views::enumerate

Document #: P2164R6
Date: 2022-08-09
Programming Language C++
Audience: LEWG, SG-9
Reply-to: Corentin Jabot <corentin.jabot@gmail.com>

Abstract

We propose a view enumerate whose value type is a struct with 2 members index and value representing respectively the position and value of the elements in the adapted range.

Revisions

R6

Wording changes:

• Add enumerate_result to the list of tuple-like types

• Because enumerate_view::iterator::operator* returns values, enumerate_view::iterator cannot be a Cpp17ForwardIterator. Change iterator_category and add iterator_concept accordingly.

R5

Instead of adding complexity to enumerate_result, we assume changes made by P2165R2 [2]. P2165R2 [2] makes pair constructible from pair-like objects, and associative containers deduction guides work with ranges of pair-like objects. With these changes, enumerate_result can remain a simple aggregate. We just need to implement the tuple protocol for it (get, tuple_element, tuple_size).

For simplicity, consistency with zip and cartesian_product and to avoid enumerate_result propagating, the reference type of enumerate_view is enumerate_result and its value type is tuple.

P2165R2 [2] ensures a common reference exists as long as one exists between each element. count_type is renamed to index_type. I am not sure why I ever chose count_type as the initial name.
This revision is intended to illustrate the effort necessary to support named fields for index and value. In previous revisions, the value and reference types were identical, a regrettable blunder that made the wording and implementation efforts smaller than they are. reference and value_type types however needs to be different, if only to make the ranges::to presented in this very paper.

If that direction is acceptable, better wording will be provided to account for these new reference and value_type types.

This revision also gets rid of the const index value as LEWG strongly agreed that it was a terrible idea to begin with, one that would make composition with other views cumbersome.

R3

- Typos and minor wording improvements

R2, following mailing list reviews

- Make value_type different from reference to match other views
- Remove inconsistencies between the wording and the description
- Add relevant includes and namespaces to the examples

R1

- Fix the index type

<table>
<thead>
<tr>
<th>Before</th>
<th>After</th>
</tr>
</thead>
</table>

```c++
#include <ranges>
std::vector days{"Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun"};
int idx = 0;
for(const auto & d : days) {
    print("{} {} \n", idx, d);
    idx++;
}
```

```c++
std::vector days{"Mon", "Tue", "Wed", "Thu", "Fri", "Sat", "Sun"};
for(const auto & e : std::views::enumerate(days)) {
    print("{} {} \n", e.index, e.value);
}
```
Motivation

The impossibility to extract an index from a range-based for loop leads to the use of non-range-based for loops, or the introduction of a variable in the outer scope. This is both more verbose and error-prone: in the example above, the type of \( \text{idx} \) is incorrect.

\textit{enumerate} is a library solution solving this problem, enabling the use of range-based for loops in more cases.

It also composes nicely with other range facilities: The following creates a map from a vector using the position of each element as key.

\begin{verbatim}
my_vector | views::enumerate | ranges::to<map>;
\end{verbatim}

This feature exists in some form in Python, Rust, Go (backed into the language), and in many C++ libraries: ranges-v3, folly, boost::ranges (indexed).

The existence of this feature or lack thereof is the subject of recurring StackOverflow questions.

Design

The reference type is a simple aggregate with name members

Following the trend of using meaningful names instead of returning pairs or tuples, this proposal uses a struct with named public members.

\begin{verbatim}
struct enumerate_result {
    count index;
    T value;
};
\end{verbatim}

This design was previously discussed by LEWGI in Belfast in the context of \texttt{P1894R0} \[4\], and many people have expressed a desire for such struct with names. Using this struct for both the reference type and the value type would add significant complexity, as the value and reference type need to share a \texttt{common_reference} (see \texttt{P2164R4} \[1\]).

Instead, we propose that the reference type is \texttt{enumerate_result<index, range_reference_t<Base>}> and the value type is \texttt{tuple<index, range_value_t<Base>>}.

