f, InputIterator l,
                        size_type n = see below,
                        const hasher& hf = hasher(),
                        const key_equal& eql = key_equal(),
                        const allocator_type& a = allocator_type());

template<container-compatible-range<value_type> R>
    unordered_multimap(from_range_t, R&& rg,
                        size_type n = see below,
                        const hasher& hf = hasher(),
                        const key_equal& eql = key_equal(),
                        const allocator_type& a = allocator_type());

unordered_multimap(initializer_list<value_type> il,
                        size_type n = see below,
                        const hasher& hf = hasher(),
                        const key_equal& eql = key_equal(),
                        const allocator_type& a = allocator_type());

3 Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l), rg, or il, respectively. max_load_factor() returns 1.0.

4 Complexity: Average case linear, worst case quadratic.

24.5.5.3 Modifiers [unord.multimap.modifiers]

template<class P>
    iterator insert(P&& obj);

1 Constraints: is_constructible_v<value_type, P&&> is true.

2 Effects: Equivalent to: return emplace(std::forward<P>(obj));
template<class P>
iterator insert(const_iterator hint, P&& obj);

3 Constraints: is_constructible_v<value_type, P&&> is true.
4 Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

24.5.5.4 Erasure [unord.multimap.erasure]

template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_multimap<K, T, H, P, A>::size_type
erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);

1 Effects: Equivalent to:
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();

24.5.6 Class template unordered_set [unord.set]

24.5.6.1 Overview [unord.set.overview]

1 An unordered_set is an unordered associative container that supports unique keys (an unordered_set contains at most one of each key value) and in which the elements’ keys are the elements themselves. The unordered_set class supports forward iterators.

2 An unordered_set meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_set supports the a_unique operations in that table, not the a_eq operations. For an unordered_set<Key> the key_type and the value_type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

3 Subclause 24.5.6 only describes operations on unordered_set that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key, 
        class Hash = hash<Key>, 
        class Pred = equal_to<Key>, 
        class Allocator = allocator<Key>> 
    class unordered_set {
public:
    // types
    using key_type = Key;
    using value_type = Key;
    using hasher = Hash;
    using key_equal = Pred;

§ 24.5.6.1 963
A `size_type` parameter type in an `unordered_set` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 24.5.6.2 Constructors

`unordered_set()` : `unordered_set(size_type(see below))` { }

```cpp
explicit unordered_set(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
```

**Effects:** Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

**Complexity:** Constant.

```cpp
template<class InputIterator>
unordered_set(InputIterator f, InputIterator l,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());
```

**Effects:** Constructs an empty `unordered_set` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. If `n` is not provided, the number of buckets is implementation-defined. Then inserts elements from the range `[f, l)`. `rg` or `il`, respectively. `max_load_factor()` returns 1.0.

**Complexity:** Average case linear, worst case quadratic.
24.5.6.3 Erasure

template<class K, class H, class P, class A, class Predicate>
    typename unordered_set<K, H, P, A>::size_type
erase_if(unordered_set<K, H, P, A>& c, Predicate pred);

Effects: Equivalent to:

    auto original_size = c.size();
    for (auto i = c.begin(), last = c.end(); i != last; ) {
        if (pred(*i)) {
            i = c.erase(i);
        } else {
            ++i;
        }
    }
    return original_size - c.size();

24.5.7 Class template unordered_multiset

24.5.7.1 Overview

An unordered_multiset is an unordered associative container that supports equivalent keys (an instance of unordered_multiset may contain multiple copies of the same key value) and in which each element’s key is the element itself. The unordered_multiset class supports forward iterators.

An unordered_multiset meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unsorted associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multiset supports the a_eq operations in that table, not the a_uniq operations. For an unordered_multiset<Key> the key_type and the value_type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 24.5.7 only describes operations on unordered_multiset that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key,
        class Hash = hash<Key>,
        class Pred = equal_to<Key>,
        class Allocator = allocator<Key>>
    class unordered_multiset {
        public:
            // types
            using key_type = Key;
            using value_type = Key;
            using hasher = Hash;
            using key_equal = Pred;

  class Hash = hash<ranges::range_value_t<R>>,
  class Pred = equal_to<ranges::range_value_t<R>>,
  class Allocator = allocator<ranges::range_value_t<R>>>
unordered_multiset(from_range_t, R&&, typename see_below::size_type = see below,
  Hash = Hash(), Pred = Pred(), Allocator = Allocator())
-> unordered_multiset<ranges::range_value_t<R>, Hash, Pred, Allocator>;

template<class T, class Hash = hash<T>,
  class Pred = equal_to<T>, class Allocator = allocator<T>>
unordered_multiset(initializer_list<T>, typename see_below::size_type = see below,
  Hash = Hash(), Pred = Pred(), Allocator = Allocator())
-> unordered_multiset<T, Hash, Pred, Allocator>;

template<class InputIterator, class Allocator>
unordered_multiset(InputIterator, InputIterator,
  typename see_below::size_type, Allocator)
-> unordered_multiset<iter_value_type<InputIterator>,
  hash<iter_value_type<InputIterator>>,
  equal_to<iter_value_type<InputIterator>>,
  Allocator>;

template<class InputIterator, class Hash, class Allocator>
unordered_multiset(InputIterator, InputIterator,
  typename see_below::size_type,
  Hash, Allocator)
-> unordered_multiset<iter_value_type<InputIterator>, Hash,
  equal_to<iter_value_type<InputIterator>>,
  Allocator>;

§ 24.5.7.1
A `size_type` parameter type in an `unordered_multiset` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 24.5.7.2 Constructors [unord.multiset.cnstr]

```cpp
unordered_multiset() : unordered_multiset(size_type(see below)) { } explicit unordered_multiset(size_type n, const hasher& hf = hasher(), const key_equal& eql = key_equal(), const allocator_type& a = allocator_type());
```

**Effects:** Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least \( n \) buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns 1.0.

**Complexity:** Constant.

```cpp
template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l, size_type n = see below, const hasher& hf = hasher(), const key_equal& eql = key_equal(), const allocator_type& a = allocator_type());
```

**Effects:** Constructs an empty `unordered_multiset` using the specified hash function, key equality predicate, and allocator, and using at least \( n \) buckets. If \( n \) is not provided, the number of buckets is implementation-defined. Then inserts elements from the range \([f, l)\), \(rg\), or \(il\), respectively. `max_load_factor()` returns 1.0.

**Complexity:** Average case linear, worst case quadratic.
24.5.7.3 Erasure

\[\text{template\langle class } K, \text{ class } H, \text{ class } P, \text{ class } A, \text{ class Predicate}\rangle\]
\[\text{typename unordered\_multiset\langle } K, \text{ } H, \text{ } P, \text{ } A\rangle::\text{size\_type}\]
\[\text{erase\_if}(\text{unordered\_multiset\langle } K, \text{ } H, \text{ } P, \text{ } A\rangle& \text{ c, Predicate pred});\]

1 \textit{Effects:} Equivalent to:
\[
\begin{align*}
&\text{auto original\_size} = \text{c.size()}; \\
&\text{for (auto } i = \text{c.begin()}, \text{last} = \text{c.end(); } i \neq \text{last; }) \{ \\
&\quad \text{if (pred(*i))} \{ \\
&\qquad i = \text{c.erase(i)}; \\
&\quad \} \text{ else } \{ \\
&\qquad ++i; \\
&\quad \} \\
&\}\text{return original\_size} - \text{c.size();}
\end{align*}
\]

24.6 Container adaptors

24.6.1 In general

1 The headers \textlt{queue}, \textlt{stack}, \textlt{flat\_map}, and \textlt{flat\_set} define the container adaptors \textlt{queue} and \textlt{priority\_queue}, \textlt{stack}, \textlt{flat\_map} and \textlt{flat\_multimap}, and \textlt{flat\_set} and \textlt{flat\_multiset}, respectively.

2 Each container adaptor takes one or more template parameters named \textit{Container}, \textit{KeyContainer}, or \textit{MappedContainer} that denote the types of containers that the container adaptor adapts. Each container adaptor has at least one constructor that takes a reference argument to one or more such template parameters. For each constructor reference argument to a container \textit{C}, the constructor copies the container into the container adaptor. If \textit{C} takes an allocator, then a compatible allocator may be passed in to the adaptor’s constructor. Otherwise, normal copy or move construction is used for the container argument. For the container adaptors that take a single container template parameter \textit{Container}, the first template parameter \textit{T} of the container adaptor shall denote the same type as \textit{Container::value\_type}.

3 For container adaptors, no \textit{swap} function throws an exception unless that exception is thrown by the swap of the adaptor’s \textit{Container}, \textit{KeyContainer}, \textit{MappedContainer}, or \textit{Compare} object (if any).

4 A constructor template of a container adaptor shall not participate in overload resolution if it has an \textit{Input\_Iterator} template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

5 For container adaptors that have them, the \textit{insert}, \textit{emplace}, and \textit{erase} members affect the validity of iterators, references, and pointers to the adaptor’s container(s) in the same way that the containers’ respective \textit{insert}, \textit{emplace}, and \textit{erase} members do.

[\textit{Example 1:} A call to \textlt{flat\_map<Key, T>::insert} can invalidate all iterators to the \textlt{flat\_map}. — \textit{end example}]  

6 A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

(6.1) — It has an \textit{Input\_Iterator} template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(6.2) — It has a \textit{Compare} template parameter and a type that qualifies as an allocator is deduced for that parameter.

(6.3) — It has a \textit{Container}, \textit{KeyContainer}, or \textit{MappedContainer} template parameter and a type that qualifies as an allocator is deduced for that parameter.

(6.4) — It has no \textit{Container}, \textit{KeyContainer}, or \textit{MappedContainer} template parameter, and it has an \textit{Allocator} template parameter, and it has an \textit{Allocate\_parameter}, and a type that does not qualify as an allocator is deduced for that parameter.

(6.5) — It has both \textit{Container} and \textit{Allocate\_parameter} template parameters, and \textit{uses\_allocator\_v<Container, Allocate\_parameter>} is false.

(6.6) — It has both \textit{KeyContainer} and \textit{Allocate\_parameter} template parameters, and \textit{uses\_allocator\_v<KeyContainer, Allocate\_parameter>} is false.

(6.7) — It has both \textit{MappedContainer} and \textit{Allocate\_parameter} template parameters, and \textit{uses\_allocator\_v<Mapped\_Container, Allocate\_parameter>} is false.

\[\text{§ 24.6.1}\]
The exposition-only alias template \texttt{iter-value-type} defined in 24.3.1 and the exposition-only alias templates \texttt{iter-key-type} and \texttt{iter-mapped-type} defined in 24.4.1 may appear in deduction guides for container adaptors.

The following exposition-only alias templates may appear in deduction guides for container adaptors:

\begin{verbatim}
template<class Container>
using cont-key-type = // exposition only
    remove_const_t<typename Container::value_type::first_type>;

template<class Container>
using cont-mapped-type = // exposition only
    typename Container::value_type::second_type;
\end{verbatim}

24.6.6 Class template queue

24.6.6.1 Definition

Any sequence container supporting operations front(), back(), push_back() and pop_front() can be used to instantiate queue. In particular, list (24.3.10) and deque (24.3.8) can be used.

namespace std {
  template<class T, class Container = deque<T>>
    class queue {
    public:
      using value_type = typename Container::value_type;
      using reference = typename Container::reference;
      using const_reference = typename Container::const_reference;
      using size_type = typename Container::size_type;
      using container_type = Container;

    protected:
      Container c;

    public:
      queue() : queue(Container()) {}  
      explicit queue(const Container&);  
      explicit queue(Container&&);  
      template<class InputIterator> queue(InputIterator first, InputIterator last);  
      template<container-compatible-range>T R queue(from_range_t, R&& rg);  
      template<class Alloc> explicit queue(const Alloc&);  
      template<class Alloc> queue(const Container&, const Alloc&);  
      template<class Alloc> queue(Container&&, const Alloc&);  
      template<class Alloc> queue(const queue&, const Alloc&);  

§ 24.6.6.1
template<
class Alloc> queue(queue&&, const Alloc&);
template<
class InputIterator, class Alloc>
queue(InputIterator first, InputIterator last, const Alloc&);
template<
class-compatible-range<T> R, class Alloc>
queue(from_range_t, R&& rg, const Alloc&);

[[nodiscard]] bool empty() const { return c.empty(); }
size_type size() const { return c.size(); }
reference front() { return c.front(); }
const_reference front() const { return c.front(); }
reference back() { return c.back(); }
const_reference back() const { return c.back(); }
void push(const value_type& x) { c.push_back(x); }
void push(value_type&& x) { c.push_back(std::move(x)); }
template<
class-compatible-range<T> R> void push_range(R&& rg);
template<class... Args>
decltype(auto) emplace(Args&&... args)
    { return c.emplace_back(std::forward<Args>(args)...); }
void pop() { c.pop_front(); }
void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
    { using std::swap; swap(c, q.c); }
};
template<class Container>
queue(Container) -> queue<typename Container::value_type, Container>;
template<class InputIterator>
queue(InputIterator, InputIterator) -> queue<
iter-value-type<InputIterator>>;
template<
class-compatible-range<T> R>
queue(from_range_t, R&&) -> queue<ranges::range_value_t<R>>;
template<class Container, class Allocator>
queue(Container, Allocator) -> queue<typename Container::value_type, Container>;
template<class InputIterator, class Allocator>
queue(InputIterator, InputIterator, Allocator)
    -> queue<iter-value-type<InputIterator>>, 
deque<iter-value-type<InputIterator>>, 
    Allocator>;
template<
class-compatible-range<T> R, class Allocator>
queue(from_range_t, R&&, Allocator)
    -> queue<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;
template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc>
    : uses_allocator<Container, Alloc>::type { };

24.6.6.2 Constructors

explicit queue(const Container& cont);
1
Effects: Initializes c with cont.

explicit queue(Container&& cont);
2
Effects: Initializes c with std::move(cont).

template<class InputIterator>
queue(InputIterator first, InputIterator last);
3
Effects: Initializes c with first as the first argument and last as the second argument.
template<container-compatible-range<T> R>
  queue(from_range_t, R&& rg);
  
Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.6.3 Constructors with allocators

If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit queue(const Alloc& a);  
  Effects: Initializes c with a.

template<class Alloc> queue(const container_type& cont, const Alloc& a);  
  Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> queue(container_type&& cont, const Alloc& a);  
  Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> queue(const queue& q, const Alloc& a);  
  Effects: Initializes c with q.c as the first argument and a as the second argument.

template<class Alloc> queue(queue&& q, const Alloc& a);  
  Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.

template<class Alloc> queue(const Alloc& a);

24.6.6.4 Modifiers

void push_range(R&& rg);
  Effects: Equivalent to c.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise ranges::copy(rg, back_inserter(c)).

24.6.6.5 Operators

template<class T, class Container>
  bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);
  Returns: x.c == y.c.

template<class T, class Container>
  bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);
  Returns: x.c != y.c.

template<class T, class Container>
  bool operator<(const queue<T, Container>& x, const queue<T, Container>& y);
  Returns: x.c < y.c.

template<class T, class Container>
  bool operator>(const queue<T, Container>& x, const queue<T, Container>& y);
  Returns: x.c > y.c.

template<class T, class Container>
  bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);
  Returns: x.c <= y.c.

§ 24.6.6.5

975
template<class T, class Container>
bool operator>=(const queue<T, Container>& x, 
const queue<T, Container>& y);

Returns: x.c >= y.c.

template<class T, three_way_comparable Container>
compare_three_way_result_t<Container> 
operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c <=> y.c.

24.6.6.6 Specialized algorithms

template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

Constraints: is_swappable_v<Container> is true.

Effects: As if by x.swap(y).

24.6.7 Class template priority_queue

24.6.7.1 Overview

Any sequence container with random access iterator and supporting operations front(), push_back() and 
pop_back() can be used to instantiate priority_queue. In particular, vector (24.3.11) and deque (24.3.8) 
can be used. Instantiating priority_queue also involves supplying a function or function object for 
making priority comparisons; the library assumes that the function or function object defines a strict weak 
ordering (27.8).

namespace std {

template<class T, class Container = vector<T>,
    class Compare = less<typename Container::value_type>>
class priority_queue {

public:
    using value_type = typename Container::value_type;
    using reference = typename Container::reference;
    using const_reference = typename Container::const_reference;
    using size_type = typename Container::size_type;
    using container_type = Container;
    using value_compare = Compare;

protected:
    Container c;
    Compare comp;

public:
    priority_queue() : priority_queue(Compare()) {} 
    explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {} 
    priority_queue(const Compare& x, Container&);
    priority_queue(const Compare& x, const Container&);
    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());
    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x, 
        const Container&);
    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x, 
        Container&);
    template<class InputIterator>
    priority_queue(InputIterator first, InputIterator last, const Compare& x, 
        Container&&);
    template<container-compatible-range<T> R>
    priority_queue(from_range_t, R&& rg, const Compare& x = Compare());
    template<class Alloc> explicit priority_queue(const Alloc&);
    template<class Alloc> priority_queue(const Compare&, const Alloc);
    template<class Alloc> priority_queue(const Compare&, Container&, const Alloc&);
    template<class Alloc> priority_queue(const Compare&, Container&&, const Alloc&);
    template<class Alloc> priority_queue(const priority_queue&, const Alloc&);
    template<class Alloc> priority_queue(priority_queue&&, const Alloc&);

§ 24.6.7.1 976
template<class InputIterator, class Alloc>

§ 24.6.7.1
template<ranges::input_range R, class Compare, class Allocator>
    priority_queue(from_range_t, R&&, Compare, Allocator)  
    -> priority_queue<ranges::range_value_t<R>, vector<ranges::range_value_t<R>, Allocator>, Compare>; 

template<ranges::input_range R, class Allocator>
    priority_queue(from_range_t, R&&, Allocator)  
    -> priority_queue<ranges::range_value_t<R>, vector<ranges::range_value_t<R>, Allocator>>;

// no equality is provided

template<class T, class Container, class Compare, class Alloc> 
    struct uses_allocator<priority_queue<T, Container, Compare>, Alloc> 
    : uses_allocator<Container, Alloc>::type { }; 

24.6.7.2 Constructors [priqueue.cons]

priority_queue(const Compare& x, const Container& y);  
    Preconditions: x defines a strict weak ordering (27.8).  
    Effects: Initializes comp with x and c with y (copy constructing or move constructing as appropriate); 
    calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator> 
    priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());  
    Preconditions: x defines a strict weak ordering (27.8).  
    Effects: Initializes c with first as the first argument and last as the second argument, and initializes 
    comp with x; then calls make_heap(c.begin(), c.end(), comp).

24.6.7.3 Constructors with allocators [priqueue.cons.alloc]

If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit priority_queue(const Alloc& a);  
    Effects: Initializes c with a and value-initializes comp.

template<class Alloc> priority_queue(const Compare& compare, const Alloc& a);  
    Effects: Initializes c with a and initializes comp with compare.

template<class Alloc> 
    priority_queue(const Compare& compare, const Container& cont, const Alloc& a);  
    Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp 
    with compare; calls make_heap(c.begin(), c.end(), comp).
template<class Alloc>
    priority_queue(const Compare& compare, Container&& cont, const Alloc& a);

Effects: Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

template<class Alloc> priority_queue(const priority_queue& q, const Alloc& a);

Effects: Initializes c with q.c as the first argument and a as the second argument, and initializes comp with q.comp.

template<class Alloc> priority_queue(priority_queue&& q, const Alloc& a);

Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument, and initializes comp with std::move(q.comp).

template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Alloc& a);

Effects: Initializes c with first as the first argument, last as the second argument, and a as the third argument, and value-initializes comp; calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Compare& compare, const Alloc& a);

Effects: Initializes c with first as the first argument, last as the second argument, and a as the third argument, and initializes comp with compare; calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Compare& compare, const Container& cont, const Alloc& a);

Effects: Initializes c with cont as the first argument and a as the second argument, and initializes comp with compare; calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

template<class InputIterator, class Alloc>
    priority_queue(InputIterator first, InputIterator last, const Compare& compare, Container&& cont, const Alloc& a);

Effects: Initializes c with std::move(cont) as the first argument and a as the second argument, and initializes comp with compare; calls c.insert(c.end(), first, last); and finally calls make_heap(c.begin(), c.end(), comp).

template<container-compatible-range<T> R, class Alloc>
    priority_queue(from_range_t, R&& rg, const Compare& compare, const Alloc& a);

Effects: Initializes comp with compare and c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

template<container-compatible-range<T> R, class Alloc>
    priority_queue(from_range_t, R&& rg, const Alloc& a);

Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

24.6.7.4 Members [pqueue.members]

void push(const value_type& x);

Effects: As if by:
    c.push_back(x);
    push_heap(c.begin(), c.end(), comp);

void push(value_type&& x);

Effects: As if by:
    c.push_back(std::move(x));
    push_heap(c.begin(), c.end(), comp);
template<
c
container-compatible-range<T> R>
void push_range(R&& rg);

Effects: Insert all elements of rg in c.

Postconditions: is_heap(c.begin(), c.end(), comp) is true.

template<class... Args> void emplace(Args&&... args);

Effects: As if by:

    c.emplace_back(std::forward<Args>(args)...);
    push_heap(c.begin(), c.end(), comp);

void pop();

Effects: As if by:

    pop_heap(c.begin(), c.end(), comp);
    c.pop_back();

24.6.7.5 Specialized algorithms

template<class T, class Container, class Compare>
void swap(priority_queue<T, Container, Compare>& x,
          priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

Constraints: is_swappable_v<Container> is true and is_swappable_v<Compare> is true.

Effects: As if by x.swap(y).

24.6.8 Class template stack

24.6.8.1 General

Any sequence container supporting operations back(), push_back() and pop_back() can be used to instantiate stack. In particular, vector (24.3.11), list (24.3.10) and deque (24.3.8) can be used.

24.6.8.2 Definition

namespace std {
    template<class T, class Container = deque<T>>
    class stack {
    public:
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;

    protected:
        Container c;

    public:
        stack() : stack(Container()) {}  
        explicit stack(const Container&);  
        explicit stack(Container&&); 

        template<class InputIterator> stack(InputIterator first, InputIterator last);
        template<container-compatible-range<T> R> stack(from_range_t, R&& rg);
        template<class Alloc> explicit stack(const Alloc&);
        template<class Alloc> stack(const Container&, const Alloc&);
        template<class Alloc> stack(Container&&, const Alloc&);
        template<class Alloc> stack(stack&&, const Alloc&);
        template<class InputIterator, class Alloc>
        stack(InputIterator first, InputIterator last, const Alloc&);
        template<container-compatible-range<T> R, class Alloc>
        stack(from_range_t, R&& rg, const Alloc&);
    }
24.6.8.3 Constructors

explicit stack(const Container& cont);

Effects: Initializes c with cont.

explicit stack(Container&& cont);

Effects: Initializes c with std::move(cont).

template<class InputIterator>
stack(InputIterator first, InputIterator last);

Effects: Initializes c with first as the first argument and last as the second argument.

template<container-compatible-range<T> R>
stack(from_range_t, R&& rg);

Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.8.4 Constructors with allocators

If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

§ 24.6.8.4
template<class Alloc> explicit stack(const Alloc& a);

   Effects: Initializes c with a.

template<class Alloc> stack(const container_type& cont, const Alloc& a);

   Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> stack(container_type&& cont, const Alloc& a);

   Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> stack(const stack& s, const Alloc& a);

   Effects: Initializes c with s.c as the first argument and a as the second argument.

template<class Alloc> stack(stack&& s, const Alloc& a);

   Effects: Initializes c with std::move(s.c) as the first argument and a as the second argument.

template<class Alloc> stack(InputIterator first, InputIterator last, const Alloc& alloc);

   Effects: Initializes c with first as the first argument, last as the second argument, and alloc as the third argument.

template<container-compatible-range<T> R, class Alloc>
    stack(from_range_t, R&& rg, const Alloc& a);

   Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a).

24.6.8.5 Modifiers
    [stack.mod]

    template<container-compatible-range<T> R>
    void push_range(R&& rg);

   Effects: Equivalent to c.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise
             ranges::copy(rg, back_inserter(c)).

24.6.8.6 Operators
    [stack.ops]

template<class T, class Container>
    bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);

   Returns: x.c == y.c.

template<class T, class Container>
    bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);

   Returns: x.c != y.c.

template<class T, class Container>
    bool operator<(const stack<T, Container>& x, const stack<T, Container>& y);

   Returns: x.c < y.c.

template<class T, class Container>
    bool operator>(const stack<T, Container>& x, const stack<T, Container>& y);

   Returns: x.c > y.c.

template<class T, class Container>
    bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);

   Returns: x.c <= y.c.

template<class T, class Container>
    bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);

   Returns: x.c >= y.c.
template<class T, three_way_comparable Container>
    operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);

    Returns: x.c <=> y.c.

24.6.8.7 Specialized algorithms [stack.special]

template<class T, class Container>
    void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));

    Constraints: is_swappable_v<Container> is true.

    Effects: As if by x.swap(y).

24.6.9 Class template flat_map [flat.map]

24.6.9.1 Overview [flat.map.overview]

A flat_map is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. flat_map supports iterators that meet the Cpp17InputIterator requirements and model the random_access_iterator concept (25.3.4.13).

A flat_map meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). flat_map meets the requirements of an associative container (24.2.7), except that:

(2.1) it does not meet the requirements related to node handles (24.2.5),

(2.2) it does not meet the requirements related to iterator invalidation, and

(2.3) the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

[Note 1: A flat_map does not meet the additional requirements of an allocator-aware container (24.2.2.5). — end note]

A flat_map also provides most operations described in 24.2.7 for unique keys. This means that a flat_map supports the a_uniq operations in 24.2.7 but not the a_eq operations. For a flat_map<Key, T> the key_type is Key and the value_type is pair<Key, T>.

Descriptions are provided here only for operations on flat_map that are not described in one of those sets of requirements or for operations where there is additional semantic information.

A flat_map maintains the following invariants:

(5.1) it contains the same number of keys and values;

(5.2) the keys are sorted with respect to the comparison object; and

(5.3) the value at offset off within the value container is the value associated with the key at offset off within the key container.

If any member function in 24.6.9.2 exits via an exception the invariants are restored.

[Note 2: This can result in the flat_map being emptied. — end note]

Any sequence container (24.2.4) C supporting Cpp17RandomAccessIterator can be used to instantiate flat_map, as long as invocations of member functions C::size and C::max_size do not exit via an exception. In particular, vector (24.3.11) and deque (24.3.8) can be used.

[Note 3: vector<bool> is not a sequence container. — end note]

The program is ill-formed if Key is not the same type as KeyContainer::value_type or T is not the same type as MappedContainer::value_type.

The effect of calling a constructor that takes both key_container_type and mapped_container_type arguments with containers of different sizes is undefined.

The effect of calling a constructor or member function that takes a sorted_unique_t argument with a container, containers, or range that is not sorted with respect to key_comp(), or that contains equal elements, is undefined.

§ 24.6.9.2 987
24.6.9.3 Constructors

`flat_map(key_container_type key_cont, mapped_container_type mapped_cont);`

**Effects:** Initializes `c.keys` with `std::move(key_cont)` and `c.values` with `std::move(mapped_cont)`; value-initializes `compare`; sorts the range `[begin(), end())` with respect to `value_comp();` and finally erases the duplicate elements as if by:

§ 24.6.9.3 988
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());

**Complexity:** Linear in \( N \) if the container arguments are already sorted with respect to \( \text{value\_comp}() \) and otherwise \( N \log N \), where \( N \) is the value of \( \text{key\_cont\_size}() \) before this call.

```cpp
template<class Allocator>
flat_map(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
const Allocator& a);
```

**Constraints:** \(\text{uses\_allocator\_v<key\_container\_type, Allocator> is true and uses\_allocator\_v<mapped\_container\_type, Allocator> is true.}\)

**Effects:** Equivalent to \(\text{flat\_map(key\_cont, mapped\_cont)}\), except that \(c\).keys and \(c\).values are constructed with uses-allocator construction \((20.2.8.2)\).

**Complexity:** Same as \(\text{flat\_map(key\_cont, mapped\_cont)}\).

```cpp
flat_map(sorted_unique_t, key_container_type key_cont, mapped_container_type mapped_cont);
```

**Effects:** Initializes \(c\).keys with \(\text{std::move(key\_cont)}\) and \(c\).values with \(\text{std::move(mapped\_cont)}\); value-initializes \(\text{compare}\).

**Complexity:** Constant.

```cpp
template<class Allocator>
flat_map(sorted_unique_t s, const key_container_type& key_cont,
const mapped_container_type& mapped_cont, const Allocator& a);
```

**Constraints:** \(\text{uses\_allocator\_v<key\_container\_type, Allocator> is true and uses\_allocator\_v<mapped\_container\_type, Allocator> is true.}\)

**Effects:** Equivalent to \(\text{flat\_map(s, key\_cont, mapped\_cont)}\), except that \(c\).keys and \(c\).values are constructed with uses-allocator construction \((20.2.8.2)\).

**Complexity:** Linear.

```cpp
template<class Allocator>
explicit flat_map(const Allocator& a);
```

```cpp
template<class Allocator>
flat_map(InputIterator first, InputIterator last, const key_compare& comp, const Allocator& a);
```

**Constraints:** \(\text{uses\_allocator\_v<key\_container\_type, Allocator> is true and uses\_allocator\_v<mapped\_container\_type, Allocator> is true.}\)

**Effects:** Equivalent to \(\text{flat\_map(s, key\_cont, mapped\_cont)}\), except that \(c\).keys and \(c\).values are constructed with uses-allocator construction \((20.2.8.2)\).

**Complexity:** Linear.
Effects: Equivalent to the corresponding non-allocator constructors except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

24.6.9.4 Capacity

size_type size() const noexcept;

1 Returns: `c.keys.size()`.

size_type max_size() const noexcept;

2 Returns: `min<size_type>(c.keys.max_size(), c.values.max_size())`.

24.6.9.5 Access

mapped_type& operator[](const key_type& x);

1 Effects: Equivalent to: `return try_emplace(x).first->second`;

mapped_type& operator[](key_type&& x);

2 Effects: Equivalent to: `return try_emplace(std::move(x)).first->second`;

template<class K> mapped_type& operator[](K&& x);

3 Constraints: The qualified-id `Compare::is_transparent` is valid and denotes a type.

4 Effects: Equivalent to: `return try_emplace(std::forward<K>(x)).first->second`;

mapped_type& at(const key_type& x);
const mapped_type& at(const key_type& x) const;

5 Returns: A reference to the `mapped_type` corresponding to `x` in `*this`.

6 Throws: An exception object of type `out_of_range` if no such element is present.

7 Complexity: Logarithmic.

template<class K> mapped_type& at(const K& x);
template<class K> const mapped_type& at(const K& x) const;

8 Constraints: The qualified-id `Compare::is_transparent` is valid and denotes a type.

Preconditions: The expression `find(x)` is well-formed and has well-defined behavior.

9 Returns: A reference to the `mapped_type` corresponding to `x` in `*this`.

10 Throws: An exception object of type `out_of_range` if no such element is present.

11 Complexity: Logarithmic.

12

24.6.9.6 Modifiers

template<class... Args> pair<iterator, bool> emplace(Args&&... args);

1 Constraints: `is_constructible_v<pair<key_type, mapped_type>, Arg...>` is true.

2 Effects: Initializes an object `t` of type `pair<key_type, mapped_type>` with `std::forward<Args>(args)`...; if the map already contains an element whose key is equivalent to `t.first`, `*this` is unchanged. Otherwise, equivalent to:

```cpp
auto key_it = ranges::upper_bound(c.keys, t.first, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.insert(key_it, std::move(t.first));
c.values.insert(value_it, std::move(t.second));
```

3 Returns: The `bool` component of the returned pair is `true` if and only if the insertion took place, and the iterator component of the pair points to the element with key equivalent to `t.first`.

template<class P> pair<iterator, bool> insert(P&& x);
template<class P> iterator insert(const_iterator position, P&& x);

4 Constraints: `is_constructible_v<pair<key_type, mapped_type>, P>` is true.

5 Effects: The first form is equivalent to `return emplace(std::forward<P>(x))`. The second form is equivalent to `return emplace_hint(position, std::forward<P>(x))`.

§ 24.6.9.6 990
template<class InputIterator>
void insert(InputIterator first, InputIterator last);

Effects: Adds elements to c as if by:
for (; first != last; ++first) {
    value_type value = *first;
    c.keys.insert(c.keys.end(), std::move(value.first));
    c.values.insert(c.values.end(), std::move(value.second));
}

Then, sorts the range of newly inserted elements with respect to value_comp(); merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());

Complexity: $N + M \log M$, where $N$ is size() before the operation and $M$ is distance(first, last).

Remarks: Since this operation performs an in-place merge, it may allocate memory.

template<class InputIterator>
void insert(sorted_unique_t, InputIterator first, InputIterator last);

Effects: Adds elements to c as if by:
for (; first != last; ++first) {
    value_type value = *first;
    c.keys.insert(c.keys.end(), std::move(value.first));
    c.values.insert(c.values.end(), std::move(value.second));
}

Then, merges the sorted range of newly added elements and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, compare).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());

Complexity: Linear in $N$, where $N$ is size() after the operation.

Remarks: Since this operation performs an in-place merge, it may allocate memory.

template<container-compatible-range <value_type> R>
void insert_range(R&& rg);

Effects: Adds elements to c as if by:
for (const auto& e : rg) {
    c.keys.insert(c.keys.end(), e.first);
    c.values.insert(c.values.end(), e.second);
}

Then, sorts the range of newly inserted elements with respect to value_comp(); merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, compare).begin();
auto dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());

Complexity: $N + M \log M$, where $N$ is size() before the operation and $M$ is ranges::distance(rg).

Remarks: Since this operation performs an in-place merge, it may allocate memory.
template<class... Args>
    pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);

template<class... Args>
    pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);

template<class... Args>
    iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);  

template<class... Args>
    iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

Constraints: \textit{is\_constructible\_v<}mapped\_type, Args\ldots\textit{>} is true. 

Effects: If the map already contains an element whose key is equivalent to \( k \), \( \ast\textit{this} \) and \( \textit{args} \ldots \) are unchanged. Otherwise equivalent to:

\[
\text{auto key\_it} = \text{ranges::upper\_bound(c.keys, k, compare)}; \\
\text{auto value\_it} = \text{c.values.begin()} + \text{distance(c.keys.begin(), key\_it)}; \\
\text{c.keys.insert(key\_it, std::forward<decltype(k)>(k))}; \\
\text{c.values.emplace(value\_it, std::forward<Args>(args)\ldots)};
\]

Returns: In the first two overloads, the \texttt{bool} component of the returned pair is \texttt{true} if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \). 

Complexity: The same as \textit{emplace} for the first two overloads, and the same as \textit{emplace\_hint} for the last two overloads.

template<class K, class... Args>
    pair<iterator, bool> try_emplace(K&& k, Args&&... args);

template<class K, class... Args>
    iterator try_emplace(const_iterator hint, K&& k, Args&&... args);

Constraints:
\begin{itemize}
\item (19.1) The \texttt{qualified\_id Compare::is\_transparent} is valid and denotes a type.
\item (19.2) \textit{is\_constructible\_v<key\_type, K>} is true.
\item (19.3) \textit{is\_constructible\_v<mapped\_type, Args\ldots>} is true.
\item (19.4) For the first overload, \textit{is\_convertible\_v<K&&, const\_iterator>} and \textit{is\_convertible\_v<K&&, iterator>} are both false.
\end{itemize}

Preconditions: The conversion from \( k \) into \texttt{key\_type} constructs an object \( u \), for which \texttt{find(k) == find(u)} is true.

Effects: If the map already contains an element whose key is equivalent to \( k \), \( \ast\textit{this} \) and \( \textit{args} \ldots \) are unchanged. Otherwise equivalent to:

\[
\text{auto key\_it} = \text{ranges::upper\_bound(c.keys, k, compare)}; \\
\text{auto value\_it} = \text{c.values.begin()} + \text{distance(c.keys.begin(), key\_it)}; \\
\text{c.keys.emplace(key\_it, std::forward<K>(k))}; \\
\text{c.values.emplace(value\_it, std::forward<Args>(args)\ldots)};
\]

Returns: In the first overload, the \texttt{bool} component of the returned pair is \texttt{true} if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \). 

Complexity: The same as \textit{emplace} and \textit{emplace\_hint}, respectively.

template<class M>
    pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);

template<class M>
    pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);

template<class M>
    iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj); 

template<class M>
    iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

Constraints: \textit{is\_assignable\_v<mapped\_type, M>} is true and \textit{is\_constructible\_v<mapped\_type, M>} is true.

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns \texttt{std::forward<M>(obj)} to \( e.second \). Otherwise, equivalent to

\[
\text{try\_emplace(std::forward<decltype(k)>(k), std::forward<M>(obj))}
\]
for the first two overloads or

```cpp
try_emplace_hint(hint, std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the last two overloads.

**Returns:** In the first two overloads, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

**Complexity:** The same as `emplace` for the first two overloads and the same as `emplace_hint` for the last two overloads.

```cpp
template<class K, class M>
pair<iterator, bool> insert_or_assign(K&& k, M&& obj);
template<class K, class M>
iterator insert_or_assign(const_iterator hint, K&& k, M&& obj);
```

**Constraints:**

1. The qualified-id `Compare::is_transparent` is valid and denotes a type.
2. `is_constructible_v<key_type, K>` is `true`.
3. `isAssignable_v<mapped_type, M>` is `true`.
4. `isConstructible_v<mapped_type, M>` is `true`.

**Preconditions:** The conversion from `k` into `key_type` constructs an object `u`, for which `find(k) == find(u)` is `true`.

**Effects:** If the map already contains an element `e` whose key is equivalent to `k`, assigns `std::forward<M>(obj)` to `e.second`. Otherwise, equivalent to

```cpp
try_emplace(std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the first overload or

```cpp
try_emplace_hint(hint, std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the second overload.

**Returns:** In the first overload, the `bool` component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

**Complexity:** The same as `emplace` and `emplace_hint`, respectively.

```cpp
void swap(flat_map& y) noexcept;
```

**Effects:** Equivalent to:

```cpp
ranges::swap(compare, y.compare);
ranges::swap(c.keys, y.c.keys);
ranges::swap(c.values, y.c.values);
```

**Postconditions:** `*this` is emptied, even if the function exits via an exception.

**Returns:** `std::move(c)`.

```cpp
void replace(key_container_type&& key_cont, mapped_container_type&& mapped_cont);
```

**Preconditions:** `key_cont.size() == mapped_cont.size()` is `true`, the elements of `key_cont` are sorted with respect to `compare`, and `key_cont` contains no equal elements.

**Effects:** Equivalent to:

```cpp
c.keys = std::move(key_cont);
c.values = std::move(mapped_cont);
```

### 24.6.9.7 Erasure

**Preconditions:** `Key` and `T` meet the Cpp17MoveAssignable requirements.
Effects: Let \( E \) be \( \text{bool}(\text{pred}(\text{pair<const Key&}, \text{const T&}>(e))) \). Erases all elements \( e \) in \( c \) for which \( E \) holds.

Returns: The number of elements erased.

Complexity: Exactly \( c.\text{size()} \) applications of the predicate.

Remarks: Stable (16.4.6.8). If an invocation of \( \text{erase_if} \) exits via an exception, \( c \) is in a valid but unspecified state (3.67).

[Note 1: \( c \) still meets its invariants, but can be empty. — end note]

### 24.6.10 Class template \( \text{flat_multimap} \) [flat.multimap]

#### 24.6.10.1 Overview [flat.multimap.overview]

1. A \( \text{flat_multimap} \) is a container adaptor that provides an associative container interface that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type \( T \) based on the keys. \( \text{flat_multimap} \) supports iterators that meet the \text{Cpp17InputIterator} requirements and model the \text{random_access_iterator} concept (25.3.4.13).

2. A \( \text{flat_multimap} \) meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). \( \text{flat_multimap} \) meets the requirements of an associative container (24.2.7), except that:

(2.1) it does not meet the requirements related to node handles (24.2.5),

(2.2) it does not meet the requirements related to iterator invalidation, and

(2.3) the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

[Note 1: A \( \text{flat_multimap} \) does not meet the additional requirements of an allocator-aware container (24.2.2.5). — end note]

3. A \( \text{flat_multimap} \) also provides most operations described in 24.2.7 for equal keys. This means that a \( \text{flat multimap} \) supports the \text{a_eq} operations in 24.2.7 but not the \text{a_uniq} operations. For a \( \text{flat_multimap}<\text{Key}, \text{T}> \) the \text{key_type} is \text{Key} and the \text{value_type} is \text{pair<Key, T>}.

4. Except as otherwise noted, operations on \( \text{flat_multimap} \) are equivalent to those of \( \text{flat_map} \), except that \( \text{flat_multimap} \) operations do not remove or replace elements with equal keys.

[Example 1: \( \text{flat_multimap} \) constructors and emplace do not erase non-unique elements after sorting them. — end example]

5. A \( \text{flat_multimap} \) maintains the following invariants:

(5.1) it contains the same number of keys and values;

(5.2) the keys are sorted with respect to the comparison object; and

(5.3) the value at offset \( \text{off} \) within the value container is the value associated with the key at offset \( \text{off} \) within the key container.

6. If any member function in 24.6.10.2 exits via an exception, the invariants are restored.

[Note 2: This can result in the \( \text{flat_multimap} \) being emptied. — end note]

7. Any sequence container (24.2.4) \( C \) supporting \text{Cpp17RandomAccessIterator} can be used to instantiate \( \text{flat_multimap} \), as long as invocations of member functions \( C.\text{size} \) and \( C.\text{max_size} \) do not exit via an exception. In particular, \( \text{vector} \) (24.3.11) and \( \text{deque} \) (24.3.8) can be used.

[Note 3: \( \text{vector<bool>} \) is not a sequence container. — end note]

8. The program is ill-formed if \( \text{Key} \) is not the same type as \( \text{KeyContainer::value_type} \) or \( \text{T} \) is not the same type as \( \text{MappedContainer::value_type} \).

9. The effect of calling a constructor that takes both \text{key_container_type} and \text{mapped_container_type} arguments with containers of different sizes is undefined.

10. The effect of calling a constructor or member function that takes a \text{sorted_equivalent_t} argument with a container, containers, or range that are not sorted with respect to \text{key_comp()} is undefined.
namespace std {

template<Key, class T, class Compare, class KeyContainer, class MappedContainer, class Allocator>
struct uses_allocator<flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>, Allocator>
: bool_constant<uses_allocator_v<KeyContainer, Allocator> && 
eses_allocator_v<MappedContainer, Allocator>> { };

1 The member type containers has the data members and special members specified above. It has no base
classes or members other than those specified.

24.6.10.3 Constructors [flat.multimap.cons]

flat_multimap(key_container_type key_cont, mapped_container_type mapped_cont);
1 Effects: Initializes c.keys with std::move(key_cont) and c.values with std::move(mapped_cont);
value-initializes compare; and sorts the range [begin(), end()) with respect to value_comp().
2 Complexity: Linear in N if the container arguments are already sorted with respect to value_comp()
and otherwise N \log N, where N is the value of key_cont.size() before this call.

template<Allocator>
flat_multimap(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
const Allocator& a);
3 Constraints: uses_allocator_v<key_container_type, Allocator> is true and uses_allocator_-
v<mapped_container_type, Allocator> is true.
4 Effects: Equivalent to flat_multimap(key_cont, mapped_cont), except that c.keys and c.values
are constructed with uses-allocator construction (20.2.8.2).
5 Complexity: Same as flat_multimap(key_cont, mapped_cont).

flat_multimap(sorted_equivalent_t, key_container_type key_cont, mapped_container_type mapped_cont);
6 Effects: Initializes c.keys with std::move(key_cont) and c.values with std::move(mapped_cont);
value-initializes compare.
7 Complexity: Constant.

template<Allocator>
flat_multimap(sorted_equivalent_t s, const key_container_type& key_cont,
const mapped_container_type& mapped_cont, const Allocator& a);
8 Constraints: uses_allocator_v<key_container_type, Allocator> is true and uses_allocator_-
v<mapped_container_type, Allocator> is true.
9 Effects: Equivalent to flat_multimap(s, key_cont, mapped_cont), except that c.keys and c.val-
ues are constructed with uses-allocator construction (20.2.8.2).
10 Complexity: Linear.

template<Allocator>
flat_multimap(const key_compare& comp, const Allocator& a);

template<Allocator>
explicit flat_multimap(const Allocator& a);
template<class InputIterator, class Allocator>
    flat_multimap(InputIterator first, InputIterator last, const key_compare& comp,
                  const Allocator& a);

template<class InputIterator, class Allocator>
    flat_multimap(InputIterator first, InputIterator last, const Allocator& a);

template<
    container-compatible-range <value_type> R, class Allocator>
    flat_multimap(from_range_t, R&& rg, const Allocator& a);

template<
    container-compatible-range <value_type> R, class Allocator>
    flat_multimap(from_range_t, R&& rg, const key_compare& comp, const Allocator& a);

template<class InputIterator, class Allocator>
    flat_multimap(sorted_equivalent_t, InputIterator first, InputIterator last,
                  const key_compare& comp, const Allocator& a);

template<class InputIterator, class Allocator>
    flat_multimap(sorted_equivalent_t, InputIterator first, InputIterator last,
                  const Allocator& a);

template<class Allocator>
    flat_multimap(initializer_list<value_type> il, const key_compare& comp, const Allocator& a);

template<class Allocator>
    flat_multimap(initializer_list<value_type> il, const Allocator& a);

template<class Allocator>
    flat_multimap(sorted_equivalent_t, initializer_list<value_type> il,
                  const key_compare& comp, const Allocator& a);

template<class Allocator>
    flat_multimap(sorted_equivalent_t, initializer_list<value_type> il, const Allocator& a);

Constraints: uses_allocator_v<key_container_type, Allocator> is true and uses_allocator_v<mapped_container_type, Allocator> is true.

Effects: Equivalent to the corresponding non-allocator constructors except that c.keys and c.values are constructed with uses-allocator construction (20.2.8.2).

24.6.10.4 Erasure

template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
         class Predicate>
    typename flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>::size_type
    erase_if(flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);

Preconditions: Key and T meet the Cpp17MoveAssignable requirements.

Effects: Let E be bool(pred(pair<const Key&, const T&>(e))). Erases all elements e in c for which E holds.

Returns: The number of elements erased.

Complexity: Exactly c.size() applications of the predicate.

Remarks: Stable (16.4.6.8). If an invocation of erase_if exits via an exception, c is in a valid but unspecified state (3.67).

[Note 1: c still meets its invariants, but can be empty. — end note]

24.6.11 Class template flat_set

24.6.11.1 Overview

A flat_set is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of the keys themselves. flat_set supports iterators that model the random_access_iterator concept (25.3.4.13).

A flat_set meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). flat_set meets the requirements of an associative container (24.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (24.2.5.1),
(2.2) — it does not meet the requirements related to iterator invalidation, and
(2.3) — the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.
[Note 1: A flat_set does not meet the additional requirements of an allocator-aware container, as described in 24.2.2.5. — end note]

A flat_set also provides most operations described in 24.2.7 for unique keys. This means that a flat_set supports the a_uniq operations in 24.2.7 but not the a_eq operations. For a flat_set<Key>, both the key_type and value_type are Key.

Descriptions are provided here only for operations on flat_set that are not described in one of those sets of requirements or for operations where there is additional semantic information.

A flat_set maintains the invariant that the keys are sorted with respect to the comparison object.

If any member function in 24.6.11.2 exits via an exception, the invariant is restored.

[Note 2: This can result in the flat_set's being emptied. — end note]

Any sequence container (24.2.4) supporting Cpp17RandomAccessIterator can be used to instantiate flat_set. In particular, vector (24.3.11) and deque (24.3.8) can be used.

[Note 3: vector<bool> is not a sequence container. — end note]

The program is ill-formed if Key is not the same type as KeyContainer::value_type.

The effect of calling a constructor or member function that takes a sorted_unique_t argument with a range that is not sorted with respect to key_comp(), or that contains equal elements, is undefined.

24.6.11.2 Definition

```cpp
namespace std {
    template<class Key, class Compare = less<Key>, class KeyContainer = vector<Key>>
    class flat_set {
    public:

flat_set(initializer_list<Key>, Compare = Compare())
    -> flat_set<Key, Compare>;

24.6.11.3 Constructors

explicit flat_set(container_type cont);

Effects: Initializes c with std::move(cont), value-initializes compare, sorts the range [begin(), end())
with respect to compare, and finally erases all but the first element from each group of consecutive
equivalent elements.

Complexity: Linear in N if `cont` is sorted with respect to `compare` and otherwise N \log N, where N is the value of `cont.size()` before this call.

```cpp
template<class Allocator>
flat_set(const container_type& cont, const Allocator& a);
```

Constraints: `uses_allocator_v<container_type, Allocator>` is true.

Effects: Equivalent to `flat_set(cont)`, except that `c` is constructed with uses-allocator construction (20.2.8.2).

Complexity: Same as `flat_set(cont)`.

```cpp
template<class Allocator>
flat_set(sorted_unique_t s, const container_type& cont, const Allocator& a);
```

Constraints: `uses_allocator_v<container_type, Allocator>` is true.

Effects: Equivalent to `flat_set(s, cont)`, except that `c` is constructed with uses-allocator construction (20.2.8.2).

Complexity: Linear.

```cpp
template<class Allocator>
flat_set(const key_compare& comp, const Allocator& a);
```

```cpp
template<class Allocator>
explicit flat_set(const Allocator& a);
```

```cpp
template<class InputIterator, class Allocator>
flat_set(InputIterator first, InputIterator last, const key_compare& comp, const Allocator& a);
```

```cpp
template<class InputIterator, class Allocator>
flat_set(InputIterator first, InputIterator last, const Allocator& a);
```

```cpp
template<class Allocator>
flat_set(initializer_list<key_type> il, const key_compare& comp, const Allocator& a);
```

```cpp
template<class Allocator>
flat_set(initializer_list<key_type> il, const Allocator& a);
```

```cpp
template<class Allocator>
flat_set(sorted_unique_t, initializer_list<key_type> il, const key_compare& comp, const Allocator& a);
```

```cpp
template<class Allocator>
flat_set(sorted_unique_t, initializer_list<key_type> il, const Allocator& a);
```

Constraints: `uses_allocator_v<container_type, Allocator>` is true.

Effects: Equivalent to the corresponding non-allocator constructors except that `c` is constructed with uses-allocator construction (20.2.8.2).

### 24.6.11.4 Modifiers

```cpp
template<K> pair<iterator, bool> insert(K&& x);
```

Constraints: The qualified-id `Compare::is_transparent` is valid and denotes a type. `is_constructible_v<value_type, K>` is true.

Preconditions: The conversion from `x` into `value_type` constructs an object `u`, for which `find(x) == find(u)` is true.

Effects: If the set already contains an element equivalent to `x`, `*this` and `x` are unchanged. Otherwise, inserts a new element as if by `emplace(std::forward<K>(x))`. 

§ 24.6.11.4 1005
Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the element whose key is equivalent to x.

```cpp
template<class InputIterator>
void insert(InputIterator first, InputIterator last);
```

Effects: Adds elements to c as if by:
```
c.insert(c.end(), first, last);
```
Then, sorts the range of newly inserted elements with respect to compare; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but the first element from each group of consecutive equivalent elements.

Complexity: \(N + M \log M\), where \(N\) is size() before the operation and \(M\) is distance(first, last).

Remarks: Since this operation performs an in-place merge, it may allocate memory.

```cpp
template<class InputIterator>
void insert(sorted_unique_t, InputIterator first, InputIterator last);
```

Effects: Equivalent to `insert(first, last)`.

Complexity: Linear.

```cpp
template<container-compatible-range<value_type> R>
void insert_range(R&& rg);
```

Effects: Adds elements to c as if by:
```
for (const auto& e : rg) {
    c.insert(c.end(), e);
}
```
Then, sorts the range of newly inserted elements with respect to compare; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but the first element from each group of consecutive equivalent elements.

Complexity: \(N + M \log M\), where \(N\) is size() before the operation and \(M\) is distance(first, last).

Remarks: Since this operation performs an in-place merge, it may allocate memory.

```cpp
void swap(flat_set& y) noexcept;
```

Effects: Equivalent to:
```
ranges::swap(compare, y.compare);
ranges::swap(c, y.c);
```

```cpp
container_type extract() &&;
```

Postconditions: *this is emptied, even if the function exits via an exception.

Returns: std::move(c).

```cpp
void replace(container_type&& cont);
```

Preconditions: The elements of cont are sorted with respect to compare, and cont contains no equal elements.

Effects: Equivalent to: \(c = std::move(cont)\);

24.6.11.5 Erasure

```cpp
template<class Key, class Compare, class KeyContainer, class Predicate>
typename flat_set<Key, Compare, KeyContainer>::size_type
erase_if(flat_set<Key, Compare, KeyContainer>& c, Predicate pred);
```

Effects: Equivalent to:
```
auto [erase_first, erase_last] = ranges::remove_if(c, pred);
auto n = erase_last - erase_first;
c.erase(erase_first, erase_last);
return n;
```
24.6.12  Class template flat_multiset

24.6.12.1  Overview

A flat_multiset is a container adaptor that provides an associative container interface that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of the keys themselves. flat_multiset supports iterators that model the random_access_iterator concept (25.3.4.13).

A flat_multiset meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). flat_multiset meets the requirements of an associative container (24.2.7), except that:

1. it does not meet the requirements related to node handles (24.2.5.1),
2. it does not meet the requirements related to iterator invalidation, and
3. the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.

[Note 1: A flat_multiset does not meet the additional requirements of an allocator-aware container, as described in 24.2.2.5. — end note]

A flat_multiset also provides most operations described in 24.2.7 for equal keys. This means that a flat_multiset supports the a_eq operations in 24.2.7 but not the a_uniq operations. For a flat_multiset<Key>, both the key_type and value_type are Key.

Descriptions are provided here only for operations on flat_multiset that are not described in one of the general sections or for operations where there is additional semantic information.

A flat_multiset maintains the invariant that the keys are sorted with respect to the comparison object.

If any member function in 24.6.12.2 exits via an exception, the invariant is restored.

[Note 2: This can result in the flat_multiset’s being emptied. — end note]

Any sequence container (24.2.4) supporting Cpp17RandomAccessIterator can be used to instantiate flat_multiset. In particular, vector (24.3.11) and deque (24.3.8) can be used.

[Note 3: vector<bool> is not a sequence container. — end note]

The program is ill-formed if Key is not the same type as KeyContainer::value_type.

The effect of calling a constructor or member function that takes a sorted_equivalent_t argument with a range that is not sorted with respect to key_comp() is undefined.

    struct uses_allocator<flat_multiset<Key, Compare, KeyContainer>, Allocator>
    : bool_constant<uses_allocator_v<KeyContainer, Allocator>> { };
Effects: Equivalent to the corresponding non-allocator constructors except that \( c \) is constructed with uses-allocator construction \((20.2.8.2)\).

24.6.12.4 Modifiers [flat.multiset.modifiers]

\[
\begin{align*}
t & \quad \text{template<class... Args> \ iterator emplace(Args\&\&... args);} \\
& \quad \text{\begin{enumerate}
\item Constraints: is_constructible_v\langle key\_type, Args...\rangle \text{ is true.}
\item Effects: First, initializes an object \( t \) of type \text{key\_type} with std::forward\langle Args\rangle(\text{args})..., then inserts \( t \) as if by:
\begin{itemize}
\item auto it = ranges::upper_bound(c, t, compare);
\item c.insert(it, std::move(t));
\end{itemize}
\item Returns: An iterator that points to the inserted element.
\end{enumerate}}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{template<class InputIterator>}
& \quad \text{void insert(InputIterator first, InputIterator last);} \\
& \quad \text{\begin{enumerate}
\item Effects: Adds elements to \( c \) as if by:
\begin{itemize}
\item c.insert(c.end(), first, last);
\end{itemize}
Then, sorts the range of newly inserted elements with respect to \text{compare}, and merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range.
\item Complexity: \( N + M \log M \), where \( N \) is size() before the operation and \( M \) is distance(first, last).
\item Remarks: Since this operation performs an in-place merge, it may allocate memory.
\end{enumerate}}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{template<class InputIterator>}
& \quad \text{void insert(sorted\_equivalent_t, InputIterator first, InputIterator last);} \\
& \quad \text{\begin{enumerate}
\item Effects: Equivalent to insert(first, last).
\item Complexity: Linear.
\end{enumerate}}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{void swap(flat\_multiset\& y) noexcept;} \\
& \quad \text{\begin{enumerate}
\item Effects: Equivalent to:
\begin{itemize}
\item ranges::swap(compare, y.compare);
\item ranges::swap(c, y.c);
\end{itemize}
\item container\_type extract() \&\&;
\item Postconditions: *this is emptied, even if the function exits via an exception.
\item Returns: std::move(c).
\end{enumerate}}
\end{align*}
\]

\[
\begin{align*}
& \quad \text{void replace(container\_type\&\& cont);} \\
& \quad \text{\begin{enumerate}
\item Preconditions: The elements of \( \text{cont} \) are sorted with respect to \text{compare}.
\item Effects: Equivalent to: \( c = \text{std::move(cont)}; \)
\end{enumerate}}
\end{align*}
\]

24.6.12.5 Erasure [flat.multiset.erasurement]

\[
\begin{align*}
& \quad \text{template<class Key, class Compare, class KeyContainer, class Predicate>}
& \quad \text{typename flat\_multiset<Key, Compare, KeyContainer>::size\_type}
& \quad \text{erase\_if(flat\_multiset<Key, Compare, KeyContainer>& c, Predicate pred);} \\
& \quad \text{\begin{enumerate}
\item Effects: Equivalent to:
\begin{itemize}
\item auto [erase\_first, erase\_last] = ranges::remove\_if(c, pred);
\item auto n = erase\_last - erase\_first;
\item c.erase(erase\_first, erase\_last);
\item return n;
\end{itemize}
\end{enumerate}}
\end{align*}
\]

24.6.13 Container adaptors formatting [container.adaptors.format]

For each of queue, priority_queue, and stack, the library provides the following formatter specialization where \text{adaptor\_type} is the name of the template:
namespace std {
    template<class charT, class T, formattable<charT> Container, class... U>
    struct formatter<adaptor-type<T, Container, U...>, charT> {
        private:
            using maybe-const-adaptor = fmt-maybe-const<adaptor-type<T, Container, U...>, charT>;
            formatter<Container, charT> underlying_;
        public:
            template<class ParseContext>
            constexpr typename ParseContext::iterator
                parse(ParseContext& ctx);
            template<class FormatContext>
            typename FormatContext::iterator
                format(maybe-const-adaptor r, FormatContext& ctx) const;
    }
    template<class ParseContext>
    constexpr typename ParseContext::iterator
        parse(ParseContext& ctx);
    template<class FormatContext>
    typename FormatContext::iterator
        format(maybe-const-adaptor r, FormatContext& ctx) const;

24.7 Views [views]
24.7.1 General [views.general]
1 The header <span> defines the view span. The header <mdspan> defines the class template mdspan and other facilities for interacting with these multidimensional views.

24.7.2 Header <span> synopsis [span.syn]

namespace std {
    // constants
    inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

    // 24.7.3, class template span
    template<class ElementType, size_t Extent = dynamic_extent>
    class span;

    template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_view<span<ElementType, Extent>> = true;
    template<class ElementType, size_t Extent>
    inline constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

    // 24.7.3.8, views of object representation
    template<class ElementType, size_t Extent>
    span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
        as_bytes(span<ElementType, Extent> s) noexcept;
    template<class ElementType, size_t Extent>
    span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
        as_writable_bytes(span<ElementType, Extent> s) noexcept;
}

24.7.3 Class template span [views.span]
24.7.3.1 Overview [span.overview]
1 A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.
All member functions of `span` have constant time complexity.

```cpp
namespace std {
    template<class ElementType, size_t Extent = dynamic_extent>
    class span {
    public:
        // constants and types
        using element_type = ElementType;
        using value_type = remove_cv_t<ElementType>;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        using pointer = element_type*;
        using const_pointer = const element_type*;
        using reference = element_type&;
        using const_reference = const element_type&;
        using iterator = implementation-defined; // see 24.7.3.7
        using const_iterator = std::const_iterator<iterator>;
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::const_iterator<reverse_iterator>;
        static constexpr size_type extent = Extent;

        // 24.7.3.2, constructors, copy, and assignment
        constexpr span() noexcept;
        template<class It>
        constexpr explicit(span(It first, size_type count));
        template<class It, class End>
        constexpr explicit(span(It first, End last));
        template<class N>
        constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
        template<class T, size_t N>
        constexpr span(array<T, N>& arr) noexcept;
        template<class T, size_t N>
        constexpr span(const array<T, N>& arr) noexcept;
        template<class R>
        constexpr explicit(span(R&& r));
        constexpr span(const span& other) noexcept = default;
        constexpr span(const span<OtherElementType, OtherExtent>& s) noexcept;
        ~span() noexcept = default;
        constexpr span& operator=(const span& other) noexcept = default;

        // 24.7.3.4, subviews
        template<size_t Count>
        constexpr span<element_type, Count> first() const;
        template<size_t Count>
        constexpr span<element_type, Count> last() const;
        template<size_t Offset, size_type Count = dynamic_extent>
        constexpr span<element_type, see below> subspan() const;
        constexpr span<element_type, dynamic_extent> first(size_type count) const;
        constexpr span<element_type, dynamic_extent> last(size_type count) const;
        constexpr span<element_type, dynamic_extent> subspan(
            size_type offset, size_type count = dynamic_extent) const;

        // 24.7.3.5, observers
        constexpr size_type size() const noexcept;
        constexpr size_type size_bytes() const noexcept;
        [[nodiscard]] constexpr bool empty() const noexcept;

        // 24.7.3.6, element access
        constexpr reference operator[](size_type idx) const;
        constexpr reference front() const;
    }
}
```
constexpr reference back() const;
constexpr pointer data() const noexcept;

// 24.7.3.7, iterator support
constexpr iterator begin() const noexcept;
constexpr iterator end() const noexcept;
constexpr const_iterator cbegin() const noexcept { return begin(); }
constexpr const_iterator cend() const noexcept { return end(); }
constexpr reverse_iterator rbegin() const noexcept;
constexpr reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept { return rbegin(); }
constexpr const_reverse_iterator crend() const noexcept { return rend(); }

private:
pointer data_;  // exposition only
size_type size_;  // exposition only
};

3 span<ElementType, Extent> is a trivially copyable type (6.8.1).
4 ElementType is required to be a complete object type that is not an abstract class type.

24.7.3.2 Constructors, copy, and assignment  [span.cons]

constexpr span() noexcept;

1 Constraints: Extent == dynamic_extent || Extent == 0 is true.
2 Postconditions: size() == 0 && data() == nullptr.

template<class It>
constexpr explicit(extent != dynamic_extent) span(It first, size_type count);

3 Constraints: Let U be remove_reference_t<iter_reference_t<It>>.
   — It satisfies contiguous_iterator.
   — is_convertible_v<U(*)[], element_type(*)[]> is true.
   [Note 1: The intent is to allow only qualification conversions of the iterator reference type to element_type.
   — end note]
4 Preconditions:
   — [first, first + count) is a valid range.
   — It models contiguous_iterator.
   — If extent is not equal to dynamic_extent, then count is equal to extent.
5 Effects: Initializes data_ with to_address(first) and size_ with count.
6 Throws: Nothing.

template<class It, class End>
constexpr explicit(extent != dynamic_extent) span(It first, End last);

7 Constraints: Let U be remove_reference_t<iter_reference_t<It>>.
   — is_convertible_v<U(*)[], element_type(*)[]> is true.
Note 2: The intent is to allow only qualification conversions of the iterator reference type to `element_type`. —end note

(7.2) It satisfies `contiguous_iterator`.
(7.3) End satisfies `sized_sentinel_for<It>`.
(7.4) `is_convertible_v<End, size_t>` is false.

Preconditions:

- If `extent` is not equal to `dynamic_extent`, then `last - first` is equal to `extent`.
- `[first, last)` is a valid range.
- It models `contiguous_iterator`.
- End models `sized_sentinel_for<It>`.

Effects: Initializes `data_` with `to_address(first)` and `size_` with `last - first`.

Throws: When and what `last - first` throws.

```cpp
template<size_t N> constexpr span(type_identity_t<element_type>(&arr)[N]) noexcept;
template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;
```

Constraints: Let `U` be `remove_pointer_t<decltype(data(arr))>.

- `extent == dynamic_extent || N == extent` is true, and
- `is_convertible_v<U(*)[], element_type(*)[]>` is true.

Note 3: The intent is to allow only qualification conversions of the array element type to `element_type`. —end note

Effects: Constructs a span that is a view over the supplied array.

Note 4: `type_identity_t` affects class template argument deduction. —end note

Postconditions: `size() == N && data() == data(arr)` is true.

```cpp
template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);
```

Constraints: Let `U` be `remove_reference_t<ranges::range_reference_t<R>>.

- `R` satisfies `ranges::contiguous_range` and `ranges::sized_range`.
- Either `R` satisfies `ranges::borrowed_range` or `is_const_v<element_type>` is true.
- `remove_cvref_t<R>` is not a specialization of `span`.
- `remove_cvref_t<R>` is not a specialization of `array`.
- `is_array_v<remove_cvref_t<R>>` is false.
- `is_convertible_v<U(*)[], element_type(*)[]>` is true.

Note 5: The intent is to allow only qualification conversions of the range reference type to `element_type`. —end note

Preconditions:

- If `extent` is not equal to `dynamic_extent`, then `ranges::size(r)` is equal to `extent`.
- `R` models `ranges::contiguous_range` and `ranges::sized_range`.
- If `is_const_v<element_type>` is false, `R` models `ranges::borrowed_range`.

Effects: Initializes with ranges::data(r) and size_ with `ranges::size(r)`.

Throws: What and when `ranges::data(r)` and `ranges::size(r)` throw.

```cpp
constexpr span(const span& other) noexcept = default;
```

Postconditions: `other.size() == size() && other.data() == data()`.

```cpp
template<class OtherElementType, size_t OtherExtent>
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;
```

Constraints:
(19.1) — extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent is true, and

(19.2) — is_convertible_v<OtherElementType(*[]), element_type(*[])> is true.

[Note 6: The intent is to allow only qualification conversions of the OtherElementType to element_type. — end note]

Preconditions: If extent is not equal to dynamic_extent, then s.size() is equal to extent.

Effects: Constructs a span that is a view over the range [s.data(), s.data() + s.size()).

Postconditions: size() == s.size() && data() == s.data().

Remarks: The expression inside explicit is equivalent to:

```c++
extent != dynamic_extent && OtherExtent == dynamic_extent
```

constexpr span& operator=(const span& other) noexcept = default;

Postconditions: size() == other.size() && data() == other.data().

### 24.7.3.3 Deduction guides

[span.deduct]

```c++
template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>;
```

Constraints: It satisfies contiguous_iterator.

```c++
template<class R>
span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>;
```

Constraints: R satisfies ranges::contiguous_range.

### 24.7.3.4 Subviews

[span.sub]

```c++
template<size_t Count> constexpr span<element_type, Count> first() const;
 Mandates: Count <= Extent is true.
 Preconditions: Count <= size() is true.
 Effects: Equivalent to: return R{data(), Count}; where R is the return type.

template<size_t Count> constexpr span<element_type, Count> last() const;
 Mandates: Count <= Extent is true.
 Preconditions: Count <= size() is true.
 Effects: Equivalent to: return R{data() + (size() - Count), Count}; where R is the return type.

template<size_t Offset, size_t Count = dynamic_extent>
constexpr span<element_type, see below> subspan() const;
 Mandates:
 Offset <= Extent && (Count == dynamic_extent || Count <= Extent - Offset)
 is true.
 Preconditions:
 Offset <= size() && (Count == dynamic_extent || Count <= size() - Offset)
 is true.
 Effects: Equivalent to:
 return span<ElementType, see below>(
   data() + Offset, Count != dynamic_extent ? Count : size() - Offset);
 Remarks: The second template argument of the returned span type is:

```c++
Count != dynamic_extent ? Count 
  : (Extent != dynamic_extent ? Extent - Offset 
     : dynamic_extent)
```
constexpr span<element_type, dynamic_extent> first(size_type count) const;

**Preconditions**: count <= size() is true.
**Effects**: Equivalent to: return (data(), count);

constexpr span<element_type, dynamic_extent> last(size_type count) const;

**Preconditions**: count <= size() is true.
**Effects**: Equivalent to: return (data() + (size() - count), count);

constexpr span<element_type, dynamic_extent> subspan(
    size_type offset, size_type count = dynamic_extent) const;

**Preconditions**:
offset <= size() && (count == dynamic_extent || count <= size() - offset)

**Effects**: Equivalent to:
return (data() + offset, count == dynamic_extent ? size() - offset : count);

### 24.7.3.5 Observers [span.obs]

constexpr size_type size() const noexcept;

**Effects**: Equivalent to: return size_;

constexpr size_type size_bytes() const noexcept;

**Effects**: Equivalent to: return size() * sizeof(element_type);

[[nodiscard]] constexpr bool empty() const noexcept;

**Effects**: Equivalent to: return size() == 0;

### 24.7.3.6 Element access [span.elem]

constexpr reference operator[](size_type idx) const;

**Preconditions**: idx < size() is true.
**Effects**: Equivalent to: return *(data() + idx);

constexpr reference front() const;

**Preconditions**: empty() is false.
**Effects**: Equivalent to: return *data();

constexpr reference back() const;

**Preconditions**: empty() is false.
**Effects**: Equivalent to: return *(data() + (size() - 1));

constexpr pointer data() const noexcept;

**Effects**: Equivalent to: return data_;

### 24.7.3.7 Iterator support [span.iterators]

using iterator = implementation-defined;

The type models contiguous_iterator (25.3.4.14), meets the `Cpp17RandomAccessIterator` requirements (25.3.5.7), and meets the requirements for constexpr iterators (25.3.1), whose value type is `value_type` and whose reference type is `reference`.

All requirements on container iterators (24.2) apply to `span::iterator` as well.

constexpr iterator begin() const noexcept;

**Returns**: An iterator referring to the first element in the span. If empty() is true, then it returns the same value as end().
constexpr iterator end() const noexcept;

4 Returns: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() const noexcept;

5 Effects: Equivalent to: return reverse_iterator(end());

castexpr reverse_iterator rend() const noexcept;

6 Effects: Equivalent to: return reverse_iterator(begin());

24.7.3.8 Views of object representation [span.objectrep]

```cpp
template<class ElementType, size_t Extent>
span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_bytes(span<ElementType, Extent> s) noexcept;
```

1 Effects: Equivalent to: return R{reinterpret_cast<const byte*>(s.data()), s.size_bytes()};

where R is the return type.

template<class ElementType, size_t Extent>
span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_writable_bytes(span<ElementType, Extent> s) noexcept;

2 Constraints: is_const_v<ElementType> is false.

3 Effects: Equivalent to: return R{reinterpret_cast<byte*>(s.data()), s.size_bytes()}; where R is the return type.

24.7.4 Header <mdspan> synopsis [mdspan.syn]

namespace std {

// 24.7.6, class template extents
template<class IndexType, size_t... Extents>
class extents;

// 24.7.6.6, alias template dextents
template<class IndexType, size_t Rank>
using dextents = see below;

// 24.7.7, layout mapping
struct layout_left;
struct layout_right;
struct layout_stride;

// 24.7.8.3, class template default_accessor
template<class ElementType>
class default_accessor;

// 24.7.9, class template mdspan
template<class ElementType, class Extents, class LayoutPolicy = layout_right,
class AccessorPolicy = default_accessor<ElementType>>
class mdspan;
}

24.7.5 Overview [mdspan.overview]

1 A multidimensional index space is a Cartesian product of integer intervals. Each interval can be represented by a half-open range \([L_i, U_i)\), where \(L_i\) and \(U_i\) are the lower and upper bounds of the \(i^{th}\) dimension. The rank of a multidimensional index space is the number of intervals it represents. The size of a multidimensional index space is the product of \(U_i - L_i\) for each dimension \(i\) if its rank is greater than 0, and 1 otherwise.

2 An integer \(r\) is a rank index of an index space \(S\) if \(r\) is in the range \([0, \text{rank of } S)\).

3 A pack of integers \(\text{idx}\) is a multidimensional index in a multidimensional index space \(S\) (or representation thereof) if both of the following are true:

\[(3.1)\] sizeof...(\text{idx}) is equal to the rank of \(S\), and
\[(3.2)\] for every rank index \(i\) of \(S\), the \(i^{th}\) value of \(\text{idx}\) is an integer in the interval \([L_i, U_i)\) of \(S\).
24.7.6 Class template extents

24.7.6.1 Overview

The class template extents represents a multidimensional index space of rank equal to \(\text{sizeof}(\ldots(\text{Extents}))\). In subclause (24.7), extents is used synonymously with multidimensional index space.

namespace std {
  template<class IndexType, size_t... Extents>
  class extents {
    public:
      using index_type = IndexType;
      using size_type = make_unsigned_t<index_type>;
      using rank_type = size_t;
      // 24.7.6.4, observers of the multidimensional index space
      static constexpr rank_type rank() noexcept { return sizeof...(Extents); }
      static constexpr rank_type rank_dynamic() noexcept {
        return dynamic_index(rank());
      }
      static constexpr size_t static_extent(rank_type) noexcept;
      constexpr index_type extent(rank_type) const noexcept;
    // 24.7.6.3, constructors
      constexpr extents() noexcept = default;
      template<class OtherIndexType, size_t... OtherExtents>
      constexpr explicit(see below) extents(const extents<OtherIndexType, OtherExtents...>&) noexcept;
      template<class... OtherIndexTypes>
      constexpr explicit extents(OtherIndexTypes...) noexcept;
      template<class OtherIndexType, size_t N>
      constexpr explicit(N != rank_dynamic()) extents(span<OtherIndexType, N>) noexcept;
      template<class OtherIndexType, size_t N>
      constexpr explicit(N != rank_dynamic()) extents(const array<OtherIndexType, N>&) noexcept;
    // 24.7.6.5, comparison operators
      template<class OtherIndexType, size_t... OtherExtents>
      friend constexpr bool operator==(const extents&, const extents<OtherIndexType, OtherExtents...>&) noexcept;
  // 24.7.6.2, exposition-only helpers
      constexpr size_t fwd-prod-of-extents(rank_type) const noexcept;
      constexpr size_t rev-prod-of-extents(rank_type) const noexcept;
      template<class OtherIndexType>
      static constexpr auto index-cast(OtherIndexType&&) noexcept;
  private:
      static constexpr rank_type dynamic_index(rank_type) noexcept;
      static constexpr rank_type dynamic_index_inv(rank_type) noexcept;
      array<index_type, rank_dynamic()> dynamic_extents{};
    }

  template<class... Integrals>
  explicit extents(Integrals...) -> see below;
}

1 Mandates:
(1.1) — IndexType is a signed or unsigned integer type, and
(1.2) — each element of Extents is either equal to dynamic_extent, or is representable as a value of type IndexType.

2 Each specialization of extents models regular and is trivially copyable.
Let \( E_r \) be the \( r \)th element of \( \text{Extents} \). \( E_r \) is a \emph{dynamic extent} if it is equal to \texttt{dynamic_extent}, otherwise \( E_r \) is a \emph{static extent}. Let \( D_r \) be the value of \texttt{dynamic-extents[\text{dynamic-index}(r)]} if \( E_r \) is a dynamic extent, otherwise \( E_r \).

The \( r \)th interval of the multidimensional index space represented by an \texttt{extents} object is \([0, D_r)\).

### 24.7.6.2 Exposition-only helpers

\[ \texttt{static constexpr rank_type dynamic-index(rank_type i) noexcept; \quad // exposition only} \]

1. **Preconditions**: \( i \leq \text{rank()} \) is true.
2. **Returns**: The number of \( E_r \) with \( r < i \) for which \( E_r \) is a dynamic extent.

\[ \texttt{static constexpr rank_type dynamic-index-inv(rank_type i) noexcept; \quad // exposition only} \]

3. **Preconditions**: \( i < \text{rank_dynamic()} \) is true.
4. **Returns**: The minimum value of \( r \) such that \( \text{dynamic-index}(r + 1) = i + 1 \) is true.

\[ \texttt{constexpr size_t fwd-prod-of-extents(rank_type i) const noexcept; \quad // exposition only} \]

5. **Preconditions**: \( i \leq \text{rank()} \) is true.
6. **Returns**: If \( i > 0 \) is true, the product of \( \text{extent}(k) \) for all \( k \) in the range \([0, i)\), otherwise 1.

\[ \texttt{constexpr size_t rev-prod-of-extents(rank_type i) const noexcept; \quad // exposition only} \]

7. **Preconditions**: \( i < \text{rank()} \) is true.
8. **Returns**: If \( i + 1 < \text{rank()} \) is true, the product of \( \text{extent}(k) \) for all \( k \) in the range \([i + 1, \text{rank()})\), otherwise 1.

\[ \texttt{template<class OtherIndexType> static constexpr auto index-cast(OtherIndexType&& i) noexcept; \quad // exposition only} \]

9. **Effects**:
   - (9.1) If \( \text{OtherIndexType} \) is an integral type other than \texttt{bool}, then equivalent to \texttt{return i;},
   - (9.2) otherwise, equivalent to \texttt{return static_cast<index_type>(i);}.

   \[ \text{[Note 1: This function will always return an integral type other than bool. Since this function's call sites are constrained on convertibility of OtherIndexType to index_type, integer-class types can use the static_cast branch without loss of precision. — end note]} \]

### 24.7.6.3 Constructors

\[ \texttt{template<class OtherIndexType, size_t... OtherExtents> constexpr explicit(see below) extents(const extents<OtherIndexType, OtherExtents...>& other) noexcept;} \]

1. **Constraints**:
   - (1.1) \( \text{sizeof...(OtherExtents)} \) == \text{rank()} is true.
   - (1.2) \( ((\text{OtherExtents} == \text{dynamic_extent} \; || \; \text{Extents} == \text{dynamic_extent} \; || \; \text{OtherExtents} == \text{Extents}) \; && \; \ldots) \) is true.

2. **Preconditions**:
   - (2.1) \( \text{other.extent}(r) \) equals \( E_r \) for each \( r \) for which \( E_r \) is a static extent, and
   - (2.2) either
     - (2.2.1) \( \text{sizeof...(OtherExtents)} \) is zero, or
     - (2.2.2) \( \text{other.extent}(r) \) is representable as a value of type \texttt{index_type} for every rank index \( r \) of \( \text{other} \).

3. **Postconditions**: \( *\text{this} == \text{other} \) is true.
4. **Remarks**: The expression inside \texttt{explicit} is equivalent to:

   \[ (((\text{Extents} != \text{dynamic_extent}) \; && \; (\text{OtherExtents} == \text{dynamic_extent})) \; || \; \ldots) \; || \]
   \[ (\text{numeric_limits<index_type>::max()} < \text{numeric_limits<OtherIndexType>::max()}) \]
template<class... OtherIndexTypes>
    explicit constexpr extents(OtherIndexTypes... exts) noexcept;
Let \( N \) be \( \text{sizeof...}(\text{OtherIndexTypes}) \), and let \( \text{exts\_arr} \) be \( \text{array<index\_type,}\ N\{\text{static\_cast<index\_type>}(\text{std::move}(\text{exts}))\...}\). Constraints:
(6.1) \( \text{(is\_convertible\_v<OtherIndexTypes, index\_type> && ...)} \) is true,
(6.2) \( \text{(is\_nothrow\_constructible\_v<index\_type, OtherIndexTypes> && ...)} \) is true, and
(6.3) \( \text{\( N == \text{rank\_dynamic()} \) || \( N == \text{rank()} \) is true.} \)
[Note 1: One can construct \( \text{extents} \) from just dynamic extents, which are all the values getting stored, or from all the extents with a precondition. —end note]
Preconditions:
(7.1) \( \text{If \( N != \text{rank\_dynamic()} \) is true,} \ exts\_arr[r] \) equals \( E_r \) for each \( r \) for which \( E_r \) is a static extent, and
(7.2) \( \text{— either} \)
(7.2.1) \( \text{sizeof...}(\text{exts}) == 0 \) is true, or
(7.2.2) \( \text{each element of} \ exts \) is nonnegative and is representable as a value of type \( \text{index\_type} \).
Postconditions: \( \*\text{this} == \text{extents}(\text{exts\_arr}) \) is true.

template<class OtherIndexType, size_t N>
    constexpr explicit(N != rank_dynamic())
    extents(span<OtherIndexType, N> exts) noexcept;
    template<class OtherIndexType, size_t N>
    constexpr explicit(N != rank_dynamic())
    extents(const array<OtherIndexType, N>& exts) noexcept;
Constraints:
(9.1) \( \text{(is\_convertible\_v<const OtherIndexType\&, index\_type> is true,} \)
(9.2) \( \text{(is\_nothrow\_constructible\_v<index\_type, const OtherIndexType\&> is true, and} \)
(9.3) \( \text{\( N == \text{rank\_dynamic()} \) || \( N == \text{rank()} \) is true.} \)
Preconditions:
(10.1) \( \text{If \( N != \text{rank\_dynamic()} \) is true,} \ exts[r] \) equals \( E_r \) for each \( r \) for which \( E_r \) is a static extent, and
(10.2) \( \text{— either} \)
(10.2.1) \( \text{N is zero, or} \)
(10.2.2) \( \text{exts[r] is nonnegative and is representable as a value of type} \ index\_type \) for every rank index \( r \).
Effects:
(11.1) \( \text{If \( N \) equals dynamic\_rank(), for all} \ d \ \text{in the range} \ [0, \text{rank\_dynamic()}),} \ \text{direct\-non\-list\-initializes} \ \text{dynamic\_extent}[d] \ \text{with} \ \text{as\_const}(\text{exts}[d]).} \)
(11.2) \( \text{Otherwise, for all} \ d \ \text{in the range} \ [0, \text{rank\_dynamic()}),} \ \text{direct\-non\-list\-initializes} \ \text{dynamic\_extent}[d] \ \text{with} \ \text{as\_const}(\text{exts}[\text{dynamic\_index\_inv}(d)]).} \)

template<class... Integrals>
    explicit extents(Integrals...) -> see below;
Constraints: \( \text{(is\_convertible\_v<Integrals, size\_t> && ...)} \) is true.
Remarks: The deduced type is \( \text{dextents<size\_t, sizeof...(Integrals)>}. \)
24.7.6.4 Observers of the multidimensional index space

static constexpr size_t static_extent(rank_type i) noexcept;
Preconditions: \( i < \text{rank()} \) is true.
Returns: \( E_i \).
constexpr index_type extent(rank_type i) const noexcept;

Preconditions: i < rank() is true.

Returns: \( D_i \).

24.7.6.5 Comparison operators

\[
\begin{align*}
&\text{template<class OtherIndexType, size_t... OtherExtents>} \\
&\quad \text{friend constexpr bool operator== (const extents& lhs,} \\
&\quad\quad \text{const extents<OtherIndexType, OtherExtents...& rhs) noexcept;} \\
&\quad \text{Returns: true if lhs.rank() equals rhs.rank() and if lhs.extent(r) equals rhs.extent(r) for} \\
&\quad \text{every rank index r of rhs, otherwise false.}
\end{align*}
\]

24.7.6.6 Alias template \text{dextents}

\[
\begin{align*}
&\text{template<class IndexType, size_t Rank>} \\
&\quad \text{using dextents = see below;} \\
&\quad \text{Result: A type E that is a specialization of extents such that E::rank() == Rank && E::rank() ==} \\
&\quad \text{E::rank_dynamic() is true, and E::index_type denotes IndexType.}
\end{align*}
\]

24.7.7 Layout mapping

24.7.7.1 General

In subclauses 24.7.7.2 and 24.7.7.3:

(1.1) \( M \) denotes a layout mapping class.

(1.2) \( m \) denotes a (possibly const) value of type \( M \).

(1.3) \( i \) and \( j \) are packs of (possibly const) integers that are multidimensional indices in \( m\text{.extents()} \) (24.7.5).

[Note 1: The type of each element of the packs can be a different integer type. — end note]

(1.4) \( r \) is a (possibly const) rank index of \( \text{typename } M\text{::extents\_type} \).

(1.5) \( d_r \) is a pack of (possibly const) integers for which \( \text{sizeof...(d_r)} == M\text{::extents\_type::rank()} \) is true, the \( r \)th element is equal to 1, and all other elements are equal to 0.

In subclauses 24.7.7.2 through 24.7.7.7, let \( \text{is\text{-}mapping\_of} \) be the exposition-only variable template defined as follows:

\[
\begin{align*}
&\text{template<class Layout, class Mapping>} \\
&\quad \text{constexpr bool is\text{-}mapping\_of = } // \text{exposition only} \\
&\quad \text{is\_same\_v<\text{typename Layout::template mapping<typename Mapping::extents\_type>, Mapping>;} \\
&\end{align*}
\]

24.7.7.2 Requirements

A type \( M \) meets the layout mapping requirements if

(1.1) \( M \) models copyable and equality_comparable,

(1.2) \( \text{is\_nothrow\_move\_constructible_v<M> is true,} \)

(1.3) \( \text{is\_nothrow\_move\_assignable_v<M> is true,} \)

(1.4) \( \text{is\_nothrow\_swappable_v<M> is true, and} \)

(1.5) \( \) the following types and expressions are well-formed and have the specified semantics.

\[
\begin{align*}
&\text{typename } M\text{::extents\_type} \\
&\text{Result: A type that is a specialization of extents.} \\
&\text{typename } M\text{::index\_type} \\
&\text{Result: \text{typename } M\text{::extents\_type::index\_type.} } \\
&\text{typename } M\text{::rank\_type} \\
&\text{Result: \text{typename } M\text{::extents\_type::rank\_type.}}
\end{align*}
\]
typedef M::layout_type

Result: A type \( MP \) that meets the layout mapping policy requirements (24.7.7.3) and for which \( \text{is-mapping-of<MP, M>} \) is true.

\[ \text{m.extents()} \]

Result: const typename M::extents_type&

\[ \text{m(i...)} \]

Result: typename M::index_type

Returns: A nonnegative integer less than \( \text{numeric_limits<typename M::index_type>::max()} \) and less than or equal to \( \text{numeric_limits<size_t>::max()} \).

\[ \text{m(i...)} == \text{m(static_cast<typename M::index_type>(i...))} \]

Result: bool

\[ \text{m.required_span_size()} \]

Result: typename M::index_type

Returns: If the size of the multidimensional index space \( \text{m.extents()} \) is 0, then 0, else 1 plus the maximum value of \( \text{m}(i...) \) for all \( i \).

\[ \text{m.is_unique()} \]

Result: bool

Returns: true only if for every \( i \) and \( j \) where \( (i != j || \ldots) \) is true, \( \text{m}(i...) != \text{m}(j...) \) is true.

[Note 1: A mapping can return \text{false} even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is unique. —end note]

\[ \text{m.is_exhaustive()} \]

Result: bool

Returns: true only if for all \( k \) in the range \( [0, \text{m.required_span_size()}) \) there exists an \( i \) such that \( \text{m}(i...) \) equals \( k \).

[Note 2: A mapping can return \text{false} even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is exhaustive. —end note]

\[ \text{m.is_strided()} \]

Result: bool

Returns: true only if for every rank index \( r \) of \( \text{m.extents()} \) there exists an integer \( s_r \) such that, for all \( i \) where \( (i + d_r) \) is a multidimensional index in \( \text{m.extents()} \) (24.7.5), \( \text{m}((i + d_r)... - \text{m}(i...) \) equals \( s_r \).

[Note 3: This implies that for a strided layout \( m(i_0, \ldots, i_k) = m(0, \ldots, 0) + i_0 \times s_0 + \cdots + i_k \times s_k \). —end note]

[Note 4: A mapping can return \text{false} even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is strided. —end note]

\[ \text{m.stride(r)} \]

Preconditions: \( \text{m.is_strided()} \) is true.

Result: typename M::index_type

Returns: \( s_r \) as defined in \( \text{m.is_strided()} \) above.

\[ \text{M::is_always_unique()} \]

Result: A constant expression (7.7) of type bool.

Returns: true only if \( \text{m.is_unique()} \) is true for all possible objects \( \text{m} \) of type \( M \).

[Note 5: A mapping can return \text{false} even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is unique. —end note]
M::is_always_exhaustive()

Result: A constant expression (7.7) of type bool.

Returns: true only if m.is_exhaustive() is true for all possible objects m of type M.

[Note 6: A mapping can return false even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is exhaustive. — end note]

M::is_always_strided()

Result: A constant expression (7.7) of type bool.

Returns: true only if m.is_strided() is true for all possible objects m of type M.

[Note 7: A mapping can return false even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is strided. — end note]

24.7.7.3 Layout mapping policy requirements

A type MP meets the layout mapping policy requirements if for a type E that is a specialization of extents, MP::mapping<E> is valid and denotes a type X that meets the layout mapping requirements (24.7.7.2), and for which the qualified-id X::layout_type is valid and denotes the type MP and the qualified-id X::extents_type denotes E.

24.7.7.4 Layout mapping policies

namespace std {
    struct layout_left {
        template<class Extents>
        class mapping;
    };
    struct layout_right {
        template<class Extents>
        class mapping;
    };
    struct layout_stride {
        template<class Extents>
        class mapping;
    };
}

Each of layout_left, layout_right, and layout_stride meets the layout mapping policy requirements and is a trivial type.

24.7.7.5 Class template layout_left::mapping

24.7.7.5.1 Overview

layout_left provides a layout mapping where the leftmost extent has stride 1, and strides increase left-to-right as the product of extents.

namespace std {
    template<class Extents>
    class layout_left::mapping {
        public:
            using extents_type = Extents;
            using index_type = typename extents_type::index_type;
            using size_type = typename extents_type::size_type;
            using rank_type = typename extents_type::rank_type;
            using layout_type = layout_left;

            // 24.7.7.5.2, constructors
            constexpr mapping() noexcept = default;
            constexpr mapping(const mapping&) noexcept = default;
            constexpr mapping(const extents_type&) noexcept;
            template<class OtherExtents>
            constexpr explicit(!is_convertible_v<OtherExtents, extents_type>&) noexcept;
    };
}
template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const layout_right::mapping<OtherExtents>&) noexcept;

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const layout_left::mapping<OtherExtents>&);

constexpr mapping& operator=(const mapping&) noexcept = default;

// 24.7.7.5.3, observers
constexpr index_type required_span_size() const noexcept;

template<class... Indices>
constexpr index_type operator()(Indices...) const noexcept;

static constexpr bool is_always_unique() noexcept { return true; }
static constexpr bool is_always_exhaustive() noexcept { return true; }
static constexpr bool is_always_strided() noexcept { return true; }

constexpr index_type stride(rank_type) const noexcept;

template<class OtherExtents>
friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

private:
  extents_type extents_; // exposition only
};

If Extents is not a specialization of extents, then the program is ill-formed.

layout_left::mapping<E> is a trivially copyable type that models regular for each E.

24.7.7.5.2 Constructors

constexpr mapping(const extents_type& e) noexcept;

  Preconditions: The size of the multidimensional index space e is representable as a value of type
index_type (6.8.2).
  Effects: Direct-non-list-initializes extents_ with e.

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const mapping<OtherExtents>& other) noexcept;

  Constraints: is_constructible_v<extents_type, OtherExtents> is true.
  Preconditions: other.required_span_size() is representable as a value of type index_type (6.8.2).
  Effects: Direct-non-list-initializes extents_ with other.extents().

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const layout_right::mapping<OtherExtents>& other) noexcept;

  Constraints:
     — extents_type::rank() <= 1 is true, and
     — is_constructible_v<extents_type, OtherExtents> is true.
  Preconditions: other.required_span_size() is representable as a value of type index_type (6.8.2).
  Effects: Direct-non-list-initializes extents_ with other.extents().
```cpp
template<class OtherExtents>
constexpr explicit(extents_type::rank() > 0)
mapping(const layout_stride::mapping<OtherExtents>& other);

Constraints: is_constructible_v<extents_type, OtherExtents> is true.

