 const tuple_element_t<I, tuple<Types...>>&
 get(const tuple<Types...>& t) noexcept; // Note B

template<
 size_t I,
 class... Types>
 constexpr
 tuple_element_t<I, tuple<Types...>>& get(const tuple<Types...>&& t) noexcept;

Mandates: I < sizeof...(Types).

Returns: A reference to the Ith element of t, where indexing is zero-based.

[Note 1: [Note A] If a type T in Types is some reference type X&, the return type is X&, not X&&. However, if the element type is a non-reference type T, the return type is T&&. —end note]

[Note 2: [Note B] Constness is shallow. If a type T in Types is some reference type X&, the return type is X&, not const X&. However, if the element type is a non-reference type T, the return type is const T&. This is consistent with how constness is defined to work for non-static data members of reference type. —end note]

template<class T, class... Types>
 constexpr
 T&
 get(tuple<Types...>& t) noexcept;

template<class T, class... Types>
 constexpr
 T&&
 get(tuple<Types...>&& t) noexcept;

template<class T, class... Types>
 constexpr
 const T&
 get(const tuple<Types...>& t) noexcept;

template<class T, class... Types>
 constexpr
 const T&&
 get(const tuple<Types...>&& t) noexcept;

Mandates: The type T occurs exactly once in Types.

Returns: A reference to the element of t corresponding to the type T in Types.

[Example 1:]

const tuple<int, const int, double, double> t(1, 2, 3.4, 5.6);
const int& i1 = get<int>(t); // OK, i1 has value 1
const int& i2 = get<const int>(t); // OK, i2 has value 2
const double& d = get<double>(t); // error: type double is not unique within t
—end example

[Note 3: The reason get is a non-member function is that if this functionality had been provided as a member function, code where the type depended on a template parameter would have required using the template keyword. —end note]

22.4.9 Relational operators

template<class... TTypes, class... UTypes>
constexpr bool operator==(const tuple<TTypes...>& t, const tuple<UTypes...>& u);

For the first overload let UTuple be tuple<UTypes>...

Mandates: For all i, where 0 ≤ i < sizeof...(TTypes), get<i>(t) == get<i>(u) is a valid expression. sizeof...(TTypes) equals tuple_size_v<UTuple>.

Preconditions: For all i, decltype(get<i>(t) == get<i>(u)) models boolean-testable.

Returns: true if get<i>(t) == get<i>(u) for all i, otherwise false.

[Note 1: If sizeof...(TTypes) equals zero, returns true. —end note]

Remarks:
(5.1) The elementary comparisons are performed in order from the zeroth index upwards. No comparisons or element accesses are performed after the first equality comparison that evaluates to false.

(5.2) The second overload is to be found via argument-dependent lookup (6.5.4) only.

Effects: Performs a lexicographical comparison between t and u. If sizeof...(TTypes) equals zero, returns strong_ordering::equal. Otherwise, equivalent to:

if (auto c = synth-three-way(get<0>(t), get<0>(u)); c != 0) return c;
return t_tail <=> u_tail;

where r_tail for some r is a tuple containing all but the first element of r.

Remarks: The second overload is to be found via argument-dependent lookup (6.5.4) only.

[Note 2: The above definition does not require t_tail (or u_tail) to be constructed. It might not even be possible, as t and u are not required to be copy constructible. Also, all comparison operator functions are short circuited; they do not perform element accesses beyond what is required to determine the result of the comparison. —end note]

22.4.10 common_reference related specializations

In the descriptions that follow:
(1.1) Let TTypes be a pack formed by the sequence of tuple_element_t<i>, TTuple> for every integer 0 ≤ i < tuple_size_v<TTuple>.

(1.2) Let UTypes be a pack formed by the sequence of tuple_element_t<i>, UTuple> for every integer 0 ≤ i < tuple_size_v<UTuple>.

Constraints:

§ 22.4.10 703
TTuple is a specialization of tuple or UTuple is a specialization of tuple.

— is_same_v<TTuple, decay_t<TTuple>> is true.
— is_same_v<UTuple, decay_t<UTuple>> is true.
— tuple_size_v<TTuple> equals tuple_size_v<UTuple>.
— tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...> denotes a type.

The member typedef-name type denotes the type tuple<common_reference_t<TQual<TTypes>, UQual<UTypes>>...>.

```
template<tuple-like TTuple, tuple-like UTuple>
struct common_type<TTuple, UTuple> {
    using type = see below;
};
```

22.4.11 Tuple traits

template<class... Types, class Alloc>
struct uses_allocator<tuple<Types...>, Alloc> : true_type { };

1 Preconditions: Alloc meets the Cpp17Allocator requirements (16.4.4.6.1).

2 [Note 1: Specialization of this trait informs other library components that tuple can be constructed with an
   allocator, even though it does not have a nested allocator_type. — end note]

22.4.12 Tuple specialized algorithms

template<class... Types>
constexpr void swap(tuple<Types...>& x, tuple<Types...>& y) noexcept(see below);
```
template<class... Types>
constexpr void swap(const tuple<Types...>& x, const tuple<Types...>& y) noexcept(see below);
```

1 Constraints:

(1.1) — For the first overload, (is_swappable_v<Types> && ...) is true.
(1.2) — For the second overload, (is_swappable_v<const Types> && ...) is true.

2 Effects: As if by x.swap(y).

3 Remarks: The exception specification is equivalent to:
   noexcept(x.swap(y))

22.5 Optional objects

22.5.1 In general

1 Subclause 22.5 describes class template optional that represents optional objects. An optional object is an
   object that contains the storage for another object and manages the lifetime of this contained object, if any.
   The contained object may be initialized after the optional object has been initialized, and may be destroyed
   before the optional object has been destroyed. The initialization state of the contained object is tracked by
   the optional object.

22.5.2 Header <optional> synopsis

```
#include <compare>  // see 17.11.1
```
namespace std {  
  // 22.5.3, class template optional
  template<class T>
  class optional;

  template<class T>
  concept is-derived-from-optional = requires(const T& t) { 
    [](class U>(const optional<U>&){ }(t); 
    
  };

  // 22.5.4, no-value state indicator
  struct nullopt_t{ see below};
  inline constexpr nullopt_t nullopt(unspecified);

  // 22.5.5, class bad_optional_access
  class bad_optional_access;

  // 22.5.6, relational operators
  template<class T, class U>
  constexpr bool operator==(const optional<T>&, const optional<U>&);
  template<class T, class U>
  constexpr bool operator!=(const optional<T>&, const optional<U>&);
  template<class T, class U>
  constexpr bool operator<(const optional<T>&, const optional<U>&);
  template<class T, class U>
  constexpr bool operator>(const optional<T>&, const optional<U>&);
  template<class T, class U>
  constexpr bool operator<=(const optional<T>&, const optional<U>&);
  template<class T, class U>
  constexpr bool operator>=(const optional<T>&, const optional<U>&);
  template<class T, class U>
  constexpr compare_three_way_result_t<T, U>  
  operator<=>(const optional<T>&, const optional<U>&);

  // 22.5.7, comparison with nullopt
  template<class T> constexpr bool operator==(const optional<T>&, nullopt_t) noexcept;
  template<class T>
  constexpr strong_ordering operator<=>(const optional<T>&, nullopt_t) noexcept;

  // 22.5.8, comparison with T
  template<class T, class U> constexpr bool operator==(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator==(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator!=(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator!=(const T&, const optional<U>&);
  template<class T, class U> constexpr bool operator<(const optional<T>&, const U&);
  template<class T, class U> constexpr bool operator<(const T&, const optional<U>&);
  template<class T, class U>
  requires (!is-derived-from-optional<U> && three_way_comparable_with<T, U> 
  operator<=>(const optional<T>&, const U&);

  // 22.5.9, specialized algorithms
  template<class T>
  constexpr void swap(optional<T>&, optional<T>&) noexcept(see below);

  template<class T>
  constexpr optional<see below> make_optional(T&&);
template<class T, class... Args>
constexpr optional<T> make_optional(Args&&... args);

template<class T, class U, class... Args>
constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);

// 22.5.10, hash support
template<class T> struct hash;
namespace std {
    template<class T> struct hash<optional<T>>;
}

22.5.3 Class template optional

22.5.3.1 General

namespace std {
    template<class T>
    class optional {
    public:
        using value_type = T;

        // 22.5.3.2, constructors
        constexpr optional() noexcept;
        constexpr optional(nullopt_t) noexcept;
        constexpr optional(const optional&);
        constexpr optional(optional&&) noexcept;
        template<class... Args>
        constexpr explicit optional(in_place_t, Args&&...);
        template<class U, class... Args>
        constexpr explicit optional(in_place_t, initializer_list<U>, Args&&...);
        template<class U = T>
        constexpr explicit(optional(U&&));
        template<class U>
        constexpr explicit(const optional<U>&);
        template<class U>
        constexpr explicit(optional<U>&&);

        // 22.5.3.3, destructor
        constexpr ~optional();

        // 22.5.3.4, assignment
        constexpr optional& operator=(nullopt_t) noexcept;
        constexpr optional& operator=(const optional&);
        constexpr optional& operator=(optional&&) noexcept;
        template<class U = T> constexpr optional& operator=(U&&);
        template<class U>
        constexpr optional& operator=(const optional<U>&);
        template<class U>
        constexpr optional& operator=(optional<U>&&);

        // 22.5.3.5, swap
        constexpr void swap(optional&) noexcept;

        // 22.5.3.6, observers
        constexpr const T* operator->() const noexcept;
        constexpr T* operator->() noexcept;
        constexpr const T& operator*() const & noexcept;
        constexpr T& operator*() & noexcept;
        constexpr T&& operator*() && noexcept;
        constexpr const T&& operator*() const && noexcept;
        constexpr explicit operator bool() const noexcept;
        constexpr bool has_value() const noexcept;
        constexpr const T& value() const &;
        constexpr T& value() &;
        constexpr T&& value() &&;
    }
}
template<class U> constexpr T value_or(U&&) const &;

template<class U> constexpr T value_or(U&&) &&;

// 22.5.3.7, monadic operations

template<class F> constexpr auto and_then(F&& f) &;

template<class F> constexpr auto and_then(F&& f) &&;

template<class F> constexpr auto and_then(F&& f) const &;

template<class F> constexpr auto and_then(F&& f) const &&;

template<class F> constexpr auto transform(F&& f) &;

template<class F> constexpr auto transform(F&& f) &&;

template<class F> constexpr auto transform(F&& f) const &;

template<class F> constexpr auto transform(F&& f) const &&;

// 22.5.3.8, modifiers

templatexpr void reset() noexcept;

private:
    T *val; // exposition only

};

template<class T>
optional(T) -> optional<T>;

1 Any instance of optional<T> at any given time either contains a value or does not contain a value. When an instance of optional<T> contains a value, it means that an object of type T, referred to as the optional object’s contained value, is allocated within the storage of the optional object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate its contained value. When an object of type optional<T> is contextually converted to bool, the conversion returns true if the object contains a value; otherwise the conversion returns false.

2 When an optional<T> object contains a value, member val points to the contained value.

3 T shall be a type other than cvin_place_t or cnullopt_t that meets the Cpp17Destructible requirements (Table 36).

22.5.3.2 Constructors [optional_ctor]  

1 The exposition-only variable template converts-from-any-cvref is used by some constructors for optional.

2 Postconditions: *this does not contain a value.

3 Remarks: No contained value is initialized. For every object type T these constructors are constexpr constructors (9.2.6).

4 Effects: If rhs contains a value, direct-non-list-initializes the contained value with *rhs.

5 Postconditions: rhs.has_value() == this->has_value().

6 Throws: Any exception thrown by the selected constructor of T.

7 Remarks: This constructor is defined as deleted unless is_copy_constructible_v<T> is true. If is_trivially_copy_constructible_v<T> is true, this constructor is trivial.
constexpr optional(optional&& rhs) noexcept(see below);

Constraints: is_move_constructible_v<T> is true.

Effects: If rhs contains a value, direct-non-list-initializes the contained value with std::move(*rhs). rhs.has_value() is unchanged.

Postconditions: rhs.has_value() == this->has_value().

Throws: Any exception thrown by the selected constructor of T.

Remarks: The exception specification is equivalent to is_nothrow_move_constructible_v<T>. If is_trivially_move_constructible_v<T> is true, this constructor is trivial.

template<class... Args> constexpr explicit optional(in_place_t, Args&&... args);

Constraints: is_constructible_v<T, Args...> is true.

Effects: Direct-non-list-initializes the contained value with std::forward<Args>(args)....

Postconditions: *this contains a value.

Throws: Any exception thrown by the selected constructor of T.

Remarks: If T's constructor selected for the initialization is a constexpr constructor, this constructor is a constexpr constructor.

template<class U, class... Args>
constexpr explicit optional(in_place_t, initializer_list<U> il, Args&&... args);

Constraints: is_constructible_v<T, initializer_list<U>&, Args...> is true.

Effects: Direct-non-list-initializes the contained value with il, std::forward<Args>(args)....

Postconditions: *this contains a value.

Throws: Any exception thrown by the selected constructor of T.

Remarks: If T's constructor selected for the initialization is a constexpr constructor, this constructor is a constexpr constructor.

template<class U = T> constexpr explicit(optional<U&& v);

Constraints:
(28.1) is_constructible_v<T, const U&> is true, and
(28.2) converts-from-any-cvref<T, optional<U>> is false.

Effects: If rhs contains a value, direct-non-list-initializes the contained value with *rhs.

Postconditions: rhs.has_value() == this->has_value().

Throws: Any exception thrown by the selected constructor of T.

Remarks: The expression inside explicit is equivalent to:

!is_convertible_v<U, T>

template<class U> constexpr explicit(see below) optional(const optional<U>& rhs);

Constraints:
(28.1) is_constructible_v<T, const U&> is true, and
(28.2) converts-from-any-cvref<T, optional<U>> is false.

Effects: If rhs contains a value, direct-non-list-initializes the contained value with *rhs.

Postconditions: rhs.has_value() == this->has_value().

Throws: Any exception thrown by the selected constructor of T.

Remarks: The expression inside explicit is equivalent to:

!is_convertible_v<const U&, T>

template<class U> constexpr explicit(see below) optional(optional<U>&& rhs);

Constraints:
(33.1) is_constructible_v<T, U> is true, and
— converts-from-any-cvref\(<T\), optional\(<U>\)) is false.

**Effects:** If \(\text{rhs}\) contains a value, direct-non-list-initializes the contained value with \(\text{std::move(*rhs)}\). \(\text{rhs}\).\text{has_value()} is unchanged.

**Postconditions:** \(\text{rhs}\).\text{has_value()} == \text{this}->\text{has_value()}.

**Throws:** Any exception thrown by the selected constructor of \(T\).

**Remarks:** The expression inside \text{explicit} is equivalent to:

\[
!\text{is_convertible_v}<U, T>
\]

### 22.5.3.3 Destructor

```cpp
constexpr ~optional();
```

**Effects:** If \text{is_trivially_destructible_v}<\(T\) != true \text{and} \text{val}->\text{T}::\text{T}() \text{calls}

**Remarks:** If \text{is_trivially_destructible_v}<\(T\) is true, then this destructor is trivial.

### 22.5.3.4 Assignment

```cpp
constexpr optional\(<T>\)& operator=(nullopt_t) noexcept;
```

**Effects:** If \text{this} contains a value, calls \text{val}->\text{T}::\text{T}() to destroy the contained value; otherwise no effect.

**Postconditions:** \text{this} does not contain a value.

**Returns:** \text{this}.

```cpp
constexpr optional\(<T>\)& operator=(const optional& \text{rhs});
```

**Effects:** See Table 59.

**Table 59: optional::operator=(const optional& \text{effects})**

<table>
<thead>
<tr>
<th>\text{rhs contains a value}</th>
<th>\text{rhs does not contain a value}</th>
</tr>
</thead>
<tbody>
<tr>
<td>assigns \text{rhs} to the contained value</td>
<td>destroys the contained value by calling \text{val}-&gt;\text{T}::\text{T}()</td>
</tr>
<tr>
<td>direct-non-list-initializes the contained value with \text{*rhs}</td>
<td>no effect</td>
</tr>
</tbody>
</table>

**Postconditions:** \text{rhs}.\text{has_value()} == \text{this}->\text{has_value()}.

**Returns:** \text{this}.

**Remarks:** If any exception is thrown, the result of the expression \text{this}->\text{has_value()} remains unchanged. If an exception is thrown during the call to \text{T}'s copy constructor, no effect. If an exception is thrown during the call to \text{T}'s copy assignment, the state of its contained value is as defined by the exception safety guarantee of \text{T}'s copy assignment. This operator is defined as deleted unless \text{is_trivially_copy_constructible_v}<\(T\) \text{and} \text{is_trivially_copy_assignable_v}<\(T\) \text{is true. If \text{is_trivially_copy_constructible_v}<\(T\) \text{and} \text{is_trivially_copy_assignable_v}<\(T\) \text{is true, this assignment operator is trivial.}

```cpp
constexpr optional& operator=(optional&& \text{rhs}) noexcept(see below);
```

**Constraints:** \text{is_move_constructible_v}<\(T\) \text{is true and} \text{is_move_assignable_v}<\(T\) \text{is true.}

**Effects:** See Table 60. The result of the expression \text{rhs}.\text{has_value()} remains unchanged.

**Postconditions:** \text{rhs}.\text{has_value()} == \text{this}->\text{has_value()}.

**Returns:** \text{this}.

**Remarks:** The exception specification is equivalent to:

\[
\text{is_nothrow_move_assignable_v}<\(T\) \text{and} \text{is_nothrow_move_constructible_v}<\(T\)
\]
Table 60: `optional::operator=(optional&&)` effects

<table>
<thead>
<tr>
<th>*this contains a value</th>
<th>*this does not contain a value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rhs contains a value</strong></td>
<td>assigns <code>std::move(*rhs)</code> to the contained value</td>
</tr>
<tr>
<td><strong>rhs does not contain a value</strong></td>
<td>destroys the contained value by calling <code>val-&gt;T::~T()</code></td>
</tr>
</tbody>
</table>

If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T’s move constructor, the state of `*rhs.val` is determined by the exception safety guarantee of T’s move constructor. If an exception is thrown during the call to T’s move assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of T’s move assignment. If `is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T> && is_trivially_destructible_v<T>` is true, this assignment operator is trivial.

```
template<class U = T> constexpr optional<T>& operator=(U&& v);
```

**Constraints:**

1. `is_constructible_v<T, const U&>` is true,
2. `is_assignable_v<T&, const U&>` is true,
3. `converts-from-any-cvref_t<T, optional<U>>` is false,
4. `is_assignable_v<T&, optional<U>&>` is false,
5. `is_assignable_v<T&, optional<U>&&>` is false,
6. `is_assignable_v<T&, const optional<U>&>` is false, and
7. `is_assignable_v<T&, const optional<U>&&>` is false.

**Effects:** See Table 61.

```
template<class U> constexpr optional<T>& operator=(const optional<U>& rhs);
```

**Constraints:**

1. `is_same_v<remove_cvref_t<const optional<U>>, optional<T>>` is false,
2. `is_same_v<remove_cvref_t<U>, optional<T>>` is false,
3. `is_same_v<decay_t<U>, T>` is false, `is_constructible_v<T, U>` is true, and `is_assignable_v<T&, U>` is true.

**Effects:** If `*this` contains a value, assigns `std::forward<U>(v)` to the contained value; otherwise direct-non-list-initializes the contained value with `std::forward<U>(v)`.

**Postconditions:** `*this` contains a value.

**Returns:** `*this`.

**Remarks:** If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T’s constructor, the state of `v` is determined by the exception safety guarantee of T’s constructor. If an exception is thrown during the call to T’s assignment, the state of `*val` and `v` is determined by the exception safety guarantee of T’s assignment.

Table 61: `optional::operator=(const optional<U>&)` effects

<table>
<thead>
<tr>
<th>*this contains a value</th>
<th>*this does not contain a value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rhs contains a value</strong></td>
<td>assigns <code>*rhs</code> to the contained value</td>
</tr>
<tr>
<td><strong>rhs does not contain a value</strong></td>
<td>destroys the contained value by calling <code>val-&gt;T::~T()</code></td>
</tr>
</tbody>
</table>

**Postconditions:** `rhs.has_value() == this->has_value()`.

**Returns:** `*this`.

§ 22.5.3.4
Remarks: If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's constructor, the state of `*rhs.val` is determined by the exception safety guarantee of T's constructor. If an exception is thrown during the call to T's assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of T's assignment.

```cpp
template<class U> constexpr optional<T>& operator=(optional<U>&& rhs);
```

Constraints:
- (24.1) `is_constructible_v<T, U>` is true,
- (24.2) `isAssignable_v<T&, U>` is true,
- (24.3) `converts-from-any-cvref<T, optional<U>>` is false,
- (24.4) `isAssignable_v<T&, optional<U>&>` is false,
- (24.5) `isAssignable_v<T&, optional<U>&&>` is false,
- (24.6) `isAssignable_v<T&, const optional<U>&>` is false, and
- (24.7) `isAssignable_v<T&, const optional<U>&&>` is false.

Effects: See Table 62. The result of the expression `rhs.has_value()` remains unchanged.

Table 62: `optional::operator=(optional<U>&&)` effects

<table>
<thead>
<tr>
<th><code>*this</code> contains a value</th>
<th><code>*this</code> does not contain a value</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>rhs contains a value</strong></td>
<td>assigns <code>std::move(*rhs)</code> to the contained value</td>
</tr>
<tr>
<td><strong>rhs does not contain a value</strong></td>
<td>destroys the contained value by calling <code>val-&gt;T::~T()</code></td>
</tr>
</tbody>
</table>

Postconditions: `rhs.has_value() == this->has_value()`.

Returns: `*this`.

Remarks: If any exception is thrown, the result of the expression `this->has_value()` remains unchanged. If an exception is thrown during the call to T's constructor, the state of `*rhs.val` is determined by the exception safety guarantee of T's constructor. If an exception is thrown during the call to T's assignment, the state of `*val` and `*rhs.val` is determined by the exception safety guarantee of T's assignment.

```cpp
template<class... Args> constexpr T& emplace(Args&&... args);
```

Mandates: `is_constructible_v<T, Args...>` is true.

Effects: Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `std::forward<Args>(args)....`

Postconditions: `*this` contains a value.

Returns: A reference to the new contained value.

Throws: Any exception thrown by the selected constructor of T.

Remarks: If an exception is thrown during the call to T's constructor, `*this` does not contain a value, and the previous `*val` (if any) has been destroyed.

```cpp
template<class U, class... Args> constexpr T& emplace(initializer_list<U> il, Args&&... args);
```

Constraints: `is_constructible_v<T, initializer_list<U>&, Args...>` is true.

Effects: Calls `*this = nullopt`. Then direct-non-list-initializes the contained value with `il, std::forward<Args>(args)....`

Postconditions: `*this` contains a value.

Returns: A reference to the new contained value.

§ 22.5.3.4
39        **Throws:** Any exception thrown by the selected constructor of T.

40        **Remarks:** If an exception is thrown during the call to T’s constructor, *this does not contain a value, and the previous *val (if any) has been destroyed.

### 22.5.3.5 Swap

```cpp
constexpr void swap(optional& rhs) noexcept(see below);
```

**Mandates:** is_move_constructible_v<T> is true.

**Preconditions:** T meets the Cpp17Swappable requirements (16.4.4.3).

**Effects:** See Table 63.

<table>
<thead>
<tr>
<th><strong>rhs contains a value</strong></th>
<th><strong>rhs does not contain a value</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>*this contains a value</td>
<td>*this does not contain a value</td>
</tr>
<tr>
<td>calls swap(*(*this), *rhs)</td>
<td>direct-non-list-initializes the contained value of *this with std::move(*rhs), followed by rhs.val-&gt;T::~T(); postcondition is that *this contains a value and rhs does not contain a value</td>
</tr>
<tr>
<td>direct-non-list-initializes the contained value of rhs with std::move(*(*this)), followed by val-&gt;T::~T(); postcondition is that *this does not contain a value and rhs contains a value</td>
<td>no effect</td>
</tr>
</tbody>
</table>

**Throws:** Any exceptions thrown by the operations in the relevant part of Table 63.

**Remarks:** The exception specification is equivalent to:

is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T>

If any exception is thrown, the results of the expressions this->has_value() and rhs.has_value() remain unchanged. If an exception is thrown during the call to function swap, the state of *val and *rhs.val is determined by the exception safety guarantee of swap for lvalues of T. If an exception is thrown during the call to T’s move constructor, the state of *val and *rhs.val is determined by the exception safety guarantee of T’s move constructor.

### 22.5.3.6 Observers

```cpp
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
```

**Preconditions:** *this contains a value.

**Returns:** val.

**Remarks:** These functions are constexpr functions.

```cpp
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
```

**Preconditions:** *this contains a value.

**Returns:** *val.

**Remarks:** These functions are constexpr functions.
constexpr T&& operator*() && noexcept;
constexpr const T&& operator*() const && noexcept;

**Preconditions**: *this contains a value.

**Effects**: Equivalent to: return std::move(*val);

constexpr explicit operator bool() const noexcept;

**Returns**: true if and only if *this contains a value.

**Remarks**: This function is a constexpr function.

constexpr bool has_value() const noexcept;

**Returns**: true if and only if *this contains a value.

**Remarks**: This function is a constexpr function.

constexpr const T& value() const &;
constexpr T& value() &;

**Effects**: Equivalent to:
return has_value() ? *val : throw bad_optional_access();

constexpr T&& value() &&;
constexpr const T&& value() const &&;

**Effects**: Equivalent to:
return has_value() ? std::move(*val) : throw bad_optional_access();

template<class U> constexpr T value_or(U&& v) const &;

**Mandates**: is_copy_constructible_v<T> && is_convertible_v<U&&, T> is true.

**Effects**: Equivalent to:
return has_value() ? **this : static_cast<T>(std::forward<U>(v));

template<class U> constexpr T value_or(U&& v) &&;

**Mandates**: is_move_constructible_v<T> && is_convertible_v<U&&, T> is true.

**Effects**: Equivalent to:
return has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v));

22.5.3.7 Monadic operations

**Monadic operations**

template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;

Let U be invoke_result_t<F, decltype(value())>.

**Mandates**: remove_cvref_t<U> is a specialization of optional.

**Effects**: Equivalent to:
if (*this) {
    return invoke(std::forward<F>(f), value());
} else {
    return remove_cvref_t<U>();
}

}template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;

Let U be invoke_result_t<F, decltype(std::move(value()))>.

**Mandates**: remove_cvref_t<U> is a specialization of optional.

**Effects**: Equivalent to:
if (*this) {
    return invoke(std::forward<F>(f), std::move(value()));
} else {

§ 22.5.3.7 713
template<class F> constexpr auto transform(F&& f) &;
    template<class F> constexpr auto transform(F&& f) const &;
Let U be remove_cv_t<invoke_result_t<F, decltype(value())>>.
Mandates: U is a non-array object type other than in_place_t or nullopt_t. The declaration
U u(invoke(std::forward<F>(f), value()));
is well-formed for some invented variable u.
[Note 1: There is no requirement that U is movable (9.4.1). — end note]
Returns: If *this contains a value, an optional<U> object whose contained value is direct-non-list-
initialized with invoke(std::forward<F>(f), value()); otherwise, optional<U>().

template<class F> constexpr auto transform(F&& f) &&;
    template<class F> constexpr auto transform(F&& f) const &&;
Let U be remove_cv_t<invoke_result_t<F, decltype(std::move(value()))>>.
Mandates: U is a non-array object type other than in_place_t or nullopt_t. The declaration
U u(invoke(std::forward<F>(f), std::move(value())));
is well-formed for some invented variable u.
[Note 2: There is no requirement that U is movable (9.4.1). — end note]
Returns: If *this contains a value, an optional<U> object whose contained value is direct-non-list-
initialized with invoke(std::forward<F>(f), std::move(value())); otherwise, optional<U>().

template<class F> constexpr optional or_else(F&& f) const &;
    template<class F> constexpr optional or_else(F&& f) const &&;
Constraints: F models invocable<> and T models copy_constructible.
Mandates: is_same_v<remove_cvref_t<invoke_result_t<F>>, optional> is true.
Effects: Equivalent to:
if (*this) {
    return *this;
} else {
    return std::forward<F>(f());
}

template<class F> constexpr optional or_else(F&& f) &&;
Constraints: F models invocable<> and T models move_constructible.
Mandates: is_same_v<remove_cvref_t<invoke_result_t<F>>, optional> is true.
Effects: Equivalent to:
if (*this) {
    return std::move(*this);
} else {
    return std::forward<F>(f());
}

22.5.3.8 Modifiers

constexpr void reset() noexcept;
Effects: If *this contains a value, calls val->T::~T() to destroy the contained value; otherwise no
effect.
Postconditions: *this does not contain a value.

22.5.4 No-value state indicator

struct nullopt_t{see below};
inline constexpr nullopt_t nullopt(unspecified);
The struct `nullopt_t` is an empty class type used as a unique type to indicate the state of not containing a value for `optional` objects. In particular, `optional<T>` has a constructor with `nullopt_t` as a single argument; this indicates that an optional object not containing a value shall be constructed.

Type `nullopt_t` shall not have a default constructor or an initializer-list constructor, and shall not be an aggregate.

### 22.5.5 Class `bad_optional_access`

```cpp
namespace std {
    class bad_optional_access : public exception {
    public:
        // see 17.9.3 for the specification of the special member functions
        const char* what() const noexcept override;
    }
};
```

The class `bad_optional_access` defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an optional object that does not contain a value.

```cpp
const char* what() const noexcept override;
```

**Returns:** An implementation-defined NTBS.

### 22.5.6 Relational operators

```cpp
template<class T, class U> constexpr bool operator==(const optional<T>& x, const optional<U>& y);
```

**Mandates:** The expression `*x == *y` is well-formed and its result is convertible to `bool`.

**Note 1:** `T` need not be `Cpp17EqualityComparable`. — end note

**Returns:** If `x.has_value() != y.has_value()`, false; otherwise if `x.has_value() == false, true; otherwise *x == *y.`

**Remarks:** Specializations of this function template for which `*x == *y` is a core constant expression are constexpr functions.

```cpp
template<class T, class U> constexpr bool operator!=(const optional<T>& x, const optional<U>& y);
```

**Mandates:** The expression `*x != *y` is well-formed and its result is convertible to `bool`.

**Returns:** If `x.has_value() != y.has_value()`, true; otherwise if `x.has_value() == false, false; otherwise *x != *y`.

**Remarks:** Specializations of this function template for which `*x != *y` is a core constant expression are constexpr functions.

```cpp
template<class T, class U> constexpr bool operator<(const optional<T>& x, const optional<U>& y);
```

**Mandates:** The expression `*x < *y` is well-formed and its result is convertible to `bool`.

**Returns:** If `!y`, false; otherwise, if `!x, true; otherwise *x < *y`.

**Remarks:** Specializations of this function template for which `*x < *y` is a core constant expression are constexpr functions.

```cpp
template<class T, class U> constexpr bool operator>(const optional<T>& x, const optional<U>& y);
```

**Mandates:** The expression `*x > *y` is well-formed and its result is convertible to `bool`.

**Returns:** If `!x, false; otherwise, if !y, true; otherwise *x > *y`.

**Remarks:** Specializations of this function template for which `*x > *y` is a core constant expression are constexpr functions.

```cpp
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const optional<U>& y);
```

**Mandates:** The expression `*x <= *y` is well-formed and its result is convertible to `bool`.

**Returns:** If `!x`, true; otherwise, if `!y, false; otherwise *x <= *y`.

**Remarks:** Specializations of this function template for which `*x <= *y` is a core constant expression are constexpr functions.
template<class T, class U> constexpr bool operator>=(const optional<T>& x, const optional<U>& y);

**Mandates:** The expression *x >= *y is well-formed and its result is convertible to bool.

**Returns:** If !y, true; otherwise, if !x, false; otherwise *x >= *y.

**Remarks:** Specializations of this function template for which *x >= *y is a core constant expression are constexpr functions.

template<class T, three_way_comparable_with<T> U>
constexpr compare_three_way_result_t<T, U> operator<=>(const optional<T>& x, const optional<U>& y);

**Returns:** If x && y, *x <=> *y; otherwise x.has_value() <=> y.has_value().

**Remarks:** Specializations of this function template for which *x <=> *y is a core constant expression are constexpr functions.

### 22.5.7 Comparison with nullopt

[optional.nullops]

template<class T> constexpr bool operator==(const optional<T>& x, nullopt_t) noexcept;

**Returns:** !x.

template<class T> constexpr strong_ordering operator<=>(const optional<T>& x, nullopt_t) noexcept;

**Returns:** x.has_value() <=> false.

### 22.5.8 Comparison with T

[optional.comp.with.t]

template<class T, class U> constexpr bool operator==(const optional<T>& x, const U& v);

**Mandates:** The expression *x == v is well-formed and its result is convertible to bool.

**[Note 1: T need not be Cpp17EqualityComparable. — end note]**

**Effects:** Equivalent to: return x.has_value() ? *x == v : false;

template<class T, class U> constexpr bool operator==(const T& v, const optional<U>& x);

**Mandates:** The expression v == *x is well-formed and its result is convertible to bool.

**Effects:** Equivalent to: return x.has_value() ? v == *x : true;

template<class T, class U> constexpr bool operator!=(const optional<T>& x, const U& v);

**Mandates:** The expression *x != v is well-formed and its result is convertible to bool.

**Effects:** Equivalent to: return x.has_value() ? *x != v : true;

template<class T, class U> constexpr bool operator!=(const T& v, const optional<U>& x);

**Mandates:** The expression v != *x is well-formed and its result is convertible to bool.

**Effects:** Equivalent to: return x.has_value() ? v != *x : false;

template<class T, class U> constexpr bool operator<(const optional<T>& x, const U& v);

**Mandates:** The expression *x < v is well-formed and its result is convertible to bool.

**Effects:** Equivalent to: return x.has_value() ? *x < v : false;

template<class T, class U> constexpr bool operator<(const T& v, const optional<U>& x);

**Mandates:** The expression v < *x is well-formed and its result is convertible to bool.

**Effects:** Equivalent to: return x.has_value() ? v < *x : true;

§ 22.5.8
template<class T, class U> constexpr bool operator<=(const optional<T>& x, const U& v);

Mandates: The expression \( x <= v \) is well-formed and its result is convertible to bool.

Effects: Equivalent to: return x.has_value() ? \*x <= v : true;

template<class T, class U> constexpr bool operator<=(const T& v, const optional<U>& x);

Mandates: The expression \( v <= \*x \) is well-formed and its result is convertible to bool.

Effects: Equivalent to: return x.has_value() ? v <= \*x : false;

template<class T, class U> constexpr bool operator<=(const optional<T>& x, const U& v);

Mandates: The expression \( \*x >= v \) is well-formed and its result is convertible to bool.

Effects: Equivalent to: return x.has_value() ? \*x >= v : false;

template<class T, class U> constexpr bool operator<=(const T& v, const optional<U>& x);

Mandates: The expression \( v >= \*x \) is well-formed and its result is convertible to bool.

Effects: Equivalent to: return x.has_value() ? v >= \*x : true;

template<class T, class U> requires (!is-derived-from-optional<U>) && three_way_comparable_with<T, U>
        constexpr compare_three_way_result_t<T, U> operator<=>(const optional<T>& x, const U& v);

Effects: Equivalent to: return x.has_value() ? \*x <=> v : strong_ordering::less;

22.5.9 Specialized algorithms [optional.specalg]

template<class T>
    constexpr void swap(optional<T>& x, optional<T>& y) noexcept(noexcept(x.swap(y)));

Constraints: is_move_constructible_v<T> is true and is_swappable_v<T> is true.

Effects: Calls x.swap(y).

template<class T> constexpr optional<decay_t<T>> make_optional(T&& v);

Returns: optional<decay_t<T>>(std::forward<T>(v)).

template<class T, class...Args>
    constexpr optional<T> make_optional(T&& v, Args&&... args);

Effects: Equivalent to: return optional<T>(in_place, std::forward<Args>(args)...);

template<class T, class U, class... Args>
    constexpr optional<T> make_optional(initializer_list<U> il, Args&&... args);

Effects: Equivalent to: return optional<T>(in_place, il, std::forward<Args>(args)...);

22.5.10 Hash support [optional.hash]

template<class T> struct hash<optional<T>>;

The specialization hash<optional<T>> is enabled (22.10.19) if and only if hash<remove_const_t<T>>
is enabled. When enabled, for an object o of type optional<T>, if o.has_value() == true, then
hash<optional<T>>(o) evaluates to the same value as hash<remove_const_t<T>>(o); otherwise
it evaluates to an unspecified value. The member functions are not guaranteed to be noexcept.

22.6 Variants [variant]

22.6.1 In general [variant.general]

A variant object holds and manages the lifetime of a value. If the variant holds a value, that value’s
type has to be one of the template argument types given to variant. These template arguments are called
alternatives.

22.6.2 Header <variant> synopsis [variant.syn]

#include <compare> // see 17.11.1
namespace std {
    // 22.6.3, class template variant
    template<class... Types>
    class variant;

    // 22.6.4, variant helper classes
    template<class T> struct variant_size; // not defined
    template<class T> struct variant_size<const T>;
    template<class T>
    constexpr size_t variant_size_v = variant_size<T>::value;

    template<class... Types>
    struct variant_size<variant<Types...>>;

    template<size_t I, class T> struct variant_alternative;
    template<size_t I, class T> struct variant_alternative<I, const T>;
    template<size_t I, class T>
    using variant_alternative_t = typename variant_alternative<I, T>::type;

    template<size_t I, class... Types>
    struct variant_alternative<I, variant<Types...>>;

    inline constexpr size_t variant_npos = -1;

    // 22.6.5, value access
    template<class T, class... Types>
    constexpr bool holds_alternative(const variant<Types...>&) noexcept;

    template<size_t I, class... Types>
    constexpr variant_alternative_t<I, variant<Types...>>& get(variant<Types...>&);
    template<size_t I, class... Types>
    constexpr variant_alternative_t<I, variant<Types...>>&& get(variant<Types...>&&);

    // 22.6.12, hash support
    template<class T> struct hash;
    template<class... Types> struct hash<variant<Types...>>;
    template<> struct hash<monostate>;
}
### 22.6.3.3  Destructor

```cpp
constexpr ~variant();
```

### 22.6.3.4  Assignment

```cpp
constexpr variant& operator=(const variant&);  
constexpr variant& operator=(variant&&) noexcept(see below);
```

```cpp
template<class T> constexpr variant& operator=(T&&) noexcept(see below);
```

### 22.6.3.5  Modifiers

```cpp
template<class T, class... Args>
constexpr T& emplace(Args&&...);
```

```cpp
template<class T, class U, class... Args>
constexpr T& emplace(initializer_list<U>, Args&&...);
```

```cpp
template<size_t I, class... Args>
constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&...);
```

```cpp
template<size_t I, class U, class... Args>
constexpr variant_alternative_t<I, variant<Types...>>&
emplace(initializer_list<U>, Args&&...);
```

### 22.6.3.6  Value Status

```cpp
constexpr bool valueless_by_exception() const noexcept;
```

```cpp
constexpr size_t index() const noexcept;
```

### 22.6.3.7  Swap

```cpp
constexpr void swap(variant&) noexcept(see below);
```

1. Any instance of `variant` at any given time either holds a value of one of its alternative types or holds no value. When an instance of `variant` holds a value of alternative type `T`, it means that a value of type `T`, referred to as the `variant` object’s contained value, is allocated within the storage of the `variant` object. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the contained value.

2. All types in `Types` shall meet the `Cpp17Destructible` requirements (Table 36).

A program that instantiates the definition of `variant` with no template arguments is ill-formed.

#### 22.6.3.2  Constructors

1. In the descriptions that follow, let `i` be in the range `[0, sizeof...(Types))`, and `Ti` be the `i`th type in `Types`.

```cpp
constexpr variant() noexcept(see below);
```

2. **Constraints:** `is_default_constructible_v<Ti>` is true.

3. **Effects:** Constructs a `variant` holding a value-initialized value of type `Ti`.

4. **Postconditions:** `valueless_by_exception()` is false and `index()` is 0.

5. **Throws:** Any exception thrown by the value-initialization of `T0`.

6. **Remarks:** This function is `constexpr` if and only if the value-initialization of the alternative type `Ti` would satisfy the requirements for a `constexpr` function. The exception specification is equivalent to `is_nothrow_default_constructible_v<Ti<T0>>`.

[Note 1: See also class `monostate`. — end note]

```cpp
constexpr variant(const variant& w);
```

7. **Effects:** If `w` holds a value, initializes the `variant` to hold the same alternative as `w` and direct-initializes the contained value with `get<j>(w)`, where `j` is `w.index()`. Otherwise, initializes the `variant` to not hold a value.

8. **Throws:** Any exception thrown by direct-initializing any `Ti` for all `i`.

9. **Remarks:** This constructor is defined as deleted unless `is_copy_constructible_v<Ti<T0>>` is true for all `i`. If `is_trivially_copy_constructible_v<Ti<T0>>` is true for all `i`, this constructor is trivial.
constexpr variant(variant&& w) noexcept(see below);

Constraints: is_move_constructible_v<Ti> is true for all i.

Effects: If w holds a value, initializes the variant to hold the same alternative as w and direct-initializes the contained value with get<j>(std::move(w)), where j is w.index(). Otherwise, initializes the variant to not hold a value.

Throws: Any exception thrown by move-constructing any Ti for all i.

Remarks: The exception specification is equivalent to the logical and of is_nothrow_move_constructible_v<Ti> for all i. If is_trivially_move_constructible_v<Ti> is true for all i, this constructor is trivial.

template<class T> constexpr variant(T&& t) noexcept(see below);

Let Tj be a type that is determined as follows: build an imaginary function FUN(Ti) for each alternative type Ti for which Ti x[] = {std::forward<T>(t)} is well-formed for some invented variable x. The overload FUN(Tj) selected by overload resolution for the expression FUN(std::forward<T>(t)) defines the alternative Tj which is the type of the contained value after construction.

Constraints:

(15.1) sizeof...(Types) is nonzero,
(15.2) is_same_v<remove_cvref_t<T>, variant> is false,
(15.3) remove_cvref_t<T> is neither a specialization of in_place_type_t nor a specialization of in_place_index_t,
(15.4) is_constructible_v<Tj, T> is true, and
(15.5) the expression FUN(std::forward<T>(t)) (with FUN being the above-mentioned set of imaginary functions) is well-formed.

[Note 2: variant<string, string> v("abc"); is ill-formed, as both alternative types have an equally viable constructor for the argument. — end note]

Effects: Initializes *this to hold the alternative type Tj and direct-non-list-initializes the contained value with std::forward<T>(t).

Postconditions: holds_alternative<Tj>(*this) is true.

Throws: Any exception thrown by the initialization of the selected alternative Tj.

Remarks: The exception specification is equivalent to is_nothrow_constructible_v<Tj, T>. If Tj’s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

template<class T, class... Args> constexpr explicit variant(in_place_type_t<T>, Args&&... args);

Constraints:

(20.1) There is exactly one occurrence of T in Types... and
(20.2) is_constructible_v<T, Args...> is true.

Effects: Direct-non-list-initializes the contained value of type T with std::forward<Args>(args)....

Postconditions: holds_alternative<T>(*this) is true.

Throws: Any exception thrown by calling the selected constructor of T.

Remarks: If T’s selected constructor is a constexpr constructor, this constructor is a constexpr constructor.

template<class T, class U, class... Args>
constexpr explicit variant(in_place_type_t<T>, initializer_list<U> il, Args&&... args);

Constraints:

(25.1) There is exactly one occurrence of T in Types... and
(25.2) is_constructible_v<T, initializer_list<U> & , Args...> is true.
Effects: Direct-non-list-initializes the contained value of type \( T \) with \( i1, \text{std::forward<Args>(args)}... \).

Postconditions: \text{holds_alternative}\langle\!\langle T\rangle\!\rangle(*\!	ext{this}) \text{ is true.}

Throws: Any exception thrown by calling the selected constructor of \( T \).

Remarks: If \( T \)'s selected constructor is a \text{constexpr} constructor, this constructor is a \text{constexpr} constructor.

\[
\text{template<}\text{size_t} \text{I, class... Args}\text{> constexpr explicit variant(in_place_index_t<\!	ext{I}>, \text{Args}\&\&... \text{args});}
\]

Constraints:
(30.1) \text{I is less than sizeof...(Types) and}
(30.2) \text{is_constructible_v}<T_{\!	ext{I}}, \text{Args}\&\&... \text{is true.}

Effects: Direct-non-list-initializes the contained value of type \( T_{\!	ext{I}} \) with \text{std::forward<Args>(args)}....

Postconditions: \( \text{index()} \text{ is I.} \)

Throws: Any exception thrown by calling the selected constructor of \( T_{\!	ext{I}} \).

Remarks: If \( T_{\!	ext{I}} \)'s selected constructor is a \text{constexpr} constructor, this constructor is a \text{constexpr} constructor.

\[
\text{template<}\text{size_t} \text{I, class U, class... Args}\text{> constexpr explicit variant(in_place_index_t<\!	ext{I}>, \text{initializer_list<U>} \text{i1}, \text{Args}\&\&... \text{args});}
\]

Constraints:
(35.1) \text{I is less than sizeof...(Types) and}
(35.2) \text{is_constructible_v}<T_{\!	ext{I}}, \text{initializer_list<U>&}, \text{Args}\&\&... \text{is true.}

Effects: Direct-non-list-initializes the contained value of type \( T_{\!	ext{I}} \) with \text{std::forward<Args>(args)}....

Postconditions: \( \text{index()} \text{ is I.} \)

Remarks: If \( T_{\!	ext{I}} \)'s selected constructor is a \text{constexpr} constructor, this constructor is a \text{constexpr} constructor.

\section*{22.6.3.3 Destructor} \hfill [variant.dtor]
\text{constexpr ~variant();}

Effects: If \text{valueless\_by\_exception()} \text{ is false, destroys the currently contained value.}

Remarks: If \text{is\_trivially\_destructible\_v}<T_{\!	ext{i}} > \text{ is true} for all \( T_{\!	ext{i}} \), then this destructor is trivial.

\section*{22.6.3.4 Assignment} \hfill [variant.assign]
\text{constexpr variant\&} \text{ operator=} \langle\text{const variant\&} \text{ rhs}\rangle;

Let \( j \text{ be rhs.index()}. \)

Effects:
(2.1) If neither \text{*this} nor \text{rhs} holds a value, there is no effect.
(2.2) Otherwise, if \text{*this} holds a value but \text{rhs} does not, destroys the value contained in \text{*this} and sets \text{*this} to not hold a value.
(2.3) Otherwise, if \text{index()} == \text{j} assigns the value contained in \text{rhs} to the value contained in \text{*this}.
(2.4) Otherwise, if either \text{is\_nothrow\_copy\_constructible\_v}<T_{\!	ext{j}} > \text{ is true} or \text{is\_nothrow\_move\_constructible\_v}<T_{\!	ext{j}} > \text{ is false}, equivalent to \text{emplace}\langle\!	ext{j}\rangle\langle\text{get}\langle\!	ext{j}\rangle\langle\text{rhs}\rangle\rangle.
(2.5) Otherwise, equivalent to \text{operator=} \langle\text{variant(rhs)}\rangle.

Postconditions: \text{index()} == \text{rhs.index()}. \text{Returns: *this.}

Remarks: This operator is defined as deleted unless \text{is\_copy\_constructible\_v}<T_{\!	ext{i}} > \&\& \text{is\_copy\_assignable\_v}<T_{\!	ext{i}} > \text{is true} for all \( i \). If \text{is\_trivially\_copy\_constructible\_v}<T_{\!	ext{i}} > \&\& \text{is\_trivially\_
copy_assignable_v<T> && is_trivially_destructible_v<T> is true for all i, this assignment operator is trivial.

constexpr variant& operator=(variant&& rhs) noexcept(see below);

Let j be rhs.index().

Constraints: is_move_constructible_v<T> && is_move_assignable_v<T> is true for all i.

Effects:
(8.1) If neither *this nor rhs holds a value, there is no effect.
(8.2) Otherwise, if *this holds a value but rhs does not, destroys the value contained in *this and sets *this to not hold a value.
(8.3) Otherwise, if index() = j, assigns get<index>(std::move(rhs)) to the value contained in *this.
(8.4) Otherwise, equivalent to emplace<index>(get<index>(std::move(rhs))).

Returns: *this.

Remarks: If is_trivially_move_constructible_v<T> && is_trivially_move_assignable_v<T> is true for all i, this assignment operator is trivial. The exception specification is equivalent to is_nothrow_move_constructible_v<T> && is_nothrow_move_assignable_v<T> for all i.

(10.1) If an exception is thrown during the call to T_j's move construction (with j being rhs.index()), the variant will hold no value.
(10.2) If an exception is thrown during the call to T_j's move assignment, the state of the contained value is as defined by the exception safety guarantee of T_j's move assignment; index() will be j.

template<class T> constexpr variant& operator=(T&& t) noexcept(see below);

Let T_j be a type that is determined as follows: build an imaginary function FUN(T_i) for each alternative type T_i for which T_i x[] = {std::forward<T>(t)} is well-formed for some invented variable x. The overload FUN(T_j) selected by overload resolution for the expression FUN(std::forward<T>(t)) defines the alternative T_j which is the type of the contained value after assignment.

Constraints:
(12.1) is_same_v<remove_cvref_t<T>, variant> is false,
(12.2) is_assignable_v<T_j&, T> && is_constructible_v<T_j, T> is true, and
(12.3) the expression FUN(std::forward<T>(t)) (with FUN being the above-mentioned set of imaginary functions) is well-formed.

[Note 1: variant<string, string> v;
  v = "abc";
  is ill-formed, as both alternative types have an equally viable constructor for the argument. — end note]

Effects:
(13.1) If *this holds a T_j, assigns std::forward<T>(t) to the value contained in *this.
(13.2) Otherwise, if is_nothrow_constructible_v<T_j, T> || !is_nothrow_move_constructible_v<T_j, T> is true, equivalent to emplace<index>(std::forward<T>(t)).
(13.3) Otherwise, equivalent to emplace<index>(T_j(std::forward<T>(t))).

Postconditions: holds_alternative<T_j>(*this) is true, with T_j selected by the imaginary function overload resolution described above.

Returns: *this.

Remarks: The exception specification is equivalent to:

is_nothrow_assignable_v<T_j&, T> && is_nothrow_constructible_v<T_j, T>

(16.1) If an exception is thrown during the assignment of std::forward<T>(t) to the value contained in *this, the state of the contained value and t are as defined by the exception safety guarantee of the assignment expression; valueless_by_exception() will be false.
If an exception is thrown during the initialization of the contained value, the `variant` object is permitted to not hold a value.

### 22.6.3.5 Modifiers

```cpp
template<class T, class... Args> constexpr T& emplace(Args&&... args);
```

**Constraints:** `is_constructible_v<T, Args...>` is true, and T occurs exactly once in `Types`.

**Effects:** Equivalent to:

```
return emplace<I>(std::forward<Args>(args)...);
```
where `I` is the zero-based index of T in `Types`.

```cpp
template<class T, class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args);
```

**Constraints:** `is_constructible_v<T, initializer_list<U>&, Args...>` is true, and T occurs exactly once in `Types`.

**Effects:** Equivalent to:

```
return emplace<I>(il, std::forward<Args>(args)...);
```
where `I` is the zero-based index of T in `Types`.

```cpp
template<size_t I, class... Args>
constexpr variant_alternative_t<I, variant<Types...>>& emplace(Args&&... args);
```

**Mandates:** `I < sizeof...(Types)`.

**Constraints:** `is_constructible_v<T_I, Args...>` is true.

**Effects:** Destroys the currently contained value if `valueless_by_exception()` is false. Then direct-
non-list-initializes the contained value of type `T_I` with the arguments `std::forward<Args>(args)....`

**Postconditions:** `index()` is I.

**Returns:** A reference to the new contained value.

**Remarks:** If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

```cpp
template<size_t I, class U, class... Args>
constexpr variant_alternative_t<I, variant<Types...>>&
emplace(initializer_list<U> il, Args&&... args);
```

**Mandates:** `I < sizeof...(Types)`.

**Constraints:** `is_constructible_v<T_I, initializer_list<U>&, Args...>` is true.

**Effects:** Destroys the currently contained value if `valueless_by_exception()` is false. Then direct-
non-list-initializes the contained value of type `T_I` with `il, std::forward<Args>(args)....`

**Postconditions:** `index()` is I.

**Returns:** A reference to the new contained value.

**Remarks:** If an exception is thrown during the initialization of the contained value, the `variant` is permitted to not hold a value.

### 22.6.3.6 Value status

```cpp
constexpr bool valueless_by_exception() const noexcept;
```

**Effects:** Returns `false` if and only if the `variant` holds a value.

[Note 1]: It is possible for a `variant` to hold no value if an exception is thrown during a type-changing assignment or emplacement. The latter means that even a `variant<float, int>` can become `valueless_by_exception()`, for instance by
```cpp
struct S { operator int() { throw 42; }};
variant<float, int> v{12.f};
```
v.emplace<i>(S());
— end note]

constexpr size_t index() const noexcept;

**Effects:** If `valueless_by_exception()` is `true`, returns `variant_npos`. Otherwise, returns the zero-based index of the alternative of the contained value.

### 22.6.3.7 Swap

```cpp
constexpr void swap(variant& rhs) noexcept(see below);
```

**Mandates:** `is_move_constructible_v<T_i>` is `true` for all `i`.

**Preconditions:** Each `T_i` meets the `Cpp17Swappable` requirements (16.4.4.3).

**Effects:**

1. If `valueless_by_exception() && rhs.valueless_by_exception()` no effect.
2. Otherwise, if `index() == rhs.index()`, calls `swap(get<i>(*this), get<i>(rhs))` where `i` is `index()`.
3. Otherwise, exchanges values of `rhs` and `*this`.

**Throws:** If `index() == rhs.index()`, any exception thrown by `swap(get<i>(*this), get<i>(rhs))` with `i` being `index()`. Otherwise, any exception thrown by the move constructor of `T_i` or `T_j` with `i` being `index()` and `j` being `rhs.index()`.

**Remarks:** If an exception is thrown during the call to function `swap(get<i>(*this), get<i>(rhs))`, the states of the contained values of `*this` and of `rhs` are determined by the exception safety guarantee of `swap` for lvalues of `T_i` with `i` being `index()`. If an exception is thrown during the exchange of the values of `*this` and `rhs`, the states of the values of `*this` and of `rhs` are determined by the exception safety guarantee of `variant`’s move constructor. The exception specification is equivalent to the logical AND of `is_nothrow_move_constructible_v<T_i>` & `is_nothrow_swappable_v<T_i>` for all `i`.

### 22.6.4 variant helper classes

```cpp
template<class T> struct variant_size;
```

All specializations of `variant_size` meet the `Cpp17UnaryTypeTrait` requirements (21.3.2) with a base characteristic of `integral_constant<size_t, N>` for some `N`.

```cpp
template<class T> struct variant_size<const T>;
```

Let `VS` denote `variant_size<T>` of the cv-unqualified type `T`. Then each specialization of the template meets the `Cpp17UnaryTypeTrait` requirements (21.3.2) with a base characteristic of `integral_constant<size_t, VS::value>`.

```cpp
template<class... Types>
struct variant_size<variant<Types...>> : integral_constant<size_t, sizeof...(Types)> { };  
```

```cpp
template<size_t I, class T> struct variant_alternative<I, const T>;
```

Let `VA` denote `variant_alternative<I, T>` of the cv-unqualified type `T`. Then each specialization of the template meets the `Cpp17TransformationTrait` requirements (21.3.2) with a member typedef `type` that names the type `add_const_t<VA::type>`.

```cpp
variant_alternative<I, variant<Types...>>::type
```

**Mandates:** `I < sizeof...(Types)`.

**Type:** The type `T_i`.

### 22.6.5 Value access

```cpp
template<class T, class... Types>
constexpr bool holds_alternative(const variant<Types...>& v) noexcept;
```

**Mandates:** The type `T` occurs exactly once in `Types`.

**Returns:** `true` if `index()` is equal to the zero-based index of `T` in `Types`.  

§ 22.6.5
template<
    size_t I,
    class... Types>
    constexpr variant_alternative_t<I, variant<Types...>>&
    get(variant<Types...>& v);

template<
    size_t I,
    class... Types>
    constexpr variant_alternative_t<I, variant<Types...>>&&
    get(variant<Types...>&& v);

template<
    size_t I,
    class... Types>
    constexpr const variant_alternative_t<I, variant<Types...>>&
    get(const variant<Types...>& v);

template<
    size_t I,
    class... Types>
    constexpr const variant_alternative_t<I, variant<Types...>>&&
    get(const variant<Types...>&& v);

Mandates: I < sizeof...(Types).

Effects: If v.index() is I, returns a reference to the object stored in the
variant. Otherwise, throws an exception of type bad_variant_access.

template<class T, class... Types>
    constexpr T&
    get(variant<Types...>& v);

template<class T, class... Types>
    constexpr T&&
    get(variant<Types...>&& v);

template<class T, class... Types>
    constexpr const T&
    get(const variant<Types...>& v);

template<class T, class... Types>
    constexpr const T&&
    get(const variant<Types...>&& v);

Mandates: The type T occurs exactly once in Types.

Effects: If v holds a value of type T, returns a reference to that value. Otherwise, throws an exception
of type bad_variant_access.

template<
    size_t I,
    class... Types>
    constexpr add_pointer_t<variant_alternative_t<I, variant<Types...>>>
    get_if(variant<Types...>* v) noexcept;

template<
    size_t I,
    class... Types>
    constexpr add_pointer_t<const variant_alternative_t<I, variant<Types...>>>
    get_if(const variant<Types...>* v) noexcept;

Mandates: I < sizeof...(Types).

Returns: A pointer to the value stored in the variant, if v != nullptr and v->index() == I.
Otherwise, returns nullptr.

template<class T, class... Types>
    constexpr add_pointer_t<T>
    get_if(variant<Types...>* v) noexcept;

template<class T, class... Types>
    constexpr add_pointer_t<const T>
    get_if(const variant<Types...>* v) noexcept;

Mandates: The type T occurs exactly once in Types.

Effects: Equivalent to: return get_if<i>(v); with i being the zero-based index of T in Types.

22.6.6 Relational operators

template<class... Types>
    constexpr bool operator==(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) == get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.index() != w.index(), false; otherwise if v.valueless_by_exception(), true; other-
wise get<i>(v) == get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator!=(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) != get<i>(w) is a valid expression that is convertible to bool, for all i.

Returns: If v.index() != w.index(), true; otherwise if v.valueless_by_exception(), false; oth-
wise get<i>(v) != get<i>(w) with i being v.index().

template<class... Types>
    constexpr bool operator<(const variant<Types...>& v, const variant<Types...>& w);

Mandates: get<i>(v) < get<i>(w) is a valid expression that is convertible to bool, for all i.
template<class... Types>
constexpr bool operator>(const variant<Types...>& v, const variant<Types...>& w);

Mandates: \[\text{get}\langle i\rangle(v) > \text{get}\langle i\rangle(w)\] is a valid expression that is convertible to bool, for all \(i\).

Returns: If \(v.\text{valueless\_by\_exception()}\), false; otherwise if \(w.\text{valueless\_by\_exception()}\), true; otherwise, if \(v.\text{index()} > w.\text{index()}\), true; otherwise if \(v.\text{index()} < w.\text{index()}\), false; otherwise \(\text{get}\langle i\rangle(v) > \text{get}\langle i\rangle(w)\) with \(i\) being \(v.\text{index}\).
Let $m$ be a pack of $n$ values of type `size_t`. Such a pack is valid if $0 \leq m_i < \text{variant\_size\_v<remove\_reference\_t<T_i>}>$ for all $0 \leq i < n$. For each valid pack $m$, let $e(m)$ denote the expression:

```cpp
INVOKEx(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4
```

for the first form and

```cpp
INVOKEx<R>(std::forward<Visitor>(vis), get<m>(std::forward<V>(vars))...) // see 22.10.4
```

for the second form.

**Mandates:** For each valid pack $m$, $e(m)$ is a valid expression. All such expressions are of the same type and value category.

**Returns:** $e(m)$, where $m$ is the pack for which $m_i$ is `as-variant<vars_i>.index()` for all $0 \leq i < n$. The return type is `decltype(e(m))` for the first form.

**Throws:** `bad_variant_access` if `(as-variant<vars>.valueless_by_exception() || ...)` is true.

**Complexity:** For $n \leq 1$, the invocation of the callable object is implemented in constant time, i.e., for $n = 1$, it does not depend on the number of alternative types of $V_0$. For $n > 1$, the invocation of the callable object has no complexity requirements.

### 22.6.8 Class monostate

```cpp
struct monostate{};
```

The class `monostate` can serve as a first alternative type for a `variant` to make the `variant` type default constructible.

### 22.6.9 monostate relational operators

```cpp
constexpr bool operator==(monostate, monostate) noexcept { return true; }
constexpr strong_ordering operator<=>(monostate, monostate) noexcept { return strong_ordering::equal; }
```

**Note 1:** `monostate` objects have only a single state; they thus always compare equal. — end note]

### 22.6.10 Specialized algorithms

```cpp
template<class... Types>
constexpr void swap(variant<Types...>& v, variant<Types...>& w) noexcept(see below);
```

**Constraints:** `is_move_constructible_v<T_i>` && `is_swappable_v<T_i>` is true for all $i$.

**Effects:** Equivalent to `v.swap(w)`.

**Remarks:** The exception specification is equivalent to `noexcept(v.swap(w))`.

### 22.6.11 Class bad_variant_access

```cpp
namespace std {
    class bad_variant_access : public exception {
        public:
            // see 17.9.3 for the specification of the special member functions
            const char* what() const noexcept override;
    }
}
```

Objects of type `bad_variant_access` are thrown to report invalid accesses to the value of a `variant` object.

**Returns:** An implementation-defined NTBS.

### 22.6.12 Hash support

```cpp
template<class... Types> struct hash<variant<Types...>>;
```

The specialization `hash<variant<Types...>>` is enabled (22.10.19) if and only if every specialization in `hash<remove_const_t<Types>>`... is enabled. The member functions are not guaranteed to be noexcept.
template<> struct hash<monostate>;

The specialization is enabled (22.10.19).

22.7 Storage for any type
22.7.1 General
Subclause 22.7 describes components that C++ programs may use to perform operations on objects of a discriminated type.

1 [Note 1: The discriminated type can contain values of different types but does not attempt conversion between them, i.e., 5 is held strictly as an int and is not implicitly convertible either to "5" or to 5.0. This indifference to interpretation but awareness of type effectively allows safe, generic containers of single values, with no scope for surprises from ambiguous conversions. —end note]

22.7.2 Header <any> synopsis

namespace std {
    // 22.7.3, class bad_any_cast
    class bad_any_cast;

    // 22.7.4, class any
    class any;

    // 22.7.5, non-member functions
    void swap(any& x, any& y) noexcept;

    template<class T, class... Args>
    any make_any(Args&&... args);

    template<class T, class U, class... Args>
    any make_any(initializer_list<U> il, Args&&... args);

    template<class T>
    T any_cast(const any& operand);

    template<class T>
    T any_cast(any& operand);

    template<class T>
    const T* any_cast(const any* operand) noexcept;

    template<class T>
    T* any_cast(any* operand) noexcept;
}

22.7.3 Class bad_any_cast

namespace std {
    class bad_any_cast : public bad_cast {
        public:
            // see 17.9.3 for the specification of the special member functions
            const char* what() const noexcept override;
    }
}

1 Objects of type bad_any_cast are thrown by a failed any_cast (22.7.5).

    const char* what() const noexcept override;

2 Returns: An implementation-defined NTBS.

22.7.4 Class any
22.7.4.1 General

namespace std {
    class any {
        public:
            // 22.7.4.2, construction and destruction

§ 22.7.4.1 729
constexpr any() noexcept;
any(const any& other);
any(any&& other) noexcept;

template<class T>
any(T&& value);

template<class T, class... Args>
    explicit any(in_place_type_t<T>, Args&&...);

template<class T, class U, class... Args>
    explicit any(in_place_type_t<T>, initializer_list<U>, Args&&...);

~-any();

// 22.7.4.3, assignments
any& operator=(const any& rhs);
any& operator=(any&& rhs) noexcept;

template<class T>
any& operator=(T&& rhs);

// 22.7.4.4, modifiers
template<class T, class... Args>
decay_t<T>& emplace(Args&&...);

template<class T, class U, class... Args>
decay_t<T>& emplace(initializer_list<U>, Args&&...);

void reset() noexcept;
void swap(any& rhs) noexcept;

// 22.7.4.5, observers
bool has_value() const noexcept;
const type_info& type() const noexcept;
};

1 An object of class any stores an instance of any type that meets the constructor requirements or it has no value, and this is referred to as the state of the class any object. The stored instance is called the contained value. Two states are equivalent if either they both have no value, or they both have a value and the contained values are equivalent.

2 The non-member any_cast functions provide type-safe access to the contained value.

3 Implementations should avoid the use of dynamically allocated memory for a small contained value. However, any such small-object optimization shall only be applied to types T for which is_nothrow_move_constructible_v<T> is true.

[Example 1: A contained value of type int could be stored in an internal buffer, not in separately-allocated memory. —end example]

22.7.4.2 Construction and destruction [any.cons]

costexpr any() noexcept;

1 Postconditions: has_value() is false.

any(const any& other);

2 Effects: If other.has_value() is false, constructs an object that has no value. Otherwise, equivalent to any(in_place_type_t<T>, any_cast<const T&>(other)) where T is the type of the contained value.

3 Throws: Any exceptions arising from calling the selected constructor for the contained value.

any(any&& other) noexcept;

4 Effects: If other.has_value() is false, constructs an object that has no value. Otherwise, constructs an object of type any that contains either the contained value of other, or contains an object of the same type constructed from the contained value of other considering that contained value as an rvalue.
template<class T>
any(T&& value);

Let VT be decay_t<T>.

Constraints: VT is not the same type as any, VT is not a specialization of in_place_type_t, and is_copy_constructible_v<VT> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.

Effects: Constructs an object of type any that contains an object of type VT direct-initialized with std::forward<T>(value).

Throws: Any exception thrown by the selected constructor of VT.

template<class T, class... Args>
explicit any(in_place_type_t<T>, Args&&... args);

Let VT be decay_t<T>.

Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.

Effects: Direct-non-list-initializes the contained value of type VT with std::forward<Args>(args)....

Postconditions: *this contains a value of type VT.

Throws: Any exception thrown by the selected constructor of VT.

template<class T, class U, class... Args>
explicit any(in_place_type_t<T>, initializer_list<U> il, Args&&... args);

Let VT be decay_t<T>.

Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, initializer_list<U>&, Args...> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.

Effects: Direct-non-list-initializes the contained value of type VT with il, std::forward<Args>(args)....

Postconditions: *this contains a value.

Throws: Any exception thrown by the selected constructor of VT.

~any();

Effects: As if by reset().

22.7.4.3 Assignment

any& operator=(const any& rhs);

Effects: As if by any(rhs).swap(*this). No effects if an exception is thrown.

Returns: *this.

Throws: Any exceptions arising from the copy constructor for the contained value.

any& operator=(any&& rhs) noexcept;

Effects: As if by any(std::move(rhs)).swap(*this).

Postconditions: The state of *this is equivalent to the original state of rhs.

Returns: *this.

template<class T>
any& operator=(T& rhs);

Let VT be decay_t<T>.

Constraints: VT is not the same type as any and is_copy_constructible_v<VT> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.
Effects: Constructs an object tmp of type any that contains an object of type VT direct-initialized with std::forward<T>(rhs), and tmp.swap(*this). No effects if an exception is thrown.

Returns: *this.

Throws: Any exception thrown by the selected constructor of VT.

22.7.4.4 Modifiers

```cpp
template<class T, class... Args>
decay_t<T>& emplace(Args&&... args);
```

Let VT be decay_t<T>.

Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, Args...> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.

Effects: Calls reset(). Then direct-non-list-initializes the contained value of type VT with std::forward<Args>(args)....

Postconditions: *this contains a value.

Returns: A reference to the new contained value.

Throws: Any exception thrown by the selected constructor of VT.

Remarks: If an exception is thrown during the call to VT's constructor, *this does not contain a value, and any previously contained value has been destroyed.

```cpp
template<class T, class U, class... Args>
decay_t<T>& emplace(initializer_list<U> il, Args&&... args);
```

Let VT be decay_t<T>.

Constraints: is_copy_constructible_v<VT> is true and is_constructible_v<VT, initializer_list<U>&, Args...> is true.

Preconditions: VT meets the Cpp17CopyConstructible requirements.

Effects: Calls reset(). Then direct-non-list-initializes the contained value of type VT with il, std::forward<Args>(args)....

Postconditions: *this contains a value.

Returns: A reference to the new contained value.

Throws: Any exception thrown by the selected constructor of VT.

Remarks: If an exception is thrown during the call to VT's constructor, *this does not contain a value, and any previously contained value has been destroyed.

```cpp
void reset() noexcept;
```

Effects: If has_value() is true, destroys the contained value.

Postconditions: has_value() is false.

```cpp
void swap(any& rhs) noexcept;
```

Effects: Exchanges the states of *this and rhs.

22.7.4.5 Observers

```cpp
bool has_value() const noexcept;
```

Returns: true if *this contains an object, otherwise false.

```cpp
const type_info& type() const noexcept;
```

Returns: typeid(T) if *this has a contained value of type T, otherwise typeid(void).

[Note 1: Useful for querying against types known either at compile time or only at runtime. — end note]
22.7.5  Non-member functions

void swap(any& x, any& y) noexcept;

Effects: Equivalent to x.swap(y).

template<class T, class... Args>
any make_any(Args&&... args);

Effects: Equivalent to: return any(in_place_type<T>, std::forward<Args>(args)...);  

template<class T, class U, class... Args>
any make_any(initializer_list<U> il, Args&&... args);

Effects: Equivalent to: return any(in_place_type<T>, il, std::forward<Args>(args)...);

template<class T>
T any_cast(const any& operand);
template<class T>
T any_cast(any& operand);
template<class T>
T any_cast(any&& operand);

Let U be the type remove_cvref_t<T>.

Mandates: For the first overload, is_constructible_v<T, const U&> is true. For the second overload, is_constructible_v<T, U&> is true. For the third overload, is_constructible_v<T, U> is true.

Returns: For the first and second overload, static_cast<T>(*any_cast<U>(&operand)). For the third overload, static_cast<T>(std::move(*any_cast<U>(&operand)));

Throws: bad_any_cast if operand.type() != typeid(remove_reference_t<T>);

[Example 1:]

any x(5);  // x holds int
assert(any_cast<int>(x) == 5);  // cast to value
any_cast<int&>(x) = 10;  // cast to reference
assert(any_cast<int>(x) == 10);

any_cast<int&>(x) = 10;  // cast to reference
x = "Meow";  // x holds const char*
assert(strcmp(any_cast<const char*>(x), "Meow") == 0);
any_cast<const char&>(x) = "Harry";
assert(strcmp(any_cast<const char*>(x), "Harry") == 0);

any_cast<const char&>(x) = "Harry";

any_cast<string&>(x) = move(s2);  // move to any
assert(any_cast<const string&>(x) == "Jane");

any_cast(string&)(y);  // error: cannot any_cast away const
—end example]

[Example 2:]

§ 22.7.5

733
22.8 Expected objects

22.8.1 In general

Subclause 22.8 describes the class template `expected` that represents expected objects. An `expected<T, E>` object holds an object of type `T` or an object of type `unexpected<E>` and manages the lifetime of the contained objects.

22.8.2 Header `<expected>` synopsis

```cpp
namespace std {
    // 22.8.3, class template unexpected
template<class E> class unexpected;

    // 22.8.4, class template bad_expected_access
template<class E> class bad_expected_access;

    // 22.8.5, specialization for void
template<> class bad_expected_access<void>;

    // in-place construction of unexpected values
struct unexpected_t {
    explicit unexpected_t() = default;
};
inline constexpr unexpected_t unexpect{};

    // 22.8.6, class template expected
template<class T, class E> class expected;

    // 22.8.7, partial specialization of expected for void types
template<class T, class E> requires is_void_v<T> class expected<T, E>;
}
```

22.8.3 Class template `unexpected`

22.8.3.1 General

Subclause 22.8.3 describes the class template `unexpected` that represents unexpected objects stored in `expected` objects.

```cpp
namespace std {
    template<class E>
    class unexpected {
        public:
            // 22.8.3.2, constructors
            constexpr unexpected(const unexpected&) = default;
            constexpr unexpected(unexpected&&) = default;
            template<class Err = E>
            constexpr explicit unexpected(Err&&);
            template<class... Args>
            constexpr explicit unexpected(in_place_t, Args&&...);
            template<class U, class... Args>
            constexpr explicit unexpected(in_place_t, initializer_list<U>, Args&&...);

            constexpr unexpected& operator=(const unexpected&) = default;
            constexpr unexpected& operator=(unexpected&&) = default;

            constexpr const E& error() const & noexcept;
            constexpr E& error() & noexcept;
            constexpr const E&& error() const && noexcept;
            constexpr E&& error() && noexcept;
```
constexpr void swap(unexpected& other) noexcept;

template<class E2>
friend constexpr bool operator==(const unexpected&, const unexpected<E2>&);

friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));

private:
  E unex;  // exposition only
};

template<class E> unexpected(E) -> unexpected<E>;

2 A program that instantiates the definition of unexpected for a non-object type, an array type, a specialization of unexpected, or a cv-qualified type is ill-formed.

22.8.3.2 Constructors

template<class Err = E>
constexpr explicit unexpected(Err&& e);

Constraints:
(1.1) — is_same_v<remove_cvref_t<Err>, unexpected> is false; and
(1.2) — is_same_v<remove_cvref_t<Err>, in_place_t> is false; and
(1.3) — is_constructible_v<E, Err> is true.
Effects: Direct-non-list-initializes unex with std::forward<Err>(e).
throws: Any exception thrown by the initialization of unex.

template<class... Args>
constexpr explicit unexpected(in_place_t, Args&&... args);

Constraints: is_constructible_v<E, Args...> is true.
Effects: Direct-non-list-initializes unex with std::forward<Args>(args)....
throws: Any exception thrown by the initialization of unex.

template<class U, class... Args>
constexpr explicit unexpected(in_place_t, initializer_list<U> il, Args&&... args);

Constraints: is_constructible_v<E, initializer_list<U>&, Args...> is true.
Effects: Direct-non-list-initializes unex with il, std::forward<Args>(args)....
throws: Any exception thrown by the initialization of unex.

22.8.3.3 Observers

constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
constexpr E&& error() && noexcept;

Returns: unex.

22.8.3.4 Swap

constexpr void swap(unexpected& other) noexcept(is_nothrow_swappable_v<E>);

Mandates: is_swappable_v<E> is true.
Effects: Equivalent to: using std::swap; swap(unex, other.unex);
friend constexpr void swap(unexpected& x, unexpected& y) noexcept(noexcept(x.swap(y)));  

Constraints: is_swappable_v<E> is true.

Effects: Equivalent to x.swap(y).

### 22.8.3.5 Equality operator

```cpp
template<class E2>
friend constexpr bool operator==(const unexpected& x, const unexpected<E2>& y);
```

Mandates: The expression x.error() == y.error() is well-formed and its result is convertible to bool.

Returns: x.error() == y.error().

### 22.8.4 Class template bad_expected_access

```cpp
namespace std {
    template<class E>
    class bad_expected_access : public bad_expected_access<void> {
    public:
        explicit bad_expected_access(E);
        const char* what() const noexcept override;
        E& error() & noexcept;
        const E& error() const & noexcept;
        E&& error() && noexcept;
        const E&& error() const && noexcept;
    private:
        E unex; // exposition only
    };
}
```

The class template bad_expected_access defines the type of objects thrown as exceptions to report the situation where an attempt is made to access the value of an expected<T, E> object for which has_value() is false.

```cpp
explicit bad_expected_access(E e);
```

Effects: Initializes unex with std::move(e).

```cpp
const E& error() const & noexcept;
E& error() & noexcept;
```

Returns: unex.

```cpp
E&& error() && noexcept;
const E&& error() const && noexcept;
```

Returns: std::move(unex).

```cpp
const char* what() const noexcept override;
```

Returns: An implementation-defined NTBS.

### 22.8.5 Class template specialization bad_expected_access<void>

```cpp
namespace std {
    template<>  
    class bad_expected_access<void> : public exception {
        protected:
            bad_expected_access() noexcept;
            bad_expected_access(const bad_expected_access&);
            bad_expected_access(bad_expected_access&&);
            bad_expected_access& operator=(const bad_expected_access&);
            bad_expected_access& operator=(bad_expected_access&&);
            ~bad_expected_access();
        }
    }
```
public:
    const char* what() const noexcept override;
};

const char* what() const noexcept override;

Returns: An implementation-defined NTBS.

22.8.6 Class template expected

22.8.6.1 General

namespace std {
    template<class T, class E>
    class expected {
    public:
        using value_type = T;
        using error_type = E;
        using unexpected_type = unexpected<E>;

        template<class U>
        using rebind = expected<U, error_type>;

        // 22.8.6.2, constructors
        constexpr expected();
        constexpr expected(const expected&);
        constexpr expected(expected&&) noexcept(see below);
        template<class U, class G>
        constexpr explicit(see below) expected(const expected<U, G>&);
        template<class U, class G>
        constexpr explicit(see below) expected(expected<U, G>&&);
        template<class U = T>
        constexpr explicit(see below) expected(U&& v);
        template<class G>
        constexpr explicit(see below) expected(const unexpected<G>&);
        template<class G>
        constexpr explicit(see below) expected(unexpected<G>&&);
        template<class... Args>
        constexpr explicit expected(in_place_t, Args&&...);
        template<class U, class... Args>
        constexpr T& emplace(Args&&...) noexcept;

        // 22.8.6.3, destructor
        constexpr ~expected();

        // 22.8.6.4, assignment
        constexpr expected& operator=(const expected&);
        constexpr expected& operator=(expected&&) noexcept(see below);
        template<class U = T> constexpr expected& operator=(U&&);
        template<class G>
        constexpr expected& operator=(const unexpected<G>&);
        template<class G>
        constexpr expected& operator=(unexpected<G>&&);
        template<class... Args>
        constexpr T& emplace(Args&&...) noexcept;
    };
} [expected.expected]

[expected.object.general]
// 22.8.6.5, swap
constexpr void swap(expected&) noexcept(see below);
friend constexpr void swap(expected x, expected y) noexcept(noexcept(x.swap(y)));

// 22.8.6.6, observers
constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;
constexpr const T& operator*() const & noexcept;
constexpr T& operator*() & noexcept;
constexpr const T&& operator*() const && noexcept;
constexpr T&& operator*() && noexcept;
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
constexpr const T& value() const &;
constexpr T& value() &;
constexpr const T&& value() const &&;
constexpr T&& value() &&;
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
constexpr const E&& error() const && noexcept;
constexpr E&& error() && noexcept;

// 22.8.6.7, monadic operations
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &;
template<class F> constexpr auto and_then(F&& f) const &&;
template<class F> constexpr auto or_else(F&& f) &;
template<class F> constexpr auto or_else(F&& f) &&;
template<class F> constexpr auto or_else(F&& f) const &;
template<class F> constexpr auto or_else(F&& f) const &&;
template<class F> constexpr auto transform(F&& f) &;
template<class F> constexpr auto transform(F&& f) &&;
template<class F> constexpr auto transform(F&& f) const &;
template<class F> constexpr auto transform(F&& f) const &&;

// 22.8.6.8, equality operators
template<class T2, class E2> requires (!is_void_v<T2>)
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);

friend constexpr bool operator==(const expected&, const unexpected<E2>&);

private:
  bool has_val; // exposition only
  union {
    T val; // exposition only
    E unex; // exposition only
  };

1 Any object of type expected<T, E> either contains a value of type T or a value of type E within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate
the object of type T or the object of type E. Member has_val indicates whether the expected<T, E> object contains an object of type T.

2 A type T is a valid value type for expected if remove_cv_t<T> is void or a complete non-array object type that is not in_place_t, unexpected_t, or a specialization of unexpected_t. A program which instantiates class template expected<T, E> with an argument T that is not a valid value type for expected is ill-formed. A program that instantiates the definition of the template expected<T, E> with a type for the E parameter that is not a valid template argument for unexpected is ill-formed.

3 When T is not cv void, it shall meet the Cpp17Destructible requirements (Table 36). E shall meet the Cpp17Destructible requirements.

22.8.6.2 Constructors

The exposition-only variable template converts-from-any-cvref defined in 22.5.3.2 is used by some constructors for expected.

```cpp
constexpr expected();
```

**Constraints**: is_default_constructible_v<T> is true.

**Effects**: Value-initializes val.

**Postconditions**: has_value() is true.

**Throws**: Any exception thrown by the initialization of val.

```cpp
constexpr expected(const expected& rhs);
```

**Effects**: If rhs.has_value() is true, direct-non-list-initializes val with *rhs. Otherwise, direct-non-list-initializes unex with rhs.error().

**Postconditions**: rhs.has_value() == this->has_value().

**Throws**: Any exception thrown by the initialization of val or unex.

**Remarks**: This constructor is defined as deleted unless

(9.1) — is_copy_constructible_v<T> is true and
(9.2) — is_copy_constructible_v<E> is true.

This constructor is trivial if

(10.1) — is_trivially_copy_constructible_v<T> is true and
(10.2) — is_trivially_copy_constructible_v<E> is true.

```cpp
constexpr expected(expected&& rhs) noexcept(see below);
```

**Constraints**: — is_move_constructible_v<T> is true and
(11.2) — is_move_constructible_v<E> is true.

**Effects**: If rhs.has_value() is true, direct-non-list-initializes val with std::move(*rhs). Otherwise, direct-non-list-initializes unex with std::move(rhs.error()).

**Postconditions**: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.

**Throws**: Any exception thrown by the initialization of val or unex.

**Remarks**: The exception specification is equivalent to is_nothrow_move_constructible_v<T> && is_nothrow_move_constructible_v<E>.

This constructor is trivial if

(16.1) — is_trivially_move_constructible_v<T> is true and
(16.2) — is_trivially_move_constructible_v<E> is true.

```cpp
template<class U, class G>
constexpr explicit(see below) expected(const expected<U, G>& rhs);
```

```cpp
template<class U, class G>
constexpr explicit(see below) expected(expected<U, G>&& rhs);
```

Let:
— UF be const U& for the first overload and U for the second overload.
— GF be const G& for the first overload and G for the second overload.

Constraints:
— is_constructible_v<T, UF> is true; and
— is_constructible_v<E, GF> is true; and
— converts-from-any-cvref<T, expected<U, G>> is false; and
— is_constructible_v<unexpected<E>, expected<U, G>>& is false; and
— is_constructible_v<unexpected<E>, const expected<U, G>>& is false; and
— is_constructible_v<unexpected<E>, const expected<U, G>> is false.

Effects: If rhs.has_value(), direct-non-list-initializes val with std::forward<UF>(*rhs). Otherwise, direct-non-list-initializes unex with std::forward<GF>(rhs.error()).
Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.
Throws: Any exception thrown by the initialization of val or unex.
Remarks: The expression inside explicit is equivalent to !isConvertible_v<UF, T> || !isConvertible_v<GF, E>.

\[ \text{template<class U = T> constexpr explicit(!isConvertible_v<U, T>) expected(U&& v);} \]

Constraints:
— is_same_v<remove_cvref_t<U>, in_place_t> is false; and
— is_same_v<expected, remove_cvref_t<U>> is false; and
— remove_cvref_t<U> is not a specialization of unexpected; and
— is_constructible_v<T, U> is true.

Effects: Direct-non-list-initializes val with std::forward<U>(v).
Postconditions: has_value() is true.
Throws: Any exception thrown by the initialization of val.

\[ \text{template<class G> constexpr explicit(!isConvertible_v<const G&, E>) expected(const unexpected<G>& e);} \]

Constraints: is_constructible_v<E, GF> is true.
Effects: Direct-non-list-initializes unex with std::forward<GF>(e.error()).
Postconditions: has_value() is false.
Throws: Any exception thrown by the initialization of unex.

\[ \text{template<class... Args> constexpr expected(in_place_t, Args&&... args);} \]

Constraints: is_constructible_v<T, Args...> is true.
Effects: Direct-non-list-initializes val with std::forward<Args>(args)....
Postconditions: has_value() is true.
Throws: Any exception thrown by the initialization of val.

\[ \text{template<class U, class... Args> constexpr expected(in_place_t, initializer_list<U> il, Args&&... args);} \]

Constraints: is_constructible_v<T, initializer_list<U>&, Args...> is true.
Effects: Direct-non-list-initializes val with il, std::forward<Args>(args)....
Postconditions: \texttt{has\_value()} is true.

Throws: Any exception thrown by the initialization of \texttt{val}.

\begin{verbatim}
template<class... Args>
constexpr explicit expected(unexpect_t, Args&&... args);
\end{verbatim}

Constraints: \texttt{is\_constructible\_v\langle E, Args...\rangle} is true.

Effects: Direct-non-list-initializes \texttt{unex} with \texttt{std::forward\langle Args\rangle\langle args\rangle}.

Postconditions: \texttt{has\_value()} is false.

Throws: Any exception thrown by the initialization of \texttt{unex}.

\begin{verbatim}
 template<class U, class... Args>
constexpr explicit expected(unexpect_t, initializer_list<U> il, Args&&... args);
\end{verbatim}

Constraints: \texttt{is\_constructible\_v\langle E, initializer\_list\langle U\rangle\&}, Args...\rangle is true.

Effects: Direct-non-list-initializes \texttt{unex} with \texttt{il}, \texttt{std::forward\langle Args\rangle\langle args\rangle}.

Postconditions: \texttt{has\_value()} is false.

Throws: Any exception thrown by the initialization of \texttt{unex}.

\section*{22.8.6.3 Destructor} \hfill [expected.object.dtor]

\begin{verbatim}
constexpr ~expected();
\end{verbatim}

Effects: If \texttt{has\_value()} is true, destroys \texttt{val}, otherwise destroys \texttt{unex}.

Remarks: If \texttt{is\_trivially\_destructible\_v\langle T\rangle} is true, and \texttt{is\_trivially\_destructible\_v\langle E\rangle} is true, then this destructor is a trivial destructor.

\section*{22.8.6.4 Assignment} \hfill [expected.object.assign]

This subclause makes use of the following exposition-only function:

\begin{verbatim}
template<class T, class U, class... Args>
constexpr void reinit-expected(T& newval, U& oldval, Args&&... args) {
  // exposition only
  if constexpr (is_nothrow_constructible_v<T, Args...>) {
    destroy_at(addressof(oldval));
    construct_at(addressof(newval), std::forward<Args>(args)...);
  } else if constexpr (is_nothrow_move_constructible_v<T>) {
    T tmp(std::forward<Args>(args)...);
    destroy_at(addressof(oldval));
    construct_at(addressof(newval), std::move(tmp));
  } else {
    U tmp(std::move(oldval));
    destroy_at(addressof(oldval));
    try {
      construct_at(addressof(newval), std::forward<Args>(args)...);
    } catch (...) {
      construct_at(addressof(oldval), std::move(tmp));
      throw;
    }
  }
}
\end{verbatim}

\begin{verbatim}
constexpr expected& operator=(const expected& rhs);
\end{verbatim}

Effects:

\begin{enumerate}
  \item If \texttt{this->has\_value()} \&\& \texttt{rhs.has\_value()} is true, equivalent to \texttt{val = *rhs}.
  \item Otherwise, if \texttt{this->has\_value()} is true, equivalent to:
    \begin{verbatim}
    reinit-expected(unex, val, rhs.error())
    \end{verbatim}
  \item Otherwise, if \texttt{rhs.has\_value()} is true, equivalent to:
    \begin{verbatim}
    reinit-expected(val, unex, *rhs)
    \end{verbatim}
  \item Otherwise, equivalent to \texttt{unex = rhs.error}.
\end{enumerate}
template<class T, class E>
constexpr expected& operator=(expected&& rhs) noexcept(
    see below);

Returns: *this.

Remarks: This operator is defined as deleted unless:

- is_copyAssignable_v<T> is true
- is_copyConstructible_v<T> is true
- is_copyAssignable_v<E> is true
- is_copyConstructible_v<E> is true
- is_nothrow_moveConstructible_v<T> || is_nothrow_moveConstructible_v<E> is true.

Constraints:

- is_moveConstructible_v<T> is true and
- is_moveAssignable_v<T> is true and
- is_moveConstructible_v<E> is true and
- is_moveAssignable_v<E> is true and
- is_nothrow_moveConstructible_v<T> || is_nothrow_moveConstructible_v<E> is true.

Effects:

- If this->has_value() && rhs.has_value() is true, equivalent to:
  val = std::move(*rhs).
- Otherwise, if this->has_value() is true, equivalent to:
  reinit-expected(unex, val, std::move(rhs.error()))
- Otherwise, if rhs.has_value() is true, equivalent to:
  reinit-expected(val, unex, std::move(*rhs))
- Otherwise, equivalent to unex = std::move(rhs.error()).

Then, if no exception was thrown, equivalent to: has_val = rhs.has_value(); return *this;

Returns: *this.

Remarks: The exception specification is equivalent to:

is_nothrow_moveAssignable_v<T> && is_nothrow_moveConstructible_v<T> &&
is_nothrow_moveAssignable_v<E> && is_nothrow_moveConstructible_v<E>

template<class U = T>
constexpr expected& operator=(U&& v);

Returns: *this.

Remarks: The exception specification is equivalent to:

is_nothrow_moveAssignable_v<T> && is_nothrow_moveConstructible_v<T> &&
is_nothrow_moveAssignable_v<E> && is_nothrow_moveConstructible_v<E>

Constraints:

- is_same_v<expected, remove_cvref_t<U>> is false; and
- remove_cvref_t<U> is not a specialization of unexpected; and
- is_constructible_v<T, U> is true; and
- is_assignable_v<T&, U> is true; and
- is_nothrow_constructible_v<T, U> || is_nothrow_move_constructible_v<T> ||
is_nothrow_move_constructible_v<E> is true.

Effects:

- If has_value() is true, equivalent to:
  val = std::forward<U>(v);
- Otherwise, equivalent to:
  reinit-expected(val, unex, std::forward<U>(v));
  has_val = true;

Returns: *this.

template<class G>
constexpr expected& operator=(const unexpected<G>& e);

§ 22.8.6.4 742
template<class G>
constexpr expected& operator=(unexpected<G>&& e);

Let GF be const G& for the first overload and G for the second overload.

Constraints:
- is_constructible_v<E, GF> is true; and
- is_assignable_v<E&, GF> is true; and
- is_nothrow_constructible_v<E, GF> || is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

Effects:
- If has_value() is true, equivalent to:
  ```cpp
tinit-expected(unex, val, std::forward<GF>(e.error()));
  has_val = false;
```
- Otherwise, equivalent to: unex = std::forward<GF>(e.error());

Returns: *this.

template<class... Args>
constexpr T& emplace(Args&&... args) noexcept;

Constraints: is_nothrow_constructible_v<T, Args...> is true.

Effects: Equivalent to:
```cpp
if (has_value()) {
    destroy_at(addressof(val));
} else {
    destroy_at(addressof(unex));
    has_val = true;
}
return *construct_at(addressof(val), std::forward<Args>(args)...);
```

template<class U, class... Args>
constexpr T& emplace(initializer_list<U> il, Args&&... args) noexcept;

Constraints: is_nothrow_constructible_v<T, initializer_list<U>&, Args...> is true.

Effects: Equivalent to:
```cpp
if (has_value()) {
    destroy_at(addressof(val));
} else {
    destroy_at(addressof(unex));
    has_val = true;
}
return *construct_at(addressof(val), il, std::forward<Args>(args)...);
```

22.8.6.5 Swap [expected.object.swap]

constexpr void swap(expected& rhs) noexcept;

Constraints:
- is_swappable_v<T> is true and
- is_swappable_v<E> is true and
- is_move_constructible_v<T> && is_move_constructible_v<E> is true, and
- is_nothrow_move_constructible_v<T> || is_nothrow_move_constructible_v<E> is true.

Effects: See Table 64.

For the case where rhs.value() is false and this->has_value() is true, equivalent to:
```cpp
if constexpr (is_nothrow_move_constructible_v<E>) {
    E tmp(std::move(rhs.unex));
    destroy_at(addressof(rhs.unex));
```
Table 64: swap(expected&) effects

<table>
<thead>
<tr>
<th></th>
<th>this-&gt;has_value()</th>
<th>!this-&gt;has_value()</th>
</tr>
</thead>
<tbody>
<tr>
<td>rhs.has_value()</td>
<td>equivalent to: using std::swap; swap(val, rhs.val);</td>
<td>calls rhs.swap(*this)</td>
</tr>
<tr>
<td>!rhs.has_value()</td>
<td>see below</td>
<td>equivalent to: using std::swap; swap(unex, rhs.unex);</td>
</tr>
</tbody>
</table>

try {
    construct_at(addressof(rhs.val), std::move(val));
    destroy_at(addressof(val));
    construct_at(addressof(unex), std::move(tmp));
} catch(...) {
    construct_at(addressof(rhs.unex), std::move(tmp));
    throw;
}

} else {
    T tmp(std::move(val));
    destroy_at(addressof(val));
    try {
        construct_at(addressof(unex), std::move(rhs.unex));
        destroy_at(addressof(rhs.unex));
        construct_at(addressof(rhs.val), std::move(tmp));
    } catch(...) {
        construct_at(addressof(val), std::move(tmp));
        throw;
    }
}

has_val = false;
rhs.has_val = true;

Throws: Any exception thrown by the expressions in the Effects.

Remarks: The exception specification is equivalent to:

is_nothrow_move_constructible_v<T> && is_nothrow_swappable_v<T> &&
is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>

friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));

Effects: Equivalent to x.swap(y).

22.8.6.6 Observers

constexpr const T* operator->() const noexcept;
constexpr T* operator->() noexcept;

1 Preconditions: has_value() is true.

2 Returns: addressof(val).

constexpr const Tk* operator*() const & noexcept;
constexpr Tk* operator*() & noexcept;

3 Preconditions: has_value() is true.

4 Returns: val.

constexpr Tk& operator*() & & noexcept;
constexpr const Tk& operator*() const & & noexcept;

5 Preconditions: has_value() is true.

6 Returns: std::move(val).

constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;

7 Returns: has_val.

§ 22.8.6.6 744
 constexpr const T& value() const &;
 constexpr T& value() &;

 Returns: val, if has_value() is true.

 Throws: bad_expected_access(error()) if has_value() is false.

 constexpr T&& value() &&;
 constexpr const T&& value() const &&;

 Returns: std::move(val), if has_value() is true.

 Throws: bad_expected_access(std::move(error())) if has_value() is false.

 constexpr const E& error() const & noexcept;
 constexpr E& error() & noexcept;

 Preconditions: has_value() is false.

 Returns: unex.

 constexpr E&& error() && noexcept;
 constexpr const E&& error() const && noexcept;

 Preconditions: has_value() is false.

 Returns: std::move(unex).

 template<class U> constexpr T value_or(U&& v) const &;
 template<class U> constexpr T value_or(U&& v) &&;

 Mandates: is_copy_constructible_v<T> is true and is_convertible_v<U, T> is true.

 Returns: has_value() ? **this : static_cast<T>(std::forward<U>(v)).

 template<class U> constexpr T value_or(U&& v) const &;
 template<class U> constexpr T value_or(U&& v) &&;

 Mandates: is_move_constructible_v<T> is true and is_convertible_v<U, T> is true.

 Returns: has_value() ? std::move(**this) : static_cast<T>(std::forward<U>(v)).

 template<class G = E> constexpr E error_or(G&& e) const &;
 template<class G = E> constexpr E error_or(G&& e) &&;

 Mandates: is_copy_constructible_v<E> is true and is_convertible_v<G, E> is true.

 Returns: std::forward<G>(e) if has_value() is true, error() otherwise.

 template<class G = E> constexpr E error_or(G&& e) const &;
 template<class G = E> constexpr E error_or(G&& e) &&;

 Mandates: is_move_constructible_v<E> is true and is_convertible_v<G, E> is true.

 Returns: std::forward<G>(e) if has_value() is true, std::move(error()) otherwise.

 22.8.6.7 Monadic operations

 template<class F> constexpr auto and_then(F&& f) &;
 template<class F> constexpr auto and_then(F&& f) &&;

 Let U be remove_cvref_t<invoke_result_t<F, decltype(value())>>.

 Constraints: is_copy_constructible_v<F> is true.

 Mandates: U is a specialization of expected and is_same_v<U::error_type, E> is true.

 Effects: Equivalent to:
 if (has_value())
 return invoke(std::forward<F>(f), value());
 else
 return U(unexpect, error());

 template<class F> constexpr auto and_then(F&& f) &&;
 template<class F> constexpr auto and_then(F&& f) const &;

 Let U be remove_cvref_t<invoke_result_t<F, decltype(std::move(value()))>>.

 Constraints: is_move_constructible_v<F> is true.

 Mandates: U is a specialization of expected and is_same_v<U::error_type, E> is true.
\section*{(2.1) \hspace{1cm} If has_value() is false, returns expected\textlt{U, E}(\texttt{unexpect}, error()).}

\section*{(2.2) \hspace{1cm} Otherwise, if is\texttt{void}_\textlt{U} is false, returns an expected\textlt{U, E} object whose has\texttt{val} member is true and val member is direct-non-list-initialized with invoke(std::forward\textlt{F}(f), value()).}

\section*{(2.3) \hspace{1cm} Otherwise, evaluates invoke(std::forward\textlt{F}(f), value()) and then returns expected\textlt{U, E}().}

\section*{(24.1) \hspace{1cm} If has_value() is false, returns expected\textlt{U, E}(\texttt{unexpect}, std::move(error())).
— Otherwise, if `is_void_v<U>` is false, returns an `expected<U, E>` object whose `has_val` member is true and `val` member is direct-non-list-initialized with `invoke(std::forward<F>(f), std::move(value()))`.

— Otherwise, evaluates `invoke(std::forward<F>(f), std::move(value()))` and then returns `expected<U, E>()`.

```
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) const &;
```

Let `G` be `remove_cv_t<invoke_result_t<F, decltype(error())>>`.

**Constraints:** `is_copy_constructible_v<T>` is true.

**Mandates:** `G` is a valid value type for `expected` and the declaration

\[ G \text{g}(\text{invoke}(\text{std::forward<F>(f)}, \text{error}())); \]

is well-formed.

**Returns:** If `has_value()` is true, `expected<T, G>(\text{in_place, value()})`; otherwise, an `expected<T, G>` object whose `has_val` member is false and `unex` member is direct-non-list-initialized with `invoke(std::forward<F>(f), \text{error}())`.

```
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &&;
```

Let `G` be `remove_cv_t<invoke_result_t<F, decltype(std::move(error()))>>`.

**Constraints:** `is_move_constructible_v<T>` is true.

**Mandates:** `G` is a valid value type for `expected` and the declaration

\[ G \text{g}(\text{invoke}(\text{std::forward<F>(f), std::move(error())})); \]

is well-formed.

**Returns:** If `has_value()` is true, `expected<T, G>(\text{in_place, std::move(value()})`; otherwise, an `expected<T, G>` object whose `has_val` member is false and `unex` member is direct-non-list-initialized

\[ \text{invoke}(\text{std::forward<F>(f), std::move(error())}); \]

22.8.6.8 Equality operators

```
template<class T2, class E2> requires (!is_void_v<T2>)
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

**Mandates:** The expressions `*x == *y` and `x.error() == y.error()` are well-formed and their results are convertible to bool.

**Returns:** If `x.has_value()` does not equal `y.has_value()`, `false`; otherwise if `x.has_value()` is true, `*x == *y`; otherwise `x.error() == y.error()`.

```
template<class T2> friend constexpr bool operator==(const expected& x, const T2& v);
```

**Mandates:** The expression `*x == v` is well-formed and its result is convertible to bool.

**Note 1:** `T1` need not be `Cpp17EqualityComparable`. —end note

**Returns:** `x.has_value()` && static_cast<bool>(*x == v).