With is design, only \texttt{get}, \texttt{tuple_element}, \texttt{tuple_size} need to be implemented for \texttt{enumerate_result}, and \texttt{enumerate_result} remains a simple aggregate.

This design works nicely with \texttt{ranges::to} as it will create a container based on the value type:

\begin{verbatim}
std::vector<double> v;
enumerate(view) | to<std::vector>(); // std::vector<std::tuple<std::size_t, double>>.
enumerate(view) | to<std::map>(); // std::map<std::size_t, double>.
\end{verbatim}

This gives us some consistency: \texttt{enumerate}'s value type is a tuple, similar to that of \texttt{zip}, \texttt{carthesian_product}, while retaining the ease of use and added benefits of a struct with named members while iterating over an \texttt{enumerate_view}. 

3
Why not just always return a tuple/pair and rely on structure binding?

If a range reference type is convertible to the index type, it is error-prone whether one should write

```cpp
for(auto && [value, index] : view | std::views::enumerate)
for(auto && [index, value] : view | std::views::enumerate)
```

Having named members avoids this issue. The feedback I keep getting is “we should use a struct if we can”. Which is consistent with previous LEWG guidelines to avoid using pair when a more meaningful type is possible.

And we can. The proposed design in R5 is not involved. Keep in mind that zipping the view with iota does not actually work (see also P2214R0 [3]), and a custom `index_view` would need to be used as the first range composed with `zip`, so a custom `enumerate` view with appropriately named members is not adding a lot of work if we pursue P2165R2 [2].

Granted, P2165R2 [2] and this paper justify each other, and P2165R2 [2] is not a trivial amount of work. However, P2165 offers further benefits besides enabling a slightly nicer `enumerate`, so if we think P2165 is generally useful, we can pursue this paper. If we don’t, we can quickly respecify `enumerate` in terms of `zip` and some `index_view`, for which we have usage experience.

`enumerate` as presented here is slightly less work for the compiler, but both solutions generate similar assembly.

**index_type**

`index_type` is defined as follow:

- `ranges::range_size_t<Base>` if `Base` models `ranges::sized_range`
- Otherwise, `make_unsigned_t<ranges::range_difference_t<Base>>`

This is consistent with ranges-v3 and allows the view to support both sized and non-sized ranges.

**Performance**

An optimizing compiler can generate the same machine code for `views::enumerate` as it would for an equivalent `for` loop. Compiler Explorer [Editor’s note: This implementation is a prototype not fully reflective of the proposed design].

**Implementation**

This proposal has been implemented (Github) There exist an implementation in ranges-v3 (where the enumerate view uses `zip_with` and a pair value type).
Proposal

We propose a view `enumerate` whose value type is a struct with 2 members `index` and `value` representing respectively the position and value of the elements in the adapted range.

Wording

[Editor's note: TODO: ranges synopsis]

Concept `tuple-like` [tupple.like]

```cpp
template <typename T>
concept tuple-like = see below;                  // exposition only
```

A type `T` models and satisfies the exposition-only concept `tuple-like` if `std::remove_cvref_t<T>` is a specialization of `array`, `pair`, `tuple`, `ranges::enumerate_result`, or `ranges::subrange`.

Enumerate view [range.enumerate]

Overview [range.enumerate.overview]

`enumerate_view` presents a view with a value type that represents both the position and value of the adapted view's value-type.

The name `views::enumerate` denotes a range adaptor object. Given the subexpressions `E` the expression `views::enumerate(E)` is expression-equivalent to `enumerate_view{E}`.