Preconditions:
(10.1) If extents_type::rank() > 0 is true, then for all r in the range [0, extents_type::rank()),
other.stride(r) equals extents().fwd-prod-of-extents(r), and
(10.2) other.required_span_size() is representable as a value of type index_type (6.8.2).

Effects: Direct-non-list-initializes extents_ with other.extents().

24.7.7.5.3 Observers [mdspan.layout.left.obs]
constexpr index_type required_span_size() const noexcept;

Constraints:
(2.1) sizeof...(Indices) == extents_type::rank() is true,
(2.2) (is_convertible_v<Indices, index_type> && ...) is true, and
(2.3) (is_nothrow_constructible_v<index_type, Indices> && ...) is true.

Preconditions: extents_type::index-cast(i) is a multidimensional index in extents_ (24.7.5).

Effects: Let P be a parameter pack such that
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
is true. Equivalent to:
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);

constexpr index_type stride(rank_type i) const;

Constraints: extents_type::rank() > 0 is true.

Preconditions: i < extents_type::rank() is true.

Returns: extents().fwd-prod-of-extents(i).
```

```cpp
24.7.7.6 Class template layout_right::mapping [mdspan.layout.right]

24.7.7.6.1 Overview [mdspan.layout.right.overview]

layout_right provides a layout mapping where the rightmost extent is stride 1, and strides increase right-to-left as the product of extents.
```

```cpp
namespace std {
  template<class Extents>
  class layout_right::mapping {
    public:
      using extents_type = Extents;
      using index_type = typename extents_type::index_type;
      using size_type = typename extents_type::size_type;
      using rank_type = typename extents_type::rank_type;
      using layout_type = layout_right;

      // 24.7.7.6.2, constructors
      constexpr mapping() noexcept = default;
      constexpr mapping(const mapping&) noexcept = default;
  };
}
```
constexpr mapping(const extents_type&) noexcept;

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const mapping<OtherExtents>&) noexcept;

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const layout_left::mapping<OtherExtents>&) noexcept;

template<class OtherExtents>
constexpr explicit(extents_type::rank() > 0)
    mapping(const layout_stride::mapping<OtherExtents>&) noexcept;

castexpr mapping& operator=(const mapping&) noexcept = default;

// 24.7.7.6.3, observers
constexpr const extents_type& extents() const noexcept { return extents_; }

castexpr index_type required_span_size() const noexcept;

template<class... Indices>
constexpr index_type operator()(Indices...) const noexcept;

static constexpr bool is_always_unique() noexcept { return true; }
static constexpr bool is_always_exhaustive() noexcept { return true; }
static constexpr bool is_always_strided() noexcept { return true; }
static constexpr bool is_unique() noexcept { return true; }
static constexpr bool is_exhaustive() noexcept { return true; }
static constexpr bool is_strided() noexcept { return true; }

castexpr index_type stride(rank_type) const noexcept;

template<class OtherExtents>
friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

2 If Extents is not a specialization of extents, then the program is ill-formed.

3 layout_right::mapping<E> is a trivially copyable type that models regular for each E.

24.7.7.6.2 Constructors

constexpr mapping(const extents_type& e) noexcept;

1 Preconditions: The size of the multidimensional index space e is representable as a value of type
index_type (6.8.2).

Effects: Direct-non-list-initializes extents_ with e.

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const mapping&<OtherExtents>& other) noexcept;

3 Constraints: is_constructible_v<extents_type, OtherExtents> is true.

4 Preconditions: other.required_span_size() is representable as a value of type index_type (6.8.2).

5 Effects: Direct-non-list-initializes extents_ with other.extents().

template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
    mapping(const layout_left::mapping<OtherExtents>& other) noexcept;

6 Constraints:

(6.1) — extents_type::rank() <= 1 is true, and
§ 24.7.7.6.3 Observers

index_type required_span_size() const noexcept;

Returns: extents().fwd-prod-of-extents(extents_type::rank()).

template<class... Indices>
constexpr index_type operator()(Indices... i) const noexcept;

Constraints: sizeof...(Indices) == extents_type::rank() is true,

(2.1) — If extents_type::rank() > 0 is true, then for all r in the range [0, extents_type::rank()),
       other.stride(r) equals extents().rev-prod-of-extents(r).

(2.2) — extents_type::index-cast(i) is a multidimensional index in extents_(24.7.5).

Effects: Let P be a parameter pack such that

is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>

is true. Equivalent to:

return ((static_cast<index_type>(i) * stride(P)) + ... + 0);

constexpr index_type stride(rank_type i) const noexcept;

Constraints: extents_type::rank() > 0 is true.

Preconditions: i < extents_type::rank() is true.

Returns: extents().rev-prod-of-extents(i).

friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;

Constraints: extents_type::rank() == OtherExtents::rank() is true.

Effects: Equivalent to: return x.extents() == y.extents();

24.7.7.7 Class template layout_stride::mapping

layout_stride provides a layout mapping where the strides are user-defined.

namespace std {
  template<class Extents>
  class layout_stride::mapping {
      public:
          using extents_type = Extents;
          using index_type = typename extents_type::index_type;
          using size_type = typename extents_type::size_type;
          using rank_type = typename extents_type::rank_type;
          using layout_type = layout_stride;
          ...
private:
    static constexpr rank_type rank_ = extents_type::rank(); // exposition only

public:
    // 24.7.7.7.3, constructors
    constexpr mapping() noexcept = default;
    constexpr mapping(const mapping&) noexcept = default;
    template<class OtherIndexType>
        constexpr mapping(const extents_type&, span<OtherIndexType, rank_> ) noexcept;
    template<class OtherIndexType>
        constexpr mapping(const extents_type&, const array<OtherIndexType, rank_> & ) noexcept;
    template<class StridedLayoutMapping>
        constexpr explicit(see below) mapping(const StridedLayoutMapping&) noexcept;
    constexpr mapping& operator=(const mapping&) noexcept = default;

    // 24.7.7.7.4, observers
    constexpr const extents_type& extents() const noexcept { return extents_; }
    constexpr array<index_type, rank_> strides() const noexcept { return strides_; }
    constexpr index_type required_span_size() const noexcept;
    template<class... Indices>
        constexpr index_type operator()(Indices...) const noexcept;
    static constexpr bool is_always_unique() noexcept { return true; }
    static constexpr bool is_always_exhaustive() noexcept { return false; }
    static constexpr bool is_always_strided() noexcept { return true; }
    static constexpr bool is_unique() noexcept { return true; }
    constexpr bool is_exhaustive() const noexcept;
    static constexpr bool is_strided() noexcept { return true; }
    constexpr index_type stride(rank_type i) const noexcept { return strides_[i]; }
    template<class OtherMapping>
        friend constexpr bool operator==(const mapping&, const OtherMapping&) noexcept;

private:
    extents_type extents_; // exposition only
    array<index_type, rank_> strides_; // exposition only
};

2 If Extents is not a specialization of extents, then the program is ill-formed.
3 layout_stride::mapping<E> is a trivially copyable type that models regular for each E.

24.7.7.7.2 Exposition-only helpers

1 Let REQUIRED-SPAN-SIZE(e, strides) be:
(1.1) — 1, if e.rank() == 0 is true,
(1.2) — otherwise 0, if the size of the multidimensional index space e is 0,
(1.3) — otherwise 1 plus the sum of products of (e.extent(r) - 1) and strides[r] for all r in the range [0, e.rank()).

2 Let OFFSET(m) be:
(2.1) — m(), if e.rank() == 0 is true,
(2.2) — otherwise 0, if the size of the multidimensional index space e is 0,
(2.3) — otherwise m(z...) for a pack of integers z that is a multidimensional index in m.extents() and each element of z equals 0.
3 Let \textit{is-extents} be the exposition-only variable template defined as follows:

\begin{verbatim}
template<class T>
constexpr bool is-extents = false; // exposition only

template<class IndexType, size_t... Args>
constexpr bool is-extents<extents<IndexType, Args...>> = true; // exposition only
\end{verbatim}

4 Let \textit{layout-mapping-alike} be the exposition-only concept defined as follows:

\begin{verbatim}
template<class M>
concept layout-mapping-alike = requires {
  // exposition only
  requires is-extents<typename M::extents_type>;
  { M::is_always_strided() } -> same_as<bool>;
  { M::is_always_exhaustive() } -> same_as<bool>;
  { M::is_always_unique() } -> same_as<bool>;
  bool_constant<M::is_always_strided>::value;
  bool_constant<M::is_always_exhaustive>::value;
  bool_constant<M::is_always_unique>::value;
};
\end{verbatim}

\[\text{Note 1: This concept checks that the functions } M::is_always_strided(), M::is_always_exhaustive(), \text{ and } M::is_always_unique() \text{ exist, are constant expressions, and have a return type of bool. — end note}\]

### § 24.7.7.7.3 Constructors

**Template**

```cpp
template<class OtherIndexType>
constexpr mapping(const extents_type& e, span<OtherIndexType, rank_> s) noexcept;
```

**Constraints**

- \textit{is_convertible_v<const OtherIndexType&, index_type> is true, and}
- \textit{is_nothrow_constructible_v<index_type, const OtherIndexType&> is true.}

**Preconditions**

1. \textit{s[i] > 0 is true for all }i\text{ in the range }[0, \text{rank}_].
2. \textit{REQUIRED-SPAN-SIZE(e, s) is representable as a value of type index_type (6.8.2).}
3. \textit{If }\text{rank}_\text{ is greater than 0, then there exists a permutation }P\text{ of the integers in the range }[0, \text{rank}_],\text{ such that }s[p_i] >= s[p_{i-1}] * e.extent(p_{i-1})\text{ is true for all }i\text{ in the range }[1, \text{rank}_],\text{ where }p_i\text{ is the }i\text{th element of }P.\text{ — end note}

**Effects**: Direct-non-list-initializes \textit{extents_} with \textit{e}, and for all \textit{d} in the range \([0, \text{rank}_]\), direct-non-list-initializes \textit{strides_}[\textit{d}] with \textit{as_const(s[d])}.

**Template**

```cpp
template<class StridedLayoutMapping>
constexpr explicit(see below)
mapping(const StridedLayoutMapping& other) noexcept;
```

**Constraints**

1. \textit{layout-mapping-alike<StridedLayoutMapping> is satisfied.}
2. \textit{is_constructible_v<extents_type, typename StridedLayoutMapping::extents_type> is true.}
3. \textit{StridedLayoutMapping::is_always_unique() is true.}
4. \textit{StridedLayoutMapping::is_always_strided() is true.}

**Preconditions**

- \textit{StridedLayoutMapping meets the layout mapping requirements (24.7.7.3),}
- \textit{other.stride(r) > 0 is true for every rank index }r\text{ of extents(),}
- \textit{other.required_span_size() is representable as a value of type index_type (6.8.2), and}
- \textit{OFFSET(other) == 0 is true.}
**Effects**: Direct-non-list-initializes `extents_` with `other.extents()`, and for all `d` in the range `[0, rank_)`, direct-non-list-initializes `strides_[d]` with `other.stride(d)`.

Remarks: The expression inside `explicit` is equivalent to:

```cpp
!is_convertible_v<typename StridedLayoutMapping::extents_type, extents_type> &&
(is-mapping-of<layout_left, LayoutStrideMapping> ||
 is-mapping-of<layout_right, LayoutStrideMapping> ||
 is-mapping-of<layout_stride, LayoutStrideMapping>))
```

### 24.7.7.7.4 Observers

```cpp
castexpr index_type required_span_size() const noexcept;
```

**Returns**: `REQUIRED-SPAN-SIZE(extents(), strides_)`.

```cpp
template<class... Indices>
castexpr index_type operator()(Indices... i) const noexcept;
```

**Constraints**:

1. `sizeof...(Indices) == rank_` is true,
2. `(is_convertible_v<Indices, index_type> && ...)` is true, and
3. `(is_nothrow_constructible_v<Indices, index_type> && ...)` is true.

**Preconditions**: `extents_type::index-cast(i)` is a multidimensional index in `extents_(24.7.5)`.

**Effects**: Let `P` be a parameter pack such that `is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>` is true. Equivalent to:

```cpp
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```

```cpp
castexpr bool is_exhaustive() const noexcept;
```

**Returns**:

1. `true` if `rank_` is 0.
2. Otherwise, `true` if there is a permutation `P` of the integers in the range `[0, rank_`) such that `stride(p_0)` equals 1, and `stride(p_i)` equals `stride(p_{i-1}) * extents().extent(p_{i-1})` for `i` in the range `[1, rank_)`, where `p_i` is the `i`th element of `P`.
3. Otherwise, `false`.

```cpp
template<class OtherMapping>
friend castexpr bool operator==(const mapping& x, const OtherMapping& y) noexcept;
```

**Constraints**:

1. `layout-mapping-alike<OtherMapping>` is satisfied.
2. `rank_ == OtherMapping::extents_type::rank()` is true.
3. `OtherMapping::is_always_strided()` is true.

**Preconditions**: `OtherMapping` meets the layout mapping requirements (24.7.7.3).

**Returns**: `true` if `x.extents() == y.extents()` is true, `OFFSET(y) == 0` is `true`, and each of `x.stride(r) == y.stride(r)` is `true` for `r` in the range `[0, x.extents().rank())`. Otherwise, `false`.

### 24.7.8 Accessor policy

#### 24.7.8.1 General

**An accessor policy** defines types and operations by which a reference to a single object is created from an abstract data handle to a number of such objects and an index.

**A range of indices** `[0, N)` is an accessible range of a given data handle and an accessor if, for each `i` in the range, the accessor policy’s `access` function produces a valid reference to an object.

In subclause 24.7.8.2,

1. `A` denotes an accessor policy.
a denotes a value of type A or const A.

p denotes a value of type A::data_handle_type or const A::data_handle_type.

[Note 1: The type A::data_handle_type need not be dereferenceable. — end note]

n, i, and j each denote values of type size_t.

24.7.8.2 Requirements

A type A meets the accessor policy requirements if

1. A models copyable,
2. is_nothrow_move_constructible_v<A> is true,
3. is_nothrow_move_assignable_v<A> is true,
4. is_nothrow_swappable_v<A> is true, and
5. the following types and expressions are well-formed and have the specified semantics.

24.7.8.3 Class template default_accessor

24.7.8.3.1 Overview
struct default_accessor {
    using offset_policy = default_accessor;
    using element_type = ElementType;
    using reference = ElementType&;
    using data_handle_type = ElementType*;

    constexpr default_accessor() noexcept = default;
    template<class OtherElementType>
        constexpr default_accessor(default_accessor<OtherElementType>) noexcept;
    constexpr reference access(data_handle_type p, size_t i) const noexcept;
    constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
};

default_accessor meets the accessor policy requirements.
ElementType is required to be a complete object type that is neither an abstract class type nor an array type.
Each specialization of default_accessor is a trivially copyable type that models semiregular.
[0, n) is an accessible range for an object p of type data_handle_type and an object of type default_accessor if and only if [p, p + n) is a valid range.

24.7.8.3.2 Members

template<class OtherElementType>
    constexpr default_accessor(const default_accessor<OtherElementType>) noexcept {}
1 Constraints: is_convertible_v<OtherElementType(*)[], element_type(*)[]> is true.
    constexpr reference access(data_handle_type p, size_t i) const noexcept;
2 Effects: Equivalent to: return p[i];
    constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
3 Effects: Equivalent to: return p + i;

24.7.9 Class template mdspan

24.7.9.1 Overview

mdspan is a view of a multidimensional array of elements.

namespace std {
    template<class ElementType, class Extents, class LayoutPolicy, class AccessorPolicy>
        class mdspan {
        public:
            using extents_type = Extents;
            using layout_type = LayoutPolicy;
            using accessor_type = AccessorPolicy;
            using mapping_type = typename layout_type::template mapping<extents_type>;
            using element_type = ElementType;
            using value_type = remove_cv_t<element_type>;
            using index_type = typename extents_type::index_type;
            using size_type = typename extents_type::size_type;
            using rank_type = typename extents_type::rank_type;
            using data_handle_type = typename accessor_type::data_handle_type;
            using reference = typename accessor_type::reference;

            static constexpr rank_type rank() noexcept { return extents_type::rank(); }
            static constexpr rank_type rank_dynamic() noexcept { return extents_type::rank_dynamic(); }
            static constexpr size_t static_extent(rank_type r) noexcept
                { return extents_type::static_extent(r); }
            constexpr index_type extent(rank_type r) const noexcept { return extents().extent(r); }

            // 24.7.9.2, constructors
            constexpr mdspan();
            constexpr mdspan(const mdspan& rhs) = default;
            constexpr mdspan(mdspan&& rhs) = default;
}
template<
    class... OtherIndexTypes>
constexpr explicit mdspan(data_handle_type ptr, OtherIndexTypes... exts);

template<

const AccessorType&)
-> mdspan<typename AccessorType::element_type, typename MappingType::extents_type,
    typename MappingType::layout_type, AccessorType>;
```

2 **Mandates:**

(2.1) — `ElementType` is a complete object type that is neither an abstract class type nor an array type,

(2.2) — `Extents` is a specialization of `extents`, and

(2.3) — `is_same_v<ElementType, typename AccessorPolicy::element_type>` is true.

3 **LayoutPolicy** shall meet the layout mapping policy requirements (24.7.7.3), and **AccessorPolicy** shall meet the accessor policy requirements (24.7.8.2).

4 Each specialization MDS of `mdspan` models copyable and

(4.1) — `is_nothrow_move_constructible_v<MDS>` is true,

(4.2) — `is_nothrow_move_assignable_v<MDS>` is true, and

(4.3) — `is_nothrow_swappable_v<MDS>` is true.

5 A specialization of `mdspan` is a trivially copyable type if its `accessor_type`, `mapping_type`, and `data_handle_type` are trivially copyable types.

### 24.7.9.2 Constructors

```cpp
constexpr mdspan();
```

1 **Constraints:**

(1.1) — `rank_dynamic() > 0` is true.

(1.2) — `is_default_constructible_v<data_handle_type>` is true.

template<class... OtherIndexTypes>
constexpr explicit mdspan(data_handle_type p, OtherIndexTypes... exts);

Let \( N \) be \( \text{sizeof}(...) \text{(OtherIndexTypes)} \).

Constraints:

(5.1) — \( \text{is_convertible}_v<\text{OtherIndexTypes, index_type} \&\& ... \) is true,
(5.2) — \( \text{is_nothrow_constructible}<\text{index_type, OtherIndexTypes} \&\& ... \) is true,
(5.3) — \( N == \text{rank}() \mid N == \text{rank_dynamic}() \) is true,
(5.4) — \( \text{is_default_constructible}_v<\text{mapping_type, extents_type} \) is true, and
(5.5) — \( \text{is_default_constructible}_v<\text{accessor_type} \) is true.

Preconditions: \([0, \text{map_.required_span_size}())\) is an accessible range of \( \text{ptr} \) and \( \text{acc} \) for the values of \( \text{map} \) and \( \text{acc} \) after the invocation of this constructor.

Effects: Value-initializes \( \text{ptr} \), \( \text{map} \), and \( \text{acc} \).

template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
mdspan(data_handle_type p, span<OtherIndexType, N> exts);

template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
mdspan(data_handle_type p, const array<OtherIndexType, N>& exts);

Constraints:

(8.1) — \( \text{is_convertible}_v<\text{const OtherIndexType\&, index_type} \) is true,
(8.2) — \( \text{is_nothrow_constructible}<\text{index_type, const OtherIndexType\&} \&\& ... \) is true,
(8.3) — \( N == \text{rank}() \mid N == \text{rank_dynamic}() \) is true,
(8.4) — \( \text{is_constructible}_v<\text{mapping_type, extents_type} \) is true, and
(8.5) — \( \text{is_default_constructible}_v<\text{accessor_type} \) is true.

Preconditions: \([0, \text{map_.required_span_size}())\) is an accessible range of \( p \) and \( \text{acc} \) for the values of \( \text{map} \) and \( \text{acc} \) after the invocation of this constructor.

Effects:

(10.1) — Direct-non-list-initializes \( \text{ptr} \) with \( \text{std::move}(p) \),
(10.2) — direct-non-list-initializes \( \text{map} \) with \( \text{extents_type}() \text{(static_cast<index_type>(std::move(exts \( ... \)))}, \) and
(10.3) — value-initializes \( \text{acc} \).

constexpr mdspan(data_handle_type p, const extents_type& ext);

Constraints:

(11.1) — \( \text{is_convertible}_v<\text{mapping_type, const extents_type\&} \) is true, and
(11.2) — \( \text{is_default_constructible}_v<\text{accessor_type} \) is true.

Preconditions: \([0, \text{map_.required_span_size}())\) is an accessible range of \( p \) and \( \text{acc} \) for the values of \( \text{map} \) and \( \text{acc} \) after the invocation of this constructor.

Effects:

```cpp
cconstexpr mdspan(data_handle_type p, const mapping_type& m);
```

**Constraints:** is_default_constructible_v<accessor_type> is true.

**Preconditions:** \([0, \text{m}.\text{required_span_size}())\) is an accessible range of \( p \) and \( \text{acc}_- \) for the value of \( \text{acc}_- \) after the invocation of this constructor.

**Effects:**
- Direct-non-list-initializes \( \text{ptr}_- \) with std::move(\( p \)), |
- direct-non-list-initializes \( \text{map}_- \) with \( \text{m} \), and |
- value-initializes \( \text{acc}_- \).

```cpp
cconstexpr mdspan(data_handle_type p, const mapping_type& m, const accessor_type& a);
```

**Preconditions:** \([0, \text{m}.\text{required_span_size}())\) is an accessible range of \( p \) and \( \text{a} \).

**Effects:**
- Direct-non-list-initializes \( \text{ptr}_- \) with std::move(\( p \)), |
- direct-non-list-initializes \( \text{map}_- \) with \( \text{m} \), and |
- direct-non-list-initializes \( \text{acc}_- \) with \( \text{a} \).

```cpp
template<class OtherElementType, class OtherExtents, class OtherLayoutPolicy, class OtherAccessor>
cconstexpr explicit(see below)
mdspan(const mdspan<OtherElementType, OtherExtents, OtherLayoutPolicy, OtherAccessor>& other);
```

**Constraints:**
- is_constructible_v<mapping_type, const OtherLayoutPolicy::template mapping<OtherExtents>&> is true, and |
- is_constructible_v<accessor_type, const OtherAccessor&> is true.

**Mandates:**
- is_constructible_v<data_handle_type, const OtherAccessor::data_handle_type&> is true, and |
- is_constructible_v<extents_type, OtherExtents> is true.

**Preconditions:**
- For each rank index \( r \) of extents_type, static_extent(\( r \)) == dynamic_extent || static_extent(\( r \)) == other.extent(\( r \)) is true.
- \([0, \text{map}.\text{required_span_size}())\) is an accessible range of \( \text{ptr}_- \) and \( \text{acc}_- \) for values of \( \text{ptr}_- \), \( \text{map}_- \), and \( \text{acc}_- \) after the invocation of this constructor.

**Effects:**
- Direct-non-list-initializes \( \text{ptr}_- \) with other.\( \text{ptr}_- \), |
- direct-non-list-initializes \( \text{map}_- \) with other.\( \text{map}_- \), and |
- direct-non-list-initializes \( \text{acc}_- \) with other.\( \text{acc}_- \).

**Remarks:** The expression inside explicit is equivalent to:

\[
!\text{is_convertible_v<const OtherLayoutPolicy::template mapping<OtherExtents>&, mapping_type>}
\] || !\text{is_convertible_v<const OtherAccessor&, accessor_type>}

---

### 24.7.9.3 Members

```cpp
template<class... OtherIndexTypes>
cconstexpr reference operator[](OtherIndexTypes... indices) const;
```

**Constraints:**
Let I be `extents_type::index_cast(std::move(indices))`.

**Preconditions:** I is a multidimensional index in `extents()`.

*Note 1:* This implies that `map_(I) < map_.required_span_size()` is true. — end note

**Effects:** Equivalent to:

```
return acc_.access(ptr_, map_(static_cast<index_type>(std::move(indices))...));
```

```template<class OtherIndexType>
constexpr reference operator[] (span<OtherIndexType, rank()> indices) const;
```template<class OtherIndexType>
```constexpr reference operator[] (const array<OtherIndexType, rank()>& indices) const;
```

**Constraints:**

(5.1) `is_convertible_v<const OtherIndexType&, index_type>` is true, and

(5.2) `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is true.

**Effects:** Let P be a parameter pack such that

```
is_same_v<make_index_sequence<rank()>, index_sequence<P...>>
```

is true. Equivalent to:

```
return operator[](as_const(indices[P])...);
```

```constexpr size_type size() const noexcept;```

**Preconditions:** The size of the multidimensional index space `extents()` is representable as a value of type `size_type` (6.8.2).

**Returns:** `extents().fwd-prod-of-extents(rank())`.

```[[nodiscard]] constexpr bool empty() const noexcept;```

**Returns:** `true` if the size of the multidimensional index space `extents()` is 0, otherwise `false`.

**Effects:** Equivalent to:

```
swap(x.ptr_, y.ptr_);
swap(x.map_, y.map_);
swap(x.acc_, y.acc_);
```
25 Iterators library

25.1 General

This Clause describes components that C++ programs may use to perform iterations over containers (Clause 24), streams (31.7), stream buffers (31.6), and other ranges (Clause 26).

The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 85.

Table 85: Iterators library summary

25.3.1 In general

Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator \( i \) supports the expression \(*i\), resulting in a value of some object type \( T \), called the value type of the iterator. An output iterator \( i \) has a non-empty set of types that are indirectly writable to the iterator; for each such type \( T \), \(|i|\) would be a value of type \( T \).
the expression \( *i = o \) is valid where \( o \) is a value of type \( T \). For every iterator type \( X \), there is a corresponding signed integer-like type (25.3.4.4) called the difference type of the iterator.

Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: input iterators, output iterators, forward iterators, bidirectional iterators, random access iterators, and contiguous iterators, as shown in Table 86.

<table>
<thead>
<tr>
<th>Contiguous</th>
<th>Random Access</th>
<th>Bidirectional</th>
<th>Forward</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
</table>

The six categories of iterators correspond to the iterator concepts

1. input_iterator (25.3.4.9),
2. output_iterator (25.3.4.10),
3. forward_iterator (25.3.4.11),
4. bidirectional_iterator (25.3.4.12),
5. random_access_iterator (25.3.4.13), and
6. contiguous_iterator (25.3.4.14),

respectively. The generic term iterator refers to any type that models the input_or_output_iterator concept (25.3.4.6).

Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.

Iterators that further meet the requirements of output iterators are called mutable iterators. Nonmutable iterators are referred to as constant iterators.

In addition to the requirements in this subclause, the nested typedef-names specified in 25.3.2.3 shall be provided for the iterator type.

[Note 1: Either the iterator type must provide the typedef-names directly (in which case iterator_traits pick them up automatically), or an iterator_traits specialization must provide them. — end note]

Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a past-the-end value. Values of an iterator \( i \) for which the expression \( *i \) is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the Cpp17DefaultConstructible requirements, using a value-initialized iterator as the source of a copy or move operation.

[Note 2: This guarantee is not offered for default-initialization, although the distinction only matters for types with trivial default constructors such as pointers or aggregates holding pointers. — end note]

In these cases the singular value is overwritten the same way as any other value. Dereferenceable values are always non-singular.

Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A range is an iterator and a sentinel that designate the beginning and end of the computation, or an iterator and a count that designate the beginning and the number of elements to which the computation is to be applied.\(^\text{217}\)

\(^{217}\) The sentinel denoting the end of a range can have the same type as the iterator denoting the beginning of the range, or a different type.
An iterator and a sentinel denoting a range are comparable. A range \([i, s]\) is empty if \(i == s\); otherwise, \([i, s]\) refers to the elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the first iterator \(j\) such that \(j == s\).

A sentinel \(s\) is called **reachable from** an iterator \(i\) if and only if there is a finite sequence of applications of the expression \(++i\) that makes \(i == s\). If \(s\) is reachable from \(i\), \([i, s]\) denotes a **valid range**.

A **counted range** \(i + [0, n]\) is empty if \(n == 0\); otherwise, \(i + [0, n]\) refers to the \(n\) elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the result of \(n\) applications of \(++i\). A counted range \(i + [0, n]\) is **valid** if and only if \(n == 0\); or \(n\) is positive, \(i\) is dereferenceable, and \(++i + [0, \neg n]\) is valid.

The result of the application of library functions to invalid ranges is undefined.

All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.

An **invalid iterator** is an iterator that may be singular.\(^{218}\)

Iterators are called **constexpr iterators** if all operations provided to meet iterator category requirements are constexpr functions.

\([\text{Note 3: For example, the types } \text{“pointer to } \text{int” and reverse_iterator<int*> areconstexpr iterators. — end note}]\]

### 25.3.2 Associated types

#### 25.3.2.1 Incrementable traits

To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if \(WI\) is the name of a type that models the weakly_incrementable concept (25.3.4.4), the type

\[
\text{iter_difference_t<WI>}
\]

be defined as the incrementable type’s difference type.

```cpp
namespace std {
    template<class> struct incrementable_traits {};

    template<class T>
    requires is_object_v<T>
    struct incrementable_traits<T*> {
        using difference_type = ptrdiff_t;
    };

    template<class I>
    struct incrementable_traits<const I> : incrementable_traits<I> {};

    template<class T>
    requires requires { typename T::difference_type; }
    struct incrementable_traits<T> {
        using difference_type = typename T::difference_type;
    };

    template<class T>
    requires (!requires { typename T::difference_type; } &&
              requires(const T& a, const T& b) {
                a - b
              } -> integral;)
    struct incrementable_traits<T> {
        using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
    };
}
```

\(^{218}\) This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.
template<class T>
    using iter_difference_t = see below;

2 Let \( R \) be \( \text{remove_cvref}_t\langle I \rangle \). The type \( \text{iter_difference}_t\langle I \rangle \) denotes

(2.1) \( \text{incrementable_traits}_t\langle R \rangle \text{::difference_type} \) if \( \text{iterator_traits}_t\langle R \rangle \text{::difference_type} \) names a specialization generated from the primary template, and

(2.2) \( \text{iterator_traits}_t\langle R \rangle \text{::difference_type} \) otherwise.

3 Users may specialize \( \text{incrementable_traits}_t \) on program-defined types.

25.3.2.2 Indirectly readable traits

1 To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if \( R \) is the name of a type that models the \( \text{indirectly-readable} \) concept (25.3.4.2), the type

\( \text{iter}_t\langle R \rangle \)

be defined as the indirectly readable type’s value type.

\[
\text{template<class R> struct cond-value-type \{ }; \quad // exposition only
\text{template<class T> requires is_object_v\langle T \rangle
    struct cond-value-type\langle T \rangle
    \{ using value_type = remove_cv_t\langle T \rangle; \};
\text{template<class T>
    concept has-member-value-type = requires \{ typename T::value_type; \}; \quad // exposition only
\text{template<class T>
    concept has-member-element-type = requires \{ typename T::element_type; \}; \quad // exposition only
\text{template<class> struct indirectly_readable_traits \{ \};
\text{template<class T>
    struct indirectly_readable_traits\langle T\rangle
    : cond-value-type\langle T \rangle \{ \};
\text{template<class I>
    requires is_array_v\langle I \rangle
    struct indirectly_readable_traits\langle I \rangle
    \{ using value_type = remove_cv_t\langle remove_extent_t\langle I \rangle\rangle; \};
\text{template<class I>
    struct indirectly_readable_traits\langle const I \rangle
    : indirectly_readable_traits\langle I \rangle \{ \};
\text{template<has-member-value-type T>
    struct indirectly_readable_traits\langle T\rangle
    : cond-value-type\langle typename T::value_type \rangle \{ \};
\text{template<has-member-element-type T>
    struct indirectly_readable_traits\langle T\rangle
    : cond-value-type\langle typename T::element_type \rangle \{ \};
\text{template<has-member-value-type T>
    requires has-member-element-type\langle T \rangle
    struct indirectly_readable_traits\langle T \rangle \{ \};
\text{template<has-member-value-type T>
    requires has-member-element-type\langle T \rangle \&\&
    same_as\langle remove_cv_t\langle typename T::element_type \rangle, remove_cv_t\langle typename T::value_type \rangle\rangle
    struct indirectly_readable_traits\langle T \rangle
2 Let $R_I$ be `remove_cvref_t<I>`. The type `iter_value_t` denotes

(2.1) — `indirectly_readable_traits<R_I>::value_type` if `iterator_traits<R_I>` names a specialization

generated from the primary template, and

(2.2) — `iterator_traits<R_I>::value_type` otherwise.

3 Class template `indirectly_readable_traits` may be specialized on program-defined types.

[Note 1: Some legacy output iterators define a nested type named `value_type` that is an alias for `void`. These types are not `indirectly_readable` and have no associated value types. — end note]

[Note 2: Smart pointers like `shared_ptr<int>` are `indirectly_readable` and have an associated value type, but a smart pointer like `shared_ptr<void>` is not `indirectly_readable` and has no associated value type. — end note]

### 25.3.2.3 Iterator traits

To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if $I$ is the type of an iterator, the type

* `iterator_traits<I>::iterator_category`

be defined as the iterator’s iterator category. In addition, the types

* `iterator_traits<I>::pointer`
* `iterator_traits<I>::reference`

shall be defined as the iterator’s pointer and reference types; that is, for an iterator object $a$ of class type, the same type as `decltype(a.operator->())` and `decltype(*a)`, respectively. The type `iterator_traits<I>::pointer` shall be `void` for an iterator of class type $I$ that does not support `operator->`. Additionally, in the case of an output iterator, the types

* `iterator_traits<I>::value_type`
* `iterator_traits<I>::difference_type`
* `iterator_traits<I>::reference`

may be defined as `void`.

2 The definitions in this subclause make use of the following exposition-only concepts:

```cpp
template<class I>
concept cpp17-iterator =
    requires(I i) {
        { *i } -> can-reference;
        { ++i } -> same_as<I&>;
        { *i++ } -> can-reference;
    } && copyable<I>;

template<class I>
concept cpp17-input-iterator =
    cpp17-iterator<I> && equality_comparable<I> && requires(I i) {
        typename incrementable_traits<I>::difference_type;
        typename indirectly_readable_traits<I>::value_type;
        typename common_reference_t<iter_reference_t<I>&&,
            typename indirectly_readable_traits<I>::value_type&>;
        requires signed_integral<typename incrementable_traits<I>::difference_type>;
    };

template<class I>
concept cpp17-forward-iterator =
    cpp17-input-iterator<I> && constructible_from<I> &&
    requires(I i) {
        typename indirectly_readable_traits<I>::value_type & &
    };
```

```cpp
def (i++) -> convertible_to<const I&>;
def (*i++) -> same_as<iter_reference_t<I>>;
```

```cpp
template<class I>
concept cpp17-bidirectional_iterator =
cpp17-forward_iterator<I> && requires(I i) {
    { --i } -> same_as<I&>;
    { i-- } -> convertible_to<const I&>;
    { *i-- } -> same_as<iter_reference_t<I>>;
};
```

```cpp
template<class I>
concept cpp17-random-access_iterator =
cpp17-bidirectional_iterator<I> && totally_ordered<I> && requires(I i, typename incrementable_traits<I>::difference_type n) {
    { i += n } -> same_as<I&>;
    { i -= n } -> same_as<I&>;
    { i + n } -> same_as<I>;
    { n + i } -> same_as<I>;
    { i - n } -> same_as<I>;
    { i - i } -> same_as<decltype(n)>;
    { i[n] } -> convertible_to<iter_reference_t<I>>;
};
```

3 The members of a specialization iterator_traits<I> generated from the iterator_traits primary template are computed as follows:

(3.1) — If I has valid (13.10.3) member types difference_type, value_type, reference, and iterator_category, then iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = typename I::iterator_category;
using value_type = typename I::value_type;
using difference_type = typename I::difference_type;
using pointer = see below;
using reference = see below;
```

If the qualified-id I::pointer is valid and denotes a type, then iterator_traits<I>::pointer names that type; otherwise, it names void.

(3.2) — Otherwise, if I satisfies the exposition-only concept cpp17-input_iterator, iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = see below;
using value_type = typename indirectly_readable_traits<I>::value_type;
using difference_type = typename incrementable_traits<I>::difference_type;
using pointer = see below;
using reference = see below;
```

(3.2.1) — If the qualified-id I::pointer is valid and denotes a type, pointer names that type. Otherwise, if decltype(declval<I&>().operator->()) is well-formed, then pointer names that type. Otherwise, pointer names void.

(3.2.2) — If the qualified-id I::reference is valid and denotes a type, reference names that type. Otherwise, reference names iter_reference_t<I>.

(3.2.3) — If the qualified-id I::iterator_category is valid and denotes a type, iterator_category names that type. Otherwise, iterator_category names:

```cpp
random_access_iterator_tag if I satisfies cpp17-random-access_iterator, or otherwise
bidirectional_iterator_tag if I satisfies cpp17-bidirectional_iterator, or otherwise
forward_iterator_tag if I satisfies cpp17-forward_iterator, or otherwise
input_iterator_tag.
```

(3.3) — Otherwise, if I satisfies the exposition-only concept cpp17-iterator, then iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = output_iterator_tag;
```
using value_type = void;
using difference_type = see below;
using pointer = void;
using reference = void;

If the qualified-id incrementable_traits<I>::difference_type is valid and denotes a type, then
difference_type names that type; otherwise, it names void.

— Otherwise, iterator_traits<I> has no members by any of the above names.

4 Explicit or partial specializations of iterator_traits may have a member type iterator_concept that is
used to indicate conformance to the iterator concepts (25.3.4).

[Example 1: To indicate conformance to the input_iterator concept but a lack of conformance to the Cpp17InputIter-
ator requirements (25.3.5.3), an iterator_traits specialization might have iterator_concept denote input_iterator_tag
but not define iterator_category. — end example]

5 iterator_traits is specialized for pointers as

```cpp
namespace std {
    template<class T>
    requires is_object_v<T>
    struct iterator_traits<T*> {
        using iterator_concept = contiguous_iterator_tag;
        using iterator_category = random_access_iterator_tag;
        using value_type = remove_cv_t<T>;
        using difference_type = ptrdiff_t;
        using pointer = T*;
        using reference = T&;
    };
}
```

[Example 2: To implement a generic reverse function, a C++ program can do the following:

```cpp
template<class BI>
void reverse(BI first, BI last) {
    typename iterator_traits<BI>::difference_type n =
        distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BI>::value_type
            tmp = *first;
        *first++ = --last;
        *last = tmp;
        n -= 2;
    }
}
```
— end example]

25.3.3 Customization point objects [iterator.cust]

25.3.3.1 ranges::iter_move [iterator.cust.move]

1 The name ranges::iter_move denotes a customization point object (16.3.3.6). The expression ranges::
iter_move(E) for a subexpression E is expression-equivalent to:

(1.1) — iter_move(E), if E has class or enumeration type and iter_move(E) is a well-formed expression when
        treated as an unevaluated operand, with overload resolution performed in a context that does not
        include a declaration of ranges::iter_move but does include the declaration
        void iter_move();

(1.2) — Otherwise, if the expression *E is well-formed:

(1.2.1) — if *E is an lvalue, std::move(*E);

(1.2.2) — otherwise, *E.

(1.3) — Otherwise, ranges::iter_move(E) is ill-formed.

[Note 1: This case can result in substitution failure when ranges::iter_move(E) appears in the immediate
circuit of a template instantiation. — end note]
2 If `ranges::iter_move(E)` is not equal to `*E`, the program is ill-formed, no diagnostic required.

25.3.3.2 `ranges::iter_swap`  
[iterator.cust.swap]
1 The name `ranges::iter_swap` denotes a customization point object (16.3.3.6) that exchanges the values (18.4.9) denoted by its arguments.

2 Let `iter-exchange-move` be the exposition-only function:

```cpp
template<class X, class Y>
constexpr iter_value_t<X> iter_exchange_move(X&& x, Y&& y)
  noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
         noexcept(*x = iter_move(y)));
```

3 **Effects**: Equivalent to:

```cpp
type X_t = iter_value_t<X>;
X_t old_value = iter_move(x);
*x = iter_move(y);
return old_value;
```

4 The expression `ranges::iter_swap(E1, E2)` for subexpressions `E1` and `E2` is expression-equivalent to:

- (4.1) `(void)iter_swap(E1, E2)`, if either `E1` or `E2` has class or enumeration type and `iter_swap(E1, E2)` is a well-formed expression with overload resolution performed in a context that includes the declaration

  ```cpp
  template<class I1, class I2>
  void iter_swap(I1, I2) = delete;
  ```

  and does not include a declaration of `ranges::iter_swap`. If the function selected by overload resolution does not exchange the values denoted by `E1` and `E2`, the program is ill-formed, no diagnostic required.

- (4.2) Otherwise, if the types of `E1` and `E2` each model `indirectly_readable`, and if the reference types of `E1` and `E2` model `swappable_with` (18.4.9), then `ranges::swap(*E1, *E2)`.

- (4.3) Otherwise, if the types `T1` and `T2` of `E1` and `E2` model `indirectly_movable_storable<T1, T2>` and `indirectly_movable_storable<T2, T1>`, then `(void)(*E1 = iter-exchange-move(E2, E1))`, except that `E1` is evaluated only once.

- (4.4) Otherwise, `ranges::iter_swap(E1, E2)` is ill-formed.

[Note 1: This case can result in substitution failure when `ranges::iter_swap(E1, E2)` appears in the immediate context of a template instantiation. — end note]

25.3.4 Iterator concepts  
[iterator.concepts]
25.3.4.1 General  
[iterator.concepts.general]
1 For a type `I`, let `ITER_TRAITS(I)` denote the type `I` if `iterator_traits<I>` names a specialization generated from the primary template. Otherwise, `ITER_TRAITS(I)` denotes `iterator_traits<I>`.

1.1 — If the qualified-id `ITER_TRAITS(I)::iterator_concept` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.

1.2 — Otherwise, if the qualified-id `ITER_TRAITS(I)::iterator_category` is valid and names a type, then `ITER_CONCEPT(I)` denotes that type.

1.3 — Otherwise, if `iterator_traits<I>` names a specialization generated from the primary template, then `ITER_CONCEPT(I)` denotes `random_access_iterator_tag`.

1.4 — Otherwise, `ITER_CONCEPT(I)` does not denote a type.

2 [Note 1: `ITER_TRAITS` enables independent syntactic determination of an iterator’s category and concept. — end note]

[Example 1:]

```cpp
struct I {
  using value_type = int;
  using difference_type = int;

  int operator*() const;
  I& operator++();
  I I operator++(int);
  I& operator--();
  I I operator--(int);
```
bool operator==(I) const;
};

iterator_traits<I>::iterator_category denotes input_iterator_tag, and ITER_CONCEPT(I) denotes random_access_iterator_tag. —end example

### 25.3.4.2 Concept indirectly_readable

[iterator.concept.readable]

Types that are indirectly readable by applying operator* model the indirectly_readable concept, including pointers, smart pointers, and iterators.

```cpp
template<class In>
concept indirectly-readable-impl =
requires(const In in) {
    typename iter_value_t<In>;
    typename iter_reference_t<In>;
    typename iter_rvalue_reference_t<In>;
    { *in } -> same_as<iter_reference_t<In>>;
    { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
} &&
common_reference_with<iter_reference_t<In>&&, iter_value_t<In>&> &&
common_reference_with<iter_reference_t<In>&&, iter_rvalue_reference_t<In>&&> &&
common_reference_with<iter_rvalue_reference_t<In>&&, const iter_value_t<In>&>;

template<class In>
concept indirectly_readable =
indirectly-readable-impl<remove_cvref_t<In>>;
```

Given a value i of type I, I models indirectly_readable only if the expression *i is equality-preserving.

### 25.3.4.3 Concept indirectly_writable

[iterator.concept.writable]

The indirectly_writable concept specifies the requirements for writing a value into an iterator's referenced object.

```cpp
template<class Out, class T>
concept indirectly_writable =
requires(Out&& o, T&& t) {
    *o = std::forward<T>(t); // not required to be equality-preserving
    *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
    const_cast<const iter_reference_t<Out>&&>(*o) =
        std::forward<T>(t); // not required to be equality-preserving
    const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
        std::forward<T>(t); // not required to be equality-preserving
};
```

Let E be an expression such that decltype((E)) is T, and let o be a dereferenceable object of type Out. Out and T model indirectly_writable<Out, T> only if

(2.1) — If Out and T model indirectly_readable<Out> && same_as<iter_value_t<Out>, decay_t<T>>, then *o after any above assignment is equal to the value of E before the assignment.

After evaluating any above assignment expression, o is not required to be dereferenceable.

If E is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.15).

[Note 1: The only valid use of an operator* is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once. —end note]

[Note 2: indirectly_writable has the awkward const_cast expressions to reject iterators with prvalue non-proxy reference types that permit rvalue assignment but do not also permit const rvalue assignment. Consequently, an iterator type I that returns std::string by value does not model indirectly_writable<I, std::string>. —end note]

### 25.3.4.4 Concept weakly_incrementable

[iterator.concept.winc]

The weakly_incrementable concept specifies the requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are not required to be equality-preserving, nor is the type required to be equality_comparable.

```cpp
template<class T>
inline constexpr bool is-integer-like = see below; // exposition only
```
template<class T>
inline constexpr bool is_signed_integer_like = see below;  // exposition only

template<class I>
concept weakly_incrementable =
movable<I> &&
requires(I i) {
    typename iter_difference_t<I>;
    requires is_signed_integer_like<iter_difference_t<I>>;
    { ++i } -> same_as<I&>;  // not required to be equality-preserving
    i++;  // not required to be equality-preserving
};

2 A type I is an integer-class type if it is in a set of implementation-defined types that behave as integer types do, as defined below.

[Note 1: An integer-class type is not necessarily a class type. —end note]

3 The range of representable values of an integer-class type is the continuous set of values over which it is defined. For any integer-class type, its range of representable values is either \(-2^{N-1}\) to \(2^{N-1} - 1\) (inclusive) for some integer \(N\), in which case it is a signed integer-class type, or \(0\) to \(2^N - 1\) (inclusive) for some integer \(N\), in which case it is an unsigned integer-class type. In both cases, \(N\) is called the width of the integer-class type. The width of an integer-class type is greater than that of every integral type of the same signedness.

4 A type I other than cv bool is integer-like if it models integral<I> or if it is an integer-class type. An integer-like type I is signed-integer-like if it models signed_integral<I> or if it is a signed-integer-class type. An integer-like type I is unsigned-integer-like if it models unsigned_integral<I> or if it is an unsigned-integer-class type.

5 For every integer-class type I, let B(I) be a unique hypothetical extended integer type of the same signedness with the same width (6.8.2) as I.

[Note 2: The corresponding hypothetical specialization numeric_limits<B(I)> meets the requirements on numeric_limits specializations for integral types (17.3.5). —end note]

For every integral type J, let B(J) be the same type as J.

6 Expressions of integer-class type are explicitly convertible to any integer-like type, and implicitly convertible to any integer-class type of equal or greater width and the same signedness. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types and between two integer-class types do not exit via an exception. The result of such a conversion is the unique value of the destination type that is congruent to the source modulo \(2^N\), where \(N\) is the width of the destination type.

7 Let a be an object of integer-class type I, let b be an object of integer-like type I2 such that the expression b is implicitly convertible to I, let x and y be, respectively, objects of type B(I) and B(I2) as described above that represent the same values as a and b, and let c be an lvalue of any integral type.

(7.1) — The expressions a++ and a-- shall be prvalues of type I whose values are equal to that of a prior to the evaluation of the expressions. The expression a++ shall modify the value of a by adding 1 to it. The expression a-- shall modify the value of a by subtracting 1 from it.

(7.2) — The expressions ++a, --a, and &a shall be expression-equivalent to a += 1, a -= 1, and addressof(a), respectively.

(7.3) — For every unary-operator @ other than & for which the expression @x is well-formed, @a shall also be well-formed and have the same value, effects, and value category as @x. If @x has type bool, so too does @a; if @x has type B(I), then @a has type I.

(7.4) — For every assignment operator @= for which c @= x is well-formed, c @= a shall also be well-formed and shall have the same value and effects as c @= x. The expression c @= a shall be an lvalue referring to c.

(7.5) — For every assignment operator @= for which x @= y is well-formed, a @= b shall also be well-formed and shall have the same effects as x @= y, except that the value that would be stored into x is stored into a. The expression a @= b shall be an lvalue referring to a.

(7.6) — For every non-assignment binary operator @ for which x @ y and y @ x are well-formed, a @ b and b @ a shall also be well-formed and shall have the same value, effects, and value category as x @ y and y
\( \ast x \), respectively. If \( x \ast y \) or \( y \ast x \) has type \( B(I) \), then \( a \ast b \) or \( b \ast a \), respectively, has type \( I \); if \( x \ast y \) or \( y \ast x \) has type \( B(I2) \), then \( a \ast b \) or \( b \ast a \), respectively, has type \( I2 \); if \( x \ast y \) or \( y \ast x \) has any other type, then \( a \ast b \) or \( b \ast a \), respectively, has that type.

8 An expression \( E \) of integer-class type \( I \) is contextually convertible to \( bool \) as if by \( bool(E \neq I(0)) \).

9 All integer-class types model \( \text{regular} \) (18.6) and \( \text{three\_way\_comparable<\text{strong\_ordering}>} \) (17.12.4).

10 A value-initialized object of integer-class type has value 0.

11 For every (possibly cv-qualified) integer-class type \( I \), \( \text{numeric\_limits<}I\text{>} \) is specialized such that each static data member \( m \) has the same value as \( \text{numeric\_limits<B(I)>::m} \), and each static member function \( f \) returns \( I(\text{numeric\_limits<B(I)>::f}) \).

12 For any two integer-like types \( I1 \) and \( I2 \), at least one of which is an integer-class type, \( \text{common\_type\_t<}I1,I2\text{>} \) denotes an integer-class type whose width is not less than that of \( I1 \) or \( I2 \). If both \( I1 \) and \( I2 \) are signed-integer-like types, then \( \text{common\_type\_t<}I1,I2\text{>} \) is also a signed-integer-like type.

13 \( \text{is\_integer\_like<}I\text{>} \) is \text{true} if and only if \( I \) is an integer-like type. \( \text{is\_signed\_integer\_like<}I\text{>} \) is \text{true} if and only if \( I \) is a signed-integer-like type.

14 Let \( i \) be an object of type \( I \). When \( i \) is in the domain of both pre- and post-increment, \( i \) is said to be \text{incrementable}. \( I \) models \( \text{weakly\_incrementable<}I\text{>} \) only if

\[ \text{(2.1)} \quad \text{if } \text{bool}(a == b) \text{ then bool}(a++ == b). \]

\[ \text{(2.2)} \quad \text{if } \text{bool}(a == b) \text{ then bool}(((\text{void})a++, a) == ++b). \]

3 [Note 2: The requirement that \( a \) equals \( b \) implies \( ++a \) equals \( ++b \) (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model \text{incrementable}. — end note]

25.3.4.5 Concept incrementable [iterator.concept.inc]

The \text{incrementable} concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be \text{equality\_comparable}.

[Note 1: This supersedes the annotations on the increment expressions in the definition of \text{weakly\_incrementable}. — end note]

\[
\text{template<}\text{class } I\text{>} \\
\text{concept incrementable} = \\
\text{regular<}I\text{>} \&\& \\
\text{weakly\_incrementable<}I\text{>} \&\& \\
\text{requires}(I \ i \ { \{ i++ } \rightarrow \text{same\_as<}I\text{>; }); \\
\]

2 Let \( a \) and \( b \) be incrementable objects of type \( I \). \( I \) models \text{incrementable} only if

\[ \text{(2.1)} \quad \text{if } \text{bool}(a == b) \text{ then bool}(a++ == b). \]

\[ \text{(2.2)} \quad \text{if } \text{bool}(a == b) \text{ then bool}(((\text{void})a++, a) == ++b). \]

3 [Note 2: The requirement that \( a \) equals \( b \) implies \( ++a \) equals \( ++b \) (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model \text{incrementable}. — end note]

25.3.4.6 Concept input_or_output_iterator [iterator.concept.iterator]

The \text{input\_or\_output\_iterator} concept forms the basis of the iterator concept taxonomy; every iterator models \text{input\_or\_output\_iterator}. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (25.3.4.7), to read (25.3.4.9) or write (25.3.4.10) values, or to provide a richer set of iterator movements (25.3.4.11, 25.3.4.12, 25.3.4.13).
2 [Note 1: Unlike the Cpp17Iterator requirements, the input_or_output_iterator concept does not require copyability. —end note]

25.3.4.7 Concept sentinel_for

The sentinel_for concept specifies the relationship between an input_or_output_iterator type and a semiregular type whose values denote a range.

```
template<class S, class I>
concept sentinel_for =
    semiregular<S> &&
    input_or_output_iterator<I> &&
    weakly-equality-comparable-with<S, I>; // see 18.5.4
```

2 Let s and i be values of type S and I such that [i,s) denotes a range. Types S and I model sentinel_for<S, I> only if
(2.1) i == s is well-defined.
(2.2) If bool(i != s) then i is dereferenceable and [++i,s) denotes a range.
(2.3) assignable_from<I&, S> is either modeled or not satisfied.

3 The domain of == is not static. Given an iterator i and sentinel s such that [i,s) denotes a range and i != s, i and s are not required to continue to denote a range after incrementing any other iterator equal to i. Consequently, i == s is no longer required to be well-defined.

25.3.4.8 Concept sized_sentinel_for

The sized_sentinel_for concept specifies requirements on an input_or_output_iterator type I and a corresponding sentinel_for<I> that allow the use of the - operator to compute the distance between them in constant time.

```
template<class S, class I>
concept sized_sentinel_for =
    sentinel_for<S, I> &&
    !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
    requires(const I& i, const S& s) {
        { s - i } -> same_as<iter_difference_t<I>>;
        { i - s } -> same_as<iter_difference_t<I>>;
    };
```

2 Let i be an iterator of type I, and s a sentinel of type S such that [i,s) denotes a range. Let N be the smallest number of applications of ++i necessary to make bool(i == s) be true. S and I model sized_sentinel_for<S, I> only if
(2.1) If N is representable by iter_difference_t<I>, then s - i is well-defined and equals N.
(2.2) If -N is representable by iter_difference_t<I>, then i - s is well-defined and equals -N.

3 Remarks: Pursuant to 16.4.5.2.1, users may specialize disable_sized_sentinel_for for cv-unqualified non-array object types S and I if S and/or I is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

4 [Note 1: disable_sized_sentinel_for allows use of sentinels and iterators with the library that satisfy but do not in fact model sized_sentinel_for. —end note]

5 [Example 1: The sized_sentinel_for concept is modeled by pairs of random_access_iterators (25.3.4.13) and by counted iterators and their sentinels (25.5.7.1). —end example]
25.3.4.9 Concept input_iterator

The input_iterator concept defines requirements for a type whose referenced values can be read (from the requirement for indirectly_readable (25.3.4.2)) and which can be both pre- and post-incremented.

[Note 1: Unlike the Cpp17InputIterator requirements (25.3.5.3), the input_iterator concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

```cpp
template<class I>
concept input_iterator =
    input_or_output_iterator<I> &&
    indirectly_readable<I> &&
    requires { typename ITER_CONCEPT(I); } &&
    derived_from<ITER_CONCEPT(I), input_iterator_tag>;
```

25.3.4.10 Concept output_iterator

The output_iterator concept defines requirements for a type that can be used to write values (from the requirement for indirectly_writable (25.3.4.3)) and which can be both pre- and post-incremented.

[Note 1: Output iterators are not required to model equality_comparable. — end note]

```cpp
template<class I, class T>
concept output_iterator =
    input_or_output_iterator<I> &&
    indirectly_writable<I, T> &&
    requires(I i, T&& t) {
        *i++ = std::forward<T>(t);
        // not required to be equality-preserving
    };
```

2 Let \( E \) be an expression such that `decltype((E))` is \( T \), and let \( i \) be a dereferenceable object of type \( I \). \( I \) and \( T \) model output_iterator\(\langle I, T\rangle \) only if \(*i++ = E; \) has effects equivalent to:

```cpp
*i = E;
++i;
```

3 Recommended practice: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

25.3.4.11 Concept forward_iterator

The forward_iterator concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

```cpp
template<class I>
concept forward_iterator =
    input_iterator<I> &&
    derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
    incrementable<I> &&
    sentinel_for<I, I>;
```

2 The domain of \( == \) for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

3 Pointers and references obtained from a forward iterator into a range \([i, s)\) shall remain valid while \([i, s)\) continues to denote a range.

4 Two dereferenceable iterators \( a \) and \( b \) of type \( X \) offer the multi-pass guarantee if:

\[
\begin{align*}
(4.1) & \quad \text{\( a == b \) implies \( \mathbf{***a} = \mathbf{***b} \) and} \\
(4.2) & \quad \text{the expression \( ((\text{void}[])\{X x\}\{++x;\})()\{a, \mathbf{***a}\} \) is equivalent to the expression \( \mathbf{***a} \).}
\end{align*}
\]

5 [Note 2: The requirement that \( a == b \) implies \( \mathbf{***a} = \mathbf{***b} \) and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — end note]
template<class I>
concept bidirectional_iterator =
  forward_iterator<I> &&
  derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
  requires(I i) {
    { --i } -> same_as<I&>;
    { i-- } -> same_as<I>;
  };

2 A bidirectional iterator r is decrementable if and only if there exists some q such that ++q == r. Decrementable iterators r shall be in the domain of the expressions --r and r--.

Let a and b be equal objects of type I. I models bidirectional_iterator only if:

(3.1) — If a and b are decrementable, then all of the following are true:
     (3.1.1) — addressof(--a) == addressof(a)
     (3.1.2) — bool(a-- == b)
     (3.1.3) — after evaluating both a-- and --b, bool(a == b) is still true
     (3.1.4) — bool(+(--a) == b)

(3.2) — If a and b are incrementable, then bool(--(++a) == b).

25.3.4.13 Concept random_access_iterator [iterator.concept.random.access]

1 The random_access_iterator concept adds support for constant-time advancement with +=, +, -=, and -, as well as the computation of distance in constant time with -. Random access iterators also support array notation via subscripting.

template<class I>
concept random_access_iterator =
  bidirectional_iterator<I> &&
  derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
  totally_ordered<I> &&
  sized_sentinel_for<I, I> &&
  requires(I i, const I j, const iter_difference_t<I> n) {
    { i += n } -> same_as<I&>;
    { j + n } -> same_as<I>;
    { n + j } -> same_as<I>;
    { i -= n } -> same_as<I&>;
    { j - n } -> same_as<I>;
    { j[n] } -> same_as<iter_reference_t<I>>;
  };

2 Let a and b be valid iterators of type I such that b is reachable from a after n applications of ++a, let D be iter_difference_t<I>, and let n denote a value of type D. I models random_access_iterator only if

(2.1) — (a += n) is equal to b.
(2.2) — addressof(a += n) is equal to addressof(a).
(2.3) — (a + n) is equal to (a += n).
(2.4) — For any two positive values x and y of type D, if (a + D(x + y)) is valid, then (a + D(x + y)) is equal to ((a + x) + y).
(2.5) — (a + D(0)) is equal to a.
(2.6) — If (a + D(n - 1)) is valid, then (a + n) is equal to [](I c){ return ++c; }(a + D(n - 1)).
(2.7) — (b += D(-n)) is equal to a.
(2.8) — (b -= n) is equal to a.
(2.9) — addressof(b -= n) is equal to addressof(b).
(2.10) — (b - n) is equal to (b -= n).
(2.11) — If b is dereferenceable, then a[n] is valid and is equal to *b.
(2.12) — bool(a <= b) is true.
25.3.4.14 Concept contiguous_iterator

The contiguous_iterator concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
concept contiguous_iterator =
    random_access_iterator<I> &&
    derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
    requires(const I& i) {
        to_address(i) \rightarrow same_as<add_pointer_t<iter_reference_t<I>>>;
    };
```

Let a and b be dereferenceable iterators and c be a non-dereferenceable iterator of type I such that b is reachable from a and c is reachable from b, and let D be iter_difference_t<I>. The type I models contiguous_iterator only if

1. \( \text{to\_address}(a) = \text{addressof}(\*a) \),
2. \( \text{to\_address}(b) = \text{to\_address}(a) + D(b - a) \),
3. \( \text{to\_address}(c) = \text{to\_address}(a) + D(c - a) \),
4. \( \text{ranges::iter\_move}(a) \) has the same type, value category, and effects as \( \text{std::move}(\*a) \), and
5. if \( \text{ranges::iter\_swap}(a, b) \) is well-formed, it has effects equivalent to \( \text{ranges::swap}(\*a, \*b) \).

25.3.5 C++17 iterator requirements

25.3.5.1 General

In the following sections, a and b denote values of type X or const X, difference_type and reference refer to the types iterator_traits<X>::difference_type and iterator_traits<X>::reference, respectively, n denotes a value of difference_type, u, tmp, and m denote identifiers, r denotes a value of X&, t denotes a value of value type T, o denotes a value of some type that is writable to the output iterator.

[Note 1: For an iterator type X there must be an instantiation of iterator_traits<X> (25.3.2.3). — end note]

25.3.5.2 Cpp17Iterator

The Cpp17Iterator requirements form the basis of the iterator taxonomy; every iterator meets the Cpp17Iterator requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (25.3.5.3) or write (25.3.5.4) values, or to provide a richer set of iterator movements (25.3.5.5, 25.3.5.6, 25.3.5.7).

A type X meets the Cpp17Iterator requirements if:

1. X meets the Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (16.4.4.2) and lvalues of type X are swappable (16.4.4.3), and
2. iterator_traits<X>::difference_type is a signed integer type or void, and
3. the expressions in Table 87 are valid and have the indicated semantics.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion(note) pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>*r</td>
<td>unspecified</td>
<td>Preconditions: r is dereferenceable.</td>
<td></td>
</tr>
<tr>
<td>++r</td>
<td>X&amp;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

25.3.5.3 Input iterators

A class or pointer type X meets the requirements of an input iterator for the value type T if X meets the Cpp17Iterator (25.3.5.2) and Cpp17EqualityComparable (Table 29) requirements and the expressions in Table 88 are valid and have the indicated semantics.
In Table 88, the term the domain of \(==\) is used in the ordinary mathematical sense to denote the set of values over which \(==\) is (required to be) defined. This set can change over time. Each algorithm places additional requirements on the domain of \(==\) for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of \(==\) and \(!=\).

[Example 1: The call \(\text{find}(a,b,x)\) is defined only if the value of \(a\) has the property \(p\) defined as follows: \(b\) has property \(p\) and a value \(i\) has property \(p\) if \((i==x)\) or if \((i!=x \text{ and } ++i \text{ has property } p)\). — end example]

Table 88: \textit{Cpp17InputIterator} requirements (in addition to \textit{Cpp17Iterator})  \[\text{tab:inputiterator}\]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>(a != b)</td>
<td>contextually convertible to (\text{bool})</td>
<td>(!(a == b))</td>
<td>Preconditions: ((a, b)) is in the domain of (==).</td>
</tr>
<tr>
<td>(*a)</td>
<td>reference, convertible to (T)</td>
<td></td>
<td>Preconditions: (a) is dereferenceable. The expression ((\text{void}) *a, *a) is equivalent to (*a). If (a == b) and ((a, b)) is in the domain of (==) then (*a) is equivalent to (*b).</td>
</tr>
<tr>
<td>(a-&gt;m)</td>
<td>((*a).m)</td>
<td></td>
<td>Preconditions: (a) is dereferenceable.</td>
</tr>
<tr>
<td>(++r)</td>
<td>(X&amp;)</td>
<td></td>
<td>Preconditions: (r) is dereferenceable. Postconditions: (r) is dereferenceable or (r) is past-the-end; any copies of the previous value of (r) are no longer required to be dereferenceable nor to be in the domain of (==).</td>
</tr>
<tr>
<td>((\text{void}) r++)</td>
<td></td>
<td>equivalent to ((\text{void}) ++r)</td>
<td></td>
</tr>
<tr>
<td>(*r++)</td>
<td>convertible to (T)</td>
<td>{ (T\ \text{tmp} = *r; ++r;) (\text{return tmp;}) }</td>
<td></td>
</tr>
</tbody>
</table>

\(3\) \textit{Recommended practice:} The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.
[Note 1: For input iterators, \( a == b \) does not imply \( ++a == ++b \). (Equality does not guarantee the substitution property or referential transparency.) Value type \( T \) is not required to be a \texttt{Cpp17CopyAssignable} type (Table 35). Such an algorithm can be used with streams as the source of the input data through the \texttt{istream_iterator} class template. — end note]

25.3.5.4 Output iterators

A class or pointer type \( X \) meets the requirements of an output iterator if \( X \) meets the \texttt{Cpp17Iterator} requirements (25.3.5.2) and the expressions in Table 89 are valid and have the indicated semantics.

Table 89: \texttt{Cpp17OutputIterator} requirements (in addition to \texttt{Cpp17Iterator})

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>( *r = o )</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation ( r ) is not required to be dereferenceable. Postconditions: ( r ) is incrementable.</td>
</tr>
<tr>
<td>++( r )</td>
<td>( X&amp; )</td>
<td></td>
<td>addressof(( r )) == addressof(( ++r )). Remarks: After this operation ( r ) is not required to be dereferenceable. Postconditions: ( r ) is incrementable.</td>
</tr>
<tr>
<td>( r++ )</td>
<td>convertible to ( const X&amp; )</td>
<td>{ ( X ) ( tmp = r; ++r; ) ( return tmp; ) }</td>
<td>Remarks: After this operation ( r ) is not required to be dereferenceable. Postconditions: ( r ) is incrementable.</td>
</tr>
<tr>
<td>( *r++ = o )</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation ( r ) is not required to be dereferenceable. Postconditions: ( r ) is incrementable.</td>
</tr>
</tbody>
</table>

2 Recommended practice: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

[Note 1: The only valid use of an \texttt{operator*} is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality are not necessarily defined. — end note]

25.3.5.5 Forward iterators

A class or pointer type \( X \) meets the requirements of a forward iterator if

1. \( X \) meets the \texttt{Cpp17InputIterator} requirements (25.3.5.3),
2. \( X \) meets the \texttt{Cpp17DefaultConstructible} requirements (16.4.4.2),
3. if \( X \) is a mutable iterator, \texttt{reference} is a reference to \( T \); if \( X \) is a constant iterator, \texttt{reference} is a reference to \texttt{const T},
4. the expressions in Table 90 are valid and have the indicated semantics, and
5. objects of type \( X \) offer the multi-pass guarantee, described below.

The domain of \( == \) for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

Two dereferenceable iterators \( a \) and \( b \) of type \( X \) offer the multi-pass guarantee if:

1. \( a == b \) implies \( ++a == ++b \) and
(3.2) — \( X \) is a pointer type or the expression \((\text{void})++X(a)\), \(^\ast a\) is equivalent to the expression \(^\ast a\).

4 [Note 2: The requirement that \(a == b\) implies \(++a == ++b\) (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — end note]

Table 90: \texttt{Cpp17ForwardIterator} requirements (in addition to \texttt{Cpp17InputIterator})

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>( r++ )</td>
<td>convertible to \ const ( X ) &amp;</td>
<td>{ ( X ) \ tmp = ( r ); ( ++r; ) \ return \ tmp; }</td>
<td></td>
</tr>
<tr>
<td>(^{\ast}r++)</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

5 If \( a \) and \( b \) are equal, then either \( a \) and \( b \) are both dereferenceable or else neither is dereferenceable.

6 If \( a \) and \( b \) are both dereferenceable, then \( a == b \) if and only if \(^{\ast}a\) and \(^{\ast}b\) are bound to the same object.

25.3.5.6 Bidirectional iterators

1 A class or pointer type \( X \) meets the requirements of a bidirectional iterator if, in addition to meeting the \texttt{Cpp17ForwardIterator} requirements, the following expressions are valid as shown in Table 91.

Table 91: \texttt{Cpp17BidirectionalIterator} requirements (in addition to \texttt{Cpp17ForwardIterator})

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>(--r)</td>
<td>( X &amp;)</td>
<td>( Preconditions: ) there exists ( s ) such that ( r == ++s. ) \ Postconditions: ( r ) is dereferenceable. ( --(++r) == r. ) ( --r == --s ) \ implies ( r == s. ) ( \text{addressof}(r) == \text{addressof}(--r). )</td>
<td></td>
</tr>
<tr>
<td>( r--)</td>
<td>convertible to \ const ( X &amp;)</td>
<td>{ ( X ) \ tmp = ( r ); ( --r; ) \ return \ tmp; }</td>
<td></td>
</tr>
<tr>
<td>(^{\ast}r--)</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

<td>b &lt; a</td>
<td>&gt; is a total ordering relation opposite to &lt;.</td>
</tr>
<tr>
<td>a &gt;= b</td>
<td>contextually convertible to bool</td>
<td>!(a &lt; b)</td>
<td></td>
</tr>
<tr>
<td>a &lt;= b</td>
<td>contextually convertible to bool</td>
<td>!(a &gt; b)</td>
<td></td>
</tr>
</tbody>
</table>

25.3.6 Indirect callable requirements [indirectcallable]

25.3.6.1 General [indirectcallable.general]

There are several concepts that group requirements of algorithms that take callable objects (22.10.3) as arguments.

25.3.6.2 Indirect callables [indirectcallable.indirectinvocable]

The indirect callable concepts are used to constrain those algorithms that accept callable objects (22.10.3) as arguments.

namespace std {
    template<class F, class I>
    concept indirectly_unary_invocable =
        indirectly_readable<I> &&
        copy_constructible<F> &&
        invocable<F, iter_value_t<I>&> &&
        invocable<F, iter_reference_t<I>> &&
        invocable<F, iter_common_reference_t<I>> &&
        common_reference_with<

§ 25.3.6.2
invoke_result_t<F&, iter_value_t<I>&>,
invoke_result_t<F&, iter_reference_t<I>>;

template<class F, class I>
concept indirectly_regular_unary_invocable =
indirectly_readable<I> &&
copy_constructible<F> &&
regular_invocable<F&, iter_value_t<I>&> &&
regular_invocable<F&, iter_reference_t<I>>&
regular_invocable<F&, iter_common_reference_t<I>>&
common_reference_with<
  invoke_result_t<F&, iter_value_t<I>&>,
  invoke_result_t<F&, iter_reference_t<I>>;
There are several additional iterator concepts that are commonly applied to families of algorithms. These group together iterator requirements of algorithm families. There are three relational concepts that specify how element values are transferred between indirectly_readable and indirectly_writable types: indirectly_movable, indirectly_copyable, and indirectly_swappable. There are three relational concepts for rearrangements: permutable, mergeable, and sortable. There is one relational concept for comparing values from different sequences: indirectly_comparable.

1 [Note 1: The ranges::less function object type used in the concepts below imposes constraints on the concepts’ arguments in addition to those that appear in the concepts’ bodies (22.10.9). — end note]

The indirectly_movable concept specifies the relationship between a indirectly_readable type and a indirectly_writable type between which values may be moved.

```cpp
template<class In, class Out>
concept indirectly_movable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_rvalue_reference_t<In>>;
```

The indirectly_movable_storable concept augments indirectly_movable with additional requirements enabling the transfer to be performed through an intermediate object of the indirectly_readable type’s value type.

```cpp
template<class In, class Out>
concept indirectly_movable_storable =
    indirectly_movable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>> &&
    movable<iter_value_t<In>> &&
    constructible_from<iter_value_t<In>, iter_value_reference_t<In>>, iter_rvalue_reference_t<In>> &&
    assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;
```

Let `i` be a dereferenceable value of type `In`. `In` and `Out` model indirectly_movable_storable<In, Out> only if after the initialization of the object `obj` in

```cpp
iter_value_t<In> obj(ranges::iter_move(i));
```

`obj` is equal to the value previously denoted by `*i`. If `iter_rvalue_reference_t<In>` is an rvalue reference type, the resulting state of the value denoted by `*i` is valid but unspecified (16.4.6.15).

The indirectly_copyable concept specifies the relationship between a indirectly_readable type and a indirectly_writable type between which values may be copied.

```cpp
template<class In, class Out>
concept indirectly_copyable =
    indirectly_readable<In> &&
    indirectly_writable<Out, iter_reference_t<In>>;
```

The indirectly_copyable_storable concept augments indirectly_copyable with additional requirements enabling the transfer to be performed through an intermediate object of the indirectly_readable type’s value type. It also requires the capability to make copies of values.

```cpp
template<class In, class Out>
concept indirectly_copyable_storable =
    indirectly_copyable<In, Out> &&
    indirectly_writable<Out, iter_value_t<In>> &&
    indirectly_writable<Out, const iter_value_t<In>> &&
    indirectly_writable<Out, const iter_value_t<In>&&> &&
    indirectly_writable<Out, const iter_value_t<In>&>&
```
Let \( i \) be a dereferenceable value of type \( \text{In} \). \( \text{In} \) and \( \text{Out} \) model \text{indirectly_copyable_storable}\( \text{In}, \text{Out} \) only if after the initialization of the object \( \text{obj} \) in

\[
\text{iter\_value\_t<\text{In}> obj(*i)};
\]

\( \text{obj} \) is equal to the value previously denoted by \( *i \). If \( \text{iter\_reference\_t<\text{In}>} \) is an rvalue reference type, the resulting state of the value denoted by \( *i \) is valid but unspecified (16.4.6.15).

### 25.3.7.4 Concept indirectly_swappable

The \text{indirectly_swappable} concept specifies a swappable relationship between the values referenced by two \text{indirectlyReadable} types.

\[
\text{template<class I1, class I2 = I1>}
\]

\[
\text{concept indirectly_swappable =}
\]

\[
\text{indirectly\_readable<I1> \&\& indirectly\_readable<I2> \&\&}
\]

\[
\text{requires(const I1 i1, const I2 i2) {}
\]

\[
\text{ranges::iter\_swap(i1, i1)};
\]

\[
\text{ranges::iter\_swap(i2, i2)};
\]

\[
\text{ranges::iter\_swap(i1, i2)};
\]

\[
\text{ranges::iter\_swap(i2, i1)};
\]

\[
};
\]

### 25.3.7.5 Concept indirectly_comparable

The \text{indirectly_comparable} concept specifies the common requirements of algorithms that compare values from two different sequences.

\[
\text{template<class I1, class I2, class R, class P1 = identity, class P2 = identity>}
\]

\[
\text{concept indirectly_comparable =}
\]

\[
\text{indirect\_binary\_predicate<R, projected<I1, P1>, projected<I2, P2>>>;
\]

### 25.3.7.6 Concept permutable

The \text{permutable} concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

\[
\text{template<class I>}
\]

\[
\text{concept permutable =}
\]

\[
\text{forward\_iterator<I> \&\&}
\]

\[
\text{indirectly\_movable\_storable<I, I> \&\&}
\]

\[
\text{indirectly\_swappable<I, I>};
\]

### 25.3.7.7 Concept mergeable

The \text{mergeable} concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

\[
\text{template<class I1, class I2, class Out, class R = ranges::less, class P1 = identity, class P2 = identity>}
\]

\[
\text{concept mergeable =}
\]

\[
\text{input\_iterator<I1> \&\&}
\]

\[
\text{input\_iterator<I2> \&\&}
\]

\[
\text{weakly\_incrementable<Out> \&\&}
\]

\[
\text{indirectly\_copyable<I1, Out> \&\&}
\]

\[
\text{indirectly\_copyable<I2, Out> \&\&}
\]

\[
\text{indirect\_strict\_weak\_order<R, projected<I1, P1>, projected<I2, P2>>>;
\]

### 25.3.7.8 Concept sortable

The \text{sortable} concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., \text{sort}).

\[
\text{template<class I, class R = ranges::less, class P = identity>}
\]

\[
\text{concept sortable =}
\]

\[
\text{permutable<I> \&\&}
\]

\[
\text{indirect\_strict\_weak\_order<R, projected<I, P>>>;
\]
25.4 Iterator primitives

25.4.1 General

To simplify the use of iterators, the library provides several classes and functions.

25.4.2 Standard iterator tags

It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces category tag classes which are used as compile time tags for algorithm selection. They are: output_iterator_tag, input_iterator_tag, forward_iterator_tag, bidirectional_iterator_tag, random_access_iterator_tag, and contiguous_iterator_tag. For every iterator of type \( I \), \( \text{iterator_traits}<I>::\text{iterator_category} \) shall be defined to be a category tag that describes the iterator’s behavior. Additionally, \( \text{iterator_traits}<I>::\text{iterator_concept} \) may be used to indicate conformance to the iterator concepts (25.3.4).

```cpp
namespace std {
    struct output_iterator_tag { }
    struct input_iterator_tag { }
    struct forward_iterator_tag: public input_iterator_tag { }
    struct bidirectional_iterator_tag: public forward_iterator_tag { }
    struct random_access_iterator_tag: public bidirectional_iterator_tag { }
    struct contiguous_iterator_tag: public random_access_iterator_tag { }
}
```

Example 1: A program-defined iterator `BinaryTreeIterator` can be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```cpp
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
    using iterator_category = bidirectional_iterator_tag;
    using difference_type = ptrdiff_t;
    using value_type = T;
    using pointer = T*;
    using reference = T&;
};
```

Example 2: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```cpp
template<class BidirectionalIterator>
inline void evolve(BidirectionalIterator first, BidirectionalIterator last) {
    // more generic, but less efficient algorithm
}
```

```cpp
template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
            bidirectional_iterator_tag) {
    // more generic, but less efficient algorithm
}
```

```cpp
template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
            random_access_iterator_tag) {
    // more efficient, but less generic algorithm
}
```

25.4.3 Iterator operations

Since only random access iterators provide + and - operators, the library provides two function templates `advance` and `distance`. These function templates use + and - for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use ++ to provide linear time implementations.
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);

Preconditions: n is negative only for bidirectional iterators.

Effects: Increments i by n if n is non-negative, and decrements i by -n otherwise.

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);

Preconditions: last is reachable from first, or InputIterator meets the Cpp17RandomAccessIterator requirements and first is reachable from last.

Effects: If InputIterator meets the Cpp17RandomAccessIterator requirements, returns (last - first); otherwise, increments first until last is reached and returns the number of increments.

template<class InputIterator>
constexpr InputIterator next(InputIterator x, 
    typename iterator_traits<InputIterator>::difference_type n = 1);

Effects: Equivalent to: advance(x, n); return x;

template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x, 
    typename iterator_traits<BidirectionalIterator>::difference_type n = 1);

Effects: Equivalent to: advance(x, -n); return x;

25.4.4 Range iterator operations

25.4.4.1 General

The library includes the function templates ranges::advance, ranges::distance, ranges::next, and ranges::prev to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type.

[Example 1: ranges::advance uses the + operator to move a random_access_iterator forward n steps in constant time. For an iterator type that does not model random_access_iterator, ranges::advance instead performs n individual increments with the ++ operator. — end example]

The function templates defined in 25.4.4 are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the postfix-expression in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[Example 2:

    void foo() {
        using namespace std::ranges;
        std::vector<int> vec{1,2,3};
        distance(begin(vec), end(vec)); // #1
    }
]

The function call expression at #1 invokes std::ranges::distance, not std::distance, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::distance is more specialized (13.7.7.3) than std::ranges::distance since the former requires its first two parameters to have the same type. — end example]

The number and order of deducible template parameters for the function templates defined in 25.4.4 is unspecified, except where explicitly stated otherwise.

25.4.4.2 ranges::advance

template<input_or_output_iterator I>
constexpr void ranges::advance(I& i, iter_difference_t<I> n);

Preconditions: If I does not model bidirectional_iterator, n is not negative.

Effects:

(2.1) — If I models random_access_iterator, equivalent to i += n.
(2.2) — Otherwise, if n is non-negative, increments i by n.
(2.3) — Otherwise, decrements i by -n.
template<input_or_output_iterator I, sentinel_for<I> S>  
constexpr void ranges::advance(I& i, S bound);  

Preconditions: Either assignable_from<i&, S> || sized_sentinel_for<S, I> is modeled, or [i, bound) denotes a range.

Effects:
(4.1) — If I and S model assignable_from<i&, S>, equivalent to i = std::move(bound).
(4.2) — Otherwise, if S and I model sized_sentinel_for<S, I>, equivalent to ranges::advance(i, bound - i).
(4.3) — Otherwise, while bool(i != bound) is true, increments i.

template<input_or_output_iterator I, sentinel_for<I> S>  
constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);  

Preconditions: If n > 0, [i, bound) denotes a range. If n == 0, [i, bound) or [bound, i) denotes a range. If n < 0, [bound, i) denotes a range, I models bidirectional_iterator, and I and S model same_as<I, S>.

Effects:
(6.1) — If S and I model sized_sentinel_for<S, I>:
  (6.1.1) — If |n| ≥ |bound - i|, equivalent to ranges::advance(i, bound).
  (6.1.2) — Otherwise, equivalent to ranges::advance(i, n).
(6.2) — Otherwise,
  (6.2.1) — if n is non-negative, while bool(i != bound) is true, increments i but at most n times.
  (6.2.2) — Otherwise, while bool(i != bound) is true, decrements i but at most -n times.

Returns: n - M, where M is the difference between the ending and starting positions of i.

25.4.4.3 ranges::distance  

template<input_or_output_iterator I, sentinel_for<I> S>  
requires (!sized_sentinel_for<S, I>)  
constexpr iter_difference_t<I> ranges::distance(I first, S last);  

Preconditions: [first, last) denotes a range.

Effects: Increments first until last is reached and returns the number of increments.

template<input_or_output_iterator I, sized_sentinel_for<I> S>  
constexpr iter_difference_t<I> ranges::distance(const I& first, const S& last);  

Effects: Equivalent to: return last - first;

template<range R>  
constexpr range_difference_t<R> ranges::distance(R&& r);  

Effects: If R models sized_range, equivalent to:
  return static_cast<range_difference_t<R>>(ranges::size(r));  // 26.3.10
Otherwise, equivalent to:
  return ranges::distance(ranges::begin(r), ranges::end(r));  // 26.3

25.4.4.4 ranges::next  

template<input_or_output_iterator I>  
constexpr I ranges::next(I x);  

Effects: Equivalent to: ++x; return x;

template<input_or_output_iterator I>  
constexpr I ranges::next(I x, iter_difference_t<I> n);  

Effects: Equivalent to: ranges::advance(x, n); return x;
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, S bound);

Effects: Equivalent to: ranges::advance(x, bound); return x;

template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);

Effects: Equivalent to: ranges::advance(x, n, bound); return x;

25.4.4.5 ranges::prev

template<bidirectional_iterator I>
constexpr I ranges::prev(I x);

Effects: Equivalent to: --x; return x;

template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n);

Effects: Equivalent to: ranges::advance(x, -n); return x;

template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);

Effects: Equivalent to: ranges::advance(x, -n, bound); return x;

25.5 Iterator adaptors

25.5.1 Reverse iterators

25.5.1.1 General

Class template reverse_iterator is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

25.5.1.2 Class template reverse_iterator

namespace std {
    template<class Iterator>
    class reverse_iterator {
    public:
        using iterator_type = Iterator;
        using iterator_concept = see below;
        using iterator_category = see below;
        using value_type = iter_value_t<Iterator>;
        using difference_type = iter_difference_t<Iterator>;
        using pointer = typename iterator_traits<Iterator>::pointer;
        using reference = iter_reference_t<Iterator>;

        constexpr reverse_iterator();
        constexpr explicit reverse_iterator(Iterator x);
        template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
        template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

        constexpr Iterator base() const;
        constexpr reference operator*() const;
        constexpr pointer operator->() const requires see below;

        constexpr reverse_iterator& operator++();
        constexpr reverse_iterator operator++(int);
        constexpr reverse_iterator& operator--();
        constexpr reverse_iterator operator--(int);

        constexpr reverse_iterator operator+ (difference_type n) const;
        constexpr reverse_iterator& operator+=(difference_type n);
        constexpr reverse_iterator operator- (difference_type n) const;
        constexpr reverse_iterator& operator-=(difference_type n);
        constexpr unspecified operator[](difference_type n) const;

    };
}
friend constexpr iter_rvalue_reference_t<Iterator>  
iter_move(const reverse_iterator& i) noexcept(see below);

template<indirectly_swappable<Iterator> Iterator2>  
friend constexpr void  
iter_swap(const reverse_iterator& x,  
const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:  
Iterator current;
};

1 The member typedef-name iterator_concept denotes

(1.1) — random_access_iterator_tag if Iterator models random_access_iterator, and

(1.2) — bidirectional_iterator_tag otherwise.

2 The member typedef-name iterator_category denotes

(2.1) — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models derived_from<random_access_iterator_tag>, and

(2.2) — iterator_traits<Iterator>::iterator_category otherwise.

25.5.1.3 Requirements [reverse.iter.requirements]

1 The template parameter Iterator shall either meet the requirements of a Cpp17BidirectionalIterator (25.3.5.6) or model bidirectional_iterator (25.3.4.12).

2 Additionally, Iterator shall either meet the requirements of a Cpp17RandomAccessIterator (25.3.5.7) or model random_access_iterator (25.3.4.13) if the definitions of any of the members

(2.1) — operator+, operator-, operator+=, operator-= (25.5.1.7), or

(2.2) — operator[] (25.5.1.6),

or the non-member operators (25.5.1.8)

(2.3) — operator<, operator>, operator<=, operator>=, operator-, or operator+ (25.5.1.9)

are instantiated (13.9.2).

25.5.1.4 Construction and assignment [reverse.iter.cons]

castexpr reverse_iterator();

1 Effects: Value-initializes current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.

castexpr explicit reverse_iterator(Iterator x);

2 Effects: Initializes current with x.

template<class U> castexpr reverse_iterator(const reverse_iterator<U>& u);

3 Constraints: is_same_v<U, Iterator> is false and const U& models convertible_to<Iterator>.

4 Effects: Initializes current with u.current.

template<class U>
castexpr reverse_iterator&  
operator=(const reverse_iterator<U>& u);

5 Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and assignable_from<Iterator&, const U&> is modeled.

6 Effects: Assigns u.current to current.

7 Returns: *this.
25.5.1.5 Conversion

constexpr Iterator base() const; // explicit

Returns: current.

25.5.1.6 Element access

constexpr reference operator*() const;

Effects: As if by:
Iterator tmp = current;
return *--tmp;

constexpr pointer operator->() const
requires (is_pointer_v<Iterator> ||
    requires(const Iterator i) { i.operator->(); });

Effects:
(2.1) — If Iterator is a pointer type, equivalent to: return prev(current);
(2.2) — Otherwise, equivalent to: return prev(current).operator->();

constexpr unspecified operator[](difference_type n) const;

Returns: current[-n-1].

25.5.1.7 Navigation

constexpr reverse_iterator operator+(difference_type n) const;
Returns: reverse_iterator(current-n).

constexpr reverse_iterator operator-(difference_type n) const;
Returns: reverse_iterator(current+n).

constexpr reverse_iterator& operator++();
Effects: As if by: --current;
Returns: *this.

constexpr reverse_iterator operator++(int);
Effects: As if by:
reverse_iterator tmp = *this;
--current;
return tmp;

constexpr reverse_iterator& operator--();
Effects: As if by ++current.
Returns: *this.

constexpr reverse_iterator operator--(int);
Effects: As if by:
reverse_iterator tmp = *this;
++current;
return tmp;

constexpr reverse_iterator& operator+=(difference_type n);
Effects: As if by: current -= n;
Returns: *this.

constexpr reverse_iterator& operator-=(difference_type n);
Effects: As if by: current += n;
Returns: *this.
25.5.1.8 Comparisons

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator==(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Constraints: \(x.\text{base}() == y.\text{base}()\) is well-formed and convertible to \(\text{bool}\).

Returns: \(x.\text{base}() == y.\text{base}()\).

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator!=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Constraints: \(x.\text{base}() \neq y.\text{base}()\) is well-formed and convertible to \(\text{bool}\).

Returns: \(x.\text{base}() \neq y.\text{base}()\).

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Constraints: \(x.\text{base}() > y.\text{base}()\) is well-formed and convertible to \(\text{bool}\).

Returns: \(x.\text{base}() > y.\text{base}()\).

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator>(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Constraints: \(x.\text{base}() < y.\text{base}()\) is well-formed and convertible to \(\text{bool}\).

Returns: \(x.\text{base}() < y.\text{base}()\).

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Constraints: \(x.\text{base}() \geq y.\text{base}()\) is well-formed and convertible to \(\text{bool}\).

Returns: \(x.\text{base}() \geq y.\text{base}()\).

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator>=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Constraints: \(x.\text{base}() \leq y.\text{base}()\) is well-formed and convertible to \(\text{bool}\).

Returns: \(x.\text{base}() \leq y.\text{base}()\).