```
template<class E2> friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

**Mandates:** The expression `x.error() == e.error()` is well-formed and its result is convertible to bool.

**Returns:** `!x.has_value()` && static_cast<bool>(x.error() == e.error()).

22.8.7 Partial specialization of expected for void types

### General

```
template<class T, class E> requires is_void_v<T>
class expected<T, E> {
public:
    using value_type = T;
    using error_type = E;

§ 22.8.7.1

747
using unexpected_type = unexpected<E>;

template<class U>
using rebinding = expected<U, error_type>;

// 22.8.7.2, constructors
constexpr expected() noexcept;
constexpr expected(const expected&);
constexpr expected(expected&&) noexcept(
    see below);

template<class F> constexpr auto transform(F&& f) const &&;

template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) &&;
template<class F> constexpr auto transform_error(F&& f) const &;
template<class F> constexpr auto transform_error(F&& f) const &&;

// § 22.8.7.8, equality operators

// 22.8.7.8, equality operators
template<class T2, class E2> requires is_void_v<T2>
friend constexpr bool operator==(const expected&, const expected<T2, E2>&);

friend constexpr bool operator==(const expected&, const unexpected<E2>&);

private:
  bool has_val;  // exposition only
  union {
    E unex;    // exposition only
  };
};

1 Any object of type expected<T, E> either represents a value of type T, or contains a value of type E within its own storage. Implementations are not permitted to use additional storage, such as dynamic memory, to allocate the object of type E. Member has_val indicates whether the expected<T, E> object represents a value of type T.

2 A program that instantiates the definition of the template expected<T, E> with a type for the E parameter that is not a valid template argument for unexpected is ill-formed.

3 E shall meet the requirements of Cpp17Destructible (Table 36).

### 22.8.7.2 Constructors

{expected(void.cons)

1 Postconditions: has_value() is true.

constexpr expected() noexcept;

2 Effects: If rhs.has_value() is false, direct-non-list-initializes unex with rhs.error().

3 Postconditions: rhs.has_value() == this->has_value().

4 Throws: Any exception thrown by the initialization of unex.

5 Remarks: This constructor is defined as deleted unless is_copy_constructible_v<E> is true.

6 This constructor is trivial if is_trivially_copy_constructible_v<E> is true.

constexpr expected(expected&& rhs) noexcept(is_nothrow_move_constructible_v<E>);

7 Constraints: is_move_constructible_v<E> is true.

8 Effects: If rhs.has_value() is false, direct-non-list-initializes unex with std::move(rhs.error()).

9 Postconditions: rhs.has_value() is unchanged; rhs.has_value() == this->has_value() is true.

10 Throws: Any exception thrown by the initialization of unex.

11 Remarks: This constructor is trivial if is_trivially_move_constructible_v<E> is true.

template<class U, class G>
constexpr explicit(!is_convertible_v<const G&, E>) expected(const expected<U, G>& rhs);

12 Let GF be const G& for the first overload and G for the second overload.

13 Constraints:

(13.1) — is_void_v<U> is true; and

(13.2) — is_constructible_v<E, GF> is true; and

749
template<class G>
    constexpr explicit(!is_convertible_v<const G&, E>) expected(const unexpected<G>& e);

template<class... Args>
    constexpr explicit(expected(unexpect_t, Args&&... args));

template<class U, class... Args>
    constexpr explicit(expected(unexpect_t, initializer_list<U> il, Args&&... args));
Returns: *this.

Remarks: This operator is defined as deleted unless is_copy_assignable_v<E> is true and is_copy_constructible_v<E> is true.

constexpr expected& operator=(expected&& rhs) noexcept(see below);

Effects:

(4.1) If this->has_value() && rhs.has_value() is true, no effects.

(4.2) Otherwise, if this->has_value() is true, equivalent to:

  construct_at(addressof(unex), std::move(rhs.unex));
  has_val = false;

(4.3) Otherwise, if rhs.has_value() is true, destroys unex and sets has_val to true.

(4.4) Otherwise, equivalent to unex = std::move(rhs.error()).

Returns: *this.

Remarks: The exception specification is equivalent to is_nothrow_move_constructible_v<E> && is_nothrow_moveAssignable_v<E>.

This operator is defined as deleted unless is_move_constructible_v<E> is true and is_moveAssignable_v<E> is true.

template<class G>
constexpr expected& operator=(const unexpected<G>& e);

template<class G>
constexpr expected& operator=(unexpected<G>&& e);

Let GF be const G& for the first overload and G for the second overload.

Constraints: is_constructible_v<E, GF> is true and is_assignable_v<E&, GF> is true.

Effects:

(10.1) If has_value() is true, equivalent to:

  construct_at(addressof(unex), std::forward<GF>(e.error()));
  has_val = false;

(10.2) Otherwise, equivalent to: unex = std::forward<GF>(e.error());

Returns: *this.

constexpr void emplace() noexcept;

Effects: If has_value() is false, destroys unex and sets has_val to true.

22.8.7.5 Swap [expected.void.swap]

constexpr void swap(expected& rhs) noexcept(see below);

Constraints: is_swappable_v<E> is true and is_move_constructible_v<E> is true.

Effects: See Table 65.

Table 65: swap(expected&) effects [tab:expected.void.swap]

<p>| | |</p>
<table>
<thead>
<tr>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>this-&gt;has_value()</td>
<td>!this-&gt;has_value()</td>
</tr>
<tr>
<td>rhs.has_value()</td>
<td>no effects calls rhs.swap(*this)</td>
</tr>
<tr>
<td>!rhs.has_value()</td>
<td>see below equivalent to: using std::swap; swap(unex, rhs.unex);</td>
</tr>
</tbody>
</table>

For the case where rhs.value() is false and this->has_value() is true, equivalent to:

  construct_at(addressof(unex), std::move(rhs.unex));
  destroy_at(addressof(rhs.unex));
  has_val = false;
  rhs.has_val = true;
Throws: Any exception thrown by the expressions in the Effects.

Remarks: The exception specification is equivalent to `is_nothrow_move_constructible_v<E> && is_nothrow_swappable_v<E>.

```cpp
friend constexpr void swap(expected& x, expected& y) noexcept(noexcept(x.swap(y)));
```

Effects: Equivalent to `x.swap(y).

### 22.8.7.6 Observers

```cpp
constexpr explicit operator bool() const noexcept;
constexpr bool has_value() const noexcept;
```

Returns: `has_val`.

```cpp
constexpr void operator*() const noexcept;
```

Preconditions: `has_value()` is true.

```cpp
constexpr void value() const &;
```

Throws: `bad_expected_access(error())` if `has_value()` is false.

```cpp
constexpr void value() &&;
```

Throws: `bad_expected_access(std::move(error()))` if `has_value()` is false.

```cpp
constexpr const E& error() const & noexcept;
constexpr E& error() & noexcept;
```

Preconditions: `has_value()` is false.

```cpp
constexpr E&& error() && noexcept;
constexpr const E&& error() const && noexcept;
```

Preconditions: `has_value()` is false.

```cpp
template<class G = E> constexpr E error_or(G&& e) const &;
```

Mandates: `is_copy_constructible_v<E>` is true and `is_convertible_v<G, E>` is true.

Returns: `std::forward<G>(e)` if `has_value()` is true, `error()` otherwise.

```cpp
template<class G = E> constexpr E error_or(G&& e) &&;
```

Mandates: `is_move_constructible_v<E>` is true and `is_convertible_v<G, E>` is true.

Returns: `std::move(error())` otherwise.

### 22.8.7.7 Monadic operations

```cpp
template<class F> constexpr auto and_then(F&& f) &;
template<class F> constexpr auto and_then(F&& f) const &;
```

Let `U` be `remove_cvref_t<invoke_result_t<F>>.`

Constraints: `is_copy_constructible_v<E>` is true.

Mandates: `U` is a specialization of `expected` and `is_same_v<U::error_type, E>` is true.

Effects: Equivalent to:

```cpp
if (has_value())
    return invoke(std::forward<F>(f));
else
    return U(unexpect, error());
```

```cpp
template<class F> constexpr auto and_then(F&& f) &&;
template<class F> constexpr auto and_then(F&& f) const &&;
```

Let `U` be `remove_cvref_t<invoke_result_t<F>>.`

Constraints: `is_move_constructible_v<E>` is true.
Mandates: U is a specialization of expected and \(\text{is\_same\_v}(<U>::\text{error\_type}, E)\) is true.

Effects: Equivalent to:

\[
\begin{align*}
\text{if (has\_value())} \\
\quad \text{return invoke(std::forward<F>(f))}; \\
\text{else} \\
\quad \text{return U(unexpect, std::move(error()))};
\end{align*}
\]

```
template<class F> constexpr auto or_else(F&& f) &;
```

```
template<class F> constexpr auto or_else(F&& f) const &;
```

Let G be `remove_cvref_t<invoke_result_t<F, decltype(error())>>`. Constraints: `is_copy_constructible_v<E>` is true.

Mandates: G is a specialization of expected and \(\text{is\_same\_v}(G::\text{value\_type}, T)\) is true.

Effects: Equivalent to:

\[
\begin{align*}
\text{if (has\_value())} \\
\quad \text{return G();} \\
\text{else} \\
\quad \text{return invoke(std::forward<F>(f), error());}
\end{align*}
\]

```
template<class F> constexpr auto transform(F&& f) &;
```

```
template<class F> constexpr auto transform(F&& f) const &;
```

Let U be `remove_cv_t<invoke_result_t<F, decltype(error())>>`. Constraints: `is_copy_constructible_v<E>` is true.

Mandates: U is a valid value type for expected. If `is_void_v<U>` is false, the declaration

\[
U u(\text{invoke}(\text{std::forward}\langle F\rangle(f)));
\]

is well-formed.

Effects:

(18.1) — If `has_value()` is false, returns `expected(U, E)(unexpect, error())`.

(18.2) — Otherwise, if `is_void_v<U>` is false, returns an `expected(U, E)` object whose `has\_val` member is true and `val` member is direct-non-list-initialized with `invoke(std::forward<F>(f))`.

(18.3) — Otherwise, evaluates `invoke(std::forward<F>(f))` and then returns `expected(U, E)(f)`.

```
template<class F> constexpr auto transform(F&& f) &;
```

```
template<class F> constexpr auto transform(F&& f) const &;
```

Let U be `remove_cv_t<invoke_result_t<F>>`. Constraints: `is_move_constructible_v<E>` is true.

Mandates: U is a valid value type for expected. If `is_void_v<U>` is false, the declaration

\[
U u(\text{invoke}(\text{std::forward}\langle F\rangle(f)));
\]

is well-formed.

Effects:

(22.1) — If `has_value()` is false, returns `expected(U, E)(unexpect, std::move(error()))`.

(22.2) — Otherwise, if `is_void_v<U>` is false, returns an `expected(U, E)` object whose `has\_val` member is true and `val` member is direct-non-list-initialized with `invoke(std::forward<F>(f))`.  

§ 22.8.7.7 753
— Otherwise, evaluates `invoke(std::forward<F>(f))` and then returns `expected<U, E>()`.

```cpp
template<class F> constexpr auto transform_error(F&& f) &;
template<class F> constexpr auto transform_error(F&& f) const &;
```

22.8.7.8 Equality operators [expected.void.eq]

```cpp
template<class T2, class E2> requires is_void_v<T2>
friend constexpr bool operator==(const expected& x, const expected<T2, E2>& y);
```

1 Mandates: The expression `x.error() == y.error()` is well-formed and its result is convertible to `bool`.
2 Returns: If `x.has_value()` does not equal `y.has_value()`, false; otherwise `x.has_value() || static_cast<bool>(x.error() == y.error())`.

```cpp
template<class E2>
friend constexpr bool operator==(const expected& x, const unexpected<E2>& e);
```

3 Mandates: The expression `x.error() == e.error()` is well-formed and its result is convertible to `bool`.
4 Returns: `!x.has_value() && static_cast<bool>(x.error() == e.error())`.

22.9 Bitsets [bitset]

22.9.1 Header <bitset> synopsis [bitset.syn]

The header `<bitset>` defines a class template and several related functions for representing and manipulating fixed-size sequences of bits.

```cpp
#include <string>  // see 23.4.2
#include <iosfwd>  // for istream (31.7.1), ostream (31.7.2), see 31.3.1

namespace std {
    template<size_t N> class bitset;

    // 22.9.4, bitset operators
    template<
        size_t N>
    constexpr bitset<
        N>
        operator& (const bitset<
            N>&,
        const bitset<
            N>&) noexcept;
    template<
        size_t N>
    constexpr bitset<
        N>
        operator| (const bitset<
            N>&,
        const bitset<
            N>&) noexcept;
    template<
        size_t N>
    constexpr bitset<
        N>
        operator^ (const bitset<
            N>&,
        const bitset<
            N>&) noexcept;
```
template<class charT, class traits, size_t N>
basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bitset<N>& x);

template<class charT, class traits, size_t N>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);

}  

22.9.2 Class template bitset  
22.9.2.1 General  

namespace std {  
template<size_t N> class bitset {  
public:  

// bit reference  

class reference {  
friend class bitset;  
constexpr reference() noexcept;  

public:  
constexpr reference(const reference&) = default;  
constexpr ~reference();  
constexpr reference& operator=(bool x) noexcept;  
constexpr reference& operator=(const reference&) noexcept;  
constexpr bool operator~() const noexcept;  
constexpr operator bool() const noexcept;  
constexpr reference& flip() noexcept;  
};  

// 22.9.2.2, constructors  
constexpr bitset() noexcept;  
constexpr bitset(unsigned long long val) noexcept;  
template<class charT, class traits, class Allocator>  
constexpr explicit bitset(  
    const basic_string<charT, traits, Allocator>& str,  
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,  
    typename basic_string<charT, traits, Allocator>::size_type n = basic_string<charT, traits, Allocator>::npos,  
    charT zero = charT(‘0’),  
    charT one = charT(‘1’));  
template<class charT>  
constexpr explicit bitset(  
    const charT* str,  
    typename basic_string<charT>::size_type n = basic_string<charT>::npos,  
    charT zero = charT(‘0’),  
    charT one = charT(‘1’));  

// 22.9.2.3, bitset operations  
constexpr bitset& operator=(const bitset& rhs) noexcept;  
constexpr bitset& operator|=(const bitset& rhs) noexcept;  
constexpr bitset& operator^=(const bitset& rhs) noexcept;  
constexpr bitset& operator<<=(size_t pos) noexcept;  
constexpr bitset& operator>>=(size_t pos) noexcept;  
constexpr bitset operator<<(size_t pos) const noexcept;  
constexpr bitset operator>>(size_t pos) const noexcept;  
constexpr bitset& set() noexcept;  
constexpr bitset& set(size_t pos, bool val = true);  
constexpr bitset& reset() noexcept;  
constexpr bitset& reset(size_t pos);  
constexpr bitset& operator~(const noexcept);  
constexpr bitset& flip() noexcept;  
constexpr bitset& flip(size_t pos);

§ 22.9.2.1 755
// element access
constexpr bool operator[](size_t pos) const;
constexpr reference operator[](size_t pos);
constexpr unsigned long to_ulong() const;
constexpr unsigned long long to_ullong() const;

// observers
constexpr size_t count() const noexcept;
constexpr size_t size() const noexcept;
constexpr bool operator==(const bitset& rhs) const noexcept;
constexpr bool test(size_t pos) const;
constexpr bool all() const noexcept;
constexpr bool any() const noexcept;
constexpr bool none() const noexcept;
};

// 22.9.3, hash support
template<class T> struct hash;
template<size_t N> struct hash<bitset<N>>;
}

The class template `bitset<N>` describes an object that can store a sequence consisting of a fixed number of bits, N.

Each bit represents either the value zero (reset) or one (set). To toggle a bit is to change the value zero to one, or the value one to zero. Each bit has a non-negative position `pos`. When converting between an object of class `bitset<N>` and a value of some integral type, bit position `pos` corresponds to the bit value `1 << pos`. The integral value corresponding to two or more bits is the sum of their bit values.

The functions described in 22.9.2 can report three kinds of errors, each associated with a distinct exception:

1. an invalid-argument error is associated with exceptions of type `invalid_argument` (19.2.5);
2. an out-of-range error is associated with exceptions of type `out_of_range` (19.2.7);
3. an overflow error is associated with exceptions of type `overflow_error` (19.2.10).

### 22.9.2.2 Constructors `[bitset.cons]`

```cpp
constexpr bitset() noexcept;
Effects: Initializes all bits in *this to zero.
```

```cpp
constexpr bitset(unsigned long long val) noexcept;
Effects: Initializes the first M bit positions to the corresponding bit values in val. M is the smaller of N and the number of bits in the value representation (6.8.1) of `unsigned long long`. If `M < N`, the remaining bit positions are initialized to zero.
```

```cpp
template<class charT, class traits, class Allocator>
constexpr explicit bitset(
    const basic_string<charT, traits, Allocator>& str,
    typename basic_string<charT, traits, Allocator>::size_type pos = 0,
    typename basic_string<charT, traits, Allocator>::size_type n = basic_string<charT, traits, Allocator>::npos,
    charT zero = charT('0'),
    charT one = charT('1'));
Effects: Determines the effective length `rlen` of the initializing string as the smaller of `n` and `str.size()` - `pos`. Initializes the first M bit positions to values determined from the corresponding characters in the string `str`. M is the smaller of N and rlen.
```
An element of the constructed object has value zero if the corresponding character in str, beginning at position pos, is zero. Otherwise, the element has the value one. Character position \( \text{pos} + \text{M} - 1 \) corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions.

If \( \text{M} < \text{N} \), remaining bit positions are initialized to zero.

The function uses traits::eq to compare the character values.

**Throws:** out_of_range if \( \text{pos} > \text{str}.\text{size()} \) or invalid_argument if any of the rlen characters in str beginning at position pos is other than zero or one.

```cpp
template<class charT>
constexpr explicit bitset(
    const charT* str,
    typename basic_string<charT>::size_type n = basic_string<charT>::npos,
    charT zero = charT('0'),
    charT one = charT('1'))
{
    Effects: As if by:
    bitset(n == basic_string<charT>::npos
        ? basic_string<charT>(str)
        : basic_string<charT>(str, n),
        0, n, zero, one)
}
```

### 22.9.2.3 Members

```cpp
constexpr bitset& operator&=(const bitset& rhs) noexcept;
Effects: Clears each bit in *this for which the corresponding bit in rhs is clear, and leaves all other bits unchanged.
Returns: *this.
```

```cpp
constexpr bitset& operator|=(const bitset& rhs) noexcept;
Effects: Sets each bit in *this for which the corresponding bit in rhs is set, and leaves all other bits unchanged.
Returns: *this.
```

```cpp
constexpr bitset& operator^=(const bitset& rhs) noexcept;
Effects: Toggles each bit in *this for which the corresponding bit in rhs is set, and leaves all other bits unchanged.
Returns: *this.
```

```cpp
constexpr bitset& operator<<=(size_t pos) noexcept;
Effects: Replaces each bit at position I in *this with a value determined as follows:
(7.1) If I < pos, the new value is zero;
(7.2) If I >= pos, the new value is the previous value of the bit at position I - pos.
Returns: *this.
```

```cpp
constexpr bitset& operator>>=(size_t pos) noexcept;
Effects: Replaces each bit at position I in *this with a value determined as follows:
(9.1) If pos >= N - I, the new value is zero;
(9.2) If pos < N - I, the new value is the previous value of the bit at position I + pos.
Returns: *this.
```

```cpp
constexpr bitset operator<<(size_t pos) const noexcept;
Returns: bitset(*this) <<= pos.
```

```cpp
constexpr bitset operator>>(size_t pos) const noexcept;
Returns: bitset(*this) >>= pos.
```
constexpr bitset& set() noexcept;
  Effects: Sets all bits in *this.
  Returns: *this.

constexpr bitset& set(size_t pos, bool val = true);
  Effects: Stores a new value in the bit at position pos in *this. If val is true, the stored value is one, otherwise it is zero.
  Returns: *this.
  Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bitset& reset() noexcept;
  Effects: Resets all bits in *this.
  Returns: *this.

constexpr bitset& reset(size_t pos);
  Effects: Resets the bit at position pos in *this.
  Returns: *this.
  Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bitset operator~() const noexcept;
  Effects: Constructs an object x of class bitset and initializes it with *this.
  Returns: x.flip().

constexpr bitset& flip() noexcept;
  Effects: Toggles all bits in *this.
  Returns: *this.

constexpr bitset& flip(size_t pos);
  Effects: Toggles the bit at position pos in *this.
  Returns: *this.
  Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bool operator[](size_t pos) const;
  Preconditions: pos is valid.
  Returns: true if the bit at position pos in *this has the value one, otherwise false.
  Throws: Nothing.

constexpr bitset::reference operator[](size_t pos);
  Preconditions: pos is valid.
  Returns: An object of type bitset::reference such that (*this)[pos] == this->test(pos), and such that (*this)[pos] = val is equivalent to this->set(pos, val).
  Throws: Nothing.
  Remarks: For the purpose of determining the presence of a data race (6.9.2), any access or update through the resulting reference potentially accesses or modifies, respectively, the entire underlying bitset.

constexpr unsigned long to_ulong() const;
  Returns: x.
  Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long.
constexpr unsigned long long to_ullong() const;

Returns: x.

Throws: overflow_error if the integral value x corresponding to the bits in *this cannot be represented as type unsigned long long.

-template<
class charT = char,
class traits = char_traits<charT>,
class Allocator = allocator<charT>
constexpr basic_string<charT, traits, Allocator>
to_string(charT zero = charT('0'), charT one = charT('1')) const;

Effects: Constructs a string object of the appropriate type and initializes it to a string of length N characters. Each character is determined by the value of its corresponding bit position in *this. Character position N - 1 corresponds to bit position zero. Subsequent decreasing character positions correspond to increasing bit positions. Bit value zero becomes the character zero, bit value one becomes the character one.

Returns: The created object.

constexpr size_t count() const noexcept;

Returns: A count of the number of bits set in *this.

constexpr size_t size() const noexcept;

Returns: N.

constexpr bool operator==(const bitset& rhs) const noexcept;

Returns: true if the value of each bit in *this equals the value of the corresponding bit in rhs.

constexpr bool test(size_t pos) const noexcept;

Returns: true if the bit at position pos in *this has the value one.

Throws: out_of_range if pos does not correspond to a valid bit position.

constexpr bool all() const noexcept;

Returns: count() == size().

constexpr bool any() const noexcept;

Returns: count() != 0.

constexpr bool none() const noexcept;

Returns: count() == 0.

22.9.3 bitset hash support

template<size_t N> struct hash<bitset<N>>;

The specialization is enabled (22.10.19).

22.9.4 bitset operators

template<size_t N>
constexpr bitset<N> operator&(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;

Returns: bitset<N>(lhs) &= rhs.

template<size_t N>
constexpr bitset<N> operator|(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;

Returns: bitset<N>(lhs) |= rhs.

template<size_t N>
constexpr bitset<N> operator^(const bitset<N>& lhs, const bitset<N>& rhs) noexcept;

Returns: bitset<N>(lhs) ^= rhs.
template<class charT, class traits, size_t N>
    basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, bitset<N>& x);

A formatted input function (31.7.5.3).

Effects: Extracts up to N characters from is. Stores these characters in a temporary object str of type
    basic_string<charT, traits>, then evaluates the expression x = bitset<N>(str). Characters are
    extracted and stored until any of the following occurs:

1. N characters have been extracted and stored;
2. end-of-file occurs on the input sequence;
3. the next input character is neither is.widen(‘0’) nor is.widen(‘1’) (in which case the input
   character is not extracted).

If N > 0 and no characters are stored in str, ios_base::failbit is set in the input function’s local
error state before setstate is called.

Returns: is.

template<class charT, class traits, size_t N>
    basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const bitset<N>& x);

Returns:
    os << x.template to_string<charT, traits, allocator<charT>>(
        use_facet<ctype<charT>>(os.getloc()).widen(‘0’),
        use_facet<ctype<charT>>(os.getloc()).widen(‘1’))
(see 31.7.6.3).

22.10 Function objects [function.objects]

22.10.1 General [function.objects.general]

1 A function object type is an object type (6.8.1) that can be the type of the postfix-expression in a function
call (7.6.1.3, 12.2.2.2). A function object is an object of a function object type. In the places where one
would expect to pass a pointer to a function to an algorithmic template (Clause 27), the interface is specified
to accept a function object. This not only makes algorithmic templates work with pointers to functions, but
also enables them to work with arbitrary function objects.

22.10.2 Header <functional> synopsis [functional.syn]

namespace std {
    // 22.10.5, invoke
    template<class F, class... Args>
    constexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args) noexcept(is_nothrow_invocable_v<F, Args...>);

    template<class R, class F, class... Args>
    constexpr R invoke_r(F&& f, Args&&... args) noexcept(is_nothrow_invocable_r_v<R, F, Args...>);

    // 22.10.6, reference_wrapper
    template<class T> class reference_wrapper;

    template<class T> constexpr reference_wrapper<T> ref(T& r) noexcept;

[Example 1: If a C++ program wants to have a by-element addition of two vectors a and b containing double and put the result into a, it can do:
  transform(a.begin(), a.end(), b.begin(), a.begin(), plus<double>().);
  —end example]

[Example 2: To negate every element of a:
  transform(a.begin(), a.end(), a.begin(), negate<double>().);
  —end example]

22.10.3 Definitions [func.def]

The following definitions apply to this Clause:

A *call signature* is the name of a return type followed by a parenthesized comma-separated list of zero or more argument types.

A *callable type* is a function object type (22.10) or a pointer to member.

A *callable object* is an object of a callable type.

A *call wrapper type* is a type that holds a callable object and supports a call operation that forwards to that object.

A *call wrapper* is an object of a call wrapper type.

A *target object* is the callable object held by a call wrapper.

A call wrapper type may additionally hold a sequence of objects and references that may be passed as arguments to the target object. These entities are collectively referred to as *bound argument entities*.

The target object and bound argument entities of the call wrapper are collectively referred to as *state entities*.

22.10.4 Requirements [func.require]

Define \( \text{INVOKE}(f, t_1, t_2, \ldots, t_N) \) as follows:

1. \( \text{INVOKE}(f, t_1, t_2, \ldots, t_N) \) when \( f \) is a pointer to a member function of a class \( T \) and is_base_of_v<T, remove_reference_t<decltype(t_1)>> is true:
   - \( (t_1 \ast f)(t_2, \ldots, t_N) \) when \( f \) is a pointer to a member function of a class \( T \) and remove_cvref_t<decltype(t_1)> is a specialization of reference_wrapper;
   - \( ((\ast t_1) \ast f)(t_2, \ldots, t_N) \) when \( f \) is a pointer to a member function of a class \( T \) and \( t_1 \) does not satisfy the previous two items;
   - \( t_1 \ast f \) when \( N == 1 \) and \( f \) is a pointer to data member of a class \( T \) and is_base_of_v<T, remove_reference_t<decltype(t_1)>> is true;
   - \( t_1 \cdot f \) when \( N == 1 \) and \( f \) is a pointer to data member of a class \( T \) and remove_cvref_t<decltype(t_1)> is a specialization of reference_wrapper;
   - \( ((\ast t_1) \cdot f) \) when \( N == 1 \) and \( f \) is a pointer to data member of a class \( T \) and \( t_1 \) does not satisfy the previous two items;
   - \( f(t_1, t_2, \ldots, t_N) \) in all other cases.

2. Define \( \text{INVOKE}<R>(f, t_1, t_2, \ldots, t_N) \) as static_cast<void>(INVOKE(f, t_1, t_2, \ldots, t_N)) if \( R \) is cv void, otherwise INVOKE(f, t_1, t_2, \ldots, t_N) implicitly converted to \( R \). If reference_converts_from_temporary_v<R, decltype(INVOKE(f, t_1, t_2, \ldots, t_N))> is true, \( \text{INVOKE}<R>(f, t_1, t_2, \ldots, t_N) \) is ill-formed.
Every call wrapper (22.10.3) meets the Cpp17MoveConstructible and Cpp17Destructible requirements. An argument forwarding call wrapper is a call wrapper that can be called with an arbitrary argument list and delivers the arguments to the target object as references. This forwarding step delivers rvalue arguments as rvalue references and lvalue arguments as lvalue references.

[Note 1: In a typical implementation, argument forwarding call wrappers have an overloaded function call operator of the form]

```
template<class... UnBoundArgs>
constexpr R operator()(UnBoundArgs&&... unbound_args) cv-qual;
'''

--- end note

A perfect forwarding call wrapper is an argument forwarding call wrapper that forwards its state entities to the underlying call expression. This forwarding step delivers a state entity of type \(T\) as \(cv\ T\&\) when the call is performed on an lvalue of the call wrapper type and as \(cv\ T&&\) otherwise, where \(cv\) represents the \(cv\)-qualifiers of the call wrapper and where \(cv\) shall be neither volatile nor const volatile.

A call pattern defines the semantics of invoking a perfect forwarding call wrapper. A postfix call performed on a perfect forwarding call wrapper is expression-equivalent (3.21) to an expression determined from its call pattern \(cp\) by replacing all occurrences of the arguments of the call wrapper and its state entities with references as described in the corresponding forwarding steps.

A simple call wrapper is a perfect forwarding call wrapper that meets the Cpp17CopyConstructible and Cpp17CopyAssignable requirements and whose copy constructor, move constructor, and assignment operators are constexpr functions that do not throw exceptions.

The copy/move constructor of an argument forwarding call wrapper has the same apparent semantics as if memberwise copy/move of its state entities were performed (11.4.5.3).

[Note 2: This implies that each of the copy/move constructors has the same exception-specification as the corresponding implicit definition and is declared as constexpr if the corresponding implicit definition would be considered to be constexpr. --- end note]

Argument forwarding call wrappers returned by a given standard library function template have the same type if the types of their corresponding state entities are the same.

### 22.10.5 invoke functions

#### template<
class F, class... Args>
cconstexpr invoke_result_t<F, Args...> invoke(F&& f, Args&&... args)
            noexcept(is_nothrow_invocable_v<F, Args...>);  

Constraints: is_invocable_v<F, Args...> is true.

Returns: INVOKE(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4).

#### template<
class R, class F, class... Args>
cconstexpr R invoke_r(F&& f, Args&&... args)
            noexcept(is_nothrow_invocable_r_v<R, F, Args...>);  

Constraints: is_invocable_r_v<R, F, Args...> is true.

Returns: INVOKE<R>(std::forward<F>(f), std::forward<Args>(args)...) (22.10.4).

### 22.10.6 Class template reference_wrapper

#### General

```cpp
namespace std {
    template<class T> class reference_wrapper {
        public:
            // types
            using type = T;

            // 22.10.6.2, constructors
            template<class U>
                constexpr reference_wrapper(U&&) noexcept(see below);
            constexpr reference_wrapper(const reference_wrapper& x) noexcept;

            // 22.10.6.3, assignment
            constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;
    }
}
```

§ 22.10.6.1 764
// 22.10.6.4, access
constexpr operator T& () const noexcept;
constexpr T& get() const noexcept;

// 22.10.6.5, invocation
template<class... ArgTypes>
constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&...) const
    noexcept(is_nothrow_invocable_v<T&, ArgTypes...>);
};

template<class T>
reference_wrapper(T&) -> reference_wrapper<T>;

reference_wrapper<T> is a Cpp17CopyConstructible and Cpp17CopyAssignable wrapper around a reference
to an object or function of type T.

The template parameter T of reference_wrapper may be an incomplete type.

22.10.6.2 Constructors

template<class U>
constexpr reference_wrapper(U&& u) noexcept(
    see below);

Let FUN denote the exposition-only functions
    void FUN(T&) noexcept;
    void FUN(T&&) = delete;

Constraints: The expression FUN(declval<U>()) is well-formed and is_same_v<remove_cvref_t<U>,
    reference_wrapper> is false.

Effects: Creates a variable r as if by T& r = std::forward<U>(u), then constructs a reference _
    wrapper object that stores a reference to r.

Remarks: The exception specification is equivalent to noexcept(FUN(declval<U>())).

constexpr reference_wrapper(const reference_wrapper& x) noexcept;

Effects: Constructs a reference_wrapper object that stores a reference to x.get().

22.10.6.3 Assignment

constexpr reference_wrapper& operator=(const reference_wrapper& x) noexcept;

Postconditions: *this stores a reference to x.get().

22.10.6.4 Access

constexpr operator T& () const noexcept;

Returns: The stored reference.

constexpr T& get() const noexcept;

Returns: The stored reference.

22.10.6.5 Invocation

template<class... ArgTypes>
constexpr invoke_result_t<T&, ArgTypes...> operator()(ArgTypes&&... args) const
    noexcept(is_nothrow_invocable_v<T&, ArgTypes...>);

Mandates: T is a complete type.

Returns: INVOKE(get(), std::forward<ArgTypes>(args)...). (22.10.4)

22.10.6.6 Helper functions

The template parameter T of the following ref and cref function templates may be an incomplete type.
template<class T> constexpr reference_wrapper<T> ref(T& t) noexcept;

Returns: reference_wrapper<T>(t).

template<class T> constexpr reference_wrapper<T> ref(reference_wrapper<T> t) noexcept;

Returns: t.

template<class T> constexpr reference_wrapper<const T> cref(const T& t) noexcept;

Returns: reference_wrapper<const T>(t).

template<class T> constexpr reference_wrapper<const T> cref(reference_wrapper<T> t) noexcept;

Returns: t.

22.10.7 Arithmetic operations

22.10.7.1 General

The library provides basic function object classes for all of the arithmetic operators in the language (7.6.5, 7.6.6).

22.10.7.2 Class template plus

template<class T = void> struct plus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x + y.

template<> struct plus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) + std::forward<U>(u));

Returns: std::forward<T>(t) + std::forward<U>(u).

22.10.7.3 Class template minus

template<class T = void> struct minus {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

Returns: x - y.

template<> struct minus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));

    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) - std::forward<U>(u));

Returns: std::forward<T>(t) - std::forward<U>(u).

22.10.7.4 Class template multiplies

template<class T = void> struct multiplies {
    constexpr T operator()(const T& x, const T& y) const;
};
constexpr T operator()(const T& x, const T& y) const;

Returns: x * y.

```cpp
template<> struct multiplies<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) * std::forward<U>(u));

    using is_transparent = unspecified;
};
```

Returns: std::forward<T>(t) * std::forward<U>(u).

22.10.7.5 Class template divides

```cpp
template<class T = void> struct divides {
    constexpr T operator()(const T& x, const T& y) const;
};
```

Returns: x / y.

```cpp
template<> struct divides<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) / std::forward<U>(u));

    using is_transparent = unspecified;
};
```

Returns: std::forward<T>(t) / std::forward<U>(u).

22.10.7.6 Class template modulus

```cpp
template<class T = void> struct modulus {
    constexpr T operator()(const T& x, const T& y) const;
};
```

Returns: x % y.

```cpp
template<> struct modulus<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) % std::forward<U>(u));

    using is_transparent = unspecified;
};
```

Returns: std::forward<T>(t) % std::forward<U>(u).

22.10.7.7 Class template negate

```cpp
template<class T = void> struct negate {
    constexpr T operator()(const T& x) const;
};
```

Returns: -x.
template<> struct negate<void> {
  template<class T> constexpr auto operator()(T&& t) const
  -> decltype(-std::forward<T>(t));

  using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
  -> decltype(-std::forward<T>(t));

Returns: -std::forward<T>(t).

22.10.8 Comparisons

22.10.8.1 General

The library provides basic function object classes for all of the comparison operators in the language (7.6.9, 7.6.10).

For templates less, greater, less_equal, and greater_equal, the specializations for any pointer type yield a result consistent with the implementation-defined strict total order over pointers (3.27).

[Note 1: If a < b is well-defined for pointers a and b of type P, then (a < b) == less<P>()(a, b), (a > b) == greater<P>()(a, b), and so forth. —end note]

For template specializations less<void>, greater<void>, less_equal<void>, and greater_equal<void>, if the call operator calls a built-in operator comparing pointers, the call operator yields a result consistent with the implementation-defined strict total order over pointers.

22.10.8.2 Class template equal_to

template<class T = void> struct equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

Returns: x == y.

template<> struct equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) == std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) == std::forward<U>(u));

Returns: std::forward<T>(t) == std::forward<U>(u).

22.10.8.3 Class template not_equal_to

template<class T = void> struct not_equal_to {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;

Returns: x != y.

template<> struct not_equal_to<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) != std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) != std::forward<U>(u));

Returns: std::forward<T>(t) != std::forward<U>(u).
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) != std::forward<U>(u));

2 Returns: std::forward<T>(t) != std::forward<U>(u).

22.10.8.4 Class template greater

template<class T = void> struct greater {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1 Returns: x > y.

template<> struct greater<void> {
  constexpr bool operator()(const T& x, const T& y) const;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) > std::forward<U>(u));

using is_transparent = unspecified;

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) > std::forward<U>(u));
2 Returns: std::forward<T>(t) > std::forward<U>(u).

22.10.8.5 Class template less

template<class T = void> struct less {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1 Returns: x < y.

template<> struct less<void> {
  constexpr bool operator()(const T& x, const T& y) const;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) < std::forward<U>(u));

using is_transparent = unspecified;

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) < std::forward<U>(u));
2 Returns: std::forward<T>(t) < std::forward<U>(u).

22.10.8.6 Class template greater_equal

template<class T = void> struct greater_equal {
  constexpr bool operator()(const T& x, const T& y) const;
};

constexpr bool operator()(const T& x, const T& y) const;
1 Returns: x >= y.

template<> struct greater_equal<void> {
  constexpr bool operator()(const T& x, const T& y) const;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) >= std::forward<U>(u));

using is_transparent = unspecified;

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) >= std::forward<U>(u));
2 Returns: std::forward<T>(t) >= std::forward<U>(u).
22.10.8.7 Class template less_equal

```cpp
template<class T = void> struct less_equal {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

Returns: \( x \leq y \).

```cpp
template<> struct less_equal<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) <= std::forward<U>(u));
    using is_transparent = unspecified;
};
```

Returns: \( \text{std::forward}(t) \leq \text{std::forward}(u) \).

22.10.8.8 Class compare_three_way

```cpp
namespace std {
    struct compare_three_way {
        template<class T, class U>
        constexpr auto operator()(T&& t, U&& u) const;
        using is_transparent = unspecified;
    };
}
```

```cpp
template<class T, class U>
constexpr auto operator()(T&& t, U&& u) const;
```

Constraints: \( T \) and \( U \) satisfy three_way_comparable_with.

Preconditions: If the expression \( \text{std::forward}(t) \Leftrightarrow \text{std::forward}(u) \) results in a call to a built-in operator \( \Leftrightarrow \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2); otherwise, \( T \) and \( U \) model three_way_comparable_with.

Effects:

- If the expression \( \text{std::forward}(t) \Leftrightarrow \text{std::forward}(u) \) results in a call to a built-in operator \( \Leftrightarrow \) comparing pointers of type \( P \), returns \text{strong_ordering}::less if \( (\text{the converted value of}) \ t \) precedes \( u \) in the implementation-defined strict total order over pointers (3.27), \text{strong_ordering}::greater if \( u \) precedes \( t \), and otherwise \text{strong_ordering}::equal.
- Otherwise, equivalent to: return \( \text{std::forward}(t) \Leftrightarrow \text{std::forward}(u) \);

22.10.9 Concept-constrained comparisons

```cpp
struct ranges::equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
```

Constraints: \( T \) and \( U \) satisfy equality_comparable_with.

Preconditions: If the expression \( \text{std::forward}(t) == \text{std::forward}(u) \) results in a call to a built-in operator \( == \) comparing pointers of type \( P \), the conversion sequences from both \( T \) and \( U \) to \( P \) are equality-preserving (18.2); otherwise, \( T \) and \( U \) model equality_comparable_with.

Effects:
— If the expression `std::forward<T>(t) == std::forward<U>(u)` results in a call to a built-in operator `==` comparing pointers: returns `false` if either (the converted value of) `t` precedes `u` or `u` precedes `t` in the implementation-defined strict total order over pointers (3.27) and otherwise `true`.

— Otherwise, equivalent to: `return std::forward<T>(t) == std::forward<U>(u);`

```cpp
struct ranges::not_equal_to {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
```

4 Constraints: `T` and `U` satisfy `equality_comparable_with`.

5 Effects: Equivalent to:
   ```cpp
   return !ranges::equal_to{}(std::forward<T>(t), std::forward<U>(u));
   ```

```cpp
struct ranges::greater {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
```

6 Constraints: `T` and `U` satisfy `totally_ordered_with`.

7 Effects: Equivalent to:
   ```cpp
   return ranges::less{}(std::forward<U>(u), std::forward<T>(t));
   ```

```cpp
struct ranges::less {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;
```

8 Constraints: `T` and `U` satisfy `totally_ordered_with`.

9 Preconditions: If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers of type `P`, the conversion sequences from both `T` and `U` to `P` are equality-preserving (18.2); otherwise, `T` and `U` model `totally_ordered_with`. For any expressions `ET` and `EU` such that `decltype((ET))` is `T` and `decltype((EU))` is `U`, exactly one of `ranges::less{}(ET, EU)`, `ranges::less{}(EU, ET)`, or `ranges::equal_to{}(ET, EU)` is `true`.

10 Effects:

10.1 — If the expression `std::forward<T>(t) < std::forward<U>(u)` results in a call to a built-in operator `<` comparing pointers: returns `true` if (the converted value of) `t` precedes `u` in the implementation-defined strict total order over pointers (3.27) and otherwise `false`.

10.2 — Otherwise, equivalent to: `return std::forward<T>(t) < std::forward<U>(u);`

```cpp
struct ranges::greater_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;

    using is_transparent = unspecified;
};
```
template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.

Effects: Equivalent to:
    return !ranges::less{}(std::forward<T>(t), std::forward<U>(u));

struct ranges::less_equal {
    template<class T, class U>
    constexpr bool operator()(T&& t, U&& u) const;
    using is_transparent = unspecified;
};

template<class T, class U>
constexpr bool operator()(T&& t, U&& u) const;

Constraints: T and U satisfy totally_ordered_with.

Effects: Equivalent to:
    return !ranges::less{}(std::forward<U>(u), std::forward<T>(t));

### 22.10.10 Logical operations

#### General

The library provides basic function object classes for all of the logical operators in the language (7.6.14, 7.6.15, 7.6.2.2).

#### Class template logical_and

```cpp
template<class T = void> struct logical_and {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr bool operator()(const T& x, const T& y) const;
```

Returns: `x && y`.

```cpp
template<> struct logical_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) && std::forward<U>(u));
    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) && std::forward<U>(u));
```

Returns: `std::forward<T>(t) && std::forward<U>(u)`.

#### Class template logical_or

```cpp
template<class T = void> struct logical_or {
    constexpr bool operator()(const T& x, const T& y) const;
};
```

```cpp
constexpr bool operator()(const T& x, const T& y) const;
```

Returns: `x || y`.

```cpp
template<> struct logical_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) || std::forward<U>(u));
    using is_transparent = unspecified;
};
```

```cpp
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));
```

Returns: `std::forward<T>(t) || std::forward<U>(u)`.
template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) || std::forward<U>(u));

2 Returns: std::forward<T>(t) || std::forward<U>(u).

22.10.10.4 Class template logical_not [logical.operations.not]

template<class T = void> struct logical_not {
    constexpr bool operator()(const T& x) const;
};

constexpr bool operator()(const T& x) const;

1 Returns: !x.

template<> struct logical_not<void> {
    template<class T> constexpr auto operator()(T&& t) const
        -> decltype(!std::forward<T>(t));
    using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&& t) const
    -> decltype(!std::forward<T>(t));

2 Returns: !std::forward<T>(t).

22.10.11 Bitwise operations [bitwise.operations]

22.10.11.1 General [bitwise.operations.general]

The library provides basic function object classes for all of the bitwise operators in the language (7.6.11, 7.6.13, 7.6.12, 7.6.2.2).

22.10.11.2 Class template bit_and [bitwise.operations.and]

template<class T = void> struct bit_and {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x & y.

template<> struct bit_and<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) & std::forward<U>(u));
    using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) & std::forward<U>(u));

2 Returns: std::forward<T>(t) & std::forward<U>(u).

22.10.11.3 Class template bit_or [bitwise.operations.or]

template<class T = void> struct bit_or {
    constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;

1 Returns: x | y.

template<> struct bit_or<void> {
    template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
        -> decltype(std::forward<T>(t) | std::forward<U>(u));

using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) | std::forward<U>(u));
2
Returns: std::forward<T>(t) | std::forward<U>(u).

22.10.11.4 Class template bit_xor

[bitwise.operations.xor]

template<class T = void> struct bit_xor {
  constexpr T operator()(const T& x, const T& y) const;
};

constexpr T operator()(const T& x, const T& y) const;
1
Returns: x ^ y.

template<> struct bit_xor<void> {
  template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
    -> decltype(std::forward<T>(t) ^ std::forward<U>(u));

  using is_transparent = unspecified;
};

template<class T, class U> constexpr auto operator()(T&& t, U&& u) const
  -> decltype(std::forward<T>(t) ^ std::forward<U>(u));
2
Returns: std::forward<T>(t) ^ std::forward<U>(u).

22.10.11.5 Class template bit_not

[bitwise.operations.not]

template<class T = void> struct bit_not {
  constexpr T operator()(const T& x) const;
};

constexpr T operator()(const T& x) const;
1
Returns: ~x.

template<> struct bit_not<void> {
  template<class T> constexpr auto operator()(T&& t) const
    -> decltype(~std::forward<T>(t));

  using is_transparent = unspecified;
};

template<class T> constexpr auto operator()(T&&) const
  -> decltype(~std::forward<T>(t));
2
Returns: ~std::forward<T>(t).

22.10.12 Class identity

[func.identity]

struct identity {
  template<class T>
    constexpr T&& operator()(T&& t) const noexcept;

  using is_transparent = unspecified;
};

template<class T>
  constexpr T&& operator()(T&& t) const noexcept;
1
Effects: Equivalent to: return std::forward<T>(t);

22.10.13 Function template not_fn

[func.not.fn]

template<class F> constexpr unspecified not_fn(F&& f);
1

In the text that follows:
(1.1) $g$ is a value of the result of a `not_fn` invocation,
(1.2) $FD$ is the type `decay_t<F>`,
(1.3) $fd$ is the target object of $g$ (22.10.3) of type $FD$, direct-non-list-initialized with `std::forward<F>(f)`,
(1.4) `call_args` is an argument pack used in a function call expression (7.6.1.3) of $g$.

**Mandates:** $\text{is_constructible_v}<FD, F> \&\& \text{is_move_constructible_v}<FD>$ is true.

**Preconditions:** $FD$ meets the `Cpp17MoveConstructible` requirements.

**Returns:** A perfect forwarding call wrapper (22.10.4) $g$ with call pattern `!invoke(fd, call_args...)`.

**Throws:** Any exception thrown by the initialization of $fd$.

### 22.10.14 Function templates bind_front and bind_back

```cpp
template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);

template<class F, class... Args>
constexpr unspecified bind_back(F&& f, Args&&... args);
```

Within this subclause:

(1.1) $g$ is a value of the result of a `bind_front` or `bind_back` invocation,
(1.2) $FD$ is the type `decay_t<F>`,
(1.3) $fd$ is the target object of $g$ (22.10.3) of type $FD$, direct-non-list-initialized with `std::forward<F>(f)`,
(1.4) `BoundArgs` is a pack that denotes `decay_t<Args>...`,
(1.5) `bound_args` is a pack of bound argument entities of $g$ (22.10.3) of types `BoundArgs...`, direct-non-list-initialized with `std::forward<Args>(args)...`, respectively, and
(1.6) `call_args` is an argument pack used in a function call expression (7.6.1.3) of $g$.

**Mandates:**
- $\text{is_constructible_v}<FD, F> \&\& \text{is_move_constructible_v}<FD>$
- $(\text{is_constructible_v}<BoundArgs, Args> \&\& ...) \&\&
  $(\text{is_move_constructible_v}<BoundArgs> \&\& ...)$

is true.

**Preconditions:** $FD$ meets the `Cpp17MoveConstructible` requirements. For each $T_i$ in `BoundArgs`, if $T_i$ is an object type, $T_i$ meets the `Cpp17MoveConstructible` requirements.

**Returns:** A perfect forwarding call wrapper (22.10.4) $g$ with call pattern:

(4.1) `!invoke(fd, bound_args..., call_args...)` for a `bind_front` invocation, or
(4.2) `!invoke(fd, call_args..., bound_args...)` for a `bind_back` invocation.

**Throws:** Any exception thrown by the initialization of the state entities of $g$ (22.10.3).

### 22.10.15 Function object binders

**22.10.15.1 General**

Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

**22.10.15.2 Class template is_bind_expression**

```cpp
namespace std {
    template<class T> struct is_bind_expression; // see below
}
```

The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.

Specializations of the `is_bind_expression` template shall meet the `Cpp17UnaryTypeTrait` requirements (21.3.2). The implementation provides a definition that has a base characteristic of `true_type` if $T$ is a type returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this

---

(1) $g$ is a value of the result of a `not_fn` invocation,
(2) $FD$ is the type `decay_t<F>`,
(3) $fd$ is the target object of $g$ (22.10.3) of type $FD$, direct-non-list-initialized with `std::forward<F>(f)`,
(4) `call_args` is an argument pack used in a function call expression (7.6.1.3) of $g$. **Mandates:** $\text{is_constructible_v}<FD, F> \&\& \text{is_move_constructible_v}<FD>$ is true.

**Preconditions:** $FD$ meets the `Cpp17MoveConstructible` requirements.

**Returns:** A perfect forwarding call wrapper (22.10.4) $g$ with call pattern `!invoke(fd, call_args...)`.

**Throws:** Any exception thrown by the initialization of $fd$.

### 22.10.14 Function templates bind_front and bind_back

```cpp
template<class F, class... Args>
constexpr unspecified bind_front(F&& f, Args&&... args);

template<class F, class... Args>
constexpr unspecified bind_back(F&& f, Args&&... args);
```

Within this subclause:

(1.1) $g$ is a value of the result of a `bind_front` or `bind_back` invocation,
(1.2) $FD$ is the type `decay_t<F>`,
(1.3) $fd$ is the target object of $g$ (22.10.3) of type $FD$, direct-non-list-initialized with `std::forward<F>(f)`,
(1.4) `BoundArgs` is a pack that denotes `decay_t<Args>...`,
(1.5) `bound_args` is a pack of bound argument entities of $g$ (22.10.3) of types `BoundArgs...`, direct-non-list-initialized with `std::forward<Args>(args)...`, respectively, and
(1.6) `call_args` is an argument pack used in a function call expression (7.6.1.3) of $g$.

**Mandates:**
- $\text{is_constructible_v}<FD, F> \&\& \text{is_move_constructible_v}<FD>$
- $(\text{is_constructible_v}<BoundArgs, Args> \&\& ...) \&\&
  $(\text{is_move_constructible_v}<BoundArgs> \&\& ...)$

is true.

**Preconditions:** $FD$ meets the `Cpp17MoveConstructible` requirements. For each $T_i$ in `BoundArgs`, if $T_i$ is an object type, $T_i$ meets the `Cpp17MoveConstructible` requirements.

**Returns:** A perfect forwarding call wrapper (22.10.4) $g$ with call pattern:

(4.1) `!invoke(fd, bound_args..., call_args...)` for a `bind_front` invocation, or
(4.2) `!invoke(fd, call_args..., bound_args...)` for a `bind_back` invocation.

**Throws:** Any exception thrown by the initialization of the state entities of $g$ (22.10.3).

### 22.10.15 Function object binders

**22.10.15.1 General**

Subclause 22.10.15 describes a uniform mechanism for binding arguments of callable objects.

**22.10.15.2 Class template is_bind_expression**

```cpp
namespace std {
    template<class T> struct is_bind_expression; // see below
}
```

The class template `is_bind_expression` can be used to detect function objects generated by `bind`. The function template `bind` uses `is_bind_expression` to detect subexpressions.

Specializations of the `is_bind_expression` template shall meet the `Cpp17UnaryTypeTrait` requirements (21.3.2). The implementation provides a definition that has a base characteristic of `true_type` if $T$ is a type returned from `bind`, otherwise it has a base characteristic of `false_type`. A program may specialize this

---

(1) $g$ is a value of the result of a `not_fn` invocation,
(2) $FD$ is the type `decay_t<F>`,
(3) $fd$ is the target object of $g$ (22.10.3) of type $FD$, direct-non-list-initialized with `std::forward<F>(f)`,
template for a program-defined type \( T \) to have a base characteristic of \texttt{true\_type} to indicate that \( T \) should be treated as a subexpression in a \texttt{bind} call.

### 22.10.15.3 Class template \texttt{is\_placeholder}

```cpp
namespace std {
    template<class T> struct is_placeholder;  // see below
}
```

1 The class template \texttt{is\_placeholder} can be used to detect the standard placeholders \_\_1, \_\_2, and so on (22.10.15.5). The function template \texttt{bind} uses \texttt{is\_placeholder} to detect placeholders.

2 Specializations of the \texttt{is\_placeholder} template shall meet the \texttt{Cpp17UnaryTypeTrait} requirements (21.3.2). The implementation provides a definition that has the base characteristic of \texttt{integral\_constant<int, J>} if \( T \) is the type of \texttt{std::placeholders::\_\_J}, otherwise it has a base characteristic of \texttt{integral\_constant<int, 0>}.

### 22.10.15.4 Function template \texttt{bind}

```cpp
template<class R, class F, class... BoundArgs>
constexpr unspecified bind(F&& f, BoundArgs&&... bound_args);
```

1 In the text that follows:

- \( \text{g} \) is a value of the result of a \texttt{bind} invocation,
- \( \text{FD} \) is the type \texttt{decay\_t\<\texttt{F}\>},
- \( \text{fd} \) is an lvalue that is a target object of \( \text{g} \) (22.10.3) of type \( \text{FD} \) direct-non-list-initialized with \texttt{std::forward\<\texttt{F}\>(f)},
- \( T_i \) is the \( i \)th type in the template parameter pack \texttt{BoundArgs},
- \( TD_i \) is the type \texttt{decay\_t\<\texttt{T}\>},
- \( t_i \) is the \( i \)th argument in the function parameter pack \texttt{bound\_args},
- \( td_i \) is a bound argument entity of \( \text{g} \) (22.10.3) of type \( \text{TD}_i \) direct-non-list-initialized with \texttt{std::forward\<\texttt{T}\>(t_i)},
- \( U_j \) is the \( j \)th deduced type of the \texttt{UnBoundArgs\&\&...} parameter of the argument forwarding call wrapper, and
- \( u_j \) is the \( j \)th argument associated with \( U_j \).

2 \textit{Mandates:} \texttt{is\_constructible\_v<\texttt{FD}, \texttt{F}> is \texttt{true}.} For each \( T_i \) in \texttt{BoundArgs}, \texttt{is\_constructible\_v<\texttt{TD}_i, T_i>} is \texttt{true}.

3 \textit{Preconditions:} \( \text{FD} \) and each \( \text{TD}_i \) meet the \texttt{Cpp17MoveConstructible} and \texttt{Cpp17Destructible} requirements. \texttt{INVOKER(\text{fd}, w_1, w_2, \ldots, w_N)} (22.10.4) is a valid expression for some values \( w_1, w_2, \ldots, w_N \), where \( N \) has the value \texttt{sizeof...(\texttt{bound\_args})}.

4 \textit{Returns:} An argument forwarding call wrapper \( \text{g} \) (22.10.4). A program that attempts to invoke a volatile-qualified \( \text{g} \) is ill-formed. When \( \text{g} \) is not volatile-qualified, invocation of \( \text{g}(u_1, u_2, \ldots, u_M) \) is expression-equivalent (3.21) to

- \( \text{INVOKER(static\_cast<\texttt{V}_1>(v_{i_1}), static\_cast<\texttt{V}_2>(v_{i_2}), \ldots, static\_cast<\texttt{V}_N>(v_{i_N}))} \)

for the first overload, and

- \( \text{INVOKER(\text{static\_cast<\texttt{V}_1>(v_{i_1}), static\_cast<\texttt{V}_2>(v_{i_2}), \ldots, static\_cast<\texttt{V}_N>(v_{i_N}))} \)

for the second overload, where the values and types of the target argument \( v_{\text{fd}} \) and of the bound arguments \( v_1, v_2, \ldots, v_N \) are determined as specified below.

5 \textit{Throws:} Any exception thrown by the initialization of the state entities of \( \text{g} \).

### Note 1

- If all of \( \text{FD} \) and \( \text{TD}_i \) meet the requirements of \texttt{Cpp17CopyConstructible}, then the return type meets the requirements of \texttt{Cpp17CopyConstructible}. — end note
The values of the bound arguments \( v_1, v_2, \ldots, v_N \) and their corresponding types \( V_1, V_2, \ldots, V_N \) depend on the types \( TD_i \) derived from the call to `bind` and the cv-qualifiers \( cv \) of the call wrapper \( g \) as follows:

1. If \( TD_i \) is `reference_wrapper<T>` or \( \text{is_bind_expression_v<TD}_i \rangle \) is true, the argument is `std::forward<U_j>(u_j)`...
2. If the value \( j \) of \( \text{is_placeholder_v<TD}_i \rangle \) is not zero, the argument is `std::forward<U_j>(u_j)`...
3. Otherwise, the value is `td_i` and its type \( V_i \) is `cv TD_i &`.

The value of the target argument \( v_{td} \) is `fd` and its corresponding type \( V_{fd} \) is `cv FD &`.

### 22.10.15.5 Placeholders

```cpp
namespace std::placeholders {
    // M is the number of placeholders
    see below _1;
    see below _2;
    .
    .
    see below _M;
}
```

1. The number \( M \) of placeholders is implementation-defined.
2. All placeholder types meet the `Cpp17DefaultConstructible` and `Cpp17CopyConstructible` requirements, and their default constructors and copy/move constructors are constexpr functions that do not throw exceptions.
3. It is implementation-defined whether placeholder types meet the `Cpp17CopyAssignable` requirements, but if so, their copy assignment operators are constexpr functions that do not throw exceptions.
4. Placeholders are freestanding items (16.3.3.6).

### 22.10.16 Function template `mem_fn`

```cpp
template<class R, class T> constexpr unspecified mem_fn(R T::* pm) noexcept;
```

1. Returns: A simple call wrapper (22.10.4) \( fn \) with call pattern `invoke(pm, call_args...)`, where \( pm \) is the target object of \( fn \) of type \( R T::* \) direct-non-list-initialized with \( pm \), and `call_args` is an argument pack used in a function call expression (7.6.1.3) of \( fn \).

### 22.10.17 Polymorphic function wrappers

1. Subclause 22.10.17 describes polymorphic wrapper classes that encapsulate arbitrary callable objects.

#### 22.10.17.2 Class `bad_function_call`

1. An exception of type `bad_function_call` is thrown by `function::operator()` (22.10.17.3.5) when the function wrapper object has no target.
const char* what() const noexcept override;

2 Returns: An implementation-defined NTBS.

22.10.17.3 Class template function

22.10.17.3.1 General

namespace std {
  template<class> class function;  // not defined

template<class R, class... ArgTypes>
class function<R(ArgTypes...)> { public:
  using result_type = R;

  // 22.10.17.3.2, construct/copy/destroy
  function() noexcept;
  function(nullptr_t) noexcept;
  function(const function&);
  function(function&&) noexcept;
  template<class F> function(F&&);

  function& operator=(const function&);
  function& operator=(function&&);
  function& operator=(nullptr_t) noexcept;
  template<class F> function& operator=(function(F&&));
  template<class F> function& operator=(reference_wrapper<F>) noexcept;

  ~function();

  // 22.10.17.3.3, function modifiers
  void swap(function&) noexcept;

  // 22.10.17.3.4, function capacity
  explicit operator bool() const noexcept;

  // 22.10.17.3.5, function invocation
  R operator()(ArgTypes...) const;

  // 22.10.17.3.6, function target access
  const type_info& target_type() const noexcept;
  template<class T> T* target() noexcept;
  template<class T> const T* target() const noexcept;
};

template<class R, class... ArgTypes>
function(R(*)(ArgTypes...)) -> function<R(ArgTypes...)>

1 The function class template provides polymorphic wrappers that generalize the notion of a function pointer. Wrappers can store, copy, and call arbitrary callable objects (22.10.3), given a call signature (22.10.3).

2 A callable type (22.10.3) F is Value-Callable for argument types ArgTypes and return type R if the expression INVOKE<R>(declval<F&>(), declval<ArgTypes>()...), considered as an unevaluated operand (7.2.3), is well-formed (22.10.4).

3 The function class template is a call wrapper (22.10.3) whose call signature (22.10.3) is R(ArgTypes...).

4 [Note 1: The types deduced by the deduction guides for function might change in future revisions of C++. — end note]

22.10.17.3.2 Constructors and destructor

function() noexcept;

1 Postconditions: !*this.
function(nullptr_t) noexcept;

Postconditions: !*this.

function(const function& f);

Postconditions: !*this if !f; otherwise, the target object of *this is a copy of f.target().

Throws: Nothing if f’s target is a specialization of reference_wrapper or a function pointer. Otherwise, may throw bad_alloc or any exception thrown by the copy constructor of the stored callable object.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f’s target is an object holding only a pointer or reference to an object and a member function pointer.

function(function&& f) noexcept;

Postconditions: If !f, *this has no target; otherwise, the target of *this is equivalent to the target of f before the construction, and f is in a valid state with an unspecified value.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f’s target is an object holding only a pointer or reference to an object and a member function pointer.

template<class F> function(F&& f);

Let FD be decay_t<F>.

Constraints:
(9.1) — is_same_v<remove_cvref_t<F>, function> is false, and
(9.2) — FD is Lvalue-Callable (22.10.17.3) for argument types ArgTypes... and return type R.

Mandates:
(10.1) — is_copy_constructible_v<FD> is true, and
(10.2) — is_constructible_v<FD, F> is true.

Preconditions: FD meets the Cpp17CopyConstructible requirements.

Postconditions: !*this is true if any of the following hold:
(12.1) — f is a null function pointer value.
(12.2) — f is a null member pointer value.
(12.3) — remove_cvref_t<F> is a specialization of the function class template, and !f is true.

Otherwise, *this has a target object of type FD direct-non-list-initialized with std::forward<F>(f).

Throws: Nothing if FD is a specialization of reference_wrapper or a function pointer type. Otherwise, may throw bad_alloc or any exception thrown by the initialization of the target object.

Recommended practice: Implementations should avoid the use of dynamically allocated memory for small callable objects, for example, where f refers to an object holding only a pointer or reference to an object and a member function pointer.

template<class F> function(F) -> function<see below>;

Constraints: &F::operator() is well-formed when treated as an unevaluated operand and either
(16.1) — F::operator() is a non-static member function and decltype(&F::operator()) is either of the form R(G::*)(A...) cv k_opt noexcept_opt or of the form R(*)(G, A...) noexcept_opt for a type G, or
(16.2) — F::operator() is a static member function and decltype(&F::operator()) is of the form R(*)(A...) noexcept_opt.

Remarks: The deduced type is function<R(A...)>. 

[Example 1]:
void f() {
    int i(5);
    function g = [&](double) { return i; };  // deduces function<int(double)>
}
— end example]

```cpp
function& operator=(const function& f);

Effect: As if by function(f).swap(*this);
Returns: *this.
```

```cpp
function& operator=(function&& f);

Effect: Replaces the target of *this with the target of f.
Returns: *this.
```

```cpp
function& operator=(nullptr_t) noexcept;

Effects: If *this != nullptr, destroys the target of this.
Postconditions: !(*this).
Returns: *this.
```

```cpp
template<class F> function& operator=(F&& f);

Constraints: decay_t<F> is Lvalue-Callable (22.10.17.3) for argument types ArgTypes...
and return type R.
Effects: As if by: function(std::forward<F>(f)).swap(*this);
Returns: *this.
```

```cpp
template<class F> function& operator=(reference_wrapper<F> f) noexcept;

Effect: As if by: function(f).swap(*this);
Returns: *this.
```

```cpp
~function();

Effect: If *this != nullptr, destroys the target of this.
```

22.10.17.3.3Modifiers

```cpp
void swap(function& other) noexcept;

Effect: Interchanges the target objects of *this and other.
```

22.10.17.3.4Capacity

```cpp
explicit operator bool() const noexcept;

Returns: true if *this has a target, otherwise false.
```

22.10.17.3.5Invocation

```cpp
R operator()(ArgTypes... args) const;

Returns: INVOKE<R>(f, std::forward<ArgTypes>(args)...) (22.10.4), where f is the target object
(22.10.3) of *this.

Throws: bad_function_call if !*this; otherwise, any exception thrown by the target object.
```

22.10.17.3.6Target access

```cpp
const type_info& target_type() const noexcept;

Returns: If *this has a target of type T, typeid(T); otherwise, typeid(void).
```

```cpp
template<class T> T* target() noexcept;
template<class T> const T* target() const noexcept;

Returns: If target_type() == typeid(T) a pointer to the stored function target; otherwise a null pointer.
```
Null pointer comparison operator functions

template<class R, class... ArgTypes>
bool operator==(const function<R(ArgTypes...)> & f, nullptr_t) noexcept;

Returns: !f.

Specialized algorithms

template<class R, class... ArgTypes>
void swap(function<R(ArgTypes...)> & f1, function<R(ArgTypes...)> & f2) noexcept;

Effects: As if by: f1.swap(f2);

Move only wrapper

The header provides partial specializations of move_only_function for each combination of the possible replacements of the placeholders cv, ref, and noex where

1. cv is either const or empty,
2. ref is either &, &&, or empty, and
3. noex is either true or false.

For each of the possible combinations of the placeholders mentioned above, there is a placeholder inv-quals defined as follows:

1. If ref is empty, let inv-quals be cv&,
2. otherwise, let inv-quals be cv ref.

Class template move_only_function

namespace std {
    template<class... S> class move_only_function; // not defined

    template<class R, class... ArgTypes>
    class move_only_function<R(ArgTypes...)> cv ref noexcept(noex) {
        public:
            using result_type = R;

        // constructors, assignment, and destructor
        move_only_function() noexcept;
        move_only_function(nullptr_t) noexcept;
        move_only_function(move_only_function&&) noexcept;
        template<class F> move_only_function(F&&);
        template<class T, class... Args>
            explicit move_only_function(in_place_type_t<T>, Args&&...);
        template<class T, class U, class... Args>
            explicit move_only_function(in_place_type_t<T>, initializer_list<U>, Args&&...);

        move_only_function& operator=(move_only_function&&);
        move_only_function& operator=(nullptr_t) noexcept;
        template<class F> move_only_function& operator=(F&&);

        ~move_only_function();

        // invocation
        explicit operator bool() const noexcept;
        R operator()(ArgTypes...) cv ref noexcept(noex);

        // utility
        void swap(move_only_function&) noexcept;
        friend void swap(move_only_function&, move_only_function&) noexcept;
        friend bool operator==(const move_only_function&, nullptr_t) noexcept;
    }
}
The `move_only_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

`Recommended practice:` Implementations should avoid the use of dynamically allocated memory for a small contained value.

[Note 1: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is true. — end note]

### 22.10.17.4.3 Constructors, assignment, and destructor

**template**<class VT>
```cpp
    static constexpr bool is-callable-from = see below;  // exposition only
};
```

1. The `move_only_function` class template provides polymorphic wrappers that generalize the notion of a callable object (22.10.3). These wrappers can store, move, and call arbitrary callable objects, given a call signature.

2. **Recommended practice:** Implementations should avoid the use of dynamically allocated memory for a small contained value.

   [Note 1: Such small-object optimization can only be applied to a type `T` for which `is_nothrow_move_constructible_v<T>` is true. — end note]

#### 22.10.17.4.3.1 Constructors, assignment, and destructor

**template**<class VT>
```cpp
    static constexpr bool is-callable-from = see below;
    
    If noex is true, is-callable-from<VT> is equal to:
    ```cpp
    is_nothrow_invocable_r_v<R, VT cv ref, ArgTypes...> &&
    is_nothrow_invocable_r_v<R, VT inv-quals, ArgTypes...>
    ```
    Otherwise, is-callable-from<VT> is equal to:
    ```cpp
    is_invocable_r_v<R, VT cv ref, ArgTypes...> &&
    is_invocable_r_v<R, VT inv-quals, ArgTypes...>
    ```
    ```cpp
    move_only_function() noexcept;
    move_only_function(nullptr_t) noexcept;
    ```

2. **Postconditions:** *this has no target object.

3. **Postconditions:** The target object of *this is the target object `f` had before construction, and `f` is in a valid state with an unspecified value.

   **template**<class F>
   ```cpp
   move_only_function(F&& f);
   ```

4. Let `VT` be `decay_t<F>`.

5. **Constraints:**
   ```
   (5.1) — remove_cvref_t<F> is not the same type as move_only_function, and
   (5.2) — remove_cvref_t<F> is not a specialization of `in_place_type_t`, and
   (5.3) — is-callable-from<VT> is true.
   ```

6. **Mandates:** `is_constructible_v<VT, F>` is true.

7. **Preconditions:** `VT` meets the `Cpp17Destructible` requirements, and if `is_move_constructible_v<VT>` is true, `VT` meets the `Cpp17MoveConstructible` requirements.

8. **Postconditions:** *this has no target object if any of the following hold:
   ```
   (8.1) — `f` is a null function pointer value, or
   (8.2) — `f` is a null member pointer value, or
   (8.3) — remove_cvref_t<F> is a specialization of the move_only_function class template, and `f` has no target object.
   ```
   Otherwise, *this has a target object of type `VT` direct-non-list-initialized with `std::forward<F>(f)`.

9. **Throws:** Any exception thrown by the initialization of the target object. May throw `bad_alloc` unless `VT` is a function pointer or a specialization of `reference_wrapper`.

   **template**<class T, class... Args>
   ```cpp
   explicit move_only_function(in_place_type_t<T>, Args&&... args);
   ```

10. Let `VT` be `decay_t<T>`.
Constraints:

11.1 is_constructible_v<VT, Args...> is true, and
11.2 is_callable_from<VT> is true.

Mandates: VT is the same type as T.

Preconditions: VT meets the Cpp17Destructible requirements, and if is_move_constructible_v<VT> is true, VT meets the Cpp17MoveConstructible requirements.

Postconditions: *this has a target object of type VT direct-non-list-initialized with std::forward<Args>(args)...

Throws: Any exception thrown by the initialization of the target object. May throw bad_alloc unless VT is a function pointer or a specialization of reference_wrapper.

```cpp
template<class T, class U, class... Args>
explicit move_only_function(in_place_type_t<T>, initializer_list<U> ilist, Args&&... args);
```

Let VT be decay_t<T>.

Constraints:

17.1 is_constructible_v<VT, initializer_list<U>&, Args...> is true, and
17.2 is_callable_from<VT> is true.

Mandates: VT is the same type as T.

Preconditions: VT meets the Cpp17Destructible requirements, and if is_move_constructible_v<VT> is true, VT meets the Cpp17MoveConstructible requirements.

Postconditions: *this has a target object of type VT direct-non-list-initialized with ilist, std::forward<Args>(args)...

Throws: Any exception thrown by the initialization of the target object. May throw bad_alloc unless VT is a function pointer or a specialization of reference_wrapper.

move_only_function& operator=(move_only_function&& f);

Effects: Equivalent to: move_only_function(std::move(f)).swap(*this);

Returns: *this.

move_only_function& operator=(nullptr_t) noexcept;

Effects: Destroys the target object of *this, if any.

Returns: *this.

```cpp
template<class F> move_only_function& operator=(F&& f);
```

Effects: Equivalent to: move_only_function(std::forward<F>(f)).swap(*this);

Returns: *this.

~move_only_function();

Effects: Destroys the target object of *this, if any.

22.10.17.4.4 Invocation

```cpp
explicit operator bool() const noexcept;
```

Returns: true if *this has a target object, otherwise false.

R operator()(ArgTypes... args) cv ref noexcept(noexcept);

Preconditions: *this has a target object.

Effects: Equivalent to:

```cpp
return INVOKE<R>(static_cast<F inv-quals>(f), std::forward<ArgTypes>(args)...);
```

where f is an lvalue designating the target object of *this and F is the type of f.
22.10.17.4.5 Utility

```cpp
void swap(move_only_function& other) noexcept;
```

*Effects*: Exchanges the target objects of *this and other.*

```cpp
friend void swap(move_only_function& f1, move_only_function& f2) noexcept;
```

*Effects*: Equivalent to `f1.swap(f2)`.

```cpp
friend bool operator==(const move_only_function& f, nullptr_t) noexcept;
```

*Returns*: `true` if `f` has no target object, otherwise `false`.

22.10.18 Searchers

22.10.18.1 General

Subclause 22.10.18 provides function object types (22.10) for operations that search for a sequence `[pat_first, pat_last)` in another sequence `[first, last)` that is provided to the object's function call operator. The first sequence (the pattern to be searched for) is provided to the object's constructor, and the second (the sequence to be searched) is provided to the function call operator.

Each specialization of a class template specified in 22.10.18 shall meet the Cpp17CopyConstructible and Cpp17CopyAssignable requirements. Template parameters named

1. ForwardIterator,
2. ForwardIterator1,
3. ForwardIterator2,
4. RandomAccessIterator,
5. RandomAccessIterator1,
6. RandomAccessIterator2, and
7. BinaryPredicate

of templates specified in 22.10.18 shall meet the same requirements and semantics as specified in 27.1. Template parameters named `Hash` shall meet the Cpp17Hash requirements (Table 38).

The Boyer-Moore searcher implements the Boyer-Moore search algorithm. The Boyer-Moore-Horspool searcher implements the Boyer-Moore-Horspool search algorithm. In general, the Boyer-Moore searcher will use more memory and give better runtime performance than Boyer-Moore-Horspool.

22.10.18.2 Class template default_searcher

```cpp
namespace std {
    template<class ForwardIterator1, class BinaryPredicate = equal_to<>>
    class default_searcher {
        public:
            constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                                         BinaryPredicate pred = BinaryPredicate());

            template<class ForwardIterator2>
            constexpr pair<ForwardIterator2, ForwardIterator2>
            operator()(ForwardIterator2 first, ForwardIterator2 last) const;

        private:
            ForwardIterator1 pat_first_;     // exposition only
            ForwardIterator1 pat_last_;      // exposition only
            BinaryPredicate pred_;           // exposition only
        };
    }
```

```cpp
constexpr default_searcher(ForwardIterator1 pat_first, ForwardIterator1 pat_last,
                          BinaryPredicate pred = BinaryPredicate());
```

*Effects*: Constructs a `default_searcher` object, initializing `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, and `pred_` with `pred`.

*Throws*: Any exception thrown by the copy constructor of `BinaryPredicate` or `ForwardIterator1`.

§ 22.10.18.2 784
template<class ForwardIterator2>
constexpr pair<ForwardIterator2, ForwardIterator2>
operator()(ForwardIterator2 first, ForwardIterator2 last) const;

Effects: Returns a pair of iterators i and j such that
(3.1)  i == search(first, last, pat_first_, pat_last_, pred_), and
(3.2)  if i == last, then j == last, otherwise j == next(i, distance(pat_first_, pat_last_)).

22.10.18.3 Class template boyer_moore_searcher

namespace std {
    template<class RandomAccessIterator1,
        class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
        class BinaryPredicate = equal_to<>>
    class boyer_moore_searcher {
    public:
        boyer_moore_searcher(RandomAccessIterator1 pat_first,
                              RandomAccessIterator1 pat_last,
                              Hash hf = Hash(),
                              BinaryPredicate pred = BinaryPredicate());
        
        template<class RandomAccessIterator2>
        pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
    private:
        RandomAccessIterator1 pat_first_;  // exposition only
        RandomAccessIterator1 pat_last_;  // exposition only
        Hash hash_;  // exposition only
        BinaryPredicate pred_;  // exposition only
    }
}

boyer_moore_searcher(RandomAccessIterator1 pat_first,
                      RandomAccessIterator1 pat_last,
                      Hash hf = Hash(),
                      BinaryPredicate pred = BinaryPredicate());

Preconditions: The value type of RandomAccessIterator1 meets the Cpp17DefaultConstructible, the Cpp17CopyConstructible, and the Cpp17CopyAssignable requirements.

Let V be iterator_traits<RandomAccessIterator1>::value_type. For any two values A and B of type V, if pred(A, B) == true, then hf(A) == hf(B) is true.

Effects: Initializes pat_first_ with pat_first, pat_last_ with pat_last, hash_ with hf, and pred_ with pred.

Throws: Any exception thrown by the copy constructor of RandomAccessIterator1, or by the default constructor, copy constructor, or the copy assignment operator of the value type of RandomAccessIterator1, or the copy constructor or operator() of BinaryPredicate or Hash. May throw bad_alloc if additional memory needed for internal data structures cannot be allocated.

template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;

Mandates: RandomAccessIterator1 and RandomAccessIterator2 have the same value type.

Effects: Finds a subsequence of equal values in a sequence.

Returns: A pair of iterators i and j such that
(7.1)  i is the first iterator in the range [first, last - (pat_last_ - pat_first_)) such that for every non-negative integer n less than pat_last_ - pat_first_ the following condition holds: pred(*i + n), *(pat_first_ + n)) != false, and
(7.2)  j == next(i, distance(pat_first_, pat_last_)).
Returns `make_pair(first, first)` if `[pat_first_, pat_last_)` is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

**Complexity:** At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.

### 22.10.18.4 Class template boyer_moore_horspool_searcher

```cpp
namespace std {
    template<class RandomAccessIterator1,
             class Hash = hash<typename iterator_traits<RandomAccessIterator1>::value_type>,
             class BinaryPredicate = equal_to<>>
    class boyer_moore_horspool_searcher {
    public:
        boyer_moore_horspool_searcher(RandomAccessIterator1 pat_first,
                                       RandomAccessIterator1 pat_last,
                                       Hash hf = Hash(),
                                       BinaryPredicate pred = BinaryPredicate());

        template<class RandomAccessIterator2>
        pair<RandomAccessIterator2, RandomAccessIterator2>
        operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
    private:
        RandomAccessIterator1 pat_first_;  // exposition only
        RandomAccessIterator1 pat_last_;   // exposition only
        Hash hash_;                        // exposition only
        BinaryPredicate pred_;            // exposition only
    };
}
```

**Preconditions:** The value type of `RandomAccessIterator1` meets the `Cpp17DefaultConstructible`, `Cpp17CopyConstructible`, and `Cpp17CopyAssignable` requirements.

Let V be `iterator_traits<RandomAccessIterator1>::value_type`. For any two values `A` and `B` of type V, if `pred(A, B) == true`, then `hf(A) == hf(B)` is true.

**Effects:** Initializes `pat_first_` with `pat_first`, `pat_last_` with `pat_last`, `hash_` with `hf`, and `pred_` with `pred`.

**Throws:** Any exception thrown by the copy constructor of `RandomAccessIterator1`, or by the default constructor, copy constructor, or the copy assignment operator of the value type of `RandomAccessIterator1`, or the copy constructor or `operator()` of `BinaryPredicate` or `Hash`. May throw `bad_alloc` if additional memory needed for internal data structures cannot be allocated.

```cpp
template<class RandomAccessIterator2>
pair<RandomAccessIterator2, RandomAccessIterator2>
operator()(RandomAccessIterator2 first, RandomAccessIterator2 last) const;
```

**Mandates:** `RandomAccessIterator1` and `RandomAccessIterator2` have the same value type.

**Effects:** Finds a subsequence of equal values in a sequence.

**Returns:** A pair of iterators `i` and `j` such that

1. `i` is the first iterator in the range `[first, last - (pat_last_ - pat_first_) + 1)` such that for every non-negative integer `n` less than `pat_last_ - pat_first_` the following condition holds:
   ```cpp
   pred(*(i + n), *(pat_first_ + n)) != false
   ```

2. `j` == `next(i, distance(pat_first_, pat_last_))`.

Returns `make_pair(first, first)` if `[pat_first_, pat_last_)` is empty, otherwise returns `make_pair(last, last)` if no such iterator is found.

**Complexity:** At most `(last - first) * (pat_last_ - pat_first_)` applications of the predicate.
22.10.19 Class template hash

The unordered associative containers defined in 24.5 use specializations of the class template `hash` (22.10.2) as the default hash function.

Each specialization of `hash` is either enabled or disabled, as described below.

[Note 1: Enabled specializations meet the Cpp17Hash requirements, and disabled specializations do not. — end note]

Each header that declares the template `hash` provides enabled specializations of `hash` for `nullptr_t` and all cv-unqualified arithmetic, enumeration, and pointer types. For any type `Key` for which neither the library nor the user provides an explicit or partial specialization of the class template `hash`, `hash<Key>` is disabled.

If the library provides an explicit or partial specialization of `hash<Key>`, that specialization is enabled except as noted otherwise, and its member functions are noexcept except as noted otherwise.

If `H` is a disabled specialization of `hash`, these values are false: `is_default_constructible_v<H>`, `is_copy_constructible_v<H>`, `is_move_constructible_v<H>`, `is_copyAssignable_v<H>`, and `is_moveAssignable_v<H>`. Disabled specializations of `hash` are not function object types (22.10).

[Note 2: This means that the specialization of `hash` exists, but any attempts to use it as a Cpp17Hash will be ill-formed. — end note]

An enabled specialization `hash<Key>` will:

1. meet the Cpp17Hash requirements (Table 38), with `Key` as the function call argument type, the Cpp17DefaultConstructible requirements (Table 31), the Cpp17CopyAssignable requirements (Table 35), and the Cpp17Swappable requirements (16.4.4.3),
2. meet the requirement that if `k1 == k2` is true, `h(k1) == h(k2)` is also true, where `h` is an object of type `hash<Key>` and `k1` and `k2` are objects of type `Key`;
3. meet the requirement that the expression `h(k)`, where `h` is an object of type `hash<Key>` and `k` is an object of type `Key`, shall not throw an exception unless `hash<Key>` is a program-defined specialization.

22.11 Class type_index

22.11.1 Header <typeindex> synopsis

```cpp
#include <compare>  // see 17.11.1

namespace std {
    class type_index;
    template<class T> struct hash;
    template<> struct hash<type_index>;
}
```

22.11.2 type_index overview

```cpp
namespace std {
    class type_index {
    public:
        type_index(const type_info& rhs) noexcept;
        bool operator==(const type_index& rhs) const noexcept;
        bool operator<( const type_index& rhs) const noexcept;
        bool operator> (const type_index& rhs) const noexcept;
        bool operator<=(const type_index& rhs) const noexcept;
        bool operator>=(const type_index& rhs) const noexcept;
        bool operator<(const type_info& rhs) const noexcept;
        bool operator>=(const type_info& rhs) const noexcept;
        strong_ordering operator<=>(const type_info& rhs) const noexcept;
        size_t hash_code() const noexcept;
        const char* name() const noexcept;
    }
    private:
        const type_info* target;  // exposition only
        // Note that the use of a pointer here, rather than a reference,
        // means that the default copy/move constructor and assignment
        // operators will be provided and work as expected.
    }
```
The class `type_index` provides a simple wrapper for `type_info` which can be used as an index type in associative containers (24.4) and in unordered associative containers (24.5).

### 22.11.3 `type_index` members

```cpp
type_index(const type_info& rhs) noexcept;
```

**Effects**: Constructs a `type_index` object, the equivalent of `target = &rhs`.

```cpp
bool operator==(const type_index& rhs) const noexcept;
```

**Returns**: `*target == *rhs.target`.

```cpp
bool operator<(const type_index& rhs) const noexcept;
```

**Returns**: `target->before(*rhs.target)`.

```cpp
bool operator>(const type_index& rhs) const noexcept;
```

**Returns**: `rhs.target->before(*target)`.

```cpp
bool operator<=(const type_index& rhs) const noexcept;
```

**Returns**: `!rhs.target->before(*target)`.

```cpp
bool operator>=(const type_index& rhs) const noexcept;
```

**Returns**: `!target->before(*rhs.target)`.

```cpp
strong_ordering operator<=>(const type_index& rhs) const noexcept;
```

**Effects**: Equivalent to:

```cpp
if (*target == *rhs.target) return strong_ordering::equal;
if (target->before(*rhs.target)) return strong_ordering::less;
return strong_ordering::greater;
```

```cpp
size_t hash_code() const noexcept;
```

**Returns**: `target->hash_code()`.

```cpp
const char* name() const noexcept;
```

**Returns**: `target->name()`.

### 22.11.4 Hash support

```cpp
template<> struct hash<type_index>;
```

For an object `index` of type `type_index`, `hash<type_index>()(index)` shall evaluate to the same result as `index.hash_code()`.

### 22.12 Execution policies

#### 22.12.1 In general

Subclause 22.12 describes classes that are *execution policy* types. An object of an execution policy type indicates the kinds of parallelism allowed in the execution of an algorithm and expresses the consequent requirements on the element access functions.

*Example 1:
```
using namespace std;
vector<int> v = /* ... */;

// standard sequential sort
sort(v.begin(), v.end());

// explicitly sequential sort
sort(execution::seq, v.begin(), v.end());

// permitting parallel execution
sort(execution::par, v.begin(), v.end());
```
// permitting vectorization as well
sort(execution::par_unseq, v.begin(), v.end());

—end example

[Note 1: Implementations can provide additional execution policies to those described in this standard as extensions to address parallel architectures that require idiosyncratic parameters for efficient execution. — end note]

### 22.12.2 Header `<execution>` synopsis

```cpp
namespace std {
    // 22.12.3, execution policy type trait
    template<class T> struct is_execution_policy;
    template<class T> constexpr bool is_execution_policy_v = is_execution_policy<T>::value;
}

namespace std::execution {
    // 22.12.4, sequenced execution policy
    class sequenced_policy;

    // 22.12.5, parallel execution policy
    class parallel_policy;

    // 22.12.6, parallel and unsequenced execution policy
    class parallel_unsequenced_policy;

    // 22.12.7, unsequenced execution policy
    class unsequenced_policy;

    // 22.12.8, execution policy objects
    inline constexpr sequenced_policy seq{ unspecified };  
    inline constexpr parallel_policy par{ unspecified };  
    inline constexpr parallel_unsequenced_policy par_unseq{ unspecified };  
    inline constexpr unsequenced_policy unseq{ unspecified };  
}
```

### 22.12.3 Execution policy type trait

```cpp
template<class T> struct is_execution_policy { see below };
```

1. `is_execution_policy` can be used to detect execution policies for the purpose of excluding function signatures from otherwise ambiguous overload resolution participation.

2. `is_execution_policy<T>` is a `Cpp17UnaryTypeTrait` with a base characteristic of `true_type` if T is the type of a standard or implementation-defined execution policy, otherwise `false_type`.

[Note 1: This provision reserves the privilege of creating non-standard execution policies to the library implementation. — end note]

3. The behavior of a program that adds specializations for `is_execution_policy` is undefined.

### 22.12.4 Sequenced execution policy

```cpp
class execution::sequenced_policy { unspecified };
```

1. The class `execution::sequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and require that a parallel algorithm’s execution may not be parallelized.

2. During the execution of a parallel algorithm with the `execution::sequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

### 22.12.5 Parallel execution policy

```cpp
class execution::parallel_policy { unspecified };
```

1. The class `execution::parallel_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized.
During the execution of a parallel algorithm with the `execution::parallel_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

### 22.12.6 Parallel and unsequenced execution policy

The class `execution::parallel_unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be parallelized and vectorized. During the execution of a parallel algorithm with the `execution::parallel_unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

### 22.12.7 Unsequenced execution policy

The class `unsequenced_policy` is an execution policy type used as a unique type to disambiguate parallel algorithm overloading and indicate that a parallel algorithm’s execution may be vectorized, e.g., executed on a single thread using instructions that operate on multiple data items. During the execution of a parallel algorithm with the `execution::unsequenced_policy` policy, if the invocation of an element access function exits via an exception, `terminate` is invoked (14.6.2).

### 22.12.8 Execution policy objects

The header `<execution>` declares global objects associated with each type of execution policy.

### 22.13 Primitive numeric conversions

When a function is specified with a type placeholder of `integer-type`, the implementation provides overloads for all cv-unqualified signed and unsigned integer types and `char` in lieu of `integer-type`. When a function is specified with a type placeholder of `floating-point-type`, the implementation provides overloads for all cv-unqualified floating-point types (6.8.2) in lieu of `floating-point-type`.

```cpp
namespace std {
    // floating-point format for primitive numerical conversion
    enum class chars_format {
        scientific = unspecified,
        fixed = unspecified,
        hex = unspecified,
        general = fixed | scientific
    };

    // 22.13.2, primitive numerical output conversion
    struct to_chars_result {
        char* ptr;
        errc ec;
        friend bool operator==(const to_chars_result&, const to_chars_result&) = default;
    };

    constexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);
    to_chars_result to_chars(char* first, char* last, bool value, int base = 10) = delete;
    to_chars_result to_chars(char* first, char* last, floating-point-type value);
    to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);
    to_chars_result to_chars(char* first, char* last, floating-point-type value,
                             chars_format fmt, int precision);
}  
```

§ 22.13.1 790
// 22.13.3, primitive numerical input conversion
struct from_chars_result {
    const char* ptr;
    errc ec;
    friend bool operator==(const from_chars_result&, const from_chars_result&) = default;
};

constexpr from_chars_result from_chars(const char* first, const char* last,
    integer-type& value, int base = 10);

from_chars_result from_chars(const char* first, const char* last,
    floating-point-type& value,
    chars_format fmt = chars_format::general);

2 The type chars_format is a bitmask type (16.3.3.3.3) with elements scientific, fixed, and hex.

3 The types to_chars_result and from_chars_result have the data members and special members specified above. They have no base classes or members other than those specified.

22.13.2 Primitive numeric output conversion

All functions named to_chars convert value into a character string by successively filling the range [first, last), where [first, last) is required to be a valid range. If the member ec of the return value is such that the value is equal to the value of a value-initialized errc, the conversion was successful and the member ptr is the one-past-the-end pointer of the characters written. Otherwise, the member ec has the value errc::value_too_large, the member ptr has the value last, and the contents of the range [first, last) are unspecified.

[Note 1: This guarantee applies only if to_chars and from_chars are executed on the same implementation. — end note]

If there are several such representations, the representation with the smallest difference from the floating-point argument value is chosen, resolving any remaining ties using rounding according to round_to_nearest (17.3.4.1).

3 The functions taking a chars_format parameter determine the conversion specifier for printf as follows: The conversion specifier is f if fmt is chars_format::fixed, e if fmt is chars_format::scientific, a (without leading "0x" in the result) if fmt is chars_format::hex, and g if fmt is chars_format::general.

castexpr to_chars_result to_chars(char* first, char* last, integer-type value, int base = 10);

4 Preconditions: base has a value between 2 and 36 (inclusive).

5 Effects: The value of value is converted to a string of digits in the given base (with no redundant leading zeros). Digits in the range 10..35 (inclusive) are represented as lowercase characters a..z. If value is less than zero, the representation starts with ‘-’.

6 Throws: Nothing.

to_chars_result to_chars(char* first, char* last, floating-point-type value);

7 Effects: value is converted to a string in the style of printf in the "C" locale. The conversion specifier is f or e, chosen according to the requirement for a shortest representation (see above); a tie is resolved in favor of f.

8 Throws: Nothing.

9 to_chars_result to_chars(char* first, char* last, floating-point-type value, chars_format fmt);

10 Preconditions: fmt has the value of one of the enumerators of chars_format.

11 Effects: value is converted to a string in the style of printf in the "C" locale.

Throws: Nothing.
to_chars_result to_chars(char* first, char* last, floating-point-type value, 
chars_format fmt, int precision);

Preconditions: fmt has the value of one of the enumerators of chars_format.

Effects: value is converted to a string in the style of printf in the "C" locale with the given precision.

Throws: Nothing.

SEE ALSO: ISO C 7.21.6.1

22.13.3 Primitive numeric input conversion [charconv.from.chars]

All functions named from_chars analyze the string [first, last) for a pattern, where [first, last) is required to be a valid range. If no characters match the pattern, value is unmodified, the member ptr of the return value is first and the member ec is equal to errc::invalid_argument.

[Note 1: If the pattern allows for an optional sign, but the string has no digit characters following the sign, no characters match the pattern. —end note]

Otherwise, the characters matching the pattern are interpreted as a representation of a value of the type of value. The member ptr of the return value points to the first character not matching the pattern, or has the value last if all characters match. If the parsed value is not in the range representable by the type of value, value is unmodified and the member ec of the return value is equal to errc::result_out_of_range. Otherwise, value is set to the parsed value, after rounding according to round_to_nearest (17.3.4.1), and the member ec is value-initialized.

constexpr from_chars_result from_chars(const char* first, const char* last, 
integer-type& value, int base = 10);

Preconditions: base has a value between 2 and 36 (inclusive).

Effects: The pattern is the expected form of the subject sequence in the "C" locale for the given nonzero base, as described for strtol, except that no "0x" or "0X" prefix shall appear if the value of base is 16, and except that '-' is the only sign that may appear, and only if value has a signed type.

Throws: Nothing.

from_chars_result from_chars(const char* first, const char* last, 
floating-point-type& value, 
chars_format fmt = chars_format::general);

Preconditions: fmt has the value of one of the enumerators of chars_format.

Effects: The pattern is the expected form of the subject sequence in the "C" locale, as described for strtod, except that

(6.1) the sign '+' may only appear in the exponent part;
(6.2) if fmt has chars_format::scientific set but not chars_format::fixed, the otherwise optional exponent part shall appear;
(6.3) if fmt has chars_format::fixed set but not chars_format::scientific, the optional exponent part shall not appear; and
(6.4) if fmt is chars_format::hex, the prefix "0x" or "0X" is assumed.

[Example 1: The string 0x123 is parsed to have the value 0 with remaining characters x123. —end example]

In any case, the resulting value is one of at most two floating-point values closest to the value of the string matching the pattern.

Throws: Nothing.

22.14.2 Format string

22.14.2.1 In general

A format string for arguments args is a (possibly empty) sequence of replacement fields, escape sequences, and characters other than { and }. Let charT be the character type of the format string. Each character that is not part of a replacement field or an escape sequence is copied unchanged to the output. An escape sequence is one of { or }. It is replaced with { or }, respectively, in the output. The syntax of replacement fields is as follows:

replacement-field:
  { arg-id_opt format-specifier_opt }

arg-id:
  0
  positive-integer

positive-integer:
  nonzero-digit
  positive-integer digit

nonnegative-integer:
  digit
  nonnegative-integer digit

nonzero-digit: one of
  1 2 3 4 5 6 7 8 9

digit: one of
  0 1 2 3 4 5 6 7 8 9

format-specifier:
  : format-spec

format-spec:
  as specified by the formatter specialization for the argument type

2 The arg-id field specifies the index of the argument in args whose value is to be formatted and inserted into the output instead of the replacement field. If there is no argument with the index arg-id in args, the string is not a format string for args. The optional format-specifier field explicitly specifies a format for the replacement value.

3 [Example 1:

  string s = format("{0}-{1", 8);  // value of s is "8-{"—end example]
If all arg-ids in a format string are omitted (including those in the format-spec, as interpreted by the corresponding formatter specialization), argument indices 0, 1, 2, ... will automatically be used in that order. If some arg-ids are omitted and some are present, the string is not a format string.

[Note 1: A format string cannot contain a mixture of automatic and manual indexing. — end note]

[Example 2:

        string s0 = format("{} to {}", "a", "b"); // OK, automatic indexing
        string s1 = format("{1} to {0}", "a", "b"); // OK, manual indexing
        string s2 = format("{0} to {}", "a", "b"); // not a format string (mixing automatic and manual indexing), // ill-formed
        string s3 = format("{} to {1}", "a", "b"); // not a format string (mixing automatic and manual indexing), // ill-formed

— end example]

The format-spec field contains format specifications that define how the value should be presented. Each type can define its own interpretation of the format-spec field. If format-spec does not conform to the format specifications for the argument type referred to by arg-id, the string is not a format string for args.

[Example 3:

(5.1) — For arithmetic, pointer, and string types the format-spec is interpreted as a std-format-spec as described in (22.14.2.2).
(5.2) — For chrono types the format-spec is interpreted as a chrono-format-spec as described in (29.12).
(5.3) — For user-defined formatter specializations, the behavior of the parse member function determines how the format-spec is interpreted.

— end example]

22.14.2.2 Standard format specifiers

Each formatter specializations described in 22.14.6.3 for fundamental and string types interprets format-spec as a std-format-spec.

[Note 1: The format specification can be used to specify such details as field width, alignment, padding, and decimal precision. Some of the formatting options are only supported for arithmetic types. — end note]

The syntax of format specifications is as follows:

\[
\text{std-format-spec:} \\
\quad \text{fill-and-align}_{\text{opt}} \ \text{sign}_{\text{opt}} \ \#_{\text{opt}} \ 0_{\text{opt}} \ \text{width}_{\text{opt}} \ \text{precision}_{\text{opt}} \ \text{L}_{\text{opt}} \ \text{type}_{\text{opt}} \\
\text{fill-and-align:} \\
\quad \text{fill}_{\text{opt}} \ \text{align} \\
\quad \text{fill:} \quad \text{any character other than } \{} \text{ or } \} \\
\quad \text{align:} \quad \text{one of} \\
\quad \quad < \ > \ ^{\wedge} \\
\quad \text{sign:} \quad \text{one of} \\
\quad \quad + \ - \ \text{space} \\
\quad \text{width:} \\
\quad \quad \text{positive-integer} \\
\quad \quad \{ \ \text{arg-id}_{\text{opt}} \} \\
\quad \text{precision:} \\
\quad \quad \text{nonnegative-integer} \\
\quad \quad \{ \ \text{arg-id}_{\text{opt}} \} \\
\quad \text{type:} \quad \text{one of} \\
\quad \quad a \ \ A \ \ b \ \ B \ \ c \ \ d \ \ e \ \ E \ \ f \ \ F \ \ g \ \ G \ \ o \ \ p \ \ s \ \ x \ \ X \ \ ?
\]

[Note 2: The fill character can be any character other than \{} or \}. The presence of a fill character is signaled by the character following it, which must be one of the alignment options. If the second character of std-format-spec is not a valid alignment option, then it is assumed that both the fill character and the alignment option are absent. — end note]

3 The align specifier applies to all argument types. The meaning of the various alignment options is as specified in Table 66.

[Example 1:
char c = 120;
string s0 = format("{:6}", 42);  // value of s0 is " 42"
string s1 = format("{:6}", 'x');  // value of s1 is "x"
string s2 = format("{:<6}", 'x');  // value of s2 is "x*****"
string s3 = format("{:>6}", 'x');  // value of s3 is "*****x"
string s4 = format("{:*<6}", 'x');  // value of s4 is "*x*****"
string s5 = format("{:*>6}", c);  // value of s5 is "*****x"
string s6 = format("{:6d}", c);  // value of s6 is " 120"
string s7 = format("{:6}", true);  // value of s7 is "true"

— end example

[Note 3: Unless a minimum field width is defined, the field width is determined by the size of the content and the alignment option has no effect. — end note]

Table 66: Meaning of align options  [tab:format.align]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;</td>
<td>Forces the field to be aligned to the start of the available space. This is the default for non-arithmetic non-pointer types, charT, and bool, unless an integer presentation type is specified.</td>
</tr>
<tr>
<td>&gt;</td>
<td>Forces the field to be aligned to the end of the available space. This is the default for arithmetic types other than charT and bool, pointer types, or when an integer presentation type is specified.</td>
</tr>
<tr>
<td>-</td>
<td>Forces the field to be centered within the available space by inserting (\lfloor \frac{n}{2} \rfloor) characters before and (\lceil \frac{n}{2} \rceil) characters after the value, where (n) is the total number of fill characters to insert.</td>
</tr>
</tbody>
</table>

The sign option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. The meaning of the various options is as specified in Table 67.

Table 67: Meaning of sign options  [tab:format.sign]

<table>
<thead>
<tr>
<th>Option</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| +      | Indicates that a sign should be used for both non-negative and negative numbers. The + sign is inserted before the output of to_chars for non-negative numbers other than negative zero.  
[Note 4: For negative numbers and negative zero the output of to_chars will already contain the sign so no additional transformation is performed. — end note] |
| -      | Indicates that a sign should be used for negative numbers and negative zero only (this is the default behavior). |
| space  | Indicates that a leading space should be used for non-negative numbers other than negative zero, and a minus sign for negative numbers and negative zero. |

The sign option applies to floating-point infinity and NaN.

[Example 2:]
double inf = numeric_limits<double>::infinity();
double nan = numeric_limits<double>::quiet_NaN();
string s0 = format("{0:},{0:+},{0:-},{0: }", 1);  // value of s0 is "1,+1,1, 1"
string s1 = format("{0:},{0:+},{0:-},{0: }", -1);  // value of s1 is "-1,-1,-1,-1"
string s2 = format("{0:},{0:+},{0:-},{0: }", inf);  // value of s2 is "inf,+inf,inf, inf"
string s3 = format("{0:},{0:+},{0:-},{0: }", nan);  // value of s3 is "nan,+nan,nan, nan"
— end example]
conversions only if a digit follows it. In addition, for g and G conversions, trailing zeros are not removed from the result.

7 A zero (0) character preceding the width field pads the field with leading zeros (following any indication of sign or base) to the field width, except when applied to an infinity or NaN. This option is only valid for arithmetic types other than charT and bool or when an integer presentation type is specified. If the 0 character and an align option both appear, the 0 character is ignored.

[Example 3:

```cpp
char c = 120;
string s1 = format("{:+06d}", c); // value of s1 is "+00120"
string s2 = format("{:#06x}", 0xa); // value of s2 is "0x000a"
string s3 = format("{:<06}", -42); // value of s3 is "-42 " (0 is ignored because of < alignment)
```
—end example]

8 If `{ arg-id, opt }` is used in a width or precision, the value of the corresponding formatting argument is used in its place. If the corresponding formatting argument is not of integral type, or its value is negative, an exception of type format_error is thrown.

9 The positive-integer in width is a decimal integer defining the minimum field width. If width is not specified, there is no minimum field width, and the field width is determined based on the content of the field.

10 The width of a string is defined as the estimated number of column positions appropriate for displaying it in a terminal.

[Note 5: This is similar to the semantics of the POSIX wcswidth function. — end note]

For the purposes of width computation, a string is assumed to be in a locale-independent, implementation-defined encoding. Implementations should use a Unicode encoding on platforms capable of displaying Unicode text in a terminal.

[Note 6: This is the case for Windows 209-based and many POSIX-based operating systems. — end note]

12 For a string in a Unicode encoding, implementations should estimate the width of a string as the sum of estimated widths of the first code points in its extended grapheme clusters. The extended grapheme clusters of a string are defined by UAX #29. The estimated width of the following code points is 2:

(12.1) — U+1100 – U+115F
(12.2) — U+2329 – U+232A
(12.3) — U+2E80 – U+303E
(12.4) — U+3040 – U+A4CF
(12.5) — U+AC00 – U+D7A3
(12.6) — U+F900 – U+FAFF
(12.7) — U+FE10 – U+FE19
(12.8) — U+FE30 – U+FE6F
(12.9) — U+FF00 – U+FF60
(12.10) — U+FFE0 – U+FFE6
(12.11) — U+1F300 – U+1F64F
(12.12) — U+1F900 – U+1F9FF
(12.13) — U+20000 – U+2FFFD
(12.14) — U+30000 – U+3FFFD

The estimated width of other code points is 1.

13 For a string in a non-Unicode encoding, the width of a string is unspecified.

14 The nonnegative-integer in precision is a decimal integer defining the precision or maximum field size. It can only be used with floating-point and string types. For floating-point types this field specifies the formatting precision. For string types, this field provides an upper bound for the estimated width of the prefix of the input string that is copied into the output. For a string in a Unicode encoding, the formatter copies to the

209) Windows® is a registered trademark of Microsoft Corporation. This information is given for the convenience of users of this document and does not constitute an endorsement by ISO or IEC of this product.
output the longest prefix of whole extended grapheme clusters whose estimated width is no greater than the precision.