[Example:

```cpp
vector<int> vec{ 1, 2, 3 };    
for (auto [index, value] : enumerate(vec) )
    cout << index << ":" << value ' '; // prints: 0:1 1:2 2:3
 — end example]
```

Class template `enumerate_view` [range.enumerate.view]

```cpp
namespace std::ranges {
    template <class Index, class Value>
    struct enumerate_result {
        Index index;
        Value value;
    };

    template<size_t I, class Index, class Value>
    constexpr tuple_element_t<I, enumerate_result<Index, Value>>&
    get(enumerate_result<Index, Value>&) noexcept;
}
```
template<size_t I, class Index, class Value>
constexpr tuple_element_t<I, enumerate_result<Index, Value>>&&
get(enumerate_result<Index, Value>&&) noexcept;

template<size_t I, class Index, class Value>
constexpr const tuple_element_t<I, enumerate_result<Index, Value>>&
get(const enumerate_result<Index, Value>&) noexcept;

template<size_t I, class Index, class Value>
constexpr const tuple_element_t<I, enumerate_result<Index, Value>>&&
get(const enumerate_result<Index, Value>&&) noexcept;

template<input_range V>
requires view<V>
class enumerate_view : public view_interface<enumerate_view<V>> {

private:
  V base_ = {};

  template <bool Const>
  class iterator; // exposition only
  template <bool Const>
  struct sentinel; // exposition only

public:

  constexpr enumerate_view() = default;
  constexpr enumerate_view(V base);

  constexpr auto begin() requires (!simple_view<V>)
  { return iterator<false>(ranges::begin(base_), 0); } 

  constexpr auto begin() const requires simple_view<V>
  { return iterator<true>(ranges::begin(base_), 0); } 

  constexpr auto end()
  { return sentinel<false>{end(base_)}; } 

  constexpr auto end()
  requires common_range<V> && sized_range<V>
  { return iterator<false>{ranges::end(base_),
      static_cast<range_difference_t<V>>(size()) }; } 

  constexpr auto end() const
  requires range<const V>
  { return sentinel<true>{ranges::end(base_)}; } 

  constexpr auto end() const
  requires common_range<const V> && sized_range<V>
  { return iterator<true>{ranges::end(base_),
      static_cast<range_difference_t<V>>(size())}; } 

}
constexpr auto size() requires sized_range<V>
{ return ranges::size(base_); }

constexpr auto size() const requires sized_range<const V>
{ return ranges::size(base_); }

constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return move(base_); }

namespace std {

    template<class Index, class Value>
    struct tuple_size<ranges::enumerate_result<Index, Value>> : integral_constant<size_t, 2> { }

    template<size_t I, class Index, class Value>
    struct tuple_element<I, ranges::enumerate_result<Index, Value>> {
        using type = see below ;
    }

    template<size_t I, class Index, class Value>
    constexpr tuple_element_t<I, enumerate_result<Index, Value>>&
    get(enumerate_result<Index, Value>& r) noexcept;

    template<size_t I, class Index, class Value>
    constexpr tuple_element_t<I, enumerate_result<Index, Value>>&&
    get(enumerate_result<Index, Value>&& r) noexcept;

    template<size_t I, class Index, class Value>
    constexpr const tuple_element_t<I, enumerate_result<Index, Value>>&
    get(const enumerate_result<Index, Value>& r) noexcept;

    template<size_t I, class Index, class Value>
    constexpr const tuple_element_t<I, enumerate_result<Index, Value>>&&
    get(const enumerate_result<Index, Value>&& r) noexcept;
}

Mandates: I < 2.

Type: The type Index if I is 0, otherwise the type Value.
get(const enumerate_result<Index, Value>&& r) noexcept;

_Mandates:_ \( I < 2 \). _Returns:_
- if \( I \) is 0, returns a reference to \( r._\text{index} \).
- if \( I \) is 1, returns a reference to \( r._\text{value} \).

constexpr enumerate_view(V base);

_Effects:_ Initializes `base_` with `move(base)`.