```cpp
template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2> operator<=>(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);
```

Returns: \(y.\text{base}() \iff x.\text{base}()\).

[Note 1: The argument order in the Returns: element is reversed because this is a reverse iterator. — end note]

25.5.1.9 Non-member functions

```cpp
template<class Iterator1, class Iterator2>
constexpr auto operator-(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
```

Returns: \(y.\text{base}() - x.\text{base}()\).
template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(iter_difference_t<Iterator> n, const reverse_iterator<Iterator>& x);

Returns: reverse_iterator<Iterator>(x.base() - n).

friend constexpr iter_rvalue_reference_t<Iterator> iter_move(const reverse_iterator<Iterator>& i) noexcept(see below);

Effects: Equivalent to:
auto tmp = i.base();
return ranges::iter_move(--tmp);

Remarks: The exception specification is equivalent to:
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator&>()))

friend constexpr void iter_swap(const reverse_iterator<Iterator>& x, const reverse_iterator<Iterator>& y) noexcept(see below);

Effects: Equivalent to:
auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);

Remarks: The exception specification is equivalent to:
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_swap(--declval<Iterator&>() , --declval<Iterator&>()))

template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);

Returns: reverse_iterator<Iterator>(i).

25.5.2 Insert iterators [insert.iterators]

25.5.2.1 General [insert.iterators.general]

To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called insert iterators, are provided in the library. With regular iterator classes,

while (first != last) *result++ = *first++;

causes a range [first, last) to be copied into a range starting with result. The same code with result being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the insert mode instead of the regular overwrite mode.

An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. operator* returns the insert iterator itself. The assignment operator=(const T& x) is defined on insert iterators to allow writing into them, it inserts x right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. back_insert_iterator inserts elements at the end of a container, front_insert_iterator inserts elements at the beginning of a container, and insert_iterator inserts elements where the iterator points to in a container. back_inserter, front_inserter, and inserter are three functions making the insert iterators out of a container.

25.5.2.2 Class template back_insert_iterator [back.insert.iterator]

namespace std {
  template<class Container>
  class back_insert_iterator {
    protected:
      Container* container;
  };
public:
  using iterator_category = output_iterator_tag;
  using value_type = void;
  using difference_type = ptrdiff_t;
  using pointer = void;
  using reference = void;
  using container_type = Container;

constexpr explicit back_insert_iterator(Container& x);
constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
constexpr back_insert_iterator& operator*();
constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator operator++(int);

25.5.2.2.1 Operations

constexpr explicit back_insert_iterator(Container& x);

Effects: Initializes container with addressof(x).

constexpr back_insert_iterator& operator=(const typename Container::value_type& value);

Effects: As if by: container->push_back(value);

Returns: *this.

constexpr back_insert_iterator& operator=(typename Container::value_type&& value);

Effects: As if by: container->push_back(std::move(value));

Returns: *this.

constexpr back_insert_iterator& operator*();

Returns: *this.

constexpr back_insert_iterator& operator++();
constexpr back_insert_iterator operator++(int);

Returns: *this.

25.5.2.2 back_inserter

template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);

Returns: back_insert_iterator<Container>(x).

25.5.2.3 Class template front_insert_iterator

namespace std {
  template<class Container>
  class front_insert_iterator {

protected:
  Container* container;

public:
  using iterator_category = output_iterator_tag;
  using value_type = void;
  using difference_type = ptrdiff_t;
  using pointer = void;
  using reference = void;
  using container_type = Container;

constexpr explicit front_insert_iterator(Container& x);
constexpr front_insert_iterator& operator=(const typename Container::value_type& value);
constexpr front_insert_iterator& operator=(typename Container::value_type&& value);
constexpr front_insert_iterator& operator*();
constexpr front_insert_iterator& operator++();
constexpr front_insert_iterator operator++(int);
};

25.5.2.3.1 Operations

constexpr explicit front_insert_iterator(Container& x);

Effects: Initializes container with addressof(x).

constexpr front_insert_iterator& operator=(const typename Container::value_type& value);

Effects: As if by: container->push_front(value);
Returns: *this.

constexpr front_insert_iterator& operator=(typename Container::value_type&& value);

Effects: As if by: container->push_front(std::move(value));
Returns: *this.

constexpr front_insert_iterator& operator*();

Returns: *this.

constexpr front_insert_iterator& operator++();

Returns: *this.

constexpr front_insert_iterator operator++(int);

Returns: *this.

25.5.2.3.2 front_inserter

template<class Container>
constexpr front_insert_iterator<Container> front_inserter(Container& x);

Returns: front_insert_iterator<Container>(x).

25.5.2.4 Class template insert_iterator

namespace std {
    template<class Container>
    class insert_iterator {
        protected:
            Container* container;
            ranges::iterator_t<Container> iter;

        public:
            using iterator_category = output_iterator_tag;
            using value_type = void;
            using difference_type = ptrdiff_t;
            using pointer = void;
            using reference = void;
            using container_type = Container;

            constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
            constexpr insert_iterator& operator=(const typename Container::value_type& value);
            constexpr insert_iterator& operator=(typename Container::value_type&& value);
            constexpr insert_iterator& operator*();
            constexpr insert_iterator& operator++();
            constexpr insert_iterator& operator++(int);
        }
    }

25.5.2.4.1 Operations

constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);

Effects: Initializes container with addressof(x) and iter with i.
constexpr insert_iterator& operator=(const typename Container::value_type& value);

Effects: As if by:

iter = container->insert(iter, value);
++iter;

Returns: *this.

constexpr insert_iterator& operator=(typename Container::value_type&& value);

Effects: As if by:

iter = container->insert(iter, std::move(value));
++iter;

Returns: *this.

constexpr insert_iterator& operator*();

Returns: *this.

constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);

Returns: *this.

25.5.2.4.2 inserter

template<class Container>
constexpr insert_iterator<Container> inserter(Container& x, ranges::iterator_t<Container> i);

Returns: insert_iterator<Container>(x, i).

25.5.3 Constant iterators and sentinels

25.5.3.1 General

Class template basic_const_iterator is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator's indirection operator to a type such that the adapted iterator is a constant iterator (25.3). Some generic algorithms can be called with constant iterators to avoid mutation.

Specializations of basic_const_iterator are constant iterators.

25.5.3.2 Alias templates

template<indirectly_readable It>
using iter_const_reference_t = common_reference_t<const iter_value_t<It>&&, iter_reference_t<It>>;

template<class It>
concept constant_iterator = // exposition only
input_iterator<It> && same_as<iter_const_reference_t<It>>, iter_reference_t<It>>;

Result: If I models constant_iterator, I. Otherwise, basic_const_iterator<I>.

template<input_iterator I>
using const_iterator = see below;

Result: If I models input_iterator, const_iterator<I>. Otherwise, I.

template<class S>
using const_sentinel = see below;

Result: If S models input_iterator, const_iterator<S>. Otherwise, S.

25.5.3.3 Class template basic_const_iterator

namespace std {

template<class I>
concept not-a-const_iterator = see below;
template<input_iterator Iterator>
class basic_const_iterator {
  Iterator current_ = Iterator(); // exposition only
  using reference = iter_const_reference_t<Iterator>; // exposition only

public:
  using iterator_concept = see below;
  using iterator_category = see below; // not always present
  using value_type = iter_value_t<Iterator>
  using difference_type = iter_difference_t<Iterator>

  basic_const_iterator() requires default_initializable<Iterator> = default;
  constexpr basic_const_iterator(Iterator current);
  template<convertible_to<Iterator> U>
  constexpr basic_const_iterator(basic_const_iterator<U> current);
  template<different-from<basic_const_iterator> T>
  requires convertible_to<T, Iterator>
  constexpr basic_const_iterator(T&& current);

  constexpr const Iterator& base() const & noexcept;
  constexpr Iterator base() &&;

  constexpr reference operator*() const;
  constexpr const value_type* operator->() const
  requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
  same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;

  constexpr basic_const_iterator& operator++();
  constexpr void operator++(int);
  constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;

  constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
  constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;

  constexpr basic_const_iterator& operator+=(difference_type n)
  requires random_access_iterator<Iterator>;
  constexpr basic_const_iterator& operator-=(difference_type n)
  requires random_access_iterator<Iterator>;

  constexpr reference operator[](difference_type n) const
  requires random_access_iterator<Iterator>;

  template<sentinel_for<Iterator> S>
  friend constexpr bool operator==(const basic_const_iterator& x, const S& s);

  friend constexpr bool operator<(const basic_const_iterator& x, const basic_const_iterator& y)
  requires random_access_iterator<Iterator>;
  friend constexpr bool operator<(const basic_const_iterator& x, const basic_const_iterator& y)
  requires random_access_iterator<Iterator>;

  friend constexpr bool operator<<(const basic_const_iterator& x,
  const basic_const_iterator& y)
  requires random_access_iterator<Iterator>;
  friend constexpr bool operator<<(const basic_const_iterator& x,
  const basic_const_iterator& y)
  requires random_access_iterator<Iterator>;

  friend constexpr auto operator>>(const basic_const_iterator& x,
  const basic_const_iterator& y)
  requires random_access_iterator<Iterator> && three_way_comparable<Iterator>;

  template<different-from<basic_const_iterator> I>
  friend constexpr bool operator<<(const basic_const_iterator& x, const I& y)
  requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;

§ 25.5.3.3
Given some type `I`, the concept `not-a-const-iterator` is defined as `false` if `I` is a specialization of `basic_const_iterator` and `true` otherwise.

### 25.5.3.4 Member types

[const.iterators.types]

1. `basic_const_iterator<Iterator>::iterator_concept` is defined as follows:

   1.1. If `Iterator` models `contiguous_iterator`, then `iterator_concept` denotes `contiguous_iterator_tag`.
   1.2. Otherwise, if `Iterator` models `random_access_iterator`, then `iterator_concept` denotes `random_access_iterator_tag`.
   1.3. Otherwise, if `Iterator` models `bidirectional_iterator`, then `iterator_concept` denotes `bidirectional_iterator_tag`.
   1.4. Otherwise, if `Iterator` models `forward_iterator`, then `iterator_concept` denotes `forward_iterator_tag`.
   1.5. Otherwise, `iterator_concept` denotes `input_iterator_tag`.

2. The member `typedef-name iterator_category` is defined if and only if `Iterator` models `forward_iterator`. In that case, `basic_const_iterator<Iterator>::iterator_category` denotes the type `iterator_traits<Iterator>::iterator_category`.

§ 25.5.3.4 1081
25.5.3.5 Operations

constexpr basic_const_iterator(Iterator current);

1  Effects: Initializes current_ with std::move(current).

template<convertible_to<Iterator> U>
constexpr basic_const_iterator(basic_const_iterator<U> current);

2  Effects: Initializes current_ with std::move(current.current_).

template<different-from<basic_const_iterator> T>
requires convertible_to<T, Iterator>
constexpr basic_const_iterator(T&& current);

3  Effects: Initializes current_ with std::forward<T>(current).

constexpr const Iterator& base() const & noexcept;

4  Effects: Equivalent to: return current_.

constexpr Iterator base() &&;

5  Effects: Equivalent to: return std::move(current_);

constexpr reference operator*() const;

6  Effects: Equivalent to: return static_cast<reference>(*current_);

constexpr const value_type* operator->() const
requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;

7  Returns: If Iterator models contiguous_iterator, to_address(current_); otherwise, address-of(*current_).

constexpr basic_const_iterator& operator++();

8  Effects: Equivalent to:

  ++current_;  return *this;

constexpr void operator++(int);

9  Effects: Equivalent to: ++current_

constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;

10 Effects: Equivalent to:

    auto tmp = *this;
    +++this;
    return tmp;

constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;

11 Effects: Equivalent to:

    --current_;  return *this;

constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;

12 Effects: Equivalent to:

    auto tmp = *this;
    --*this;
    return tmp;

constexpr basic_const_iterator& operator+=(difference_type n)
requires random_access_iterator<Iterator>;

constexpr basic_const_iterator& operator+=(difference_type n)
requires random_access_iterator<Iterator>;

13 Let op be the operator.
Effects: Equivalent to:

```cpp
current_op n;
return *this;
```

`constexpr reference operator[](difference_type n) const requires random_access_iterator<Iterator>`

Effects: Equivalent to: `return static_cast<reference>(current_[n]);`

```cpp
template<sentinel_for<Iterator> S>
friend constexpr bool operator==(const basic_const_iterator& x, const S& s);
```

Effects: Equivalent to: `return x.current_ == s;`

```cpp
template<sentinel_for<Iterator> S>
friend constexpr bool operator<(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr bool operator>(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr bool operator<=(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr bool operator>=(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && three_way_comparable<Iterator>;
```

Returns: Equivalent to: `return x.current_ op y.current_;

```cpp
template<different-from<basic_const_iterator> I>
friend constexpr bool operator<(const basic_const_iterator& x, const I& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
friend constexpr bool operator>(const basic_const_iterator& x, const I& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
friend constexpr bool operator<=(const basic_const_iterator& x, const I& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
friend constexpr bool operator>=(const basic_const_iterator& x, const I& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I> && three_way_comparable_with<Iterator, I>;
```

Returns: Equivalent to: `return x.current_ op y;

```cpp
template<not-a-const-iterator I>
friend constexpr bool operator<(const I& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
friend constexpr bool operator>(const I& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
friend constexpr bool operator<=(const I& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;
friend constexpr bool operator>=(const I& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I> && three_way_comparable_with<Iterator, I>;
```

Let `op` be the operator.

```cpp
friend constexpr basic_const_iterator operator+(const basic_const_iterator& i, difference_type n) requires random_access_iterator<Iterator>;
```
friend constexpr basic_const_iterator operator+(difference_type n, const basic_const_iterator& i) requires random_access_iterator<Iterator>;

Effects: Equivalent to: return basic_const_iterator(i.current_ + n);

friend constexpr basic_const_iterator operator-(const basic_const_iterator& i, difference_type n) requires random_access_iterator<Iterator>;

Effects: Equivalent to: return basic_const_iterator(i.current_ - n);

template<sized_sentinel_for<Iterator> S>
friend constexpr difference_type operator-(const basic_const_iterator& x, const S& y);

Effects: Equivalent to: return x.current_ - y;

template<sized_sentinel_for<Iterator> S>
requires different_from<S, basic_const_iterator>
friend constexpr difference_type operator-(const S& x, const basic_const_iterator& y);

Effects: Equivalent to: return x - y.current_;

25.5.4 Move iterators and sentinels

25.5.4.1 General

Class template move_iterator is an iterator adaptor with the same behavior as the underlying iterator except that its indirect operator implicitly converts the value returned by the underlying iterator’s indirect operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

[Example 1:

\begin{verbatim}
list<string> s;
// populate the list s
vector<string> v1(s.begin(), s.end()); // copies strings into v1
vector<string> v2(make_move_iterator(s.begin()),
                 make_move_iterator(s.end())); // moves strings into v2
\end{verbatim}

— end example]

25.5.4.2 Class template move_iterator

namespace std {

template<class Itertor>
class move_iterator {

public:

using iterator_type = Iterator;
using iterator_concept = see below;
using iterator_category = see below; // not always present
using value_type = iter_value_t<Iterator>;
using difference_type = iter_difference_t<Iterator>;
using pointer = Iterator;
using reference = iter_rvalue_reference_t<Iterator>;

constexpr move_iterator();
constexpr explicit move_iterator(Iterator i);
template<class U> constexpr move_iterator(const move_iterator<U>& u);
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

constexpr const Iterator& base() const & noexcept;
constexpr Iterator base() &&;
constexpr reference operator*() const;
constexpr move_iterator& operator++();
constexpr auto operator++(int);
constexpr move_iterator& operator--();
constexpr move_iterator operator--(int);

\end{verbatim}

§ 25.5.4.2 1084
constexpr move_iterator operator+(difference_type n) const;
constexpr move_iterator& operator+=(difference_type n);
constexpr move_iterator operator-(difference_type n) const;
constexpr move_iterator& operator-=(difference_type n);
constexpr reference operator[](difference_type n) const;

template<sentinel_for<Iterator> S>
friend constexpr bool
operator==(const move_iterator& x, const move_sentinel<S>& y);

template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
Iterator current;  // exposition only
};

1 The member typedef-name iterator_concept is defined as follows:

(1.1) — If Iterator models random_access_iterator, then iterator_concept denotes random_access_iterator_tag.
(1.2) — Otherwise, if Iterator models bidirectional_iterator, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) — Otherwise, if Iterator models forward_iterator, then iterator_concept denotes forward_iterator_tag.
(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if the qualified-id iterator_traits<Iterator>::iterator_category is valid and denotes a type. In that case, iterator_category denotes

(2.1) random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models derived_from<random_access_iterator_tag>, and
(2.2) iterator_traits<Iterator>::iterator_category otherwise.

25.5.4.3 Requirements

The template parameter Iterator shall either meet the Cpp17InputIterator requirements (25.3.5.3) or model input_iterator (25.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated, the template parameter shall either meet the Cpp17BidirectionalIterator requirements (25.3.5.6) or model bidirectional_iterator (25.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the Cpp17RandomAccessIterator requirements (25.3.5.7) or model random_access_iterator (25.3.4.13).

25.5.4.4 Construction and assignment

constexpr move_iterator();

Effects: Value-initializes current.

constexpr explicit move_iterator(Iterator i);

Effects: Initializes current with std::move(i).
template<class U> constexpr move_iterator(const move_iterator<U>& u);

3 Constraints: is_same_v< U, Iterator> is false and const U& models convertible_to<Iterator>.
4 Effects: Initializes current with u.current.

template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
5 Constraints: is_same_v< U, Iterator> is false, const U& models convertible_to<Iterator>, and
assignable_from<Iterator&, const U&> is modeled.
6 Effects: Assigns u.current to current.
7 Returns: *this.

25.5.4.5 Conversion [move.iter.op.conv]

cconstexpr const Iterator& base() const & noexcept;
1 Returns: current.

cconstexpr Iterator base() &&;
2 Returns: std::move(current).

25.5.4.6 Element access [move.iter.elem]

cconstexpr reference operator*() const;
1 Effects: Equivalent to: return ranges::iter_move(current);

cconstexpr reference operator[](difference_type n) const;
2 Effects: Equivalent to: return ranges::iter_move(current + n);

25.5.4.7 Navigation [move.iter.nav]

cconstexpr move_iterator& operator++();
1 Effects: As if by ++current.
2 Returns: *this.

cconstexpr auto operator++(int);
3 Effects: If Iterator models forward_iterator, equivalent to:
move_iterator tmp = *this;
++current;
return tmp;
Otherwise, equivalent to ++current.

cconstexpr move_iterator& operator--();
4 Effects: As if by --current.
5 Returns: *this.

cconstexpr move_iterator operator--(int);
6 Effects: As if by:
move_iterator tmp = *this;
--current;
return tmp;

cconstexpr move_iterator operator+(difference_type n) const;
7 Returns: move_iterator(current + n).

cconstexpr move_iterator& operator+=(difference_type n);
8 Effects: As if by: current += n;
9 Returns: *this.
constexpr move_iterator operator-(difference_type n) const;
10 Returns: move_iterator(current - n).

constexpr move_iterator& operator-=(difference_type n);
11 Effects: As if by: current -= n;
12 Returns: *this.

25.5.4.8 Comparisons

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x,
                           const move_iterator<Iterator2>& y);
```
1 Constraints: x.base() == y.base() is well-formed and convertible to bool.
2 Returns: x.base() == y.base().

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x,
                        const move_iterator<Iterator2>& y);
```
3 Constraints: x.base() < y.base() is well-formed and convertible to bool.
4 Returns: x.base() < y.base().

```cpp
template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x,
                         const move_iterator<Iterator2>& y);
```
7 Constraints: y.base() < x.base() is well-formed and convertible to bool.
8 Returns: !(y < x).

```cpp
template<class Iterator1, class Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const move_iterator<Iterator1>& x,
             const move_iterator<Iterator2>& y);
```
11 Returns: x.base() <=> y.base().

25.5.4.9 Non-member functions

```cpp
template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());
```
1 Returns: x.base() - y.base().
template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);

Constraints: x.base() + n is well-formed and has type Iterator.

Returns: x + n.

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

Effects: Equivalent to: return ranges::iter_move(i.current);

friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

template<class Iterator>
constexpr move_iterator<Iterator>
make_move_iterator(Iterator i);

Returns: move_iterator<Iterator>(std::move(i)).

25.5.4.10 Class template move_sentinel

class template move_sentinel is a sentinel adaptor useful for denoting ranges together with move_iterator. When an input iterator type I and sentinel type S model sentinel_for<S, I>, move_sentinel<S> and move_iterator<I> model sentinel_for<move_sentinel<S>, move_iterator<I>> as well.

[Example 1: A move_if algorithm is easily implemented with copy_if using move_iterator and move_sentinel:

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, indirect_unary_predicate<I> Pred>
requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
    ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
—end example]

namespace std {
    class move_sentinel {
    public:
        constexpr move_sentinel();
        constexpr explicit move_sentinel(S s);
        template<class S2>
        requires convertible_to<const S2&, S>
        constexpr move_sentinel(const move_sentinel<S2>& s);
        template<class S2>
        requires assignable_from<S&, const S2&>
        constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

        constexpr S base() const;
    private:
        S last;     // exposition only
    };
}

25.5.4.11 Operations

constexpr move_sentinel();

Effects: Value-initializes last. If is_trivially_default_constructible_v<S> is true, then this constructor is a constexpr constructor.

constexpr explicit move_sentinel(S s);

Effects: Initializes last with std::move(s).
template<class S2>
  requires convertible_to<const S2&, S>
  constexpr move_sentinel(const move_sentinel<S2>& s);

Effects: Initializes last with s.last.

template<class S2>
  requires assignable_from<S&, const S2&>
  constexpr move_sentinel& operator=(const move_sentinel<S2>& s);

Effects: Equivalent to: last = s.last; return *this;

constexpr S base() const;

Returns: last.

25.5.5 Common iterators

25.5.5.1 Class template common_iterator

Class template common_iterator is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

[Note 1: The common_iterator type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — end note]

[Example 1:]

template<class ForwardIterator>
void fun(ForwardIterator begin, ForwardIterator end);

list<int> s;
// populate the list s
using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
// call fun on a range of 10 ints
fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));

—end example]
template<class I2, sentinel_for<I> S2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);

template<class I2, sentinel_for<I> S2>
requires sentinel_for<S, I2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);

template<class I2, sentinel_for<I> S2>
requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);

friend constexpr iter_difference_t<I2> operator-(const common_iterator& x, const common_iterator<I2, S2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i) noexcept(noexcept(ranges::iter_move(declval<const I&>())));

private:
  variant<I, S> v_;  // exposition only  
};

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
  using difference_type = iter_difference_t<I>;
};

template<input_iterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
  using iterator_concept = see below;
  using iterator_category = see below;
  using value_type = iter_value_t<I>;
  using difference_type = iter_difference_t<I>;
  using pointer = see below;
  using reference = iter_reference_t<I>;
};

25.5.5.2 Associated types [common.iter.types]

1 The nested typedef-names of the specialization of iterator_traits for common_iterator<I, S> are defined as follows.

(1.1) — iterator_concept denotes forward_iterator_tag if I models forward_iterator; otherwise it denotes input_iterator_tag.

(1.2) — iterator_category denotes forward_iterator_tag if the qualified-id iterator_traits<I>::iterator_category is valid and denotes a type that models derived_from<forward_iterator_tag>; otherwise it denotes input_iterator_tag.

(1.3) — Let a denote an lvalue of type const common_iterator<I, S>. If the expression a.operator->() is well-formed, then pointer denotes decltype(a.operator->()). Otherwise, pointer denotes void.

25.5.5.3 Constructors and conversions [common.iter.const]

constexpr common_iterator(I i);

1 Effects: Initializes v_ as if by v_{in_place_type<I>}, std::move(i)).

constexpr common_iterator(S s);

2 Effects: Initializes v_ as if by v_{in_place_type<S>}, std::move(s)).
template<class I2, class S2>
    requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
    constexpr common_iterator(const common_iterator<I2, S2>& x);

3 \textit{Preconditions:} \texttt{x.v\_}.\texttt{valueless\_by\_exception()} is false.
4 \textit{Effects:} Initializes \texttt{v\_} as if by \texttt{v\_}{{\texttt{\{in\_place\_index\<i\>, get\<i\>(x.v\_)\}}}}, where \texttt{i} is \texttt{x.v\_}.\texttt{index()}.

template<class I2, class S2>
    requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
    assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
    constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

5 \textit{Preconditions:} \texttt{x.v\_}.\texttt{valueless\_by\_exception()} is false.
6 \textit{Effects:} Equivalent to:
\begin{enumerate}
\item[(6.1)] If \texttt{v\_}.\texttt{index()} == \texttt{x.v\_}.\texttt{index()}, then
\quad \texttt{get\<i\>(v\_)} = \texttt{get\<i\>(x.v\_)},
\item[(6.2)] Otherwise, \texttt{v\_.emplace\<i\>(get\<i\>(x.v\_)},
\end{enumerate}

where \texttt{i} is \texttt{x.v\_}.\texttt{index()}.
7 \textit{Returns:} *this

\section*{25.5.5.4 Accessors \hfill [common.iter.access]}

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
    requires dereferenceable<const I>;
1 \textit{Preconditions:} \texttt{holds\_alternative\<I\>\(\(v\_\)\)} is true.
2 \textit{Effects:} Equivalent to: return \texttt{*get\<I\>(v\_)};

constexpr auto operator->() const
    requires see below;
3 The expression in the \texttt{requires-clause} is equivalent to:
\begin{enumerate}
\item[(3.1)] \texttt{i.operator->\()\}; \quad \texttt{!is\_reference\_v\<iter\_reference\_t\<I\>> ||}
\item[(3.2)] \texttt{constructible\_from<iter\_value\_t\<I\>, iter\_reference\_t\<I\>>>}
\end{enumerate}
4 \textit{Preconditions:} \texttt{holds\_alternative\<I\>\(\(v\_\)\)} is true.
5 \textit{Effects:}
\begin{enumerate}
\item[(5.1)] If \texttt{I} is a pointer type or if the expression \texttt{get\<I\>(v\_).\texttt{operator->\()\}} is well-formed, equivalent to:
\quad return \texttt{get\<I\>(v\_)};
\item[(5.2)] Otherwise, if \texttt{iter\_reference\_t\<I\>\}} is a reference type, equivalent to:
\quad auto&& \texttt{tmp = *get\<I\>(v\_)};
\quad return \texttt{addressof(tmp)};
\item[(5.3)] Otherwise, equivalent to: return \texttt{proxy(*get\<I\>(v\_))}; where \texttt{proxy} is the exposition-only class:
\begin{verbatim}
class proxy {
    iter_value_t<I> keep;
    constexpr proxy(iter_reference_t<I>&& x)
        : keep(std::move(x)) {}
public:
    constexpr const iter_value_t<I>* operator->() const noexcept {
        return addressof(keep_);
    }
};
\end{verbatim}
\end{enumerate}

\section*{25.5.5.5 Navigation \hfill [common.iter.nav]}

constexpr common_iterator& operator++();
1 \textit{Preconditions:} \texttt{holds\_alternative\<I\>\(\(v\_\)\)} is true.

§ 25.5.5.5 1091
Effects: Equivalent to \( ++\text{get}<I>(v_) \).

Returns: \*this.

def constexpr decltype(auto) operator++(int);

Preconditions: holds_alternative\(<I>(v_) \) is true.

Effects: If \( I \) models forward_iterator, equivalent to:

```cpp
common_iterator tmp = \*this;
++\*this;
return tmp;
```

Otherwise, if requires(I\& i) \{ \{ \*i++ \} \} \rightarrow \text{can-reference}; \} is true or indirectly_readable\(<I> \) \&\& constructible_from<\text{iter_value_t}<I>, \text{iter_reference_t}<I>> \&\& move_constructible<\text{iter_value_t}<I>>

is false, equivalent to:

```cpp
return get<\text{I}>(v_++);
```

Otherwise, equivalent to:

```cpp
postfix-proxy p(**this);
++\*this;
return p;
```

where \text{postfix-proxy} is the exposition-only class:

```cpp
class postfix-proxy {
    \text{iter_value_t}<I> keep_;
    constexpr postfix-proxy(iter_reference_t<I>&& x)
    : keep_(std::forward<iter_reference_t<I>>(x)) {} 
    public:
        constexpr const iter_value_t<I>& operator*() const noexcept {
            return keep_; 
        }
    }
};
```

25.5.5.6 Comparisons [common.iter.cmp]

```cpp
template<class I2, sentinel_for<I> S2>
requires sentinel_for<S, I2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
```

Preconditions: \( x.v_.\text{valueless_by_exception}() \) and \( y.v_.\text{valueless_by_exception}() \) are each false.

Returns: true if \( i == j \), and otherwise \( \text{get}<i>(x.v_) == \text{get}<j>(y.v_) \), where \( i \) is \( x.v_.\text{index}() \) and \( j \) is \( y.v_.\text{index}() \).

```cpp
template<class I2, sentinel_for<I> S2>
requires sentinel_for<S, I2> \&\& equality_comparable_with<I, I2>
friend constexpr bool operator==(const common_iterator\& x, const common_iterator\& I2, S2&& y);
```

Preconditions: \( x.v_.\text{valueless_by_exception}() \) and \( y.v_.\text{valueless_by_exception}() \) are each false.

Returns: true if \( i \) and \( j \) are each 1, and otherwise \( \text{get}<i>(x.v_) == \text{get}<j>(y.v_) \), where \( i \) is \( x.v_.\text{index}() \) and \( j \) is \( y.v_.\text{index}() \).

```cpp
template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(const common_iterator\& x, const common_iterator\& I2, S2\& y);
```

Preconditions: \( x.v_.\text{valueless_by_exception}() \) and \( y.v_.\text{valueless_by_exception}() \) are each false.
Returns: 0 if \( i \) and \( j \) are each 1, and otherwise \( \text{get}<i>(x.v_.) - \text{get}<j>(y.v_.) \), where \( i \) is \( x.v_.\text{index}() \) and \( j \) is \( y.v_.\text{index}() \).

### 25.5.5.7 Customizations

```cpp
friend constexpr iter_value_reference_t<I> iter_move(const common_iterator& i)
  noexcept(noexcept(ranges::iter_move(declval<const I&>())))
  requires input_iterator<I>;
```

**Effects:** Equivalent to: \( \text{return ranges::iter_move(get<I>(i.v_));} \)

```cpp
friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
  noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))
  requires input_iterator<I>;
```

**Effects:** Equivalent to \( \text{ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_));} \).

### 25.5.6 Default sentinel

```cpp
namespace std {
  struct default_sentinel_t { }
}
```

**Class** `default_sentinel_t` is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., `counted_iterator` (25.5.7.1)).

### 25.5.7 Counted iterators

#### 25.5.7.1 Class template `counted_iterator`

Class template `counted_iterator` is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with `default_sentinel` in calls to generic algorithms to operate on a range of \( N \) elements starting at a given position without needing to know the end position a priori.

**[Example 1]:**

```cpp
list<string> s;
  // populate the list s with at least 10 strings
vector<string> v;
  // copies 10 strings into v:
  ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
```

**[end example]**

Two values \( i1 \) and \( i2 \) of types `counted_iterator<I1>` and `counted_iterator<I2>` refer to elements of the same sequence if and only if there exists some integer \( n \) such that `next(i1.base(), i1.count() + n)` and `next(i2.base(), i2.count() + n)` refer to the same (possibly past-the-end) element.

```cpp
namespace std {
  template<input_or_output_iterator I>
  class counted_iterator {
    public:
      using iterator_type = I;
      using value_type = iter_value_t<I>;
      // present only
      using difference_type = iter_difference_t<I>;
      using iterator_concept = typename I::iterator_concept;
      // present only
      using iterator_category = typename I::iterator_category;
      // present only
      constexpr counted_iterator() requires default_initializable<I> = default;
      constexpr counted_iterator(I x, iter_difference_t<I> n);
      template<class I2>
      requires convertible_to<const I2&, I>
      constexpr counted_iterator(const counted_iterator<I2>& x);
  }
}
```
template<class I2>

struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
    using pointer = conditional_t<contiguous_iterator<I>,
        add_pointer_t<iter_reference_t<I>>, void>;
}

25.5.7.2 Constructors and conversions

constexpr counted_iterator(I i, iter_difference_t<I> n);
1 Preconditions: n >= 0.
2 Effects: Initializes current with std::move(i) and length with n.

template<class I2>
    requires convertible_to<const I2&, I>
constexpr counted_iterator(const counted_iterator<I2>& x);
3 Effects: Initializes current with x.current and length with x.length.

template<class I2>
    requires assignable_from<I&, const I2&>
constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
4 Effects: Assigns x.current to current and x.length to length.
5 Returns: *this.

25.5.7.3 Accessors

constexpr const I& base() const & noexcept;
1 Effects: Equivalent to: return current;

castexpr I base() &&;
2 Returns: std::move(current).

castexpr iter_difference_t<I> count() const noexcept;
3 Effects: Equivalent to: return length;

25.5.7.4 Element access

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
    requires dereferenceable<const I>;
1 Preconditions: length > 0 is true.
2 Effects: Equivalent to: return *current;

constexpr auto operator->() const noexcept
    requires contiguous_iterator<I>;
3 Effects: Equivalent to: return to_address(current);

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
    requires random_access_iterator<I>;
4 Preconditions: n < length.
5 Effects: Equivalent to: return current[n];
25.5.7.5 Navigation

constexpr counted_iterator& operator++();
1
   Preconditions: length > 0.
2
   Effects: Equivalent to:
       ++current;
       --length;
       return *this;

constexpr decltype(auto) operator++(int);
3
   Preconditions: length > 0.
4
   Effects: Equivalent to:
       --length;
       try { return current++; }
       catch(...) { ++length; throw; }

constexpr counted_iterator operator++(int)
   requires forward_iterator<I>;
5
   Effects: Equivalent to:
       counted_iterator tmp = *this;
       ++this;
       return tmp;

constexpr counted_iterator& operator--()
   requires bidirectional_iterator<I>;
6
   Effects: Equivalent to:
       --current;
       ++length;
       return *this;

constexpr counted_iterator operator--(int)
   requires bidirectional_iterator<I>;
7
   Effects: Equivalent to:
       counted_iterator tmp = *this;
       --this;
       return tmp;

constexpr counted_iterator operator+(iter_difference_t<I> n) const
   requires random_access_iterator<I>;
8
   Effects: Equivalent to: return counted_iterator(current + n, length - n);

friend constexpr counted_iterator operator+( 
   iter_difference_t<I> n, const counted_iterator& x)
   requires random_access_iterator<I>;
9
   Effects: Equivalent to: return x + n;

constexpr counted_iterator& operator+=(iter_difference_t<I> n)
   requires random_access_iterator<I>;
10
   Preconditions: n <= length.
11
   Effects: Equivalent to:
       current += n;
       length -= n;
       return *this;

constexpr counted_iterator operator-(iter_difference_t<I> n) const
   requires random_access_iterator<I>;
12
   Effects: Equivalent to: return counted_iterator(current - n, length + n);
template<common_with<I> I2>
friend constexpr iter_difference_t<I2> operator-(
const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

Effects: Equivalent to: return y.length - x.length;

friend constexpr iter_difference_t<I> operator-(
const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: return -x.length;

friend constexpr iter_difference_t<I> operator-(
default_sentinel_t, const counted_iterator& y);

Effects: Equivalent to: return y.length;

counted_iterator& operator-=(iter_difference_t<I> n)
requires random_access_iterator<I>;

Preconditions: -n <= length.

Effects: Equivalent to:
current -= n;
length += n;
return *this;

25.5.7.6 Comparisons [counted.iter.cmp]

template<common_with<I> I2>
friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

Effects: Equivalent to: return x.length == y.length;

friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: return x.length == 0;

template<common_with<I> I2>
friend constexpr strong_ordering operator<=>(const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

Effects: Equivalent to: return y.length <=> x.length;

[Note 1: The argument order in the Effects: element is reversed because length counts down, not up. — end note]

25.5.7.7 Customizations [counted.iter.cust]

friend constexpr iter_rvalue_reference_t<I>
iter_move(const counted_iterator& i)
oexcept(noexcept(ranges::iter_move(i.current)))
requires input_iterator<I>;

Preconditions: i.length > 0 is true.

Effects: Equivalent to: return ranges::iter_move(i.current);

template<indirectly_swappable<I> I2>
friend constexpr void
iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
oexcept(noexcept(ranges::iter_swap(x.current, y.current)));

Preconditions: Both x.length > 0 and y.length > 0 are true.

Effects: Equivalent to ranges::iter_swap(x.current, y.current).
25.5.8 Unreachable sentinel

Class unreachable_sentinel_t can be used with any weakly_incrementable type to denote the “upper bound” of an unbounded interval.

Example 1:

```cpp
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of unreachable_sentinel above potentially makes the call to find more efficient since the loop test against the sentinel does not require a conditional branch. — end example

```cpp
namespace std {
    struct unreachable_sentinel_t {
        template<weakly_incrementable I>
        friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept {
            return false;
        }
    };
}
```

25.6 Stream iterators

25.6.1 General

To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.

Example 1:

```cpp
partial_sum(istream_iterator<double, char>(cin),
            istream_iterator<double, char>(),
            ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from cin, and prints the partial sums onto cout. — end example

25.6.2 Class template istream_iterator

25.6.2.1 General

The class template istream_iterator is an input iterator (25.3.5.3) that reads successive elements from the input stream for which it was constructed.

```cpp
namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>,
             class Distance = ptrdiff_t>
    class istream_iterator {
        public:
            using iterator_category = input_iterator_tag;
            using value_type = T;
            using difference_type = Distance;
            using pointer = const T*;
            using reference = const T&;
            using char_type = charT;
            using traits_type = traits;
            using istream_type = basic_istream<charT,traits>;

            constexpr istream_iterator();
            constexpr istream_iterator(default_sentinel_t);
            istream_iterator(istream_iterator& s);
            ~istream_iterator() = default;
            istream_iterator& operator=(const istream_iterator& x) = default;
            istream_iterator& operator=(const istream_iterator& x) = default;

            const T& operator*() const;
            const T* operator->() const;
            istream_iterator& operator++();
            istream_iterator operator++(int);
        }
    }
```
The type \( T \) shall meet the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and `Cpp17CopyAssignable` requirements.

### 25.6.2.2 Constructors and destructor

**constexpr istream_iterator();**

**constexpr istream_iterator(default_sentinel_t);**

**Effects**: Constructs the end-of-stream iterator, value-initializing \( value \).

**Postconditions**: \( \text{in\_stream == nullptr is true.} \)

**Remarks**: If the initializer \( T() \) in the declaration \( \text{auto x = T();} \) is a constant initializer (7.7), then these constructors are `constexpr` constructors.

**istream_iterator(istream_type& s);**

**Effects**: Initializes \( \text{in\_stream with addressof(s), value-initializes value, and then calls operator++().} \)

**Postconditions**: \( \text{in\_stream == x.in\_stream is true.} \)

**Remarks**: If \( \text{is\_trivially\_copy\_constructible\_v<T> is true, then this constructor is trivial.} \)

**~istream_iterator() = default;**

**Remarks**: If \( \text{is\_trivially\_destructible\_v<T> is true, then this destructor is trivial.} \)

### 25.6.2.3 Operations

**const T& operator*() const;**

**Preconditions**: \( \text{in\_stream != nullptr is true.} \)

**Returns**: \( \text{value} \).

**const T* operator->() const;**

**Preconditions**: \( \text{in\_stream != nullptr is true.} \)

**Returns**: \( \text{addressof(value).} \)

**istream_iterator& operator++();**

**Preconditions**: \( \text{in\_stream != nullptr is true.} \)

**Effects**: Equivalent to:

\[
\text{if (!(}\text{in\_stream >> value})\text{)}
\]

\[
\text{in\_stream = nullptr;}
\]

**Returns**: \( \text{*this} \).

**istream_iterator operator++(int);**

**Preconditions**: \( \text{in\_stream != nullptr is true.} \)

**Effects**: Equivalent to:

\[
\text{istream\_iterator tmp = *this;}
\]

\[
\text{++*this;}
\]

\[
\text{return tmp;}
\]

**template<class T, class charT, class traits, class Distance>
bool operator==(const istream_iterator<T,charT,traits,Distance>& x, const istream_iterator<T,charT,traits,Distance>& y);**

**Returns**: \( \text{x.in\_stream == y.in\_stream.} \)
friend bool operator==(const istream_iterator& i, default_sentinel_t);

Returns: !i.in_stream.

25.6.3 Class template ostream_iterator

25.6.3.1 General

ostream_iterator writes (using operator<<) successive elements onto the output stream from which it was constructed. If it was constructed with charT* as a constructor argument, this string, called a delimiter string, is written to the stream after every T is written.

namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>>
    class ostream_iterator {
    public:
        using iterator_category = output_iterator_tag;
        using value_type = void;
        using difference_type = ptrdiff_t;
        using pointer = void;
        using reference = void;
        using char_type = charT;
        using traits_type = traits;
        using ostream_type = basic_ostream<charT,traits>;

        ostream_iterator(ostream_type& s);
        ostream_iterator(ostream_type& s, const charT* delimiter);
        ~ostream_iterator();
        ostream_iterator& operator=(const ostream_iterator& x);
        ostream_iterator& operator=(const T& value);
        ostream_iterator& operator*();
        ostream_iterator& operator++();
        ostream_iterator& operator++(int);
    private:
        basic_ostream<charT,traits>* out_stream; // exposition only
        const charT* delim; // exposition only
    };
}

25.6.3.2 Constructors and destructor

ostream_iterator(ostream_type& s);

Effects: Initializes out_stream with addressof(s) and delim with nullptr.

ostream_iterator(ostream_type& s, const charT* delimiter);

Effects: Initializes out_stream with addressof(s) and delim with delimiter.

25.6.3.3 Operations

ostream_iterator& operator=(const T& value);

Effects: As if by:

    *out_stream << value;
    if (delim)
        *out_stream << delim;
    return *this;

ostream_iterator& operator*();

Returns: *this.

ostream_iterator& operator++();

ostream_iterator& operator++(int);

Returns: *this.
25.6.4 Class template istreambuf_iterator

25.6.4.1 General

The class template `istreambuf_iterator` defines an input iterator (25.3.5.3) that reads successive characters from the streambuf for which it was constructed. `operator*` provides access to the current input character, if any. Each time `operator++` is evaluated, the iterator advances to the next input character. If the end of stream is reached (`(streambuf_type::sgetc() returns traits::eof())`), the iterator becomes equal to the end-of-stream iterator value. The default constructor `istreambuf_iterator()` and the constructor `istreambuf_iterator(nullptr)` both construct an end-of-stream iterator object suitable for use as an end-of-range. All specializations of `istreambuf_iterator` shall have a trivial copy constructor, a `constexpr` default constructor, and a trivial destructor.

The result of `operator*()` on an end-of-stream iterator is undefined. For any other iterator value a `char_type` value is returned. It is impossible to assign a character via an input iterator.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class istreambuf_iterator {
        public:
            using iterator_category = input_iterator_tag;
            using value_type = charT;
            using difference_type = typename traits::off_type;
            using pointer = unspecified;
            using reference = charT;
            using char_type = charT;
            using traits_type = traits;
            using int_type = typename traits::int_type;
            using streambuf_type = basic_streambuf<charT,traits>;
            using istream_type = basic_istream<charT,traits>;

            // 25.6.4.2, class istreambuf_iterator::proxy
            class proxy {
                using iterator_category = input_iterator_tag;
                using value_type = charT;
                using difference_type = typename traits::off_type;
                using pointer = unspecified;
                using reference = charT;
                using char_type = charT;
                using traits_type = traits;
                using int_type = typename traits::int_type;
                using streambuf_type = basic_streambuf<charT,traits>;
                using istream_type = basic_istream<charT,traits>;

                // exposition only
                constexpr istreambuf_iterator() noexcept;
                constexpr istreambuf_iterator(default_sentinel_t) noexcept;
                istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
                ~istreambuf_iterator() = default;
                istreambuf_iterator(istream_type& s) noexcept;
                istreambuf_iterator(streambuf_type* s) noexcept;
                istreambuf_iterator(const proxy& p) noexcept;
                istreambuf_iterator& operator=(const istreambuf_iterator&) noexcept = default;
                bool equal(const istreambuf_iterator& b) const;

                friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

                private:
                    streambuf_type* sbuf_; // exposition only
                };
    };
}
```

25.6.4.2 Class istreambuf_iterator::proxy

Class `istreambuf_iterator<charT,traits>::proxy` is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class `istreambuf_iterator<charT,traits>::proxy` provides a temporary placeholder as the return value of the post-increment operator (`operator++`). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```cpp
namespace std {
    template<class charT, class traits>
    class istreambuf_iterator<charT, traits>::proxy {
        // exposition only
        charT keep_;
    };
}
```
25.6.4.3 Constructors

For each `istreambuf_iterator` constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member `sbuf_` is initialized with a null pointer value.

```cpp
constexpr istreambuf_iterator() noexcept;
constexpr istreambuf_iterator(default_sentinel_t) noexcept;
istreambuf_iterator(istream_type& s) noexcept;
istreambuf_iterator(streambuf_type* s) noexcept;
istreambuf_iterator(const proxy& p) noexcept;
```

25.6.4.4 Operations

```cpp
operator*() const;
operator++();
proxy operator++(int);
bool equal(const istreambuf_iterator& b) const;
template<class charT, class traits>
bool operator==(const istreambuf_iterator<charT, traits>& a, const istreambuf_iterator<charT, traits>& b);
friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);
```

25.6.5 Class template ostreambuf_iterator

The class template `ostreambuf_iterator` writes successive characters onto the output stream from which it was constructed.

```cpp
namespace std {
    template<class charT, class traits = char_traits<charT>>
    class ostreambuf_iterator {
        public:
            using iterator_category = output_iterator_tag;
            using value_type = void;
            using basic_streambuf<charT, traits>* sbuf_;
            proxy(charT c, basic_streambuf<charT, traits>* sbuf)
                : keep_(c), sbuf_(sbuff) { }
            ;
            public:
                charT operator*() { return keep_; }
            ;
    };
```
using difference_type  = ptrdiff_t;
using pointer       = void;
using reference    = void;
using char_type    = charT;
using traits_type  = traits;
using streambuf_type  = basic_streambuf<charT,traits>;
using ostream_type  = basic_ostream<charT,traits>;

ostreambuf_iterator(ostream_type& s) noexcept;
ostreambuf_iterator(streambuf_type* s) noexcept;
ostreambuf_iterator& operator=(charT c);
ostreambuf_iterator& operator*();
ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);
bool failed() const noexcept;

private:
  streambuf_type* sbuf_;    // exposition only
};

25.6.5.2 Constructors [ostreambuf.iter.cons]

ostreambuf_iterator(ostream_type& s) noexcept;

1 Preconditions: s.rdbuf() is not a null pointer.
2 Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;

3 Preconditions: s is not a null pointer.
4 Effects: Initializes sbuf_ with s.

25.6.5.3 Operations [ostreambuf.iter.ops]

ostreambuf_iterator& operator=(charT c);

1 Effects: If failed() yields false, calls sbuf_->sputc(c); otherwise has no effect.
2 Returns: *this.

ostreambuf_iterator& operator*();

3 Returns: *this.

ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);

4 Returns: *this.

bool failed() const noexcept;

5 Returns: true if in any prior use of member operator=, the call to sbuf_->sputc() returned traits::eof(); or false otherwise.

25.7 Range access [iterator.range]

In addition to being available via inclusion of the <iterator> header, the function templates in 25.7 are available when any of the following headers are included: <array> (24.3.2), <deque> (24.3.3), <forward_list> (24.3.4), <list> (24.3.5), <map> (24.4.2), <regex> (32.3), <set> (24.4.3), <span> (24.7.2), <string> (23.4.2), <string_view> (23.3.2), <unordered_map> (24.5.2), <unordered_set> (24.5.3), and <vector> (24.3.6). Each of these templates is a designated customization point (16.4.5.2.1).

template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());

2 Returns: c.begin().

§ 25.7
template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());

Returns: c.end().

template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;

Returns: array.

template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;

Returns: array + N.

template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c))) -> decltype(std::begin(c));

Returns: std::begin(c).

template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c))) -> decltype(std::end(c));

Returns: std::end(c).

template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());

Returns: c.rbegin().

template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);

Returns: reverse_iterator<T*>(array + N).

template<class E> constexpr reverse_iterator<const E*> rbegin(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.end()).

template<class E> constexpr reverse_iterator<const E*> rend(initializer_list<E> il);

Returns: reverse_iterator<const E*>(il.begin()).

template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));

Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));

Returns: std::rend(c).

template<class C> constexpr auto size(const C& c) -> decltype(c.size());

Effects: Equivalent to:

    return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());

template<class C> constexpr auto ssize(const C& c) -> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;

Returns: N.

template<class C> constexpr auto ssize(const C& c) -> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;

Returns: N.
template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
Returns: false.

template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
Returns: il.begin().
26 Ranges library

26.1 General

This Clause describes components for dealing with ranges of elements.

The following subclauses describe range and view requirements, and components for range primitives and range generators as summarized in Table 93.

Table 93: Ranges library summary

struct from_range_t { explicit from_range_t() = default; }; // freestanding
inline constexpr from_range_t from_range{}; // freestanding
}

1 Within this Clause, for an integer-like type X (25.3.4.4), make_unsigned-like-t<X> denotes make_unsigned_t<X> if X is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as X. For an expression x of type X, to_unsigned-like(x) is x explicitly converted to make_unsigned-like-t<X>.

2 Also within this Clause, make_signed-like-t<X> for an integer-like type X denotes make_signed_t<X> if X is an integer type; otherwise, it denotes a corresponding unspecified signed-integer-like type of the same width as X.

26.3 Range access

26.3.1 General

1 In addition to being available via inclusion of the <ranges> header, the customization point objects in 26.3 are available when <iterator> (25.2) is included.

2 Within 26.3, the reified object of a subexpression E denotes

(2.1) — the same object as E if E is a glvalue, or

(2.2) — the result of applying the temporary materialization conversion (7.3.5) to E otherwise.
26.3.2 ranges::begin

The name ranges::begin denotes a customization point object (16.3.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::begin(E) is ill-formed.
2. Otherwise, if T is an array type (9.3.4.5) and remove_all_extents_t<T> is an incomplete type, ranges::begin(E) is ill-formed with no diagnostic required.
3. Otherwise, if T is an array type, ranges::begin(E) is expression-equivalent to t + 0.
4. Otherwise, if T is a class or enumeration type and auto(begin(t)) is a valid expression whose type models input_or_output_iterator with overload resolution performed in a context in which unqualified lookup for begin finds only the declarations
   ```cpp
   void begin(auto&) = delete;
   void begin(const auto&) = delete;
   ```
   then ranges::begin(E) is expression-equivalent to auto(begin(t)) with overload resolution performed in the above context.

26.3.3 ranges::end

The name ranges::end denotes a customization point object (16.3.3.3.6).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::end(E) is ill-formed.
2. Otherwise, if T is an array type (9.3.4.5) and remove_all_extents_t<T> is an incomplete type, ranges::end(E) is ill-formed with no diagnostic required.
3. Otherwise, if T is an array of unknown bound, ranges::end(E) is ill-formed.
4. Otherwise, if T is an array, ranges::end(E) is expression-equivalent to t + extent_v<T>.
5. Otherwise, if auto(t.end()) is a valid expression whose type models sentinel_for<iterator_t<T>>, then ranges::end(E) is expression-equivalent to auto(t.end()).
6. Otherwise, if T is a class or enumeration type and auto(end(t)) is a valid expression whose type models sentinel_for<iterator_t<T>>, with overload resolution performed in a context in which unqualified lookup for end finds only the declarations
   ```cpp
   void end(auto&) = delete;
   void end(const auto&) = delete;
   ```
   then ranges::end(E) is expression-equivalent to auto(end(t)) with overload resolution performed in the above context.

26.3.4 ranges::cbegin

The name ranges::cbegin denotes a customization point object (16.3.3.3.6). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:
26.3.5 `ranges::cend`  

The name `ranges::cend` denotes a customization point object (16.3.3.3.6). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

1. If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::cend(E)` is ill-formed.
2. Otherwise, let `U` be `ranges::end(possibly-const-range(t))`. `ranges::cend(E)` is expression-equivalent to `const_sentinel<decltype(U)>(U)`.

2 [Note 1: Whenever `ranges::cend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. If `S` models `input_iterator`, then `S` also models `constant_iterator`. — end note]

26.3.6 `ranges::rbegin`  

The name `ranges::rbegin` denotes a customization point object (16.3.3.3.6). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

1. If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rbegin(E)` is ill-formed.
2. Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.
3. Otherwise, if `auto(t.rbegin())` is a valid expression whose type models `sentinel_for<decltype(ranges::rbegin(E))>` then `ranges::rbegin(E)` is expression-equivalent to `auto(t.rbegin())`.
4. Otherwise, if `T` is a class or enumeration type and `auto(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` with overload resolution performed in a context in which unqualified lookup for `rbegin` finds only the declarations

```cpp
void rbegin(auto&) = delete;
void rbegin(const auto&) = delete;
```

then `ranges::rbegin(E)` is expression-equivalent to `auto(rbegin(t))` with overload resolution performed in the above context.

5. Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.
6. Otherwise, `ranges::rbegin(E)` is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — end note]
4 [Note 2: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

26.3.7 `ranges::rend`  

The name `ranges::rend` denotes a customization point object (16.3.3.3.6). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

1. If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rend(E)` is ill-formed.
2. Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.
3. Otherwise, if `auto(t.rend())` is a valid expression whose type models `sentinel_for<decltype( ranges::rbegin(E))>` then `ranges::rend(E)` is expression-equivalent to `auto(t.rend())`.
(2.4) Otherwise, if \( T \) is a class or enumeration type and \( \text{auto}(\text{rend}(t)) \) is a valid expression whose type models \( \text{sentinel	extunderscore for}\langle\text{decltype(ranges::rbegin(E))}\rangle \) with overload resolution performed in a context in which unqualified lookup for \( \text{rend} \) finds only the declarations

\[
\begin{align*}
\text{void } \text{rend}(\text{auto}&) &= \text{delete}; \\
\text{void } \text{rend}(\text{const auto}&) &= \text{delete};
\end{align*}
\]

then \( \text{ranges::rend}(E) \) is expression-equivalent to \( \text{auto}(\text{rend}(t)) \) with overload resolution performed in the above context.

(2.5) Otherwise, if both \( \text{ranges::begin}(t) \) and \( \text{ranges::end}(t) \) are valid expressions of the same type which models \( \text{bidirectional	extunderscore iterator} \) (25.3.4.12), then \( \text{ranges::rend}(E) \) is expression-equivalent to \( \text{make	extunderscore reverse	extunderscore iterator}(\text{ranges::begin}(t)) \).

(2.6) Otherwise, \( \text{ranges::rend}(E) \) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when \( \text{ranges::rend}(E) \) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever \( \text{ranges::rend}(E) \) is a valid expression, the types \( S \) and \( I \) of the expressions \( \text{ranges::rend}(E) \) and \( \text{ranges::rbegin}(E) \) model \( \text{sentinel	extunderscore for}\langle S, I \rangle \). — end note]

### 26.3.8 \( \text{ranges::crbegin} \) [range.access.crbegin]

The name \( \text{ranges::crbegin} \) denotes a customization point object (16.3.3.3.6). Given a subexpression \( E \) with type \( T \), let \( t \) be an lvalue that denotes the reified object for \( E \). Then:

(1.1) If \( E \) is an rvalue and \( \text{enable	extunderscore borrowed	extunderscore range}\langle\text{remove	extunderscore cv}_t<T\rangle> \) is false, \( \text{ranges::crbegin}(E) \) is ill-formed.

(1.2) Otherwise, let \( U \) be \( \text{ranges::begin}(\text{possibly	extunderscore const	extunderscore range}(t)) \). \( \text{ranges::crbegin}(E) \) is expression-equivalent to \( \text{const	extunderscore iterator}\langle\text{decltype}(U)\rangle(U) \).

2 [Note 1: Whenever \( \text{ranges::crbegin}(E) \) is a valid expression, its type models \( \text{input	extunderscore or	extunderscore output	extunderscore iterator} \) and \( \text{constant	extunderscore iterator} \). — end note]

### 26.3.9 \( \text{ranges::crend} \) [range.access.crend]

The name \( \text{ranges::crend} \) denotes a customization point object (16.3.3.3.6). Given a subexpression \( E \) with type \( T \), let \( t \) be an lvalue that denotes the reified object for \( E \). Then:

(1.1) If \( E \) is an rvalue and \( \text{enable	extunderscore borrowed	extunderscore range}\langle\text{remove	extunderscore cv}_t<T\rangle> \) is false, \( \text{ranges::crend}(E) \) is ill-formed.

(1.2) Otherwise, let \( U \) be \( \text{ranges::rend}(\text{possibly	extunderscore const	extunderscore range}(t)) \). \( \text{ranges::crend}(E) \) is expression-equivalent to \( \text{const	extunderscore sentinel}\langle\text{decltype}(U)\rangle(U) \).

2 [Note 1: Whenever \( \text{ranges::crend}(E) \) is a valid expression, the types \( S \) and \( I \) of the expressions \( \text{ranges::crend}(E) \) and \( \text{ranges::crbegin}(E) \) model \( \text{sentinel	extunderscore for}\langle S, I \rangle \). If \( S \) models \( \text{input	extunderscore iterator} \), then \( S \) also models \( \text{constant	extunderscore iterator} \). — end note]

### 26.3.10 \( \text{ranges::size} \) [range.prim.size]

The name \( \text{ranges::size} \) denotes a customization point object (16.3.3.3.6).

Given a subexpression \( E \) with type \( T \), let \( t \) be an lvalue that denotes the reified object for \( E \). Then:

(2.1) If \( T \) is an array of unknown bound (9.3.4.5), \( \text{ranges::size}(E) \) is ill-formed.

(2.2) Otherwise, if \( T \) is an array type, \( \text{ranges::size}(E) \) is expression-equivalent to \( \text{auto}(\text{extent}_v<T>) \).

(2.3) Otherwise, if \( \text{disable	extunderscore sized	extunderscore range}\langle\text{remove	extunderscore cv}_v<T\rangle> \) (26.4.3) is false and \( \text{auto}(t.\text{size}()) \) is a valid expression of integer-like type (25.3.4.4), \( \text{ranges::size}(E) \) is expression-equivalent to \( \text{auto}(t.\text{size}()) \).

(2.4) Otherwise, if \( T \) is a class or enumeration type, \( \text{disable	extunderscore sized	extunderscore range}\langle\text{remove	extunderscore cv}_v<T\rangle> \) is false and \( \text{auto}(\text{size}(t)) \) is a valid expression of integer-like type with overload resolution performed in a context in which unqualified lookup for \( \text{size} \) finds only the declarations

\[
\begin{align*}
\text{void } \text{size}(\text{auto}&) &= \text{delete}; \\
\text{void } \text{size}(\text{const auto}&) &= \text{delete};
\end{align*}
\]

then \( \text{ranges::size}(E) \) is expression-equivalent to \( \text{auto}(\text{size}(t)) \) with overload resolution performed in the above context.
26.3.11 ranges::ssize

The name ranges::ssize denotes a customization point object (16.3.3.3.6).

2

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. If ranges::size(t) is ill-formed, ranges::ssize(E) is ill-formed. Otherwise let D be make-signed-like-t decltype(ranges::size(t)), or ptrdiff_t if it is wider than that type; ranges::ssize(E) is expression-equivalent to static_cast<D>(ranges::size(t)).

26.3.12 ranges::empty

The name ranges::empty denotes a customization point object (16.3.3.3.6).

2

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

(2.1) If T is an array of unknown bound (9.3.4.5), ranges::empty(E) is ill-formed.

(2.2) Otherwise, if bool(t.empty()) is a valid expression, ranges::empty(E) is expression-equivalent to bool(t.empty()).

(2.3) Otherwise, if (ranges::size(t) == 0) is a valid expression, ranges::empty(E) is expression-equivalent to (ranges::size(t) == 0).

(2.4) Otherwise, if bool(ranges::begin(t) == ranges::end(t)) is a valid expression and the type of ranges::begin(t) models forward_iterator, ranges::empty(E) is expression-equivalent to bool(ranges::begin(t) == ranges::end(t)).

(2.5) Otherwise, ranges::empty(E) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::empty(E) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever ranges::empty(E) is a valid expression, it has type bool. — end note]

26.3.13 ranges::data

The name ranges::data denotes a customization point object (16.3.3.3.6).

2

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

(2.1) If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::data(E) is ill-formed.

(2.2) Otherwise, if T is an array type (9.3.4.5) and remove_all_extents_t<T> is an incomplete type, ranges::data(E) is ill-formed with no diagnostic required.

(2.3) Otherwise, if auto(t.data()) is a valid expression of pointer to object type, ranges::data(E) is expression-equivalent to auto(t.data()).

(2.4) Otherwise, if ranges::begin(t) is a valid expression whose type models contiguous_iterator, ranges::data(E) is expression-equivalent to to_address(ranges::begin(t)).

(2.5) Otherwise, ranges::data(E) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::data(E) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever ranges::data(E) is a valid expression, it has pointer to object type. — end note]

26.3.14 ranges::cdata

template<class T>
constexpr auto as-const-pointer(const T* p) { return p; } // exposition only
The name `ranges::cdata` denotes a customization point object (16.3.3.3.6). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::cdata(E)` is ill-formed.
2. Otherwise, `ranges::cdata(E)` is expression-equivalent to `as_const_pointer(ranges::data(possibly-const-range(t)))`.

[Note 1: Whenever `ranges::cdata(E)` is a valid expression, it has pointer to constant object type. — end note]

### 26.4 Range requirements

#### [range.req]

#### 26.4.1 General

Ranges are an abstraction that allows a C++ program to operate on elements of data structures uniformly. Calling `ranges::begin` on a range returns an object whose type models `input_or_output_iterator` (25.3.4.6). Calling `ranges::end` on a range returns an object whose type S, together with the type I of the object returned by `ranges::begin`, models `sentinel_for<S, I>`. The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

The `range` concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The `sized_range` concept refines `range` with the requirement that `ranges::size` be amortized \( O(1) \).

The `view` concept specifies requirements on a `range` type to provide operations with predictable complexity.

Several refinements of `range` group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models `random_access_iterator` (25.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

#### 26.4.2 Ranges

The `range` concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```cpp
template<class T>
concept range =
    requires(T& t) {
    ranges::begin(t);  // sometimes equality-preserving (see below)
    ranges::end(t);
    };
```

The required expressions `ranges::begin(t)` and `ranges::end(t)` of the `range` concept do not require implicit expression variations (18.2).

Given an expression t such that `decltype((t))` is T& T models `range` only if

1. `[ranges::begin(t), ranges::end(t)]` denotes a range (25.3.1),
2. both `ranges::begin(t)` and `ranges::end(t)` are amortized constant time and non-modifying, and
3. if the type of `ranges::begin(t)` models `forward_iterator`, `ranges::begin(t)` is equality-preserving.

[Note 1: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a `range` whose iterator type models `forward_iterator` to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model `forward_iterator`, it is possible for repeated calls to not return equal values or to not be well-defined. — end note]

```cpp
template<class T>
concept borrowed_range =
    range<T> & (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

Let U be `remove_reference_t<T>` if T is an rvalue reference type, and T otherwise. Given a variable u of type U, T models `borrowed_range` only if the validity of iterators obtained from u is not tied to the lifetime of that variable.
[Note 2: Since the validity of iterators is not tied to the lifetime of a variable whose type models \texttt{borrowed\_range}, a function with a parameter of such a type can return iterators obtained from it without danger of dangling. — end note]

\begin{verbatim}
template<class>
inline constexpr bool enable_borrowed_range = false;
\end{verbatim}

\textbf{Remarks:} Pursuant to 16.4.5.2.1, users may specialize \texttt{enable\_borrowed\_range} for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type \texttt{const bool}.

\begin{verbatim}
[Example 1: Each specialization \texttt{S} of class template \texttt{subrange} (26.5.4) models \texttt{borrowed\_range} because
\begin{enumerate}
\item \texttt{enable\_borrowed\_range}\texttt{<S>} is specialized to have the value \texttt{true}, and
\item \texttt{S}'s iterators do not have validity tied to the lifetime of an \texttt{S} object because they are “borrowed” from some other range.
\end{enumerate}
— end example]
\end{verbatim}

\section*{26.4.3 Sized ranges} \([\text{range.sized}]\)

The \texttt{sized\_range} concept refines \texttt{range} with the requirement that the number of elements in the range can be determined in amortized constant time using \texttt{ranges::size}.

\begin{verbatim}
template<class T>
concept sized_range =
range<T> && requires(T& t) { ranges::size(t); };
\end{verbatim}

Given an lvalue \texttt{t} of type \texttt{remove\_reference\_t<T>}, \texttt{T} models \texttt{sized\_range} only if

\begin{enumerate}
\item \texttt{ranges::size(t)} is amortized \(\mathcal{O}(1)\), does not modify \texttt{t}, and is equal to \texttt{ranges::distance(ranges::begin(t), ranges::end(t))}, and
\item if \texttt{iterator\_t<T>} models \texttt{forward\_iterator}, \texttt{ranges::size(t)} is well-defined regardless of the evaluation of \texttt{ranges::begin(t)}.
\end{enumerate}

\[\text{Note 1: ranges::size(t)}\] is otherwise not required to be well-defined after evaluating \texttt{ranges::begin(t)}. For example, it is possible for \texttt{ranges::size(t)} to be well-defined for a \texttt{sized\_range} whose iterator type does not model \texttt{forward\_iterator} only if evaluated before the first call to \texttt{ranges::begin(t)}. — end note

\begin{verbatim}
template<class>
inline constexpr bool disable_sized_range = false;
\end{verbatim}

\textbf{Remarks:} Pursuant to 16.4.5.2.1, users may specialize \texttt{disable\_sized\_range} for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type \texttt{const bool}.

\[\text{Note 2: disable\_sized\_range}\] allows use of range types with the library that satisfy but do not in fact model \texttt{sized\_range}. — end note

\section*{26.4.4 Views} \([\text{range.view}]\)

The \texttt{view} concept specifies the requirements of a \texttt{range} type that has the semantic properties below, which make it suitable for use in constructing range adaptor pipelines (26.7).

\begin{verbatim}
template<class T>
concept view =
range<T> && movable<T> && enable_view<T>;
\end{verbatim}

\texttt{T} models \texttt{view} only if:

\begin{enumerate}
\item \texttt{T} has \(\mathcal{O}(1)\) move construction; and
\item move assignment of an object of type \texttt{T} is no more complex than destruction followed by move construction; and
\item if \(N\) copies and/or moves are made from an object of type \texttt{T} that contained \(M\) elements, then those \(N\) objects have \(\mathcal{O}(N+M)\) destruction; and
\item \texttt{copy\_constructible<T>} is \texttt{false}, or \texttt{T} has \(\mathcal{O}(1)\) copy construction; and
\end{enumerate}
— copyable<T> is false, or copy assignment of an object of type T is no more complex than destruction followed by copy construction.

3 [Note 1: The constraints on copying and moving imply that a moved-from object of type T has \( \Theta(1) \) destruction. — end note]

4 [Example 1: Examples of views are:

(4.1) — A range type that wraps a pair of iterators.
(4.2) — A range type that holds its elements by shared_ptr and shares ownership with all its copies.
(4.3) — A range type that generates its elements on demand.

A container such as vector<string> does not meet the semantic requirements of view since copying the container copies all of the elements, which cannot be done in constant time. — end example]

5 Since the difference between range and view is largely semantic, the two are differentiated with the help of enable_view.

template<class T>
inline constexpr bool is-derived-from-view-interface = see below; // exposition only

template<class T>
inline constexpr bool enable_view =
    derived_from<T, view_base> || is-derived-from-view-interface<T>;

For a type T, is-derived-from-view-interface<T> is true if and only if T has exactly one public base class view_interface<U> for some type U and T has no base classes of type view_interface<V> for any other type V.

7 Remarks: Pursuant to 16.4.5.2.1, users may specialize enable_view to true for cv-unqualified program-defined types which model view, and false for types which do not. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

26.4.5 Other range refinements

1 The output_range concept specifies requirements of a range type for which ranges::begin returns a model of output_iterator (25.3.4.10). input_range, forward_range, bidirectional_range, and random_access_range are defined similarly.

template<class R, class T>
concept output_range =
    range<R> && output_iterator<iterator_t<R>, T>;

template<class T>
concept input_range =
    range<T> && input_iterator<iterator_t<T>>;

template<class T>
concept forward_range =
    input_range<T> && forward_iterator<iterator_t<T>>;

template<class T>
concept bidirectional_range =
    forward_range<T> && bidirectional_iterator<iterator_t<T>>;

template<class T>
concept random_access_range =
    bidirectional_range<T> && random_access_iterator<iterator_t<T>>;

2 contiguous_range additionally requires that the ranges::data customization point object (26.3.13) is usable with the range.

template<class T>
concept contiguous_range =
    random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
    requires(T& t) { { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>; };

§ 26.4.5 1121
Given an expression t such that decltype((t)) is T&, T models contiguous_range only if to_address(ranges::begin(t)) == ranges::data(t) is true.

The common_range concept specifies requirements of a range type for which ranges::begin and ranges::end return objects of the same type.

[Example 1: The standard containers (Clause 24) model common_range. — end example]

```cpp
template<class T>
    concept common_range =
        range<T> && same_as<iterator_t<T>, sentinel_t<T>>;
```

5 For a type R, is-initializer-list<R> is true if and only if remove_cvref_t<R> is a specialization of initializer_list.

6 The viewable_range concept specifies the requirements of a range type that can be converted to a view safely.

```cpp
template<class T>
    concept viewable_range =
        range<T> &&
            (!view<remove_cvref_t<T>> ||
            (is_lvalue_reference_v<T> ||
             movable<remove_reference_t<T>> &&
             !is-initializer-list<T>));
```

7 The constant_range concept specifies the requirements of a range type whose elements are not modifiable.

```cpp
template<class T>
    concept constant_range =
        input_range<T> &&
            constant_iterator<iterator_t<T>>;
```

26.5 Range utilities

26.5.1 General

The components in 26.5 are general utilities for representing and manipulating ranges.

26.5.2 Helper concepts

Many of the types in subclause 26.5 are specified in terms of the following exposition-only concepts:

```cpp
template<class R>
    concept simple-view =
        view<R> && range<const R> &&
            same_as<iterator_t<R>, const iterator_t<R>> &&
            same_as<sentinel_t<R>, const sentinel_t<R>>;
```

```cpp
template<class I>
    concept has-arrow =
        input_iterator<I> && (is_pointer_v<I> ||
            requires(I i) { i.operator->(); });
```

```cpp
template<class T, class U>
    concept different-from =
        !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;
```

26.5.3 View interface

The class template view_interface is a helper for defining view-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```cpp
namespace std::ranges {
    template<class D>
        requires is_class_v<D> && same_as<D, remove_cv_t<D>>
    class view_interface {
        private:
            constexpr D& derived() noexcept {
```

§ 26.5.3.1
```cpp
    return static_cast<D&>(*this);
}
constexpr const D& derived() const noexcept {
    // exposition only
    return static_cast<const D&>(*this);
}

public:
constexpr bool empty() requires sized_range<D> || forward_range<D> {
    if constexpr (sized_range<D>)
        return ranges::size(derived()) == 0;
    else
        return ranges::begin(derived()) == ranges::end(derived());
}
constexpr bool empty() const requires sized_range<const D> || forward_range<const D> {
    if constexpr (sized_range<const D>)
        return ranges::size(derived()) == 0;
    else
        return ranges::begin(derived()) == ranges::end(derived());
}
constexpr auto cbegin() {
    return ranges::cbegin(derived());
}
constexpr auto cbegin() const requires range<const D> {
    return ranges::cbegin(derived());
}
constexpr auto cend() {
    return ranges::cend(derived());
}
constexpr auto cend() const requires range<const D> && contiguous_iterator<iterator_t<const D>> {
    return to_address(ranges::begin(derived()));
}
constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
    return to_address(ranges::begin(derived()));
}
constexpr auto data() const requires range<const D> && contiguous_iterator<iterator_t<const D>> {
    return to_address(ranges::begin(derived()));
}
constexpr auto size() requires forward_range<D> &&
    sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
    return ranges::end(derived()) - ranges::begin(derived());
}
constexpr auto size() const requires forward_range<const D> &&
    sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
    return ranges::end(derived()) - ranges::begin(derived());
}
constexpr decltype(auto) front() requires forward_range<D>;  
constexpr decltype(auto) front() const requires forward_range<const D>;
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
```
constexpr decltype(auto) back() const
  requires bidirectional_range<const D> && common_range<const D>;

template<random_access_range R = D>
constexpr decltype(auto) operator[](range_difference_t<R> n) {
  return ranges::begin(derived())[n];
}
template<random_access_range R = const D>
constexpr decltype(auto) operator[](range_difference_t<R> n) const {
  return ranges::begin(derived())[n];
};

The template parameter D for view_interface may be an incomplete type. Before any member of the resulting specialization of view_interface other than special member functions is referenced, D shall be complete, and model both derived_from<view_interface<D>> and view.

26.5.3.2 Members [view.interface.members]

constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;

Preconditions: !empty() is true.

Effects: Equivalent to: return *ranges::begin(derived());

constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
  requires bidirectional_range<const D> && common_range<const D>;

Preconditions: !empty() is true.

Effects: Equivalent to: return *ranges::prev(ranges::end(derived()));

26.5.4 Sub-ranges [range.subrange]

26.5.4.1 General [range.subrange.general]

The subrange class template combines together an iterator and a sentinel into a single object that models the view concept. Additionally, it models the sized_range concept when the final template parameter is subrange_kind::sized.

namespace std::ranges {
  template<class From, class To>
  concept uses-nonqualification-pointer-conversion =
    // exposition only
    is_pointer_v<From> && is_pointer_v<To> &&
    !convertible_to<remove_pointer_t<From>(*)[], remove_pointer_t<To>(*)[]>;

  template<class From, class To>
  concept convertible-to-non-slicing =
    // exposition only
    convertible_to<From, To> &&
    !uses-nonqualification-pointer-conversion<decay_t<From>, decay_t<To>>;

  template<class T, class U, class V>
  concept pair-like-convertible-from =
    // exposition only
    !range<T> && !is_reference_v<T> &&
    pair-like<T> &&
    constructible_from<T, U, V> &&
    convertible-to-non-slicing<U, tuple_element_t<0, T>, T> &&
    convertible_to<V, tuple_element_t<1, T>>;

  template<input_or_output_iterator I, sentinel_for<I> S = I, subrange_kind K =
    sized_sentinel_for<S, I> ? subrange_kind::sized : subrange_kind::unsized>
    requires (K == subrange_kind::sized || !sized_sentinel_for<S, I>)
    class subrange : public view_interface<subrange<I, S, K>> {
    private:
      static constexpr bool StoreSize =
        // exposition only
        K == subrange_kind::sized && !sized_sentinel_for<S, I>;
    }

```cpp
I begin_ = I(); // exposition only
S end_ = S(); // exposition only
make-unsigned-like-t<iter_difference_t<I>> size_ = 0; // exposition only; present only
// when StoreSize is true

public:
subrange() requires default_initializable<I> = default;

constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);

constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
make-unsigned-like-t<iter_difference_t<I>> n)
requires (K == subrange_kind::sized);

template<different-from<subrange> R>
requires borrowed_range<R> & &
    convertible-to-non-slicing<iterator_t<R>, I> & &
    convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);

template<borrowed_range R>
requires convertible-to-non-slicing<iterator_t<R>, I> & &
    convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r, make-unsigned-like-t<iter_difference_t<I>> n)
requires (K == subrange_kind::sized)
    : subrange(ranges::begin(r), ranges::end(r), n) {}

template<different-from<subrange> PairLike>
requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;

constexpr I begin() const requires copyable<I>;
[[nodiscard]] constexpr I begin() requires (!copyable<I>);

constexpr S end() const;

constexpr bool empty() const;
constexpr make-unsigned-like-t<iter_difference_t<I>> size() const
requires (K == subrange_kind::sized);

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
requires forward_iterator<I>;
[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;
[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
requires bidirectional_iterator<I>;
constexpr subrange& advance(iter_difference_t<I> n);

};

template<input_or_output_iterator I, sentinel_for<I> S>
subrange(I, S) -> subrange<I, S>;

template<input_or_output_iterator I, sentinel_for<I> S>
subrange(I, S, make-unsigned-like-t<iter_difference_t<I>>>) ->
    subrange<I, S, subrange_kind::sized>;

template<borrowed_range R>
subrange(R&&) ->
    subrange<iterator_t<R>, sentinel_t<R>,
        (sized_range<R> | sized_sentinel_for<sentinel_t<R>, iterator_t<R>>)
        ? subrange_kind::sized : subrange_kind::unsized>;

template<borrowed_range R>
subrange(R&&, make-unsigned-like-t<range_difference_t<R>>) ->
    subrange<iterator_t<R>, sentinel_t<R>, subrange_kind::sized>;
```
26.5.4.2 Constructors and conversions

```cpp
constexpr subrange(convertible-to-non-slicing<I> auto i, S s) requires (!StoreSize);
```

1. **Preconditions**: `[i, s)` is a valid range.
2. **Effects**: Initializes `begin_` with `std::move(i)` and `end_` with `s`.

```cpp
constexpr subrange(convertible-to-non-slicing<I> auto i, S s, 
make-unsigned-like<iter_difference_t<I>> n) 
requires (K == subrange_kind::sized);
```

3. **Preconditions**: `[i, s)` is a valid range, and `n == to-unsigned-like(ranges::distance(i, s))` is true.
4. **Effects**: Initializes `begin_` with `std::move(i)` and `end_` with `s`. If `StoreSize` is true, initializes `size_` with `n`.

[Note 1: Accepting the length of the range and storing it to later return from `size()` enables `subrange` to model `sized_range` even when it stores an iterator and sentinel that do not model `sized_sentinel_for`. — end note]

```cpp
template<different-from<subrange> R> 
requires borrowed_range<R> && 
convertible-to-non-slicing<iterator_t<R>, I> && 
convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires (!StoreSize || sized_range<R>);
```

6. **Effects**: Equivalent to:

- If `StoreSize` is true, `subrange(r, static_cast<decltype(size_>>(ranges::size(r))))`.
- Otherwise, `subrange(ranges::begin(r), ranges::end(r))`.

```cpp
template<different-from<subrange> PairLike> 
requires pair-like-convertible-from<PairLike, const I&, const S&>
constexpr operator PairLike() const;
```

7. **Effects**: Equivalent to: `return PairLike(begin_, end_);`

26.5.4.3 Accessors

```cpp
constexpr I begin() const requires copyable<I>;
```

1. **Effects**: Equivalent to: `return begin_;
[ nodiscard ] constexpr I begin() requires (!copyable<I>);
2. **Effects**: Equivalent to: `return std::move(begin_);
constexpr S end() const;
3. **Effects**: Equivalent to: `return end_;
constexpr bool empty() const;
4. **Effects**: Equivalent to: `return begin_ == end_;
constexpr make-unsigned-like<iter_difference_t<I>> size() const 
requires (K == subrange_kind::sized);
5. **Effects**:

- If `StoreSize` is true, equivalent to: `return size_;
- Otherwise, equivalent to: `return to-unsigned-like(end_ - begin_);
[ nodiscard ] constexpr subrange next(iter_difference_t<I> n = 1) const & 
requires forward_iterator<I>;
6. **Effects**: Equivalent to:

```cpp
auto tmp = *this;
tmp.advance(n);
return tmp;
```
EFFECTS: Equivalent to:
auto tmp = *this;
tmp.advance(-n);
return tmp;

constexpr subrange& advance(iter_difference_t<I> n);

EFFECTS: Equivalent to:
if constexpr (bidirectional_iterator<I>) {
    if (n < 0) {
        ranges::advance(begin_, n);
        if constexpr (StoreSize)
            size_ += to_unsigned_like(-n);
        return *this;
    }
}
auto d = n - ranges::advance(begin_, n, end_);
if constexpr (StoreSize)
    size_ -= to_unsigned_like(d);
return *this;

template<size_t N, class I, class S, subrange_kind K>
requires ((N == 0 && copyable<I>) || N == 1)
constexpr auto get(const subrange<I, S, K>& r);

template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);

EFFECTS: Equivalent to:
if constexpr (N == 0)
    return r.begin();
else
    return r.end();

26.5.5 Dangling iterator handling

The tag type dangling is used together with the template aliases borrowed_iterator_t and borrowed_subrange_t. When an algorithm that typically returns an iterator into, or a subrange of, a range argument is called with an rvalue range argument that does not model borrowed_range (26.4.2), the return value possibly refers to a range whose lifetime has ended. In such cases, the tag type dangling is returned instead of an iterator or subrange.

namespace std::ranges {
struct dangling {
    constexpr dangling() noexcept = default;
    constexpr dangling(auto&&...) noexcept {}  
};
}

[EXAMPLE 1:
vector<int> f();
auto result1 = ranges::find(f(), 42);  // #1
static_assert(same_as<decltype(result1), ranges::dangling>);
auto vec = f();
auto result2 = ranges::find(vec, 42);  // #2
static_assert(same_as<decltype(result2), vector<int>::iterator>);
auto result3 = ranges::find(ranges::subrange(vec), 42);  // #3
static_assert(same_as<decltype(result3), vector<int>::iterator>);

The call to ranges::find at #1 returns ranges::dangling since f() is an rvalue vector; it is possible for the vector to be destroyed before a returned iterator is dereferenced. However, the calls at #2 and #3 both return iterators since the lvalue vec and specializations of subrange model borrowed_range. — end example

For a type R that models range:

(3.1) — if R models borrowed_range, then borrowed_iterator_t<R> denotes iterator_t<R>, and borrowed_subrange_t<R> denotes subrange<iterator_t<R>>;  
(3.2) — otherwise, both borrowed_iterator_t<R> and borrowed_subrange_t<R> denote dangling.

### 26.5.6 Class template elements_of

Specializations of elements_of encapsulate a range and act as a tag in overload sets to disambiguate when a range should be treated as a sequence rather than a single value.

**Example 1:**
```cpp
template<bool YieldElements>
generator<any> f(ranges::input_range auto&& r) {
    if constexpr (YieldElements)
        co_yield ranges::elements_of(r);  // yield each element of r
    else
        co_yield r;  // yield r as a single value
}
```

—end example]

namespace std::ranges {
    template<range R, class Allocator = allocator<byte>>
    struct elements_of {
        [[no_unique_address]] R range;
        [[no_unique_address]] Allocator allocator = Allocator();
    };

    template<class R, class Allocator = allocator<byte>>
    elements_of(R&&, Allocator = Allocator()) -> elements_of<R&&, Allocator>;
}

### 26.5.7 Range conversions

#### 26.5.7.1 General

The range conversion functions construct an object (usually a container) from a range, by using a constructor taking a range, a from_range_t tagged constructor, or a constructor taking a pair of iterators, or by inserting each element of the range into the default-constructed object.

ranges::to is applied recursively, allowing the conversion of a range of ranges.

**Example 1:**
```cpp
string_view str = "the quick brown fox";
auto words = views::split(str, ' ') | to<vector<string>>();  // words is vector<string>{"the", "quick", "brown", "fox"}
```

—end example]

Let reservable-container be defined as follows:
```cpp
template<class Container>
constexpr bool reservable-container =  // exposition only
    sized_range<Container> &&
    requires(Container&& c, range_size_t<Container> n) {
        c.reserve(n);
        { c.capacity() } -> same_as<decltype(n)>;
        { c.max_size() } -> same_as<decltype(n)>;
    };
```

Let container-insertable be defined as follows:
template<
    class Container,
    class Ref
>
constexpr bool
container-insertable = // exposition only
    requires(Container& c, Ref&& ref) {
    requires(requires { c.push_back(std::forward<Ref>(ref)); } ||
        requires { c.insert(c.end(), std::forward<Ref>(ref)); });
};

Let \textit{container-inserter} be defined as follows:

```cpp
template<class Ref, class Container>
constexpr auto
container-inserter(Container& c) {
    // exposition only
    if constexpr (requires { c.push_back(declval<Ref>()); })
        return back_inserter(c);
    else
        return inserter(c, c.end());
}
```

§ 26.5.7.2 \texttt{ranges::to} [range.utility.conv.to]

```cpp
template<class C, input_range R, class... Args>
requires (!view<C>)
constexpr C
to(R&& r, Args&&... args);
```

\textbf{Returns:} An object of type \textit{C} constructed from the elements of \textit{r} in the following manner:

\begin{enumerate}
\item \textbf{(1.1)}
\begin{enumerate}
\item \textbf{(1.1.1)}
\begin{enumerate}
\item If convertible_to<\textit{range_reference_t}<\textit{R}>, \textit{range_value_t}<\textit{C}> is true:
\item If constructible_from<\textit{C}, \textit{R}, Args...> is true:
\textit{C}(std::forward<\textit{R}>(\textit{r}), std::forward<Args>(\textit{args})...)
\end{enumerate}
\item Otherwise, if constructible_from<\textit{C}, from_range_t, \textit{R}, Args...> is true:
\textit{C}(from_range, std::forward<\textit{R}>(\textit{r}), std::forward<Args>(\textit{args})...)
\end{enumerate}
\item Otherwise, if
\begin{enumerate}
\item common_range<\textit{R}> is true,
\item \textit{cpp17-input-iterator}<\textit{iterator_t}<\textit{R}>> is true, and
\item constructible_from<\textit{C}, iterator_t<\textit{R}>, sentinel_t<\textit{R}>, Args...> is true:
\textit{C}(ranges::begin(\textit{r}), ranges::end(\textit{r}), std::forward<Args>(\textit{args})...)
\end{enumerate}
\item Otherwise, if
\begin{enumerate}
\item constructible_from<\textit{C}, Args...> is true, and
\item container-insertable<\textit{C}, range_reference_t<\textit{R}> is true:
\begin{enumerate}
\item \textit{C}(std::forward<Args>(\textit{args})...);
\item \textit{c}.reserve((sized_range<\textit{R} \&\& reservable-container<\textit{C}>)
\textit{c}.reserve(ranges::size(\textit{r}));
\item \textit{ranges}::copy(\textit{r}, container-inserter<range_reference_t<\textit{R}>>(\textit{c}));
\end{enumerate}
\item Otherwise, if input_range<range_reference_t<\textit{R}> is true:
\begin{enumerate}
\item to<\textit{C}>(\textit{r} \mid views::transform([](auto\&\ elem) {
\begin{enumerate}
\item\ return to<range_value_t<\textit{C}>>(std::forward<decltype(\textit{elem}))(\textit{elem});
\end{enumerate}
}), std::forward<Args>(\textit{args})...));
\item Otherwise, the program is ill-formed.
\end{enumerate}
\end{enumerate}
\end{enumerate}
\end{enumerate}
```

Let \textit{input-iterator} be an exposition-only type:

```cpp
struct input-iterator {
    // exposition only
    using iterator_category = input_iterator_tag;
    using value_type = range_value_t<\textit{R}>;
    using difference_type = ptrdiff_t;
    using pointer = add_pointer_t<range_reference_t<\textit{R}>>
    using reference = range_reference_t<\textit{R}>;
    reference operator*() const;
    pointer operator->() const;
```

\section*{§ 26.5.7.2}
input_iterator& operator++();
input_iterator operator++(int);
bool operator==(const input_iterator&) const;
}

[Note 1: input_iterator meets the syntactic requirements of Cpp17InputIterator. —end note]

Let \texttt{DEDUCE_EXPR} be defined as follows:

\begin{align}
(3.1) & \quad \text{C(\text{declval}<\text{R}>(), \text{declval}<\text{Args}>\ldots) if that is a valid expression,} \\
(3.2) & \quad \text{otherwise, C(\text{from_range}, \text{declval}<\text{R}>(), \text{declval}<\text{Args}>\ldots) if that is a valid expression,} \\
(3.3) & \quad \text{otherwise, C(\text{declval}<\text{input_iterator}>(), \text{declval}<\text{input_iterator}>(), \text{declval}<\text{Args}>\ldots) if that is a valid expression,} \\
(3.4) & \quad \text{otherwise, the program is ill-formed.}
\end{align}

\textbf{Returns:} \texttt{to<typename(DEDUCE_EXPR)>(std::forward<R>(r), std::forward<Args>(args)\ldots)}.

26.5.7.3 \textbf{ranges::to [range.utility.conv.adaptors]}

\begin{align}
\text{template<class C, class... Args> requires (!view<C>)} \\
\text{constexpr auto to(Args&&... args);} \\
\text{template<template<class...> class C, class... Args>} \\
\text{constexpr auto to(Args&&... args);} \\
\end{align}

\textbf{Returns:} A range adaptor closure object (26.7.2) \texttt{f} that is a perfect forwarding call wrapper (22.10.4) with the following properties:

\begin{enumerate}
\item It has no target object.
\item Its bound argument entities \texttt{bound_args} consist of objects of types \texttt{decay_t<Args>\ldots} direct-
\item Its call pattern is \texttt{to<C>(r, bound_args\ldots)}, where \texttt{r} is the argument used in a function call expression of \texttt{f}.
\end{enumerate}

26.6 \textbf{Range factories [range.factories]}

26.6.1 \textbf{General [range.factories.general]}

Subclause 26.6 defines \textit{range factories}, which are utilities to create a \textit{view}.

26.6.2 \textbf{Empty view [range.empty]}

26.6.2.1 \textbf{Overview [range.empty.overview]}

\texttt{empty_view} produces a \textit{view} of no elements of a particular type.

[Example 1:
\begin{verbatim}
auto e = views::empty<int>;
static_assert(e.empty());
static_assert(0 == e.size());
\end{verbatim}
—end example]

26.6.2.2 \textbf{Class template \texttt{empty_view} [range.empty.view]}

\begin{verbatim}
namespace std::ranges {
\text{template<class T>
\text{requires is_object_v<T>}
\text{class empty_view : public view_interface<empty_view<T>> { }
public:

26.6.3 Single view
26.6.3.1 Overview

single_view produces a view that contains exactly one element of a specified value.

The name views::single denotes a customization point object (16.3.3.3.6). Given a subexpression E, the expression views::single(E) is expression-equivalent to single_view<decay_t<decltype((E))>>(E).

[Example 1:
for (int i : views::single(4))
    cout << i;  // prints 4
— end example]

26.6.3.2 Class template single_view

namespace std::ranges {
    template<move_constructible T>
    requires is_object_v<T>
    class single_view : public view_interface<single_view<T>> {
        private:
            movable-box<T> value_;  // exposition only (see 26.7.3)

        public:
            single_view() requires default_initializable<T> = default;
            constexpr explicit single_view(const T& t) requires copy_constructible<T>;
            constexpr explicit single_view(T&& t);
            template<class... Args>
                requires constructible_from<T, Args...>
                constexpr explicit single_view(in_place_t, Args&&... args);

            constexpr T* begin() noexcept;
            constexpr const T* begin() const noexcept;
            constexpr T* end() noexcept;
            constexpr const T* end() const noexcept;
            static constexpr size_t size() noexcept;
            constexpr T* data() noexcept;
            constexpr const T* data() const noexcept;
    };

    template<class T>
    single_view(T) -> single_view<T>;
}

constexpr explicit single_view(const T& t) requires copy_constructible<T>;

Effects: Initializes value_ with t.

constexpr explicit single_view(T&& t);

Effects: Initializes value_ with std::move(t).

template<class... Args>
    requires constructible_from<T, Args...>
    constexpr explicit single_view(in_place_t, Args&&... args);

Effects: Initializes value_ as if by value_{in_place, std::forward<Args>(args)...}.

constexpr T* begin() noexcept;
constexpr const T* begin() const noexcept;

Effects: Equivalent to: return data();

constexpr T* end() noexcept;
constexpr const T* end() const noexcept;

Effects: Equivalent to: return data() + 1;

static constexpr size_t size() noexcept;

Effects: Equivalent to: return 1;
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

**Effects:** Equivalent to: \(\text{return value\_.operator\-\rightarrow()\};\)

### § 26.6.4 Iota view

#### § 26.6.4.1 Overview

`iota_view` generates a sequence of elements by repeatedly incrementing an initial value.

The name `views::iota` denotes a customization point object (16.3.3.3.6). Given subexpressions \(E\) and \(F\), the expressions `views::iota(E)` and `views::iota(E, F)` are expression-equivalent to `iota_view(E)` and `iota_view(E, F)`, respectively.

**Example 1:**

```cpp
for (int i : views::iota(1, 10))
    cout << i << ' '; // prints 1 2 3 4 5 6 7 8 9
```

—end example—

#### § 26.6.4.2 Class template `iota_view`

```cpp
namespace std::ranges {

    template<class I>
    concept decrementable = see below; // exposition only

    template<class I>
    concept advanceable = see below; // exposition only

    template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
    class iota_view : public view_interface<iota_view<W, Bound>> {
        private:
            // 26.6.4.3, class iota_view::iterator
            struct iterator; // exposition only

            // 26.6.4.4, class iota_view::sentinel
            struct sentinel; // exposition only

        W value_ = W(); // exposition only
        Bound bound_ = Bound(); // exposition only

        public:
            iota_view() requires default_initializable<W> = default;
            constexpr explicit iota_view(W value);
            constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
            constexpr iota_view(iterator first, see below last);

            constexpr iterator begin() const;
            constexpr auto end() const requires same_as<W, Bound>;

            constexpr auto size() const requires see below;
        };

    template<class W, class Bound>
    requires (!is-integer-like<W> || !is-integer-like<Bound> ||
               (is-signed-integer-like<W> == is-signed-integer-like<Bound>))
    iota_view(W, Bound) -> iota_view<W, Bound>;
}
```

Let \(IOTA\text{-DIFF-T}(W)\) be defined as follows:

1. If \(W\) is not an integral type, or if it is an integral type and `sizeof(iter_difference_t<\!W>)` is greater than `sizeof(W)`, then \(IOTA\text{-DIFF-T}(W)\) denotes `iter_difference_t<\!W>`.  
2. Otherwise, \(IOTA\text{-DIFF-T}(W)\) is a signed integer type of width greater than the width of \(W\) if such a type exists.
(1.3) Otherwise, IOTA-DIFF-T(w) is an unspecified signed-integer-like type (25.3.4.4) of width not less than the width of W.

[Note 1: It is unspecified whether this type satisfies weakly_incrementable. — end note]

The exposition-only decrementable concept is equivalent to:

```cpp
template<class I>
concept decrementable = // exposition only
    incrementable<I> && requires(I i) {
    { --i } -> same_as<I&>;
    { i-- } -> same_as<I>;
    };
```

When an object is in the domain of both pre- and post-decrement, the object is said to be decrementable.

Let a and b be equal objects of type I. I models decrementable only if

(4.1) If a and b are decrementable, then the following are all true:

(4.1.1) addressof(--a) == addressof(a)
(4.1.2) bool(a-- == b)
(4.1.3) bool(((void)a--, a) == --b)
(4.1.4) bool(;++(--a) == b).

The exposition-only advanceable concept is equivalent to:

```cpp
template<class I>
concept advanceable = // exposition only
    decrementable<I> && totally_ordered<I> && requires(I i, const I j, const IOTA-DIFF-T(I) n) {
    { i += n } -> same_as<I&>;
    { i -= n } -> same_as<I&>;
    I(j + n);
    I(n + j);
    I(j - n);
    { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
    };
```

Let D be IOTA-DIFF-T(I). Let a and b be objects of type I such that b is reachable from a after n applications of ++a, for some value n of type D. I models advanceable only if

(5.1) (a += n) is equal to b.
(5.2) addressof(a += n) is equal to addressof(a).
(5.3) I(a + n) is equal to (a += n).
(5.4) For any two positive values x and y of type D, if I(a + D(x + y)) is well-defined, then I(a + D(x + y)) is equal to I(I(a + x) + y).
(5.5) I(a + D(0)) is equal to a.
(5.6) If I(a + D(n - 1)) is well-defined, then I(a + n) is equal to \[I(I(c) \{ return ++c; \}(I(a + D(n - 1)))).
(5.7) (b += -n) is equal to a.
(5.8) (b -= n) is equal to a.
(5.9) addressof(b -= n) is equal to addressof(b).
(5.10) I(b - n) is equal to (b -= n).
(5.11) D(b - a) is equal to n.
(5.12) D(a - b) is equal to D(-n).
(5.13) bool(a <= b) is true.

constexpr explicit iota_view(W value);

Preconditions: Bound denotes unreachable_sentinel_t or Bound() is reachable from value.

§ 26.6.4.2
Effects: Initializes value_ with value.