When the L option is used, the form used for the conversion is called the \textit{locale-specific form}. The L option is only valid for arithmetic types, and its effect depends upon the type.

\begin{enumerate}
\item[(15.1)] For integral types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group separator characters.
\item[(15.2)] For floating-point types, the locale-specific form causes the context’s locale to be used to insert the appropriate digit group and radix separator characters.
\item[(15.3)] For the textual representation of \texttt{bool}, the locale-specific form causes the context’s locale to be used to insert the appropriate string as if obtained with \texttt{numpunct::truename} or \texttt{numpunct::falsename}.
\end{enumerate}

The type determines how the data should be presented.

The available string presentation types are specified in Table 68.

Table 68: Meaning of \textit{type} options for strings 

<table>
<thead>
<tr>
<th>Type</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>none, s</td>
<td>Copies the string to the output.</td>
</tr>
<tr>
<td>?</td>
<td>Copies the escaped string ((22.14.6.4)) to the output.</td>
</tr>
</tbody>
</table>

The meaning of some non-string presentation types is defined in terms of a call to \texttt{to_chars}. In such cases, let \([\textit{first}, \textit{last}]\) be a range large enough to hold the \texttt{to_chars} output and \textit{value} be the formatting argument value. Formatting is done as if by calling \texttt{to_chars} as specified and copying the output through the output iterator of the format context.

\[\text{Note 7: Additional padding and adjustments are performed prior to copying the output through the output iterator as specified by the format specifiers. — end note}\]

The available integer presentation types for integral types other than \texttt{bool} and \texttt{charT} are specified in Table 69.

\[\text{Example 4:}\]

\begin{verbatim}
string s0 = format("{}", 42);  // value of s0 is "42"
string s1 = format("{0:b} {0:d} {0:o} {0:x}", 42);  // value of s1 is "101010 42 52 2a"
string s2 = format("{0:x} {0:X}", 42);  // value of s2 is "0x2a 0X2A"
string s3 = format("{0:#x} {0:#X}", 1234);  // value of s3 can be "1,234"
                            // (depending on the locale)
\end{verbatim}

\[\text{— end example}\]

</tr>
</tbody>
</table>
22.14.3 Error reporting

Formatting functions throw `format_error` if an argument `fmt` is passed that is not a format string for `args`. They propagate exceptions thrown by operations of `formatter` specializations and iterators. Failure to allocate storage is reported by throwing an exception as described in 16.4.6.13.

22.14.4 Class template basic_format_string

```cpp
namespace std {
    template<class charT, class... Args>
    struct basic_format_string {
        private:
            basic_string_view<charT> str; // exposition only
        public:
            template<class T> consteval basic_format_string(const T& s);
            constexpr basic_string_view<charT> get() const noexcept { return str; }
    };
}
```

1. **Constraints:** `const T&` models convertible_to<basic_string_view<charT>>.
2. **Effects:** Direct-non-list-initializes `str` with `s`.
3. **Remarks:** A call to this function is not a core constant expression (7.7) unless there exist `args` of types `Args` such that `str` is a format string for `args`.

22.14.5 Formatting functions

1. In the description of the functions, operator `+` is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of `a + n` are the same as in 27.2.

```cpp
template<class... Args>
string format(format_string<Args...> fmt, Args&&... args);
```

2. **Effects:** Equivalent to:
```
return vformat(fmt.str, make_format_args(args...));
```

```cpp
template<class... Args>
wstring format(wformat_string<Args...> fmt, Args&&... args);
```

3. **Effects:** Equivalent to:
```
return vformat(fmt.str, make_wformat_args(args...));
```

```cpp
template<class... Args>
string format(const locale& loc, format_string<Args...> fmt, Args&&... args);
```

4. **Effects:** Equivalent to:
```
return vformat(loc, fmt.str, make_format_args(args...));
```

```cpp
template<class... Args>
wstring format(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

5. **Effects:** Equivalent to:
```
return vformat(loc, fmt.str, make_wformat_args(args...));
```

```cpp
string vformat(string_view fmt, format_args args);
wstring vformat(wstring_view fmt, wformat_args args);
string vformat(const locale& loc, string_view fmt, format_args args);
wstring vformat(const locale& loc, wstring_view fmt, wformat_args args);
```

6. **Returns:** A string object holding the character representation of formatting arguments provided by `args` formatted according to specifications given in `fmt`. If present, `loc` is used for locale-specific formatting.
7. **Throws:** As specified in 22.14.3.
template<class Out, class... Args>
Out format_to(Out out, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), fmt.str, make_format_args(args...));

template<class Out, class... Args>
Out format_to(Out out, wformat_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), fmt.str, make_wformat_args(args...));

template<class Out, class... Args>
Out format_to(Out out, const locale& loc, format_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), loc, fmt.str, make_format_args(args...));

template<class Out, class... Args>
Out format_to(Out out, const locale& loc, wformat_string<Args...> fmt, Args&&... args);

Effects: Equivalent to:
return vformat_to(std::move(out), loc, fmt.str, make_wformat_args(args...));

Let
charT be decltype(fmt)::value_type.

Constraints: Out satisfies output_iterator<const charT&>.

Preconditions: Out models output_iterator<const charT&>.

Effects: Places the character representation of formatting the arguments provided by args, formatted according to the specifications given in fmt, into the range [out, out + N), where N is the number of characters in that character representation. If present, loc is used for locale-specific formatting.

Returns: out + N.

Throws: As specified in 22.14.3.
Constraints: Out satisfies \texttt{output\_iterator<const charT&>}.  

Preconditions: Out models \texttt{output\_iterator<const charT&>}, and \texttt{formatter<remove\_cvref\_t<T,>, charT>} meets the \texttt{BasicFormatter} requirements \texttt{(22.14.6.1)} for each \(T_i\) in Args.  

Effects: Places the first \(M\) characters of the character representation of formatting the arguments provided by \texttt{args}, formatted according to the specifications given in \texttt{fmt}, into the range \([\texttt{out}, \texttt{out} + M)\). If present, \texttt{loc} is used for locale-specific formatting.  

Returns: \{\texttt{out} + \(M\), \#\}.  

Throws: As specified in 22.14.3.

```
template<class... Args>
size_t formatted_size(format_string<Args...> fmt, Args&&... args);
template<class... Args>
size_t formatted_size(wformat_string<Args...> fmt, Args&&... args);
template<class... Args>
size_t formatted_size(const locale& loc, format_string<Args...> fmt, Args&&... args);
template<class... Args>
size_t formatted_size(const locale& loc, wformat_string<Args...> fmt, Args&&... args);
```

Let \(\texttt{charT}\) be \texttt{decltype(fmt.str)::value\_type}.  

Preconditions: \texttt{formatter<remove\_cvref\_t<T,>, charT>} meets the \texttt{BasicFormatter} requirements \texttt{(22.14.6.1)} for each \(T_i\) in Args.  

Returns: The number of characters in the character representation of formatting arguments \texttt{args} formatted according to specifications given in \texttt{fmt}. If present, \texttt{loc} is used for locale-specific formatting.  

Throws: As specified in 22.14.3.

### 22.14.6 Formatter

#### 22.14.6.1 Formatter requirements

A type \(F\) meets the \texttt{BasicFormatter} requirements if it meets the

- (1.1) \texttt{Cpp17DefaultConstructible} (Table 31),
- (1.2) \texttt{Cpp17CopyConstructible} (Table 33),
- (1.3) \texttt{Cpp17CopyAssignable} (Table 35),
- (1.4) \texttt{Cpp17Swappable} (16.4.4.3), and
- (1.5) \texttt{Cpp17Destructible} (Table 36)

requirements, and the expressions shown in Table 74 are valid and have the indicated semantics.

A type \(F\) meets the \texttt{Formatter} requirements if it meets the \texttt{BasicFormatter} requirements and the expressions shown in Table 75 are valid and have the indicated semantics.

Given character type \(\texttt{charT}\), output iterator type \(\texttt{Out}\), and formatting argument type \(T\), in Table 74 and Table 75:

- (3.1) \(f\) is a value of type (possibly const) \(F\),
- (3.2) \(g\) is an lvalue of type \(F\),
- (3.3) \(u\) is an lvalue of type \(T\),
- (3.4) \(t\) is a value of a type convertible to (possibly const) \(T\),
- (3.5) \(\texttt{PC}\) is \texttt{basic\_format\_parse\_context<charT>},
- (3.6) \(\texttt{FC}\) is \texttt{basic\_format\_context<Out, charT>},
- (3.7) \(\texttt{pc}\) is an lvalue of type \(\texttt{PC}\), and
- (3.8) \(\texttt{fc}\) is an lvalue of type \(\texttt{FC}\).

\(\texttt{pc.begin()}\) points to the beginning of the \texttt{format-spec} \texttt{(22.14.2)} of the replacement field being formatted in the format string. If \texttt{format-spec} is empty then either \(\texttt{pc.begin()} == \texttt{pc.end()}\) or \(*\texttt{pc.begin()} == '}'\).

### 22.14.6.2 Concept formattable

Let \texttt{fmt\_iter\_for<\texttt{charT}>} be an unspecified type that models \texttt{output\_iterator<const charT&>} (25.3.4.10).
Table 74: BasicFormatter requirements [tab:formatter.basic]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>g.parse(pc)</td>
<td>PC::iterator</td>
<td>Parses format-spec (22.14.2) for type T in the range [pc.begin(), pc.end()) until the first unmatched character. Throws format_error unless the whole range is parsed or the unmatched character is }.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>[Note 1: This allows formatters to emit meaningful error messages. — end note]</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Stores the parsed format specifiers in *this and returns an iterator past the end of the parsed range.</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>Formats u according to the specifiers stored in *this, writes the output to fc.out(), and returns an iterator past the end of the output range. The output shall only depend on u, fc.locale(), fc.arg(n) for any value n of type size_t, and the range [pc.begin(), pc.end()) from the last call to f.parse(pc).</td>
</tr>
</tbody>
</table>

Table 75: Formatter requirements [tab:formatter]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>f.format(t, fc)</td>
<td>FC::iterator</td>
<td>Formats t according to the specifiers stored in *this, writes the output to fc.out(), and returns an iterator past the end of the output range. The output shall only depend on t, fc.locale(), fc.arg(n) for any value n of type size_t, and the range [pc.begin(), pc.end()) from the last call to f.parse(pc).</td>
</tr>
<tr>
<td>f.format(u, fc)</td>
<td>FC::iterator</td>
<td>As above, but does not modify u.</td>
</tr>
</tbody>
</table>

```
template<class T, class charT>
concept formattable =
  semiregular<formatter<remove_cvref_t<T>, charT>> &&
  requires(formatter<remove_cvref_t<T>, charT> f,
    const formatter<remove_cvref_t<T>, charT> cf,
    T t,
    basic_format_context<fmt-iter-for<charT>, charT> fc,
    basic_format_parse_context<charT> pc) {
    { f.parse(pc) } -> same_as<basic_format_parse_context<charT>::iterator>;
    { cf.format(t, fc) } -> same_as<fmt-iter-for<charT> >;
  };
```

2 A type T and a character type charT model formattable if formatter<remove_cvref_t<T>, charT> meets the BasicFormatter requirements (22.14.6.1) and, if remove_reference_t<T> is const-qualified, the Formatter requirements.

22.14.6.3 Formatter specializations [format.formatter.spec]

The functions defined in 22.14.5 use specializations of the class template formatter to format individual arguments.

2 Let charT be either char or wchar_t. Each specialization of formatter is either enabled or disabled, as described below. A debug-enabled specialization of formatter additionally provides a public, constexpr, non-static member function set_debug_format() which modifies the state of the formatter to be as if the type of the std-format-spec parsed by the last call to parse were ?. Each header that declares the template formatter provides the following enabled specializations:
© ISO/IEC

The debug-enabled specializations

```cpp
template<> struct formatter<char, char>;
template<> struct formatter<char, wchar_t>;
template<> struct formatter<wchar_t, wchar_t>;
```

For each `charT`, the debug-enabled string type specializations

```cpp
template<> struct formatter<charT*, charT>;
template<> struct formatter<const charT*, charT>;
template<sizeof N> struct formatter<charT[N], charT>;
template<sizeof N> struct formatter<const charT[N], charT>;
template<class traits, class Allocator>
    struct formatter<basic_string<charT, traits, Allocator>, charT>;
template<class traits>
    struct formatter<basic_string_view<charT, traits>, charT>;
```

For each `charT`, for each cv-unqualified arithmetic type `ArithmeticT` other than `char`, `wchar_t`, `char8_t`, `char16_t`, or `char32_t`, a specialization

```cpp
template<> struct formatter<ArithmeticT, charT>;
```

For each `charT`, the pointer type specializations

```cpp
template<> struct formatter<nullptr_t, charT>;
template<> struct formatter<void*, charT>;
template<> struct formatter<const void*, charT>;
```

The parse member functions of these formatters interpret the format specification as a `std-format-spec` as described in 22.14.2.2.

[Note 1: Specializations such as `formatter<wchar_t, char>` and `formatter<const char*, wchar_t>` that would require implicit multibyte / wide string or character conversion are disabled. — end note]

3 For any types `T` and `charT` for which neither the library nor the user provides an explicit or partial specialization of the class template `formatter`, `formatter<T, charT>` is disabled.

4 If the library provides an explicit or partial specialization of `formatter<T, charT>`, that specialization is enabled and meets the `Formatter` requirements except as noted otherwise.

5 If `F` is a disabled specialization of `formatter`, these values are `false`:  

```cpp
- is_default_constructible_v<F>,
- is_copy_constructible_v<F>,
- is_move_constructible_v<F>,
- is_copy_assignable_v<F>, and
- is_move_assignable_v<F>.
```

6 An enabled specialization `formatter<T, charT>` meets the `BasicFormatter` requirements (22.14.6.1).

[Example 1:

```cpp
#include <format>

enum color { red, green, blue };
const char* color_names[] = { "red", "green", "blue" };

template<> struct std::formatter<color> : std::formatter<const char*> {
    auto format(color c, format_context& ctx) const {
        return formatter<const char*>::format(color_names[c], ctx);
    }
};

struct err {};

std::string s0 = std::format("{}", 42);  // OK, library-provided formatter
std::string s1 = std::format("{}", L"foo");  // error: disabled formatter
std::string s2 = std::format("{}", red);  // OK, user-provided formatter
std::string s3 = std::format("{}", err());  // error: disabled formatter
```

— end example]
22.14.6.4 Formatting escaped characters and strings [format.string.escaped]

1 A character or string can be formatted as escaped to make it more suitable for debugging or for logging.

2 The escaped string $E$ representation of a string $S$ is constructed by encoding a sequence of characters as follows. The associated character encoding $CE$ (Table 13) is used to both interpret $S$ and construct $E$.

(2.1) — $U+0022$ QUOTATION MARK (") is appended to $E$.

(2.2) — For each code unit sequence $X$ in $S$ that either encodes a single character, is a shift sequence, or is a sequence of ill-formed code units, processing is in order as follows:

(2.2.1) — If $X$ encodes a single character $C$, then:

(2.2.1.1) — If $C$ is one of the characters in Table 76, then the two characters shown as the corresponding escape sequence are appended to $E$.

(2.2.1.2) — Otherwise, if $C$ is not $U+0020$ SPACE and

(2.2.1.2) — $CE$ is a Unicode encoding and $C$ corresponds to either a UCS scalar value whose Unicode property General_Category has a value in the groups Separator (Z) or Other (C) or to a UCS scalar value which has the Unicode property Grapheme_Extend=Yes, as described by table 12 of UAX #44, or

(2.2.1.2) — $CE$ is not a Unicode encoding and $C$ is one of an implementation-defined set of separator or non-printable characters then the sequence $\backslash u\{\text{hex-digit-sequence}\}$ is appended to $E$, where \text{hex-digit-sequence} is the shortest hexadecimal representation of $C$ using lower-case hexadecimal digits.

(2.2.1.3) — Otherwise, $C$ is appended to $E$.

(2.2.2) — Otherwise, if $X$ is a shift sequence, the effect on $E$ and further decoding of $S$ is unspecified.

Recommended practice: A shift sequence should be represented in $E$ such that the original code unit sequence of $S$ can be reconstructed.

(2.2.3) — Otherwise ($X$ is a sequence of ill-formed code units), each code unit $U$ is appended to $E$ in order as the sequence $\backslash x\{\text{hex-digit-sequence}\}$, where \text{hex-digit-sequence} is the shortest hexadecimal representation of $U$ using lower-case hexadecimal digits.

(2.3) — Finally, $U+0022$ QUOTATION MARK (") is appended to $E$.

Table 76: Mapping of characters to escape sequences [tab:format.escape.sequences]

<table>
<thead>
<tr>
<th>Character</th>
<th>Escape sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>U+0009 CHARACTER TABULATION</td>
<td>\t</td>
</tr>
<tr>
<td>U+000A LINE FEED</td>
<td>\n</td>
</tr>
<tr>
<td>U+000D CARRIAGE RETURN</td>
<td>\r</td>
</tr>
<tr>
<td>U+0022 QUOTATION MARK</td>
<td>&quot;</td>
</tr>
<tr>
<td>U+005C REVERSE SOLIDUS</td>
<td>\</td>
</tr>
</tbody>
</table>

3 The escaped string representation of a character $C$ is equivalent to the escaped string representation of a string of $C$, except that:

(3.1) — the result starts and ends with $U+0027$ APOSTROPHE (') instead of $U+0022$ QUOTATION MARK ("), and

(3.2) — if $C$ is $U+0027$ APOSTROPHE, the two characters ‘’ are appended to $E$, and

(3.3) — if $C$ is $U+0022$ QUOTATION MARK, then $C$ is appended unchanged.

[Example 1:]

```cpp
string s0 = format("[{}]", "h\t{llo}");  // s0 has value: [h llo]
string s1 = format("[{:?}]", "h\t{llo}");  // s1 has value: ['h\t{llo}"
string s3 = format("[{:?}]", "\', '"');  // s3 has value: ['\', '"']

// The following examples assume use of the UTF-8 encoding
string s4 = format("[{:?}]", string("\0 \n \t \x02 \x1b", 9));  // s4 has value: [\"\0\n\t\u{0a}\u{09}\u{02}\u{1b}"
string s5 = format("[{:?}]", "\xc3\x28");  // invalid UTF-8, s5 has value: ["\xc3\"
```

§ 22.14.6.4
22.14.6.5 Class template basic_format_parse_context

namespace std {

    template<class charT>
    class basic_format_parse_context {
    public:
        using char_type = charT;
        using const_iterator = typename basic_string_view<charT>::const_iterator;
        using iterator = const_iterator;

        private:
            iterator begin_; // exposition only
            iterator end_; // exposition only
            enum indexing { unknown, manual, automatic }; // exposition only
            indexing indexing_; // exposition only
            size_t next_arg_id_; // exposition only
            size_t num_args_; // exposition only

        public:
            constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt, size_t num_args = 0) noexcept;
            basic_format_parse_context(const basic_format_parse_context&) = delete;
            basic_format_parse_context& operator=(const basic_format_parse_context&) = delete;
            constexpr const_iterator begin() const noexcept;
            constexpr const_iterator end() const noexcept;
            constexpr void advance_to(const_iterator it);
            constexpr size_t next_arg_id();
            constexpr void check_arg_id(size_t id);
    };
}

An instance of basic_format_parse_context holds the format string parsing state consisting of the format string range being parsed and the argument counter for automatic indexing.

constexpr explicit basic_format_parse_context(basic_string_view<charT> fmt, size_t num_args = 0) noexcept;

Effects: Initializes begin_ with fmt.begin(), end_ with fmt.end(), indexing_ with unknown, next_arg_id_ with 0, and num_args_ with num_args.

constexpr const_iterator begin() const noexcept;
Returns: begin_.

constexpr const_iterator end() const noexcept;
Returns: end_.

constexpr void advance_to(const_iterator it);

Preconditions: end() is reachable from it.

Effects: Equivalent to: begin_ = it;

constexpr size_t next_arg_id();

Effects: If indexing_ != manual, equivalent to:

if (indexing_ == unknown)
    indexing_ = automatic;
return next_arg_id++;

Throws: format_error if indexing_ == manual which indicates mixing of automatic and manual argument indexing.
constexpr void check_arg_id(size_t id);

Effects: If indexing_ != automatic, equivalent to:
if (indexing_ == unknown)
    indexing_ = manual;

Throws: format_error if indexing_ == automatic which indicates mixing of automatic and manual argument indexing.

Remarks: Call expressions where id >= num_args_ are not core constant expressions (7.7).

22.14.6.6 Class template basic_format_context

namespace std {
    template<class Out, class charT>
    class basic_format_context {
        basic_format_args<basic_format_context> args_; // exposition only
        Out out_; // exposition only

    public:
        using iterator = Out;
        using char_type = charT;
        template<class T> using formatter_type = formatter<T, charT>;

        basic_format_arg<basic_format_context> arg(size_t id) const noexcept;
        std::locale locale();
        iterator out();
        void advance_to(iterator it);
    };
}

An instance of basic_format_context holds formatting state consisting of the formatting arguments and the output iterator.

Out shall model output_iterator<const charT&>.

format_context is an alias for a specialization of basic_format_context with an output iterator that appends to string, such as back_insert_iterator<string>. Similarly, wformat_context is an alias for a specialization of basic_format_context with an output iterator that appends to wstring.

Recommended practice: For a given type charT, implementations should provide a single instantiation of basic_format_context for appending to basic_string<charT>, vector<charT>, or any other container with contiguous storage by wrapping those in temporary objects with a uniform interface (such as a span<charT>) and polymorphic reallocation.

basic_format_arg<basic_format_context> arg(size_t id) const noexcept;

Returns: args_.get(id).

std::locale locale();

Returns: The locale passed to the formatting function if the latter takes one, and std::locale() otherwise.

iterator out();

Effects: Equivalent to: return std::move(out_);

void advance_to(iterator it);

Effects: Equivalent to: out_ = std::move(it);

Example 1:
struct S { int value; };

template<> struct std::formatter<S> {
    size_t width_arg_id = 0;
}
// Parses a width argument id in the format { digit }.
constexpr auto parse(format_parse_context& ctx) {
    auto iter = ctx.begin();
    auto get_char = [&]() { return iter != ctx.end() ? *iter : 0; };
    if (get_char() != '{')
        return iter;
    ++iter;
    char c = get_char();
    if (!isdigit(c) || (++iter, get_char()) != '}
        throw format_error("invalid format");
    width_arg_id = c - '0';
    ctx.check_arg_id(width_arg_id);
    return ++iter;
}

// Formats an S with width given by the argument width_arg_id.
auto format(S s, format_context& ctx) const {
    int width = visit_format_arg([](auto value) -> int {
        if constexpr (!is_integral_v<decltype(value)>)
            throw format_error("width is not integral");
        else if (value < 0 || value > numeric_limits<int>::max())
            throw format_error("invalid width");
        else
            return value;
    }, ctx.arg(width_arg_id));
    return format_to(ctx.out(), "{0:x<{1}}", s.value, width);
}

std::string s = std::format("{0:{1}}", S{42}, 10);  // value of s is "xxxxxxxx42"
—end example]

22.14.7 Formatting of ranges

22.14.7.1 Variable template format_kind

template<ranges::input_range R>
    requires same_as<R, remove_cvref_t<R>>
constexpr range_format format_kind<R> = see below;

A program that instantiates the primary template of format_kind is ill-formed.

For a type R, format_kind<R> is defined as follows:

(2.1) — If same_as<remove_cvref_t<ranges::range_reference_t<R>>, R> is true, format_kind<R> is range_format::disabled.

[Note 1: This prevents constraint recursion for ranges whose reference type is the same range type. For example, std::filesystem::path is a range of std::filesystem::path. — end note]

(2.2) — Otherwise, if the qualified-id R::key_type is valid and denotes a type:

(2.2.1) — If the qualified-id R::mapped_type is valid and denotes a type, let U be remove_cvref_<
t<ranges::range_reference_t<R>>. If either U is a specialization of pair or U is a specialization of tuple and tuple_size_v<U> == 2, format_kind<R> is range_format::map.

(2.2.2) — Otherwise, format_kind<R> is range_format::set.

(2.3) — Otherwise, format_kind<R> is range_format::sequence.

Remarks: Pursuant to 16.4.5.2.1, users may specialize format_kind for cv-unqualified program-defined types that model ranges::input_range. Such specializations shall be usable in constant expressions (7.7) and have type const range_format.

22.14.7.2 Class template range_formatter

namespace std {
    template<class T, class charT = char
        requires same_as<remove_cvref_t<T>, T> && formattable<T, charT>
The class template `range_formatter` is a utility for implementing `formatter` specializations for range types. `range_formatter` interprets `format-spec` as a `range-format-spec`. The syntax of format specifications is as follows:

```
range-format-spec:
  range-fill-and-align_opt width_opt n_opt range-type_opt range-underlying-spec_opt
range-fill-and-align:
  range-fill_opt align
range-fill:
  any character other than { or } or :
range-type:
  m
  s
  ?s
range-underlying-spec:
  : format-spec
```

For `range_formatter<T, charT>`, the `format-spec` in a `range-underlying-spec`, if any, is interpreted by `formatter<T, charT>`. The `range-fill-and-align` is interpreted the same way as a `fill-and-align` (22.14.2.2). The productions `align` and `width` are described in 22.14.2.

The `n` option causes the range to be formatted without the opening and closing brackets.

[Note 1: This is equivalent to invoking `set_brackets({}, {})`. — end note]

The `range-type` specifier changes the way a range is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 77.

If the `range-type` is `s` or `?s`, then there shall be no `n` option and no `range-underlying-spec`.

```
constexpr void set_separator(basic_string_view<charT> sep);
```

**Effects**: Equivalent to: `separator_ = sep;

```
constexpr void set_brackets(basic_string_view<charT> opening, basic_string_view<charT> closing);
```

**Effects**: Equivalent to:

```
opening-bracket_ = opening;
closing-bracket_ = closing;
```
Table 77: Meaning of range-type options

<table>
<thead>
<tr>
<th>Option</th>
<th>Requirements</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>m</td>
<td>T shall be either a specialization of pair or a specialization of tuple such that tuple_size_v&lt;T&gt; is 2.</td>
<td>Indicates that the opening bracket should be &quot;{&quot;, the closing bracket should be &quot;}&quot;&quot;, the separator should be &quot;,&quot;, and each range element should be formatted as if m were specified for its tuple-type. [Note 2: If the n option is provided in addition to the m option, both the opening and closing brackets are still empty. —end note]</td>
</tr>
<tr>
<td>s</td>
<td>T shall be charT.</td>
<td>Indicates that the range should be formatted as a string.</td>
</tr>
<tr>
<td>?s</td>
<td>T shall be charT.</td>
<td>Indicates that the range should be formatted as an escaped string (22.14.6.4).</td>
</tr>
</tbody>
</table>

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

Effects: Parses the format specifier as a range-format-spec and stores the parsed specifiers in *this. The values of opening-bracket_, closing-bracket_, and separator_ are modified if and only if required by the range-type or the n option, if present. If:

(9.1) the range-type is neither s nor ?s,
(9.2) underlying_.set_debug_format() is a valid expression, and
(9.3) there is no range-underlying-spec,
then calls underlying_.set_debug_format().

Returns: An iterator past the end of the range-format-spec.

template<ranges::input_range R, class FormatContext>
requires formattable<ranges::range_reference_t<R>, charT> &&
same_as<remove_cvref_t<ranges::range_reference_t<R>>, T>
typename FormatContext::iterator
format(R&& r, FormatContext& ctx) const;

Effects: Writes the following into ctx.out(), adjusted according to the range-format-spec:

(11.1) If the range-type was s, then as if by formatting basic_string<charT>(from_range, r).
(11.2) Otherwise, if the range-type was ?s, then as if by formatting basic_string<charT>(from_range, r) as an escaped string (22.14.6.4).
(11.3) Otherwise,
(11.3.1) opening-bracket_,
(11.3.2) for each element e of the range r:
(11.3.2.1) the result of writing e via underlying_ and
(11.3.2.2) separator_, unless e is the last element of r, and
(11.3.3) closing-bracket_.

Returns: An iterator past the end of the output range.

22.14.7.3 Class template range-default-formatter

 namespace std {
 template<ranges::input_range R, class charT>
 struct range-default-formatter<range_format::sequence, R, charT> { // exposition only
 private:
 using maybe-const-r = fmt-maybe-const<R, charT>; // exposition only
 range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-r>>, charT> underlying_; // exposition only
 } // exposition only

§ 22.14.7.3
public:
  constexpr void set_separator(basic_string_view<charT> sep);
  constexpr void set_brackets(basic_string_view<charT> opening,
                               basic_string_view<charT> closing);

template<class ParseContext>
  constexpr typename ParseContext::iterator
  parse(ParseContext& ctx);

template<class FormatContext>
  typename FormatContext::iterator
  format(maybe-const-r elems, FormatContext& ctx) const;

constexpr void set_separator(basic_string_view<charT> sep);

Effects: Equivalent to: underlying_.set_separator(sep);

constexpr void set_brackets(basic_string_view<charT> opening,
                             basic_string_view<charT> closing);

Effects: Equivalent to: underlying_.set_brackets(opening, closing);

template<class ParseContext>
  constexpr typename ParseContext::iterator
  parse(ParseContext& ctx);

Effects: Equivalent to: return underlying_.parse(ctx);

template<class FormatContext>
  typename FormatContext::iterator
  format(maybe-const-r elems, FormatContext& ctx) const;

Effects: Equivalent to: return underlying_.format(elems, ctx);

22.14.7.4 Specialization of range-default-formatter for maps

namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::map, R, charT> {
  private:
    using maybe-const-map = fmt-maybe-const<R, charT>;
    // exposition only
    using element-type = remove_cvref_t<ranges::range_reference_t<maybe-const-map>>;
    range_formatter<element-type, charT> underlying_;
    // exposition only

  public:
    constexpr range-default-formatter();

    template<class ParseContext>
      constexpr typename ParseContext::iterator
      parse(ParseContext& ctx);

    template<class FormatContext>
      typename FormatContext::iterator
      format(maybe-const-r& r, FormatContext& ctx) const;
  };

  constexpr range-default-formatter();

  Mandates: Either:
  (1.1) element-type is a specialization of pair, or
  (1.2) element-type is a specialization of tuple and tuple_size_v<T> == 2.

  Effects: Equivalent to:
    underlying_.set_brackets(STATICALLY-WIDEN<charT>("{"),
                             STATICALLY-WIDEN<charT>(""));

§ 22.14.7.4
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

Effects: Equivalent to: return underlying_.parse(ctx);

template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-map r, FormatContext& ctx) const;

Effects: Equivalent to: return underlying_.format(r, ctx);

22.14.7.5 Specialization of range-default-formatter for sets

namespace std {
  template<ranges::input_range R, class charT>
  struct range-default-formatter<range_format::set, R, charT> {
    private:
      using maybe-const-set = fmt-maybe-const<R, charT>;
      // exposition only
      range_formatter<remove_cvref_t<ranges::range_reference_t<maybe-const-set>>, charT> underlying_;
      // exposition only
    public:
      constexpr range-default-formatter();
      template<class ParseContext>
      constexpr typename ParseContext::iterator
      parse(ParseContext& ctx);
      template<class FormatContext>
      typename FormatContext::iterator
      format(maybe-const-set r, FormatContext& ctx) const;
    };
  }

constexpr range-default-formatter();

Effects: Equivalent to:
underlying_.set_brackets("{"), STATICALLY-WIDEN<charT>(""");

template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);

Effects: Equivalent to: return underlying_.parse(ctx);

template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-set r, FormatContext& ctx) const;

Effects: Equivalent to: return underlying_.format(r, ctx);

22.14.7.6 Specialization of range-default-formatter for strings

namespace std {
  template<range_format K, ranges::input_range R, class charT>
  requires (K == range_format::string || K == range_format::debug_string)
  struct range-default-formatter<K, R, charT> {
    private:
      formatter<basic_string<charT>, charT> underlying_;
      // exposition only
    public:
      template<class ParseContext, charT>
      constexpr typename ParseContext::iterator
      parse(ParseContext& ctx);
  };
}

§ 22.14.7.6
template<class FormatContext>
    typename FormatContext::iterator
    format(see below & str, FormatContext& ctx) const;
};

Mandates: same_as<remove_cvref_t<range_reference_t<R>>, charT> is true.

template<class ParseContext>
    constexpr typename ParseContext::iterator
    parse(ParseContext& ctx);

Effects: Equivalent to:
    auto i = underlying_.parse(ctx);
    if constexpr (K == range_format::debug_string) {
        underlying_.set_debug_format();
    }
    return i;

template<class FormatContext>
    typename FormatContext::iterator
    format(see below & r, FormatContext& ctx) const;

The type of r is const R& if ranges::input_range<const R> is true and R& otherwise.

Effects: Let s be a basic_string<charT> such that ranges::equal(s, r) is true. Equivalent to:
    return underlying_.format(s, ctx);

22.14.8 Arguments

22.14.8.1 Class template basic_format_arg

namespace std {
    template<class Context>
    class basic_format_arg {
        public:
            class handle;

        private:
            using char_type = typename Context::char_type;
            // exposition only
            variant<monostate, bool, char_type,
                int, unsigned int, long long int,
                float, double, long double,
                const char_type*,
                basic_string_view<char_type>,
                const void*, handle> value;
            // exposition only

            template<class T> explicit basic_format_arg(T&& v) noexcept;
            explicit basic_format_arg(float n) noexcept;
            explicit basic_format_arg(double n) noexcept;
            explicit basic_format_arg(long double n) noexcept;
            explicit basic_format_arg(const char_type* s);
            // exposition only

            template<class T> explicit basic_format_arg(T* p) noexcept;
            // exposition only

            template<class traits, class Allocator>
                explicit basic_format_arg( const basic_string<char_type, traits, Allocator>& s) noexcept;
            // exposition only

            explicit basic_format_arg(nullptr_t) noexcept;
            // exposition only

            template<class T>
                explicit basic_format_arg(T&& v) noexcept;
                // exposition only

            template<class traits, class Allocator>
                explicit basic_format_arg( const basic_string<char_type, traits, Allocator>& s) noexcept;
                // exposition only

            explicit basic_format_arg(nullptr_t) noexcept;
            // exposition only

            template<class T>
                explicit basic_format_arg(T* p) noexcept;
                // exposition only

    };
};
An instance of `basic_format_arg` provides access to a formatting argument for user-defined formatters.

The behavior of a program that adds specializations of `basic_format_arg` is undefined.

```cpp
public:
  basic_format_arg() noexcept;

  explicit operator bool() const noexcept;
};
```

Postconditions: !(this).

### Constraints

The template specialization

```cpp
typename Context::template formatter_type<remove_cvref_t<T>>
```

meets the `BasicFormatter` requirements (22.14.6.1). The extent to which an implementation determines that the specialization meets the `BasicFormatter` requirements is unspecified, except that as a minimum the expression

```cpp
typename Context::template formatter_type<remove_cvref_t<T>>() .format(declval<T&>(), declval<Context&>())
```

shall be well-formed when treated as an unevaluated operand (7.2.3).

#### Effects:

- if `T` is `bool` or `char_type`, initializes `value` with `v`;
- otherwise, if `T` is `char` and `char_type` is `wchar_t`, initializes `value` with `static_cast<wchar_t>(v)`;
- otherwise, if `T` is a signed integer type (6.8.2) and `sizeof(T) <= sizeof(int)`, initializes `value` with `static_cast<int>(v)`;
- otherwise, if `T` is an unsigned integer type and `sizeof(T) <= sizeof(unsigned int)`, initializes `value` with `static_cast<unsigned int>(v)`;
- otherwise, if `T` is a signed integer type and `sizeof(T) <= sizeof(long long int)`, initializes `value` with `static_cast<long long int>(v)`;
- otherwise, if `T` is an unsigned integer type and `sizeof(T) <= sizeof(unsigned long long int)`, initializes `value` with `static_cast<unsigned long long int>(v)`;
- otherwise, initializes `value` with `handle(v)`.

### Examples

```cpp
explicit basic_format_arg(float n) noexcept;
explicit basic_format_arg(double n) noexcept;
explicit basic_format_arg(long double n) noexcept;
```

Effects: Initializes `value` with `n`.

```cpp
explicit basic_format_arg(const char_type* s);
```

Preconditions: `s` points to a NTCTS (3.36).

Effects: Initializes `value` with `s`.

```cpp
template<class traits>
explicit basic_format_arg(basic_string_view<char_type, traits> s) noexcept;
```

Effects: Initializes `value` with `basic_string_view<char_type>(s.data(), s.size())`.

```cpp
template<class traits, class Allocator>
explicit basic_format_arg(
    const basic_string<char_type, traits, Allocator>& s) noexcept;
```

Effects: Initializes `value` with `basic_string_view<char_type>(s.data(), s.size())`.
explicit basic_format_arg(nullptr_t) noexcept;

Effects: Initializes value with static_cast<const void*>(nullptr).

template<class T> explicit basic_format_arg(T* p) noexcept;

Constraints: is_void_v<T> is true.

Effects: Initializes value with p.

[Note 1: Constructing `basic_format_arg` from a pointer to a member is ill-formed unless the user provides an enabled specialization of `formatter` for that pointer to member type. — end note]

explicit operator bool() const noexcept;

Returns: !holds_alternative<monostate>(value).

The class `handle` allows formatting an object of a user-defined type.

namespace std {

template<class Context>
class basic_format_arg<Context>::handle {
  const void* ptr_;  // exposition only
  void (*format_)(basic_format_parse_context<char_type>&,
                  Context&, const void*);  // exposition only

  template<class T> explicit handle(T&& val) noexcept;  // exposition only

friend class basic_format_arg<Context>;  // exposition only

public:
  void format(basic_format_parse_context<char_type>&, Context& ctx) const;
};

}

template<class T> explicit handle(T&& val) noexcept;

Let

(17.1) — TD be remove_cvref_t<T>,
(17.2) — const-formattable be true if typename Context::template formatter_type<TD>()
      .format(declval<const TD&>(), declval<Context&>()) is well-formed, otherwise false,
(17.3) — TQ be const TD if const-formattable is true and TD otherwise.

Mandates: const-formattable || !is_const_v<remove_reference_t<T>> is true.

Effects: Initializes ptr_ with addressof(val) and format_ with

>[](basic_format_parse_context<char_type>& parse_ctx,
    Context& format_ctx, const void* ptr) {
  typename Context::template formatter_type<TD> f;
  parse_ctx.advance_to(f.parse(parse_ctx));
  format_ctx.advance_to(f.format(*const_cast<TQ*>(static_cast<const TD*>(ptr)),
                                 format_ctx));
}

void format(basic_format_parse_context<char_type>& parse_ctx, Context& format_ctx) const;

Effects: Equivalent to: format_(parse_ctx, format_ctx, ptr_);

template<class Visitor, class Context>
dcltype(auto) visit_format_arg(Visitor& vis, basic_format_arg<Context> arg);

Effects: Equivalent to: return visit(std::forward<Visitor>(vis), arg.value);

22.14.8.2 Class template format-arg-store

namespace std {

template<class Context, class... Args>
class format-arg-store {
  array<basic_format_arg<Context>, sizeof...(Args)> args;  // exposition only
};

22.14.8.2.1 Class template format-arg-store::handle

"""format-arg-store"""
An instance of `format-arg-store` stores formatting arguments.

```cpp
template<class Context = format_context, class... Args>
    format-arg-store<Context, Args...> make_format_args(Args&&... fmt_args);
```

**Preconditions:** The type `typename Context::template formatter_type<Ti>` meets the BasicFormatter requirements (22.14.6.1) for each `Ti` in `Args`.

**Returns:** An object of type `format-arg-store<Context, Args...>` whose `args` data member is initialized with `{basic_format_arg<Context>(fmt_args)...}`.

```cpp
template<class... Args>
    format-arg-store<wformat_context, Args...> make_wformat_args(Args&&... args);
```

**Effects:** Equivalent to: `return make_format_args<wformat_context>(args...);`

22.14.8.3 Class template `basic_format_args`  

```cpp
namespace std {
    template<class Context>
        class basic_format_args {
            size_t size_; // exposition only
            const basic_format_arg<Context>* data_; // exposition only

        public:
            basic_format_args() noexcept;
            template<class... Args>
                basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
            basic_format_arg<Context> get(size_t i) const noexcept;
        }
}
```

An instance of `basic_format_args` provides access to formatting arguments. Implementations should optimize the representation of `basic_format_args` for a small number of formatting arguments.

**Note 1:** For example, by storing indices of type alternatives separately from values and packing the former. — end note

```cpp
basic_format_args() noexcept;
```

**Effects:** Initializes `size_` with 0.

```cpp
template<class... Args>
    basic_format_args(const format-arg-store<Context, Args...>& store) noexcept;
```

**Effects:** Initializes `size_` with `sizeof...(Args)` and `data_` with `store.args.data()`.

```cpp
basic_format_arg<Context> get(size_t i) const noexcept;
```

**Returns:** `i < size_ ? data_[i] : basic_format_arg<Context>()`.

22.14.9 Tuple formatter  

For each of `pair` and `tuple`, the library provides the following formatter specialization where `pair-or-tuple` is the name of the template:

```cpp
namespace std {
    template<class charT, formattable<charT>... Ts>
        struct formatter<pair-or-tuple<Ts...>, charT> {
            private:
                tuple<formatter<remove_cvref_t<Ts>, charT>...> underlying_; // exposition only
                basic_string_view<charT> separator_ = STATICALLY-WIDEN<charT>(" "); // exposition only
                basic_string_view<charT> opening-bracket_ = STATICALLY-WIDEN<charT>("("); // exposition only
                basic_string_view<charT> closing-bracket_ = STATICALLY-WIDEN<charT>(")"); // exposition only

```
The `parse` member functions of these formatters interpret the format specification as a `tuple-format-spec` according to the following syntax:

```
tuple-format-spec:
  tuple-fill-and-align_opt width_opt tuple-type_opt

tuple-fill-and-align:
  tuple-fill_opt align

  tuple-fill:
    any character other than { or } or :

  tuple-type:
    m
    n
```

The `tuple-fill-and-align` is interpreted the same way as a `fill-and-align` (22.14.2.2). The productions `align` and `width` are described in 22.14.2.

The `tuple-type` specifier changes the way a `pair` or `tuple` is formatted, with certain options only valid with certain argument types. The meaning of the various type options is as specified in Table 78.

<table>
<thead>
<tr>
<th>Option</th>
<th>Requirements</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| m      | `sizeof...(Ts) == 2` | Equivalent to:
  
  ```
  set_separator(STATICALLY-WIDEN<charT>(" ");
  set_brackets({}, {});
  ```
| n      | none         | Equivalent to: `set_brackets({}, {});`
| none   | none         | No effects |

The `set_separator` function stores the separator as specified in the format string.

```
constexpr void set_separator(basic_string_view<charT> sep);
```

**Effects:** Equivalent to: `separator_ = sep;`

The `set_brackets` function stores the opening and closing characters as specified in the format string.

```
constexpr void set_brackets(basic_string_view<charT> opening, basic_string_view<charT> closing);
```

**Effects:** Equivalent to:

```
opening-bracket_ = opening;
closing-bracket_ = closing;
```

**Returns:** An iterator past the end of the `tuple-format-spec`. 

### Table 78: Meaning of `tuple-type` options

<table>
<thead>
<tr>
<th>Option</th>
<th>Requirements</th>
<th>Meaning</th>
</tr>
</thead>
</table>
| `m`    | `sizeof...(Ts) == 2` | Equivalent to:
  
  ```
  set_separator(STATICALLY-WIDEN<charT>(" ");
  set_brackets({}, {});
  ```
| `n`    | none         | Equivalent to: `set_brackets({}, {});`
| none   | none         | No effects |
template<class FormatContext>
  typename FormatContext::iterator
  format(see below & elems, FormatContext& ctx) const;

  The type of elems is:

  (9.1) — If (formattable<const Ts, charT> && ...) is true, const pair-or-tuple<Ts...>&.

  (9.2) — Otherwise pair-or-tuple<Ts...>&.

  Effects: Writes the following into ctx.out(), adjusted according to the tuple-format-spec:

  (10.1) — opening-bracket_,

  (10.2) — for each index I in the [0, sizeof...(Ts)):

  (10.2.1) — if I != 0, separator_,

  (10.2.2) — the result of writing get<I>(elems) via get<I>(underlying_), and

  (10.3) — closing-bracket_.

  Returns: An iterator past the end of the output range.

22.14.10 Class format_error

namespace std {
  class format_error : public runtime_error {
    public:
      explicit format_error(const string& what_arg);
      explicit format_error(const char* what_arg);
  };
}

1 The class format_error defines the type of objects thrown as exceptions to report errors from the formatting library.

format_error(const string& what_arg);

2 Postconditions: strcmp(what(), what_arg.c_str()) == 0.

format_error(const char* what_arg);

3 Postconditions: strcmp(what(), what_arg) == 0.

22.15 Bit manipulation

22.15.1 General

1 The header <bit> provides components to access, manipulate and process both individual bits and bit sequences.

22.15.2 Header <bit> synopsis

```
// all freestanding
namespace std {
  template<class To, class From>
  constexpr To bit_cast(const From& from) noexcept;

  template<class T>
  constexpr T byteswap(T value) noexcept;

  template<class T>
  constexpr bool has_single_bit(T x) noexcept;

  template<class T>
  constexpr T bit_ceil(T x);

  template<class T>
  constexpr T bit_floor(T x) noexcept;

  template<class T>
  constexpr int bit_width(T x) noexcept;
```
// 22.15.6, rotating
template<class T>
[modis[car]] constexpr T rotl(T x, int s) noexcept;
template<class T>
[modis[car]] constexpr T rotr(T x, int s) noexcept;

// 22.15.7, counting
template<class T>
constexpr int countl_zero(T x) noexcept;
template<class T>
constexpr int countl_one(T x) noexcept;
template<class T>
constexpr int countr_zero(T x) noexcept;
template<class T>
constexpr int countr_one(T x) noexcept;
template<class T>
constexpr int popcount(T x) noexcept;

// 22.15.8, endian
enum class endian {
    little = see below,
    big = see below,
    native = see below
};

22.15.3 Function template bit_cast
[bit.cast]

template<class To, class From>
constexpr To bit_cast(const From& from) noexcept;

1 Constraints:
(1.1) sizeof(To) == sizeof(From) is true;
(1.2) is_trivially_copyable_v<To> is true; and
(1.3) is_trivially_copyable_v<From> is true.

2 Returns: An object of type To. Implicitly creates objects nested within the result (6.7.2). Each bit of the value representation of the result is equal to the corresponding bit in the object representation of from. Padding bits of the result are unspecified. For the result and each object created within it, if there is no value of the object’s type corresponding to the value representation produced, the behavior is undefined. If there are multiple such values, which value is produced is unspecified. A bit in the value representation of the result is indeterminate if it does not correspond to a bit in the value representation of from or corresponds to a bit of an object that is not within its lifetime or has an indeterminate value (6.7.4). For each bit in the value representation of the result that is indeterminate, the smallest object containing that bit has an indeterminate value; the behavior is undefined unless that object is of unsigned ordinary character type or std::byte type. The result does not otherwise contain any indeterminate values.

3 Remarks: This function is constexpr if and only if To, From, and the types of all subobjects of To and From are types T such that:
(3.1) is_union_v<T> is false;
(3.2) is_pointer_v<T> is false;
(3.3) is_member_pointer_v<T> is false;
(3.4) is_volatile_v<T> is false; and
(3.5) T has no non-static data members of reference type.

22.15.4 byteswap
[bit.byteswap]

template<class T>
constexpr T byteswap(T value) noexcept;

1 Constraints: T models integral.
Mandates: T does not have padding bits (6.8.1).

Let the sequence R comprise the bytes of the object representation of value in reverse order.

Returns: An object v of type T such that each byte in the object representation of v is equal to the byte in the corresponding position in R.

22.15.5 Integral powers of 2

template<class T>
constexpr bool has_single_bit(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).

Returns: true if x is an integral power of two; false otherwise.

template<class T>
constexpr T bit_ceil(T x);

Let N be the smallest power of 2 greater than or equal to x.

Constraints: T is an unsigned integer type (6.8.2).

Preconditions: N is representable as a value of type T.

Returns: N.

Throws: Nothing.

Remarks: A function call expression that violates the precondition in the Preconditions: element is not a core constant expression (7.7).

template<class T>
constexpr T bit_floor(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).

Returns: If x == 0, 0; otherwise the maximal value y such that has_single_bit(y) is true and y <= x.

template<class T>
constexpr int bit_width(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).

Returns: If x == 0, 0; otherwise one plus the base-2 logarithm of x, with any fractional part discarded.

22.15.6 Rotating

In the following descriptions, let N denote numeric_limits<T>::digits.

template<class T>
[[nodiscard]] constexpr T rotl(T x, int s) noexcept;

Constraints: T is an unsigned integer type (6.8.2).

Let r be s % N.

Returns: If r is 0, x; if r is positive, (x << r) | (x >> (N - r)); if r is negative, rotr(x, -r).

template<class T>
[[nodiscard]] constexpr T rotr(T x, int s) noexcept;

Constraints: T is an unsigned integer type (6.8.2).

Let r be s % N.

Returns: If r is 0, x; if r is positive, (x >> r) | (x << (N - r)); if r is negative, rotl(x, -r).

22.15.7 Counting

In the following descriptions, let N denote numeric_limits<T>::digits.

template<class T>
constexpr int countl_zero(T x) noexcept;

Constraints: T is an unsigned integer type (6.8.2).
Returns: The number of consecutive 0 bits in the value of x, starting from the most significant bit.

[Note 1: Returns \( N \) if \( x = 0 \). — end note]

\[
\text{template}<\text{class } T> \\
\text{constexpr int } \text{countl_one}(T x) \text{ noexcept};
\]

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 1 bits in the value of x, starting from the most significant bit.

[Note 2: Returns \( N \) if \( x = \text{numeric_limits}<T>::\text{max}() \). — end note]

\[
\text{template}<\text{class } T> \\
\text{constexpr int } \text{countr_zero}(T x) \text{ noexcept};
\]

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 0 bits in the value of x, starting from the least significant bit.

[Note 3: Returns \( N \) if \( x = 0 \). — end note]

\[
\text{template}<\text{class } T> \\
\text{constexpr int } \text{countr_one}(T x) \text{ noexcept};
\]

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of consecutive 1 bits in the value of x, starting from the least significant bit.

[Note 4: Returns \( N \) if \( x = \text{numeric_limits}<T>::\text{max}() \). — end note]

\[
\text{template}<\text{class } T> \\
\text{constexpr int } \text{popcount}(T x) \text{ noexcept};
\]

Constraints: \( T \) is an unsigned integer type (6.8.2).

Returns: The number of 1 bits in the value of x.

### 22.15.8 Endian

Two common methods of byte ordering in multibyte scalar types are big-endian and little-endian in the execution environment. Big-endian is a format for storage of binary data in which the most significant byte is placed first, with the rest in descending order. Little-endian is a format for storage of binary data in which the least significant byte is placed first, with the rest in ascending order. This subclause describes the endianness of the scalar types of the execution environment.

```cpp
enum class endian {
  little = see below,
  big = see below,
  native = see below
};
```

If all scalar types have size 1 byte, then all of `endian::little`, `endian::big`, and `endian::native` have the same value. Otherwise, `endian::little` is not equal to `endian::big`. If all scalar types are big-endian, `endian::native` is equal to `endian::big`. If all scalar types are little-endian, `endian::native` is equal to `endian::little`. Otherwise, `endian::native` is not equal to either `endian::big` or `endian::little`. 
23 Strings library

23.1 General

1 This Clause describes components for manipulating sequences of any non-array trivial standard-layout (6.8.1) type. Such types are called char-like types, and objects of char-like types are called char-like objects or simply characters.

2 The following subclauses describe a character traits class, string classes, and null-terminated sequence utilities, as summarized in Table 79.

<table>

</tr>
</tbody>
</table>

23.2 Character traits

23.2.1 General

1 Subclause 23.2 defines requirements on classes representing character traits, and defines a class template `char_traits<charT>`, along with five specializations, `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`, that meet those requirements.

2 Most classes specified in 23.4, 23.3, and Clause 31 need a set of related types and functions to complete the definition of their semantics. These types and functions are provided as a set of member typedef-names and functions in the template parameter traits used by each such template. Subclause 23.2 defines the semantics of these members.

3 To specialize those templates to generate a string, string view, or iostream class to handle a particular character container type (3.10) C, that and its related character traits class X are passed as a pair of parameters to the string, string view, or iostream template as parameters `charT` and `traits`. If X::char_type is not the same type as C, the program is ill-formed.

23.2.2 Character traits requirements

1 In Table 80, X denotes a traits class defining types and functions for the character container type C; c and d denote values of type C; p and q denote values of type const C*; s denotes a value of type C*; n, i and j denote values of type size_t; e and f denote values of type X::int_type; pos denotes a value of type X::pos_type; and r denotes an lvalue of type C. No expression which is part of the character traits requirements specified in this subclause 23.2.2 shall exit via an exception.

The class template

```cpp
template<class charT> struct char_traits;
```

is provided in the header `<string>` as a basis for explicit specializations.

### 23.2.3 Traits typedefs

using int_type = see below;

Preconditions: int_type shall be able to represent all of the valid characters converted from the corresponding char_type values, as well as an end-of-file value, `eof()`.

using state_type = see below;

Preconditions: state_type meets the Cpp17Destructible (Table 36), Cpp17CopyAssignable (Table 35), Cpp17CopyConstructible (Table 33), and Cpp17DefaultConstructible (Table 31) requirements.

### 23.2.4 char_traits specializations

#### 23.2.4.1 General

```cpp
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
```

1 The header `<string>` defines five specializations of the class template `char_traits`: `char_traits<char>`, `char_traits<char8_t>`, `char_traits<char16_t>`, `char_traits<char32_t>`, and `char_traits<wchar_t>`.

#### 23.2.4.2 struct char_traits<char>

```cpp
namespace std {
    template<> struct char_traits<char> {
        using char_type = char;
        using int_type = int;
        using off_type = streamoff;
        using pos_type = streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
    }
}
```

210) If `eof()` can be held in `char_type` then some iostreams operations can give surprising results.
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;
};
}

1 The type mbstate_t is defined in <cwchar> and can represent any of the conversion states that can occur in an implementation-defined set of supported multibyte character encoding rules.

2 The two-argument member assign is defined identically to the built-in operator =. The two-argument members eq and lt are defined identically to the built-in operators == and < for type unsigned char.

3 The member eof() returns EOF.

23.2.4.3 struct char_traits<char8_t> [char.traits.specializations.char8.t]
namespace std {
    template<> struct char_traits<char8_t> {
        using char_type = char8_t;
        using int_type = unsigned int;
        using off_type = streamoff;
        using pos_type = u8streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                               const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };
}

1 The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and < respectively.

2 The member eof() returns an implementation-defined constant that cannot appear as a valid UTF-8 code unit.

23.2.4.4 struct char_traits<char16_t> [char.traits.specializations.char16.t]
namespace std {
    template<> struct char_traits<char16_t> {
        using char_type = char16_t;
        using int_type = uint_least16_t;
        using off_type = streamoff;
        using pos_type = u16streampos;
        using state_type = mbstate_t;
        using comparison_category = strong_ordering;

        static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
        static constexpr bool eq(char_type c1, char_type c2) noexcept;
        static constexpr bool lt(char_type c1, char_type c2) noexcept;
        static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
        static constexpr size_t length(const char_type* s);
        static constexpr const char_type* find(const char_type* s, size_t n,
                                               const char_type& a);
        static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
        static constexpr char_type* assign(char_type* s, size_t n, char_type a);
        static constexpr int_type not_eof(int_type c) noexcept;
        static constexpr char_type to_char_type(int_type c) noexcept;
        static constexpr int_type to_int_type(char_type c) noexcept;
        static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
        static constexpr int_type eof() noexcept;
    };

The two-argument members \texttt{assign}, \texttt{eq}, and \texttt{lt} are defined identically to the built-in operators \texttt{=}, \texttt{==}, and \texttt{<}, respectively.

The member \texttt{eof()} returns an implementation-defined constant that cannot appear as a valid UTF-16 code unit.

\subsection{23.2.4.5 \texttt{struct char_traits<char32_t}}

```cpp
namespace std { 
  template<> struct char_traits<char32_t> { 
    using char_type = char32_t; 
    using int_type = uint_least32_t; 
    using off_type = streamoff; 
    using pos_type = u32streampos; 
    using state_type = mbstate_t; 
    using comparison_category = strong_ordering; 
    static constexpr void assign(char_type& c1, const char_type& c2) noexcept; 
    static constexpr bool eq(char_type c1, char_type c2) noexcept; 
    static constexpr bool lt(char_type c1, char_type c2) noexcept; 
    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n); 
    static constexpr size_t length(const char_type* s); 
    static constexpr const char_type* find(const char_type* s, size_t n, 
                                           const char_type& a); 
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n); 
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n); 
    static constexpr char_type* assign(char_type* s, size_t n, char_type a); 
    static constexpr int_type not_eof(int_type c) noexcept; 
    static constexpr char_type to_char_type(int_type c) noexcept; 
    static constexpr int_type to_int_type(char_type c) noexcept; 
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept; 
    static constexpr int_type eof() noexcept; 
  }; 
}
```

The two-argument members \texttt{assign}, \texttt{eq}, and \texttt{lt} are defined identically to the built-in operators \texttt{=}, \texttt{==}, and \texttt{<}, respectively.

The member \texttt{eof()} returns an implementation-defined constant that cannot appear as a valid Unicode code point.

\subsection{23.2.4.6 \texttt{struct char_traits<wchar_t}}

```cpp
namespace std { 
  template<> struct char_traits<wchar_t> { 
    using char_type = wchar_t; 
    using int_type = wint_t; 
    using off_type = streamoff; 
    using pos_type = wstreampos; 
    using state_type = mbstate_t; 
    static constexpr void assign(char_type& c1, const char_type& c2) noexcept; 
    static constexpr bool eq(char_type c1, char_type c2) noexcept; 
    static constexpr bool lt(char_type c1, char_type c2) noexcept; 
    static constexpr int compare(const char_type* s1, const char_type* s2, size_t n); 
    static constexpr size_t length(const char_type* s); 
    static constexpr const char_type* find(const char_type* s, size_t n, 
                                           const char_type& a); 
    static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n); 
    static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n); 
    static constexpr char_type* assign(char_type* s, size_t n, char_type a); 
    static constexpr int_type not_eof(int_type c) noexcept; 
    static constexpr char_type to_char_type(int_type c) noexcept; 
    static constexpr int_type to_int_type(char_type c) noexcept; 
    static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept; 
    static constexpr int_type eof() noexcept; 
  }; 
}
```

The two-argument members \texttt{assign}, \texttt{eq}, and \texttt{lt} are defined identically to the built-in operators \texttt{=}, \texttt{==}, and \texttt{<}, respectively.

The member \texttt{eof()} returns an implementation-defined constant that cannot appear as a Unicode code point.
using comparison_category = strong_ordering;

static constexpr void assign(char_type& c1, const char_type& c2) noexcept;
static constexpr bool eq(char_type c1, char_type c2) noexcept;
static constexpr bool lt(char_type c1, char_type c2) noexcept;
static constexpr int compare(const char_type* s1, const char_type* s2, size_t n);
static constexpr size_t length(const char_type* s);
static constexpr const char_type* find(const char_type* s, size_t n, const char_type& a);
static constexpr char_type* move(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* copy(char_type* s1, const char_type* s2, size_t n);
static constexpr char_type* assign(char_type* s, size_t n, char_type a);
static constexpr int_type not_eof(int_type c) noexcept;
static constexpr char_type to_char_type(int_type c) noexcept;
static constexpr int_type to_int_type(char_type c) noexcept;
static constexpr bool eq_int_type(int_type c1, int_type c2) noexcept;
static constexpr int_type eof() noexcept;

// The two-argument members assign, eq, and lt are defined identically to the built-in operators =, ==, and <, respectively.

// The member eof() returns WEOF.

23.3 String view classes

23.3.1 General

The class template `basic_string_view` describes an object that can refer to a constant contiguous sequence of char-like (23.1) objects with the first element of the sequence at position zero. In the rest of 23.3, the type of the char-like objects held in a `basic_string_view` object is designated by `charT`.

[Note 1: The library provides implicit conversions from `const charT*` and `std::basic_string<charT, ...>` to `std::basic_string_view<charT, ...>` so that user code can accept just `std::basic_string_view<charT>` as a non-templated parameter wherever a sequence of characters is expected. User-defined types can define their own implicit conversions to `std::basic_string_view<charT>` in order to interoperate with these functions. — end note]

23.3.2 Header `<string_view>` synopsis

```
#include <compare>  // see 17.11.1
namespace std {

  // 23.3.3, class template basic_string_view
  template<class charT, class traits = char_traits<charT>>
  class basic_string_view;

  template<class charT, class traits>

private:
  const_pointer data_;  // exposition only
  size_type size_;      // exposition only
};

// 23.3.3.3, deduction guides
template<class It, class End>
  basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;
template<class R>
  basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;

1 In every specialization basic_string_view<charT, traits>, the type traits shall meet the character
   traits requirements (23.2).
   [Note 1: The program is ill-formed if traits::char_type is not the same type as charT. — end note]

2 For a basic_string_view str, any operation that invalidates a pointer in the range
   [str.data(), str.data() + str.size())
   invalidates pointers, iterators, and references returned from str’s member functions.

3 The complexity of basic_string_view member functions is $O(1)$ unless otherwise specified.

4 basic_string_view<charT, traits> is a trivially copyable type (6.8.1).

23.3.3.2 Construction and assignment

constexpr basic_string_view() noexcept;
Postconditions: size_ == 0 and data_ == nullptr.

constexpr basic_string_view(const charT* str);
Preconditions: [str, str + traits::length(str)) is a valid range.
Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with
         traits::length(str).
Complexity: $O(trait::length(str)).$

constexpr basic_string_view(const charT* str, size_type len);
Preconditions: [str, str + len) is a valid range.
Effects: Constructs a basic_string_view, initializing data_ with str and initializing size_ with len.
template<class It, class End>
    constexpr basic_string_view(It begin, End end);

    Constraints:
    (7.1)  It satisfies contiguous_iterator.
    (7.2)  End satisfies sized_sentinel_for<It>.
    (7.3)  is_same_v<iter_value_t<It>, charT> is true.
    (7.4)  is_convertible_v<End, size_type> is false.

    Preconditions:
    (8.1)  [begin, end) is a valid range.
    (8.2)  It models contiguous_iterator.
    (8.3)  End models sized_sentinel_for<It>.

    Effects: Initializes data_ with to_address(begin) and initializes size_ with end - begin.

    Throws: When and what end - begin throws.

template<class R>
    constexpr explicit basic_string_view(R&& r);

    Let d be an lvalue of type remove_cvref_t<R>.

    Constraints:
    (12.1) remove_cvref_t<R> is not the same type as basic_string_view,
    (12.2) R models ranges::contiguous_range and ranges::sized_range,
    (12.3) is_same_v<ranges::range_value_t<R>, charT> is true,
    (12.4) is_convertible_v<R, const charT*> is false,
    (12.5) d.operator ::std::basic_string_view<charT, traits>() is not a valid expression, and
    (12.6) if the qualified-id remove_reference_t<R>::traits_type is valid and denotes a type, is_same_v<remove_reference_t<R>::traits_type, traits> is true.

    Effects: Initializes data_ with ranges::data(r) and size_ with ranges::size(r).

    Throws: Any exception thrown by ranges::data(r) and ranges::size(r).

23.3.3.3 Deduction guides  [string.view.deduct]

    template<class It, class End>
        basic_string_view(It, End) -> basic_string_view<iter_value_t<It>>;

        Constraints:
        (1.1)  It satisfies contiguous_iterator.
        (1.2)  End satisfies sized_sentinel_for<It>.

    template<class R>
        basic_string_view(R&&) -> basic_string_view<ranges::range_value_t<R>>;

        Constraints: R satisfies ranges::contiguous_range.

23.3.3.4 Iterator support  [string.view.iterators]

    using const_iterator = implementation-defined;

    A type that meets the requirements of a constant Cpp17RandomAccessIterator (25.3.5.7), models contiguous_iterator (25.3.4.14), and meets the constexpr iterator requirements (25.3.1), whose value_type is the template parameter charT.

    All requirements on container iterators (24.2) apply to basic_string_view::const_iterator as well.

    constexpr const_iterator begin() const noexcept;
    constexpr const_iterator cbegin() const noexcept;

    Returns: An iterator such that
constexpr const_iterator end() const noexcept;
constexpr const_iterator cend() const noexcept;

Returns: begin() + size().

constexpr const_reverse_iterator rbegin() const noexcept;
constexpr const_reverse_iterator crbegin() const noexcept;

Returns: const_reverse_iterator(end()).

constexpr const_reverse_iterator rend() const noexcept;
constexpr const_reverse_iterator crend() const noexcept;

Returns: const_reverse_iterator(begin()).

23.3.3.5 Capacity [string.view.capacity]

constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

Returns: size_.

constexpr size_type max_size() const noexcept;

Returns: The largest possible number of char-like objects that can be referred to by a basic_string_view.

[[nodiscard]] constexpr bool empty() const noexcept;

Returns: size_ == 0.

23.3.3.6 Element access [string.view.access]

constexpr const_reference operator[](size_type pos) const;

Preconditions: pos < size().

Returns: data_[pos].

Throws: Nothing.

[Note 1: Unlike basic_string::operator[], basic_string_view::operator[](size()) has undefined behavior instead of returning charT. — end note]

constexpr const_reference at(size_type pos) const;

Returns: data_[pos].

Throws: out_of_range if pos >= size().

constexpr const_reference front() const;

Preconditions: !empty().

Returns: data_[0].

Throws: Nothing.

constexpr const_reference back() const;

Preconditions: !empty().

Returns: data_[size() - 1].

Throws: Nothing.

constexpr const_pointer data() const noexcept;

Returns: data_.

[Note 2: Unlike basic_string::data() and string-literals, data() can return a pointer to a buffer that is not null-terminated. Therefore it is typically a mistake to pass data() to a function that takes just a const charT* and expects a null-terminated string. — end note]
23.3.3.7 Modifiers

```cpp
constexpr void remove_prefix(size_type n);
1  Preconditions: n <= size().
2  Effects: Equivalent to: data_ += n; size_ -= n;
```

```cpp
constexpr void remove_suffix(size_type n);
3  Preconditions: n <= size().
4  Effects: Equivalent to: size_ -= n;
```

```cpp
constexpr void swap(basic_string_view& s) noexcept;
5  Effects: Exchanges the values of *this and s.
```

23.3.3.8 String operations

```cpp
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
1  Let rlen be the smaller of n and size() - pos.
2  Preconditions: [s, s + rlen) is a valid range.
3  Effects: Equivalent to traits::copy(s, data() + pos, rlen).
4  Returns: rlen.
5  Throws: out_of_range if pos > size().
6  Complexity: \( \Theta(rlen) \).
```

```cpp
constexpr basic_string_view substr(size_type pos = 0, size_type n = npos) const;
7  Let rlen be the smaller of n and size() - pos.
8  Effects: Determines rlen, the effective length of the string to reference.
9  Returns: basic_string_view(data() + pos, rlen).
10  Throws: out_of_range if pos > size().
```

```cpp
constexpr int compare(basic_string_view str) const noexcept;
11  Let rlen be the smaller of size() and str.size().
12  Effects: Determines rlen, the effective length of the strings to compare. The function then compares
13    the two strings by calling traits::compare(data(), str.data(), rlen).
14  Returns: The nonzero result if the result of the comparison is nonzero. Otherwise, returns a value as
15    indicated in Table 81.
```

Table 81: compare() results

<table>
<thead>
<tr>
<th>Condition</th>
<th>Return Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>size() &lt; str.size()</td>
<td>&lt; 0</td>
</tr>
<tr>
<td>size() == str.size()</td>
<td>0</td>
</tr>
<tr>
<td>size() &gt; str.size()</td>
<td>&gt; 0</td>
</tr>
</tbody>
</table>

```cpp
14  Complexity: \( \Theta(rlen) \).
```

```cpp
constexpr int compare(size_type pos1, size_type n1, basic_string_view str) const;
15  Effects: Equivalent to: return substr(pos1, n1).compare(str);
```

```cpp
constexpr int compare(size_type pos1, size_type n1, basic_string_view str,
16  size_type pos2, size_type n2) const;
17  Effects: Equivalent to: return substr(pos1, n1).compare(str.substr(pos2, n2));
```

```cpp
constexpr int compare(const charT* s) const;
18  Effects: Equivalent to: return compare(basic_string_view(s));
```
constexpr int compare(size_type pos1, size_type n1, const charT* s) const;

Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s));

constexpr int compare(size_type pos1, size_type n1, const charT* s, size_type n2) const;

Effects: Equivalent to: return substr(pos1, n1).compare(basic_string_view(s, n2));

constexpr bool starts_with(basic_string_view x) const noexcept;

Effects: Equivalent to: return substr(0, x.size()) == x;

constexpr bool starts_with(charT x) const noexcept;

Effects: Equivalent to: return !empty() && traits::eq(front(), x);

constexpr bool starts_with(const charT* x) const;

Effects: Equivalent to: returns starts_with(basic_string_view(x));

constexpr bool ends_with(basic_string_view x) const noexcept;

Effects: Equivalent to: return size() >= x.size() && compare(size() - x.size(), npos, x) == 0;

constexpr bool ends_with(charT x) const noexcept;

Effects: Equivalent to: return !empty() && traits::eq(back(), x);

constexpr bool ends_with(const charT* x) const;

Effects: Equivalent to: returns ends_with(basic_string_view(x));

constexpr bool contains(basic_string_view x) const noexcept;

constexpr bool contains(charT x) const noexcept;

constexpr bool contains(const charT* x) const;

Effects: Equivalent to: returns find(x) != npos;

23.3.3.9 Searching
[string.view.find]

Member functions in this subclause have complexity $O(size() \times str.size())$ at worst, although implementations should do better.

Let $F$ be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.

(2.1) Each member function of the form

```cpp
constexpr return-type F(const charT* s, size_type pos) const;
```

has effects equivalent to: return $F(basic_string_view(s), pos)$;

(2.2) Each member function of the form

```cpp
constexpr return-type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: return $F(basic_string_view(s, n), pos)$;

(2.3) Each member function of the form

```cpp
constexpr return-type F(charT c, size_type pos) const noexcept;
```

has effects equivalent to: return $F(basic_string_view(addressof(c), 1), pos)$;

```cpp
constexpr size_type find(basic_string_view str, size_type pos = 0) const noexcept;
```

Let $xpos$ be the lowest position, if possible, such that the following conditions hold:

(3.1) $pos <= xpos$
(3.2) $xpos + str.size() <= size()$
(3.3) traits::eq(at(xpos + I), str.at(I)) for all elements $I$ of the string referenced by str.

Effects: Determines $xpos$.

Returns: $xpos$ if the function can determine such a value for $xpos$. Otherwise, returns npos.
constexpr size_type rfind(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos + str.size() <= size()
- traits::eq(at(xpos + I), str.at(I)) for all elements I of the string referenced by str.

Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_of(basic_string_view str, size_type pos = 0) const noexcept;

Let xpos be the lowest position, if possible, such that the following conditions hold:

- pos <= xpos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.

Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_of(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for some element I of the string referenced by str.

Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_first_not_of(basic_string_view str, size_type pos = 0) const noexcept;

Let xpos be the lowest position, if possible, such that the following conditions hold:

- pos <= xpos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.

Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

constexpr size_type find_last_not_of(basic_string_view str, size_type pos = npos) const noexcept;

Let xpos be the highest position, if possible, such that the following conditions hold:

- xpos <= pos
- xpos < size()
- traits::eq(at(xpos), str.at(I)) for no element I of the string referenced by str.

Effects: Determines xpos.
Returns: xpos if the function can determine such a value for xpos. Otherwise, returns npos.

23.3.4 Non-member comparison functions

Let S be basic_string_view<charT, traits>, and sv be an instance of S. Implementations shall provide sufficient additional overloads marked constexpr and noexcept so that an object t with an implicit conversion to S can be compared according to Table 82.

[Example 1: A sample conforming implementation for operator== would be:

```cpp
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs, basic_string_view<charT, traits> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}
template<class charT, class traits>
constexpr bool operator==(basic_string_view<charT, traits> lhs,
                    type_identity_t<basic_string_view<charT, traits>> rhs) noexcept {
    return lhs.compare(rhs) == 0;
}

2 Returns: lhs.compare(rhs) == 0.

template<class charT, class traits>
constexpr see below operator<=>(basic_string_view<charT, traits> lhs,
                    basic_string_view<charT, traits> rhs) noexcept;

3 Let R denote the type traits::comparison_category if that qualified-id is valid and denotes a
   type (13.10.3), otherwise R is weak_ordering.

4 Mandates: R denotes a comparison category type (17.11.2).

5 Returns: static_cast<R>(lhs.compare(rhs) <=> 0).

### 23.3.5 Inserters and extractors [string.view.io]

```cpp
template<class charT, class traits>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, basic_string_view<charT, traits> str);
```

1 Effects: Behaves as a formatted output function (31.7.6.3.1) of os. Forms a character sequence seq,
   initially consisting of the elements defined by the range [str.begin(), str.end()). Determines padding
   for seq as described in 31.7.6.3.1. Then inserts seq as if by calling os.rdbuf()->sputn(seq, n),
   where n is the larger of os.width() and str.size(); then calls os.width(0).

2 Returns: os

### 23.3.6 Hash support [string.view.hash]

```cpp
template<> struct hash<string_view>;
template<> struct hash<u8string_view>;
template<> struct hash<u16string_view>;
template<> struct hash<u32string_view>;
template<> struct hash<wstring_view>;
```

1 The specialization is enabled (22.10.19).

---

<td>sv &lt;=&gt; S(t)</td>
</tr>
</tbody>
</table>
Note 1: The hash value of a string view object is equal to the hash value of the corresponding string object (23.4.6). — end note

23.3.7 Suffix for basic_string_view literals

constexpr string_view operator"sv(const char* str, size_t len) noexcept;
Returns: string_view{str, len}.

constexpr u8string_view operator"sv(const char8_t* str, size_t len) noexcept;
Returns: u8string_view{str, len}.

constexpr u16string_view operator"sv(const char16_t* str, size_t len) noexcept;
Returns: u16string_view{str, len}.

constexpr u32string_view operator"sv(const char32_t* str, size_t len) noexcept;
Returns: u32string_view{str, len}.

constexpr wstring_view operator"sv(const wchar_t* str, size_t len) noexcept;
Returns: wstring_view{str, len}.

23.4 String classes

23.4.1 General

The header <string> defines the basic_string class template for manipulating varying-length sequences of char-like objects and five typedef-names, string, u8string, u16string, u32string, and wstring, that name the specializations basic_string<char>, basic_string<char8_t>, basic_string<char16_t>, basic_string<char32_t>, and basic_string<wchar_t>, respectively.

23.4.2 Header <string> synopsis

#include <compare>      // see 17.11.1
#include <initializer_list>  // see 17.10.2

namespace std {

    // 23.2, character traits

23.4.3 Class template basic_string

23.4.3.1 General

The class template basic_string describes objects that can store a sequence consisting of a varying number of arbitrary char-like objects with the first element of the sequence at position zero. Such a sequence is also called a “string” if the type of the char-like objects that it holds is clear from context. In the rest of 23.4.3, the type of the char-like objects held in a basic_string object is designated by charT.

A specialization of basic_string is a contiguous container (24.2.2.1).

In all cases, [data().data() + size()] is a valid range, data() + size() points at an object with value charT() (a “null terminator”), and size() <= capacity() is true.

constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;
constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;
constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;
}

template<class InputIterator,  
   class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
basic_string(InputIterator, InputIterator, Allocator = Allocator())  
-> basic_string<typename iterator_traits<InputIterator>::value_type,  
   char_traits<typename iterator_traits<InputIterator>::value_type>,  
   Allocator>;

template<ranges::input_range R,  
   class Allocator = allocator<ranges::range_value_t<R>>>
basic_string(from_range_t, R&&, Allocator = Allocator())  
-> basic_string<ranges::range_value_t<R>, char_traits<ranges::range_value_t<R>>,  
   Allocator>;

template<class charT,  
   class traits,  
   class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits>, const Allocator& = Allocator())  
-> basic_string<charT, traits, Allocator>;

template<class charT,  
   class traits,  
   class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits>,  
   typename see below::size_type, typename see below::size_type,  
   const Allocator& = Allocator())  
-> basic_string<charT, traits, Allocator>;

4 A size_type parameter type in a basic_string deduction guide refers to the size_type member type of the type deduced by the deduction guide.
5 The types iterator and const_iterator meet the constexpr iterator requirements (25.3.1).

23.4.3.2 General requirements [string.require]
1 If any operation would cause size() to exceed max_size(), that operation throws an exception object of type length_error.
2 If any member function or operator of basic_string throws an exception, that function or operator has no other effect on the basic_string object.
3 In every specialization basic_string<charT, traits, Allocator>, the type allocator_traits<Allocator>::value_type shall name the same type as charT. Every object of type basic_string<charT, traits, Allocator> uses an object of type Allocator to allocate and free storage for the contained charT objects as needed. The Allocator object used is obtained as described in 24.2.2.1. In every specialization basic_string<charT, traits, Allocator>, the type traits shall meet the character traits requirements (23.2).
References, pointers, and iterators referring to the elements of a `basic_string` sequence may be invalidated by the following uses of that `basic_string` object:

1. Passing as an argument to any standard library function taking a reference to non-const `basic_string` as an argument.\(^{212}\)
2. Calling non-const member functions, except `operator[]`, `at`, `data`, `front`, `back`, `begin`, `rbegin`, `end`, and `rend`.

### 23.4.3.3 Constructors and assignment operators

```cpp
constexpr explicit basic_string(const Allocator& a) noexcept;
```

**Postconditions:** `size()` is equal to 0.

```cpp
constexpr basic_string(const basic_string& str);
constexpr basic_string(basic_string&& str) noexcept;
```

**Effects:** Constructs an object whose value is that of `str` prior to this call.

**Remarks:** In the second form, `str` is left in a valid but unspecified state.

```cpp
constexpr basic_string(const basic_string& str, size_type pos, const Allocator& a = Allocator());
```

**Let**

1. `s` be the value of `str` prior to this call and
2. `rlen` be `pos + min(n, s.size() - pos)` for the overloads with parameter `n`, and `s.size()` otherwise.

**Effects:** Constructs an object whose initial value is the range `[s.data() + pos, s.data() + rlen)`.

**Throws:** `out_of_range` if `pos > s.size()`.

**Remarks:** For the overloads with a `basic_string&&` parameter, `str` is left in a valid but unspecified state.

**Recommended practice:** For the overloads with a `basic_string&&` parameter, implementations should avoid allocation if `s.get_allocator() == a` is true.

```cpp
template<class T>
constexpr basic_string(const T& t, size_type pos, size_type n, const Allocator& a = Allocator());
```

**Constraints:** `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true.

**Effects:** Creates a variable, `sv`, as if by `basic_string_view<charT, traits> sv = t`; and then behaves the same as:

`basic_string(sv.substr(pos, n), a);`

```cpp
template<class T>
constexpr explicit basic_string(const T& t, const Allocator& a = Allocator());
```

**Constraints:**

1. `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and
2. `is_convertible_v<const T&, const charT*>` is false.

---

\(^{212}\) For example, as an argument to non-member functions `swap()` (23.4.4.3), `operator>>()` (23.4.4.4), and `getline()` (23.4.4.4), or as an argument to `basic_string::swap()`.
```cpp
12  Effects: Creates a variable, sv, as if by `basic_string_view<charT, traits> sv = t;` and then behaves the same as `basic_string(sv.data(), sv.size(), a).

constexpr basic_string(const charT* s, size_type n, const Allocator& a = Allocator());

13  Preconditions: `[s, s + n)` is a valid range.
14  Effects: Constructs an object whose initial value is the range `[s, s + n)`.
15  Postconditions: `size()` is equal to `n`, and `traits::compare(data(), s, n)` is equal to 0.

constexpr basic_string(const charT* s, const Allocator& a = Allocator());

16  Constraints: `Allocator` is a type that qualifies as an allocator (24.2.2.1).
[Note 1: This affects class template argument deduction. — end note]
17  Effects: Equivalent to: `basic_string(s, traits::length(s), a).`

constexpr basic_string(size_type n, charT c, const Allocator& a = Allocator());

18  Constraints: `Allocator` is a type that qualifies as an allocator (24.2.2.1).
[Note 2: This affects class template argument deduction. — end note]
19  Effects: Constructs an object whose value consists of `n` copies of `c`.

template<class InputIterator>
constexpr basic_string(InputIterator begin, InputIterator end, const Allocator& a = Allocator());

20  Constraints: `InputIterator` is a type that qualifies as an input iterator (24.2.2.1).
21  Effects: Constructs a string from the values in the range `[begin, end)`, as specified in 24.2.4.

template<container-compatible-range<charT> R>
constexpr basic_string(from_range_t<R>&& rg, const Allocator& = Allocator());

22  Effects: Constructs a string from the values in the range `rg`, as specified in 24.2.4.

constexpr basic_string(initializer_list<charT> il, const Allocator& a = Allocator());

23  Effects: Equivalent to `basic_string(il.begin(), il.end(), a).`

constexpr basic_string(const basic_string& str, const Allocator& alloc);
constexpr basic_string(basic_string&& str, const Allocator& alloc);

24  Effects: Constructs an object whose value is that of `str` prior to this call. The stored allocator is constructed from `alloc`. In the second form, `str` is left in a valid but unspecified state.

    Throws: The second form throws nothing if `alloc == str.get_allocator()`.

template<class InputIterator, class Allocator = allocator<typename iterator_traits<InputIterator>::value_type>>
basic_string(InputIterator, InputIterator, Allocator = Allocator())
    -> basic_string<typename iterator_traits<InputIterator>::value_type, char_traits<typename iterator_traits<InputIterator>::value_type>, Allocator>;

25  Constraints: `InputIterator` is a type that qualifies as an input iterator, and `Allocator` is a type that qualifies as an allocator (24.2.2.1).

template<class charT, class traits, class Allocator = allocator<charT>>
explicit basic_string(basic_string_view<charT, traits> sv, const Allocator& = Allocator())
    -> basic_string<charT, traits, Allocator>;

template<class charT, class traits, class Allocator = allocator<charT>>
basic_string(basic_string_view<charT, traits> sv, typename see below::size_type,
    typename see below::size_type, const Allocator& = Allocator())
```
 Constraints: Allocator is a type that qualifies as an allocator (24.2.2.1).

** constexpr basic_string& operator=(const basic_string& str);**

*Effects:* If *this and str are the same object, has no effect. Otherwise, replaces the value of *this with a copy of str.
*Returns:* *this.

** constexpr basic_string& operator=(basic_string&& str)**

*noexcept(allocation_traits<Allocator>::propagate_on_container_move_assignment::value ||
allocator_traits<Allocator>::is_always_equal::value);*

*Effects:* Move assigns as a sequence container (24.2), except that iterators, pointers and references may be invalidated.
*Returns:* *this.

**template<class T>*

** constexpr basic_string& operator=(const T& t);**

*Constraints:*

— is_convertible_v<const T& basic_string_view<charT, traits>> is true and
— is_convertible_v<const T& const charT>> is false.

*Effects:* Equivalent to:

basic_string_view<charT, traits> sv = t;
return assign(sv);

** constexpr basic_string& operator=(const charT* s);**

*Effects:* Equivalent to:

return *this = basic_string_view<charT, traits>(s);

** constexpr basic_string& operator=(charT c);**

*Effects:* Equivalent to:

return *this = basic_string_view<charT, traits>(addressof(c), 1);

** constexpr basic_string& operator=(initializer_list<charT> il);**

*Effects:* Equivalent to:

return *this = basic_string_view<charT, traits>(il.begin(), il.size());

### 23.4.3.4 Iterator support

**constexpr iterator begin() noexcept;**
**constexpr const_iterator begin() const noexcept;**
**constexpr const_iterator cbegin() const noexcept;**

*Returns:* An iterator referring to the first character in the string.

**constexpr iterator end() noexcept;**
**constexpr const_iterator end() const noexcept;**
**constexpr const_iterator cend() const noexcept;**

*Returns:* An iterator which is the past-the-end value.

**constexpr reverse_iterator rbegin() noexcept;**
**constexpr const_reverse_iterator rbegin() const noexcept;**
**constexpr const_reverse_iterator crbegin() const noexcept;**

*Returns:* An iterator which is semantically equivalent to reverse_iterator(end()).

**constexpr reverse_iterator rend() noexcept;**
**constexpr const_reverse_iterator rend() const noexcept;**
**constexpr const_reverse_iterator crend() const noexcept;**

*Returns:* An iterator which is semantically equivalent to reverse_iterator(begin()).

§ 23.4.3.4
23.4.3.5 Capacity

```cpp
constexpr size_type size() const noexcept;
constexpr size_type length() const noexcept;

Returns: A count of the number of char-like objects currently in the string.
Complexity: Constant time.
```

```cpp
constexpr size_type max_size() const noexcept;

Returns: The largest possible number of char-like objects that can be stored in a basic_string.
Complexity: Constant time.
```

```cpp
constexpr void resize(size_type n, charT c);

Effects: Alters the value of *this as follows:
(5.1) If n <= size(), erases the last size() - n elements.
(5.2) If n > size(), appends n - size() copies of c.
```

```cpp
constexpr void resize(size_type n);

Effects: Equivalent to resize(n, charT()).
```

```cpp
template<class Operation> constexpr void resize_and_overwrite(size_type n, Operation op);

Let
(7.1) o = size() before the call to resize_and_overwrite.
(7.2) k be min(o, n).
(7.3) p be a charT*, such that the range [p, p + n] is valid and this->compare(0, k, p, k) == 0 is true before the call. The values in the range [p + k, p + n] may be indeterminate (6.7.4).
(7.4) OP be the expression std::move(op)(p, n).
(7.5) r = OP.

Mandates: OP has an integer-like type (25.3.4.4).

Preconditions:
(9.1) OP does not throw an exception or modify p or n.
(9.2) r ≥ 0.
(9.3) r ≤ n.
(9.4) After evaluating OP there are no indeterminate values in the range [p, p + r].

Effects: Evaluates OP, replaces the contents of *this with [p, p + r], and invalidates all pointers and references to the range [p, p + n].

Recommended practice: Implementations should avoid unnecessary copies and allocations by, for example, making p a pointer into internal storage and by restoring *(p + r) to charT() after evaluating OP.
```

```cpp
constexpr size_type capacity() const noexcept;

Returns: The size of the allocated storage in the string.
Complexity: Constant time.
```

```cpp
constexpr void reserve(size_type res_arg);

Effects: A directive that informs a basic_string of a planned change in size, so that the storage allocation can be managed accordingly. After reserve(), capacity() is greater or equal to the argument of reserve if reallocation happens; and equal to the previous value of capacity() otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of reserve().

Throws: length_error if res_arg > max_size() or any exceptions thrown by allocator_traits<Allocator>::allocate.
constexpr void shrink_to_fit();

Effects: `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[Note 1: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation.

Complexity: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 2: If no reallocation happens, they remain valid. — end note]

customexpr void clear() noexcept;

Effects: Equivalent to: `erase(begin(), end());`

[[nodiscard]] constexpr bool empty() const noexcept;

Effects: Equivalent to: `return size() == 0;`

### 23.4.3.6 Element access

```cpp
constexpr const_reference operator[](size_type pos) const;
customexpr reference operator[](size_type pos);
```

1 Preconditions: `pos <= size()`.

2 Returns: `*(begin() + pos)` if `pos < size()`. Otherwise, returns a reference to an object of type `charT` with value `charT()`, where modifying the object to any value other than `charT()` leads to undefined behavior.

3 Throws: Nothing.

Complexity: Constant time.

```cpp
constexpr const_reference at(size_type pos) const;
customexpr reference at(size_type pos);
```

5 Returns: `operator[](pos)`.

6 Throws: `out_of_range` if `pos >= size()`.

```cpp
constexpr const charT& front() const;
customexpr charT& front();
```

7 Preconditions: `!empty()`.

8 Effects: Equivalent to: `return operator[](0);`

```cpp
constexpr const charT& back() const;
customexpr charT& back();
```

9 Preconditions: `!empty()`.

10 Effects: Equivalent to: `return operator[](size() - 1);`

### 23.4.3.7 Modifiers

#### 23.4.3.7.1 basic_string::operator+=

```cpp
constexpr basic_string& operator+=(const basic_string& str);
```

1 Effects: Equivalent to: `return append(str);`

```cpp
template<class T>
constexpr basic_string& operator+=(const T& t);
```

2 Constraints:

(2.1) — `is_convertible_v<const T&, basic_string_view<charT, traits>>` is true and

(2.2) — `is_convertible_v<const T&, const charT*>` is false.
```cpp
constexpr basic_string& operator+=(const T& t);
Constraints:
— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.
Effects: Equivalent to:
  basic_string_view<charT, traits> sv = t;
  return append(sv.data(), sv.size());

template<class T>
constexpr basic_string& append(const T& t, size_type pos, size_type n = npos);
Constraints:
— is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
— is_convertible_v<const T&, const charT*> is false.
Effects: Equivalent to:
  basic_string_view<charT, traits> sv = t;
  return append(sv.data(), sv.size());
constexpr basic_string& append(const charT* s, size_type n);
Preconditions: [s, s + n) is a valid range.
Effects: Appends a copy of the range [s, s + n) to the string.
Returns: *this.
constexpr basic_string& append(const charT* s);
Effects: Equivalent to: return append(s, traits::length(s));
constexpr basic_string& append(size_type n, charT c);
Effects: Appends n copies of c to the string.
Returns: *this.
template<class InputIterator>
constexpr basic_string& append(InputIterator first, InputIterator last);
Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).```
Effects: Equivalent to: return append(basic_string(first, last, get_allocator()));

template<container-compatible-range<charT> R>
constexpr basic_string& append_range(R&& rg);

Effects: Equivalent to: return append(basic_string(from_range, std::forward<R>(rg), get_allocator()));

constexpr basic_string& append(initializer_list<charT> il);

Effects: Equivalent to: return append(il.begin(), il.size());

constexpr void push_back(charT c);

Effects: Equivalent to: append(size_type{1}, c).

23.4.3.7.3 basic_string::assign

constexpr basic_string& assign(const basic_string& str);

Effects: Equivalent to: return *this = str;

constexpr basic_string& assign(basic_string&& str) noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value || allocator_traits<Allocator>::is_always_equal::value);

Effects: Equivalent to: return *this = std::move(str);

constexpr basic_string& assign(const basic_string& str, size_type pos, size_type n = npos);

Effects: Equivalent to:

   return assign(basic_string_view<charT, traits>(str).substr(pos, n));

template<class T>
constexpr basic_string& assign(const T& t);

Constraints:

(4.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(4.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

   basic_string_view<charT, traits> sv = t;
   return assign(sv.data(), sv.size());

template<class T>
constexpr basic_string& assign(const T& t, size_type pos, size_type n = npos);

Constraints:

(6.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(6.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

   basic_string_view<charT, traits> sv = t;
   return assign(sv.substr(pos, n));

constexpr basic_string& assign(const charT* s, size_type n);

 Preconditions: [s, s + n) is a valid range.

Effects: Replaces the string controlled by *this with a copy of the range [s, s + n).

Returns: *this.

constexpr basic_string& assign(const charT* s);

Effects: Equivalent to: return assign(s, traits::length(s));

constexpr basic_string& assign(initializer_list<charT> il);

Effects: Equivalent to: return assign(il.begin(), il.size());
```cpp
constexpr basic_string& assign(size_type n, charT c);

Effects: Equivalent to:
        clear();
        resize(n, c);
        return *this;

```template<class InputIterator>
constexpr basic_string& assign(InputIterator first, InputIterator last);

Constraints: InputIterator is a type that qualifies as an input iterator (24.2.2.1).
Effects: Equivalent to: return assign(basic_string(first, last, get_allocator()));

```template<container-compatible-range<charT> R>
constexpr basic_string& assign_range(R&& rg);
```

Effects: Equivalent to: return assign(basic_string(from_range, std::forward<R>(rg), get_allocator()));

```23.4.3.7.4 basic_string::insert
```

```template<class T>
constexpr basic_string& insert(size_type pos, const basic_string& str);

Effects: Equivalent to: return insert(pos, str.data(), str.size());
```

```template<class T>
constexpr basic_string& insert(size_type pos1, const basic_string& str, size_type pos2, size_type n = npos);
```

Effects: Equivalent to:
        return insert(pos1, basic_string_view<charT, traits>(str), pos2, n);

```template<class T>
constexpr basic_string& insert(size_type pos, const T& t);
```

Constraints:
(3.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(3.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
        basic_string_view<charT, traits> sv = t;
        return insert(pos, sv.data(), sv.size());

```template<class T>
constexpr basic_string& insert(size_type pos1, const T& t, size_type pos2, size_type n = npos);
```

Constraints:
(5.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and
(5.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:
        basic_string_view<charT, traits> sv = t;
        return insert(pos1, sv.substr(pos2, n));

```constexpr basic_string& insert(size_type pos, const charT* s, size_type n);
```

Preconditions: [s, s + n) is a valid range.
Effects: Inserts a copy of the range [s, s + n) immediately before the character at position pos if pos < size(), or otherwise at the end of the string.
Returns: *this.

Throws:
(10.1) out_of_range if pos > size(),
(10.2) length_error if n > max_size() - size(), or
(10.3) any exceptions thrown by allocator_traits<Allocator>::allocate.
constexpr basic_string& insert(size_type pos, const charT* s);

**Effects:** Equivalent to: return insert(pos, s, traits::length(s));

constexpr basic_string& insert(size_type pos, size_type n, charT c);

**Effects:** Inserts n copies of c before the character at position pos if pos < size(), or otherwise at the end of the string.

**Returns:** *this

**Throws:**

1. out_of_range if pos > size(),
2. length_error if n > max_size() - size(), or
3. any exceptions thrown by allocator_traits<Allocator>::allocate.

constexpr iterator insert(const_iterator p, charT c);

**Preconditions:** p is a valid iterator on *this.

**Effects:** Inserts a copy of c at the position p.

**Returns:** An iterator which refers to the inserted character.

constexpr iterator insert(const_iterator p, size_type n, charT c);

**Preconditions:** p is a valid iterator on *this.

**Effects:** Inserts n copies of c at the position p.

**Returns:** An iterator which refers to the first inserted character, or p if n == 0.

template<class InputIterator>
constexpr iterator insert(const_iterator p, InputIterator first, InputIterator last);

**Constraints:** InputIterator is a type that qualifies as an input iterator (24.2.2.1).

**Preconditions:** p is a valid iterator on *this.

**Effects:** Equivalent to insert(p - begin(), basic_string(first, last, get_allocator())).

**Returns:** An iterator which refers to the first inserted character, or p if first == last.

template<container-compatible-range<charT> R>
constexpr iterator insert_range(const_iterator p, R&& rg);

**Preconditions:** p is a valid iterator on *this.

**Effects:** Equivalent to insert(p - begin(), basic_string(from_range, std::forward<R>(rg), get_allocator())).

**Returns:** An iterator which refers to the first inserted character, or p if rg is empty.

constexpr iterator insert(const_iterator p, initializer_list<charT> il);

**Effects:** Equivalent to: return insert(p, il.begin(), il.end());

23.4.3.7.5 `basic_string::erase` [string.erase]

constexpr basic_string& erase(size_type pos = 0, size_type n = npos);

**Effects:** Determines the effective length xlen of the string to be removed as the smaller of n and size() - pos. Removes the characters in the range [begin() + pos, begin() + pos + xlen).

**Returns:** *this.

**Throws:** out_of_range if pos > size().

constexpr iterator erase(const_iterator p);

**Preconditions:** p is a valid dereferenceable iterator on *this.

**Effects:** Removes the character referred to by p.

**Returns:** An iterator which points to the element immediately following p prior to the element being erased. If no such element exists, end() is returned.
Throws: Nothing.

constexpr iterator erase(const_iterator first, const_iterator last);

Preconditions: first and last are valid iterators on *this. [first, last) is a valid range.

Effects: Removes the characters in the range [first, last).

Returns: An iterator which points to the element pointed to by last prior to the other elements being erased. If no such element exists, end() is returned.

Throws: Nothing.

constexpr void pop_back();

Preconditions: !empty().

Effects: Equivalent to erase(end() - 1).

Throws: Nothing.

23.4.3.7.6  basic_string::replace

constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str);

Effects: Equivalent to: return replace(pos1, n1, str.data(), str.size());

constexpr basic_string& replace(size_type pos1, size_type n1, const basic_string& str,
size_type pos2, size_type n2 = npos);

Effects: Equivalent to:

return replace(pos1, n1, basic_string_view<charT, traits>(str).substr(pos2, n2));

template<class T>
constexpr basic_string& replace(size_type pos1, size_type n1, const T& t);

Constraints:

(3.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(3.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.data(), sv.size());

template<class T>
constexpr basic_string& replace(size_type pos1, size_type n1, const T& t,
size_type pos2, size_type n2 = npos);

Constraints:

(5.1) is_convertible_v<const T&, basic_string_view<charT, traits>> is true and

(5.2) is_convertible_v<const T&, const charT*> is false.

Effects: Equivalent to:

basic_string_view<charT, traits> sv = t;
return replace(pos1, n1, sv.substr(pos2, n2));

constexpr basic_string& replace(size_type pos1, size_type n1, const charT* s, size_type n2);

Preconditions: [s, s + n2) is a valid range.

Effects: Determines the effective length xlen of the string to be removed as the smaller of n1 and size() - pos1. If size() - xlen >= max_size() - n2 throws length_error. Otherwise, the function replaces the characters in the range [begin() + pos1, begin() + pos1 + xlen) with a copy of the range [s, s + n2).

Returns: *this.

Throws:

(10.1) out_of_range if pos1 > size(),

(10.2) length_error if the length of the resulting string would exceed max_size(), or

§ 23.4.3.7.6
any exceptions thrown by \texttt{allocator_traits<Allocator>::allocate}.\

\begin{verbatim}
constexpr basic_string& replace(size_type pos, size_type n, const charT* s);

\textit{Effects}: Equivalent to: \texttt{return replace(pos, n, s, traits::length(s));}
\end{verbatim}

\begin{verbatim}
constexpr basic_string& replace(size_type pos1, size_type n1, size_type n2, charT c);

\textit{Effects}: Determines the effective length \texttt{xlen} of the string to be removed as the smaller of \texttt{n1} and \texttt{size()} - \texttt{pos1}. If \texttt{size()} - \texttt{xlen} >= \texttt{max_size()} - \texttt{n2} throws \texttt{length_error}. Otherwise, the function replaces the characters in the range \texttt{[begin() + pos1, begin() + pos1 + xlen]} with \texttt{n2} copies of \texttt{c}.

\textit{Returns}: \texttt{*this}.
\end{verbatim}

\begin{verbatim}
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const basic_string& str);

\textit{Effects}: Equivalent to: \texttt{return replace(i1, i2, basic_string_view<charT, traits>(str));}
\end{verbatim}

\begin{verbatim}
template<class T>
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const T& t);

\textit{Constraints}:
\begin{itemize}
\item \texttt{is_convertible_v<const T&, basic_string_view<charT, traits>>} is true and
\item \texttt{is_convertible_v<const T&, const charT*}} is false.
\end{itemize}

\textit{Preconditions}: \texttt{[begin(), i1)} and \texttt{[i1, i2)} are valid ranges.
\end{verbatim}

\begin{verbatim}
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s, size_type n);

\textit{Effects}: Equivalent to: \texttt{return replace(i1, i2, basic_string_view<charT, traits>(s, n));}
\end{verbatim}

\begin{verbatim}
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const charT* s);

\textit{Effects}: Equivalent to: \texttt{return replace(i1, i2, basic_string_view<charT, traits>(s));}
\end{verbatim}

\begin{verbatim}
constexpr basic_string& replace(const_iterator i1, const_iterator i2, const_iterator i2, const basic_string& str);

\textit{Effects}: Equivalent to: \texttt{return replace(i1, i2, basic_string_view<charT, traits>(str));}
\end{verbatim}

\begin{verbatim}
template<class InputIterator>
constexpr basic_string& replace(const_iterator i1, const_iterator i2, InputIterator j1, InputIterator j2);

\textit{Constraints}: \texttt{InputIterator} is a type that qualifies as an input iterator (24.2.2.1).
\end{verbatim}

\begin{verbatim}
constexpr basic_string& replace(const_iterator i1, const_iterator i2, initializer_list<charT> il);

\textit{Effects}: Equivalent to: \texttt{return replace(i1, i2, il.begin(), il.size());}
\end{verbatim}
23.4.3.7.7 basic_string::copy

```cpp
constexpr size_type copy(charT* s, size_type n, size_type pos = 0) const;
```

**Effects**: Equivalent to: return basic_string_view<charT, traits>(*this).copy(s, n, pos);

[Note 1: This does not terminate s with a null object. — end note]

23.4.3.7.8 basic_string::swap

```cpp
constexpr void swap(basic_string& s) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
   allocator_traits<Allocator>::is_always_equal::value);
```

**Preconditions**: allocator_traits< Allocator >::propagate_on_container_swap::value is true or get_allocator() == s.get_allocator().

**Postconditions**: *this contains the same sequence of characters that was in s, s contains the same sequence of characters that was in *this.

**Throws**: Nothing.

**Complexity**: Constant time.

23.4.3.8 String operations

23.4.3.8.1 Accessors

```cpp
constexpr const charT* c_str() const noexcept;
constexpr const charT* data() const noexcept;
```

**Returns**: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].

**Complexity**: Constant time.

**Remarks**: The program shall not modify any of the values stored in the character array; otherwise, the behavior is undefined.

```cpp
constexpr charT* data() noexcept;
```

**Returns**: A pointer p such that p + i == addressof(operator[](i)) for each i in [0, size()].

**Complexity**: Constant time.

**Remarks**: The program shall not modify the value stored at p + size() to any value other than charT(); otherwise, the behavior is undefined.

```cpp
constexpr operator basic_string_view<charT, traits>() const noexcept;
```

**Effects**: Equivalent to: return basic_string_view<charT, traits>(data(), size());

```cpp
constexpr allocator_type get_allocator() const noexcept;
```

**Returns**: A copy of the Allocator object used to construct the string or, if that allocator has been replaced, a copy of the most recent replacement.