◆ **Class `enumerate_view::iterator`**  

```cpp
namespace std::ranges {
    template<input_range V>
        requires view<V>
    template<bool Const>
        class enumerate_view<V>::iterator {

        using Base = conditional_t<Const, const V, V>;
        using index_type = see below;

        iterator_t<Base> current_ = iterator_t<Base>();
        index_type pos_ = 0;

        public:
            using iterator_category = input_iterator_tag;
            using iterator_concept = see below;

            using reference = enumerate_result<index_type, range_reference_t<Base>>;
            using value_type = tuple<index_type, range_value_t<Base>>;

            using difference_type = range_difference_t<Base>;

            iterator() = default;
            constexpr explicit iterator(iterator_t<Base> current, range_difference_t<Base> pos);
            constexpr iterator(iterator<!Const> i)
                requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
            constexpr iterator_t<Base> base() const&
                requires copyable<iterator_t<Base>>;
            constexpr iterator_t<Base> base() &&;

            constexpr decltype(auto) operator*() const {
                return reference{pos_, *current_};
            }

            constexpr iterator& operator++();
    }
}
```
constexpr void operator++(int) requires (!forward_range<Base>);
constexpr iterator operator++(int) requires forward_range<Base>;

constexpr iterator& operator--() requires bidirectional_range<Base>;
constexpr iterator operator--(int) requires bidirectional_range<Base>;

constexpr iterator& operator+=(difference_type x)
requires random_access_range<Base>;
constexpr iterator& operator+=(difference_type x)
requires random_access_range<Base>;

constexpr decltype(auto) operator[]((difference_type n) const
requires random_access_range<Base>
{
    return reference{static_cast<difference_type>(pos_ + n), *(current_ + n)};
}

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires equality_comparable<iterator_t<Base>>;

friend constexpr bool operator<(const iterator& x, const iterator& y)
requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

friend constexpr iterator operator+(const iterator& x, difference_type y)
requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type x, const iterator& y)
requires random_access_range<Base>;
friend constexpr iterator operator-(const iterator& x, difference_type y)
requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y)
requires random_access_range<Base>;

};

iterator::iterator_concept is defined as follows:

• If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.

• Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.

• Otherwise, if Base models forward_range, then iterator_concept iterator_concept denotes forward_iterator_tag.
• Otherwise, iterator_concept denotes input_iterator_tag.

**iterator::index_type** is defined as follow:

• ranges::range_size_t<Base> if Base models ranges::sized_range
• Otherwise, make_unsigned_t<ranges::range_difference_t<Base>>

```cpp
constexpr explicit iterator(iterator_t<Base> current, range_difference_t<Base> pos = 0);
```

*Effects:* Initializes current_ with move(current) and pos with static_cast<index_type>(pos).

```cpp
constexpr iterator(iterator<!Const> i)
requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

*Effects:* Initializes current_ with move(i.current_) and pos with i.pos_.

```cpp
constexpr iterator_t<Base> base() const&
requires copyable<iterator_t<Base>>;
```

*Effects:* Equivalent to: return current_;

```cpp
constexpr iterator_t<Base> base() &&;
```

*Effects:* Equivalent to: return move(current_);

```cpp
constexpr iterator& operator++();
```

*Effects:* Equivalent to:

```cpp
++pos;
++current_;
return *this;
```

```cpp
constexpr void operator++(int) requires (!forward_range<Base>);
```

*Effects:* Equivalent to:

```cpp
++pos;
++current_;
```

```cpp
constexpr iterator operator++(int) requires forward_range<Base>;
```

*Effects:* Equivalent to:

```cpp
auto temp = *this;
++pos;
++current_; return temp;
```

```cpp
constexpr iterator& operator--() requires bidirectional_range<Base>;
```
**Effects:** Equivalent to:

```cpp
--pos_;  
--current_;  
return *this;
```

constexpr iterator operator--(int) requires bidirectional_range<Base>;

**Effects:** Equivalent to:

```cpp
auto temp = *this;  
--current_;  
--pos_;  
return temp;
```

constexpr iterator& operator+=(difference_type n);  
requires random_access_range<Base>;

**Effects:** Equivalent to:

```cpp
current_ += n;  
pos_ += n;  
return *this;
```

constexpr iterator& operator-=(difference_type n)  
requires random_access_range<Base>;

**Effects:** Equivalent to:

```cpp
current_ -= n;  
pos_ -= n;  
return *this;
```

friend constexpr bool operator==(const iterator& x, const iterator& y)  
requires equality_comparable<Base>;

**Effects:** Equivalent to: return x.current_ == y.current_;