```cpp
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
```

Preconditions: Bound denotes unreachable_sentinel_t or bound is reachable from value. When W and Bound model totally_ordered_with, then bool(value <= bound) is true.

Effects: Initializes value_ with value and bound_ with bound.

```cpp
constexpr iota_view(iterator first, see below last);
```

Effects: Equivalent to:

- If same_as<W, Bound> is true, iota_view(first.value_, last.value_).
- Otherwise, if Bound denotes unreachable_sentinel_t, iota_view(first.value_, last).
- Otherwise, iota_view(first.value_, last.bound_).

Remarks: The type of last is:

- If same_as<W, Bound> is true, iterator.
- Otherwise, if Bound denotes unreachable_sentinel_t, Bound.
- Otherwise, sentinel.

```cpp
constexpr iterator begin() const;
```

Effects: Equivalent to:

```cpp
return iterator{value_};
```

```cpp
constexpr auto end() const;
```

Effects: Equivalent to:

```cpp
if constexpr (same_as<Bound, unreachable_sentinel_t>)
    return unreachable_sentinel;
else
    return sentinel{bound_};
```

```cpp
constexpr iterator end() const requires same_as<W, Bound>;
```

Effects: Equivalent to:

```cpp
return iterator{bound_};
```

```cpp
constexpr auto size() const requires see below;
```

Effects: Equivalent to:

```cpp
if constexpr (
    is-integer-like<W> && is-integer-like<Bound>)
    return (value_ < 0)?
        ((bound_ < 0)?
            to-unsigned-like(-value_) - to-unsigned-like(-bound_)
        : to-unsigned-like(bound_)) + to-unsigned-like(-value_))
    : to-unsigned-like(bound_) - to-unsigned-like(value_);
else
    return to-unsigned-like(bound_ - value_);
```

Remarks: The expression in the requires-clause is equivalent to:

```cpp
to-unsigned-like(bound_ - value_);
```

26.6.4.3 Class iota_view::iterator

```cpp
namespace std::ranges {
    template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
    struct iota_view<W, Bound>::iterator {
        private:
            W value_ = W(); // exposition only
        public:
            using iterator_concept = see below;
            using iterator_category = input_iterator_tag; // present only if W models incrementable and
            // IOTA-DIFF-T(W) is an integral type
            using value_type = W;
```
using difference_type = IOTA-DIFF-T(W);

iterator() requires default_initializable<W> = default;
constexpr explicit iterator(W value);

constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires incrementable<W>;
constexpr iterator& operator--() requires decrementable<W>;
constexpr iterator operator--(int) requires decrementable<W>;

constexpr iterator& operator+=(difference_type n) requires advanceable<W>;
constexpr iterator& operator-=(difference_type n) requires advanceable<W>;
constexpr W operator[](difference_type n) const requires advanceable<W>;

friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires totally_ordered<W> && three_way_comparable<W>;
friend constexpr iterator operator+(iterator i, difference_type n) requires advanceable<W>;
friend constexpr iterator operator+(difference_type n, iterator i) requires advanceable<W>;
friend constexpr iterator operator-(iterator i, difference_type n) requires advanceable<W>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires advanceable<W>;

1 iterator::iterator_concept is defined as follows:
(1.1) If W models advanceable, then iterator_concept is random_access_iterator_tag.
(1.2) Otherwise, if W models decrementable, then iterator_concept is bidirectional_iterator_tag.
(1.3) Otherwise, if W models incrementable, then iterator_concept is forward_iterator_tag.
(1.4) Otherwise, iterator_concept is input_iterator_tag.

2 [Note 1: Overloads for iter_move and iter_swap are omitted intentionally. — end note]

constexpr explicit iterator( W value);

constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

3 Effects: Initializes value_with value.

4 Effects: Equivalent to: return value;

5 [Note 2: The noexcept clause is needed by the default iter_move implementation. — end note]
constexpr iterator operator++();

**Effects:** Equivalent to:
   
   ++value_
   
   return *this;

constexpr void operator++(int);

**Effects:** Equivalent to ++*this.

constexpr iterator operator++(int) requires incrementable<W>;

**Effects:** Equivalent to:
   
   auto tmp = *this;
   
   return tmp;

constexpr iterator operator--() requires decrementable<W>;

**Effects:** Equivalent to:
   
   value_ --
   
   return *this;

constexpr iterator operator--(int) requires decrementable<W>;

**Effects:** Equivalent to:
   
   auto tmp = *this;
   
   return tmp;

**Effects:** Equivalent to:
   
   if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
       if (n >= difference_type(0))
           value_ += static_cast<W>(n);
       else
           value_ -= static_cast<W>(-n);
   } else {
       value_ += n;
   }
   
   return *this;

constexpr iterator operator-=(difference_type n) requires advanceable<W>;

**Effects:** Equivalent to:
   
   if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
       if (n >= difference_type(0))
           value_ -= static_cast<W>(n);
       else
           value_ += static_cast<W>(-n);
   } else {
       value_ -= n;
   }
   
   return *this;

constexpr W operator[](difference_type n) const

**Effects:** Equivalent to: return W(value_ + n);

friend constexpr bool operator==(const iterator& x, const iterator& y)

**Effects:** Equivalent to: return x.value_ == y.value_;
friend constexpr bool operator<(const iterator& x, const iterator& y) requires totally_ordered<W>;
   Effects: Equivalent to: return x.value_ < y.value_; 
friend constexpr bool operator>(const iterator& x, const iterator& y) requires totally_ordered<W>;
   Effects: Equivalent to: return y < x; 
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires totally_ordered<W>;
   Effects: Equivalent to: return !(y < x); 
friend constexpr bool operator>=(const iterator& x, const iterator& y) requires totally_ordered<W>;
   Effects: Equivalent to: return !(x < y); 
friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires totally_ordered<W> && three_way_comparable<W>;
   Effects: Equivalent to: return x.value_ <=> y.value_; 
friend constexpr iterator operator+(iterator i, difference_type n) requires advanceable<W>;
   Effects: Equivalent to: 
   i += n; 
   return i; 
friend constexpr iterator operator+(difference_type n, iterator i) requires advanceable<W>;
   Effects: Equivalent to: return i + n; 
friend constexpr iterator operator-(iterator i, difference_type n) requires advanceable<W>;
   Effects: Equivalent to: 
   i -= n; 
   return i; 
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires advanceable<W>;
   Effects: Equivalent to: 
   using D = difference_type;
   if constexpr (is-integer-like<W>) {
      if constexpr (is-signed-integer-like<W>)
         return D(D(x.value_) - D(y.value_));
      else
         return (y.value_ > x.value_)
            ? D(-D(y.value_ - x.value_))
            : D(x.value_ - y.value_);
   } else {
      return x.value_ - y.value_;
   }

26.6.4.4 Class iota_view::sentinel

namespace std::ranges { 
   template<weakly_incrementable W, semiregular Bound> 
   requires weakly-equality-comparable-with<W, Bound> && copyable<W> 
   struct iota_view<W, Bound>::::sentinel {
      private:
         Bound bound_ = Bound(); // exposition only
      public:
         sentinel() = default;
   }

§ 26.6.4.4
constexpr explicit sentinel(Bound bound);

friend constexpr bool operator==(const iterator& x, const sentinel& y);

friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
requires sized_sentinel_for<Bound, W>;
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
requires sized_sentinel_for<Bound, W>;
};

constexpr explicit sentinel(Bound bound);

Effects: Initializes bound_ with bound.

friend constexpr bool operator==(const iterator& x, const sentinel& y);

Effects: Equivalent to: return x.value_ == y.bound_.

friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
requires sized_sentinel_for<Bound, W>;
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
requires sized_sentinel_for<Bound, W>;

Effects: Equivalent to: return -(y - x);

26.6.5 Repeat view

26.6.5.1 Overview

repeat_view generates a sequence of elements by repeatedly producing the same value.

The name views::repeat denotes a customization point object (16.3.3.3.6). Given subexpressions E and F, the expressions views::repeat(E) and views::repeat(E, F) are expression-equivalent to repeat_view(E) and repeat_view(E, F), respectively.

[Example 1:
  for (int i : views::repeat(17, 4))
    cout << i << ' ';
  // prints 17 17 17 17
  —end example]

26.6.5.2 Class template repeat_view

namespace std::ranges {
template<move_constructible W, semiregular Bound = unreachable_sentinel_t>
requires (is_object_v<W> && same_as<W, remove_cv_t<W>> &&
  (is-integer-like<Bound> || same_as<Bound, unreachable_sentinel_t>))
class repeat_view : public view_interface<repeat_view<W, Bound>> {
private:
  // 26.6.5.3, class repeat_view::iterator
  struct iterator;
  // exposition only

  movable-box<W> value_ = W();
  // exposition only, see 26.7.3
  Bound bound_ = Bound();
  // exposition only

public:
  repeat_view() requires default_initializable<W> = default;

  constexpr explicit repeat_view(const W& value, Bound bound = Bound())
requires copy_constructible<W>;
  constexpr explicit repeat_view(W&& value, Bound bound = Bound());
}
template<class... WArgs, class... BoundArgs>
requires constructible_from<W, WArgs...> &&
constructible_from<Bound, BoundArgs...>
constexpr explicit repeat_view(piecewise_construct_t,
tuple<WArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>());

constexpr iterator begin() const;
constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);
constexpr unreachable_sentinel_t end() const noexcept;
constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);

template<class W, class Bound>
repeat_view(W, Bound) -> repeat_view<W, Bound>;

constexpr explicit repeat_view(const W& value, Bound bound = Bound())
requires copy_constructible<W>;

Preconditions: If Bound is not unreachable_sentinel_t, bound \(\geq 0\).
Effects: Initializes \(\text{value}_\) with value and \(\text{bound}_\) with bound.

constexpr explicit repeat_view(W&& value, Bound bound = Bound());
Preconditions: If Bound is not unreachable_sentinel_t, bound \(\geq 0\).
Effects: Initializes \(\text{value}_\) with std::move(value) and \(\text{bound}_\) with bound.

template<class... WArgs, class... BoundArgs>
requires constructible_from<W, WArgs...> &&
constructible_from<Bound, BoundArgs...>
constexpr explicit repeat_view(piecewise_construct_t,
tuple<Wargs...> value_args, tuple<BoundArgs...> bound_args = tuple<>());

Effects: Initializes \(\text{value}_\) with arguments of types WArgs... obtained by forwarding the elements of value_args and initializes \(\text{bound}_\) with arguments of types BoundArgs... obtained by forwarding the elements of bound_args. (Here, forwarding an element \(x\) of type \(U\) within a tuple object means calling std::forward\(<U>(x)\).)

constexpr iterator begin() const;
Effects: Equivalent to: return iterator(addressof(*value_));

constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);
Effects: Equivalent to: return iterator(addressof(*value_), bound_);

constexpr unreachable_sentinel_t end() const noexcept;

constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);
Effects: Equivalent to: return to_unsigned-like(bound_);

26.6.5.3 Class repeat_view::iterator

namespace std::ranges {
    template<move_constructible W, semiregular Bound = unreachable_sentinel_t>

Effects: Equivalent to:
    current_ += n;
    return *this;

constexpr iterator & operator-=(difference_type n);

Preconditions: If Bound is not unreachable_sentinel_t, current_ − n ≥ 0.

Effects: Equivalent to:
    current_ -= n;
    return *this;

constexpr const W & operator[](difference_type n) const noexcept;

Effects: Equivalent to: return *(this + n);

friend constexpr bool operator==(const iterator & x, const iterator & y);

Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr auto operator<=>(const iterator & x, const iterator & y);

Effects: Equivalent to: return x.current_. <=> y.current_;

friend constexpr iterator operator+(iterator i, difference_type n);

friend constexpr iterator operator+(difference_type n, iterator i);

Effects: Equivalent to:
    i += n;
    return i;

friend constexpr iterator operator-(iterator i, difference_type n);

Effects: Equivalent to:
    i -= n;
    return i;

friend constexpr difference_type operator-(const iterator & x, const iterator & y);

Effects: Equivalent to:
    return static_cast<difference_type>(x.current_) - static_cast<difference_type>(y.current_);

26.6.6 Istream view

26.6.6.1 Overview

basic_istream_view models input_range and reads (using operator>>) successive elements from its corresponding input stream.

The name views::istream<T> denotes a customization point object (16.3.3.3.6). Given a type T and a subexpression E of type U, if U models derived_from<basic_istream<typename U::char_type, typename U::traits_type>>, then the expression views::istream<T>(E) is expression-equivalent to basic_istream_view<T, typename U::char_type, typename U::traits_type>(E); otherwise, views::istream<T>(E) is ill-formed.

[Example 1):
    auto ints = istringstream{"0 1 2 3 4"};
    ranges::copy(views::istream<int>(ints), ostream_iterator<int>{cout, "-"});
    // prints 0-1-2-3-4-
    — end example]
26.6.6.2 Class template basic_istream_view

namespace std::ranges {
  template<class Val, class CharT, class Traits>
  concept stream-extractable =
      requires(basic_istream<CharT, Traits>& is, Val& t) {
        is >> t;
      };
  
  template<movable Val, class CharT, class Traits = char_traits<CharT>>
  requires default_initializable<Val> &&
    stream-extractable<Val, CharT, Traits>
  class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
    public:
      constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);
      
      constexpr default_sentinel_t end() const noexcept;
    
    private:
      // 26.6.6.3, class basic_istream_view::iterator
      struct iterator {
        using iterator_concept = input_iterator_tag;
        using difference_type = ptrdiff_t;
        using value_type = Val;
        
        constexpr explicit iterator(basic_istream_view& parent) noexcept;
        iterator(const iterator&) = delete;
        iterator& operator=(const iterator&) = default;
        iterator& operator=(iterator&&) = default;
        iterator& operator++();
        void operator++(int);
        Val& operator*() const;
        
        friend bool operator==(const iterator& x, default_sentinel_t);
};
```
private:
    basic_istream_view* parent_; // exposition only
};

constexpr explicit iterator(basic_istream_view& parent) noexcept;
1 Effects: Initializes parent_ with addressof(parent).

iterator& operator++();
2 Effects: Equivalent to:
    *parent_->stream_ >> parent_->value;
    return *this;

void operator++(int);
3 Effects: Equivalent to **this.

Val& operator*() const;
4 Effects: Equivalent to: return parent_->value;

friend bool operator==(const iterator& x, default_sentinel_t);
5 Effects: Equivalent to: return !*x.

26.7 Range adaptors [range.adaptors]

26.7.1 General [range.adaptors.general]

1 Subclause 26.7 defines range adaptors, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

2 Range adaptors are declared in namespace std::ranges::views.

3 The bitwise or operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

4 [Example 1]:
    vector<int> ints{0,1,2,3,4,5};
    auto even = [](int i) { return 0 == i % 2; };
    auto square = [](int i) { return i * i; };
    for (int i : ints | views::filter(even) | views::transform(square)) {
        cout << i << ' ';
    } // prints 0 4 16
    assert(ranges::equal(ints | views::filter(even), views::filter(ints, even));
— end example]

26.7.2 Range adaptor objects [range.adaptor.object]

1 A range adaptor closure object is a unary function object that accepts a range argument. For a range adaptor closure object C and an expression R such that decltype((R)) models range, the following expressions are equivalent:

   C(R)
   R | C

Given an additional range adaptor closure object D, the expression C | D produces another range adaptor closure object E. E is a perfect forwarding call wrapper (22.10.4) with the following properties:

   (1.1) — Its target object is an object d of type decay_t decltype((D)) direct-non-list-initialized with D.
   (1.2) — It has one bound argument entity, an object c of type decay_t decltype((C)) direct-non-list-initialized with C.
   (1.3) — Its call pattern is d(c(arg)), where arg is the argument used in a function call expression of E.

The expression C | D is well-formed if and only if the initializations of the state entities of E are all well-formed.

2 Given an object t of type T, where
t is a unary function object that accepts a range argument,

T models derived_from<range_adaptor_closure<T>>.

T has no other base classes of type range_adaptor_closure<U> for any other type U, and

T does not model range
	hen the implementation ensures that t is a range adaptor closure object.

The template parameter D for range_adaptor_closure may be an incomplete type. If an expression of type cv D is used as an operand to the | operator, D shall be complete and model derived_from<range_adaptor_closure<D>>. The behavior of an expression involving an object of type cv D as an operand to the | operator is undefined if overload resolution selects a program-defined operator| function.

If an expression of type cv U is used as an operand to the | operator, where U has a base class of type range_adaptor_closure<T> for some type T other than U, the behavior is undefined.

The behavior of a program that adds a specialization for range_adaptor_closure is undefined.

A range adaptor object is a customization point object (16.3.3.6) that accepts a viewable_range as its first argument and returns a view.

If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

If a range adaptor object adaptor accepts more than one argument, then let range be an expression such that decltype((range)) models viewable_range, let args... be arguments such that adaptor(range, args...) is a well-formed expression as specified in the rest of subclause 26.7, and let BoundArgs be a pack that denotes decay_t<decltype((args))>... . The expression adaptor(args...) produces a range adaptor closure object f that is a perfect forwarding call wrapper (22.10.4) with the following properties:

- Its target object is a copy of adaptor.
- Its bound argument entities bound_args consist of objects of types BoundArgs... direct-non-list-initialized with std::forward<decltype((args))>(args)..., respectively.
- Its call pattern is adaptor(r, bound_args...), where r is the argument used in a function call expression of f.

The expression adaptor(args...) is well-formed if and only if the initialization of the bound argument entities of the result, as specified above, are all well-formed.

26.7.3 Movable wrapper

Many types in this subclause are specified in terms of an exposition-only class template movable-box. movable-box<T> behaves exactly like optional<T> with the following differences:

- movable-box<T> constrains its type parameter T with move_constructible<T> && is_object_v<T>.
- The default constructor of movable-box<T> is equivalent to:
  
  constexpr movable-box() noexcept(is_nothrow_default_constructible_v<T>) requires default_initializable<T>
  : movable-box(in_place) {} 

- If copyable<T> is not modeled, the copy assignment operator is equivalent to:

  constexpr movable-box& operator=(const movable-box& that) noexcept(is_nothrow_copy_constructible_v<T>)
  requires copy_constructible<T> {
    if (this != addressof(that)) {
      if (that) emplace(*that);
      else reset();
    }
    return *this;
  }

- If movable<T> is not modeled, the move assignment operator is equivalent to:

  constexpr movable-box& operator=(movable-box&& that) noexcept(is_nothrow_move_constructible_v<T>) {
    if (this != addressof(that)) {
      if (that) emplace(std::move(*that));
      else reset();
  }
Recommended practice:

(2.1) — If copy_constructible<T> is true, movable-box<T> should store only a T if either T models copyable, or is_nothrow_move_constructible_v<T> && is_nothrow_copy_constructible_v<T> is true.

(2.2) — Otherwise, movable-box<T> should store only a T if either T models movable or is_nothrow_move_constructible_v<T> is true.

26.7.4 Non-propagating cache

Some types in subclause 26.7 are specified in terms of an exposition-only class template non-propagating-cache<T> behaves exactly like optional<T> with the following differences:

(1.1) — non-propagating-cache<T> constrains its type parameter T with is_object_v<T>.

(1.2) — The copy constructor is equivalent to:

```cpp
constexpr non-propagating-cache(const non-propagating-cache&) noexcept {}
```

(1.3) — The move constructor is equivalent to:

```cpp
constexpr non-propagating-cache(non-propagating-cache&& other) noexcept {
    other.reset();
}
```

(1.4) — The copy assignment operator is equivalent to:

```cpp
constexpr non-propagating-cache& operator=(const non-propagating-cache& other) noexcept {
    if (addressof(other) != this)
        reset();
    return *this;
}
```

(1.5) — The move assignment operator is equivalent to:

```cpp
constexpr non-propagating-cache& operator=(non-propagating-cache&& other) noexcept {
    reset();
    other.reset();
    return *this;
}
```

(1.6) — non-propagating-cache<T> has an additional member function template specified as follows:

```cpp
template<class I>
constexpr T& emplace-deref(const I& i); // exposition only
```

Mandates: The declaration T t(*i); is well-formed for some invented variable t.

[Note 1: If *i is a prvalue of type cv T, there is no requirement that it is movable (9.4.1). —end note]

Effects: Calls reset(). Then direct-non-list-initializes the contained value with *i.

Postconditions: *this contains a value.

Returns: A reference to the new contained value.

Throws: Any exception thrown by the initialization of the contained value.

Remarks: If an exception is thrown during the initialization of T, *this does not contain a value, and the previous value (if any) has been destroyed.

[Note 2: non-propagating-cache enables an input view to temporarily cache values as it is iterated over. —end note]

26.7.5 Range adaptor helpers

```cpp
namespace std::ranges {
    template<
        class F, class Tuple>
    constexpr auto tuple-transform(F&& f, Tuple&& t) { // exposition only
        return apply([&]<class... Ts>(Ts&&... elements) {
            return tuple<invoke_result_t<F&, Ts>...>(invoke(f, std::forward<Ts>(elements))...);
        }, std::forward<Tuple>(t));
    }
```
template<class F, class Tuple>
constexpr void
tuple-for-each(F&& f, Tuple&& t) { // exposition only
    apply(std::invoke(f, std::forward<Tuple>(t)), ...);
}

26.7.6 All view

26.7.6.1 General

1 views::all returns a view that includes all elements of its range argument.

2 The name views::all denotes a range adaptor object (26.7.2). Given a subexpression E, the expression views::all(E) is expression-equivalent to:

(2.1) — decay-copy(E) if the decayed type of E models view.
(2.2) — Otherwise, ref_view(E) if that expression is well-formed.
(2.3) — Otherwise, owning_view(E).

26.7.6.2 Class template ref_view

1 ref_view is a view of the elements of some other range.

namespace std::ranges {
    template<range R>
    requires is_object_v<R>
    class ref_view : public view_interface<ref_view<R>> {
        private:
        R* r_; // exposition only
        public:
        template<different-from<ref_view> T>
        requires see below
        constexpr ref_view(T& t);
        constexpr ref_view(T&& t) = delete;
        constexpr R& base() const { return *r_; }
        constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
        constexpr sentinel_t<R> end() const { return ranges::end(*r_); }
        constexpr bool empty() const
            requires requires { ranges::empty(*r_); }
        { return ranges::empty(*r_); }
        constexpr auto size() const
            requires requires { sized_range<R> }
        { return ranges::size(*r_); }
        constexpr auto data() const
            requires requires { contiguous_range<R> }
        { return ranges::data(*r_); }
    };

    template<class R>
    ref_view(R&) -> ref_view<R>;
}

2 template<different-from<ref_view> T>
requires see below
constexpr ref_view(T& t);

Effects: Initializes r_ with addressof(static_cast<R&>(std::forward<T>(t))).

Remarks: Let FUN denote the exposition-only functions

void FUN(R&);
void FUN(R&&) = delete;
The expression in the requires-clause is equivalent to:

```cpp
convertible_to<T, R&> && requires { FUN(declval<T>()); }
```

26.7.6.3 Class template owning_view

owning_view is a move-only view of the elements of some other range.

```cpp
namespace std::ranges {
  template<range R>
  requires movable<R> && (!is-initializer-list<R>) // see 26.4.5
  class owning_view : public view_interface<owning_view<R>> {
    private:
      R r_ = R(); // exposition only
    public:
      owning_view() requires default_initializable<R> = default;
      constexpr owning_view(R&& t);
      owning_view(owning_view&&) = default;
      owning_view& operator=(owning_view&&) = default;
      constexpr R& base() & noexcept { return r_; }
      constexpr const R& base() const & noexcept { return r_; }
      constexpr R&& base() && noexcept { return std::move(r_); }
      constexpr const R&& base() const && noexcept { return std::move(r_); }
      constexpr iterator_t<R> begin() { return ranges::begin(r_); }
      constexpr sentinel_t<R> end() { return ranges::end(r_); }
      constexpr auto begin() const requires range<const R> { return ranges::begin(r_); }
      constexpr auto end() const requires range<const R> { return ranges::end(r_); }
      constexpr bool empty() requires requires { ranges::empty(r_); } { return ranges::empty(r_); }
      constexpr bool empty() const requires requires { ranges::empty(r_); } { return ranges::empty(r_); }
      constexpr auto size() requires sized_range<R> { return ranges::size(r_); }
      constexpr auto size() const requires sized_range<const R> { return ranges::size(r_); }
      constexpr auto data() requires contiguous_range<R> { return ranges::data(r_); }
      constexpr auto data() const requires contiguous_range<const R> { return ranges::data(r_); }
  }
}
```

```cpp
constexpr owning_view(R&& t);
```

Effects: Initializes `r_` with `std::move(t)`.

26.7.7 As rvalue view

26.7.7.1 Overview

as_rvalue_view presents a view of an underlying sequence with the same behavior as the underlying sequence except that its elements are rvalues. Some generic algorithms can be called with a as_rvalue_view to replace copying with moving.

The name views::as_rvalue denotes a range adaptor object (26.7.2). Let `E` be an expression and let `T` be decltype((E)). The expression views::as_rvalue(E) is expression-equivalent to:

1. `views::all(E)` if `same_as<range_rvalue_reference_t<T>, range_reference_t<T>>` is true.
2. Otherwise, as_rvalue_view(E).
```
3  [Example 1:  
  vector<string> words = {"the", "quick", "brown", "fox", "ate", "a", "pterodactyl"};  
  vector<string> new_words;  
  ranges::copy(words | views::as_rvalue, back_inserter(new_words));  
  // moves each string from words into new_words
  —end example]

26.7.7.2 Class template as_rvalue_view

namespace std::ranges {
  template<view V>
  requires input_range<V>
  class as_rvalue_view : public view_interface<as_rvalue_view<V>> {
    V base_ = V();  // exposition only

    public:
      as_rvalue_view() requires default_initializable<V> = default;
      constexpr explicit as_rvalue_view(V base);

      constexpr V base() const & requires copy_constructible<V> { return base_; }
      constexpr V base() && { return std::move(base_); }

      constexpr auto begin() requires (!simple_view<V>) {
        if constexpr (common_range<V>) {
          return move_iterator(ranges::begin(base_));
        } else {
          return move_sentinel(ranges::end(base_));
        }
      }
      constexpr auto begin() const requires range<const V> {
        if constexpr (common_range<const V>) {
          return move_iterator(ranges::begin(base_));
        } else {
          return move_sentinel(ranges::end(base_));
        }
      }

      constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
      constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }
    }

    template<class R>
    as_rvalue_view(R&&) -> as_rvalue_view<views::all_t<R>>;
  }

  constexpr explicit as_rvalue_view(V base);

  Effects: Initializes base_ with std::move(base).
}

26.7.8 Filter view

26.7.8.1 Overview

filter_view presents a view of the elements of an underlying sequence that satisfy a predicate.

2  The name views::filter denotes a range adaptor object (26.7.2). Given subexpressions E and P, the expression views::filter(E, P) is expression-equivalent to filter_view(E, P).

3  [Example 1:  
  vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };  
  auto evens = views::filter(is, [](int i) { return 0 == i % 2; });
```
for (int i : evens)  
cout << i << ' '; // prints 0 2 4 6
—end example]  

26.7.8.2 Class template filter_view

```cpp
namespace std::ranges {
  template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
  requires view<V> && is_object_v<Pred>
  class filter_view : public view_interface<filter_view<V, Pred>> {
    private:
      V base_ = V();  // exposition only
      movable-box<Pred> pred_;  // exposition only

      // 26.7.8.3, class filter_view::iterator
      class iterator;
      // exposition only

      // 26.7.8.4, class filter_view::sentinel
      class sentinel;
      // exposition only

    public:
      filter_view() requires default_initializable<V> && default_initializable<Pred> = default;
      constexpr filter_view(V base, Pred pred);
      constexpr V base() const & requires copy_constructible<V> { return base_; }
      constexpr V base() && { return std::move(base_); }
      constexpr const Pred& pred() const;
      constexpr iterator begin();
      constexpr auto end() {
        if constexpr (common_range<V>)
          return iterator{*this, ranges::end(base_)};
        else
          return sentinel{*this};
      }
  }
}
```

```cpp
template<class R, class Pred> filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
```

```cpp
constexpr filter_view(V base, Pred pred);
```

1 **Effects:** Initializes base_ with std::move(base) and initializes pred_ with std::move(pred).

```cpp
constexpr const Pred& pred() const;
```

2 **Effects:** Equivalent to: return *pred_;

```cpp
constexpr iterator begin();
```

3 **Preconditions:** pred_.has_value() is true.

```cpp
constexpr auto end() {  
  if constexpr (common_range<V>)  
    return iterator{*this, ranges::end(base_)};
  else
    return sentinel{*this};
}
```

```
template<class R, class Pred> filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
```

```cpp
constexpr filter_view(V base, Pred pred);
```

1 **Effects:** Initializes base_ with std::move(base) and initializes pred_ with std::move(pred).

```cpp
constexpr const Pred& pred() const;
```

2 **Effects:** Equivalent to: return *pred_;

```cpp
constexpr iterator begin();
```

3 **Preconditions:** pred_.has_value() is true.

```cpp
constexpr auto end() {  
  if constexpr (common_range<V>)  
    return iterator{*this, ranges::end(base_)};
  else
    return sentinel{*this};
}
```

```
template<class R, class Pred> filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
```

1 **Effects:** Initializes base_ with std::move(base) and initializes pred_ with std::move(pred).

```cpp
constexpr const Pred& pred() const;
```

2 **Effects:** Equivalent to: return *pred_;
filter_view* parent_ = nullptr;       // exposition only

public:
    using iterator_concept = see below;
    using iterator_category = see below;   // not always present
    using value_type = range_value_t<V>;
    using difference_type = range_difference_t<V>;

    iterator() requires default_initializable<iterator_t<V>> = default;
    constexpr iterator(filter_view& parent, iterator_t<V> current);

    constexpr const iterator_t<V>& base() const & noexcept;
    constexpr iterator_t<V> base() &&;
    constexpr range_reference_t<V> operator*() const;
    constexpr iterator_t<V> operator->() const
        requires has_arrow<iterator_t<V>> && copyable<iterator_t<V>>;

    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<V>;

    constexpr iterator& operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
        requires equality_comparable<iterator_t<V>>;

    friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current_.current_)));

    friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.current_.current_, y.current_)));

};

1 Modification of the element a filter_view::iterator denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 iterator::iterator_concept is defined as follows:

(2.1) — If V models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(2.2) — Otherwise, if V models forward_range, then iterator_concept denotes forward_iterator_tag.
(2.3) — Otherwise, iterator_concept denotes input_iterator_tag.

3 The member typedef-name iterator_category is defined if and only if V models forward_range. In that case, iterator::iterator_category is defined as follows:

(3.1) — Let C denote the type iterator_traits<iterator_t<V>>::iterator_category.
(3.2) — If C models derived_from<bidirectional_iterator_tag>, then iterator_category denotes bi-directional_iterator_tag.
(3.3) — Otherwise, if C models derived_from<forward_iterator_tag>, then iterator_category denotes forward_iterator_tag.
(3.4) — Otherwise, iterator_category denotes C.

4 constexpr iterator(filter_view& parent, iterator_t<V> current);
   Effects: Initializes current_ with std::move(current) and parent_ with addressof(parent).

5 constexpr const iterator_t<V>& base() const & noexcept;
   Effects: Equivalent to: return current_;

6 constexpr iterator_t<V> base() &&;
   Effects: Equivalent to: return std::move(current_);
constexpr range_reference_t<V> operator*() const;

Effects: Equivalent to: return *current_

constexpr iterator_t<V> operator->() const

requires has_arrow<iterator_t<V>> && copyable<iterator_t<V>>;

Effects: Equivalent to: return current_

constexpr iterator& operator++();

Effects: Equivalent to:

current_ = ranges::find_if(std::move(++current_), ranges::end(parent_->base_),
    ref(*parent_->pred_));

return *this;

constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires forward_range<V>;

Effects: Equivalent to:

auto tmp = *this;

+++this;

return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;

Effects: Equivalent to:

do
  --current_;
while (!invoke(*parent_->pred_, *current_));

return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;

Effects: Equivalent to:

auto tmp = *this;

--*this;

return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)

requires equality_comparable<iterator_t<V>>;

Effects: Equivalent to:

return x.current_ == y.current_

friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)

noexcept(noexcept(ranges::iter_move(i.current_)));

Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y)

noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))

requires indirectly_swappable<iterator_t<V>>;

Effects: Equivalent to ranges::iter_swap(x.current_, y.current_).

26.7.8.4 Class filter_view::sentinel

namespace std::ranges {
    template<input_range V, indirect Unary predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
    class filter_view<V, Pred>::sentinel {
        private:
            sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

        public:
            sentinel() = default;
            constexpr explicit sentinel(filter_view& parent);

§ 26.7.8.4
constexpr sentinel_t<V> base() const;
friend constexpr bool operator==(const iterator& x, const sentinel& y);

constexpr explicit sentinel(filter_view& parent);

Effects: Initializes \texttt{end} with \texttt{ranges::end(parent.base_)}.

constexpr sentinel_t<V> base() const;

Effects: Equivalent to: return \texttt{end}.

friend constexpr bool operator==(const iterator& x, const sentinel& y);

Effects: Equivalent to: return \texttt{x.current_} \texttt{== y.end}.

## 26.7.9 Transform view

### 26.7.9.1 Overview

\texttt{transform_view} presents a view of an underlying sequence after applying a transformation function to each element.

The name \texttt{views::transform} denotes a range adaptor object (26.7.2). Given subexpressions \texttt{E} and \texttt{F}, the expression \texttt{views::transform(E, F)} is expression-equivalent to \texttt{transform_view(E, F)}.

**Example 1:**

```
vector<int> v = {0, 1, 2, 3, 4};
auto squares = views::transform(v, [](int i) { return i * i; });
for (int i : squares)
    cout << i << ' '; // prints 0 1 4 9 16
```

--- end example

### 26.7.9.2 Class template transform_view

```cpp
namespace std::ranges {
    template<input_range V, move_constructible F>
    requires view<V> && is_object_v<F> &&
    regular_invocable<F&, range_reference_t<V>> &&
    can_reference<invoke_result_t<F&, range_reference_t<V>>> class transform_view : public view_interface<transform_view<V, F>> {
        private:
            // 26.7.9.3, class template transform_view::iterator
            template<bool> struct iterator; // exposition only

            // 26.7.9.4, class template transform_view::sentinel
            template<bool> struct sentinel; // exposition only

    requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

§ 26.7.9.3
iterator::iterator_concept is defined as follows:

1. If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
2. Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
3. Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.
4. Otherwise, iterator_concept denotes input_iterator_tag.

The member typedef-name iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows: Let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.

1. If is_lvalue_reference_v<invoke_result_t<maybe-const<const, F>&, range_reference_t<Base>>> is true, then
   1.1. If C models derived_from<contiguous_iterator_tag>, iterator_category denotes random_access_iterator_tag;
   1.2. Otherwise, iterator_category denotes C.
2. Otherwise, iterator_category denotes input_iterator_tag.

constexpr iterator(Parent& parent, iterator_t<Base> current);
Effects: Initializes current_ with std::move(current) and parent_ with addressof(parent).

constexpr iterator(iterator<!Const> i) requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
Effects: Initializes current_ with std::move(i.current_) and parent_ with i.parent_.

constexpr const iterator_t<Base>& base() const & noexcept;
Effects: Equivalent to: return current_;

constexpr iterator_t<Base>& base() &&;
Effects: Equivalent to: return std::move(current_);

  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
  friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& y, const iterator<OtherConst>& x);
5 Effects: Equivalent to: return x.current_ - y.end_;

template<bool OtherConst>
  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
  friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& y, const iterator<OtherConst>& x);
6 Effects: Equivalent to: return y.end_ - x.current_;

26.7.10 Take view [range.take]
26.7.10.1 Overview [range.take.overview]
1 take_view produces a view of the first N elements from another view, or all the elements if the adapted view contains fewer than N.
The name `views::take` denotes a range adaptor object (26.7.2). Let \( E \) and \( F \) be expressions, let \( T \) be `remove_cvref_t<decltype((E))>` and let \( D \) be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::take(E, F)` is ill-formed. Otherwise, the expression `views::take(E, F)` is expression-equivalent to:

- If \( T \) is a specialization of `ranges::empty_view` (26.6.2.2), then `((void)F, decay_copy(E))`, except that the evaluations of \( E \) and \( F \) are indeterminately sequenced.

- Otherwise, if \( T \) models `random_access_range` and `sized_range` and is a specialization of `span` (24.7.3), `basic_string_view` (23.3), or `ranges::subrange` (26.5.4), then `U(ranges::begin(E), ranges::begin(E) + std::min<D>(ranges::distance(E), F))`, except that \( E \) is evaluated only once, where \( U \) is a type determined as follows:

  - if \( T \) is a specialization of `span`, then \( U \) is `span<typename T::element_type>`;
  
  - otherwise, if \( T \) is a specialization of `basic_string_view`, then \( U \) is `T`;

  - otherwise, \( T \) is a specialization of `ranges::subrange`, and \( U \) is `ranges::subrange<iterator_t<T>>`;

- Otherwise, if \( T \) is a specialization of `ranges::repeat_view` (26.6.5.2):

  - if \( T \) models `sized_range`, then
    
    `views::repeat(*E.value_, std::min<D>(ranges::distance(E), F))`
    
    except that \( E \) is evaluated only once;

  - otherwise, `views::repeat(*E.value_, static_cast<D>(F))`.

- Otherwise, `ranges::take_view(E, F)`.

[Example 1]:

```cpp
vector<int> is={0,1,2,3,4,5,6,7,8,9};
for (int i : is | views::take(5))
  cout << i << ' '; // prints 0 1 2 3 4
```

---

26.7.10.2 Class template `take_view`

```cpp
namespace std::ranges {

  template<class V>
  class take_view : public view_interface<take_view<V>> {

    private:

    V base_ = V();        // exposition only
    range_difference_t<V> count_ = 0;  // exposition only

    template<bool>
    class sentinel;

  public:

    take_view() requires default_initializable<V> = default;
    constexpr take_view(V base, range_difference_t<V> count);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr auto begin() requires (!simple_view<V>) {
      if constexpr (sized_range<V>) {

          return ranges::begin(base_);
        } else {
          auto sz = range_difference_t<V>(size());
          return counted_iterator(ranges::begin(base_), sz);
        }
      } else {

      }

    } else {

    }

```
constexpr auto begin() const requires range<const V> {
    if constexpr (sized_range<const V>) {
        if constexpr (random_access_range<const V>) {
            return ranges::begin(base_);
        } else {
            auto sz = range_difference_t<const V>(size());
            return counted_iterator(ranges::begin(base_), sz);
        }
    } else {
        return counted_iterator(ranges::begin(base_), count_);
    }
}

constexpr auto end() requires (!simple_view<V>) {
    if constexpr (sized_range<V>) {
        if constexpr (random_access_range<V>)
            return ranges::begin(base_) + range_difference_t<V>(size());
        else
            return default_sentinel;
    } else {
        return sentinel<typeof(ranges::end(base_))>;
    }
}

constexpr auto end() const requires range<const V> {
    if constexpr (sized_range<const V>) {
        if constexpr (random_access_range<const V>)
            return ranges::begin(base_) + range_difference_t<const V>(size());
        else
            return default_sentinel;
    } else {
        return sentinel<true>{ranges::end(base_)};
    }
}

constexpr auto size() requires sized_range<V> {
    auto n = ranges::size(base_);
    return ranges::min(n, static_cast<decay_t<n> >(count_));
}

constexpr auto size() const requires sized_range<const V> {
    auto n = ranges::size(base_);
    return ranges::min(n, static_cast<decay_t<n> >(count_));
}

};

template<class R>
take_view(R&&, range_difference_t<R>)
  -> take_view::all_t<R>;
}

constexpr take_view(V base, range_difference_t<V> count);

Effects: Initializes base_ with std::move(base) and count_ with count.

26.7.10.3 Class template take_view::sentinel

namespace std::ranges {
    template<view V>
    template<bool Const>
    class take_view<V>::sentinel {

§ 26.7.10.3
private:
    using Base = maybe-const<Const, V>;
    // exposition only
    template<bool OtherConst>
        using CI = counted_iterator<iterator_t<maybe-const<OtherConst, V>>;  // exposition only

public:
    sentinel() = default;
    constexpr explicit sentinel(sentinel_t<Base> end);

    constexpr sentinel(sentinel<!Const> s)
        requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

    constexpr sentinel_t<Base> base() const;

friend constexpr bool operator==(const CI<Const>& y, const sentinel& x);

template<bool OtherConst = !Const>
    requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>  // exposition only
friend constexpr bool operator==(const CI<OtherConst>& y, const sentinel& x);

constexpr explicit sentinel(sentinel_t<Base> end);

1 Effects: Initializes end_ with end.

constexpr sentinel(sentinel<!Const> s)
    requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

2 Effects: Initializes end_ with std::move(s.end_).

constexpr sentinel_t<Base> base() const;

4 Effects: Equivalent to: return y.count() == 0 || y.base() == x.end_;

26.7.11 Take while view

26.7.11.1 Overview

Given a unary predicate pred and a view r, take_while_view produces a view of the range [ranges::begin(r), ranges::find_if_not(r, pred)].

1 Example 1:

    auto input = istringstream{"0 1 2 3 4 5 6 7 8 9"};
    auto small = []{ (const auto x) noexcept { return x < 5; }};
    auto small_ints = views::istream<int>(input) | views::take_while(small);
    for (const auto i : small_ints) {
        cout << i << ' ';
    }  // prints 0 1 2 3 4
    auto i = 0;
    input >> i;
    cout << i;  // prints 6

—end example]

26.7.11.2 Class template take_while_view

namespace std::ranges {
    template<view V, class Pred>
        requires input_range<V> && is_object_v<Pred> &&
namespace std::ranges {

    indirect_unary_predicate<const Pred, iterator_t<V>>
    class take_while_view : public view_interface<take_while_view<V, Pred>> {
        // 26.7.11.3, class template take_while_view::sentinel
        template<bool> class sentinel; // exposition only

        V base_ = V(); // exposition only
        movable-box<Pred> pred_; // exposition only

        public:
            take_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
            constexpr take_while_view(V base, Pred pred);
            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr const Pred& pred() const;
            constexpr auto begin() requires (!simple_view<V>){ return ranges::begin(base_); }
            constexpr auto begin() const requires range<const V> && indirect_unary_predicate<const Pred, iterator_t<const V>>{ return ranges::begin(base_); }
            constexpr auto end() requires (!simple_view<V>){ return sentinel<false>(ranges::end(base_), addressof(*pred_)); }
            constexpr auto end() const requires range<const V> && indirect_unary_predicate<const Pred, iterator_t<const V>>{ return sentinel<true>(ranges::end(base_), addressof(*pred_)); }
    };

    template<class R, class Pred>
    take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;
}

1 Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

2 Effects: Equivalent to: return *pred_;

26.7.11.3 Class template take_while_view::sentinel

    using Base = maybe-const<Const, V>;

    template<class R, class Pred>
    take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;

    template<class R, class Pred>
    take_while_view(R&&, Pred) -> take_while_view<views::all_t<R>, Pred>;

    template<bool Const>
    class take_while_view<V, Pred>::sentinel {
        using Base = maybe-const<Const, V>;

        sentinel_t<Base> end_ = sentinel_t<Base>();// exposition only
        const Pred* pred_ = nullptr; // exposition only

        public:

            constexpr sentinel(sentinel_t<Const> s)
                requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
            constexpr sentinel_t<Base> base() const { return end_; }

    };

§ 26.7.11.3
friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

template<bool OtherConst = !Const>
requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x, const sentinel& y);

constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);

Effects: Initializes end_ with end and pred_ with pred.

constexpr sentinel(sentinel<!Const> s) requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes end_ with std::move(s.end_) and pred_ with s.pred_.

friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

template<bool OtherConst = !Const>
requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x, const sentinel& y);

Effects: Equivalent to: return y.end_ == x || !invoke(*y.pred_, *x);

26.7.12 Drop view [range.drop]

26.7.12.1 Overview [range.drop.overview]

drop_view produces a view excluding the first \(N\) elements from another view, or an empty range if the adapted view contains fewer than \(N\) elements.

The name views::drop denotes a range adaptor object (26.7.2). Let \(E\) and \(F\) be expressions, let \(T\) be remove_cvref_t<decltype\((E)\)>, and let \(D\) be range_difference_t<decltype\((E)\)>. If decltype\((F)\) does not model convertible_to\(<D>\), views::drop\((E, F)\) is ill-formed. Otherwise, the expression views::drop\((E, F)\) is expression-equivalent to:

\[\text{(2.1)} \quad \begin{cases} 
\text{If } T \text{ is a specialization of ranges::empty_view (26.6.2.2), then } (\text{void})F, \text{ decay-copy}(E), \text{ except that the evaluations of } E \text{ and } F \text{ are indeterminately sequenced.} \\
\text{Otherwise, if } T \text{ models random_access_range and sized_range and is} \\
\quad \begin{cases} 
\text{a specialization of span (24.7.3),} \\
\text{a specialization of basic_string_view (23.3),} \\
\text{a specialization of ranges::iota_view (26.6.4.2), or} \\
\text{a specialization of ranges::subrange (26.5.4) where } T::\text{StoreSize} \text{ is false,} \\
\quad \text{then } U\langle \text{ranges::begin}(E) + \text{std::min}(D)\langle \text{ranges::distance}(E), F \rangle, \text{ranges::end}(E)\rangle \text{, except that } E \text{ is evaluated only once, where } U \text{ is span<typename } T::\text{element_type}> \text{ if } T \text{ is a specialization of span and } T \text{ otherwise.} \\

\text{Otherwise, if } T \text{ is a specialization of ranges::repeat_view (26.6.5.2):} \\
\quad \begin{cases} 
\text{if } T \text{ models sized_range, then} \\
\text{views::repeat(}*E.\text{value_}, \text{ranges::distance}(E) - \text{std::min}(D)\langle \text{ranges::distance}(E), F \rangle) \text{ except that } E \text{ is evaluated only once;} \\
\text{otherwise, } (\text{void})F, \text{ decay-copy}(E), \text{ except that the evaluations of } E \text{ and } F \text{ are indeterminately sequenced.} \\
\text{Otherwise, ranges::drop_view}(E, F). 
\end{cases} 
\end{cases} \]

§ 26.7.12.1 1162
Example 1:

```cpp
auto ints = views::iota(0) | views::take(10);
for (auto i : ints | views::drop(5)) {
    cout << i << ' ';
}  // prints 5 6 7 8 9
```

—end example—

26.7.12.2 Class template drop_view

namespace std::ranges {
    template<view V>
    class drop_view : public view_interface<drop_view<V>> { public:
        drop_view() requires default_initializable<V> = default;
        constexpr drop_view(V base, range_difference_t<V> count);

        constexpr auto begin() requires (!(
            simple-view<V> &&
            random_access_range<const V> && sized_range<const V>));
        constexpr auto begin() const requires random_access_range<const V> && sized_range<const V>;

        constexpr auto end() requires (!
            simple-view<V>)
        { return ranges::end(base_); }
        constexpr auto end() const requires range<const V>
        { return ranges::end(base_); }

        constexpr auto size() requires sized_range<V> {
            const auto s = ranges::size(base_);
            const auto c = static_cast<decltype(s)>(count_);
            return s < c ? 0 : s - c;
        }
        constexpr auto size() const requires sized_range<const V> {
            const auto s = ranges::size(base_);
            const auto c = static_cast<decltype(s)>(count_);
            return s < c ? 0 : s - c;
        }

        private:
            V base_ = V();  // exposition only
            range_difference_t<V> count_ = 0;  // exposition only
    };

template<class R>
    drop_view(R&&, range_difference_t<R>) -> drop_view::views::all_t<R>>;

    constexpr drop_view(V base, range_difference_t<V> count);

    Preconditions: count >= 0 is true.

    Effects: Initializes base_ with std::move(base) and count_ with count.

    constexpr auto begin()
        requires (!(
            simple-view<V> &&
            random_access_range<const V> && sized_range<const V>));
    constexpr auto begin() const
        requires random_access_range<const V> && sized_range<const V>;

    Returns: ranges::next(ranges::begin(base_), count_, ranges::end(base_)).
Remarks: In order to provide the amortized constant-time complexity required by the range concept when drop_view models forward_range, the first overload caches the result within the drop_view for use on subsequent calls.

[Note 1: Without this, applying a reverse_view over a drop_view would have quadratic iteration complexity. — end note]

26.7.13 Drop while view

26.7.13.1 Overview

Given a unary predicate pred and a view r, drop_while_view produces a view of the range [ranges::find_if_not(r, pred), ranges::end(r)].

The name views::drop_while denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::drop_while(E, F) is expression-equivalent to drop_while_view(E, F).

[Example 1:

```cpp
constexpr auto source = " \t \t \t hello there";
auto is_invisible = [] (const auto x) { return x == ' ' || x == '\t'; };
auto skip_ws = views::drop_while(source, is_invisible);
for (auto c : skip_ws) {
    cout << c; // prints hello there with no leading space
}
```
—end example]

26.7.13.2 Class template drop_while_view

namespace std::ranges {
    template<class V, class Pred>
    requires input_range<V> && is_object_v<Pred> &&
    indirect_unary_predicate(const Pred, iterator_t<V>)
    class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
public:
    drop_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
    constexpr drop_while_view(V base, Pred pred);

    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr const Pred& pred() const;

    constexpr auto begin();
    constexpr auto end() { return ranges::end(base_); }

private:
    V base_ = V(); // exposition only
    movable-box<Pred> pred_; // exposition only
};

    template<class R, class Pred>
    drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
}

constexpr drop_while_view(V base, Pred pred);  
Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;
Effects: Equivalent to: return *pred_;

constexpr auto begin();
Preconditions: pred_.has_value() is true.

Returns: ranges::find_if_not(base_, cref(*pred_)).
Remarks: In order to provide the amortized constant-time complexity required by the `range` concept when `drop_while_view` models `forward_range`, the first call caches the result within the `drop_while_view` for use on subsequent calls.

[Note 1: Without this, applying a `reverse_view` over a `drop_while_view` would have quadratic iteration complexity. — end note]

### 26.7.14 Join view

#### 26.7.14.1 Overview

`join_view` flattens a view of ranges into a view.

The name `views::join` denotes a range adaptor object (26.7.2). Given a subexpression `E`, the expression `views::join(E)` is expression-equivalent to

```cpp
join_view<views::all_t<decltype((E))>>{E}
```

**Example 1:**
```cpp
vector<string> ss{"hello", " ", "world", ","};
for (char ch : ss | views::join)
    cout << ch; // prints hello world!
```

--- end example

#### 26.7.14.2 Class template `join_view`

```cpp
namespace std::ranges {
    template<input_range V>
    requires view<V> && input_range<range_reference_t<V>>
    class join_view : public view_interface<join_view<V>> {
        private:
            using InnerRng = range_reference_t<V>; // exposition only

        // 26.7.14.3, class template `join_view::iterator`
        template<bool Const>
        struct iterator;
        // exposition only

        // 26.7.14.4, class template `join_view::sentinel`
        template<bool Const>
        struct sentinel;
        // exposition only

        V base_ = V(); // exposition only

        non-propagating-cache<remove_cv_t<InnerRng>> inner_; // exposition only, present only
        // when !is_reference_v<InnerRng>

        public:
            join_view() requires default_initializable<V> = default;
            constexpr explicit join_view(V base);
            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr auto begin() {
                constexpr bool use_const = simple_view<V> && is_reference_v<InnerRng>;
                return iterator<use_const>{*this, ranges::begin(base_)};
            }

            constexpr auto begin() const
                requires input_range<const V> && is_reference_v<range_reference_t<const V>>
            { return iterator<true>{*this, ranges::begin(base_)}; }

            constexpr auto end() {
                if constexpr (forward_range<V> && is_reference_v<InnerRng> && forward_range<InnerRng> &&
                    common_range<V> && common_range<InnerRng>)
                    return iterator<simple_view<V>>{*this, ranges::end(base_)};
            }
```
else
    return sentinel<simple-view<V>>{*this};
}

constexpr auto end() const
    requires input_range<const V> &&
    is_reference_v<range_reference_t<const V>>
    
    if constexpr (forward_range<const V> &&
                  forward_range<range_reference_t<const V>> &&
                  common_range<const V> &&
                  common_range<range_reference_t<const V>>)
        return iterator<true>{*this, ranges::end(base_)};
    else
        return sentinel<true>{*this};
};

namespace std::ranges {
    template<input_range V>
        requires view<V> && input_range<range_reference_t<V>>

            constexpr InnerIter operator->() const
                requires has-arrow<InnerIter> && copyable<InnerIter>;

§ 26.7.14.3 1166
constexpr iterator operator++();
constexpr void operator++(int);
constexpr iterator operator++(int)
  requires ref-is-glvalue && forward_range<Base> &&
  forward_range<range_reference_t<Base>>;

constexpr iterator operator--();
constexpr void operator--(int)
  requires ref-is-glvalue && bidirectional_range<Base> &&
  bidirectional_range<range_reference_t<Base>> &&
  common_range<range_reference_t<Base>>;

friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&
  equality_comparable<iterator_t<range_reference_t<Base>>>;

friend constexpr decltype(auto) iter_move(const iterator& i)
  noexcept(noexcept(ranges::iter_move(i.inner_))) {
    return ranges::iter_move(i.inner_);
  }

friend constexpr void iter_swap(const iterator& x, const iterator& y)
  noexcept(noexcept(ranges::iter_swap(x.inner_, y.inner_)))
  requires indirectly_swappable<InnerIter>;

1 iterator::iterator_concept is defined as follows:

1.1 — If ref-is-glvalue is true, Base models bidirectional_range, and
range_reference_t<Base> models both bidirectional_range and common_range, then
iterator_concept denotes bidirectional_iterator_tag.

1.2 — Otherwise, if ref-is-glvalue is true and Base and range_reference_t<Base> each model
forward_range, then iterator_concept denotes forward_iterator_tag.

1.3 — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if ref-is-glvalue is true, Base models
forward_range, and range_reference_t<Base> models forward_range. In that case, iterator::iterator_category is defined as follows:

2.1 — Let OUTERC denote iterator_traits<iterator_t<Base>>::iterator_category, and let INNERC
denote iterator_traits<iterator_t<range_reference_t<Base>>::iterator_category.

2.2 — If OUTERC and INNERC each model derived_from<bidirectional_iterator_tag> and range_reference_t<Base> models common_range, iterator_category denotes bidirectional_iterator_tag.

2.3 — Otherwise, if OUTERC and INNERC each model derived_from<forward_iterator_tag>, iterator_category denotes forward_iterator_tag.

2.4 — Otherwise, iterator_category denotes input_iterator_tag.

3 iterator::difference_type denotes the type:

    common_type_t<
      range_difference_t<Base>,
      range_difference_t<range_reference_t<Base>>>.

4 join_view iterators use the satisfy function to skip over empty inner ranges.

constexpr void satisfy();

5 Effects: Equivalent to:

§ 26.7.14.3
auto update_inner = [this](const iterator_t<Base>& x) -> auto&& {
if constexpr (ref_is_glvalue) // *x is a reference
    return *x;

3  Effects: Equivalent to: return x.outer_ == y.end_;

§ 26.7.14.4 1169
26.7.15 Join with view

26.7.15.1 Overview

join_with_view takes a view and a delimiter, and flattens the view, inserting every element of the delimiter in between elements of the view. The delimiter can be a single element or a view of elements.

The name views::join_with denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::join_with(E, F) is expression-equivalent to join_with_view(E, F).

[Example 1:
   vector<string> vs = {"the", "quick", "brown", "fox"};
   for (char c : vs | views::join_with(’-’)) {
       cout << c;
   }
   // The above prints the-quick-brown-fox
   — end example]

26.7.15.2 Class template join_with_view

    requires indirectly_swappable<InnerIter, PatternIter> {
    visit(ranges::iter_swap, x.inner_it_, y.inner_it_);
}

1 iterator::iterator_concept is defined as follows:
(1.1) — If ref-is-glvalue is true, Base models bidirectional_range, and InnerBase and PatternBase
    each model bidirectional-common, then iterator_concept denotes bidirectional_iterator_tag.
(1.2) — Otherwise, if ref-is-glvalue is true and Base and InnerBase each model forward_range, then
    iterator_concept denotes forward_iterator_tag.
(1.3) — Otherwise, iterator_concept denotes input_iterator_tag.
The member \texttt{typedef-name} \texttt{iterator\_category} is defined if and only if \texttt{ref-is-glvalue} is true, and \texttt{Base} and \texttt{InnerBase} each model \texttt{forward\_range}. In that case, \texttt{iterator\_\::\::iterator\_category} is defined as follows:

\begin{enumerate}
\item Let \texttt{OUTERC} denote \texttt{iterator\_traits<OuterIter>::iterator\_category}, let \texttt{INNERC} denote \texttt{iterator\_traits<InnerIter>::iterator\_category}, and let \texttt{PATTERNC} denote \texttt{iterator\_traits<PatternIter>::iterator\_category}.
\item If \texttt{is\_lvalue\_reference\_v<common\_reference\_t<iter\_reference\_t<InnerIter>, iter\_reference\_t<PatternIter>>>} is false, \texttt{iterator\_category} denotes \texttt{input\_iterator\_tag}.
\item Otherwise, if \texttt{OUTERC}, \texttt{INNERC}, and \texttt{PATTERNC} each model \texttt{derived\_from<bidirectional\_iterator\_category>} and \texttt{InnerBase} and \texttt{PatternBase} each model \texttt{common\_range}, \texttt{iterator\_category} denotes \texttt{bidirectional\_iterator\_tag}.
\item Otherwise, if \texttt{OUTERC}, \texttt{INNERC}, and \texttt{PATTERNC} each model \texttt{derived\_from<forward\_iterator\_tag>}, \texttt{iterator\_category} denotes \texttt{forward\_iterator\_tag}.
\item Otherwise, \texttt{iterator\_category} denotes \texttt{input\_iterator\_tag}.
\end{enumerate}

3 \texttt{iterator\_\::\::value\_type} denotes the type:
\[
\text{common\_type\_t<\text{iter\_value\_t<InnerIter>, iter\_value\_t<PatternIter>>}
\]

4 \texttt{iterator\_\::\::difference\_type} denotes the type:
\[
\text{common\_type\_t<}
\begin{align*}
&\text{iter\_difference\_t<OuterIter>,} \\
&\text{iter\_difference\_t<InnerIter>,} \\
&\text{iter\_difference\_t<PatternIter>>}
\end{align*}
\]

\begin{verbatim}
constexpr auto&& update-inner(const OuterIter& x);
\end{verbatim}

**Effects:** Equivalent to:
\[
\text{if constexpr (ref-is-\text{glvalue})}
\]

\[
\begin{align*}
&\text{return } *x; \\
&\text{else}
\end{align*}
\]

\[
\text{return parent_\->inner_.emplace\_deref(x);} \\
\]

\begin{verbatim}
constexpr auto&& get-inner(const OuterIter& x);
\end{verbatim}

**Effects:** Equivalent to:
\[
\text{if constexpr (ref-is-\text{glvalue})}
\]

\[
\begin{align*}
&\text{return } *x; \\
&\text{else}
\end{align*}
\]

\[
\text{return } *parent_\->inner_; \\
\]

\begin{verbatim}
constexpr void satisfy();
\end{verbatim}

**Effects:** Equivalent to:
\[
\text{while (true)}{
\begin{align*}
&\text{if (inner_it_\::\::index() == 0) } \\
&\quad\text{if (std::get<0>(inner_it_ \!= ranges::end(parent_\->pattern_))}
\end{align*}
\]

\[
\text{break;} \\
\text{auto&& inner = update-inner(outer_it_);} \\
\text{inner_it_\::\::emplace<1>(ranges::begin(inner));}
\]

\[
\text{else } \\
\quad\text{auto&& inner = get-inner(outer_it_);} \\
\quad\text{if (std::get<1>(inner_it_ \!= ranges::end(inner))}

26.7.16 Lazy split view

26.7.16.1 Overview

lazy_split_view takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

The name views::lazy_split denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::lazy_split(E, F) is expression-equivalent to lazy_split_view(E, F).

[Example 1:

```cpp
string str{"the quick brown fox");
for (auto word : str | views::lazy_split(' ')) {
    for (char ch : word)
        cout << ch;
    cout << '*';
} // The above prints the*quick*brown*fox*
```
—end example]

26.7.16.2 Class template lazy_split_view

namespace std::ranges {
    template<auto> struct require-constant; // exposition only

template<class R>
    concept tiny-range = sized_range<R> &&
        { typename require-constant<remove_reference_t<R>::size>(); } &&

Effects: Equivalent to ranges::iter_swap(x.i_.current, y.i_.current).

26.7.17 Split view

26.7.17.1 Overview

split_view takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

The name views::split denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::split(E, F) is expression-equivalent to split_view(E, F).
Example 1:

```cpp
string str{"the quick brown fox"};
for (string_view word : views::split(str, ' ')) {
    cout << word << '*'s;
}
// The above prints the*quick*brown*fox*
```

---

### 26.7.17.2 Class template split_view

```cpp
namespace std::ranges {
    template<forward_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
        indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
    class split_view : public view_interface<split_view<V, Pattern>> {
private:
    V base_ = V(); // exposition only
    Pattern pattern_ = Pattern(); // exposition only

    // 26.7.17.3, class split_view::iterator
    struct iterator;
    // exposition only

    // 26.7.17.4, class split_view::sentinel
    struct sentinel;
    // exposition only

public:
    split_view() requires default_initializable<V> && default_initializable<Pattern> = default;
    constexpr split_view(V base, Pattern pattern);

    template<forward_range R>
    requires constructible_from<V, views::all_t<R>> &&
        constructible_from<Pattern, single_view<range_value_t<R>>>;
    constexpr V base() const & requires copy_constructible<V> { return base_; }
    constexpr V base() && { return std::move(base_); }

    constexpr iterator begin();
    constexpr auto end() {
        if constexpr (common_range<V>) {
            return iterator{*this, ranges::end(base_), {}};
        } else {
            return sentinel{*this};
        }
    }

    constexpr subrange<iterator_t<V>> find_next(iterator_t<V>);
    // exposition only
};
```

```cpp
template<class R, class P>
split_view(R&&, P&&) -> split_view<views::all_t<R>, views::all_t<P>>;
```

```cpp
template<forward_range R>
split_view(R&&, range_value_t<R>)
    -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;
```

```cpp
constexpr split_view(V base, Pattern pattern);
```

**Effects:** Initializes base_ with std::move(base), and pattern_ with std::move(pattern).
template<forward_range R>
        requires constructible_from<V, views::all_t<R>> &&
        constructible_from<Pattern, single_view<range_value_t<R>>> 
constexpr split_view(R&& r, range_value_t<R> e);

Effects: Initializes base_ with views::all(std::forward<R>(r)), and pattern_ with views::
          single(std::move(e)).

constexpr iterator begin();

Effects: Initializes parent_ with addressof(parent), cur_ with std::move(current), and next_
          with subrange<iterator_t<V>>().

constexpr iterator_t<V> base() const;

Effects: Equivalent to return cur_.

constexpr value_type operator*() const;

Effects: Equivalent to return {cur_, next_.begin()};

§ 26.7.17.3 1183
constexpr iterator operator++();

Effects: Equivalent to:

```cpp
cur_ = next_.begin();
if (cur_ != ranges::end(parent_->base_)) {
    cur_ = next_.end();
    if (cur_ == ranges::end(parent_->base_)) {
        trailing_empty_ = true;
        next_ = {cur_, cur_};
    } else {
        next_ = parent_->find-next(cur_);
    }
} else {
    trailing_empty_ = false;
}
return *this;
```

constexpr iterator operator++(int);

Effects: Equivalent to:

```cpp
auto tmp = *this;
++*this;
return tmp;
```

friend constexpr bool operator==(const iterator& x, const iterator& y);

Effects: Equivalent to:

```cpp
return x.cur_ == y.cur_ && x.trailing_empty_ == y.trailing_empty_;
```

### 26.7.17.4 Class split_view::sentinel

```cpp
namespace std::ranges {
    template<forward_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
        indirectly_comparable<iterator_t<V>, iterator_t<Pattern>>, ranges::equal_to
    struct split_view<V, Pattern>::sentinel {
        private:
            sentinel_t<V> end_ = sentinel_t<V>(); // exposition only

        public:
            sentinel() = default;
            constexpr explicit sentinel(split_view& parent);

            friend constexpr explicit sentinel(split_view& parent);
    }
```

1. Effects: Initializes end_ with ranges::end(parent.base_).

friend constexpr bool operator==(const iterator& x, const sentinel& y);

Effects: Equivalent to: return x.cur_ == y.end_ && !x.trailing_empty_;

### 26.7.18 Counted view

A counted view presents a view of the elements of the counted range \((25.3.1) i + [0, n)\) for an iterator \(i\) and non-negative integer \(n\).

The name views::counted denotes a customization point object \((16.3.3.3.6)\). Let \(E\) and \(F\) be expressions, let \(T\) be decay_t<decltype\((E)\)> \(,\) and let \(D\) be iter_difference_t<T>. If decltype\((F)\) does not model convertible_to<D> \(\) \(,\) views::counted\((E, F)\) is ill-formed.

[Note 1: This case can result in substitution failure when views::counted\((E, F)\) appears in the immediate context of a template instantiation. — end note]

Otherwise, views::counted\((E, F)\) is expression-equivalent to:
If \( T \) models `contiguous_iterator`, then `span(to_address(E), static_cast<size_t>(static_cast<D>(F)))`.

Otherwise, if \( T \) models `random_access_iterator`, then `subrange(E, E + static_cast<D>(F))`, except that \( E \) is evaluated only once.

Otherwise, `subrange(counted_iterator(E, F), default_sentinel)`.

26.7.19 Common view

26.7.19.1 Overview

`common_view` takes a view which has different types for its iterator and sentinel and turns it into a view of the same elements with an iterator and sentinel of the same type.

[Note 1: `common_view` is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — end note]

The name `views::common` denotes a range adaptor object (26.7.2). Given a subexpression \( E \), the expression `views::common(E)` is expression-equivalent to:

1. `views::all(E)`, if `decltype((E))` models `common_range` and `views::all(E)` is a well-formed expression.
2. Otherwise, `common_view(E)`.

[Example 1:

```cpp
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);

template<forward_range R>
void my_algo(R&& r) {
    auto&& common = views::common(r);
    auto cnt = count(common.begin(), common.end());
    // ...
}
```

— end example]

26.7.19.2 Class template `common_view`

```cpp
namespace std::ranges {
    template<view V>
    requires (!common_range<V> && copyable<iterator_t<V>>)
    class common_view : public view_interface<common_view<V>> {
        private:
            V base_ = V(); // exposition only
        public:
            common_view() requires default_initializable<V> = default;
            constexpr explicit common_view(V r);
            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr auto begin() {
                if constexpr (random_access_range<V> && sized_range<V>)
                    return ranges::begin(base_);
                else
                    return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
            }
            constexpr auto begin() const requires range<const V> {
                if constexpr (random_access_range<const V> && sized_range<const V>)
                    return ranges::begin(base_);
                else
                    return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
            }
        }
    }
```
```cpp
constexpr auto end() {
if constexpr (random_access_range<V> && sized_range<V>)
    return ranges::begin(base_ + ranges::size(base_));
else
    return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
}

constexpr auto end() const requires range<const V> {
if constexpr (random_access_range<const V> && sized_range<const V>)
    return ranges::begin(base_ + ranges::size(base_));
else
    return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
}

constexpr auto size() requires sized_range<V> {
    return ranges::size(base_);
}

constexpr auto size() const requires sized_range<const V> {
    return ranges::size(base_);
}
};

template<class R>
common_view(R&&) -> common_view<views::all_t<R>>;

constexpr explicit common_view(V base);

Effects: Initializes base_ with std::move(base).

26.7.20 Reverse view

26.7.20.1 Overview

reverse_view takes a bidirectional view and produces another view that iterates the same elements in reverse order.

The name views::reverse denotes a range adaptor object (26.7.2). Given a subexpression E, the expression views::reverse(E) is expression-equivalent to:

(2.1) — If the type of E is a (possibly cv-qualified) specialization of reverse_view, equivalent to E.base().

(2.2) — Otherwise, if the type of E is cv subrange<reverse_iterator<I>, reverse_iterator<I>, K> for some iterator type I and value K of type subrange_kind,

(2.2.1) — if K is subrange_kind::sized, equivalent to:
        subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())

(2.2.2) — otherwise, equivalent to:
        subrange<I, I, K>(E.end().base(), E.begin().base())

However, in either case E is evaluated only once.

(2.3) — Otherwise, equivalent to reverse_view(E).

3 [Example 1:
   vector<int> is {0,1,2,3,4};
   for (int i : is | views::reverse)
       cout << i << " "; // prints 4 3 2 1 0
   — end example]

26.7.20.2 Class template reverse_view

namespace std::ranges {
    template<class V>
        requires bidirectional_range<V>
    class reverse_view : public view_interface<reverse_view<V>> {
        private:
            V base_ = V(); // exposition only
    }
```
public:
  reverse_view() requires default_initializable<V> = default;

constexpr explicit reverse_view(V r);

constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr reverse_iterator<iterator_t<V>> begin();
constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
constexpr auto begin() const requires common_range<const V>;

constexpr reverse_iterator<iterator_t<V>> end();
constexpr auto end() const requires common_range<const V>;

constexpr auto size() requires sized_range<V> {
  return ranges::size(base_);
}
constexpr auto size() const requires sized_range<const V> {
  return ranges::size(base_);
}

template<class R>
  reverse_view(R&&) -> reverse_view<views::all_t<R>>;

constexpr explicit reverse_view(V base);

Effects: Initializes base_ with std::move(base).

constexpr reverse_iterator<iterator_t<V>> begin();

Returns:
  make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))

Remarks: In order to provide the amortized constant time complexity required by the range concept, this function caches the result within the reverse_view for use on subsequent calls.

constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
constexpr auto begin() const requires common_range<const V>;

Effects: Equivalent to: return make_reverse_iterator(ranges::end(base_));

constexpr reverse_iterator<iterator_t<V>> end();
constexpr auto end() const requires common_range<const V>;

Effects: Equivalent to: return make_reverse_iterator(ranges::begin(base_));

26.7.21 As const view

26.7.21.1 Overview

as_const_view presents a view of an underlying sequence as constant. That is, the elements of an as_const_view cannot be modified.

The name views::as_const denotes a range adaptor object (26.7.2). Let E be an expression, let T be decltype((E)), and let U be remove_cvref_t<T>. The expression views::as_const(E) is expression-equivalent to:

(2.1) If views::all_t<T> models constant_range, then views::all(E).
(2.2) Otherwise, if U denotes span<X, Extent> for some type X and some extent Extent, then span<const X, Extent>(E).
(2.3) Otherwise, if E is an lvalue, const U models constant_range, and U does not model view, then ref_view(static_cast<const U&>(E)).
(2.4) Otherwise, as_const_view(E).
Example 1:

```cpp
template<ranges::constant_range R>
void cant_touch_this(R&&);

vector<char> hammer = {'m', 'c'};
span<char> beat = hammer;
cant_touch_this(views::as_const(beat)); // will not modify the elements of hammer
```

--- end example ---

### 26.7.21.2 Class template as_const_view

```cpp
namespace std::ranges {
    template<view V>
    requires input_range<V>
    class as_const_view : public view_interface<as_const_view<V>> {
        V base_ = V(); // exposition only

        public:
            as_const_view() requires default_initializable<V> = default;
            constexpr explicit as_const_view(V base);
            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr auto begin() requires (!
            simple-view<V>) { return ranges::cbegin(base_); }
            constexpr auto begin() const requires range<const V> { return ranges::cbegin(base_); }
            constexpr auto end() requires (!
            simple-view<V>) { return ranges::cend(base_); }
            constexpr auto end() const requires range<const V> { return ranges::cend(base_); }
            constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
            constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }
    };
    template<class R>
    as_const_view(R&&) -> as_const_view<views::all_t<R>>;
}
```

1. **Effects:** Initializes `base_` with `std::move(base)`.

### 26.7.22 Elements view

#### 26.7.22.1 Overview

Elements view takes a view of tuple-like values and a size_t, and produces a view with a value-type of the Nth element of the adapted view's value-type.

1. The name `views::elements<N>` denotes a range adaptor object (26.7.2). Given a subexpression E and constant expression N, the expression `views::elements<N>(E)` is expression-equivalent to `elements_view<views::all_t<decltype((E))>, N>{E}`.

Example 1:

```cpp
auto historical_figures = map{
    pair("Lovelace"sv, 1815),
    "Turing"sv, 1912),
    "Babbage"sv, 1791),
    "Hamilton"sv, 1936
};

auto names = historical_figures | views::elements<0>;
for (auto& name : names) {
    cout << name << ' '; // prints Babbage Hamilton Lovelace Turing
}
auto birth_years = historical_figures | views::elements<1>;
for (auto& born : birth_years) {
    cout << born << ' ';
} // prints 1791 1936 1815 1912

— end example

3 keys_view is an alias for elements_view<R, 0>, and is useful for extracting keys from associative containers.

[Example 2]:
auto names = historical_figures | views::keys;
for (auto& name : names) {
    cout << name << ' ';
} // prints Babbage Hamilton Lovelace Turing

— end example

4 values_view is an alias for elements_view<R, 1>, and is useful for extracting values from associative containers.

[Example 3]:
auto is_even = [](const auto x) { return x % 2 == 0; };
cout << ranges::count_if(historical_figures | views::values, is_even); // prints 2

— end example

26.7.22.2 Class template elements_view

namespace std::ranges {
    #template<class T, size_t N>
    concept has-tuple-element =
        // exposition only
tuple-like<T> && N < tuple_size_v<T>;

template<class T, size_t N>
    concept returnable-element =
        // exposition only
    is_reference_v<T> || move_constructible<tuple_element_t<N, T>>;

template<input_range V, size_t N>
requires view<V> && has-tuple-element<range_value_t<V>, N> &&
    has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
    returnable-element<range_reference_t<V>, N>
    class elements_view : public view_interface<elements_view<V, N>> {
        public:
        elements_view() requires default_initializable<V> = default;
        constexpr explicit elements_view(V base);

        constexpr V base() const requires copy_constructible<V> {
            return base_; }

        constexpr auto begin() requires (!simple_view<V>) {
            return iterator<false>(ranges::begin(base_)); }

        constexpr auto begin() const requires range<const V> {
            return iterator<true>(ranges::begin(base_)); }

        constexpr auto end() requires (!simple_view<V> && !common_range<V>) {
            return sentinel<false>(ranges::end(base_)); }

        constexpr auto end() const requires range<const V> {
            return sentinel<true>(ranges::end(base_)); }

        constexpr auto end() const requires common_range<const V> {
            return iterator<true>(ranges::end(base_)); }

        } // class elements_view
    } // namespace std::ranges

§ 26.7.22.2 1189
```cpp
constexpr auto size() requires sized_range<V>
{ return ranges::size(base_); }

constexpr auto size() const requires sized_range<const V>
{ return ranges::size(base_); }

private:
// 26.7.22.3, class template elements_view::iterator
template<bool> class iterator;       // exposition only

// 26.7.22.4, class template elements_view::sentinel
template<bool> class sentinel;       // exposition only

V base_ = V();                        // exposition only
}
}

constexpr explicit elements_view(V base);

1 Effects: Initializes base_ with std::move(base).

26.7.22.3 Class template elements_view::iterator

namespace std::ranges {

template<input_range V, size_t N>
requires view<V> && has-tuple-element<range_value_t<V>, N> &&
has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
returnable-element<range_reference_t<V>, N>

template<bool Const>
class elements_view<V, N>::iterator {
using Base = maybe-const<Const, V>;      // exposition only
iterator_t<Base> current_ = iterator_t<Base>();    // exposition only

static constexpr decltype(auto) get-element(const iterator_t<Base>& i);    // exposition only

public:
using iterator_concept = see below;
using iterator_category = see below;       // not always present
using value_type = remove_cvref_t<
    tuple_element_t<N, range_value_t<Base>>;
using difference_type = range_difference_t<Base>;

iterator() requires default_initializable<iterator_t<Base>> = default;
constexpr explicit iterator(iterator_t<Base> current);
constexpr iterator(iterator<!Const> i)
    requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

constexpr const iterator_t<Base>& base() const & noexcept;
constexpr iterator_t<Base>& base() &&;

constexpr decltype(auto) operator*() const
{ return get-element(current_); }

constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires forward_range<Base>;

constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;

constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
constexpr iterator& operator+=(difference_type x)
    requires random_access_range<Base>;
```

§ 26.7.22.3
constexpr decltype(auto) operator[](difference_type n) const
requires random_access_range<Base>
{ return get_element(current_ + n); }

friend constexpr bool operator==(const iterator x, const iterator y)
requires equality_comparable<iterator_t<Base>>;

friend constexpr bool operator<(const iterator x, const iterator y)
requires random_access_range<Base>;

friend constexpr bool operator>(const iterator x, const iterator y)
requires random_access_range<Base>;

friend constexpr bool operator<=(const iterator x, const iterator y)
requires random_access_range<Base>;

friend constexpr bool operator>=(const iterator x, const iterator y)
requires random_access_range<Base>;

friend constexpr auto operator<=>(const iterator x, const iterator y)
requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

friend constexpr iterator operator+(const iterator x, difference_type y)
requires random_access_range<Base>;

friend constexpr iterator operator+(difference_type x, const iterator y)
requires random_access_range<Base>;

friend constexpr iterator operator-(const iterator x, difference_type y)
requires random_access_range<Base>;

friend constexpr difference_type operator-(const iterator x, const iterator y)
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

The member typedef-name iterator_concept is defined as follows:

1. If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
2. Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
3. Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.
4. Otherwise, iterator_concept denotes input_iterator_tag.

The member typedef-name iterator_category is defined if and only if Base models forward_range. In that case, iterator_category is defined as follows: Let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.

1. If std::get<N>(*current_) is an rvalue, iterator_category denotes input_iterator_tag.
2. Otherwise, if C models derived_from<random_access_iterator_tag>, iterator_category denotes random_access_iterator_tag.
3. Otherwise, iterator_category denotes C.

static constexpr decltype(auto) get_element(const iterator_t<Base>& i);

Effects: Equivalent to:

if constexpr (is_reference_v<range_reference_t<Base>>) {
    return std::get<N>(*i);
} else {
    using E = remove_cv_t<tuple_element_t<N, range_reference_t<Base>>>;
    return static_cast<E>(std::get<N>(*i));
}

constexpr explicit iterator(iterator_t<Base> current);

Effects: Initializes current_ with std::move(current).

constexpr iterator(iterator_t<Base> current);

Effects: Initializes current_ with std::move(i.current_).
constexpr const iterator_t<Base>& base() const & noexcept;

Effects: Equivalent to: return current_; 

constexpr iterator_t<Base> base() &&;

Effects: Equivalent to: return std::move(current_); 

constexpr iterator& operator++();

Effects: Equivalent to: 
  ++current_; 
  return *this; 

constexpr void operator++(int);

Effects: Equivalent to: ++current_. 

constexpr iterator operator++(int) requires forward_range<Base>;

Effects: Equivalent to:

    Effects: Equivalent to: return x.end_ - y.current_;

26.7.23 Zip view

26.7.23.1 Overview

zip_view takes any number of views and produces a view of tuples of references to the corresponding elements of the constituent views.

The name views::zip denotes a customization point object (16.3.3.3.6). Given a pack of subexpressions 
Es..., the expression views::zip(Es...) is expression-equivalent to

— auto(views::empty&lt;tuple&gt;&gt;) if Es is an empty pack,
— otherwise, zip_view&lt;views::all_t&lt;decltype((Es))&gt;...(Es...).

[Example 1:]

vector v = {1, 2};
list l = {'a', 'b', 'c'};

auto z = views::zip(v, l);
range_reference_t&lt;decltype(z)&gt; f = z.front();  // f is a tuple&lt;int&amp;, char&amp;&gt;
 // that refers to the first element of v and l

for (auto&amp; [x, y] : z) {
    cout &lt;&lt; '(' &lt;&lt; x &lt;&lt; ', ' &lt;&lt; y &lt;&lt; ')' &lt;&lt; endl;
}

—end example]
// 26.7.23.3, class template zip_view::iterator
template<bool> class iterator; // exposition only

// 26.7.23.4, class template zip_view::sentinel
template<bool> class sentinel; // exposition only

public:
zip_view() = default;
constexpr explicit zip_view(Views... views);

constexpr auto begin() requires (!((simple-view<Views> && ...) {  
  return iterator<false>(tuple-transform(ranges::begin, views_));  
})
constexpr auto begin() const requires (range<const Views> && ...) {  
  return iterator<true>(tuple-transform(ranges::begin, views_));  
})
constexpr auto end() requires (!((simple-view<Views> && ...) {  
  if constexpr (!zip-is-common<Views...>) {  
    return sentinel<false>(tuple-transform(ranges::end, views_));  
  } else if constexpr ((random_access_range<Views> && ...)) {  
    return begin() + iter_difference_t<iterator<false>>(size());  
  } else {  
    return iterator<false>(tuple-transform(ranges::end, views_));  
  }  
})
constexpr auto end() const requires (range<const Views> && ...) {  
  if constexpr (!zip-is-common<const Views...>) {  
    return sentinel<true>(tuple-transform(ranges::end, views_));  
  } else if constexpr ((random_access_range<const Views> && ...)) {  
    return begin() + iter_difference_t<iterator<true>>(size());  
  } else {  
    return iterator<true>(tuple-transform(ranges::end, views_));  
  }  
})
constexpr auto size() requires (sized_range<Views> && ...);
constexpr auto size() const requires (sized_range<const Views> && ...);

template<class... Rs>
zip_view(Rs&&...) -> zip_view<views::all_t<Rs>...>;
}

1 Two zip_view objects have the same underlying sequence if and only if the corresponding elements of views are equal (18.2) and have the same underlying sequence.

[Note 1: In particular, comparison of iterators obtained from zip_view objects that do not have the same underlying sequence is not required to produce meaningful results (25.3.4.11). — end note]

castexpr explicit zip_view(Views... views);

2 Effects: Initializes views_ with std::move(views)....

castexpr auto size() requires (sized_range<Views> && ...);
castexpr auto size() const requires (sized_range<const Views> && ...);

3 Effects: Equivalent to:

  return apply(\(\rightarrow\)auto... .sizes) {  
    using CT = make-unsigned-like-t<common_type_t<decltype(sizes)...>>;  
    return ranges::min({CT(sizes)...});  
  }, tuple-transform(ranges::size, views_);
26.7.23.3 Class template `zip_view::iterator` [range.zip.iterator]

namespace std::ranges {
    template<bool Const, class... Views>
    concept all-random-access = // exposition only
        (random_access_range<maybe-const<Const, Views>> && ...);

    template<bool Const, class... Views>
    concept all-bidirectional = // exposition only
        (bidirectional_range<maybe-const<Const, Views>> && ...);

    template<bool Const, class... Views>
    concept all-forward = // exposition only
        (forward_range<maybe-const<Const, Views>> && ...);

template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)
    template<bool Const>
    class zip_view<Views...>::iterator {
        tuple<iterator_t<maybe-const<Const, Views>>...> current_; // exposition only
        // exposition only

        public:
            using iterator_category = input_iterator_tag; // not always present
            using iterator_concept = see below
            using value_type = tuple<range_value_t<maybe-const<Const, Views>>...>
            using difference_type = common_type_t<range_difference_t<maybe-const<Const, Views>>...>

            iterator() = default;
            constexpr iterator(iterator<!Const> i) requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

            constexpr auto operator*() const;
            constexpr iterator& operator++();
            constexpr void operator++(int);
            constexpr iterator& operator+=(difference_type x) requires all-random-access<Const, Views...>;
            constexpr iterator& operator-=(difference_type x) requires all-random-access<Const, Views...>;
            constexpr iterator operator[](difference_type n) const requires all-random-access<Const, Views...>;

            friend constexpr bool operator==(const iterator& x, const iterator& y) requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

            friend constexpr auto operator<(const iterator& x, const iterator& y) requires all-random-access<Const, Views...>;

            friend constexpr auto operator<=(const iterator& x, const iterator& y) requires all-random-access<Const, Views...>;

            friend constexpr auto operator>(const iterator& x, const iterator& y) requires all-random-access<Const, Views...>;

            friend constexpr auto operator>=(const iterator& x, const iterator& y) requires all-random-access<Const, Views...>;

            friend constexpr auto iter_move(const iterator& i) noexcept(see below);
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept (see below)
  requires (indirectly_swappable<iterator_t<maybe_const<Const, Views>>> && ...);
};

iterator::iterator_concept is defined as follows:

(1.1) — If all-random-access<Const, Views...> is modeled, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if all-bidirectional<Const, Views...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if all-forward<Const, Views...> is modeled, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

iterator::iterator_category is present if and only if all-forward<Const, Views...> is modeled.

If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

castexpr explicit iterator(tuple<iterator_t<maybe-const<Const, Views>>>...) current);

Effects: Initializes current_ with std::move(current).

castexpr iterator(iterator<Const> i)
  requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

Effects: Initializes current_ with std::move(i.current_).

castexpr auto operator*() const;

Effects: Equivalent to:

return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

castexpr iterator& operator++();

Effects: Equivalent to:

tuple-for-each([](auto& i) { ++i; }, current_);

return *this;

castexpr void operator++(int);

Effects: Equivalent to +++this.

castexpr iterator operator++(int) requires all-forward<Const, Views...>;

Effects: Equivalent to:

castexpr iterator& operator--() requires all-bidirectional<Const, Views...>;

Effects: Equivalent to:

castexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;

Effects: Equivalent to:

castexpr iterator& operator+=(difference_type x)
  requires all-random-access<Const, Views...>;

Effects: Equivalent to:

§ 26.7.23.3
tuple-for-each ([&]$<\text{class } I>(I& i) \{ i += \text{iter}\_\text{difference}\_t<I>(x); \}, \text{current}_\_); 
return *this;

constexpr iterator& operator-=(difference_type x)
requires all-random-access<Const, Views...>;
Effects: Equivalent to:
tuple-for-each ([&]$<\text{class } I>(I& i) \{ i -= \text{iter}\_\text{difference}\_t<I>(x); \}, \text{current}_\_);
return *this;

constexpr auto operator[](difference_type n) const
requires all-random-access<Const, Views...>;
Effects: Equivalent to:
return tuple-transform([&]$<\text{class } I>(I& i) \rightarrow \text{decltype(auto)} \{ 
    return i[\text{iter}\_\text{difference}\_t<I>(n)]; 
}, \text{current}_\_);

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires (equality\_comparable<\text{iterator}\_t<\text{maybe-const}<\text{Const}, \text{Views}>>> && ...);

Returns:
(15.1) x.current_ == y.current_ if all\_\text{bidirectional}<\text{Const}, \text{Views}...> is true.
(15.2) Otherwise, true if there exists an integer 0 ≤ i < sizeof...(Views) such that bool(std::get<i>(x.current_) == std::get<i>(y.current_)) is true.
[Note 1: This allows zip\_view to model common\_range when all constituent views model common\_range.]
— end note
(15.3) Otherwise, false.

friend constexpr auto operator>(=(const iterator& x, const iterator& y)
requires all-random-access<Const, Views...>;

Returns: x.current_ -= y.current_.

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
requires all-random-access<Const, Views...>;

Returns: x.current_ <= y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)
requires all-random-access<Const, Views...>;

friend constexpr iterator operator+(difference_type n, const iterator& i)
requires all-random-access<Const, Views...>;
Effects: Equivalent to:
auto r = i;
r += n;
return r;

friend constexpr iterator operator-=(const iterator& i, difference_type n)
requires all-random-access<Const, Views...>;
Effects: Equivalent to:
auto r = i;
r -= n;
return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
requires (sized\_sentinel\_for<\text{iterator}\_t<\text{maybe-const}<\text{Const}, \text{Views}>>, \text{iterator}\_t<\text{maybe-const}<\text{Const}, \text{Views}>>> && ...);

Let\ DIST(i)\ be\ difference\_type(std::get<i>(x.current_) - std::get<i>(y.current_)).
Returns: The value with the smallest absolute value among\ DIST(n)\ for all integers 0 ≤ n < sizeof...(Views).

friend constexpr auto iter\_move(const iterator& i) noexcept(see below);
Effects: Equivalent to:
return tuple\_transform(ranges::iter\_move, i.current_);
Remarks: The exception specification is equivalent to:
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);

Effects: For every integer \(0 \leq i < \text{sizeof}...(Views)\), performs:
\[
\text{ranges::iter_swap}((\text{std::get<i>}(l.current_)), \text{std::get<i>}(r.current_))
\]

Remarks: The exception specification is equivalent to the logical AND of the following expressions:
\[
\text{noexcept}((\text{ranges::iter_swap}((\text{std::get<i>}(l.current_)), \text{std::get<i>}(r.current_))))
\]
for every integer \(0 \leq i < \text{sizeof}...(Views)\).

### 26.7.23.4 Class template zip_view::sentinel

```cpp
namespace std::ranges {
    template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)
    template<bool Const>
    class zip_view<Views...>::sentinel
    {
        tuple<sentinel_t<maybe-const<Const, Views>>...> end_; // exposition only
        constexpr explicit sentinel(tuple<sentinel_t<maybe-const<Const, Views>>...> end);
            // exposition only
        public:
            sentinel() = default;
            constexpr sentinel(sentinel<!Const> i)
                requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);
            template<bool OtherConst>
                requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                        iterator_t<maybe-const<OtherConst, Views>>> && ...)
                friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
            template<bool OtherConst>
                requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                        iterator_t<maybe-const<OtherConst, Views>>> && ...)
                friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...> operator-(const iterator<OtherConst>& x, const sentinel& y);
            template<bool OtherConst>
                requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
                        iterator_t<maybe-const<OtherConst, Views>>> && ...)
                friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...> operator-(const sentinel& y, const iterator<OtherConst>& x);
    };
}
```

```cpp
constexpr explicit sentinel(tuple<sentinel_t<maybe-const<Const, Views>>...> end);
```

Effects: Initializes `end_` with `end`.

```cpp
constexpr sentinel(sentinel<!Const> i)
    requires Const && (convertible_to<sentinel_t<Views>, sentinel_t<const Views>> && ...);
```

Effects: Initializes `end_` with `std::move(i.end_)`.

```cpp
template<bool OtherConst>
    requires (sentinel_for<sentinel_t<maybe-const<Const, Views>>,
            iterator_t<maybe-const<OtherConst, Views>>> && ...)
    friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
```

Returns: `true` if there exists an integer \(0 \leq i < \text{sizeof}...(Views)\) such that `bool((std::get<i>)(x.current_) == std::get<i>)(y.end_))` is `true`. Otherwise, `false`.

§ 26.7.23.4 1199
Let $D$ be the return type. Let $\text{DIST}(i)$ be $D(\text{std::get}<i>(x.\text{current}_i) - \text{std::get}<i>(y.\text{end}_i))$.

Returns: The value with the smallest absolute value among $\text{DIST}(n)$ for all integers $0 \leq n < \text{sizeof}(...)$. Views).

Effects: Equivalent to return $-(x - y)$;

26.7.24 Zip transform view

26.7.24.1 Overview

$\text{zip\_transform\_view}$ takes an invocable object and any number of views and produces a view whose $M$th element is the result of applying the invocable object to the $M$th elements of all views.