23.4.3.8.2 Searching

**Let F be one of find, rfind, find_first_of, find_last_of, find_first_not_of, and find_last_not_of.**

(1.1) — Each member function of the form

```cpp
constexpr size_type F(const basic_string& str, size_type pos) const noexcept;
```

has effects equivalent to: return F(basic_string_view<charT, traits>(str), pos);

(1.2) — Each member function of the form

```cpp
constexpr size_type F(const charT* s, size_type pos) const;
```

has effects equivalent to: return F(basic_string_view<charT, traits>(s), pos);

(1.3) — Each member function of the form

```cpp
constexpr size_type F(const charT* s, size_type pos, size_type n) const;
```

has effects equivalent to: return F(basic_string_view<charT, traits>(s, n), pos);
(1.4) Each member function of the form

```cpp
constexpr size_type \( F(\text{charT} \ c, \text{size_type} \ pos) \) const noexcept;
```

has effects equivalent to:

```cpp
return \( F(\text{basic_string_view<\text{charT}, \traits>(}\text{addressof(c)}, 1), \pos) \);
```

```cpp
template<class T>
constexpr size_type find(const T& t, \text{size_type} pos = 0) \text{const noexcept(see below)};
```

```cpp
template<class T>
constexpr size_type rfind(const T& t, \text{size_type} pos = \npos) \text{const noexcept(see below)};
```

```cpp
template<class T>
constexpr size_type find_first_of(const T& t, \text{size_type} pos = 0) \text{const noexcept(see below)};
```

```cpp
template<class T>
constexpr size_type find_last_of(const T& t, \text{size_type} pos = \npos) \text{const noexcept(see below)};
```

```cpp
template<class T>
constexpr size_type find_first_not_of(const T& t, \text{size_type} pos = 0) \text{const noexcept(see below)};
```

```cpp
template<class T>
constexpr size_type find_last_not_of(const T& t, \text{size_type} pos = \npos) \text{const noexcept(see below)};
```

2 Constraints:

(2.1) \text{is\_convertible\_v<\text{const T}&, \text{basic\_string\_view<\text{charT}, \traits>}} \text{is true and}

(2.2) \text{is\_convertible\_v<\text{const T}&, \text{const charT}>} \text{is false.}

3 Effects: Let \( G \) be the name of the function. Equivalent to:

```cpp
\text{basic\_string\_view<\text{charT}, \traits> s = \text{this}, sv = t; return s.} G(\text{sv}, \text{pos});
```

4 Remarks: The exception specification is equivalent to \text{is\_nothrow\_convertible\_v<\text{const T}&, \text{basic\_string\_view<\text{charT}, \traits>}}.

23.4.3.8.3 basic\_string::substr

```cpp
constexpr \text{basic\_string} substr(\text{size_type} pos = 0, \text{size_type} n = \npos) \text{const &;}
```

Effects: Equivalent to: \text{return basic\_string(**this, pos, n);}.

```cpp
constexpr \text{basic\_string} substr(\text{size_type} pos = 0, \text{size_type} n = \npos) \&\&;
```

Effects: Equivalent to: \text{return basic\_string(std::move(**this), pos, n);}.

23.4.3.8.4 basic\_string::compare

```cpp
template<class T>
constexpr int compare(const T& t) \text{const noexcept(see below);};
```

```cpp
template<class T>
constexpr int compare(size_type pos1, \text{size_type} n1, const T& t) \text{const;}
```

4 Constraints:

(4.1) \text{is\_convertible\_v<\text{const T}&, \text{basic\_string\_view<\text{charT}, \traits>}} \text{is true and}

(4.2) \text{is\_convertible\_v<\text{const T}&, \text{const charT}>} \text{is false.}

5 Effects: Equivalent to:

```cpp
\text{return basic\_string\_view<\text{charT}, \traits>(**this).} substr(pos1, n1).compare(t);
```
template<class T>
    constexpr int compare(size_type pos1, size_type n1, const T& t,
        size_type pos2, size_type n2 = npos) const;

Constraints:

— is_convertible_v<const T& basic_string_view<charT, traits>> is true and

— is_convertible_v<const T& const charT*> is false.

Effects: Equivalent to:

    basic_string_view<charT, traits> x = *this, y = t;
    return x.substr(pos1, n1).compare(y.substr(pos2, n2));

constexpr int compare(const basic_string& str) const noexcept;

Effects: Equivalent to:

    return compare(basic_string_view<charT, traits>(str));

constexpr int compare(size_type pos1, size_type n1, const basic_string& str) const;

Effects: Equivalent to:

    return compare(pos1, n1, basic_string_view<charT, traits>(str));

constexpr int compare(size_type pos1, size_type n1, const basic_string& str,
                      size_type pos2, size_type n2 = npos) const;

Effects: Equivalent to:

    return compare(pos1, n1, basic_string_view<charT, traits>(str), pos2, n2);

constexpr int compare(const charT* s) const;

Effects: Equivalent to:

    return compare(basic_string_view<charT, traits>(s));

constexpr int compare(size_type pos, size_type n1, const charT* s) const;

Effects: Equivalent to:

    return compare(pos, n1, basic_string_view<charT, traits>(s));

constexpr int compare(size_type pos, size_type n1, const charT* s, size_type n2) const;

Effects: Equivalent to:

    return compare(pos, n1, basic_string_view<charT, traits>(s, n2));

23.4.3.8.5 basic_string::starts_with

constexpr bool starts_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool starts_with(charT x) const noexcept;
constexpr bool starts_with(const charT* x) const;

Effects: Equivalent to:

    return basic_string_view<charT, traits>(data(), size()).starts_with(x);

23.4.3.8.6 basic_string::ends_with

constexpr bool ends_with(basic_string_view<charT, traits> x) const noexcept;
constexpr bool ends_with(charT x) const noexcept;
constexpr bool ends_with(const charT* x) const;

Effects: Equivalent to:

    return basic_string_view<charT, traits>(data(), size()).ends_with(x);

23.4.3.8.7 basic_string::contains

constexpr bool contains(basic_string_view<charT, traits> x) const noexcept;
constexpr bool contains(charT x) const noexcept;
constexpr bool contains(const charT* x) const;

Effects: Equivalent to:

    return basic_string_view<charT, traits>(data(), size()).contains(x);
23.4.4 Non-member functions

23.4.4.1 operator+

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
          const basic_string<charT, traits, Allocator>& rhs);

Effects: Equivalent to:
          basic_string<charT, traits, Allocator> r = lhs;
          r.append(rhs);
          return r;
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, const charT* rhs);

Effects: Equivalent to:
          lhs.append(rhs);
          return std::move(lhs);
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs,
          const basic_string<charT, traits, Allocator>& rhs);

Effects: Equivalent to:
          lhs.append(rhs);
          return std::move(lhs);
```

except that both `lhs` and `rhs` are left in valid but unspecified states.

[Note 1: If `lhs` and `rhs` have equal allocators, the implementation can move from either. — end note]

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs,
          basic_string<charT, traits, Allocator>&& rhs);

Effects: Equivalent to:
          rhs.insert(0, lhs);
          return std::move(rhs);
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(const charT* lhs, basic_string<charT, traits, Allocator>&& rhs);

Effects: Equivalent to:
          basic_string<charT, traits, Allocator> r = rhs;
          r.insert(0, lhs);
          return r;
```

```cpp
template<class charT, class traits, class Allocator>
constexpr basic_string<charT, traits, Allocator>
operator+(charT lhs, const basic_string<charT, traits, Allocator>& rhs);

Effects: Equivalent to:
```
basic_string<
  charT, traits, Allocator> r = rhs;
  r.insert(r.begin(), lhs);
  return r;

template<class charT, class traits, class Allocator>
constexpr basic_string<
  charT, traits, Allocator> operator+(charT lhs, basic_string<
  charT, traits, Allocator>&& rhs);

Effects: Equivalent to:
  rhs.insert(rhs.begin(), lhs);
  return std::move(rhs);

template<class charT, class traits, class Allocator>
operator+(const basic_string<charT, traits, Allocator>& lhs, charT rhs);

Effects: Equivalent to:
  basic_string<charT, traits, Allocator> r = lhs;
  r.push_back(rhs);
  return r;

template<class charT, class traits, class Allocator>
operator+(basic_string<charT, traits, Allocator>&& lhs, charT rhs);

Effects: Equivalent to:
  lhs.push_back(rhs);
  return std::move(lhs);

23.4.4.2 Non-member comparison operator functions

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
  const basic_string<charT, traits, Allocator>& rhs) noexcept;

template<class charT, class traits, class Allocator>
constexpr bool operator==(const basic_string<charT, traits, Allocator>& lhs,
  const charT* rhs);

Effects: Let \( \text{op} \) be the operator. Equivalent to:
  return basic_string_view<charT, traits>(lhs) \( \text{op} \)
  basic_string_view<charT, traits>(rhs);

23.4.4.3 swap

template<class charT, class traits, class Allocator>
constexpr void swap(basic_string<charT, traits, Allocator>& lhs,
  basic_string<charT, traits, Allocator>& rhs)
  noexcept(noexcept(lhs.swap(rhs)));

Effects: Equivalent to \( \text{lhs} \).\( \text{swap} \)(\( \text{rhs} \)).

23.4.4.4 Inserters and extractors

template<class charT, class traits, class Allocator>
basic_istream<charT, traits>& operator>>(
  basic_istream<charT, traits>& is, basic_string<charT, traits, Allocator>& str);

Effects: Behaves as a formatted input function (31.7.5.3.1). After constructing a
sentry object, if the sentry object returns true when converted to a value of type bool,
calls str.erase() and then

§ 23.4.4.4
extracts characters from is and appends them to str as if by calling str.append(1, c). If is.width() is greater than zero, the maximum number n of characters appended is is.width(); otherwise n is str.max_size(). Characters are extracted and appended until any of the following occurs:

1. n characters are stored;
2. end-of-file occurs on the input sequence;
3. isspace(c, is.getloc()) is true for the next available input character c.

After the last character (if any) is extracted, is.width(0) is called and the sentry object is destroyed.

If the function extracts no characters, ios_base::failbit is set in the input function’s local error state before setstate is called.

Returns: is.

template<class charT, class traits, class Allocator>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os,
const basic_string<charT, traits, Allocator>& str);

Effects: Equivalent to: return os << basic_string_view<charT, traits>(str);

Returns: is.

23.4.4.5 Erasure [string.erase]

template<class charT, class traits, class Allocator, class U>
constexpr typename basic_string<charT, traits, Allocator>::size_type
§ 23.4.4.5 863
erase(basic_string<charT, traits, Allocator>& c, const U& value);

Effects: Equivalent to:
  auto it = remove(c.begin(), c.end(), value);
  auto r = distance(it, c.end());
  c.erase(it, c.end());
  return r;

template<class charT, class traits, class Allocator, class Predicate>
constexpr typename basic_string<charT, traits, Allocator>::size_type
erase_if(basic_string<charT, traits, Allocator>& c, Predicate pred);

Effects: Equivalent to:
  auto it = remove_if(c.begin(), c.end(), pred);
  auto r = distance(it, c.end());
  c.erase(it, c.end());
  return r;

23.4.5 Numeric conversions

int stoi(const string& str, size_t* idx = nullptr, int base = 10);
long stol(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const string& str, size_t* idx = nullptr, int base = 10);
long long stoll(const string& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const string& str, size_t* idx = nullptr, int base = 10);

Effects: The first two functions call strtol(str.c_str(), ptr, base), and the last three functions call
strtohl(str.c_str(), ptr, base), strtohl(str.c_str(), ptr, base), and strtohll(str.c_str(), ptr, base), respectively. Each function returns the converted result, if any. The argument
ptr designates a pointer to an object internal to the function that is used to determine what to store
at *idx. If the function does not throw an exception and idx != nullptr, the function stores in *idx
the index of the first unconverted element of str.

Returns: The converted result.

Throws: invalid_argument if strtol, strtohl, strtohll, or strtohll reports that no conversion can
be performed. Throws out_of_range if strtol, strtohl, strtohll or strtohll sets errno to ERANGE,
or if the converted value is outside the range of representable values for the return type.

float stof(const string& str, size_t* idx = nullptr);
double std(const string& str, size_t* idx = nullptr);
long double stdl(const string& str, size_t* idx = nullptr);

Effects: These functions call strtof(str.c_str(), ptr), strtod(str.c_str(), ptr), and strtohl(
str.c_str(), ptr), respectively. Each function returns the converted result, if any. The argument
ptr designates a pointer to an object internal to the function that is used to determine what to store
at *idx. If the function does not throw an exception and idx != nullptr, the function stores in *idx
the index of the first unconverted element of str.

Returns: The converted result.

Throws: invalid_argument if strtof, strtod, or strtohl reports that no conversion can be performed.
Throws out_of_range if strtof, strtod, or strtohl sets errno to ERANGE or if the converted value
is outside the range of representable values for the return type.

string to_string(int val);
string to_string(unsigned val);
string to_string(long val);
string to_string(unsigned long val);
string to_string(long long val);
string to_string(unsigned long long val);
string to_string(float val);
string to_string(double val);
string to_string(long double val);

Returns: Each function returns a string object holding the character representation of the value of
its argument that would be generated by calling sprintf(buf, fmt, val) with a format specifier of
"%d", "%u", "%ld", "%lu", "%lld", "%llu", "%f", "%F", or "%Lf", respectively, where buf designates an internal character buffer of sufficient size.

```c
int stoi(const wstring& str, size_t* idx = nullptr, int base = 10);
long stol(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long stoul(const wstring& str, size_t* idx = nullptr, int base = 10);
long long stoll(const wstring& str, size_t* idx = nullptr, int base = 10);
unsigned long long stoull(const wstring& str, size_t* idx = nullptr, int base = 10);
```

**Effects:** The first two functions call wcstol(str.c_str(), ptr, base), and the last three functions call wcstoul(str.c_str(), ptr, base), wcstoll(str.c_str(), ptr, base), and wcstoull(str.c_str(), ptr, base), respectively. Each function returns the converted result, if any. The argument ptr designates a pointer to an object internal to the function that is used to determine what to store at *idx. If the function does not throw an exception and idx != nullptr, the function stores in *idx the index of the first unconverted element of str.

**Returns:** The converted result.

**Throws:** invalid_argument if wcstol, wcstoul, wcstoll, or wcstoull reports that no conversion can be performed. Throws out_of_range if the converted value is outside the range of representable values for the return type.

```c
float stof(const wstring& str, size_t* idx = nullptr);
double stod(const wstring& str, size_t* idx = nullptr);
long double stold(const wstring& str, size_t* idx = nullptr);
```

**Effects:** These functions call wcstof(str.c_str(), ptr), wcstod(str.c_str(), ptr), and wcstold(str.c_str(), ptr), respectively. Each function returns the converted result, if any. The argument ptr designates a pointer to an object internal to the function that is used to determine what to store at *idx. If the function does not throw an exception and idx != nullptr, the function stores in *idx the index of the first unconverted element of str.

**Returns:** The converted result.

**Throws:** invalid_argument if wcstof, wcstod, or wcstold reports that no conversion can be performed. Throws out_of_range if wcstof, wcstod, or wcstold sets errno to ERANGE.

```c
wstring to_wstring(int val);
wstring to_wstring(unsigned val);
wstring to_wstring(long val);
wstring to_wstring(unsigned long val);
wstring to_wstring(long long val);
wstring to_wstring(float val);
wstring to_wstring(double val);
wstring to_wstring(long double val);
```

**Returns:** Each function returns a wstring object holding the character representation of the value of its argument that would be generated by calling swprintf(buf, buffsz, fmt, val) with a format specifier of L"%d", L"%u", L"%ld", L"%lu", L"%lld", L"%llu", L"%f", L"%F", or L"%Lf", respectively, where buf designates an internal character buffer of sufficient size buffsz.

### 23.4.6 Hash support

```
template<class A> struct hash<basic_string<char, char_traits<char>, A>>;
template<class A> struct hash<basic_string<char8_t, char_traits<char8_t>, A>>;
template<class A> struct hash<basic_string<char16_t, char_traits<char16_t>, A>>;
template<class A> struct hash<basic_string<char32_t, char_traits<char32_t>, A>>;
```

If S is one of these string types, SV is the corresponding string view type, and s is an object of type S, then hash<S>()(s) == hash<SV>()(SV(s)).

### 23.4.7 Suffix for basic_string literals

```
constexpr string operator""s(const char* str, size_t len);
```

**Returns:** string(str, len).
constexpr u8string operator"s(const char8_t* str, size_t len);

Returns: u8string{str, len}.

constexpr u16string operator"s(const char16_t* str, size_t len);

Returns: u16string{str, len}.

constexpr u32string operator"s(const char32_t* str, size_t len);

Returns: u32string{str, len}.

constexpr wstring operator"s(const wchar_t* str, size_t len);

Returns: wstring{str, len}.

[Note 1: The same suffix s is used for chrono::duration literals denoting seconds but there is no conflict, since duration suffixes apply to numbers and string literal suffixes apply to character array literals. — end note]

23.5 Null-terminated sequence utilities

23.5.1 Header <cctype> synopsis

namespace std {
    int isalnum(int c);
    int isalpha(int c);
    int isblank(int c);
    int iscntrl(int c);
    int isdigit(int c);
    int isgraph(int c);
    int islower(int c);
    int isprint(int c);
    int ispunct(int c);
    int isspace(int c);
    int isupper(int c);
    int isxdigit(int c);
    int tolower(int c);
    int toupper(int c);
}

1 The contents and meaning of the header <cctype> are the same as the C standard library header <ctype.h>.

    int iswprint(wint_t wc);
    int iswpunct(wint_t wc);
    int iswspace(wint_t wc);
    int iswupper(wint_t wc);
    int iswxdigit(wint_t wc);
    wctype_t wctype(const char* property);
    wint_t towlower(wint_t wc);
    wint_t towupper(wint_t wc);
    wint_t towctrans(wint_t wc, wctrans_t desc);
    wctrans_t wctrans(const char* property);
}
The contents and meaning of the header `<cwctype>` are the same as the C standard library header `<wctype.h>`. See also: ISO C 7.30

23.5.3 Header `<cstring>` synopsis

```cpp
namespace std {
  using size_t = see 17.2.4;
  using mbstate_t = see below;
  using wint_t = see below;

  struct tm;

  int fprintf(FILE* stream, const wchar_t* format, ...);
  int fscanf(FILE* stream, const wchar_t* format, ...);
  int swprintf(wchar_t* s, size_t n, const wchar_t* format, ...);
  int swscanf(const wchar_t* s, const wchar_t* format, ...);
  int vfprintf(FILE* stream, const wchar_t* format, va_list arg);
  int vfscanf(FILE* stream, const wchar_t* format, va_list arg);
}
```

The contents and meaning of the header `<cstring>` are the same as the C standard library header `<string.h>`. See also: ISO C 7.24

23.5.4 Header `<cwchar>` synopsis

```cpp
namespace std {
  using size_t = see 17.2.4;
  using mbstate_t = see below;
  using wint_t = see below;

  struct tm;

  int fprintf(FILE* stream, const wchar_t* format, ...);
  int fscanf(FILE* stream, const wchar_t* format, ...);
  int swprintf(wchar_t* s, size_t n, const wchar_t* format, ...);
  int swscanf(const wchar_t* s, const wchar_t* format, ...);
  int vfprintf(FILE* stream, const wchar_t* format, va_list arg);
  int vfscanf(FILE* stream, const wchar_t* format, va_list arg);
}
```
int vswprintf(wchar_t* s, size_t n, const wchar_t* format, va_list arg);
int vswscanf(const wchar_t* s, const wchar_t* format, va_list arg);
int wprintf(const wchar_t* format, va_list arg);

size_t mbrtowc(wchar_t* pwc, const char* s, size_t n, mbstate_t* ps);
size_t wcrtomb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbsrtowcs(wchar_t* dst, const wchar_t** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);

§ 23.5.4 multibyte / wide string and character conversion functions

#define NULL see 17.2.3
#define WCHAR_MAX see below
#define WCHAR_MIN see below
#define WEOF see below

1 The contents and meaning of the header `<cwchar>` are the same as the C standard library header `<wchar.h>`, except that it does not declare a type `wchar_t`.

2 [Note 1: The functions `wcachr`, `wcempbrk`, `wcschr`, `wcsstr`, and `wmemchr` have different signatures in this document, but they have the same behavior as in the C standard library (16.2). — end note]

See also: ISO C 7.29

23.5.5 Header `<cuchar>` synopsis

namespace std {
    using mbstate_t = see below;
    using size_t = see 17.2.4;

    size_t mbtosc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);
    size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);
    size_t mbtosc16(char16_t* pc16, const char* s, size_t n, mbstate_t* ps);
    size_t cl16tomb(char* s, char16_t c16, mbstate_t* ps);
    size_t mbtosc32(char32_t* pc32, const char* s, size_t n, mbstate_t* ps);
    size_t c32rtomb(char* s, char32_t c32, mbstate_t* ps);
}

1 The contents and meaning of the header `<cuchar>` are the same as the C standard library header `<uchar.h>`, except that it declares the additional `mbtosc8` and `c8rtomb` functions and does not declare types `char16_t` nor `char32_t`.

See also: ISO C 7.28

23.5.6 Multibyte / wide string and character conversion functions

1 [Note 1: The headers `<cstdlib>` (17.2.2), `<cuchar>` (23.5.5), and `<cwchar>` (23.5.4) declare the functions described in this subclause. — end note]

int mbsinit(const mbstate_t* ps);
int mbllen(const char* s, size_t n);
size_t mbstowcs(wchar_t* pwcs, const char* s, size_t n);
size_t wcstombs(char* s, const wchar_t* pwcs, size_t n);

Effects: These functions have the semantics specified in the C standard library.

See also: ISO C 7.22.7.1, 7.22.8, 7.29.6.2.1

int mbtowc(wchar_t* pwc, const char* s, size_t n);
int wctomb(char* s, wchar_t wchar);

3 Effects: These functions have the semantics specified in the C standard library.

Remarks: Calls to these functions may introduce a data race (16.4.6.10) with other calls to the same function.

See also: ISO C 7.22.7

size_t mblen(const char* s, size_t n, mbstate_t* ps);
size_t mbstowc(wchar_t* pwcs, const char* s, size_t n, mbstate_t* ps);
size_t wcstomwb(char* s, wchar_t wc, mbstate_t* ps);
size_t mbtowcs(wchar_t* dst, const char** src, size_t len, mbstate_t* ps);
size_t wcsrtombs(char* dst, const wchar_t** src, size_t len, mbstate_t* ps);

Effects: These functions have the semantics specified in the C standard library.

Remarks: Calling these functions with an `mbstate_t*` argument that is a null pointer value may introduce a data race (16.4.6.10) with other calls to the same function with an `mbstate_t*` argument that is a null pointer value.
size_t mbtovc8(char8_t* pc8, const char* s, size_t n, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to mbtovc8(nullptr, ",", 1, ps). Otherwise, the function inspects at most n bytes beginning with the byte pointed to by s to determine the number of bytes needed to complete the next multibyte character (including any shift sequences). If the function determines that the next multibyte character is complete and valid, it determines the values of the corresponding UTF-8 code units and then, if pc8 is not a null pointer, stores the value of the first (or only) such code unit in the object pointed to by pc8. Subsequent calls will store successive UTF-8 code units without consuming any additional input until all the code units have been stored. If the corresponding Unicode character is U+0000 NULL, the resulting state described is the initial conversion state.

Returns: The first of the following that applies (given the current conversion state):

1. 0, if the next n or fewer bytes complete the multibyte character that corresponds to the U+0000 NULL Unicode character (which is the value stored).
2. between 1 and n (inclusive), if the next n or fewer bytes complete a valid multibyte character (whose first (or only) code unit is stored); the value returned is the number of bytes that complete the multibyte character.
3. (size_t)(-3), if the next code unit resulting from a previous call has been stored (no bytes from the input have been consumed by this call).
4. (size_t)(-2), if the next n bytes contribute to an incomplete (but potentially valid) multibyte character, and all n bytes have been processed (no value is stored).
5. (size_t)(-1), if an encoding error occurs, in which case the next n or fewer bytes do not contribute to a complete and valid multibyte character (no value is stored); the value of the macro EILSEQ is stored in errno, and the conversion state is unspecified.

size_t c8rtomb(char* s, char8_t c8, mbstate_t* ps);

Effects: If s is a null pointer, equivalent to c8rtomb(buf, u8'\0', ps) where buf is an internal buffer. Otherwise, if c8 completes a sequence of valid UTF-8 code units, determines the number of bytes needed to represent the multibyte character (including any shift sequences), and stores the multibyte character representation in the array whose first element is pointed to by s. At most MB_CUR_MAX bytes are stored. If the multibyte character is a null character, a null byte is stored, preceded by any shift sequence needed to restore the initial shift state; the resulting state described is the initial conversion state.

Returns: The number of bytes stored in the array object (including any shift sequences). If c8 does not contribute to a sequence of char8_t corresponding to a valid multibyte character, the value of the macro EILSEQ is stored in errno, (size_t) (-1) is returned, and the conversion state is unspecified.

Remarks: Calls to c8rtomb with a null pointer argument for s may introduce a data race (16.4.6.10) with other calls to c8rtomb with a null pointer argument for s.
24 Containers library

24.1 General

This Clause describes components that C++ programs may use to organize collections of information.

The following subclauses describe container requirements, and components for sequence containers and associative containers, as summarized in Table 83.

Table 83: Containers library summary

24.2 Requirements

24.2.1 Preamble

Containers are objects that store other objects. They control allocation and deallocation of these objects through constructors, destructors, insert and erase operations.

All of the complexity requirements in this Clause are stated solely in terms of the number of operations on the contained objects.

[Example 1: The copy constructor of type vector<vector<int>> has linear complexity, even though the complexity of copying each contained vector<int> is itself linear. —end example]

Allocator-aware containers (24.2.2.5) other than basic_string construct elements using the function allocator_traits<allocator_type>::rebind_traits<U>::construct and destroy elements using the function allocator_traits<allocator_type>::rebind_traits<U>::destroy (20.2.9.3), where U is either allocator_type::value_type or an internal type used by the container. These functions are called only for the container’s element type, not for internal types used by the container.

[Note 1: This means, for example, that a node-based container would need to construct nodes containing aligned buffers and call construct to place the element into the buffer. — end note]

24.2.2 General containers

24.2.2.1 General

In subclause 24.2.2,

1. X denotes a container class containing objects of type T,
2. a denotes a value of type X,
3. b and c denote values of type (possibly const) X,
4. i and j denote values of type (possibly const) X::iterator,
5. u denotes an identifier,
6. v denotes an lvalue of type (possibly const) X or an rvalue of type const X,
7. s and t denote non-const lvalues of type X, and
8. rv denotes a non-const rvalue of type X.

A type X meets the container requirements if the following types, statements, and expressions are well-formed and have the specified semantics.
```plaintext
typename X::value_type
  Result: T
  Preconditions: T is Cpp17Erasable from X (see 24.2.2.5, below).

typename X::reference
  Result: T&

typename X::const_reference
  Result: const T&

typename X::iterator
  Result: A type that meets the forward iterator requirements (25.3.5.5) with value type T. The type X::iterator is convertible to X::const_iterator.

typename X::const_iterator
  Result: A type that meets the requirements of a constant iterator and those of a forward iterator with value type T.

typename X::difference_type
  Result: A signed integer type, identical to the difference type of X::iterator and X::const_iterator.

typename X::size_type
  Result: An unsigned integer type that can represent any non-negative value of X::difference_type.

X u;
X u = X();
  Postconditions: u.empty()
  Complexity: Constant.

X u(v);
X u = v;
  Preconditions: T is Cpp17CopyInsertable into X (see below).
  Postconditions: u == v.
  Complexity: Linear.

X u(rv);
X u = rv;
  Postconditions: u is equal to the value that rv had before this construction.
  Complexity: Linear for array and constant for all other standard containers.

t = v;
  Result: Xk.
  Postconditions: t == v.
  Complexity: Linear.

t = rv
  Result: Xk.
  Effects: All existing elements of t are either move assigned to or destroyed.
  Postconditions: If t and rv do not refer to the same object, t is equal to the value that rv had before this assignment.
  Complexity: Linear.

a.~X()
  Result: void.
  Effects: Destroys every element of a; any memory obtained is deallocated.
```

§ 24.2.2.2
Complexity: Linear.

b.begin()

Result: iterator; const_iterator for constant b.

Returns: An iterator referring to the first element in the container.

Complexity: Constant.

b.end()

Result: iterator; const_iterator for constant b.

Returns: An iterator which is the past-the-end value for the container.

Complexity: Constant.

b.cbegin()

Result: const_iterator.

Returns: const_cast<X const&>(b).begin()

Complexity: Constant.

b.cend()

Result: const_iterator.

Returns: const_cast<X const&>(b).end()

Complexity: Constant.

i <=> j

Result: strong_ordering.

Constraints: X::iterator meets the random access iterator requirements.

Complexity: Constant.

c == b

Preconditions: T meets the C++17EqualityComparable requirements.

Result: bool.

Returns: equal(c.begin(), c.end(), b.begin(), b.end())

[Note 1: The algorithm equal is defined in 27.6.13. — end note]

Complexity: Constant if c.size() != b.size(), linear otherwise.

Remarks: == is an equivalence relation.

c != b

Effects: Equivalent to !(c == b).

t.swap(s)

Result: void.

Effects: Exchanges the contents of t and s.

Complexity: Linear for array and constant for all other standard containers.

swap(t, s)

Effects: Equivalent to t.swap(s).

c.size()

Result: size_type.

Returns: distance(c.begin(), c.end()), i.e. the number of elements in the container.

Complexity: Constant.

Remarks: The number of elements is defined by the rules of constructors, inserts, and erases.
c.max_size()

Result: size_type.

Returns: distance(begin(), end()) for the largest possible container.

Complexity: Constant.

c.empty()

Result: bool.

Returns: c.begin() == c.end()

Complexity: Constant.

Remarks: If the container is empty, then c.empty() is true.

In the expressions

\begin{align*}
    i &= j \\
    i &!= j \\
    i &< j \\
    i &\leq j \\
    i &\geq j \\
    i &> j \\
    i &\leftrightarrow j \\
    i &- j
\end{align*}

where \(i\) and \(j\) denote objects of a container's iterator type, either or both may be replaced by an object of the container's const_iterator type referring to the same element with no change in semantics.

64 Unless otherwise specified, all containers defined in this Clause obtain memory using an allocator (see 16.4.4.6).

[Note 2: In particular, containers and iterators do not store references to allocated elements other than through the allocator's pointer type, i.e., as objects of type \(P\) or \(\text{pointer_traits<}P\>::\text{template rebind<unspecified>}\), where \(P\) is \(\text{allocator_traits<}\text{allocator_type>::}::\text{pointer}\). —end note]

Copy constructors for these container types obtain an allocator by calling \(\text{allocator_traits<}\text{allocator_type>::}::\text{select_on_container_copy_construction}\) on the allocator belonging to the container being copied. Move constructors obtain an allocator by move construction from the allocator belonging to the container being moved. Such move construction of the allocator shall not exit via an exception. All other constructors for these container types take a \(\text{const allocator_type}{}\&\) argument.

[Note 3: If an invocation of a constructor uses the default value of an optional allocator argument, then the allocator type must support value-initialization. —end note]

A copy of this allocator is used for any memory allocation and element construction performed, by these constructors and by all member functions, during the lifetime of each container object or until the allocator is replaced. The allocator may be replaced only via assignment or \(\text{swap()}\). Allocator replacement is performed by copy assignment, move assignment, or swapping of the allocator only if

\begin{align*}
    - &\text{allocator_traits<}\text{allocator_type>::}::\text{propagate_on_container_copy_assignment::}::\text{value,} \\
    - &\text{allocator_traits<}\text{allocator_type>::}::\text{propagate_on_container_move_assignment::}::\text{value, or} \\
    - &\text{allocator_traits<}\text{allocator_type>::}::\text{propagate_on_container_swap::}::\text{value}
\end{align*}

is true within the implementation of the corresponding container operation. In all container types defined in this Clause, the member \(\text{get_allocator()}\) returns a copy of the allocator used to construct the container or, if that allocator has been replaced, a copy of the most recent replacement.

65 The expression \(a\text{.swap(b)}\), for containers \(a\) and \(b\) of a standard container type other than \(\text{array}\), shall exchange the values of \(a\) and \(b\) without invoking any move, copy, or swap operations on the individual container elements. Any \(\text{Compare, Pred, or Hash}\) types belonging to \(a\) and \(b\) shall meet the \(\text{Cpp17Swappable}\) requirements and shall be exchanged by calling \(\text{swap}\) as described in 16.4.4.3. If \(\text{allocator_traits<}\text{allocator_type>::}::\text{propagate_on_container_swap::}::\text{value}\) is true, then \(\text{allocator_type}\) shall meet the \(\text{Cpp17Swappable}\) requirements and the allocators of \(a\) and \(b\) shall also be exchanged by calling \(\text{swap}\) as described in 16.4.4.3. Otherwise, the allocators shall not be swapped, and the behavior is undefined unless \(a\text{.get_allocator()} == b\text{.get_allocator()}\). Every iterator referring to an element in one container before the swap shall refer to the same element in the other container after the swap. It is unspecified whether an iterator with value \(a\text{.end()}\) before the swap will have value \(b\text{.end()}\) after the swap.
24.2.2.3 Reversible container requirements

A type \( X \) meets the reversible container requirements if \( X \) meets the container requirements, the iterator type of \( X \) belongs to the bidirectional or random access iterator categories (25.3), and the following types and expressions are well-formed and have the specified semantics.

\[
\text{typename } X::\text{reverse_iterator}
\]

Result: The type \text{reverse_iterator<X::iterator>}, an iterator type whose value type is \( T \).

\[
\text{typename } X::\text{const_reverse_iterator}
\]

Result: The type \text{reverse_iterator<X::const_iterator>}, a constant iterator type whose value type is \( T \).

\[
a.rbegin()
\]

Result: \text{reverse_iterator; const_reverse_iterator} for constant \( a \).

Returns: \text{reverse_iterator}(end())

Complexity: Constant.

\[
a.rend()
\]

Result: \text{reverse_iterator; const_reverse_iterator} for constant \( a \).

Returns: \text{reverse_iterator}(begin())

Complexity: Constant.

\[
a.crbegin()
\]

Result: \text{const_reverse_iterator}.

Returns: \text{const_cast<X const&>(a).rbegin()}

Complexity: Constant.

\[
a.crend()
\]

Result: \text{const_reverse_iterator}.

Returns: \text{const_cast<X const&>(a).rend()}

Complexity: Constant.

Unless otherwise specified (see 24.2.7.2, 24.2.8.2, 24.3.8.4, and 24.3.11.5) all container types defined in this Clause meet the following additional requirements:

(16.1) If an exception is thrown by an \text{insert()} or \text{emplace()} function while inserting a single element, that function has no effects.

(16.2) If an exception is thrown by a \text{push_back()}, \text{push_front()}, \text{emplace_back()}, or \text{emplace_front()} function, that function has no effects.

(16.3) No \text{erase()}, \text{clear()}, \text{pop_back()} or \text{pop_front()} function throws an exception.

(16.4) No copy constructor or assignment operator of a returned iterator throws an exception.

(16.5) No \text{swap()} function throws an exception.

(16.6) No \text{swap()} function invalidates any references, pointers, or iterators referring to the elements of the containers being swapped.

[Note 1: The \text{end()} iterator does not refer to any element, so it can be invalidated. — end note]

Unless otherwise specified (either explicitly or by defining a function in terms of other functions), invoking a container member function or passing a container as an argument to a library function shall not invalidate iterators to, or change the values of, objects within that container.

A contiguous container is a container whose member types \text{iterator} and \text{const_iterator} meet the \text{Cpp17RandomAccessIterator} requirements (25.3.5.7) and model \text{contiguous_iterator} (25.3.4.14).

24.2.2.4 Optional container requirements

The following operations are provided for some types of containers but not others. Those containers for which the listed operations are provided shall implement the semantics as described unless otherwise stated. If the
Iterators passed to `lexicographical_compare_three_way` meet the constexpr iterator requirements (25.3.1) then the operations described below are implemented by constexpr functions.

\[ a \leftrightarrow b \]

**Result:** `synth-three-way-result<X::value_type>`.

**Preconditions:** Either \( \leftrightarrow \) is defined for values of type (possibly const) \( T \), or \( < \) is defined for values of type (possibly const) \( T \) and \(<\) is a total ordering relationship.

**Returns:** `lexicographical_compare_three_way(a.begin(), a.end(), b.begin(), b.end(), synth-three-way)`

[Note 1: The algorithm `lexicographical_compare_three_way` is defined in Clause 27. — end note]

**Complexity:** Linear.

### 24.2.2.5 Allocator-aware containers [container.alloc.reqmts]

All of the containers defined in Clause 24 and in 23.4.3 except `array` meet the additional requirements of an `allocator-aware container`, as described below.

Given an allocator type \( A \) and given a container type \( X \) having a `value_type` identical to \( T \) and an `allocator_type` identical to `allocator_traits<A>::rebind_alloc<T>` and given an lvalue \( m \) of type \( A \), a pointer \( p \) of type \( T^* \), an expression \( v \) of type \( T \) or `const T`, and an rvalue \( rv \) of type \( T \), the following terms are defined. If \( X \) is not allocator-aware or is a specialization of `basic_string`, the terms below are defined as if \( A \) were `allocator<T>` — no allocator object needs to be created and user specializations of `allocator<T>` are not instantiated:

1. **(2.1)** \( T \) is `Cpp17DefaultInsertable into X` means that the following expression is well-formed:

   \[
   \text{allocator_traits}<A>::\text{construct}(m, p)
   \]

2. **(2.2)** An element of \( X \) is `default-inserted` if it is initialized by evaluation of the expression

   \[
   \text{allocator_traits}<A>::\text{construct}(m, p)
   \]

   where \( p \) is the address of the uninitialized storage for the element allocated within \( X \).

3. **(2.3)** \( T \) is `Cpp17MoveInsertable into X` means that the following expression is well-formed:

   \[
   \text{allocator_traits}<A>::\text{construct}(m, p, rv)
   \]

   and its evaluation causes the following postcondition to hold: The value of \( *p \) is equivalent to the value of \( rv \) before the evaluation.

   [Note 1: \( rv \) remains a valid object. Its state is unspecified — end note]

4. **(2.4)** \( T \) is `Cpp17CopyInsertable into X` means that, in addition to \( T \) being `Cpp17MoveInsertable into X`, the following expression is well-formed:

   \[
   \text{allocator_traits}<A>::\text{construct}(m, p, v)
   \]

   and its evaluation causes the following postcondition to hold: The value of \( v \) is unchanged and is equivalent to \( *p \).

5. **(2.5)** \( T \) is `Cpp17EmplaceConstructible into X from args`, for zero or more arguments \( \text{args} \), means that the following expression is well-formed:

   \[
   \text{allocator_traits}<A>::\text{construct}(m, p, \text{args})
   \]

6. **(2.6)** \( T \) is `Cpp17Erasable from X` means that the following expression is well-formed:

   \[
   \text{allocator_traits}<A>::\text{destroy}(m, p)
   \]

   [Note 2: A container calls ` allocator_traits<A>::construct(m, p, \text{args})` to construct an element at \( p \) using \( \text{args} \), with \( m == \text{get_allocator}() \). The default `construct` in `allocator` will call `::new((\text{void}*)p) T(\text{args})`, but specialized allocators can choose a different definition. — end note]

The following exposition-only concept is used in the definition of containers:

\[
\text{template<class R, class T>}
\text{concept container-compatible-range = // exposition only}
\text{ranges::input_range<R> && convertible_to<ranges::range_reference_t<R>, T>};
\]

In this subclause,

1. **(4.1)** \( X \) denotes an allocator-aware container class with a `value_type` of \( T \) using an allocator of type \( A \),
A type \( X \) meets the allocator-aware container requirements if \( X \) meets the container requirements and the following types, statements, and expressions are well-formed and have the specified semantics.

\[
\text{typename } X::\text{allocator\_type} \\
\text{Result: } A \\
\text{Preconditions: } \text{allocator\_type::value\_type} \text{ is the same as } X::\text{value\_type}.
\]

\[
c\text{.get\_allocator()} \\
\text{Result: } A \\
\text{Complexity: Constant.}
\]

\[
X \ u; \\
X \ u = X(); \\
\text{Preconditions: } A \text{ meets the } \text{Cpp17DefaultConstructible} \text{ requirements.} \\
\text{Postconditions: } u.\text{empty()} \text{ returns true, } u.\text{get\_allocator()} == A(). \\
\text{Complexity: Constant.}
\]

\[
X \ u(m); \\
\text{Postconditions: } u.\text{empty()} \text{ returns true, } u.\text{get\_allocator()} == m. \\
\text{Complexity: Constant.}
\]

\[
X \ u(t, m); \\
\text{Preconditions: } T \text{ is } \text{Cpp17CopyInsertable} \text{ into } X. \\
\text{Postconditions: } u == t, u.\text{get\_allocator()} == m \\
\text{Complexity: Linear.}
\]

\[
X \ u(rv); \\
\text{Postconditions: } u \text{ has the same elements as } rv \text{ had before this construction; the value of } u.\text{get\_allocator()} \text{ is the same as the value of } rv.\text{get\_allocator()} \text{ before this construction.} \\
\text{Complexity: } \text{Constant if } m == rv.\text{get\_allocator()}, \text{otherwise linear.}
\]

\[
a = t \\
\text{Result: } Xk. \\
\text{Preconditions: } T \text{ is } \text{Cpp17CopyInsertable} \text{ into } X \text{ and } \text{Cpp17CopyAssignable}. \\
\text{Postconditions: } a == t \text{ is true.} \\
\text{Complexity: Linear.}
\]

\[
a = rv \\
\text{Result: } Xk.
\]
Preconditions: If allocator_traits<allocator_type>::propagate_on_container_move_assignment::value is false, T is Cpp17MoveInsertable into X and Cpp17MoveAssignable.

Effects: All existing elements of a are either move assigned to or destroyed.

Postconditions: If a and rv do not refer to the same object, a is equal to the value that rv had before this assignment.

Complexity: Linear.

```cpp
da.swap(b)
```

Result: void

Effects: Exchanges the contents of a and b.

Complexity: Constant.

The behavior of certain container member functions and deduction guides depends on whether types qualify as input iterators or allocators. The extent to which an implementation determines that a type cannot be an input iterator is unspecified, except that as a minimum integral types shall not qualify as input iterators. Likewise, the extent to which an implementation determines that a type cannot be an allocator is unspecified, except that as a minimum a type A shall not qualify as an allocator unless it meets both of the following conditions:

1. The qualified-id A::value_type is valid and denotes a type (13.10.3).
2. The expression declval<A&>().allocate(size_t{}) is well-formed when treated as an unevaluated operand.

24.2.3 Container data races [container.requirements.dataraces]

For purposes of avoiding data races (16.4.6.10), implementations shall consider the following functions to be const: begin, end, rbegin, rend, front, back, data, find, lower_bound, upper_bound, equal_range, at and, except in associative or unordered associative containers, operator[].

Notwithstanding 16.4.6.10, implementations are required to avoid data races when the contents of the contained object in different elements in the same container, excepting vector<bool>, are modified concurrently.

[Note 1: For a vector<int> x with a size greater than one, x[1] = 5 and *x.begin() = 10 can be executed concurrently without a data race, but x[0] = 5 and *x.begin() = 10 executed concurrently can result in a data race. As an exception to the general rule, for a vector<bool> y, y[0] = true can race with y[1] = true. — end note]

24.2.4 Sequence containers [sequence.reqmts]

A sequence container organizes a finite set of objects, all of the same type, into a strictly linear arrangement. The library provides four basic kinds of sequence containers: vector, forward_list, list, and deque. In addition, array is provided as a sequence container which provides limited sequence operations because it has a fixed number of elements. The library also provides container adaptors that make it easy to construct abstract data types, such as stacks, queues, flat_maps, flat_multimaps, flat_sets, or flat_multisets, out of the basic sequence container kinds (or out of other program-defined sequence containers).

[Note 1: The sequence containers offer the programmer different complexity trade-offs. vector is appropriate in most circumstances. array has a fixed size known during translation. list or forward_list support frequent insertions and deletions from the middle of the sequence. deque supports efficient insertions and deletions taking place at the beginning or at the end of the sequence. When choosing a container, remember vector is best; leave a comment to explain if you choose from the rest! — end note]

In this subclause,

1. X denotes a sequence container class,
2. a denotes a value of type X containing elements of type T,
3. u denotes the name of a variable being declared,
4. A denotes X::allocator_type if the qualified-id X::allocator_type is valid and denotes a type (13.10.3) and allocator<T> if it doesn’t,
5. i and j denote iterators that meet the Cpp17InputIterator requirements and refer to elements implicitly convertible to value_type,
6. [i, j) denotes a valid range,

§ 24.2.4
rg denotes a value of a type \( R \) that models \texttt{container-compatible-range<\texttt{T}>},

il designates an object of type \texttt{initializer_list<value_type>},

\( n \) denotes a value of type \texttt{X::size_type},

\( p \) denotes a valid constant iterator to \( a \),

\( q \) denotes a valid dereferenceable constant iterator to \( a \),

\([q1, q2)\) denotes a valid range of constant iterators in \( a \),

\( t \) denotes an lvalue or a const rvalue of \texttt{X::value_type}, and

\( rv \) denotes a non-const rvalue of \texttt{X::value_type}.

\( \text{Args} \) denotes a template parameter pack;

\( \text{args} \) denotes a function parameter pack with the pattern \texttt{Args&&}.

The complexities of the expressions are sequence dependent.

A type \( X \) meets the \texttt{sequence container} requirements if \( X \) meets the container requirements and the following statements and expressions are well-formed and have the specified semantics.

\begin{verbatim}
X u(n, t);

Preconditions: T is \texttt{Cpp17CopyInsertable} into X.

Effects: Constructs a sequence container with \( n \) copies of \( t \).

Postconditions: distance(u.begin(), u.end()) == n is true.
\end{verbatim}

\begin{verbatim}
X u(i, j);

Preconditions: T is \texttt{Cpp17EmplaceConstructible} into X from \*i. For \texttt{vector}, if the iterator does not meet the \texttt{Cpp17ForwardIterator} requirements (25.3.5.5), T is also \texttt{Cpp17MoveInsertable} into X.

Effects: Constructs a sequence container equal to the range \([i, j)\). Each iterator in the range \([i, j)\) is dereferenced exactly once.

Postconditions: distance(u.begin(), u.end()) == distance(i, j) is true.
\end{verbatim}

\begin{verbatim}
X(from_range, rg)

Preconditions: T is \texttt{Cpp17EmplaceConstructible} into X from \*ranges::begin(rg). For \texttt{vector}, if \( R \) models neither \texttt{ranges::sized_range} nor \texttt{ranges::forward_range}, T is also \texttt{Cpp17MoveInsertable} into X.

Effects: Constructs a sequence container equal to the range \( \texttt{rg} \). Each iterator in the range \( \texttt{rg} \) is dereferenced exactly once.

Postconditions: distance(begin(), end()) == ranges::distance(rg) is true.
\end{verbatim}

\begin{verbatim}
X(il)

Effects: Equivalent to \( X(\texttt{il.begin()}, \texttt{il.end()}) \).
\end{verbatim}

\begin{verbatim}
a = il

Result: X&.

Preconditions: T is \texttt{Cpp17CopyInsertable} into X and \texttt{Cpp17CopyAssignable}.

Effects: Assigns the range \([\texttt{il.begin()}, \texttt{il.end()})\) into \( a \). All existing elements of \( a \) are either assigned to or destroyed.

Returns: \*this.
\end{verbatim}

\begin{verbatim}
a.emplace(p, args)

Result: iterator.

Preconditions: T is \texttt{Cpp17EmplaceConstructible} into X from \texttt{args}. For \texttt{vector} and \texttt{deque}, T is also \texttt{Cpp17MoveInsertable} into X and \texttt{Cpp17MoveAssignable}.

Effects: Inserts an object of type T constructed with std::forward<\texttt{Args}>(\texttt{args})... before p.

[Note 2: \texttt{args} can directly or indirectly refer to a value in \( a \). — end note]
Returns: An iterator that points to the new element constructed from \texttt{args} into \texttt{a}.

\texttt{a.insert(p, t)}

Result: \texttt{iterator}.

Preconditions: \texttt{T} is \texttt{Cpp17CopyInsertable} into \texttt{X}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17CopyAssignable}.

Effects: Inserts a copy of \texttt{t} before \texttt{p}.

Returns: An iterator that points to the copy of \texttt{t} inserted into \texttt{a}.

\texttt{a.insert(p, rv)}

Result: \texttt{iterator}.

Preconditions: \texttt{T} is \texttt{Cpp17MoveInsertable} into \texttt{X}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17MoveAssignable}.

Effects: Inserts a copy of \texttt{rv} before \texttt{p}.

Returns: An iterator that points to the copy of \texttt{rv} inserted into \texttt{a}.

\texttt{a.insert(p, n, t)}

Result: \texttt{iterator}.

Preconditions: \texttt{T} is \texttt{Cpp17CopyInsertable} into \texttt{X} and \texttt{Cpp17CopyAssignable}.

Effects: Inserts \texttt{n} copies of \texttt{t} before \texttt{p}.

Returns: An iterator that points to the copy of the first element inserted into \texttt{a}, or \texttt{p} if \texttt{n} == 0.

\texttt{a.insert(p, i, j)}

Result: \texttt{iterator}.

Preconditions: \texttt{T} is \texttt{Cpp17EmplaceConstructible} into \texttt{X} from \(*i\). For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17MoveInsertable} into \texttt{X}, and \texttt{T} meets the \texttt{Cpp17MoveConstructible}, \texttt{Cpp17MoveAssignabe}, and \texttt{Cpp17Swappable} (16.4.4.3) requirements. Neither \texttt{i} nor \texttt{j} are iterators into \texttt{a}.

Effects: Inserts copies of elements in \([i, j)\) before \texttt{p}. Each iterator in the range \([i, j)\) shall be dereferenced exactly once.

Returns: An iterator that points to the copy of the first element inserted into \texttt{a}, or \texttt{p} if \texttt{i} == \texttt{j}.

\texttt{a.insert_range(p, rg)}

Result: \texttt{iterator}.

Preconditions: \texttt{T} is \texttt{Cpp17EmplaceConstructible} into \texttt{X} from \texttt{*ranges::begin(rg)}. For \texttt{vector} and \texttt{deque}, \texttt{T} is also \texttt{Cpp17MoveInsertable} into \texttt{X}, and \texttt{T} meets the \texttt{Cpp17MoveConstructible}, \texttt{Cpp17MoveAssignabe}, and \texttt{Cpp17Swappable} (16.4.4.3) requirements. \texttt{rg} and \texttt{a} do not overlap.

Effects: Inserts copies of elements in \texttt{rg} before \texttt{p}. Each iterator in the range \texttt{rg} is dereferenced exactly once.

Returns: An iterator that points to the copy of the first element inserted into \texttt{a}, or \texttt{p} if \texttt{rg} is empty.

\texttt{a.insert(p, il)}

Effects: Equivalent to \texttt{a.insert(p, il.begin(), il.end())}.

\texttt{a.erase(q)}

Result: \texttt{iterator}.

Preconditions: For \texttt{vector} and \texttt{deque}, \texttt{T} is \texttt{Cpp17MoveAssignabe}.

Effects: Erases the element pointed to by \texttt{q}.

Returns: An iterator that points to the element immediately following \texttt{q} prior to the element being erased. If no such element exists, \texttt{a.end()} is returned.

\texttt{a.erase(q1, q2)}

Result: \texttt{iterator}.

Preconditions: For \texttt{vector} and \texttt{deque}, \texttt{T} is \texttt{Cpp17MoveAssignabe}.
Effects: Erases the elements in the range \([q_1, q_2)\).

Returns: An iterator that points to the element pointed to by \(q_2\) prior to any elements being erased. If no such element exists, \(a\).\(\text{end}()\) is returned.

\(a\).clear()

Result: void

Effects: Destroys all elements in \(a\). Invalidates all references, pointers, and iterators referring to the elements of \(a\) and may invalidate the past-the-end iterator.

Postconditions: \(a\).empty() is true.

Complexity: Linear.

\(a\).assign(i, j)

Result: void

Preconditions: \(T\) is \(\text{Cpp17EmplaceConstructible}\) into \(X\) from \(*i\) and assignable from \(*i\). For \(\text{vector}\), if the iterator does not meet the forward iterator requirements (25.3.5.5), \(T\) is also \(\text{Cpp17MoveInsertable}\) into \(X\). Neither \(i\) nor \(j\) are iterators into \(a\).

Effects: Replaces elements in \(a\) with a copy of \([i, j)\). Invalidates all references, pointers and iterators referring to the elements of \(a\). For \(\text{vector}\) and \(\text{deque}\), also invalidates the past-the-end iterator. Each iterator in the range \([i, j)\) is dereferenced exactly once.

\(a\).assign_range(rg)

Result: void

Mandates: assignable_from\(<T\&, \text{ranges::range_reference_t\(<R>\)>\> is modeled.

Preconditions: \(T\) is \(\text{Cpp17EmplaceConstructible}\) into \(X\) from \(*\text{ranges::begin}(rg)\). For \(\text{vector}\), if \(R\) models neither \(\text{ranges::sized_range}\) nor \(\text{ranges::forward_range}\), \(T\) is also \(\text{Cpp17MoveInsertable}\) into \(X\). \(rg\) and \(a\) do not overlap.

Effects: Replaces elements in \(a\) with a copy of each element in \(rg\). Invalidates all references, pointers, and iterators referring to the elements of \(a\). For \(\text{vector}\) and \(\text{deque}\), also invalidates the past-the-end iterator. Each iterator in the range \(rg\) is dereferenced exactly once.

\(a\).assign(il)

Effects: Equivalent to \(a\).assign(il.begin(), il.end()).

\(a\).assign(n, t)

Result: void

Preconditions: \(T\) is \(\text{Cpp17CopyInsertable}\) into \(X\) and \(\text{Cpp17CopyAssignable}\). \(t\) is not a reference into \(a\).

Effects: Replaces elements in \(a\) with \(n\) copies of \(t\). Invalidates all references, pointers and iterators referring to the elements of \(a\). For \(\text{vector}\) and \(\text{deque}\), also invalidates the past-the-end iterator.

For every sequence container defined in this Clause and in Clause 23:

(68.1) — If the constructor

\[
\text{template<\text{class InputIterator}>}
\text{X(InputIterator first, InputIterator last,}
\text{const \text{allocator_type}}\& \text{alloc = allocator_type());}
\]

is called with a type \(\text{InputIterator}\) that does not qualify as an input iterator, then the constructor shall not participate in overload resolution.

(68.2) — If the member functions of the forms:

\[
\text{template<\text{class InputIterator}>}
\text{return-type F(const\_iterator p,}
\text{InputIterator first, InputIterator last); \quad \text{// such as insert}
\]

\[
\text{template<\text{class InputIterator}>}
\text{return-type F(InputIterator first, InputIterator last); \quad \text{// such as append, assign}
\]

§ 24.2.4
template<class InputIterator>
  return-type F(const_iterator i1, const_iterator i2,
                  InputIterator first, InputIterator last);  // such as replace

(68.3) — A deduction guide for a sequence container shall not participate in overload resolution if it has an
InputIterator template parameter and a type that does not qualify as an input iterator is deduced
for that parameter, or if it has an Allocator template parameter and a type that does not qualify as
an allocator is deduced for that parameter.

69 The following operations are provided for some types of sequence containers but not others. Operations other
than prepend_range and append_range are implemented so as to take amortized constant time.

a.front()
  Result: reference; const_reference for constant a.
  Returns: *a.begin()
  Remarks: Required for basic_string, array, deque, forward_list, list, and vector.

a.back()
  Result: reference; const_reference for constant a.
  Effects: Equivalent to:
  auto tmp = a.end();
  --tmp;
  return *tmp;
  Remarks: Required for basic_string, array, deque, list, and vector.

a.emplace_front(args)
  Result: reference
  Preconditions: T is Cpp17EmplaceConstructible into X from args.
  Effects: Prepends an object of type T constructed with std::forward<Args>(args)....
  Returns: a.front().
  Remarks: Required for deque, forward_list, and list.

a.emplace_back(args)
  Result: reference
  Preconditions: T is Cpp17EmplaceConstructible into X from args. For vector, T is also Cpp17MoveInsertable into X.
  Effects: Appends an object of type T constructed with std::forward<Args>(args)....
  Returns: a.back().
  Remarks: Required for deque, list, and vector.

a.push_front(t)
  Result: void
  Preconditions: T is Cpp17CopyInsertable into X.
  Effects: Prepends a copy of t.
  Remarks: Required for deque, forward_list, and list.

a.push_front(rv)
  Result: void
  Preconditions: T is Cpp17MoveInsertable into X.
  Effects: Prepends a copy of rv.
  Remarks: Required for deque, forward_list, and list.
a.prepend_range(rg)

Result: void

Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg).
Effects: Inserts copies of elements in rg before begin(). Each iterator in the range rg is dereferenced exactly once.

[Note 3: The order of elements in rg is not reversed. — end note]
Remarks: Required for deque, forward_list, and list.

a.push_back(t)

Result: void

Preconditions: T is Cpp17CopyInsertable into X.
Effects: Appends a copy of t.
Remarks: Required for basic_string, deque, list, and vector.

a.push_back(rv)

Result: void

Preconditions: T is Cpp17MoveInsertable into X.
Effects: Appends a copy of rv.
Remarks: Required for basic_string, deque, list, and vector.

a.append_range(rg)

Result: void

Preconditions: T is Cpp17EmplaceConstructible into X from *ranges::begin(rg). For vector, T is also Cpp17MoveInsertable into X.
Effects: Inserts copies of elements in rg before end(). Each iterator in the range rg is dereferenced exactly once.
Remarks: Required for deque, list, and vector.

a.pop_front()

Result: void

Preconditions: a.empty() is false.
Effects: Destroys the first element.
Remarks: Required for deque, forward_list, and list.

a.pop_back()

Result: void

Preconditions: a.empty() is false.
Effects: Destroys the last element.
Remarks: Required for basic_string, deque, list, and vector.

a[n]

Result: reference; const_reference for constant a
Returns: *(a.begin() + n)
Remarks: Required for basic_string, array, deque, and vector.

a.at(n)

Result: reference; const_reference for constant a
Returns: *(a.begin() + n)
Throws: out_of_range if n >= a.size().
Remarks: Required for basic_string, array, deque, and vector.
24.2.5 Node handles

24.2.5.1 Overview

A node handle is an object that accepts ownership of a single element from an associative container (24.2.7) or an unordered associative container (24.2.8). It may be used to transfer that ownership to another container with compatible nodes. Containers with compatible nodes have the same node handle type. Elements may be transferred in either direction between container types in the same row of Table 84.

Table 84: Container types with compatible nodes

<table>
<thead>
<tr>
<th>map&lt;K, T, C1, A&gt;</th>
<th>map&lt;K, T, C2, A&gt;</th>
</tr>
</thead>
<tbody>
<tr>
<td>map&lt;K, T, C1, A&gt;</td>
<td>multimap&lt;K, T, C2, A&gt;</td>
</tr>

<td>unordered_multiset&lt;K, H2, E2, A&gt;</td>
</tr>
</tbody>
</table>

If a node handle is not empty, then it contains an allocator that is equal to the allocator of the container when the element was extracted. If a node handle is empty, it contains no allocator.

Class node-handle is for exposition only.

If a user-defined specialization of pair exists for pair<const Key, T> or pair<Key, T>, where Key is the container’s key_type and T is the container’s mapped_type, the behavior of operations involving node handles is undefined.

```cpp
template<unspecified>
class node-handle {
public:
    // These type declarations are described in 24.2.7 and 24.2.8.
    using value_type = see below; // not present for map containers
    using key_type = see below; // not present for set containers
    using mapped_type = see below; // not present for set containers
    using allocator_type = see below;

    private:
        using container_node_type = unspecified; // exposition only
        using ator_traits = allocator_traits<allocator_type>; // exposition only

typename ator_traits::template
    rebind_traits<container_node_type>::pointer ptr_; // exposition only
    optional<allocator_type> alloc_; // exposition only

public:
    // 24.2.5.2, constructors, copy, and assignment
    constexpr node-handle() noexcept : ptr_(), alloc_() {}  
    node-handle(node-handle&&) noexcept;
    node-handle(node-handle&&) noexcept;
    node-handle(node-handle&&);  

    // 24.2.5.3, destructor
    ~node-handle();
    
    // 24.2.5.4, observers
    value_type& value() const; // not present for map containers
    key_type& key() const; // not present for set containers
    mapped_type& mapped() const; // not present for set containers

    allocator_type get_allocator() const;
    explicit operator bool() const noexcept;
    [[nodiscard]] bool empty() const noexcept;
}
```

§ 24.2.5.1 884
// 24.2.5.5, modifiers
void swap(node-handle&)
    noexcept(ator_traits::propagate_on_container_swap::value ||
    ator_traits::is_always_equal::value);

friend void swap(node-handle x, node-handle y) noexcept(noexcept(x.swap(y))) {
    x.swap(y);
}

24.2.5.2 Constructors, copy, and assignment

node-handle(node-handle&& nh) noexcept;
1
Effects: Constructs a node-handle object initializing ptr_ with nh.ptr_. Move constructs alloc_ with
nh.alloc_. Assigns nullptr to nh.ptr_ and assigns nullopt to nh.alloc_.

node-handle& operator=(node-handle&& nh);
2
Preconditions: Either !alloc_ or ator_traits::propagate_on_container_move_assignment::value is true, or alloc_ == nh.alloc_.
3
Effects:
(3.1) If ptr_ != nullptr, destroys the value_type subobject in the container_node_type object
pointed to by ptr_ by calling ator_traits::destroy, then deallocates ptr_ by calling ator_traits::template rebind_traits<container_node_type>::deallocate.
(3.2) Assigns nh.ptr_ to ptr_.
(3.3) If !alloc_ or ator_traits::propagate_on_container_move_assignment::value is true,
move assigns nh.alloc_ to alloc_.
(3.4) Assigns nullptr to nh.ptr_ and assigns nullopt to nh.alloc_.
4
Returns: *this.
5
Throws: Nothing.

24.2.5.3 Destructor

~node-handle();
1
Effects: If ptr_ != nullptr, destroys the value_type subobject in the container_node_type object
pointed to by ptr_ by calling ator_traits::destroy, then deallocates ptr_ by calling ator_traits::template rebind_traits<container_node_type>::deallocate.

24.2.5.4 Observers

value_type& value() const;
1
Preconditions: empty() == false.
2
Returns: A reference to the value_type subobject in the container_node_type object pointed to by
ptr_.
3
Throws: Nothing.

key_type& key() const;
4
Preconditions: empty() == false.
5
Returns: A non-const reference to the key_type member of the value_type subobject in the contain-
er_node_type object pointed to by ptr_.
6
Throws: Nothing.
7
Remarks: Modifying the key through the returned reference is permitted.

mapped_type& mapped() const;
8
Preconditions: empty() == false.
9
Returns: A reference to the mapped_type member of the value_type subobject in the container_node_type object pointed to by ptr_.
Throws: Nothing.

allocator_type get_allocator() const;

Preconditions: empty() == false.

Returns: *alloc_.

Throws: Nothing.

explicit operator bool() const noexcept;

Returns: ptr_ != nullptr.

[[nodiscard]] bool empty() const noexcept;

Returns: ptr_ == nullptr.

24.2.5.5 Modifiers

void swap(node-handle& nh)

    noexcept(ator_traits::propagate_on_container_swap::value ||
             ator_traits::is_always_equal::value);

Preconditions: !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value is true, or alloc_ == nh.alloc_.

Effects: Calls swap(ptr_, nh.ptr_). If !alloc_, or !nh.alloc_, or ator_traits::propagate_on_container_swap::value is true calls swap(alloc_, nh.alloc_).

24.2.6 Insert return type

The associative containers with unique keys and the unordered containers with unique keys have a member function insert that returns a nested type insert_return_type. That return type is a specialization of the template specified in this subclause.

    template<class Iterator, class NodeType>
    struct insert-return-type
    {
        Iterator position;
        bool inserted;
        NodeType node;
    };

The name insert-return-type is exposition only. insert-return-type has the template parameters, data members, and special members specified above. It has no base classes or members other than those specified.

24.2.7 Associative containers

24.2.7.1 General

Associative containers provide fast retrieval of data based on keys. The library provides four basic kinds of associative containers: set, multiset, map and multimap. The library also provides container adaptors that make it easy to construct abstract data types, such as flat_maps, flat_multimaps, flat_sets, or flat_multisets, out of the basic sequence container kinds (or out of other program-defined sequence containers).

Each associative container is parameterized on Key and an ordering relation Compare that induces a strict weak ordering (27.8) on elements of Key. In addition, map and multimap associate an arbitrary mapped type T with the Key. The object of type Compare is called the comparison object of a container.

The phrase “equivalence of keys” means the equivalence relation imposed by the comparison object. That is, two keys k1 and k2 are considered to be equivalent if for the comparison object comp, comp(k1, k2) == false & & comp(k2, k1) == false.

[Note 1: This is not necessarily the same as the result of k1 == k2. — end note]

For any two keys k1 and k2 in the same container, calling comp(k1, k2) shall always return the same value.

An associative container supports unique keys if it may contain at most one element for each key. Otherwise, it supports equivalent keys. The set and map classes support unique keys; the multiset and multimap
classes support equivalent keys. For `multiset` and `multimap`, `insert`, `emplace`, and `erase` preserve the relative ordering of equivalent elements.

5 For `set` and `multiset` the value type is the same as the key type. For `map` and `multimap` it is equal to `pair<const Key, T>`. 

6 `iterator` of an associative container is of the bidirectional iterator category. For associative containers where the value type is the same as the key type, both `iterator` and `const_iterator` are constant iterators. It is unspecified whether or not `iterator` and `const_iterator` are the same type.

[Note 2: `iterator` and `const_iterator` have identical semantics in this case, and `iterator` is convertible to `const_iterator`. Users can avoid violating the one-definition rule by always using `const_iterator` in their function parameter lists. — end note]

7 In this subclause,

- (7.1) X denotes an associative container class,
- (7.2) a denotes a value of type X,
- (7.3) a2 denotes a value of a type with nodes compatible with type X (Table 84),
- (7.4) b denotes a value or type X or `const` X,
- (7.5) u denotes the name of a variable being declared,
- (7.6) a_uniq denotes a value of type X when X supports unique keys,
- (7.7) a_eq denotes a value of type X when X supports multiple keys,
- (7.8) a_tran denotes a value of type X or `const` X when the `qualified-id` X::key_compare::is_transparent is valid and denotes a type (13.10.3),
- (7.9) i and j meet the `Cpp17InputIterator` requirements and refer to elements implicitly convertible to `value_type`,
- (7.10) [i, j) denotes a valid range,
- (7.11) rg denotes a value of a type R that models `container-compatible-range<value_type>`,
- (7.12) p denotes a valid constant iterator to a,
- (7.13) q denotes a valid dereferenceable constant iterator to a,
- (7.14) r denotes a valid dereferenceable iterator to a,
- (7.15) [q1, q2) denotes a valid range of constant iterators in a,
- (7.16) il designates an object of type `initializer_list<value_type>`,
- (7.17) t denotes a value of a type X::value_type,
- (7.18) k denotes a value of a type X::key_type, and
- (7.19) c denotes a value of a type X::key_compare or `const` X::key_compare;
- (7.20) kl is a value such that a is partitioned (27.8) with respect to c(x, kl), with x the key value of e and e in a;
- (7.21) ku is a value such that a is partitioned with respect to !c(ku, x), with x the key value of e and e in a;
- (7.22) ke is a value such that a is partitioned with respect to c(x, ke) and !c(ke, x), with c(x, ke) implying !c(ke, x) and with x the key value of e and e in a;
- (7.23) kx is a value such that
  - (7.23.1) a is partitioned with respect to c(x, kx) and !c(kx, x), with c(x, kx) implying !c(kx, x) and with x the key value of e and e in a, and
  - (7.23.2) kx is not convertible to either `iterator` or `const_iterator`; and
- (7.24) A denotes the storage allocator used by X, if any, or allocator<X::value_type> otherwise,
- (7.25) m denotes an allocator of a type convertible to A, and nh denotes a non-const rvalue of type X::node_type.

8 A type X meets the `associative_container` requirements if X meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the
specified semantics, except that for map and multimap, the requirements placed on value_type in 24.2.2.5 apply instead to key_type and mapped_type.

[Note 3: For example, in some cases key_type and mapped_type are required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. — end note]

typename X::key_type
   Result: Key.

typename X::mapped_type
   Result: T.
   Remarks: For map and multimap only.

typename X::value_type
   Result: Key for set and multiset only; pair<const Key, T> for map and multimap only.
   Preconditions: X::value_type is Cpp17Erasable from X.

typename X::key_compare
   Result: Compare.
   Preconditions: key_compare is Cpp17CopyConstructible.

typename X::value_compare
   Result: A binary predicate type. It is the same as key_compare for set and multiset; is an ordering relation on pairs induced by the first component (i.e., Key) for map and multimap.

typename X::node_type
   Result: A specialization of the node-handle class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(c)
   Effects: Constructs an empty container. Uses a copy of c as a comparison object.
   Complexity: Constant.

X u = X();
X u;
   Preconditions: key_compare meets the Cpp17DefaultConstructible requirements.
   Effects: Constructs an empty container. Uses Compare() as a comparison object.
   Complexity: Constant.

X(i, j, c)
   Preconditions: value_type is Cpp17EmplaceConstructible into X from *i.
   Effects: Constructs an empty container and inserts elements from the range [i, j) into it; uses c as a comparison object.
   Complexity: \(N \log N\) in general, where \(N\) has the value distance(i, j); linear if [i, j) is sorted with respect to value_comp().

X(i, j)
   Preconditions: key_compare meets the Cpp17DefaultConstructible requirements. value_type is Cpp17EmplaceConstructible into X from *i.
   Effects: Constructs an empty container and inserts elements from the range [i, j) into it; uses Compare() as a comparison object.
   Complexity: \(N \log N\) in general, where \(N\) has the value distance(i, j); linear if [i, j) is sorted with respect to value_comp().

X(from_range, rg, c)
   Preconditions: value_type is Cpp17EmplaceConstructible into X from *ranges::begin(rg).
Effects: Constructs an empty container and inserts each element from \( \text{rg} \) into it. Uses \( c \) as the comparison object.

Complexity: \( N \log N \) in general, where \( N \) has the value \( \text{ranges::distance(rg)} \); linear if \( \text{rg} \) is sorted with respect to \( \text{value\_comp()} \).

\( X(\text{from\_range, rg}) \)

Preconditions: \( \text{key\_compare} \) meets the \( \text{Cpp17DefaultConstructible} \) requirements. \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \star \text{ranges::begin(rg)} \).

Effects: Constructs an empty container and inserts each element from \( \text{rg} \) into it. Uses \( \text{Compare()} \) as the comparison object.

Complexity: Same as \( X(\text{from\_range, rg, c}) \).

\( X(\text{il, c}) \)

Effects: Equivalent to \( X(\text{il.begin()}, \text{il.end()}, \text{c}) \).

\( X(\text{il}) \)

Effects: Equivalent to \( X(\text{il.begin()}, \text{il.end}) \).

\( a = \text{il} \)

Result: \( X \& \)

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17CopyInsertable} \) into \( X \) and \( \text{Cpp17CopyAssignable} \).

Effects: Assigns the range \( [\text{il.begin()}, \text{il.end}()] \) into \( a \). All existing elements of \( a \) are either assigned to or destroyed.

Complexity: \( N \log N \) in general, where \( N \) has the value \( \text{il\_size()} + \text{a\_size()} \); linear if \( [\text{il\_begin()}, \text{il\_end}()] \) is sorted with respect to \( \text{value\_comp()} \).

\( b\text{.key\_comp()} \)

Result: \( X::\text{key\_compare} \)

Returns: The comparison object out of which \( b \) was constructed.

Complexity: Constant.

\( b\text{.value\_comp()} \)

Result: \( X::\text{value\_compare} \)

Returns: An object of \( \text{value\_compare} \) constructed out of the comparison object.

Complexity: Constant.

\( a\text{\_uniq}\text{.emplace(args)} \)

Result: \( \text{pair<iterator, bool>} \)

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \text{args} \).

Effects: Inserts a \( \text{value\_type} \) object \( t \) constructed with \( \text{std::forward<Args>(args)} \)\ldots if and only if there is no element in the container with key equivalent to the key of \( t \).

Returns: The \text{bool} component of the returned pair is \text{true} if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of \( t \).

Complexity: Logarithmic.

\( a\text{\_eq}\text{.emplace(args)} \)

Result: \( \text{iterator} \)

Preconditions: \( \text{value\_type} \) is \( \text{Cpp17EmplaceConstructible} \) into \( X \) from \( \text{args} \).

Effects: Inserts a \( \text{value\_type} \) object \( t \) constructed with \( \text{std::forward<Args>(args)} \)\ldots If a range containing elements equivalent to \( t \) exists in \( a\text{\_eq} \), \( t \) is inserted at the end of that range.

Returns: An iterator pointing to the newly inserted element.

Complexity: Logarithmic.
a.emplace_hint(p, args)

Result: iterator

Effects: Equivalent to a.emplace(std::forward<Args>(args)...), except that the element is inserted as close as possible to the position just prior to p.

Returns: An iterator pointing to the element with the key equivalent to the newly inserted element.

Complexity: Logarithmic in general, but amortized constant if the element is inserted right before p.

a_uniq.insert(t)

Result: pair<iterator, bool>

Preconditions: If t is a non-const rvalue, value_type is Cpp17MoveInsertable into X; otherwise, value_type is Cpp17CopyInsertable into X.

Effects: Inserts t if and only if there is no element in the container with key equivalent to the key of t.

Returns: The bool component of the returned pair is true if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of t.

Complexity: Logarithmic.

a_eq.insert(t)

Result: iterator

Preconditions: If t is a non-const rvalue, value_type is Cpp17MoveInsertable into X; otherwise, value_type is Cpp17CopyInsertable into X.

Effects: Inserts t and returns the iterator pointing to the newly inserted element. If a range containing elements equivalent to t exists in a_eq, t is inserted at the end of that range.

Complexity: Logarithmic.

a.insert(p, t)

Result: iterator

Preconditions: If t is a non-const rvalue, value_type is Cpp17MoveInsertable into X; otherwise, value_type is Cpp17CopyInsertable into X.

Effects: Inserts t if and only if there is no element with key equivalent to the key of t in containers with unique keys; always inserts t in containers with equivalent keys. t is inserted as close as possible to the position just prior to p.

Returns: An iterator pointing to the element with key equivalent to the key of t.

Complexity: Logarithmic in general, but amortized constant if t is inserted right before p.

a.insert(i, j)

Result: void

Preconditions: value_type is Cpp17EmplaceConstructible into X from *i. Neither i nor j are iterators into a.

Effects: Inserts each element from the range [i, j) if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

Complexity: \(N \log(a.size() + N)\), where \(N\) has the value distance(i, j).

a.insert_range(rg)

Result: void

Preconditions: value_type is Cpp17EmplaceConstructible into X from *ranges::begin(rg). rg and a do not overlap.

Effects: Inserts each element from rg if and only if there is no element with key equivalent to the key of that element in containers with unique keys; always inserts that element in containers with equivalent keys.

Complexity: \(N \log(a.size() + N)\), where \(N\) has the value ranges::distance(rg).

§ 24.2.7.1
a.insert(il)

Effects: Equivalent to a.insert(il.begin(), il.end()).

a_uniq.insert(nh)

Result: insert_return_type

Preconditions: nh is empty or a_uniq.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect. Otherwise, inserts the element owned by nh if and only if there is no element in the container with a key equivalent to nh.key().

Returns: If nh is empty, inserted is false, position is end(), and node is empty. Otherwise if the insertion took place, inserted is true, position points to the inserted element, and node is empty; if the insertion failed, inserted is false, node has the previous value of nh, and position points to an element with a key equivalent to nh.key().

Complexity: Logarithmic.

a_eq.insert(nh)

Result: iterator

Preconditions: nh is empty or a_eq.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect and returns a_eq.end(). Otherwise, inserts the element owned by nh and returns an iterator pointing to the newly inserted element. If a range containing elements with keys equivalent to nh.key() exists in a_eq, the element is inserted at the end of that range.

Postconditions: nh is empty.

Complexity: Logarithmic.

a.insert(p, nh)

Result: iterator

Preconditions: nh is empty or a.get_allocator() == nh.get_allocator() is true.

Effects: If nh is empty, has no effect and returns a.end(). Otherwise, inserts the element owned by nh if and only if there is no element with key equivalent to nh.key() in containers with unique keys; always inserts the element owned by nh in containers with equivalent keys. The element is inserted as close as possible to the position just prior to p.

Postconditions: nh is empty if insertion succeeds, unchanged if insertion fails.

Returns: An iterator pointing to the element with key equivalent to nh.key().

Complexity: Logarithmic in general, but amortized constant if the element is inserted right before p.

a.extract(k)

Result: node_type

Effects: Removes the first element in the container with key equivalent to k.

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: log(a.size())

a_tran.extract(kx)

Result: node_type

Effects: Removes the first element in the container with key r such that !c(r, kx) && !c(kx, r) is true.

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: log(a_tran.size())

a.extract(q)

Result: node_type

Effects: Removes the element pointed to by q.

Returns: A node_type owning that element.
Complexity: Amortized constant.

a.merge(a2)

Result: void

Preconditions: a.get_allocator() == a2.get_allocator().

Effects: Attempts to extract each element in a2 and insert it into a using the comparison object of a. In containers with unique keys, if there is an element in a with key equivalent to the key of an element from a2, then that element is not extracted from a2.

Postconditions: Pointers and references to the transferred elements of a2 refer to those same elements but as members of a. Iterators referring to the transferred elements will continue to refer to their elements, but they now behave as iterators into a, not into a2.

Throws: Nothing unless the comparison object throws.

Complexity: N log(a.size()+N), where N has the value a2.size().

a.erase(k)

Result: size_type

Effects: Erases all elements in the container with key equivalent to k.

Returns: The number of erased elements.

Complexity: log(a.size()) + a.count(k)

a_tran.erase(kx)

Result: size_type

Effects: Erases all elements in the container with key r such that !(c(r, kx) && !c(kx, r)) is true.

Returns: The number of erased elements.

Complexity: log(a.size()) + a_tran.count(kx)

a.erase(q)

Result: iterator

Effects: Erases the element pointed to by q.

Returns: An iterator pointing to the element immediately following q prior to the element being erased. If no such element exists, returns a.end().

Complexity: Amortized constant.

a.erase(r)

Result: iterator

Effects: Erases the element pointed to by r.

Returns: An iterator pointing to the element immediately following r prior to the element being erased. If no such element exists, returns a.end().

Complexity: Amortized constant.

a.erase(q1, q2)

Result: iterator

Effects: Erases all the elements in the range [q1,q2).

Returns: An iterator pointing to the element pointed to by q2 prior to any elements being erased. If no such element exists, a.end() is returned.

Complexity: log(a.size()) + N, where N has the value distance(q1, q2).

a.clear()

Effects: Equivalent to a.erase(a.begin(), a.end()).

Postconditions: a.empty() is true.

Complexity: Linear in a.size().
b.find(k)

Result: iterator; const_iterator for constant b.

Returns: An iterator pointing to an element with the key equivalent to k, or b.end() if such an element
is not found.

Complexity: Logarithmic.

a_tran.find(ke)

Result: iterator; const_iterator for constant a_tran.

Returns: An iterator pointing to an element with key r such that \( !c(r, ke) \&\& !c(ke, r) \) is true,
or a_tran.end() if such an element is not found.

Complexity: Logarithmic.

b.count(k)

Result: size_type

Returns: The number of elements with key equivalent to k.

Complexity: \( \log(b.size()) + b.count(k) \)

a_tran.count(ke)

Result: size_type

Returns: The number of elements with key r such that \( !c(r, ke) \&\& !c(ke, r) \).

Complexity: \( \log(a_tran.size()) + a_tran.count(ke) \)

b.contains(k)

Result: bool

Effects: Equivalent to: return b.find(k) != b.end();

a_tran.contains(ke)

Result: bool

Effects: Equivalent to: return a_tran.find(ke) != a_tran.end();

b.lower_bound(k)

Result: iterator; const_iterator for constant b.

Returns: An iterator pointing to the first element with key not less than k, or b.end() if such an
element is not found.

Complexity: Logarithmic.

a_tran.lower_bound(kl)

Result: iterator; const_iterator for constant a_tran.

Returns: An iterator pointing to the first element with key r such that \( !c(r, kl) \), or a_tran.end() if
such an element is not found.

Complexity: Logarithmic.

b.upper_bound(k)

Result: iterator; const_iterator for constant b.

Returns: An iterator pointing to the first element with key greater than k, or b.end() if such an
element is not found.

Complexity: Logarithmic.

a_tran.upper_bound(ku)

Result: iterator; const_iterator for constant a_tran.

Returns: An iterator pointing to the first element with key r such that c(ku, r), or a_tran.end() if
such an element is not found.
Complexity: Logarithmic.

\[
\text{b.equal_range(k)}
\]
\[
\text{Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant b.}
\]
\[
\text{Effects: Equivalent to: return make_pair(b.lower_bound(k), b.upper_bound(k));}
\]
\[
\text{Complexity: Logarithmic.}
\]

\[
\text{a_tran.equal_range(ke)}
\]
\[
\text{Result: pair<iterator, iterator>; pair<const_iterator, const_iterator> for constant a_tran.}
\]
\[
\text{Effects: Equivalent to: return make_pair(a_tran.lower_bound(ke), a_tran.upper_bound(ke));}
\]
\[
\text{Complexity: Logarithmic.}
\]

The \text{insert, insert\_range, and emplace} members shall not affect the validity of iterators and references to the container, and the \text{erase} members shall invalidate only iterators and references to the erased elements.

The \text{extract} members invalidate only iterators to the removed element; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a \text{node\_type} is undefined behavior. References and pointers to an element obtained while it is owned by a \text{node\_type} are invalidated if the element is successfully inserted.

The fundamental property of iterators of associative containers is that they iterate through the containers in the non-descending order of keys where non-descending is defined by the comparison that was used to construct them. For any two dereferenceable iterators \(i\) and \(j\) such that distance from \(i\) to \(j\) is positive, the following condition holds:

\[
\text{value\_comp(*j, *i) == false}
\]

For associative containers with unique keys the stronger condition holds:

\[
\text{value\_comp(*i, *j) != false}
\]

When an associative container is constructed by passing a comparison object the container shall not store a pointer or reference to the passed object, even if that object is passed by reference. When an associative container is copied, through either a copy constructor or an assignment operator, the target container shall then use the comparison object from the container being copied, as if that comparison object had been passed to the target container in its constructor.

The member function templates \text{find, count, contains, lower\_bound, upper\_bound, equal\_range, erase, and extract} shall not participate in overload resolution unless the \text{qualified-id Compare::is\_transparent} is valid and denotes a type (13.10.3). Additionally, the member function templates \text{extract} and \text{erase} shall not participate in overload resolution if \text{is\_convertible_v<K&&, iterator>} || \text{is\_convertible_v<K&&, const\_iterator>} is true, where \(K\) is the type substituted as the first template argument.

A deduction guide for an associative container shall not participate in overload resolution if any of the following are true:

(181.1) — It has an \text{InputIterator} template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(181.2) — It has an \text{Allocator} template parameter and a type that does not qualify as an allocator is deduced for that parameter.

(181.3) — It has a \text{Compare} template parameter and a type that qualifies as an allocator is deduced for that parameter.

\section*{24.2.7.2 Exception safety guarantees \hfill [associative\_reqmts\_except]}

1 For associative containers, no \text{clear()} function throws an exception. \text{erase(k)} does not throw an exception unless that exception is thrown by the container’s \text{Compare} object (if any).

2 For associative containers, if an exception is thrown by any operation from within an \text{insert} or \text{emplace} function inserting a single element, the insertion has no effect.

3 For associative containers, no \text{swap} function throws an exception unless that exception is thrown by the swap of the container’s \text{Compare} object (if any).
24.2.8 Unordered associative containers [unord.req]

24.2.8.1 General [unord.req.general]

1 Unordered associative containers provide an ability for fast retrieval of data based on keys. The worst-case complexity for most operations is linear, but the average case is much faster. The library provides four unordered associative containers: unordered_set, unordered_map, unordered_multiset, and unordered_multimap.

2 Unordered associative containers conform to the requirements for Containers (24.2), except that the expressions a == b and a != b have different semantics than for the other container types.

3 Each unordered associative container is parameterized by Key, by a function object type Hash that meets the C++17Hash requirements (16.4.4.5) and acts as a hash function for argument values of type Key, and by a binary predicate Pred that induces an equivalence relation on values of type Key. Additionally, unordered_map and unordered_multimap associate an arbitrary mapped type T with the Key.

4 The container’s object of type Hash — denoted by hash — is called the hash function of the container. The container’s object of type Pred — denoted by pred — is called the key equality predicate of the container.

5 Two values k1 and k2 are considered equivalent if the container’s key equality predicate pred(k1, k2) is valid and returns true when passed those values. If k1 and k2 are equivalent, the container’s hash function shall return the same value for both.

[Note 1: Thus, when an unordered associative container is instantiated with a non-default Pred parameter it usually needs a non-default Hash parameter as well. — end note]

For any two keys k1 and k2 in the same container, calling pred(k1, k2) shall always return the same value. For any key k in a container, calling hash(k) shall always return the same value.

6 An unordered associative container supports unique keys if it may contain at most one element for each key. Otherwise, it supports equivalent keys. unordered_set and unordered_map support unique keys. unordered_multiset and unordered_multimap support equivalent keys. In containers that support equivalent keys, elements with equivalent keys are adjacent to each other in the iteration order of the container. Thus, although the absolute order of elements in an unordered container is not specified, its elements are grouped into equivalent-key groups such that all elements of each group have equivalent keys. Mutating operations on unordered containers shall preserve the relative order of elements within each equivalent-key group unless otherwise specified.

7 For unordered_set and unordered_multiset the value type is the same as the key type. For unordered_map and unordered_multimap it is pair<const Key, T>.

8 For unordered containers where the value type is the same as the key type, both iterator and const_iterator are constant iterators. It is unspecified whether or not iterator and const_iterator are the same type.

[Note 2: iterator and const_iterator have identical semantics in this case, and iterator is convertible to const_iterator. Users can avoid violating the one-definition rule by always using const_iterator in their function parameter lists. — end note]

9 The elements of an unordered associative container are organized into buckets. Keys with the same hash code appear in the same bucket. The number of buckets is automatically increased as elements are added to an unordered associative container, so that the average number of elements per bucket is kept below a bound. Rehashing invalidates iterators, changes ordering between elements, and changes which buckets elements appear in, but does not invalidate pointers or references to elements. For unordered_multiset and unordered_multimap, rehashing preserves the relative ordering of equivalent elements.

10 In this subclause,

(10.1) — X denotes an unordered associative container class,
(10.2) — a denotes a value of type X,
(10.3) — a2 denotes a value of a type with nodes compatible with type X (Table 84),
(10.4) — b denotes a value of type X or const X,
(10.5) — a_uniq denotes a value of type X when X supports unique keys,
(10.6) — a_eq denotes a value of type X when X supports equivalent keys,
(10.7) — a_tran denotes a value of type X or const X when the qualified-ids X::key_equal::is_transparent and X::hasher::is_transparent are both valid and denote types (13.10.3),
i and j denote input iterators that refer to value_type,

[i, j) denotes a valid range,

rg denotes a value of a type R that models container-compatible-range<value_type>,

p and q2 denote valid constant iterators to a,

q and q1 denote valid dereferenceable constant iterators to a,

r denotes a valid dereferenceable iterator to a,

[q1, q2) denotes a valid range in a,

il denotes a value of type initializer_list<value_type>,

t denotes a value of type X::value_type,

k denotes a value of type key_type,

hf denotes a value of type hasher or const hasher,

eq denotes a value of type key_equal or const key_equal,

ke is a value such that

— eq(r1, ke) == eq(ke, r1),
— hf(r1) == hf(ke) if eq(r1, ke) is true, and
— (eq(r1, ke) && eq(r1, r2)) == eq(r2, ke),

where r1 and r2 are keys of elements in a_tran,

kx is a value such that

— eq(r1, kx) == eq(kx, r1),
— hf(r1) == hf(kx) if eq(r1, kx) is true,
— (eq(r1, kx) && eq(r1, r2)) == eq(r2, kx), and
— kx is not convertible to either iterator or const_iterator,

where r1 and r2 are keys of elements in a_tran,

n denotes a value of type size_type,

z denotes a value of type float, and

nh denotes an rvalue of type X::node_type.

A type X meets the unordered associative container requirements if X meets all the requirements of an allocator-aware container (24.2.2.1) and the following types, statements, and expressions are well-formed and have the specified semantics, except that for unordered_map and unordered_multimap, the requirements placed on value_type in 24.2.2.5 apply instead to key_type and mapped_type.

[Note 3: For example, key_type and mapped_type are sometimes required to be Cpp17CopyAssignable even though the associated value_type, pair<const key_type, mapped_type>, is not Cpp17CopyAssignable. —end note]

typename X::key_type

Result: Key.

typename X::mapped_type

Result: T.

Remarks: For unordered_map and unordered_multimap only.

typename X::value_type

Result: Key for unordered_set and unordered_multiset only; pair<const Key, T> for unordered_map and unordered_multimaps only.

Preconditions: value_type is Cpp17Erasable from X.

typename X::hasher

Result: Hash.

Preconditions: Hash is a unary function object type such that the expression hf(k) has type size_t.
typename X::key_equal

Result: Pred.

Preconditions: Pred meets the Cpp17CopyConstructible requirements. Pred is a binary predicate that takes two arguments of type Key. Pred is an equivalence relation.

typename X::local_iterator

Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::iterator's.

[Note 4: A local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typename X::const_local_iterator

Result: An iterator type whose category, value type, difference type, and pointer and reference types are the same as X::const_iterator's.

[Note 5: A const_local_iterator object can be used to iterate through a single bucket, but cannot be used to iterate across buckets. — end note]

typename X::node_type

Result: A specialization of a node-handle class template (24.2.5), such that the public nested types are the same types as the corresponding types in X.

X(n, hf, eq)

Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate.

Complexity: $\Theta(n)$

X(n, hf)

Preconditions: key_equal meets the Cpp17DefaultConstructible requirements.

Effects: Constructs an empty container with at least n buckets, using hf as the hash function and key_equal() as the key equality predicate.

Complexity: $\Theta(n)$

X(n)

Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

Effects: Constructs an empty container with at least n buckets, using hasher() as the hash function and key_equal() as the key equality predicate.

Complexity: $\Theta(n)$

X a = X();
X a;

Preconditions: hasher and key_equal meet the Cpp17DefaultConstructible requirements.

Effects: Constructs an empty container with an unspecified number of buckets, using hasher() as the hash function and key_equal() as the key equality predicate.

Complexity: Constant.

X(i, j, n, hf, eq)

Preconditions: value_type is Cpp17EmplaceConstructible into X from *i.

Effects: Constructs an empty container with at least n buckets, using hf as the hash function and eq as the key equality predicate, and inserts elements from [i, j) into it.

Complexity: Average case $\Theta(N)$ ($N$ is distance(i, j)), worst case $\Theta(N^2)$.

X(i, j, n, hf)

Preconditions: key_equal meets the Cpp17DefaultConstructible requirements. value_type is Cpp17-EmplaceConstructible into X from *i.
Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \code{key_equal()} as the key equality predicate, and inserts elements from \([i, j] \) into it.

Complexity: Average case \( \Theta(N) \) \((N \text{ is } \text{distance}(i, j))\), worst case \( \Theta(N^2) \).

\( X(i, j, n) \)

Preconditions: \code{hasher} and \code{key_equal} meet the \code{Cpp17EmplaceConstructible} requirements. \code{value_type} is \code{Cpp17EmplaceConstructible} into \( X \) from \(*i\).

Effects: Constructs an empty container with at least \( n \) buckets, using \code{hasher()} as the hash function and \code{key_equal()} as the key equality predicate, and inserts elements from \([i, j] \) into it.

Complexity: Average case \( \Theta(N) \) \((N \text{ is } \text{distance}(i, j))\), worst case \( \Theta(N^2) \).

\( X(i, j) \)

Preconditions: \code{hasher} and \code{key_equal} meet the \code{Cpp17DefaultConstructible} requirements. \code{value_type} is \code{Cpp17EmplaceConstructible} into \( X \) from \(*i\).

Effects: Constructs an empty container with an unspecified number of buckets, using \code{hasher()} as the hash function and \code{key_equal()} as the key equality predicate, and inserts elements from \([i, j] \) into it.

Complexity: Average case \( \Theta(N) \) \((N \text{ is } \text{distance}(i, j))\), worst case \( \Theta(N^2) \).

\( X(\text{from\_range}, \text{rg}, n, hf, eq) \)

Preconditions: \code{value_type} is \code{Cpp17EmplaceConstructible} into \( X \) from \(*\text{ranges}::begin(\text{rg})\).

Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \code{eq} as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) \((N \text{ is } \text{ranges}::\text{distance}(\text{rg}))\), worst case \( \Theta(N^2) \).

\( X(\text{from\_range}, \text{rg}, n, hf) \)

Preconditions: \code{key_equal} meets the \code{Cpp17DefaultConstructible} requirements. \code{value_type} is \code{Cpp17EmplaceConstructible} into \( X \) from \(*\text{ranges}::begin(\text{rg})\).

Effects: Constructs an empty container with at least \( n \) buckets, using \( hf \) as the hash function and \code{key_equal()} as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) \((N \text{ is } \text{ranges}::\text{distance}(\text{rg}))\), worst case \( \Theta(N^2) \).

\( X(\text{from\_range}, \text{rg}) \)

Preconditions: \code{hasher} and \code{key_equal} meet the \code{Cpp17DefaultConstructible} requirements. \code{value_type} is \code{Cpp17EmplaceConstructible} into \( X \) from \(*\text{ranges}::begin(\text{rg})\).

Effects: Constructs an empty container with an unspecified number of buckets, using \code{hasher()} as the hash function and \code{key_equal()} as the key equality predicate, and inserts elements from \( \text{rg} \) into it.

Complexity: Average case \( \Theta(N) \) \((N \text{ is } \text{ranges}::\text{distance}(\text{rg}))\), worst case \( \Theta(N^2) \).

\( X(\text{il}) \)

Effects: Equivalent to \( X(\text{il}.\text{begin()}, \text{il}.\text{end()}) \).

\( X(\text{il}, n) \)

Effects: Equivalent to \( X(\text{il}.\text{begin()}, \text{il}.\text{end()}, n) \).

\( X(\text{il}, n, hf) \)

Effects: Equivalent to \( X(\text{il}.\text{begin()}, \text{il}.\text{end()}, n, hf) \).
X(il, n, hf, eq)

Effects: Equivalent to X(il.begin(), il.end(), n, hf, eq).

X(b)

Effects: In addition to the container requirements (24.2.2.1), copies the hash function, predicate, and maximum load factor.

Complexity: Average case linear in b.size(), worst case quadratic.

a = b

Result: X&

Effects: In addition to the container requirements, copies the hash function, predicate, and maximum load factor.

Complexity: Average case linear in b.size(), worst case quadratic.

a = il

Result: X&

Preconditions: value_type is Cpp17CopyInsertable into X and Cpp17CopyAssignable.

Effects: Assigns the range [il.begin(), il.end()) into a. All existing elements of a are either assigned to or destroyed.

Complexity: Average case linear in il.size(), worst case quadratic.

b.hash_function()

Result: hasher

Returns: b's hash function.

Complexity: Constant.

b.key_eq()

Result: key_equal

Returns: b's key equality predicate.

Complexity: Constant.

a_uniq.emplace(args)

Result: pair<iterator, bool>

Preconditions: value_type is Cpp17EmplaceConstructible into X from args.

Effects: Inserts a value_type object t constructed with std::forward<Args>(args)... if and only if there is no element in the container with key equivalent to the key of t.

Returns: The bool component of the returned pair is true if and only if the insertion takes place, and the iterator component of the pair points to the element with key equivalent to the key of t.

Complexity: Average case $O(1)$, worst case $O(a_uniq.size())$.

a_eq.emplace(args)

Result: iterator

Preconditions: value_type is Cpp17EmplaceConstructible into X from args.

Effects: Inserts a value_type object t constructed with std::forward<Args>(args)....

Returns: An iterator pointing to the newly inserted element.

Complexity: Average case $O(1)$, worst case $O(a_eq.size())$.

a.emplace_hint(p, args)

Result: iterator

Preconditions: value_type is Cpp17EmplaceConstructible into X from args.

Effects: Equivalent to a.emplace(std::forward<Args>(args)...).
Returns: An iterator pointing to the element with the key equivalent to the newly inserted element. The `const_iterator p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\[
a\text{uniq}.\text{insert}(t)
\]

Result: `pair<iterator, bool>`

Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.

Effects: Inserts `t` if and only if there is no element in the container with key equivalent to the key of `t`.

Returns: The `bool` component of the returned pair indicates whether the insertion takes place, and the `iterator` component points to the element with key equivalent to the key of `t`.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\[
a\text{eq}.\text{insert}(t)
\]

Result: `iterator`

Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.

Effects: Inserts `t`.

Returns: An iterator pointing to the newly inserted element.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\[
a.\text{insert}(p, t)
\]

Result: `iterator`

Preconditions: If `t` is a non-const rvalue, `value_type` is `Cpp17MoveInsertable` into `X`; otherwise, `value_type` is `Cpp17CopyInsertable` into `X`.

Effects: Equivalent to `a.insert(t)`. The iterator `p` is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Returns: An iterator pointing to the element with the key equivalent to that of `t`.

Complexity: Average case $\Theta(1)$, worst case $\Theta(a.size())$.

\[
a.\text{insert}(i, j)
\]

Result: `void`

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into `X` from `*i`. Neither `i` nor `j` are iterators into `a`.

Effects: Equivalent to `a.insert(t)` for each element in `[i, j)`.

Complexity: Average case $\Theta(N)$, where $N$ is `distance(i, j)`, worst case $\Theta(N(a.size() + 1))$.

\[
a.\text{insert\_range}(rg)
\]

Result: `void`

Preconditions: `value_type` is `Cpp17EmplaceConstructible` into `X` from `ranges::begin(rg)`. `rg` and `a` do not overlap.

Effects: Equivalent to `a.insert(t)` for each element `t` in `rg`.

Complexity: Average case $\Theta(N)$, where $N$ is `ranges::distance(rg)`, worst case $\Theta(N(a.size() + 1))$.

\[
a.\text{insert}(il)
\]

Effects: Equivalent to `a.insert(il.begin(), il.end())`.

\[
a\text{uniq}.\text{insert}(nh)
\]

Result: `insert\_return\_type`

Preconditions: `nh` is empty or `a.uniq.get_allocator() == nh.get_allocator()` is true.
Effects: If \( nh \) is empty, has no effect. Otherwise, inserts the element owned by \( nh \) if and only if there is no element in the container with a key equivalent to \( nh.key() \).

Postconditions: If \( nh \) is empty, \( inserted \) is \( false \), \( position \) is \( end() \), and \( node \) is empty. Otherwise, if the insertion took place, \( inserted \) is \( true \), \( position \) points to the inserted element, and \( node \) is empty; if the insertion failed, \( inserted \) is \( false \), \( node \) has the previous value of \( nh \), and \( position \) points to an element with a key equivalent to \( nh.key() \).

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(a_{uniq}.size()) \).

\[ a\_eq.insert(nh) \]

Result: iterator

Preconditions: \( nh \) is empty or \( a\_eq.get_allocator() == nh.get_allocator() \) is true.

Effects: If \( nh \) is empty, has no effect and returns \( a\_eq.end() \). Otherwise, inserts the element owned by \( nh \) and returns an iterator pointing to the newly inserted element.

Postconditions: \( nh \) is empty.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(a_{eq}.size()) \).

\[ a.insert(q, nh) \]

Result: iterator

Preconditions: \( nh \) is empty or \( a.get_allocator() == nh.get_allocator() \) is true.

Effects: If \( nh \) is empty, has no effect and returns \( a.end() \). Otherwise, inserts the element owned by \( nh \) if and only if there is no element with key equivalent to \( nh.key() \) in containers with unique keys; always inserts the element owned by \( nh \) in containers with equivalent keys. The iterator \( q \) is a hint pointing to where the search should start. Implementations are permitted to ignore the hint.

Postconditions: \( nh \) is empty if insertion succeeds, unchanged if insertion fails.

Returns: An iterator pointing to the element with key equivalent to \( nh.key() \).

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(a.size()) \).

\[ a.extract(k) \]

Result: node_type

Effects: Removes an element in the container with key equivalent to \( k \).

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(a.size()) \).

\[ a\_tran.extract(kx) \]

Result: node_type

Effects: Removes an element in the container with key equivalent to \( kx \).

Returns: A node_type owning the element if found, otherwise an empty node_type.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(a\_tran.size()) \).

\[ a.extract(q) \]

Result: node_type

Effects: Removes the element pointed to by \( q \).

Returns: A node_type owning that element.

Complexity: Average case \( \Theta(1) \), worst case \( \Theta(a.size()) \).

\[ a.merge(a2) \]

Result: void

Preconditions: \( a.get_allocator() == a2.get_allocator() \).

Effects: Attempts to extract each element in \( a2 \) and insert it into \( a \) using the hash function and key equality predicate of \( a \). In containers with unique keys, if there is an element in \( a \) with key equivalent to the key of an element from \( a2 \), then that element is not extracted from \( a2 \).
**Postconditions:** Pointers and references to the transferred elements of a2 refer to those same elements but as members of a. Iterators referring to the transferred elements and all iterators referring to a will be invalidated, but iterators to elements remaining in a2 will remain valid.

**Complexity:** Average case $\Theta(N)$, where $N$ is a2.size(), worst case $\Theta(N + a.size() + N)$.

- **a.erase(k)**
  - **Result:** size_type
  - **Effects:** Erases all elements with key equivalent to k.
  - **Returns:** The number of elements erased.
  - **Complexity:** Average case $\Theta(a.count(k))$, worst case $\Theta(a.size())$.

- **a_tran.erase(kx)**
  - **Result:** size_type
  - **Effects:** Erases all elements with key equivalent to kx.
  - **Returns:** The number of elements erased.
  - **Complexity:** Average case $\Theta(a_tran.count(kx))$, worst case $\Theta(a_tran.size())$.

- **a.erase(q)**
  - **Result:** iterator
  - **Effects:** Erases the element pointed to by q.
  - **Returns:** The iterator immediately following q prior to the erasure.
  - **Complexity:** Average case $\Theta(1)$, worst case $\Theta(a.size())$.

- **a.erase(r)**
  - **Result:** iterator
  - **Effects:** Erases the element pointed to by r.
  - **Returns:** The iterator immediately following r prior to the erasure.
  - **Complexity:** Average case $\Theta(1)$, worst case $\Theta(a.size())$.

- **a.erase(q1, q2)**
  - **Result:** iterator
  - **Effects:** Erases all elements in the range [q1, q2).
  - **Returns:** The iterator immediately following the erased elements prior to the erasure.
  - **Complexity:** Average case linear in distance(q1, q2), worst case $\Theta(a.size())$.

- **a.clear()**
  - **Result:** void
  - **Effects:** Erases all elements in the container.
  - **Postconditions:** a.empty() is true.
  - **Complexity:** Linear in a.size().

- **b.find(k)**
  - **Result:** iterator; const_iterator for constant b.
  - **Returns:** An iterator pointing to an element with key equivalent to k, or b.end() if no such element exists.
  - **Complexity:** Average case $\Theta(1)$, worst case $\Theta(b.size())$.

- **a_tran.find(ke)**
  - **Result:** iterator; const_iterator for constant a_tran.
  - **Returns:** An iterator pointing to an element with key equivalent to ke, or a_tran.end() if no such element exists.

\[\text{§ 24.2.8.1} \]
Complexity: Average case $O(1)$, worst case $O(a_{\text{tran}.\text{size}}())$.

\texttt{b.count(k)}

Result: \texttt{size_type}

Returns: The number of elements with key equivalent to \texttt{k}.

Complexity: Average case $O(\text{b.count}(k))$, worst case $O(\text{b.size})$.

\texttt{a_{\text{tran}.\text{count}}(ke)}

Result: \texttt{size_type}

Returns: The number of elements with key equivalent to \texttt{ke}.

Complexity: Average case $O(\text{a_{\text{tran}.\text{count}}(ke)})$, worst case $O(\text{a_{\text{tran}.\text{size}}})$.

\texttt{b.contains(k)}

Effects: Equivalent to \texttt{b.find(k) \neq b.end()}. 

\texttt{a_{\text{tran}.\text{contains}}(ke)}

Effects: Equivalent to \texttt{a_{\text{tran}.\text{find}}(ke) \neq a_{\text{tran}.\text{end}}()}. 

\texttt{b.equal_range(k)}

Result: \texttt{pair<iterator, iterator>; pair<const iterator, const iterator>} for constant \texttt{b}.

Returns: A range containing all elements with keys equivalent to \texttt{k}. Returns \texttt{make_pair(b.end(), b.end())} if no such elements exist.

Complexity: Average case $O(\text{b.count}(k))$, worst case $O(\text{b.size})$.

\texttt{a_{\text{tran}.\text{equal_range}}(ke)}

Result: \texttt{pair<iterator, iterator>; pair<const iterator, const iterator>} for constant \texttt{a_{\text{tran}}}. 

Returns: A range containing all elements with keys equivalent to \texttt{ke}. Returns \texttt{make_pair(a_{\text{tran}.\text{end}}(), a_{\text{tran}.\text{end}}())} if no such elements exist.

Complexity: Average case $O(\text{a_{\text{tran}.\text{count}}(ke)})$, worst case $O(\text{a_{\text{tran}.\text{size}}})$.

\texttt{b.bucket_count()}

Returns: The number of buckets that \texttt{b} contains.

Complexity: Constant.

\texttt{b.max_bucket_count()}

Returns: An upper bound on the number of buckets that \texttt{b} can ever contain.

Complexity: Constant.

\texttt{b.bucket(k)}

Result: \texttt{size_type}

Preconditions: \texttt{b.bucket_count() > 0}.

Returns: The index of the bucket in which elements with keys equivalent to \texttt{k} would be found, if any such element existed. The return value is in the range $[0, \text{b.bucket_count}]$.

Complexity: Constant.

\texttt{b.bucket_size(n)}

Result: \texttt{size_type}

Preconditions: \texttt{n} shall be in the range $[0, \text{b.bucket_count}]$.

Returns: The number of elements in the $n$th bucket.

Complexity: $\theta(\text{b.bucket_size}(n))$
b.begin(n)
Result: local_iterator; const_local_iterator for constant b.
Preconditions: n is in the range [0, b.bucket_count()).
Returns: An iterator referring to the first element in the bucket. If the bucket is empty, then b.begin(n) == b.end(n).
Complexity: Constant.

b.end(n)
Result: local_iterator; const_local_iterator for constant b.
Preconditions: n is in the range [0, b.bucket_count()).
Returns: An iterator which is the past-the-end value for the bucket.
Complexity: Constant.

b.cbegin(n)
Result: const_local_iterator
Preconditions: n shall be in the range [0, b.bucket_count()).
Returns: An iterator referring to the first element in the bucket. If the bucket is empty, then b.cbegin(n) == b.cend(n).
Complexity: Constant.

b.cend(n)
Result: const_local_iterator
Preconditions: n is in the range [0, b.bucket_count()).
Returns: An iterator which is the past-the-end value for the bucket.
Complexity: Constant.

b.load_factor()
Result: float
Returns: The average number of elements per bucket.
Complexity: Constant.

b.max_load_factor()
Result: float
Returns: A positive number that the container attempts to keep the load factor less than or equal to. The container automatically increases the number of buckets as necessary to keep the load factor below this number.
Complexity: Constant.

a.max_load_factor(z)
Result: void
Preconditions: z is positive. May change the container’s maximum load factor, using z as a hint.
Complexity: Constant.

a.rehash(n)
Result: void
Postconditions: a.bucket_count() >= a.size() / a.max_load_factor() and a.bucket_count() >= n.
Complexity: Average case linear in a.size(), worst case quadratic.

a.reserve(n)
Effects: Equivalent to a.rehash(ceil(n / a.max_load_factor())).
Two unordered containers \(a\) and \(b\) compare equal if \(a.size() == b.size()\) and, for every equivalent-key group \([Ea1, Ea2]\) obtained from \(a.equal\_range(Ea1)\), there exists an equivalent-key group \([Eb1, Eb2]\) obtained from \(b.equal\_range(Ea1)\), such that \(is\_permutation(Ea1, Ea2, Eb1, Eb2)\) returns true. For unordered_set and unordered_map, the complexity of \(\text{operator==}\) (i.e., the number of calls to the \(==\) operator of the value_type, to the predicate returned by key_eq(), and to the hasher returned by hash_function()) is proportional to \(N\) in the average case and to \(N^2\) in the worst case, where \(N\) is \(a.size()\). For unordered_multiset and unordered_multimap, the complexity of \(\text{operator==}\) is proportional to \(\sum E_i^2\) in the average case and to \(N^2\) in the worst case, where \(N\) is \(a.size()\), and \(E_i\) is the size of the \(i\)th equivalent-key group in \(a\). However, if the respective elements of each corresponding pair of equivalent-key groups \(Ea_i\) and \(Eb_i\) are arranged in the same order (as is commonly the case, e.g., if \(a\) and \(b\) are unmodified copies of the same container), then the average-case complexity for unordered_multiset and unordered_multimap becomes proportional to \(N\) (but worst-case complexity remains \(\Theta(N^2)\), e.g., for a pathologically bad hash function). The behavior of a program that uses \(\text{operator==}\) or \(\text{operator!=}\) on unordered containers is undefined unless the \(\text{Pred}\) function object has the same behavior for both containers and the equality comparison function for \(\text{Key}\) is a refinement\(^{213}\) of the partition into equivalent-key groups produced by \(\text{Pred}\).

The iterator types \text{iterator} and \text{const\_iterator} of an unordered associative container are of at least the forward iterator category. For unordered associative containers where the key type and value type are the same, both \text{iterator} and \text{const\_iterator} are constant iterators.

The \text{insert}, \text{insert\_range}, and \text{emplace} members shall not affect the validity of references to container elements, but may invalidate all iterators to the container. The \text{erase} members shall invalidate only iterators and references to the erased elements, and preserve the relative order of the elements that are not erased.

The \text{insert}, \text{insert\_range}, and \text{emplace} members shall not affect the validity of iterators if \((N+n) <= z \times B\), where \(N\) is the number of elements in the container prior to the insert operation, \(n\) is the number of elements inserted, \(B\) is the container’s bucket count, and \(z\) is the container’s maximum load factor.

The \text{extract} members invalidate only iterators to the removed element, and preserve the relative order of the elements that are not erased; pointers and references to the removed element remain valid. However, accessing the element through such pointers and references while the element is owned by a node_type is undefined behavior. References and pointers to an element obtained while it is owned by a node_type are invalidated if the element is successfully inserted.

The member function templates \text{find}, \text{count}, \text{equal\_range}, \text{contains}, \text{extract}, and \text{erase} shall not participate in overload resolution unless the qualified-ids \text{Pred::is\_transparent} and \text{Hash::is\_transparent} are both valid and denote types (13.10.3). Additionally, the member function templates \text{extract} and \text{erase} shall not participate in overload resolution if \(\text{is\_convertible\_v<K&&, iterator> || is\_convertible\_v<K&&, const\_iterator>\) is true, where \(K\) is the type substituted as the first template argument.

A deduction guide for an unordered associative container shall not participate in overload resolution if any of the following are true:

\begin{itemize}
  \item It has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
  \item It has an Allocator template parameter and a type that does not qualify as an allocator is deduced for that parameter.
  \item It has a Hash template parameter and an integral type or a type that qualifies as an allocator is deduced for that parameter.
  \item It has a Pred template parameter and a type that qualifies as an allocator is deduced for that parameter.
\end{itemize}

\subsection{24.2.8.2 Exception safety guarantees \[\text{unord.req.except}\]}

\begin{enumerate}
  \item For unordered associative containers, no \text{clear()} function throws an exception. \text{erase(k)} does not throw an exception unless that exception is thrown by the container’s Hash or \text{Pred} object (if any).
  \item For unordered associative containers, if an exception is thrown by any operation other than the container’s hash function from within an \text{insert} or \text{emplace} function inserting a single element, the insertion has no effect.
  \item For unordered associative containers, no \text{swap} function throws an exception unless that exception is thrown by the swap of the container’s Hash or \text{Pred} object (if any).
\end{enumerate}

\(^{213}\) Equality comparison is a refinement of partitioning if no two objects that compare equal fall into different partitions.
For unordered associative containers, if an exception is thrown from within a `rehash()` function other than by the container’s hash function or comparison function, the `rehash()` function has no effect.

24.3 Sequence containers [sequences]

24.3.1 In general [sequences.general]

The headers `<array>` (24.3.2), `<deque>` (24.3.3), `<forward_list>` (24.3.4), `<list>` (24.3.5), and `<vector>` (24.3.6) define class templates that meet the requirements for sequence containers.

The following exposition-only alias template may appear in deduction guides for sequence containers:

```cpp
template<class InputIterator>
using iter_value_type = typename iterator_traits<InputIterator>::value_type; // exposition only
```

24.3.2 Header `<array>` synopsis [array.syn]

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
    // 24.3.7, class template array
    template<class T, size_t N> struct array;
    template<class T, size_t N>
        constexpr bool operator==(const array<T, N>& x, const array<T, N>& y);
    template<class T, size_t N>
        constexpr synth_three_way_result<T>
            operator<=>(const array<T, N>& x, const array<T, N>& y);

    // 24.3.7.4, specialized algorithms
    template<class T, size_t N>
        constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

    // 24.3.7.6, array creation functions
    template<class T, size_t N>
        constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
    template<class T, size_t N>
        constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);

    // 24.3.7.7, tuple interface
    template<class T> struct tuple_size;
    template<size_t I, class T> struct tuple_element;
    template<class T, size_t N>
        struct tuple_size<array<T, N>>;
    template<size_t I, class T, size_t N>
        struct tuple_element<I, array<T, N>>;
    template<size_t I, class T, size_t N>
        constexpr T& get(array<T, N>&) noexcept;
    template<size_t I, class T, size_t N>
        constexpr T&& get(array<T, N>&&) noexcept;
    template<size_t I, class T, size_t N>
        constexpr const T& get(const array<T, N>&) noexcept;
    template<size_t I, class T, size_t N>
        constexpr const T&& get(const array<T, N>&&) noexcept;
}
```

24.3.3 Header `<deque>` synopsis [deque.syn]

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

namespace std {
    // 24.3.8, class template deque
    template<class T, class Allocator = allocator<T>> class deque;
}
```
template<class T, class Allocator>
bool operator==(const deque<T, Allocator>& x, const deque<T, Allocator>& y);

template<class T, class Allocator>
synth-three-way-result<T> operator<=>(const deque<T, Allocator>& x,
const deque<T, Allocator>& y);

template<class T, class Allocator>
void swap(deque<T, Allocator>& x, deque<T, Allocator>& y)
    noexcept(noexcept(x.swap(y)));

// 24.3.8.5, erasure
template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
    erase(deque<T, Allocator>& c, const U& value);

namespace pmr {
    template<class T>
    using deque = std::deque<T, polymorphic_allocator<T>>;
}

24.3.4 Header <forward_list> synopsis

#include <compare>     // see 17.11.1
#include <initializer_list>  // see 17.10.2

namespace std {

// 24.3.12.2. formatter specialization for vector<bool>
template<class T, class charT> requires is-vector-bool-reference<T>
struct formatter<T, charT>;
}

24.3.7 Class template array

24.3.7.1 Overview

1 The header <array> defines a class template for storing fixed-size sequences of objects. An array is a contiguous container (24.2.2.1). An instance of array<T, N> stores N elements of type T, so that size() == N is an invariant.

2 An array is an aggregate (9.4.2) that can be list-initialized with up to N elements whose types are convertible to T.

3 An array meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), except that a default constructed array object is not empty if N > 0. An array meets some of the requirements of a sequence container (24.2.4). Descriptions are provided here only for operations on array that are not described in one of these tables and for operations where there is additional semantic information.

4 array<T, N> is a structural type (13.2) if T is a structural type. Two values a1 and a2 of type array<T, N> are template-argument-equivalent (13.6) if and only if each pair of corresponding elements in a1 and a2 are template-argument-equivalent.

5 The types iterator and const_iterator meet the constexpr iterator requirements (25.3.1).

namespace std {
    template<class T, size_t N>
    struct array {
        // types
        using value_type = T;
        using pointer = T*;
        using const_pointer = const T*;
        using reference = T&;
        using const_reference = const T&;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        // no explicit construct/copy/destroy for aggregate type
        constexpr void fill(const T& u);
        constexpr void swap(array&) noexcept(is_nothrow_swappable_v<T>);
        // iterators
        constexpr iterator begin() noexcept;
        constexpr const_iterator begin() const noexcept;
        constexpr iterator end() noexcept;
        constexpr const_iterator end() const noexcept;
        constexpr reverse_iterator rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;
        constexpr const_iterator cbegin() const noexcept;
        constexpr const_iterator cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;
    }
}

§ 24.3.7.1 909
// capacity
[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr reference at(size_type n);
constexpr const_reference at(size_type n) const;
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

};

template<class T, class... U>
array(T, U...) -> array<T, 1 + sizeof...(U)>;

24.3.7.2 Constructors, copy, and assignment

The conditions for an aggregate (9.4.2) shall be met. Class array relies on the implicitly-declared special member functions (11.4.5.2, 11.4.7, 11.4.5.3) to conform to the container requirements table in 24.2. In addition to the requirements specified in the container requirements table, the implicit move constructor and move assignment operator for array require that T be Cpp17MoveConstructible or Cpp17MoveAssignable, respectively.

Mandates: (is_same_v<T, U> && ...) is true.

24.3.7.3 Member functions

constexpr size_type size() const noexcept;

Returns: N.

constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

Returns: A pointer such that [data(), data() + size()) is a valid range. For a non-empty array, data() == addressof(front()).

constexpr void fill(const T& u);

Effects: As if by fill_n(begin(), N, u).

constexpr void swap(array& y) noexcept(is_nothrow_swappable_v<T>);

Effects: Equivalent to swap_ranges(begin(), end(), y.begin()).

[Note 1: Unlike the swap function for other containers, array::swap takes linear time, can exit via an exception, and does not cause iterators to become associated with the other container. — end note]

24.3.7.4 Specialized algorithms

template<class T, size_t N>
constexpr void swap(array<T, N>& x, array<T, N>& y) noexcept(noexcept(x.swap(y)));

Constraints: N == 0 or is_swappable_v<T> is true.

Effects: As if by x.swap(y).

Complexity: Linear in N.
24.3.7.5 Zero-sized arrays

array shall provide support for the special case \( N == 0 \).
1
In the case that \( N == 0 \), begin() == end() == unique value. The return value of data() is unspecified.
2
The effect of calling front() or back() for a zero-sized array is undefined.
3
Member function swap() shall have a non-throwing exception specification.
4

24.3.7.6 Array creation functions

```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&a)[N]);
```
1
Mandates: is_array_v<T> is false and is_constructible_v<T, T&> is true.
2
Preconditions: T meets the Cpp17CopyConstructible requirements.
3
Returns: {{ a[0], ..., a[N - 1] }}.
4
```
template<class T, size_t N>
constexpr array<remove_cv_t<T>, N> to_array(T (&&a)[N]);
```
4
Mandates: is_array_v<T> is false and is_move_constructible_v<T> is true.
5
Preconditions: T meets the Cpp17MoveConstructible requirements.
6
Returns: {{ std::move(a[0]), ..., std::move(a[N - 1]) }}.
7

24.3.7.7 Tuple interface

```
template<class T, size_t N>
struct tuple_size<array<T, N>> : integral_constant<size_t, N> { };
```
1
```
template<size_t I, class T, size_t N>
struct tuple_element<I, array<T, N>> {
  using type = T;
};
```
1
Mandates: I < N is true.
2
```
template<size_t I, class T, size_t N>
constexpr T& get(array<T, N>& a) noexcept;
```
2
Mandates: I < N is true.
3
Returns: A reference to the \( I \)th element of \( a \), where indexing is zero-based.
4

24.3.8 Class template deque

24.3.8.1 Overview

A deque is a sequence container that supports random access iterators (25.3.5.7). In addition, it supports constant time insert and erase operations at the beginning or the end; insert and erase in the middle take linear time. That is, a deque is especially optimized for pushing and popping elements at the beginning and end. Storage management is handled automatically.
1
A deque meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on deque that are not described in one of these tables or for operations where there is additional semantic information.
2

```cpp
namespace std {
  template<class T, class Allocator = allocator<T>>
  class deque {
    public:
      // types
```
using value_type = T;
using allocator_type = Allocator;
using pointer = typename allocator_traits<Allocator>::pointer;
using const_pointer = typename allocator_traits<Allocator>::const_pointer;
using reference = value_type&;
using const_reference = const value_type&;
using size_type = implementation-defined; // see 24.2
using difference_type = implementation-defined; // see 24.2
using iterator = implementation-defined; // see 24.2
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// 24.3.8.2, construct/copy/destroy
deque() : deque(Allocator()) { }
explicit deque(const Allocator&);
deque(size_type n, const Allocator& = Allocator());
template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<container-compatible-range<R>

deque(from_range_t, R&& rg, const Allocator& = Allocator());
deque(const deque& x);
deque(deque&&);
deque(const deque&, const type_identity_t<Allocator>&);
deque(deque&&, const type_identity_t<Allocator>&);
deque(initializer_list<T>, const Allocator& = Allocator());

~deque();
deque& operator=(const deque& x);
deque& operator=(deque&& x)
    noexcept(allocator_traits<Allocator>::is_always_equal::value);
deque& operator=(initializer_list<T>);
template<class InputIterator>
    void assign(InputIterator first, InputIterator last);
template<container-compatible-range<R>
    void assign_range(R&& rg);
    void assign(size_type n, const T& t);
    void assign(initializer_list<T>);
    allocator_type get_allocator() const noexcept;

// iterators
iterator begin() noexcept;
const_iterator begin() const noexcept;
iterator end() noexcept;
const_iterator end() const noexcept;
reverse_iterator rbegin() noexcept;
const_reverse_iterator rbegin() const noexcept;
reverse_iterator rend() noexcept;
const_reverse_iterator rend() const noexcept;
const_iterator cbegin() const noexcept;
const_iterator cend() const noexcept;
const_reverse_iterator crbegin() const noexcept;
const_reverse_iterator crend() const noexcept;

// 24.3.8.3, capacity
[[nodiscard]] bool empty() const noexcept;
size_type size() const noexcept;
size_type max_size() const noexcept;
void resize(size_type sz);
void resize(size_type sz, const T& c);
void shrink_to_fit();
// element access
reference operator[](size_type n);
const_reference operator[](size_type n) const;
reference at(size_type n);
const_reference at(size_type n) const;
reference front();
const_reference front() const;
reference back();
const_reference back() const;

// 24.3.8.4, modifiers
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);

void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
void append_range(R&& rg);

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);

void pop_front();
void pop_back();

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void swap(deque&)
   noexcept(algorithm_traits<Allocator>::is_always_equal::value);
   clear() noexcept;
};

template<class InputIterator, class Allocator = allocator<iter-value-type<InputIterator>>>
deque<InputIterator, InputIterator, Allocator = Allocator()>
-> deque<iter-value-type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
deque(from_range_t R, Allocator = Allocator())
-> deque<ranges::range_value_t<R>, Allocator>;

24.3.8.2 Constructors, copy, and assignment [deque.cons]

explicit deque(const Allocator&);
   
   Effects: Constructs an empty deque, using the specified allocator.
   Complexity: Constant.

explicit deque(size_type n, const Allocator& = Allocator());
   
   Preconditions: T is Cpp17DefaultInsertable into *this.
   Effects: Constructs a deque with n default-inserted elements using the specified allocator.
   Complexity: Linear in n.
deque(size_type n, const T& value, const Allocator& = Allocator());

**Preconditions**: T is Cpp17CopyInsertable into *this.

**Effects**: Constructs a deque with n copies of value, using the specified allocator.

**Complexity**: Linear in n.

```cpp
template<class InputIterator>
deque(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

**Effects**: Constructs a deque equal to the range [first, last), using the specified allocator.

**Complexity**: Linear in distance(first, last).

```cpp
template<container-compatible-range<T> R>
deque(from_range_t, R&& rg, const Allocator& = Allocator());
```

**Effects**: Constructs a deque with the elements of the range rg, using the specified allocator.

**Complexity**: Linear in ranges::distance(rg).

### 24.3.8.3 Capacity

```cpp
void resize(size_type sz);
```

**Preconditions**: T is Cpp17MoveInsertable and Cpp17DefaultInsertable into *this.

**Effects**: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() default-inserted elements to the sequence.

```cpp
void resize(size_type sz, const T& c);
```

**Preconditions**: T is Cpp17CopyInsertable into *this.

**Effects**: If sz < size(), erases the last size() - sz elements from the sequence. Otherwise, appends sz - size() copies of c to the sequence.

```cpp
void shrink_to_fit();
```

**Preconditions**: T is Cpp17MoveInsertable into *this.

**Effects**: shrink_to_fit is a non-binding request to reduce memory use but does not change the size of the sequence.

**Note 1**: The request is non-binding to allow latitude for implementation-specific optimizations. —end note

If the size is equal to the old capacity, or if an exception is thrown other than by the move constructor of a non-Cpp17CopyInsertable T, then there are no effects.

**Complexity**: If the size is not equal to the old capacity, linear in the size of the sequence; otherwise constant.

**Remarks**: If the size is not equal to the old capacity, then invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

### 24.3.8.4Modifiers

```cpp
iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
```

```cpp
template<class InputIterator>
iterator insert(const_iterator position, InputIterator first, InputIterator last);
```

```cpp
template<container-compatible-range<T> R>
iterator insert_range(const_iterator position, R&& rg);
```

```cpp
iterator insert(const_iterator position, initializer_list<T>);
```

```cpp
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
```

```cpp
void push_front(const T& x);
void push_front(T&& x);
```
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);

Effects: An insertion in the middle of the deque invalidates all the iterators and references to elements of the deque. An insertion at either end of the deque invalidates all the iterators to the deque, but has no effect on the validity of references to elements of the deque.

Complexity: The complexity is linear in the number of elements inserted plus the lesser of the distances to the beginning and end of the deque. Inserting a single element at either the beginning or end of a deque always takes constant time and causes a single call to a constructor of T.

Remarks: If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T there are no effects. If an exception is thrown while inserting a single element at either end, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);
void pop_front();
void pop_back();

Effects: An erase operation that erases the last element of a deque invalidates only the past-the-end iterator and all iterators and references to the erased elements. An erase operation that erases the first element of a deque but not the last element invalidates only iterators and references to the erased elements. An erase operation that erases neither the first element nor the last element of a deque invalidates the past-the-end iterator and all iterators and references to all the elements of the deque.

[Note 1: pop_front and pop_back are erase operations. — end note]

Throws: Nothing unless an exception is thrown by the assignment operator of T.

Complexity: The number of calls to the destructor of T is the same as the number of elements erased, but the number of calls to the assignment operator of T is no more than the lesser of the number of elements before the erased elements and the number of elements after the erased elements.

24.3.8.5 Erasure

template<class T, class Allocator, class U>
typename deque<T, Allocator>::size_type
erase(deque<T, Allocator>& c, const U& value);

Effects: Equivalent to:
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<class T, class Allocator, class Predicate>
typename deque<T, Allocator>::size_type
erase_if(deque<T, Allocator>& c, Predicate pred);

Effects: Equivalent to:
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

24.3.9 Class template forward_list

24.3.9.1 Overview

A forward_list is a container that supports forward iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Fast random access to list elements is not supported.
[Note 1: It is intended that `forward_list` have zero space or time overhead relative to a hand-written C-style singly linked list. Features that would conflict with that goal have been omitted. — end note]

2 A `forward_list` meets all of the requirements of a container (24.2.2.2), except that the `size()` member function is not provided and `operator==` has linear complexity. A `forward_list` also meets all of the requirements for an allocator-aware container (24.2.2.5). In addition, a `forward_list` provides the `assign` member functions and several of the optional sequence container requirements (24.2.4). Descriptions are provided here only for operations on `forward_list` that are not described in that table or for operations where there is additional semantic information.

[Note 2: Modifying any list requires access to the element preceding the first element of interest, but in a `forward_list` there is no constant-time way to access a preceding element. For this reason, `erase_after` and `splice_after` take fully-open ranges, not semi-open ranges. — end note]

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class forward_list {
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 24.2
        using difference_type = implementation-defined; // see 24.2
        // see 24.2
        using iterator = implementation-defined;
        using const_iterator = implementation-defined;
        // 24.3.9.2, construct/copy/destroy
        forward_list() : forward_list(Allocator()) { }
        explicit forward_list(const Allocator&);
        explicit forward_list(size_type n, const Allocator& = Allocator());
        forward_list(size_type n, const T& value, const Allocator& = Allocator());
        template<class InputIterator>
        forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());
        template<container-compatible-range<R> R>
        forward_list(from_range_t, R&& rg, const Allocator& = Allocator());
        forward_list(const forward_list& x);
        forward_list(forward_list&& x);
        forward_list(const forward_list&amp; x, const type_identity_t<Allocator>&);
        forward_list(forward_list&amp; x, const type_identity_t<Allocator>&);
        // 24.3.9.1
        iterator before_begin() noexcept;
        const_iterator before_begin() const noexcept;
        iterator begin() noexcept;
        const_iterator begin() const noexcept;
        iterator end() noexcept;
        const_iterator end() const noexcept;
    
    // 24.3.9.3, iterators
    iterator before_begin() noexcept;
    const_iterator before_begin() const noexcept;
    iterator begin() noexcept;
    const_iterator begin() const noexcept;
    iterator end() noexcept;
    const_iterator end() const noexcept;
}
```
const_iterator cbegin() const noexcept;
const_iterator before_begin() const noexcept;
const_iterator cend() const noexcept;

// capacity
[[nodiscard]] bool empty() const noexcept;
size_type max_size() const noexcept;

// 24.3.9.4, element access
reference front();
const_reference front() const;

// 24.3.9.5, modifiers
template<class... Args> reference emplace_front(Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
    void prepend_range(R&& rg);
void pop_front();

template<class... Args> iterator emplace_after(const_iterator position, Args&&... args);
iterator insert_after(const_iterator position, const T& x);
iterator insert_after(const_iterator position, T&& x);
iterator insert_after(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
iterator insert_after(const_iterator position, initializer_list<T> il);
template<container-compatible-range<T> R>
    iterator insert_range_after(const_iterator position, R&& rg);

iterator erase_after(const_iterator position);
iterator erase_after(const_iterator position, const_iterator last);
void swap(forward_list&) noexcept(allocator_traits<Allocator>::is_always_equal::value);

void resize(size_type sz);
void resize(size_type sz, const value_type& c);
void clear() noexcept;

// 24.3.9.6, forward_list operations
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
void splice_after(const_iterator position, forward_list& x, const_iterator i);
void splice_after(const_iterator position, forward_list&& x, const_iterator i);
void splice_after(const_iterator position, forward_list& x, const_iterator first, const_iterator last);
void splice_after(const_iterator position, forward_list&& x, const_iterator first, const_iterator last);

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);
size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);
An incomplete type \( T \) may be used when instantiating `forward_list` if the allocator meets the allocator completeness requirements (16.4.4.6.2). \( T \) shall be complete before any member of the resulting specialization of `forward_list` is referenced.

### 24.3.9.2 Constructors, copy, and assignment

**explicit forward_list(const Allocator&);**

- **Effects:** Constructs an empty `forward_list` object using the specified allocator.
- **Complexity:** Constant.

**explicit forward_list(size_type n, const Allocator& = Allocator());**

- **Preconditions:** \( T \) is `Cpp17DefaultInsertable` into `*this`.
- **Effects:** Constructs a `forward_list` object with \( n \) default-inserted elements using the specified allocator.
- **Complexity:** Linear in \( n \).

**forward_list(size_type n, const T& value, const Allocator& = Allocator());**

- **Preconditions:** \( T \) is `Cpp17CopyInsertable` into `*this`.
- **Effects:** Constructs a `forward_list` object with \( n \) copies of `value` using the specified allocator.
- **Complexity:** Linear in \( n \).

**template<class InputIterator>**

- **forward_list(InputIterator first, InputIterator last, const Allocator& = Allocator());**
  - **Effects:** Constructs a `forward_list` object equal to the range \([first, last)\).
  - **Complexity:** Linear in distance(first, last).

**template<container-compatible-range<T> R>**

- **forward_list(from_range_t, R&& rg, const Allocator& = Allocator());**
  - **Effects:** Constructs a `forward_list` object with the elements of the range `rg`.
  - **Complexity:** Linear in ranges::distance(rg).

### 24.3.9.3 Iterators

**iterator before_begin() noexcept;**

**const_iterator before_begin() const noexcept;**

**const_iterator cbefore_begin() const noexcept;**

- **Effects:** `cbefore_begin()` is equivalent to `const_cast<forward_list const&>(*this).before_begin()`.
- **Returns:** A non-dereferenceable iterator that, when incremented, is equal to the iterator returned by `begin()`.
- **Remarks:** `before_begin()` == `end()` shall equal false.

### 24.3.9.4 Element access

**reference front();**

**const_reference front() const;**

- **Returns:** `*begin()`
24.3.9.5  Modifiers

None of the overloads of `insert_after` shall affect the validity of iterators and references, and `erase_after` shall invalidate only iterators and references to the erased elements. If an exception is thrown during `insert_after` there shall be no effect. Inserting \( n \) elements into a `forward_list` is linear in \( n \), and the number of calls to the copy or move constructor of \( T \) is exactly equal to \( n \). Erasing \( n \) elements from a `forward_list` is linear in \( n \) and the number of calls to the destructor of type \( T \) is exactly equal to \( n \).

```cpp
template<class... Args> reference emplace_front(Args&&... args);
```

**Effects:** Inserts an object of type `value_type` constructed with `value_type(std::forward<Args>(args)...)` at the beginning of the list.

```cpp
void push_front(const T& x);
void push_front(T&& x);
```

**Effects:** Inserts a copy of \( x \) at the beginning of the list.

```cpp
template<container-compatible-range<T> R>
void prepend_range(R&& rg);
```

**Effects:** Inserts a copy of each element of \( rg \) at the beginning of the list.

```cpp
void pop_front();
```

**Effects:** As if by `erase_after(before_begin())`.

```cpp
iterator insert_after(const_iterator position, const T& x);
```

**Preconditions:** \( T \) is `Cpp17CopyInsertable` into `forward_list`. \( position \) is `before_begin()` or is a dereferenceable iterator in the range \([begin(),end())\).

**Effects:** Inserts a copy of \( x \) after \( position \).

**Returns:** An iterator pointing to the copy of \( x \).

```cpp
iterator insert_after(const_iterator position, T&& x);
```

**Preconditions:** \( T \) is `Cpp17MoveInsertable` into `forward_list`. \( position \) is `before_begin()` or is a dereferenceable iterator in the range \([begin(),end())\).

**Effects:** Inserts a copy of \( x \) after \( position \).

**Returns:** An iterator pointing to the copy of \( x \).

```cpp
iterator insert_after(const_iterator position, size_type n, const T& x);
```

**Preconditions:** \( T \) is `Cpp17CopyInsertable` into `forward_list`. \( position \) is `before_begin()` or is a dereferenceable iterator in the range \([begin(),end())\).

**Effects:** Inserts \( n \) copies of \( x \) after \( position \).

**Returns:** An iterator pointing to the last inserted copy of \( x \), or \( position \) if \( n == 0 \) is true.

```cpp
template<class InputIterator>
iterator insert_after(const_iterator position, InputIterator first, InputIterator last);
```

**Preconditions:** \( T \) is `Cpp17EmplaceConstructible` into `forward_list` from `*first`. \( position \) is `before_begin()` or is a dereferenceable iterator in the range \([begin(),end())\). Neither \( first \) nor \( last \) are iterators in \(*this\).

**Effects:** Inserts copies of elements in \([first,last)\) after \( position \).

**Returns:** An iterator pointing to the last inserted element, or \( position \) if \( first == last \) is true.

```cpp
template<container-compatible-range<T> R>
iterator insert_range_after(const_iterator position, R&& rg);
```

**Preconditions:** \( T \) is `Cpp17EmplaceConstructible` into `forward_list` from `*ranges::begin(rg)`. \( position \) is `before_begin()` or is a dereferenceable iterator in the range \([begin(),end())\). \( rg \) and \(*this\) do not overlap.

**Effects:** Inserts copies of elements in the range \( rg \) after \( position \).
Returns: An iterator pointing to the last inserted element, or position if `rg` is empty.

```cpp
iterator insert_after(const_iterator position, initializer_list<T> il);
```

Effects: Equivalent to: `return insert_after(position, il.begin(), il.end());`

```cpp
template<class... Args>
iterator emplace_after(const_iterator position, Args&&... args);
```

Preconditions: `T` is `Cpp17EmplaceConstructible` into `forward_list` from `std::forward<Args>(args)...`. `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`.

Effects: Inserts an object of type `value_type` direct-non-list-initialized with `std::forward<Args>(args)...` after `position`.

Returns: An iterator pointing to the new object.

```cpp
iterator erase_after(const_iterator position);
```

Preconditions: The iterator following `position` is dereferenceable.

Effects: Erases the element pointed to by the iterator following `position`.

Returns: An iterator pointing to the element following the one that was erased, or `end()` if no such element exists.

Throws: Nothing.

```cpp
iterator erase_after(const_iterator position, const_iterator last);
```

Preconditions: All iterators in the range `(position, last)` are dereferenceable.

Effects: Erases the elements in the range `(position, last)`.

Returns: `last`.

Throws: Nothing.

```cpp
void resize(size_type sz);
```

Preconditions: `T` is `Cpp17DefaultInsertable` into `*this`.

Effects: If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` default-inserted elements at the end of the list.

```cpp
void resize(size_type sz, const value_type& c);
```

Preconditions: `T` is `Cpp17CopyInsertable` into `*this`.

Effects: If `sz < distance(begin(), end())`, erases the last `distance(begin(), end()) - sz` elements from the list. Otherwise, inserts `sz - distance(begin(), end())` copies of `c` at the end of the list.

```cpp
void clear() noexcept;
```

Effects: Erases all elements in the range `[begin(), end())`.

Remarks: Does not invalidate past-the-end iterators.

### 24.3.9.6 Operations [forward.list.ops]

In this subclause, arguments for a template parameter named `Predicate` or `BinaryPredicate` shall meet the corresponding requirements in 27.2. The semantics of `i + n`, where `i` is an iterator into the list and `n` is an integer, are the same as those of `next(i, n)`. The expression `i - n`, where `i` is an iterator into the list and `n` is an integer, means an iterator `j` such that `j + n == i` is `true`. For `merge` and `sort`, the definitions and requirements in 27.8 apply.

```cpp
void splice_after(const_iterator position, forward_list& x);
void splice_after(const_iterator position, forward_list&& x);
```

Preconditions: `position` is `before_begin()` or is a dereferenceable iterator in the range `[begin(), end())`. `get_allocator()` == `x.get_allocator()` is `true`. `addressof(x) != this` is `true`.
Effects: Inserts the contents of \(x\) after \(\textit{position}\), and \(x\) becomes empty. Pointers and references to the moved elements of \(x\) now refer to those same elements but as members of *\textit{this}*. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *\textit{this}*, not into \(x\).

Throws: Nothing.

Complexity: \(\Theta(1)\)

Preconditions: \(\textit{position}\) is before \(\textit{begin}\)() or is a dereferenceable iterator in the range \([\textit{begin}\(), \textit{end}\)()). The iterator following \(\textit{i}\) is a dereferenceable iterator in \(x\). \(\textit{get\_allocator}() = x.\textit{get\_allocator}\)() is true.

Effects: Inserts the element following \(\textit{i}\) into *\textit{this}*, following \(\textit{position}\), and removes it from \(x\). The result is unchanged if \(\textit{position} = \textit{i}\) or \(\textit{position} = ++\textit{i}\). Pointers and references to *++i* continue to refer to the same element but as a member of *\textit{this}*. Iterators to *++i* continue to refer to the same element, but now behave as iterators into *\textit{this}*, not into \(x\).

Throws: Nothing.

Complexity: \(\Theta(1)\)

Preconditions: \(\textit{position}\) is before \(\textit{begin}\)() or is a dereferenceable iterator in the range \([\textit{begin}\(), \textit{end}\)()). \((\textit{first}\), \(\textit{last}\)) is a valid range in \(x\), and all iterators in the range \((\textit{first}\), \(\textit{last}\)) are dereferenceable. \(\textit{position}\) is not an iterator in the range \((\textit{first}\), \(\textit{last}\)). \(\textit{get\_allocator}() = x.\textit{get\_allocator}\)() is true.

Effects: Inserts elements in the range \((\textit{first}\), \(\textit{last}\)) after \(\textit{position}\) and removes the elements from \(x\). Pointers and references to the moved elements of \(x\) now refer to those same elements but as members of *\textit{this}*. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *\textit{this}*, not into \(x\).

Complexity: \(\Theta(1)\)

Preconditions: \(\textit{position} = \textit{begin}\)() or \(\textit{position} = \textit{begin}\)() for the first overload.

Preconditions: \(\textit{binary\_pred}\) is an equivalence relation.

Effects: Erases all the elements in the list referred to by a list iterator \(i\) for which the following conditions hold: *\textit{i} == \textit{value}\) (for \textit{remove}\)(), \(\textit{pred}(\textit{i})\) is true (for \textit{remove\_if}\)(). Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the equality comparison or the predicate.

Complexity: Exactly \(\textit{distance}(\textit{begin}\)(), \(\textit{end}\)()) applications of the corresponding predicate.

Remarks: Stable \((16.4.6.8)\).

Preconditions: \(\textit{binary\_pred}\) be \textit{equal\_to\_rel}\)() for the first overload.

Preconditions: \(\textit{binary\_pred}\) is an equivalence relation.

Effects: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator \(i\) in the range \([\textit{begin}() + 1, \textit{end}()\) for which \(\textit{binary\_pred}(\textit{i}, *(\textit{i} - 1))\) is true. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the predicate.
Complexity: If empty() is false, exactly distance(begin(), end()) - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

```cpp
void merge(forward_list& x);
void merge(forward_list&& x);
template<class Compare> void merge(forward_list& x, Compare comp);
template<class Compare> void merge(forward_list&& x, Compare comp);
```

Let comp be less for the first two overloads.

**Preconditions:** *this and x are both sorted with respect to the comparator comp, and get_allocator() == x.get_allocator() is true.

**Effects:** If addressof(x) == this, there are no effects. Otherwise, merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). The result is a range that is sorted with respect to the comparator comp. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

**Complexity:** At most distance(begin(), end()) + distance(x.begin(), x.end()) - 1 comparisons if addressof(x) != this; otherwise, no comparisons are performed.

**Remarks:** Stable (16.4.6.8). If addressof(x) != this, x is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison, there are no effects.

```cpp
void sort();
template<class Compare> void sort(Compare comp);
```

**Effects:** Sorts the list according to the operator< or the comp function object. If an exception is thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and references.

**Complexity:** Approximately \(N \log N\) comparisons, where \(N\) is distance(begin(), end()).

**Remarks:** Stable (16.4.6.8).

```cpp
void reverse() noexcept;
```

**Effects:** Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

**Complexity:** Linear time.

### 24.3.9.7 Erasure

```cpp
template<class T, class Allocator, class U>
typename forward_list<T, Allocator>::size_type erase(forward_list<T, Allocator>& c, const U& value);
```

**Effects:** Equivalent to:

```cpp
return erase_if(c, \[&\](auto& elem) { return elem == value; });
```

```cpp
template<class T, class Allocator, class Predicate>
typename forward_list<T, Allocator>::size_type erase_if(forward_list<T, Allocator>& c, Predicate pred);
```

**Effects:** Equivalent to:

```cpp
return c.remove_if(pred);
```

### 24.3.10 Class template list

**[list]**

#### 24.3.10.1 Overview

**[list.overview]**

A list is a sequence container that supports bidirectional iterators and allows constant time insert and erase operations anywhere within the sequence, with storage management handled automatically. Unlike vectors (24.3.11) and deques (24.3.8), fast random access to list elements is not supported, but many algorithms only need sequential access anyway.

A list meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of a sequence container, including most of the optional sequence container requirements (24.2.4). The exceptions are the `operator []` and `at` member functions, which are
Descriptions are provided here only for operations on `list` that are not described in one of these tables or for operations where there is additional semantic information.

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class list {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 24.2
        using difference_type = implementation-defined; // see 24.2
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

    // 24.3.10.2, construct/copy/destroy
    list() : list(Allocator()) {}  // 
    explicit list(const Allocator&);
    explicit list(size_type n, const Allocator& = Allocator());
    list(size_type n, const T& value, const Allocator& = Allocator());
    template<class InputIterator>
    list(InputIterator first, InputIterator last, const Allocator& = Allocator());
    template<container-compatible-range<T> R>
    list(from_range_t, R&& rg, const Allocator& = Allocator());
    list(const list& x);
    list(list&& x);
    list(const list&, const type_identity_t<Allocator>&);
    list(list&&, const type_identity_t<Allocator>&);

  size_type unique(BinaryPredicate binary_pred);

void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);

void sort();
template<class Compare> void sort(Compare comp);
void reverse() noexcept;
}

template<class InputIterator, class Allocator = allocator<iter_value_type<InputIterator>>>
list(InputIterator, InputIterator, Allocator = Allocator())
-> list<iter_value_type<InputIterator>, Allocator>;

template<ranges::input_range R, class Allocator = allocator<ranges::range_value_t<R>>>
list(from_range_t, R&&, Allocator = Allocator())
-> list<ranges::range_value_t<R>, Allocator>;

3 An incomplete type T may be used when instantiating list if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of list is referenced.

24.3.10.2 Constructors, copy, and assignment

explicit list(const Allocator&);

1 Effects: Constructs an empty list, using the specified allocator.
2 Complexity: Constant.

explicit list(size_type n, const Allocator& = Allocator());

3 Preconditions: T is Cpp17DefaultInsertable into *this.
4 Effects: Constructs a list with n default-inserted elements using the specified allocator.
5 Complexity: Linear in n.

list(size_type n, const T& value, const Allocator& = Allocator());

6 Preconditions: T is Cpp17CopyInsertable into *this.
7 Effects: Constructs a list with n copies of value, using the specified allocator.
8 Complexity: Linear in n.

template<class InputIterator>
list(InputIterator first, InputIterator last, const Allocator& = Allocator());

9 Effects: Constructs a list equal to the range [first, last).
10 Complexity: Linear in distance(first, last).

template<container-compatible-range<T> R>
list(from_range_t, R&& rg, const Allocator& = Allocator());

11 Effects: Constructs a list object with the elements of the range rg.
12 Complexity: Linear in ranges::distance(rg).

24.3.10.3 Capacity

void resize(size_type sz);

1 Preconditions: T is Cpp17DefaultInsertable into *this.
2 Effects: If size() < sz, appends sz - size() default-inserted elements to the sequence. If sz <= size(), equivalent to:
   list<T>::iterator it = begin();
   advance(it, sz);
   erase(it, end());

void resize(size_type sz, const T& c);

3 Preconditions: T is Cpp17CopyInsertable into *this.
4 Effects: As if by:
   if (sz > size())
      insert(end(), sz-size(), c);
else if (sz < size()) {
    iterator i = begin();
    advance(i, sz);
    erase(i, end());
} else
    // do nothing

24.3.10.4 Modifiers

iterator insert(const_iterator position, const T& x);
iterator insert(const_iterator position, T&& x);
iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
    iterator insert(const_iterator position, InputIterator first,
                    InputIterator last);
template<container-compatible-range<T> R>
    iterator insert_range(const_iterator position, R&& rg);
iterator insert(const_iterator position, initializer_list<T>);
template<class... Args> reference emplace_front(Args&&... args);
template<class... Args> reference emplace_back(Args&&... args);
template<class... Args> iterator emplace(const_iterator position, Args&&... args);
void push_front(const T& x);
void push_front(T&& x);
template<container-compatible-range<T> R>
    void prepend_range(R&& rg);
void push_back(const T& x);
void push_back(T&& x);
template<container-compatible-range<T> R>
    void append_range(R&& rg);

1 Complexity: Insertion of a single element into a list takes constant time and exactly one call to a constructor of T. Insertion of multiple elements into a list is linear in the number of elements inserted, and the number of calls to the copy constructor or move constructor of T is exactly equal to the number of elements inserted.

2 Remarks: Does not affect the validity of iterators and references. If an exception is thrown there are no effects.

iterator erase(const_iterator position);
iterator erase(const_iterator first, const_iterator last);

void pop_front();
void pop_back();
void clear() noexcept;

3 Effects: Invalidates only the iterators and references to the erased elements.

4 Throws: Nothing.

5 Complexity: Erasing a single element is a constant time operation with a single call to the destructor of T. Erasing a range in a list is linear time in the size of the range and the number of calls to the destructor of type T is exactly equal to the size of the range.

24.3.10.5 Operations

Since lists allow fast insertion and erasing from the middle of a list, certain operations are provided specifically for them.215 In this subclause, arguments for a template parameter named Predicate or BinaryPredicate shall meet the corresponding requirements in 27.2. The semantics of i + n and i - n, where i is an iterator into the list and n is an integer, are the same as those of next(i, n) and prev(i, n), respectively. For merge and sort, the definitions and requirements in 27.8 apply.

list provides three splice operations that destructively move elements from one list to another. The behavior of splice operations is undefined if get_allocator() != x.get_allocator().

215) As specified in 16.4.4.6, the requirements in this Clause apply only to lists whose allocators compare equal.
void splice(const_iterator position, list& x);
void splice(const_iterator position, list&& x);

Preconditions: addressof(x) != this is true.

Effects: Inserts the contents of x before position and x becomes empty. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

§ 24.3.10.5 927

void splice(const_iterator position, list& x, const_iterator i);
void splice(const_iterator position, list&& x, const_iterator i);

Preconditions: i is a valid dereferenceable iterator of x.

Effects: Inserts an element pointed to by i from list x before position and removes the element from x. The result is unchanged if position == i or position == ++i. Pointers and references to *i continue to refer to this same element but as a member of *this. Iterators to *i (including i itself) continue to refer to the same element, but now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

void splice(const_iterator position, list& x, const_iterator first,
const_iterator last);
void splice(const_iterator position, list&& x, const_iterator first,
const_iterator last);

Preconditions: [first, last) is a valid range in x. position is not an iterator in the range [first, last).

Effects: Inserts elements in the range [first, last) before position and removes the elements from x. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

Throws: Nothing.

Complexity: Constant time.

size_type remove(const T& value);
template<class Predicate> size_type remove_if(Predicate pred);

Effects: Erases all the elements in the list referred to by a list iterator i for which the following conditions hold: *i == value, pred(*i) != false. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by *i == value or pred(*i) != false.

Complexity: Exactly size() applications of the corresponding predicate.

Remarks: Stable (16.4.6.8).

size_type unique();
template<class BinaryPredicate> size_type unique(BinaryPredicate binary_pred);

Let binary_pred be equal_to<>{} for the first overload.

Preconditions: binary_pred is an equivalence relation.

Effects: Erases all but the first element from every consecutive group of equivalent elements. That is, for a nonempty list, erases all elements referred to by the iterator i in the range [begin() + 1, end()) for which binary_pred(*i, *(i - 1)) is true. Invalidates only the iterators and references to the erased elements.

Returns: The number of elements erased.

Throws: Nothing unless an exception is thrown by the predicate.
Complexity: If empty() is false, exactly size() - 1 applications of the corresponding predicate, otherwise no applications of the predicate.

```cpp
void merge(list& x);
void merge(list&& x);
template<class Compare> void merge(list& x, Compare comp);
template<class Compare> void merge(list&& x, Compare comp);
```

Let comp be less for the first two overloads.

**Preconditions:** *this and x are both sorted with respect to the comparator comp, and get_allocator() == x.get_allocator() is true.

**Effects:** If addressof(x) == this, there are no effects. Otherwise, merges the two sorted ranges [begin(), end()) and [x.begin(), x.end()). The result is a range that is sorted with respect to the comparator comp. Pointers and references to the moved elements of x now refer to those same elements but as members of *this. Iterators referring to the moved elements will continue to refer to their elements, but they now behave as iterators into *this, not into x.

**Complexity:** At most size() + x.size() - 1 comparisons if addressof(x) != this; otherwise, no comparisons are performed.

**Remarks:** Stable (16.4.6.8). If addressof(x) != this, x is empty after the merge. No elements are copied by this operation. If an exception is thrown other than by a comparison there are no effects.

```cpp
void reverse() noexcept;
```

**Effects:** Reverses the order of the elements in the list. Does not affect the validity of iterators and references.

**Complexity:** Linear time.

```cpp
void sort();
template<class Compare> void sort(Compare comp);
```

**Effects:** Sorts the list according to the operator< or a Compare function object. If an exception is thrown, the order of the elements in *this is unspecified. Does not affect the validity of iterators and references.

**Complexity:** Approximately N log N comparisons, where N == size().

**Remarks:** Stable (16.4.6.8).

### 24.3.10.6 Erasure

```cpp
template<class T, class Allocator, class U>
typename list<T, Allocator>::size_type erase(list<T, Allocator>& c, const U& value);
```

**Effects:** Equivalent to: return erase_if(c, [&](auto& elem) { return elem == value; });

```cpp
template<class T, class Allocator, class Predicate>
typename list<T, Allocator>::size_type erase_if(list<T, Allocator>& c, Predicate pred);
```

**Effects:** Equivalent to: return c.remove_if(pred);

### 24.3.11 Class template vector

#### 24.3.11.1 Overview

A vector is a sequence container that supports (amortized) constant time insert and erase operations at the end; insert and erase in the middle take linear time. Storage management is handled automatically, though hints can be given to improve efficiency.

A vector meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of a sequence container, including most of the optional sequence container requirements (24.2.4), and, for an element type other than bool, of a contiguous container (24.2.2.1). The exceptions are the push_front, prepend_range, pop_front, and emplace_front member functions, which are not provided. Descriptions are provided here only for operations on vector that are not described in one of these tables or for operations where there is additional semantic information.
The types `iterator` and `const_iterator` meet the constexpr iterator requirements (25.3.1).

```cpp
namespace std {
    template<class T, class Allocator = allocator<T>>
    class vector {
    public:
        // types
        using value_type = T;
        using allocator_type = Allocator;
        using pointer = typename allocator_traits<Allocator>::pointer;
        using const_pointer = typename allocator_traits<Allocator>::const_pointer;
        using reference = value_type&;
        using const_reference = const value_type&;
        using size_type = implementation-defined; // see 24.2
        using difference_type = implementation-defined; // see 24.2
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;

        // 24.3.11.2, construct/copy/destroy
        constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) { }constexpr explicit vector(const Allocator&) noexcept;
        constexpr explicit vector(size_type n, const Allocator& = Allocator());
        constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
        template<class InputIterator>
        constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
        template<
            container-compatible-range<T> R>
        constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
        constexpr vector(const vector& x);
        constexpr vector(vector&&) noexcept;
        constexpr vector(const vector&, const type_identity_t<Allocator>&);
        constexpr vector(vector&&, const type_identity_t<Allocator>&);
        constexpr vector(initializer_list<T>, const Allocator& = Allocator());
        constexpr ~vector();
        constexpr vector& operator=(const vector& x);
        constexpr vector& operator=(vector&& x)
            noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
            allocator_traits<Allocator>::is_always_equal::value);
        constexpr vector& operator=(initializer_list<T>);
        template<class InputIterator>
        constexpr void assign(InputIterator first, InputIterator last);
        template<
            container-compatible-range<T> R>
        constexpr void assign_range(R&& rg);
        constexpr void assign(size_type n, const T& u);
        constexpr void assign(initializer_list<T>);
        constexpr allocator_type get_allocator() const noexcept;

        // iterators
        constexpr iterator begin() noexcept;
        constexpr const_iterator begin() const noexcept;
        constexpr iterator end() noexcept;
        constexpr const_iterator end() const noexcept;
        constexpr reverse_iterator rbegin() noexcept;
        constexpr const_reverse_iterator rbegin() const noexcept;
        constexpr reverse_iterator rend() noexcept;
        constexpr const_reverse_iterator rend() const noexcept;
        constexpr const_iterator cbegin() const noexcept;
        constexpr const_iterator cend() const noexcept;
        constexpr const_reverse_iterator crbegin() const noexcept;
        constexpr const_reverse_iterator crend() const noexcept;
    }
```
// 24.3.11.3, capacity
[[nodiscard]] constexpr bool empty() const noexcept;
constexpr size_type size() const noexcept;
constexpr size_type max_size() const noexcept;
constexpr size_type capacity() const noexcept;
constexpr void resize(size_type sz);
constexpr void resize(size_type sz, const T& c);
constexpr void reserve(size_type n);
constexpr void shrink_to_fit();

// element access
constexpr reference operator[](size_type n);
constexpr const_reference operator[](size_type n) const;
constexpr const_reference at(size_type n) const;
constexpr reference at(size_type n);
constexpr reference front();
constexpr const_reference front() const;
constexpr reference back();
constexpr const_reference back() const;

// 24.3.11.4, data access
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;

// 24.3.11.5, modifiers
template<class... Args> constexpr reference emplace_back(Args&&... args);
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
template<container-compatible-range<T> R>
  constexpr void append_range(R&& rg);
constexpr void pop_back();
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
template<class InputIterator>
  constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<T> R>
  constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<T> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&);

§ 24.3.11.1 930

4 An incomplete type T may be used when instantiating vector if the allocator meets the allocator completeness requirements (16.4.4.6.2). T shall be complete before any member of the resulting specialization of vector is referenced.
24.3.11.2 Constructors

```cpp
constexpr explicit vector(const Allocator&) noexcept;
```

Effects: Constructs an empty `vector`, using the specified allocator.

Complexity: Constant.

```cpp
constexpr explicit vector(size_type n, const Allocator& = Allocator());
```

Preconditions: `T` is `Cpp17DefaultInsertable` into `*this`.

Effects: Constructs a `vector` with `n` default-inserted elements using the specified allocator.

Complexity: Linear in `n`.

```cpp
constexpr vector(size_type n, const T& value, const Allocator& = Allocator());
```

Preconditions: `T` is `Cpp17CopyInsertable` into `*this`.

Effects: Constructs a `vector` with `n` copies of `value`, using the specified allocator.

Complexity: Linear in `n`.

```cpp
template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
```

Effects: Constructs a `vector` equal to the range `[first, last)`, using the specified allocator.

Complexity: Makes only `N` calls to the copy constructor of `T` (where `N` is the distance between `first` and `last`) and no reallocations if iterators `first` and `last` are of forward, bidirectional, or random access categories. It makes order `N` calls to the copy constructor of `T` and order `log N` reallocations if they are just input iterators.

```cpp
template<container-compatible-range<T> R>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
```

Effects: Constructs a `vector` object with the elements of the range `rg`, using the specified allocator.

Complexity: Initializes exactly `N` elements from the results of dereferencing successive iterators of `rg`, where `N` is `ranges::distance(rg)`. Performs no reallocations if `R` models `ranges::forward_range` or `ranges::sized_range`; otherwise, performs order `log N` reallocations and order `N` calls to the copy or move constructor of `T`.

24.3.11.3 Capacity

```cpp
constexpr size_type capacity() const noexcept;
```

Returns: The total number of elements that the vector can hold without requiring reallocation.

Complexity: Constant time.

```cpp
constexpr void reserve(size_type n);
```

Preconditions: `T` is `Cpp17MoveInsertable` into `*this`.

Effects: A directive that informs a `vector` of a planned change in size, so that it can manage the storage allocation accordingly. After `reserve()`, `capacity()` is greater or equal to the argument of `reserve` if reallocation happens; and equal to the previous value of `capacity()` otherwise. Reallocation happens at this point if and only if the current capacity is less than the argument of `reserve()`. If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` type, there are no effects.

Throws: `length_error` if `n > max_size()`.

Complexity: It does not change the size of the sequence and takes at most linear time in the size of the sequence.

Remarks: Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator.

[Note 1: If no reallocation happens, they remain valid. — end note]
No reallocation shall take place during insertions that happen after a call to `reserve()` until an insertion would make the size of the vector greater than the value of `capacity()`.

```cpp
constexpr void shrink_to_fit();
```

**Preconditions:** `T` is `Cpp17MoveInsertable` into `*this`.

**Effects:** `shrink_to_fit` is a non-binding request to reduce `capacity()` to `size()`.

[Note 2: The request is non-binding to allow latitude for implementation-specific optimizations. — end note]

It does not increase `capacity()`, but may reduce `capacity()` by causing reallocation. If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` `T` there are no effects.

**Complexity:** If reallocation happens, linear in the size of the sequence.

**Remarks:** Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence as well as the past-the-end iterator.

[Note 3: If no reallocation happens, they remain valid. — end note]

```cpp
constexpr void swap(vector& x) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value || allocator_traits<Allocator>::is_always_equal::value);
```

**Effects:** Exchanges the contents and `capacity()` of `*this` with that of `x`.

**Complexity:** Constant time.

```cpp
constexpr void resize(size_type sz);
```

**Preconditions:** `T` is `Cpp17MoveInsertable` and `Cpp17DefaultInsertable` into `*this`.

**Effects:** If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` default-inserted elements to the sequence.

**Remarks:** If an exception is thrown other than by the move constructor of a non-`Cpp17CopyInsertable` `T` there are no effects.

```cpp
constexpr void resize(size_type sz, const T& c);
```

**Preconditions:** `T` is `Cpp17CopyInsertable` into `*this`.

**Effects:** If `sz < size()`, erases the last `size() - sz` elements from the sequence. Otherwise, appends `sz - size()` copies of `c` to the sequence.

**Remarks:** If an exception is thrown there are no effects.

### Data

```cpp
24.3.11.4 Data [vector.data]
```

```cpp
constexpr T* data() noexcept;
constexpr const T* data() const noexcept;
```

**Returns:** A pointer such that `[data(), data() + size()]` is a valid range. For a non-empty vector, `data() == addressof(front())`.

**Complexity:** Constant time.

### Modifiers

```cpp
24.3.11.5 Modifiers [vector.modifiers]
```

```cpp
constexpr iterator insert(const_iterator position, const T& x);
constexpr iterator insert(const_iterator position, T&& x);
constexpr iterator insert(const_iterator position, size_type n, const T& x);
```

```cpp
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
```

```cpp
template<container-compatible-range<T> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
```

```cpp
constexpr iterator insert(const_iterator position, initializer_list<T>);
```

```cpp
template<class... Args> constexpr reference emplace_back(Args&&... args);
```

```cpp
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
```

```cpp
constexpr void push_back(const T& x);
constexpr void push_back(T&& x);
```
template<container-compatible-range<T> R>
constexpr void append_range(R&& rg);

1 Complexity: If reallocation happens, linear in the number of elements of the resulting vector; otherwise, linear in the number of elements inserted plus the distance to the end of the vector.

2 Remarks: Causes reallocation if the new size is greater than the old capacity. Reallocation invalidates all the references, pointers, and iterators referring to the elements in the sequence, as well as the past-the-end iterator. If no reallocation happens, then references, pointers, and iterators before the insertion point remain valid but those at or after the insertion point, including the past-the-end iterator, are invalidated. If an exception is thrown other than by the copy constructor, move constructor, assignment operator, or move assignment operator of T or by any inputIterator operation there are no effects. If an exception is thrown while inserting a single element at the end and T is Cpp17CopyInsertable or is_nothrow_move_constructible_v<T> is true, there are no effects. Otherwise, if an exception is thrown by the move constructor of a non-Cpp17CopyInsertable T, the effects are unspecified.

constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void pop_back();

3 Effects: Invalidates iterators and references at or after the point of the erase.

4 Throws: Nothing unless an exception is thrown by the assignment operator or move assignment operator of T.

5 Complexity: The destructor of T is called the number of times equal to the number of the elements erased, but the assignment operator of T is called the number of times equal to the number of elements in the vector after the erased elements.

24.3.11.6 Erasure [vector.erase]

template<class T, class Allocator, class U>
constexpr typename vector<T, Allocator>::size_type erase(vector<T, Allocator>& c, const U& value);

1 Effects: Equivalent to:
auto it = remove(c.begin(), c.end(), value);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

template<class T, class Allocator, class Predicate>
constexpr typename vector<T, Allocator>::size_type erase_if(vector<T, Allocator>& c, Predicate pred);

2 Effects: Equivalent to:
auto it = remove_if(c.begin(), c.end(), pred);
auto r = distance(it, c.end());
c.erase(it, c.end());
return r;

24.3.12 Specialization of vector for bool [vector.bool]

24.3.12.1 Partial class template specialization vector<bool, Allocator> [vector.bool.pspc]

To optimize space allocation, a partial specialization of vector for bool elements is provided:

namespace std {
    template<class Allocator>
    class vector<bool, Allocator> {
    public:
        // types
        using value_type = bool;
        using allocator_type = Allocator;
        using pointer = implementation-defined;
        using const_pointer = implementation-defined;
        using const_reference = bool;
        using size_type = implementation-defined; // see 24.2
using difference_type = implementation-defined; // see 24.2
using iterator = implementation-defined; // see 24.2
using const_iterator = implementation-defined; // see 24.2
using reverse_iterator = std::reverse_iterator<iterator>;
using const_reverse_iterator = std::reverse_iterator<const_iterator>;

// bit reference
class reference {
    friend class vector;
    constexpr reference() noexcept;
public:
    constexpr reference(const reference&) = default;
    constexpr ~reference();
    constexpr operator bool() const noexcept;
    constexpr reference& operator=(bool x) noexcept;
    constexpr reference& operator=(const reference& x) noexcept;
    constexpr const reference& operator=(bool x) const noexcept;
    constexpr void flip() noexcept;  // flips the bit
};

// construct/copy/destroy
constexpr vector() noexcept(noexcept(Allocator())) : vector(Allocator()) {}
constexpr explicit vector(const Allocator&) noexcept;
constexpr explicit vector(size_type n, const Allocator& = Allocator());
constexpr vector(size_type n, const bool& value, const Allocator& = Allocator());
template<class InputIterator>
constexpr vector(InputIterator first, InputIterator last, const Allocator& = Allocator());
template<container-compatible-range<br> R>
constexpr vector(from_range_t, R&& rg, const Allocator& = Allocator());
constexpr vector(const vector& x);
constexpr vector(vector&& x) noexcept;
constexpr vector(const vector&, const type_identity_t<Allocator>&);
constexpr vector(vector&&, const type_identity_t<Allocator>&);
constexpr vector(initializer_list<bool>, const Allocator& = Allocator());
constexpr ~vector();
constexpr vector& operator=(const vector& x);
constexpr vector& operator=(vector&& x) noexcept(allocator_traits<Allocator>::propagate_on_container_move_assignment::value ||
    allocator_traits<Allocator>::is_always_equal::value);
constexpr vector& operator=(initializer_list<bool>);

constexpr void push_back(const bool& x);
template<container-compatible-range<br> R>
constexpr void append_range(R&& rg);
constexpr void pop_back();
template<class... Args> constexpr iterator emplace(const_iterator position, Args&&... args);
constexpr iterator insert(const_iterator position, const bool& x);
constexpr iterator insert(const_iterator position, size_type n, const bool& x);
template<class InputIterator>
constexpr iterator insert(const_iterator position, InputIterator first, InputIterator last);
template<container-compatible-range<br> R>
constexpr iterator insert_range(const_iterator position, R&& rg);
constexpr iterator insert(const_iterator position, initializer_list<bool> il);
constexpr iterator erase(const_iterator position);
constexpr iterator erase(const_iterator first, const_iterator last);
constexpr void swap(vector&) noexcept(allocator_traits<Allocator>::propagate_on_container_swap::value ||
allocator_traits<Allocator>::is_always_equal::value);
static constexpr void swap(reference x, reference y) noexcept;
constexpr void flip() noexcept; // flips all bits
constexpr void clear() noexcept;

2 Unless described below, all operations have the same requirements and semantics as the primary vector
template, except that operations dealing with the bool value type map to bit values in the container storage
and allocator_traits::construct (20.2.9.3) is not used to construct these values.

3 There is no requirement that the data be stored as a contiguous allocation of bool values. A space-optimized
representation of bits is recommended instead.

4 reference is a class that simulates the behavior of references of a single bit in vector<bool>. The conversion
function returns true when the bit is set, and false otherwise. The assignment operators set the bit when
the argument is (convertible to) true and clear it otherwise. flip reverses the state of the bit.

constexpr void flip() noexcept;

5 Effects: Replaces each element in the container with its complement.

static constexpr void swap(reference x, reference y) noexcept;

6 Effects: Exchanges the contents of x and y as if by:

    bool b = x;
    x = y;

§ 24.3.12.1
y = b;

```cpp
template<class Allocator> struct hash<vector<bool, Allocator>>;
```

7 The specialization is enabled (22.10.19).

```cpp
template<class T>
constexpr bool is-vector-bool-reference = see below;
```

8 The expression `is-vector-bool-reference<T>` is true if `T` denotes the type `vector<bool, Alloc>::reference` for some type `Alloc` and `vector<bool, Alloc>` is not a program-defined specialization.

### 24.3.12.2 Formatter specialization for `vector<bool>`

```cpp
namespace std {
  template<class T, class charT>
  requires is-vector-bool-reference<T>
  struct formatter<T, charT> {
    private:
      formatter<bool, charT> underlying_; // exposition only

    public:
      template<class ParseContext>
      constexpr typename ParseContext::iterator
      parse(ParseContext& ctx);

      template<class FormatContext>
      typename FormatContext::iterator
      format(const T& ref, FormatContext& ctx) const;
  }
}
```

1 Equivalent to: `return underlying_.parse(ctx);`

2 Equivalent to: `return underlying_.format(ref, ctx);`

### 24.4 Associative containers

#### 24.4.1 In general

1 The header `<map>` defines the class templates `map` and `multimap`; the header `<set>` defines the class templates `set` and `multiset`.

2 The following exposition-only alias templates may appear in deduction guides for associative containers:

```cpp
template<class InputIterator>
using iter-value-type = typename iterator_traits<InputIterator>::value_type; // exposition only
```

```cpp
template<class InputIterator>
using iter-key-type = remove_const_t<
  tuple_element_t<0, iter-value-type<InputIterator>>>
// exposition only
```

```cpp
template<class InputIterator>
using iter-mapped-type =
  tuple_element_t<1, iter-value-type<InputIterator>>;
// exposition only
```

```cpp
template<class InputIterator>
using iter-to-alloc-type = pair<
  add_const_t<tuple_element_t<0, iter-value-type<InputIterator>>>,
  tuple_element_t<1, iter-value-type<InputIterator>>,
// exposition only
```

```cpp
template<ranges::input_range Range>
using range-key-type =
  remove_const_t<typename ranges::range_value_t<Range>::first_type>; // exposition only
```

§ 24.4.1 936
template<ranges::input_range Range>
    using range-mapped-type = typename ranges::range_value_t<Range>::second_type;  // exposition only

template<ranges::input_range Range>
    using range-to-alloc-type =
        pair<add_const_t<typename ranges::range_value_t<Range>::first_type>,
        typename ranges::range_value_t<Range>::second_type>;
        // exposition only

24.4.2 Header <map> synopsis

    }
}
```
24.4.4 Class template map

24.4.4.1 Overview

A map is an associative container that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type T based on the keys. The map class supports bidirectional iterators.

A map meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A map also provides most operations described in 24.2.7 for unique keys. This means that a map supports the a_uniq operations in 24.2.7 but not the a_eq operations. For a map<Key,T> the key_type is Key and the value_type is pair<const Key,T>. Descriptions are provided here only for operations on map that are not described in one of those tables or for operations where there is additional semantic information.

namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class map {
        public:
            // types
            using key_type = Key;
            using mapped_type = T;
            using value_type = pair<const Key, T>;
            using key_compare = Compare;
            using allocator_type = Allocator;

map(initializer_list<pair<Key, T>>, Compare = Compare(), Allocator = Allocator())
-> map<Key, T, Compare, Allocator>;

template<class InputIterator, class Allocator>
map(InputIterator first, InputIterator last,
const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty map using the specified comparison object and allocator.

Complexity: Constant.

template<ranges::input_range R, class Compare = less<range-key-type<R>>,
class Allocator = allocator<range-to-alloc-type<R>>>
map(from_range_t, R&&, Compare = Compare(), Allocator = Allocator())
-> map<range-key-type<R>, range-mapped-type<R>, Compare, Allocator>;

Effects: Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range [first,last).

Complexity: Linear in N if the range [first,last) is already sorted with respect to comp and otherwise N log N, where N is last - first.

template<container-compatible-range<value_type> R>
map(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty map using the specified comparison object and allocator, and inserts elements from the range rg.

Complexity: Linear in N if rg is already sorted with respect to comp and otherwise N log N, where N is ranges::distance(rg).
24.4.4.3 Element access

mapped_type& operator[](const key_type& x);  
*Effects:* Equivalent to: return try_emplace(x).first->second;

mapped_type& operator[](key_type&& x);  
*Effects:* Equivalent to: return try_emplace(std::move(x)).first->second;

mapped_type& at(const key_type& x);  
const mapped_type& at(const key_type& x) const;

*Returns:* A reference to the mapped_type corresponding to x in *this.

*Throws:* An exception object of type out_of_range if no such element is present.

*Complexity:* Logarithmic.

24.4.4.4 Modifiers

template<class P> 
pair<iterator, bool> insert(P&& x); 

template<class P> 
iterator insert(const_iterator position, P&& x); 

*Constraints:* is_constructible_v<value_type, P&&> is true.

*Effects:* The first form is equivalent to return emplace(std::forward<P>(x)). The second form is equivalent to return emplace_hint(position, std::forward<P>(x)).

template<class... Args> 
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args); 

template<class... Args> 
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args); 

*Preconditions:* value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

*Effects:* If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

*Returns:* In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

*Complexity:* The same as emplace and emplace_hint, respectively.

template<class... Args> 
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args); 

template<class... Args> 
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args); 

*Preconditions:* value_type is Cpp17EmplaceConstructible into map from piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

*Effects:* If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

*Returns:* In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to k.

*Complexity:* The same as emplace and emplace_hint, respectively.

template<M> 
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj); 

template<M> 
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj); 

*Mandates:* is_assignable_v<mapped_type&, M&&> is true.

*Preconditions:* value_type is Cpp17EmplaceConstructible into map from k, std::forward<M>(obj).
Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns `std::forward<M>(obj)` to \( e.second \). Otherwise inserts an object of type `value_type` constructed with \( \text{std::move}(k), \text{std::forward}(M)(obj) \).

Returns: In the first overload, the bool component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

Mandates: `is_assignable_v<mapped_type &, M&&>` is true.

 Preconditions: `value_type` is Cpp17EmplaceConstructible into map from `std::move(k), std::forward<M>(obj)`.

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns `std::forward<M>(obj)` to \( e.second \). Otherwise inserts an object of type `value_type` constructed with `std::move(k), std::forward<M>(obj)`.

Returns: In the first overload, the bool component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

24.4.4.5 Erasure

```
template<class Key, class T, class Compare, class Allocator, class Predicate>
    typename map<Key, T, Compare, Allocator>::size_type
erase_if(map<Key, T, Compare, Allocator>& c, Predicate pred);
```

Effects: Equivalent to:

```c++
    auto original_size = c.size();
    for (auto i = c.begin(), last = c.end(); i != last; ) {
        if (pred(*i)) {
            i = c.erase(i);
        } else {
            ++i;
        }
    }
    return original_size - c.size();
```

24.4.5 Class template multimap

### 24.4.5.1 Overview

A multimap is an associative container that supports equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast retrieval of values of another type \( T \) based on the keys. The multimap class supports bidirectional iterators.

A multimap meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), and of an associative container (24.2.7). A multimap also provides most operations described in 24.2.7 for equal keys. This means that a multimap supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `multimap<Key,T>` the `key_type` is `Key` and the `value_type` is `pair<const Key, T>`. Descriptions are provided here only for operations on `multimap` that are not described in one of those tables or for operations where there is additional semantic information.

```
namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class Allocator = allocator<pair<const Key, T>>>
    class multimap {
        public:
            // types
            using key_type = Key;
            using mapped_type = T;
            using value_type = pair<const Key, T>;

24.4.5.2 Constructors [multimap.cons]

explicit multimap(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty multimap using the specified comparison object and allocator.

Complexity: Constant.

§ 24.4.5.2 947
\textbf{Effects}: Constructs an empty \texttt{multimap} using the specified comparison object and allocator, and inserts elements from the range \([\texttt{first}, \texttt{last}]\).

\textbf{Complexity}: Linear in \(N\) if the range \([\texttt{first}, \texttt{last}]\) is already sorted with respect to \texttt{comp} and otherwise \(N \log N\), where \(N\) is \(\texttt{last} - \texttt{first}\).

\textbf{Effects}: Constructs an empty \texttt{multimap} using the specified comparison object and allocator, and inserts elements from the range \texttt{rg}.

\textbf{Complexity}: Linear in \(N\) if \texttt{rg} is already sorted with respect to \texttt{comp} and otherwise \(N \log N\), where \(N\) is \texttt{ranges::distance(rg)}.

24.4.6.2 Constructors, copy, and assignment

explicit set(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator.

Complexity: Constant.

template<class InputIterator>
set(InputIterator first, InputIterator last,
const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range [first, last).

Complexity: Linear in \( N \) if the range \([first, last)\) is already sorted with respect to \( \text{comp} \) and otherwise \( N \log N \), where \( N \) is \( last - first \).

template<container-compatible-range<value_type> R>
set(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty set using the specified comparison object and allocator, and inserts elements from the range \( rg \).
Complexity: Linear in $N$ if $rg$ is already sorted with respect to $\text{comp}$ and otherwise $N \log N$, where $N$ is \text{ranges::distance}(rg).

24.4.6.3 Erasure

```cpp
template<class Key, class Compare, class Allocator, class Predicate>
typename set<Key, Compare, Allocator>::size_type
erase_if(set<Key, Compare, Allocator>& c, Predicate pred);
```

Effects: Equivalent to:

```cpp
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
    if (pred(*i)) {
        i = c.erase(i);
    } else {
        ++i;
    }
}
return original_size - c.size();
```

24.4.7 Class template multiset

24.4.7.1 Overview

A `multiset` is an associative container that supports equivalent keys (i.e., possibly contains multiple copies of the same key value) and provides for fast retrieval of the keys themselves. The `multiset` class supports bidirectional iterators.

A `multiset` meets all of the requirements of a container (24.2.2.2), of a reversible container (24.2.2.3), of an allocator-aware container (24.2.2.5), of an associative container (24.2.7). `multiset` also provides most operations described in 24.2.7 for duplicate keys. This means that a `multiset` supports the `a_eq` operations in 24.2.7 but not the `a_uniq` operations. For a `multiset<Key>` both the `key_type` and `value_type` are `Key`.

Descriptions are provided here only for operations on `multiset` that are not described in one of these tables and for operations where there is additional semantic information.

```cpp
namespace std {
    template<class Key, class Compare = less<Key>,
             class Allocator = allocator<Key>>
    class multiset {
public:
    // types
    using key_type = Key;
    using key_compare = Compare;
    using value_type = Key;
    using value_compare = Compare;
    using allocator_type = Allocator;

}  // namespace ranges

24.4.7.2 Constructors \[multiset.cons\]

explicit multiset(const Compare& comp, const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator.

Complexity: Constant.

template<class InputIterator>
multiset(InputIterator first, InputIterator last,
const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range [first, last).

Complexity: Linear in \(N\) if the range [first, last) is already sorted with respect to \(\text{comp}\) and otherwise \(N \log N\), where \(N\) is last - first.

template<container-compatible-range<value_type> R>
multiset(from_range_t, R&& rg, const Compare& comp = Compare(), const Allocator& = Allocator());

Effects: Constructs an empty multiset using the specified comparison object and allocator, and inserts elements from the range \(\text{rg}\).

Complexity: Linear in \(N\) if \(\text{rg}\) is already sorted with respect to \(\text{comp}\) and otherwise \(N \log N\), where \(N\) is ranges::distance(\(\text{rg}\)).

24.4.7.3 Erasure \[multiset.erasure\]

template<class Key, class Compare, class Allocator, class Predicate>
typename multiset<Key, Compare, Allocator>::size_type
erase_if(multiset<Key, Compare, Allocator>& c, Predicate pred);

Effects: Equivalent to:

```cpp
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```
24.5 Unordered associative containers [unord]

24.5.1 In general [unord.general]

1 The header `<unordered_map>` defines the class templates `unordered_map` and `unordered_multimap`; the header `<unordered_set>` defines the class templates `unordered_set` and `unordered_multiset`.

2 The exposition-only alias templates `iter-value-type`, `iter-key-type`, `iter-mapped-type`, `iter-to-alloc-type`, `range-key-type`, `range-mapped-type`, and `range-to-alloc-type` defined in 24.4.1 may appear in deduction guides for unordered containers.

24.5.2 Header `<unordered_map>` synopsis [unord.map.syn]

```cpp
#include <compare> // see 17.11.1
#include <initializer_list> // see 17.10.2

}

24.5.4 Class template unordered_map

24.5.4.1 Overview

An unordered_map is an unordered associative container that supports unique keys (an unordered_map contains at most one of each key value) and that associates values of another type mapped_type with the keys. The unordered_map class supports forward iterators.

An unordered_map meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_map supports the a_uniq operations in that table, not the a_eq operations. For an unordered_map<Key, T> the key_type is Key, the mapped_type is T, and the value_type is pair<const Key, T>.

Subclause 24.5.4 only describes operations on unordered_map that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key,  
        class T,  
        class Hash = hash<Key>,  
        class Pred = equal_to<Key>,  
        class Allocator = allocator<pair<const Key, T>>>  
    class unordered_map {
        public:
        // types  
        using key_type = Key;  
        using mapped_type = T;  
        using value_type = pair<const Key, T>;

template<class Key, class T, class Allocator>
unordered_map(initializer_list<pair<Key, T>>, Allocator)
-> unordered_map<Key, T, Hash, Pred, Allocator>;

4 A size_type parameter type in an unordered_map deduction guide refers to the size_type member type
of the type deduced by the deduction guide.

24.5.4.2 Constructors [unord.map.cnstr]

unordered_map() : unordered_map(size_type(see below)) {} 
explicit unordered_map(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    ...
const allocator_type& a = allocator_type();

Effects: Constructs an empty unordered_map using the specified hash function, key equality predicate, and allocator, and using at least \( n \) buckets. For the default constructor, the number of buckets is implementation-defined. \texttt{max_load_factor()} returns 1.0.

Complexity: Constant.

\begin{verbatim}
// 24.5.4.3 Element access

mapped_type& operator[](const key_type& k);

Effects: Equivalent to: \texttt{return try_emplace(k).first->second;}

mapped_type& operator[](key_type&& k);

Effects: Equivalent to: \texttt{return try_emplace(std::move(k)).first->second;}

mapped_type& at(const key_type& k);

const mapped_type& at(const key_type& k) const;

Returns: A reference to \( x.second \), where \( x \) is the (unique) element whose key is equivalent to \( k \).

Throws: An exception object of type \texttt{out_of_range} if no such element is present.

// 24.5.4.4 Modifiers

template<class P>
pair<iterator, bool> insert(P&& obj);

Constraints: \texttt{is_constructible_v<value_type, P&&>} is true.

Effects: Equivalent to: \texttt{return emplace(std::forward<P>(obj));}

template<class P>
iterator insert(const_iterator hint, P&& obj);

Constraints: \texttt{is_constructible_v<value_type, P&&>} is true.

Effects: Equivalent to: \texttt{return emplace_hint(hint, std::forward<P>(obj));}

template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
\end{verbatim}
template<class... Args>
  iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);

  Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct,
  forward_as_tuple(k), forward_as_tuple(std::forward<Args>(args)...).

  Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise
  inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(k),
  forward_as_tuple(std::forward<Args>(args)...).

  Returns: In the first overload, the bool component of the returned pair is true if and only if the
  insertion took place. The returned iterator points to the map element whose key is equivalent to k.

  Complexity: The same as emplace and emplace_hint, respectively.

template<class... Args>
  pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);

template<class... Args>
  iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);

  Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from piecewise_construct,
  forward_as_tuple(std::move(k)), forward_as_tuple(std::forward<Args>(args)...).

  Effects: If the map already contains an element whose key is equivalent to k, there is no effect. Otherwise
  inserts an object of type value_type constructed with piecewise_construct, forward_as_tuple(std::move(k)),
  forward_as_tuple(std::forward<Args>(args)...).

  Returns: In the first overload, the bool component of the returned pair is true if and only if the
  insertion took place. The returned iterator points to the map element whose key is equivalent to k.

  Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
  pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);

template<class M>
  iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);

  Mandates: is_assignable_v<mapped_type&, M&&> is true.

  Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from k, std::forward<M>(obj).

  Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with k,
  std::forward<M>(obj).

  Returns: In the first overload, the bool component of the returned pair is true if and only if the
  insertion took place. The returned iterator points to the map element whose key is equivalent to k.

  Complexity: The same as emplace and emplace_hint, respectively.

template<class M>
  pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);

template<class M>
  iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);

  Mandates: is_assignable_v<mapped_type&, M&&> is true.

  Preconditions: value_type is Cpp17EmplaceConstructible into unordered_map from std::move(k),
  std::forward<M>(obj).

  Effects: If the map already contains an element e whose key is equivalent to k, assigns std::forward<M>(obj) to e.second. Otherwise inserts an object of type value_type constructed with std::
  move(k), std::forward<M>(obj).

  Returns: In the first overload, the bool component of the returned pair is true if and only if the
  insertion took place. The returned iterator points to the map element whose key is equivalent to k.

  Complexity: The same as emplace and emplace_hint, respectively.
24.5.4.5 Erasure

```cpp
template<class K, class T, class H, class P, class A, class Predicate>
typename unordered_map<K, T, H, P, A>::size_type
erase_if(unordered_map<K, T, H, P, A>& c, Predicate pred);
```

Effects: Equivalent to:
```cpp
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();
```

24.5.5 Class template unordered_multimap

24.5.5.1 Overview

An `unordered_multimap` is an unordered associative container that supports equivalent keys (an instance of `unordered_multimap` may contain multiple copies of each key value) and that associates values of another type `mapped_type` with the keys. The `unordered_multimap` class supports forward iterators.

An `unordered_multimap` meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an `unordered_multimap` supports the `a_eq` operations in that table, not the `a_uniq` operations. For an `unordered_multimap<Key, T>` the `key_type` is `Key`, the `mapped_type` is `T`, and the `value_type` is `pair<const Key, T>`.

Subclause 24.5.5 only describes operations on `unordered_multimap` that are not described in one of the requirement tables, or for which there is additional semantic information.

```cpp
namespace std {
  template<class Key,
           class T, 
           class Hash = hash<Key>, 
           class Pred = equal_to<Key>,
           class Allocator = allocator<pair<const Key, T>>> 
  class unordered_multimap {
public:
  // types
  using key_type = Key;
  using mapped_type = T;
  using value_type = pair<const Key, T>;
  using hasher = Hash;
  using key_equal = Pred;
  using allocator_type = Allocator;
  using pointer = typename allocator_traits<Allocator>::pointer;
  using const_pointer = typename allocator_traits<Allocator>::const_pointer;
  using reference = value_type&;
  using const_reference = const value_type&;
  using size_type = implementation-defined; // see 24.2
  using difference_type = implementation-defined; // see 24.2
  using iterator = implementation-defined; // see 24.2
  using const_iterator = implementation-defined; // see 24.2
  using local_iterator = implementation-defined; // see 24.2
  using const_local_iterator = implementation-defined; // see 24.2
  using node_type = unspecified;

  // 24.5.5.2, construct/copy/destroy
  unordered_multimap();
```

A `size_type` parameter type in an `unordered_multimap` deduction guide refers to the `size_type` member type of the type deduced by the deduction guide.

### 24.5.5.2 Constructors [unord.multimap.cnstr]

- `unordered_multimap()` : `unordered_multimap(size_type(see below))` { }
  - `explicit unordered_multimap(size_type n,`
    - `const hasher& hf = hasher(),`
    - `const key_equal& eql = key_equal(),`
    - `const allocator_type& a = allocator_type();`)

  **Effects:** Constructs an empty `unordered_multimap` using the specified hash function, key equality predicate, and allocator, and using at least `n` buckets. For the default constructor, the number of buckets is implementation-defined. `max_load_factor()` returns `1.0`.

  **Complexity:** Constant.
const allocator_type& a = allocator_type());
unordered_multimap(initializer_list<value_type> il,
    size_type n = see below,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multimap using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f,l), rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.5.3 Modifiers

template<class P>
    iterator insert(P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace(std::forward<P>(obj));

template<class P>
    iterator insert(const_iterator hint, P&& obj);

Constraints: is_constructible_v<value_type, P&&> is true.

Effects: Equivalent to: return emplace_hint(hint, std::forward<P>(obj));

24.5.5.4 Erasure

template<class K, class T, class H, class P, class A, class Predicate>
    typename unordered_multimap<K, T, H, P, A>::size_type
        erase_if(unordered_multimap<K, T, H, P, A>& c, Predicate pred);

Effects: Equivalent to:
    auto original_size = c.size();
    for (auto i = c.begin(), last = c.end(); i != last; ) {
        if (pred(*i)) {
            i = c.erase(i);
        } else {
            ++i;
        }
    }
    return original_size - c.size();

24.5.6 Class template unordered_set

24.5.6.1 Overview

An unordered_set is an unordered associative container that supports unique keys (an unordered_set contains at most one of each key value) and in which the elements’ keys are the elements themselves. The unordered_set class supports forward iterators.

An unordered_set meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for unique keys; that is, an unordered_set supports the a_uniq operations in that table, not the a_eq operations. For an unordered_set<Key> the key_type and the value_type are both Key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 24.5.6 only describes operations on unordered_set that are not described in one of the requirement tables, or for which there is additional semantic information.

namespace std {
    template<class Key,
        class Hash = hash<Key>,
        class Pred = equal_to<Key>,
        class Allocator = allocator<Key>>
class unordered_set {

-> unordered_set<iter_value_type<InputIterator>, hash<iter_value_type<InputIterator>>, equal_to<iter_value_type<InputIterator>>, Allocator>;

A size_type parameter type in an unordered_set deduction guide refers to the size_type member type of the type deduced by the deduction guide.

24.5.6.2 Constructors

unordered_set() : unordered_set(size_type(see below)) { }
explicit unordered_set(size_type n,
  const hasher& hf = hasher(),
  const key_equal& eqi = key_equal(),
  const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_set using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.
template<class InputIterator>
unordered_set(InputIterator f, InputIterator l,
size_type n = see below, const hasher& hf = hasher(),
const key_equal& eq = key_equal(), const allocator_type& a = allocator_type());

template<container-compatible-range <value_type> R>
unordered_multiset(from_range_t, R&& rg,
size_type n = see below, const hasher& hf = hasher(),
const key_equal& eq = key_equal(), const allocator_type& a = allocator_type());

unordered_set(initializer_list<value_type> il,
size_type n = see below, const hasher& hf = hasher(),
const key_equal& eq = key_equal(), const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_set using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l), rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.6.3 Erasure

template<class K, class H, class P, class A, class Predicate>
typename unordered_set<K, H, P, A>::size_type
erase_if(unordered_set<K, H, P, A>& c, Predicate pred);

Effects: Equivalent to:
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}

24.5.7 Class template unordered_multiset

24.5.7.1 Overview

An unordered_multiset is an unordered associative container that supports equivalent keys (an instance of unordered_multiset may contain multiple copies of the same key value) and in which each element’s key is the element itself. The unordered_multiset class supports forward iterators.

An unordered_multiset meets all of the requirements of a container (24.2.2.2), of an allocator-aware container (24.2.2.5), and of an unordered associative container (24.2.8). It provides the operations described in the preceding requirements table for equivalent keys; that is, an unordered_multiset supports the a_eq operations in that table, not the a_uniq operations. For an unordered_multiset<key> the key_type and the value_type are both key. The iterator and const_iterator types are both constant iterator types. It is unspecified whether they are the same type.

Subclause 24.5.7 only describes operations on unordered_multiset that are not described in one of the requirement tables, or for which there is additional semantic information.
// types
using key_type = Key;
using value_type = Key;

  class Pred = equal_to<iter_value_type<InputIterator>>,
  class Allocator = allocator<iter_value_type<InputIterator>>>
unordered_multiset(InputIterator, InputIterator,
  see below::size_type = see below,
  Hash = Hash(), Pred = Pred(), Allocator = Allocator())
  -> unordered_multiset<iter_value_type<InputIterator>>,
  Hash, Pred, Allocator>>;

template<ranges::input_range R,
  class Hash = hash<ranges::range_value_t<R>>,
  class Pred = equal_to<ranges::range_value_t<R>>,
  class Allocator = allocator<ranges::range_value_t<R>>>
unordered_multiset(from_range_t, R&&, typename see below::size_type = see below,
    Hash = Hash(), Pred = Pred(), Allocator = Allocator())
-> unordered_multiset<ranges::range_value_t<R>, Hash, Pred, Allocator>;

template<class T, class Hash = hash<T>,
    class Pred = equal_to<T>, class Allocator = allocator<T>>
unordered_multiset(initializer_list<T>, typename see below::size_type = see below,
    Hash = Hash(), Pred = Pred(), Allocator = Allocator())
-> unordered_multiset<T, Hash, Pred, Allocator>;

template<class InputIterator, class Allocator>
unordered_multiset(InputIterator, InputIterator, typename see below::size_type,
    Hash, Allocator)
-> unordered_multiset<iter_value_type<InputIterator>,
    hash<iter_value_type<InputIterator>>,
    equal_to<iter_value_type<InputIterator>>,
    Allocator>;

template<ranges::input_range R, class Allocator>
unordered_multiset(from_range_t, R&&, typename see below::size_type,
    Hash, Allocator)
-> unordered_multiset<ranges::range_value_t<R>, hash<ranges::range_value_t<R>>,
    equal_to<ranges::range_value_t<R>>, Allocator>;

A size_type parameter type in an unordered_multiset deduction guide refers to the size_type member type of the type deduced by the deduction guide.

24.5.7.2 Constructors

unordered_multiset() : unordered_multiset(size_type(see below)) { }
explicit unordered_multiset(size_type n,
    const hasher& hf = hasher(),
    const key_equal& eql = key_equal(),
    const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multiset using the specified hash function, key equality predicate, and allocator, and using at least n buckets. For the default constructor, the number of buckets is implementation-defined. max_load_factor() returns 1.0.

Complexity: Constant.
template<class InputIterator>
unordered_multiset(InputIterator f, InputIterator l,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

template<container-compatible-range <value_type> R>
unordered_multiset(from_range_t, R&& rg,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());
unordered_multiset(initializer_list<value_type> il,
size_type n = see below,
const hasher& hf = hasher(),
const key_equal& eql = key_equal(),
const allocator_type& a = allocator_type());

Effects: Constructs an empty unordered_multiset using the specified hash function, key equality predicate, and allocator, and using at least n buckets. If n is not provided, the number of buckets is implementation-defined. Then inserts elements from the range [f, l), rg, or il, respectively. max_load_factor() returns 1.0.

Complexity: Average case linear, worst case quadratic.

24.5.7.3 Erasure

template<class K, class H, class P, class A, class Predicate>
typename unordered_multiset<K, H, P, A>::size_type
erase_if(unordered_multiset<K, H, P, A>& c, Predicate pred);

Effects: Equivalent to:
auto original_size = c.size();
for (auto i = c.begin(), last = c.end(); i != last; ) {
  if (pred(*i)) {
    i = c.erase(i);
  } else {
    ++i;
  }
}
return original_size - c.size();

24.6 Container adaptors

24.6.1 In general

The headers <queue>, <stack>, <flat_map>, and <flat_set> define the container adaptors queue and priority_queue, stack, flat_map and flat_multimap, and flat_set and flat_multiset, respectively.

Each container adaptor takes one or more template parameters named Container, KeyContainer, or MappedContainer that denote the types of containers that the container adaptor adapts. Each container adaptor has at least one constructor that takes a reference argument to one or more such template parameters. For each constructor reference argument to a container C, the constructor copies the container into the container adaptor. If C takes an allocator, then a compatible allocator may be passed in to the adaptor’s constructor. Otherwise, normal copy or move construction is used for the container argument. For the container adaptors that take a single container template parameter Container, the first template parameter T of the container adaptor shall denote the same type as Container::value_type.

For container adaptors, no swap function throws an exception unless that exception is thrown by the swap of the adaptor’s Container, KeyContainer, MappedContainer, or Compare object (if any).

A constructor template of a container adaptor shall not participate in overload resolution if it has an InputIterator template parameter and a type that does not qualify as an input iterator is deduced for that parameter.
For container adaptors that have them, the `insert`, `emplace`, and `erase` members affect the validity of iterators, references, and pointers to the adaptor’s container(s) in the same way that the containers’ respective `insert`, `emplace`, and `erase` members do.

[Example 1: A call to `flat_map<Key, T>::insert` can invalidate all iterators to the `flat_map`. —end example]

A deduction guide for a container adaptor shall not participate in overload resolution if any of the following are true:

(6.1) It has an `InputIterator` template parameter and a type that does not qualify as an input iterator is deduced for that parameter.

(6.2) It has a `Compare` template parameter and a type that qualifies as an allocator is deduced for that parameter.

(6.3) It has a `Container`, `KeyContainer`, or `MappedContainer` template parameter and a type that qualifies as an allocator is deduced for that parameter.

(6.4) It has no `Container`, `KeyContainer`, or `MappedContainer` template parameter, and it has an `Allocator` template parameter, and a type that does not qualify as an allocator is deduced for that parameter.

(6.5) It has both `Container` and `Allocator` template parameters, and `uses_allocator_v<Container, Allocator>` is false.

(6.6) It has both `KeyContainer` and `Allocator` template parameters, and `uses_allocator_v<KeyContainer, Allocator>` is false.

(6.7) It has both `MappedContainer` and `Allocator` template parameters, and `uses_allocator_v<MappedContainer, Allocator>` is false.

The exposition-only alias template `iter-value-type` defined in 24.3.1 and the exposition-only alias templates `iter-key-type`, `iter-mapped-type`, `range-key-type`, and `range-mapped-type` defined in 24.4.1 may appear in deduction guides for container adaptors.

24.6.6 Class template queue

24.6.6.1 Definition

1 Any sequence container supporting operations front(), back(), push_back() and pop_front() can be used
to instantiate queue. In particular, list (24.3.10) and deque (24.3.8) can be used.
namespace std {
    template<class T, class Container = deque<T>>
    class queue {
    public:
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;
    protected:
        Container c;
    public:
        queue() : queue(Container()) {}
        explicit queue(const Container&);
        explicit queue(Container&&);
        template<class InputIterator> queue(InputIterator first, InputIterator last);
        template<
            container-compatible-range<br>
        > queue(from_range_t, R&& rg);
        template<class Alloc> explicit queue(const Alloc&);
        template<class Alloc> queue(const Container&, const Alloc&);
        template<class Alloc> queue(Container&&, const Alloc&);
        template<class Alloc> queue(const queue&, const Alloc&);
        template<class Alloc> queue(queue&&, const Alloc&);
        template<class Alloc> queue(InputIterator, InputIterator last, const Alloc&);
        template<class container_type, class Alloc>
        queue(from_range_t, R&& rg, const Alloc&);
        [[nodiscard]] bool empty() const { return c.empty(); }
        size_type size() const { return c.size(); }
        reference front() { return c.front(); }
        const_reference front() const { return c.front(); }
        reference back() { return c.back(); }
        const_reference back() const { return c.back(); }
        void push(const value_type& x) { c.push_back(x); }
        void push(value_type&& x) { c.push_back(std::move(x)); }
        template<
            container-compatible-range<br>
        > void push_range(R&& rg);
        template<class... Args>
        decltype(auto) emplace(Args&&... args)
        {
            return c.emplace_back(std::forward<Args>(args)...);
        }
        void pop() { c.pop_front(); }
        void swap(queue& q) noexcept(is_nothrow_swappable_v<Container>)
        {
            using std::swap;
            swap(c, q.c);
        }
    };

    template<class Container>
    queue(Container) -> queue<typename Container::value_type, Container>;

            Alloc>;<br>
template<ranges::input_range R, class Allocator>
queue(from_range_t, R&&, Allocator)
-> queue<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;

template<class T, class Container, class Alloc>
struct uses_allocator<queue<T, Container>, Alloc>
: uses_allocator<Container, Alloc>::type {};

24.6.6.2 Constructors

explicit queue(const Container& cont);

Effects: Initializes c with cont.

explicit queue(Container&& cont);

Effects: Initializes c with std::move(cont).

template<class InputIterator>
queue(InputIterator first, InputIterator last);

Effects: Initializes c with first as the first argument and last as the second argument.

template<typename compatible_range<T> R>
queue(from_range_t, R&& rg);

Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.6.3 Constructors with allocators

1 If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit queue(const Alloc& a);

Effects: Initializes c with a.

template<class Alloc> queue(const container_type& cont, const Alloc& a);

Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> queue(container_type&& cont, const Alloc& a);

Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> queue(const queue& q, const Alloc& a);

Effects: Initializes c with q.c as the first argument and a as the second argument.

template<class Alloc> queue(queue&& q, const Alloc& a);

Effects: Initializes c with std::move(q.c) as the first argument and a as the second argument.

template<class InputIterator, class Alloc>
queue(InputIterator first, InputIterator last, const Alloc& alloc);

Effects: Initializes c with first as the first argument, last as the second argument, and alloc as the third argument.

template<typename compatible_range<T> R, class Alloc>
queue(from_range_t, R&& rg, const Alloc& alloc);

Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a).

24.6.6.4 Modifiers

template<typename compatible_range<T> R>
void push_range(R&& rg);

Effects: Equivalent to c.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise
ranges::copy(rg, back_inserter(c)).
24.6.6.5 Operators

```cpp
template<class T, class Container>
bool operator==(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c == y.c.
```

```cpp
template<class T, class Container>
bool operator!=(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c != y.c.
```

```cpp
template<class T, class Container>
bool operator<(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c < y.c.
```

```cpp
template<class T, class Container>
bool operator>(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c > y.c.
```

```cpp
template<class T, class Container>
bool operator<=(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c <= y.c.
```

```cpp
template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const queue<T, Container>& x, const queue<T, Container>& y);

Returns: x.c <=> y.c.
```

24.6.6.6 Specialized algorithms

```cpp
template<class T, class Container>
void swap(queue<T, Container>& x, queue<T, Container>& y) noexcept(noexcept(x.swap(y)));

Constraints: is_swappable_v<Container> is true.

Effects: As if by x.swap(y).
```

24.6.7 Class template priority_queue

24.6.7.1 Overview

Any sequence container with random access iterator and supporting operations front(), push_back() and pop_back() can be used to instantiate priority_queue. In particular, vector (24.3.11) and deque (24.3.8) can be used. Instantiating priority_queue also involves supplying a function or function object for making priority comparisons; the library assumes that the function or function object defines a strict weak ordering (27.8).