The name $\text{views::zip\_transform}$ denotes a customization point object (16.3.3.3.6). Let $F$ be a subexpression, and let $E_s\ldots$ be a pack of subexpressions.

(2.1) — If $E_s$ is an empty pack, let $F_D$ be $\text{decay\_t<decltype(F)>>}$.

(2.1.1) — If $\text{copy\_constructible\<FD\> & regular\_invocable\<FD\>}$ is false, or if $\text{decay\_t<invoke\_result\_t<FD\>}}$ is not an object type, $\text{views::zip\_transform(F, E_s\ldots)}$ is ill-formed.

(2.1.2) — Otherwise, the expression $\text{views::zip\_transform(F, E_s\ldots)}$ is expression-equivalent to $(\text{void})F, \text{auto(views::empty<decay\_t<invoke\_result\_t<FD\>}>))$

(2.2) — Otherwise, the expression $\text{views::zip\_transform(F, E_s\ldots)}$ is expression-equivalent to $\text{zip\_transform\_view}(F, E_s\ldots)$.

[Example 1]:
vector v1 = {1, 2};
vector v2 = {4, 5, 6};

for (auto i : views::zip\_transform(plus(), v1, v2)) {
    cout << i << ' '; // prints 5 7
}
— end example]
// 26.7.24.4, class template zip_transform_view::sentinel
template<bool> class sentinel;   // exposition only

public:
zip_transform_view() = default;

constexpr explicit zip_transform_view(F fun, Views... views);

constexpr auto begin() { return iterator<false>(*this, zip_.begin()); }

constexpr auto end() { if constexpr (common_range<InnerView>) {
  return iterator<false>(*this, zip_.end());
} else {
  return sentinel<false>(zip_.end());
}

constexpr auto end() const requires range<const InnerView> && regular_invocable<const F&, range_reference_t<const Views>...) {
  if constexpr (common_range<const InnerView>) {
    return iterator<true>(*this, zip_.end());
  } else {
    return sentinel<true>(zip_.end());
  }
}

constexpr auto size() requires sized_range<InnerView> { return zip_.size(); }

constexpr auto size() const requires sized_range<const InnerView> { return zip_.size(); }

};

template<class F, class... Rs>
zip_transform_view(F, Rs&&...) -> zip_transform_view<F, views::all_t<Rs>...>;

constexpr explicit zip_transform_view(F fun, Views... views);

Effects: Initializes fun_ with std::move(fun) and zip_ with std::move(views)....

### 26.7.24.3 Class template zip_transform_view::iterator [range.zip.transform.iterator]

    requires random_access_range<Base>;
friend constexpr iterator operator+(const iterator& i, difference_type n)  
    requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)  
    requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
    requires sized_sentinel_for<ziperator<Const>, zipperator<Const>>;

1 The member typedef-name iterator::iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows:

(1.1) — If
    invoke_result_t<maybe-const<Const, F>&, range_reference_t<maybe-const<Const, Views>>...>

is not an lvalue reference, iterator_category denotes input_iterator_tag.

(1.2) — Otherwise, let Cs denote the pack of types iterator_traits<iterator_t<maybe-const<Const, Views>>>::iterator_category....

(1.2.1) — If (derived_from<Cs, random_access_iterator_tag> && ...) is true, iterator_category denotes random_access_iterator_tag.

(1.2.2) — Otherwise, if (derived_from<Cs, bidirectional_iterator_tag> && ...) is true, iterator_category denotes bidirectional_iterator_tag.

(1.2.3) — Otherwise, if (derived_from<Cs, forward_iterator_tag> && ...) is true, iterator_category denotes forward_iterator_tag.

(1.2.4) — Otherwise, iterator_category denotes input_iterator_tag.

§ 26.7.24.3
constexpr iterator(Parent & parent, ziperator<Const> inner);

 Effects: Initializes parent_ with addressof(parent) and inner_ with std::move(inner).

constexpr iterator(iterator<!Const> i)
 requires Const && convertible_to<ziperator<false>, ziperator<Const>>;

 Effects: Initializes parent_ with i.parent_ and inner_ with std::move(i.inner_).

constexpr decltype(auto) operator*() const noexcept;

 Effects: Equivalent to:
        return apply([&](const auto&... iters) -> decltype(auto) {
            return invoke(*parent_->fun_, *iters...);
        }, inner_.current_);

 Remarks: Let Is be the pack 0, 1, ..., (sizeof...(Views)-1). The exception specification is equivalent to: noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_))...)).

constexpr iterator& operator++();

 Effects: Equivalent to:
           ++inner_; return *this;

constexpr void operator++(int);

 Effects: Equivalent to: +++this.

constexpr iterator operator++(int) requires forward_range<Base>;

 Effects: Equivalent to:
           auto tmp = *this;
           +++this;
           return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

 Effects: Equivalent to:
           --inner_; return *this;

constexpr iterator operator--(int) requires bidirectional_range<Base>;

 Effects: Equivalent to:
           auto tmp = *this;
           --*this;
           return tmp;

constexpr iterator& operator+=(difference_type x)
 requires random_access_range<Base>;

 Effects: Equivalent to:
           inner_ += x;
           return *this;

constexpr iterator& operator-=(difference_type x)
 requires random_access_range<Base>;

 Effects: Equivalent to:
           inner_ -= x;
           return *this;

constexpr decltype(auto) operator[](difference_type n) const
 requires random_access_range<Base>;

 Effects: Equivalent to:
friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires equality_comparable<ziperator<Const>>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
    requires random_access_range<Base>;

    Effects: Equivalent to: return x.operator_ op y.operator_;
constexpr sentinel(sentinel<!Const> i)
   requires Const && convertible_to<sentinel<false>, sentinel<Const>>;

   Effects: Initializes inner_ with std::move(i.inner_).

   template<bool OtherConst>
     requires sentinel_for<sentinel<Const>, zerator<OtherConst>>
   friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

   Effects: Equivalent to: return x.inner_ == y.inner_;
constexpr auto begin() const requires range<const V> {
    return iterator<true>(ranges::begin(base_), ranges::end(base_));
}

constexpr auto end() requires (!simple_view<V>) {

friend constexpr auto iter_move(const iterator& i) noexcept;
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept;

§ 26.7.25.3

iterator::iterator_concept is defined as follows:
(1.1) If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
(1.2) Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) Otherwise, iterator_concept denotes forward_iterator_tag.

If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr iterator (iterator_t<Base> first, sentinel_t<Base> last);

Postconditions: current_[0] == first is true, and for every integer 1 ≤ i < N, current_[i] ==
ranges::next(current_[i-1], 1, last) is true.

constexpr iterator (as-sentinel, iterator_t<Base> first, iterator_t<Base> last);

Postconditions: If Base does not model bidirectional_range, each element of current_ is equal to
last. Otherwise, current_[N-1] == last is true, and for every integer 0 ≤ i < (N-1), current_[i] ==
ranges::prev(current_[i+1], 1, first) is true.

constexpr iterator (iterator<Const> i)
requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

Effects: Initializes each element of current_ with the corresponding element of i.current_ as an
xvalue.
constexpr auto operator*() const;

Effects: Equivalent to:

return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();

Preconditions: current_.back() is incrementable.

Postconditions: Each element of current_ is equal to ranges::next(i), where i is the value of that element before the call.

Returns: *this.

constexpr iterator operator++(int);

Effects: Equivalent to:

auto tmp = *this;
++*this;
return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Preconditions: current_.front() is decrementable.

Postconditions: Each element of current_ is equal to ranges::prev(i), where i is the value of that element before the call.

Returns: *this.

constexpr iterator operator--(int) requires bidirectional_range<Base>;

Effects: Equivalent to:

auto tmp = *this;
-->*this;
return tmp;

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;

Preconditions: current_.back() + x has well-defined behavior.

Postconditions: Each element of current_ is equal to i + x, where i is the value of that element before the call.

Returns: *this.

constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

Preconditions: current_.front() - x has well-defined behavior.

Postconditions: Each element of current_ is equal to i - x, where i is the value of that element before the call.

Returns: *this.

constexpr auto operator[](difference_type n) const
requires random_access_range<Base>;

Effects: Equivalent to:

return tuple-transform([](auto& i) -> decltype(auto) { return i[n]; }, current_);

friend constexpr bool operator==(const iterator& x, const iterator& y);

Returns: x.current_.back() == y.current_.back().

friend constexpr bool operator<(const iterator& x, const iterator& y)
requires random_access_range<Base>;

Returns: x.current_.back() < y.current_.back.
friend constexpr bool operator>(const iterator& x, const iterator& y) 
requires random_access_range<Base>;

Effects: Equivalent to: return y < x;

friend constexpr bool operator%(const iterator& x, const iterator& y) 
requires random_access_range<Base>;

Effects: Equivalent to: return !(y < x);

friend constexpr bool operator%(const iterator& x, const iterator& y) 
requires random_access_range<Base>;

Effects: Equivalent to: return !(x < y);

friend constexpr auto operator%(const iterator& x, const iterator& y) 
requires random_access_range<Base> &&
three_way_comparable<iterator_t<Base>>;

Returns: x.current_.back() <=> y.current_.back().

friend constexpr iterator operator+(const iterator& i, difference_type n) 
requires random_access_range<Base>;

friend constexpr iterator operator+(difference_type n, const iterator& i) 
requires random_access_range<Base>;

Effects: Equivalent to:
auto r = i;
r += n;
return r;

friend constexpr iterator operator-(const iterator& i, difference_type n) 
requires random_access_range<Base>;

Effects: Equivalent to:
auto r = i;
r -= n;
return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y) 
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

Effects: Equivalent to: return x.current_.back() - y.current_.back();

friend constexpr auto iter_move(const iterator& i) noexcept(see below);

Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);

Remarks: The exception specification is equivalent to:
noexcept(ranges::iter_move(declval<const iterator_t<Base>>&())) &&
is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>

26.7.25.4 Class template adjacent_view::sentinel

namespace std::ranges {

template<forward_range V, size_t N> 
requires view<V> && (N > 0) 
template<bool Const> 
class adjacent_view<V, N>::sentinel {
using Base = maybe-const<Const, V>;

sentinel_t<Base> end_ = sentinel_t<Base>();

// exposition only

§ 26.7.25.4

constexpr explicit sentinel(sentinel_t<Base> end);  // exposition only

public:
    sentinel() = default;
constexpr sentinel(sentinel<!Const> i)
    requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

template<bool OtherConst>
    requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst>, V>>

template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& y, const iterator<OtherConst>& x);

1 Effects: Initializes end_ with end.

castexpr sentinel(sentinel<!Const> i)
    requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

2 Effects: Initializes end_ with std::move(i.end_).

template<bool OtherConst>
    requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& y, const iterator<OtherConst>& x);

3 Effects: Equivalent to: return x.current_.back() - y.end_;

template<bool OtherConst>
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>
    friend constexpr range_difference_t<maybe-const<OtherConst, V>>
    operator-(const sentinel& y, const iterator<OtherConst>& x);

4 Effects: Equivalent to: return y.end_ - x.current_.back();

26.7.26 Adjacent transform view

26.7.26.1 Overview

adjacent_transform_view takes an invocable object and a view and produces a view whose Mth element is the result of applying the invocable object to the Mth through (M + N − 1)th elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

The name views::adjacent_transform<N> denotes a range adaptor object (26.7.2). Given subexpressions E and F and a constant expression N:

(2.1) If N is equal to 0, views::adjacent_transform<N>(E, F) is expression-equivalent to ((void)E, views::zip_transform(F)), except that the evaluations of E and F are indeterminately sequenced.

(2.2) Otherwise, the expression views::adjacent_transform<N>(E, F) is expression-equivalent to adjacent_transform_view<views::all_t<decltype((E))>, decay_t<decltype((F))>, N>(E, F).

[Example 1:}

§ 26.7.26.1
vector v = {1, 2, 3, 4};

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
    cout << i << ' ' << // prints 2 6 12
}

—end example]  

26.7.26.2 Class template adjacent_transform_view  

namespace std::ranges {
    template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
        regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
        can_reference<invoke_result_t<F&>, REPEAT(range_reference_t<V>, N)...>
    class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
        movable_box<F> fun_;  // exposition only
        adjacent_view<V, N> inner_;  // exposition only

        using InnerView = adjacent_view<V, N>;  // exposition only
        template<Const>
            using inner_iterator = iterator_t<maybe_const<Const, InnerView>>;  // exposition only
        template<Const>
            using inner_sentinel = sentinel_t<maybe_const<Const, InnerView>>;  // exposition only

        // 26.7.26.3, class template adjacent_transform_view::iterator
        template<bool> class iterator;
        // exposition only

        // 26.7.26.4, class template adjacent_transform_view::sentinel
        template<bool> class sentinel;
        // exposition only

    public:
        adjacent_transform_view() = default;
        constexpr explicit adjacent_transform_view(V base, F fun);

        constexpr auto begin() {
            return iterator<false>(*this, inner_.begin());
        }

        constexpr auto begin() const requires range<const InnerView> &&
            regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
            return iterator<true>(*this, inner_.begin());
        }

        constexpr auto end() {
            if constexpr (common_range<InnerView>) {
                return iterator<false>(*this, inner_.end());
            } else {
                return sentinel<false>(inner_.end());
            }
        }

        constexpr auto end() const requires range<const InnerView> &&
            regular_invocable<const F&, REPEAT(range_reference_t<const V>, N)...> {
            if constexpr (common_range<InnerView>) {
                return iterator<true>(*this, inner_.end());
            } else {
                return sentinel<true>(inner_.end());
            }
        }

        constexpr auto size() requires sized_range<InnerView> {
            return inner_.size();
        }
}
constexpr auto size() const requires sized_range<const InnerView> {
    return inner_.size();
};

constexpr explicit adjacent_transform_view(V base, F fun);

Effects: Initializes \texttt{fun} with \texttt{std::move}(\texttt{fun}) and \texttt{inner} with \texttt{std::move}(\texttt{base}).

26.7.26.3 Class template adjacent_transform_view::iterator
[range.adjacent.transform.iterator]

namespace std::ranges {
    template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
    regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
    can_reference<invoke_result_t<F&>, REPEAT(range_reference_t<V>, N)...>>
    template<bool Const>
    class adjacent_transform_view<V, F, N>::iterator {

Returns: div-ceil(x.end_ - x.current_, x.n_).

friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y) requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

27

Effects: Equivalent to: return -(y - x);

26.7.28 Slide view

26.7.28.1 Overview

slide_view takes a view and a number N and produces a view whose Mth element is a view over the Mth through (M + N - 1)th elements of the original view. If the original view has fewer than N elements, the resulting view is empty.

2 The name views::slide denotes a range adaptor object (26.7.2). Given subexpressions E and N, the expression views::slide(E, N) is expression-equivalent to slide_view(E, N).

[Example 1:

vector v = {1, 2, 3, 4};

for (auto i : v | views::slide(2)) {
    cout << '[' << i[0] << ', ' << i[1] << ']' << endl; // prints [1, 2] [2, 3] [3, 4]
}
—end example]

26.7.28.2 Class template slide_view

namespace std::ranges {

template<class V>

concept slide-caches-nothing = random_access_range<V> && sized_range<V>;                // exposition only

template<class V>

concept slide-caches-last =            // exposition only
    !slide-caches-nothing<V> && bidirectional_range<V> && common_range<V>;

template<class V>

concept slide-caches-first =            // exposition only
    !slide-caches-nothing<V> && !slide-caches-last<V>;

template<forward_range V>

requires view<V>

class slide_view : public view_interface<slide_view<V>> {

    V base_;                                      // exposition only
    range_difference_t<V> n_;                     // exposition only

    // 26.7.28.3, class template slide_view::iterator
    template<bool> class iterator;                // exposition only

    // 26.7.28.4, class slide_view::sentinel
    class sentinel;                               // exposition only

    public:

        constexpr explicit slide_view(V base, range_difference_t<V> n);

        constexpr auto begin() requires (!simple-view<V> && slide-caches-nothing<const V>); // exposition only

        constexpr auto begin() const requires slide-caches-nothing<const V>;

};

§ 26.7.28.2 1224
constexpr auto end()
    requires (!((simple-view<V> && slide-caches-nothing<const V>)));
constexpr auto end() const requires slide-caches-nothing<const V>;
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
};

template<class R>
slide_view(R&& r, range_difference_t<R>) -> slide_view<views::all_t<R>>;

constexpr explicit slide_view(V base, range_difference_t<V> n);
1  Preconditions: n > 0 is true.
2  Effects: Initializes base_ with std::move(base) and n_ with n.

constexpr auto begin()
    requires (!((simple-view<V> && slide-caches-nothing<const V>)));
3  Returns:
(3.1)  — If V models slide-caches-first,
        iterator<false>(ranges::begin(base_),
                        ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)
(3.2)  — Otherwise, iterator<false>(ranges::begin(base_), n_).
4  Remarks: In order to provide the amortized constant-time complexity required by the range concept,
           this function caches the result within the slide_view for use on subsequent calls when V models
           slide-caches-first.

constexpr auto begin() const requires slide-caches-nothing<const V>;
5  Returns: iterator<true>(ranges::begin(base_), n_).

constexpr auto end()
    requires (!((simple-view<V> && slide-caches-nothing<const V>)));
6  Returns:
(6.1)  — If V models slide-caches-nothing,
        iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)
(6.2)  — Otherwise, if V models slide-caches-last,
        iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)
(6.3)  — Otherwise, if V models common_range,
        iterator<false>(ranges::end(base_), ranges::end(base_), n_)
(6.4)  — Otherwise, sentinel(ranges::end(base_)).
7  Remarks: In order to provide the amortized constant-time complexity required by the range concept,
           this function caches the result within the slide_view for use on subsequent calls when V models
           slide-caches-last.

constexpr auto end() const requires slide-caches-nothing<const V>;
8  Returns: begin() + range_difference_t<const V>(size()).

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;
9  Effects: Equivalent to:
    auto sz = ranges::distance(base_) - n_ + 1;
    if (sz < 0) sz = 0;
    return to_unsigned-like(sz);
26.7.28.3 Class template slide_view::iterator

namespace std::ranges {
  template<forward_range V>
  requires view<V>
  template<bool Const>
  class slide_view<V>::iterator {
    using Base = maybe-const<Const, V>;
    iterator_t<Base> current_, last_ele_; // exposition only
    range_difference_t<Base> n_ = 0; // exposition only
    constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n) // exposition only
      requires (!slide-caches-first<Base>);
    constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele, // exposition only
                       range_difference_t<Base> n)
      requires slide-caches-first<Base>;

    public:
      using iterator_category = input_iterator_tag;
      using iterator_concept = see below;
      using value_type = decltype(views::counted(current_, n_));
      using difference_type = range_difference_t<Base>;
      iterator() = default;
      constexpr iterator(!Const) i)
        requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
      constexpr auto operator*() const;
      constexpr iterator& operator++();
      constexpr iterator operator++(int);
      constexpr iterator& operator--() requires bidirectional_range<Base>;
      constexpr iterator operator--(int) requires bidirectional_range<Base>;
      constexpr iterator& operator+=(difference_type x)
        requires random_access_range<Base>;
      constexpr iterator operator+=(difference_type x)
        requires random_access_range<Base>;
      constexpr auto operator[](difference_type n) const
        requires random_access_range<Base>;
      friend constexpr bool operator==(const iterator& x, const iterator& y);
      friend constexpr bool operator<(const iterator& x, const iterator& y)
        requires random_access_range<Base>;
      friend constexpr bool operator>(const iterator& x, const iterator& y)
        requires random_access_range<Base>;
      friend constexpr bool operator<=(const iterator& x, const iterator& y)
        requires random_access_range<Base>;
      friend constexpr bool operator>=(const iterator& x, const iterator& y)
        requires random_access_range<Base>;
      friend constexpr auto operator<=>(const iterator& x, const iterator& y)
        requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;
      friend constexpr iterator operator+(const iterator& i, difference_type n)
        requires random_access_range<Base>;
      friend constexpr iterator operator+(difference_type n, const iterator& i)
        requires random_access_range<Base>;

        requires random_access_range<Base>;

  } // class slide_view<V>::iterator
} // namespace std::ranges
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
};
}

1 iterator::iterator_concept is defined as follows:

- If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
- Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
- Otherwise, iterator_concept denotes forward_iterator_tag.

2 If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr iterator(iterator_t<Base> current, range_difference_t<Base> n)
    requires (!slide-caches-first<Base>);

Effects: Initializes current_ with current and n_ with n.

constexpr iterator(iterator_t<Base> current, iterator_t<Base> last_ele, range_difference_t<Base> n)
    requires slide-caches-first<Base>;

Effects: Initializes current_ with current, last_ele_ with last_ele, and n_ with n.

constexpr iterator(iterator<Const> i)
    requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

Effects: Initializes current_ with std::move(i.current_) and n_ with i.n_.

[Note 1: iterator<true> can only be formed when Base models slide-caches-nothing, in which case last_ele_ is not present. —end note]

constexpr auto operator*() const;

Returns: views::counted(current_, n_).

constexpr iterator& operator++();

Preconditions: current_ and last_ele_ (if present) are incrementable.

Postconditions: current_ and last_ele_ (if present) are each equal to ranges::next(i), where i is the value of that data member before the call.

Returns: *this.

constexpr iterator operator++(int);

Effects: Equivalent to:
    auto tmp = *this;
    ***this;
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Preconditions: current_ and last_ele_ (if present) are decrementable.

Postconditions: current_ and last_ele_ (if present) are each equal to ranges::prev(i), where i is the value of that data member before the call.

Returns: *this.

constexpr iterator operator--(int) requires bidirectional_range<Base>;

Effects: Equivalent to:
    auto tmp = *this;
    --**this;
    return tmp;
constexpr iterator operator+=(difference_type x)  
requires random_access_range<Base>;

15 Preconditions: current_ + x and last_ele_ + x (if last_ele_ is present) have well-defined behavior.
16 Postconditions: current_ and last_ele_ (if present) are each equal to \( i + x \), where \( i \) is the value of that data member before the call.

17 Returns: *this.

constexpr iterator operator-=(difference_type x)  
requires random_access_range<Base>;

18 Preconditions: current_ - x and last_ele_ - x (if last_ele_ is present) have well-defined behavior.
19 Postconditions: current_ and last_ele_ (if present) are each equal to \( i - x \), where \( i \) is the value of that data member before the call.

20 Returns: *this.

constexpr auto operator[](difference_type n) const  
requires random_access_range<Base>;

21 Effects: Equivalent to: return views::counted(current_ + n, n_);

friend constexpr bool operator==(const iterator& x, const iterator& y);

22 Returns: If last_ele_ is present, x.last_ele_ == y.last_ele_; otherwise, x.current_ == y.current_.

friend constexpr bool operator<(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

23 Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

24 Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

25 Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y)  
requires random_access_range<Base>;

26 Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y)  
requires random_access_range<Base> &&
three_way_comparable<iterator_t<Base>>;

27 Returns: x.current_ <=> y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)  
requires random_access_range<Base>;

28 Effects: Equivalent to:
   auto r = i;
   r += n;
   return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)  
requires random_access_range<Base>;

29 Effects: Equivalent to:
   auto r = i;
   r -= n;
   return r;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

Returns: If last_ele_ is present, x.last_ele_ - y.last_ele_; otherwise, x.current_ - y.current_.

26.7.28.4 Class slide_view::sentinel

namespace std::ranges {
    template<forward_range V>
        requires view<V>
    class slide_view<V>::sentinel {
        sentinel_t<V> end_ = sentinel_t<V>(); // exposition only
    } // exposition only

public:
    sentinel() = default;

friend constexpr explicit sentinel(sentinel_t<V> end);

friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

friend constexpr range_difference_t<V>
    operator-(const iterator<false>& x, const sentinel& y)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

friend constexpr range_difference_t<V>
    operator-(const sentinel& y, const iterator<false>& x)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
};

1 [Note 1: sentinel is used only when slide-caches-first<V> is true. — end note]
2 constexpr explicit sentinel(sentinel_t<V> end);
3 Effects: Initializes end_ with end.

friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

friend constexpr range_difference_t<V>
    operator-(const iterator<false>& x, const sentinel& y)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
4 Returns: x.last_ele_ == y.end_.

friend constexpr range_difference_t<V>
    operator-(const sentinel& y, const iterator<false>& x)
    requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
5 Returns: y.end_ - x.last_ele_.

26.7.29 Chunk by view

26.7.29.1 Overview

chunk_by_view takes a view and a predicate, and splits the view into subranges between each pair of adjacent elements for which the predicate returns false.

The name views::chunk_by denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::chunk_by(E, F) is expression-equivalent to chunk_by_view(E, F).

[Example 1:

```c++
vector v = {1, 2, 2, 3, 0, 4, 5, 2};

for (auto r : v | views::chunk_by(ranges::less_equal{})) {
    cout << '[';
    auto sep = "";
    for (auto i : r) {
        cout << sep << i;
    }
    cout << ']
```
namespace std::ranges {

    template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
    class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
        V base_; // exposition only
        movable-box<Pred> pred_; // exposition only

        // 26.7.29.3, class chunk_by_view::iterator
        class iterator; // exposition only

        public:
            chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
            constexpr explicit chunk_by_view(V base, Pred pred);
            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr const Pred& pred() const;
            constexpr iterator begin();
            constexpr auto end();
            constexpr iterator_t<V> find-next(iterator_t<V>);
            constexpr iterator_t<V> find-prev(iterator_t<V>) // exposition only
                requires bidirectional_range<V>;
    };

    template<class R, class Pred>
    chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;

    constexpr explicit chunk_by_view(V base, Pred pred); // exposition only

    1 Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).
    2 constexpr const Pred& pred() const;
        Effects: Equivalent to: return *pred_;
    3 constexpr iterator begin();
    4 constexpr auto end();
    5 constexpr iterator_t<V> find-next(iterator_t<V>);
    6 constexpr iterator_t<V> find-prev(iterator_t<V>) // exposition only
        requires bidirectional_range<V>;

    template<class R, class Pred>
    chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;

    constexpr explicit chunk_by_view(V base, Pred pred);

    § 26.7.29.2 1230
constexpr iterator_t<V> find-next(iterator_t<V> current);

Preconditions: pred_.has_value() is true.

Returns:
ranges::next(ranges::adjacent_find(current, ranges::end(base_), not_fn(ref(*pred_))),
1, ranges::end(base_))

constexpr iterator_t<V> find-prev(iterator_t<V> current) requires bidirectional_range<V>;

Preconditions:
(9.1) current is not equal to ranges::begin(base_).
(9.2) pred_.has_value() is true.

Returns: An iterator \(i\) in the range \([\text{ranges}::\text{begin}(\text{base}_), \text{current}]\) such that:
(10.1) ranges::adjacent_find(i, current, not_fn(ref(*pred_))) is equal to current; and
(10.2) if \(i\) is not equal to ranges::begin(base_), then bool(invoke(*pred_, *ranges::prev(i), *i)) is false.

26.7.29.3 Class chunk_by_view::iterator

namespace std::ranges {

template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
requires view<V> && is_object_v<Pred>
class chunk_by_view<V, Pred>::iterator {

chunk_by_view* parent_ = nullptr;
// exposition only
iterator_t<V> current_ = iterator_t<V>();
// exposition only
iterator_t<V> next_ = iterator_t<V>();
// exposition only

constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);

public:
using value_type = subrange<iterator_t<V>>;
using difference_type = range_difference_t<V>;
using iterator_category = input_iterator_tag;
using iterator_concept = see below;

iterator() = default;

constexpr value_type operator*() const;
constexpr iterator& operator++();
constexpr iterator operator++(int);

constexpr iterator& operator--() requires bidirectional_range<V>;
constexpr iterator operator--(int) requires bidirectional_range<V>;

friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
};

1 iterator::iterator_concept is defined as follows:
(1.1) If \(V\) models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.2) Otherwise, iterator_concept denotes forward_iterator_tag.

constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);
Effects: Initializes parent_ with addressof(parent), current_ with current, and next_ with next.

constexpr value_type operator*() const;

Preconditions: current_ is not equal to next_.

Returns: subrange(current_, next_).
constexpr iterator& operator++();
5  Preconditions: current_ is not equal to next_.
6  Effects: Equivalent to:
   current_ = next_;  
   next_ = parent_->find-next(current_);  
   return *this;

constexpr iterator operator++(int);
7  Effects: Equivalent to:
   auto tmp = *this;  
   +++*this;  
   return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;
8  Effects: Equivalent to:
   next_ = current_;  
   current_ = parent_->find-prev(next_);  
   return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;
9  Effects: Equivalent to:
   auto tmp = *this;  
   --*this;  
   return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y);
10 Returns: x.current_ == y.current_.

friend constexpr bool operator==(const iterator& x, default_sentinel_t);
11 Returns: x.current_ == x.next_.

26.7.30 Stride view
26.7.30.1 Overview
1 stride_view presents a view of an underlying sequence, advancing over n elements at a time, as opposed to
the usual single-step succession.
2 The name views::stride denotes a range adaptor object (26.7.2). Given subexpressions E and N, the
expression views::stride(E, N) is expression-equivalent to stride_view(E, N).
3 [Example 1:]
   auto input = views::iota(0, 12) | views::stride(3);
   ranges::copy(input, ostream_iterator<int>(cout, " "));  // prints 0 3 6 9
   ranges::copy(input | views::reverse, ostream_iterator<int>(cout, " "));  // prints 9 6 3 0
   —end example]

26.7.30.2 Class template stride_view

namespace std::ranges {
   template<input_range V>
      requires view<V>
   class stride_view : public view_interface<stride_view<V>> { 
      V base_;  // exposition only

  requires indirectly_swappable<iterator_t<Base>>;

§ 26.7.30.3

1 iterator::iterator_concept is defined as follows:

(1.1) — If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows:

(2.1) — Let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.

(2.2) — If C models derived_from<random_access_iterator_tag>, then iterator_category denotes random_access_iterator_tag.

(2.3) — Otherwise, iterator_category denotes C.

constexpr iterator(Parent* parent, iterator_t<Base> current,  
  range_difference_t<Base> missing = 0);

Effects: Initializes current_ with std::move(current), end_ with ranges::end(parent->base_),  
  stride_ with parent->stride_, and missing_ with missing.

constexpr iterator(iterator<!Const> i)  
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>  
  && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes current_ with std::move(i.current_), end_ with std::move(i.end_), stride_  
  with i.stride_, and missing_ with i.missing_.

constexpr iterator_t<Base> base() &&;

Returns: std::move(current_).

constexpr const iterator_t<Base>& base() const & noexcept;

Returns: current_.

constexpr iterator& operator++();

Preconditions: current_ != end_ is true.

Effects: Equivalent to:

  missing_ = ranges::advance(current_, stride_, end_);  
  return *this;

constexpr void operator++(int);

Effects: Equivalent to: +++this;
constexpr iterator operator++(int) requires forward_range<Base>;

**Effects**: Equivalent to:
```cpp
auto tmp = *this;
++*this;
return tmp;
```

constexpr iterator& operator--() requires bidirectional_range<Base>;

**Effects**: Equivalent to:
```cpp
ranges::advance(current_, missing_ - stride_);
missing_ = 0;
return *this;
```

constexpr iterator& operator--(int) requires bidirectional_range<Base>;

**Effects**: Equivalent to:
```cpp
auto tmp = *this;
--*this;
return tmp;
```

constexpr iterator& operator+=(difference_type n) requires random_access_range<Base>;

**Preconditions**: If \( n \) is positive, \( \text{ranges}::\text{distance}(\text{current}_-, \text{end}_-) > \text{stride}_- \ast (n - 1) \) is true.

[Note 1: If \( n \) is negative, the Effects paragraph implies a precondition. — end note]

**Effects**: Equivalent to:
```cpp
if (n > 0) {
    missing_ = ranges::advance(current_, stride_ \ast n, end_);
} else if (n < 0) {
    ranges::advance(current_, stride_ \ast n + missing_);
    missing_ = 0;
}
return *this;
```

constexpr iterator& operator=(difference_type x) requires random_access_range<Base>;

**Effects**: Equivalent to: \( \text{return } *\text{this} \oplus -x; \)

friend constexpr bool operator==(const iterator& x, default_sentinel_t);

**Returns**: \( x.\text{current}_- \oplus x.\text{end}_- \)

friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<iterator_t<Base>>;

**Returns**: \( x.\text{current}_- \oplus y.\text{current}_- \)

friend constexpr bool operator<(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Effects**: Equivalent to: \( \text{return } y < x; \)

friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Effects**: Equivalent to: \( \text{return } !(y < x); \)

friend constexpr bool operator>(const iterator& x, const iterator& y) requires random_access_range<Base>;

**Effects**: Equivalent to: \( \text{return } !(x < y); \)
friend constexpr auto operator<=>(const iterator& x, const iterator& y)  
requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

22 Returns: x.current_ <=> y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n)  
requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i)  
requires random_access_range<Base>;

23 Effects: Equivalent to:
 auto r = i;
 r += n;
 return r;

friend constexpr iterator operator-(const iterator& i, difference_type n)  
requires random_access_range<Base>;

24 Effects: Equivalent to:
 auto r = i;
 r -= n;
 return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

25 Returns: Let N be (x.current_ - y.current_).

(25.1) — If Base models forward_range, (N + x.missing_ - y.missing_) / x.stride_.
(25.2) — Otherwise, if N is negative, -div-ceil(-N, x.stride_).
(25.3) — Otherwise, div-ceil(N, x.stride_).

friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)  
requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

26 Returns: div-ceil(x.end_ - x.current_, x.stride_).

friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)  
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

27 Effects: Equivalent to: return -(y - x);

friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)  
noexcept(noexcept(ranges::iter_move(i.current_)));

28 Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y)  
noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))  
requires indirectly_swappable<iterator_t<Base>>;

29 Effects: Equivalent to: ranges::iter_swap(x.current_, y.current_);

26.7.31 Cartesian product view [range.cartesian]

26.7.31.1 Overview [range.cartesian.overview]

1 cartesian_product_view takes any non-zero number of ranges n and produces a view of tuples calculated by the n-ary cartesian product of the provided ranges.

2 The name views::cartesian_product denotes a customization point object (16.3.3.3.6). Given a pack of subexpressions Es, the expression views::cartesian_product(Es...) is expression-equivalent to

(21) — views::single(tuple()) if Es is an empty pack,
(22) — otherwise, cartesian_product_view<views::all_t<decltype((Es))>...>(Es...).

3 [Example 1]:
 vector<int> v { 0, 1, 2 };
```cpp
for (auto&& [a, b, c] : views::cartesian_product(v, v, v)) {
    cout << a << ' ' << b << ' ' << c << '
';
}
// The above prints
// 0 0 0
// 0 0 1
// 0 0 2
// 0 1 0
// 0 1 1
// ...
@end example]

### 26.7.31.2 Class template cartesian_product_view

```
public:
constexpr cartesian_product_view() = default;
constexpr explicit cartesian_product_view(First first_base, Vs... bases);

constexpr iterator<false> begin()
   requires (!simple_view<First> || ... || !simple_view<Vs>);
constexpr iterator<true> begin() const
   requires (range<First> && ... && range<Vs>);

constexpr iterator<false> end()
   requires ((!simple_view<First> || ... || !simple_view<Vs>)
              && cartesian_product_is_common<First, Vs...>);
constexpr iterator<true> end() const
   requires cartesian_product_is_common<const First, const Vs...>;
constexpr default_sentinel_t end() const noexcept;

constexpr see below size()
   requires cartesian_product_is_sized<First, Vs...>;
constexpr see below size() const
   requires cartesian_product_is_sized<const First, const Vs...>;

};

template<class... Vs>
cartesian_product_view(Vs&&...) -> cartesian_product_view<all_t<Vs>...>;

constexpr explicit cartesian_product_view(First first_base, Vs... bases);

Effects: Initializes bases_ with std::move(first_base), std::move(bases)....

constexpr iterator<false> begin()
   requires (!simple_view<First> || ... || !simple_view<Vs>);

Effects: Equivalent to: return iterator<false>(tuple_transform(ranges::begin, bases_));

constexpr iterator<true> begin() const
   requires (range<First> && ... && range<Vs>);

Effects: Equivalent to: return iterator<true>(tuple_transform(ranges::begin, bases_));

constexpr iterator<false> end()
   requires ((!simple_view<First> || ... || !simple_view<Vs>)
              && cartesian_product_is_common<First, Vs...>);
constexpr iterator<true> end() const
   requires cartesian_product_is_common<const First, const Vs...>;

Let:

(4.1) — is-const be true for the const-qualified overload, and false otherwise;

(4.2) — is-empty be true if the expression ranges::empty(rng) is true for any rng among the underlying
       ranges except the first one and false otherwise; and

(4.3) — begin-or-first-end(rng) be expression-equivalent to is-empty ?
       ranges::begin(rng) :
       cartesian_common_arg_end(rng) if rng is the first underlying range and
       ranges::begin(rng) otherwise.

Effects: Equivalent to:
iterator<is-const> it(tuple_transform(
   [](auto& rng){ return begin-or-first-end(rng); }, bases_));
return it;

constexpr default_sentinel_t end() const noexcept;

Returns: default_sentinel.

constexpr see below size()
   requires cartesian_product_is_sized<First, Vs...>;

§ 26.7.31.2
```cpp
constexpr see below size() const
    requires cartesian-product-is-sized<const First, const Vs...>;

The return type is an implementation-defined unsigned-integer-like type.

Recommended practice: The return type should be the smallest unsigned-integer-like type that is
sufficiently wide to store the product of the maximum sizes of all the underlying ranges, if such a type
exists.

Let $p$ be the product of the sizes of all the ranges in `bases_`.

Preconditions: $p$ can be represented by the return type.

Returns: $p$.

26.7.31.3 Class template cartesian_product_view::iterator

namespace std::ranges {

    template<input_range First, forward_range... Vs>
        requires (view<First> && ... && view<Vs>)
    class cartesian_product_view<First, Vs...>::iterator {
        using iterator_category = input_iterator_tag;
        using iterator_concept = see below;
        using value_type = tuple<range_value_t<maybe-const<First>, First>>,
                         range_value_t<maybe-const<First, Vs>>...>; // see below
        using reference = tuple<range_reference_t<maybe-const<First>, First>>,
                         range_reference_t<maybe-const<First, Vs>>...>; // see below
        using difference_type = see below;

        iterator() requires forward_range<maybe-const<First, Const>>, First> = default;
        constexpr iterator(iterator<!Const> i) requires Const &&
            (convertible_to<_iterator_t<First>, iterator_t<const First>> &&
            ... && convertible_to<iterator_t<Vs>, iterator_t<const Vs>>);

        constexpr auto operator*() const;
        constexpr iterator& operator++();
        constexpr void operator++(int);
        constexpr iterator& operator++(int) requires forward_range<maybe-const<First, Const>, First>;

        constexpr iterator& operator--() requires cartesian-product-is-bidirectional<Const, First, Vs>;
        constexpr iterator& operator--(int) requires cartesian-product-is-bidirectional<Const, First, Vs>;

        constexpr iterator& operator+=(difference_type x) requires cartesian-product-is-random-access<Const, First, Vs>;
        constexpr iterator& operator-=(difference_type x) requires cartesian-product-is-random-access<Const, First, Vs>;

        constexpr reference operator[](difference_type n) const
            requires cartesian-product-is-random-access<Const, First, Vs>;

        friend constexpr bool operator==(const iterator& x, const iterator& y)
            requires equality_comparable<iterator_t<maybe-const<First, Const>>;

        friend constexpr bool operator==(const iterator& x, default_sentinel_t);

        friend constexpr auto operator<=>(const iterator& x, const iterator& y)
            requires all-random-access<Const, First, Vs>;

        friend constexpr iterator operator+(const iterator& x, difference_type y)
            requires cartesian-product-is-random-access<Const, First, Vs>;
        friend constexpr iterator operator+(difference_type x, const iterator& y)
            requires cartesian-product-is-random-access<Const, First, Vs>;
    }

§ 26.7.31.3
friend constexpr iterator operator-(const iterator& x, difference_type y) 
  requires cartesian-product-is-random-access<Const, First, Vs...>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) 
  requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;

friend constexpr difference_type operator-(iterator i, default_sentinel_t) 
  requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;
friend constexpr difference_type operator-(default_sentinel_t, iterator i) 
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below) 
  requires (indirectly_swappable<iterator_t<maybe-const<Const, First>>> && ... &&
            indirectly_swappable<iterator_t<maybe-const<Const, Vs>>>);

private:
  maybe-const<Const, cartesian_product_view>* parent_ = nullptr; // exposition only
  tuple<iterator_t<maybe-const<Const, First>>, 
        iterator_t<maybe-const<Const, Vs>>...> current_; // exposition only

template<
  size_t N = sizeof...(Vs)> 
  constexpr void next(); // exposition only

template<
  size_t N = sizeof...(Vs)> 
  constexpr void prev(); // exposition only

template<class Tuple> 
  constexpr difference_type distance-from(Tuple t); // exposition only

customexpr explicit iterator(tuple<iterator_t<maybe-const<Const, First>>, 
                               iterator_t<maybe-const<Const, Vs>>...> current); // exposition only
};

1 iterator::iterator_concept is defined as follows:

(1.1) — If cartesian-product-is-random-access<Const, First, Vs...> is modeled, then iterator_concept denotes random_access_iterator_tag.
(1.2) — Otherwise, if cartesian-product-is-bidirectional<Const, First, Vs...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) — Otherwise, if maybe-const<Const, First> models forward_range, then iterator_concept denotes forward_iterator_tag.
(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 iterator::difference_type is an implementation-defined signed-integer-like type.

3 Recommended practice: iterator::difference_type should be the smallest signed-integer-like type that is sufficiently wide to store the product of the maximum sizes of all underlying ranges if such a type exists.

4 template<
  size_t N = sizeof...(Vs)> 
  constexpr void next();

5 Effects: Equivalent to:

auto& it = std::get<N>(current_);
++it;
if constexpr (N > 0) {
  if (it == ranges::end(std::get<N>(parent_->bases))) {
    it = ranges::begin(std::get<N>(parent_->bases));
    next<N - 1>();
  }
}
template<size_t N = sizeof...(Vs)>
constexpr void prev();

Effects: Equivalent to:
auto& it = std::get<N>(current_);
if (it == ranges::begin(std::get<N>(parent_->bases_))) {
    it = cartesian-common-arg-end(std::get<N>(parent_->bases_));
    if constexpr (N > 0) {
        prev<N - 1>();
    }
}
--it;

template<class Tuple>
constexpr difference_type distance-from(Tuple t);

Let:
— \textit{scaled-size}(N) be the product of static_cast<difference_type>(ranges::size(std::get<N>(parent_->bases_))) and \textit{scaled-size}(N + 1) if \( N < \text{sizeof...}(\text{Vs})\), otherwise static_cast<difference_type>(1);
— \textit{scaled-distance}(N) be the product of static_cast<difference_type>(std::get<N>(current_) - std::get<N>(t)) and \textit{scaled-size}(N + 1); and
— \textit{scaled-sum} be the sum of \textit{scaled-distance}(N) for every integer \( 0 \leq N \leq \text{sizeof...}(\text{Vs})\).

Preconditions: \textit{scaled-sum} can be represented by difference_type.

Returns: \textit{scaled-sum}.

constexpr explicit iterator(tuple<iterator_t<maybe-const<Const, First>>, iterator_t<maybe-const<Const, Vs>>...> current);

Effects: Initializes current_ with std::move(current).

constexpr iterator(iterator<Const> i) requires Const && (convertible_to<iterator_t<First>, iterator_t<const First>> && ...
... && convertible_to<iterator_t<Vs>, iterator_t<const Vs>>);

Effects: Initializes current_ with std::move(i.current_).

constexpr auto operator*() const;

Effects: Equivalent to:
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();

Effects: Equivalent to:
next();
return *this;

constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires forward_range<maybe-const<Const, First>>;

Effects: Equivalent to:
auto tmp = *this;
++this;
return tmp;

constexpr iterator& operator--() requires cartesian-product-is-bidirectional<Const, First, Vs...>;

Effects: Equivalent to:
prev();
return *this;
constexpr iterator operator--(int)
   requires cartesian-product-is-bidirectional<Const, First, Vs...>;
17  Effects: Equivalent to:
      auto tmp = *this;
      --*this;
      return tmp;

constexpr iterator& operator+=(difference_type x)
   requires cartesian-product-is-random-access<Const, First, Vs...>;
18  Let orig be the value of *this before the call.

Let ret be:
   (18.1) If x > 0, the value of *this had next been called x times.
   (18.2) Otherwise, if x < 0, the value of *this had prev been called -x times.
   (18.3) Otherwise, orig.
19  Preconditions: x is in the range [ranges::distance(*this, ranges::begin(*parent_)),
  ranges::distance(*this, ranges::end(*parent_))].
20  Effects: Sets the value of *this to ret.
21  Returns: *this.
22  Complexity: Constant.

constexpr iterator& operator-=(difference_type x)
   requires cartesian-product-is-random-access<Const, First, Vs...>;
23  Effects: Equivalent to:
      *this += -x;
      return *this;

constexpr reference operator[](difference_type n) const
   requires cartesian-product-is-random-access<Const, First, Vs...>;
24  Effects: Equivalent to: return *((*this) + n);

friend constexpr bool operator==(const iterator& x, const iterator& y)
   requires equality_comparable<iterator_t<maybe-const<Const, First>>>;
25  Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr bool operator==(const iterator& x, default_sentinel_t);
26  Returns: true if std::get<i>(x.current_) == ranges::end(std::get<i>(x.parent_->bases_))
   is true for any integer 0 ≤ i ≤ sizeof...(Vs); otherwise, false.

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
   requires all-random-access<Const, First, Vs...>;
27  Effects: Equivalent to: return x.current_ <=> y.current_;

friend constexpr iterator operator+(const iterator& x, difference_type y)
   requires cartesian-product-is-random-access<Const, First, Vs...>;
28  Effects: Equivalent to: return iterator(x) += y;

friend constexpr iterator operator+(difference_type x, const iterator& y)
   requires cartesian-product-is-random-access<Const, First, Vs...>;
29  Effects: Equivalent to: return y + x;

friend constexpr iterator operator-(const iterator& x, difference_type y)
   requires cartesian-product-is-random-access<Const, First, Vs...>;
30  Effects: Equivalent to: return iterator(x) -= y;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
  requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;

  Effects: Equivalent to: return x.distance-from(y.current_);

friend constexpr difference_type operator-((iterator i, default_sentinel_t)
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;

  Effects: Equivalent to: return i.distance-from(end-tuple);

friend constexpr difference_type operator-(default_sentinel_t s,
  iterator i)
  requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;

  Effects: Equivalent to: return -(i - s);

friend constexpr auto iter_move(const iterator& i) noexcept(see below);

  Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);

  Remarks: The exception specification is equivalent to the logical AND of the following expressions:
  — noexcept(ranges::iter_move(std::get<N>(i.current_))) for every integer 0 ≤ N ≤ sizeof...(Vs),
  — is_nothrow_move_constructible_v<range_rvalue_reference_t<maybe-const<Const, T>>> for every type T in First, Vs...

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires (indirectly_swappable<iterator_t<maybe-const<Const, First>>> && ... && indirectly_swappable<iterator_t<maybe-const<Const, Vs>>>);

  Effects: For every integer 0 ≤ i ≤ sizeof...(Vs), performs:
  — ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))

  Remarks: The exception specification is equivalent to the logical AND of the following expressions:
  — noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))) for every integer 0 ≤ i ≤ sizeof...(Vs).

26.8 Range generators

26.8.1 Overview

Class template generator presents a view of the elements yielded by the evaluation of a coroutine.

A generator generates a sequence of elements by repeatedly resuming the coroutine from which it was returned. Elements of the sequence are produced by the coroutine each time a co_yield statement is evaluated. When the co_yield statement is of the form co_yield elements_of(r), each element of the range r is successively produced as an element of the sequence.

[Example 1:]

generator<int> ints(int start = 0) {
    while (true)
        co_yield start++;
}

void f() {
    for (auto i : ints() | views::take(3))
        cout << i << ' '; // prints 0 1 2
}
— end example]
26.8.2 Header <generator> synopsis

```cpp
namespace std {
    // 26.8.3, class template generator
template<class Ref, class V = void, class Allocator = void>
    class generator;
}
```

26.8.3 Class template generator

```cpp
namespace std {
template<class Ref, class V = void, class Allocator = void>
class generator : public ranges::view_interface<generator<Ref, V, Allocator>> {
private:
    using value = conditional_t<is_void_v<V>, remove_cvref_t<Ref>, V>; // exposition only
    using reference = conditional_t<is_void_v<V>, Ref&&, Ref>; // exposition only

    // 26.8.6, class generator::iterator
class iterator; // exposition only

public:
    using yielded = conditional_t<is_reference_v<reference>, reference, const reference&>;

    // 26.8.5, class generator::promise_type
class promise_type;

generator(const generator&) = delete;
generator(generator&& other) noexcept;
~generator();
generator& operator=(generator other) noexcept;

    iterator begin();
    default_sentinel_t end() const noexcept;

private:
    coroutine_handle<promise_type> coroutine_ = nullptr; // exposition only
    unique_ptr<stack<coroutine_handle<>>> active_; // exposition only
};
```

**Mandates:**

1. If `Allocator` is not void, `allocator_traits<Allocator>::pointer` is a pointer type.
2. `value` is a cv-unqualified object type.
3. `reference` is either a reference type, or a cv-unqualified object type that models `copy_constructible`.
4. Let `RRef` denote `remove_reference_t<reference>&&` if `reference` is a reference type, and `reference` otherwise. Each of:
   - `common_reference_with<reference&&, value&&>
   - common_reference_with<reference&&, RRef&&>,
   - `common_reference_with<RRef&&, const value&>`
   is modeled.

   [Note 1: These requirements ensure the exposition-only `iterator` type can model `indirectly_readable` and thus `input_iterator`. — end note]

2. If `Allocator` is not void, it shall meet the `Cpp17Allocator` requirements.
3. Specializations of `generator` model `view` and `input_range`.
4. The behavior of a program that adds a specialization for `generator` is undefined.
26.8.4 Members

generator(generator&& other) noexcept;

Effects: Initializes coroutine_ with exchange(other.coroutine_, {}) and active_ with exchange(other.active_, nullptr).

[Note 1: Iterators previously obtained from other are not invalidated; they become iterators into *this. — end note]

~generator();

Effects: Equivalent to:

if (coroutine_) {
    coroutine_.destroy();
}

[Note 2: Ownership of recursively yielded generators is held in awaitable objects in the coroutine frame of the yielding generator, so destroying the root generator effectively destroys the entire stack of yielded generators. — end note]

generator& operator=(generator other) noexcept;

Effects: Equivalent to:

swap(coroutine_, other.coroutine_);
swap(active_, other.active_);

Returns: *this.

[Note 3: Iterators previously obtained from other are not invalidated; they become iterators into *this. — end note]

iterator begin();

Preconditions: coroutine_ refers to a coroutine suspended at its initial suspend point (9.5.4).

Effects: Pushes coroutine_ into *active_, then evaluates coroutine_.resume().

Returns: An iterator object whose member coroutine_ refers to the same coroutine as does coroutine_.

[Note 4: A program that calls begin more than once on the same generator has undefined behavior. — end note]

default_sentinel_t end() const noexcept;

Returns: default_sentinel.

26.8.5 Class generator::promise_type

namespace std {
    template<class Ref, class V, class Allocator>

auto yield_value(const remove_reference_t<yielded>& lval)
  requires is_rvalue_reference_v<yielded> &&
  constructible_from<remove_cvref_t<yielded> const remove_reference_t<yielded>&>;

Preconditions: A handle referring to the coroutine whose promise object is *this is at the top of
  *active of some generator object x. This function is called by that coroutine upon reaching its final
  suspend point (9.5.4).

Returns: An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the
  calling coroutine to be suspended, pop the coroutine handle from the top of *x.active_, and resume
  execution of the coroutine referred to by x.active_->top() if *x.active_ is not empty. If it is empty,
  control flow returns to the current coroutine caller or resumer (9.5.4).

suspend_always yield_value(yielded val) noexcept;

Effects: Equivalent to value_ = addressof(val).

Returns: {}.

auto yield_value(const remove_reference_t<yielded>& lval)
  requires is_rvalue_reference_v<yielded> &&
  constructible_from<remove_cvref_t<yielded> const remove_reference_t<yielded>&>;

Preconditions: A handle referring to the coroutine whose promise object is *this is at the top of
  *active of some generator object x.

Returns: An awaitable object of an unspecified type (7.6.2.4) that stores an object of type
  remove_cvref_t<yielded> direct-non-list-initialized with lval, whose member functions arrange for value_to
  point to that stored object and then suspend the coroutine.

Throws: Any exception thrown by the initialization of the stored object.

Remarks: A yield-expression that calls this function has type void (7.6.17).

template<class T2, class V2, class Alloc2, class Unused>
  requires same_as<typename generator<T2, V2, Alloc2>::yielded, yielded>
auto yield_value(ranges::elements_of<generator<T2, V2, Alloc2>&&, Unused> g) noexcept;

**Preconditions**: A handle referring to the coroutine whose promise object is *this is at the top of *active_ of some generator object x. The coroutine referred to by g.range.coroutine_ is suspended at its initial suspend point.

**Returns**: An awaitable object of an unspecified type (7.6.2.4) into which g.range is moved, whose member await_ready returns false, whose member await_suspend pushes g.range.coroutine_ into *x.active_ and resumes execution of the coroutine referred to by g.range.coroutine_, and whose member await_resume evaluates rethrow_exception(except_) if bool(except_) is true. If bool(except_) is false, the await_resume member has no effects.

**Remarks**: A yield-expression that calls this function has type void (7.6.17).

```cpp
template<ranges::input_range R, class Alloc>
requires convertible_to<ranges::range_reference_t<R>, yielded>
auto yield_value(ranges::elements_of<R, Alloc> r) noexcept;
```

**Effects**: Equivalent to:

```
auto nested = [](allocator_arg_t, Alloc, ranges::iterator_t<R> i, ranges::sentinel_t<R> s)
    -> generator<yielded, ranges::range_value_t<R>, Alloc> {
    for (; i != s; ++i) {
        co_yield static_cast<yielded>(*i);
    }
    return yield_value(ranges::elements_of(nested(
        allocator_arg, r.allocator, ranges::begin(r.range), ranges::end(r.range))));
```

**Remarks**: A yield-expression that calls this function has type void (7.6.17).

```cpp
void unhandled_exception();
```

**Preconditions**: A handle referring to the coroutine whose promise object is *this is at the top of *active_ of some generator object x.

**Effects**: If the handle referring to the coroutine whose promise object is *this is the sole element of *x.active_, equivalent to: throw; Otherwise, assigns current_exception() to except_.

```cpp
void* operator new(size_t size)
    requires same_as<Allocator, void> || default_initializable<Allocator>;
```

```cpp
template<class Alloc, class... Args>
requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);
```

```cpp
template<class This, class Alloc, class... Args>
requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc, const Args&...);
```

Let A be

(17.1) — Allocator, if it is not void,

(17.2) — Alloc for the overloads with a template parameter Alloc, or

(17.3) — allocator<void> otherwise.

Let B be allocator_traits<A>::template rebind_alloc<U> where U is an unspecified type whose size and alignment are both __STDCPP_DEFAULT_NEW_ALIGNMENT__.

**Mandates**: allocator_traits<B>::pointer is a pointer type.

**Effects**: Initializes an allocator b of type B with A(alloc), for the overloads with a function parameter alloc, and with A() otherwise. Uses b to allocate storage for the smallest array of U sufficient to provide storage for a coroutine state of size size, and unspecified additional state necessary to ensure that operator delete can later deallocate this memory block with an allocator equal to b.

**Returns**: A pointer to the allocated storage.

§ 26.8.5
void operator delete(void* pointer, size_t size) noexcept;

**Preconditions:** `pointer` was returned from an invocation of one of the above overloads of `operator new` with a `size` argument equal to `size`.

**Effects:** Deallocates the storage pointed to by `pointer` using an allocator equivalent to that used to allocate it.

### 26.8.6 Class generator::iterator

```cpp
namespace std {
    template<class Ref, class V, class Allocator>
    class generator<Ref, V, Allocator>::iterator {
        public:
            using value_type = value;
            using difference_type = ptrdiff_t;

            iterator(iterator&& other) noexcept;
            iterator& operator=(iterator&& other) noexcept;

            reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
            iterator& operator++();
            void operator++(int);

            friend bool operator==(iterator i, default_sentinel_t);

        private:
            coroutine_handle<promise_type> coroutine_; // exposition only
        }
    }
```

**iterator(iterator&& other) noexcept:**

**Effects:** Initializes `coroutine_` with `exchange(other.coroutine_, {})`.

**iterator& operator=(iterator&& other) noexcept:**

**Effects:** Equivalent to `coroutine_ = exchange(other.coroutine_, {})`.

**Returns:** `*this`.

**reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);**

**Preconditions:** For some `generator` object `x`, `coroutine_` is in `*x.active_` and `x.active_->top()` refers to a suspended coroutine with promise object `p`.

**Effects:** Equivalent to: `return static_cast<reference>(*p.value_)`.

**iterator& operator++();**

**Preconditions:** For some `generator` object `x`, `coroutine_` is in `*x.active_`.

**Effects:** Equivalent to `x.active_->top().resume()`.

**Returns:** `*this`.

**void operator++(int);**

**Effects:** Equivalent to `***this`.

**friend bool operator==(iterator i, default_sentinel_t);**

**Effects:** Equivalent to: `return i.coroutine_.done()`;

27 Algorithms library

27.1 General

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 24) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 94.

27.2 Algorithms requirements

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the std::ranges namespace in this Clause are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the postfix-expression in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[Example 1:]

```cpp
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1, 2, 3};
    find(begin(vec), end(vec), 2);  // #1
}
```

The function call expression at #1 invokes std::ranges::find, not std::find, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::find is more specialized (13.7.7.3) than std::ranges::find since the former requires its first two parameters to have the same type. — end example

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

- If an algorithm’s Effects element specifies that a value pointed to by any iterator passed as an argument is modified, then the type of that argument shall meet the requirements of a mutable iterator (25.3).

- If an algorithm’s template parameter is named InputIterator, InputIterator1, or InputIterator2, the template argument shall meet the Cpp17InputIterator requirements (25.3.5.3).

- If an algorithm’s template parameter is named OutputIterator, OutputIterator1, or OutputIterator2, the template argument shall meet the Cpp17OutputIterator requirements (25.3.5.4).

- If an algorithm’s template parameter is named ForwardIterator, ForwardIterator1, ForwardIterator2, or NoThrowForwardIterator, the template argument shall meet the Cpp17ForwardIterator requirements (25.3.5.5).
requirements (25.3.5.5) if it is required to be a mutable iterator, or model forward_iterator (25.3.4.11) otherwise.

(4.5) — If an algorithm’s template parameter is named NoThrowForwardIterator, the template argument is also required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

(4.6) — If an algorithm’s template parameter is named BidirectionalIterator, BidirectionalIterator1, or BidirectionalIterator2, the template argument shall meet the Cpp17BidirectionalIterator requirements (25.3.5.6) if it is required to be a mutable iterator, or model bidirectional_iterator (25.3.4.12) otherwise.

(4.7) — If an algorithm’s template parameter is named RandomAccessIterator, RandomAccessIterator1, or RandomAccessIterator2, the template argument shall meet the Cpp17RandomAccessIterator requirements (25.3.5.7) if it is required to be a mutable iterator, or model random_access_iterator (25.3.4.13) otherwise.

[Note 1: These requirements do not affect iterator arguments that are constrained, for which iterator category and mutability requirements are expressed explicitly.—end note]

5 Both in-place and copying versions are provided for certain algorithms.219 When such a version is provided for algorithm it is called algorithm_copy. Algorithms that take predicates end with the suffix _if (which follows the suffix _copy).

6 When not otherwise constrained, the Predicate parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as true. In other words, if an algorithm takes Predicate pred as its argument and first as its iterator argument with value type T, it should work correctly in the construct pred(*first) contextually converted to bool (7.3). The function object pred shall not apply any non-constant function through the dereferenced iterator. Given a glvalue u of type (possibly const) T that designates the same object as *first, pred(u) shall be a valid expression that is equal to pred(*first).

7 When not otherwise constrained, the BinaryPredicate parameter is used whenever an algorithm expects a function object that, when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type T when T is part of the signature, returns a value testable as true. In other words, if an algorithm takes BinaryPredicate binary_pred as its argument and first1 and first2 as its iterator arguments with respective value types T1 and T2, it should work correctly in the construct binary_pred(*first1, *first2) contextually converted to bool (7.3). Unless otherwise specified, BinaryPredicate always takes the first iterator’s value_type as its first argument, that is, in those cases when T value is part of the signature, it should work correctly in the construct binary_pred(*first1, value) contextually converted to bool (7.3). binary_pred shall not apply any non-constant function through the dereferenced iterators. Given a glvalue u of type (possibly const) T1 that designates the same object as *first1, and a glvalue v of type (possibly const) T2 that designates the same object as *first2, binary_pred(u, *first2), binary_pred(*first1, v), and binary_pred(u, v) shall each be a valid expression that is equal to binary_pred(*first1, *first2), and binary_pred(u, value) shall be a valid expression that is equal to binary_pred(*first1, value).

8 The parameters UnaryOperation, BinaryOperation, BinaryOperation1, and BinaryOperation2 are used whenever an algorithm expects a function object (22.10).

[Note 2: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a non-copied implementation object such as reference_wrapper<T> (22.10.6), or some equivalent solution, can be used.—end note]

10 When the description of an algorithm gives an expression such as *first == value for a condition, the expression shall evaluate to either true or false in boolean contexts.

11 In the description of the algorithms, operator + is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of a + n are the same as those of

```cpp
auto tmp = a;
for (; n < 0; ++n) --tmp;
for (; n > 0; --n) ++tmp;
return tmp;
```

219) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, sort_copy is not included because the cost of sorting is much more significant, and users can invoke copy followed by sort.
Similarly, operator \( - \) is used for some combinations of iterators and sentinel types for which it does not have to be defined. If \([a, b)\) denotes a range, the semantics of \(b - a\) in these cases are the same as those of

\[
\begin{align*}
&\text{iter_difference_t<decltype(a)> n = 0;} \\
&\text{for (auto tmp = a; tmp != b; ++tmp) ++n;} \\
&\text{return n;}
\end{align*}
\]

and if \([b, a)\) denotes a range, the same as those of

\[
\begin{align*}
&\text{iter_difference_t<decltype(b)> n = 0;} \\
&\text{for (auto tmp = b; tmp != a; ++tmp) --n;} \\
&\text{return n;}
\end{align*}
\]

12 In the description of the algorithms, given an iterator \(a\) whose difference type is \(D\), and an expression \(n\) of integer-like type other than \(cv\ D\), the semantics of \(a + n\) and \(a - n\) are, respectively, those of \(a + D(n)\) and \(a - D(n)\).

13 In the description of algorithm return values, a sentinel value \(s\) denoting the end of a range \([i, s)\) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using \(\text{ranges::next}(i, s)\).

14 Overloads of algorithms that take \(\text{range}\) arguments (26.4.2) behave as if they are implemented by calling \(\text{ranges::begin}\) and \(\text{ranges::end}\) on the \(\text{range}(s)\) and dispatching to the overload in namespace \(\text{ranges}\) that takes separate iterator and sentinel arguments.

15 The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

[Note 3: Consequently, an implementation can declare an algorithm with different template parameters than those presented. —end note]

27.3 Parallel algorithms [algorithms.parallel]

27.3.1 Preamble [algorithms.parallel.defns]

Subclause 27.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

A parallel algorithm is a function template listed in this document with a template parameter named \(\text{ExecutionPolicy}\).

Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

(3.1) — All operations of the categories of the iterators that the algorithm is instantiated with.

(3.2) — Operations on those sequence elements that are required by its specification.

(3.3) — User-provided function objects to be applied during the execution of the algorithm, if required by the specification.

(3.4) — Operations on those function objects required by the specification.

[Note 1: See 27.2. —end note]

These functions are herein called element access functions.

[Example 1: The \texttt{sort} function may invoke the following element access functions:

(3.5) — Operations of the random-access iterator of the actual template argument (as per 25.3.5.7), as implied by the name of the template parameter \texttt{RandomAccessIterator}.

(3.6) — The \texttt{swap} function on the elements of the sequence (as per the preconditions specified in 27.8.2.1).

(3.7) — The user-provided \texttt{Compare} function object.

—end example]

A standard library function is \textit{vectorization-unsafe} if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

[Note 2: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. —end note]

[Example 2:

\begin{verbatim}
int x = 0;
\end{verbatim}]

§ 27.3.1
std::mutex m;
void f() {
    int a[] = {1,2};
    std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&](int) {
        std::lock_guard<mutex> guard(m); // incorrect: lock_guard constructor calls m.lock()
        ++x;
    });
}

The above program may result in two consecutive calls to m.lock() on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution. —end example

27.3.2 Requirements on user-provided function objects  [algorithms.parallel.user]

1 Unless otherwise specified, function objects passed into parallel algorithms as objects of type Predicate, BinaryPredicate, Compare, UnaryOperation, BinaryOperation1, BinaryOperation2, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

27.3.3 Effect of execution policies on algorithm execution  [algorithms.parallel.exec]

1 Parallel algorithms have template parameters named ExecutionPolicy (22.12) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

[Note 1: For example, swap, ++, --, @=, and assignments modify the object. For the assignment and @= operators, only the left argument is modified. — end note]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type T) from sequences where is_trivially_copy_constructible_v<T> and is_trivially_destructible_v<T> are true.

[Note 2: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as reference_wrapper<T> (22.10.6), or some equivalent solution, can be used. —end note]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::sequenced_policy all occur in the calling thread of execution.

[Note 3: The invocations are not interleaved; see 6.9.1. — end note]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::unsequenced_policy are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

[Note 4: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note]

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a execution::unsequenced_policy algorithm.

[Note 5: Because execution::unsequenced_policy allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note]

6 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type execution::parallel_policy are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by thread (33.4.3) or jthread (33.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

[Note 6: It is the caller’s responsibility to ensure that the invocation does not introduce data races or deadlocks. — end note]

§ 27.3.3
Example 1:

```cpp
int a[] = {0, 1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
  v.push_back(i*2+1); // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — end example

Example 2:

```cpp
std::atomic<int> x{0};
int a[] = {1, 2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
  x.fetch_add(1, std::memory_order::relaxed);
  // spin wait for another iteration to change the value of x
  while (x.load(std::memory_order::relaxed) == 1) {} // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — end example

Example 3:

```cpp
int x = 0;
std::mutex m;
int a[] = {1, 2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&] (int) {
  std::lock_guard<mutex> guard(m);
  ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — end example

The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_unsequenced_policy` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

Note 7: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note

The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::parallel_unsequenced_policy` algorithm.

Note 8: Because `execution::parallel_unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note

Note 9: The semantics of invocation with `execution::unsequenced_policy`, `execution::parallel_policy`, or `execution::parallel_unsequenced_policy` allow the implementation to fall back to sequential execution if the system cannot parallelize an algorithm invocation, e.g., due to lack of resources. — end note

If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either

9.1 temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or

9.2 eventually execute an element access function;

the thread of execution will continue to do so until the algorithm is finished.

Note 10: In blocking with forward progress guarantee delegation in this context, a thread of execution created by the library is considered to have finished execution as soon as it has finished the execution of the particular element access function that the invoking thread of execution logically depends on. — end note

The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.
27.3.4 Parallel algorithm exceptions

1 During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

2 During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

27.3.5 ExecutionPolicy algorithm overloads

1 Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter.

[Note 1: Not all algorithms have parallel algorithm overloads. — end note]

2 Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.

3 Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most `expr`” or “exactly `expr`” and does not specify the number of assignments or swaps, and `expr` is not already expressed with $O()$ notation, the complexity of the algorithm shall be $O(expr)$.

4 Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is true.

27.4 Header `<algorithm>` synopsis

```cpp
#include <initializer_list>  // see 17.11.2

namespace std {
  namespace ranges {
    // 27.5, algorithm result types
    template<class I, class F>
    struct in_fun_result;

    template<class I1, class I2>
    struct in_in_result;

    template<class I, class O>
    struct in_out_result;

    template<class I1, class I2, class O>
    struct in_in_out_result;

    template<class I, class O1, class O2>
    struct in_out_out_result;

    template<class T>
    struct min_max_result;

    template<class I>
    struct in_found_result;

    template<class I, class T>
    struct in_value_result;

    template<class O, class T>
    struct out_value_result;
  }
}

// 27.6, non-modifying sequence operations
// 27.6.1, all of
template<class InputIterator, class Predicate>
  constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);
```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool all_of(ExecutionPolicy&& exec, // see 27.3.5
    ForwardIterator first, ForwardIterator last, Predicate pred);

namespace ranges {
    template<input_iterator I, sentinel_for<I> S, class Proj = identity,
        indirect_unary_predicate<projected<I, Proj>> Pred>
    constexpr bool all_of(I first, S last, Pred pred, Proj proj = {});
    template<input_range R, class Proj = identity,
        indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
    constexpr bool all_of(R&& r, Pred pred, Proj proj = {});

    }
};

§ 27.6 Non-modifying sequence operations

27.6.1 All of

template<class InputIterator, class Predicate>
constexpr bool all_of(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool all_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
    indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::all_of(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,
    indirect_unary_predicate<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::all_of(R&& r, Pred pred, Proj proj = {});

1 Let E be:
(1.1) — pred(*i) for the overloads in namespace std;
(1.2) — invoke(pred, invoke(proj, *i)) for the overloads in namespace ranges.

2 Returns: false if E is false for some iterator i in the range [first, last), and true otherwise.

3 Complexity: At most last - first applications of the predicate and any projection.
27.6.2 Any of

```cpp
template<class InputIterator, class Predicate>
constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
```

```cpp
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:
   - (1.1) pred(*i) for the overloads in namespace std;
   - (1.2) invoke(pred, invoke(proj, *i)) for the overloads in namespace ranges.

2 Returns: true if E is true for some iterator i in the range [first, last), and false otherwise.

3 Complexity: At most last - first applications of the predicate and any projection.

27.6.3 None of

```cpp
template<class InputIterator, class Predicate>
constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
             Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
```

```cpp
template<input_range R, class Proj = identity,
         indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

1 Let E be:
   - (1.1) pred(*i) for the overloads in namespace std;
   - (1.2) invoke(pred, invoke(proj, *i)) for the overloads in namespace ranges.

2 Returns: false if E is true for some iterator i in the range [first, last), and true otherwise.

3 Complexity: At most last - first applications of the predicate and any projection.

27.6.4 Contains

```cpp
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr bool ranges::contains(I first, S last, const T& value, Proj proj = {});
```

```cpp
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr bool ranges::contains(R&& r, const T& value, Proj proj = {});
```

1 Returns: ranges::find(std::move(first), last, value, proj) != last.

```cpp
template<forward_iterator I1, sentinel_for<I1> S1,
         forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::contains_subrange(I1 first1, S1 last1, I2 first2, S2 last2,
                                         Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::contains_subrange(R1&& r1, R2&& r2, Pred pred = {}),
```
27.6.5  For each

template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);

Preconditions: Function meets the Cpp17MoveConstructible requirements (Table 32).

[Note 1: Function need not meet the requirements of Cpp17CopyConstructible (Table 33). — end note]

Effects: Applies f to the result of dereferencing every iterator in the range [first, last), starting from first and proceeding to last - 1.

[Note 2: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator. — end note]

Returns: f.

Complexity: Applies f exactly last - first times.

Remarks: If f returns a result, the result is ignored.

§ 27.6.5 1298
Effects: Applies \( f \) to the result of dereferencing every iterator in the range \([\text{first}, \text{first} + n]\) in order.

[Note 8: If the type of \texttt{first} meets the requirements of a mutable iterator, \( f \) can apply non-constant functions through the dereferenced iterator. — end note]

Returns: \( \text{first} + n \).

Remarks: If \( f \) returns a result, the result is ignored.

```
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n,
    Function f);
```

Mandates: The type \texttt{Size} is convertible to an integral type (7.3.9, 11.4.8).

Preconditions: \( n \geq 0 \) is true. \( f \) meets the \texttt{Cpp17CopyConstructible} requirements.

Effects: Applies \( f \) to the result of dereferencing every iterator in the range \([\text{first}, \text{first} + n]\).

[Note 9: If the type of \texttt{first} meets the requirements of a mutable iterator, \( f \) can apply non-constant functions through the dereferenced iterator. — end note]

Returns: \( \text{first} + n \).

Remarks: If \( f \) returns a result, the result is ignored. Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

```
template<input_iterator I, class Proj = identity, indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_n_result<I, Fun> ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

Preconditions: \( n \geq 0 \) is true.

Effects: Calls \( \text{invoke}(f, \text{invoke}(\text{proj}, \ast i)) \) for every iterator \( i \) in the range \([\text{first}, \text{first} + n]\) in order.

[Note 10: If the result of \( \text{invoke}(\text{proj}, \ast i) \) is a mutable reference, \( f \) can apply non-constant functions. — end note]

Returns: \{first + n, std::move(f)\}.

Remarks: If \( f \) returns a result, the result is ignored.

[Note 11: The overload in namespace \texttt{ranges} requires \texttt{Fun} to model \texttt{copy_constructible}. — end note]

### 27.6.6 Find

```
template<class InputIterator, class T>
constexpr InputIterator find(InputIterator first, InputIterator last, const T& value);
```

```
template<class ExecutionPolicy, class ForwardIterator, class T>
ForwardIterator find(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, const T& value);
```

```
template<class InputIterator, class Predicate>
constexpr InputIterator find_if(InputIterator first, InputIterator last, Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator find_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<class InputIterator, class Predicate>
constexpr InputIterator find_if_not(InputIterator first, InputIterator last, Predicate pred);
```

```
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator find_if_not(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);
```

```
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr I ranges::find(I first, S last, const T& value, Proj proj = {});
```
1
Let $E$ be:

- $(1.1) \neg *i == value$ for find;
- $(1.2) \neg pred(*i) != false$ for find_if;
- $(1.3) *i == false$ for find_if_not;
- $(1.4) bool(invoke(proj, *i) == value)$ for ranges::find;
- $(1.5) bool(invoke(pred, invoke(proj, *i)))$ for ranges::find_if;
- $(1.6) bool(!invoke(pred, invoke(proj, *i)))$ for ranges::find_if_not.

2
Returns: The first iterator $i$ in the range $[\text{first}, \text{last})$ for which $E$ is true. Returns last if no such iterator is found.

3
Complexity: At most $last - first$ applications of the corresponding predicate and any projection.

27.6.7 Find last

[alg.find.last]

1
Let $E$ be:

- $(1.1) bool(invoke(proj, *i) == value)$ for ranges::find_last;
- $(1.2) bool(invoke(pred, invoke(proj, *i)))$ for ranges::find_last_if;
- $(1.3) bool(!invoke(pred, invoke(proj, *i)))$ for ranges::find_last_if_not.

2
Returns: Let $i$ be the last iterator in the range $[\text{first}, \text{last})$ for which $E$ is true. Returns $\{i, last\}$, or $\{last, last\}$ if no such iterator is found.

3
Complexity: At most $last - first$ applications of the corresponding predicate and projection.
27.6.8 Find end [alg.find.end]

```
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);
```

```
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);
```

```
template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
          class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                 Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2,
          class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::find_end(R1&& r1, R2&& r2, Pred pred = {},
                 Proj1 proj1 = {}, Proj2 proj2 = {});
```

1 Let:

(1.1) — pred be equal_to{} for the overloads with no parameter pred;

(1.2) — E be:

(1.2.1) — pred(*(i + n), *(first2 + n)) for the overloads in namespace std;

(1.2.2) — invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))) for the overloads in namespace ranges;

(1.3) — i be last1 if \( [\text{first2, last2}) \) is empty, or if \((\text{last2} - \text{first2}) \geq (\text{last1} - \text{first1}) \) is true, or if there is no iterator in the range \([\text{first1, last1}) - (\text{last2} - \text{first2}) \) such that for every non-negative integer \( n < (\text{last2} - \text{first2}) \), \( E \) is true. Otherwise \( i \) is the last such iterator in \([\text{first1, last1}) - (\text{last2} - \text{first2}) \).

2 Returns:

(2.1) — i for the overloads in namespace std.

(2.2) — \{i, i + (i == last1 ? 0 : last2 - first2)\} for the overloads in namespace ranges.

3 Complexity: At most \((\text{last2} - \text{first2}) \times (\text{last1} - \text{first1}) - (\text{last2} - \text{first2}) + 1\) applications of the corresponding predicate and any projections.

27.6.9 Find first [alg.find.first.of]

```
template<class InputIterator, class ForwardIterator>
constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
              InputIterator first2, InputIterator last2);
```

§ 27.6.9
Let $E$ be:

1. $i == j$ for the overloads with no parameter $\text{pred}$;
2. $\text{pred}(i, j) != \text{false}$ for the overloads with a parameter $\text{pred}$ and no parameter $\text{proj}$;
3. $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}_1, i), \text{invoke}(\text{proj}_2, j)))$ for the overloads with parameters $\text{pred}$ and $\text{proj}$.

Effects: Finds an element that matches one of a set of values.

Returns: The first iterator $i$ in the range $[\text{first1}, \text{last1})$ such that for some iterator $j$ in the range $[\text{first2}, \text{last2}) E$ holds. Returns last1 if $[\text{first2}, \text{last2})$ is empty or if no such iterator is found.

Complexity: At most $(\text{last1-\text{first1}}) \times (\text{last2-\text{first2}})$ applications of the corresponding predicate and any projections.

27.6.10 Adjacent find

template<class ForwardIterator1>
constexpr ForwardIterator
adjacent_find(ForwardIterator first1, ForwardIterator last1);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_first_of(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2);

         projected<iterator_t<R>, Proj>> Pred = ranges::equal_to>
constexpr borrowed_iterator_t<R> ranges::adjacent_find(R&& r, Pred pred = {}, Proj proj = {});

1 Let E be:

— *(i + 1) for the overloads with no parameter pred;
— pred(*i, *(i + 1)) != false for the overloads with a parameter pred and no parameter proj;
— bool(invoke(pred, invoke(proj, *i), invoke(proj, *(i + 1)))) for the overloads with both parameters pred and proj.

2 Returns: The first iterator i such that both i and i + 1 are in the range [first, last) for which E holds. Returns last if no such iterator is found.

3 Complexity: For the overloads with no ExecutionPolicy, exactly

\[ \min((i - first) + 1, (last - first) - 1) \]

applications of the corresponding predicate, where i is adjacent_find’s return value. For the overloads with an ExecutionPolicy, \( \Theta(last - first) \) applications of the corresponding predicate, and no more than twice as many applications of any projection.

### 27.6.11 Count

template<class InputIterator, class T>
constexpr typename iterator_traits<InputIterator>::difference_type
count(InputIterator first, InputIterator last, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class T>
typename iterator_traits<ForwardIterator>::difference_type
count(ExecutionPolicy&& exec,
      ForwardIterator first, ForwardIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr typename iterator_traits<InputIterator>::difference_type
count_if(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
typename iterator_traits<ForwardIterator>::difference_type
count_if(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>;
constexpr iter_difference_t<I>
ranges::count(I first, S last, const T& value, Proj proj = {});

template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>;
constexpr range_difference_t<R>
ranges::count(R&& r, const T& value, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity,
          indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr iter_difference_t<I>
ranges::count_if(I first, S last, Pred pred, Proj proj = {});
Let $E$ be:

- (1.1) $i == \text{value}$ for the overloads with no parameter $\text{pred}$ or $\text{proj}$;
- (1.2) $\text{pred(*i)} != \text{false}$ for the overloads with a parameter $\text{pred}$ but no parameter $\text{proj}$;
- (1.3) $\text{invoke(\text{proj}, *i)} == \text{value}$ for the overloads with a parameter $\text{proj}$ but no parameter $\text{pred}$;
- (1.4) $\text{bool(invoke(\text{pred}, \text{invoke(\text{proj}, *i)}))}$ for the overloads with both parameters $\text{proj}$ and $\text{pred}$.

**Effects**: Returns the number of iterators $i$ in the range $[\text{first}, \text{last})$ for which $E$ holds.

**Complexity**: Exactly $\text{last} - \text{first}$ applications of the corresponding predicate and any projection.

### 27.6.12 Mismatch

```cpp
template<class InputIterator1, class InputIterator2>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
pair<ForwardIterator1, ForwardIterator2>
mismatch(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, BinaryPredicate pred);
```
Let last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2.

Let E be:

1. !(*(first1 + n) == *(first2 + n)) for the overloads with no parameter pred;
2. pred(*(first1 + n), *(first2 + n)) == false for the overloads with a parameter pred and no parameter proj1;
3. !invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n))) for the overloads with both parameters pred and proj1.

Let N be min(last1 - first1, last2 - first2).

Returns: { first1 + n, first2 + n }, where n is the smallest integer in [0, N) such that E holds, or N if no such integer exists.

Complexity: At most N applications of the corresponding predicate and any projections.
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2,
    BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,
    Pred pred = {},
    Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},
    Proj1 proj1 = {}, Proj2 proj2 = {});

Let:
(1.1) last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2;
(1.2) pred be equal_to{} for the overloads with no parameter pred;
(1.3) E be:
    (1.3.1) pred(*i, *(first2 + (i - first1))) for the overloads with no parameter proj1;
    (1.3.2) invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1)))) for
        the overloads with parameter proj1.

Returns: If last1 - first1 !=(last2 - first2), return false. Otherwise return true if E holds
for every iterator i in the range [first1,last1). Otherwise, returns false.

Complexity: If
(3.1) the types of first1, last1, first2, and last2 meet the Cpp17RandomAccessIterator
requirements (25.3.5.7) and last1 - first1 != last2 - first2 for the overloads in namespace std;
(3.2) the types of first1, last1, first2, and last2 pairwise model sized_sentinel_for (25.3.4.8)
and last1 - first1 != last2 - first2 for the first overload in namespace ranges,
(3.3) R1 and R2 each model sized_range and ranges::distance(r1) != ranges::distance(r2) for
the second overload in namespace ranges,
then no applications of the corresponding predicate and each projection; otherwise,
(3.4) For the overloads with no ExecutionPolicy, at most min(last1 - first1, last2 - first2)
applications of the corresponding predicate and any projections.
(3.5) For the overloads with an ExecutionPolicy, O(min(last1 - first1, last2 - first2)) appli-
cations of the corresponding predicate.

27.6.14 Is permutation

template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2);

template<class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, BinaryPredicate pred);

template<class ForwardIterator1, class ForwardIterator2>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2);

template<class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
constexpr bool is_permutation(ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2,
    BinaryPredicate pred);

§ 27.6.14 1306
Let last2 be first2 + (last1 - first1) for the overloads with no parameter named last2, and let pred be equal_to{} for the overloads with no parameter pred.

**Mandates:** ForwardIterator1 and ForwardIterator2 have the same value type.

**Preconditions:** The comparison function is an equivalence relation.

**Returns:** If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin, pred) returns true; otherwise, returns false.

**Complexity:** No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2, pred) would return true; otherwise, at worst $O(N^2)$, where $N$ has the value last1 - first1.

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2, class Proj1 = identity, class Proj2 = identity, indirect_equivalence_relation<projected<I1, Proj1>, projected<I2, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2, class Proj1 = identity, class Proj2 = identity, indirect_equivalence_relation<projected<_iterator_t<R1>, Proj1>, projected<_iterator_t<R2>, Proj2>> Pred = ranges::equal_to>
constexpr bool ranges::is_permutation(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

**Returns:** If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), bounded by [pfirst, plast), such that ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2) returns true; otherwise, returns false.

**Complexity:** No applications of the corresponding predicate and projections if:

- (7.1) for the first overload,
  - S1 and I1 model sized_sentinel_for<S1, I1>,
  - S2 and I2 model sized_sentinel_for<S2, I2>, and
  - last1 - first1 != last2 - first2;

- (7.2) for the second overload, R1 and R2 each model sized_range, and ranges::distance(r1) != ranges::distance(r2).

Otherwise, exactly last1 - first1 applications of the corresponding predicate and projections if ranges::equal(first1, last1, first2, last2, pred, proj1, proj2) would return true; otherwise, at worst $O(N^2)$, where $N$ has the value last1 - first1.

### 27.6.15 Search

**template<class ForwardIterator1, class ForwardIterator2>**
constexpr ForwardIterator1 search(ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);

**template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>**
ForwardIterator1 search(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);
template<class ForwardIterator1, class ForwardIterator2, 
class BinaryPredicate>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1, 
ForwardIterator2 first2, ForwardIterator2 last2, 
BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
class BinaryPredicate>
ForwardIterator1
search(ExecutionPolicy&& exec, 
ForwardIterator1 first1, ForwardIterator1 last1, 
ForwardIterator2 first2, ForwardIterator2 last2, 
BinaryPredicate pred);

Returns: The first iterator \( i \) in the range \([\text{first1}, \text{last1} - (\text{last2}-\text{first2}))\) such that for every non-negative integer \( n \) less than \( \text{last2} - \text{first2} \) the following corresponding conditions hold: \( *(i + n) == *(\text{first2} + n) \), \( \text{pred}(*(i + n), *(\text{first2} + n)) != \text{false} \). Returns \text{first1} if \([\text{first2}, \text{last2})\) is empty, otherwise returns \text{last1} if no such iterator is found.

Complexity: At most \((\text{last1} - \text{first1}) \ast (\text{last2} - \text{first2})\) applications of the corresponding predicate.

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, 
sentinel_for<I2> S2, class Pred = ranges::equal_to, 
class Proj1 = identity, class Proj2 = identity>
constexpr subrange<I1>
ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, 
Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2, class Pred = ranges::equal_to, 
class Proj1 = identity, class Proj2 = identity>
constexpr borrowed_subrange_t<R1>
ranges::search(R1&& r1, R2&& r2, Pred pred = {}, 
Proj1 proj1 = {}, Proj2 proj2 = {});

Returns:
1. \( \{i, i + (\text{last2} - \text{first2})), \) where \( i \) is the first iterator in the range \([\text{first1}, \text{last1} - (\text{last2} - \text{first2}))\) such that for every non-negative integer \( n \) less than \( \text{last2} - \text{first2} \) the condition
   \[
   \text{bool}(\text{invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(\text{first2} + n))}))
   \]
   is true.
2. Returns \( \{\text{last1}, \text{last1}\} \) if no such iterator exists.

Complexity: At most \((\text{last1} - \text{first1}) \ast (\text{last2} - \text{first2})\) applications of the corresponding predicate and projections.
template<class ExecutionPolicy, class ForwardIterator, class Size, class T, class BinaryPredicate>
ForwardIterator
search_n(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last,
Size count, const T& value,
BinaryPredicate pred);

Mandates: The type Size is convertible to an integral type (7.3.9, 11.4.8).

Returns: The first iterator \( i \) in the range \([first, last - count)\) such that for every non-negative integer \( n \) less than count the following corresponding conditions hold: \( *(i + n) == value, \) \( pred(*(i + n), value) \neq false \). Returns last if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate.

template<forward_iterator I, sentinel_for<I> S, class T, class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<I, const T*, Pred, Proj>
constexpr subrange<I>
ranges::search_n(I first, S last, iter_difference_t<I> count,
const T& value, Pred pred = {}, Proj proj = {});
	emplate<forward_range R, class T, class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
constexpr borrowed_subrange_t<R>
ranges::search_n(R&& r, range_difference_t<R> count,
const T& value, Pred pred = {}, Proj proj = {});

Returns: \( \{i, i + count\} \) where \( i \) is the first iterator in the range \([first, last - count)\) such that for every non-negative integer \( n \) less than count, the following condition holds: \( invoke(pred, invoke(proj, *(i + n)), value) \). Returns \( \{last, last\} \) if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate and projection.

template<class ForwardIterator, class Searcher>
constexpr ForwardIterator
search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);

Effects: Equivalent to: return searcher(first, last).first;

Remarks: Searcher need not meet the Cpp17CopyConstructible requirements.

27.6.16 Starts with

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
	emplate<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Returns:
ranges::mismatch(std::move(first1), last1, std::move(first2), last2, pred, proj1, proj2).in2 == last2

27.6.17 Ends with

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
(forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}),
Let $N_1$ be last1 - first1 and $N_2$ be last2 - first2.

Returns: false if $N_1 < N_2$, otherwise

```
ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2,
pred, proj1, proj2)
```

```
template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity,
class Proj2 = identity>
requires (forward_range<R1> || sized_range<R1>) &&
(forward_range<R2> || sized_range<R2>) &&
indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(R1&& r1, R2&& r2, Pred pred = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let $N_1$ be ranges::distance(r1) and $N_2$ be ranges::distance(r2).

Returns: false if $N_1 < N_2$, otherwise

```
ranges::equal(ranges::drop_view(ranges::ref_view(r1), N1 - N2), r2, pred, proj1, proj2)
```

27.6.18 Fold

```
template<input_iterator I, sentinel_for<I> S, class T,
indirectly-binary-left-foldable<T, I> F>
constexpr auto ranges::fold_left(I first, S last, T init, F f);

template<input_range R, class T,
indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
constexpr auto ranges::fold_left(R&& r, T init, F f);

1 Returns:
ranges::fold_left_with_iter(std::move(first), last, std::move(init), f).value
```

```
template<input_iterator I, sentinel_for<I> S,
indirectly-binary-left-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr auto ranges::fold_left_first(I first, S last, F f);

template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr auto ranges::fold_left_first(R&& r, F f);

2 Returns:
ranges::fold_left_first_with_iter(std::move(first), last, f).value
```

```
template<bidirectional_iterator I, sentinel_for<I> S, class T,
indirectly-binary-right-foldable<T, I> F>
constexpr auto ranges::fold_right(I first, S last, T init, F f);

template<bidirectional_range R, indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr auto ranges::fold_right(R&& r, T init, F f);

3 Effects: Equivalent to:
```
using U = decay_t<invoke_result_t<F&, iter_reference_t<I>, T>>;
if (first == last)
    return U(std::move(init));
I tail = ranges::next(first, last);
U accum = invoke(f, *--tail, std::move(init));
while (first != tail)
    accum = invoke(f, *--tail, std::move(accum));
return accum;
```

```
template<bidirectional_iterator I, sentinel_for<I> S,
indirectly-binary-right-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr auto ranges::fold_right_last(I first, S last, F f);

template<bidirectional_range R,
indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr auto ranges::fold_right_last(R&& r, F f);

Let U be decltype(ranges::fold_right(first, last, iter_value_t<I>(*first), f)).

**Effects:** Equivalent to:

```
if (first == last)
    return optional<U>();
I tail = ranges::prev(ranges::next(first, std::move(last)));
return optional<U>(in_place,
    ranges::fold_right(std::move(first), tail, iter_value_t<I>(*tail), std::move(f)));
```

template<input_iterator I, sentinel_for<I> S, class T, indirectly-binary-left-foldable<T, I> F>
constexpr see below ranges::fold_left_with_iter(I first, S last, T init, F f);

template<input_range R, class T, indirectly-binary-left-foldable<T, iterator_t<R>> F>
constexpr see below ranges::fold_left_with_iter(R&& r, T init, F f);

Let U be decay_t<invoke_result_t<F&, T, iter_reference_t<I>>>.

**Effects:** Equivalent to:

```
if (first == last)
    return {std::move(first), U(std::move(init))};
U accum = invoke(f, std::move(init), *first);
for (++first; first != last; ++first)
    accum = invoke(f, std::move(accum), *first);
return {std::move(first), std::move(accum)};
```

**Remarks:** The return type is fold_left_with_iter_result<I, U> for the first overload and fold_left_with_iter_result<borrowed_iterator_t<R>, U> for the second overload.

template<input_iterator I, sentinel_for<I> S, indirectly-binary-left-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr see below ranges::fold_left_first_with_iter(I first, S last, F f);

template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr see below ranges::fold_left_first_with_iter(R&& r, F f);

Let U be
decaytype(ranges::fold_left(std::move(first), last, iter_value_t<I>(*first), f))

**Effects:** Equivalent to:

```
if (first == last)
    return optional<U>();
optional<U> init(in_place, *first);
for (;++first; first != last; ++first)
    *init = invoke(f, std::move(*init), *first);
return {std::move(first), std::move(init)};
```

**Remarks:** The return type is fold_left_first_with_iter_result<I, optional<U>> for the first overload and fold_left_first_with_iter_result<borrowed_iterator_t<R>, optional<U>> for the second overload.