```cpp
namespace std {
    template<class T, class Container = vector<T>,
     class Compare = less<typename Container::value_type>>
    class priority_queue {
    public:
        using value_type = typename Container::value_type;
        using reference = typename Container::reference;
        using const_reference = typename Container::const_reference;
        using size_type = typename Container::size_type;
        using container_type = Container;
        using value_compare = Compare;
    }
}
```
protected:
    Container c;
    Compare comp;

public:
    priority_queue() : priority_queue(Compare()) {}  
    explicit priority_queue(const Compare& x) : priority_queue(x, Container()) {}  
    priority_queue(const Compare& x, const Container&);  
    template<class InputIterator>
        priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());  
    template<class InputIterator>
        priority_queue(InputIterator first, InputIterator last, const Compare& x,  
                        const Container&);  
    template<class InputIterator>
        priority_queue(InputIterator first, InputIterator last, const Compare& x,  
                        Container&&);  
    template<class Alloc> explicit priority_queue(const Alloc&);  
    template<class Alloc> priority_queue(const Compare&, const Alloc&);  
    template<class Alloc> priority_queue(const Compare&, const Container&, const Alloc&);  
    template<class Alloc> priority_queue(const Compare&, Container&&, const Alloc&);  
    template<class Alloc> priority_queue(const priority_queue&, const Alloc&);  
    template<class Alloc> priority_queue(priority_queue&&, const Alloc&);  
    template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Alloc&);  
    template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Compare&, const Alloc&);  
    template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Compare&, const Container&,  
                        const Alloc&);  
    template<class InputIterator, class Alloc>
        priority_queue(InputIterator, InputIterator, const Compare&, Container&&, const Alloc&);  
    template<class Alloc> priority_queue(from_range_t, R&& rg, const Compare& x = Compare());  
    template<class Alloc> priority_queue(from_range_t, R&& rg, const Alloc&);  
    
    [[nodiscard]] bool empty() const { return c.empty(); }
    size_type size() const { return c.size(); }
    const_reference top() const { return c.front(); }
    void push(const value_type& x);
    void push(value_type&& x);
    template<
        container-compatible-range<T> R>
        void push_range(R&& rg);
    template<class... Args> void emplace(Args&&... args);
    void pop();
    void swap(priority_queue& q) noexcept(is_nothrow_swappable_v<Container> &&  
                   is_nothrow_swappable_v<Compare>)  
        { using std::swap; swap(c, q.c); swap(comp, q.comp); }
    
    template<class Compare, class Container>
        priority_queue(Compare, Container)
            -> priority_queue<typename Container::value_type, Container, Compare>;
    
    template<class InputIterator, class Compare = less<iter-value-type<InputIterator>>,  
             class Container = vector<iter-value-type<InputIterator>>>  
        priority_queue(InputIterator, InputIterator, Compare = Compare(), Container = Container())  
            -> priority_queue<iter-value-type<InputIterator>, Container, Compare>;

§ 24.6.7.1 987
template<ranges::input_range R, class Compare = less<ranges::range_value_t<R>>>  
 priority_queue(from_range_t, R&&, Compare = Compare())  
 -> priority_queue<ranges::range_value_t<R>, vector<ranges::range_value_t<R>>, Compare>;

template<class Compare, class Container, class Allocator>  
 priority_queue(Compare, Container, Allocator)  
 -> priority_queue<typename Container::value_type, Container, Compare>;

template<class InputIterator, class Allocator>  
 priority_queue(InputIterator, InputIterator, Allocator)  
 -> priority_queue<iter-value-type<InputIterator>,  
 vector<iter-value-type<InputIterator>>, Allocator>,  
 less<iter-value-type<InputIterator>>>;

template<class InputIterator>  
 priority_queue(InputIterator, InputIterator, const Compare& x = Compare());  
 Preconditions: x defines a strict weak ordering (27.8).

Effects: Initializes \( \text{comp} \) with \( x \) and \( \text{c} \) with \( y \) (copy constructing or move constructing as appropriate);  
calls \text{make_heap}(\text{c.begin}(), \text{c.end}(), \text{comp}).

template<class InputIterator>  
 priority_queue(InputIterator first, InputIterator last, const Compare& x = Compare());  
 Preconditions: x defines a strict weak ordering (27.8).

Effects: Initializes \( \text{c} \) with \( \text{first} \) as the first argument and \( \text{last} \) as the second argument, and initializes  
\text{comp} with \( x \); then calls \text{make_heap}(\text{c.begin}(), \text{c.end}(), \text{comp}).

template<class InputIterator>  
 priority_queue(InputIterator first, InputIterator last, const Compare& x, const Container& y);  
template<class InputIterator>  
 priority_queue(InputIterator first, InputIterator last, const Compare& x, Container&& y);  
 Preconditions: x defines a strict weak ordering (27.8).

Effects: Initializes \( \text{comp} \) with \( x \) and \( \text{c} \) with \( y \) (copy constructing or move constructing as appropriate);  
calls \text{c.insert}(\text{c.end}(), \text{first}, \text{last}); and finally calls \text{make_heap}(\text{c.begin}(), \text{c.end}(), \text{comp}).
template<typename Container, typename Compare, typename Alloc>
    priority_queue(Container&& c, Compare comp, Alloc a);

7 Preconditions: c is a container of elements that satisfy the
8 strong ordering (27.8). Effects: Initializes c with c as the first
9 argument and a as the second argument, and initializes
10 comp with comp; calls make_heap(c.begin(), c.end(), comp).

24.6.7.3 Constructors with allocators

If uses_allocator_v<container_type, Alloc> is false the constructors in
this subclause shall not participate in overload resolution.

template<Alloc> explicit priority_queue(const Alloc& a);

Effects: Initializes c with a and value-initializes comp.

template<Alloc> priority_queue(const Compare& compare, const Alloc& a);

Effects: Initializes c with a and initializes comp with compare.

template<Alloc>
    priority_queue(const Compare& compare, const Container& cont, const Alloc& a);

Effects: Initializes c with cont as the first argument and a as the second
argument, and initializes comp with compare; calls make_heap(c.begin(),
c.end(), comp).

template<Alloc>
    priority_queue(const Compare& compare, Container&& cont, const Alloc& a);

Effects: Initializes c with std::move(cont) as the first argument and a as the second
argument, and initializes comp with comp; calls make_heap(c.begin(),
c.end(), comp).

template<Alloc> priority_queue(const priority_queue& q, const Alloc& a);

Effects: Initializes c with q.c as the first argument and a as the second
argument, and initializes comp with q.comp.

template<Alloc> priority_queue(priority_queue&& q, const Alloc& a);

Effects: Initializes c with std::move(q.c) as the first argument and a as the second
argument, and initializes comp with std::move(q.comp).

§ 24.6.7.3 989
template<container-compatible-range<T> R, class Alloc>
  priority_queue(from_range_t, R&& rg, const Compare& compare, const Alloc& a);

  Effects: Initializes comp with compare and c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

template<container-compatible-range<T> R, class Alloc>
  priority_queue(from_range_t, R&& rg, const Alloc& a);

  Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a); calls make_heap(c.begin(), c.end(), comp).

### 24.6.7.4 Members

void push(const value_type& x);

  Effects: As if by:
  c.push_back(x);
  push_heap(c.begin(), c.end(), comp);

void push(value_type&& x);

  Effects: As if by:
  c.push_back(std::move(x));
  push_heap(c.begin(), c.end(), comp);

template<container-compatible-range<T> R>
  void push_range(R&& rg);

  Effects: Insert all elements of rg in c.

  Postconditions: is_heap(c.begin(), c.end(), comp) is true.

template<class... Args> void emplace(Args&&... args);

  Effects: As if by:
  c.emplace_back(std::forward<Args>(args)...);
  push_heap(c.begin(), c.end(), comp);

void pop();

  Effects: As if by:
  pop_heap(c.begin(), c.end(), comp);
  c.pop_back();

### 24.6.7.5 Specialized algorithms

template<class T, class Container, class Compare>
  void swap(priority_queue<T, Container, Compare>& x, priority_queue<T, Container, Compare>& y) noexcept(noexcept(x.swap(y)));

  Constraints: is_swappable_v<Container> is true and is_swappable_v<Compare> is true.

### 24.6.8 Class template stack

24.6.8.1 General

Any sequence container supporting operations back(), push_back() and pop_back() can be used to instantiate stack. In particular, vector (24.3.11), list (24.3.10) and deque (24.3.8) can be used.

24.6.8.2 Definition

namespace std {
  template<class T, class Container = deque<T>>
  class stack {
    public:
      using value_type = typename Container::value_type;
      using reference = typename Container::reference;
      using const_reference = typename Container::const_reference;
  }
}
using size_type = typename Container::size_type;
using container_type = Container;

protected:
    Container c;

public:
    stack() : stack(Container()) {}
    explicit stack(const Container&);
    explicit stack(Container&&);
    template<class InputIterator> stack(InputIterator first, InputIterator last);
    template<container-compatible-range<
    R> stack(from_range_t, R&& rg);
    template<class Alloc> explicit stack(const Alloc&);
    template<class Alloc> stack(const Container&, const Alloc&);
    template<class Alloc> stack(Container&&, const Alloc&);
    template<class Alloc> stack(const stack&, const Alloc&);
    template<class Alloc> stack(stack&&, const Alloc&);
    template<class InputIterator, class Alloc>
        stack(InputIterator first, InputIterator last, const Alloc&);
    template<container-compatible-range<
    R, class Alloc>
        stack(from_range_t, R, class Alloc)
        stack(from_range_t, R&& rg, const Alloc&);
    [[nodiscard]] bool empty() const { return c.empty(); }
    size_type size() const { return c.size(); }
    reference top() { return c.back(); }
    const_reference top() const { return c.back(); }
    void push(const value_type& x) { c.push_back(x); }
    void push(value_type&& x) { c.push_back(std::move(x)); }
    template<container-compatible-range<
    R> push_range(R&& rg);
    template<class... Args>
        decltype(auto) emplace(Args&&... args)
            { return c.emplace_back(std::forward<Args>(args)...); }
    void pop() { c.pop_back(); }
    void swap(stack& s) noexcept(is_nothrow_swappable_v<Container>)
        { using std::swap; swap(c, s.c); }

    template<class Container>
        stack(Container) -> stack<typename Container::value_type, Container>;
    template<class InputIterator>
        stack(InputIterator, InputIterator) -> stack<iter-value-type<InputIterator>>;
    template<ranges::input_range R>
        stack(from_range_t, R&&) -> stack<ranges::range_value_t<R>;
    template<class Container, class Allocator>
        stack(Container, Allocator) -> stack<typename Container::value_type, Container>;
    template<class InputIterator, class Allocator>
        stack(InputIterator, InputIterator, Allocator)
            -> stack<iter-value-type<InputIterator>, deque<
            iter-value-type<InputIterator>, 
           Allocator>>;
    template<ranges::input_range R, class Allocator>
        stack(from_range_t, R&&, Allocator)
            -> stack<ranges::range_value_t<R>, deque<ranges::range_value_t<R>, Allocator>>;
    template<class T, class Container, class Alloc>
        struct uses_allocator<stack<T, Container>, Alloc>
            : uses_allocator<Container, Alloc>::type { };
24.6.8.3 Constructors

explicit stack(const Container& cont);
   Effects: Initializes c with cont.

explicit stack(Container&& cont);
   Effects: Initializes c with std::move(cont).

template<class InputIterator>
   stack(InputIterator first, InputIterator last);
   Effects: Initializes c with first as the first argument and last as the second argument.

template<container-compatible-range<T> R>
   stack(from_range_t, R&& rg);
   Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg)).

24.6.8.4 Constructors with allocators

If uses_allocator_v<container_type, Alloc> is false the constructors in this subclause shall not participate in overload resolution.

template<class Alloc> explicit stack(const Alloc& a);
   Effects: Initializes c with a.

template<class Alloc> stack(const container_type& cont, const Alloc& a);
   Effects: Initializes c with cont as the first argument and a as the second argument.

template<class Alloc> stack(container_type&& cont, const Alloc& a);
   Effects: Initializes c with std::move(cont) as the first argument and a as the second argument.

template<class Alloc> stack(const stack& s, const Alloc& a);
   Effects: Initializes c with s.c as the first argument and a as the second argument.

template<class Alloc> stack(stack&& s, const Alloc& a);
   Effects: Initializes c with std::move(s.c) as the first argument and a as the second argument.

template<class InputIterator, class Alloc>
   stack(InputIterator first, InputIterator last, const Alloc& alloc);
   Effects: Initializes c with first as the first argument, last as the second argument, and alloc as the third argument.

template<container-compatible-range<T> R, class Alloc>
   stack(from_range_t, R&& rg, const Alloc& a);
   Effects: Initializes c with ranges::to<Container>(std::forward<R>(rg), a).

24.6.8.5 Modifiers

template<container-compatible-range<T> R>
   void push_range(R&& rg);
   Effects: Equivalent to c.append_range(std::forward<R>(rg)) if that is a valid expression, otherwise
             ranges::copy(rg, back_inserter(c)).

24.6.8.6 Operators

template<class T, class Container>
   bool operator==(const stack<T, Container>& x, const stack<T, Container>& y);
   Returns: x.c == y.c.

template<class T, class Container>
   bool operator!=(const stack<T, Container>& x, const stack<T, Container>& y);
   Returns: x.c != y.c.
template<class T, class Container>
bool operator< (const stack<T, Container>& x, const stack<T, Container>& y);
3
Returns: \( x.c < y.c \).

template<class T, class Container>
bool operator> (const stack<T, Container>& x, const stack<T, Container>& y);
4
Returns: \( x.c > y.c \).

template<class T, class Container>
bool operator<=(const stack<T, Container>& x, const stack<T, Container>& y);
5
Returns: \( x.c \leq y.c \).

template<class T, class Container>
bool operator>=(const stack<T, Container>& x, const stack<T, Container>& y);
6
Returns: \( x.c \geq y.c \).

template<class T, three_way_comparable Container>
compare_three_way_result_t<Container>
operator<=>(const stack<T, Container>& x, const stack<T, Container>& y);
7
Returns: \( x.c \lessgtr y.c \).

24.6.8.7 Specialized algorithms
[stack.special]
template<class T, class Container>
void swap(stack<T, Container>& x, stack<T, Container>& y) noexcept(noexcept(x.swap(y)));
1
Constraints: \texttt{is\_swappable\_v<Container>} is true.
Effects: As if by \texttt{x.swap(y)}.

24.6.9 Class template \texttt{flat\_map}
[flat.map]
24.6.9.1 Overview
[flat.map.overview]
1 A \texttt{flat\_map} is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of values of another type \( T \) based on the keys. \texttt{flat\_map} supports iterators that meet the \texttt{Cpp17InputIterator} requirements and model the \texttt{random\_access\_iterator} concept (25.3.4.13).

2 A \texttt{flat\_map} meets all of the requirements of a container (24.2.2.2) and of a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). \texttt{flat\_map} meets the requirements of an associative container (24.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (24.2.5),
(2.2) — it does not meet the requirements related to iterator invalidation, and
(2.3) — the time complexity of the operations that insert or erase a single element from the map is linear, including the ones that take an insertion position iterator.

[Note 1: A \texttt{flat\_map} does not meet the additional requirements of an allocator-aware container (24.2.2.5). — end note]

3 A \texttt{flat\_map} also provides most operations described in 24.2.7 for unique keys. This means that a \texttt{flat\_map} supports the \texttt{a\_uniq} operations in 24.2.7 but not the \texttt{a\_eq} operations. For a \texttt{flat\_map<Key, T>} the \texttt{key\_type} is \texttt{Key} and the \texttt{value\_type} is \texttt{pair<Key, T>}.

4 Descriptions are provided here only for operations on \texttt{flat\_map} that are not described in one of those sets of requirements or for operations where there is additional semantic information.

5 A \texttt{flat\_map} maintains the following invariants:

(5.1) — it contains the same number of keys and values;
(5.2) — the keys are sorted with respect to the comparison object; and
(5.3) — the value at offset \( \texttt{off} \) within the value container is the value associated with the key at offset \( \texttt{off} \) within the key container.

6 If any member function in 24.6.9.2 exits via an exception the invariants are restored.
Any type C that meets the sequence container requirements (24.2.4) can be used to instantiate `flat_map`, as long as C::iterator meets the `Cpp17RandomAccessIterator` requirements and invocations of member functions C::size and C::max_size do not exit via an exception. In particular, vector (24.3.11) and deque (24.3.8) can be used.

The program is ill-formed if Key is not the same type as KeyContainer::value_type or T is not the same type as MappedContainer::value_type.

The effect of calling a constructor that takes both key_container_type and mapped_container_type arguments with containers of different sizes is undefined.

The effect of calling a constructor or member function that takes a sorted_unique_t argument with a container, containers, or range that is not sorted with respect to key_comp(), or that contains equal elements, is undefined.

24.6.9.2 Definition

```cpp
namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class KeyContainer = vector<Key>, class MappedContainer = vector<T>>
    class flat_map {
    public:
        // types
        using key_type = Key;
        using mapped_type = T;
        using value_type = pair<key_type, mapped_type>;
        using key_compare = Compare;
        using reference = pair<const key_type&, mapped_type&>;
        using const_reference = pair<const key_type&, const mapped_type&>;
        using size_type = size_t;
        using difference_type = ptrdiff_t;
        using iterator = implementation-defined; // see 24.2
        using const_iterator = implementation-defined; // see 24.2
        using reverse_iterator = std::reverse_iterator<iterator>;
        using const_reverse_iterator = std::reverse_iterator<const_iterator>;
        using key_container_type = KeyContainer;
        using mapped_container_type = MappedContainer;

        class value_compare {
            private:
                key_compare comp; // exposition only
                value_compare(key_compare c) : comp(c) {} // exposition only
            public:
                bool operator()(const_reference x, const_reference y) const {
                    return comp(x.first, y.first);
                }
        };

        struct containers {
            key_container_type keys;
            mapped_container_type values;
        };

        // 24.6.9.3, construct/copy/destroy
        flat_map() : flat_map(key_compare()) {} }
    }
}
```

§ 24.6.9.2
template<class Key, class T, class Compare, class KeyContainer, class MappedContainer, class Allocator>
struct uses_allocator<flat_map<Key, T, Compare, KeyContainer, MappedContainer>, Allocator>
  : bool_constant<uses_allocator_v<KeyContainer, Allocator> &&
    uses_allocator_v<MappedContainer, Allocator>> { };

The member type `containers` has the data members and special members specified above. It has no base classes or members other than those specified.

### 24.6.9.3 Constructors

**flat_map(key_container_type key_cont, mapped_container_type mapped_cont);**

*Effects:* Initializes `c.keys` with `std::move(key_cont)` and `c.values` with `std::move(mapped_cont)`, value-initializes `compare`; sorts the range `[begin(), end())` with respect to `value_comp()`; and finally erases the duplicate elements as if by:

```cpp
c.loads = ranges::zip_view(c.keys, c.values);
c.it = ranges::unique(c.loads, key_equiv(compare)).begin();
c.dist = distance(zv.begin(), it);
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

*Complexity:* Linear in `N` if the container arguments are already sorted with respect to `value_comp()` and otherwise `N \log N`, where `N` is the value of `key_cont.size()` before this call.

**flat_map(const key_container_type& key_cont, const mapped_container_type& mapped_cont, const Allocator& a);**

*Constraints:* `uses_allocator_v<key_container_type, Allocator>` is `true` and `uses_allocator_v<mapped_container_type, Allocator>` is `true`.

*Effects:* Equivalent to `flat_map(key_cont, mapped_cont)`, except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

*Complexity:* Same as `flat_map(key_cont, mapped_cont)`.

**flat_map(sorted_unique_t, key_container_type key_cont, mapped_container_type mapped_cont);**

*Effects:* Initializes `c.keys` with `std::move(key_cont)` and `c.values` with `std::move(mapped_cont)`; value-initializes `compare`.

*Complexity:* Constant.

**flat_map(sorted_unique_t s, const key_container_type& key_cont, const mapped_container_type& mapped_cont, const Allocator& a);**

*Constraints:* `uses_allocator_v<key_container_type, Allocator>` is `true` and `uses_allocator_v<mapped_container_type, Allocator>` is `true`.

*Effects:* Equivalent to `flat_map(s, key_cont, mapped_cont)`, except that `c.keys` and `c.values` are constructed with uses-allocator construction (20.2.8.2).

*Complexity:* Linear.
template<class InputIterator, class Allocator>
flat_map(sorted_unique_t, InputIterator first, InputIterator last,
const key_compare& comp, const Allocator& a);

template<class InputIterator, class Allocator>
flat_map(sorted_unique_t, InputIterator first, InputIterator last, const Allocator& a);

template<class Allocator>
flat_map(initializer_list<value_type> il, const key_compare& comp, const Allocator& a);

template<class Allocator>
flat_map(initializer_list<value_type> il, const Allocator& a);

template<class Allocator>
flat_map(sorted_unique_t, initializer_list<value_type> il,
const key_compare& comp, const Allocator& a);

template<class Allocator>
flat_map(sorted_unique_t, initializer_list<value_type> il, const Allocator& a);

Constraints: uses_allocator_v<key_container_type, Allocator> is true and uses_allocator_v<mapped_container_type, Allocator> is true.

Effects: Equivalent to the corresponding non-allocator constructors except that c.keys and c.values are constructed with uses-allocator construction (20.2.8.2).

24.6.9.4 Capacity

size_type size() const noexcept;

Returns: c.keys.size().

size_type max_size() const noexcept;

Returns: min<
size_type>(c.keys.max_size(), c.values.max_size()).

24.6.9.5 Access

mapped_type& operator[](const key_type& x);

Effects: Equivalent to: return try_emplace(x).first->second;

mapped_type& operator[](key_type&& x);

Effects: Equivalent to: return try_emplace(std::move(x)).first->second;

template<class K> mapped_type& operator[](K& x);

Constraints: The qualified-id Compare::is_transparent is valid and denotes a type.

Effects: Equivalent to: return try_emplace(std::forward<K>(x)).first->second;

mapped_type& at(const key_type& x);

const mapped_type& at(const key_type& x) const;

Returns: A reference to the mapped_type corresponding to x in *this.

Throws: An exception object of type out_of_range if no such element is present.

Complexity: Logarithmic.

template<class K> mapped_type& at(const K& x);

template<class K> const mapped_type& at(const K& x) const;

Constraints: The qualified-id Compare::is_transparent is valid and denotes a type.

Preconditions: The expression find(x) is well-formed and has well-defined behavior.

Returns: A reference to the mapped_type corresponding to x in *this.

Throws: An exception object of type out_of_range if no such element is present.

Complexity: Logarithmic.

24.6.9.6 Modifiers

template<class... Args> pair<
iterator, bool> emplace(Args&&... args);

Constraints: is_constructible_v<pair<key_type, mapped_type>, Arg...> is true.
Effects: Initializes an object \( t \) of type pair<key_type, mapped_type> with std::forward<Args>(args)\ldots; if the map already contains an element whose key is equivalent to \( t\.firs t \), \(*this\) is unchanged. Otherwise, equivalent to:

\[
\begin{align*}
&\text{auto key}_\text{it} = \text{ranges::upper_bound(c.keys, t.first, compare);}\\
&\text{auto value}_\text{it} = \text{c.values.begin() + distance(c.keys.begin(), key}_\text{it});\\
&\text{c.keys.insert(key}_\text{it, std::move(t.first))};\\
&\text{c.values.insert(value}_\text{it, std::move(t.second))};
\end{align*}
\]

Returns: The bool component of the returned pair is true if and only if the insertion took place, and the iterator component of the pair points to the element with key equivalent to \( t\.firs t \).

```cpp
template<class P> pair<iterator, bool> insert(P&& x);
```

Constraints: is_constructible_v<pair<key_type, mapped_type>, P> is true.

Effects: The first form is equivalent to return emplace(std::forward<P>(x));. The second form is equivalent to return emplace_hint(position, std::forward<P>(x));.

```cpp
template<class InputIterator>
void insert(InputIterator first, InputIterator last);
```

Effects: Adds elements to \( c \) as if by:

\[
\begin{align*}
&\text{for (; first != last; ++first) \{}\\
&\text{value}_\text{type value} = \text{*first};\\
&\text{c.keys.insert(c.keys.end(), std::move(value.first))};\\
&\text{c.values.insert(c.values.end(), std::move(value.second))};
&\text{\}}
\end{align*}
\]

Then, sorts the range of newly inserted elements with respect to value_comp(); merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

\[
\begin{align*}
&\text{auto zv = ranges::zip_view(c.keys, c.values);}\\
&\text{auto it = ranges::unique(zv, key_equiv(compare)).begin();}\\
&\text{auto dist = distance(zv.begin(), it);}\\
&\text{c.keys.erase(c.keys.begin() + dist, c.keys.end());}\\
&\text{c.values.erase(c.values.begin() + dist, c.values.end());}
\end{align*}
\]

Complexity: \( N + M \log M \), where \( N \) is size() before the operation and \( M \) is distance(first, last).

Remarks: Since this operation performs an in-place merge, it may allocate memory.

```cpp
template<class InputIterator>
void insert(sorted_unique_t, InputIterator first, InputIterator last);
```

Effects: Adds elements to \( c \) as if by:

\[
\begin{align*}
&\text{for (; first != last; ++first) \{}\\
&\text{value}_\text{type value} = \text{*first};\\
&\text{c.keys.insert(c.keys.end(), std::move(value.first))};\\
&\text{c.values.insert(c.values.end(), std::move(value.second))};
&\text{\}}
\end{align*}
\]

Then, merges the sorted range of newly added elements and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

\[
\begin{align*}
&\text{auto zv = ranges::zip_view(c.keys, c.values);}\\
&\text{auto it = ranges::unique(zv, key_equiv(compare)).begin();}\\
&\text{auto dist = distance(zv.begin(), it);}\\
&\text{c.keys.erase(c.keys.begin() + dist, c.keys.end());}\\
&\text{c.values.erase(c.values.begin() + dist, c.values.end());}
\end{align*}
\]

Complexity: Linear in \( N \), where \( N \) is size() after the operation.

Remarks: Since this operation performs an in-place merge, it may allocate memory.
void insert_range(R&& rg);

*Effects:* Adds elements to c as if by:

```cpp
for (const auto& e : rg) {
    c.keys.insert(c.keys.end(), e.first);
    c.values.insert(c.values.end(), e.second);
}
```

Then, sorts the range of newly inserted elements with respect to `value_comp()`; merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range; and finally erases the duplicate elements as if by:

```cpp
auto zv = ranges::zip_view(c.keys, c.values);
auto it = ranges::unique(zv, key_equiv(compare)).begin();
c.keys.erase(c.keys.begin() + dist, c.keys.end());
c.values.erase(c.values.begin() + dist, c.values.end());
```

*Complexity:* $N + M \log M$, where $N$ is `size()` before the operation and $M$ is `ranges::distance(rg)`.

*Remarks:* Since this operation performs an in-place merge, it may allocate memory.

```cpp
template<class... Args>
pair<iterator, bool> try_emplace(const key_type& k, Args&&... args);
```

```cpp
template<class... Args>
pair<iterator, bool> try_emplace(key_type&& k, Args&&... args);
```

```cpp
template<class... Args>
iterator try_emplace(const_iterator hint, const key_type& k, Args&&... args);
```

```cpp
template<class... Args>
iterator try_emplace(const_iterator hint, key_type&& k, Args&&... args);
```

*Constraints:* `is_constructible_v<mapped_type, Args...>` is true.

*Effects:* If the map already contains an element whose key is equivalent to `k`, `*this` and `args...` are unchanged. Otherwise equivalent to:

```cpp
auto key_it = ranges::upper_bound(c.keys, k, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.insert(key_it, std::forward<decltype(k)>(k));
c.values.emplace(value_it, std::forward<Args>(args)...);
```

*Returns:* In the first two overloads, the bool component of the returned pair is `true` if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to `k`.

*Complexity:* The same as `emplace` for the first two overloads, and the same as `emplace_hint` for the last two overloads.

```cpp
template<class K, class... Args>
pair<iterator, bool> try_emplace(K&& k, Args&&... args);
```

```cpp
template<class K, class... Args>
iterator try_emplace(const_iterator hint, K&& k, Args&&... args);
```

*Constraints:*

- The qualified-id `Compare::is_transparent` is valid and denotes a type.
- `is_constructible_v<key_type, K>` is true.
- `is_constructible_v<mapped_type, Args...>` is true.
- For the first overload, `is_convertible_v<K&&, const_iterator>` and `is_convertible_v<K&&, iterator>` are both false.

*Preconditions:* The conversion from `k` into `key_type` constructs an object `u`, for which `find(k) == find(u)` is true.

*Effects:* If the map already contains an element whose key is equivalent to `k`, `*this` and `args...` are unchanged. Otherwise equivalent to:

```cpp
auto key_it = ranges::upper_bound(c.keys, k, compare);
auto value_it = c.values.begin() + distance(c.keys.begin(), key_it);
c.keys.emplace(key_it, std::forward<K>(k));
c.values.emplace(value_it, std::forward<Args>(args)...);
```
Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```cpp
template<class M>
pair<iterator, bool> insert_or_assign(const key_type& k, M&& obj);
template<class M>
pair<iterator, bool> insert_or_assign(key_type&& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, const key_type& k, M&& obj);
template<class M>
iterator insert_or_assign(const_iterator hint, key_type&& k, M&& obj);
```

Constraints: isAssignable_v<mapped_type&, M> is true and isConstructible_v<mapped_type, M> is true.

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns std::forward<M>(obj) to \( e\.second \). Otherwise, equivalent to

```cpp
try_emplace(std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the first two overloads or

```cpp
try_emplace_hint(hint, std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the last two overloads.

Returns: In the first two overloads, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` for the first two overloads and the same as `emplace_hint` for the last two overloads.

```cpp
template<class K, class M>
pair<iterator, bool> insert_or_assign(K&& k, M&& obj);
template<class K, class M>
iterator insert_or_assign(const_iterator hint, K&& k, M&& obj);
```

(28.1) The qualified-id Compare::is_transparent is valid and denotes a type.
(28.2) isConstructible_v<key_type, K> is true.
(28.3) isAssignable_v<mapped_type&, M> is true.
(28.4) isConstructible_v<mapped_type, M> is true.

Preconditions: The conversion from \( k \) into key_type constructs an object \( u \), for which find(k) == find(u) is true.

Effects: If the map already contains an element \( e \) whose key is equivalent to \( k \), assigns std::forward<M>(obj) to \( e\.second \). Otherwise, equivalent to

```cpp
try_emplace(std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the first overload or

```cpp
try_emplace_hint(hint, std::forward<decltype(k)>(k), std::forward<M>(obj))
```

for the second overload.

Returns: In the first overload, the bool component of the returned pair is true if and only if the insertion took place. The returned iterator points to the map element whose key is equivalent to \( k \).

Complexity: The same as `emplace` and `emplace_hint`, respectively.

```cpp
void swap(flat_map& y) noexcept;
```

Effects: Equivalent to:

```cpp
ranges::swap(compare, y\.compare);
ranges::swap(c\.keys, y\.c\.keys);
ranges::swap(c\.values, y\.c\.values);
```
containers extract() &&;

Postconditions: *this is emptied, even if the function exits via an exception.

Returns: std::move(c).

void replace(key_container_type&& key_cont, mapped_container_type&& mapped_cont);

Preconditions: key_cont.size() == mapped_cont.size() is true, the elements of key_cont are
sorted with respect to compare, and key_cont contains no equal elements.

Effects: Equivalent to:
    c.keys = std::move(key_cont);
    c.values = std::move(mapped_cont);

§ 24.6.9.7 Erasure [flat.map.erasure]

template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
    class Predicate>
typename flat_map<Key, T, Compare, KeyContainer, MappedContainer>::size_type
erase_if(flat_map<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);

Preconditions: Key and T meet the Cpp17MoveAssignable requirements.

Effects: Let E be bool(pred(pair<const Key&, const T&>(e))). Erases all elements e in c for
which E holds.

Returns: The number of elements erased.

Complexity: Exactly c.size() applications of the predicate.

Remarks: Stable (16.4.6.8). If an invocation of erase_if exits via an exception, c is in a valid but
unspecified state (3.66).

[Note 1: c still meets its invariants, but can be empty. — end note]

§ 24.6.10 Class template flat_multimap [flat.multimap]

24.6.10.1 Overview [flat.multimap.overview]

A flat_multimap is a container adaptor that provides an associative container interface that supports
equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast
retrieval of values of another type T based on the keys. flat_multimap supports iterators that meet the
Cpp17InputIterator requirements and model the random_access_iterator concept (25.3.4.13).

A flat_multimap meets all of the requirements for a container (24.2.2.2) and for a reversible container
(24.2.2.3), plus the optional container requirements (24.2.2.4). flat_multimap meets the requirements of an
associative container (24.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (24.2.5),
(2.2) — it does not meet the requirements related to iterator invalidation, and
(2.3) — the time complexity of the operations that insert or erase a single element from the map is linear,
including the ones that take an insertion position iterator.

[Note 1: A flat_multimap does not meet the additional requirements of an allocator-aware container (24.2.2.5).
— end note]

A flat_multimap also provides most operations described in 24.2.7 for equal keys. This means that a flat_multimap supports the a_eq operations in 24.2.7 but not the a_uniq operations. For a flat_multimap<Key,
T> the key_type is Key and the value_type is pair<Key, T>.

Except as otherwise noted, operations on flat_multimap are equivalent to those of flat_map, except that
flat_multimap operations do not remove or replace elements with equal keys.

[Example 1: flat_multimap constructors and emplace do not erase non-unique elements after sorting them. — end example]

A flat_multimap maintains the following invariants:

(5.1) — it contains the same number of keys and values;
(5.2) — the keys are sorted with respect to the comparison object; and
the value at offset `off` within the value container is the value associated with the key at offset `off` within the key container.

6 If any member function in 24.6.10.2 exits via an exception, the invariants are restored.

[Note 2: This can result in the flat_multimap being emptied. — end note]

7 Any type `C` that meets the sequence container requirements (24.2.4) can be used to instantiate flat_multimap, as long as `C::iterator` meets the Cpp17RandomAccessIterator requirements and invocations of member functions `C::size` and `C::max_size` do not exit via an exception. In particular, vector (24.3.11) and deque (24.3.8) can be used.

[Note 3: vector<bool> is not a sequence container. — end note]

8 The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type` or `T` is not the same type as `MappedContainer::value_type`.

9 The effect of calling a constructor that takes both `key_container_type` and `mapped_container_type` arguments with containers of different sizes is undefined.

10 The effect of calling a constructor or member function that takes a `sorted_equivalent_t` argument with a container, containers, or range that are not sorted with respect to `key_comp()` is undefined.

24.6.10.2 Definition

```cpp
namespace std {
    template<class Key, class T, class Compare = less<Key>,
             class KeyContainer = vector<Key>, class MappedContainer = vector<T>>
    class flat_multimap {
    public:
        // types
        using key_type = Key;

-> flat_multimap<Key, T, Compare>;

24.6.10.3 Constructors [flat.multimap.cons]

flat_multimap(key_container_type key_cont, mapped_container_type mapped_cont);

Effects: Initializes c.keys with std::move(key_cont) and c.values with std::move(mapped_cont);
    value-initializes compare; and sorts the range [begin(), end()) with respect to value_comp().

Complexity: Linear in N if the container arguments are already sorted with respect to value_comp() and
    otherwise N log N, where N is the value of key_cont.size() before this call.

template<class Allocator>
flat_multimap(const key_container_type& key_cont, const mapped_container_type& mapped_cont,
    const Allocator& a);

Constraints: uses_allocator_v<key_container_type, Allocator> is true and uses_allocator_v<
mapped_container_type, Allocator> is true.

Effects: Equivalent to flat_multimap(key_cont, mapped_cont), except that c.keys and c.values
    are constructed with uses-allocator construction (20.2.8.2).

Complexity: Same as flat_multimap(key_cont, mapped_cont).
flat_multimap(sorted_equivalent_t, key_container_type key_cont, mapped_container_type mapped_cont);

Effects: Initializes c.keys with std::move(key_cont) and c.values with std::move(mapped_cont); value-initializes compare.

Complexity: Constant.

template<class Allocator>
flat_multimap(sorted_equivalent_t s, const key_container_type& key_cont,
const mapped_container_type& mapped_cont, const Allocator& a);

Constraints: uses_allocator_v<key_container_type, Allocator> is true and uses_allocator-_v<mapped_container_type, Allocator> is true.

Effects: Equivalent to flat_multimap(s, key_cont, mapped_cont), except that c.keys and c.values are constructed with uses-allocator construction (20.2.8.2).

Complexity: Linear.

24.6.10.4 Erasure

template<class Key, class T, class Compare, class KeyContainer, class MappedContainer,
class Predicate>
typename flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>::size_type
erase_if(flat_multimap<Key, T, Compare, KeyContainer, MappedContainer>& c, Predicate pred);

Preconditions: Key and T meet the Cpp17MoveAssignable requirements.

Effects: Let $E$ be bool(pred(pair<const Key&, const T&>(e))). Erases all elements e in c for which $E$ holds.

Returns: The number of elements erased.

Complexity: Exactly c.size() applications of the predicate.
Remarks: Stable (16.4.6.8). If an invocation of `erase_if` exits via an exception, `c` is in a valid but unspecified state (3.66).

[Note 1: `c` still meets its invariants, but can be empty. — end note]

### 24.6.11 Class template flat_set

#### 24.6.11.1 Overview

A `flat_set` is a container adaptor that provides an associative container interface that supports unique keys (i.e., contains at most one of each key value) and provides for fast retrieval of the keys themselves. `flat_set` supports iterators that model the `random_access_iterator` concept (25.3.4.13).

A `flat_set` meets all of the requirements for a container (24.2.2.2) and for a reversible container (24.2.2.3), plus the optional container requirements (24.2.2.4). `flat_set` meets the requirements of an associative container (24.2.7), except that:

- it does not meet the requirements related to node handles (24.2.5.1),
- it does not meet the requirements related to iterator invalidation, and
- the time complexity of the operations that insert or erase a single element from the set is linear, including the ones that take an insertion position iterator.

[Note 1: A `flat_set` does not meet the additional requirements of an allocator-aware container, as described in 24.2.2.5. — end note]

A `flat_set` also provides most operations described in 24.2.7 for unique keys. This means that a `flat_set` supports the `a_uniq` operations in 24.2.7 but not the `a_eq` operations. For a `flat_set<Key>`, both the `key_type` and `value_type` are `Key`.

Descriptions are provided here only for operations on `flat_set` that are not described in one of those sets of requirements or for operations where there is additional semantic information.

A `flat_set` maintains the invariant that the keys are sorted with respect to the comparison object.

If any member function in 24.6.11.2 exits via an exception, the invariant is restored.

Any sequence container (24.2.4) supporting `Cpp17RandomAccessIterator` can be used to instantiate `flat_set`. In particular, `vector` (24.3.11) and `deque` (24.3.8) can be used.

The program is ill-formed if `Key` is not the same type as `KeyContainer::value_type`.

The effect of calling a constructor or member function that takes a `sorted_unique_t` argument with a range that is not sorted with respect to `key_comp()`, or that contains equal elements, is undefined.

#### 24.6.11.2 Definition

```cpp

flat_set(initializer_list<value_type> il, const Allocator& a);
template<class Allocator>
flat_set(sorted_unique_t, initializer_list<value_type> il,
const key_compare& comp, const Allocator& a);
template<class Allocator>
  flat_set(sorted_unique_t, initializer_list<value_type> il, const Allocator& a);

  Constraints: uses_allocator_v<container_type, Allocator> is true.
  Effects: Equivalent to the corresponding non-allocator constructors except that c is constructed with
  uses-allocator construction (20.2.8.2).

24.6.11.4 Modifiers

template<class K> pair<iterator, bool> insert(K&& x);
template<class K> iterator insert(const_iterator hint, K&& x);

  Constraints: The qualified-id Compare::is_transparent is valid and denotes a type. is_constructible_v<
  value_type, K> is true.
  Preconditions: The conversion from x into value_type constructs an object u, for which find(x) ==
  find(u) is true.
  Effects: If the set already contains an element equivalent to x, *this and x are unchanged. Otherwise,
  inserts a new element as if by emplace(std::forward<K>(x)).
  Returns: In the first overload, the bool component of the returned pair is true if and only if the
  insertion took place. The returned iterator points to the element whose key is equivalent to x.

template<class InputIterator>
  void insert(InputIterator first, InputIterator last);
  Effects: Adds elements to c as if by:
  c.insert(c.end(), first, last);
  Then, sorts the range of newly inserted elements with respect to compare; merges the resulting sorted
  range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but
  the first element from each group of consecutive equivalent elements.
  Complexity: $N + M \log M$, where $N$ is size() before the operation and $M$ is distance(first,
  last).
  Remarks: Since this operation performs an in-place merge, it may allocate memory.

template<class InputIterator>
  void insert(sorted_unique_t, InputIterator first, InputIterator last);
  Effects: Equivalent to insert(first, last).
  Complexity: Linear.

template<container-compatible-range<value_type> R>
  void insert_range(R&& rg);
  Effects: Adds elements to c as if by:
  for (const auto& e : rg) {
    c.insert(c.end(), e);
  }
  Then, sorts the range of newly inserted elements with respect to compare; merges the resulting sorted
  range and the sorted range of pre-existing elements into a single sorted range; and finally erases all but
  the first element from each group of consecutive equivalent elements.
  Complexity: $N + M \log M$, where $N$ is size() before the operation and $M$ is distance(first,
  last).
  Remarks: Since this operation performs an in-place merge, it may allocate memory.

void swap(flat_set& y) noexcept;
  Effects: Equivalent to:
  ranges::swap(compare, y.compare);
  ranges::swap(c, y.c);
container_type extract() &&;

14 Postconditions: *this is emptied, even if the function exits via an exception.

Returns: std::move(c).

void replace(container_type&& cont);

16 Preconditions: The elements of cont are sorted with respect to compare, and cont contains no equal

17 Elements.

Effects: Equivalent to: c = std::move(cont);

24.6.11.5 Erasure [flat.set.eraser]

template<class Key, class Compare, class KeyContainer, class Predicate>
typename flat_set<Key, Compare, KeyContainer>::size_type
erase_if(flat_set<Key, Compare, KeyContainer>& c, Predicate pred);

Effects: Equivalent to:

1 auto [erase_first, erase_last] = ranges::remove_if(c, pred);
2 auto n = erase_last - erase_first;
3 c.erase(erase_first, erase_last);
4 return n;

24.6.12 Class template flat_multiset [flat.multiset]

24.6.12.1 Overview [flat.multiset.overview]

1 A flat_multiset is a container adaptor that provides an associative container interface that supports

2 equivalent keys (i.e., possibly containing multiple copies of the same key value) and provides for fast

3 retrieval of the keys themselves. flat_multiset supports iterators that model the random_access_iterator

4 concept (25.3.4.13).

2 A flat_multiset meets all of the requirements for a container (24.2.2.2) and for a reversible container

(24.2.2.3), plus the optional container requirements (24.2.2.4). flat_multiset meets the requirements of an

associative container (24.2.7), except that:

(2.1) — it does not meet the requirements related to node handles (24.2.5.1),

(2.2) — it does not meet the requirements related to iterator invalidation, and

(2.3) — the time complexity of the operations that insert or erase a single element from the set is linear,

including the ones that take an insertion position iterator.

[Note 1: A flat_multiset does not meet the additional requirements of an allocator-aware container, as described in

24.2.2.5. — end note]

3 A flat_multiset also provides most operations described in 24.2.7 for equal keys. This means that a flat_-

multiset supports the a_eq operations in 24.2.7 but not the a_uniq operations. For a flat_multiset<Key>,

both the key_type and value_type are Key.

4 Descriptions are provided here only for operations on flat_multiset that are not described in one of the

general sections or for operations where there is additional semantic information.

5 A flat_multiset maintains the invariant that the keys are sorted with respect to the comparison object.

6 If any member function in 24.6.12.2 exits via an exception, the invariant is restored.

[Note 2: This can result in the flat_multiset’s being emptied. — end note]

7 Any sequence container (24.2.4) supporting Cpp17RandomAccessIterator can be used to instantiate flat_-

multiset. In particular, vector (24.3.11) and deque (24.3.8) can be used.

[Note 3: vector<bool> is not a sequence container. — end note]

8 The program is ill-formed if Key is not the same type as KeyContainer::value_type.

9 The effect of calling a constructor or member function that takes a sorted_equivalent_t argument with a

range that is not sorted with respect to key_comp() is undefined.
24.6.12.2 Definition

namespace std {
  template<class Key, class Compare = less<Key>, class KeyContainer = vector<Key>>

  : bool_constant<uses_allocator_v<KeyContainer, Allocator>> { }
};

24.6.12.3 Constructors [flat.multiset.cons]

explicit flat_multiset(container_type cont);

1 Effects: Initializes c with std::move(cont), value-initializes compare, and sorts the range [begin(),
end()) with respect to compare.
2 Complexity: Linear in N if cont is sorted with respect to compare and otherwise N log N, where
N is the value of cont.size() before this call.

template<class Allocator>
  flat_multiset(const container_type& cont, const Allocator& a);
3 Constraints: uses_allocator_v<container_type, Allocator> is true.
4 Effects: Equivalent to flat_multiset(cont), except that c is constructed with uses-allocator construction
(20.2.8.2).
5 Complexity: Same as flat_multiset(cont).

template<class Allocator>
  flat_multiset(sorted_equivalent_t s, const container_type& cont, const Allocator& a);
6 Constraints: uses_allocator_v<container_type, Allocator> is true.
7 Effects: Equivalent to flat_multiset(s, cont), except that c is constructed with uses-allocator construction
(20.2.8.2).
8 Complexity: Linear.

template<class Allocator>
  explicit flat_multiset(const Allocator& a);

template<class Allocator>
  template<class Key_compare, class Allocator a> 
  explicit flat_multiset(const Allocator& a);
template<class InputIterator, class Allocator>
    flat_multiset(InputIterator first, InputIterator last, 
    const key_compare& comp, const Allocator& a);

template<class InputIterator, class Allocator>
    flat_multiset(InputIterator first, InputIterator last, const Allocator& a);

template<
    container-compatible-range <value_type> R, class Allocator>
    flat_multiset(from_range_t, R&& rg, const Allocator& a);

template<
    container-compatible-range <value_type> R, class Allocator>
    flat_multiset(from_range_t, R&& rg, const key_compare& comp, const Allocator& a);

// Constraints: uses_allocator_v<container_type, Allocator> is true.

// Effects: Equivalent to the corresponding non-allocator constructors except that c is constructed with uses-allocator construction (20.2.8.2).

24.6.12.4 Modifiers [flat.multiset.modifiers]

template<class... Args> iterator emplace(Args&&... args);

// Constraints: is_constructible_v<value_type, Args...> is true.

// Effects: First, initializes an object t of type value_type with std::forward<Args>(args)..., then inserts t as if by:
// auto it = ranges::upper_bound(c, t, compare); 
// c.insert(it, std::move(t));

// Returns: An iterator that points to the inserted element.

template<class InputIterator>
    void insert(InputIterator first, InputIterator last);

// Effects: Adds elements to c as if by:
// c.insert(c.end(), first, last);

// Then, sorts the range of newly inserted elements with respect to compare, and merges the resulting sorted range and the sorted range of pre-existing elements into a single sorted range.

// Complexity: N + M log M, where N is size() before the operation and M is distance(first, last).

// Remarks: Since this operation performs an in-place merge, it may allocate memory.

template<class InputIterator>
    void insert(sorted_equivalent_t, InputIterator first, InputIterator last);

// Effects: Equivalent to insert(first, last).

// Complexity: Linear.

void swap(flat_multiset& y) noexcept;

// Effects: Equivalent to:
// ranges::swap(compare, y.compare);
// ranges::swap(c, y.c);
container_type extract() &&;

Postconditions: *this is emptied, even if the function exits via an exception.
Returns: std::move(c).

void replace(container_type&& cont);

Preconditions: The elements of cont are sorted with respect to compare.
Effects: Equivalent to: c = std::move(cont);

24.6.12.5 Erasure

```
template<class Key, class Compare, class KeyContainer, class Predicate>
type/flat_multiset<Key, Compare, KeyContainer>::size_type
   erase_if(flat_multiset<Key, Compare, KeyContainer>& c, Predicate pred);
```

Effects: Equivalent to:
```
auto [erase_first, erase_last] = ranges::remove_if(c, pred);
auto n = erase_last - erase_first;
c.erase(erase_first, erase_last);
return n;
```

24.6.13 Container adaptors formatting

For each of queue, priority_queue, and stack, the library provides the following formatter specialization where adaptor-type is the name of the template:

```
namespace std {
    template<class charT, class T, formattable<charT> Container, class... U>
    struct formatter<adaptor-type<T, Container, U...>, charT> {
        private:
            using maybe-const-adaptor = // exposition only
                fmt-maybe-const<adaptor-type<T, Container, U...>, charT>;
            formatter<Container, charT> underlying_; // exposition only
        public:
            template<class ParseContext>
            constexpr typename ParseContext::iterator
            parse(ParseContext& ctx);

            template<class FormatContext>
            typename FormatContext::iterator
            format(maybe-const-adaptor& r, FormatContext& ctx) const;
    };
}
```

```
template<class ParseContext>
constexpr typename ParseContext::iterator
parse(ParseContext& ctx);
```

Effects: Equivalent to: return underlying_.parse(ctx);

```
template<class FormatContext>
typename FormatContext::iterator
format(maybe-const-adaptor& r, FormatContext& ctx) const;
```

Effects: Equivalent to: return underlying_.format(r.c, ctx);

24.7 Views

24.7.1 General

The header <span> defines the view span. The header <mdspan> defines the class template mdspan and other facilities for interacting with these multidimensional views.
24.7.2 Contiguous access

24.7.2.1 Header <span> synopsis

namespace std {
  // constants
  inline constexpr size_t dynamic_extent = numeric_limits<size_t>::max();

  // 24.7.2.2, class template span
  template<class ElementType, size_t Extent = dynamic_extent>
    class span;

    template<class ElementType, size_t Extent>
      constexpr bool ranges::enable_view<span<ElementType, Extent>> = true;
    template<class ElementType, size_t Extent>
      constexpr bool ranges::enable_borrowed_range<span<ElementType, Extent>> = true;

  // 24.7.2.3, views of object representation
  template<class ElementType, size_t Extent>
    span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
      as_bytes(span<ElementType, Extent> s) noexcept;
  template<class ElementType, size_t Extent>
    span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
      as_writable_bytes(span<ElementType, Extent> s) noexcept;
};

24.7.2.2 Class template span

24.7.2.2.1 Overview

A span is a view over a contiguous sequence of objects, the storage of which is owned by some other object.

All member functions of span have constant time complexity.

namespace std {
  template<class ElementType, size_t Extent = dynamic_extent>
    class span {
    public:
      // constants and types
      using element_type = ElementType;
      using value_type = remove_cv_t<ElementType>;
      using size_type = size_t;
      using difference_type = ptrdiff_t;
      using pointer = element_type*;
      using const_pointer = const element_type*;
      using reference = element_type&;
      using const_reference = const element_type&;
      using iterator = implementation-defined;  // see 24.7.2.2.7
      using const_iterator = std::const_iterator<iterator>;

 span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>>
; template<class T, size_t N>
 span(T [&][N]) -> span<T, N>>
; template<class T, size_t N>
 span(array<T, N>&) -> span<T, N>>
; template<class T, size_t N>
 span(const array<T, N>&) -> span<const T, N>>
; template<class R>
 span(R&&) -> span<remove_reference_t<ranges::range_reference_t<R>>>
;
3 span<ElementType, Extent> is a trivially copyable type (6.8.1).
4 ElementType is required to be a complete object type that is not an abstract class type.
24.7.2.2.2 Constructors, copy, and assignment

constexpr span() noexcept;

Constraints: Extent == dynamic_extent || Extent == 0 is true.
Postconditions: size() == 0 && data() == nullptr.

template<class It>
constexpr explicit(extent != dynamic_extent) span(It first, size_type count);

Constraints: Let U be remove_reference_t<iter_reference_t<It>>.

(3.1) It satisfies contiguous_iterator.
(3.2) is_convertible_v<U(*)[], element_type(*)[]> is true.
   [Note 1: The intent is to allow only qualification conversions of the iterator reference type to element_type.
   —end note]

Preconditions:
(4.1) [first, first + count) is a valid range.
(4.2) It models contiguous_iterator.
(4.3) If extent is not equal to dynamic_extent, then count is equal to extent.

Effects: Initializes data_ with to_address(first) and size_ with count.

Throws: Nothing.

template<class It, class End>
constexpr explicit(extent != dynamic_extent) span(It first, End last);

Constraints: Let U be remove_reference_t<iter_reference_t<It>>.

(7.1) is_convertible_v<U(*)[], element_type(*)[]> is true.
   [Note 2: The intent is to allow only qualification conversions of the iterator reference type to element_type.
   —end note]
(7.2) It satisfies contiguous_iterator.
(7.3) End satisfies sized_sentinel_for<It>.
(7.4) is_convertible_v<End, size_t> is false.

Preconditions:
(8.1) If extent is not equal to dynamic_extent, then last - first is equal to extent.
(8.2) [first, last) is a valid range.
(8.3) It models contiguous_iterator.
(8.4) End models sized_sentinel_for<It>.

Effects: Initializes data_ with to_address(first) and size_ with last - first.

Throws: When and what last - first throws.

template<size_t N> constexpr span(type_identity_t<element_type> (&arr)[N]) noexcept;
template<class T, size_t N> constexpr span(array<T, N>& arr) noexcept;
template<class T, size_t N> constexpr span(const array<T, N>& arr) noexcept;

Constraints: Let U be remove_pointer_t<decltype(data(arr))>.

(11.1) extent == dynamic_extent || N == extent is true, and
(11.2) is_convertible_v<U(*)[], element_type(*)[]> is true.
   [Note 3: The intent is to allow only qualification conversions of the array element type to element_type.
   —end note]

Effects: Constructs a span that is a view over the supplied array.
   [Note 4: type_identity_t affects class template argument deduction. —end note]

Postconditions: size() == N && data() == data(arr) is true.
template<class R> constexpr explicit(extent != dynamic_extent) span(R&& r);

Constraints: Let \( U \) be remove_reference_t<ranges::range_reference_t<R>>.

- \( R \) satisfies ranges::contiguous_range and ranges::sized_range.

(14.1)

- Either \( R \) satisfies ranges::borrowed_range or is_const_v<element_type> is true.

(14.2)

- remove_cvref_t<R> is not a specialization of span.

(14.3)

- remove_cvref_t<R> is not a specialization of array.

(14.4)

- is_array_v<remove_cvref_t<R>> is false.

(14.5)

- is_convertible_v<U(*)[], element_type(*)[]] is true.

[Note 5: The intent is to allow only qualification conversions of the range reference type to element_type.
—end note]

(14.6)

Preconditions:

- If extent is not equal to dynamic_extent, then ranges::size(r) is equal to extent.

(15.1)

- \( R \) models ranges::contiguous_range and ranges::sized_range.

(15.2)

- If is_const_v<element_type> is false, \( R \) models ranges::borrowed_range.

(15.3)

Effects: Initializes data_ with ranges::data(r) and size_ with ranges::size(r).

Throws: What and when ranges::data(r) and ranges::size(r) throw.

constexpr span(const span& other) noexcept = default;

Postconditions: other.size() == size() && other.data() == data().

template<class OtherElementType, size_t OtherExtent>
constexpr explicit(see below) span(const span<OtherElementType, OtherExtent>& s) noexcept;

Constraints:

- extent == dynamic_extent || OtherExtent == dynamic_extent || extent == OtherExtent is true, and

(19.1)

- is_convertible_v<OtherElementType(*)[], element_type(*)[]] is true.

[Note 6: The intent is to allow only qualification conversions of the OtherElementType to element_type.
—end note]

(19.2)

Preconditions: If extent is not equal to dynamic_extent, then s.size() is equal to extent.

Effects: Constructs a span that is a view over the range [s.data(), s.data() + s.size()).

Postconditions: size() == s.size() && data() == s.data().

Remarks: The expression inside explicit is equivalent to:

extent != dynamic_extent && OtherExtent == dynamic_extent

constexpr span& operator=(const span& other) noexcept = default;

Postconditions: size() == other.size() && data() == other.data().

24.7.2.2.3 Deduction guides

[span.deduct]

template<class It, class EndOrSize>
span(It, EndOrSize) -> span<remove_reference_t<iter_reference_t<It>>;)

Constraints: It satisfies contiguous_iterator.

template<class R>
span(R&&) -> span<ranges::range_reference_t<R>>;

Constraints: R satisfies ranges::contiguous_range.

24.7.2.2.4 Subviews

[span.sub]

template<
size_t Count>
constexpr span<
        element_type, Count>
first() const;

Mandates: Count <= Extent is true.

Preconditions: Count <= size() is true.
Effects: Equivalent to: return R{data(), Count}; where R is the return type.

template<size_t Count> constexpr span<element_type, Count> last() const;

Mandates: Count <= Extent is true.

Preconditions: Count <= size() is true.

Effects: Equivalent to: return R{data() + (size() - Count), Count}; where R is the return type.

Effects: Equivalent to: return R{data(), Count}; where R is the return type.

Effects: Equivalent to: return R{data() + (size() - Count), Count}; where R is the return type.
Effects: Equivalent to: \( \text{return } *(\text{data()} + \text{idx}); \)

constexpr reference front() const;

Preconditions: empty() is false.

Effects: Equivalent to: \( \text{return } \text{data}(); \)

constexpr reference back() const;

Preconditions: empty() is false.

Effects: Equivalent to: \( \text{return } *(\text{data()} + (\text{size()} - 1)); \)

constexpr pointer data() const noexcept;

Effects: Equivalent to: \( \text{return data\_}; \)

### 24.7.2.2.7 Iterator support

using iterator = implementation-defined;

1. The type models contiguous_iterator (25.3.4.14), meets the Cpp17RandomAccessIterator requirements (25.3.5.7), and meets the requirements for constexpr iterators (25.3.1), whose value type is value_type and whose reference type is reference.

2. All requirements on container iterators (24.2) apply to \( \text{span::iterator} \) as well.

constexpr iterator begin() const noexcept;

3. Returns: An iterator referring to the first element in the span. If empty() is true, then it returns the same value as end().

constexpr iterator end() const noexcept;

4. Returns: An iterator which is the past-the-end value.

constexpr reverse_iterator rbegin() const noexcept;

5. Effects: Equivalent to: \( \text{return reverse_iterator(end());} \)

constexpr reverse_iterator rend() const noexcept;

6. Effects: Equivalent to: \( \text{return reverse_iterator(begin());} \)

### 24.7.2.3 Views of object representation

template<class ElementType, size_t Extent>
span<const byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_bytes(span<ElementType, Extent> s) noexcept;

1. Effects: Equivalent to: \( \text{return } \text{R\{reinterpret_cast<const byte*>(s.data()), s.size_bytes()\};} \) where R is the return type.

template<class ElementType, size_t Extent>
span<byte, Extent == dynamic_extent ? dynamic_extent : sizeof(ElementType) * Extent>
as_writable_bytes(span<ElementType, Extent> s) noexcept;

2. Constraints: is_const_v<ElementType> is false.

3. Effects: Equivalent to: \( \text{return } \text{R\{reinterpret_cast<byte*>(s.data()), s.size_bytes()\};} \) where R is the return type.

### 24.7.3 Multidimensional access

#### 24.7.3.1 Overview

A multidimensional index space is a Cartesian product of integer intervals. Each interval can be represented by a half-open range \( [L_i, U_i) \), where \( L_i \) and \( U_i \) are the lower and upper bounds of the \( i^{th} \) dimension. The rank of a multidimensional index space is the number of intervals it represents. The size of a multidimensional index space is the product of \( U_i - L_i \) for each dimension \( i \) if its rank is greater than 0, and 1 otherwise.

An integer \( r \) is a rank index of an index space \( S \) if \( r \) is in the range \([0, \text{rank of } S)\).
A pack of integers $\text{idx}$ is a *multidimensional index* in a multidimensional index space $S$ (or representation thereof) if both of the following are true:

1. $\text{sizeof}(\text{idx})$ is equal to the rank of $S$, and
2. for every rank index $i$ of $S$, the $i^{th}$ value of $\text{idx}$ is an integer in the interval $[L_i, U_i)$ of $S$.

### 24.7.3.2 Header <mdspan> synopsis

```cpp
namespace std {
    // 24.7.3.3, class template extents
    template<class IndexType, size_t... Extents>
    class extents;

    // 24.7.3.3.6, alias template dextents
    template<class IndexType, size_t Rank>
    using dextents = see below;

    // 24.7.3.4, layout mapping
    struct layout_left;
    struct layout_right;
    struct layout_stride;

    // 24.7.3.5.3, class template default_accessor
    template<class ElementType>
    class default_accessor;

    // 24.7.3.6, class template mdspan
    template<class ElementType, class Extents, class LayoutPolicy = layout_right,
             class AccessorPolicy = default_accessor<ElementType>>
    class mdspan;
}
```

### 24.7.3.3 Class template extents

#### 24.7.3.3.1 Overview

The class template *extents* represents a multidimensional index space of rank equal to $\text{sizeof}(\text{...(Extents)}$. In subclause (24.7), *extents* is used synonymously with multidimensional index space.

```cpp
namespace std {
    template<class IndexType, size_t... Extents>
    class extents {
        public:
            using index_type = IndexType;
            using size_type = make_unsigned_t<index_type>;
            using rank_type = size_t;

            // 24.7.3.3.4, observers of the multidimensional index space
            static constexpr rank_type rank() noexcept { return sizeof...(Extents); }
            static constexpr rank_type rank_dynamic() noexcept { return dynamic_index(rank()); }
            static constexpr size_t static_extent(rank_type) noexcept;
            constexpr index_type extent(rank_type) const noexcept;

            // 24.7.3.3.3, constructors
            constexpr extents() noexcept = default;
            template<class OtherIndexType, size_t... OtherExtents>
            constexpr explicit(see below)
                extents(const extents<OtherIndexType, OtherExtents...>&) noexcept;
            template<class... OtherIndexTypes>
            constexpr explicit extents(OtherIndexTypes...) noexcept;
            template<class OtherIndexType, size_t N>
            constexpr explicit(N != rank_dynamic())
                extents(span<OtherIndexType, N>) noexcept;
            template<class OtherIndexType, size_t N>
            constexpr explicit(N != rank_dynamic())
                extents(const array<OtherIndexType, N>&) noexcept;
```

§ 24.7.3.3.1
Mandates:
(1.1) — IndexType is a signed or unsigned integer type, and
(1.2) — each element of Extents is either equal to dynamic_extent, or is representable as a value of type
IndexType.

Each specialization of extents models regular and is trivially copyable.

Let \( E_r \) be the \( r^{th} \) element of Extents. \( E_r \) is a dynamic extent if it is equal to dynamic_extent, otherwise \( E_r \)
is a static extent. Let \( D_r \) be the value of dynamic-extents[rank_dynamic()](r) if \( E_r \) is a dynamic extent, otherwise \( E_r \).

The \( r^{th} \) interval of the multidimensional index space represented by an extents object is \([0, D_r)\).

24.7.3.3.2 Exposition-only helpers

static constexpr rank_type dynamic-index(rank_type i) noexcept;

Preconditions: \( i \leq \text{rank()} \) is true.

Returns: The number of \( E_r \) with \( r < i \) for which \( E_r \) is a dynamic extent.

static constexpr rank_type dynamic-index-\( \text{inv} \)(rank_type i) noexcept;

Preconditions: \( i < \text{rank}() \) is true.

Returns: The minimum value of \( r \) such that \( \text{dynamic-index}(r+1) = i+1 \) is true.

constexpr size_t fwd-prod-of-extents(rank_type i) const noexcept;

Preconditions: \( i \leq \text{rank()} \) is true.

Returns: If \( i > 0 \) is true, the product of extent\((k)\) for all \( k \) in the range \([0, i)\), otherwise 1.

constexpr size_t rev-prod-of-extents(rank_type i) const noexcept;

Preconditions: \( i < \text{rank()} \) is true.

Returns: If \( i + 1 < \text{rank()} \) is true, the product of extent\((k)\) for all \( k \) in the range \([i + 1, \text{rank()})\), otherwise 1.

Effects:
(9.1) — If OtherIndexType is an integral type other than bool, then equivalent to return i;
(9.2) — otherwise, equivalent to return static_cast<index_type>(i);
[Note 1: This function will always return an integral type other than `bool`. Since this function’s call sites are constrained on convertibility of `OtherIndexType` to `index_type`, integer-class types can use the static_cast branch without loss of precision. — end note]

### 24.7.3.3.3 Constructors

```cpp
template<class OtherIndexType, size_t... OtherExtents>
constexpr explicit(see below) extents(const extents<OtherIndexType, OtherExtents...>& other) noexcept;
```

1. **Constraints:**
   - (1.1) `sizeof... (OtherExtents) == rank()` is true.
   - (1.2) `((OtherExtents == dynamic_extent || Extents == dynamic_extent || OtherExtents == Extents) && ...)` is true.

2. **Preconditions:**
   - (2.1) `other.extent(r)` equals `E_r` for each `r` for which `E_r` is a static extent, and
   - (2.2) either
     - (2.2.1) `sizeof... (OtherExtents)` is zero, or
     - (2.2.2) `other.extent(r)` is representable as a value of type `index_type` for every rank index `r` of `other`.

3. **Postconditions: *this == other is true.**

4. **Remarks:** The expression inside `explicit` is equivalent to:
   ```cpp
   (((Extents != dynamic_extent) && (OtherExtents == dynamic_extent)) || ... ) ||
   (numeric_limits<index_type>::max() < numeric_limits<OtherIndexType>::max())
   ```

```cpp
template<class... OtherIndexTypes>
constexpr explicit extents(OtherIndexTypes... exts) noexcept;
```

5. Let `N` be `sizeof...(OtherIndexTypes)`, and let `exts_arr` be `array<index_type, N>{static_cast<index_type>(std::move(exts))...}`.

6. **Constraints:**
   - (6.1) `(is_convertible_v<OtherIndexTypes, index_type> && ...)` is true,
   - (6.2) `(is_nothrow_constructible_v<index_type, OtherIndexTypes> && ...)` is true, and
   - (6.3) `N == rank_dynamic() || N == rank()` is true.
   
   [Note 1: One can construct extents from just dynamic extents, which are all the values getting stored, or from all the extents with a precondition. — end note]

7. **Preconditions:**
   - (7.1) If `N != rank_dynamic()` is true, `exts_arr[r]` equals `E_r` for each `r` for which `E_r` is a static extent, and
   - (7.2) either
     - (7.2.1) `sizeof...(exts) == 0` is true, or
     - (7.2.2) each element of `exts` is nonnegative and is representable as a value of type `index_type`.

8. **Postconditions: *this == extents(exts_arr) is true.**

```cpp
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic()) extents(span<OtherIndexType, N> exts) noexcept;
```

9. **Constraints:**
   - (9.1) `is_convertible_v<const OtherIndexType&, index_type>` is true,
   - (9.2) `is_nothrow_constructible_v<index_type, const OtherIndexType&>` is true, and
   - (9.3) `N == rank_dynamic() || N == rank()` is true.
10 **Preconditions:**

(10.1) If \( N \neq \) \texttt{rank\_dynamic()} is true, \texttt{exts}[r] equals \( E_r \) for each \( r \) for which \( E_r \) is a static extent, and

(10.2)

(10.2.1) \( N \) is zero, or

(10.2.2) \( \texttt{exts}[r] \) is nonnegative and is representable as a value of type \texttt{index\_type} for every rank index \( r \).

11 **Effects:**

(11.1) If \( N \) equals \texttt{dynamic\_rank()} for all \( d \) in the range \([0, \texttt{rank\_dynamic()})\), direct-non-list-initializes \texttt{dynamic\_extents}[d] with \texttt{as\_const(exts[d])}.

(11.2) Otherwise, for all \( d \) in the range \([0, \texttt{rank\_dynamic()})\), direct-non-list-initializes \texttt{dynamic\_extents}[d] with \texttt{as\_const(exts[\texttt{dynamic\_index\_inv}(d)])}.

\[
\text{template<class... Integrals> explicit extents(Integrals...) -> see below;}
\]

12 **Constraints:** \texttt{(is\_convertible_v<Integrals, size\_t> \&\& ...)} is true.

13 **Remarks:** The deduced type is \texttt{dextents<size\_t, sizeof...(Integrals)>>}.

24.7.3.3.4 Observers of the multidimensional index space

\[
\text{static constexpr size\_t static\_extent(rank\_type i) noexcept;}
\]

1 **Preconditions:** \( i < \texttt{rank()} \) is true.

2 **Returns:** \( E_i \).

\[
\text{constexpr index\_type extent(rank\_type i) const noexcept;}
\]

3 **Preconditions:** \( i < \texttt{rank()} \) is true.

4 **Returns:** \( D_i \).

24.7.3.3.5 Comparison operators

\[
\text{template<class OtherIndexType, size\_t... OtherExtents> friend constexpr bool operator==(const extents& lhs, const extents<OtherIndexType, OtherExtents...>& rhs) noexcept;}
\]

1 **Returns:** true if \( \text{lhs.rank()} \) equals \( \text{rhs.rank()} \) and if \( \text{lhs.extent}(r) \) equals \( \text{rhs.extent}(r) \) for every rank index \( r \) of \( \text{rhs} \), otherwise false.

24.7.3.3.6 Alias template \texttt{dextents}

\[
\text{template<class IndexType, size\_t Rank> using dextents = see below;}
\]

1 **Result:** A type \( E \) that is a specialization of \texttt{extents} such that \( E::\texttt{rank()} == \text{Rank} \&\& E::\texttt{rank\_dynamic()} \) is true, and \( E::\texttt{index\_type} \) denotes \texttt{IndexType}.

24.7.3.4 Layout mapping

24.7.3.4.1 General

In subclauses 24.7.3.4.2 and 24.7.3.4.3:

(1.1) \( M \) denotes a layout mapping class.

(1.2) \( m \) denotes a (possibly const) value of type \( M \).

(1.3) \( i \) and \( j \) are packs of (possibly const) integers that are multidimensional indices in \( M::\texttt{extents()} \) (24.7.3.1).

[Note 1: The type of each element of the packs can be a different integer type. — end note]

(1.4) \( r \) is a (possibly const) rank index of \texttt{typename M::extents\_type}.

(1.5) \( d_r \) is a pack of (possibly const) integers for which \( \text{sizeof...}(d_r) == M::\texttt{extents\_type::rank()} \) is true, the \( r \)th element is equal to 1, and all other elements are equal to 0.
In subclauses 24.7.3.4.2 through 24.7.3.4.7, let is-mapping-of be the exposition-only variable template defined as follows:

```cpp
template<class Layout, class Mapping>
constexpr bool is-mapping-of = // exposition only
  is_same_v<typename Layout::template mapping<typename Mapping::extents_type>, Mapping>;
```

### 24.7.3.4.2 Requirements

[mdspan.layout.reqmts]

A type `M` meets the layout mapping requirements if

1. `M` models copyable and equality_comparable,
2. `is_nothrow_move_constructible_v<M>` is true,
3. `is_nothrow_move_assignable_v<M>` is true,
4. `is_nothrow_swappable_v<M>` is true, and
5. the following types and expressions are well-formed and have the specified semantics.

- **typename `M::extents_type`**
  
  *Result:* A type that is a specialization of `extents`.

- **typename `M::index_type`**
  
  *Result:* `typename M::extents_type::index_type`.

- **typename `M::rank_type`**
  
  *Result:* `typename M::extents_type::rank_type`.

- **typename `M::layout_type`**
  
  *Result:* A type `MP` that meets the layout mapping policy requirements (24.7.3.4.3) and for which `is-mapping-of<MP, M>` is true.

- **`m.extents()`**
  
  *Result:* `const typename M::extents_type&`

- **`m(i...)`**
  
  *Result:* `typename M::index_type`

  *Returns:* A nonnegative integer less than `numeric_limits<typename M::index_type>::max()` and less than or equal to `numeric_limits<size_t>::max()`.

  ```cpp
  m(i...) == m(static_cast<typename M::index_type>(i...))
  ```

- **`m.required_span_size()`**
  
  *Result:* `typename M::index_type`

  *Returns:* If the size of the multidimensional index space `m.extents()` is 0, then 0, else 1 plus the maximum value of `m(i...)` for all `i`.

- **`m.is_unique()`**
  
  *Result:* `bool`

  *Returns:* `true` only if for every `i` and `j` where `(i != j || ...)` is `true`, `m(i...) != m(j...)` is `true`.

  [Note 1: A mapping can return `false` even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is unique. — end note]

- **`m.is_exhaustive()`**
  
  *Result:* `bool`

  *Returns:* `true` only if for all `k` in the range `[0, m.required_span_size())` there exists an `i` such that `m(i...)` equals `k`.

§ 24.7.3.4.2 1034
[Note 2: A mapping can return false even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is exhaustive. — end note]

\( m.\text{is\_strided}() \)

Result: bool

Returns: true only if for every rank index \( r \) of \( m.\text{extents}() \) there exists an integer \( s_r \) such that, for all \( i \) where \((i + d_r)\) is a multidimensional index in \( m.\text{extents}() \) (24.7.3.1), \( m((i + d_r)...) - m(i...) \) equals \( s_r \).

[Note 3: This implies that for a strided layout \( m(i_0,...,i_k) = m(0,...,0) + i_0 \times s_0 + \cdots + i_k \times s_k \). — end note]

[Note 4: A mapping can return false even if the condition is met. For certain layouts, it is possibly not feasible to determine efficiently whether the layout is strided. — end note]

\( m.\text{stride}(r) \)

Preconditions: \( m.\text{is\_strided}() \) is true.

Result: typename M::index_type

Returns: \( s_r \) as defined in \( m.\text{is\_strided}() \) above.

\( M::\text{is\_always\_unique}() \)

Result: A constant expression (7.7) of type bool.

Returns: true only if \( m.\text{is\_unique}() \) is true for all possible objects \( m \) of type \( M \).

[Note 5: A mapping can return false even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is unique. — end note]

\( M::\text{is\_always\_exhaustive}() \)

Result: A constant expression (7.7) of type bool.

Returns: true only if \( m.\text{is\_exhaustive}() \) is true for all possible objects \( m \) of type \( M \).

[Note 6: A mapping can return false even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is exhaustive. — end note]

\( M::\text{is\_always\_strided}() \)

Result: A constant expression (7.7) of type bool.

Returns: true only if \( m.\text{is\_strided}() \) is true for all possible objects \( m \) of type \( M \).

[Note 7: A mapping can return false even if the above condition is met. For certain layout mappings, it is possibly not feasible to determine whether every instance is strided. — end note]

24.7.3.4.3 Layout mapping policy requirements

A type MP meets the layout mapping policy requirements if for a type E that is a specialization of extents, \( MP::\text{mapping}\langle E \rangle \) is valid and denotes a type X that meets the layout mapping requirements (24.7.3.4.2), and for which the qualified-id \( X::\text{layout\_type} \) is valid and denotes the type MP and the qualified-id \( X::\text{extents\_type} \) denotes E.

24.7.3.4.4 Layout mapping policies
1 Each of `layout_left`, `layout_right`, and `layout_stride` meets the layout mapping policy requirements and is a trivial type.

24.7.3.4.5 Class template `layout_left::mapping` [mdspan.layout.left]

24.7.3.4.5.1 Overview [mdspan.layout.left.overview]

`layout_left` provides a layout mapping where the leftmost extent has stride 1, and strides increase left-to-right as the product of extents.

```cpp
namespace std {
    template<class Extents>
    class layout_left::mapping {
        public:
            using extents_type = Extents;
            using index_type = typename extents_type::index_type;
            using size_type = typename extents_type::size_type;
            using rank_type = typename extents_type::rank_type;
            using layout_type = layout_left;

            // 24.7.3.4.5.2, constructors
            constexpr mapping() noexcept = default;
            constexpr mapping(const mapping&) noexcept = default;
            constexpr mapping(const extents_type&) noexcept;
            template<class OtherExtents>
                constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
                    mapping(const mapping<OtherExtents>&) noexcept;
            template<class OtherExtents>
                constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
                    mapping(const layout_right::mapping<OtherExtents>&) noexcept;
            template<class OtherExtents>
                constexpr explicit(extents_type::rank() > 0)
                    mapping(const layout_stride::mapping<OtherExtents>&);

            constexpr mapping& operator=(const mapping&) noexcept = default;

            // 24.7.3.4.5.3, observers
            constexpr const extents_type& extents() const noexcept { return extents_; }
            constexpr index_type required_span_size() const noexcept;
            template<class... Indices>
                constexpr index_type operator()(Indices...) const noexcept;
            static constexpr bool is_always_unique() noexcept { return true; }
            static constexpr bool is_always_exhaustive() noexcept { return true; }
            static constexpr bool is_always_strided() noexcept { return true; }
            static constexpr bool is_unique() noexcept { return true; }
            static constexpr bool is_exhaustive() noexcept { return true; }
            static constexpr bool is_strided() noexcept { return true; }

            constexpr index_type stride(rank_type) const noexcept;

            template<class OtherExtents>
                friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

        private:
            extents_type extents_; // exposition only
    };
}
```

2 If `Extents` is not a specialization of `extents`, then the program is ill-formed.

3 `layout_left::mapping<E>` is a trivially copyable type that models `regular` for each `E`.

§ 24.7.3.4.5 1036
24.7.3.4.5.2 Constructors

```cpp
constexpr mapping(const extents_type& e) noexcept;
```

**Preconditions:** The size of the multidimensional index space `e` is representable as a value of type `index_type (6.8.2)`.

**Effects:** Direct-non-list-initializes `extents_` with `e`.

```cpp
template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const mapping<OtherExtents>& other) noexcept;
```

**Constraints:**
- is_constructible_v<extents_type, OtherExtents> is true.

**Preconditions:** `other.required_span_size()` is representable as a value of type `index_type (6.8.2)`.

**Effects:** Direct-non-list-initializes `extents_` with `other.extents()`.

```cpp
template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const layout_right::mapping<OtherExtents>& other) noexcept;
```

**Constraints:**
- extents_type::rank() <= 1 is true, and
- is_constructible_v<extents_type, OtherExtents> is true.

**Preconditions:**
- other.required_span_size() is representable as a value of type `index_type (6.8.2)`.

**Effects:** Direct-non-list-initializes `extents_` with `other.extents()`.

```cpp
template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const layout_stride::mapping<OtherExtents>& other);
```

**Constraints:**
- is_constructible_v<extents_type, OtherExtents> is true.

**Preconditions:**
- If extents_type::rank() > 0 is true, then for all `r` in the range `[0, extents_type::rank())`, other.stride(r) equals extents().fwd-prod-of-extents(r), and
- other.required_span_size() is representable as a value of type `index_type (6.8.2)`.

**Effects:** Direct-non-list-initializes `extents_` with `other.extents()`.

24.7.3.4.5.3 Observers

```cpp
constexpr index_type required_span_size() const noexcept;
```

**Returns:** `extents().fwd-prod-of-extents(extents_type::rank())`.

```cpp
template<class... Indices>
constexpr index_type operator()(Indices... i) const noexcept;
```

**Constraints:**
- sizeof...(Indices) == extents_type::rank() is true,
- (is_convertible_v<Indices, index_type> && ...) is true, and
- (is_nothrow_constructible_v<index_type, Indices> && ...) is true.

**Preconditions:**
- extents_type::index-cast(i) is a multidimensional index in `extents_ (24.7.3.1)`.

**Effects:** Let `P` be a parameter pack such that
- is_same_v<index_sequence_for<Indices...>, index_sequence<P...>> is true. Equivalent to:
  ```cpp
  return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
  ```

```cpp
constexpr index_type stride(rank_type i) const;
```

**Constraints:** `extents_type::rank() > 0` is true.

**Preconditions:** `i < extents_type::rank()` is true.
template<class OtherExtents>
friend constexpr bool operator==(const mapping& x, const mapping<OtherExtents>& y) noexcept;

Constraints: extents_type::rank() == OtherExtents::rank() is true.

Effects: Equivalent to: return x.extents() == y.extents();

24.7.3.4.6 Class template layout_right::mapping

layout_right provides a layout mapping where the rightmost extent is stride 1, and strides increase right-to-left as the product of extents.

namespace std {
    template<class Extents>
    class layout_right::mapping {
    public:
        using extents_type = Extents;
        using index_type = typename extents_type::index_type;
        using size_type = typename extents_type::size_type;
        using rank_type = typename extents_type::rank_type;
        using layout_type = layout_right;

        constexpr mapping() noexcept = default;
        constexpr mapping(const mapping&) noexcept = default;
        constexpr mapping(const extents_type&) noexcept;
        template<class OtherExtents>
            constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
            mapping(const mapping<OtherExtents>&) noexcept;
        template<class OtherExtents>
            constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
            mapping(const layout_left::mapping<OtherExtents>&) noexcept;
        template<class OtherExtents>
            constexpr explicit(extents_type::rank() > 0)
            mapping(const layout_stride::mapping<OtherExtents>&) noexcept;

        constexpr mapping& operator=(const mapping&) noexcept = default;

        // 24.7.3.4.6.3, observers
        constexpr index_type required_span_size() const noexcept { return extents_; }
        template<class... Indices>
            constexpr index_type operator()(Indices...) const noexcept;

        static constexpr bool is_always_unique() noexcept { return true; }
        static constexpr bool is_always_exhaustive() noexcept { return true; }
        static constexpr bool is_always_strided() noexcept { return true; }
        static constexpr bool is_unique() noexcept { return true; }
        static constexpr bool is_exhaustive() noexcept { return true; }
        static constexpr bool is_strided() noexcept { return true; }

        constexpr index_type stride(rank_type) const noexcept;
        template<class OtherExtents>
            friend constexpr bool operator==(const mapping&, const mapping<OtherExtents>&) noexcept;

    private:
        extents_type extents_; // exposition only
    };
}
If Extents is not a specialization of extents, then the program is ill-formed.

layout_right::mapping<E> is a trivially copyable type that models regular for each E.

### 24.7.3.4.6.2 Constructors

```cpp
constexpr mapping(const extents_type& e) noexcept;
```

**Preconditions:** The size of the multidimensional index space e is representable as a value of type `index_type` (6.8.2).

**Effects:** Direct-non-list-initializes extents with e.

```cpp
template<class OtherExtents>
constexpr explicit(!is_convertible_v<OtherExtents, extents_type>)
mapping(const mapping<OtherExtents>& other) noexcept;
```

**Constraints:** `is_constructible_v<extents_type, OtherExtents>` is true.

**Preconditions:** other.required_span_size() is representable as a value of type `index_type` (6.8.2).

**Effects:** Direct-non-list-initializes extents with other.extents().

```cpp
template<class OtherExtents>
constexpr explicit(extents_type::rank() > 0)
mapping(const layout_stride::mapping<OtherExtents>& other) noexcept;
```

**Constraints:** `is_constructible_v<extents_type, OtherExtents>` is true.

**Preconditions:**
- If extents_type::rank() > 0 is true, then for all r in the range [0, extents_type::rank()),
  other.stride(r) equals extents().rev-prod-of-extents(r).
- other.required_span_size() is representable as a value of type `index_type` (6.8.2).

**Effects:** Direct-non-list-initializes extents with other.extents().

### 24.7.3.4.6.3 Observers

```cpp
index_type required_span_size() const noexcept;
```

**Returns:** extents().fwd-prod-of-extents(extents_type::rank()).

```cpp
template<class... Indices>
constexpr index_type operator()(Indices... i) const noexcept;
```

**Constraints:**
- sizeof...(Indices) == extents_type::rank() is true.
- (is_convertible_v<Indices, index_type> && ...) is true, and
- (is_nothrow_constructible_v<index_type, Indices> && ...) is true.

**Preconditions:** extents_type::index-cast(i) is a multidimensional index in extents (24.7.3.1).

**Effects:** Let P be a parameter pack such that
- is_same_v<index_sequence_for<Indices...>, index_sequence<P...>> is true. Equivalent to:

```cpp
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);
```
constexpr index_type stride(rank_type i) const noexcept;

Constraints: extents_type::rank() > 0 is true.

Preconditions: i < extents_type::rank() is true.

Returns: extents().rev-prod-of-extents(i).

24.7.3.4.7 Class template layout_stride::mapping

24.7.3.4.7.1 Overview

layout_stride provides a layout mapping where the strides are user-defined.

namespace std {

    template<class Extents>
    class layout_stride::mapping {

    public:
        using extents_type = Extents;
        using index_type = typename extents_type::index_type;
        using size_type = typename extents_type::size_type;
        using rank_type = typename extents_type::rank_type;
        using layout_type = layout_stride;

    private:
        static constexpr rank_type rank_ = extents_type::rank(); // exposition only

    public:

    // 24.7.3.4.7.3, constructors
        constexpr mapping() noexcept = default;
        constexpr mapping(const mapping&) noexcept = default;
        template<class OtherIndexType>
        constexpr mapping(const extents_type&, span<OtherIndexType, rank_>) noexcept;
        template<class OtherIndexType>
        constexpr mapping(const extents_type&, const array<OtherIndexType, rank_>&) noexcept;

        template<class StridedLayoutMapping>
        constexpr explicit(see below) mapping(const StridedLayoutMapping&) noexcept;

        constexpr mapping& operator=(const mapping&) noexcept = default;

    // 24.7.3.4.7.4, observers
        constexpr const extents_type& extents() const noexcept { return extents_; }
        constexpr array<index_type, rank_> strides() const noexcept { return strides_; }

        constexpr index_type required_span_size() const noexcept;

        template<class... Indices>
        constexpr index_type operator()(Indices...) const noexcept;

        static constexpr bool is_always_unique() noexcept { return true; }
        static constexpr bool is_always_exhaustive() noexcept { return false; }
        static constexpr bool is_always_strided() noexcept { return true; }

        static constexpr bool is_unique() noexcept { return true; }
        static constexpr bool is_exhaustive() const noexcept;
        static constexpr bool is_strided() noexcept { return true; }

        constexpr index_type stride(rank_type i) const noexcept { return strides_[i]; }

    template<class OtherMapping>
        friend constexpr bool operator==(const mapping& x, const OtherMapping& y) noexcept;

    } // layout_stride

} // std
private:
    extents_type extents_{};  // exposition only
    array<index_type, rank_> strides_{};  // exposition only
};

2 If Extents is not a specialization of extents, then the program is ill-formed.

3 layout_stride::mapping<E> is a trivially copyable type that models regular for each E.

24.7.3.4.7.2 Exposition-only helpers

1 Let REQUIRED-SPAN-SIZE(e, strides) be:
   (1.1) — 1, if e.rank() == 0 is true,
   (1.2) — otherwise 0, if the size of the multidimensional index space e is 0,
   (1.3) — otherwise 1 plus the sum of products of (e.extent(r) - 1) and strides[r] for all r in the range [0, e.rank()).

2 Let OFFSET(m) be:
   (2.1) — m(), if e.rank() == 0 is true,
   (2.2) — otherwise 0, if the size of the multidimensional index space e is 0,
   (2.3) — otherwise m(z...) for a pack of integers z that is a multidimensional index in m.extents() and each element of z equals 0.

3 Let is-extents be the exposition-only variable template defined as follows:
   template<class T>
   constexpr bool is-extents = false;  // exposition only
   template<class IndexType, size_t... Args>
   constexpr bool is-extents<extents<IndexType, Args...>> = true;  // exposition only

4 Let layout-mapping-alike be the exposition-only concept defined as follows:
   template<class M>
   concept layout-mapping-alike = requires {
     requires is-extents<type_name M::extents_type>;
     { M::is_always_strided() } -> same_as<bool>;
     { M::is_always_exhaustive() } -> same_as<bool>;
     { M::is_always_unique() } -> same_as<bool>;
     bool_constant<M::is_always_strided>::value;
     bool_constant<M::is_always_exhaustive>::value;
     bool_constant<M::is_always_unique>::value;
   };

[Note 1: This concept checks that the functions M::is_always_strided(), M::is_always_exhaustive(), and M::is_always_unique() exist, are constant expressions, and have a return type of bool. — end note]

24.7.3.4.7.3 Constructors

1 template<class OtherIndexType>
   constexpr mapping(const extents_type& e, span<OtherIndexType, rank_> s) noexcept;
   template<class OtherIndexType>
   constexpr mapping(const extents_type& e, const array<OtherIndexType, rank_> s) noexcept;

   Constraints:
   (1.1) — is_convertible_v<const OtherIndexType&, index_type> is true, and
   (1.2) — is_nothrow_constructible_v<index_type, const OtherIndexType&> is true.

   Preconditions:
   (2.1) — s[i] > 0 is true for all i in the range [0, rank_).
   (2.2) — REQUIRED-SPAN-SIZE(e, s) is representable as a value of type index_type (6.8.2).
   (2.3) — If rank_ is greater than 0, then there exists a permutation P of the integers in the range [0, rank_), such that s[p[i]] >= s[p[i-1]] * e.extent(p[i-1]) is true for all i in the range [1, rank_), where p[i] is the i-th element of P.
[Note 1: For layout_stride, this condition is necessary and sufficient for is_unique() to be true. — end note]

Effects: Direct-non-list-initializes extents_ with e, and for all d in the range [0, rank_), direct-non-list-initializes strides_[d] with as_const(s[d]).

template<class StridedLayoutMapping>
constexpr explicit(see below)
    mapping(const StridedLayoutMapping& other) noexcept;

4 Constraints:
(4.1) — layout-mapping-alike<StridedLayoutMapping> is satisfied.
(4.2) — is_constructible_v<extents_type, typename StridedLayoutMapping::extents_type> is true.
(4.3) — StridedLayoutMapping::is_always_unique() is true.
(4.4) — StridedLayoutMapping::is_always_strided() is true.

Preconditions:
(5.1) — StridedLayoutMapping meets the layout mapping requirements (24.7.3.4.3),
(5.2) — other.stride(r) > 0 is true for every rank index r of extents(),
(5.3) — other.required_span_size() is representable as a value of type index_type (6.8.2), and
(5.4) — OFFSET(other) == 0 is true.

Effects: Direct-non-list-initializes extents_ with other.extents(), and for all d in the range [0, rank_),
direct-non-list-initializes strides_[d] with other.stride(d).

Remarks: The expression inside explicit is equivalent to:

!is_convertible_v<typename StridedLayoutMapping::extents_type, extents_type> &&
(is-mapping-of<layout_left, LayoutStrideMapping> ||
is-mapping-of<layout_right, LayoutStrideMapping> ||
is-mapping-of<layout_stride, LayoutStrideMapping>))

24.7.3.4.7.4 Observers

constexpr index_type required_span_size() const noexcept;

template<class... Indices>
constexpr index_type operator()(Indices... i) const noexcept;

Constraints:
(2.1) — sizeof...(Indices) == rank_ is true,
(2.2) — (is_convertible_v<Indices, index_type> && ...) is true, and
(2.3) — (is_nothrow_constructible_v<index_type, Indices> && ...) is true.

Preconditions: extents_type::index-cast(i) is a multidimensional index in extents_ (24.7.3.1).

Effects: Let P be a parameter pack such that
is_same_v<index_sequence_for<Indices...>, index_sequence<P...>>
is true. Equivalent to:
return ((static_cast<index_type>(i) * stride(P)) + ... + 0);

constexpr bool is_exhaustive() const noexcept;

Returns:
(5.1) — true if rank_ is 0.
(5.2) — Otherwise, true if there is a permutation P of the integers in the range [0, rank_) such that
stride(p_0) equals 1, and stride(p_i) equals stride(p_{i-1}) * extents().extent(p_{i-1}) for i in
the range [1, rank_), where p_i is the i_th element of P.
(5.3) — Otherwise, false.
template<class OtherMapping>
friend constexpr bool operator==(const mapping& x, const OtherMapping& y) noexcept;

Constraints:

(6.1) layout-mapping-alike<OtherMapping> is satisfied.
(6.2) rank_ == OtherMapping::extents_type::rank() is true.
(6.3) OtherMapping::is_always_strided() is true.

Preconditions: OtherMapping meets the layout mapping requirements (24.7.3.4.3).

Returns: true if x.extents() == y.extents() is true, OFFSET(y) == 0 is true, and each of x.stride(r) == y.stride(r) is true for r in the range [0, x.extents().rank()). Otherwise, false.

24.7.3.5 Accessor policy [mdspan.accessor]

24.7.3.5.1 General [mdspan.accessor.general]

An accessor policy defines types and operations by which a reference to a single object is created from an abstract data handle to a number of such objects and an index.

A range of indices [0, N) is an accessible range of a given data handle and an accessor if, for each i in the range, the accessor policy’s access function produces a valid reference to an object.

In subclause 24.7.3.5.2,

(3.1) A denotes an accessor policy.
(3.2) a denotes a value of type A or const A.
(3.3) p denotes a value of type A::data_handle_type or const A::data_handle_type.

[Note 1: The type A::data_handle_type need not be dereferenceable. — end note]

(3.4) n, i, and j each denote values of type size_t.

24.7.3.5.2 Requirements [mdspan.accessor.reqmts]

A type A meets the accessor policy requirements if

(1.1) A models copyable,
(1.2) is_nothrow_move_constructible_v<A> is true,
(1.3) is_nothrow_move_assignable_v<A> is true,
(1.4) is_nothrow_swappable_v<A> is true, and
(1.5) the following types and expressions are well-formed and have the specified semantics.

typename A::element_type

Result: A complete object type that is not an abstract class type.

typename A::data_handle_type

Result: A type that models copyable, and for which is_nothrow_move_constructible_v<A::data_handle_type> is true, is_nothrow_moveAssignable_v<A::data_handle_type> is true, and is_nothrow_swappable_v<A::data_handle_type> is true.

[Note 1: The type of data_handle_type need not be element_type*. — end note]

typename A::reference

Result: A type that models common_reference_with<A::reference&&, A::element_type&&>.

[Note 2: The type of reference need not be element_type&. — end note]

typename A::offset_policy

Result: A type OP such that:

(5.1) OP meets the accessor policy requirements,
(5.2) constructible_from<OP, const A&> is modeled, and
(5.3) is_same_v<typename OP::element_type, typename A::element_type> is true.
a.access(p, i)

Result: A::reference

Remarks: The expression is equality preserving.

[Note 3: Concrete accessor policies can impose preconditions for their access function. However, they might not. For example, an accessor where p is span<A::element_type, dynamic_extent> and access(p, i) returns p[i % p.size()] does not need to impose a precondition on i. — end note]

a.offset(p, i)

Result: A::offset_policy::data_handle_type

Returns: q such that for b being A::offset_policy(a), and any integer n for which [0, n) is an accessible range of p and a:

(10.1) — [0, n – i) is an accessible range of q and b; and

(10.2) — b.access(q, j) provides access to the same element as a.access(p, i + j), for every j in the range [0, n – i).

Remarks: The expression is equality-preserving.

24.7.3.5.3 Class template default_accessor

24.7.3.5.3.1 Overview

namespace std {

    template<class ElementType>
    struct default_accessor {
        using offset_policy = default_accessor;
        using element_type = ElementType;
        using reference = ElementType&;
        using data_handle_type = ElementType*;

        constexpr default_accessor() noexcept = default;
        template<class OtherElementType>
        constexpr default_accessor(default_accessor<OtherElementType>) noexcept;
        constexpr reference access(data_handle_type p, size_t i) const noexcept;
        constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;
    };
}

default_accessor meets the accessor policy requirements.

ElementType is required to be a complete object type that is neither an abstract class type nor an array type.

Each specialization of default_accessor is a trivially copyable type that models semiregular.

[0, n) is an accessible range for an object p of type data_handle_type and an object of type default_accessor if and only if [p, p + n) is a valid range.

24.7.3.5.3.2 Members

    template<class OtherElementType>
    constexpr default_accessor(default_accessor<OtherElementType>) noexcept {}

    Constraints: is_convertible_v<OtherElementType(*)[], element_type(*)[]> is true.

    constexpr reference access(data_handle_type p, size_t i) const noexcept;

    Effects: Equivalent to: return p[i];

    constexpr data_handle_type offset(data_handle_type p, size_t i) const noexcept;

    Effects: Equivalent to: return p + i;

24.7.3.6 Class template mdspan

24.7.3.6.1 Overview

mdspan is a view of a multidimensional array of elements.
namespace std {
    template<class ElementType, class Extents, class LayoutPolicy = layout_right,
       class AccessorPolicy = default_accessor<ElementType>>
    class mdspan {
        public:
            using extents_type = Extents;
            using layout_type = LayoutPolicy;
            using accessor_type = AccessorPolicy;
            using mapping_type = typename layout_type::template mapping<extents_type>;
            using element_type = ElementType;
            using value_type = remove_cv_t<element_type>;
            using index_type = typename extents_type::index_type;
            using size_type = typename extents_type::size_type;
            using rank_type = typename extents_type::rank_type;
            using data_handle_type = typename accessor_type::data_handle_type;
            using reference = typename accessor_type::reference;

            static constexpr rank_type rank() noexcept { return extents_type::rank(); }
            static constexpr rank_type rank_dynamic() noexcept { return extents_type::rank_dynamic(); }
            static constexpr size_t static_extent(rank_type r) noexcept { return extents_type::static_extent(r); }

            constexpr index_type extent(rank_type r) const noexcept { return extents().extent(r); }

template<class CArray>
requires(is_array_v<CArray> && rank_v<CArray> == 1)
mdspan(CArray&) -> mdspan<remove_all_extents_t<CArray>, extents<size_t, extent_v<CArray, 0>>>

};

template<class Pointer>
requires(is_pointer_v<remove_reference_t<Pointer>>)
mdspan(Pointer&&) -> mdspan<remove_pointer_t<remove_reference_t<Pointer>>, extents<size_t>>

};

template<class ElementType, class... Integrals>
requires((is_convertible_v<Integrals, size_t> && ...) && sizeof...(Integrals) > 0)
explicit mdspan(ElementType*, Integrals...)
-> mdspan<ElementType, dextents<size_t, sizeof...(Integrals)>>

};

template<class ElementType, class OtherIndexType, size_t N>
mdspan(ElementType*, span<OtherIndexType, N>)
-> mdspan<ElementType, dextents<size_t, N>>

};

template<class ElementType, class OtherIndexType, size_t N>
mdspan(ElementType*, const array<OtherIndexType, N>&)
-> mdspan<ElementType, const array<OtherIndexType, N>>

};

template<class ElementType, class IndexType, size_t... ExtentsPack>
mdspan(ElementType*, const extents<IndexType, ExtentsPack...>&)
-> mdspan<ElementType, extents<IndexType, ExtentsPack...>>

};

template<class ElementType, class MappingType>
mdspan(ElementType*, const MappingType&)
-> mdspan<ElementType, typename MappingType::extents_type,
  typename MappingType::layout_type>

};

template<class MappingType, class AccessorType>
mdspan(const typename AccessorType::data_handle_type&, const MappingType&,
  const AccessorType&)
-> mdspan<typename AccessorType::element_type, typename MappingType::extents_type,
  typename MappingType::layout_type, AccessorType>

}
2 Mandates:
   — ElementType is a complete object type that is neither an abstract class type nor an array type,
   — Extents is a specialization of extents, and
   — is_same_v<ElementType, typename AccessorPolicy::element_type> is true.
3 LayoutPolicy shall meet the layout mapping policy requirements (24.7.3.4.3), and AccessorPolicy shall meet the accessor policy requirements (24.7.3.5.2).
4 Each specialization MDS of mdspan models copyable and
   — is_nothrow_move_constructible_v<MDS> is true,
   — is_nothrow_move_assignable_v<MDS> is true, and
   — is_nothrow_swappable_v<MDS> is true.
5 A specialization of mdspan is a trivially copyable type if its accessor_type, mapping_type, and data_handle_type are trivially copyable types.

24.7.3.6.2 Constructors

constexpr mdspan();

Constraints:
   — rank_dynamic() > 0 is true.
   — is_default_constructible_v<data_handle_type> is true.
   — is_default_constructible_v<mapping_type> is true.
   — is_default_constructible_v<accessor_type> is true.

Preconditions: [0, map_.required_span_size()) is an accessible range of ptr_ and acc_ for the values of map_ and acc_ after the invocation of this constructor.

Effects: Value-initializes ptr_, map_, and acc_.

```cpp
template<class... OtherIndexTypes>
constexpr explicit mdspan(data_handle_type p, OtherIndexTypes... exts);
```

Let N be sizeof...(OtherIndexTypes).

Constraints:
   — (is_convertible_v<OtherIndexTypes, index_type> && ...) is true,
   — (is_nothrow_constructible<index_type, OtherIndexTypes> && ...) is true,
   — N == rank() || N == rank_dynamic() is true,
   — is_constructible_v<mapping_type, extents_type> is true, and
   — is_default_constructible_v<accessor_type> is true.

Preconditions: [0, map_.required_span_size()) is an accessible range of p and acc_ for the values of map_ and acc_ after the invocation of this constructor.

Effects:
   — Direct-non-list-initializes ptr_ with std::move(p),
   — direct-non-list-initializes map_ with extents_type(static_cast<index_type>(std::move(exts ))...), and
   — value-initializes acc_.

```cpp
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
    mdspan(data_handle_type p, span<OtherIndexType, N> exts);
```

```cpp
template<class OtherIndexType, size_t N>
constexpr explicit(N != rank_dynamic())
    mdspan(data_handle_type p, const array<OtherIndexType, N>& exts);
```

Constraints:
   — is_convertible_v<const OtherIndexType&, index_type> is true,
— (is_nothrow_constructible<index_type, const OtherIndexType&> && ...) is true,
— N == rank() || N == rank_dynamic() is true,
— is_constructible_v<mapping_type, extents_type> is true, and
— is_default_constructible_v<accessor_type> is true.

Preconditions: \([0, \text{map_.required_span_size}())\) is an accessible range of \(p\) and \(\text{acc}\) for the values of \(\text{map}\) and \(\text{acc}\) after the invocation of this constructor.

Effects:
— Direct-non-list-initializes \(\text{ptr}\) with std::move(\(p\)),
— direct-non-list-initializes \(\text{map}\) with extents_type(\(\text{exts}\)), and
— value-initializes \(\text{acc}\).

constexpr mdspan(const mdspan<OtherElementType, OtherExtents, OtherLayoutPolicy, OtherAccessor>& other);

Constraints:
— is_constructible_v<mapping_type, const OtherLayoutPolicy::template mapping<OtherExtents>&> is true, and
— is_constructible_v<accessor_type, const OtherAccessor&> is true.

Mandates:
§ 24.7.3.6.2 1048
(20.1) \(\text{is\_constructible\_v}\) is true, and
(20.2) \(\text{is\_constructible\_v}\) is true.

**21 Preconditions:**

(21.1) For each rank index \(r\) of \(\text{static\_extent}(r) == \text{dynamic\_extent} \mid \text{static\_extent}(r) == \text{other\_extent}(r)\) is true.
(21.2) \([0, \text{map\_required\_span\_size()}]\) is an accessible range of \(\text{ptr\_}\) and \(\text{acc\_}\) for values of \(\text{ptr\_}\), \(\text{map\_}\), and \(\text{acc\_}\) after the invocation of this constructor.

**22 Effects:**

(22.1) Direct-non-list-initializes \(\text{ptr\_}\) with \(\text{other\_ptr\_}\).
(22.2) Direct-non-list-initializes \(\text{map\_}\) with \(\text{other\_map\_}\), and
(22.3) Direct-non-list-initializes \(\text{acc\_}\) with \(\text{other\_acc\_}\).

**23 Remarks:** The expression inside \texttt{explicit} is equivalent to:

\[
\neg \text{is\_convertible\_v}\left(\text{const\ OtherLayoutPolicy\::\template\ mapping\(\text{OtherExtents}\)&, mapping\_type}\right) \lor \neg \text{is\_convertible\_v}\left(\text{const\ OtherAccessor\&}, accessor\_type\right)
\]

### 24.7.3.6.3 Members

**template<class... OtherIndexTypes>**

\texttt{constexpr reference operator\[\](OtherIndexTypes... indices) const;}

**1 Constraints:**

(1.1) \(\text{is\_convertible\_v}\left(\text{OtherIndexTypes}, index\_type\right) \&\& ...\) is true,
(1.2) \(\text{is\_nothrow\_constructible\_v}\left(index\_type, \text{OtherIndexTypes} \&\& ...\right)\) is true, and
(1.3) \(\text{sizeof}(\text{OtherIndexTypes}) == \text{rank}()\) is true.

Let \(I\) be \(\text{extents\_type\::\index\_cast}(\text{std}\_\text{move}(\text{indices}))\).

**2 Preconditions:** \(I\) is a multidimensional index in \(\text{extents}()\).

**[Note 1:** This implies that \(\text{map\_}(I) < \text{map\_\_required\_span\_size()}\) is true. — end note]

**3 Effects:** Equivalent to:

\[
\text{return acc\_\_access(\text{ptr\_}, \text{map\_}(\text{static\_cast<index\_type>>(\text{std}\_\text{move}(\text{indices}))...)));}
\]

**template<class OtherIndexType>**

\texttt{constexpr reference operator\[\](\text{span<OtherIndexType, rank>() indices}) const;}

**4 Constraints:**

(4.1) \(\text{is\_convertible\_v}\left(\text{const\ OtherIndexType\&}, index\_type\right)\) is true, and
(4.2) \(\text{is\_nothrow\_constructible\_v}\left(index\_type, \text{const\ OtherIndexType\&}\right)\) is true.

**5 Effects:** Let \(P\) be a parameter pack such that 

\[
\text{is\_same\_v}\left(\text{make\_index\_sequence<rank>(), index\_sequence<P...>}, \text{index\_sequence}\right)\) is true. Equivalent to:

\[
\text{return\ operator\[](\text{as\_const(indices[P])...});}
\]

\texttt{constexpr size\_type size() const noexcept;}  

**6 Preconditions:** The size of the multidimensional index space \(\text{extents}()\) is representable as a value of type \(\text{size\_type}\) (6.8.2).

**Returns:** \(\text{extents().\text{fwd\_prod\_of\_extents}(rank())}\).

**[[\text{nodiscard}]] constexpr bool empty() const noexcept;**

**7 Returns:** \texttt{true} if the size of the multidimensional index space \(\text{extents}()\) is 0, otherwise \texttt{false}.  

\[\text{§ 24.7.3.6.3} \]
friend constexpr void swap(mdspan& x, mdspan& y) noexcept;

Effects: Equivalent to:
- swap(x.ptr_, y.ptr_);
- swap(x.map_, y.map_);
- swap(x.acc_, y.acc_);
25 Iterators library

25.1 General

This Clause describes components that C++ programs may use to perform iterations over containers (Clause 24), streams (31.7), stream buffers (31.6), and other ranges (Clause 26).

The following subclauses describe iterator requirements, and components for iterator primitives, predefined iterators, and stream iterators, as summarized in Table 85.

Table 85: Iterators library summary

25.3 Iterator requirements

25.3.1 In general

Iterators are a generalization of pointers that allow a C++ program to work with different data structures (for example, containers and ranges) in a uniform manner. To be able to construct template algorithms
that work correctly and efficiently on different types of data structures, the library formalizes not just the interfaces but also the semantics and complexity assumptions of iterators. An input iterator \( i \) supports the expression \(*i\), resulting in a value of some object type \( T \), called the value type of the iterator. An output iterator \( i \) has a non-empty set of types that are indirectly_writable to the iterator; for each such type \( T \), the expression \(*i = o\) is valid where \( o \) is a value of type \( T \). For every iterator type \( X \), there is a corresponding signed integer-like type (25.3.4.4) called the difference type of the iterator.

Since iterators are an abstraction of pointers, their semantics are a generalization of most of the semantics of pointers in C++. This ensures that every function template that takes iterators works as well with regular pointers. This document defines six categories of iterators, according to the operations defined on them: input iterators, output iterators, forward iterators, bidirectional iterators, random access iterators, and contiguous iterators, as shown in Table 86.

Table 86: Relations among iterator categories

<table>
<thead>
<tr>
<th>Contiguous</th>
<th>Random Access</th>
<th>Bidirectional</th>
<th>Forward</th>
<th>Input</th>
<th>Output</th>
</tr>
</thead>
</table>

The six categories of iterators correspond to the iterator concepts

1. input_iterator (25.3.4.9),
2. output_iterator (25.3.4.10),
3. forward_iterator (25.3.4.11),
4. bidirectional_iterator (25.3.4.12),
5. random_access_iterator (25.3.4.13), and
6. contiguous_iterator (25.3.4.14), respectively. The generic term iterator refers to any type that models the input_or_output_iterator concept (25.3.4.6).

Forward iterators meet all the requirements of input iterators and can be used whenever an input iterator is specified; Bidirectional iterators also meet all the requirements of forward iterators and can be used whenever a forward iterator is specified; Random access iterators also meet all the requirements of bidirectional iterators and can be used whenever a bidirectional iterator is specified; Contiguous iterators also meet all the requirements of random access iterators and can be used whenever a random access iterator is specified.

Iterators that further meet the requirements of output iterators are called mutable iterators. Nonmutable iterators are referred to as constant iterators.

In addition to the requirements in this subclause, the nested typedef-names specified in 25.3.2.3 shall be provided for the iterator type.

Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a past-the-end value. Values of an iterator \( i \) for which the expression \(*i\) is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the Cpp17DefaultConstructible requirements, using a value-initialized iterator as the source of a copy or move operation.

Just as a regular pointer to an array guarantees that there is a pointer value pointing past the last element of the array, so for any iterator type there is an iterator value that points past the last element of a corresponding sequence. Such a value is called a past-the-end value. Values of an iterator \( i \) for which the expression \(*i\) is defined are called dereferenceable. The library never assumes that past-the-end values are dereferenceable. Iterators can also have singular values that are not associated with any sequence. Results of most expressions are undefined for singular values; the only exceptions are destroying an iterator that holds a singular value, the assignment of a non-singular value to an iterator that holds a singular value, and, for iterators that meet the Cpp17DefaultConstructible requirements, using a value-initialized iterator as the source of a copy or move operation.

Most of the library’s algorithmic templates that operate on data structures have interfaces that use ranges. A range is an iterator and a sentinel that designate the beginning and end of the computation, or an iterator
and a count that designate the beginning and the number of elements to which the computation is to be applied.\textsuperscript{217}

9 An iterator and a sentinel denoting a range are comparable. A range \([i, s]\) is empty if \(i == s\); otherwise, \([i, s]\) refers to the elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the first iterator \(j\) such that \(j == s\).

10 A sentinel \(s\) is called \textit{reachable from} an iterator \(i\) if and only if there is a finite sequence of applications of the expression \(\texttt{++i}\) that makes \(i == s\). If \(s\) is reachable from \(i\), \([i, s]\) denotes a \textit{valid range}.

11 A \textit{counted range} \(i + [0, n]\) is empty if \(n == 0\); otherwise, \(i + [0, n]\) refers to the \(n\) elements in the data structure starting with the element pointed to by \(i\) and up to but not including the element, if any, pointed to by the result of \(n\) applications of \(\texttt{++i}\). A counted range \(i + [0, n]\) is \textit{valid} if and only if \(n == 0\); or \(n\) is positive, \(i\) is dereferenceable, and \(\texttt{++i + [0, --n]}\) is valid.

12 The result of the application of library functions to invalid ranges is undefined.

13 All the categories of iterators require only those functions that are realizable for a given category in constant time (amortized). Therefore, requirement tables and concept definitions for the iterators do not specify complexity.

14 Destruction of a non-forward iterator may invalidate pointers and references previously obtained from that iterator.

15 An \textit{invalid iterator} is an iterator that may be singular.\textsuperscript{218}

16 Iterators are called \textit{constexpr iterators} if all operations provided to meet iterator category requirements are constexpr functions.

[Note 3: For example, the types “pointer to \texttt{int}” and \texttt{reverse_iterator<int*>} are constexpr iterators. — end note]

\section*{25.3.2 Associated types [iterator.assoc.types]}
\subsection*{25.3.2.1 Incrementable traits [incrementable.traits]}

1 To implement algorithms only in terms of incrementable types, it is often necessary to determine the difference type that corresponds to a particular incrementable type. Accordingly, it is required that if \(WI\) is the name of a type that models the \texttt{weakly_incrementable} concept (25.3.4.4), the type

\begin{verbatim}
    iter_difference_t<WI>
\end{verbatim}

be defined as the incrementable type’s difference type.

\begin{verbatim}
namespace std {
    template<class T> struct incrementable_traits { };

    template<class T>
    requires is_object_v<T>
    struct incrementable_traits<T*> {
        using difference_type = ptrdiff_t;
    };

    template<class I>
    struct incrementable_traits<const I>
    : incrementable_traits<I> { };

    template<class T>
    requires requires { typename T::difference_type; }
    struct incrementable_traits<T> {
        using difference_type = typename T::difference_type;
    };

    template<class T>
    requires (!requires { typename T::difference_type; } & &
\end{verbatim}

\textsuperscript{217} The sentinel denoting the end of a range can have the same type as the iterator denoting the beginning of the range, or a different type.

\textsuperscript{218} This definition applies to pointers, since pointers are iterators. The effect of dereferencing an iterator that has been invalidated is undefined.
requires(const T& a, const T& b) { { a - b } -> integral; })
struct incrementable_traits<T> {
    using difference_type = make_signed_t<decltype(declval<T>() - declval<T>())>;
};

template<class T>
using iter_difference_t = see below;

Let \( R_I \) be remove_cvref_t<I>. The type \( \text{iter\_difference\_t}<I> \) denotes

\[ \begin{align*}
(2.1) & \quad \text{incrementable_traits}<R_I>::\text{difference\_type} \quad \text{if} \quad \text{iterator\_traits}<R_I> \quad \text{names a specialization generated from the primary template, and} \\
(2.2) & \quad \text{iterator\_traits}<R_I>::\text{difference\_type} \quad \text{otherwise.}
\end{align*} \]

Users may specialize \text{incrementable\_traits} on program-defined types.

25.3.2.2 Indirectly readable traits

To implement algorithms only in terms of indirectly readable types, it is often necessary to determine the value type that corresponds to a particular indirectly readable type. Accordingly, it is required that if \( R \) is the name of a type that models the \text{indirectly\_readable} concept (25.3.4.2), the type

\[
\text{iter\_value\_t}<R>
\]
be defined as the indirectly readable type's value type.

\[
\begin{align*}
\text{template<class> struct cond\_value\_type} & \quad \{ \}; & \text{[exposition only]} \\
\text{template<class T}} & \quad \text{requires is\_object\_v<T>}} \\
& \quad \text{struct cond\_value\_type<T>} & \quad \{ \}
\end{align*}
\]

\[
\text{template<class T}} & \quad \text{concept has\_member\_value\_type} = \text{requires} & \quad \{ \text{typename T::value\_type}; \}; & \text{[exposition only]} \\
\text{template<class T}} & \quad \text{concept has\_member\_element\_type} = \text{requires} & \quad \{ \text{typename T::element\_type}; \}; & \text{[exposition only]}
\]

\[
\text{template<class> struct indirectly\_readable\_traits} & \quad \{ \};
\]

\[
\text{template<class T}} & \quad \text{struct indirectly\_readable\_traits<T*>>} & \quad : \text{cond\_value\_type<T>} & \quad \{ \};
\]

\[
\text{template<class I}} & \quad \text{requires is\_array\_v<I>}} \\
& \quad \text{struct indirectly\_readable\_traits<I>>} & \quad \{ \}
\]

\[
\text{template<class I}} & \quad \text{struct indirectly\_readable\_traits<const I>}} & \quad : \text{indirectly\_readable\_traits<I>}} & \quad \{ \};
\]

\[
\text{template<has\_member\_value\_type T}} & \quad \text{struct indirectly\_readable\_traits<T>}} & \quad : \text{cond\_value\_type<typename T::value\_type>}} & \quad \{ \};
\]

\[
\text{template<has\_member\_element\_type T}} & \quad \text{struct indirectly\_readable\_traits<T>}} & \quad : \text{cond\_value\_type<typename T::element\_type>}} & \quad \{ \};
\]

\[
\text{template<has\_member\_value\_type T}} & \quad \text{requires has\_member\_element\_type<T>}} \\
& \quad \text{struct indirectly\_readable\_traits<T>}} & \quad \{ \};
\]
2 Let $R_1$ be \texttt{remove_cvref_t\langle I\rangle}. The type \texttt{iter_value_t\langle I\rangle} denotes

\[ \text{indirectly_readable_traits}<R_1>::\text{value_type} \]

if \texttt{iterator_traits}<\texttt{R}_1> names a specialization generated from the primary template, and

\[ \text{iterator_traits}<R_1>::\text{value_type} \]

otherwise.

Class template \texttt{indirectly_readable_traits} may be specialized on program-defined types.

\[ \text{Note 1}: \text{Some legacy output iterators define a nested type named} \text{ value_type that is an alias for} \text{ void. These types are not indirectly readable and have no associated value types.} \quad \text{end note} \]

\[ \text{Note 2}: \text{Smart pointers like} \texttt{shared_ptr<int>} \text{are indirectly readable and have an associated value type, but a smart pointer like} \texttt{shared_ptr<void>} \text{is not indirectly readable and has no associated value type.} \quad \text{end note} \]

25.3.2.3 \textbf{Iterator traits} \quad [\text{iterator.traits}]

To implement algorithms only in terms of iterators, it is sometimes necessary to determine the iterator category that corresponds to a particular iterator type. Accordingly, it is required that if $I$ is the type of an iterator, the type

\[ \text{iterator_traits}\langle I\rangle::\text{iterator_category} \]

be defined as the iterator’s iterator category. In addition, the types

\[ \text{iterator_traits}\langle I\rangle::\text{pointer} \]
\[ \text{iterator_traits}\langle I\rangle::\text{reference} \]

shall be defined as the iterator’s pointer and reference types: that is, for an iterator object $a$ of class type, the same type as $\text{decltype}(a\text{\textunderscore\text{operator\text{\textunderscore}\text{\textasciitilde\text{operator\textunderscore}\text{\textasciitilde}\text{\textasciitilde}}}())$ and $\text{decltype}(\ast a)$, respectively. The type $\text{iterator\textunderscore traits}\langle I\rangle::\text{pointer}$ shall be void for an iterator of class type $I$ that does not support $\text{operator\textunderscore\text{\textasciitilde\text{operator\textunderscore\text{\textasciitilde}\text{\textasciitilde}}}()$. Additionally, in the case of an output iterator, the types

\[ \text{iterator_traits}\langle I\rangle::\text{value_type} \]
\[ \text{iterator_traits}\langle I\rangle::\text{difference_type} \]
\[ \text{iterator_traits}\langle I\rangle::\text{reference} \]

may be defined as void.

2 The definitions in this subclause make use of the following exposition-only concepts:

```
template<class I>
concept cpp17\textunderscore\texttt{input\textunderscore\texttt{iterator}} =
   requires(I i) {
   \{ *i \} -> can\text{-}reference;
   \{ ++i \} -> same\text{\textasciitilde}as\langle I\&\rangle;
   \{ *i++ \} -> can\text{-}reference;
   } & copyable\langle I\rangle;
```

```
template<class I>
concept cpp17\textunderscore\texttt{input\textunderscore\texttt{iterator}}
   &\& equality\text{\textasciitilde}comparable\langle I\rangle &\& requires(I i) {
   \text{typename}\ \text{incrementable\textunderscore traits}\langle I\rangle::\text{difference\textunderscore type};
   \text{typename}\ \text{indirectly\textunderscore readable\textunderscore traits}\langle I\rangle::\text{value\textunderscore type};
   \text{typename}\ \text{common\textunderscore reference\textunderscore traits}\langle I\rangle::\text{reference\textunderscore traits}\langle I\rangle &\&,
   \text{typename}\ \text{indirectly\textunderscore readable\textunderscore traits}\langle I\rangle::\text{value\textunderscore type&};
   \text{typename}\ \text{common\textunderscore reference\textunderscore traits}\langle I\rangle::\text{difference\textunderscore type};
   \text{typename}\ \text{indirectly\textunderscore readable\textunderscore traits}\langle I\rangle::\text{value\textunderscore type&};
   \text{requires}\ \text{signed\textunderscore integral}\langle \text{typename}\ \text{incrementable\textunderscore traits}\langle I\rangle::\text{difference\textunderscore type}\rangle;
   
   \}
```
template<class I>
concept cpp17-forward-iterator =
    cpp17-input_iterator<I> && constructible_from<I> &&
    is_reference_v<iter_reference_t<I>> &&
    same_as<remove_cvref_t<iter_reference_t<I>>,
    typename indirectly_readable_traits<I>::value_type> &&
    requires(I i) {
    { i++ } -> convertible_to<const I&>;
    { *i++ } -> same_as<iter_reference_t<I>>;
    };

template<class I>
concept cpp17-bidirectional-iterator =
    cpp17-forward_iterator<I> && requires(I i) {
    { --i } -> same_as<I&>;
    { i-- } -> convertible_to<const I&>;
    { *i-- } -> same_as<iter_reference_t<I>>;
    };

template<class I>
concept cpp17-random-access-iterator =
    cpp17-bidirectional_iterator<I> && totally_ordered<I> &&
    requires(I i, typename incrementable_traits<I>::difference_type n) {
    { i += n } -> same_as<I&>;
    { i -= n } -> same_as<I&>;
    { i + n } -> same_as<I&>;
    { n + i } -> same_as<I>;
    { i - n } -> same_as<I>;
    { i[ ] } -> same_as<decltype(n)>;
    { i[n] } -> convertible_to<iter_reference_t<I>>;
    };

3 The members of a specialization iterator_traits<I> generated from the iterator_traits primary template are computed as follows:

(3.1) — If I has valid (13.10.3) member types difference_type, value_type, reference, and iterator_category, then iterator_traits<I> has the following publicly accessible members:

    using iterator_category = typename I::iterator_category;
    using value_type = typename I::value_type;
    using difference_type = typename I::difference_type;
    using pointer = see below;
    using reference = see below;

    If the qualified-id I::pointer is valid and denotes a type, then iterator_traits<I>::pointer names that type; otherwise, it names void.

(3.2) — Otherwise, if I satisfies the exposition-only concept cpp17-input_iterator, iterator_traits<I> has the following publicly accessible members:

    using iterator_category = see below;
    using value_type = typename indirectly_readable_traits<I>::value_type;
    using difference_type = typename incrementable_traits<I>::difference_type;
    using pointer = see below;
    using reference = see below;

(3.2.1) — If the qualified-id I::pointer is valid and denotes a type, pointer names that type. Otherwise, if decltype(declval<I&>().operator->()) is well-formed, then pointer names that type. Otherwise, pointer names void.

(3.2.2) — If the qualified-id I::reference is valid and denotes a type, reference names that type. Otherwise, reference names iter_reference_t<I>.

(3.2.3) — If the qualified-id I::iterator_category is valid and denotes a type, iterator_category names that type. Otherwise, iterator_category names:

(3.2.3.1) random_access_iterator_tag if I satisfies cpp17-random-access_iterator, or otherwise

(3.2.3.2) bidirectional_iterator_tag if I satisfies cpp17-bidirectional_iterator, or otherwise
(3.2.3.3) — forward_iterator_tag if I satisfies cpp17-forward-iterator, or otherwise

(3.2.3.4) — input_iterator_tag.

(3.3) — Otherwise, if I satisfies the exposition-only concept cpp17-iterator, then iterator_traits<I> has the following publicly accessible members:

```cpp
using iterator_category = output_iterator_tag;
using value_type = void;
using difference_type = see below;
using pointer = void;
using reference = void;
```

If the qualified-id incrementable_traits<I>::difference_type is valid and denotes a type, then difference_type names that type; otherwise, it names void.

(3.4) — Otherwise, iterator_traits<I> has no members by any of the above names.

4 Explicit or partial specializations of iterator_traits may have a member type iterator_concept that is used to indicate conformance to the iterator concepts (25.3.4).

[Example 1: To indicate conformance to the input_iterator concept but a lack of conformance to the Cpp17InputIterator requirements (25.3.5.3), an iterator_traits specialization might have iterator_concept denote input_iterator_tag but not define iterator_category. — end example]

5 iterator_traits is specialized for pointers as

```cpp
namespace std {
    template<class T>
    requires is_object_v<T>
    struct iterator_traits<T*> {
        using iterator_concept = contiguous_iterator_tag;
        using iterator_category = random_access_iterator_tag;
        using value_type = remove_cv_t<T>;
        using difference_type = ptrdiff_t;
        using pointer = T*;
        using reference = T&;
    }
}
```

6 [Example 2: To implement a generic reverse function, a C++ program can do the following:

```cpp
template<class BI>
void reverse(BI first, BI last) {
    typename iterator_traits<BI>::difference_type n =
        distance(first, last);
    --n;
    while(n > 0) {
        typename iterator_traits<BI>::value_type
            tmp = *first;
        *first++ = *--last;
        *last = tmp;
        n -= 2;
    }
}
```

— end example]

25.3.3 Customization point objects [iterator.cust]

25.3.3.1 ranges::iter_move [iterator.cust.move]

1 The name ranges::iter_move denotes a customization point object (16.3.3.3.5). The expression ranges::iter_move(E) for a subexpression E is expression-equivalent to:

```
(1.1) — iter_move(E), if E has class or enumeration type and iter_move(E) is a well-formed expression when treated as an unevaluated operand, where the meaning of iter_move is established as-if by performing argument-dependent lookup only (6.5.4).
```

(1.2) — Otherwise, if the expression *E is well-formed:

```
(1.2.1) — if *E is an lvalue, std::move(*E);
```
25.3.3.2 ranges::iter_swap

The name ranges::iter_swap denotes a customization point object (16.3.3.3.5) that exchanges the values (18.4.9) denoted by its arguments.

Let iter-exchange-move be the exposition-only function:

```cpp
template<class X, class Y>
constexpr iter_value_t<X> iter-exchange-move(X&& x, Y&& y)
    noexcept(noexcept(iter_value_t<X>(iter_move(x))) &&
    noexcept(*x = iter_move(y)));
```

2 The expression ranges::iter_swap(E1, E2) for subexpressions E1 and E2 is expression-equivalent to:

(4.1) — (void)iter_swap(E1, E2), if either E1 or E2 has class or enumeration type and iter_swap(E1, E2) is a well-formed expression with overload resolution performed in a context that includes the declaration

```cpp
```template<class I1, class I2>
void iter_swap(I1, I2) = delete;
```
and does not include a declaration of ranges::iter_swap. If the function selected by overload resolution does not exchange the values denoted by E1 and E2, the program is ill-formed, no diagnostic required.

[Note 1: This precludes calling unconstrained std::iter_swap. When the deleted overload is viable, program-defined overloads need to be more specialized (13.7.7.3) to be selected. — end note]

(4.2) — Otherwise, if the types of E1 and E2 each model indirectly_readable, and if the reference types of E1 and E2 model swappable_with (18.4.9), then ranges::swap(*E1, *E2).

(4.3) — Otherwise, if the types T1 and T2 of E1 and E2 model indirectly_movable_storable<T1, T2> and indirectly_movable_storable<T2, T1>, then (void)(*E1 = iter-exchange-move(E2, E1)), except that E1 is evaluated only once.

(4.4) — Otherwise, ranges::iter_swap(E1, E2) is ill-formed.

[Note 2: This case can result in substitution failure when ranges::iter_swap(E1, E2) appears in the immediate context of a template instantiation. — end note]
Example 1:
```cpp
struct I {
    using value_type = int;
    using difference_type = int;

    int operator*() const;
    I& operator++();
    I operator++(int);
    I& operator--();
    I operator--(int);

    bool operator==(I) const;
};
```

iterator_traits<I>::iterator_category denotes input_iterator_tag, and ITER_CONCEPT(I) denotes random_access_iterator_tag. — end example

25.3.4.2 Concept indirectly_readable

Types that are indirectly readable by applying operator* model the indirectly_readable concept, including pointers, smart pointers, and iterators.

```cpp
template<class In>
concepts indirectly_readable_impl =
    requires(const In in) {
        typename iter_value_t<In>;
        typename iter_reference_t<In>;
        typename iter_rvalue_reference_t<In>;
        { *in } -> same_as<iter_reference_t<In>>;
        { ranges::iter_move(in) } -> same_as<iter_rvalue_reference_t<In>>;
    } &&
    common_reference_with<iter_reference_t<In>&, iter_value_t<In>&> &&
    common_reference_with<iter_reference_t<In>&, iter_rvalue_reference_t<In>&> &&
    common_reference_with<iter_rvalue_reference_t<In>&, const iter_value_t<In>&>;
```

```cpp
template<class In>
concepts indirectly_readable =
    indirectly_readable_impl<remove_cvref_t<In>>;
```

Given a value i of type I, I models indirectly_readable only if the expression *i is equality-preserving.

25.3.4.3 Concept indirectly_writable

The indirectly_writable concept specifies the requirements for writing a value into an iterator’s referenced object.

```cpp
template<class Out, class T>
concepts indirectly_writable =
    requires(Out&& o, T&& t) {
        *o = std::forward<T>(t); // not required to be equality-preserving
        *std::forward<Out>(o) = std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*o) =
            std::forward<T>(t); // not required to be equality-preserving
        const_cast<const iter_reference_t<Out>&&>(*std::forward<Out>(o)) =
            std::forward<T>(t); // not required to be equality-preserving
    };
```

Let E be an expression such that decltype((E)) is T, and let o be a dereferenceable object of type Out. Out and T model indirectly_writable<Out, T> only if

2.1 — If Out and T model indirectly_readable<Out> && same_as<iter_value_t<Out>, decay_t<T>>, then *o after any above assignment is equal to the value of E before the assignment.

After evaluating any above assignment expression, o is not required to be dereferenceable.

If E is an xvalue (7.2.1), the resulting state of the object it denotes is valid but unspecified (16.4.6.15).

[Note 1: The only valid use of an operator* is on the left side of the assignment statement. Assignment through the same value of the indirectly writable type happens only once. — end note]
The range of representable values of an integer-class type is the continuous set of values over which it is defined. For any integer-class type, its range of representable values is either $-2^{N-1}$ to $2^{N-1} - 1$ (inclusive) for some integer $N$, in which case it is a signed-integer-class type, or 0 to $2^N - 1$ (inclusive) for some integer $N$, in which case it is an unsigned-integer-class type. In both cases, $N$ is called the width of the integer-class type. The width of an integer-class type is greater than that of every integral type of the same signedness.

A type $I$ other than cv bool is integer-like if it models integral$I$ or if it is an integer-class type. An integer-like type $I$ is signed-integer-like if it models signed_integral$I$ or if it is a signed-integer-class type. An integer-like type $I$ is unsigned-integer-like if it models unsigned_integral$I$ or if it is an unsigned-integer-class type.

For every integer-class type $I$, let $B(I)$ be a unique hypothetical extended integer type of the same signedness with the same width (6.8.2) as $I$.

Expressions of integer-class type are explicitly convertible to any integer-like type, and implicitly convertible to any integer-class type of equal or greater width and the same signedness. Expressions of integral type are both implicitly and explicitly convertible to any integer-class type. Conversions between integral and integer-class types and between two integer-class types do not exit via an exception. The result of such a conversion is the unique value of the destination type that is congruent to the source modulo $2^N$, where $N$ is the width of the destination type.

Let $a$ be an object of integer-class type $I$, let $b$ be an object of integer-like type $I2$ such that the expression $b$ is implicitly convertible to $I$, let $x$ and $y$ be, respectively, objects of type $B(I)$ and $B(I2)$ as described above that represent the same values as $a$ and $b$, and let $c$ be an lvalue of any integral type.

1. The expressions $a++$ and $a--$ shall be prvalues of type $I$ whose values are equal to that of $a$ prior to the evaluation of the expressions. The expression $a++$ shall modify the value of $a$ by adding 1 to it. The expression $a--$ shall modify the value of $a$ by subtracting 1 from it.

2. The expressions $++a$, $--a$, and $&a$ shall be expression-equivalent to $a += 1$, $a -= 1$, and $\text{addressof}(a)$, respectively.
For every unary-operator \( \oplus \) other than \& for which the expression \( \oplus x \) is well-formed, \( \oplus a \) shall also be well-formed and have the same value, effects, and value category as \( \oplus x \). If \( \oplus x \) has type bool, so too does \( \oplus a \); if \( \oplus x \) has type B(I), then \( \oplus a \) has type I.

For every assignment operator \( \oplus \) for which \( c \oplus x \) is well-formed, \( c \oplus a \) shall also be well-formed and shall have the same value and effects as \( c \oplus x \). The expression \( c \oplus a \) shall be an lvalue referring to \( c \).

For every assignment operator \( \oplus \) for which \( x \oplus y \) is well-formed, \( a \oplus b \) shall also be well-formed and shall have the same effects as \( x \oplus y \), except that the value that would be stored into \( x \) is stored into \( a \). The expression \( a \oplus b \) shall be an lvalue referring to \( a \).

For every non-assignment binary operator \( \oplus \) for which \( x \oplus y \) and \( y \oplus x \) are well-formed, \( a \oplus b \) and \( b \oplus a \) shall also be well-formed and shall have the same value, effects, and value category as \( x \oplus y \) and \( y \oplus x \), respectively. If \( x \oplus y \) or \( y \oplus x \) has type B(I), then \( a \oplus b \) or \( b \oplus a \), respectively, has type I; if \( x \oplus y \) or \( y \oplus x \) has type I2; if \( x \oplus y \) or \( y \oplus x \) has any other type, then \( a \oplus b \) or \( b \oplus a \), respectively, has that type.

An expression \( E \) of integer-class type \( I \) is contextually convertible to bool as if by bool(E != I(0)).

All integer-class types model regular (18.6) and three_way_comparable<strong_ordering> (17.11.4).

A value-initialized object of integer-class type has value 0.

For every (possibly cv-qualified) integer-class type \( I \), numeric_limits<\( I \)> is specialized such that each static data member \( m \) has the same value as numeric_limits<B(I)>::m, and each static member function \( f \) returns I(numeric_limits<B(\( I \))>::f()).

For any two integer-like types \( I1 \) and \( I2 \), at least one of which is an integer-class type, common_type_t<\( I1, I2 \)> denotes an integer-class type whose width is not less than that of \( I1 \) or \( I2 \). If both \( I1 \) and \( I2 \) are signed-integer-like types, then common_type_t<\( I1, I2 \)> is also a signed-integer-like type.

is_integer_like<\( I \)> is true if and only if \( I \) is an integer-like type. is_signed_integer_like<\( I \)> is true if and only if \( I \) is a signed-integer-like type.

Let \( i \) be an object of type \( I \). When \( i \) is in the domain of both pre- and post-increment, \( i \) is said to be incrementable. \( I \) models weakly_incrementable<\( I \)> only if

- The expressions ++\( i \) and i++ have the same domain.
- If \( i \) is incrementable, then both ++\( i \) and i++ advance \( i \) to the next element.
- If \( i \) is incrementable, then addressof(++\( i \)) is equal to addressof(i).

Recommended practice: The implementation of an algorithm on a weakly incrementable type should never attempt to pass through the same incrementable value twice; such an algorithm should be a single-pass algorithm.

[Note 3: For weakly_incrementable types, a equals b does not imply that ++a equals ++b. (Equality does not guarantee the substitution property or referential transparency.) Such algorithms can be used with istreams as the source of the input data through the istream_iterator class template. — end note]

25.3.4.5 Concept incrementable

The incrementable concept specifies requirements on types that can be incremented with the pre- and post-increment operators. The increment operations are required to be equality-preserving, and the type is required to be equality_comparable.

[Note 1: This supersedes the annotations on the increment expressions in the definition of weakly_incrementable. — end note]

```cpp
template<class I>
concept incrementable =
  regular<I> &&
  weakly_incrementable<I> &&
  requires(I i) {
    { i++ } -> same_as<I>;
  };
```

Let \( a \) and \( b \) be incrementable objects of type \( I \). \( I \) models incrementable only if

- If \( \text{bool}(a == b) \) then \( \text{bool}(a++ == b) \).
If `bool(a == b)` then `bool(((void)a++, a) == ++b)`.

[Note 2: The requirement that `a` equals `b` implies `++a` equals `++b` (which is not true for weakly incrementable types) allows the use of multi-pass one-directional algorithms with types that model `incrementable`. — end note]

### 25.3.4.6 Concept `input_or_output_iterator` [iterator.concept.iterator]

The `input_or_output_iterator` concept forms the basis of the iterator concept taxonomy; every iterator models `input_or_output_iterator`. This concept specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to compare iterators with sentinels (25.3.4.7), to read (25.3.4.9) or write (25.3.4.10) values, or to provide a richer set of iterator movements (25.3.4.11, 25.3.4.12, 25.3.4.13).

```cpp
template<class I>
concept input_or_output_iterator =
  requires(I i) {
    {*i} -> can-reference;
  } &&
  weakly_incrementable<I>;
```

[Note 1: Unlike the Cpp17Iterator requirements, the `input_or_output_iterator` concept does not require copyability. — end note]

### 25.3.4.7 Concept `sentinel_for` [iterator.concept.sentinel]

The `sentinel_for` concept specifies the relationship between an `input_or_output_iterator` type and a `semiregular` type whose values denote a range.

```cpp
template<class S, class I>
concept sentinel_for =
  semiregular<S> &&
  input_or_output_iterator<I> &&
  weakly-equality-comparable-with<S, I>; // see 18.5.4
```

Let `s` and `i` be values of type `S` and `I` such that `[i, s)` denotes a range. Types `S` and `I` model `sentinel_for<S, I>` only if

1. `i == s` is well-defined.
2. `i != s` is dereferenceable and `[++i, s)` denotes a range.
3. `assignable_from<I&, S>` is either modeled or not satisfied.

The domain of `==` is not static. Given an iterator `i` and sentinel `s` such that `[i, s)` denotes a range and `i != s`, `i` and `s` are not required to continue to denote a range after incrementing any other iterator equal to `i`. Consequently, `i == s` is no longer required to be well-defined.

### 25.3.4.8 Concept `sized_sentinel_for` [iterator.concept.sizedsentinel]

The `sized_sentinel_for` concept specifies requirements on an `input_or_output_iterator` type `I` and a corresponding `sentinel_for<I>` that allow the use of the `=` operator to compute the distance between them in constant time.

```cpp
template<class S, class I>
concept sized_sentinel_for =
  sentinel_for<S, I> &&
  !disable_sized_sentinel_for<remove_cv_t<S>, remove_cv_t<I>> &&
  requires(const I& i, const S& s) {
    { s - i } -> same_as<iter_difference_t<I>>;
    { i - s } -> same_as<iter_difference_t<I>>;
  };
```

Let `i` be an iterator of type `I`, and `s` a sentinel of type `S` such that `[i, s)` denotes a range. Let `N` be the smallest number of applications of `++i` necessary to make `bool(i == s)` be `true`. `S` and `I` model `sized_sentinel_for<S, I>` only if

1. `N` is representable by `iter_difference_t<I>`, then `s - i` is well-defined and equals `N`.
2. `− N` is representable by `iter_difference_t<I>`, then `i - s` is well-defined and equals `− N`.

§ 25.3.4.8 1069
template<class S, class I>
constexpr bool disable_sized_sentinel_for = false;

Remarks: Pursuant to 16.4.5.2.1, users may specialize disable_sized_sentinel_for for cv-unqualified non-array object types S and I if S and/or I is a program-defined type. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

[Note 1: disable_sized_sentinel_for allows use of sentinels and iterators with the library that satisfy but do not in fact model sized_sentinel_for. — end note]

[Example 1: The sized_sentinel_for concept is modeled by pairs of random_access_iterators (25.3.4.13) and by counted iterators and their sentinels (25.5.7.1). — end example]

25.3.4.9 Concept input_iterator

The input_iterator concept defines requirements for a type whose referenced values can be read (from the requirement for indirectly_readable (25.3.4.2)) and which can be both pre- and post-incremented. [Note 1: Unlike the Cpp17InputIterator requirements (25.3.5.3), the input_iterator concept does not need equality comparison since iterators are typically compared to sentinels. — end note]

template<class I>
concept input_iterator =
    input_or_output_iterator<I> &&
    indirectly_readable<I> &&
    requires { typename ITER_CONCEPT(I); } &&
    derived_from<ITER_CONCEPT(I), input_iterator_tag>;

25.3.4.10 Concept output_iterator

The output_iterator concept defines requirements for a type that can be used to write values (from the requirement for indirectly_writable (25.3.4.3)) and which can be both pre- and post-incremented. [Note 1: Output iterators are not required to model equality_comparable. — end note]

template<class I, class T>
concept output_iterator =
    input_or_output_iterator<I> &&
    indirectly_writable<I, T> &&
    requires(I i, T&& t) {
        *i++ = std::forward<T>(t);  // not required to be equality-preserving
    };

2 Let E be an expression such that decltype((E)) is T, and let i be a dereferenceable object of type I. I and T model output_iterator<I, T> only if *i++ = E; has effects equivalent to:

    *i = E;
    ++i;

3 Recommended practice: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

25.3.4.11 Concept forward_iterator

The forward_iterator concept adds copyability, equality comparison, and the multi-pass guarantee, specified below.

template<class I>
concept forward_iterator =
    input_iterator<I> &&
    derived_from<ITER_CONCEPT(I), forward_iterator_tag> &&
    incrementable<I> &&
    sentinel_for<I, I>;

2 The domain of == for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators of the same type may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]

3 Pointers and references obtained from a forward iterator into a range [i, s) shall remain valid while [i, s) continues to denote a range.

4 Two dereferenceable iterators a and b of type X offer the multi-pass guarantee if:
(4.1) \( a == b \) implies \( ++a == ++b \) and

(4.2) The expression \(((\text{void})[X x] \{ ++x; \}(a), *a)\) is equivalent to the expression \( *a \).

[Note 2: The requirement that \( a == b \) implies \( ++a == ++b \) and the removal of the restrictions on the number of assignments through a mutable iterator (which applies to output iterators) allow the use of multi-pass one-directional algorithms with forward iterators. — end note]

25.3.4.12 Concept bidirectional_iterator

The \texttt{bidirectional_iterator} concept adds the ability to move an iterator backward as well as forward.

```cpp
#include <iostream>

template<class I>
concept bidirectional_iterator =
    forward_iterator<I> &&
    derived_from<ITER_CONCEPT(I), bidirectional_iterator_tag> &&
    requires(I i) {
        { --i } -> same_as<I&>;
        { i-- } -> same_as<I>;
    };
```

1 A bidirectional iterator \( r \) is decrementable if and only if there exists some \( q \) such that \( ++q == r \). Decrementable iterators \( r \) shall be in the domain of the expressions \( --r \) and \( r-- \).

3 Let \( a \) and \( b \) be equal objects of type \( I \). \( I \) models \texttt{bidirectional_iterator} only if:

(3.1) If \( a \) and \( b \) are decrementable, then all of the following are true:

(3.1.1) \( \text{addressof}(--a) == \text{addressof}(a) \)

(3.1.2) \( \text{bool}(a-- == b) \)

(3.1.3) after evaluating both \( a-- \) and \( --b \), \( \text{bool}(a == b) \) is still true

(3.1.4) \( \text{bool}(++(--a) == b) \)

(3.2) If \( a \) and \( b \) are incrementable, then \( \text{bool}((-++a) == b) \).

25.3.4.13 Concept random_access_iterator

The \texttt{random_access_iterator} concept adds support for constant-time advancement with \( +=, +, -=, \) and \( - \), as well as the computation of distance in constant time with \( - \). Random access iterators also support array notation via subscripting.

```cpp
template<class I>
concept random_access_iterator =
    bidirectional_iterator<I> &&
    derived_from<ITER_CONCEPT(I), random_access_iterator_tag> &&
    totally_ordered<I> &&
    sized_sentinel_for<I, I> &&
    requires(I i, const I j, const iter_difference_t<I> n) {
        { i += n } -> same_as<I&>;
        { j + n } -> same_as<I>;
        { n + j } -> same_as<I>;
        { i -= n } -> same_as<I>;
        { j - n } -> same_as<I>;
        { j[n] } -> same_as<iter_reference_t<I>>;
    };
```

2 Let \( a \) and \( b \) be valid iterators of type \( I \) such that \( b \) is reachable from \( a \) after \( n \) applications of \( ++a \), let \( D \) be \texttt{iter_difference_t<I>} \( \), and let \( n \) denote a value of type \( D \). \( I \) models \texttt{random_access_iterator} only if

(2.1) \( (a += n) \) is equal to \( b \).

(2.2) \( \text{addressof}(a += n) \) is equal to \( \text{addressof}(a) \).

(2.3) \( (a + n) \) is equal to \( (a += n) \).

(2.4) For any two positive values \( x \) and \( y \) of type \( D \), if \( (a + D(x + y)) \) is valid, then \( (a + D(x + y)) \) is equal to \( ((a + x) + y) \).

(2.5) \( (a + D(0)) \) is equal to \( a \).

(2.6) If \( (a + D(n - 1)) \) is valid, then \( (a + n) \) is equal to \( [](I c) \{ return ++c; }(a + D(n - 1)) \).
(2.7) \((\text{b} += D(-n))\) is equal to \(a\).
(2.8) \((\text{b} -= n)\) is equal to \(a\).
(2.9) \(\text{addressof}(\text{b} -= n)\) is equal to \(\text{addressof}(\text{b})\).
(2.10) \((\text{b} - n)\) is equal to \((\text{b} -= n)\).
(2.11) If \(\text{b}\) is dereferenceable, then \(a[n]\) is valid and is equal to \(*\text{b}\).
(2.12) \(\text{bool}(a <= b)\) is true.

25.3.4.14 Concept contiguous_iterator

The contiguous_iterator concept provides a guarantee that the denoted elements are stored contiguously in memory.

```
template<class I>
concept contiguous_iterator =
    random_access_iterator<I> &&
    derived_from<ITER_CONCEPT(I), contiguous_iterator_tag> &&
    is_lvalue_reference_v<iter_reference_t<I>> &&
    same_as<iter_value_t<I>, remove_cvref_t<iter_reference_t<I>>> &&
    requires(const I& i) {
        to_address(i) -> same_as<add_pointer_t<iter_reference_t<I>>>;
    };
```

Let \(\text{a}\) and \(\text{b}\) be dereferenceable iterators and \(\text{c}\) be a non-dereferenceable iterator of type \(I\) such that \(\text{b}\) is reachable from \(\text{a}\) and \(\text{c}\) is reachable from \(\text{b}\), and let \(D\) be \(\text{iter_difference_t}<I>\). The type \(I\) models contiguous_iterator only if

- \(\text{to_address(a)} == \text{addressof(*a)}\),
- \(\text{to_address(b)} == \text{to_address(a)} + D(b - a)\),
- \(\text{to_address(c)} == \text{to_address(a)} + D(c - a)\),
- \(\text{ranges::iter_move(a)}\) has the same type, value category, and effects as \(\text{std::move(*a)}\), and
- \(\text{ranges::iter_swap(a, b)}\) is well-formed, it has effects equivalent to \(\text{ranges::swap(*a, *b)}\).

25.3.5 C++17 iterator requirements

25.3.5.1 General

In the following sections, \(a\) and \(b\) denote values of type \(X\) or const \(X\), \(n\) denotes a value of \(\text{difference_type}\), \(u\), \(tmp\), and \(m\) denote identifiers, \(r\) denotes a value of \(X\), \(t\) denotes a value of value type \(T\), and \(o\) denotes a value of some type that is writable to the output iterator.

[Note 1: For an iterator type \(X\) there must be an instantiation of \(\text{iterator_traits}<X>\) (25.3.2.3). — end note]

25.3.5.2 Cpp17Iterator

The Cpp17Iterator requirements form the basis of the iterator taxonomy; every iterator meets the Cpp17Iterator requirements. This set of requirements specifies operations for dereferencing and incrementing an iterator. Most algorithms will require additional operations to read (25.3.5.3) or write (25.3.5.4) values, or to provide a richer set of iterator movements (25.3.5.5, 25.3.5.6, 25.3.5.7).

2 A type \(X\) meets the Cpp17Iterator requirements if:

- \(X\) meets the Cpp17CopyConstructible, Cpp17CopyAssignable, Cpp17Swappable, and Cpp17Destructible requirements (16.4.4.2, 16.4.4.3), and
- \(\text{iterator_traits}<X>::\text{difference_type}\) is a signed integer type or void, and
- the expressions in Table 87 are valid and have the indicated semantics.

25.3.5.3 Input iterators

A class or pointer type \(X\) meets the requirements of an input iterator for the value type \(T\) if \(X\) meets the Cpp17Iterator (25.3.5.2) and Cpp17EqualityComparable (Table 29) requirements and the expressions in Table 88 are valid and have the indicated semantics.

In Table 88, the term the domain of \(==\) is used in the ordinary mathematical sense to denote the set of values over which \(==\) is (required to be) defined. This set can change over time. Each algorithm places additional
Table 87: *Cpp17Iterator* requirements [tab:iterator]

<table>
<thead>
<tr>

</tr>
<tr>
<td>++r</td>
<td>X&amp;</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

requirements on the domain of `==` for the iterator values it uses. These requirements can be inferred from the uses that algorithm makes of `==` and `!=`.

[Example 1: The call `find(a, b, x)` is defined only if the value of `a` has the property \( p \) defined as follows: `b` has property \( p \) and a value `i` has property \( p \) if \( \*i==x \) or if \( \*i!=x \text{ and } ++i \) has property \( p \). — end example]

Table 88: *Cpp17InputIterator* requirements (in addition to *Cpp17Iterator*) [tab:inputiterator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note pre-/post-condition</th>
</tr>
</thead>
<tbody>
<tr>
<td>a != b</td>
<td>decltype(a != b) models <code>boolean-test-able</code></td>
<td>!(a == b)</td>
<td>Preconditions: ((a, b)) is in the domain of <code>==</code>.</td>
</tr>
<tr>
<td>*a</td>
<td>reference, convertible to (T)</td>
<td></td>
<td>Preconditions: (a) is dereferenceable. The expression <code>(void)*a, *a</code> is equivalent to (*a). If (a == b) and ((a, b)) is in the domain of <code>==</code> then (*a) is equivalent to (*b).</td>
</tr>
<tr>
<td>a-&gt;m</td>
<td>((*a).m)</td>
<td></td>
<td>Preconditions: (a) is dereferenceable.</td>
</tr>
<tr>
<td>++r</td>
<td>X&amp;</td>
<td></td>
<td>Preconditions: (r) is dereferenceable. Postconditions: (r) is dereferenceable or (r) is past-the-end; any copies of the previous value of (r) are no longer required to be dereferenceable nor to be in the domain of <code>==</code>.</td>
</tr>
<tr>
<td><code>(void)r++</code></td>
<td>equivalent to <code>(void)++r</code></td>
<td></td>
<td></td>
</tr>
<tr>
<td>*r++</td>
<td>convertible to (T)</td>
<td>{ (T) tmp = *r; ++r; return tmp; }</td>
<td></td>
</tr>
</tbody>
</table>

3 Recommended practice: The implementation of an algorithm on input iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single pass algorithm.
[Note 1: For input iterators, \(a == b\) does not imply \(++a == ++b\). (Equality does not guarantee the substitution property or referential transparency.) Value type \(T\) is not required to be a \(Cpp17CopyAssignable\) type (Table 35). Such an algorithm can be used with istreams as the source of the input data through the \(istream\_iterator\) class template. — end note]

### 25.3.5.4 Output iterators

1 A class or pointer type \(X\) meets the requirements of an output iterator if \(X\) meets the \(Cpp17Iterator\) requirements (25.3.5.2) and the expressions in Table 89 are valid and have the indicated semantics.

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>(*r = o)</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incrementable.</td>
</tr>
<tr>
<td>(++r)</td>
<td>(X&amp;)</td>
<td>(\text{addressof}(r) == \text{addressof}(++r)). Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incrementable.</td>
<td></td>
</tr>
<tr>
<td>(r++)</td>
<td>convertible to (\text{const (X&amp;)}) ({ \ X \ tmp = r; \ + + r ; \ \text{return} \ tmp ; \ })</td>
<td>Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incrementable.</td>
<td></td>
</tr>
<tr>
<td>(*r++ = o)</td>
<td>result is not used</td>
<td></td>
<td>Remarks: After this operation (r) is not required to be dereferenceable. Postconditions: (r) is incrementable.</td>
</tr>
</tbody>
</table>

2 Recommended practice: The implementation of an algorithm on output iterators should never attempt to pass through the same iterator twice; such an algorithm should be a single-pass algorithm.

[Note 1: The only valid use of an \(\text{operator}\star\) is on the left side of the assignment statement. Assignment through the same value of the iterator happens only once. Equality and inequality are not necessarily defined. — end note]

### 25.3.5.5 Forward iterators

1 A class or pointer type \(X\) meets the requirements of a forward iterator if

- \(X\) meets the \(Cpp17InputIterator\) requirements (25.3.5.3),
- \(X\) meets the \(Cpp17DefaultConstructible\) requirements (16.4.4.2),
- if \(X\) is a mutable iterator, \(\text{reference}\) is a reference to \(T\); if \(X\) is a constant iterator, \(\text{reference}\) is a reference to \(\text{const \(T\)}\),
- the expressions in Table 90 are valid and have the indicated semantics, and
- objects of type \(X\) offer the multi-pass guarantee, described below.

2 The domain of \(==\) for forward iterators is that of iterators over the same underlying sequence. However, value-initialized iterators may be compared and shall compare equal to other value-initialized iterators of the same type.

[Note 1: Value-initialized iterators behave as if they refer past the end of the same empty sequence. — end note]
Two dereferenceable iterators a and b of type X offer the multi-pass guarantee if:

1. a == b implies ++a == ++b and
2. X is a pointer type or the expression (void)++X(a), *a is equivalent to the expression *a.

[Note 2: The requirement that a == b implies ++a == ++b (which is not true for input and output iterators) and the removal of the restrictions on the number of the assignments through a mutable iterator (which applies to output iterators) allows the use of multi-pass one-directional algorithms with forward iterators. — end note]

Table 90: Cpp17ForwardIterator requirements (in addition to Cpp17InputIterator) [tab:forwarditerator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>
</tr>
</thead>
<tbody>
<tr>
<td>r++</td>
<td>convertible to</td>
<td>{ X tmp = r; const X&amp; ++r; return tmp; }</td>
<td></td>
</tr>
<tr>
<td>*r++</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

If a and b are equal, then either a and b are both dereferenceable or else neither is dereferenceable.

If a and b are both dereferenceable, then a == b if and only if *a and *b are bound to the same object.

25.3.5.6 Bidirectional iterators [bidirectional.iterators]

1. A class or pointer type X meets the requirements of a bidirectional iterator if, in addition to meeting the Cpp17ForwardIterator requirements, the following expressions are valid as shown in Table 91.

Table 91: Cpp17BidirectionalIterator requirements (in addition to Cpp17ForwardIterator) [tab:bidirectionaliterator]

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
<th>Assertion/note</th>

</thead>
<tbody>
<tr>
<td>--r</td>
<td>X&amp;</td>
<td></td>
<td>Preconditions: there exists s such that r == ++s. Postconditions: r is dereferenceable. --(++r) == r. --r == --s implies r == s. addressof(r) == addressof(--r).</td>
</tr>
<tr>
<td>r--</td>
<td>convertible to</td>
<td>{ X tmp = r; const X&amp; --r; return tmp; }</td>
<td></td>
</tr>
<tr>
<td>*r--</td>
<td>reference</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

[Note 1: Bidirectional iterators allow algorithms to move iterators backward as well as forward. — end note]

25.3.5.7 Random access iterators [random.access.iterators]

1. A class or pointer type X meets the requirements of a random access iterator if, in addition to meeting the Cpp17BidirectionalIterator requirements, the following expressions are valid as shown in Table 92.

§ 25.3.5.7 1075
Table 92: Cpp17RandomAccessIterator requirements (in addition to Cpp17BidirectionalIterator)

</tbody>
</table>

25.3.6 Indirect callable requirements [indirectcallable]

25.3.6.1 General [indirectcallable.general]
1 There are several concepts that group requirements of algorithms that take callable objects (22.10.3) as arguments.

25.3.6.2 Indirect callables [indirectcallable.indirectinvocable]
1 The indirect callable concepts are used to constrain those algorithms that accept callable objects (22.10.3) as arguments.

namespace std {
    template<class F, class I>
    concept indirectly Unary invocable = indirectly readable<I> &&
            copy constructible<F> &&
}
invocable<F&, iter_value_t<I>&> &&
invocable<F&, iter_reference_t<I>>&
invocable<F&, iter_common_reference_t<I>>&
common_reference_with<
  invoke_result_t<F&, iter_value_t<I>&>,
  invoke_result_t<F&, iter_reference_t<I>>;}

25.3.6.3 Class template \texttt{projected} [projected]

Class template \texttt{projected} is used to constrain algorithms that accept callable objects and projections (3.44). It combines a \texttt{indirectly_readable} type \texttt{I} and a callable object type \texttt{Proj} into a new \texttt{indirectly_readable} type whose \texttt{reference} type is the result of applying \texttt{Proj} to the \texttt{iter\_reference\_t} of \texttt{I}.
namespace std {
    template<indirectly_readable I, indirectly_regular_unary_invocable<I> Proj>
    struct projected {
        using value_type = remove_cvref_t<indirect_result_t<Proj&, I>>;
        indirect_result_t<Proj&, I> operator*() const; // not defined
    };

template<weakly_incrementable I, class Proj>
struct incrementable_traits<projected<I, Proj>> {
    using difference_type = iter_difference_t<I>;
};
}

25.3.7 Common algorithm requirements
    [alg.req]

25.3.7.1 General
        [alg.req.general]
1 There are several additional iterator concepts that are commonly applied to families of algorithms. These
group together iterator requirements of algorithm families. There are three relational concepts that specify
how element values are transferred between indirectly_readable and indirectly_writable types: indirectly_movable, indirectly_copyable, and indirectly_swappable. There are three relational concepts for rearrangements: permutable, mergeable, and sortable. There is one relational concept for
comparing values from different sequences: indirectly_comparable.

2 [Note 1: The ranges::less function object type used in the concepts below imposes constraints on the concepts' arguments in addition to those that appear in the concepts' bodies (22.10.9). — end note]

25.3.7.2 Concept indirectly_movable
        [alg.req.ind.move]
1 The indirectly_movable concept specifies the relationship between a indirectly_readable type and a indirectly_writable type between which values may be moved.

    template<class In, class Out>
    concept indirectly_movable =
        indirectly_readable<In> &&
        indirectly_writable<Out, iter_rvalue_reference_t<In>>;

2 The indirectly_movable_storable concept augments indirectly_movable with additional requirements enabling the transfer to be performed through an intermediate object of the indirectly_readable type's value type.

    template<class In, class Out>
    concept indirectly_movable_storable =
        indirectly_movable<In, Out> &&
        indirectly_writable<Out, iter_reference_t<In>> &&
        movable<iter_value_t<In>> &&
        constructible_from<iter_value_t<In>, iter_rvalue_reference_t<In>> &&
        assignable_from<iter_value_t<In>&, iter_rvalue_reference_t<In>>;

3 Let i be a dereferenceable value of type In. In and Out model indirectly_movable_storable<In, Out> only if after the initialization of the object obj in

    iter_value_t<In> obj(ranges::iter_move(i));

obj is equal to the value previously denoted by *i. If iter_rvalue_reference_t<In> is an rvalue reference type, the resulting state of the value denoted by *i is valid but unspecified (16.4.6.15).

25.3.7.3 Concept indirectly_copyable
        [alg.req.ind.copy]
1 The indirectly_copyable concept specifies the relationship between a indirectly_readable type and a indirectly_writable type between which values may be copied.

    template<class In, class Out>
    concept indirectly_copyable =
        indirectly_readable<In> &&
        indirectly_writable<Out, iter_reference_t<In>>;

2 The indirectly_copyable_storable concept augments indirectly_copyable with additional requirements enabling the transfer to be performed through an intermediate object of the indirectly_readable type's value type. It also requires the capability to make copies of values.

§ 25.3.7.3 1078
template<class In, class Out>
concept indirectly_copyable_storable =
indirectly_copyable<In, Out> &&
indirectly_writable<Out, iter_value_t<In>> &&
indirectly_writable<Out, const iter_value_t<In>> &&
indirectly_writable<Out, iter_value_t<In> const> &&
indirectly_writable<Out, const iter_value_t<In> const> &&
copyable<iter_value_t<In>> &&
constructible_from<iter_value_t<In>, iter_reference_t<In> &&
assignable_from<iter_value_t<In>, iter_reference_t<In> &&

3 Let i be a dereferenceable value of type In. In and Out model indirectly_copyable_storable<In, Out> only if after the initialization of the object obj in

iter_value_t<In> obj(*i);

obj is equal to the value previously denoted by *i. If iter_reference_t<In> is an rvalue reference type, the resulting state of the value denoted by *i is valid but unspecified (16.4.6.15).

25.3.7.4 Concept indirectly_swappable [alg.req.ind.swap]

1 The indirectly_swappable concept specifies a swappable relationship between the values referenced by two indirectly_readable types.

template<class I1, class I2 = I1>
concept indirectly_swappable =
indirectly_readable<I1> && indirectly_readable<I2> &&
requires(const I1 i1, const I2 i2) {
    ranges::iter_swap(i1, i1);
    ranges::iter_swap(i2, i2);
    ranges::iter_swap(i1, i2);
    ranges::iter_swap(i2, i1);
};

25.3.7.5 Concept indirectly_comparable [alg.req.ind.cmp]

1 The indirectly_comparable concept specifies the common requirements of algorithms that compare values from two different sequences.

template<class I1, class I2, class R, class P1 = identity,
class P2 = identity>
concept indirectly_comparable =
indirect_binary_predicate<R, projected<I1, P1>, projected<I2, P2>>;

25.3.7.6 Concept permutable [alg.req.permutable]

1 The permutable concept specifies the common requirements of algorithms that reorder elements in place by moving or swapping them.

template<class I>
concept permutable =
forward_iterator<I> &&
indirectly_movable_storable<I, I> &&
indirectly_swappable<I, I>;

25.3.7.7 Concept mergeable [alg.req.mergeable]

1 The mergeable concept specifies the requirements of algorithms that merge sorted sequences into an output sequence by copying elements.

template<class I1, class I2, class Out, class R = ranges::less,
class P1 = identity, class P2 = identity>
concept mergeable =
input_iterator<I1> &&
input_iterator<I2> &&
weakly_incrementable<Out> &&
indirectly_copyable<I1, Out> &&
indirectly_copyable<I2, Out> &&
indirect_strict_weak_order<R, projected<I1, P1>, projected<I2, P2>>;

§ 25.3.7.7 1079
The `sortable` concept specifies the common requirements of algorithms that permute sequences into ordered sequences (e.g., `sort`).

```cpp
template<class I, class R = ranges::less, class P = identity>
concept sortable =
   permutable<I> &&
   indirect_strict_weak_order<R, projected<I, P>>;
```

## 25.4 Iterator primitives

### 25.4.1 General

To simplify the use of iterators, the library provides several classes and functions.

### 25.4.2 Standard iterator tags

It is often desirable for a function template specialization to find out what is the most specific category of its iterator argument, so that the function can select the most efficient algorithm at compile time. To facilitate this, the library introduces category tag classes which are used as compile time tags for algorithm selection. They are: `output_iterator_tag`, `input_iterator_tag`, `forward_iterator_tag`, `bidirectional_iterator_tag`, `random_access_iterator_tag`, and `contiguous_iterator_tag`. For every iterator of type `I`, `iterator_traits<I>::iterator_category` shall be defined to be a category tag that describes the iterator's behavior. Additionally, `iterator_traits<I>::iterator_concept` may be used to indicate conformance to the iterator concepts (25.3.4).

```cpp
namespace std {
   struct output_iterator_tag { }
   struct input_iterator_tag { }
   struct forward_iterator_tag: public input_iterator_tag { }
   struct bidirectional_iterator_tag: public forward_iterator_tag { }
   struct random_access_iterator_tag: public bidirectional_iterator_tag { }
   struct contiguous_iterator_tag: public random_access_iterator_tag { }
}
```

### Example 1: A program-defined iterator `BinaryTreeIterator` can be included into the bidirectional iterator category by specializing the `iterator_traits` template:

```cpp
template<class T> struct iterator_traits<BinaryTreeIterator<T>> {
   using iterator_category = bidirectional_iterator_tag;
   using difference_type = ptrdiff_t;
   using value_type = T;
   using pointer = T*;
   using reference = T&;
};
```

--- end example

### Example 2: If `evolve()` is well-defined for bidirectional iterators, but can be implemented more efficiently for random access iterators, then the implementation is as follows:

```cpp
template<class BidirectionalIterator>
inline void evolve(BidirectionalIterator first, BidirectionalIterator last) {
   evolve(first, last,
      typename iterator_traits<BidirectionalIterator>::iterator_category());
}
```

```cpp
template<class BidirectionalIterator>
void evolve(BidirectionalIterator first, BidirectionalIterator last,
   bidirectional_iterator_tag) {
   // more generic, but less efficient algorithm
}
```

```cpp
template<class RandomAccessIterator>
void evolve(RandomAccessIterator first, RandomAccessIterator last,
   random_access_iterator_tag) {
   // more efficient, but less generic algorithm
}
```
25.4.3 Iterator operations

Since only random access iterators provide + and - operators, the library provides two function templates `advance` and `distance`. These function templates use + and - for random access iterators (and are, therefore, constant time for them); for input, forward and bidirectional iterators they use ++ to provide linear time implementations.

```cpp
template<class InputIterator, class Distance>
constexpr void advance(InputIterator& i, Distance n);  
```

**Preconditions:** \text{n} is negative only for bidirectional iterators.

**Effects:** Increments \text{i} by \text{n} if \text{n} is non-negative, and decrements \text{i} by \text{-n} otherwise.

```cpp
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::difference_type
distance(InputIterator first, InputIterator last);  
```

**Preconditions:** \text{last} is reachable from \text{first}, or \text{InputIterator} meets the Cpp17RandomAccessIterator requirements and \text{first} is reachable from \text{last}.

**Effects:** If \text{InputIterator} meets the Cpp17RandomAccessIterator requirements, returns \text{(last - first)}; otherwise, increments \text{first} until \text{last} is reached and returns the number of increments.

```cpp
template<class InputIterator>
constexpr InputIterator next(InputIterator x, 
    typename iterator_traits<InputIterator>::difference_type n = 1);  
```

**Effects:** Equivalent to: \text{advance(x, n)}; return \text{x};

```cpp
template<class BidirectionalIterator>
constexpr BidirectionalIterator prev(BidirectionalIterator x, 
    typename iterator_traits<BidirectionalIterator>::difference_type n = 1);  
```

**Effects:** Equivalent to: \text{advance(x, -n)}; return \text{x};

25.4.4 Range iterator operations

25.4.4.1 General

The library includes the function templates `ranges::advance`, `ranges::distance`, `ranges::next`, and `ranges::prev` to manipulate iterators. These operations adapt to the set of operators provided by each iterator category to provide the most efficient implementation possible for a concrete iterator type.

**Example 1:** `ranges::advance` uses the + operator to move a random_access_iterator forward \text{n} steps in constant time. For an iterator type that does not model random_access_iterator, `ranges::advance` instead performs \text{n} individual increments with the ++ operator. —end example

The function templates defined in 25.4.4 are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the postfix-expression in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

**Example 2:**

```cpp
void foo() {  
    using namespace std::ranges;  
    std::vector<int> vec{1,2,3};  
    distance(begin(vec), end(vec));  // #1  
}
```

The function call expression at \#1 invokes `std::ranges::distance`, not `std::distance`, despite that (a) the iterator type returned from `begin(vec)` and `end(vec)` may be associated with namespace `std` and (b) `std::distance` is more specialized (13.7.7.3) than `std::ranges::distance` since the former requires its first two parameters to have the same type. —end example

The number and order of deducible template parameters for the function templates defined in 25.4.4 is unspecified, except where explicitly stated otherwise.
25.4.4.2 `ranges::advance` [range.iter.op.advance]

```cpp
template<input_or_output_iterator I>
constexpr void ranges::advance(I& i, iter_difference_t<I> n);
```

1 Preconditions: If I does not model `bidirectional_iterator`, n is not negative.

2 Effects:
   2.1 If I models `random_access_iterator`, equivalent to `i += n`.
   2.2 Otherwise, if n is non-negative, increments i by n.
   2.3 Otherwise, decrements i by -n.

```cpp
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr void ranges::advance(I& i, S bound);
```

3 Preconditions: Either `assignable_from<I&, S> || sized_sentinel_for<S, I>` is modeled, or `[i, bound)` denotes a range.

4 Effects:
   4.1 If I and S model `assignable_from<I&, S>`, equivalent to `i = std::move(bound)`.
   4.2 Otherwise, if S and I model `sized_sentinel_for<S, I>`, equivalent to `ranges::advance(i, bound - i)`.
   4.3 Otherwise, while `bool(i != bound)` is true, increments i.

```cpp
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::advance(I& i, iter_difference_t<I> n, S bound);
```

5 Preconditions: If n > 0, `[i, bound)` denotes a range. If n == 0, `[i, bound)` or `[bound, i)` denotes a range. If n < 0, `[bound, i)` denotes a range, I models `bidirectional_iterator`, and I and S model `same_as<I, S>`.

6 Effects:
   6.1 If S and I model `sized_sentinel_for<S, I>`:
      6.1.1 If `|n| ≥ |bound - i|`, equivalent to `ranges::advance(i, bound)`.
      6.1.2 Otherwise, equivalent to `ranges::advance(i, n)`.
   6.2 Otherwise,
      6.2.1 if n is non-negative, while `bool(i != bound)` is true, increments i but at most n times.
      6.2.2 Otherwise, while `bool(i != bound)` is true, decrements i but at most -n times.

7 Returns: n - M, where M is the difference between the ending and starting positions of i.

25.4.4.3 `ranges::distance` [range.iter.op.distance]

```cpp
template<input_or_output_iterator I, sentinel_for<I> S>
requires (!sized_sentinel_for<S, I>)
constexpr iter_difference_t<I> ranges::distance(I first, S last);
```

1 Preconditions: `[first, last)` denotes a range.

2 Effects: Increments first until last is reached and returns the number of increments.

```cpp
template<input_or_output_iterator I, sized_sentinel_for<I> S>
constexpr iter_difference_t<I> ranges::distance(const I& first, const S& last);
```

3 Effects: Equivalent to: return last - first;

```cpp
template<range R>
constexpr range_difference_t<R> ranges::distance(R&& r);
```

4 Effects: If R models `sized_range`, equivalent to:
   ```cpp
   return static_cast<range_difference_t<R>>(ranges::size(r));  // 26.3.10
   ```
   Otherwise, equivalent to:
   ```cpp
   return ranges::distance(ranges::begin(r), ranges::end(r));  // 26.3
   ```
25.4.4.4 ranges::next

```
template<input_or_output_iterator I>
constexpr I ranges::next(I x);
```

*Effects:* Equivalent to: `++x; return x;`

```
template<input_or_output_iterator I>
constexpr I ranges::next(I x, iter_difference_t<I> n);
```

*Effects:* Equivalent to: `ranges::advance(x, n); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, S bound);
```

*Effects:* Equivalent to: `ranges::advance(x, bound); return x;`

```
template<input_or_output_iterator I, sentinel_for<I> S>
constexpr I ranges::next(I x, iter_difference_t<I> n, S bound);
```

*Effects:* Equivalent to: `ranges::advance(x, n, bound); return x;`

25.4.4.5 ranges::prev

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x);
```

*Effects:* Equivalent to: `--x; return x;`

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n);
```

*Effects:* Equivalent to: `ranges::advance(x, -n); return x;`

```
template<bidirectional_iterator I>
constexpr I ranges::prev(I x, iter_difference_t<I> n, I bound);
```

*Effects:* Equivalent to: `ranges::advance(x, -n, bound); return x;`

25.5 Iterator adaptors

25.5.1 Reverse iterators

1 Class template **reverse_iterator** is an iterator adaptor that iterates from the end of the sequence defined by its underlying iterator to the beginning of that sequence.

25.5.1.2 Class template **reverse_iterator**

```
namespace std {
    template<class Iterator>
    class reverse_iterator {
        public:
            using iterator_type = Iterator;
            using iterator_concept = see below;
            using iterator_category = see below;
            using value_type = iter_value_t<Iterator>;
            using difference_type = iter_difference_t<Iterator>;
            using pointer = typename iterator_traits<Iterator>::pointer;
            using reference = iter_reference_t<Iterator>;

            constexpr reverse_iterator();
            constexpr explicit reverse_iterator(Iterator x);
            template<class U> constexpr reverse_iterator(const reverse_iterator<U>& u);
            template<class U> constexpr reverse_iterator& operator=(const reverse_iterator<U>& u);

            constexpr Iterator base() const;
            constexpr reference operator*() const;
            constexpr pointer operator->() const requires see below;
    }
}
```
```cpp
constexpr reverse_iterator& operator++();
constexpr reverse_iterator operator++(int);
constexpr reverse_iterator& operator--();
constexpr reverse_iterator operator--(int);
constexpr reverse_iterator operator+ (difference_type n) const;
constexpr reverse_iterator& operator+=(difference_type n);
constexpr reverse_iterator operator- (difference_type n) const;
constexpr reverse_iterator& operator-=(difference_type n);
constexpr unspecified operator[] (difference_type n) const;

friend constexpr iter_rvalue_reference_t<Iterator>
   iter_move(const reverse_iterator& i) noexcept(see below);

template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
   iter_swap(const reverse_iterator& x,
             const reverse_iterator<Iterator2>& y) noexcept(see below);

protected:
   Iterator current;
};
```

1 The member typedef-name iterator_concept denotes
   — random_access_iterator_tag if Iterator models random_access_iterator, and
   — bidirectional_iterator_tag otherwise.

2 The member typedef-name iterator_category denotes
   — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category models derived_from<random_access_iterator_tag>, and
   — iterator_traits<Iterator>::iterator_category otherwise.

### 25.5.1.3 Requirements

1 The template parameter Iterator shall either meet the requirements of a Cpp17BidirectionalIterator (25.3.5.6) or model bidirectional_iterator (25.3.4.12).

2 Additionally, Iterator shall either meet the requirements of a Cpp17RandomAccessIterator (25.3.5.7) or model random_access_iterator (25.3.4.13) if the definitions of any of the members
   — operator+, operator-, operator+=, operator-= (25.5.1.7), or
   — operator[] (25.5.1.6),
   or the non-member operators (25.5.1.8)
   — operator<, operator>, operator<=, operator>=, operator-, or operator+ (25.5.1.9)
   are instantiated (13.9.2).

### 25.5.1.4 Construction and assignment

```cpp
constexpr reverse_iterator();
```  
1 *Effects*: Value-initializes current. Iterator operations applied to the resulting iterator have defined behavior if and only if the corresponding operations are defined on a value-initialized iterator of type Iterator.

```cpp
constexpr explicit reverse_iterator(Iterator x);
```  
2 *Effects*: Initializes current with x.

```cpp
template<class U>
constexpr reverse_iterator(const reverse_iterator<U>& u);
```  
3 *Constraints*: is_same_v< U, Iterator> is false and const U& models convertible_to<Iterator>.

4 *Effects*: Initializes current with u.current.
template<class U>
constexpr reverse_iterator&
operator=(const reverse_iterator<U>& u);

Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and assignable_from<Iterator&, const U&> is modeled.

Effects: Assigns u.current to current.

Returns: *this.

25.5.1.5 Conversion

constexpr Iterator base() const; // explicit

Returns: current.

25.5.1.6 Element access

constexpr reference operator*() const;

Effects: As if by:
Iterator tmp = current;
return *--tmp;

constexpr pointer operator->() const
requires (is_pointer_v<Iterator> ||
requires(const Iterator i) { i.operator->(); });

Effects:
(2.1) If Iterator is a pointer type, equivalent to: return prev(current);
(2.2) Otherwise, equivalent to: return prev(current).operator->();

constexpr unspecified operator[](difference_type n) const;

Returns: current[-n-1].

25.5.1.7 Navigation

constexpr reverse_iterator operator+(difference_type n) const;

Returns: reverse_iterator(current-n).

constexpr reverse_iterator operator-(difference_type n) const;

Returns: reverse_iterator(current+n).

constexpr reverse_iterator& operator++();

Effects: As if by: --current;

Returns: *this.

constexpr reverse_iterator operator++(int);

Effects: As if by:
reverse_iterator tmp = *this;
--current;
return tmp;

constexpr reverse_iterator& operator--();

Effects: As if by ++current.

Returns: *this.

constexpr reverse_iterator operator--(int);

Effects: As if by:
reverse_iterator tmp = *this;
++current;
return tmp;
constexpr reverse_iterator& operator+=(difference_type n);

  Effects: As if by: current -= n;

  Returns: *this.

constexpr reverse_iterator& operator-=(difference_type n);

  Effects: As if by: current += n;

  Returns: *this.

25.5.1.8 Comparisons

template<class Iterator1, class Iterator2>
constexpr bool operator==(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

  Constraints: x.base() == y.base() is well-formed and convertible to bool.

  Returns: x.base() == y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator!=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

  Constraints: x.base() != y.base() is well-formed and convertible to bool.

  Returns: x.base() != y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator<(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

  Constraints: x.base() < y.base() is well-formed and convertible to bool.

  Returns: x.base() < y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator>(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

  Constraints: x.base() > y.base() is well-formed and convertible to bool.

  Returns: x.base() > y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

  Constraints: x.base() >= y.base() is well-formed and convertible to bool.

  Returns: x.base() >= y.base().

template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2> operator<=>(const reverse_iterator<Iterator1>& x, const reverse_iterator<Iterator2>& y);

  Returns: y.base() <=> x.base().

§ 25.5.1.8
[Note 1: The argument order in the Returns: element is reversed because this is a reverse iterator. — end note]

25.5.1.9 Non-member functions

```
template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const reverse_iterator<Iterator1>& x,
    const reverse_iterator<Iterator2>& y) -> decltype(y.base() - x.base());
```

_returns:
y.base() - x.base().

```
template<class Iterator>
constexpr reverse_iterator<Iterator> operator+(
    iter_difference_t<Iterator> n,
    const reverse_iterator<Iterator>& x);
```

_returns:
reverse_iterator<Iterator>(x.base() - n).

friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const reverse_iterator& i) noexcept(see below);

_effects:
Equivalent to:
```
auto tmp = i.base();
return ranges::iter_move(--tmp);
```

_remarks:
The exception specification is equivalent to:
```
is_nothrow_copy_constructible_v<Iterator> &&
noexcept(ranges::iter_move(--declval<Iterator&>()))
```

```
template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const reverse_iterator& x,
    const reverse_iterator<Iterator2>& y) noexcept(see below);
```

_effects:
Equivalent to:
```
auto xtmp = x.base();
auto ytmp = y.base();
ranges::iter_swap(--xtmp, --ytmp);
```

_remarks:
The exception specification is equivalent to:
```
is_nothrow_copy_constructible_v<Iterator> &&
is_nothrow_copy_constructible_v<Iterator2> &&
noexcept(ranges::iter_swap(--declval<Iterator&>(), --declval<Iterator2&>()))
```

```
template<class Iterator>
constexpr reverse_iterator<Iterator> make_reverse_iterator(Iterator i);
```

_returns:
reverse_iterator<Iterator>(i).

25.5.2 Insert iterators

25.5.2.1 General

To make it possible to deal with insertion in the same way as writing into an array, a special kind of iterator adaptors, called _insert iterators_, are provided in the library. With regular iterator classes,
```
while (first != last) *result++ = *first++;
```
causes a range [first, last) to be copied into a range starting with result. The same code with _result_ being an insert iterator will insert corresponding elements into the container. This device allows all of the copying algorithms in the library to work in the _insert mode_ instead of the _regular overwrite_ mode.

An insert iterator is constructed from a container and possibly one of its iterators pointing to where insertion takes place if it is neither at the beginning nor at the end of the container. Insert iterators meet the requirements of output iterators. _operator*_ returns the insert iterator itself. The assignment _operator=(const T& x)_ is defined on insert iterators to allow writing into them, it inserts x right before where the insert iterator is pointing. In other words, an insert iterator is like a cursor pointing into the container where the insertion takes place. _back_insert_iterator_ inserts elements at the end of a container, _front_insert_iterator_ inserts elements at the beginning of a container, and _insert_iterator_ inserts
25.5.2.2 Class template back_insert_iterator

namespace std {
    template<class Container>
    class back_insert_iterator {
        protected:
            Container* container;

        public:
            using iterator_category = output_iterator_tag;
            using value_type = void;
            using difference_type = ptrdiff_t;
            using pointer = void;
            using reference = void;
            using container_type = Container;

            constexpr explicit back_insert_iterator(Container& x);
            constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
            constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
            constexpr back_insert_iterator& operator*();
            constexpr back_insert_iterator& operator++();
            constexpr back_insert_iterator operator++(int);
    };
}

25.5.2.2.1 Operations

constexpr explicit back_insert_iterator(Container& x);
1 Effects: Initializes container with addressof(x).

constexpr back_insert_iterator& operator=(const typename Container::value_type& value);
2 Effects: As if by: container->push_back(value);
3 Returns: *this.

constexpr back_insert_iterator& operator=(typename Container::value_type&& value);
4 Effects: As if by: container->push_back(std::move(value));
5 Returns: *this.

constexpr back_insert_iterator& operator*();
6 Returns: *this.

constexpr back_insert_iterator& operator++();
7 Returns: *this.

25.5.2.2 back_inserter

template<class Container>
constexpr back_insert_iterator<Container> back_inserter(Container& x);
1 Returns: back_inserter<Container>(x).

25.5.2.3 Class template front_insert_iterator

namespace std {
    template<class Container>
    class front_insert_iterator {
        protected:
            Container* container;

§ 25.5.2.3  1088
25.5.2.3.1 Operations

```
castexpr explicit front_insert_iterator(Container& x);  
1 Effects: Initializes container with addressof(x).

castexpr front_insert_iterator& operator=(const typename Container::value_type& value);  
2 Effects: As if by: container->push_front(value);
3 Returns: *this.

castexpr front_insert_iterator& operator=(typename Container::value_type&& value);  
4 Effects: As if by: container->push_front(std::move(value));
5 Returns: *this.

castexpr front_insert_iterator& operator*();
6 Returns: *this.

castexpr front_insert_iterator& operator++();
7 Returns: *this.
```
25.5.2.4.1 Operations

```cpp
constexpr insert_iterator(Container& x, ranges::iterator_t<Container> i);
```

1 Effects: Initializes container with addressof(x) and iter with i.

```cpp
constexpr insert_iterator& operator=(const typename Container::value_type& value);
```

2 Effects: As if by:
```
iter = container->insert(iter, value);
++iter;
```

3 Returns: *this.

```cpp
constexpr insert_iterator& operator=(typename Container::value_type&& value);
```

4 Effects: As if by:
```
iter = container->insert(iter, std::move(value));
++iter;
```

5 Returns: *this.

```cpp
constexpr insert_iterator& operator*();
```

6 Returns: *this.

```cpp
constexpr insert_iterator& operator++();
constexpr insert_iterator& operator++(int);
```

7 Returns: *this.

25.5.2.4.2 inserter

```cpp
template<class Container>
constexpr insert_iterator<Container> inserter(Container& x, ranges::iterator_t<Container> i);
```

1 Returns: insert_iterator<Container>(x, i).

25.5.3 Constant iterators and sentinels

25.5.3.1 General

Class template basic_const_iterator is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator’s indirection operator to a type such that the adapted iterator is a constant iterator (25.3). Some generic algorithms can be called with constant iterators to avoid mutation.

2 Specializations of basic_const_iterator are constant iterators.

25.5.3.2 Alias templates

```cpp
template<indirectly_readable It>
using iter_const_reference_t =
    common_reference_t<const iter_value_t<It>&& , iter_reference_t<It>>;
```

```cpp
template<class It>
concept constant_iterator =
    // exposition only
    input_iterator<It> && same_as<iter_const_reference_t<It>, iter_reference_t<It>>;
```

§ 25.5.3.2
template<input_iterator I>
   using const_iterator = see below;

1 Result: If I models constant-iterator, I. Otherwise, basic_const_iterator<I>.

template<semiregular S>
   using const_sentinel = see below;

2 Result: If S models input_iterator, const_iterator<S>. Otherwise, S.

25.5.3.3 Class template basic_const_iterator

namespace std {
   template<class I>
      concept not-a-const-iterator = see below;

   template<input_iterator Iterator>
      class basic_const_iterator {
         Iterator current_ = Iterator();
         // exposition only
         using reference = iter_const_reference_t<Iterator>;
         // exposition only

         public:
            using iterator_concept = see below;
            using iterator_category = see below; // not always present
            using value_type = iter_value_t<Iterator>;
            using difference_type = iter_difference_t<Iterator>;

            basic_const_iterator() requires default_initializable<Iterator> = default;
            constexpr basic_const_iterator(Iterator current);
            template<convertible_to<Iterator> U>
               constexpr basic_const_iterator(basic_const_iterator<U> current);
            template<different-from<basic_const_iterator> T>
               requires convertible_to<T, Iterator>
               constexpr basic_const_iterator(T&& current);

            constexpr const Iterator& base() const & noexcept;
            constexpr Iterator base() &&;
            constexpr reference operator*() const;
            constexpr const value_type* operator->() const
               requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
               same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;
            constexpr basic_const_iterator& operator++();
            constexpr void operator++(int);
            constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;
            constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
            constexpr basic_const_iterator operator--(int) requires bidirectional_iterator<Iterator>;

            constexpr basic_const_iterator& operator+=(difference_type n)
               requires random_access_iterator<Iterator>;
            constexpr basic_const_iterator& operator-=(difference_type n)
               requires random_access_iterator<Iterator>;
            constexpr reference operator[] (difference_type n) const
               requires random_access_iterator<Iterator>;

            template<sentinel_for<Iterator> S>
               friend constexpr bool operator==(const basic_const_iterator& x, const S& s);

            friend constexpr bool operator<(const basic_const_iterator& x, const basic_const_iterator& y)
               requires random_access_iterator<Iterator>;
            friend constexpr bool operator>(const basic_const_iterator& x, const basic_const_iterator& y)
               requires random_access_iterator<Iterator>;

   § 25.5.3.3
friend constexpr bool operator<=(const basic_const_iterator& x,  
    const basic_const_iterator& y)  
requires random_access_iterator<Iterator>;  
friend constexpr bool operator>=(const basic_const_iterator& x,  
    const basic_const_iterator& y)  
requires random_access_iterator<Iterator>;  
friend constexpr auto operator<=>(const basic_const_iterator& x,  
    const basic_const_iterator& y)  
requires random_access_iterator<Iterator> && three_way_comparable<Iterator>;  

friend constexpr bool operator<(const basic_const_iterator& x, const I& y)  
requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;  
friend constexpr bool operator>(const basic_const_iterator& x, const I& y)  
requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;  
friend constexpr bool operator<=(const basic_const_iterator& x, const I& y)  
requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;  
friend constexpr bool operator>=(const basic_const_iterator& x, const I& y)  
requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, I>;  

friend constexpr basic_const_iterator operator+(const basic_const_iterator& i,  
    difference_type n)  
requires random_access_iterator<Iterator>;  
friend constexpr basic_const_iterator operator+(difference_type n,  
    const basic_const_iterator& i)  
requires random_access_iterator<Iterator>;  
friend constexpr basic_const_iterator operator-(const basic_const_iterator& i,  
    difference_type n)  
requires random_access_iterator<Iterator>;  
template<sized_sentinel_for<Iterator> S>  
    friend constexpr difference_type operator-(const basic_const_iterator& x, const S& y);  
template<sized_sentinel_for<Iterator> S>  
    requires different-from<S, basic_const_iterator>  
friend constexpr difference_type operator-(const S& x, const basic_const_iterator& y);  
}

1. Given some type I, the concept not-a-const-iterator is defined as false if I is a specialization of basic_const_iterator and true otherwise.

25.5.3.4 Member types

1. basic_const_iterator<Iterator>::iterator_concept is defined as follows:

(1.1) If Iterator models contiguous_iterator, then iterator_concept denotes contiguous_iterator_tag.

§ 25.5.3.4 1092
Otherwise, if Iterator models random_access_iterator, then `iterator_concept` denotes random_access_iterator_tag.

Otherwise, if Iterator models bidirectional_iterator, then `iterator_concept` denotes bidirectional_iterator_tag.

Otherwise, if Iterator models forward_iterator, then `iterator_concept` denotes forward_iterator_tag.

Otherwise, `iterator_concept` denotes input_iterator_tag.

The member typedef-name `iterator_category` is defined if and only if Iterator models forward_iterator. In that case, basic_const_iterator<Iterator>::iterator_category denotes the type iterator_traits<Iterator>::iterator_category.

### 25.5.3.5 Operations

```cpp
constexpr basic_const_iterator(Iterator current);
```

**Effects**: Initializes `current_` with `std::move(current)`.

```cpp
template<convertible_to<Iterator> U>
constexpr basic_const_iterator(basic_const_iterator<U> current);
```

**Effects**: Initializes `current_` with `std::move(current_.current_)`.

```cpp
template<different-from<basic_const_iterator> T>
requires convertible_to<T, Iterator>
constexpr basic_const_iterator(T&& current);
```

**Effects**: Initializes `current_` with `std::forward<T>(current)`.

```cpp
constexpr const Iterator& base() const & noexcept;
```

**Effects**: Equivalent to: `return current_;`

```cpp
constexpr Iterator base() &&;
```

**Effects**: Equivalent to: `return std::move(current_);`

```cpp
constexpr reference operator*() const;
```

**Effects**: Equivalent to: `return static_cast<reference>(*current_);`

```cpp
constexpr const value_type* operator->() const
requires is_lvalue_reference_v<iter_reference_t<Iterator>> &&
same_as<remove_cvref_t<iter_reference_t<Iterator>>, value_type>;
```

**Returns**: If Iterator models contiguous_iterator, `to_address(current_)`; otherwise, `address_of(*current_)`.

```cpp
constexpr basic_const_iterator& operator++();
```

**Effects**: Equivalent to:

```cpp
++current_; return *this;
```

```cpp
constexpr void operator++(int);
```

**Effects**: Equivalent to: `++current_;`

```cpp
constexpr basic_const_iterator operator++(int) requires forward_iterator<Iterator>;
```

**Effects**: Equivalent to:

```cpp
auto tmp = *this; ++*this; return tmp;
```

```cpp
constexpr basic_const_iterator& operator--() requires bidirectional_iterator<Iterator>;
```

**Effects**: Equivalent to:

```cpp
--current_;`
return *this;

constexpr basic_const_iterator operator-(int) requires bidirectional_iterator<Iterator>;

Effects: Equivalent to:
auto tmp = *this;
--*this;
return tmp;

constexpr basic_const_iterator operator+=(difference_type n) requires random_access_iterator<Iterator>;
constexpr basic_const_iterator& operator-=(difference_type n) requires random_access_iterator<Iterator>;

Effects: Let \( \text{op} \) be the operator.
Effects: Equivalent to:
current_ \text{op} n;
return *this;

constexpr reference operator[](difference_type n) const requires random_access_iterator<Iterator>;

Effects: Equivalent to: return static_cast<reference>(current_[n]);

template<sentinel_for<Iterator> S>
friend constexpr bool operator==(const basic_const_iterator& x, const S& s);

Effects: Equivalent to: return x.current_ == s;

friend constexpr bool operator<(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr bool operator>(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr bool operator<=(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr bool operator>=(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator>;
friend constexpr auto operator<=>(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && three_way_comparable<Iterator>;

Effects: Let \( \text{op} \) be the operator.
Effects: Equivalent to: return x.current_ \text{op} y.current_;

friend constexpr bool operator<(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, basic_const_iterator>;
friend constexpr bool operator>(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, basic_const_iterator>;
friend constexpr bool operator<=(const basic_const_iterator& x, const basic_const_iterator& y) requires random_access_iterator<Iterator> && totally_ordered_with<Iterator, basic_const_iterator>;

\[ \text{template<sized_sentinel_for<} \text{Iterator}> S \]
\[ \text{friend constexpr difference_type operator- (const S} \& x, \text{const basic_const_iterator} \ y); \]

\[ \text{Effects: Equivalent to: return } x - y.\text{current}_{\_}; \]

### 25.5.4 Move iterators and sentinels

#### 25.5.4.1 General

Class template \texttt{move_iterator} is an iterator adaptor with the same behavior as the underlying iterator except that its indirection operator implicitly converts the value returned by the underlying iterator’s indirection operator to an rvalue. Some generic algorithms can be called with move iterators to replace copying with moving.

\[ \text{[Example 1:} \]
\[ \text{list<} \text{string} \&> s; \]
\[ \text{// populate the list s} \]
\[ \text{vector<} \text{string} \&> \ v1(s.\text{begin()}, \ v1.\text{end}()); \]
\[ \text{// copies strings into} \ v1 \]
\[ \text{vector<} \text{string} \&> \ v2(\text{make_move_iterator}(s.\text{begin}()), \]
\[ \text{\text{make_move_iterator}(s.\text{end}());} \]
\[ \text{// moves strings into} \ v2 \]

\[ \text{— end example} \]

#### 25.5.4.2 Class template \texttt{move_iterator}

namespace std {
    template<class \text{Iterator}>
    class move_iterator {
        public:
            using iterator_type = \text{Iterator};
            using iterator_concept = \text{see below};
            using iterator_category = \text{see below}; \quad \text{not always present}
            using value_type = iter_value_t<\text{Iterator}>;
            using difference_type = iter_difference_t<\text{Iterator}>;
            using pointer = \text{Iterator};
            using reference = iter_rvalue_reference_t<\text{Iterator}>;
    }
constexpr move_iterator();
constexpr explicit move_iterator(Iterator i);
template<class U> constexpr move_iterator(const move_iterator<U>& u);
template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);

constexpr const Iterator& base() const & noexcept;
constexpr Iterator base() &&;
constexpr reference operator*() const;
constexpr move_iterator& operator++();
constexpr auto operator++(int);
constexpr move_iterator& operator--();
constexpr move_iterator operator--(int);
constexpr move_iterator operator+(difference_type n) const;
constexpr move_iterator& operator+=(difference_type n);
constexpr move_iterator operator-(difference_type n) const;
constexpr move_iterator& operator-=(difference_type n);
constexpr reference operator[](difference_type n) const;

template<sized_sentinel_for<Iterator> S>
friend constexpr bool
operator==(const move_iterator& x, const move_sentinel<S>& y);

friend constexpr iter_difference_t<Iterator> operator-(const move_sentinel<S>& x, const move_iterator& y);
friend constexpr iter_difference_t<Iterator> operator-(const move_iterator& x, const move_sentinel<S>& y);

friend constexpr iter_rvalue_reference_t<Iterator> iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));

friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
  Iterator current;  // exposition only
};

1 The member typedef-name iterator_concept is defined as follows:

(1.1) — If Iterator models random_access_iterator, then iterator_concept denotes random_access_iterator_tag.

(1.2) — Otherwise, if Iterator models bidirectional_iterator, then iterator_concept denotes bidirectional_iterator_tag.

(1.3) — Otherwise, if Iterator models forward_iterator, then iterator_concept denotes forward_iterator_tag.

(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if the qualified-id
iterator_traits<Iterator>::iterator_category is valid and denotes a type. In that case, iterator_category denotes

(2.1) — random_access_iterator_tag if the type iterator_traits<Iterator>::iterator_category mod-
elرامs derived_from<random_access_iterator_tag>, and

(2.2) — iterator_traits<Iterator>::iterator_category otherwise.

25.5.4.3 Requirements

The template parameter Iterator shall either meet the Cpp17InputIterator requirements (25.3.5.3) or model
input_iterator (25.3.4.9). Additionally, if any of the bidirectional traversal functions are instantiated,
the template parameter shall either meet the Cpp17BidirectionalIterator requirements (25.3.5.6) or model
bidirectional_iterator (25.3.4.12). If any of the random access traversal functions are instantiated, the template parameter shall either meet the Cpp17RandomAccessIterator requirements (25.3.5.7) or model random_access_iterator (25.3.4.13).

25.5.4.4 Construction and assignment

constexpr move_iterator();
1 Effects: Value-initializes current.

constexpr explicit move_iterator(Iterator i);
2 Effects: Initializes current with std::move(i).

template<class U> constexpr move_iterator(const move_iterator<U>& u);
3 Constraints: is_same_v<U, Iterator> is false and const U& models convertible_to<Iterator>.
4 Effects: Initializes current with u.current.

template<class U> constexpr move_iterator& operator=(const move_iterator<U>& u);
5 Constraints: is_same_v<U, Iterator> is false, const U& models convertible_to<Iterator>, and assignable_from<Iterator&, const U&> is modeled.
6 Effects: Assigns u.current to current.
7 Returns: *this.

25.5.4.5 Conversion

constexpr const Iterator& base() const & noexcept;
1 Returns: current.

constexpr Iterator base() &&;
2 Returns: std::move(current).

25.5.4.6 Element access

constexpr reference operator*() const;
1 Effects: Equivalent to: return ranges::iter_move(current);

constexpr reference operator[](difference_type n) const;
2 Effects: Equivalent to: return ranges::iter_move(current + n);

25.5.4.7 Navigation

constexpr move_iterator& operator++();
1 Effects: As if by ++current.
2 Returns: *this.

constexpr auto operator++(int);
3 Effects: If Iterator models forward_iterator, equivalent to:
   move_iterator tmp = *this;
   ++current;
   return tmp;
   Otherwise, equivalent to ++current.

constexpr move_iterator& operator--();
4 Effects: As if by --current.
5 Returns: *this.
constexpr move_iterator operator--(int);

Effects: As if by:

move_iterator tmp = *this;
--current;
return tmp;

constexpr move_iterator operator+(difference_type n) const;

Returns: move_iterator(current + n).

constexpr move_iterator& operator+=(difference_type n);

Effects: As if by: current += n;

Returns: *this.

constexpr move_iterator operator-(difference_type n) const;

Returns: move_iterator(current - n).

constexpr move_iterator& operator-=(difference_type n);

Effects: As if by: current -= n;

25.5.4.8 Comparisons

template<class Iterator1, class Iterator2>
constexpr bool operator==(const move_iterator<Iterator1>& x,
const move_iterator<Iterator2>& y);

Constraints: x.base() == y.base() is well-formed and convertible to bool.

Returns: x.base() == y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator<(const move_iterator<Iterator1>& x,
const move_iterator<Iterator2>& y);

Constraints: x.base() < y.base() is well-formed and convertible to bool.

Returns: x.base() < y.base().

template<class Iterator1, class Iterator2>
constexpr bool operator>(const move_iterator<Iterator1>& x,
const move_iterator<Iterator2>& y);

Constraints: y.base() < x.base() is well-formed and convertible to bool.

Returns: y < x.

template<class Iterator1, class Iterator2>
constexpr bool operator<=(const move_iterator<Iterator1>& x,
const move_iterator<Iterator2>& y);

Constraints: y.base() < x.base() is well-formed and convertible to bool.

Returns: !(y < x).

template<class Iterator1, class Iterator2>
constexpr bool operator>=(const move_iterator<Iterator1>& x,
const move_iterator<Iterator2>& y);

Constraints: x.base() < y.base() is well-formed and convertible to bool.

Returns: !(x < y).

template<class Iterator1, three_way_comparable_with<Iterator1> Iterator2>
constexpr compare_three_way_result_t<Iterator1, Iterator2>
operator<=>(const move_iterator<Iterator1>& x,
const move_iterator<Iterator2>& y);

Returns: x.base() <=> y.base.
25.5.4.9 Non-member functions

```
template<class Iterator1, class Iterator2>
constexpr auto operator-(
    const move_iterator<Iterator1>& x, const move_iterator<Iterator2>& y)
-> decltype(x.base() - y.base());

template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_sentinel<S>& x, const move_iterator& y);

template<sized_sentinel_for<Iterator> S>
friend constexpr iter_difference_t<Iterator>
operator-(const move_iterator& x, const move_sentinel<S>& y);
```

1 Returns: \( x.base() - y.base() \).

```
template<class Iterator>
constexpr move_iterator<Iterator>
operator+(iter_difference_t<Iterator> n, const move_iterator<Iterator>& x);
```

2 Constraints: \( x.base() + n \) is well-formed and has type \( \text{Iterator} \).

3 Returns: \( x + n \).

```
friend constexpr iter_rvalue_reference_t<Iterator>
iter_move(const move_iterator& i)
noexcept(noexcept(ranges::iter_move(i.current)));
```

4 Effects: Equivalent to: return ranges::iter_move(i.current);

```
template<indirectly_swappable<Iterator> Iterator2>
friend constexpr void
iter_swap(const move_iterator& x, const move_iterator<Iterator2>& y)
noexcept(noexcept(ranges::iter_swap(x.current, y.current)));
```

5 Effects: Equivalent to: ranges::iter_swap(x.current, y.current).

```
template<class Iterator>
constexpr move_iterator<Iterator> make_move_iterator(Iterator i);
```

6 Returns: move_iterator<Iterator>(std::move(i)).

25.5.4.10 Class template move_sentinel

```
class template move_sentinel
```

1 Class template `move_sentinel` is a sentinel adaptor useful for denoting ranges together with `move_iterator`. When an input iterator type \( I \) and sentinel type \( S \) model `sentinel_for<\( S, I \)>, move_sentinel<\( S \)>` and `move_iterator<\( I \)>, model sentinel_for<\( move_sentinel<\( S \)>, move_iterator<\( I \)>>` as well.

2 [Example 1: A move_if algorithm is easily implemented with `copy_if` using `move_iterator` and `move_sentinel`:

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, 
    indirect_unary_predicate<I> Pred>
requires indirectly_movable<I, O>
void move_if(I first, S last, O out, Pred pred) {
    ranges::copy_if(move_iterator<I>{first}, move_sentinel<S>{last}, out, pred);
}
```

—end example]

namespace std {
    class move_sentinel {
    public:
        constexpr move_sentinel();
        constexpr explicit move_sentinel(S s);
        template<class S2>
            requires convertible_to<const S2&, S>
        constexpr move_sentinel(const move_sentinel<S2>& s);
        template<class S2>
            requires assignable_from<S&, const S2&>
        constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
    }
constexpr S base() const;

private:
  S last;  // exposition only
};

25.5.4.11 Operations

constexpr move_sentinel();
1 Effects: Value-initializes last. If is_trivially_default_constructible_v<S> is true, then this constructor is a constexpr constructor.

constexpr explicit move_sentinel(S s);
2 Effects: Initializes last with std::move(s).

template<class S2>
  requires convertible_to<const S2&, S>
  constexpr move_sentinel(const move_sentinel<S2>& s);
3 Effects: Initializes last with s.last.

template<class S2>
  requires assignable_from<S&, const S2&>
  constexpr move_sentinel& operator=(const move_sentinel<S2>& s);
4 Effects: Equivalent to: last = s.last; return *this;

constexpr S base() const;
5 Returns: last.

25.5.5 Common iterators

25.5.5.1 Class template common_iterator
1 Class template common_iterator is an iterator/sentinel adaptor that is capable of representing a non-common range of elements (where the types of the iterator and sentinel differ) as a common range (where they are the same). It does this by holding either an iterator or a sentinel, and implementing the equality comparison operators appropriately.

[Note 1: The common_iterator type is useful for interfacing with legacy code that expects the begin and end of a range to have the same type. — end note]

[Example 1:
  template<class ForwardIterator>
  void fun(ForwardIterator begin, ForwardIterator end);

  list<int> s;
  // populate the list s
  using CI = common_iterator<counted_iterator<list<int>::iterator>, default_sentinel_t>;
  // call fun on a range of 10 ints
  fun(CI(counted_iterator(s.begin(), 10)), CI(default_sentinel));
  — end example]

namespace std {
  template<input_or_output_iterator I, sentinel_for<I> S>
    requires (!same_as<I, S> && copyable<I>)
  class common_iterator {
    public:
      constexpr common_iterator() requires default_initializable<I> = default;
      constexpr common_iterator(I i);
      constexpr common_iterator(S s);
      template<class I2, class S2>
        requires convertible_to<const I2&, I> && convertible_to<const S2&, S>
        constexpr common_iterator(const common_iterator<I2, S2>& x);
  }
template<class I2, class S2>
    requires convertible_to<const I2&, I> && convertible_to<const S2&, S> &&
    assignable_from<I&, const I2&> && assignable_from<S&, const S2&>
    constexpr common_iterator& operator=(const common_iterator<I2, S2>& x);

constexpr decltype(auto) operator*();
constexpr decltype(auto) operator*() const
    requires dereferenceable<const I>;
constexpr common_iterator& operator++();
constexpr decltype(auto) operator++(int);

template<class I2, sentinel_for<I> S2>
    requires sentinel_for<S, I2>
friend constexpr bool operator==(
    const common_iterator& x, const common_iterator<I2, S2>& y);

template<class I2, sentinel_for<I> S2>
    requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(
    const common_iterator& x, const common_iterator<I2, S2>& y);

template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
    requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
    const common_iterator& x, const common_iterator<I2, S2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
    noexcept(noexcept(ranges::iter_move(declval<const I&>())))
    requires input_iterator<I>;

template<indirectly_swappable<I> I2, class S2>
friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))

private:
    variant<I, S> v_; // exposition only
};

template<class I, class S>
struct incrementable_traits<common_iterator<I, S>> {
    using difference_type = iter_difference_t<I>;
};

template<input_iterator I, class S>
struct iterator_traits<common_iterator<I, S>> {
    using iterator_concept = see below;
    using iterator_category = see below;
    using value_type = iter_value_t<I>;
    using difference_type = iter_difference_t<I>;
    using pointer = see below;
    using reference = iter_reference_t<I>;
};

25.5.5.2 Associated types
[common.iter.types]

The nested typedef-names of the specialization of iterator_traits for common_iterator<I, S> are defined as follows.