### 27.7 Mutating sequence operations

#### 27.7.1 Copy

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last, OutputIterator result);
```

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
```
template<input_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);

Let \( N \) be \( \text{last} - \text{first} \).

**Preconditions:** \( \text{result} \) is not in the range \([\text{first}, \text{last})\).

**Effects:** Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result}, \text{result} + N)\) starting from \( \text{first} \) and proceeding to \( \text{last} \). For each non-negative integer \( n < N \), performs \( *(\text{result} + n) = *(\text{first} + n) \).

**Returns:**
- \( \text{result} + N \) for the overload in namespace std.
- \{\text{last}, \text{result} + N\} for the overloads in namespace ranges.

**Complexity:** Exactly \( N \) assignments.

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 copy(ExecutionPolicy&& policy,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result);

**Preconditions:** The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) do not overlap.

**Effects:** Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result}, \text{result} + (\text{last} - \text{first}))\). For each non-negative integer \( n < (\text{last} - \text{first}) \), performs \( *(\text{result} + n) = *(\text{first} + n) \).

**Returns:** \( \text{result} + (\text{last} - \text{first}) \).

**Complexity:** Exactly \( \text{last} - \text{first} \) assignments.

template<class InputIterator, class Size, class OutputIterator>
constexpr OutputIterator copy_n(InputIterator first, Size n,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
ForwardIterator2 copy_n(ExecutionPolicy&& exec,
ForwardIterator1 first, Size n,
ForwardIterator2 result);

**Mandates:** The type \( \text{Size} \) is convertible to an integral type (7.3.9, 11.4.8).

**Effects:** For each non-negative integer \( i < \text{Size} \), performs \( *(\text{result} + i) = *(\text{first} + i) \).

**Returns:**
- \( \text{result} + \text{Size} \) for the overload in namespace std.
- \{\text{first} + \text{Size}, \text{result} + \text{Size}\} for the overload in namespace ranges.

**Complexity:** Exactly \( \text{Size} \) assignments.

template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
OutputIterator result, Predicate pred);

**Mandates:** The type \( \text{Predicate} \) is convertible to an integral type (7.3.9, 11.4.8).

**Effects:** For each non-negative integer \( i < \text{Size} \), performs \( *(\text{result} + i) = *(\text{first} + i) \).

**Returns:**
- \( \text{result} + \text{Size} \) for the overload in namespace std.
- \{\text{first} + \text{Size}, \text{result} + \text{Size}\} for the overload in namespace ranges.

**Complexity:** Exactly \( \text{Size} \) assignments.
constexpr ranges::copy_if_result<I, O> ranges::copy_if(I first, S last, O result, Pred pred, Proj proj = {});

template<input_range R, weakly_incrementable O, class Proj = identity, indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_if_result<borrowed_iterator_t<R>, O> ranges::copy_if(R&& r, O result, Pred pred, Proj proj = {});

Let \( E \) be:
- \( \text{bool}(\text{pred}(*i)) \) for the overloads in namespace `std`;
- \( \text{bool}(\text{invoke}((\text{pred}), \text{invoke}(\text{proj}, *i))) \) for the overloads in namespace `ranges`,
and \( N \) be the number of iterators \( i \) in the range \([\text{first}, \text{last})\) for which the condition \( E \) holds.

Preconditions: The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) do not overlap.

[Note 1: For the overload with an ExecutionPolicy, there might be a performance cost if `iterator_traits<ForwardIterator1>::value_type` is not `Cpp17MoveConstructible` (Table 32). — end note]

Effects: Copies all of the elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) is true.

Returns:
- \( \text{result} + N \) for the overloads in namespace `std`.
- \( \{\text{last}, \text{result} + N\} \) for the overloads in namespace `ranges`.

Complexity: Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

Remarks: Stable (16.4.6.8).

```cpp
template<class BidirectionalIterator1, class BidirectionalIterator2>
constexpr BidirectionalIterator2 copy_backward(BidirectionalIterator1 first, BidirectionalIterator1 last, BidirectionalIterator2 result);

template<bidirectional_iterator I1, sentinel_for<I1> S1, bidirectional_iterator I2>
requires indirectly_copyable<I1, I2>
constexpr ranges::copy_backward_result<I1, I2> ranges::copy_backward(I1 first, S1 last, I2 result);

template<bidirectional_range R, bidirectional_iterator I>
requires indirectly_copyable<iterator_t<R>, I>
constexpr ranges::copy_backward_result<borrowed_iterator_t<R>, I> ranges::copy_backward(R&& r, I result);
```

Let \( N \) be \( \text{last} - \text{first} \).

Preconditions: \( \text{result} \) is not in the range \([\text{first}, \text{last})\].

Effects: Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result} - N, \text{result})\) starting from \( \text{last} - 1 \) and proceeding to \( \text{first} \).\(^{220}\) For each positive integer \( n \leq N \), performs \( *(\text{result} - n) = *(\text{last} - n) \).

Returns:
- \( \text{result} - N \) for the overload in namespace `std`.
- \( \{\text{last}, \text{result} - N\} \) for the overloads in namespace `ranges`.

Complexity: Exactly \( N \) assignments.

### 27.7.2 Move

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator move(InputIterator first, InputIterator last, OutputIterator result);
```

\(^{220}\) `copy_backward` can be used instead of `copy` when \( \text{last} \) is in the range \([\text{result} - N, \text{result})\).
Let $E$ be

- $(1.1)$ \texttt{std::move(*((first + n)))}$ for the overload in namespace \texttt{std};
- $(1.2)$ \texttt{ranges::iter_move(first + n)} for the overloads in namespace \texttt{ranges}.

Let $N$ be $\text{last} - \text{first}$.

**Preconditions:** \texttt{result} is not in the range $[\text{first, last})$.

**Effects:** Moves elements in the range $[\text{first, last}]$ into the range $[\text{result, result} + N]$ starting from \texttt{first} and proceeding to \texttt{last}. For each non-negative integer $n < N$, performs $\texttt{*((result + n)} = E$.

**Returns:**
- $\texttt{result + N}$ for the overload in namespace \texttt{std}.
- $\{\texttt{last, result + N}\}$ for the overloads in namespace \texttt{ranges}.

**Complexity:** Exactly $N$ assignments.

---

**§ 27.7.2 1314**
Returns:

1. $\text{result} - N$ for the overload in namespace `std`.
2. $\{\text{last}, \text{result} - N\}$ for the overloads in namespace `ranges`.

Complexity: Exactly $N$ assignments.

### 27.7.3 Swap

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
swap_ranges(ExecutionPolicy&& exec,
            ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
requires indirectly_swappable<I1, I2>
constexpr ranges::swap_ranges_result<I1, I2>
ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
```

```cpp
template<input_range R1, input_range R2>
requires indirectly_swappable<iterator_t<R1>, iterator_t<R2>>
constexpr ranges::swap_ranges_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
ranges::swap_ranges(R1&& r1, R2&& r2);
```

Let:

1. $\text{last2} = \text{first2} + (\text{last} - \text{first1})$ for the overloads with no parameter named `last2`;
2. $M = \min(\text{last} - \text{first1}, \text{last} - \text{first2})$.

Preconditions: The two ranges $[\text{first1}, \text{last1})$ and $[\text{first2}, \text{last2})$ do not overlap. For the overloads in namespace `std`, $*(\text{first1} + n)$ is swappable with (16.4.4.3) $*(\text{first2} + n)$.

Effects: For each non-negative integer $n < M$ performs:

1. `\text{swap}(\text{first1} + n, \text{first2} + n)` for the overloads in namespace `std`;
2. `ranges::iter_swap(first1 + n, first2 + n)` for the overloads in namespace `ranges`.

Returns:

1. $\text{last2}$ for the overloads in namespace `std`.
2. $\{\text{first1} + M, \text{first2} + M\}$ for the overloads in namespace `ranges`.

Complexity: Exactly $M$ swaps.

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

Preconditions: `a` and `b` are dereferenceable. $a$ is swappable with (16.4.4.3) $b$.

Effects: As if by `swap(*a, *b)`.

### 27.7.4 Transform

```cpp
template<class InputIterator, class OutputIterator, class UnaryOperation>
constexpr OutputIterator
transform(InputIterator first1, InputIterator last1,
          OutputIterator result, UnaryOperation op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class UnaryOperation>
ForwardIterator2
transform(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1,
          ForwardIterator2 result, UnaryOperation op);
```
template<class InputIterator1, class InputIterator2, class OutputIterator, class BinaryOperation>
constexpr OutputIterator transform(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, OutputIterator result, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator, class BinaryOperation>
ForwardIterator transform(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator result, BinaryOperation binary_op);

template<input_iterator I1, sentinel_for<I1> S1, weakly_incrementable O, copy_constructible F, class Proj = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<I1, Proj>>
constexpr ranges::unary_transform_result<I1, O> ranges::transform(I1 first1, S1 last1, O result, F op, Proj proj = {});

template<input_range R1, input_range R2, weakly_incrementable O, copy_constructible F, class Proj1 = identity, class Proj2 = identity>
requires indirectly_writable<O, indirect_result_t<F&, projected<iterator_t<R1>, Proj1>, projected<iterator_t<R2>, Proj2>>
constexpr ranges::binary_transform_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O> ranges::transform(R1&& r1, R2&& r2, O result, F binary_op, Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let:

(1.1) — last2 be first2 + (last1 - first1) for the overloads with parameter first2 but no parameter last2;

(1.2) — N be last1 - first1 for unary transforms, or min(last1 - first1, last2 - first2) for binary transforms;

(1.3) — E be

(1.3.1) — op(*(first1 + (i - result))) for unary transforms defined in namespace std;

(1.3.2) — binary_op(*(first1 + (i - result)), *(first2 + (i - result))) for binary transforms defined in namespace std;

(1.3.3) — invoke(op, invoke(proj, *(first1 + (i - result)))) for unary transforms defined in namespace ranges;

(1.3.4) — invoke(binary_op, invoke(proj1, *(first1 + (i - result))), invoke(proj2, *(first2 + (i - result)))) for binary transforms defined in namespace ranges.

2 Preconditions: op and binary_op do not invalidate iterators or subranges, nor modify elements in the ranges

(2.1) — [first1, first1 + N],

(2.2) — [first2, first2 + N], and
(2.3) \[ \text{[result, result + N]} \] \[222\]

**Effects:** Assigns through every iterator \(i\) in the range \([\text{result, result + N}]\) a new corresponding value equal to \(E\).

**Returns:**

(4.1) \(-\ \text{result + N}\) for the overloads defined in namespace `std`.

(4.2) \(-\ \{\text{first1 + N, result + N}\}\) for unary transforms defined in namespace `ranges`.

(4.3) \(-\ \{\text{first1 + N, first2 + N, result + N}\}\) for binary transforms defined in namespace `ranges`.

**Complexity:** Exactly \(N\) applications of \(op\) or `binary_op`, and any projections. This requirement also applies to the overload with an `ExecutionPolicy`.

**Remarks:** \(\text{result}\) may be equal to \(\text{first1}\) or \(\text{first2}\).

### 27.7.5 Replace [alg.replace]

```cpp
template<class ForwardIterator, class T>
constexpr void replace(ForwardIterator first, ForwardIterator last, 
const T& old_value, const T& new_value);

template<class ExecutionPolicy, class ForwardIterator, class T>
void replace(ExecutionPolicy&& exec, 
ForwardIterator first, ForwardIterator last, 
const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
constexpr void replace_if(ForwardIterator first, ForwardIterator last, 
Predicate pred, const T& new_value);

template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
void replace_if(ExecutionPolicy&& exec, 
ForwardIterator first, ForwardIterator last, 
Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>
requires indirectly_writable<I, const T2&> &&
indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T1*>&
constexpr I ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});

template<input_range R, class T1, class T2, class Proj = identity>
requires indirectly_writable<iterator_t<R>, const T2&> &&
indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T1*>&
constexpr borrowed_iterator_t<R> ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity, 
indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_writable<I, const T&>
constexpr I ranges::replace_if(I first, S last, Pred pred, const T1& old_value, Proj proj = {});

template<input_range R, class T, class Proj = identity, 
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires indirectly_writable<iterator_t<R>, const T&>
constexpr borrowed_iterator_t<R> ranges::replace_if(R&& r, Pred pred, const T1& new_value, Proj proj = {});

Let \(E\) be

(1.1) bool(*i == old_value) for `replace`;

(1.2) bool(pred(*i)) for `replace_if`;

(1.3) bool(invoke(proj, *i) == old_value) for `ranges::replace`;

(1.4) bool(invoke(pred, invoke(proj, *i))) for `ranges::replace_if`.
```

222) The use of fully closed ranges is intentional.
Mandates: new_value is writable (25.3.1) to first.

Effects: Substitutes elements referred by the iterator i in the range [first, last) with new_value, when E is true.

Returns: last for the overloads in namespace ranges.

Complexity: Exactly last - first applications of the corresponding predicate and any projection.

Let E be

1. \(\text{bool}(*(\text{first} + (i - \text{result}))) == \text{old_value}\) for replace_copy;
2. \(\text{bool}(\text{pred}(*(\text{first} + (i - \text{result}))))\) for replace_copy_if;
bool(invoke(proj, *(first + (i - result))) == old_value) for ranges::replace_copy;
bool(invoke(pred, invoke(proj, *(first + (i - result)))) for ranges::replace_copy_if.

Mandates: The results of the expressions *first and new_value are writable (25.3.1) to result.

Preconditions: The ranges [first, last) and [result, result + (last - first)) do not overlap.

Effects: Assigns through every iterator i in the range [result, result + (last - first)) a new corresponding value

Returns:

Complexity: Exactly last - first applications of the corresponding predicate and any projection.

27.7.6 Fill

```cpp
template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class T>
void fill(ExecutionPolicy&& exec,
          ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator fill_n(ExecutionPolicy&& exec,
                       ForwardIterator first, Size n, const T& value);

template<class T, output_iterator<const T&> O, sentinel_for<O> S>
constexpr O ranges::fill(O first, S last, const T& value);
template<class T, output_range<const T&> R>
constexpr borrowed_iterator_t<R> ranges::fill(R&& r, const T& value);
template<class T, output_iterator<const T&> O>
constexpr O ranges::fill_n(O first, iter_difference_t<O> n, const T& value);
```

Let N be max(0, n) for the fill_n algorithms, and last - first for the fill algorithms.

Mandates: The expression value is writable (25.3.1) to the output iterator. The type Size is convertible to an integral type (7.3.9, 11.4.8).

Effects: Assigns value through all the iterators in the range [first, first + N).

Returns: first + N.

Complexity: Exactly N assignments.

27.7.7 Generate

```cpp
template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
              ForwardIterator first, ForwardIterator last, Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);
template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
                           ForwardIterator first, Size n, Generator gen);
```

§ 27.7.7
Let \( N \) be \( \max(0, n) \) for the \texttt{generate_n} algorithms, and \( \text{last} - \text{first} \) for the \texttt{generate} algorithms.

\textbf{Mandates:} \( \text{Size} \) is convertible to an integral type (7.3.9, 11.4.8).

\textbf{Effects:} Assigns the result of successive evaluations of \texttt{gen()} through each iterator in the range \([\text{first}, \text{first} + N)\).

\textbf{Returns:} \( \text{first} + N \).

\textbf{Complexity:} Exactly \( N \) evaluations of \texttt{gen()} and assignments.

## 27.7.8 Remove

\texttt{template<class ForwardIterator, class T>}
\begin{verbatim}
constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last, const T& value);
\end{verbatim}

\texttt{template<class ExecutionPolicy, class ForwardIterator, class T>}
\begin{verbatim}
ForwardIterator remove(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, const T& value);
\end{verbatim}

\texttt{template<class ForwardIterator, class Predicate>}
\begin{verbatim}
constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last, Predicate pred);
\end{verbatim}

\texttt{template<class ExecutionPolicy, class ForwardIterator, class Predicate>}
\begin{verbatim}
ForwardIterator remove_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);
\end{verbatim}

\texttt{template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});
\end{verbatim}

\texttt{template<forward_range R, class T, class Proj = identity>
requires permutable<iterator_t<R>> && indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>
constexpr borrowed_subrange_t<R> ranges::remove(R&& r, const T& value, Proj proj = {});
\end{verbatim}

\texttt{template<permutable I, sentinel_for<I> S, class T, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirect_unary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, Pred>
constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});
\end{verbatim}

\texttt{template<forward_range R, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>, Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::remove_if(R&& r, Pred pred, Proj proj = {});
\end{verbatim}

Let \( E \) be
\begin{enumerate}
\item \( \text{bool}(*i == \text{value}) \) for \texttt{remove};
\item \( \text{bool}(	ext{pred}(*i)) \) for \texttt{remove_if};
\item \( \text{bool}(	ext{invoke(proj, *i)} == \text{value}) \) for \texttt{ranges::remove};
\item \( \text{bool}(	ext{invoke(pred, invoke(proj, *i))}) \) for \texttt{ranges::remove_if}.
\end{enumerate}

\textbf{Preconditions:} For the algorithms in namespace \texttt{std}, the type of \texttt{*first} meets the \texttt{Cpp17MoveAssignable} requirements (Table 34).
Effects: Eliminates all the elements referred to by iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

Returns: Let \( j \) be the end of the resulting range. Returns:

- \( j \) for the overloads in namespace \texttt{std}.
- \( \{j, \text{last}\} \) for the overloads in namespace \texttt{ranges}.

Complexity: Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

Remarks: Stable (16.4.6.8).

[Note 1: Each element in the range \([\text{ret}, \text{last})\), where \( \text{ret} \) is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — end note]

template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
\texttt{remove_copy}(InputIterator \texttt{first}, InputIterator \texttt{last},
OutputIterator \texttt{result}, const \texttt{T} & \texttt{value});

\texttt{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class T>}
ForwardIterator2
\texttt{remove_copy}(ExecutionPolicy&& \texttt{exec},
ForwardIterator1 \texttt{first}, ForwardIterator1 \texttt{last},
ForwardIterator2 \texttt{result}, const \texttt{T} & \texttt{value});

\texttt{template<class InputIterator, class OutputIterator, class Predicate>}
constexpr OutputIterator
\texttt{remove_copy_if}(InputIterator \texttt{first}, InputIterator \texttt{last},
OutputIterator \texttt{result}, Predicate \texttt{pred});

\texttt{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class Predicate>}
ForwardIterator2
\texttt{remove_copy_if}(ExecutionPolicy&& \texttt{exec},
ForwardIterator1 \texttt{first}, ForwardIterator1 \texttt{last},
ForwardIterator2 \texttt{result}, Predicate \texttt{pred});

\texttt{template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
class Proj = \text{identity}>}
\texttt{requires indirectly_copyable\langle I, O \rangle && indirect_binary_predicate\langle ranges::equal_to, \text{projected}\langle I, Proj \rangle, \text{const} \texttt{T} \rangle>}
\texttt{constexpr ranges::remove_copy_result\langle I, O \rangle
\texttt{ranges::remove_copy}\langle I \texttt{first}, S \texttt{last}, O \texttt{result}, \text{const} \texttt{T} \& \texttt{value}, \text{Proj} \texttt{proj} = \{\};

\texttt{template<input_range R, weakly_incrementable O, class T, class Proj = \text{identity}>}
\texttt{requires indirectly_copyable\langle iterator_t\langle R \rangle, O \rangle &&
indirect_binary_predicate\langle ranges::equal_to, \text{projected}\langle iterator_t\langle R \rangle, Proj \rangle, \text{const} \texttt{T} \rangle>}
\texttt{constexpr ranges::remove_copy_result\langle borrowed_iterator_t\langle R \rangle, O \rangle
\texttt{ranges::remove_copy}\langle R &\& \texttt{r}, O \texttt{result}, \text{const} \texttt{T} \& \texttt{value}, \text{Proj} \texttt{proj} = \{\};

\texttt{template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
class Proj = \text{identity}, indirect_unary_predicate\langle \text{projected}\langle I, Proj \rangle, Pred\rangle>
\texttt{requires indirectly_copyable\langle I, O \rangle>
\texttt{constexpr ranges::remove_copy_if_result\langle I, O \rangle
\texttt{ranges::remove_copy_if}\langle I \texttt{first}, S \texttt{last}, O \texttt{result}, Pred \texttt{pred}, \text{Proj} \texttt{proj} = \{\};

\texttt{template<input_range R, weakly_incrementable O, class Proj = \text{identity},
indirect_unary_predicate\langle \text{projected}\langle iterator_t\langle R \rangle, Proj\rangle, Pred\rangle>
\texttt{requires indirectly_copyable\langle iterator_t\langle R \rangle, O \rangle>
\texttt{constexpr ranges::remove_copy_if_result\langle borrowed_iterator_t\langle R \rangle, O \rangle
\texttt{ranges::remove_copy_if}\langle R &\& \texttt{r}, O \texttt{result}, Pred \texttt{pred}, \text{Proj} \texttt{proj} = \{\};

Let \( E \) be

- \( \text{bool}(\ast i == \text{value}) \) for \texttt{remove_copy};
- \( \text{bool}(\text{pred}(\ast i)) \) for \texttt{remove_copy_if};
- \( \text{bool}(\text{invoke}(\text{proj}, \ast i == \text{value}) \) for \texttt{ranges::remove_copy};
- \( \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, \ast i))) \) for \texttt{ranges::remove_copy_if}.
Let $N$ be the number of elements in $[\text{first}, \text{last})$ for which $E$ is false.

**Mandates:** *first* is writable (25.3.1) to result.

**Preconditions:** The ranges $[\text{first}, \text{last})$ and $[\text{result}, \text{result} + (\text{last} - \text{first}))$ do not overlap.

[Note 2: For the overloads with an ExecutionPolicy, there might be a performance cost if `iterator_traits<ForwardIterator>::value_type` does not meet the `Cpp17MoveConstructible` (Table 32) requirements. —end note]

**Effects:** Copies all the elements referred to by the iterator $i$ in the range $[\text{first}, \text{last})$ for which $E$ is false.

**Returns:**

(13.1) $\text{result} + N$, for the algorithms in namespace `std`.

(13.2) $\{\text{last}, \text{result} + N\}$, for the algorithms in namespace `ranges`.

**Complexity:** Exactly $\text{last} - \text{first}$ applications of the corresponding predicate and any projection.

**Remarks:** Stable (16.4.6.8).

### 27.7.9 Unique [alg.unique]

```cpp
template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec,
                        ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last,
                                BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec,
                        ForwardIterator first, ForwardIterator last,
                        BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
          indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
          indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

1. Let $\text{pred}$ be `equal_to()` for the overloads with no parameter $\text{pred}$, and let $E$ be
   
   (1.1) $\text{bool}(\text{pred}(*(i - 1), *i))$ for the overloads in namespace `std`;
   
   (1.2) $\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(<\text{proj}, *(i - 1)), \text{invoke}(<\text{proj}, *i)))$ for the overloads in namespace `ranges`.

2. **Preconditions:** For the overloads in namespace `std`, $\text{pred}$ is an equivalence relation and the type of $*\text{first}$ meets the `Cpp17MoveAssignable` requirements (Table 34).

3. **Effects:** For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator $i$ in the range $[\text{first} + 1, \text{last})$ for which $E$ is true.

4. **Returns:** Let $j$ be the end of the resulting range. Returns:
   
   (4.1) $j$ for the overloads in namespace `std`.
   
   (4.2) $\{j, \text{last}\}$ for the overloads in namespace `ranges`.

5. **Complexity:** For nonempty ranges, exactly $(\text{last} - \text{first}) - 1$ applications of the corresponding predicate and no more than twice as many applications of any projection.
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2

    ForwardIterator1 first, ForwardIterator1 last,
    ForwardIterator2 result, BinaryPredicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
    indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
requires indirectly_copyable<I, O> &&
    (forward_iterator<I> ||
    (input_iterator<O> && same_as<iter_value_t<I>, iter_value_t<O>>)) ||
    indirectly_copyable_storable<I, O>)
constexpr ranges::unique_copy_result<I, O> ranges::unique_copy(I first, S last, O result, C comp = {}, Proj proj = {});

template<input_range R, weakly_incrementable O, class Proj = identity,
    indirect_equivalence_relation<iterator_t<R>, Proj>> C = ranges::equal_to>
requires indirectly_copyable<iterator_t<R>, O> &&
    (forward_iterator<iterator_t<R> ||
    (input_iterator<O> && same_as<range_value_t<R>, iter_value_t<O>>)) ||
    indirectly_copyable_storable<iterator_t<R>, O>)
constexpr ranges::unique_copy_result<borrowed_iterator_t<R>, O> ranges::unique_copy(R&& r, O result, C comp = {}, Proj proj = {});

- Let pred be equal_to{} for the overloads in namespace std with no parameter pred, and let E be
  - bool(pred(*i, *(i - 1))) for the overloads in namespace std;
  - bool(invoke(comp, invoke(proj, *i), invoke(proj, *(i - 1)))) for the overloads in namespace ranges.

**Mandates:** *first* is writable (25.3.1) to result.

**Preconditions:**
- The ranges [first, last) and [result.result+(last-first)) do not overlap.
- For the overloads in namespace std:
  - The comparison function is an equivalence relation.
  - For the overloads with no ExecutionPolicy, let T be the value type of InputIterator. If InputIterator models forward_iterator (25.3.4.11), then there are no additional requirements for T. Otherwise, if OutputIterator meets the Cpp17ForwardIterator requirements and its value type is the same as T, then T meets the Cpp17CopyAssignable (Table 35) requirements. Otherwise, T meets both the Cpp17CopyConstructible (Table 33) and Cpp17CopyAssignable requirements.
  
  [Note 1: For the overloads with an ExecutionPolicy, there might be a performance cost if the value type of ForwardIterator1 does not meet both the Cpp17CopyConstructible and Cpp17CopyAssignable requirements. — end note]

**Effects:** Copies only the first element from every consecutive group of equal elements referred to by the iterator i in the range [first, last) for which E holds.

**Returns:**
- result + N for the overloads in namespace std.
27.7.10 Reverse

\[ \text{template<} \text{BidirectionalIterator}\rangle \text{ void reverse(BidirectionalIterator first, BidirectionalIterator last);} \]
\[ \text{template<} \text{class ExecutionPolicy, class BidirectionalIterator}\rangle \text{ void reverse(ExecutionPolicy&& exec,} \]
\[ \text{BidirectionalIterator first, BidirectionalIterator last);} \]
\[ \text{template<} \text{bidirectional_iterator I, sentinel_for<} \text{I}\rangle \text{ S}\rangle \]
\[ \text{requires permutable<} \text{I}\rangle \]
\[ \text{constexpr I ranges::reverse(} \text{I first, S last);} \]
\[ \text{template<} \text{bidirectional_range R}\rangle \]
\[ \text{requires permutable<} \text{iterator_t<} \text{R}\rangle\]
\[ \text{constexpr borrowed_iterator_t<} \text{R}\rangle \text{ ranges::reverse(} \text{R&& r);} \]

Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3).

Effects: For each non-negative integer \( i < (\text{last} - \text{first}) / 2 \), applies std::iter_swap, or ranges::iter_swap for the overloads in namespace ranges, to all pairs of iterators \( \text{first} + i, (\text{last} - i) - 1 \).

Returns: last for the overloads in namespace ranges.

Complexity: Exactly \( (\text{last} - \text{first})/2 \) swaps.

27.7.11 Rotate

\[ \text{template<} \text{class ForwardIterator}\rangle \text{ constexpr ForwardIterator} \]
\[ \text{§ 27.7.11 1324} \]
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);

```cpp
rotate(ExecutionPolicy&& exec,
       ForwardIterator first, ForwardIterator middle, ForwardIterator last);
```
27.7.12 Sample

```
SampleIterator sample(PopulationIterator first, PopulationIterator last,
                     SampleIterator out, Distance n,
                     UniformRandomBitGenerator&& g);
```

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>
requires (forward_iterator<I> || random_access_iterator<O>) &&
  indirectly_copyable<I, O> &&
  uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
```

```
template<input_range R, weakly_incrementable O, class Gen>
requires (forward_range<R> || random_access_iterator<O>) &&
  indirectly_copyable<iterator_t<R>, O> &&
  uniform_random_bit_generator<remove_reference_t<Gen>>
O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

**Mandates:** For the overload in namespace std, Distance is an integer type and *first is writable (25.3.1) to out.

**Preconditions:** out is not in the range [first, last). For the overload in namespace std:

(1.1) PopulationIterator meets the Cpp17InputIterator requirements (25.3.5.3).
(1.2) SampleIterator meets the Cpp17OutputIterator requirements (25.3.5.4).
(1.3) SampleIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) unless PopulationIterator models forward_iterator (25.3.4.11).
(1.4) remove_reference_t<UniformRandomBitGenerator> meets the requirements of a uniform random bit generator type (28.5.3.3).

**Effects:** Copies min(last − first, n) elements (the sample) from [first, last) (the population) to out such that each possible sample has equal probability of appearance.

[Note 1: Algorithms that obtain such effects include selection sampling and reservoir sampling. — end note]

**Returns:** The end of the resulting sample range.

**Complexity:** \( \Theta(\text{last} - \text{first}) \).

**Remarks:**

(6.1) For the overload in namespace std, stable if and only if PopulationIterator models forward_iterator. For the first overload in namespace ranges, stable if and only if I models forward_iterator.
(6.2) To the extent that the implementation of this function makes use of random numbers, the object g serves as the implementation’s source of randomness.

27.7.13 Shuffle

```
void shuffle(RandomAccessIterator first,
             RandomAccessIterator last,
             UniformRandomBitGenerator&& g);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Gen>
requires permutable<I> &&
  uniform_random_bit_generator<remove_reference_t<Gen>>
I ranges::shuffle(I first, S last, Gen&& g);
```

```
template<random_access_range R, class Gen>
requires permutable<iterator_t<R>> &&
  uniform_random_bit_generator<remove_reference_t<Gen>>
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

**Preconditions:** For the overload in namespace std:

(1.1) RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3).
— The type \texttt{remove\_reference\_t<UniformRandomBitGenerator>} meets the uniform random bit generator (28.5.3.3) requirements.

\textit{Effects}: Permutes the elements in the range \texttt{[first,last)} such that each possible permutation of those elements has equal probability of appearance.

\textit{Returns}: \texttt{last} for the overloads in namespace \texttt{ranges}.

\textit{Complexity}: Exactly \texttt{(last - first)} - 1 swaps.

\textit{Remarks}: To the extent that the implementation of this function makes use of random numbers, the object referenced by \texttt{g} shall serve as the implementation’s source of randomness.

\subsection*{27.7.14 Shift} [\texttt{alg.shift}]

\begin{verbatim}
template<class ForwardIterator>
constexpr ForwardIterator
    shift_left(ForwardIterator first, ForwardIterator last,
              typename iterator_traits<ForwardIterator>::difference_type n);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
              typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)

Preconditions: \texttt{n >= 0} is true. For the overloads in namespace \texttt{std}, the type of \texttt{*first} meets the \texttt{Cpp17MoveAssigns} requirements.

\textit{Effects}: If \texttt{n == 0} or \texttt{n >= last - first}, does nothing. Otherwise, moves the element from position \texttt{first + n + i} into position \texttt{first + i} for each non-negative integer \texttt{i < (last - first) - n}. For the overloads without an \texttt{ExecutionPolicy} template parameter, does so in order starting from \texttt{i = 0} and proceeding to \texttt{i = (last - first) - n - 1}.

\textit{Returns}: Let \texttt{NEW(last)} be \texttt{first + (last - first - n)} if \texttt{n < last - first}, otherwise \texttt{first}.

\subsection*{27.7.14 Shift} [\texttt{alg.shift}]

\begin{verbatim}
template<class ForwardIterator>
constexpr ForwardIterator
    shift_right(ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
    shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
                typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n)

Preconditions: \texttt{n >= 0} is true. For the overloads in namespace \texttt{std}, the type of \texttt{*first} meets the \texttt{Cpp17MoveAssigns} requirements, and \texttt{ForwardIterator} meets the \texttt{Cpp17BidirectionalAssigns} requirements (25.3.5.6) or the \texttt{Cpp17ValueSwappable} requirements.

\textit{Effects}: If \texttt{n == 0} or \texttt{n >= last - first}, does nothing. Otherwise, moves the element from position \texttt{first + i} into position \texttt{first + n + i} for each non-negative integer \texttt{i < (last - first) - n}. Does so in order starting from \texttt{i = (last - first) - n - 1} and proceeding to \texttt{i = 0} if:
\end{verbatim}
§ 27.8 Sorting and related operations

27.8.1 General

The operations in 27.8 defined directly in namespace std have two versions: one that takes a function object of type Compare and one that uses an operator<.

Compare is a function object type (22.10) that meets the requirements for a template parameter named BinaryPredicate (27.2). The return value of the function call operation applied to an object of type Compare, when contextually converted to bool (7.3), yields true if the first argument of the call is less than the second, and false otherwise. Compare comp is used throughout for algorithms assuming an ordering relation.

For all algorithms that take Compare, there is a version that uses operator< instead. That is, comp(*i, *j) != false defaults to *i < *j != false. For algorithms other than those described in 27.8.4, comp shall induce a strict weak ordering on the values.

The term strict refers to the requirement of an irreflexive relation (!comp(x, x) for all x), and the term weak to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define equiv(a, b) as !comp(a, b) && !comp(b, a), then the requirements are that comp and equiv both be transitive relations:

- (4.1) comp(a, b) && comp(b, c) implies comp(a, c)
- (4.2) equiv(a, b) && equiv(b, c) implies equiv(a, c)

[Note 1: Under these conditions, it can be shown that]
- (4.3) equiv is an equivalence relation,
- (4.4) comp induces a well-defined relation on the equivalence classes determined by equiv, and
- (4.5) the induced relation is a strict total ordering.

[end note]

A sequence is sorted with respect to a comp and proj for a comparator and projection comp and proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence,

bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))

is false.

A sequence is sorted with respect to a comparator comp for a comparator comp if it is sorted with respect to comp and identity{} (the identity projection).

A sequence [start, finish) is partitioned with respect to an expression f(e) if there exists an integer n such that for all 0 <= i < (finish - start), f(*(start + i)) is true if and only if i < n.

In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an operator==, but an equivalence relation induced by the strict weak ordering. That is, two elements a and b are considered equivalent if and only if !(a < b) && !(b < a).

27.8.2 Sorting

template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);
template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator last);
template<class RandomAccessIterator, class Compare>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void sort(ExecutionPolicy&& exec,
         RandomAccessIterator first, RandomAccessIterator last,
         Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::sort(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::sort(R&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2 Preconditions: For the overloads in namespace std, RandomAccessIterator meets the Cpp17Value-
Swappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 32)
and Cpp17MoveAssignable (Table 34) requirements.
3 Effects: Sorts the elements in the range [first, last) with respect to comp and proj.
4 Returns: last for the overloads in namespace ranges.
5 Complexity: Let N be last - first. \( \Theta(N \log N) \) comparisons and projections.

27.8.2.2 stable_sort

template<class RandomAccessIterator>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
void stable_sort(RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void stable_sort(ExecutionPolicy&& exec,
                 RandomAccessIterator first, RandomAccessIterator last,
                 Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::stable_sort(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::stable_sort(R&& r, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
2 Preconditions: For the overloads in namespace std, RandomAccessIterator meets the Cpp17Value-
Swappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 32)
and Cpp17MoveAssignable (Table 34) requirements.
3 Effects: Sorts the elements in the range [first, last) with respect to comp and proj.
4 Returns: last for the overloads in namespace ranges.
5 Complexity: Let N be last - first. If enough extra memory is available, \( N \log(N) \) comparisons.
Otherwise, at most \( N \log^2(N) \) comparisons. In either case, twice as many projections as the number of
comparisons.
27.8.2.3 partial_sort

```cpp
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
  RandomAccessIterator middle,
  RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
  RandomAccessIterator first,
  RandomAccessIterator middle,
  RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
  RandomAccessIterator middle,
  RandomAccessIterator last,
  Compare comp);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
  RandomAccessIterator first,
  RandomAccessIterator middle,
  RandomAccessIterator last,
  Compare comp);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
  class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

```cpp
Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
```

```cpp
Preconditions: [first, middle) and [middle, last) are valid ranges. For the overloads in namespace std,
  RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first
  meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.
```

```cpp
Effects: Places the first middle - first elements from the range [first, last) as sorted with respect
  to comp and proj into the range [first, middle). The rest of the elements in the range [middle, last)
  are placed in an unspecified order.
```

```cpp
Returns: last for the overload in namespace ranges.
```

```cpp
Complexity: Approximately (last - first) * log(middle - first) comparisons, and twice as many projections.
```

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

```cpp
Effects: Equivalent to:
  return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.2.4 partial_sort_copy

```cpp
template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
partial_sort_copy(InputIterator first, InputIterator last,
  RandomAccessIterator result_first,
  RandomAccessIterator result_last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
RandomAccessIterator
partial_sort_copy(ExecutionPolicy&& exec,
  ForwardIterator first, ForwardIterator last,
  RandomAccessIterator result_first,
  RandomAccessIterator result_last);
```
RandomAccessIterator result_last);

template<class InputIterator, class RandomAccessIterator,
        class Compare
        >
        constexpr RandomAccessIterator
        partial_sort_copy(InputIterator first, InputIterator last,
        RandomAccessIterator result_first,
        RandomAccessIterator result_last,
        Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator,
        class Compare
        >
        RandomAccessIterator
        partial_sort_copy(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last,
        RandomAccessIterator result_first,
        RandomAccessIterator result_last,
        Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2,
        class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
        requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> &&
        indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
        constexpr ranges::partial_sort_copy_result<I1, I2>
        ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last,
        Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, random_access_range R2, class Comp = ranges::less,
        class Proj1 = identity, class Proj2 = identity>
        requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> &&
        sortable<iterator_t<R2>, Comp, Proj2> &&
        indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>,
        projected<iterator_t<R2>, Proj2>>
        constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
        ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( N \) be \( \min(last - first, result_last - result_first) \). Let \( \text{cmp} \) be \( \text{less}{} \), and \( \text{proj1} \) and \( \text{proj2} \) be \( \text{identity}{} \) for the overloads with no parameters by those names.

Mandates: For the overloads in namespace \( \text{std} \), the expression \( *first \) is writable (25.3.1) to \( \text{result} - \text{first} \).

Preconditions: For the overloads in namespace \( \text{std} \), \( \text{RandomAccessIterator} \) meets the \( \text{Cpp17Value-Swappable} \) requirements (16.4.4.3), the type of \( \ast result_first \) meets the \( \text{Cpp17MoveConstructible} \) (Table 32) and \( \text{Cpp17MoveAssignable} \) (Table 34) requirements.

For iterators \( \text{a1} \) and \( \text{b1} \) in \( [\text{first}, \text{last}) \), and iterators \( \text{x2} \) and \( \text{y2} \) in \( [\text{result_first}, \text{result_last}) \), after evaluating the assignment \( *\text{y2} = *\text{b1} \), let \( E \) be the value of

\[
\text{bool}(\text{invoke}(\text{cmp}, \text{invoke}(\text{proj1}, *\text{a1}), \text{invoke}(\text{proj2}, *\text{y2}))).
\]

Then, after evaluating the assignment \( *\text{x2} = *\text{a1} \), \( E \) is equal to

\[
\text{bool}(\text{invoke}(\text{cmp}, \text{invoke}(\text{proj2}, *\text{x2}), \text{invoke}(\text{proj2}, *\text{y2}))).
\]

[Note 1: Writing a value from the input range into the output range does not affect how it is ordered by \( \text{cmp} \) and \( \text{proj1} \) or \( \text{proj2} \). — end note]

Effects: Places the first \( N \) elements as sorted with respect to \( \text{cmp} \) and \( \text{proj2} \) into the range \( [\text{result_first}, \text{result_first} + N) \).

Returns:

- \( \text{result_first} + N \) for the overloads in namespace \( \text{std} \).
- \{\( \text{last}, \text{result_first} + N \)\} for the overloads in namespace \( \text{ranges} \).

Complexity: Approximately \( (last - first) \ast \log N \) comparisons, and twice as many projections.
27.8.2.5 is_sorted

```cpp
template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
```

**Effects:** Equivalent to: return `is_sorted_until(first, last) == last;`

```cpp
template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);
```

**Effects:** Equivalent to:
```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```cpp
template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                        Compare comp);
```

**Effects:** Equivalent to:
```
return is_sorted_until(first, last, comp) == last;
```

```cpp
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
```

**Effects:** Equivalent to: return `ranges::is_sorted_until(first, last, comp, proj) == last;`

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ForwardIterator, class Compare>
constexpr ForwardIterator
is_sorted_until(ForwardIterator first, ForwardIterator last,
                Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator
is_sorted_until(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);
```

```cpp
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

**Returns:** The last iterator `i` in `[first, last]` for which the range `[first, i)` is sorted with respect to `comp` and `proj`.

§ 27.8.2.5 1332
### 27.8.3 Nth element

**template<class RandomAccessIterator>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last);
**

**template<class ExecutionPolicy, class RandomAccessIterator>
  void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last);
**

**template<class RandomAccessIterator, class Compare>
  constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);
**

**template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
  void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);
**

**template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
  requires sortable<I, Comp, Proj>
  constexpr I
  ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});**

1. Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

2. **Preconditions**: `[first, nth)` and `[nth, last)` are valid ranges. For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements (**16.4.4.3**), and the type of `*first` meets the `Cpp17MoveConstructible` (**Table 32**) and `Cpp17MoveAssignable` (**Table 34**) requirements.

3. **Effects**: After `nth_element` the element in the position pointed to by `nth` is the element that would be in that position if the whole range were sorted with respect to `comp` and `proj`, unless `nth == last`. Also for every iterator `i` in the range `[first, nth)` and every iterator `j` in the range `[nth, last)` it holds that: `bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))` is false.

4. **Returns**: `last` for the overload in namespace `ranges`.

5. **Complexity**: For the overloads with no `ExecutionPolicy`, linear on average. For the overloads with an `ExecutionPolicy`, $O(N)$ applications of the predicate, and $O(N \log N)$ swaps, where $N = \text{last} - \text{first}$.

**template<random_access_range R, class Comp = ranges::less, class Proj = identity>
  requires sortable<iterator_t<R>, Comp, Proj>
  constexpr borrowed_iterator_t<R>
  ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});**

6. **Effects**: Equivalent to:

   ```cpp
   return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);
   ```

### 27.8.4 Binary search

**27.8.4.1 General**

All of the algorithms in **27.8.4** are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

**27.8.4.2 lower_bound**

**template<class ForwardIterator, class T>
  constexpr ForwardIterator**

§ 27.8.4.2
lower_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
lower_bound(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
          indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity,
          indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression
   bool(invoke(comp, invoke(proj, e), value)).

3 Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
   range [first, i), bool(invoke(comp, invoke(proj, *j), value)) is true.

4 Complexity: At most $\log_2(last - first) + \Theta(1)$ comparisons and projections.

27.8.4.3 upper_bound

template<class ForwardIterator, class T>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator
upper_bound(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
          indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity,
          indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression
   boold(invoke(comp, value, invoke(proj, e))).

3 Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
   range [first, i), bool(invoke(comp, value, invoke(proj, *j))) is true.

4 Complexity: At most $\log_2(last - first) + \Theta(1)$ comparisons and projections.

27.8.4.4 equal_range

template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first, ForwardIterator last, const T& value);

§ 27.8.4.4
template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);  

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr subrange<I>
ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});  

template<forward_range R, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_subrange_t<R>
ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});  

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

2 Preconditions: The elements e of [first,last) are partitioned with respect to the expressions
\[\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, e), value)) \land \neg\text{bool}(\text{comp}(value, e))\]. Also, for all elements e of [first, last), \text{bool}(\text{comp}(e, value)) implies \neg\text{bool}(\text{comp}(value, e)) for the overloads in namespace std.

3 Returns:

(3.1) — For the overloads in namespace std:
\[
\{\text{lower\_bound}(\text{first}, \text{last}, value, \text{comp}), \\
\text{upper\_bound}(\text{first}, \text{last}, value, \text{comp})\}
\]

(3.2) — For the overloads in namespace ranges:
\[
\{\text{ranges\_lower\_bound}(\text{first}, \text{last}, value, \text{comp}, \text{proj}), \\
\text{ranges\_upper\_bound}(\text{first}, \text{last}, value, \text{comp}, \text{proj})\}
\]

4 Complexity: At most \(2 \times \log_2(last - first) + O(1)\) comparisons and projections.

27.8.4.5 binary_search

[binary.search]

template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {}, Proj proj = {});  

template<forward_range R, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {}, Proj proj = {});  

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.

2 Preconditions: The elements e of [first,last) are partitioned with respect to the expressions
\[\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, e), value)) \land \neg\text{bool}(\text{comp}(value, e))\]. Also, for all elements e of [first, last), \text{bool}(\text{comp}(e, value)) implies \neg\text{bool}(\text{comp}(value, e)) for the overloads in namespace std.

3 Returns: true if and only if for some iterator i in the range [first,last), \(\neg\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *i), value)) \land \neg\text{bool}(\text{invoke}(\text{comp}, \text{value}, \text{invoke}(\text{proj}, *i)))\) is true.

4 Complexity: At most \(\log_2(last - first) + O(1)\) comparisons and projections.
27.8.5 Partitions

```cpp
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});

Let proj be identity{} for the overloads with no parameter named proj.

Returns: true if and only if the elements e of [first, last) are partitioned with respect to the expression bool(invoke(pred, invoke(proj, e))).

Complexity: Linear. At most last - first applications of pred and proj.

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, Predicate pred);

Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(pred, invoke(proj, x))).

Preconditions: For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable requirements (16.4.4.3).

Effects: Places all the elements e in [first, last) that satisfy E(e) before all the elements that do not.

Returns: Let i be an iterator such that E(*j) is true for every iterator j in [first, i) and false for every iterator j in [i, last). Returns:

(7.1) — i for the overloads in namespace std.

(7.2) — {i, last} for the overloads in namespace ranges.

Complexity: Let N = last - first:

(8.1) — For the overload with no ExecutionPolicy, exactly N applications of the predicate and projection. At most N/2 swaps if the type of first meets the Cpp17BidirectionalIterator requirements for the overloads in namespace std or models bidirectional_iterator for the overloads in namespace ranges, and at most N swaps otherwise.

(8.2) — For the overload with an ExecutionPolicy, \( \Theta(N \log N) \) swaps and \( \Theta(N) \) applications of the predicate.

template<class BidirectionalIterator, class Predicate>
BidirectionalIterator
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

§ 27.8.5
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>
  BidirectionalIterator
  stable_partition(ExecutionPolicy&& exec,
                     BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
          indirect_unary_predicate<projected<I, Proj>> Pred>
  requires permutable<I>
  subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});

template<bidirectional_range R, class Proj = identity,
          indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
  requires permutable<iterator_t<R>>
  borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});

Let \( \text{proj} \) be \( \text{identity} {} \) for the overloads with no parameter named \( \text{proj} \) and let \( E(x) \) be \( \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, x))) \).

Preconditions: For the overloads in namespace \( \text{std} \), \text{BidirectionalIterator} meets the \text{Cpp17Value-Swappable} requirements (16.4.4.3) and the type of \( *\text{first} \) meets the \text{Cpp17MoveConstructible} (Table 32) and \text{Cpp17MoveAssignible} (Table 34) requirements.

Effects: Places all the elements \( e \) in \([\text{first}, \text{last})\) that satisfy \( E(e) \) before all the elements that do not. The relative order of the elements in both groups is preserved.

Returns: Let \( i \) be an iterator such that for every iterator \( j \) in \([\text{first}, i)\), \( E(*)j \) is \text{true}, and for every iterator \( j \) in the range \([i, \text{last})\), \( E(*)j \) is \text{false}. Returns:

- \( i \) for the overloads in namespace \( \text{std} \).
- \{\( i \), \( \text{last} \)\} for the overloads in namespace \( \text{ranges} \).

Complexity: Let \( N = \text{last} - \text{first} \):

- For the overloads with no \( \text{ExecutionPolicy} \), at most \( N \log_2 N \) swaps, but only \( \Theta(N) \) swaps if there is enough extra memory. Exactly \( N \) applications of the predicate and projection.
- For the overload with an \( \text{ExecutionPolicy} \), \( \Theta(N \log N) \) swaps and \( \Theta(N) \) applications of the predicate.

Let \( \text{proj} \) be \( \text{identity} {} \) for the overloads with no parameter named \( \text{proj} \) and let \( E(x) \) be \( \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, x))) \).

Mandates: For the overloads in namespace \( \text{std} \), the expression \( *\text{first} \) is writable (25.3.1) to \( \text{out\_true} \) and \( \text{out\_false} \).
16 **Preconditions**: The input range and output ranges do not overlap.

[Note 1: For the overload with an ExecutionPolicy, there might be a performance cost if first’s value type does not meet the Cpp17CopyConstructible requirements. — end note]

17 **Effects**: For each iterator \(i\) in \([\text{first}, \text{last})\), copies \(*i\) to the output range beginning with \text{out\_true} if \(E(*i)\) is true, or to the output range beginning with \text{out\_false} otherwise.

18 **Returns**: Let \(o1\) be the end of the output range beginning at \text{out\_true}, and \(o2\) the end of the output range beginning at \text{out\_false}. Returns

19 \(\text{— (18.1)}\) \{\(o1, o2\)\} for the overloads in namespace \text{std}.

18 \(\text{— (18.2)}\) \{\(\text{last}, o1, o2\)\} for the overloads in namespace \text{ranges}.

20 **Complexity**: Exactly \(\text{last} - \text{first}\) applications of \text{pred} and \text{proj}.

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});

template<forward_range R, class Proj = identity,
indirect_unary_predicate<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::partition_point(R&& r, Pred pred, Proj proj = {});

20 Let \(\text{proj}\) be \text{identity}\{\} for the overloads with no parameter named \(\text{proj}\) and let \(E(x)\) be \text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, x)))\).

21 **Preconditions**: The elements \(e\) of \([\text{first}, \text{last})\) are partitioned with respect to \(E(e)\).

22 **Returns**: An iterator \(\text{mid}\) such that \(E(*i)\) is true for all iterators \(i\) in \([\text{first}, \text{mid})\), and false for all iterators \(i\) in \([\text{mid}, \text{last})\).

23 **Complexity**: \(O(\log(\text{last} - \text{first}))\) applications of \text{pred} and \text{proj}.

**27.8.6 Merge**

27.8.6 1338

template<class InputIterator1, class InputIterator2,
class OutputIterator>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator
merge(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);

template<class InputIterator1, class InputIterator2,
class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity,
class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::merge(R1&& r1, R2&& r2, O result,
  Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( N \) be \((last1 - first1) + (last2 - first2)\). Let \( \text{comp} \) be \( \text{less}{} \), \( \text{proj1} \) be \( \text{identity}{} \), and \( \text{proj2} \) be \( \text{identity}{} \), for the overloads with no parameters by those names.

Preconditions: The ranges \([first1, last1)\) and \([first2, last2)\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively. The resulting range does not overlap with either of the original ranges.

Effects: Copies all the elements of the two ranges \([first1, last1)\) and \([first2, last2)\) into the range \([\text{result}, \text{result_last})\), where \( \text{result_last} = \text{result} + N \). If an element \( a \) precedes \( b \) in an input range, \( a \) is copied into the output range before \( b \). If \( e1 \) is an element of \([first1, last1)\) and \( e2 \) of \([first2, last2)\), \( e2 \) is copied into the output range before \( e1 \) if and only if \( \text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, e2), \text{invoke}(\text{proj1}, e1))) \) is true.

Returns:

1. \( \text{result_last} \) for the overloads in namespace \textit{std}.
2. \{\text{last1}, \text{last2}, \text{result_last}\} for the overloads in namespace \textit{ranges}.

Complexity:

1. For the overloads with no \textit{ExecutionPolicy}, at most \( N - 1 \) comparisons and applications of each projection.
2. For the overloads with an \textit{ExecutionPolicy}, \( O(N) \) comparisons.

Remarks: Stable (16.4.6.8).

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
  BidirectionalIterator middle,
  BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
  BidirectionalIterator first,
  BidirectionalIterator middle,
  BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
  BidirectionalIterator middle,
  BidirectionalIterator last, Compare comp);

template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
  BidirectionalIterator first,
  BidirectionalIterator middle,
  BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \( \text{less}{} \) and \( \text{proj} \) be \( \text{identity}{} \) for the overloads with no parameters by those names.
Preconditions: \([\text{first}, \text{middle})\) and \([\text{middle}, \text{last})\) are valid ranges sorted with respect to \(\text{comp}\) and \(\text{proj}\). For the overloads in namespace \text{std}, BidirectionalIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of \(\ast \text{first}\) meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

Effects: Merges two sorted consecutive ranges \([\text{first}, \text{middle})\) and \([\text{middle}, \text{last})\), putting the result of the merge into the range \([\text{first}, \text{last})\). The resulting range is sorted with respect to \(\text{comp}\) and \(\text{proj}\).

Returns: \(\text{last}\) for the overload in namespace \text{ranges}.

Complexity: Let \(N = \text{last} - \text{first}\):

1. For the overloads with no \text{ExecutionPolicy}, and if enough additional memory is available, exactly \(N - 1\) comparisons.
2. Otherwise, \(\Theta(N \log N)\) comparisons.

Remarks: Stable (16.4.6.8).

```cpp
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

Effects: Equivalent to:

```cpp
return ranges::inplace_merge(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

27.8.7 Set operations on sorted structures

27.8.7.1 General

1. Subclause 27.8.7 defines all the basic set operations on sorted structures. They also work with multisets (24.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to multisets in a standard way by defining \text{set union} to contain the maximum number of occurrences of every element, \text{set intersection} to contain the minimum, and so on.

27.8.7.2 \text{includes}

```cpp
template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1, 
InputIterator2 first2, InputIterator2 last2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec, 
ForwardIterator1 first1, ForwardIterator1 last1, 
ForwardIterator2 first2, ForwardIterator2 last2);
```

```cpp
template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1, 
InputIterator2 first2, InputIterator2 last2, Compare comp);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec, 
ForwardIterator1 first1, ForwardIterator1 last1, 
ForwardIterator2 first2, ForwardIterator2 last2, Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, 
class Proj1 = identity, class Proj2 = identity, 
indirect_strict_weak_order<projected<I1, Proj1>, 
projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {}, 
Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<input_range R1, input_range R2, class Proj1 = identity, 
class Proj2 = identity, 
indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>, 
projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {});
```
Let \( \text{proj1} = \{ \} \), \( \text{proj2} = \{ \} \).

1. **Preconditions:** The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively.

2. **Returns:** True if and only if \([\text{first2}, \text{last2})\) is a subsequence of \([\text{first1}, \text{last1})\).

   [Note 1: A sequence \( S \) is a subsequence of another sequence \( T \) if \( S \) can be obtained from \( T \) by removing some, all, or none of \( T \)'s elements and keeping the remaining elements in the same order. — end note]

3. **Complexity:** At most \( 2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1 \) comparisons and applications of each projection.

### 27.8.7.3 set\_union

**template<
class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set\_union(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);
**

**template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator
set\_union(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);
**

**template<
class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
set\_union(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);
**

**template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
set\_union(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);
**

**template<input\_iterator I1, sentinel\_for<I1> S1, input\_iterator I2, sentinel\_for<I2> S2,
weakly\_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O>
constexpr ranges::set\_union_result<I1, I2, O>
ranges::set\_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
**

**template<input\_range R1, input\_range R2, weakly\_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator\_t<R1>, iterator\_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set\_union_result<
borrowed\_iterator\_t<R1>, borrowed\_iterator\_t<R2>, O>
ranges::set\_union(R1&& r1, R2&& r2, O result, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
**

Let \( \text{comp} \) be \( \text{less}() \), and \( \text{proj1} \) and \( \text{proj2} \) be \( \text{identity}() \) for the overloads with no parameters by
those names.

1. **Preconditions:** The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \( \text{comp} \) and \( \text{projj} \) or \( \text{proj2} \), respectively. The resulting range does not overlap with either of the original ranges.

2. **Effects:** Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

3. **Returns:** Let \( \text{result\_last} \) be the end of the constructed range. Returns
— result_last for the overloads in namespace std.

— \{last1, last2, result_last\} for the overloads in namespace ranges.

**Complexity:** At most \(2 \times ((last1 - first1) + (last2 - first2)) - 1\) comparisons and applications of each projection.

**Remarks:** Stable (16.4.6.8). If \([first1, last1)\) contains \(m\) elements that are equivalent to each other and \([first2, last2)\) contains \(n\) elements that are equivalent to them, then all \(m\) elements from the first range are copied to the output range, in order, and then the final \(\max(n - m, 0)\) elements from the second range are copied to the output range, in order.

### 27.8.7.4 set_intersection

```
§ 27.8.7.4 1342

| template<
class InputIterator1, class InputIterator2,
class OutputIterator>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

| template<
class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);

| template<
class InputIterator1, class InputIterator2,
class OutputIterator, class Compare>
constexpr OutputIterator
set_intersection(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

| template<
class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
set_intersection(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);

| template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, 0, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, 0 result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

| template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, 0, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_intersection(R1& r1, R2& r2, 0 result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let \(\text{comp}\) be \text{less}\(\) and \(\text{proj1}\) and \(\text{proj2}\) be \text{identity}\(\) for the overloads with no parameters by those names.

**Preconditions:** The ranges \([first1, last1)\) and \([first2, last2)\) are sorted with respect to \(\text{comp}\) and \(\text{proj1}\) or \(\text{proj2}\), respectively. The resulting range does not overlap with either of the original ranges.

**Effects:** Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

**Returns:** Let \(\text{result_last}\) be the end of the constructed range. Returns — result_last for the overloads in namespace std.
— {last1, last2, result_last} for the overloads in namespace ranges.

5 Complexity: At most 2 * ((last1 - first1) + (last2 - first2)) - 1 comparisons and applications of each projection.

6 Remarks: Stable (16.4.6.8). If [first1, last1) contains m elements that are equivalent to each other and [first2, last2) contains n elements that are equivalent to them, the first \( \min(m, n) \) elements are copied from the first range to the output range, in order.

27.8.7.5 set_difference

[set_difference]

template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);

template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
set_difference(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class ForwardIterator, class Compare>
ForwardIterator
set_difference(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<I1, O>
ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>
ranges::set_difference(R1&& r1, R2&& r2, O result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by those names.

1 Preconditions: The ranges [first1, last1) and [first2, last2) are sorted with respect to comp and proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.

2 Effects: Copies the elements of the range [first1, last1) which are not present in the range [first2, last2) to the range beginning at result. The elements in the constructed range are sorted.

3 Returns: Let result_last be the end of the constructed range. Returns

(4.1) — result_last for the overloads in namespace std.

(4.2) — {last1, result_last} for the overloads in namespace ranges.
Complexity: At most \(2 \times ((last1 - first1) + (last2 - first2)) - 1\) comparisons and applications of each projection.

Remarks: If \([first1, last1)\) contains \(m\) elements that are equivalent to each other and \([first2, last2)\) contains \(n\) elements that are equivalent to them, the last \(\max(m - n, 0)\) elements from \([first1, last1)\) are copied to the output range, in order.

### 27.8.7.6 set_symmetric_difference

**Template Parameters**
- `InputIterator1`: An input iterator type.
- `InputIterator2`: An input iterator type.
- `OutputIterator`: An output iterator type.

**Function**

```cpp
cconstexpr OutputIterator set_symmetric_difference(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, OutputIterator result);
```

**Preconditions**: The ranges \([first1, last1)\) and \([first2, last2)\) are sorted with respect to `comp` and `proj1` or `proj2`, respectively. The resulting range does not overlap with either of the original ranges.

**Effects**: Copies the elements of the range \([first1, last1)\) that are not present in the range \([first2, last2)\), and the elements of the range \([first2, last2)\) that are not present in the range \([first1, last1)\) to the range beginning at `result`. The elements in the constructed range are sorted.

**Returns**: Let `result_last` be the end of the constructed range. Returns

---

© ISO/IEC N4917

§ 27.8.7.6 1344
— \{last1, last2, result_last\} for the overloads in namespace ranges.

**Complexity:** At most \(2 \times ((last1 - first1) + (last2 - first2)) - 1\) comparisons and applications of each projection.

**Remarks:** Stable (16.4.6.8). If [first1,last1) contains \(m\) elements that are equivalent to each other and [first2,last2) contains \(n\) elements that are equivalent to them, then \(|m - n|\) of those elements shall be copied to the output range: the last \(m - n\) of these elements from [first1,last1) if \(m > n\), and the last \(n - m\) of these elements from [first2,last2) if \(m < n\). In either case, the elements are copied in order.

**27.8.8 Heap operations**

**27.8.8.1 General**

A random access range \([a,b)\) is a heap with respect to comp and proj for a comparator and projection comp and proj if its elements are organized such that:

1. \(N = b - a\), for all \(0 < i < N\), \(bool(invoke(comp, invoke(proj, a[\lceil i/2 \rceil]), invoke(proj, a[i])))\) is false.

2. \(*a\) may be removed by pop_heap, or a new element added by push_heap, in \(O(\log N)\) time.

These properties make heaps useful as priority queues.

**27.8.8.2 push_heap**

```cpp
template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1. Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

2. **Preconditions:** The range \([first, last - 1)\) is a valid heap with respect to comp and proj. For the overloads in namespace std, the type of \(*first\) meets the Cpp17MoveConstructible requirements (Table 32) and the Cpp17MoveAssignable requirements (Table 34).

3. **Effects:** Places the value in the location last - 1 into the resulting heap \([first, last)\).

4. **Returns:** last for the overloads in namespace ranges.

5. **Complexity:** At most \(\log(last - first)\) comparisons and twice as many projections.

**27.8.8.3 pop_heap**

```cpp
template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
constsexpr I
ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
constsexpr borrowed_iterator_t<R>
ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \text{less\{}\} and \( \text{proj} \) be \text{identity\{}\} for the overloads with no parameters by those names.

**Preconditions:** The range \([\text{first}, \text{last})\) is a valid non-empty heap with respect to \( \text{comp} \) and \( \text{proj} \).

For the overloads in namespace \text{std}, \text{RandomAccessIterator} meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *\text{first}* meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

**Effects:** Swaps the value in the location \( \text{first} \) with the value in the location \( \text{last} - 1 \) and makes \([\text{first}, \text{last} - 1)\) into a heap with respect to \( \text{comp} \) and \( \text{proj} \).

**Returns:** \( \text{last} \) for the overloads in namespace \text{ranges}.

**Complexity:** At most \( 2 \log(\text{last} - \text{first}) \) comparisons and twice as many projections.

---

27.8.8.4 **make_heap**

```cpp
template<class RandomAccessIterator>
constsexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constsexpr void make_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
```

Let \( \text{comp} \) be \text{less\{}\} and \( \text{proj} \) be \text{identity\{}\} for the overloads with no parameters by those names.

**Preconditions:** For the overloads in namespace \text{std}, the type of *\text{first}* meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

**Effects:** Constructs a heap with respect to \( \text{comp} \) and \( \text{proj} \) out of the range \([\text{first}, \text{last})\).

**Returns:** \( \text{last} \) for the overloads in namespace \text{ranges}.

**Complexity:** At most \( 3(\text{last} - \text{first}) \) comparisons and twice as many projections.

---

27.8.8.5 **sort_heap**

```cpp
template<class RandomAccessIterator>
constsexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constsexpr void sort_heap(RandomAccessIterator first, RandomAccessIterator last, Compare comp);
```

**Preconditions:** For the overloads in namespace \text{std}, the type of *\text{first}* meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

**Effects:** Constructs a heap with respect to \( \text{comp} \) and \( \text{proj} \) out of the range \([\text{first}, \text{last})\).

**Returns:** \( \text{last} \) for the overloads in namespace \text{ranges}.

**Complexity:** At most \( 3(\text{last} - \text{first}) \) comparisons and twice as many projections.
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Preconditions: The range [first, last) is a valid heap with respect to comp and proj. For the overloads
in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3)
and the type of *first meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable
(Table 34) requirements.

Effects: Sorts elements in the heap [first, last) with respect to comp and proj.

Returns: last for the overloads in namespace ranges.

Complexity: At most 2N log N comparisons, where N = last - first, and twice as many projections.

27.8.8.6 is_heap

template<class RandomAccessIterator>
    constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);

Effects: Equivalent to: return is_heap_until(first, last) == last;

template<class ExecutionPolicy, class RandomAccessIterator>
    bool is_heap(ExecutionPolicy&& exec, 
                    RandomAccessIterator first, RandomAccessIterator last);

Effects: Equivalent to:
    return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class RandomAccessIterator, class Compare>
    constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
                            Compare comp);

Effects: Equivalent to:
    return is_heap_until(first, last, comp) == last;

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
    bool is_heap(ExecutionPolicy&& exec, 
                    RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);

Effects: Equivalent to:
    return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
            indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
    constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
            indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

template<class RandomAccessIterator>
    constexpr RandomAccessIterator
        is_heap_until(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
    RandomAccessIterator
        is_heap_until(ExecutionPolicy&& exec, 
                        RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
    constexpr RandomAccessIterator
        is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
    is_heap_until(ExecutionPolicy&& exec,
                    RandomAccessIterator first, RandomAccessIterator last,
                    Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
          indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

**Returns:** The last iterator `i` in `[first, last)` for which the range `[first, i)` is a heap with respect to `comp` and `proj`.

**Complexity:** Linear.

### 27.8.9 Minimum and maximum

[alg.min.max]

```cpp
template<class T>
constexpr const T& min(const T& a, const T& b);

template<class T, class Compare>
constexpr const T& min(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
          indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, `T` meets the `Cpp17LessThanComparable` requirements (Table 30).

Returns: The smaller value. Returns the first argument when the arguments are equivalent.

Complexity: Exactly one comparison and two applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter `T` of the
overloads in namespace `std`.

```cpp
template<class T>
constexpr T min(initializer_list<T> r);

template<class T, class Compare>
constexpr T min(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
          indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});

Preconditions: `ranges::distance(r) > 0`. For the overloads in namespace `std`, `T` meets the `Cpp17-
CopyConstructible` requirements. For the first form, `T` meets the `Cpp17LessThanComparable` requirements
(Table 30).

Returns: The smallest value in the input range. Returns a copy of the leftmost element when several
elements are equivalent to the smallest.

Complexity: Exactly `ranges::distance(r) - 1` comparisons and twice as many applications of the
projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter `T` of the
overloads in namespace `std`.

```
template<class T>
    constexpr const T& max(const T& a, const T& b);
template<class T, class Compare>
    constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
    constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});

    Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 30).
    Returns: The larger value. Returns the first argument when the arguments are equivalent.
    Complexity: Exactly one comparison and two applications of the projection, if any.
    Remarks: An invocation may explicitly specify an argument for the template parameter T of the
                  overloads in namespace std.

template<class T>
    constexpr T max(initializer_list<T> r);
template<class T, class Compare>
    constexpr T max(initializer_list<T> r, Compare comp);

    template<copyable T, class Proj = identity,
        indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
    requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>*> 
    constexpr range_value_t<R>
    ranges::max(R&& r, Comp comp = {}, Proj proj = {});

    Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
    CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
    (Table 30).
    Returns: The largest value in the input range. Returns a copy of the leftmost element when several
                  elements are equivalent to the largest.
    Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
                projection, if any.
    Remarks: An invocation may explicitly specify an argument for the template parameter T of the
                overloads in namespace std.

template<class T>
    constexpr pair<const T&, const T&> minmax(const T& a, const T& b);
template<class T, class Compare>
    constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

    template<class T, class Proj = identity,
        indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
    constexpr ranges::minmax_result<const T&>
    ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});

    Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 30).
    Returns: \{b, a\} if b is smaller than a, and \{a, b\} otherwise.
    Complexity: Exactly one comparison and two applications of the projection, if any.
    Remarks: An invocation may explicitly specify an argument for the template parameter T of the
                overloads in namespace std.

template<class T>
    constexpr pair<T, T> minmax(initializer_list<T> t);
template<class T, class Compare>
    constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);
template<copyable T, class Proj = identity, 
    indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<T>
    ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});

template<input_range R, class Proj = identity, 
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr ranges::minmax_result<range_value_t<R>>
    ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-CopyConstructible requirements. For the first form, type T meets the Cpp17LessThanComparable requirements (Table 30).

Returns: Let X be the return type. Returns X{x, y}, where x is a copy of the leftmost element with the smallest value and y a copy of the rightmost element with the largest value in the input range.

Complexity: At most (3/2)ranges::distance(r) applications of the corresponding predicate and twice as many applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the overloads in namespace std.

template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
    Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity, 
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::min_element(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity, 
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
    ranges::min_element(R&& r, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Returns: The first iterator i in the range [first, last) such that for every iterator j in the range [first, last),
bool(invoke(comp, invoke(proj, *j), invoke(proj, *i)))
is false. Returns last if first == last.

Complexity: Exactly max(last - first - 1, 0) comparisons and twice as many projections.
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
    indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::max_element(I first, S last, Comp comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity,
    indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
ranges::max_element(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be \text{less\{}{} and \( \text{proj} \) be \text{identity\{}{} for the overloads with no parameters by those names.

\textbf{Returns:} The first iterator \( i \) in the range \([\text{first}, \text{last})\) such that for every iterator \( j \) in the range \([\text{first}, \text{last})\),

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, \ast i), \text{invoke}(\text{proj}, \ast j)))
\]

is \text{false}. Returns \text{last} if \( \text{first} == \text{last} \).

\textbf{Complexity:} Exactly \( \text{max}(\text{last} - \text{first} - 1, 0) \) comparisons and twice as many projections.

\textbf{Algorithm.} Let \( N \) be \( \text{last} - \text{first} \). At most \( \text{max}(\lfloor \frac{3}{2}(N - 1) \rfloor, 0) \) comparisons and twice as many applications of the projection, if any.

\section{27.8.10 Bounded value \[\text{alg.clamp}\]}

\textbf{Algorithm.} Let \( N \) be \( \text{last} - \text{first} \). At most \( \text{max}(\lfloor \frac{3}{2}(N - 1) \rfloor, 0) \) comparisons and twice as many applications of the projection, if any.

\textbf{Algorithm.} Let \( N \) be \( \text{last} - \text{first} \). At most \( \text{max}(\lfloor \frac{3}{2}(N - 1) \rfloor, 0) \) comparisons and twice as many applications of the projection, if any.
Preconditions: bool:invoke(comp, invoke(proj, hi), invoke(proj, lo)) is false. For the first form, type T meets the Cpp17LessThanComparable requirements (Table 30).

Returns: lo if bool:invoke(comp, invoke(proj, v), invoke(proj, lo)) is true, hi if bool:invoke(comp, invoke(proj, hi), invoke(proj, v)) is true, otherwise v.

[Note 1: If NaN is avoided, T can be a floating-point type. —end note]

Complexity: At most two comparisons and three applications of the projection.

27.8.11 Lexicographical comparison

template<class InputIterator1, class InputIterator2>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool
lexicographical_compare(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool
lexicographical_compare(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class Compare>
bool
lexicographical_compare(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
class Proj1 = identity, class Proj2 = identity,
indirect_strict_weak_order<projected<I1, Proj1>,
projected<I2, Proj2>> Comp = ranges::less>
constexpr bool
ranges::lexicographical_compare(I1 first1, S1 last1, I2 first2, S2 last2,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Proj1 = identity,
class Proj2 = identity,
indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool
ranges::lexicographical_compare(R1&& r1, R2&& r2, Comp comp = {},
Proj1 proj1 = {}, Proj2 proj2 = {});

Returns: true if and only if the sequence of elements defined by the range [first1, last1) is lexicographically less than the sequence of elements defined by the range [first2, last2).

Complexity: At most 2 min(last1 - first1, last2 - first2) applications of the corresponding comparison and each projection, if any.

Remarks: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

[Example 1: ranges::lexicographical_compare(II, S1, I2, S2, Comp, Proj1, Proj2) can be implemented as:
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;]
if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;

—end example

[Note 1: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — end note]

27.8.12 Three-way comparison algorithms

```cpp
template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
InputIterator2 b2, InputIterator2 e2,
Cmp comp)
-> decltype(comp(*b1, *b2));

Let \( N \) be \( \min(e1 - b1, e2 - b2) \). Let \( E(n) \) be \( \text{comp}(*(b1 + n), *(b2 + n)) \).

Mandates: \( \text{decltype(comp(*b1, *b2))} \) is a comparison category type.

Returns: \( E(i) \), where \( i \) is the smallest integer in \( [0, N) \) such that \( E(i) \neq 0 \) is true, or \( (e1 - b1) <=> (e2 - b2) \) if no such integer exists.

Complexity: At most \( N \) applications of \( \text{comp} \).
```

```cpp
template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
InputIterator2 b2, InputIterator2 e2);
```

Effects: Equivalent to:

```cpp
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

27.8.13 Permutation generators

```cpp
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
BidirectionalIterator last, Compare comp);
```

```cpp
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<bidirectional_range R, class Comp = ranges::less,
class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::next_permutation_result<borrowed_iterator_t<R>>
ranges::next_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

Let \( \text{comp} \) be \text{less}{} and \( \text{proj} \) be \text{identity}{} for overloads with no parameters by those names.

Preconditions: For the overloads in namespace \text{std}, \text{BidirectionalIterator} meets the \text{Cpp17Value-Swappable} requirements (16.4.4.3).

Effects: Takes a sequence defined by the range \([\text{first}, \text{last}]\) and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \( \text{comp} \) and \( \text{proj} \). If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

Returns: Let \( B \) be \text{true} if a next permutation was found and otherwise \text{false}. Returns:

\[\text{(4.1)}\]

\( B \) for the overloads in namespace \text{std}.

\[\text{(4.2)}\]

\{ \text{last}, B \} for the overloads in namespace \text{ranges}.

§ 27.8.13
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::prev_permutation_result<I>
ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});

template<bidirectional_range R, class Comp = ranges::less,
class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr ranges::prev_permutation_result<borrowed_iterator_t<R>>
ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});

Let \( \text{comp} \) be less\(\{} \) and \( \text{proj} \) be identity\(\{} \) for overloads with no parameters by those names.

Preconditions: For the overloads in namespace \( \text{std} \), \( \text{BidirectionalIterator} \) meets the Cpp17Value-Swappable requirements (16.4.4.3).

Effects: Takes a sequence defined by the range \([\text{first}, \text{last})\) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \( \text{comp} \) and \( \text{proj} \). If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

Returns: Let \( B \) be true if a previous permutation was found and otherwise false. Returns:

- \( B \) for the overloads in namespace \( \text{std} \).
- \( \{ \text{last}, B \} \) for the overloads in namespace \( \text{ranges} \).

Complexity: At most \((\text{last} - \text{first}) / 2\) swaps.
// 27.10.5, inner product

template<class InputIterator1, class InputIterator2, class T>

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
   class BinaryOperation, class UnaryOperation, class T>
ForwardIterator2
transform_inclusive_scan(ExecutionPolicy&& exec, // see 27.3.5
   ForwardIterator1 first, ForwardIterator1 last,
   ForwardIterator2 result, BinaryOperation binary_op,
   UnaryOperation unary_op, T init);
27.10 Generalized numeric operations [numeric.ops]

27.10.1 General [numeric.ops.general]

[Note 1: The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional. —end note]

27.10.2 Definitions [numerics.defns]

1 Define GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aN) as follows:

1.1 — a1 when N is 1, otherwise

1.2 — op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK),
        GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) for any K where 1 < K + 1 = M ≤ N.

2 Define GENERALIZED_SUM(op, a1, ..., aN) as GENERALIZED_NONCOMMUTATIVE_SUM(op, b1, ..., bN), where b1, ..., bN may be any permutation of a1, ..., aN.

27.10.3 Accumulate [accumulate]

template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);

template<class InputIterator, class T, class BinaryOperation>
constexpr T accumulate(InputIterator first, InputIterator last, T init, BinaryOperation binary_op);

1 Preconditions: T meets the Cpp17CopyConstructible (Table 33) and Cpp17CopyAssignable (Table 35) requirements. In the range [first, last], binary_op neither modifies elements nor invalidates iterators or subranges.224

2 Effects: Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.225

27.10.4 Reduce [reduce]

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::value_type reduce(InputIterator first, InputIterator last);

template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type reduce(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last);

2 Effects: Equivalent to:

return reduce(std::forward<ExecutionPolicy>(exec), first, last, typename iterator_traits<ForwardIterator>::value_type());

template<class InputIterator, class T>
constexpr T reduce(InputIterator first, InputIterator last, T init);

3 Effects: Equivalent to:

return reduce(first, last, init, plus<>());
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last, T init);

Effects: Equivalent to:
return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());

template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init,
        BinaryOperation binary_op);
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last, T init,
        BinaryOperation binary_op);

Mandates: All of
— binary_op(init, *first),
— binary_op(*first, init),
— binary_op(init, init), and
— binary_op(*first, *first)
are convertible to T.

Preconditions:
— T meets the Cpp17MoveConstructible (Table 32) requirements.
— binary_op neither invalidates iterators or subranges, nor modifies elements in the range [first,
last].

Returns: GENERALIZED_SUM(binary_op, init, *i, ...) for every i in [first, last).

Complexity: $O((last - first))$ applications of binary_op.

[Note 1: The difference between reduce and accumulate is that reduce applies binary_op in an unspecified
order, which yields a nondeterministic result for non-associative or non-commutative binary_op such as
floating-point addition. —end note]

27.10.5 Inner product

template<class InputIterator1, class InputIterator2, class T>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1,
        InputIterator2 first2, T init);

Effects: Computes its result by initializing the accumulator acc with the initial value init and then
modifying it with acc = std::move(acc) + (*i1) * (*i2) or acc = binary_op1(std::move(acc),
binary_op2(*i1, *i2)) for every iterator i1 in the range [first1, last1) and iterator i2 in the range
[first2, first2 + (last1 - first1)) in order.

27.10.6 Transform reduce

template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
        InputIterator2 first2,
        T init);

Effects: Equivalent to:

§ 27.10.6 1359
\begin{verbatim}
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,
                   ForwardIterator2 first2,
                   T init);

Effects: Equivalent to:
return transform_reduce(std::forward<ExecutionPolicy>(exec),
                      first1, last1, first2, init, plus<>(), multiplies<>());

\template<class InputIterator1, class InputIterator2, class T,
          class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
                              InputIterator2 first2,
                              T init,
                              BinaryOperation1 binary_op1,
                              BinaryOperation2 binary_op2);

\template<class ExecutionPolicy,
          class ForwardIterator1, class ForwardIterator2, class T,
          class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
                   ForwardIterator1 first1, ForwardIterator1 last1,
                   ForwardIterator2 first2,
                   T init,
                   BinaryOperation1 binary_op1,
                   BinaryOperation2 binary_op2);

Mandates: All of
(3.1) — binary_op1(init, init),
(3.2) — binary_op1(init, binary_op2(*first1, *first2)),
(3.3) — binary_op1(binary_op2(*first1, *first2), init), and
(3.4) — binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))
are convertible to T.

Preconditions:
(4.1) — T meets the \textit{Cpp17MoveConstructible} (Table 32) requirements.
(4.2) — Neither \textit{binary_op1} nor \textit{binary_op2} invalidates subranges, nor modifies elements in the ranges
[first1, last1] and [first2, first2 + (last1 - first1)].

Returns:
\textit{GENERALIZED\_SUM} \(\textit{binary\_op1}(\textit{init}, \textit{binary\_op2}(\ast\textit{i}, \ast(\textit{first2} + (\textit{i} - \textit{first1}))), \ldots)\)
for every iterator \(i\) in \([\textit{first1}, \textit{last1})\).

Complexity: \(O(\textit{last1} - \textit{first1})\) applications each of \textit{binary\_op1} and \textit{binary\_op2}.

\template<class InputIterator, class T,
          class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
                            BinaryOperation binary_op, UnaryOperation unary_op);

\template<class ExecutionPolicy,
          class ForwardIterator, class T,
          class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
                   ForwardIterator first, ForwardIterator last,
                   T init, BinaryOperation binary_op, UnaryOperation unary_op);

Mandates: All of
(7.1) — binary_op(init, init),
(7.2) — binary_op(init, unary_op(*first)),
\end{verbatim}
— binary_op(unary_op(*first), init), and
(7.4) — binary_op(unary_op(*first), unary_op(*first))
are convertible to T.

Preconditions:
(8.1) — T meets the Cpp17MoveConstructible (Table 32) requirements.
(8.2) — Neither unary_op nor binary_op invalidates subranges, nor modifies elements in the range [first, last].

Returns:
— GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)
for every iterator i in [first, last).

Complexity: $\Theta(last - first)$ applications each of unary_op and binary_op.

[Note 1: transform_reduce does not apply unary_op to init. — end note]

27.10.7 Partial sum [partial.sum]
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
OutputIterator result);
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op);

Mandates: InputIterator’s value type is constructible from *first. The result of the expression std::move(acc) + *i or binary_op(std::move(acc), *i) is implicitly convertible to InputIterator’s value type. acc is writable (25.3.1) to result.

Preconditions: In the ranges [first, last] and [result, result + (last - first)] binary_op neither modifies elements nor invalidates iterators or subranges.227

Effects: For a non-empty range, the function creates an accumulator acc whose type is InputIterator’s value type, initializes it with *first, and assigns the result to *result. For every iterator i in [first + 1, last) in order, acc is then modified by acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) and the result is assigned to *(result + (i - first)).

Returns: result + (last - first).

Complexity: Exactly (last - first) - 1 applications of the binary operation.

Remarks: result may be equal to first.

27.10.8 Exclusive scan [exclusive.scan]
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, T init);

Effects: Equivalent to:
return exclusive_scan(first, last, result, init, plus<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, T init);

Effects: Equivalent to:
return exclusive_scan(std::forward<ExecutionPolicy>(exec),
first, last, result, init, plus<>());

227) The use of fully closed ranges is intentional.
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, T init, BinaryOperation binary_op);

template<class ExecutionPolicy,
class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, T init, BinaryOperation binary_op);

Mandates: All of
(3.1) binary_op(init, init),
(3.2) binary_op(init, *first), and
(3.3) binary_op(*first, *first)
are convertible to T.

Preconditions:
(4.1) T meets the Cpp17MoveConstructible (Table 32) requirements.
(4.2) binary_op neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result.result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of:
GENERALIZED_NONCOMMUTATIVE_SUM
  binary_op, init, *(first + 0), *(first + 1), ..., *(first + K - 1))

Returns: The end of the resulting range beginning at result.

Complexity: $\Theta(last - first)$ applications of binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between exclusive_scan and inclusive_scan is that exclusive_scan excludes the $i^{th}$ input element from the $i^{th}$ sum. If binary_op is not mathematically associative, the behavior of exclusive_scan can be nondeterministic. — end note]

27.10.9 Inclusive scan
[inclusive.scan]

template<class InputIterator, class OutputIterator>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
OutputIterator result);

Effects: Equivalent to:
return inclusive_scan(first, last, result, plus<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result);

Effects: Equivalent to:
return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryOperation>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, BinaryOperation binary_op);
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation binary_op, T init);

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec,
             ForwardIterator1 first, ForwardIterator1 last,
             ForwardIterator2 result, BinaryOperation binary_op, T init);

Let \( U \) be the value type of \( \text{decltype}(\text{first}) \).

Mandates: If \( \text{init} \) is provided, all of

\[
\begin{align*}
&\text{binary_op}(\text{init}, \text{init}), \\
&\text{binary_op}(\text{init}, \text{*first}), \text{and} \\
&\text{binary_op}(\text{*first}, \text{*first})
\end{align*}
\]

are convertible to \( T \); otherwise, \( \text{binary_op}(\text{*first}, \text{*first}) \) is convertible to \( U \).

Preconditions:

\[
\begin{align*}
&\text{If } \text{init} \text{ is provided, } T \text{ meets the } \text{Cpp17MoveConstructible} \text{ (Table 32) requirements}; \text{ otherwise, } U \text{ meets the } \text{Cpp17MoveConstructible} \text{ requirements.} \\
&\text{binary_op} \text{ neither invalidates iterators or subranges, nor modifies elements in the ranges } [\text{first}, \text{last}] \text{ or } [\text{result.result} + (\text{last} - \text{first})].
\end{align*}
\]

Effects: For each integer \( K \) in \([0, \text{last} - \text{first})\) assigns through \( \text{result} + K \) the value of

\[
\begin{align*}
&\text{GENERALIZED_NONCOMMUTATIVE_SUM}(
\begin{align*}
&\text{binary_op, init, } (*\text{first} + 0), (*\text{first} + 1), \ldots, (*\text{first} + K)
\end{align*}
\end{align*}
\]

if \( \text{init} \) is provided, or

\[
\begin{align*}
&\text{GENERALIZED_NONCOMMUTATIVE_SUM}(
\begin{align*}
&\text{binary_op, } (*\text{first} + 0), (*\text{first} + 1), \ldots, (*\text{first} + K)
\end{align*}
\end{align*}
\]

otherwise.

Returns: The end of the resulting range beginning at \( \text{result} \).

Complexity: \( O(\text{last} - \text{first}) \) applications of \( \text{binary_op} \).

Remarks: \( \text{result} \) may be equal to \( \text{first} \).

[Note 1: The difference between \text{exclusive_scan} and \text{inclusive_scan} is that \text{inclusive_scan} includes the \( i \)th
input element in the \( i \)th sum. If \( \text{binary_op} \) is not mathematically associative, the behavior of \text{inclusive_scan}
can be nondeterministic. — end note]

27.10.10 Transform exclusive scan

template<class InputIterator, class OutputIterator, class T, class BinaryOperation, class UnaryOperation>
constexpr OutputIterator
transform_exclusive_scan(InputIterator first, InputIterator last,
OutputIterator result, T init,
BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
         class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation, class UnaryOperation>
ForwardIterator2
transform_exclusive_scan(ExecutionPolicy&& exec,
                         ForwardIterator1 first, ForwardIterator1 last,
                         ForwardIterator2 result, T init,
                         BinaryOperation binary_op, UnaryOperation unary_op);

Mandates: All of

\[
\begin{align*}
&\text{binary_op}(\text{init}, \text{init}), \\
&\text{binary_op}(\text{init}, \text{unary_op}(\text{*first})), \text{and}
\end{align*}
\]

\[ § 27.10.10 \]
binary_op(unary_op(*first), unary_op(*first))
are convertible to \( T \).

**Preconditions:**

1. \( T \) meets the Cpp17MoveConstructible (Table 32) requirements.
2. Neither \( \text{unary\_op} \) nor \( \text{binary\_op} \) invalidates iterators or subranges, nor modifies elements in the ranges \([\text{first}, \text{last}]\) or \([\text{result}, \text{result} + (\text{last} - \text{first})]\).

**Effects:** For each integer \( K \) in \([0, \text{last} - \text{first}]\) assigns through \( \text{result} + K \) the value of:

\[
\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}
\begin{align*}
&\text{binary\_op, init,} \\
&\text{unary\_op(*((first + 0))), unary\_op(*((first + 1))), \ldots, unary\_op(*((first + K - 1)))}
\end{align*}
\]

**Returns:** The end of the resulting range beginning at \( \text{result} \).

**Complexity:** \( O(\text{last} - \text{first}) \) applications each of \( \text{unary\_op} \) and \( \text{binary\_op} \).

**Remarks:** \( \text{result} \) may be equal to \( \text{first} \).

Note 1: The difference between \text{transform\_exclusive\_scan} and \text{transform\_inclusive\_scan} is that \text{transform\_exclusive\_scan} excludes the \( i \)th input element from the \( i \)th sum. If \( \text{binary\_op} \) is not mathematically associative, the behavior of \text{transform\_exclusive\_scan} can be nondeterministic. \text{transform\_exclusive\_scan} does not apply \text{unary\_op} to \text{init}. — end note]
are convertible to \( T \); otherwise, \( \text{binary\_op}(\text{unary\_op}(\text{first}), \text{unary\_op}(\text{first})) \) is convertible to \( U \).

**Preconditions:**

(3.1) — If \( \text{init} \) is provided, \( T \) meets the \( \text{Cpp17MoveConstructible} \) (Table 32) requirements; otherwise, \( U \) meets the \( \text{Cpp17MoveConstructible} \) requirements.

(3.2) — Neither \( \text{unary\_op} \) nor \( \text{binary\_op} \) invalidates iterators or subranges, nor modifies elements in the ranges \([\text{first}, \text{last}]\) or \([\text{result}, \text{result} + (\text{last} - \text{first})]\).

**Effects:** For each integer \( K \) in \([0, \text{last} - \text{first})\) assigns through \( \text{result} + K \) the value of

(4.1) — \( \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{binary\_op}, \text{init}, \text{unary\_op}(*(\text{first} + 0)), \text{unary\_op}(*(\text{first} + 1)), \ldots, \text{unary\_op}(*(\text{first} + K))) \)

if \( \text{init} \) is provided, or

(4.2) — \( \text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(\text{binary\_op}, \text{unary\_op}(*(\text{first} + 0)), \text{unary\_op}(*(\text{first} + 1)), \ldots, \text{unary\_op}(*(\text{first} + K))) \)

otherwise.

**Returns:** The end of the resulting range beginning at \( \text{result} \).

**Complexity:** \( \Theta(\text{last} - \text{first}) \) applications each of \text{unary\_op} and \text{binary\_op}.

**Remarks:** \( \text{result} \) may be equal to \( \text{first} \).

[Note 1: The difference between \( \text{transform\_exclusive\_scan} \) and \( \text{transform\_inclusive\_scan} \) is that \( \text{transform\_inclusive\_scan} \) includes the \( i \)th input element in the \( i \)th sum. If \( \text{binary\_op} \) is not mathematically associative, the behavior of \( \text{transform\_inclusive\_scan} \) can be nondeterministic. \( \text{transform\_inclusive\_scan} \) does not apply \text{unary\_op} to \( \text{init} \). — end note]

### 27.10.12 Adjacent difference

```
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
OutputIterator result);
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result);
```

```
template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
adjacent_difference(InputIterator first, InputIterator last,
OutputIterator result, BinaryOperation \text{binary\_op});
```

```
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class BinaryOperation>
ForwardIterator2
adjacent_difference(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, BinaryOperation \text{binary\_op});
```

Let \( T \) be the value type of \( \text{decltype(\text{first})} \). For the overloads that do not take an argument \text{binary\_op}, let \text{binary\_op} be an lvalue that denotes an object of type \text{minus}<>.

**Mandates:**

(2.1) — For the overloads with no \text{ExecutionPolicy}, \( T \) is constructible from \( \ast \text{first. acc} \) (defined below) is writable (25.3.1) to the result output iterator. The result of the expression \( \text{binary\_op}(<\text{val}, \text{std::move(acc)}>\text{result}) \) is writable to \( \text{result} \).

(2.2) — For the overloads with an \text{ExecutionPolicy}, the result of the expressions \( \text{binary\_op}(<\text{first}, \ast\text{first}>\text{result}) \) and \( \ast\text{first} \) are writable to \( \text{result} \).

**Preconditions:**
— For the overloads with no `ExecutionPolicy`, `T` meets the `Cpp17MoveAssignable` (Table 34) requirements.

— For all overloads, in the ranges `[first, last]` and `[result.result + (last - first)]`, `binary_op` neither modifies elements nor invalidates iterators or subranges.228

**Effects:** For the overloads with no `ExecutionPolicy` and a non-empty range, the function creates an accumulator `acc` of type `T`, initializes it with `*first`, and assigns the result to `*result`. For every iterator `i` in `[first + 1, last)` in order, creates an object `val` whose type is `T`, initializes it with `*i`, computes `binary_op(val, std::move(acc))`, assigns the result to `*(result + (i - first))`, and move assigns from `val` to `acc`.

For the overloads with an `ExecutionPolicy` and a non-empty range, performs `*result = *first`. Then, for every `d` in `[1, last - first - 1]`, performs `*(result + d) = binary_op(*(first + d), *(first + (d - 1)))`.

**Returns:** `result + (last - first)`.

**Complexity:** Exactly `(last - first) - 1` applications of the binary operation.

**Remarks:** For the overloads with no `ExecutionPolicy`, `result` maybe equal to `first`. For the overloads with an `ExecutionPolicy`, the ranges `[first, last)` and `[result.result + (last - first)]` shall not overlap.

### 27.10.13 Iota

[numeric.iota]

```cpp
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

**Mandates:** `T` is convertible to `ForwardIterator`'s value type. The expression `++val`, where `val` has type `T`, is well-formed.

**Effects:** For each element referred to by the iterator `i` in the range `[first, last)`, assigns `*i = value` and increments value as if by `++value`.

**Complexity:** Exactly `last - first` increments and assignments.

```cpp
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
requires indirectly_writable<O, const T&>
constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
template<weakly_incrementable T, output_range<const T&> R>
constexpr ranges::iota_result<borrowed_iterator_t<R>, T> ranges::iota(R&& r, T value);
```

**Effects:** Equivalent to:

```cpp
while (first != last) {
    *first = as_const(value);
    ++first;
    ++value;
}
```

**Returns:** `{std::move(first), std::move(value)}`;

### 27.10.14 Greatest common divisor

[numeric.ops.gcd]

```cpp
template<class M, class N>
constexpr common_type_t<M, N> gcd(M m, N n);
```

**Mandates:** `M` and `N` both are integer types other than `cv bool`.

**Preconditions:** `|m|` and `|n|` are representable as a value of `common_type_t<M, N>`. [Note 1: These requirements ensure, for example, that `gcd(m, m) = |m|` is representable as a value of type `M`. —end note]

**Returns:** Zero when `m` and `n` are both zero. Otherwise, returns the greatest common divisor of `|m|` and `|n|`.

**Throws:** Nothing.

228) The use of fully closed ranges is intentional.
27.10.15 Least common multiple

template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);

Mandates: M and N both are integer types other than cv bool.

Preconditions: |m| and |n| are representable as a value of common_type_t<M, N>. The least common multiple of |m| and |n| is representable as a value of type common_type_t<M, N>.

Returns: Zero when either m or n is zero. Otherwise, returns the least common multiple of |m| and |n|.

Throws: Nothing.

27.10.16 Midpoint

template<class T>
constexpr T midpoint(T a, T b) noexcept;

Constraints: T is an arithmetic type other than bool.

Returns: Half the sum of a and b. If T is an integer type and the sum is odd, the result is rounded towards a.

Remarks: No overflow occurs. If T is a floating-point type, at most one inexact operation occurs.

template<class T>
constexpr T* midpoint(T* a, T* b);

Constraints: T is an object type.

Mandates: T is a complete type.

Preconditions: a and b point to, respectively, elements i and j of the same array object x.

[Note 1: As specified in 6.8.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of n elements is considered to be equivalent to a pointer to a hypothetical array element n for this purpose. — end note]

Returns: A pointer to array element i + \frac{j - i}{2} of x, where the result of the division is truncated towards zero.

27.11 Specialized <memory> algorithms

27.11.1 General

The contents specified in 27.11 are declared in the header <memory> (20.2.2).

Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement new-expression (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

[Note 1: When invoked on ranges of potentially-overlapping subobjects (6.7.2), the algorithms specified in 27.11 result in undefined behavior. — end note]

Some algorithms specified in 27.11 make use of the exposition-only function voidify:

```cpp
template<class T>
constexpr void* voidify(T& obj) noexcept {
    return const_cast<void*>(static_cast<const volatile void*>(addressof(obj)));
}
```

27.11.2 Special memory concepts

Some algorithms in this subclause are constrained with the following exposition-only concepts:

```cpp
template<class I>
concept noexcept_input_iterator = // exposition only
    input_iterator<I> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>;
```

A type I models noexcept_input_iterator only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.
3  [Note 1: This concept allows some input_iterator (25.3.4.9) operations to throw exceptions. — end note]

template<class S, class I>
concept nothrow-sentinel-for = sentinel_for<S, I>; // exposition only

4  Types S and I model nothrow-sentinel-for only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type I and S.

5  [Note 2: This concept allows some sentinel_for (25.3.4.7) operations to throw exceptions. — end note]

template<class R>
concept nothrow-input-range = // exposition only
  range<R> && nothrow-input-iterator<iterator_t<R>> && nothrow-sentinel-for<sentinel_t<R>, iterator_t<R>>;

6  A type R models nothrow-input-range only if no exceptions are thrown from calls to ranges::begin and ranges::end on an object of type R.

template<class I>
concept nothrow-forward-iterator = // exposition only
  nothrow-input-iterator<I> && forward_iterator<I> && nothrow-sentinel-for<I, I>;

7  [Note 3: This concept allows some forward_iterator (25.3.4.11) operations to throw exceptions. — end note]

27.11.3 uninitialized_default_construct [uninitialized.construct.default]

3 template<class NoThrowForwardIterator>
  void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);

1  Effects: Equivalent to:
   for (; first != last; ++first)
     :new (voidify(*first))
     typename iterator_traits<NoThrowForwardIterator>::value_type;

namespace ranges {
  template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
  requires default_initializable<iter_value_t<I>>
  I uninitialized_default_construct(I first, S last);
  template<nothrow-forward-range R>
  requires default_initializable<range_value_t<R>>
  borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}

2  Effects: Equivalent to:
   for (; first != last; ++first)
     :new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
     return first;

3 template<class NoThrowForwardIterator, class Size>
  NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);

3  Effects: Equivalent to:
   for (; n > 0; (void)++first, --n)
     :new (voidify(*first))
     typename iterator_traits<NoThrowForwardIterator>::value_type;
     return first;
namespace ranges {
    template<nothrow-forward_iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
    return uninitialized_default_construct(counted_iterator(first, n),
    default_sentinel).base();

27.11.4 uninitialized_value_construct [uninitialized.construct.value]

template<class NoThrowForwardIterator>
void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
    for (; first != last; ++first)
        ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type();

namespace ranges {
    template<nothrow-forward_iterator I, noexcept-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct(I first, S last);
    template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}

Effects: Equivalent to:
    for (; first != last; ++first)
        ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
    return first;

namespace ranges {
    template<nothrow-forward_iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
    return uninitialized_value_construct(counted_iterator(first, n),
    default_sentinel).base();

27.11.5 uninitialized_copy [uninitialized.copy]

template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
    NoThrowForwardIterator result);

Preconditions: result + [0, (last - first)) does not overlap with [first, last).

Effects: Equivalent to:
    for (; first != last; ++result, (void) ++first)
        ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
    nothrow-forward_iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_result<I, O>
    uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
    uninitialized_copy(IR&& in_range, OR&& out_range);
}

4 Preconditions: |ofirst, olast) does not overlap with |ifirst, ilast).
5 Effects: Equivalent to:
   for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
      new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
9 Preconditions: |ofirst, olast) does not overlap with |ifirst, ilast).
10 Effects: Equivalent to:
   auto t = uninitialized_copy(counted_iterator(ifirst, n),
   default_sentinel, ofirst, olast);
   return {std::move(t.in).base(), t.out};

27.11.6 uninitialized_move

namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
    nothrow-forward_iterator O, nothrow-sentinel-for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_move_result<I, O>
    uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
}

1 Preconditions: result + |0, n) does not overlap with first + |0, n).
2 Effects: Equivalent to:
   for (; first != last; (void)++result, ++first)
      new (voidify(*result))
      typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
9 Preconditions: |ofirst, olast) does not overlap with |ifirst, ilast).
10 Effects: Equivalent to:
   auto t = uninitialized_copy(counted_iterator(ifirst, n),
   default_sentinel, ofirst, olast);
   return {std::move(t.in).base(), t.out};

§ 27.11.6 1370
template<input_range IR, noexcept-forward-range OR>
requires constructible_from<range_value_t<OR>, range_rvalue_reference_t<IR>>
uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
uninitialized_move(IR&& in_range, OR&& out_range);

Preconditions: \([\text{ofirst}, \text{olast})\) does not overlap with \([\text{ifirst}, \text{ilast})\).

Effects: Equivalent to:

\[
\begin{align*}
\text{for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst) } \\
\text{::new (voidify(*ofirst)) } \\
\text{remove_reference_t<iter_reference_t<O>>(ranges::iter_move(ifirst)); } \\
\text{return \{std::move(ifirst), ofirst\};}
\end{align*}
\]

[Note 1: If an exception is thrown, some objects in the range \([\text{ifirst}, \text{ilast})\) are left in a valid, but unspecified state. — end note]

template<class InputIterator, class Size, class NoThrowForwardIterator>
pair<InputIterator, NoThrowForwardIterator>
uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);

Preconditions: \(\text{result + }[0, \text{n})\) does not overlap with \(\text{first + }[0, \text{n})\).

Effects: Equivalent to:

\[
\begin{align*}
\text{for (; n > 0; ++result, (void) ++first, --n) } \\
\text{::new (voidify(*result)) } \\
\text{typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first)); } \\
\text{return \{first, result\};}
\end{align*}
\]

namespace ranges {

    template<input_iterator I, noexcept-forward_iterator O, noexcept-sentinel_for<O> S>
requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
uninitialized_move_n_result<I, O>
uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);

Preconditions: \([\text{ofirst}, \text{olast})\) does not overlap with \(\text{ifirst + }[0, \text{n})\).

Effects: Equivalent to:

\[
\begin{align*}
\text{auto t = uninitialized_move(counted_iterator(ifirst, n), } \\
\text{default_sentinel, ofirst, olast); } \\
\text{return \{std::move(t.in).base(), t.out\};}
\end{align*}
\]

[Note 2: If an exception is thrown, some objects in the range \(\text{ifirst + }[0, \text{n})\) are left in a valid but unspecified state. — end note]

27.11.7 uninitialized_fill

template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);

Effects: Equivalent to:

\[
\begin{align*}
\text{for (; first != last; ++first) } \\
\text{::new (voidify(*first)) } \\
\text{typename iterator_traits<NoThrowForwardIterator>::value_type(x);}
\end{align*}
\]

namespace ranges {

    template<nothrow-forward_iterator I, noexcept-sentinel_for<I> S, class T>
requires constructible_from<iter_value_t<I>, const T&>
I uninitialized_fill(I first, S last, const T& x);

    template<nothrow-forward-range R, class T>
requires constructible_from<range_value_t<R>, const T&>
borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);

Effects: Equivalent to:

\[
\begin{align*}
\text{for (; first != last; ++first) } \\
\text{::new (voidify(*first)) } \\
\text{remove_reference_t<iter_reference_t<I>>(x);} \\
\end{align*}
\]
template<class NoThrowForwardIterator, class Size, class T>
NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);

Effects: Equivalent to:
for (; n--; ++first)
  ::new (voidify(*first))
  typename iterator_traits<NoThrowForwardIterator>::value_type(x);
return first;

namespace ranges {
  template<nothrow-forward_iterator I, class T>
  requires constructible_from<iter_value_t<I>, const T&>
  I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}

Effects: Equivalent to:
return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();

27.11.8 construct_at [specialized.construct]

template<class T, class... Args>
constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
  template<class T, class... Args>
  constexpr T* construct_at(T* location, Args&&... args);
}

Constraints: The expression ::new (declval<void*>()) T(declval<Args>()...) is well-formed when treated as an unevaluated operand (7.2.3).

Effects: Equivalent to:
return ::new (voidify(*location)) T(std::forward<Args>(args)...);

27.11.9 destroy [specialized.destroy]

class T
  constexpr void destroy_at(T* location);

namespace ranges {
  template<destructible T>
  constexpr void destroy_at(T* location) noexcept;
}

Effects:
(1.1) If T is an array type, equivalent to destroy(begin(*location), end(*location)).
(1.2) Otherwise, equivalent to location->~T().

template<class NoThrowForwardIterator>
constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
for (; first != last; ++first)
  destroy_at(addressof(*first));

namespace ranges {
  template<nothrow-input_iterator I, nothrow-sentinel_for<I> S>
  requires destructible<iter_value_t<I>>
  constexpr I destroy(I first, S last) noexcept;
  template<nothrow-input-range R>
  requires destructible<range_value_t<R>>
  constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}

Effects: Equivalent to:
for (; first != last; ++first)
    destroy_at(addressof(*first));
return first;

template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);

Effects: Equivalent to:
for (; n > 0; (void)++first, --n)
    destroy_at(addressof(*first));
return first;

namespace ranges {
    template<nothrow-input_iterator I>
    requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}

Effects: Equivalent to:
return destroy(counted_iterator(first, n), default_sentinel).base();

27.12 C library algorithms

[Note 1: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note]

void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
c-compare-pred* compar);

Preconditions: For qsort, the objects in the array pointed to by base are of trivially copyable type.

Effects: These functions have the semantics specified in the C standard library.

Throws: Any exception thrown by compar (16.4.6.13).

See also: ISO C 7.22.5
28 Numerics library [numerics]

28.1 General [numerics.general]

This Clause describes components that C++ programs may use to perform seminumerical operations.

The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 95.

Table 95: Numerics library summary [tab:numerics.summary]

<table>

</tr>
</tbody>
</table>

28.2 Numeric type requirements [numeric.requirements]

The complex and valarray components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A numeric type is a cv-unqualified object type T that meets the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (16.4.4.2).229

2 If any operation on T throws an exception the effects are undefined.

3 In addition, many member and related functions of valarray<T> can be successfully instantiated and will exhibit well-defined behavior if and only if T meets additional requirements specified for each such member or related function.

4 [Example 1: It is valid to instantiate valarray<complex>, but operator() will not be successfully instantiated for valarray<complex> operands, since complex does not have any ordering operators. — end example]

28.3 The floating-point environment [cfenv]

28.3.1 Header <cfenv> synopsis [cfenv.syn]

```c
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below  // optional
#define FE_INEXACT see below     // optional
#define FE_INVALID see below     // optional
#define FE_OVERFLOW see below    // optional
#define FE_UNDERFLOW see below   // optional

#define FE_DOWNWARD see below    // optional
#define FE_TONEAREST see below   // optional
#define FE_TOWARDZERO see below  // optional
#define FE_UPWARD see below      // optional

#define FE_DFL_ENV see below
```

namespace std {
  // types
  using fenv_t = object type;
  using fexcept_t = integer type;
}

229) In other words, value types. These include arithmetic types, pointers, the library class complex, and instantiations of valarray for value types.

§ 28.3.1 1374
functions

```c
int feclearexcept(int except);
int fegetexceptflag(fexcept_t* pflag, int except);
int feraiseexcept(int except);
int fesetexceptflag(const fexcept_t* pflag, int except);
int fetestexcept(int except);

int fegetround();
int fesetround(int mode);

int fegetenv(fenv_t* penv);
int feholdexcept(fenv_t* penv);
int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);
```

Note 1: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — end note

See also: ISO C 7.6

28.3.2 Threads

The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread’s floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding thread object (33.4.3) or jthread object (33.4.4) at the time it constructed the object.

Note 1: That is, the child thread gets the floating-point state of the parent thread at the time of the child’s creation. — end note

A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

28.4 Complex numbers

28.4.1 General

The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

The effect of instantiating the template complex for any type that is not a cv-unqualified floating-point type (6.8.2) is unspecified. Specializations of complex for cv-unqualified floating-point types are trivially-copyable literal types (6.8.1).

If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

If z is an lvalue of type cv `complex<T>` then:

- the expression `reinterpret_cast<cv T(&)[2]>(z)` is well-formed,
- `reinterpret_cast<cv T(&)[2]>(z)[0]` designates the real part of z, and
- `reinterpret_cast<cv T(&)[2]>(z)[1]` designates the imaginary part of z.

Moreover, if a is an expression of type cv `complex<T>*` and the expression `a[i]` is well-defined for an integer expression i, then:

- `reinterpret_cast<cv T*>(a)[2*i]` designates the real part of `a[i]`, and
- `reinterpret_cast<cv T*>(a)[2*i + 1]` designates the imaginary part of `a[i].`
// 28.4.6, operators

```cpp
template<class T> constexpr complex<T> operator+(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator+(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator+(const T&, const complex<T>&);
template<class T> constexpr complex<T> operator-(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator-(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator-(const T&, const complex<T>&);
template<class T> constexpr complex<T> operator*(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator*(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator*(const T&, const complex<T>&);
template<class T> constexpr complex<T> operator/(const complex<T>&, const complex<T>&);
template<class T> constexpr complex<T> operator/(const complex<T>&, const T&);
template<class T> constexpr complex<T> operator/(const T&, const complex<T>&);
```

// 28.4.7, values

```cpp
template<class T> constexpr T real(const complex<T>&);
template<class T> constexpr T imag(const complex<T>&);
```

// 28.4.8, transcendentals

```cpp
template<class T> complex<T> acos(const complex<T>&);
template<class T> complex<T> asin(const complex<T>&);
template<class T> complex<T> atan(const complex<T>&);
```
template< class T > complex< T > tanh ( const complex< T >& );

// 28.4.10, complex literals
inline namespace literals {
inline namespace complex_literals {
    constexpr complex<long double> operator"il(long double);
    constexpr complex<long double> operator"il(unsigned long long);
    constexpr complex<double> operator"i(long double);
    constexpr complex<double> operator"i(unsigned long long);
    constexpr complex<float> operator"if(long double);
    constexpr complex<float> operator"if(unsigned long long);
}
}

28.4.3 Class template complex

namespace std {
    template< class T > class complex {
        public:
            using value_type = T;
            constexpr complex(const T& re = T(), const T& im = T());
            constexpr complex(const complex&) = default;
            template< class X > constexpr explicit(see below) complex(const complex<X>&);
            constexpr T real() const;
            constexpr void real(T);
            constexpr T imag() const;
            constexpr void imag(T);
            constexpr complex& operator= (const T&);
            constexpr complex& operator+=(const T&);
            constexpr complex& operator-=(const T&);
            constexpr complex& operator*=(const T&);
            constexpr complex& operator/=(const T&);
            template< class X > constexpr complex& operator= (const complex<X>&);
            template< class X > constexpr complex& operator+=(const complex<X>&);
            template< class X > constexpr complex& operator-=(const complex<X>&);
            template< class X > constexpr complex& operator*=(const complex<X>&);
            template< class X > constexpr complex& operator/=(const complex<X>&);
    };
}

1 The class complex describes an object that can store the Cartesian components, real() and imag(), of a complex number.

28.4.4 Member functions

constexpr complex(const T& re = T(), const T& im = T());
1 Postconditions: real() == re && imag() == im is true.

template< class X > constexpr explicit(see below) complex(const complex<X>& other);
2 Effects: Initializes the real part with other.real() and the imaginary part with other.imag().
3 Remarks: The expression inside explicit evaluates to false if and only if the floating-point conversion rank of T is greater than or equal to the floating-point conversion rank of X.

constexpr T real() const;
4 Returns: The value of the real component.
constexpr void real(T val);
  Effects: Assigns val to the real component.

constexpr T imag() const;
  Returns: The value of the imaginary component.

constexpr void imag(T val);
  Effects: Assigns val to the imaginary component.

28.4.5 Member operators
  [complex.member.ops]

constexpr complex& operator+=(const T& rhs);
  Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.
  Returns: *this.

constexpr complex& operator-=(const T& rhs);
  Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.
  Returns: *this.

constexpr complex& operator*=(const T& rhs);
  Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.
  Returns: *this.

constexpr complex& operator/=(const T& rhs);
  Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.
  Returns: *this.

template<class X> constexpr complex& operator+=(const complex<X>& rhs);
  Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.
  Returns: *this.

template<class X> constexpr complex& operator-=(const complex<X>& rhs);
  Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.
  Returns: *this.

template<class X> constexpr complex& operator*=(const complex<X>& rhs);
  Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.
  Returns: *this.

template<class X> constexpr complex& operator/=(const complex<X>& rhs);
  Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.
  Returns: *this.

28.4.6 Non-member operations
  [complex.ops]

template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
  Returns: complex<T>(lhs).

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);

template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);
  Returns: complex<T>(lhs) += rhs.

§ 28.4.6 1378
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);

Returns: complex<T>(-lhs.real(), -lhs.imag()).

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) -= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);

Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

Remarks: The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T, class charT, class traits> basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);

Preconditions: The input values are convertible to T.
Effects: Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is the imaginary part (31.7.5.3).
If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)).
Returns: is.
Remarks: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

template<class T, class charT, class traits> basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);

Effects: Inserts the complex number x onto the stream o as if it were implemented as follows:

basic_ostringstream<charT, traits> s;
s.flags(o.flags());
s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << ',' << x.imag() << ')';
return o << s.str();

[Note 1: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — end note]

28.4.7 Value operations

[complex.value.ops]
template<class T> constexpr T real(const complex<T>& x);

Returns: x.real().

template<class T> constexpr T imag(const complex<T>& x);

Returns: x.imag().

template<class T> T abs(const complex<T>& x);

Returns: The magnitude of x.
template<class T> T arg(const complex<T>& x);
Returns: The phase angle of x, or atan2(imag(x), real(x)).

template<class T> constexpr T norm(const complex<T>& x);
Returns: The squared magnitude of x.

template<class T> constexpr complex<T> conj(const complex<T>& x);
Returns: The complex conjugate of x.

template<class T> complex<T> proj(const complex<T>& x);
Returns: The projection of x onto the Riemann sphere.
Remarks: Behaves the same as the C function cproj. See also: ISO C 7.3.9.5

template<class T> complex<T> polar(const T& rho, const T& theta = T());
Preconditions: rho is non-negative and non-NaN. theta is finite.
Returns: The complex value corresponding to a complex number whose magnitude is rho and whose
phase angle is theta.

28.4.8 Transcendentals
[complex.transcendentals]

template<class T> complex<T> acos(const complex<T>& x);
Returns: The complex arc cosine of x.
Remarks: Behaves the same as the C function cacos. See also: ISO C 7.3.5.1

template<class T> complex<T> asin(const complex<T>& x);
Returns: The complex arc sine of x.
Remarks: Behaves the same as the C function casin. See also: ISO C 7.3.5.2

template<class T> complex<T> atan(const complex<T>& x);
Returns: The complex arc tangent of x.
Remarks: Behaves the same as the C function catan. See also: ISO C 7.3.5.3

template<class T> complex<T> acosh(const complex<T>& x);
Returns: The complex arc hyperbolic cosine of x.
Remarks: Behaves the same as the C function cacosh. See also: ISO C 7.3.6.1

template<class T> complex<T> asinh(const complex<T>& x);
Returns: The complex arc hyperbolic sine of x.
Remarks: Behaves the same as the C function casinh. See also: ISO C 7.3.6.2

template<class T> complex<T> atanh(const complex<T>& x);
Returns: The complex arc hyperbolic tangent of x.
Remarks: Behaves the same as the C function catanh. See also: ISO C 7.3.6.3

template<class T> complex<T> cos(const complex<T>& x);
Returns: The complex cosine of x.

template<class T> complex<T> cosh(const complex<T>& x);
Returns: The complex hyperbolic cosine of x.

template<class T> complex<T> exp(const complex<T>& x);
Returns: The complex base-e exponential of x.

template<class T> complex<T> log(const complex<T>& x);
Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval
[−π, π].

§ 28.4.8
[Note 1: The semantics of this function are intended to be the same in C++ as they are for \texttt{clog} in C. — end note]

**Remarks:** The branch cuts are along the negative real axis.

```cpp
template<class T> complex<T> log10(const complex<T>& x);
```

**Returns:** The complex common (base-10) logarithm of \(x\), defined as \(\log(x) / \log(10)\).

**Remarks:** The branch cuts are along the negative real axis.

```cpp
template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
```

**Returns:** The complex power of base \(x\) raised to the \(y\)th power, defined as \(\exp(y \times \log(x))\). The value returned for \(\text{pow}(0, 0)\) is implementation-defined.

**Remarks:** The branch cuts are along the negative real axis.

```cpp
template<class T> complex<T> sin(const complex<T>& x);
```

**Returns:** The complex sine of \(x\).

```cpp
template<class T> complex<T> sinh(const complex<T>& x);
```

**Returns:** The complex hyperbolic sine of \(x\).

```cpp
template<class T> complex<T> sqrt(const complex<T>& x);
```

**Returns:** The complex square root of \(x\), in the range of the right half-plane.

[Note 2: The semantics of this function are intended to be the same in C++ as they are for \texttt{csqrt} in C. — end note]

**Remarks:** The branch cuts are along the negative real axis.

```cpp
template<class T> complex<T> tan(const complex<T>& x);
```

**Returns:** The complex tangent of \(x\).

```cpp
template<class T> complex<T> tanh(const complex<T>& x);
```

**Returns:** The complex hyperbolic tangent of \(x\).

### 28.4.9 Additional overloads

The following function templates shall have additional overloads:

- `arg` for calculating the argument of a complex number.
- `norm` for calculating the magnitude of a complex number.
- `conj` for calculating the conjugate of a complex number.
- `proj` for calculating the projection of a complex number.
- `imag` for calculating the imaginary part of a complex number.
- `real` for calculating the real part of a complex number.

The additional overloads shall be sufficient to ensure:

1. If the argument has a floating-point type \(T\), then it is effectively cast to `complex<T>`.
2. Otherwise, if the argument has integer type, then it is effectively cast to `complex<double>`.

Function template `pow` has additional overloads sufficient to ensure, for a call with one argument of type `complex<T1>` and the other argument of type `T2` or `complex<T2>`, both arguments are effectively cast to `complex<common_type_t<T1, T2>>`. If `common_type_t<T1, T2>` is not well-formed, then the program is ill-formed.

### 28.4.10 Suffixes for complex number literals

This subclause describes literal suffixes for constructing complex number literals. The suffixes `i`, `il`, and `if` create complex numbers of the types `complex<double>`, `complex<long double>`, and `complex<float>` respectively, with their imaginary part denoted by the given literal number and the real part being zero.

```cpp
constexpr complex<long double> operator"il(long double d);
constexpr complex<long double> operator"if(unsigned long long d);
```

**Returns:** `complex<long double>{0.0L, static_cast<long double>(d)}`.
constexpr complex<double> operator"i(long double d);
constexpr complex<double> operator"i(unsigned long long d);
3 Returns: complex<double>{0.0, static_cast<double>(d)}.

constexpr complex<float> operator"if(long double d);
constexpr complex<float> operator"if(unsigned long long d);
4 Returns: complex<float>{0.0f, static_cast<float>(d)}.

28.5 Random number generation

28.5.1 General

1 Subclause 28.5 defines a facility for generating (pseudo-)random numbers.

2 In addition to a few utilities, four categories of entities are described: uniform random bit generators, random number engines, random number engine adaptors, and random number distributions. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[Note 1: These entities are specified in such a way as to permit the binding of any uniform random bit generator object \( e \) as the argument to any random number distribution object \( d \), thus producing a zero-argument function object such as given by \( \text{bind}(d,e) \). —end note]

3 Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as result_type. With \( T \) as the result_type thus associated with such an entity, that entity is characterized:

- (3.1) — as boolean or equivalently as boolean-valued, if \( T \) is bool;
- (3.2) — otherwise as integral or equivalently as integer-valued, if \( \text{numeric_limits}<T>::\text{is_integer} \) is true;
- (3.3) — otherwise as floating-point or equivalently as real-valued.

If integer-valued, an entity may optionally be further characterized as signed or unsigned, according to \( \text{numeric_limits}<T>::\text{is_signed} \).

4 Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.

5 Throughout 28.5, the operators bitand, bitor, and xor denote the respective conventional bitwise operations. Further:

- (5.1) — the operator rshift denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
- (5.2) — the operator lshift, denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo \( 2^w \).

28.5.2 Header <random> synopsis

```cpp
#include <initializer_list> // see 17.11.2

28.5.3 Requirements

28.5.3.1 General requirements

Throughout this subclause 28.5, the effect of instantiating a template:

1. That has a template type parameter named `Sseq` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).

2. That has a template type parameter named `URBG` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).
that has a template type parameter named **Engine** is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).

— that has a template type parameter named **RealType** is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.

— that has a template type parameter named **IntType** is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

— that has a template type parameter named **UIntType** is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

2 Throughout this subclause 28.5, phrases of the form “x is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “x is a value of a type meeting the requirements of the specified iterator type”.

3 Throughout this subclause 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared **explicit**.

### 28.5.3.2 Seed sequence requirements

A **seed sequence** is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values \(i, 0 \leq i < 2^{32}\), based on the consumed data.

[Note 1: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]

A class \(S\) meets the requirements of a seed sequence if the expressions shown in Table 96 are valid and have the indicated semantics, and if \(S\) also meets all other requirements of this subclause 28.5.3.2. In that Table and throughout this subclause:

1. \(T\) is the type named by \(S\)’s associated **result_type**;
2. \(q\) is a value of \(S\) and \(r\) is a possibly const value of \(S\);
3. \(ib\) and \(ie\) are input iterators with an unsigned integer **value_type** of at least 32 bits;
4. \(rb\) and \(re\) are mutable random access iterators with an unsigned integer **value_type** of at least 32 bits;
5. \(ob\) is an output iterator; and
6. \(il\) is a value of **initializer_list<T>**.

</tr>
</tbody>
</table>

28.5.3.3 Uniform random bit generator requirements

A uniform random bit generator $g$ of type $G$ is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[Note 1: The degree to which $g$'s results approximate the ideal is often determined statistically. — end note]

```
template<class G>
concept uniform_random_bit_generator =
  invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
  requires {
    { G::min() } -> same_as<invoke_result_t<G&>>;
    { G::max() } -> same_as<invoke_result_t<G&>>;
    requires bool_constant<(G::min() < G::max())>::value;
  };
```

2 Let $g$ be an object of type $G$. $G$ models uniform_random_bit_generator only if

(2.1) $G::min() \leq g()$,
(2.2) $g() \leq G::max()$, and
(2.3) $g()$ has amortized constant complexity.

3 A class $G$ meets the uniform random bit generator requirements if $G$ models uniform_random_bit_generator, invoke_result_t<G&> is an unsigned integer type (6.8.2), and $G$ provides a nested typedef-name result_type that denotes the same type as invoke_result_t<G&>.

28.5.3.4 Random number engine requirements

A random number engine (commonly shortened to engine) $e$ of type $E$ is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

2 At any given time, $e$ has a state $e_i$ for some integer $i \geq 0$. Upon construction, $e$ has an initial state $e_0$. An engine’s state may be established via a constructor, a seed function, assignment, or a suitable operator>>.

3 $E$’s specification shall define:

(3.1) the size of $E$’s state in multiples of the size of result_type, given as an integral constant expression;
(3.2) the transition algorithm $TA$ by which $e$’s state $e_i$ is advanced to its successor state $e_{i+1}$; and
(3.3) the generation algorithm $GA$ by which an engine’s state is mapped to a value of type result_type.
A class $E$ that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a random number engine if the expressions shown in Table 97 are valid and have the indicated semantics, and if $E$ also meets all other requirements of this subclause 28.5.3.4. In that Table and throughout this subclause:

1. $T$ is the type named by $E$'s associated result_type;
2. $e$ is a value of $E$, $v$ is an lvalue of $E$, $x$ and $y$ are (possibly const) values of $E$;
3. $a$ is a value of $T$;
4. $q$ is an lvalue meeting the requirements of a seed sequence (28.5.3.2);
5. $z$ is a value of type unsigned long long;
6. $os$ is an lvalue of the type of some class template specialization basic_ostream<charT, traits>; and
7. $is$ is an lvalue of the type of some class template specialization basic_istream<charT, traits>;

where charT and traits are constrained according to Clause 23 and Clause 31.

<table>

<td>no worse than the complexity of $z$ consecutive calls $e()$</td>
</tr>
<tr>
<td>$x == y$</td>
<td>bool</td>
<td>This operator is an equivalence relation. With $S_x$ and $S_y$ as the infinite sequences of values that would be generated by repeated future calls to $x()$ and $y()$, respectively, returns true if $S_x = S_y$; else returns false.</td>
<td>$O$(size of state)</td>
</tr>
<tr>
<td>$x != y$</td>
<td>bool</td>
<td>!(x == y).</td>
<td>$O$(size of state)</td>
</tr>
</tbody>
</table>

---

230) This constructor (as well as the subsequent corresponding seed() function) can be particularly useful to applications requiring a large number of independent random sequences.

231) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes $z$ consecutive calls $e()$. 

§ 28.5.3.4
<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Pre/post-condition</th>
<th>Complexity</th>
</tr>
</thead>
<tbody>
<tr>
<td>os &lt;&lt; x</td>
<td>reference to the type of os</td>
<td>With os.fmtflags set to ios_base::dec</td>
<td>ios_base::left and the fill character set to the space character, writes to os the textual representation of x's current state. In the output, adjacent numbers are separated by one or more space characters. <strong>Postconditions</strong>: The os.fmtflags and fill character are unchanged.</td>
</tr>
</tbody>
</table>

| is >> v    | reference to the type of is | With is.fmtflags set to ios_base::dec, sets v's state as determined by reading its textual representation from is. If bad input is encountered, ensures that v's state is unchanged by the operation and calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)). If a textual representation written via os << x was subsequently read via is >> v, then x == v provided that there have been no intervening invocations of x or of v. **Preconditions**: is provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of is, and whose type's template specialization arguments charT and traits were respectively the same as those of is. **Postconditions**: The is.fmtflags are unchanged. | $\mathcal{O}(\text{size of state})$ |

---

5 E shall meet the Cpp17CopyConstructible (Table 33) and Cpp17CopyAssignable (Table 35) requirements. These operations shall each be of complexity no worse than $\mathcal{O}(\text{size of state})$.

28.5.3.5 Random number engine adaptor requirements [rand.req.adapt]  

1 A random number engine adaptor (commonly shortened to adaptor) a of type A is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine b of type B adapted in this way is termed a base engine in this context. The expression a.base() shall be valid and shall return a const reference to a's base engine.

2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

A::A();  

3 **Effects**: The base engine is initialized as if by its default constructor.

bool operator==(const A& a1, const A& a2);  

4 **Returns**: true if a1's base engine is equal to a2's base engine. Otherwise returns false.
A::A(result_type s);

Effects: The base engine is initialized with s.

template<class Sseq> A::A(Sseq & q);

Effects: The base engine is initialized with q.

void seed();

Effects: With b as the base engine, invokes b.seed().

void seed(result_type s);

Effects: With b as the base engine, invokes b.seed(s).

template<class Sseq> void seed(Sseq & q);

Effects: With b as the base engine, invokes b.seed(q).

A shall also meet the following additional requirements:

- The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
- The state of A shall include the state of its base engine. The size of A’s state shall be no less than the size of the base engine.
- Copying A’s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.
- The textual representation of A shall include the textual representation of its base engine.

28.5.3.6 Random number distribution requirements

A random number distribution (commonly shortened to distribution) d of type D is a function object returning values that are distributed according to an associated mathematical probability density function p(z) or according to an associated discrete probability function P(z_i). A distribution’s specification identifies its associated probability function p(z) or P(z_i).

An associated probability function is typically expressed using certain externally-supplied quantities known as the parameters of the distribution. Such distribution parameters are identified in this context by writing, for example, p(z | a, b) or P(z_i | a, b), to name specific parameters, or by writing, for example, p(z | {p}) or P(z_i | {p}), to denote a distribution’s parameters p taken as a whole.

A class D meets the requirements of a random number distribution if the expressions shown in Table 98 are valid and have the indicated semantics, and if D and its associated types also meet all other requirements of this subclause 28.5.3.6. In that Table and throughout this subclause,

<td>Is restored</td>
</tr>
</tbody>
</table>
Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

For every random number engine and for every random number engine adaptor X defined in 28.5.4 and in 28.5.5:

1. if the constructor
   
   ```
   template<class Sseq> explicit X(Sseq& q);
   ```
   
is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not participate in overload resolution;

2. if the member function
   
   ```
   template<class Sseq> void seed(Sseq& q);
   ```
   
is called with a type Sseq that does not qualify as a seed sequence, then this function shall not participate in overload resolution.

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

28.5.4.2 Class template linear_congruential_engine

A linear_congruential_engine random number engine produces unsigned integer random numbers. The state \( x_i \) of a linear_congruential_engine object \( x \) is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form \( T_A(x_i) = (a \cdot x_i + c) \mod m \); the generation algorithm is \( G_A(x_i) = x_i + 1 \).

```cpp
namespace std {
    template<class UIntType, UIntType a, UIntType c, UIntType m>
    class linear_congruential_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr result_type multiplier = a;
            static constexpr result_type increment = c;
            static constexpr result_type modulus = m;
            static constexpr result_type min() { return c == 0u ? 1u: 0u; }
            static constexpr result_type max() { return m - 1u; }
            static constexpr result_type default_seed = 1u;

            // constructors and seeding functions
            linear_congruential_engine() : linear_congruential_engine(default_seed) {};
            explicit linear_congruential_engine(result_type s);
            template<class Sseq> explicit linear_congruential_engine(Sseq& q);
            void seed(result_type s = default_seed);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const linear_congruential_engine& x, const linear_congruential_engine& y);

            // generating functions
            result_type operator()();
            void discard(unsigned long long z);

            // inserters and extractors
            template<class charT, class traits>
                friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const linear_congruential_engine& x);
            template<class charT, class traits>
                friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, linear_congruential_engine& x);
    };
}
```
Let the template parameter \( m \) be 0, the modulus \( m \) used throughout this subclause 28.5.4.2 is numeric_limits<result_type>::max() plus 1.

[Note 1: \( m \) need not be representable as a value of type result_type. — end note]

If the template parameter \( m \) is not 0, the following relations shall hold: \( a < m \) and \( c < m \).

The textual representation consists of the value of \( x_0 \).

```cpp
explicit linear_congruential_engine(result_type s);
```

**Effects:** If \( c \mod m = 0 \) and \( s \mod m = 0 \), sets the engine’s state to 1, otherwise sets the engine’s state to \( s \mod m \).

```cpp
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
```

**Effects:** With \( k = \left\lceil \log_2 m \right\rceil \) and \( a \) an array (or equivalent) of length \( k + 3 \), invokes \( q.generate(a + 0, a + k + 3) \) and then computes \( S = \left( \sum_{j=0}^{k-1} d_j \cdot 2^{32j} \right) \mod m \). If \( c \mod m = 0 \) and \( S = 0 \), sets the engine’s state to 1, else sets the engine’s state to \( S \).

28.5.4.3 Class template mersenne_twister_engine

A mersenne_twister_engine random number engine\(^{232} \) produces unsigned integer random numbers in the closed interval \([0, 2^n - 1] \). The state \( x_0 \) of a mersenne_twister_engine object \( x \) is of size \( n \) and consists of a sequence \( X \) of \( n \) values of the type delivered by \( x \); all subscripts applied to \( X \) are to be taken modulo \( n \).

The transition algorithm employs a twisted generalized feedback shift register defined by shift values \( n \) and \( m \), a twist value \( r \), and a conditional xor-mask \( a \). To improve the uniformity of the result, the bits of the raw shift register are additionally tempered (i.e., scrambled) according to a bit-scrambling matrix defined by values \( u, d, s, b, t, c, \) and \( \ell \).

The state transition is performed as follows:

\[ (2.1) \quad \text{Concatenate the upper} \ w - r \ \text{bits of} \ X_{i-n} \ \text{with the lower} \ r \ \text{bits of} \ X_{i+1-n} \ \text{to obtain an unsigned integer value} \ Y. \]

\[ (2.2) \quad \text{With} \ \alpha = a \cdot (Y \ \text{bitand} \ 1), \ \text{set} \ X_i \ \text{to} \ X_{i+m-n} \ \text{xor} \ (Y \ \text{rshift} \ 1) \ \text{xor} \ \alpha. \]

The sequence \( X \) is initialized with the help of an initialization multiplier \( f \).

The generation algorithm determines the unsigned integer values \( z_1, z_2, z_3, z_4 \) as follows, then delivers \( z_4 \) as its result:

\[ (3.1) \quad \text{Let} \ z_1 = X_i \ \text{xor} \ (\ (X_i \ \text{rshift} \ u) \ \text{bitand} \ d). \]

\[ (3.2) \quad \text{Let} \ z_2 = z_1 \ \text{xor} \ (z_1 \ \text{rshift}_w s) \ \text{bitand} \ b. \]

\[ (3.3) \quad \text{Let} \ z_3 = z_2 \ \text{xor} \ (z_2 \ \text{rshift}_w t) \ \text{bitand} \ c. \]

\[ (3.4) \quad \text{Let} \ z_4 = z_3 \ \text{xor} \ (z_3 \ \text{rshift}_t \ell). \]

```cpp
class mersenne_twister_engine {
public:
    // types
    using result_type = UIntType;

    // engine characteristics
    static constexpr word_size = w;

    static constexpr state_size = n;

    static constexpr shift_size = m;

    static constexpr mask_bits = r;

namespace std {
    template<class UIntType, size_t w, size_t n, size_t m, size_t r,
        UIntType a, size_t u, UIntType d, size_t s,
        UIntType b, size_t t,
        UIntType c, size_t l, UIntType f>
    class mersenne_twister_engine {

    public:
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr word_size = w;

        static constexpr state_size = n;

        static constexpr shift_size = m;

        static constexpr mask_bits = r;

232) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.
static constexpr UIntType xor_mask = a;
static constexpr size_t tempering_u = u;
static constexpr UIntType tempering_d = d;
static constexpr size_t tempering_s = s;
static constexpr UIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr UIntType initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return \(2^w - 1\); }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);

The following relations shall hold: 
0 < m, m <= n, 2u < w, u <= w, s <= w, l <= w, w <= numeric_limits<UIntType>::digits, a <= (1u<<w) - 1u, b <= (1u<<w) - 1u, c <= (1u<<w) - 1u, d <= (1u<<w) - 1u, and f <= (1u<<w) - 1u.

The textual representation of \(x_i\) consists of the values of \(X_{i-n}, \ldots, X_{i-1}\), in that order.

**Effects**: Sets \(X_{-n}\) to value \(\mod 2^w\). Then, iteratively for \(i = 1 - n, \ldots, -1\), sets \(X_i\) to
\[
[f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w - 2))) + i \mod n] \mod 2^w.
\]

**Complexity**: \(\Theta(n)\).

template<class Sseq> explicit mersenne_twister_engine(Sseq& q);

**Effects**: With \(k = \lceil w/32 \rceil\) and \(a\) an array (or equivalent) of length \(n \cdot k\), invokes \(q\).generate\((a + 0, a + n \cdot k)\) and then, iteratively for \(i = -n, \ldots, -1\), sets \(X_i\) to \(\left(\sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{2j}\right) \mod 2^w\). Finally, if the most significant \(w - r\) bits of \(X_{-n}\) are zero, and if each of the other resulting \(X_i\) is 0, changes \(X_{-n}\) to \(2^w - 1\).

### 28.5.4.4 Class template subtract_with_carry_engine

A `subtract_with_carry_engine` random number engine produces unsigned integer random numbers.

The state \(x_i\) of a `subtract_with_carry_engine` object \(x\) is of size \(\Theta(r)\), and consists of a sequence \(X\) of \(r\) integer values \(0 \leq X_i < m = 2^w\); all subscripts applied to \(X\) are to be taken modulo \(r\). The state \(x_i\) additionally consists of an integer \(c\) (known as the `carry`) whose value is either 0 or 1.

The state transition is performed as follows:

\[x_{i+1} = x_i - c_{i+1} \mod m\]

\[c_{i+1} = \begin{cases} 1 & \text{if } x_i < c_{i+1} \mod m \\ 0 & \text{otherwise} \end{cases}\]
Let $Y = X_{i-s} - X_{i-r} - c$.

Set $X_i$ to $y = Y \mod m$. Set $c$ to 1 if $Y < 0$, otherwise set $c$ to 0.

[Note 1: This algorithm corresponds to a modular linear function of the form $TA(x_i) = (a \cdot x_i) \mod b$, where $b$ is of the form $m^r - m^s + 1$ and $a = b - (b - 1)/m$. — end note]

The generation algorithm is given by $GA(x_i) = y$, where $y$ is the value produced as a result of advancing the engine's state as described above.

```cpp
namespace std {
    template<class UIntType, size_t w, size_t s, size_t r>
    class subtract_with_carry_engine {
        // types
        using result_type = UIntType;

        // engine characteristics
        static constexpr size_t word_size = w;
        static constexpr size_t short_lag = s;
        static constexpr size_t long_lag = r;
        static constexpr result_type min() { return 0; }
        static constexpr result_type max() { return m - 1; }
        static constexpr result_type default_seed = 19780503u;

        // constructors and seeding functions
        subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
        explicit subtract_with_carry_engine(result_type value);
        template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
        void seed(result_type value = default_seed);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const subtract_with_carry_engine& x, const subtract_with_carry_engine& y);

        // generating functions
        result_type operator()();
        void discard(unsigned long long z);

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
    }
}
```

The following relations shall hold: $0 < s, s < r, 0 < w$, and $w \leq \text{numeric_limits<UIntType>::digits}$.

The textual representation consists of the values of $X_{i-r}, \ldots, X_{i-1}$, in that order, followed by $c$.

```cpp
explicit subtract_with_carry_engine(result_type value);
```

**Effects:** Sets the values of $X_{i-r}, \ldots, X_{i-1}$, in that order, as specified below. If $X_{i-1}$ is then 0, sets $c$ to 1; otherwise sets $c$ to 0.

To set the values $X_k$, first construct $e$, a `linear_congruential_engine` object, as if by the following definition:

```cpp
linear_congruential_engine<result_type, 40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each $X_k$, obtain new values $z_0, \ldots, z_{n-1}$ from $n = \lceil w/32 \rceil$ successive invocations of $e$. Set $X_k$ to $\left(\sum_{j=0}^{n-1} z_{j \cdot 2^{32}}\right) \mod m$.

**Complexity:** Exactly $n \cdot r$ invocations of $e$. 

§ 28.5.4.4 1395
template<
class Sseq>
explicit subtract_with_carry_engine(Sseq& q);

Effects: With \( k = \lceil w/32 \rceil \) and \( a \) an array (or equivalent) of length \( r \cdot k \), invokes \( q.generate(a + 0, a + r \cdot k) \) and then, iteratively for \( i = -r, \ldots, -1 \), sets \( X_i \) to \( \left( \sum_{j=0}^{k-1} a_{k(i+r)+j} \cdot 2^{32j} \right) \mod m \). If \( X_{-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

### 28.5.5 Random number engine adaptor class templates

#### 28.5.5.1 In general

1. Each type instantiated from a class template specified in this subclause 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.

2. Except where specified otherwise, the complexity of each function specified in this subclause 28.5.5 is constant.

3. Except where specified otherwise, no function described in this subclause 28.5.5 throws an exception.

4. Every function described in this subclause 28.5.5 that has a function parameter \( q \) of type \( Sseq \& \) for a template type parameter named \( Sseq \) that is different from type \( seed_seq \) throws what and when the invocation of \( q.generate \) throws.

5. Descriptions are provided in this subclause 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6. Each template specified in this subclause 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

#### 28.5.5.2 Class template discard_block_engine

1. A discard_block_engine random number engine adaptor produces random numbers selected from those produced by some base engine \( e \). The state \( x_i \) of a discard_block_engine engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \) and an additional integer \( n \). The size of the state is the size of \( e \)'s state plus 1.

2. The transition algorithm discards all but \( r > 0 \) values from each block of \( p \geq r \) values delivered by \( e \). The state transition is performed as follows: If \( n \geq r \), advance the state of \( e \) from \( e_i \) to \( e_i + p-r \) and set \( n \) to 0. In any case, then increment \( n \) and advance \( e \)'s then-current state \( e_j \) to \( e_j + 1 \).

3. The generation algorithm yields the value returned by the last invocation of \( e() \) while advancing \( e \)'s state as described above.

```cpp
namespace std {
    template<class Engine, size_t p, size_t r>
    class discard_block_engine {
    public:
        // types
        using result_type = typename Engine::result_type;

        // engine characteristics
        static constexpr size_t block_size = p;
        static constexpr size_t used_block = r;
        static constexpr result_type min() { return Engine::min(); } 
        static constexpr result_type max() { return Engine::max(); } 

        // constructors and seeding functions
        discard_block_engine();
        explicit discard_block_engine(const Engine& e);
        explicit discard_block_engine(Engine&& e);
        explicit discard_block_engine(result_type s);
        template<class Sseq> explicit discard_block_engine(Sseq& q);
        void seed();
        void seed(result_type s);
        template<class Sseq> void seed(Sseq& q);

        // equality operators
        friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);
    }
};
```
// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const discard_block_engine& x);

private:
Engine e; // exposition only
size_t n; // exposition only
};

4 The following relations shall hold: 0 < r and r <= p.
5 The textual representation consists of the textual representation of e followed by the value of n.
6 In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor
sets n to 0.

28.5.5.3 Class template independent_bits_engine

An independent_bits_engine random number engine adaptor combines random numbers that are produced
by some base engine e, so as to produce random numbers with a specified number of bits w. The state x_i of
an independent_bits_engine engine adaptor object x consists of the state e_i of its base engine e; the size
of the state is the size of e’s state.

2 The transition and generation algorithms are described in terms of the following integral constants:

(2.1) — Let \( R = e.\max() - e.\min() + 1 \) and \( m = \lceil \log R \rceil \).

(2.2) — With n as determined below, let \( w_0 = \lfloor w/n \rfloor \), \( n_0 = n - w \mod n \), \( y_0 = 2^{w_0} \lfloor R/2^{w_0} \rfloor \), and \( y_1 = 2^{w_0+1} \lfloor R/2^{w_0+1} \rfloor \).

(2.3) — Let \( n = \lceil w/m \rceil \) if and only if the relation \( R - y_0 \leq \lfloor y_0/n \rfloor \) holds as a result. Otherwise let \( n = 1 + \lceil w/m \rceil \).

[Note 1: The relation \( w = n_0 w_0 + (n - n_0)(w_0 + 1) \) always holds. — end note]

3 The transition algorithm is carried out by invoking e() as often as needed to obtain \( n_0 \) values less than \( y_0 + e.\min() \) and \( n - n_0 \) values less than \( y_1 + e.\min() \).
4 The generation algorithm uses the values produced while advancing the state as described above to yield a
quantity S obtained as if by the following algorithm:

\[
S = 0;
\]

for \( k = 0; k \neq n_0; k += 1 \) \{ do \( u = e() - e.\min(); \) while \( u \geq y_0; \)
\( S = 2^{w_0} \cdot S + u \mod 2^{w_0}; \) \}

for \( k = n_0; k \neq n_1; k += 1 \) \{ do \( u = e() - e.\min(); \) while \( u \geq y_1; \)
\( S = 2^{w_0+1} \cdot S + u \mod 2^{w_0+1}; \) \}

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
// types
using result_type = UIntType;

// engine characteristics
static constexpr result_type min() { return 0; }

§ 28.5.5.3 | N4917 | 1397
static constexpr result_type max() { return 2^w - 1; }

// constructors and seeding functions
independent_bits_engine();
explicit independent_bits_engine(const Engine& e);
explicit independent_bits_engine(Engine&& e);
explicit independent_bits_engine(result_type s);
template<class Sseq> explicit independent_bits_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
  Engine e;  // exposition only
};

The following relations shall hold: 0 < w and w <= numeric_limits<result_type>::digits.

The textual representation consists of the textual representation of e.

28.5.5.4 Class template shuffle_order_engine

A shuffle_order_engine random number engine adaptor produces the same random numbers that are
produced by some base engine e, but delivers them in a different sequence. The state x of a shuffle_-
order_engine engine adaptor object x consists of the state e_i of its base engine e, an additional value Y of
the type delivered by e, and an additional sequence V of k values also of the type delivered by e. The size of
the state is the size of e’s state plus k + 1.

The transition algorithm permutes the values produced by e. The state transition is performed as follows:

(2.1) Calculate an integer \( j = \left\lfloor \frac{k (Y - e_{\text{min}})}{e_{\text{max}} - e_{\text{min}} + 1} \right\rfloor \).

(2.2) Set Y to \( V_j \) and then set \( V_j \) to e().

The generation algorithm yields the last value of Y produced while advancing e’s state as described above.

namespace std {
  template<class Engine, size_t k>
  class shuffle_order_engine {
public:
    // types
    using result_type = typename Engine::result_type;

    // engine characteristics
    static constexpr size_t table_size = k;
    static constexpr result_type min() { return Engine::min(); }
    static constexpr result_type max() { return Engine::max(); }

    static constexpr result_type max() { return 2^w - 1; }

    // constructors and seeding functions
    independent_bits_engine();
    explicit independent_bits_engine(const Engine& e);
    explicit independent_bits_engine(Engine&& e);
    explicit independent_bits_engine(result_type s);
    template<class Sseq> explicit independent_bits_engine(Sseq& q);
    void seed();
    void seed(result_type s);
    template<class Sseq> void seed(Sseq& q);

    // equality operators
    friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

    // generating functions
    result_type operator()();
    void discard(unsigned long long z);

    // property functions
    const Engine& base() const noexcept { return e; }

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
  Engine e;  // exposition only
};

The following relations shall hold: 0 < w and w <= numeric_limits<result_type>::digits.

The textual representation consists of the textual representation of e.

28.5.5.4 Class template shuffle_order_engine
// constructors and seeding functions
shuffle_order_engine();
explicit shuffle_order_engine(const Engine& e);
explicit shuffle_order_engine(Engine&& e);
explicit shuffle_order_engine(result_type s);
template<class Sseq> explicit shuffle_order_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);

private:
Engine e;  // exposition only
result_type V[k];  // exposition only
result_type Y;  // exposition only
};

4 The following relation shall hold: 0 < k.
5 The textual representation consists of the textual representation of e, followed by the k values of V, followed by the value of Y.
6 In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes V[0],...,V[k-1] and Y, in that order, with values returned by successive invocations of e().

28.5.6 Engines and engine adaptors with predefined parameters [rand.predef]

using minstd_rand0 =
linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type minstd_rand0 produces the value 1043618065.

using minstd_rand =
linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type minstd_rand produces the value 399268537.

using mt19937 =
mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
0x9908b0df, 11, 0xffffffff, 7, 0x0d2c5680, 15, 0xfedc6000, 18, 1'812'433'253>;

Required behavior: The 10000th consecutive invocation of a default-constructed object of type mt19937 produces the value 1423659995.

using mt19937_64 =
mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
0xb5026f5a96619e9, 29, 0x5555555555555555, 17,
4 Required behavior: The 10000th consecutive invocation of a default-constructed object of type mt19937_64 produces the value 9981545732273789042.

using ranlux24_base = subtract_with_carry_engine<uint_fast32_t, 24, 10, 24>;
5 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux24_base produces the value 7937952.

using ranlux48_base = subtract_with_carry_engine<uint_fast64_t, 48, 5, 12>;
6 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux48_base produces the value 61839128582725.

using ranlux24 = discard_block_engine<ranlux24_base, 223, 23>;
7 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux24 produces the value 9901578.

using ranlux48 = discard_block_engine<ranlux48_base, 389, 11>;
8 Required behavior: The 10000th consecutive invocation of a default-constructed object of type ranlux48 produces the value 249142670248501.

using knuth_b = shuffle_order_engine<minstd_rand0, 256>;
9 Required behavior: The 10000th consecutive invocation of a default-constructed object of type knuth_b produces the value 1112339016.

using default_random_engine = implementation-defined;
10 Remarks: The choice of engine type named by this typedef is implementation-defined.

[Note 1: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this typedef need not generate identical sequences across implementations. —end note]

28.5.7 Class random_device

A random_device uniform random bit generator produces nondeterministic random numbers.

If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

namespace std {
    class random_device {
    public:
        // types
        using result_type = unsigned int;

        // generator characteristics
        static constexpr result_type min() { return numeric_limits<result_type>::min(); }
        static constexpr result_type max() { return numeric_limits<result_type>::max(); }

        // constructors
        random_device() : random_device(implementation-defined) {}
        explicit random_device(const string& token);

        // generating functions
        result_type operator()();

        // property functions
        double entropy() const noexcept;

        // no copy functions
        random_device(const random_device&) = delete;

§ 28.5.7 1400
void operator=(const random_device&) = delete;
};

explicit random_device(const string& token);

Throws: A value of an implementation-defined type derived from exception if the random_device cannot be initialized.
Remarks: The semantics of the token parameter and the token value used by the default constructor are implementation-defined.²³³

double entropy() const noexcept;

Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate²³⁴ for the random numbers returned by operator(), in the range min() to log₂(max() + 1).

result_type operator()();

Returns: A nondeterministic random value, uniformly distributed between min() and max() (inclusive). It is implementation-defined how these values are generated.

Throws: A value of an implementation-defined type derived from exception if a random number cannot be obtained.

28.5.8 Utilities [rand.util]
28.5.8.1 Class seed_seq [rand.util.seedseq]
namespace std {
    class seed_seq {
        public:
            // types
            using result_type = uint_least32_t;

            // constructors
            seed_seq() noexcept;
            template<class T>
                seed_seq(initializer_list<T> il);
            template<class InputIterator>
                seed_seq(InputIterator begin, InputIterator end);

            // generating functions
            template<class RandomAccessIterator>
                void generate(RandomAccessIterator begin, RandomAccessIterator end);

            // property functions
            size_t size() const noexcept;
            template<class OutputIterator>
                void param(OutputIterator dest) const;

            // no copy functions
            seed_seq(const seed_seq&) = delete;
            void operator=(const seed_seq&) = delete;

        private:
            vector<result_type> v; // exposition only
        }
    }

    seed_seq() noexcept;

    Postconditions: v.empty() is true.

  ²³³ The parameter is intended to allow an implementation to differentiate between different sources of randomness.
  ²³⁴ If a device has \( n \) states whose respective probabilities are \( P_0, \ldots, P_{n-1} \), the device entropy \( S \) is defined as
  \[
  S = -\sum_{i=0}^{n-1} P_i \cdot \log P_i.
  \]
template<class T>
seed_seq(initializer_list<T> il);

Constraints: T is an integer type.

Effects: Same as seed_seq(il.begin(), il.end()).

template<class InputIterator>
seed_seq(InputIterator begin, InputIterator end);

Mandates: iterator_traits<InputIterator>::value_type is an integer type.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3).

Effects: Initializes v by the following algorithm:

for (InputIterator s = begin; s != end; ++s)
v.push_back((*s) mod 2^32);

template<class RandomAccessIterator>
void generate(RandomAccessIterator begin, RandomAccessIterator end);

Mandates: iterator_traits<RandomAccessIterator>::value_type is an unsigned integer type capable of accommodating 32-bit quantities.

Preconditions: RandomAccessIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) and the requirements of a mutable iterator.

Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin, end) according to the following algorithm in which each operation is to be carried out modulo 2^32, each indexing operator applied to begin is to be taken modulo n, and T(x) is defined as x xor (x rshift 27):

— By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let p = (n - t)/2 and let q = p + t, where

\[ t = (n \geq 632) \times 11 : (n \geq 68) \times 7 : (n \geq 39) \times 5 : (n \geq 7) \times 3 : (n - 1)/2; \]

— With m as the larger of s + 1 and n, transform the elements of the range: iteratively for \( k = 0, \ldots, m - 1 \), calculate values

\[ r_1 = 1664525 \cdot T(begin[k] \ xor \ begin[k+p] \ xor \ begin[k-1]) \]

\[ r_2 = \begin{cases} 
  s, & k = 0 \\
  k \mod n + v[k-1], & 0 < k \leq s \\
  k \mod n, & s < k
\end{cases} \]

and, in order, increment begin[k+p] by r1, increment begin[k+q] by r2, and set begin[k] to r2.

— Transform the elements of the range again, beginning where the previous step ended: iteratively for \( k = m, \ldots, m + n - 1 \), calculate values

\[ r_3 = 1566083941 \cdot T(begin[k] + begin[k+p] + begin[k-1]) \]

\[ r_4 = r_3 - (k \mod n) \]

and, in order, update begin[k+p] by xoring it with r3, update begin[k+q] by xoring it with r4, and set begin[k] to r4.

Throws: What and when RandomAccessIterator operations of begin and end throw.

size_t size() const noexcept;

Returns: The number of 32-bit units that would be returned by a call to param().

Complexity: Constant time.

template<class OutputIterator>
void param(OutputIterator dest) const;

Mandates: Values of type result_type are writable (25.3.1) to dest.

Preconditions: OutputIterator meets the Cpp17OutputIterator requirements (25.3.5.4).
Effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```
copy(v.begin(), v.end(), dest);
```

Throws: What and when `OutputIterator` operations of `dest` throw.

28.5.8.2 Function template `generate_canonical`  
[rand.util.canonical]

```cpp
template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);
```

Effects: Invokes `g()` `k` times to obtain values `g_0, \ldots, g_{k-1}`, respectively. Calculates a quantity

\[
S = \sum_{i=0}^{k-1} (g_i - g\.min()) \cdot R^i
\]

using arithmetic of type `RealType`.

Returns: `S/R^k`.

[Note 1: `0 \leq S/R^k < 1`. — end note]

Throws: What and when `g` throws.

Complexity: Exactly `k = \max(1, \lceil b/\log_2 R \rceil)` invocations of `g`, where `b`\(^{235}\) is the lesser of `numeric_limits<RealType>::digits` and `bits`, and `R` is the value of `g\.max() - g\.min() + 1`.

[Note 2: If the values `g_i` produced by `g` are uniformly distributed, the instantiation’s results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — end note]

28.5.9 Random number distribution class templates  
[rand.dist]

28.5.9.1 In general  
[rand.dist.general]

Each type instantiated from a class template specified in this subclause 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.

Descriptions are provided in this subclause 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

The algorithms for producing each of the specified distributions are implementation-defined.

The value of each probability density function `p(z)` and of each discrete probability function `P(z_i)` specified in this subclause is `0` everywhere outside its stated domain.

28.5.9.2 Uniform distributions  
[rand.dist.uni]

28.5.9.2.1 Class template `uniform_int_distribution`  
[rand.dist.uni.int]

A `uniform_int_distribution` random number distribution produces random integers `i`, `a \leq i \leq b`, distributed according to the constant discrete probability function

```
P(i | a, b) = 1/(b - a + 1).
```

```cpp
namespace std {
    template<class IntType = int>
    class uniform_int_distribution { // types
        using result_type = IntType;
        using param_type = unspecified;
    }
}
```

\(^{235}\) `b` is introduced to avoid any attempt to produce more bits of randomness than can be held in `RealType`. 

\(\S\) 28.5.9.2.1
// constructors and reset functions
uniform_int_distribution() : uniform_int_distribution(0) {} 
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());
explicit uniform_int_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

// generating functions
template<class URBG>
result_type operator%(URBG& g);
template<class URBG>
result_type operator%(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, uniform_int_distribution& x);

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

Preconditions: a ≤ b.

Remarks: a and b correspond to the respective parameters of the distribution.

result_type a() const;
Returns: The value of the a parameter with which the object was constructed.

result_type b() const;
Returns: The value of the b parameter with which the object was constructed.

28.5.9.2.2 Class template uniform_real_distribution [rand.dist.uni.real]
A uniform_real_distribution random number distribution produces random numbers x, a ≤ x < b, distributed according to the constant probability density function

\[ p(x | a, b) = \frac{1}{(b - a)} \, . \]

[Note 1: This implies that p(x | a, b) is undefined when a == b. — end note]

namespace std {
    template<class RealType = double>
    class uniform_real_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        uniform_real_distribution() : uniform_real_distribution(0.0) {} 
        explicit uniform_real_distribution(RealType a, RealType b = 1.0);
        explicit uniform_real_distribution(const param_type& parm);
    }
```cpp
void reset();

// equality operators
friend bool operator==(const uniform_real_distribution& x, const uniform_real_distribution& y);

// generating functions
template<class URBG>
  result_type operator()(URBG& g);
template<class URBG>
  result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);
```

28.5.9.3 Bernoulli distributions [rand.dist.bern]

28.5.9.3.1 Class bernoulli_distribution [rand.dist.bern.bernoulli]

A bernoulli_distribution random number distribution produces bool values \( b \) distributed according to the discrete probability function

\[
P(b|p) = \begin{cases} 
  p & \text{if } b = \text{true}, \\
  1 - p & \text{if } b = \text{false}.
\end{cases}
\]

namespace std {
    class bernoulli_distribution {
        public:
            // types
            using result_type = bool;
            using param_type = unspecified;

            // constructors and reset functions
            bernoulli_distribution() : bernoulli_distribution(0.5) {}
            explicit bernoulli_distribution(double p);
            explicit bernoulli_distribution(const param_type& parm);
            void reset();
```
friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);

explicit bernoulli_distribution(double p);

Preconditions: 0 ≤ p ≤ 1.
Remarks: p corresponds to the parameter of the distribution.

double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.3.2 Class template binomial_distribution [rand.dist.bern.bin]

A binomial_distribution random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i \mid t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i}.
\]

namespace std {
    template<class IntType = int>
    class binomial_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructors and reset functions
        binomial_distribution() : binomial_distribution(1) {}
        explicit binomial_distribution(IntType t, double p = 0.5);
        explicit binomial_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const binomial_distribution& x, const binomial_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);
    };
}
// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);

explicit binomial_distribution(IntType t, double p = 0.5);

Preconditions: 0 ≤ p ≤ 1 and 0 ≤ t.
Remarks: t and p correspond to the respective parameters of the distribution.

IntType t() const;
Returns: The value of the t parameter with which the object was constructed.
double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.3.3 Class template geometric_distribution
A geometric_distribution random number distribution produces integer values i ≥ 0 distributed according to the discrete probability function

\[ P(i|p) = p \cdot (1 - p)^i \].

namespace std {
    template<class IntType = int>
    class geometric_distribution {
        public:
            // types
            using result_type = IntType;
            using param_type = unspecified;

            // constructors and reset functions
            geometric_distribution() : geometric_distribution(0.5) {}
            explicit geometric_distribution(double p);
            explicit geometric_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            double p() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;
    }
}
explicit geometric_distribution(double p);

Preconditions: 0 < p < 1.

Remarks: p corresponds to the parameter of the distribution.

double p() const;

Returns: The value of the p parameter with which the object was constructed.

28.5.9.3.4 Class template negative_binomial_distribution

A negative_binomial_distribution random number distribution produces random integers \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i|k,p) = \binom{k+i-1}{i} \cdot p^k \cdot (1-p)^i.
\]

[Note 1: This implies that \( P(i|k,p) \) is undefined when \( p == 1 \). —end note]

namespace std {
    template<class IntType = int>
    class negative_binomial_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructor and reset functions
        negative_binomial_distribution() : negative_binomial_distribution(1) {}
        explicit negative_binomial_distribution(IntType k, double p = 0.5);
        explicit negative_binomial_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const negative_binomial_distribution& x,
                              const negative_binomial_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        IntType k() const;
        double p() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const negative_binomial_distribution& x);
    };
}
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
};

explicit negative_binomial_distribution(IntType k, double p = 0.5);

Preconditions: $0 < p \leq 1$ and $0 < k$.

Remarks: $k$ and $p$ correspond to the respective parameters of the distribution.

IntType k() const;

Returns: The value of the $k$ parameter with which the object was constructed.

double p() const;

Returns: The value of the $p$ parameter with which the object was constructed.

28.5.9.4 Poisson distributions

28.5.9.4.1 Class template poisson_distribution

A poisson_distribution random number distribution produces integer values $i \geq 0$ distributed according to the discrete probability function

$$P(i|\mu) = \frac{e^{-\mu} \mu^i}{i!}.$$ 

The distribution parameter $\mu$ is also known as this distribution’s mean.

template<class IntType = int>
class poisson_distribution
{
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {}  
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserter and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
};
explicit poisson_distribution(double mean);

Preconditions: 0 < mean.
Remarks: mean corresponds to the parameter of the distribution.

double mean() const;
Returns: The value of the mean parameter with which the object was constructed.

28.5.9.4.2 Class template exponential_distribution [rand.dist.pois.exp]

An exponential_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x | \lambda) = \lambda e^{-\lambda x}.
\]

namespace std {
    template<class RealType = double>
    class exponential_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructors and reset functions
            exponential_distribution() : exponential_distribution(1.0) {};
            explicit exponential_distribution(RealType lambda);
            explicit exponential_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const exponential_distribution& x, const exponential_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType lambda() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
                operator<<(basic_ostream<charT, traits>& os, const exponential_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
                operator>>(basic_istream<charT, traits>& is, exponential_distribution& x);
    };
}

explicit exponential_distribution(RealType lambda);

Preconditions: 0 < lambda.
Remarks: lambda corresponds to the parameter of the distribution.

RealType lambda() const;
Returns: The value of the lambda parameter with which the object was constructed.
A `gamma_distribution` random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^{\alpha} \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.$$ 

```cpp
def explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
```

**Preconditions:** $0 < \alpha$ and $0 < \beta$.

**Remarks:** $\alpha$ and $\beta$ correspond to the parameters of the distribution.

```cpp
def RealType alpha() const;
```

**Returns:** The value of the $\alpha$ parameter with which the object was constructed.

```cpp
def RealType beta() const;
```

**Returns:** The value of the $\beta$ parameter with which the object was constructed.
28.5.9.4.4 Class template weibull_distribution

A `weibull_distribution` random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x \mid a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).
\]

namespace std {
    template<class RealType = double>
    class weibull_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            weibull_distribution(); weibull_distribution(1.0) {}
            explicit weibull_distribution(RealType a, RealType b = 1.0);
            explicit weibull_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType a() const;
            RealType b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
    };
}

explicit weibull_distribution(RealType a, RealType b = 1.0);

Preconditions: \( 0 < a \) and \( 0 < b \).

Remarks: \( a \) and \( b \) correspond to the respective parameters of the distribution.

RealType a() const;

Returns: The value of the \( a \) parameter with which the object was constructed.

RealType b() const;

Returns: The value of the \( b \) parameter with which the object was constructed.
An extreme_value_distribution random number distribution produces random numbers $x$ distributed according to the probability density function

$$p(x | a, b) = \frac{1}{b} \exp \left( \frac{a - x}{b} - \exp \left( \frac{a - x}{b} \right) \right).$$

### namespace std

template<class RealType = double>
class extreme_value_distribution {
  public:
    // types
    using result_type = RealType;
    using param_type = unspecified;
    // constructor and reset functions
    extreme_value_distribution() : extreme_value_distribution(0.0) {};
    explicit extreme_value_distribution(RealType a, RealType b = 1.0);
    explicit extreme_value_distribution(const param_type& parm);
    void reset();
    // equality operators
    friend bool operator==(const extreme_value_distribution& x, const extreme_value_distribution& y);
    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
};

explicit extreme_value_distribution(RealType a, RealType b = 1.0);

**Preconditions:** $0 < b$.

**Remarks:** $a$ and $b$ correspond to the respective parameters of the distribution.

**Returns:** The value of the $a$ parameter with which the object was constructed.

**Returns:** The value of the $b$ parameter with which the object was constructed.

---

2. The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.
28.5.9.5 Normal distributions

28.5.9.5.1 Class template normal_distribution

A normal_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp \left( -\frac{(x - \mu)^2}{2\sigma^2} \right).
\]

The distribution parameters \( \mu \) and \( \sigma \) are also known as this distribution’s mean and standard deviation.

```cpp
namespace std {
    template<class RealType = double>
    class normal_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        normal_distribution() : normal_distribution(0.0) {}
        explicit normal_distribution(RealType mean, RealType stddev = 1.0);
        explicit normal_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const normal_distribution& x, const normal_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType mean() const;
        RealType stddev() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
    };
}
```

Explicit normal_distribution(RealType mean, RealType stddev = 1.0);

**Preconditions:** \( 0 < \text{stddev} \).

**Remarks:** \text{mean} and \text{stddev} correspond to the respective parameters of the distribution.

RealType mean() const;

**Returns:** The value of the \text{mean} parameter with which the object was constructed.

RealType stddev() const;

**Returns:** The value of the \text{stddev} parameter with which the object was constructed.
Class template `lognormal_distribution`  

A `lognormal_distribution` random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x \mid m, s) = \frac{1}{sx\sqrt{2\pi}} \exp \left( -\frac{(\ln x - m)^2}{2s^2} \right).
\]

```cpp
namespace std {
    template<class RealType = double>
    class lognormal_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            lognormal_distribution() : lognormal_distribution(0.0) {}
            explicit lognormal_distribution(RealType m, RealType s = 1.0);
            explicit lognormal_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType m() const;
            RealType s() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
    });
}
```

1. Preconditions: \( 0 < s \).
2. Remarks: \( m \) and \( s \) correspond to the respective parameters of the distribution.

RealType `m()` const;

Returns: The value of the \( m \) parameter with which the object was constructed.

RealType `s()` const;

Returns: The value of the \( s \) parameter with which the object was constructed.
28.5.9.5.3 Class template chi_squared_distribution

A `chi_squared_distribution` random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x \mid n) = \frac{x^{(n/2)-1} e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.
\]

namespace std {
    template<class RealType = double>
    class chi_squared_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        chi_squared_distribution() : chi_squared_distribution(1.0) {}
        explicit chi_squared_distribution(RealType n);
        explicit chi_squared_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const chi_squared_distribution& x, const chi_squared_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const chi_squared_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, chi_squared_distribution& x);
    }

    explicit chi_squared_distribution(RealType n);

    Preconditions: \( 0 < n \).

    Remarks: \( n \) corresponds to the parameter of the distribution.

    RealType n() const;

    Returns: The value of the \( n \) parameter with which the object was constructed.

28.5.9.5.4 Class template cauchy_distribution

A `cauchy_distribution` random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x \mid a, b) = \left( \pi b \left( 1 + \left( \frac{x - a}{b} \right)^2 \right) \right)^{-1}.
\]
namespace std {
    template<class RealType = double>
    class cauchy_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            cauchy_distribution() : cauchy_distribution(0.0) {};
            explicit cauchy_distribution(RealType a, RealType b = 1.0);
            explicit cauchy_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType a() const;
            RealType b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
    }

    explicit cauchy_distribution(RealType a, RealType b = 1.0);

    Preconditions: 0 < b.

    Remarks: a and b correspond to the respective parameters of the distribution.

    RealType a() const;
    Returns: The value of the a parameter with which the object was constructed.

    RealType b() const;
    Returns: The value of the b parameter with which the object was constructed.

28.5.9.5.5 Class template fisher_f_distribution [rand.dist.norm.f]
A fisher_f_distribution random number distribution produces random numbers $x \geq 0$ distributed according to the probability density function

$$p(x \mid m, n) = \frac{\Gamma((m + n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2) - 1} \cdot \left(1 + \frac{m \cdot x}{n}\right)^{-(m+n)/2}.$$
namespace std {
    template<class RealType = double>
    class fisher_f_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            fisher_f_distribution() : fisher_f_distribution(1.0) {};
            explicit fisher_f_distribution(RealType m, RealType n = 1.0);
            explicit fisher_f_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType m() const;
            RealType n() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
        };
    }

    explicit fisher_f_distribution(RealType m, RealType n = 1);

    // Preconditions: 0 < m and 0 < n.
    // Remarks: m and n correspond to the respective parameters of the distribution.

    RealType m() const;
    RealType n() const;
    Returns: The value of the m parameter with which the object was constructed.
    Returns: The value of the n parameter with which the object was constructed.

    § 28.5.9.5.6  Class template student_t_distribution
    A student_t_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

    \[
    p(x | n) = \frac{1}{\sqrt{\pi n}} \cdot \frac{\Gamma((n + 1)/2)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-(n+1)/2}.
    \]
namespace std {
    template<class RealType = double>
    class student_t_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;
    // constructor and reset functions
    student_t_distribution() : student_t_distribution(1.0) {};
    explicit student_t_distribution(RealType n);
    explicit student_t_distribution(const param_type& parm);
    void reset();
    // equality operators
    friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);
    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);
    // property functions
    RealType n() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;
    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
};
}

explicit student_t_distribution(RealType n);

Preconditions: 0 < n.

Remarks: n corresponds to the parameter of the distribution.

RealType n() const;

Returns: The value of the n parameter with which the object was constructed.

28.5.9.6 Sampling distributions

28.5.9.6.1 Class template discrete_distribution

A discrete_distribution random number distribution produces random integers \(i, 0 \leq i < n\), distributed according to the discrete probability function

\[ P(i | p_0, \ldots, p_{n-1}) = p_i. \]

Unless specified otherwise, the distribution parameters are calculated as: \(p_k = w_k / S\) for \(k = 0, \ldots, n - 1\), in which the values \(w_k\), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \(0 < S = w_0 + \cdots + w_{n-1}\).
// types
using result_type = IntType;
using param_type = unspecified;

// constructor and reset functions
discrete_distribution();
template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);
discrete_distribution(initializer_list<double> wl);
template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
explicit discrete_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<double> probabilities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);

Effects: Constructs a discrete_distribution object with \( n = 1 \) and \( p_0 = 1 \).

[Note 1: Such an object will always deliver the value 0. — end note]

template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);

Mandates: \( \text{is_convertible}_{v}<\text{iterator_traits}<\text{InputIterator}>::\text{value_type}, \text{double} \) is true.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3). If \( \text{firstW} = \text{lastW} \), let \( n = 1 \) and \( w_0 = 1 \). Otherwise, \([\text{firstW}, \text{lastW}]\) forms a sequence \( w \) of length \( n > 0 \).

Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

discrete_distribution(initializer_list<double> wl);

Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

Mandates: \( \text{is_invocable}_{r,v}<\text{double}, \text{UnaryOperation}\&, \text{double} \) is true.

Preconditions: If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin)/n \) holds.
Effects: Constructs a discrete_distribution object with probabilities given by the formula above, using the following values: If \( n_w = 0 \), let \( w_0 = 1 \). Otherwise, let \( w_k = f_w(x_{\text{min}} + k \cdot \delta + \delta/2) \) for \( k = 0, \ldots, n - 1 \).

Complexity: The number of invocations of \( f_w \) does not exceed \( n \).

\[
\text{vector}\langle\text{double}\rangle \text{ probabilities()} \text{ const;} \]

Returns: A vector\langle double\rangle whose size member returns \( n \) and whose operator[] member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n - 1 \).

28.5.9.6.2 Class template piecewise_constant_distribution

A piecewise_constant_distribution random number distribution produces random numbers \( x \), \( b_0 \leq x < b_n \), uniformly distributed over each subinterval \([b_i, b_{i+1})\) according to the probability density function

\[
p(x \mid b_0, \ldots, b_n, \rho_0, \ldots, \rho_{n-1}) = \rho_i, \text{ for } b_i \leq x < b_{i+1}.
\]

The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution’s interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n - 1 \). Unless specified otherwise, the remaining \( n \) distribution parameters are calculated as:

\[
\rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n - 1,
\]

in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).

namespace std {

class piecewise_constant_distribution {

public:

// using result_type = RealType;
// using param_type = unspecified;

// constructor and reset functions

piecewise_constant_distribution();

template<class InputIteratorB, class InputIteratorW>

piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,

InputIteratorW firstW);

template<class UnaryOperation>

piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

template<class UnaryOperation>

piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax,

UnaryOperation fw);

explicit piecewise_constant_distribution(const param_type& parm);

void reset();

// equality operators

friend bool operator==(const piecewise_constant_distribution& x,

const piecewise_constant_distribution& y);

// generating functions

template<class URBG>

result_type operator()(URBG& g);

template<class URBG>

result_type operator()(URBG& g, const param_type& parm);

// property functions

vector<result_type> intervals() const;

vector<result_type> densities() const;

param_type param() const;

void param(const param_type& parm);

result_type min() const;

result_type max() const;

}

}
// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);

template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);

.piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with \( n = 1, \rho_0 = 1, b_0 = 0, \) \( b_1 = 1. \)

.template<InputIteratorB, class InputIteratorW>

.piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                      InputIteratorW firstW);

Mandates: Both of

1. \is_convertible_v<
iterator_traits<InputIteratorB>::value_type, double>
2. \is_convertible_v<
iterator_traits<InputIteratorW>::value_type, double>

are true.

 Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements
(25.3.5.3). If \firstB == \lastB or ++\firstB == \lastB, let \( n = 1, w_0 = 1, b_0 = 0, \) \( b_1 = 1. \)
Otherwise, \([\firstB,\lastB]\) forms a sequence \( b \) of length \( n + 1, \) the length of the sequence \( w \) starting
from \firstW is at least \( n, \) and any \( w_k \) for \( k \geq n \) are ignored by the distribution.

Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.

template<class UnaryOperation>

.piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation \( \text{fw} \));

Mandates: \is_invocable_r_v<
double, UnaryOperation&, double> \( \text{true}. \)

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated
from the following values: If \( \text{bl}.\text{size}() < 2, \) let \( n = 1, w_0 = 1, b_0 = 0, \) \( b_1 = 1. \)
Otherwise, let \([\text{bl}.\text{begin}(),\text{bl}.\text{end}()]\) form a sequence \( b_0,\ldots,b_n, \) and let \( w_k = \text{fw}((b_{k+1} + b_k)/2) \) for \( k = 0,\ldots,n-1. \)

Complexity: The number of invocations of \( \text{fw} \) does not exceed \( n. \)

template<class UnaryOperation>

.piecewise_constant_distribution(size_t \( \text{nw} \), RealType \( \text{xmin} \), RealType \( \text{xmax} \), UnaryOperation \( \text{fw} \));

Mandates: \is_invocable_r_v<
double, UnaryOperation&, double> \( \text{true}. \)

 Preconditions: If \( \text{nw} = 0, \) let \( n = 1, \) otherwise let \( n = \text{nw}. \) The relation \( 0 < \delta = (\text{xmax} - \text{xmin})/n \) holds.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated
from the following values: Let \( b_k = \text{xmin} + k \cdot \delta \) for \( k = 0,\ldots,n, \) and \( w_k = \text{fw}(b_k + \delta/2) \) for \( k = 0,\ldots,n-1. \)

Complexity: The number of invocations of \( \text{fw} \) does not exceed \( n. \)

.vector<result_type> intervals();

Returns: A vector<result_type> whose size member returns \( n + 1 \) and whose \text{operator[]} member
returns \( b_k \) when invoked with argument \( k \) for \( k = 0,\ldots,n. \)

.vector<result_type> densities();

Returns: A vector<result_type> whose size member returns \( n \) and whose \text{operator[]} member
returns \( p_k \) when invoked with argument \( k \) for \( k = 0,\ldots,n-1. \)

28.5.9.6.3 Class template piecewise_linear_distribution [rand.dist.samp.plinear]

A piecewise_linear_distribution random number distribution produces random numbers \( x, \) \( b_0 \leq x < b_n, \)
distributed over each subinterval \([b_i, b_{i+1})\) according to the probability density function

\[
p(x|b_0,\ldots,b_n, \rho_0,\ldots,\rho_n) = \rho_i \cdot \frac{b_{i+1} - x}{b_{i+1} - b_i} + \rho_{i+1} \cdot \frac{x - b_i}{b_{i+1} - b_i}, \quad \text{for } b_i \leq x < b_{i+1}.
\]
The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution’s *interval boundaries*, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n - 1 \). Unless specified otherwise, the remaining \( n + 1 \) distribution parameters are calculated as \( \rho_k = w_k/S \) for \( k = 0, \ldots, n \), in which the values \( w_k \), commonly known as the *weights at boundaries*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

\[
0 < S = \frac{1}{2} \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).
\]

namespace std {

    template<class RealType = double>
    class piecewise_linear_distribution {
        public:
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            piecewise_linear_distribution();
            template<class InputIteratorB, class InputIteratorW>
                piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                                InputIteratorW firstW);
            template<class UnaryOperation>
                piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
            template<class UnaryOperation>
                piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
            explicit piecewise_linear_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const piecewise_linear_distribution& x,
                                   const piecewise_linear_distribution& y);

            // generating functions
            template<class URBG>
                result_type operator()(URBG& g);
            template<class URBG>
                result_type operator()(URBG& g, const param_type& parm);

            // property functions
            vector<result_type> intervals() const;
            vector<result_type> densities() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
                friend basic_ostream<charT, traits>&
                    operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
            template<class charT, class traits>
                friend basic_istream<charT, traits>&
                    operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
        }

    piecewise_linear_distribution();

    Effects: Constructs a piecewise_linear_distribution object with \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1 \).
template<class InputIteratorB, class InputIteratorW>
    piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                   InputIteratorW firstW);

    Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

    Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements
                   (25.3.5.3). If firstB == lastB or ++firstB == lastB, let n = 1, \( \rho_0 = \rho_1 = 1, b_0 = 0 \),
                   and \( b_1 = 1 \). Otherwise, \([\text{firstB},\text{lastB}]\) forms a sequence \( b \) of length \( n+1 \),
                   the length of the sequence \( w \) starting from firstW is at least \( n+1 \), and any \( w_k \) for \( k \geq n+1 \) are ignored by the distribution.

    Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.

template<class UnaryOperation>
    piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

    Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

    Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
             from the following values: If bl.size() < 2, let n = 1, \( \rho_0 = \rho_1 = 1, b_0 = 0 \), and \( b_1 = 1 \).
             Otherwise, let \([\text{bl.begin()},\text{bl.end()}]\) form a sequence \( b_0,\ldots,b_n \), and let \( w_k = \text{fw}(b_k) \) for \( k = 0,\ldots,n \).

    Complexity: The number of invocations of \( \text{fw} \) does not exceed \( n+1 \).

template<class UnaryOperation>
    piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

    Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

    Preconditions: If nw = 0, let n = 1, otherwise let n = nw. The relation \( 0 < \delta = (\text{xmax} - \text{xmin})/n \) holds.

    Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated
             from the following values: Let \( b_k = \text{xmin} + k \cdot \delta \) for \( k = 0,\ldots,n \), and \( w_k = \text{fw}(b_k) \) for \( k = 0,\ldots,n \).

    Complexity: The number of invocations of \( \text{fw} \) does not exceed \( n+1 \).

vector<result_type> intervals() const;

    Returns: A vector<result_type> whose size member returns \( n + 1 \) and whose operator[] member
             returns \( b_k \) when invoked with argument \( k \) for \( k = 0,\ldots,n \).

vector<result_type> densities() const;

    Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member
             returns \( \rho_k \) when invoked with argument \( k \) for \( k = 0,\ldots,n \).

28.5.10 Low-quality random number generation

[Note 1: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note]

    int rand();
    void srand(unsigned int seed);

    Effects: The rand and srand functions have the semantics specified in the C standard library.

    Remarks: The implementation may specify that particular library functions may call rand. It is
             implementation-defined whether the rand function may introduce data races (16.4.6.10).

[Note 2: The other random number generation facilities in this document (28.5) are often preferable to rand,
         because rand's underlying algorithm is unspecified. Use of rand therefore continues to be non-portable,
         with unpredictable and oft-questionable quality and performance. — end note]

template<class T> valarray<T> exp(const valarray<T>&);

template<class T> valarray<T> log(const valarray<T>&);

template<class T> valarray<T> log10(const valarray<T>&);
The header `<valarray>` defines five class templates (valarray, slice_array, gslice_array, mask_array, and indirect_array), two classes (slice and gslice), and a series of related function templates for representing and manipulating arrays of values.

The valarray array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

Any function returning a valarray<T> is permitted to return an object of another type, provided all the const member functions of valarray<T> are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.\(^{237}\)

Implementations introducing such replacement types shall provide additional functions and operators as follows:

\(1\) — for every function taking a const valarray<T>& other than begin and end (28.6.10), identical functions taking the replacement types shall be added;

\(2\) — for every function taking two const valarray<T>& arguments, identical functions taking every combination of const valarray<T>& and replacement types shall be added.

In particular, an implementation shall allow a valarray<T> to be constructed from such replacement types and shall allow assignments and compound assignments of such types to valarray<T>, slice_array<T>, gslice_array<T>, mask_array<T> and indirect_array<T> objects.

These library functions are permitted to throw a bad_alloc (17.7.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

### 28.6.2 Class template valarray

#### 28.6.2.1 Overview

namespace std {
   template<class T> class valarray {
      public:
         using value_type = T;

         // 28.6.2.2, construct/destroy
         valarray();
         explicit valarray(size_t);
         valarray(const T&, size_t);
         valarray(const T*, size_t);
         valarray(const valarray&);
         valarray(valarray&&) noexcept;
         valarray(const slice_array<T>&);
         valarray(const gslice_array<T>&);
         valarray(const mask_array<T>&);
         valarray(const indirect_array<T>&);
         valarray(initializer_list<T>);
         ~valarray();
   }
}

\(^{237}\) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.

cvalarray& operator^= (const valarray&);
cvalarray& operator|= (const valarray&);
cvalarray& operator&= (const valarray&);
cvalarray& operator<<=(const valarray&);
cvalarray& operator>>=(const valarray&);

// 28.6.2.8, member functions
void swap(valarray&) noexcept;

size_t size() const;
T sum() const;
T min() const;
T max() const;
valarray shift (int) const;
valarray cshift(int) const;
valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;
void resize(size_t sz, T c = T());
};

template<class T, size_t cnt> valarray(const T(&)[cnt], size_t) -> valarray<T>;
}

The class template valarray<T> is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type valarray<T> is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.238

28.6.2.2 Constructors  [valarray.cons]

valarray();
   Effects: Constructs a valarray that has zero length.239

explicit valarray(size_t n);
   Effects: Constructs a valarray that has length n. Each element of the array is value-initialized (9.4).

valarray(const T& v[, size_t n]);
   Effects: Constructs a valarray that has length n. Each element of the array is initialized with v.

valarray(const T* p[, size_t n]);
   Preconditions: [p, p + n) is a valid range.
   Effects: Constructs a valarray that has length n. The values of the elements of the array are initialized with the first n values pointed to by the first argument.240

valarray(const valarray& v);
   Effects: Constructs a valarray that has the same length as v. The elements are initialized with the values of the corresponding elements of v.241

valarray(valarray&& v) noexcept;
   Effects: Constructs a valarray that has the same length as v. The elements are initialized with the values of the corresponding elements of v.
   Complexity: Constant.

valarray(initializer_list<T> il);
   Effects: Equivalent to valarray(il.begin(), il.size()).

valarray(const slice_array<T>&);
valarray(const gslice_array<T>&);
valarray(const mask_array<T>&);
valarray(const indirect_array<T>&);

These conversion constructors convert one of the four reference templates to a valarray.

~valarray();
   Effects: The destructor is applied to every element of *this; an implementation may return all allocated memory.

---

238) The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the valarray template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

239) This default constructor is essential, since arrays of valarray can be useful. After initialization, the length of an empty array can be increased with the resize member function.

240) This constructor is the preferred method for converting a C array to a valarray object.

241) This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.
28.6.2.3 Assignment

valarray& operator=(const valarray& v);

Effects: Each element of the \*this array is assigned the value of the corresponding element of v. If the length of v is not equal to the length of \*this, resizes \*this to make the two arrays the same length, as if by calling resize(v.size()), before performing the assignment.

Postconditions: size() == v.size().

Returns: \*this.

valarray& operator=(valarray&& v) noexcept;

Effects: \*this obtains the value of v. The value of v after the assignment is not specified.

Returns: \*this.

Complexity: Linear.

valarray& operator=(initializer_list<T> il);

Effects: Equivalent to: return \*this = valarray(il);

valarray& operator=(const T& v);

Effects: Assigns v to each element of \*this.

Returns: \*this.

valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

Preconditions: The length of the array to which the argument refers equals size(). The value of an element in the left-hand side of a valarray assignment operator does not depend on the value of another element in that left-hand side.

These operators allow the results of a generalized subscripting operation to be assigned directly to a valarray.

28.6.2.4 Element access

const T& operator[](size_t n) const;
T& operator[](size_t n);

Preconditions: n < size() is true.

Returns: A reference to the corresponding element of the array.

[Note 1: The expression (a[i] == q, a[i]) == q evaluates to true for any non-constant valarray<T> a, any T q, and for any size_t i such that the value of i is less than the length of a. — end note]

Remarks: The expression addressof(a[i+j]) == addressof(a[i]) + j evaluates to true for all size_t i and size_t j such that i+j < a.size().

The expression addressof(a[i]) != addressof(b[j]) evaluates to true for any two arrays a and b and for any size_t i and size_t j such that i < a.size() and j < b.size().

[Note 2: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from operator new, and other techniques to generate efficient valarrays. — end note]

The reference returned by the subscript operator for an array shall be valid until the member function resize(size_t, T) (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

28.6.2.5 Subset operations

The member operator[] is overloaded to provide several ways to select sequences of elements from among those controlled by \*this. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new valarray object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of operator=
and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

valarray operator[](slice slicearr) const;

2 Returns: A valarray containing those elements of the controlled sequence designated by slicearr.

[Example 1:]
const valarray<char> v0("abcdefghijklmnop", 16);
// v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
—end example]

slice_array<T> operator[](slice slicearr);

3 Returns: An object that holds references to elements of the controlled sequence selected by slicearr.

[Example 2:]
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
v0[slice(2, 5, 3)] = v1;
// v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
—end example]

valarray operator[](const gslice& gslicearr) const;

4 Returns: A valarray containing those elements of the controlled sequence designated by gslicearr.

[Example 3:]
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
// v0[gslice(3, len, str)] returns
// valarray<char>("dfhkmo", 6)
—end example]

gslice_array<T> operator[](const gslice& gslicearr);

5 Returns: An object that holds references to elements of the controlled sequence selected by gslicearr.

[Example 4:]
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDEFG", 6);
const size_t lv[] = { 2, 3 };
const size_t dv[] = { 7, 2 };
const valarray<size_t> len(lv, 2), str(dv, 2);
v0[gslice(3, len, str)] = v1;
// v0 == valarray<char>("abcAeBghCijDlEnFp", 16)
—end example]

valarray operator[](const valarray<bool>& boolarr) const;

6 Returns: A valarray containing those elements of the controlled sequence designated by boolarr.

[Example 5:]
const valarray<char> v0("abcdefghijklmnop", 16);
const bool vb[] = { false, false, true, true, false, true };
// v0[valarray<bool>(vb, 6)] returns
// valarray<char>("cdf", 3)
—end example]

mask_array<T> operator[](const valarray<bool>& boolarr);

7 Returns: An object that holds references to elements of the controlled sequence selected by boolarr.

[Example 6:]
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<bool>(vb, 6)] = v1;
// v0 == valarray<char>("abABeCghijklmnop", 16)
— end example

valarray operator[](const valarray<size_t>& indarr) const;
8
Returns: A valarray containing those elements of the controlled sequence designated by indarr.
[Example 7:
const valarray<char> v0("abcdefghijklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<size_t>(vi, 5)] returns
// valarray<char>("hfcdi", 5)
— end example]

indirect_array<T> operator[](const valarray<size_t>& indarr);
9
Returns: An object that holds references to elements of the controlled sequence selected by indarr.
[Example 8:
valarray<char> v0("abcdefghijklmnop", 16);
valarray<char> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<size_t>(vi, 5)] = v1;
// v0 == valarray<char>("abCDeBgAEjklmnop", 16)
— end example]

28.6.2.6 Unary operators  
valarray operator+() const;
valarray operator-() const;
valarray operator~() const;
valarray<bool> operator!() const;
1
Mandates: The indicated operator can be applied to operands of type T and returns a value of type T (bool for operator!) or which may be unambiguously implicitly converted to type T (bool for operator!).
2
Returns: A valarray whose length is size(). Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

28.6.2.7 Compound assignment
valarray& operator*= (const valarray& v);
valarray& operator/=(const valarray& v);
valarray& operator%=(const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-=(const valarray& v);
valarray& operator^=(const valarray& v);
valarray& operator&=(const valarray& v);
valarray& operator|=(const valarray& v);
valarray& operator<<=(const valarray& v);
valarray& operator>>=(const valarray& v);
1
Mandates: The indicated operator can be applied to two operands of type T.
2
Preconditions: size() == v.size() is true.
The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.
3
Effects: Each of these operators performs the indicated operation on each of the elements of *this and the corresponding element of v.
4
Returns: *this.
Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

valarray& operator**( const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator%= (const T& v);
valarray& operator|= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|=(const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);

Mandates: The indicated operator can be applied to two operands of type T.

Effects: Each of these operators applies the indicated operation to each element of *this and v.

Returns: *this

Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

28.6.2.8 Member functions

valarray shift(int n) const;

Returns: A valarray of length size(), each of whose elements I is (*this)[I + n] if I + n is non-negative and less than size(), otherwise T().

[Note 1: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. — end note]

[Example 1: If the argument has the value −2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of *this; etc. — end example]
valarray cshift(int n) const;

Returns: A valarray of length size() that is a circular shift of this. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right −n places.

valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;

Returns: A valarray whose length is size(). Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of this.

void resize(size_t sz, T c = T());

Effects: Changes the length of the this array to sz and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

28.6.3 valarray non-member operations

28.6.3.1 Binary operators

template<class T> valarray<T> operator* (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator/ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator% (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator+ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator- (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator^ (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator& (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator| (const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator<<(const valarray<T>&, const valarray<T>&);
template<class T> valarray<T> operator>>(const valarray<T>&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Preconditions: The argument arrays have the same length.

Returns: A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
Mandates: The indicated operator can be applied to operands of type `T` and returns a value of type `T` or which can be unambiguously implicitly converted to `T`.

Returns: A `valarray` whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

### 28.6.3.2 Logical operators [valarray.comparison]

Mandates: The indicated operator can be applied to operands of type `T` and returns a value of type `bool` or which can be unambiguously implicitly converted to `bool`.

Preconditions: The two array arguments have the same length.

Returns: A `valarray<bool>` whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
template<class T> valarray<bool> operator&&(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.

Returns: A valarray<bool> whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

28.6.3.3 Transcendentals

Mandates: A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

28.6.3.4 Specialized algorithms

Effects: Equivalent to x.swap(y).

28.6.4 Class slice

28.6.4.1 Overview
The slice class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.\(^{242}\)

### 28.6.4.2 Constructors

slice();
slice(size_t start, size_t length, size_t stride);

The default constructor is equivalent to slice(0, 0, 0). A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

[Example 1: slice(3, 8, 2) constructs a slice which selects elements 3, 5, 7, ..., 17 from an array. — end example]

### 28.6.4.3 Access functions

size_t start() const;
size_t size() const;
size_t stride() const;

Returns: The start, length, or stride specified by a slice object.

Complexity: Constant time.

### 28.6.4.4 Operators

friend bool operator==(const slice& x, const slice& y);

Effects: Equivalent to:

```
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

### 28.6.5 Class template slice_array

#### 28.6.5.1 Overview

namespace std {
  template<class T> class slice_array {
    public:
      using value_type = T;
      
      void operator= (const valarray<T>&) const;
      void operator*= (const valarray<T>&) const;
      void operator/= (const valarray<T>&) const;
      void operator%= (const valarray<T>&) const;
      void operator+= (const valarray<T>&) const;
      void operator-= (const valarray<T>&) const;
      void operator^= (const valarray<T>&) const;
      void operator&= (const valarray<T>&) const;
      void operator|= (const valarray<T>&) const;
      void operator<<= (const valarray<T>&) const;
      void operator>>= (const valarray<T>&) const;
      
      slice_array(const slice_array&);
      ~slice_array();
      const slice_array& operator=(const slice_array&); const;
      void operator=(const T&); const;
      
      slice_array() = delete; // as implied by declaring copy constructor above
  };
}

This template is a helper template used by the slice subscript operator

```
slice_array<T> valarray<T>::operator[](slice);
```
It has reference semantics to a subset of an array specified by a slice object.

[Example 1: The expression \( a[\text{slice}(1, 5, 3)] = b \); has the effect of assigning the elements of \( b \) to a slice of the elements in \( a \). For the slice shown, the elements selected from \( a \) are \( 1, 4, \ldots, 13 \). — end example]

### 28.6.5.2 Assignment

```cpp
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
```

1. These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `slice_array` object refers.

### 28.6.5.3 Compound assignment

```cpp
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator<<= (const valarray<T>&) const;
void operator>>= (const valarray<T>&) const;
```

1. These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `slice_array` object refers.

### 28.6.5.4 Fill function

```cpp
void operator=(const T&) const;
```

1. This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `slice_array` object refers.

### 28.6.6 The gslice class

#### 28.6.6.1 Overview

```cpp
namespace std {
  class gslice {
    public:
      gslice();
      gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

      size_t start() const;
      valarray<size_t> size() const;
      valarray<size_t> stride() const;
  }
}
```

1. This class represents a generalized slice out of an array. A `gslice` is defined by a starting offset \( s \), a set of lengths \( l_j \), and a set of strides \( d_j \). The number of lengths shall equal the number of strides.

2. A `gslice` represents a mapping from a set of indices \( i_j \), equal in number to the number of strides, to a single index \( k \). It is useful for building multidimensional array classes using the `valarray` template, which is one-dimensional. The set of one-dimensional index values specified by a `gslice` are

\[
k = s + \sum_j i_j d_j
\]

where the multidimensional indices \( i_j \) range in value from 0 to \( l_j - 1 \).

[Example 1: The `gslice` specification

```cpp
start = 3
length = {2, 4, 3}
stride = {19, 4, 1}
```]
yields the sequence of one-dimensional indices

\[ k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1 \]

which are ordered as shown in the following table:

\[
\begin{align*}
(i_0, i_1, i_2, k) &= \\
(0, 0, 0, 3), \\
(0, 0, 1, 4), \\
(0, 0, 2, 5), \\
(0, 1, 0, 7), \\
(0, 1, 1, 8), \\
(0, 1, 2, 9), \\
(0, 2, 0, 11), \\
(0, 2, 1, 12), \\
(0, 2, 2, 13), \\
(0, 3, 0, 15), \\
(0, 3, 1, 16), \\
(0, 3, 2, 17), \\
(1, 0, 0, 22), \\
(1, 0, 1, 23), \\
\ldots \\
(1, 3, 2, 36)
\end{align*}
\]

That is, the highest-ordered index turns fastest. —end example]  

4 It is possible to have degenerate generalized slices in which an address is repeated.  

5 [Example 2: If the stride parameters in the previous example are changed to \( \{1, 1, 1\} \), the first few elements of the resulting sequence of indices will be

\[
\begin{align*}
(0, 0, 0, 3), \\
(0, 0, 1, 4), \\
(0, 0, 2, 5), \\
(0, 1, 0, 4), \\
(0, 1, 1, 5), \\
(0, 1, 2, 6), \\
\ldots
\end{align*}
\]

—end example]

6 If a degenerate slice is used as the argument to the non-\texttt{const} version of \texttt{operator[]} (\texttt{const gslice&}), the behavior is undefined.

28.6.6.2 Constructors

\texttt{gslice();
gslice(size_t start, const valarray<size_t>& lengths,
const valarray<size_t>& strides);}

1 The default constructor is equivalent to \texttt{gslice(0, valarray<size_t>(), valarray<size_t>())}. The constructor with arguments builds a \texttt{gslice} based on a specification of start, lengths, and strides, as explained in the previous subclause.

28.6.6.3 Access functions

\texttt{size_t start() const;
valarray<size_t> size() const;
valarray<size_t> stride() const;

1 Returns: The representation of the start, lengths, or strides specified for the \texttt{gslice}.

2 Complexity: \texttt{start()} is constant time. \texttt{size()} and \texttt{stride()} are linear in the number of strides.}
28.6.7 Class template gslice_array

28.6.7.1 Overview

namespace std {
    template<class T> class gslice_array {
        public:
            using value_type = T;

            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%= (const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^= (const valarray<T>&) const;
            void operator&= (const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>==(const valarray<T>&) const;
        };
    }

    gslice_array(const gslice_array&);
    ~gslice_array();
    const gslice_array& operator=(const gslice_array&) const;
    void operator=(const T&) const;
    gslice_array() = delete;     // as implied by declaring copy constructor above
    
};

1 This template is a helper template used by the gslice subscript operator
gslice_array<T> valarray<T>::operator[](const gslice&);

2 It has reference semantics to a subset of an array specified by a gslice object. Thus, the expression
   a[gslice(1, length, stride)] = b has the effect of assigning the elements of b to a generalized slice of
   the elements in a.

28.6.7.2 Assignment

void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array
elements to selected elements of the valarray<T> object to which the gslice_array refers.

28.6.7.3 Compound assignment

void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements
of the argument array and selected elements of the valarray<T> object to which the gslice_array object refers.

28.6.7.4 Fill function

void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the
valarray<T> object to which the gslice_array object refers.
28.6.8 Class template mask_array

28.6.8.1 Overview

namespace std {
    template<class T> class mask_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;

        mask_array(const mask_array&);
        ~mask_array();
        const mask_array& operator=(const mask_array&) const;
        void operator=(const T&) const;

        mask_array() = delete;  // as implied by declaring copy constructor above
    }
}

1 This template is a helper template used by the mask subscript operator:

    mask_array<T> valarray<T>::operator[](const valarray<bool>&);

2 It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression a[mask] = b; has the effect of assigning the elements of b to the masked elements in a (those for which the corresponding element in mask is true).

28.6.8.2 Assignment

void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which the mask_array object refers.

28.6.8.3 Compound assignment

void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the mask_array object refers.

28.6.8.4 Fill function

void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the mask_array object refers.
28.6.9 Class template indirect_array

28.6.9.1 Overview

namespace std {
    template<class T>
    class indirect_array {
    public:
        using value_type = T;

        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;

        indirect_array(const indirect_array&);
        ~indirect_array();
        const indirect_array& operator=(const indirect_array&) const;
        void operator=(const T&) const;
        indirect_array() = delete; // as implied by declaring copy constructor above
    };

1 This template is a helper template used by the indirect subscript operator
   indirect_array<T> valarray<T>::operator[] (const valarray<size_t>&);

2 It has reference semantics to a subset of an array specified by an indirect_array. Thus, the expression
   a[indirect] = b;
   has the effect of assigning the elements of b to the elements in a whose indices appear in indirect.

28.6.9.2 Assignment

void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;

1 These assignment operators have reference semantics, assigning the values of the argument array
   elements to selected elements of the valarray<T> object to which it refers.

2 If the indirect_array specifies an element in the valarray<T> object to which it refers more than
   once, the behavior is undefined.

3 [Example 1:]
   int addr[] = {2, 3, 1, 4, 4};
   valarray<size_t> indirect(addr, 5);
   valarray<double> a(0., 10), b(1., 5);
   a[indirect] = b;
   results in undefined behavior since element 4 is specified twice in the indirection. — end example]

28.6.9.3 Compound assignment

void operator==(const valarray<T>&) const;
void operator==(const indirect_array&) const;
void operator!=(const valarray<T>&) const;
void operator!=(const indirect_array&) const;
void operator==(const valarray<T>&) const;
void operator==(const indirect_array&) const;
void operator<(const valarray<T>&) const;
void operator<(const indirect_array&) const;
void operator<<(const valarray<T>&) const;

void operator>>(const valarray<T>&) const;

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the valarray<T> object to which the indirect_array object refers.

2 If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

28.6.9.4 Fill function
void operator=(const T&) const;

1 This function has reference semantics, assigning the value of its argument to the elements of the valarray<T> object to which the indirect_array object refers.

28.6.10 valarray range access
In the begin and end function templates that follow, unspecified1 is a type that meets the requirements of a mutable Cpp17RandomAccessIterator (25.3.5.7) and models contiguous_iterator (25.3.4.14), whose value_type is the template parameter T and whose reference type is T&. unspecified2 is a type that meets the requirements of a constant Cpp17RandomAccessIterator and models contiguous_iterator, whose value_type is the template parameter T and whose reference type is const T&.

2 The iterators returned by begin and end for an array are guaranteed to be valid until the member function resize(size_t, T) (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified1 begin(const valarray<T>& v);
3 Returns: An iterator referencing the first value in the array.

template<class T> unspecified2 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);

4 Returns: An iterator referencing one past the last value in the array.

float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);

1 The contents and meaning of the header `<cmath>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.

[Note 1: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — end note]

2 For each function with at least one parameter of type `floating-point-type`, the implementation provides an overload for each cv-unqualified floating-point type (6.8.2) where all uses of `floating-point-type` in the function signature are replaced with that floating-point type.

3 For each function with at least one parameter of type `floating-point-type` other than `abs`, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a `floating-point-type` parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of

§ 28.7.1 1449
all such arguments, where arguments of integer type are considered to have the same floating-point conversion
rank as `double`. If no such floating-point type with the greatest rank and subrank exists, then overload
resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

**SEE ALSO:** ISO C 7.12

### 28.7.2 Absolute values

**[c.math.abs]**

1 Note 1: The headers `<cstdlib>` (17.2.2) and `<cmath>` (28.7.1) declare the functions described in this subclause.

```cpp
constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);
```

2 **Effects:** These functions have the semantics specified in the C standard library for the functions `abs`,
`labs`, and `llabs`, respectively.

3 **Remarks:** If `abs` is called with an argument of type `X` for which `is_unsigned_v<X>` is `true` and if `X`
cannot be converted to `int` by integral promotion (7.3.7), the program is ill-formed.

[Note 2: Arguments that can be promoted to `int` are permitted for compatibility with C. — end note]

```cpp
constexpr floating-point-type abs(floating-point-type x);
```

4 **Returns:** The absolute value of `x`.

**SEE ALSO:** ISO C 7.12.7.2, 7.22.6.1

### 28.7.3 Three-dimensional hypotenuse

**[c.math.hypot3]**

```cpp
floating-point-type hypot(floating-point-type x, floating-point-type y, double z);
```

1 **Returns:** \( \sqrt{x^2 + y^2 + z^2} \).

### 28.7.4 Linear interpolation

**[c.math.lerp]**

```cpp
constexpr floating-point-type lerp(floating-point-type a, floating-point-type b, floating-point-type t) noexcept;
```

1 **Returns:** \( a + t(b-a) \).

2 **Remarks:** Let \( r \) be the value returned. If `isfinite(a)` && `isfinite(b)`, then:

(2.1) — If \( t == 0 \), then \( r == a \).

(2.2) — If \( t == 1 \), then \( r == b \).

(2.3) — If \( t >= 0 \) && \( t <= 1 \), then `isfinite(r)`.

(2.4) — If `isfinite(t)` && `a == b`, then \( r == a \).

(2.5) — If `isfinite(t)` \&\& `!isnan(t)` && `b-a != 0`, then `!isnan(r)`.

Let \( CMP(x,y) \) be 1 if \( x > y \), -1 if \( x < y \), and 0 otherwise. For any \( t1 \) and \( t2 \), the product of
\( CMP(lerp(a, b, t2), lerp(a, b, t1)) \), \( CMP(t2, t1) \), and \( CMP(b, a) \) is non-negative.

### 28.7.5 Classification / comparison functions

**[c.math.fpclass]**

1 The classification / comparison functions behave the same as the C macros with the corresponding names
defined in the C standard library.

**SEE ALSO:** ISO C 7.12.3, 7.12.4

### 28.7.6 Mathematical special functions

**[sf.cmath]**

#### 28.7.6.1 General

**[sf.cmath.general]**

1 If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall
return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for
just those argument values for which:

(1.1) — the function description’s **Returns:** element explicitly specifies a domain and those argument values fall
outside the specified domain, or

(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or
Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

28.7.6.2 Associated Laguerre polynomials

\[
\text{assoc\_laguerre}(\text{unsigned } n, \text{unsigned } m, \text{floating-point-type } x);
\]
\[
\text{assoc\_laguerref}(\text{unsigned } n, \text{unsigned } m, \text{float } x);
\]
\[
\text{assoc\_laguerrel}(\text{unsigned } n, \text{unsigned } m, \text{long double } x);
\]

1. **Effects**: These functions compute the associated Laguerre polynomials of their respective arguments \(n\), \(m\), and \(x\).

2. **Returns**:

\[
L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x), \quad \text{for } x \geq 0,
\]

where \(n\) is \(n\), \(m\) is \(m\), and \(x\) is \(x\).

3. **Remarks**: The effect of calling each of these functions is implementation-defined if \(n \geq 128\) or if \(m \geq 128\).

28.7.6.3 Associated Legendre functions

\[
\text{assoc\_legendre}(\text{unsigned } l, \text{unsigned } m, \text{floating-point-type } x);
\]
\[
\text{assoc\_legendref}(\text{unsigned } l, \text{unsigned } m, \text{float } x);
\]
\[
\text{assoc\_legendrel}(\text{unsigned } l, \text{unsigned } m, \text{long double } x);
\]

1. **Effects**: These functions compute the associated Legendre functions of their respective arguments \(l\), \(m\), and \(x\).

2. **Returns**:

\[
P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x), \quad \text{for } |x| \leq 1,
\]

where \(l\) is \(l\), \(m\) is \(m\), and \(x\) is \(x\).

3. **Remarks**: The effect of calling each of these functions is implementation-defined if \(l \geq 128\).

28.7.6.4 Beta function

\[
\text{beta}(\text{floating-point-type } x, \text{floating-point-type } y);
\]
\[
\text{betaf}(\text{float } x, \text{float } y);
\]
\[
\text{betal}(\text{long double } x, \text{long double } y);
\]

1. **Effects**: These functions compute the beta function of their respective arguments \(x\) and \(y\).

2. **Returns**:

\[
\beta(x,y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)}, \quad \text{for } x > 0, \ y > 0,
\]

where \(x\) is \(x\) and \(y\) is \(y\).

28.7.6.5 Complete elliptic integral of the first kind

\[
\text{comp\_ellint\_1}(\text{floating-point-type } k);
\]
\[
\text{comp\_ellint\_lf}(\text{float } k);
\]
\[
\text{comp\_ellint\_ll}(\text{long double } k);
\]

1. **Effects**: These functions compute the complete elliptic integral of the first kind of their respective arguments \(k\).

2. **Returns**:

\[
K(k) = F(k, \pi/2), \quad \text{for } |k| \leq 1,
\]

where \(k\) is \(k\).

3. See also 28.7.6.12.

---

243 A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.
28.7.6.6 Complete elliptic integral of the second kind

\texttt{floating-point-type \texttt{comp_ellint_2}(\texttt{floating-point-type k});}
\texttt{float \texttt{comp_ellint_2f(float k);} }
\texttt{long double \texttt{comp_ellint_2l(long double k);}}

1. \textit{Effects}: These functions compute the complete elliptic integral of the second kind of their respective arguments \(k\).
2. \textit{Returns}:
   \[ E(k) = E(k, \pi/2), \quad \text{for } |k| \leq 1, \]
   where \(k\) is \(k\).
3. See also 28.7.6.13.

28.7.6.7 Complete elliptic integral of the third kind

\texttt{floating-point-type \texttt{comp_ellint_3}(\texttt{floating-point-type k, floating-point-type nu);}
\texttt{float \texttt{comp_ellint_3f(float k, float nu);} }
\texttt{long double \texttt{comp_ellint_3l(long double k, long double nu);}}

1. \textit{Effects}: These functions compute the complete elliptic integral of the third kind of their respective arguments \(k\) and \(\nu\).
2. \textit{Returns}:
   \[ \Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for } |k| \leq 1, \]
   where \(k\) is \(k\) and \(\nu\) is \(\nu\).
3. See also 28.7.6.14.

28.7.6.8 Regular modified cylindrical Bessel functions

\texttt{floating-point-type \texttt{cyl_bessel_i}(\texttt{floating-point-type nu, floating-point-type x);}
\texttt{float \texttt{cyl_bessel_if(float nu, float x);} }
\texttt{long double \texttt{cyl_bessel_il(long double nu, long double x);}}

1. \textit{Effects}: These functions compute the regular modified cylindrical Bessel functions of their respective arguments \(\nu\) and \(x\).
2. \textit{Returns}:
   \[ I_\nu(x) = i^{-\nu}J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0, \]
   where \(\nu\) is \(\nu\) and \(x\) is \(x\).
3. \textit{Remarks}: The effect of calling each of these functions is implementation-defined if \(\nu \geq 128\).
4. See also 28.7.6.9.

28.7.6.9 Cylindrical Bessel functions of the first kind

\texttt{floating-point-type \texttt{cyl_bessel_j}(\texttt{floating-point-type nu, floating-point-type x);}
\texttt{float \texttt{cyl_bessel_jf(float nu, float x);} }
\texttt{long double \texttt{cyl_bessel_jl(long double nu, long double x);}}

1. \textit{Effects}: These functions compute the cylindrical Bessel functions of the first kind of their respective arguments \(\nu\) and \(x\).
2. \textit{Returns}:
   \[ J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for } x \geq 0, \]
   where \(\nu\) is \(\nu\) and \(x\) is \(x\).
3. \textit{Remarks}: The effect of calling each of these functions is implementation-defined if \(\nu \geq 128\).
28.7.6.10 Irregular modified cylindrical Bessel functions

floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float    cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);

1 Effects: These functions compute the irregular modified cylindrical Bessel functions of their respective arguments \( \text{nu} \) and \( \text{x} \).

2 Returns:

\[
K_\nu(x) = \frac{(\pi/2)^{\nu+1}}{\sin \nu \pi} (J_\nu(ix) + iN_\nu(ix)) = \begin{cases} 
\frac{\pi}{2} \frac{1_{-\nu}(x) - 1_{\nu}(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\
\frac{\pi}{2} \lim_{\mu \to \nu} \frac{1_{-\nu}(x) - 1_{\nu}(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu
\end{cases}
\]

where \( \nu \) is \( \text{nu} \) and \( \text{x} \) is \( \text{x} \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( \text{nu} \geq 128 \).

See also 28.7.6.8, 28.7.6.9, 28.7.6.11.

28.7.6.11 Cylindrical Neumann functions

floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float    cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);

1 Effects: These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments \( \text{nu} \) and \( \text{x} \).

2 Returns:

\[
N_\nu(x) = \begin{cases} 
\frac{J_\nu(x) \cos \nu \pi - J_{-\nu}(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\
\lim_{\mu \to \nu} \frac{J_\mu(x) \cos \mu \pi - J_{-\mu}(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu
\end{cases}
\]

where \( \nu \) is \( \text{nu} \) and \( \text{x} \) is \( \text{x} \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( \text{nu} \geq 128 \).

See also 28.7.6.9.

28.7.6.12 Incomplete elliptic integral of the first kind

floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float    ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);

1 Effects: These functions compute the incomplete elliptic integral of the first kind of their respective arguments \( k \) and \( \phi \) (\( \phi \) measured in radians).

2 Returns:

\[
F(k, \phi) = \int_0^\phi \frac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,
\]

where \( k \) is \( k \) and \( \phi \) is \( \phi \).

28.7.6.13 Incomplete elliptic integral of the second kind

floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float    ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);

1 Effects: These functions compute the incomplete elliptic integral of the second kind of their respective arguments \( k \) and \( \phi \) (\( \phi \) measured in radians).

2 Returns:

\[
E(k, \phi) = \int_0^\phi \sqrt{1 - k^2 \sin^2 \theta} d\theta, \text{ for } |k| \leq 1,
\]

where \( k \) is \( k \) and \( \phi \) is \( \phi \).
28.7.6.14 Incomplete elliptic integral of the third kind

floating-point-type ellint_3(floating-point-type k, floating-point-type nu, floating-point-type phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);

1 Effects: These functions compute the incomplete elliptic integral of the third kind of their respective arguments k, nu, and phi (phi measured in radians).

2 Returns:

\[ \Pi(\nu, k, \phi) = \int_{0}^{\phi} \frac{d\theta}{(1 - \nu \sin^2 \theta)\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1, \]
where \( \nu \) is nu, \( k \) is k, and \( \phi \) is phi.

28.7.6.15 Exponential integral

floating-point-type expint(floating-point-type x);
float expintf(float x);
long double expintl(long double x);

1 Effects: These functions compute the exponential integral of their respective arguments \( x \).

2 Returns:

\[ \text{Ei}(x) = -\int_{-x}^{\infty} \frac{e^{-t}}{t} dt \]

where \( x \) is \( x \).

28.7.6.16 Hermite polynomials

floating-point-type hermite(unsigned n, floating-point-type x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);

1 Effects: These functions compute the Hermite polynomials of their respective arguments \( n \) and \( x \).

2 Returns:

\[ H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} \]

where \( n \) is \( n \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

28.7.6.17 Laguerre polynomials

floating-point-type laguerre(unsigned n, floating-point-type x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);

1 Effects: These functions compute the Laguerre polynomials of their respective arguments \( n \) and \( x \).

2 Returns:

\[ L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}) \], for \( x \geq 0 \),

where \( n \) is \( n \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( n >= 128 \).

28.7.6.18 Legendre polynomials

floating-point-type legendre(unsigned l, floating-point-type x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);

1 Effects: These functions compute the Legendre polynomials of their respective arguments \( l \) and \( x \).

2 Returns:

\[ P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l \], for \( |x| \leq 1 \),

where \( l \) is \( l \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( l >= 128 \).
28.7.6.19 Riemann zeta function

```c
floating-point-type riemann_zeta(floating-point-type x);
float riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

**Effects:** These functions compute the Riemann zeta function of their respective arguments \( x \).

\[
\zeta(x) = \begin{cases} 
\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\
\frac{1}{1-2^{-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\
2^x \pi^{x-1} \sin\left(\frac{\pi x}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0
\end{cases}
\]

where \( x \) is \( x \).

28.7.6.20 Spherical Bessel functions of the first kind

```c
floating-point-type sph_bessel(unsigned n, floating-point-type x);
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Bessel functions of the first kind of their respective arguments \( n \) and \( x \).

\[
j_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} J_{n+1/2}(x), \quad \text{for } x \geq 0,
\]

where \( n \) is \( n \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

See also 28.7.6.9.

28.7.6.21 Spherical associated Legendre functions

```c
floating-point-type sph_legendre(unsigned l, unsigned m, floating-point-type theta);
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

**Effects:** These functions compute the spherical associated Legendre functions of their respective arguments \( l, m \), and \( \theta \) (\( \theta \) measured in radians).

\[
Y_{l, m}^m(\theta, \phi) = (-1)^m \left[ \frac{(2l + 1)(l - m)!}{4\pi (l + m)!} \right]^{1/2} P_{l, m}^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq l,
\]

where

\[
Y_{l, m}^m(\theta, \phi) = (-1)^m \left[ \frac{(2l + 1)(l - m)!}{4\pi (l + m)!} \right]^{1/2} P_{l, m}^m(\cos \theta) e^{im\phi}, \quad \text{for } |m| \leq l,
\]

and \( l \) is \( l \), \( m \) is \( m \), and \( \theta \) is \( \theta \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

See also 28.7.6.3.

28.7.6.22 Spherical Neumann functions

```c
floating-point-type sph_neumann(unsigned n, floating-point-type x);
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

**Effects:** These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments \( n \) and \( x \).

\[
n_n(x) = \left(\frac{\pi}{2x}\right)^{1/2} N_{n+1/2}(x), \quad \text{for } x \geq 0,
\]
where $n$ is $n$ and $x$ is $x$.

Remarks: The effect of calling each of these functions is implementation-defined if $n \geq 128$.

See also 28.7.6.11.

28.8 Numbers

28.8.1 Header <numbers> synopsis

```cpp

}
```

28.8.2 Mathematical constants

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of $e$, $\log_2 e$, $\log_{10} e$, $\pi$, $\frac{1}{\sqrt{2}}$, $\frac{1}{\sqrt{3}}$, $\ln 2$, $\ln 10$, $\sqrt{2}$, $\sqrt{3}$, $\frac{1}{\sqrt{2}}$, the Euler-Mascheroni $\gamma$ constant, and the golden ratio $\phi$ constant $\frac{1+\sqrt{5}}{2}$, respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.
29 Time library

29.1 General

This Clause describes the chrono library (29.2) and various C functions (29.14) that provide generally useful
time utilities, as summarized in Table 99.

constexpr chrono::seconds operator"s(unsigned long long);
constexpr chrono::duration<unspecified> operator"s(long double);
constexpr chrono::milliseconds operator"ms(unsigned long long);
constexpr chrono::duration<unspecified, milli> operator"ms(long double);
```cpp
constexpr chrono::microseconds operator"us(unsigned long long);
constexpr chrono::duration<unspecified, micro> operator"us(long double);

constexpr chrono::nanoseconds operator"ns(unsigned long long);
constexpr chrono::duration<unspecified, nano> operator"ns(long double);

// 29.8.3.3, non-member functions
constexpr chrono::day operator"d(unsigned long long) noexcept;

// 29.8.5.3, non-member functions
constexpr chrono::year operator"y(unsigned long long) noexcept;
```
29.4 Time-related traits
29.4.1 treat_as_floating_point

```cpp
template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> {
};
```

The `duration` template uses the `treat_as_floating_point` trait to help determine if a `duration` object can be converted to another `duration` with a different tick period. If `treat_as_floating_point_v<Rep>` is true, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations.

[Note 1: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If `treat_as_floating_point_v<Rep>` is false, `Rep` will be treated as if it behaved like an integral type for the purpose of these conversions. — end note]

29.4.2 duration_values

```cpp
template<class Rep>
struct duration_values {
    public:
        static constexpr Rep zero() noexcept;
        static constexpr Rep min() noexcept;
        static constexpr Rep max() noexcept;
};
```

The `duration` template uses the `duration_values` trait to construct special values of the duration’s representation (`Rep`). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize `duration_values` to return the indicated values.

```cpp
static constexpr Rep zero() noexcept;
```

Returns: `Rep(0)`.

[Note 1: `Rep(0)` is specified instead of `Rep()` because `Rep()` can have some other meaning, such as an uninitialized value. — end note]

Remarks: The value returned shall be the additive identity.

```cpp
static constexpr Rep min() noexcept;
```

Returns: `numeric_limits<Rep>::lowest()`.

Remarks: The value returned shall compare less than or equal to `zero()`.

```cpp
static constexpr Rep max() noexcept;
```

Returns: `numeric_limits<Rep>::max()`.

Remarks: The value returned shall compare greater than `zero()`.

29.4.3 Specializations of common_type

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
    using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};
```

The period of the `duration` indicated by this specialization of `common_type` is the greatest common divisor of `Period1` and `Period2`.

[Note 1: This can be computed by forming a ratio of the greatest common divisor of `Period1::num` and `Period2::num` and the least common multiple of `Period1::den` and `Period2::den`. — end note]

[Note 2: The typedef name `type` is a synonym for the `duration` with the largest tick period possible where both `duration` arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. — end note]

```cpp
template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
    using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
};
```
The common type of two \texttt{time_point} types is a \texttt{time_point} with the same clock as the two types and the common type of their two \texttt{duration}s.

29.4.4 Class template \texttt{is\_clock} \hfill [time.traits.is\_clock]

\texttt{is\_clock} is a \texttt{Cpp17UnaryTypeTrait} (21.3.2) with a base characteristic of \texttt{true\_type} if \texttt{T} meets the \texttt{Cpp17Clock} requirements (29.3), otherwise \texttt{false\_type}. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the \texttt{Cpp17Clock} requirements is unspecified, except that as a minimum a type \texttt{T} shall not qualify as a \texttt{Cpp17Clock} unless it meets all of the following conditions:

\begin{enumerate}
\item[(1.1)] the qualified-ids \texttt{T::rep, T::period, T::duration}, and \texttt{T::time\_point} are valid and each denotes a type (13.10.3),
\item[(1.2)] the expression \texttt{T::is\_steady} is well-formed when treated as an unevaluated operand (7.2.3),
\item[(1.3)] the expression \texttt{T::now()} is well-formed when treated as an unevaluated operand.
\end{enumerate}

The behavior of a program that adds specializations for \texttt{is\_clock} is undefined.

29.5 Class template \texttt{duration} \hfill [time.duration]

29.5.1 General \hfill [time.duration.general]

A \texttt{duration} type measures time between two points in time (\texttt{time\_points}). A \texttt{duration} has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template \texttt{ratio}.

\begin{verbatim}
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
        public:
            using rep = Rep;
            using period = typename Period::type;

        private:
            rep rep_; // exposition only

        public:
            // 29.5.2, construct/copy/destroy
            constexpr duration() = default;
            template<class Rep2>
                constexpr explicit duration(const Rep2& r);
            template<class Rep2, class Period2>
                constexpr duration(const duration<Rep2, Period2>& d);
            ~duration() = default;
            duration(const duration&) = default;
            duration& operator=(const duration&);
            duration& operator++();
            duration operator++(int);
            duration& operator--();
            duration operator--(int);
            duration& operator+=(const duration& d);
            duration& operator-=(const duration& d);

            // 29.5.3, observer
            constexpr rep count() const;

            // 29.5.4, arithmetic
            constexpr common_type_t<duration> operator+() const;
            constexpr common_type_t<duration> operator-() const;
            constexpr duration& operator++();
            constexpr duration operator++(int);
            constexpr duration& operator--();
            constexpr duration operator--(int);
            constexpr duration& operator+=(const duration& d);
            constexpr duration& operator-=(const duration& d);

            // 29.5.5, duration
            constexpr duration operator*(const duration&);
            constexpr duration operator/() const;
            constexpr duration& operator*=(const duration&);
            constexpr duration operator/=(const duration&);
    }
}
\end{verbatim}
constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);

// 29.5.5, special values
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
};

2 Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a duration type as the argument for the template parameter Rep, the program is ill-formed.

3 If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the program is ill-formed.

4 Members of duration do not throw exceptions other than those thrown by the indicated operations on their representations.

5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization of the member rep_ for copy and move, respectively, would satisfy the requirements for a constexpr function.

[Example 1:

duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long, milli> d1; // holds a count of milliseconds using a long long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of 1/30 of a second // (30 Hz) using a double
— end example]

29.5.2 Constructors

template<class Rep2>
constexpr explicit duration(const Rep2& r);

1 Constraints: is_convertible_v<const Rep2&, rep> is true and
  (1.1) treat_as_floating_point_v<rep> is true or
  (1.2) treat_as_floating_point_v<Rep2> is false.

[Example 1:

duration<int, milli> d(3); // OK
duration<int, milli> d(3.5); // error
— end example]

2 Effects: Initializes rep_ with r.

template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);

3 Constraints: No overflow is induced in the conversion and treat_as_floating_point_v<rep> is true or both ratio_divide<Period2, period>::den is 1 and treat_as_floating_point_v<Rep2> is false.

[Note 1: This requirement prevents implicit truncation error when converting between integral-based duration types. Such a construction could easily lead to confusion about the value of the duration. — end note]

[Example 2:

duration<int, milli> ms(3);
duration<int, micro> us = ms; // OK
duration<int, milli> ms2 = us; // error
— end example]

4 Effects: Initializes rep_ with duration_cast<duration>(d).count().
29.5.3 Observer

constexpr rep count() const;

Returns: rep_.

29.5.4 Arithmetic

constexpr common_type_t<duration> operator+( ) const;

Returns: common_type_t<duration>(*this).

constexpr common_type_t<duration> operator-( ) const;

Returns: common_type_t<duration>(-rep_).

constexpr duration& operator++();

Effects: Equivalent to: ++rep_.

Returns: *this.

constexpr duration operator++( int );

Effects: Equivalent to: return duration(rep_++);

constexpr duration& operator--();

Effects: Equivalent to: --rep_.

Returns: *this.

constexpr duration operator--( int );

Effects: Equivalent to: return duration(rep__);

constexpr duration& operator+=(const duration& d);

Effects: Equivalent to: rep_ += d.count().

Returns: *this.

constexpr duration& operator-=(const duration& d);

Effects: Equivalent to: rep_ -= d.count().

Returns: *this.

constexpr duration& operator*=(const rep& rhs);

Effects: Equivalent to: rep_ *= rhs.

Returns: *this.

constexpr duration& operator/=(const rep& rhs);

Effects: Equivalent to: rep_ /= rhs.

Returns: *this.

constexpr duration& operator%=(const rep& rhs);

Effects: Equivalent to: rep_ %= rhs.

Returns: *this.

constexpr duration& operator%=(const duration& rhs);

Effects: Equivalent to: rep_ %= rhs.count().

Returns: *this.

29.5.5 Special values

static constexpr duration zero() noexcept;

Returns: duration(duration_values<rep>::zero()).
static constexpr duration min() noexcept;

Returns: duration(duration_values<rep>::min()).

static constexpr duration max() noexcept;

Returns: duration(duration_values<rep>::max()).

29.5.6 Non-member arithmetic

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() + CD(rhs).count()).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CD(CD(lhs).count() - CD(rhs).count()).

template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.

Returns: CD(CD(d).count() * s).

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.

Returns: d * s.

template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator%(const duration<Rep1, Period>& d, const Rep2& s);

Constraints: is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true and Rep2 is not a specialization of duration.

Returns: CD(CD(d).count() / s).

template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Let CD be common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>.

Returns: CD(CD(lhs).count() % CD(rhs).count()).

29.5.7 Comparisons

In the function descriptions that follow, CT represents common_type_t<A, B>, where A and B are the types of the two arguments to the function.

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() == CT(rhs).count().
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() < CT(rhs).count().
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: rhs < lhs.
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: !(rhs < lhs).
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: !(lhs < rhs).
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);

Returns: CT(lhs).count() <=> CT(rhs).count().
```

29.5.8 Conversions

```cpp
template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
```

Constraints: ToDuration is a specialization of duration.

```
Returns: Let CF be ratio_divide<Period, typename ToDuration::period>, and CR be common_type<typename ToDuration::rep, Rep, intmax_t>::type.

(2.1) — If CF::num == 1 and CF::den == 1, returns

ToDuration(static_cast<typename ToDuration::rep>(d.count()))

(2.2) — otherwise, if CF::num == 1 and CF::den != 1, returns

ToDuration(static_cast<typename ToDuration::rep>((
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num))))

(2.3) — otherwise, if CF::num != 1 and CF::den == 1, returns

ToDuration(static_cast<typename ToDuration::rep>((
    static_cast<CR>(d.count()) / static_cast<CR>(CF::den))))

(2.4) — otherwise, returns

ToDuration(static_cast<typename ToDuration::rep>((
    static_cast<CR>(d.count()) / static_cast<CR>(CF::den))))
```

[Note 1: This function does not use any implicit conversions; all conversions are done with static_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — end note]
template<class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.
Returns: The greatest result \( t \) representable in ToDuration for which \( t \leq d \).

template<class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.
Returns: The least result \( t \) representable in ToDuration for which \( t \geq d \).

template<class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration and \( \text{treat_as_floating_point_v<typename ToDuration::rep>} \) is \( \text{false} \).
Returns: The value of ToDuration that is closest to \( d \). If there are two closest values, then return the value \( t \) for which \( t \% 2 == 0 \).

### 29.5.9 Suffixes for duration literals

This subclause describes literal suffixes for constructing duration literals. The suffixes \( h \), \( \text{min} \), \( s \), \( \text{ms} \), \( \text{us} \), \( \text{ns} \) denote duration values of the corresponding types \( \text{hours} \), \( \text{minutes} \), \( \text{seconds} \), \( \text{milliseconds} \), \( \text{microseconds} \), \( \text{nanoseconds} \) respectively if they are applied to integer-literals.

If any of these suffixes are applied to a floating-point-literal the result is a \( \text{chrono::duration} \) literal with an unspecified floating-point representation.

If any of these suffixes are applied to an integer-literal and the resulting \( \text{chrono::duration} \) value cannot be represented in the result type because of overflow, the program is ill-formed.

[Example 1: The following code shows some duration literals.]

```cpp
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

- Returns: A duration literal representing hours.
- Returns: A duration literal representing minutes.
- Returns: A duration literal representing seconds.

[Note 1: The same suffix \( s \) is used for \( \text{basic_string} \) but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]
constexpr chrono::duration< unspecified, nano> operator"ns(long double nsec);

Returns: A duration literal representing nsec nanoseconds.

29.5.10 Algorithms

template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);

Constraints: numeric_limits<Rep>::is_signed is true.

Returns: If d >= d.zero(), return d, otherwise return -d.

29.5.11 I/O

template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);

Effects: Inserts the duration d onto the stream os as if it were implemented as follows:

basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();

where units-suffix depends on the type Period::type as follows:

- If Period::type is atto, units-suffix is "as".
- Otherwise, if Period::type is femto, units-suffix is "fs".
- Otherwise, if Period::type is pico, units-suffix is "ps".
- Otherwise, if Period::type is nano, units-suffix is "ns".
- Otherwise, if Period::type is micro, it is implementation-defined whether units-suffix is "µs" ("\u00b5\u0073") or "us".
- Otherwise, if Period::type is milli, units-suffix is "ms".
- Otherwise, if Period::type is centi, units-suffix is "cs".
- Otherwise, if Period::type is deci, units-suffix is "ds".
- Otherwise, if Period::type is ratio<1>, units-suffix is "s".
- Otherwise, if Period::type is deca, units-suffix is "das".
- Otherwise, if Period::type is hecto, units-suffix is "hs".
- Otherwise, if Period::type is kilo, units-suffix is "ks".
- Otherwise, if Period::type is mega, units-suffix is "Ms".
- Otherwise, if Period::type is giga, units-suffix is "Gs".
- Otherwise, if Period::type is tera, units-suffix is "Ts".
- Otherwise, if Period::type is peta, units-suffix is "Ps".
- Otherwise, if Period::type is exa, units-suffix is "Es".
- Otherwise, if Period::type is ratio<60>, units-suffix is "min".
- Otherwise, if Period::type is ratio<3600>, units-suffix is "h".
- Otherwise, if Period::type is ratio<86400>, units-suffix is "d".
- Otherwise, if Period::type::den == 1, units-suffix is "[num]s".
- Otherwise, units-suffix is "[num/den]s".

In the list above, the use of num and den refers to the static data members of Period::type, which are converted to arrays of charT using a decimal conversion with no leading zeroes.

Returns: os.
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>

basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
duration<Rep, Period>& d,
basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the duration d using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid duration, is.setstate(ios_base::failbit) is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.6 Class template time_point

29.6.1 General

namespace std::chrono {

template<class Clock, class Duration = typename Clock::duration>
class time_point {

public:

using clock = Clock;
using duration = Duration;
using rep = typename duration::rep;
using period = typename duration::period;

private:

duration d_; // exposition only

public:

// 29.6.2, construct
constexpr time_point(); // has value epoch
constexpr explicit time_point(const duration& d); // same as time_point() + d
template<class Duration2>
constexpr time_point(const time_point<clock, Duration2>& t);

// 29.6.3, observer
constexpr duration time_since_epoch() const;

// 29.6.4, arithmetic
constexpr time_point& operator++();
constexpr time_point operator++(int);
constexpr time_point& operator--();
constexpr time_point operator--(int);
constexpr time_point& operator+=(const duration& d);
constexpr time_point& operator-=(const duration& d);

// 29.6.5, special values
static constexpr time_point min() noexcept;
static constexpr time_point max() noexcept;
};

1 If Duration is not a specialization of duration, the program is ill-formed.

29.6.2 Constructors

constexpr time_point();

Effects: Initializes d_ with duration::zero(). Such a time_point object represents the epoch.

constexpr explicit time_point(const duration& d);

Effects: Initializes d_ with d. Such a time_point object represents the epoch + d.
template<class Duration2>
  constexpr time_point(const time_point<clock, Duration2>& t);

Constraints: is_convertible_v<Duration2, duration> is true.
Effects: Initializes d_ with t.time_since_epoch().

29.6.3 Observer

constexpr duration time_since_epoch() const;
Returns: d_

29.6.4 Arithmetic

constexpr time_point& operator++();
Effects: Equivalent to: ++d_
Returns: *this.

constexpr time_point& operator++(int);
Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();
Effects: Equivalent to: --d_
Returns: *this.

constexpr time_point& operator--(int);
Effects: Equivalent to: return time_point{d_--};

constexpr time_point& operator+=(const duration& d);
Effects: Equivalent to: d_ += d.
Returns: *this.

constexpr time_point& operator-=(const duration& d);
Effects: Equivalent to: d_ -= d.
Returns: *this.

29.6.5 Special values

static constexpr time_point min() noexcept;
Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;
Returns: time_point(duration::max()).

29.6.6 Non-member arithmetic

template<class Clock, class Duration1, class Rep2, class Period2>
  operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
  operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);
Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
  operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);
Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.
template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

29.6.7 Comparisons

template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: !(lhs < rhs).

template<class Clock, class Duration1, class Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() <=> rhs.time_since_epoch().

29.6.8 Conversions

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))

§ 29.6.8
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch())).

29.7 Clocks

29.7.1 General

The types defined in 29.7 meet the Cpp17TrivialClock requirements (29.3) unless otherwise specified.

29.7.2 Class system_clock

29.7.2.1 Overview

namespace std::chrono {
  class system_clock {
    public:
      using rep = unspecified;
      using period = ratio<unspecified, unspecified>;
      using duration = chrono::duration<rep, period>;
      using time_point = chrono::time_point<system_clock>;
      static constexpr bool is_steady = unspecified;

      static time_point now() noexcept;
      static time_t to_time_t(const time_point& t) noexcept;
      static time_point from_time_t(time_t t) noexcept;
  };
} // namespace std::chrono

Objects of type system_clock represent wall clock time from the system-wide realtime clock. Objects of type sys_time<Duration> measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as Unix time. This measure facilitates an efficient mapping between sys_time and calendar types (29.8).

[Example 1:
  sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
  sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
  —end example]

29.7.2.2 Members

using system_clock::rep = unspecified;

Constraints: system_clock::duration::min() < system_clock::duration::zero() is true.
[Note 1: This implies that rep is a signed type. —end note]

static time_t to_time_t(const time_point& t) noexcept;

Returns: A time_t object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

static time_point from_time_t(time_t t) noexcept;

Returns: A time_point object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

29.7.2.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
3 operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);

1 Constraints: treat_as_floating_point_v<typename Duration::rep> is false, and Duration{1} <
2 days{1} is true.
3
4 Effects: Equivalent to:
5 return os << format(os.getloc(), STATICALLY_WIDEN("{:L%F %T}"), tp);

1 Example 1:
2 cout << sys_seconds{0s} << 'n'; // 1970-01-01 00:00:00
3 cout << sys_seconds{946'684'800s} << 'n'; // 2000-01-01 00:00:00
4 cout << sys_seconds{946'688'523s} << 'n'; // 2000-01-01 01:02:03
5 —end example

3 template<class charT, class traits>
4 basic_ostream<charT, traits>&
5 operator<<(basic_ostream<charT, traits>& os, const sys_days& dp);

2 Effects: os << year_month_day{dp}.
3
4 Returns: os.

3 template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
4 basic_istream<charT, traits>&
5 from_stream(basic_istream<charT, traits>& is, const charT* fmt,
6 sys_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
7 minutes* offset = nullptr);

2 Effects: Attempts to parse the input stream is into the sys_time tp using the format flags given in
3 the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %Z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

2 Returns: is.

§ 29.7.3 Class utc_clock

29.7.3.1 Overview

namespace std::chrono {
    class utc_clock {
    public:
        using rep = a signed arithmetic type;
        using period = ratio<unspezified, unspezified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<utc_clock>;
        static constexpr bool is_steady = unspezified;

        static time_point now();

        template<class Duration>
        static sys_time<common_type_t<Duration, seconds>>
        to_sys(const utc_time<Duration>& t);
        template<class Duration>
        static utc_time<common_type_t<Duration, seconds>>
        from_sys(const sys_time<Duration>& t);
    }
}

In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated
time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

[Note 1: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one can add/subtract the constant sys_days{1972y/1/1} - sys_days{1970y/1/1} (63'072'000s) from the utc_time.
—end note]
Example 1:
clock_cast<utc_clock>(sys_seconds(sys_days{1970y/January/1})).time_since_epoch() is 0s.
clock_cast<utc_clock>(sys_seconds(sys_days{2000y/January/1})).time_since_epoch() is 946'684'822s,
which is 10'957 * 86'400s + 22s.
—end example

utc_clock is not a Cpp17TrivialClock unless the implementation can guarantee that utc_clock::now()
do not propagate an exception.

[Note 2: noexcept(from_sys(system_clock::now())) is false. —end note]

29.7.3.2 Member functions

time_point now();

template<class Duration>
static sys_time<common_type_t<Duration, seconds>>
to_sys(const utc_time<Duration>& u);

Returns: A sys_time t, such that from_sys(t) == u if such a mapping exists. Otherwise u represents
a time_point during a positive leap second insertion, the conversion counts that leap second as not
inserted, and the last representable value of sys_time prior to the insertion of the leap second is
returned.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
from_sys(const sys_time<Duration>& t);

Returns: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the
sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second
insertion, then the conversion counts that leap second as inserted.

Example 1:
auto t = sys_days{July/1/2015} - 2ns;
auto u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 25s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
t += 1ns;
u = utc_clock::from_sys(t);
assert(u.time_since_epoch() - t.time_since_epoch() == 26s);
—end example

29.7.3.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const utc_time<Duration>& t);

Returns: A utc_time u, such that u.time_since_epoch() - t.time_since_epoch() is equal to the
sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second
insertion, then the conversion counts that leap second as inserted.

Example 1:
auto t = sys_days{July/1/2015} - 500ms;
auto u = clock_cast<utc_clock>(t);
for (auto i = 0; i < 8; ++i, u += 250ms)
    cout << u << " UTC
";
Produces this output:
2015-06-30 23:59:59.500 UTC
2015-06-30 23:59:59.750 UTC
2015-06-30 23:59:60.000 UTC

§ 29.7.3.3
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>

basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the utc_time tp using the format flags given in
the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit)
is called and tp is not modified. If %Z is used and successfully parsed, that value will
be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

struct leap_second_info {
  bool is_leap_second;
  seconds elapsed;
};

The type leap_second_info has data members and special members specified above. It has no base
classes or members other than those specified.

template<class Duration>
leap_second_info get_leap_second_info(const utc_time<Duration>& ut);

Returns: A leap_second_info lsi, where lsi.is_leap_second is true if ut is during a positive leap
second insertion, and otherwise false. lsi.elapsed is the sum of leap seconds between 1970-01-01
and ut. If lsi.is_leap_second is true, the leap second referred to by ut is included in the sum.

29.7.4 Class tai_clock

29.7.4.1 Overview

namespace std::chrono {

  class tai_clock {
  public:
    using rep = a signed arithmetic type;
    using period = ratio<unspecified, unspecified>;
    using duration = chrono::duration<rep, period>;
    using time_point = chrono::time_point<tai_clock>;
    static constexpr bool is_steady = unspecified;
    static time_point now();

    template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>(
      to_utc(const tai_time<Duration>&) noexcept;
    template<class Duration>
    static tai_time<common_type_t<Duration, seconds>(
      from_utc(const utc_time<Duration>&) noexcept;

  };

The clock tai_clock measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this
date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not
inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with
respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted
so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).
2 tai_clock is not a Cpp17TrivialClock unless the implementation can guarantee that tai_clock::now() does not propagate an exception.

   [Note 1: noexcept(from_utc(utc_clock::now())) is false. —end note]

29.7.4.2 Member functions

[time.clock.tai.members]

static time_point now();  
1 Returns: from_utc(utc_clock::now()), or a more accurate value of tai_time.

2 template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
   to_utc(const tai_time<Duration>& t) noexcept;

   Returns:
   utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 378691210s

   [Note 1:
   378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
   —end note]

2 template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
   from_utc(const utc_time<Duration>& t) noexcept;

3 Returns:
   tai_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 378691210s

   [Note 2:
   378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
   —end note]

29.7.4.3 Non-member functions

[time.clock.tai.nonmembers]

2 template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
   operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);

   Effects: Equivalent to:
   return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

2 [Example 1:
   auto st = sys_days{2000y/January/1};
   auto tt = clock_cast<tai_clock>(st);
   cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);

   Produces this output:
   2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI

   —end example]

3 template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
   basic_istream<charT, traits>&
      from_stream(basic_istream<charT, traits>& is, const charT* fmt,
         tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
         minutes* offset = nullptr);

   Effects: Attempts to parse the input stream is into the tai_time tp using the format flags given in
   the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit)
   is called and tp is not modified. If %Z is used and successfully parsed, that value will
   be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
   parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
   will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

4 Returns: is.
29.7.5 Class gps_clock

29.7.5.1 Overview

namespace std::chrono {
    class gps_clock {
    public:
        using rep = a signed arithmetic type;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<gps_clock>;
        static constexpr bool is_steady = unspecified;

        static time_point now();

        template<class Duration>
        static utc_time<common_type_t<Duration, seconds>>
        to_utc(const gps_time<Duration>&) noexcept;

        template<class Duration>
        static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
    };
}

1 The clock gps_clock measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 gps_clock is not a Cpp17TrivialClock unless the implementation can guarantee that gps_clock::now() does not propagate an exception. [Note 1: noexcept(from_utc(utc_clock::now())) is false. —end note]

29.7.5.2 Member functions

static time_point now();

1 Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
    to_utc(const gps_time<Duration>& t) noexcept;

2 Returns:
    utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s
[Note 1:
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    —end note]

template<class Duration>
static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;

3 Returns:
    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s
[Note 2:
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    —end note]

29.7.5.3 Non-member functions

template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
\begin{verbatim}
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

[Example 1:
  auto st = sys_days{2000y/January/1};
  auto gt = clock_cast<gps_clock>(st);
  cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);

Produces this output:
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
—end example]

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the gps_time tp using the format flags given in
the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit)
is called and tp is not modified. If %Z is used and successfully parsed, that value will
be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.
\end{verbatim}

29.7.6 Type file_clock

29.7.6.1 Overview

namespace std::chrono {
  using file_clock = see below;
}

file_clock is an alias for a type meeting the Cpp17TrivialClock requirements (29.3), and using a signed
arithmetic type for file_clock::rep. file_clock is used to create the time_point system used for
file_time_type (31.12). Its epoch is unspecified, and noexcept(file_clock::now()) is true.
[Note 1: The type that file_clock denotes can be in a different namespace than std::chrono, such as std::filesystem. —end note]

29.7.6.2 Member functions

The type denoted by file_clock provides precisely one of the following two sets of static member functions:

\begin{verbatim}
  template<class Duration>
  static sys_time<see below>
  to_sys(const file_time<Duration>&); 
  template<class Duration>
  static file_time<see below>
  from_sys(const sys_time<Duration>&);
\end{verbatim}

or:

\begin{verbatim}
  template<class Duration>
  static utc_time<see below>
  to_utc(const file_time<Duration>&); 
  template<class Duration>
  static file_time<see below>
  from_utc(const utc_time<Duration>&);
\end{verbatim}

These member functions shall provide time_point conversions consistent with those specified by utc_clock,
tai_clock, and gps_clock. The Duration of the resultant time_point is computed from the Duration of
the input time_point.
29.7.6.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);

Effects: Equivalent to:
return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the file_time tp using the format flags given
in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will
be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully
parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset
will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

29.7.7 Class steady_clock

namespace std::chrono {
    class steady_clock {
    public:
        using rep = unspecified;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = true;

        static time_point now() noexcept;
    };
}

1 Objects of class steady_clock represent clocks for which values of time_point never decrease as physical
time advances and for which values of time_point advance at a steady rate relative to real time. That is,
the clock may not be adjusted.

29.7.8 Class high_resolution_clock

namespace std::chrono {
    class high_resolution_clock {
    public:
        using rep = unspecified;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<unspecified, duration>;
        static constexpr bool is_steady = unspecified;

        static time_point now() noexcept;
    };
}

1 Objects of class high_resolution_clock represent clocks with the shortest tick period. high_resolution-
clock may be a synonym for system_clock or steady_clock.

29.7.9 Local time

The family of time points denoted by local_time<Duration> are based on the pseudo clock local_t.
local_t has no member now() and thus does not meet the clock requirements. Nevertheless local_t
<Duration> serves the vital role of representing local time with respect to a not-yet-specified time
zone. Aside from being able to get the current time, the complete time_point algebra is available for
local_time<Duration> (just as for sys_time<Duration>).
template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const local_time<Duration>& lt);

Effects:
    os << sys_time<Duration>{lt.time_since_epoch()};

Returns: os.

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
        local_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
        minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the local_time tp using the format flags given
in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.7.10 time_point conversions

time.clock.cast

29.7.10.1 Class template clock_time_conversion

time.clock.conv

namespace std::chrono {
    template<class DestClock, class SourceClock>
    struct clock_time_conversion {};
}

clock_time_conversion serves as a trait which can be used to specify how to convert a source time_point of
type time_point<SourceClock, Duration> to a destination time_point of type time_point<DestClock, Duration> via a specialization: clock_time_conversion<DestClock, SourceClock>. A specialization
of clock_time_conversion<DestClock, SourceClock> shall provide a const-qualified operator() that
takes a parameter of type time_point<SourceClock, Duration> and returns a time_point<DestClock,
OtherDuration> representing an equivalent point in time. OtherDuration is a chrono::duration
whose specialization is computed from the input Duration in a manner which can vary for each clock_time_conversion specialization. A program may specialize clock_time_conversion if at least one of the template
parameters is a user-defined clock type.

Several specializations are provided by the implementation, as described in 29.7.10.2, 29.7.10.3, 29.7.10.4,
and 29.7.10.5.

29.7.10.2 Identity conversions

time.clock.cast.id

template<class Clock>
struct clock_time_conversion<Clock, Clock> {
    template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;
};

template<class Duration>
    time_point<Clock, Duration>
        operator()(const time_point<Clock, Duration>& t) const;

Returns: t.

template<>
struct clock_time_conversion<system_clock, system_clock> {
    template<class Duration>
    sys_time<Duration>
        operator()(const sys_time<Duration>& t) const;
};
template<class Duration>
    sys_time<Duration>
    operator()(const sys_time<Duration>& t) const;

Returns: t.

template<>
struct clock_time_conversion<utc_clock, utc_clock> {
    template<class Duration>
        utc_time<Duration>
        operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
    utc_time<Duration>
    operator()(const utc_time<Duration>& t) const;

Returns: t.

29.7.10.3 Conversions between system_clock and utc_clock

[time.clock.cast.sys.utc]

template<>
struct clock_time_conversion<utc_clock, system_clock> {
    template<class Duration>
        utc_time<common_type_t<Duration, seconds>>
        operator()(const sys_time<Duration>& t) const;
};

template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
    operator()(const sys_time<Duration>& t) const;

Returns: utc_clock::from_sys(t).

template<>
struct clock_time_conversion<system_clock, utc_clock> {
    template<class Duration>
        utc_time<common_type_t<Duration, seconds>>
        operator()(const utc_time<Duration>& t) const;
};

template<class Duration>
    utc_time<common_type_t<Duration, seconds>>
    operator()(const utc_time<Duration>& t) const;

Returns: utc_clock::to_sys(t).

29.7.10.4 Conversions between system_clock and other clocks

[time.clock.cast.sys]

template<class SourceClock>
struct clock_time_conversion<system_clock, SourceClock> {
    template<class Duration>
        auto operator()(const time_point<SourceClock, Duration>& t) const
            -> decltype(SourceClock::to_sys(t));
};

template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_sys(t));

Constraints: SourceClock::to_sys(t) is well-formed.

Mandates: SourceClock::to_sys(t) returns a sys_time<Duration2> for some type Duration2 (29.6.1).

Returns: SourceClock::to_sys(t).

template<class DestClock>
struct clock_time_conversion<DestClock, system_clock> {
    template<class Duration>
        auto operator()(const sys_time<Duration>& t) const
            -> decltype(DestClock::from_sys(t));
};

auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));

Constraints: SourceClock::to_sys(t) is well-formed.

Mandates: SourceClock::to_sys(t) returns a sys_time<Duration2> for some type Duration2 (29.6.1).

Returns: SourceClock::to_sys(t).
template<class Duration>
auto operator()(const sys_time<Duration>& t) const
    -> decltype(DestClock::from_sys(t));

Constraints: DestClock::from_sys(t) is well-formed.

Mandates: DestClock::from_sys(t) returns a time_point<DestClock, Duration2> for some type Duration2 (29.6.1).

Returns: DestClock::from_sys(t).

29.7.10.5 Conversions between utc_clock and other clocks

template<class SourceClock>
struct clock_time_conversion<utc_clock, SourceClock> {
    template<class Duration>
    auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));
};

template<class Duration>
auto operator()(const time_point<SourceClock, Duration>& t) const
        -> decltype(SourceClock::to_utc(t));

Constraints: SourceClock::to_utc(t) is well-formed.

Mandates: SourceClock::to_utc(t) returns a utc_time<Duration2> for some type Duration2 (29.6.1).

Returns: SourceClock::to_utc(t).

template<class DestClock>
struct clock_time_conversion<DestClock, utc_clock> {
    template<class Duration>
    auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));
};

template<class Duration>
auto operator()(const utc_time<Duration>& t) const
        -> decltype(DestClock::from_utc(t));

Constraints: DestClock::from_utc(t) is well-formed.

Mandates: DestClock::from_utc(t) returns a time_point<DestClock, Duration2> for some type Duration2 (29.6.1).

Returns: DestClock::from_utc(t).

29.7.10.6 Function template clock_cast

template<class DestClock, class SourceClock, class Duration>
auto clock_cast(const time_point<SourceClock, Duration>& t);
A clock time conversion expression is considered better than another clock time conversion expression if it involves fewer \texttt{operator()} calls on \texttt{clock\_time\_conversion} specializations.

\textbf{Mandates:} Among the well-formed clock time conversion expressions from the above list, there is a unique best expression.

\textbf{Returns:} The best well-formed clock time conversion expression in the above list.

\section{The civil calendar} \cite{time.cal}

\subsection{In general} \cite{time.cal.general}

The types in \ref{section:29.8} describe the civil (Gregorian) calendar and its relationship to \texttt{sys\_days} and \texttt{local\_days}.

\subsection{Class \texttt{last\_spec}} \cite{time.cal.last}

\begin{verbatim}
namespace std::chrono {
    struct last_spec {
        explicit last_spec() = default;
    };
}
\end{verbatim}

The type \texttt{last\_spec} is used in conjunction with other calendar types to specify the last in a sequence. For example, depending on context, it can represent the last day of a month, or the last day of the week of a month.

\subsection{Class \texttt{day}} \cite{time.cal.day}

\subsubsection{Overview} \cite{time.cal.day.overview}

\begin{verbatim}
namespace std::chrono {
    class day {
        unsigned char d_; // exposition only
    public:
        day() = default;
        constexpr explicit day(unsigned d) noexcept;
        constexpr day& operator++() noexcept;
        constexpr day operator++(int) noexcept;
        constexpr day& operator--() noexcept;
        constexpr day operator--(int) noexcept;
        constexpr day& operator+=(const days& d) noexcept;
        constexpr day& operator-=(const days& d) noexcept;
        constexpr explicit operator unsigned() const noexcept;
        constexpr bool ok() const noexcept;
    };
}
\end{verbatim}

\texttt{day} represents a day of a month. It normally holds values in the range 1 to 31, but may hold non-negative values outside this range. It can be constructed with any \texttt{unsigned} value, which will be subsequently truncated to fit into \texttt{day}'s unspecified internal storage. \texttt{day} meets the \texttt{Cpp17EqualityComparable} (Table 29) and \texttt{Cpp17LessThanComparable} (Table 30) requirements, and participates in basic arithmetic with \texttt{days} objects, which represent a difference between two \texttt{day} objects.

\texttt{day} is a trivially copyable and standard-layout class type.

\subsubsection{Member functions} \cite{time.cal.day.members}

\begin{verbatim}
    constexpr explicit day(unsigned d) noexcept;
    \end{verbatim}

\textit{Effects:} Initializes \texttt{d\_} with \texttt{d}. The value held is unspecified if \texttt{d} is not in the range \([0, 255]\).

\begin{verbatim}
    constexpr day& operator++() noexcept;
    \end{verbatim}

\textit{Effects:} \texttt{++d\_.}

\begin{verbatim}
    Returns: *this.
    \end{verbatim}
constexpr day operator++(int) noexcept;

Effects: ++(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator--() noexcept;

Effects: Equivalent to: --d_.

Returns: *this.

constexpr day operator--(int) noexcept;

Effects: --(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr day& operator+=(const days& d) noexcept;

Effects: *this = *this + d.

Returns: *this.

constexpr day& operator-=(const days& d) noexcept;

Effects: *this = *this - d.

Returns: *this.

constexpr explicit operator unsigned() const noexcept;

Returns: d_.

constexpr bool ok() const noexcept;

Returns: 1 <= d_ && d_ <= 31.

29.8.3.3 Non-member functions

constexpr bool operator==(const day& x, const day& y) noexcept;

Returns: unsigned{x} == unsigned{y}.

constexpr strong_ordering operator<=>(const day& x, const day& y) noexcept;

Returns: unsigned{x} <=> unsigned{y}.

constexpr day operator+(const day& x, const days& y) noexcept;

Returns: day(unsigned{x} + y.count()).

constexpr day operator+(const days& x, const day& y) noexcept;

Returns: y + x.

constexpr day operator-(const day& x, const days& y) noexcept;

Returns: x + -y.

constexpr days operator-(const day& x, const day& y) noexcept;

Returns: days{int(unsigned{x}) - int(unsigned{y})}.

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const day& d);

Effects: Equivalent to:

return os << (d.ok() ?
    format(STATICALLY-WIDEN<charT>("{:%d}"), d) :
    format(STATICALLY-WIDEN<charT>("{:%d} is not a valid day"), d));

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, day& d, basic_string<charT, traits, Alloc>* abbrev = nullptr,
© ISO/IEC

minutes * offset = nullptr);

Effects: Attempts to parse the input stream is into the day d using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid day, is.setstate(ios_base::failbit) is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

constexpr chrono::day operator"d(unsigned long long d) noexcept;

Returns: day{static_cast<unsigned>(d)}.

29.8.4 Class month

29.8.4.1 Overview

namespace std::chrono {

class month {
    // exposition only
    unsigned char m_;

public:
    month() = default;
    constexpr explicit month(unsigned m) noexcept;
    constexpr month& operator++() noexcept;
    constexpr month operator++(int) noexcept;
    constexpr month& operator--() noexcept;
    constexpr month operator--(int) noexcept;
    constexpr month& operator+=(const months& m) noexcept;
    constexpr month& operator-=(const months& m) noexcept;
    constexpr explicit operator unsigned() const noexcept;
    constexpr bool ok() const noexcept;
};
}

1 month represents a month of a year. It normally holds values in the range 1 to 12, but may hold non-negative values outside this range. It can be constructed with any unsigned value, which will be subsequently truncated to fit into month's unspecified internal storage. month meets the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30) requirements, and participates in basic arithmetic with months objects, which represent a difference between two month objects.

2 month is a trivially copyable and standard-layout class type.

29.8.4.2 Member functions

constexpr explicit month(unsigned m) noexcept;

Effects: Initializes m_ with m. The value held is unspecified if m is not in the range [0, 255].

constexpr month& operator++() noexcept;

Effects: *this += months{1}.

Returns: *this.

constexpr month operator++(int) noexcept;

Effects: ++(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr month& operator--() noexcept;

Effects: *this -= months{1}.

Returns: *this.
constexpr month operator--(int) noexcept;
    Effects: --(*this).
    Returns: A copy of *this as it existed on entry to this member function.

constexpr month& operator+=(const months& m) noexcept;
    Effects: *this = *this + m.
    Returns: *this.

constexpr month& operator-=(const months& m) noexcept;
    Effects: *this = *this - m.
    Returns: *this.

constexpr explicit operator unsigned() const noexcept;
    Returns: m_.

constexpr bool ok() const noexcept;
    Returns: 1 <= m_ && m_ <= 12.

29.8.4.3 Non-member functions

constexpr bool operator==(const month& x, const month& y) noexcept;
    Returns: unsigned{x} == unsigned{y}.

constexpr strong_ordering operator<=>(const month& x, const month& y) noexcept;
    Returns: unsigned{x} <=> unsigned{y}.

constexpr month operator+(const month& x, const months& y) noexcept;
    Returns: month{modulo(static_cast<long long>(unsigned{x}) + (y.count() - 1), 12) + 1}
    where modulo(n, 12) computes the remainder of n divided by 12 using Euclidean division.
    [Note 1: Given a divisor of 12, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 11]. Assuming no overflow in the signed summation, this operation results in a month holding a value in the range [1, 12] even if !x.ok(). — end note]
    [Example 1: February + months{11} == January. — end example]

constexpr month operator+(const months& x, const month& y) noexcept;
    Returns: y + x.

constexpr month operator-(const month& x, const months& y) noexcept;
    Returns: x + -y.

constexpr months operator-(const month& x, const month& y) noexcept;
    Returns: If x.ok() == true and y.ok() == true, returns a value m in the range [months{0}, months{11}] satisfying y + m == x. Otherwise the value returned is unspecified.
    [Example 2: January - February == months{11}. — end example]

template<class charT, class traits>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const month& m);
    Effects: Equivalent to:
        return os << (m.ok() ? format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%b}"), m) : format(os.getloc(), STATICALLY-WIDEN<charT>("{} is not a valid month"), static_cast<unsigned>(m)));
template<class charT, class traits, class Alloc = allocator<charT>>
  basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt,
  month& m, basic_string<charT, traits, Alloc>* abbrev = nullptr,
  minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the month m using the format flags given in the
NTCTS fmt as specified in 29.13. If the parse fails to decode a valid month, is.setstate(ios_base::failbit)
is called and m is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if
abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null.

Returns: is.

29.8.5 Class year

29.8.5.1 Overview

namespace std::chrono {
  class year {
    short y_; // exposition only
  public:
    year() = default;
    constexpr explicit year(int y) noexcept;
    constexpr year& operator++() noexcept;
    constexpr year operator++(int) noexcept;
    constexpr year& operator--() noexcept;
    constexpr year operator--(int) noexcept;
    constexpr year& operator+=(const years& y) noexcept;
    constexpr year& operator-=(const years& y) noexcept;
    constexpr year operator+() const noexcept;
    constexpr year operator-() const noexcept;
    constexpr bool is_leap() const noexcept;
    constexpr explicit operator int() const noexcept;
    constexpr bool ok() const noexcept;
    static constexpr year min() noexcept;
    static constexpr year max() noexcept;
  };
}

1 year represents a year in the civil calendar. It can represent values in the range [min(), max()]. It can be
constructed with any int value, which will be subsequently truncated to fit into year’s unspecified internal
storage. year meets the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30)
requirements, and participates in basic arithmetic with years objects, which represent a difference between
two year objects.

2 year is a trivially copyable and standard-layout class type.

29.8.5.2 Member functions

constexpr explicit year(int y) noexcept;
  Effects: Initializes y_ with y. The value held is unspecified if y is not in the range [-32767, 32767].

constexpr year& operator++() noexcept;
  Effects: ++y_.

constexpr year operator++(int) noexcept;
  Returns: *this.

constexpr year operator++(int) noexcept;
  Effects: ++(*this).
Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator--() noexcept;

Effects: --y_.

Returns: *this.

constexpr year operator--(int) noexcept;

Effects: --(*this).

Returns: A copy of *this as it existed on entry to this member function.

constexpr year& operator+=(const years& y) noexcept;

Effects: *this = *this + y.

Returns: *this.

constexpr year& operator-=(const years& y) noexcept;

Effects: *this = *this - y.

Returns: *this.

constexpr year operator+(const years& x, const year& y) noexcept;

Returns: y + x.

constexpr year operator-(const years& x, const year& y) noexcept;

Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;

Returns: years{int{x} - int{y}}.

29.8.5.3 Non-member functions

constexpr bool operator==(const year& x, const year& y) noexcept;

Returns: int{x} == int{y}.

constexpr strong_ordering operator<=>(const year& x, const year& y) noexcept;

Returns: int{x} <=> int{y}.

constexpr year operator+(const year& x, const years& y) noexcept;

Returns: year{int{x} + static_cast<int>(y.count())}.

constexpr year operator+(const years& x, const year& y) noexcept;

Returns: y + x.

constexpr year operator-(const year& x, const years& y) noexcept;

Returns: x + -y.

constexpr years operator-(const year& x, const year& y) noexcept;

Returns: years{int{x} - int{y}}.
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const year& y);

Effects: Equivalent to:

return os << (y.ok() ?
   format("{:%Y}", y) :
   format("{:%Y} is not a valid year");

template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
   year& y, basic_string<charT, traits, Alloc>* abbrev = nullptr,
   minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the year y using the format flags given in the NTCTS
fmt as specified in 29.13. If the parse fails to decode a valid year, is.setstate(ios_base::failbit)
is called and y is not modified. If %Z is used and successfully parsed, that value will be assigned to
*abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value
will be assigned to *offset if offset is non-null.

Returns: is.

cconstexpr chrono::year operator"y(unsigned long long y) noexcept;

Returns: year{static_cast<int>(y)}.

29.8.6 Class weekday [time.cal.wd]
29.8.6.1 Overview [time.cal.wd.overview]

namespace std::chrono {

class weekday {
   unsigned char wd_; // exposition only

public:
   weekday() = default;
   constexpr explicit weekday(unsigned wd) noexcept;
   constexpr weekday(const sys_days& dp) noexcept;
   constexpr weekday(const local_days& dp) noexcept;
   constexpr weekday& operator++() noexcept;
   constexpr weekday operator++(int) noexcept;
   constexpr weekday& operator--() noexcept;
   constexpr weekday operator--(int) noexcept;
   constexpr weekday& operator+=(const days& d) noexcept;
   constexpr weekday& operator-=(const days& d) noexcept;
   constexpr unsigned c_encoding() const noexcept;
   constexpr unsigned iso_encoding() const noexcept;
   constexpr bool ok() const noexcept;
   constexpr weekday_indexed operator[] (unsigned index) const noexcept;

   constexpr weekday_last operator[] (last_spec) const noexcept;
};
}

1 weekday represents a day of the week in the civil calendar. It normally holds values in the range 0 to 6,
corresponding to Sunday through Saturday, but it may hold non-negative values outside this range. It can be
constructed with any unsigned value, which will be subsequently truncated to fit into weekday’s unspecified
internal storage. weekday meets the Cpp17EqualityComparable (Table 29) requirements.

[Note 1: weekday is not Cpp17LessThanComparable because there is no universal consensus on which day is the first
day of the week. weekday’s arithmetic operations treat the days of the week as a circular range, with no beginning
and no end. — end note]

2 weekday is a trivially copyable and standard-layout class type.
29.8.6.2 Member functions

constexpr explicit weekday(unsigned wd) noexcept;
   Effects: Initializes \( w_ \) with \( w = 7 ? 0 : w \). The value held is unspecified if \( w \) is not in the range [0, 255].

constexpr weekday(const sys_days& dp) noexcept;
   Effects: Computes what day of the week corresponds to the \( sys_days \) \( dp \), and initializes that day of the week in \( w_ \).  
   Example 1: If \( dp \) represents 1970-01-01, the constructed weekday represents Thursday by storing 4 in \( w_ \).  
   - end example

constexpr explicit weekday(const local_days& dp) noexcept;
   Effects: Computes what day of the week corresponds to the \( local_days \) \( dp \), and initializes that day of the week in \( w_ \).  
   Postconditions: The value is identical to that constructed from \( sys_days(dp.time_since_epoch()) \).

constexpr weekday& operator++() noexcept;
   Effects: \(*this += days(1)\).
   Returns: \(*this\).

constexpr weekday operator++(int) noexcept;
   Effects: \(++(*this)\).
   Returns: A copy of \(*this\) as it existed on entry to this member function.

constexpr weekday& operator--() noexcept;
   Effects: \(*this -= days(1)\).
   Returns: \(*this\).

constexpr weekday operator--(int) noexcept;
   Effects: \(--(*this)\).
   Returns: A copy of \(*this\) as it existed on entry to this member function.

constexpr weekday& operator+=(const days& d) noexcept;
   Effects: \(*this = *this + d\).
   Returns: \(*this\).

constexpr weekday& operator-=(const days& d) noexcept;
   Effects: \(*this = *this - d\).
   Returns: \(*this\).

constexpr unsigned c_encoding() const noexcept;
   Returns: \( w_ \).

constexpr unsigned iso_encoding() const noexcept;
   Returns: \( w_ == 0u ? 7u : w_ \).

constexpr bool ok() const noexcept;
   Returns: \( w_ <= 6 \).

constexpr weekday_indexed operator[](unsigned index) const noexcept;
   Returns: \{*this, index\}.

constexpr weekday_last operator[](last_spec) const noexcept;
   Returns: weekday_last{*this}.
29.8.6.3 Non-member functions

constexpr bool operator==(const weekday& x, const weekday& y) noexcept;

Returns: x.wd_ == y.wd_.

constexpr weekday operator+(const weekday& x, const days& y) noexcept;

Returns:

weekday(\text{modulo}(\text{static}\_\text{cast}<\text{long}\_\text{long}>(x.wd_ + y.count()), 7))

where \text{modulo}(n, 7) computes the remainder of n divided by 7 using Euclidean division.

[Note 1: Given a divisor of 7, Euclidean division truncates towards negative infinity and always produces a remainder in the range of [0, 6]. Assuming no overflow in the signed summation, this operation results in a weekday holding a value in the range [0, 6] even if !x.ok(). — end note]

[Example 1: Monday + days{6} == Sunday. — end example]

constexpr weekday operator+(const days& x, const weekday& y) noexcept;

Returns: y + x.

constexpr weekday operator-(const weekday& x, const days& y) noexcept;

Returns: x + -y.

constexpr days operator-(const weekday& x, const weekday& y) noexcept;

Returns: If x.ok() == true and y.ok() == true, returns a value \(d\) in the range \([\text{days}\{0\}, \text{days}\{6\}]\) satisfying \(y + d == x\). Otherwise the value returned is unspecified.

[Example 2: Sunday - Monday == days{6}. — end example]

template<class charT, class traits>

class \text{basic}\_\text{ostream}\langle\text{charT}, \text{traits}\rangle &

\text{operator\ll}(\text{basic}\_\text{ostream}\langle\text{charT}, \text{traits}\rangle & \text{os}, \text{const}\\text{weekday}\& \text{wd});

Effects: Equivalent to:

\begin{verbatim}
return os \ll (wd.ok()) ?
    format(os.getloc(), STATICALLY-WIDEN<\text{charT}>("{:L%a}\"), wd) :
    format(os.getloc(), STATICALLY-WIDEN<\text{charT}>("{} is not a valid weekday"),
    \text{static}\_\text{cast}<\text{unsigned}\>(wd.wd_));
\end{verbatim}

template<class charT, class traits, class Alloc = allocator<\text{charT}>>

class \text{basic}\_\text{istream}\langle\text{charT}, \text{traits}\rangle &

\text{from}\_\text{stream}(\text{basic}\_\text{istream}\langle\text{charT}, \text{traits}\rangle & \text{is}, \text{const}\\text{charT}\* \text{fmt},

\text{weekday}\& \text{wd}, \text{basic}\_\text{string}\langle\text{charT}, \text{traits}, \text{Alloc}\rangle\* \text{abbrev} = \text{nullptr},

\text{minutes}\* \text{offset} = \text{nullptr});

Effects: Attempts to parse the input stream \text{is} into the weekday \text{wd} using the format flags given in the NTCTS \text{fmt} as specified in 29.13. If the parse fails to decode a valid weekday, \text{is}.\text{setstate}(\text{ios}_-\text{base::failbit}) is called and \text{wd} is not modified. If \text{%Z} is used and successfully parsed, that value will be assigned to *\text{abbrev} if \text{abbrev} is non-null. If \text{%z} (or a modified variant) is used and successfully parsed, that value will be assigned to *\text{offset} if \text{offset} is non-null.

Returns: \text{is}.

29.8.7 Class weekday_indexed

29.8.7.1 Overview

namespace std::chrono {

    class weekday_indexed {

    public:

        weekday_indexed() = default;
        constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;

    }

}
constexpr chrono::weekday weekday() const noexcept;
constexpr unsigned index() const noexcept;
constexpr bool ok() const noexcept;
};

weekday_indexed represents a weekday and a small index in the range 1 to 5. This class is used to represent the first, second, third, fourth, or fifth weekday of a month.

[Note 1: A weekday_indexed object can be constructed by indexing a weekday with an unsigned. — end note]
[Example 1:
constexpr auto wdi = Sunday[2]; // wdi is the second Sunday of an as yet unspecified month
static_assert(wdi.weekday() == Sunday);
static_assert(wdi.index() == 2);
— end example]
weekday_indexed is a trivially copyable and standard-layout class type.

29.8.7.2 Member functions
constexpr weekday_indexed(const chrono::weekday& wd, unsigned index) noexcept;
Effects: Initializes wd_ with wd and index_ with index. The values held are unspecified if !wd.ok() or index is not in the range [0, 7].

constexpr chrono::weekday weekday() const noexcept;
Returns: wd_.

constexpr unsigned index() const noexcept;
Returns: index_.

constexpr bool ok() const noexcept;
Returns: wd_.ok() && 1 <= index_ && index_ <= 5.

29.8.7.3 Non-member functions
constexpr bool operator==(const weekday_indexed& x, const weekday_indexed& y) noexcept;
Returns: x.weekday() == y.weekday() && x.index() == y.index().

template<class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const weekday_indexed& wdi);
Effects: Equivalent to:
auto i = wdi.index();
return os << (i >= 1 && i <= 5 ?
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{}]"), wdi.weekday(), i) :
    format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}[{} is not a valid index]"),
        wdi.weekday(), i));

29.8.8 Class weekday_last

29.8.8.1 Overview
namespace std::chrono {
    class weekday_last {
        chrono::weekday wd_; // exposition only
    public:
        constexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
        constexpr chrono::weekday weekday() const noexcept;
        constexpr bool ok() const noexcept;
    };
weekday_last represents the last weekday of a month.

[Note 1: A weekday_last object can be constructed by indexing a weekday with last. — end note]

[Example 1:
```cpp
cconstexpr auto wdl = Sunday[last]; // wdl is the last Sunday of an as yet unspecified month
static_assert(wdl.weekday() == Sunday);
```
—end example]

weekday_last is a trivially copyable and standard-layout class type.

### 29.8.8.2 Member functions

```cpp
cconstexpr explicit weekday_last(const chrono::weekday& wd) noexcept;
```

1 **Effects**: Initializes `wd_` with `wd`.

```cpp
cconstexpr chrono::weekday weekday() const noexcept;
```

2 **Returns**: `wd_`.

```cpp
cconstexpr bool ok() const noexcept;
```

3 **Returns**: `wd_.ok()`.

### 29.8.8.3 Non-member functions

```cpp
cconstexpr bool operator==(const weekday_last& x, const weekday_last& y) noexcept;
```

1 **Returns**: `x.weekday() == y.weekday()`.

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const weekday_last& wdl);
```

2 **Effects**: Equivalent to:

```cpp
return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L}[last]"), wdl.weekday());
```

### 29.8.9 Class month_day

### 29.8.9.1 Overview

```cpp
namespace std::chrono {

class month_day {
    chrono::month m_; // exposition only
    chrono::day d_; // exposition only

public:
    month_day() = default;
    constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;

    constexpr chrono::month month() const noexcept;
    constexpr chrono::day day() const noexcept;
    constexpr bool ok() const noexcept;
};
```

1 month_day represents a specific day of a specific month, but with an unspecified year. month_day meets the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30) requirements.

2 month_day is a trivially copyable and standard-layout class type.

### 29.8.9.2 Member functions

```cpp
constexpr month_day(const chrono::month& m, const chrono::day& d) noexcept;
```

1 **Effects**: Initializes `m_` with `m`, and `d_` with `d`.

```cpp
constexpr chrono::month month() const noexcept;
```

2 **Returns**: `m_`. 

§ 29.8.9.2
constexpr chrono::day day() const noexcept;

Returns: \(d_\).

constexpr bool ok() const noexcept;

Returns: true if \(m_.ok()\) is true, \(1 \leq d_\) and \(d_\) is less than or equal to the number of days in month \(m_\); otherwise returns false. When \(m_\) == February, the number of days is considered to be 29.

29.8.9.3 Non-member functions

\begin{verbatim}
constexpr bool operator==(const month_day& x, const month_day& y) noexcept;
\end{verbatim}

Returns: \(x.month() == y.month() \&\& x.day() == y.day()\).

\begin{verbatim}
constexpr strong_ordering operator<=>(const month_day& x, const month_day& y) noexcept;
\end{verbatim}

Effects: Equivalent to:

\[
\text{if (auto c = x.month() <=> y.month(); c != 0) return c; return x.day() <=> y.day();}
\]

\begin{verbatim}
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day& md);
\end{verbatim}

Effects: Equivalent to:

\[
\text{return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{}"), md.month(), md.day());}
\]

\begin{verbatim}
template<class charT, class traits, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt, month_day& md, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);
\end{verbatim}

Effects: Attempts to parse the input stream \(is\) into the \(month_day\) \(md\) using the format flags given in the NTCTS \(fmt\) as specified in 29.13. If the parse fails to decode a valid \(month_day\), \(is.setstate(ios_base::failbit)\) is called and \(md\) is not modified. If \%Z is used and successfully parsed, that value will be assigned to \(*abbrev\) if \(abbrev\) is non-null. If \%z (or a modified variant) is used and successfully parsed, that value will be assigned to \(*offset\) if \(offset\) is non-null.

Returns: \(is\).

29.8.10 Class month_day_last

\begin{verbatim}
namespace std::chrono {
    class month_day_last {
        // exposition only

        public:
            constexpr explicit month_day_last(const chrono::month& m) noexcept;

            constexpr chrono::month month() const noexcept;
            constexpr bool ok() const noexcept;
    }
}
\end{verbatim}

1 month_day_last represents the last day of a month.

2 [Note 1: A month_day_last object can be constructed using the expression \(m/last\) or \(last/m\), where \(m\) is an expression of type \(month\). — end note]

[Example 1:

\begin{verbatim}
constexpr auto mdl = February/last; // mdl is the last day of February of an as yet unspecified year
static_assert(mdl.month() == February);
\end{verbatim}

— end example]

3 month_day_last is a trivially copyable and standard-layout class type.
constexpr explicit month_day_last(const chrono::month& m) noexcept;

   Effects: Initializes m_ with m.

constexpr month month() const noexcept;

   Returns: m_.

constexpr bool ok() const noexcept;

   Returns: m_.ok().

constexpr bool operator==(const month_day_last& x, const month_day_last& y) noexcept;

   Returns: x.month() == y.month().

constexpr strong_ordering operator<=>(const month_day_last& x, const month_day_last& y) noexcept;

   Returns: x.month() <=> y.month().

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_day_last& mdl);

   Effects: Equivalent to:
          return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/last"), mdl.month());

29.8.11 Class month_weekday

29.8.11.1 Overview

namespace std::chrono {

   class month_weekday {
      chrono::month m_;     // exposition only
      chrono::weekday_indexed wdi_;  // exposition only
   public:
      constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

      constexpr chrono::month month() const noexcept;

      constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

      constexpr bool ok() const noexcept;
   };
}

1 month_weekday represents the \(n\)th weekday of a month, of an as yet unspecified year. To do this the
month_weekday stores a month and a weekday_indexed.

2 [Example 1]:

constexpr auto mwd
   = February/Tuesday[3]; // mwd is the third Tuesday of February of an as yet unspecified year
static_assert(mwd.month() == February);
static_assert(mwd.weekday_indexed() == Tuesday[3]);
— end example]

3 month_weekday is a trivially copyable and standard-layout class type.

29.8.11.2 Member functions

constexpr month_weekday(const chrono::month& m, const chrono::weekday_indexed& wdi) noexcept;

   Effects: Initializes m_ with m, and wdi_ with wdi.

constexpr chrono::month month() const noexcept;

   Returns: m_.

constexpr chrono::weekday_indexed weekday_indexed() const noexcept;

   Returns: wdi_.

constexpr bool ok() const noexcept;

   Returns: m_.ok() && wdi_.ok().
29.8.11.3 Non-member functions

constexpr bool operator==(const month_weekday& x, const month_weekday& y) noexcept;

Returns: \( x.\text{month}() == y.\text{month}() \) && \( x.\text{weekday_indexed}() == y.\text{weekday_indexed}() \).

template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const month_weekday& mwd);

Effects: Equivalent to:

\[
\text{return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L}/{:L}")), mwd.\text{month}(), mwd.\text{weekday_indexed}());}
\]

29.8.12 Class month_weekday_last

29.8.12.1 Overview

namespace std::chrono {

class month_weekday_last {
  chrono::month m_; // exposition only
  chrono::weekday_last wdl_; // exposition only

public:
  constexpr month_weekday_last(const chrono::month& m,
                               const chrono::weekday_last& wdl) noexcept;

  constexpr chrono::month month() const noexcept;

  constexpr chrono::weekday_last weekday_last() const noexcept;

  constexpr bool ok() const noexcept;

};

}

1 month_weekday_last represents the last weekday of a month, of an as yet unspecified year. To do this the month_weekday_last stores a month and a weekday_last.

2 [Example 1:

```cpp
constexpr auto mwd
    = February/Tuesday[\text{last}]; // mwd is the last Tuesday of February of an as yet unspecified year

static_assert(mwd.\text{month}() == February);