1 iterator_concept denotes forward_iterator_tag if I models forward_iterator; otherwise it denotes input_iterator_tag.
— iterator_category denotes forward_iterator_tag if the \textit{qualified-id} \texttt{iterator_traits\langle I \rangle::iterator_category} is valid and denotes a type that models \texttt{derived_from<forward_iterator_tag>}; otherwise it denotes input_iterator_tag.

— Let a denote an lvalue of type \texttt{const common_iterator\langle I, S \rangle}. If the expression \texttt{a.operator->()} is well-formed, then \texttt{pointer} denotes \texttt{decltype(a.operator->())}. Otherwise, \texttt{pointer} denotes \texttt{void}.

25.5.5.3 Constructors and conversions

```cpp
constexpr common_iterator(I i);  
\textit{Effects:} Initializes \texttt{v_} as if by \texttt{\{in_place_type\langle I \rangle, std::move(i)\}}.
```

```cpp
constexpr common_iterator(S s);  
\textit{Effects:} Initializes \texttt{v_} as if by \texttt{\{in_place_type\langle S \rangle, std::move(s)\}}.
```

```cpp
template<class I2, class S2>  
requires convertible_to<const I2&, I> && convertible_to<const S2&, S>  
constexpr common_iterator(const common_iterator\langle I2, S2 \rangle& x);  
\textit{Preconditions:} \texttt{x.v_.valueless_by_exception()} is false.
```

```cpp
\textit{Effects:} Initializes \texttt{v_} as if by \texttt{\{in_place_index\langle i \rangle, get\langle i \rangle(x.v_)\}}, where \texttt{i} is \texttt{x.v_.index()}.
```

```cpp
template<class I2, class S2>  
requires convertible_to<const I2&, I> && convertible_to<const S2&, S> && assignable_from<I&, const I2&> && assignable_from<S&, const S2&>  
constexpr common_iterator& operator=(const common_iterator\langle I2, S2 \rangle& x);  
\textit{Preconditions:} \texttt{x.v_.valueless_by_exception()} is false.
```

```cpp
\textit{Effects:} Equivalent to:
\begin{enumerate}
\item If \texttt{v_.index()} == \texttt{x.v_.index()}, then \texttt{get\langle i \rangle(v_) = get\langle i \rangle(x.v_)}.  
\item Otherwise, \texttt{v_.emplace\langle i \rangle(get\langle i \rangle(x.v_))}.  
\end{enumerate}
\texttt{where \texttt{i} is \texttt{x.v_.index()}}.
```

25.5.5.4 Accessors

```cpp
constexpr decltype(auto) operator*();  
```

```cpp
constexpr decltype(auto) operator*() const  
requires dereferenceable<\texttt{const I}>;  
```

```cpp
\textit{Preconditions:} \texttt{holds_alternative\langle I\rangle(v_) is true}.
```

```cpp
constexpr auto operator->() const  
requires see below;  
```

\textit{The expression in the requires-clause is equivalent to:}
\begin{enumerate}
\item indirecty_readable<\texttt{const I> \&\&
\begin{enumerate}
\item requires(const \texttt{I&} i) \{ i.operator->(); \} ||
\item is_reference_v<\texttt{iter_reference_t\langle I\rangle}> ||
\item constructible_from<\texttt{iter_value_t\langle I\rangle, iter_reference_t\langle I\rangle}>)
\end{enumerate}
\item \textit{Preconditions:} \texttt{holds_alternative\langle I\rangle(v_) is true}.
\end{enumerate}
```

\textit{Effects:}
\begin{enumerate}
\item If \texttt{I} is a pointer type or if the expression \texttt{get\langle I\rangle(v_.operator->)} is well-formed, equivalent to: \texttt{return get\langle I\rangle(v_)};
\item Otherwise, if \texttt{iter_reference_t\langle I\rangle} is a reference type, equivalent to:
\begin{enumerate}
\item \texttt{auto&& tmp = *get\langle I\rangle(v_);}  
\item \texttt{return addressof(tmp);}  
\end{enumerate}
\item Otherwise, equivalent to: \texttt{return proxy(*get\langle I\rangle(v_))}; where \texttt{proxy} is the exposition-only class:
\end{enumerate}
class proxy {
    iter_value_t<I> keep_
    constexpr proxy(iter_reference_t<I>&& x)
        : keep_(std::move(x)) {}
    public:
        constexpr const iter_value_t<I>* operator->() const noexcept {
            return addressof(keep_);
        }
};

25.5.5.5 Navigation

constexpr common_iterator& operator++();
1 Preconditions: holds_alternative<I>(v_) is true.
2 Effects: Equivalent to ++get<I>(v_).
3 Returns: *this.

constexpr decltype(auto) operator++(int);
4 Preconditions: holds_alternative<I>(v_) is true.
5 Effects: If I models forward_iterator, equivalent to:
        common_iterator tmp = *this;
        this;
        return tmp;
Otherwise, if requires(I& i) { { *i++ } -> can-reference; } is true or
        indirectly_readable<I> && constructible_from<iter_value_t<I>, iter_reference_t<I>> &&
        move_constructible<iter_value_t<I>>
is false, equivalent to:
        return get<I>(v_++);
Otherwise, equivalent to:
        postfix-proxy p(*this);
        this;
        return p;
where postfix-proxy is the exposition-only class:

class postfix-proxy {
    iter_value_t<I> keep_
    constexpr postfix-proxy(iter_reference_t<I>&& x)
        : keep_(std::forward<iter_reference_t<I>>(x)) {}
    public:
        constexpr const iter_value_t<I>& operator*() const noexcept {
            return keep_;
        }
};

25.5.5.6 Comparisons

template<class I2, sentinel_for<I2> S2>
requires sentinel_for<S, I2>
friend constexpr bool operator==(const common_iterator& x, const common_iterator<I2, S2>& y);
1 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each
false.
2 Returns: true if i == j, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

§ 25.5.5.6
template<class I2, sentinel_for<I> S2>
    requires sentinel_for<S, I2> && equality_comparable_with<I, I2>
friend constexpr bool operator==(
    const common_iterator& x, const common_iterator<I2, S2>& y);

3 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
4 Returns: true if i and j are each 1, and otherwise get<i>(x.v_) == get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

template<sized_sentinel_for<I> I2, sized_sentinel_for<I> S2>
    requires sized_sentinel_for<S, I2>
friend constexpr iter_difference_t<I2> operator-(
    const common_iterator& x, const common_iterator<I2, S2>& y);

5 Preconditions: x.v_.valueless_by_exception() and y.v_.valueless_by_exception() are each false.
6 Returns: 0 if i and j are each 1, and otherwise get<i>(x.v_) - get<j>(y.v_), where i is x.v_.index() and j is y.v_.index().

25.5.5.7 Customizations [common.iter.cust]

friend constexpr iter_rvalue_reference_t<I> iter_move(const common_iterator& i)
    noexcept(noexcept(ranges::iter_move(declval<const I&>())))
    requires input_iterator<I>;
1 Preconditions: holds_alternative<I>(i.v_) is true.
2 Effects: Equivalent to: return ranges::iter_move(get<I>(i.v_));

template<indirectly_swappable<I> I2, class S2>
friend constexpr void iter_swap(const common_iterator& x, const common_iterator<I2, S2>& y)
    noexcept(noexcept(ranges::iter_swap(declval<const I&>(), declval<const I2&>())))
3 Preconditions: holds_alternative<I>(x.v_) and holds_alternative<I2>(y.v_) are each true.
4 Effects: Equivalent to ranges::iter_swap(get<I>(x.v_), get<I2>(y.v_)).

25.5.6 Default sentinel [default.sentinel]

namespace std {
    struct default_sentinel_t { };
}

1 Class default_sentinel_t is an empty type used to denote the end of a range. It can be used together with iterator types that know the bound of their range (e.g., counted_iterator (25.5.7.1)).

25.5.7 Counted iterators [iterators.counted]

25.5.7.1 Class template counted_iterator [counted.iterator]

1 Class template counted_iterator is an iterator adaptor with the same behavior as the underlying iterator except that it keeps track of the distance to the end of its range. It can be used together with default_sentinel in calls to generic algorithms to operate on a range of N elements starting at a given position without needing to know the end position a priori.

2 [Example 1:]
list<string> s;
// populate the list s with at least 10 strings
vector<string> v;
// copies 10 strings into v:
ranges::copy(counted_iterator(s.begin(), 10), default_sentinel, back_inserter(v));
   —end example

3 Two values i1 and i2 of types counted_iterator<I1> and counted_iterator<I2> refer to elements of the same sequence if and only if there exists some integer n such that next(i1.base(), i1.count() + n) and next(i2.base(), i2.count() + n) refer to the same (possibly past-the-end) element.
namespace std {
    template<input_or_output_iterator I>
    class counted_iterator {
    public:
        using iterator_type = I; // present only
        using value_type = iter_value_t<I>;
        using difference_type = iter_difference_t<I>;
        using iterator_concept = typename I::iterator_concept;
        using iterator_category = typename I::iterator_category;
        constexpr counted_iterator() requires default_initializable<I> = default;
        constexpr counted_iterator(I x, iter_difference_t<I> n);
        template<class I2>
        requires convertible_to<const I2&, I>
        constexpr counted_iterator(const counted_iterator<I2>& x);
        template<class I2>
        requires assignable_from<I&, const I2&>
        constexpr counted_iterator& operator=(const counted_iterator<I2>& x);
        constexpr const I& base() const & noexcept;
        constexpr I base() &&;
        constexpr iter_difference_t<I> count() const noexcept;
        constexpr decltype(auto) operator*();
        constexpr decltype(auto) operator*() const requires dereferenceable<const I>;
        constexpr auto operator->() const noexcept requires contiguous_iterator<I>;
        constexpr counted_iterator& operator++();
        constexpr decltype(auto) operator++(int); // present only
        constexpr counted_iterator operator++(int) requires forward_iterator<I>;
        constexpr counted_iterator& operator--();
        constexpr counted_iterator operator--(int) requires bidirectional_iterator<I>;
        constexpr counted_iterator operator+(iter_difference_t<I> n) const requires random_access_iterator<I>;
        friend constexpr counted_iterator operator+(iter_difference_t<I> n, const counted_iterator& x) requires random_access_iterator<I>;
        constexpr counted_iterator& operator+=(iter_difference_t<I> n) requires random_access_iterator<I>;
        constexpr counted_iterator operator-(iter_difference_t<I> n) const requires random_access_iterator<I>;
        friend constexpr iter_difference_t<I> operator-(const counted_iterator& x, const counted_iterator<I2>& y);
        friend constexpr iter_difference_t<I> operator-(const counted_iterator& x, default_sentinel_t);
        friend constexpr iter_difference_t<I> operator-(default_sentinel_t, const counted_iterator& y);
        constexpr counted_iterator& operator-=(iter_difference_t<I> n) requires random_access_iterator<I>;
        constexpr decltype(auto) operator[](iter_difference_t<I> n) const requires random_access_iterator<I>;
    }; // counted_iterator
}; // namespace std

§ 25.5.7.1
template<common_with<I> I2>
friend constexpr bool operator==(const counted_iterator& x, const counted_iterator<I2>& y);
friend constexpr bool operator==(const counted_iterator& x, default_sentinel_t);

template<common_with<I> I2>
friend constexpr strong_ordering operator<>(const counted_iterator& x, const counted_iterator<I2>& y);

friend constexpr iter_rvalue_reference_t<I> iter_move(const counted_iterator& i) noexcept(noexcept(ranges::iter_move(i.current)))
  requires input_iterator<I>;

template<indirectly_swappable<I> I2>
friend constexpr void iter_swap(const counted_iterator& x, const counted_iterator<I2>& y)
  noexcept(noexcept(ranges::iter_swap(x.current, y.current)));

private:
  I current = I();  // exposition only
  iter_difference_t<I> length = 0;  // exposition only
};

template<input_iterator I>
requires same_as<ITER_TRAITS(I), iterator_traits<I>> // see 25.3.4.1
struct iterator_traits<counted_iterator<I>> : iterator_traits<I> {
  using pointer = conditional_t<contiguous_iterator<I>, add_pointer_t<iter_reference_t<I>>, void>;
};

25.5.7.2 Constructors and conversions [counted.iter.const]

counted_iterator(I i, iter_difference_t<I> n);
1  Preconditions: n >= 0.
2  Effects: Initializes current with std::move(i) and length with n.

template<class I2>
requires convertible_to<const I2&, I>
  counted_iterator(const counted_iterator<I2>& x);
3  Effects: Initializes current with x.current and length with x.length.

template<class I2>
requires assignable_from<I&, const I2&>
  counted_iterator(const counted_iterator<I2>& x);
4  Effects: Assigns x.current to current and x.length to length.
5  Returns: *this.

25.5.7.3 Accessors [counted.iter.access]
counted_iterator(I& base) const & noexcept;
1  Effects: Equivalent to: return current;

counted_iterator(I& base) &&;
2  Returns: std::move(current).

counted_iterator(I& current) count() const noexcept;
3  Effects: Equivalent to: return length;

25.5.7.4 Element access [counted.iter.elem]
counted_iterator decltype(auto) operator*();
constexpr decltype(auto) operator*() const
requires dereferenceable<const I>;

1  **Preconditions:** length > 0 is true.

2  **Effects:** Equivalent to: return *current;

constexpr auto operator->() const noexcept
requires contiguous_iterator<I>;

3  **Effects:** Equivalent to: return to_address(current);

constexpr decltype(auto) operator[](iter_difference_t<I> n) const
requires random_access_iterator<I>;

4  **Preconditions:** n < length.

5  **Effects:** Equivalent to: return current[n];

### 25.5.7.5 Navigation
[couned.iter.nav]

constexpr counted_iterator& operator++();

1  **Preconditions:** length > 0.

2  **Effects:** Equivalent to:
++current;
--length;
return *this;

constexpr decltype(auto) operator++(int);

3  **Preconditions:** length > 0.

4  **Effects:** Equivalent to:
--length;
try { return current++; }
catch(...) { ++length; throw; }

constexpr counted_iterator operator++(int)
requires forward_iterator<I>;

5  **Effects:** Equivalent to:
counted_iterator tmp = *this;
***this;
return tmp;

constexpr counted_iterator& operator--();
requires bidirectional_iterator<I>;

6  **Effects:** Equivalent to:
--current;
++length;
return *this;

constexpr counted_iterator operator--(int)
requires bidirectional_iterator<I>;

7  **Effects:** Equivalent to:
counted_iterator tmp = *this;
---this;
return tmp;

constexpr counted_iterator operator+(iter_difference_t<I> n) const
requires random_access_iterator<I>;

8  **Effects:** Equivalent to: return counted_iterator(current + n, length - n);
friend constexpr counted_iterator operator+(iter_difference_t<I> n, const counted_iterator& x)  
    requires random_access_iterator<I>;

Effects: Equivalent to: return x + n;

constexpr counted_iterator& operator+=(iter_difference_t<I> n)  
    requires random_access_iterator<I>;

Preconditions: n <= length.

Effects: Equivalent to:  
current += n;
length -= n;
return *this;

constexpr counted_iterator operator-(iter_difference_t<I> n) const  
    requires random_access_iterator<I>;

Effects: Equivalent to: return counted_iterator(current - n, length + n);

template<common_with<I> I2>  
friend constexpr iter_difference_t<I2> operator-(  
    const counted_iterator& x, const counted_iterator<I2>& y);  

Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

Effects: Equivalent to: return y.length - x.length;

friend constexpr iter_difference_t<I> operator-(  
    const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: return -x.length;

friend constexpr iter_difference_t<I> operator-(  
    default_sentinel_t, const counted_iterator& y);

Effects: Equivalent to: return y.length;

constexpr counted_iterator& operator-=(iter_difference_t<I> n)  
    requires random_access_iterator<I>;

Preconditions: -n <= length.

Effects: Equivalent to:  
current -= n;
length += n;
return *this;

25.5.7.6 Comparisons [counted.iter.cmp]

template<common_with<I> I2>  
friend constexpr bool operator==(  
    const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

Effects: Equivalent to: return x.length == y.length;

friend constexpr bool operator==(  
    const counted_iterator& x, default_sentinel_t);

Effects: Equivalent to: return x.length == 0;

template<common_with<I> I2>  
friend constexpr strong_ordering operator<=>(  
    const counted_iterator& x, const counted_iterator<I2>& y);

Preconditions: x and y refer to elements of the same sequence (25.5.7.1).

Effects: Equivalent to: return y.length <=> x.length;

[Note 1: The argument order in the Effects: element is reversed because length counts down, not up. — end note]
25.5.7.7 Customizations

friend constexpr iter_rvalue_reference_t<I>
iter_move(const counted_iterator& i)
    noexcept(noexcept(ranges::iter_move(i.current)))
requires input_iterator<I>;

1 Preconditions: i.length > 0 is true.
2 Effects: Equivalent to: return ranges::iter_move(i.current);

25.5.8 Unreachable sentinel

1 Class unreachable_sentinel_t can be used with any weakly_incrementable type to denote the “upper bound” of an unbounded interval.
2 [Example 1]:

```
char* p;
// set p to point to a character buffer containing newlines
char* nl = find(p, unreachable_sentinel, '\n');
```

Provided a newline character really exists in the buffer, the use of unreachable_sentinel above potentially makes the call to find more efficient since the loop test against the sentinel does not require a conditional branch. — end example]

namespace std {
    struct unreachable_sentinel_t {
        template<weakly_incrementable I>
        friend constexpr bool operator==(unreachable_sentinel_t, const I&) noexcept
        { return false; }
    };
}

25.6 Stream iterators

25.6.1 General

1 To make it possible for algorithmic templates to work directly with input/output streams, appropriate iterator-like class templates are provided.
2 [Example 1]:

```
partial_sum(istream_iterator<double, char>(cin),
    istream_iterator<double, char>(),
    ostream_iterator<double, char>(cout, "\n"));
```

reads a file containing floating-point numbers from cin, and prints the partial sums onto cout. — end example]

25.6.2 Class template istream_iterator

25.6.2.1 General

1 The class template istream_iterator is an input iterator (25.3.5.3) that reads successive elements from the input stream for which it was constructed.

```
namespace std {
    template<class T, class charT = char, class traits = char_traits<charT>,
            class Distance = ptrdiff_t>
    class istream_iterator {
    public:
        using iterator_category = input_iterator_tag;
        using value_type = T;
        using difference_type = Distance;
        using pointer = const T*;
    }
```
using reference = const T&;
using char_type = charT;
using traits_type = traits;
using istream_type = basic_istream<charT, traits>;

constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
istream_iterator(istream_type& s);
constexpr istream_iterator(const istream_iterator& x) noexcept(see below);
~istream_iterator() = default;
istream_iterator& operator=(const istream_iterator&) = default;

const T& operator*() const;
const T* operator->() const;
istream_iterator& operator++();
istream_iterator operator++(int);

friend bool operator==(const istream_iterator& i, default_sentinel_t);

private:
  basic_istream<charT, traits>* in_stream; // exposition only
  T value; // exposition only
};

2 The type T shall meet the Cpp17DefaultConstructible, Cpp17CopyConstructible, and Cpp17CopyAssignable requirements.

25.6.2.2 Constructors and destructor [istream.iterator.cons]

constexpr istream_iterator();
constexpr istream_iterator(default_sentinel_t);
1 Effects: Constructs the end-of-stream iterator, value-initializing value.
2 Postconditions: in_stream == nullptr is true.
3 Remarks: If the initializer T() in the declaration auto x = T(); is a constant initializer (7.7), then these constructors are constexpr constructors.

istream_iterator(istream_type& s);
4 Effects: Initializes in_stream with addressof(s), value-initializes value, and then calls operator++().

constexpr istream_iterator(const istream_iterator& x) noexcept(see below);
5 Effects: Initializes in_stream with x.in_stream and initializes value with x.value.
6 Remarks: An invocation of this constructor may be used in a core constant expression if and only if the initialization of value from x.value is a constant subexpression (3.14). The exception specification is equivalent to is_nothrow_copy_constructible_v<T>.

~istream_iterator() = default;
7 Remarks: If is_trivially_destructible_v<T> is true, then this destructor is trivial.

25.6.2.3 Operations [istream.iterator.ops]

const T& operator*() const;
1 Preconditions: in_stream != nullptr is true.
2 Returns: value.

const T* operator->() const;
3 Preconditions: in_stream != nullptr is true.
4 Returns: addressof(value).
istream_iterator& operator++();

Preconditions: in_stream != nullptr is true.

Effects: Equivalent to:

if (!(in_stream >> value))
    in_stream = nullptr;

Returns: *this.

istream_iterator operator++(int);

Preconditions: in_stream != nullptr is true.

Effects: Equivalent to:

istream_iterator tmp = *this;
++*this;
return tmp;

Returns: x.in_stream == y.in_stream.

friend bool operator==(const istream_iterator& i, default_sentinel_t);

Returns: !i.in_stream.

25.6.3 Class template ostream_iterator

25.6.3.1 General

ostream_iterator writes (using operator<<) successive elements onto the output stream from which it was constructed. If it was constructed with charT* as a constructor argument, this string, called a delimiter string, is written to the stream after every T is written.

namespace std {
    template<class T, class charT = char, class traits = char_traits<charT> >
    class ostream_iterator {
public:
        using iterator_category = output_iterator_tag;
        using value_type = void;
        using difference_type = ptrdiff_t;
        using pointer = void;
        using reference = void;
        using char_type = charT;
        using traits_type = traits;
        using ostream_type = basic_ostream<charT,traits> ;
        
        ostream_iterator(ostream_type& s);
        ostream_iterator(ostream_type& s, const charT* delimiter);
        ostream_iterator(const ostream_iterator& x);
        ~ostream_iterator();
        ostream_iterator& operator=(const ostream_iterator& x) = default;
        ostream_iterator& operator=(const T& value);
        
        ostream_iterator& operator*();
        ostream_iterator& operator++();
        ostream_iterator& operator++(int);
        
private:
        basic_ostream<charT,traits>* out_stream; // exposition only
        const charT* delim; // exposition only
    };
}
25.6.3.2 Constructors and destructor

ostream_iterator(ostream_type& s);

\textit{Effects}: Initializes \textit{out\_stream} with \texttt{addressof}(s) and \texttt{delim} with \texttt{nullptr}.

ostream_iterator(ostream_type& s, const charT* delimiter);

\textit{Effects}: Initializes \textit{out\_stream} with \texttt{addressof}(s) and \texttt{delim} with \texttt{delimiter}.

25.6.3.3 Operations

ostream_iterator& operator=(const T& value);

\textit{Effects}: As if by:
\begin{verbatim}
  *out_stream << value;
  if (delim)
    *out_stream << delim;
\end{verbatim}

\textit{Returns}: *this.

ostream_iterator& operator*();

\textit{Returns}: *this.

ostream_iterator& operator++();

ostream_iterator& operator++(int);

\textit{Returns}: *this.

25.6.4 Class template istreambuf_iterator

25.6.4.1 General

The class template \texttt{istreambuf\_iterator} defines an input iterator (25.3.5.3) that reads successive \textit{characters} from the streambuf for which it was constructed. \texttt{operator*} provides access to the current input character, if any. Each time \texttt{operator++} is evaluated, the iterator advances to the next input character. If the end of stream is reached (\texttt{streambuf\_type::sgetc()} returns \texttt{traits::eof()}), the iterator becomes equal to the \textit{end-of-stream} iterator value. The default constructor \texttt{istreambuf\_iterator()} and the constructor \texttt{istreambuf\_iterator(nullptr)} both construct an end-of-stream iterator object suitable for use as an end of range. All specializations of \texttt{istreambuf\_iterator} shall have a trivial copy constructor, a \texttt{constexpr} default constructor, and a trivial destructor.

The result of \texttt{operator*()} on an end-of-stream iterator is undefined. For any other iterator value a \textit{char\_type} value is returned. It is impossible to assign a character via an input iterator.

```cpp
namespace std {
  template<class charT, class traits = char_traits<charT>>
  class istreambuf_iterator {
    public:
      using iterator_category = input_iterator_tag;
      using value_type = charT;
      using difference_type = typename traits::off_type;
      using pointer = unspecified;
      using reference = charT;
      using char_type = charT;
      using traits_type = traits;
      using int_type = typename traits::int_type;
      using streambuf_type = basic_streambuf<charT,traits>;
      using istream_type = basic_istream<charT,traits>;

      // 25.6.4.2, class istreambuf_iterator::proxy
      class proxy {
        // exposition only
      public:
        constexpr istreambuf_iterator() noexcept;
        constexpr istreambuf_iterator(default_sentinel_t) noexcept;
        istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
        ~istreambuf_iterator() = default;
        istreambuf_iterator(istream_type& s) noexcept;
        istreambuf_iterator(streambuf_type* s) noexcept;
      }
  public:
    using iterator_category = input_iterator_tag;
    using value_type = charT;
    using difference_type = typename traits::off_type;
    using pointer = unspecified;
    using reference = charT;
    using char_type = charT;
    using traits_type = traits;
    using int_type = typename traits::int_type;
    using streambuf_type = basic_streambuf<charT,traits>;
    using istream_type = basic_istream<charT,traits>;

    // 25.6.4.2, class istreambuf_iterator::proxy
    class proxy {
      // exposition only
    public:
      constexpr istreambuf_iterator() noexcept;
      constexpr istreambuf_iterator(default_sentinel_t) noexcept;
      istreambuf_iterator(const istreambuf_iterator&) noexcept = default;
      ~istreambuf_iterator() = default;
      istreambuf_iterator(istream_type& s) noexcept;
      istreambuf_iterator(streambuf_type* s) noexcept;
    }
  }
```
25.6.4.2 Class istreambuf_iterator::proxy

Class istreambuf_iterator<charT,traits>::proxy is for exposition only. An implementation is permitted to provide equivalent functionality without providing a class with this name. Class istreambuf_iterator<charT,traits>::proxy provides a temporary placeholder as the return value of the post-increment operator (operator++). It keeps the character pointed to by the previous value of the iterator for some possible future access to get the character.

```cpp
namespace std {
  template<class charT, class traits>
  class istreambuf_iterator<charT, traits>::proxy {
    // exposition only
    charT keep_;  
    basic_streambuf<charT,traits>* sbuf_;  
    proxy(charT c, basic_streambuf<charT,traits>* sbuf) : keep_(c), sbuf_(sbuf) {}  
  public:
    charT operator*() { return keep_; }  
  };  
}
```

25.6.4.3 Constructors

For each istreambuf_iterator constructor in this subclause, an end-of-stream iterator is constructed if and only if the exposition-only member sbuf_ is initialized with a null pointer value.

```cpp
constexpr istreambuf_iterator() noexcept;  
constexpr istreambuf_iterator(default_sentinel_t) noexcept;  
istreambuf_iterator(istream_type& s) noexcept;  
istreambuf_iterator(streambuf_type* s) noexcept;  
istreambuf_iterator(const proxy& p) noexcept;  
```

25.6.4.4 Operations

```cpp
charT operator*() const;  
istreambuf_iterator& operator++();  
proxy operator++(int);  
```

§ 25.6.4.4 1113
bool equal(const istreambuf_iterator& b) const;

Returns: true if and only if both iterators are at end-of-stream, or neither is at end-of-stream, regardless of what streambuf object they use.

template<class charT, class traits>
bool operator==(const istreambuf_iterator<charT,traits>& a,
const istreambuf_iterator<charT,traits>& b);

Returns: a.equal(b).

friend bool operator==(const istreambuf_iterator& i, default_sentinel_t s);

Returns: i.equal(s).

25.6.5 Class template ostreambuf_iterator

25.6.5.1 General

The class template ostreambuf_iterator writes successive characters onto the output stream from which it was constructed.

namespace std {

template<class charT, class traits = char_traits<charT>>
class ostreambuf_iterator {

public:
    using iterator_category = output_iterator_tag;
    using value_type = void;
    using difference_type = ptrdiff_t;
    using pointer = void;
    using reference = void;
    using char_type = charT;
    using traits_type = traits;
    using streambuf_type = basic_streambuf<charT,traits>;
    using ostream_type = basic_ostream<charT,traits>;

    ostreambuf_iterator(ostream_type& s) noexcept;
    ostreambuf_iterator(streambuf_type* s) noexcept;
    ostreambuf_iterator& operator=(charT c);
    ostreambuf_iterator& operator*();
    ostreambuf_iterator& operator++();
    ostreambuf_iterator& operator++(int);
    bool failed() const noexcept;

private:
    streambuf_type* sbuf_; // exposition only
};

25.6.5.2 Constructors

ostreambuf_iterator(ostream_type& s) noexcept;

Preconditions: s.rdbuf() is not a null pointer.
Effects: Initializes sbuf_ with s.rdbuf().

ostreambuf_iterator(streambuf_type* s) noexcept;

Preconditions: s is not a null pointer.
Effects: Initializes sbuf_ with s.

25.6.5.3 Operations

ostreambuf_iterator& operator=(charT c);

Effects: If failed() yields false, calls sbuf_->sputc(c); otherwise has no effect.
Returns: *this.
ostreambuf_iterator& operator*();

Returns: *this.

ostreambuf_iterator& operator++();
ostreambuf_iterator& operator++(int);

Returns: *this.

bool failed() const noexcept;

Returns: true if in any prior use of member operator=, the call to sbuf->_sputc() returned traits::eof(); or false otherwise.

### 25.7 Range access

In addition to being available via inclusion of the `<iterator>` header, the function templates in 25.7 are available when any of the following headers are included: `<array>` (24.3.2), `<deque>` (24.3.3), `<forward_list>` (24.3.4), `<list>` (24.3.5), `<map>` (24.4.2), `<regex>` (32.3), `<set>` (24.4.3), `<span>` (24.7.2.1), `<string>` (23.4.2), `<string_view>` (23.3.2), `<unordered_map>` (24.5.2), `<unordered_set>` (24.5.3), and `<vector>` (24.3.6). Each of these templates is a designated customization point (16.4.5.2.1).

```cpp
template<class C> constexpr auto begin(C& c) -> decltype(c.begin());
template<class C> constexpr auto begin(const C& c) -> decltype(c.begin());

Returns: c.begin().

template<class C> constexpr auto end(C& c) -> decltype(c.end());
template<class C> constexpr auto end(const C& c) -> decltype(c.end());

Returns: c.end().

template<class T, size_t N> constexpr T* begin(T (&array)[N]) noexcept;

template<class T, size_t N> constexpr T* end(T (&array)[N]) noexcept;

Returns: array + N.

template<class C> constexpr auto cbegin(const C& c) noexcept(noexcept(std::begin(c)))
-> decltype(std::begin(c));

Returns: std::begin(c).

template<class C> constexpr auto cend(const C& c) noexcept(noexcept(std::end(c)))
-> decltype(std::end(c));

Returns: std::end(c).

template<class C> constexpr auto rbegin(C& c) -> decltype(c.rbegin());
template<class C> constexpr auto rbegin(const C& c) -> decltype(c.rbegin());

Returns: c.rbegin().

template<class C> constexpr auto rend(C& c) -> decltype(c.rend());
template<class C> constexpr auto rend(const C& c) -> decltype(c.rend());

Returns: c.rend().

template<class T, size_t N> constexpr reverse_iterator<T*> rbegin(T (&array)[N]);
	noexcept;

template<class C> constexpr reverse_iterator<const C*> rbegin(initializer_list<C> il);

Returns: reverse_iterator<const C*>(il.begin()).

template<class C> constexpr reverse_iterator<const C*> rend(initializer_list<C> il);

Returns: reverse_iterator<const C*>(il.end()).
```
template<class C> constexpr auto crbegin(const C& c) -> decltype(std::rbegin(c));
Returns: std::rbegin(c).

template<class C> constexpr auto crend(const C& c) -> decltype(std::rend(c));
Returns: std::rend(c).

template<class C> constexpr auto size(const C& c) -> decltype(c.size());
Returns: c.size().

template<class T, size_t N> constexpr size_t size(const T (&array)[N]) noexcept;
Returns: N.

template<class C> constexpr auto ssize(const C& c)
-> common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>;
Effects: Equivalent to:
return static_cast<common_type_t<ptrdiff_t, make_signed_t<decltype(c.size())>>>(c.size());

template<class T, ptrdiff_t N> constexpr ptrdiff_t ssize(const T (&array)[N]) noexcept;
Returns: N.

template<class C> [[nodiscard]] constexpr auto empty(const C& c) -> decltype(c.empty());
Returns: c.empty().

template<class T, size_t N> [[nodiscard]] constexpr bool empty(const T (&array)[N]) noexcept;
Returns: false.

template<class E> [[nodiscard]] constexpr bool empty(initializer_list<E> il) noexcept;
Returns: il.size() == 0.

template<class C> constexpr auto data(C& c) -> decltype(c.data());
template<class C> constexpr auto data(const C& c) -> decltype(c.data());
Returns: c.data().

template<class T, size_t N> constexpr T* data(T (&array)[N]) noexcept;
Returns: array.

template<class E> constexpr const E* data(initializer_list<E> il) noexcept;
Returns: il.begin().

§ 25.7
26  Ranges library

26.1  General

1 This Clause describes components for dealing with ranges of elements.

2 The following subclauses describe range and view requirements, and components for range primitives and
range generators as summarized in Table 93.

<table>

  inline constexpr from_range_t from_range{}; // freestanding

  struct to_range_t { explicit to_range_t() = default; };
  inline constexpr to_range_t to_range{}; // freestanding

  // freestanding
1 Within this Clause, for an integer-like type X (25.3.4.4), make_unsigned-like-t<X> denotes make_unsigned_t<X> if X is an integer type; otherwise, it denotes a corresponding unspecified unsigned-integer-like type of the same width as X. For an expression x of type X, to_unsigned_like(x) is x explicitly converted to make_unsigned-like-t<X>.

2 Also within this Clause, make_signed-like-t<X> for an integer-like type X denotes make_signed_t<X> if X is an integer type; otherwise, it denotes a corresponding unspecified signed-integer-like type of the same width as X.

26.3 Range access [range.access]
26.3.1 General [range.access.general]

1 In addition to being available via inclusion of the <ranges> header, the customization point objects in 26.3 are available when <iterator> (25.2) is included.

2 Within 26.3, the reified object of a subexpression E denotes
26.3.2 ranges::begin

The name ranges::begin denotes a customization point object (16.3.3.3.5).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::begin(E) is ill-formed.
2. Otherwise, let U be ranges::begin(possibly-const-range(t)). ranges::begin(E) is expression-equivalent to const_iterator<decltype(U)>(U).

26.3.3 ranges::end

The name ranges::end denotes a customization point object (16.3.3.3.5).

Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::end(E) is ill-formed.
2. Otherwise, let U be ranges::begin(possibly-const-range(t)). ranges::end(E) is expression-equivalent to const_iterator<decltype(U)>(U).

26.3.4 ranges::cbegin

The name ranges::cbegin denotes a customization point object (16.3.3.3.5). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

1. If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::cbegin(E) is ill-formed.
2. Otherwise, let U be ranges::begin<possibly-const-range(t)>. ranges::cbegin(E) is expression-equivalent to const_iterator<decltype(U)>(U).
2  [Note 1: Whenever `ranges::cbegin(E)` is a valid expression, its type models `input_or_output_iterator` and `constant_iterator`. — end note]

26.3.5 `ranges::cend`  
The name `ranges::cend` denotes a customization point object (16.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(1.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::cend(E)` is ill-formed.

(1.2) — Otherwise, let `U` be `ranges::end(possibly-const-range(t))`. `ranges::cend(E)` is expression-equivalent to `const_sentinel<decltype(U)>>(U).

2  [Note 1: Whenever `ranges::cend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::cend(E)` and `ranges::cbegin(E)` model `sentinel_for<S, I>`. If `S` models `input_iterator`, then `S` also models `constant_iterator`. — end note]

26.3.6 `ranges::rbegin`  
The name `ranges::rbegin` denotes a customization point object (16.3.3.5).

2  Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rbegin(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rbegin(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `auto(t.rbegin())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rbegin(E)` is expression-equivalent to `auto(t.rbegin())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and `auto(rbegin(t))` is a valid expression whose type models `input_or_output_iterator` where the meaning of `rbegin` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::rbegin(E)` is expression-equivalent to that expression.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), `ranges::rbegin(E)` is expression-equivalent to `make_reverse_iterator(ranges::end(t))`.

(2.6) — Otherwise, `ranges::rbegin(E)` is ill-formed.

3  [Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rbegin(E)` appears in the immediate context of a template instantiation. — end note]

4  [Note 2: Whenever `ranges::rbegin(E)` is a valid expression, its type models `input_or_output_iterator`. — end note]

26.3.7 `ranges::rend`  
The name `ranges::rend` denotes a customization point object (16.3.3.5).

2  Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

(2.1) — If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::rend(E)` is ill-formed.

(2.2) — Otherwise, if `T` is an array type (9.3.4.5) and `remove_all_extents_t<T>` is an incomplete type, `ranges::rend(E)` is ill-formed with no diagnostic required.

(2.3) — Otherwise, if `auto(t.rend())` is a valid expression whose type models `input_or_output_iterator`, `ranges::rend(E)` is expression-equivalent to `auto(t.rend())`.

(2.4) — Otherwise, if `T` is a class or enumeration type and `auto(rend(t))` is a valid expression whose type models `input_or_output_iterator` where the meaning of `rend` is established as-if by performing argument-dependent lookup only (6.5.4), then `ranges::rend(E)` is expression-equivalent to that expression.

(2.5) — Otherwise, if both `ranges::begin(t)` and `ranges::end(t)` are valid expressions of the same type which models `bidirectional_iterator` (25.3.4.12), `ranges::rend(E)` is expression-equivalent to `make_reverse_iterator(ranges::begin(t))`. 

§ 26.3.7
— Otherwise, `ranges::rend(E)` is ill-formed.

[Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::rend(E)` appears in the immediate context of a template instantiation. — end note]

— Otherwise, `ranges::begin(E)` and `ranges::rbegin(E)` model `sentinel_for<S, I>`. — end note]

### 26.3.8 `ranges::crbegin`

The name `ranges::crbegin` denotes a customization point object (16.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

— If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::crbegin(E)` is ill-formed.

— Otherwise, let `U` be `ranges::begin(possibly-const-range(t))`. `ranges::crbegin(E)` is expression-equivalent to `const_iterator<decltype(U)>(U)`.

[Note 1: Whenever `ranges::crbegin(E)` is a valid expression, its type models `input_or_output_iterator` and `constant-iterator`. — end note]

### 26.3.9 `ranges::crend`

The name `ranges::crend` denotes a customization point object (16.3.3.5). Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

— If `E` is an rvalue and `enable_borrowed_range<remove_cv_t<T>>` is false, `ranges::crend(E)` is ill-formed.

— Otherwise, let `U` be `ranges::end(possibly-const-range(t))`. `ranges::crend(E)` is expression-equivalent to `const_sentinel<decltype(U)>(U)`.

[Note 1: Whenever `ranges::crend(E)` is a valid expression, the types `S` and `I` of the expressions `ranges::crend(E)` and `ranges::crbegin(E)` model `sentinel_for<S, I>`. If `S` models `input_iterator`, then `S` also models `constant-iterator`. — end note]

### 26.3.10 `ranges::size`

The name `ranges::size` denotes a customization point object (16.3.3.5).

Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. Then:

— If `T` is an array of unknown bound (9.3.4.5), `ranges::size(E)` is ill-formed.

— Otherwise, if `T` is an array type, `ranges::size(E)` is expression-equivalent to `auto(extent_v<T>)`.

— Otherwise, if `disable_sized_range<remove_cv_t<T>>` (26.4.3) is false and `auto(t.size())` is a valid expression of integer-like type (25.3.4.4), `ranges::size(E)` is expression-equivalent to `auto(t.size())`.

— Otherwise, if `T` is a class or enumeration type, `disable_sized_range<remove_cv_t<T>>` is false and `auto(size(t))` is a valid expression of integer-like type where the meaning of `size` is established as if by performing argument-dependent lookup only (6.5.4), then `ranges::size(E)` is expression-equivalent to that expression.

— Otherwise, if `to_unsigned-like(ranges::end(t) - ranges::begin(t))` (26.2) is a valid expression and the types `I` and `S` of `ranges::begin(t)` and `ranges::end(t)` (respectively) model both `sized_sentinel_for<S, I>` (25.3.4.8) and `forward_iterator<I>`, then `ranges::size(E)` is expression-equivalent to `to_unsigned-like(ranges::end(t) - ranges::begin(t))`.

— Otherwise, `ranges::size(E)` is ill-formed.

[Note 1: Diagnosable ill-formed cases above result in substitution failure when `ranges::size(E)` appears in the immediate context of a template instantiation. — end note]

— Otherwise, `ranges::size(E)` is ill-formed. — end note]

### 26.3.11 `ranges::ssize`

The name `ranges::ssize` denotes a customization point object (16.3.3.3.5).

Given a subexpression `E` with type `T`, let `t` be an lvalue that denotes the reified object for `E`. If `ranges::size(t)` is ill-formed, `ranges::ssize(E)` is ill-formed. Otherwise let `D` be `make_signed-like-t<decltype(ranges::ssize)`.
size(t)>>, or ptrdiff_t if it is wider than that type; ranges::ssize(E) is expression-equivalent to static_cast<D>(ranges::size(t)).

26.3.12 ranges::empty [range.prim.empty]

1 The name ranges::empty denotes a customization point object (16.3.3.3.5).

2 Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

(2.1) — If T is an array of unknown bound (9.3.4.5), ranges::empty(E) is ill-formed.

(2.2) — Otherwise, if bool(t.empty()) is a valid expression, ranges::empty(E) is expression-equivalent to bool(t.empty()).

(2.3) — Otherwise, if (ranges::size(t) == 0) is a valid expression, ranges::empty(E) is expression-equivalent to (ranges::size(t) == 0).

(2.4) — Otherwise, if bool(ranges::begin(t) == ranges::end(t)) is a valid expression and the type of ranges::begin(t) models forward_iterator, ranges::empty(E) is expression-equivalent to bool(ranges::begin(t) == ranges::end(t)).

(2.5) — Otherwise, ranges::empty(E) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::empty(E) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever ranges::empty(E) is a valid expression, it has type bool. — end note]

26.3.13 ranges::data [range.prim.data]

1 The name ranges::data denotes a customization point object (16.3.3.3.5).

2 Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

(2.1) — If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::data(E) is ill-formed.

(2.2) — Otherwise, if T is an array type (9.3.4.5) and remove_all_extents_t<T> is an incomplete type, ranges::data(E) is ill-formed with no diagnostic required.

(2.3) — Otherwise, if auto(t.data()) is a valid expression of pointer to object type, ranges::data(E) is expression-equivalent to auto(t.data()).

(2.4) — Otherwise, if ranges::begin(t) is a valid expression whose type models contiguous_iterator, ranges::data(E) is expression-equivalent to to_address(ranges::begin(t)).

(2.5) — Otherwise, ranges::data(E) is ill-formed.

3 [Note 1: Diagnosable ill-formed cases above result in substitution failure when ranges::data(E) appears in the immediate context of a template instantiation. — end note]

4 [Note 2: Whenever ranges::data(E) is a valid expression, it has pointer to object type. — end note]

26.3.14 ranges::cdata [range.prim.cdata]

1 The name ranges::cdata denotes a customization point object (16.3.3.3.5). Given a subexpression E with type T, let t be an lvalue that denotes the reified object for E. Then:

(1.1) — If E is an rvalue and enable_borrowed_range<remove_cv_t<T>> is false, ranges::cdata(E) is ill-formed.

(1.2) — Otherwise, ranges::cdata(E) is expression-equivalent to as_const_pointer(ranges::data(possibly_const_range(t))).

2 [Note 1: Whenever ranges::cdata(E) is a valid expression, it has pointer to constant object type. — end note]

26.4 Range requirements [range.req]

26.4.1 General [range.req.general]

1 Ranges are an abstraction that allows a C++ program to operate on elements of data structures uniformly. Calling ranges::begin on a range returns an object whose type models input_or_output_iterator (25.3.4.6). Calling ranges::end on a range returns an object whose type S, together with the type I of the object
The library formalizes the interfaces, semantics, and complexity of ranges to enable algorithms and range adaptors that work efficiently on different types of sequences.

The range concept requires that `ranges::begin` and `ranges::end` return an iterator and a sentinel, respectively. The sized_range concept refines range with the requirement that `ranges::size` be amortized $O(1)$. The view concept specifies requirements on a range type to provide operations with predictable complexity.

Several refinements of range group requirements that arise frequently in concepts and algorithms. Common ranges are ranges for which `ranges::begin` and `ranges::end` return objects of the same type. Random access ranges are ranges for which `ranges::begin` returns a type that models random_access_iterator (25.3.4.13). (Contiguous, bidirectional, forward, input, and output ranges are defined similarly.) Viewable ranges can be converted to views.

26.4.2 Ranges

The range concept defines the requirements of a type that allows iteration over its elements by providing an iterator and sentinel that denote the elements of the range.

```cpp
template<class T>
concept range =
  requires(T& t) {
    ranges::begin(t); // sometimes equality-preserving (see below)
    ranges::end(t);
  };
```

The required expressions `ranges::begin(t)` and `ranges::end(t)` of the range concept do not require implicit expression variations (18.2).

Given an expression `t` such that `decltype((t))` is `Tk`, `T` models range only if

1. `[ranges::begin(t), ranges::end(t)]` denotes a range (25.3.1),
2. both `ranges::begin(t)` and `ranges::end(t)` are amortized constant time and non-modifying, and
3. if the type of `ranges::begin(t)` models forward_iterator, `ranges::begin(t)` is equality-preserving.

4. [Note 1: Equality preservation of both `ranges::begin` and `ranges::end` enables passing a range whose iterator type models forward_iterator to multiple algorithms and making multiple passes over the range by repeated calls to `ranges::begin` and `ranges::end`. Since `ranges::begin` is not required to be equality-preserving when the return type does not model forward_iterator, it is possible for repeated calls to not return equal values or to not be well-defined. —end note]

```cpp
template<class T>
concept borrowed_range =
  range<T> && (is_lvalue_reference_v<T> || enable_borrowed_range<remove_cvref_t<T>>);
```

Let `U` be `remove_reference_t<T>` if `T` is an rvalue reference type, and `T` otherwise. Given a variable `u` of type `T`, `T` models borrowed_range only if the validity of iterators obtained from `u` is not tied to the lifetime of that variable.

6. [Note 2: Since the validity of iterators is not tied to the lifetime of a variable whose type models borrowed_range, a function with a parameter of such a type can return iterators obtained from it without danger of dangling. —end note]

```cpp
template<class>
constexpr bool enable_borrowed_range = false;
```

Remarks: Pursuant to 16.4.5.2.1, users may specialize `enable_borrowed_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

8. [Example 1: Each specialization `S` of class template subrange (26.5.4) models borrowed_range because

1. `enable_borrowed_range<S>` is specialized to have the value true, and
2. `S`'s iterators do not have validity tied to the lifetime of an `S` object because they are “borrowed” from some other range. —end example]
26.4.3 Sized ranges

The `sized_range` concept refines `range` with the requirement that the number of elements in the range can be determined in amortized constant time using `ranges::size`.

```
template<class T>
concept sized_range =
  range<T> && requires(T& t) { ranges::size(t); };
```

Given an lvalue `t` of type `remove_reference_t<T>`, `T` models `sized_range` only if

1. `ranges::size(t)` is amortized $O(1)$, does not modify `t`, and is equal to `ranges::distance(ranges::begin(t), ranges::end(t))`, and
2. if `iterator_t<T>` models `forward_iterator`, `ranges::size(t)` is well-defined regardless of the evaluation of `ranges::begin(t)`.

[Note 1: `ranges::size(t)` is otherwise not required to be well-defined after evaluating `ranges::begin(t)`. For example, it is possible for `ranges::size(t)` to be well-defined for a `sized_range` whose iterator type does not model `forward_iterator` only if evaluated before the first call to `ranges::begin(t). — end note]

```
template<class>
constexpr bool disable_sized_range = false;
```

Remarks: Pursuant to 16.4.5.2.1, users may specialize `disable_sized_range` for cv-unqualified program-defined types. Such specializations shall be usable in constant expressions (7.7) and have type `const bool`.

```
[Note 2: disable_sized_range allows use of range types with the library that satisfy but do not in fact model sized_range. — end note]
```

26.4.4 Views

The `view` concept specifies the requirements of a `range` type that has the semantic properties below, which make it suitable for use in constructing range adaptor pipelines (26.7).

```
template<class T>
concept view =
  range<T> && movable<T> && enable_view<T>;
```

`T` models `view` only if:

1. `T` has $O(1)$ move construction; and
2. move assignment of an object of type `T` is no more complex than destruction followed by move construction; and
3. if `N` copies and/or moves are made from an object of type `T` that contained `M` elements, then those `N` objects have $O(N + M)$ destruction; and
4. `copy_constructible<T>` is `false`, or `T` has $O(1)$ copy construction; and
5. `copyable<T>` is `false`, or copy assignment of an object of type `T` is no more complex than destruction followed by copy construction.

```
[Note 1: The constraints on copying and moving imply that a moved-from object of type `T` has $O(1)$ destruction. — end note]
```

```
[Example 1: Examples of views are:
  A `range` type that wraps a pair of iterators.
  A `range` type that holds its elements by `shared_ptr` and shares ownership with all its copies.
  A `range` type that generates its elements on demand.

A container such as `vector<string>` does not meet the semantic requirements of `view` since copying the container copies all of the elements, which cannot be done in constant time. — end example]
```

Since the difference between `range` and `view` is largely semantic, the two are differentiated with the help of `enable_view`.

```
template<class T>
constexpr bool is-derived-from-view-interface = see below; // exposition only
```

§ 26.4.4
template<class T>
constexpr bool enable_view =
derived_from<T, view_base> || is-derived-from-view-interface<T>;

For a type T, is-derived-from-view-interface<T> is true if and only if T has exactly one public base class view_interface<U> for some type U and T has no base classes of type view_interface<V> for any other type V.

Remarks: Pursuant to 16.4.5.2.1, users may specialize enable_view to true for cv-unqualified program-defined types which model view, and false for types which do not. Such specializations shall be usable in constant expressions (7.7) and have type const bool.

### 26.4.5 Other range refinements

The output_range concept specifies requirements of a range type for which ranges::begin returns a model of output_iterator (25.3.4.10). input_range, forward_range, bidirectional_range, and random_access_range are defined similarly.

```
template<class R, class T>
concept output_range =
    range<R> && output_iterator<iterator_t<R>, T>;
```

```
template<class T>
concept input_range =
    range<T> && input_iterator<iterator_t<T>>;
```

```
template<class T>
concept forward_range =
    input_range<T> && forward_iterator<iterator_t<T>>;
```

```
template<class T>
concept bidirectional_range =
    forward_range<T> && bidirectional_iterator<iterator_t<T>>;
```

```
template<class T>
concept random_access_range =
    bidirectional_range<T> && random_access_iterator<iterator_t<T>>;
```

contiguous_range additionally requires that the ranges::data customization point object (26.3.13) is usable with the range.

```
template<class T>
concept contiguous_range =
    random_access_range<T> && contiguous_iterator<iterator_t<T>> &&
    requires(T& t) {
        { ranges::data(t) } -> same_as<add_pointer_t<range_reference_t<T>>>;
    };
```

Given an expression t such that decltype((t)) is T&, T models contiguous_range only if to_address(ranges::begin(t)) == ranges::data(t) is true.

The common_range concept specifies requirements of a range type for which ranges::begin and ranges::end return objects of the same type.

[Example 1: The standard containers (Clause 24) model common_range. — end example]

```
template<class T>
concept common_range =
    range<T> && same_as<iterator_t<T>, sentinel_t<T>>;
```

```
template<class R>
inline constexpr bool is-initializer-list = see below; // exposition only
```

For a type R, is-initializer-list<R> is true if and only if remove_cvref_t<R> is a specialization of initializer_list.

The viewable_range concept specifies the requirements of a range type that can be converted to a view safely.
template<class T>
concept viewable_range =
  range<T> &&
  ((view<remove_cvref_t<T>> && constructible_from<remove_cvref_t<T>, T>) ||
   (view<remove_cvref_t<T>> &&
    (is_lvalue_reference_v<T> || (movable<remove_reference_t<T>> && !is_initializer_list<T>))));

The `constant_range` concept specifies the requirements of a `range` type whose elements are not modifiable.

template<class T>
concept constant_range =
  input_range<T> && constant_iterator<iterator_t<T>>;

### 26.5 Range utilities

#### 26.5.1 General

The components in 26.5 are general utilities for representing and manipulating ranges.

#### 26.5.2 Helper concepts

Many of the types in subclause 26.5 are specified in terms of the following exposition-only concepts:

```cpp
template<class R>
concept simple_view = // exposition only
  view<R> && range<const R> &&
  same_as<iterator_t<R>, iterator_t<const R>> &&
  same_as<sentinel_t<R>, sentinel_t<const R>>;

template<class I>
concept has_arrow = // exposition only
  input_iterator<I> && (is_pointer_v<I> || requires(I i) { i.operator->(); });

template<class T, class U>
concept different_from = // exposition only
  !same_as<remove_cvref_t<T>, remove_cvref_t<U>>;
```

### 26.5.3 View interface

#### 26.5.3.1 General

The class template `view_interface` is a helper for defining view-like types that offer a container-like interface. It is parameterized with the type that is derived from it.

```cpp
namespace std::ranges {
  template<class D>
  requires is_class_v<D> && same_as<D, remove_cv_t<D>>
  class view_interface {
    private:
      constexpr D& derived() noexcept { // exposition only
        return static_cast<D&>(*this);
      }
      constexpr const D& derived() const noexcept { // exposition only
        return static_cast<const D&>(*this);
      }
    
    public:
      constexpr bool empty() requires sized_range<D> || forward_range<D> {
        if constexpr (sized_range<D>)
          return ranges::size(derived()) == 0;
        else
          return ranges::begin(derived()) == ranges::end(derived());
      }
      constexpr bool empty() const requires sized_range<const D> || forward_range<const D> {
        if constexpr (sized_range<const D>)
          return ranges::size(derived()) == 0;
        else
          return ranges::begin(derived()) == ranges::end(derived());
      }
  }
```
constexpr auto cbegin() requires input_range<D> {
    return ranges::cbegin(derived());
}
constexpr auto cbegin() const requires input_range<const D> {
    return ranges::cbegin(derived());
}
constexpr auto cend() requires input_range<D> {
    return ranges::cend(derived());
}
constexpr auto cend() const requires input_range<const D> {
    return ranges::cend(derived());
}

constexpr explicit operator bool() requires requires { ranges::empty(derived()); } {
    return !ranges::empty(derived());
}
constexpr explicit operator bool() const requires requires { ranges::empty(derived()); } {
    return !ranges::empty(derived());
}

constexpr auto data() requires contiguous_iterator<iterator_t<D>> {
    return to_address(ranges::begin(derived()));
}
constexpr auto data() const requires range<const D> && contiguous_iterator<iterator_t<const D>> {
    return to_address(ranges::begin(derived()));
}

constexpr auto size() requires forward_range<D> && sized_sentinel_for<sentinel_t<D>, iterator_t<D>> {
    return to_unsigned-like(ranges::end(derived()) - ranges::begin(derived()));
}
constexpr auto size() const requires forward_range<const D> && sized_sentinel_for<sentinel_t<const D>, iterator_t<const D>> {
    return to_unsigned-like(ranges::end(derived()) - ranges::begin(derived()));
}

constexpr decltype(auto) front() requires forward_range<D>;
constexpr decltype(auto) front() const requires forward_range<const D>;
constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const requires bidirectional_range<const D> && common_range<const D>;

template<random_access_range R = D>
constexpr decltype(auto) operator[](range_difference_t<R> n) {
    return ranges::begin(derived())[n];
}
template<random_access_range R = const D>
constexpr decltype(auto) operator[](range_difference_t<R> n) const {
    return ranges::begin(derived())[n];
}

2 The template parameter D for view_interface may be an incomplete type. Before any member of the resulting specialization of view_interface other than special member functions is referenced, D shall be complete, and model both derived_from<view_interface<D>> and view.

26.5.3.2 Members

constexpr decltype(auto) front() requires forward_range<D>;

§ 26.5.3.2
constexpr decltype(auto) front() const requires forward_range<const D>;

1    Preconditions: !empty() is true.
2    Effects: Equivalent to: return *ranges::begin(derived());

constexpr decltype(auto) back() requires bidirectional_range<D> && common_range<D>;
constexpr decltype(auto) back() const
    requires bidirectional_range<const D> && common_range<const D>;

3    Preconditions: !empty() is true.
4    Effects: Equivalent to: return *ranges::prev(ranges::end(derived()));

26.5.4 Sub-ranges

26.5.4.1 General

The subrange class template combines together an iterator and a sentinel into a single object that models the view concept. Additionally, it models the sized_range concept when the final template parameter is subrange_kind::sized.

namespace std::ranges {
    template<class From, class To>
    concept uses-nonqualification-pointer-conversion = // exposition only
        is_pointer_v<From> && is_pointer_v<To> &&
        !convertible_to<remove_pointer_t<From>(*)[], remove_pointer_t<To>(*)[]>;  

    template<class From, class To>
    concept convertible-to-non-slicing = // exposition only
        convertible_to<From, To> &&
        !uses-nonqualification-pointer-conversion<decay_t<From>, decay_t<To>>;

    template<class T, class U, class V>
    concept pair-like-convertible-from = // exposition only

        ? subrange_kind::sized : subrange_kind::unsized>;

26.5.4.2 Constructors and conversions

constexpr subrange(convertible-to-non-slicing<I> auto i, S s)
    requires (!StoreSize);

1 Preconditions: [i, s) is a valid range.
2 Effects: Initializes begin_ with std::move(i) and end_ with s.

constexpr subrange(convertible-to-non-slicing<I> auto i, S s,
    make-unsigned-like-t<iter_difference_t<I>> n)
    requires (K == subrange_kind::sized);
3 Preconditions: [i, s) is a valid range, and n == to-unsigned-like(ranges::distance(i, s)) is true.
4 Effects: Initializes begin_ with std::move(i) and end_ with s. If StoreSize is true, initializes size_ with n.
5 [Note 1: Accepting the length of the range and storing it to later return from size() enables subrange to model sized_range even when it stores an iterator and sentinel that do not model sized_sentinel_for. — end note]
template<
    different-from=subrange
  >
requires
  borrowed_range<R> &&
  convertible-to-non-slicing<
to<sentinel_t<R>, S>,
  iterator_t<R>, I>
  &&
  convertible_to<sentinel_t<R>, S>
constexpr subrange(R&& r) requires(!
  StoreSize || sized_range<R>);

Effects: Equivalent to:
(6.1) — If StoreSize is true, subrange(r, static_cast<
decay(size_)> (ranges::size(r))).
(6.2) — Otherwise, subrange(ranges::begin(r), ranges::end(r)).

template<
    different-from=
  >
PairLike
requires
  pair-like-convertible-from<
    PairLike, const I&, const S&
  >
constexpr operator PairLike() const;

Effects: Equivalent to: return PairLike(begin_, end_);

26.5.4.3 Accessors

constexpr I begin() const requires copyable<I>;

Effects: Equivalent to: return begin_;
[[nodiscard]] constexpr I begin() requires (!copyable<I>);

Effects: Equivalent to: return std::move(begin_);
constexpr S end() const;

Effects: Equivalent to: return end_;

constexpr bool empty() const;

Effects: Equivalent to: return begin_ == end_;

constexpr make-unsigned-like-t<
  iter_difference_t<I>
>
size() const
requires (K == subrange_kind::sized);

Effects:
(5.1) — If StoreSize is true, equivalent to: return size_;
(5.2) — Otherwise, equivalent to: return to-unsigned-like(end_ - begin_);

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) const &
requires forward_iterator<I>;

Effects: Equivalent to:
auto tmp = *this;
tmp.advance(n);
return tmp;

[[nodiscard]] constexpr subrange next(iter_difference_t<I> n = 1) &&;

Effects: Equivalent to:
advance(n);
return std::move(*this);

[[nodiscard]] constexpr subrange prev(iter_difference_t<I> n = 1) const
requires bidirectional_iterator<I>;

Effects: Equivalent to:
auto tmp = *this;
tmp.advance(-n);
return tmp;

constexpr subrange& advance(iter_difference_t<I> n);

Effects: Equivalent to:
if constexpr (bidirectional_iterator<I>) {
    if (n < 0) {
        ranges::advance(begin_, n);
        if constexpr (StoreSize)
            size_ += to-unsigned-like(-n);
        return *this;
    }
}

auto d = n - ranges::advance(begin_, n, end_);
if constexpr (StoreSize)
    size_ -= to-unsigned-like(d);
return *this;

template<size_t N, class I, class S, subrange_kind K>
requires ((N == 0 && copyable<I>) || N == 1)
constexpr auto get(const subrange<I, S, K>& r);
template<size_t N, class I, class S, subrange_kind K>
requires (N < 2)
constexpr auto get(subrange<I, S, K>&& r);

Effects: Equivalent to:
if constexpr (N == 0)
    return r.begin();
else
    return r.end();
Example 1:

```cpp
template<bool YieldElements>
generator<any> f(ranges::input_range auto&& r) {
    if constexpr (YieldElements)
        co_yield ranges::elements_of(r);  // yield each element of r
    else
        co_yield r;  // yield r as a single value
}
```

—end example—

```cpp
namespace std::ranges {
    template<range R, class Allocator = allocator<byte>>
    struct elements_of {
        [[no_unique_address]] R range;
        [[no_unique_address]] Allocator allocator = Allocator();
    };

    template<class R, class Allocator = allocator<byte>>
    elements_of(R&&, Allocator = Allocator()) -> elements_of<R&&, Allocator>;
}
```

26.5.7 Range conversions

26.5.7.1 General

1 The range conversion functions construct an object (usually a container) from a range, by using a constructor taking a range, a `from_range_t` tagged constructor, or a constructor taking a pair of iterators, or by inserting each element of the range into the default-constructed object.

2 `ranges::to` is applied recursively, allowing the conversion of a range of ranges.

Example 1:

```cpp
string_view str = "the quick brown fox";
auto words = views::split(str, ' ') | to<vector<string>>();
// words is vector<string> {"the", "quick", "brown", "fox"}
```

—end example—

3 Let `reservable-container` be defined as follows:

```cpp
template<class Container>
constexpr bool reservable-container =  // exposition only
    sized_range<Container> &&
    requires(Container& c, range_size_t<Container> n) {
        c.reserve(n);
        { c.capacity() } -> same_as<decltype(n)>;
        { c.max_size() } -> same_as<decltype(n)>;
    };
```

4 Let `container-insertable` be defined as follows:

```cpp
template<class Container, class Ref>
constexpr bool container-insertable =  // exposition only
    requires(Container& c, Ref&& ref) {
        requires (requires { c.push_back(std::forward<Ref>(ref)); } ||
            requires { c.insert(c.end(), std::forward<Ref>(ref)); });
    };
```

5 Let `container-inserter` be defined as follows:

```cpp
template<class Ref, class Container>
constexpr auto container-inserter(Container& c) {  // exposition only
    if constexpr (requires { c.push_back(declval<Ref>()); })
        return back_inserter(c);
    else
        return inserter(c, c.end());
}
```
26.5.7.2 ranges::to

```cpp
template<class C, input_range R, class... Args> requires (!view<C>)
constexpr C to(R&& r, Args&&... args);
```

**Returns:** An object of type C constructed from the elements of r in the following manner:

1. If C does not satisfy input_range or convertible_to<range_reference_t<R>, range_value_t<C>> is true:
   1.1. If constructible_from<C, R, Args...> is true:
      ```cpp
      C(std::forward<R>(r), std::forward<Args>(args)...) // (1.1.1)
      ```
   1.2. Otherwise, if constructible_from<C, from_range_t, R, Args...> is true:
      ```cpp
      C(from_range, std::forward<R>(r), std::forward<Args>(args)...) // (1.1.2)
      ```
   1.3. Otherwise, if
      1.3.1. common_range<R> is true,
      1.3.2. cpp17-input-iterator<iterator_t<R>> is true, and
      1.3.3. constructible_from<C, iterator_t<R>, sentinel_t<R>, Args...> is true:
      ```cpp
      C(ranges::begin(r), ranges::end(r), std::forward<Args>(args)...) // (1.1.3)
      ```
   1.4. Otherwise, if
      1.4.1. constructible_from<C, Args...> is true, and
      1.4.2. container-insertable<C, range_reference_t<R>> is true:
      ```cpp
      C(c(std::forward<Args>(args)...);
      if constexpr (sized_range<R> && reservable-container<C>)
       c.reserve(static_cast<range_size_t<C>>(ranges::size(r)));
      ranges::copy(r, container inserter<range_reference_t<R>>(c)); // (1.1.4)
      ```
   2. Otherwise, if input_range<range_reference_t<R>> is true:
      ```cpp
      to<C>(r | views::transform([](auto&& elem) {
       return to<range_value_t<C>>(std::forward<decltype(elem)>(elem));
      }), std::forward<Args>(args)...);
      ```
2. Otherwise, the program is ill-formed.

```cpp
template<template<class...> class C, input_range R, class... Args>
constexpr auto to(R&& r, Args&&... args);
```

Let **input_iterator** be an exposition-only type:

```cpp
struct input_iterator { // exposition only
   using iterator_category = input_iterator_tag;
   using value_type = range_value_t<R>;
   using difference_type = ptrdiff_t;
   using pointer = add_pointer_t<range_reference_t<R>>;
   using reference = range_reference_t<R>;
   reference operator*() const;
   pointer operator->() const;
   input_iterator& operator++();
   input_iterator operator++(int);
   bool operator==(const input_iterator&) const;
};
```

[Note 1: input_iterator meets the syntactic requirements of Cpp17InputIterator. — end note]

Let **DEDUCE_EXPR** be defined as follows:

1. C(declval<R>(), declval<Args>()...) if that is a valid expression,
2. otherwise, C(from_range, declval<R>(), declval<Args>()...) if that is a valid expression,
3. otherwise,
   ```cpp
   C(declval<input_iterator>(), declval<input_iterator>(), declval<Args>()...)
   ```
   if that is a valid expression,
— otherwise, the program is ill-formed.

Returns: to<decltype(DEDUCE_EXPR)>(std::forward<R>(r), std::forward<Args>(args)...).

26.5.7.3 ranges::to adaptors

template<class C, class... Args> requires (!view<C>)
constexpr auto to(C&& c, Args&&... args);

Returns: A range adaptor closure object \((26.7.2) f\) that is a perfect forwarding call wrapper \((22.10.4)\) with the following properties:

(1.1) — It has no target object.

(1.2) — Its bound argument entities bound_args consist of objects of types decay_t<Args>... direction-list-initialized with std::forward<Args>(args)..., respectively.

(1.3) — Its call pattern is to<C>(r, bound_args...), where \(r\) is the argument used in a function call expression of \(f\).

26.6 Range factories

26.6.1 General

Subclause 26.6 defines range factories, which are utilities to create a view.

Range factories are declared in namespace std::ranges::views.

26.6.2 Empty view

26.6.2.1 Overview

empty_view produces a view of no elements of a particular type.

[Example 1:

```c
auto e = views::empty<int>;
static_assert(ranges::empty(e));
static_assert(0 == e.size());
```

—end example]

26.6.2.2 Class template empty_view

namespace std::ranges {
  template<class T>
  requires is_object_v<T>
  class empty_view : public view_interface<empty_view<T>> {
  public:
    static constexpr T* begin() noexcept { return nullptr; }
    static constexpr T* end() noexcept { return nullptr; }
    static constexpr T* data() noexcept { return nullptr; }
    static constexpr size_t size() noexcept { return 0; }
    static constexpr bool empty() noexcept { return true; }
  };
}

26.6.3 Single view

26.6.3.1 Overview

single_view produces a view that contains exactly one element of a specified value.

The name views::single denotes a customization point object \((16.3.3.3.5)\). Given a subexpression \(E\), the expression views::single(E) is expression-equivalent to single_view<decay_t<decltype((E))>>((E)).

[Example 1:

```c
for (int i : views::single(4))
  cout << i; // prints 4
```

—end example]
26.6.3.2 Class template single_view

namespace std::ranges {
    template<move_constructible T>
    requires is_object_v<T>
    class single_view : public view_interface<single_view<T>> {
        private:
            movable-box T value_; // exposition only (see 26.7.3)

        public:
            single_view() requires default_initializable<T> = default;
            constexpr explicit single_view(const T& t) requires copy_constructible<T>;
            constexpr explicit single_view(T&& t);
            template<class... Args>
            requires constructible_from<T, Args...>
            constexpr explicit single_view(in_place_t, Args&&... args);
            constexpr T* begin() noexcept;
            constexpr const T* begin() const noexcept;
            constexpr T* end() noexcept;
            constexpr const T* end() const noexcept;
            static constexpr size_t size() noexcept;
            constexpr T* data() noexcept;
            constexpr const T* data() const noexcept;
    }

    template<class T>
    single_view(T) -> single_view<T>;
}

1 constexpr explicit single_view(const T& t) requires copy_constructible<T>;
   Effects: Initializes value_ with t.

2 constexpr explicit single_view(T&& t);
   Effects: Initializes value_ with std::move(t).

3 template<class... Args>
    requires constructible_from<T, Args...>
    constexpr explicit single_view(in_place_t, Args&&... args);
   Effects: Initializes value_ as if by value_(in_place, std::forward<Args>(args)...

4 constexpr T* begin() noexcept;
    Effects: Equivalent to: return data();

5 constexpr T* end() noexcept;
    Effects: Equivalent to: return data() + 1;

6 static constexpr size_t size() noexcept;
    Effects: Equivalent to: return 1;

7 constexpr T* data() noexcept;
    Effects: Equivalent to: return value_.operator->();

26.6.4 Iota view

26.6.4.1 Overview

iota_view generates a sequence of elements by repeatedly incrementing an initial value.
2 The name `views::iota` denotes a customization point object (16.3.3.5). Given subexpressions E and F, the expressions `views::iota(E)` and `views::iota(E, F)` are expression-equivalent to `iota_view(E)` and `iota_view(E, F)`, respectively.

3 [Example 1:

```c++
for (int i : views::iota(1, 10))
    cout << i << ' ';// prints 1 2 3 4 5 6 7 8 9
—end example]

26.6.4.2 Class template `iota_view` [range.iota.view]

```c++
namespace std::ranges {
    template<class I>
    concept decrementable = see below; // exposition only

    template<class I>
    concept advanceable = see below; // exposition only

template<weakly_incrementable W, semiregular Bound = unreachable_sentinel_t>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
    class iota_view : public view_interface<iota_view<W, Bound>> {
        private:
            // 26.6.4.3, class iota_view::iterator
            struct iterator; // exposition only

            // 26.6.4.4, class iota_view::sentinel
            struct sentinel; // exposition only

        W value_ = W(); // exposition only
        Bound bound_ = Bound(); // exposition only

        public:
            iota_view() requires default_initializable<W> = default;
            constexpr explicit iota_view(W value);
            constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);
            constexpr iota_view(iterator first, see below last);
            constexpr iterator begin() const;
            constexpr auto end() const;
            constexpr iterator end() const requires same_as<W, Bound>;
            constexpr auto size() const requires see below;
        };

template<class W, class Bound>
    requires (!is-integer-like<W> || !is-integer-like<Bound> ||
        (is-signed-integer-like<W> == is-signed-integer-like<Bound>))
    iota_view(W, Bound) -> iota_view<W, Bound>;
}
```

1 Let $IOTA\text{-DIFF}\text{-}T(W)$ be defined as follows:

(1.1) — If $W$ is not an integral type, or if it is an integral type and `sizeof(iter_difference_t<W>)` is greater than `sizeof(W)`, then $IOTA\text{-DIFF}\text{-}T(W)$ denotes `iter_difference_t<W>`.

(1.2) — Otherwise, $IOTA\text{-DIFF}\text{-}T(W)$ is a signed integer type of width greater than the width of $W$ if such a type exists.

(1.3) — Otherwise, $IOTA\text{-DIFF}\text{-}T(W)$ is an unspecified signed-integer-like type (25.3.4.4) of width not less than the width of $W$.

[Note 1: It is unspecified whether this type satisfies weakly_incrementable. — end note]

2 The exposition-only `decrementable` concept is equivalent to:
template<class I>
concept decrementable =
  // exposition only
  incrementable<I> && requires(I i) {
    { --i } -> same_as<I&>;
    { i-- } -> same_as<I>;
  };

When an object is in the domain of both pre- and post-decrement, the object is said to be decrementable.

Let a and b be equal objects of type I. I models decrementable only if

(4.1) — If a and b are decrementable, then the following are all true:
  (4.1.1) • addressof(--a) == addressof(a)
  (4.1.2) • bool(a-- == b)
  (4.1.3) • bool(((void)a--, a) == --b)
  (4.1.4) • bool(++(--a) == b).

The exposition-only advanceable concept is equivalent to:

template<class I>
concept advanceable =
  // exposition only
decrementable<I> && totally_ordered<I> && requires(I i, const I j, const IOTA-DIFF-T(I) n) {
  { i += n } -> same_as<I&>;
  { i -= n } -> same_as<I&>;
  I(j + n);
  I(n + j);
  I(j - n);
  { j - j } -> convertible_to<IOTA-DIFF-T(I)>;
};

Let D be IOTA-DIFF-T(I). Let a and b be objects of type I such that b is reachable from a after n applications of ++a, for some value n of type D. I models advanceable only if

(5.1) — (a += n) is equal to b.
(5.2) — addressof(a += n) is equal to addressof(a).
(5.3) — I(a + n) is equal to (a += n).
(5.4) — For any two positive values x and y of type D, if I(a + D(x + y)) is well-defined, then I(a + D(x + y)) is equal to I(I(a + x) + y).
(5.5) — I(a + D(0)) is equal to a.
(5.6) — If I(a + D(n - 1)) is well-defined, then I(a + n) is equal to [I(I c) { return ++c; }](I(a + D(n - 1))).
(5.7) — (b += -n) is equal to a.
(5.8) — (b -= n) is equal to a.
(5.9) — addressof(b -= n) is equal to addressof(b).
(5.10) — I(b - n) is equal to (b -= n).
(5.11) — D(b - a) is equal to n.
(5.12) — D(a - b) is equal to D(-n).
(5.13) — bool(a <= b) is true.

constexpr explicit iota_view(W value);

Preconditions: Bound denotes unreachable_sentinel_t or Bound() is reachable from value. When W and Bound model totally_ordered_with, then bool(value <= Bound()) is true.

Effects: Initializes value_ with value.
constexpr iota_view(type_identity_t<W> value, type_identity_t<Bound> bound);

**Preconditions:** Bound denotes unreachable_sentinel_t or bound is reachable from value. When W and Bound model totally_ordered_with, then bool(value <= bound) is true.

**Effects:** Initializes value_ with value and bound_ with bound.

constexpr iota_view(iterator first, see below last);

**Effects:** Equivalent to:

- If same_as<W, Bound> is true, iota_view(first.value_, last.value_).
- Otherwise, if Bound denotes unreachable_sentinel_t, iota_view(first.value_, last).
- Otherwise, iota_view(first.value_, last.bound_).

**Remarks:** The type of last is:

- If same_as<W, Bound> is true, iterator.
- Otherwise, if Bound denotes unreachable_sentinel_t, Bound.
- Otherwise, sentinel.

constexpr iterator begin() const;

**Effects:** Equivalent to: return iterator{value_};

constexpr auto end() const;

**Effects:** Equivalent to:

if constexpr (same_as<Bound, unreachable_sentinel_t>)
    return unreachable_sentinel;
else
    return sentinel{bound_};

constexpr iterator end() const requires same_as<W, Bound>;

**Effects:** Equivalent to: return iterator{bound_};

constexpr auto size() const requires see below;

**Effects:** Equivalent to:

if constexpr (
    is-integer-like<W> &&
    is-integer-like<Bound>)
    return ((value_ < 0)
        ? (bound_ < 0)
        ? to-unsigned-like(-value_) - to-unsigned-like(-bound_)
        : to-unsigned-like(bound_) + to-unsigned-like(-value_))
        : to-unsigned-like(bound_) - to-unsigned-like(value_));
else
    return to-unsigned-like(bound_ - value_);

**Remarks:** The expression in the requires-clause is equivalent to:

(same_as<W, Bound> && advanceable<W>) || (is-integer-like<W> && is-integer-like<Bound>) || sized_sentinel_for<Bound, W>

### 26.6.4.3 Class iota_view::iterator

```cpp
namespace std::ranges {
    template<weakly_incrementable W, semiregular Bound>
    requires weakly-equality-comparable-with<W, Bound> && copyable<W>
    struct iota_view<W, Bound>::iterator {
        private:
            W value_ = W();  // exposition only

        public:
            using iterator_concept = see below;
            using iterator_category = input_iterator_tag;  // present only if W models incrementable and
            // IOTA-DIFF-T(W) is an integral type

            using value_type = W;
            using difference_type = IOTA-DIFF-T(W);
```
iterator() requires default_initializable<W> = default;
constexpr explicit iterator(W value);

constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);
constexpr iterator& operator++();
constexpr void operator++(int);
constexpr iterator operator++(int) requires incrementable<W>;

constexpr iterator& operator--() requires decrementable<W>;
constexpr iterator operator--(int) requires decrementable<W>;

constexpr iterator& operator+=(difference_type n) requires advanceable<W>;
constexpr iterator& operator-=(difference_type n) requires advanceable<W>;

constexpr W operator[](difference_type n) const requires advanceable<W>;

friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<W>;
friend constexpr bool operator<(const iterator& x, const iterator& y) requires totally_ordered<W>;
friend constexpr bool operator>(const iterator& x, const iterator& y) requires totally_ordered<W>;
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires totally_ordered<W>;
friend constexpr bool operator>=(const iterator& x, const iterator& y) requires totally_ordered<W>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires totally_ordered<W> && three_way_comparable<W>;

friend constexpr iterator operator+(iterator i, difference_type n) requires advanceable<W>;
friend constexpr iterator operator+(difference_type n, iterator i) requires advanceable<W>;

friend constexpr iterator operator-(iterator i, difference_type n) requires advanceable<W>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires advanceable<W>;

iterator::iterator_concept is defined as follows:

— If W models advanceable, then iterator_concept is random_access_iterator_tag.
— Otherwise, if W models decrementable, then iterator_concept is bidirectional_iterator_tag.
— Otherwise, if W models incrementable, then iterator_concept is forward_iterator_tag.
— Otherwise, iterator_concept is input_iterator_tag.

[Note 1: Overloads for iter_move and iter_swap are omitted intentionally. — end note]

constexpr explicit iterator(W value);

Effects: Initializes value_ with value.

constexpr W operator*() const noexcept(is_nothrow_copy_constructible_v<W>);

Effects: Equivalent to: return value_;

[Note 2: The noexcept clause is needed by the default iter_move implementation. — end note]

constexpr iterator& operator++();

Effects: Equivalent to:

§ 26.6.4.3
```cpp
++value_; 
return *this;

constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires incrementable<W>;

Effects: Equivalent to:
auto tmp = *this;
+++*this;
return tmp;

constexpr iterator& operator--() requires decrementable<W>;

Effects: Equivalent to:
--value_; 
return *this;

constexpr iterator operator--(int) requires decrementable<W>;

Effects: Equivalent to:
auto tmp = *this;
--*this;
return tmp;

constexpr iterator& operator+=(difference_type n) requires advanceable<W>;

Effects: Equivalent to:
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
  if (n >= difference_type(0))
    value_ += static_cast<W>(n);
  else
    value_ -= static_cast<W>(-n);
} else {
  value_ += n;
} 
return *this;

constexpr iterator& operator-=(difference_type n) requires advanceable<W>;

Effects: Equivalent to:
if constexpr (is-integer-like<W> && !is-signed-integer-like<W>) {
  if (n >= difference_type(0))
    value_ -= static_cast<W>(n);
  else
    value_ += static_cast<W>(-n);
} else {
  value_ -= n;
}
return *this;

constexpr W operator[](difference_type n) const
requires advanceable<W>;

Effects: Equivalent to: return W(value_ + n);

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires equality_comparable<W>;

Effects: Equivalent to: return x.value_ == y.value_;

friend constexpr bool operator<(const iterator& x, const iterator& y)
```
requires totally_ordered<W>;

Effects: Equivalent to: return x.value_ < y.value_;
constexpr explicit sentinel(Bound bound);
friend constexpr bool operator==(const iterator& x, const sentinel& y);
friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
requires sized_sentinel_for<Bound, W>;
friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
requires sized_sentinel_for<Bound, W>;
};

constexpr explicit sentinel(Bound bound);

Effects: Initializes bound_ with bound.

friend constexpr bool operator==(const iterator& x, const sentinel& y);

Effects: Equivalent to: return x.value_ == y.bound_;

friend constexpr iter_difference_t<W> operator-(const iterator& x, const sentinel& y)
requires sized_sentinel_for<Bound, W>;

Effects: Equivalent to: return x.value_ - y.bound_;

friend constexpr iter_difference_t<W> operator-(const sentinel& x, const iterator& y)
requires sized_sentinel_for<Bound, W>;

Effects: Equivalent to: return -(y - x);

26.6.5 Repeat view

26.6.5.1 Overview

repeat_view generates a sequence of elements by repeatedly producing the same value.

The name views::repeat denotes a customization point object (16.3.3.3.5). Given subexpressions E and F, the expressions views::repeat(E) and views::repeat(E, F) are expression-equivalent to repeat_view(E) and repeat_view(E, F), respectively.

[Example 1:
for (int i : views::repeat(17, 4))
  cout << i << ' ';
// prints 17 17 17 17
—end example]

26.6.5.2 Class template repeat_view

namespace std::ranges {
template<move_constructible T, semiregular Bound = unreachable_sentinel_t>
requires (is_object_v<T> && same_as<T, remove_cv_t<T>> &&
  (is-integer-like<Bound> || same_as<Bound, unreachable_sentinel_t>>))
class repeat_view : public view_interface<repeat_view<T, Bound>> {
private:
  // 26.6.5.3, class repeat_view::iterator
  struct iterator;

  movable-box<T> value_; // exposition only, see 26.7.3
  Bound bound_ = Bound(); // exposition only

public:
  repeat_view() requires default_initializable<T> = default;

  constexpr explicit repeat_view(const T& value, Bound bound = Bound())
  requires copy_constructible<T>;
  constexpr explicit repeat_view(T&& value, Bound bound = Bound());
template<
class... TArgs, class... BoundArgs>
  requires constructible_from<T, TArgs...> &&
  constructible_from<Bound, BoundArgs...>
constexpr explicit repeat_view(piecewise_construct_t,
tuple<TArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>{});

constexpr iterator begin() const;

constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);

constexpr unreachable_sentinel_t end() const noexcept;

constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);

};

template<class T, class Bound>
repeat_view(T, Bound) -> repeat_view<T, Bound>;

constexpr explicit repeat_view(const T& value, Bound bound = Bound())
  requires copy_constructible<T>;

1
Preconditions: If Bound is not unreachable_sentinel_t, bound ≥ 0.

2 Effects: Initializes value_ with value and bound_ with bound.

constexpr explicit repeat_view(T&& value, Bound bound = Bound());

3 Preconditions: If Bound is not unreachable_sentinel_t, bound ≥ 0.

4 Effects: Initializes value_ with std::move(value) and bound_ with bound.

template<class... TArgs, class... BoundArgs>
  requires constructible_from<T, TArgs...> &&
  constructible_from<Bound, BoundArgs...>
constexpr explicit repeat_view(piecewise_construct_t,
tuple<TArgs...> value_args, tuple<BoundArgs...> bound_args = tuple<>{});

5 Effects: Initializes value_ with arguments of types TArgs... obtained by forwarding the elements of value_args and initializes bound_ with arguments of types BoundArgs... obtained by forwarding the elements of bound_args. (Here, forwarding an element x of type U within a tuple object means calling std::forward<U>(x).)

constexpr iterator begin() const;

6 Effects: Equivalent to: return iterator(addressof(*value_));

constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);

7 Effects: Equivalent to: return iterator(addressof(*value_), bound_);

constexpr unreachable_sentinel_t end() const noexcept;

8 Effects: Equivalent to: return unreachable_sentinel;

constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);

9 Effects: Equivalent to: return to_unsigned-like(bound_);

26.6.5.3 Class repeat_view::iterator

namespace std::ranges {
  template<
    move_constructible T, semiregular Bound = unreachable_sentinel_t>
    requires (is_object_v<T> && same_as<T, remove_cv_t<T>> &&
      (is-integer-like<Bound> || same_as<Bound, unreachable_sentinel_t>))
  class repeat_view<T, Bound>::iterator {
    private:
      using index-type =                 // exposition only
        conditional_t<same_as<Bound, unreachable_sentinel_t>, ptrdiff_t, Bound>;
      const T* value_ = nullptr;          // exposition only
      index-type current_ = index-type(); // exposition only

    constexpr explicit iterator(const T& value, index-type b = index-type()); // exposition only

    constexpr explicit iterator(const T&& value, Bound bound = Bound());

    constexpr iterator begin() const;

    constexpr iterator end() const requires (!same_as<Bound, unreachable_sentinel_t>);

    constexpr unreachable_sentinel_t end() const noexcept;

    constexpr auto size() const requires (!same_as<Bound, unreachable_sentinel_t>);

    26.6.5.3 1150
public:
using iterator_concept = random_access_iterator_tag;
using iterator_category = random_access_iterator_tag;
using value_type = T;
using difference_type = conditional_t<
is-signed-integer-like<index-type>,
index-type,
IOTA-DIFF-T(index-type)>;

iterator() = default;

constexpr explicit iterator(const T* value, index-type b = index-type());

friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr auto operator<=>(const iterator& x, const iterator& y);

friend constexpr iterator operator+(iterator i, difference_type n);
friend constexpr iterator operator+(difference_type n, iterator i);

friend constexpr iterator operator-(const iterator& x, const iterator& y);

friend constexpr iterator operator+(iterator i, difference_type n);
friend constexpr iterator operator+(difference_type n, iterator i);

friend constexpr iterator operator-(const iterator& x, const iterator& y);

friend constexpr iterator operator-(iterator i, difference_type n);
friend constexpr iterator operator-(difference_type n, iterator i);

§ 26.6.5.3
```cpp
constexpr iterator operator+=(difference_type n);
  // Preconditions: If Bound is not unreachable_sentinel_t, current_ + n ≥ 0.
  // Effects: Equivalent to:
  //  current_ += n;
  //  return *this;

constexpr iterator operator-=(difference_type n);
  // Preconditions: If Bound is not unreachable_sentinel_t, current_ - n ≥ 0.
  // Effects: Equivalent to:
  //  current_ -= n;
  //  return *this;

constexpr const T& operator[](difference_type n) const noexcept;
  // Effects: Equivalent to: return *(this + n);

friend constexpr bool operator==(const iterator& x, const iterator& y);
  // Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr auto operator<=>(const iterator& x, const iterator& y);
  // Effects: Equivalent to: return x.current_ <=> y.current_;

friend constexpr iterator operator+(iterator i, difference_type n);
  // Effects: Equivalent to: i += n;
  //  return i;

friend constexpr iterator operator+(difference_type n, iterator i);

friend constexpr iterator operator-(iterator i, difference_type n);
  // Effects: Equivalent to: i -= n;
  //  return i;

friend constexpr difference_type operator-(const iterator& x, const iterator& y);
  // Effects: Equivalent to: return static_cast<difference_type>(x.current_) - static_cast<difference_type>(y.current_);
```

26.6.6 Istream view
[range.istream]
26.6.6.1 Overview
[range.istream.overview]

basic_istream_view models input_range and reads (using operator>>) successive elements from its corresponding input stream.

The name views::istream<T> denotes a customization point object (16.3.3.3.5). Given a type T and a subexpression E of type U, if U models derived_from<basic_istream<typename U::char_type, typename U::traits_type>>, then the expression views::istream<T>(E) is expression-equivalent to basic_istream_view<T, typename U::char_type, typename U::traits_type>(E); otherwise, views::istream<T>(E) is ill-formed.

[Example 1:
 ```c
c auto ints = istringstream("0 1 2 3 4");
 ranges::copy(views::istream<int>(ints), ostream_iterator<int>{cout, "-"});
 // prints 0-1-2-3-4-
```]
26.6.6.2 Class template `basic_istream_view`

namespace std::ranges {
    template<class Val, class CharT, class Traits>
    concept stream-extractable = // exposition only
        requires(basic_istream<CharT, Traits>& is, Val& t) {
            is >> t;
        };

    template<movable Val, class CharT, class Traits = char_traits<CharT> >
    requires default_initializable<Val> &&
        stream-extractable<Val, CharT, Traits>
    class basic_istream_view : public view_interface<basic_istream_view<Val, CharT, Traits>> {
        public:
            constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);
            constexpr auto begin() { // exposition only
                *stream_ >> value_; // exposition only
                return iterator{*this};
            }
            constexpr default_sentinel_t end() const noexcept;
        private:
            // 26.6.6.3, class basic_istream_view::iterator
            struct iterator; // exposition only
            basic_istream<CharT, Traits>& stream_; // exposition only
            Val value_ = Val(); // exposition only
    };

    constexpr explicit basic_istream_view(basic_istream<CharT, Traits>& stream);

1 Effects: Initializes `stream_` with addressof(stream).

    constexpr default_sentinel_t end() const noexcept;

2 Effects: Equivalent to: return default_sentinel;

26.6.6.3 Class `basic_istream_view::iterator`

namespace std::ranges {
    template<movable Val, class CharT, class Traits>
    requires default_initializable<Val> &&
        stream-extractable<Val, CharT, Traits>
    class basic_istream_view<Val, CharT, Traits>::iterator {
        public:
            using iterator_concept = input_iterator_tag;
            using difference_type = ptrdiff_t;
            using value_type = Val;
            constexpr explicit iterator(basic_istream_view& parent) noexcept;

            iterator(const iterator&) = delete;
            iterator& operator=(const iterator&) = default;

            iterator& operator=(const iterator&&) = default;
            iterator& operator++();
            void operator++(int);

            Val& operator*() const;

            friend bool operator==(const iterator& x, default_sentinel_t);
            
§ 26.6.6.3 1153
private:
    basic_istream_view* parent_; // exposition only
};

constexpr explicit iterator(basic_istream_view& parent) noexcept;

Effects: Initializes parent_ with addressof(parent).

iterator& operator++();

Effects: Equivalent to:
    *parent_ -> stream_ >> parent_ -> value_;
    return *this;

void operator++(int);

Effects: Equivalent to +++this.

Val& operator*() const;

Effects: Equivalent to: return *this.

friend bool operator==(const iterator& x, default_sentinel_t);

Effects: Equivalent to: return !*x.

26.7 Range adaptors [range.adaptors]

26.7.1 General [range.adaptors.general]

Subclause 26.7 defines range adaptors, which are utilities that transform a range into a view with custom behaviors. These adaptors can be chained to create pipelines of range transformations that evaluate lazily as the resulting view is iterated.

Range adaptors are declared in namespace std::ranges::views.

The bitwise or operator is overloaded for the purpose of creating adaptor chain pipelines. The adaptors also support function call syntax with equivalent semantics.

[Example 1:

    vector<int> ints{0,1,2,3,4,5};
    auto even = [](int i) { return 0 == i % 2; };
    auto square = [](int i) { return i * i; };
    for (int i : ints | views::filter(even) | views::transform(square)) {
        cout << i << ' ';
    } // prints 0 4 16
    assert(ranges::equal(ints | views::filter(even), views::filter(ints, even)));
    — end example]

26.7.2 Range adaptor objects [range.adaptor.object]

A range adaptor closure object is a unary function object that accepts a range argument. For a range adaptor closure object C and an expression R such that decltype((R)) models range, the following expressions are equivalent:

    C(R)

    R | C

Given an additional range adaptor closure object D, the expression C | D produces another range adaptor closure object E. E is a perfect forwarding call wrapper (22.10.4) with the following properties:

1. Its target object is an object d of type decay_t<decltype((D))> direct-non-list-initialized with D.
2. It has one bound argument entity, an object c of type decay_t<decltype((C))> direct-non-list-initialized with C.
3. Its call pattern is d(c(arg)), where arg is the argument used in a function call expression of E.

The expression C | D is well-formed if and only if the initializations of the state entities of E are all well-formed.

Given an object t of type T, where
(2.1) — `t` is a unary function object that accepts a range argument,

(2.2) — `T` models `derived_from<range_adaptor_closure<T>>`,

(2.3) — `T` has no other base classes of type `range_adaptor_closure<U>` for any other type `U`, and

(2.4) — `T` does not model `range`

then the implementation ensures that `t` is a range adaptor closure object.

3 The template parameter `D` for `range_adaptor_closure` may be an incomplete type. If an expression of type `cv D` is used as an operand to the `|` operator, `D` shall be complete and model `derived_from<range_adaptor_closure<D>>`. The behavior of an expression involving an object of type `cv D` as an operand to the `|` operator is undefined if overload resolution selects a program-defined `operator|` function.

4 If an expression of type `cv U` is used as an operand to the `|` operator, where `U` has a base class of type `range_adaptor_closure<T>` for some type `T` other than `U`, the behavior is undefined.

5 The behavior of a program that adds a specialization for `range_adaptor_closure` is undefined.

6 A **range adaptor object** is a customization point object (16.3.3.5) that accepts a `viewable_range` as its first argument and returns a view.

7 If a range adaptor object accepts only one argument, then it is a range adaptor closure object.

8 If a range adaptor object `adaptor` accepts more than one argument, then let `range` be an expression such that `decltype((range))` models `viewable_range`, let `args...` be arguments such that `adaptor(range, args...)` is a well-formed expression as specified in the rest of subclause 26.7, and let `BoundArgs` be a pack that denotes `decay_t<decltype((args))>...`. The expression `adaptor(args...)` produces a range adaptor closure object `f` that is a perfect forwarding call wrapper (22.10.4) with the following properties:

   (8.1) — Its target object is a copy of `adaptor`.

   (8.2) — Its bound argument entities `bound_args` consist of objects of types `BoundArgs...` direct-non-list-initialized with `std::forward<decltype((args))>(args)...`, respectively.

   (8.3) — Its call pattern is `adaptor(r, bound_args...)`, where `r` is the argument used in a function call expression of `f`.

The expression `adaptor(args...)` is well-formed if and only if the initialization of the bound argument entities of the result, as specified above, are all well-formed.

26.7.3 Movable wrapper

Many types in this subclause are specified in terms of an exposition-only class template `movable-box`. `movable-box<T>` behaves exactly like `optional<T>` with the following differences:

(1.1) — `movable-box<T>` constrains its type parameter `T` with `move_constructible<T> & is_object_v<T>`.

(1.2) — The default constructor of `movable-box<T>` is equivalent to:

```cpp
constexpr movable-box<T>() noexcept(is_nothrow_default_constructible_v<T>)
    : movable-box(in_place) {}
```

(1.3) — If `copyable<T>` is not modeled, the copy assignment operator is equivalent to:

```cpp
constexpr movable-box operator=(const movable-box& that)
    noexcept(is_nothrow_copy_constructible_v<T>) {
    if (this != addressof(that)) {
        if (that) emplace(*that);
        else reset();
    }
    return *this;
}
```

(1.4) — If `movable<T>` is not modeled, the move assignment operator is equivalent to:

```cpp
constexpr movable-box& operator=(movable-box&& that)
    noexcept(is_nothrow_move_constructible_v<T>) {
    if (this != addressof(that)) {
        if (that) emplace(std::move(*that));
        else reset();
    }
```
Recommended practice:

(2.1) If `copy_constructible<T>` is true, `movable-box<T>` should store only a `T` if either `T` models copyable, or `is_nothrow_move_constructible_v<T> & is_nothrow_copy_constructible_v<T>` is true.

(2.2) Otherwise, `movable-box<T>` should store only a `T` if either `T` models movable or `is_nothrow_move_constructible_v<T>` is true.

26.7.4 Non-propagating cache

Some types in subclause 26.7 are specified in terms of an exposition-only class template `non-propagating-cache<T>`. `non-propagating-cache<T>` behaves exactly like `optional<T>` with the following differences:

1. `non-propagating-cache<T>` constrains its type parameter `T` with `is_object_v<T>`.
2. The copy constructor is equivalent to:
   ```cpp
   constexpr non-propagating-cache(const non-propagating-cache&) noexcept {}
   ```
3. The move constructor is equivalent to:
   ```cpp
   constexpr non-propagating-cache(non-propagating-cache&& other) noexcept {
     other.reset();
   }
   ```
4. The copy assignment operator is equivalent to:
   ```cpp
   constexpr non-propagating-cache& operator=(const non-propagating-cache& other) noexcept {
     if (addressof(other) != this)
       reset();
     return *this;
   }
   ```
5. The move assignment operator is equivalent to:
   ```cpp
   constexpr non-propagating-cache& operator=(non-propagating-cache&& other) noexcept {
     reset();
     other.reset();
     return *this;
   }
   ```
6. `non-propagating-cache<T>` has an additional member function template specified as follows:

   ```cpp
   template<class I>
   constexpr T& emplace-deref(const I& i); // exposition only
   ```

   **Mandates**: The declaration `T t(*i)` is well-formed for some invented variable `t`.

   **[Note 1]**: If `*i` is a prvalue of type `cv T`, there is no requirement that it is movable (9.4.1). —end note

   **Effects**: Calls `reset()`. Then direct-non-list-initializes the contained value with `*i`.

   **Postconditions**: `*this` contains a value.

   **Returns**: A reference to the new contained value.

   **Throws**: Any exception thrown by the initialization of the contained value.

   **Remarks**: If an exception is thrown during the initialization of `T`, `*this` does not contain a value, and the previous value (if any) has been destroyed.

   **[Note 2]**: `non-propagating-cache` enables an input view to temporarily cache values as it is iterated over. —end note

26.7.5 Range adaptor helpers

```cpp
namespace std::ranges {
  template<class F, class Tuple>
  constexpr auto tuple-transform(F&& f, Tuple&& t) { // exposition only
    return apply([&]<class... Ts>(Ts&&... elements) {
      return tuple<invoke_result_t<F&, Ts>...(invoke(f, std::forward<Ts>(elements))...);
    }, std::forward<Tuple>(t));
} 
```
template<class F, class Tuple>
constexpr void
tuple-for-each(F&& f, Tuple&& t) { // exposition only
  (static_cast<void>(invoke(f, std::forward<Ts>(elements))), ...));

26.7.6 All view
26.7.6.1 General
views::all returns a view that includes all elements of its range argument.

The name views::all denotes a range adaptor object (26.7.2). Given a subexpression E, the expression views::all(E) is expression-equivalent to:

(2.1) decay-copy(E) if the decayed type of E models view.
(2.2) Otherwise, ref_view(E) if that expression is well-formed.
(2.3) Otherwise, owning_view(E).

26.7.6.2 Class template ref_view
ref_view is a view of the elements of some other range.

namespace std::ranges {
  template<range R>
  class ref_view : public view_interface<ref_view<R>> {

    private:
      R* r_; // exposition only

    public:
      template<different-from<ref_view> T>
      constexpr ref_view(T&& t);

      constexpr R& base() const { return *r_; }

      constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
      constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

      constexpr bool empty() const
      requires requires { ranges::empty(*r_); }
      { return ranges::empty(*r_); }

      constexpr auto size() const requires sized_range<R>
      requires requires { sized_range<R> } { return ranges::size(*r_); }

      constexpr auto data() const requires contiguous_range<R>
      requires requires { contiguous_range<R> } { return ranges::data(*r_); }
    }

    template<class R>
    ref_view(R& r) -> ref_view<R>;
  }

  template<different-from<ref_view> T>
  constexpr ref_view(T&& t); // exposition only

  constexpr R& base() const { return *r_; }

  constexpr iterator_t<R> begin() const { return ranges::begin(*r_); }
  constexpr sentinel_t<R> end() const { return ranges::end(*r_); }

  constexpr bool empty() const
  requires requires { ranges::empty(*r_); }
  { return ranges::empty(*r_); }

  constexpr auto size() const requires sized_range<R>
  requires requires { sized_range<R> } { return ranges::size(*r_); }

  constexpr auto data() const requires contiguous_range<R>
  requires requires { contiguous_range<R> } { return ranges::data(*r_); }
};
void FUN(R&&) = delete;

The expression in the requires-clause is equivalent to:

convertible_to<T, R&> && requires { FUN(declval<T>()); }

26.7.6.3 Class template owning_view

owning_view is a move-only view of the elements of some other range.

namespace std::ranges {
    template<range R>
    requires movable<R> && (!is-initializer-list<R>) // see 26.4.5
class owning_view : public view_interface<owning_view<R>> {
    private:
        R r_ = R(); // exposition only

    public:
        owning_view() requires default_initializable<R> = default;
        owning_view(R&& t);
        owning_view(owning_view&&) = default;
        owning_view& operator=(owning_view&&) = default;
        constexpr R& base() & noexcept { return r_; }
        constexpr const R& base() const & noexcept { return r_; }
        constexpr R&& base() && noexcept { return std::move(r_); }
        constexpr const R&& base() const && noexcept { return std::move(r_); }
        constexpr iterator_t<R> begin() { return ranges::begin(r_); }
        constexpr sentinel_t<R> end() { return ranges::end(r_); }
        constexpr auto begin() const requires range<const R> { return ranges::begin(r_); }
        constexpr auto end() const requires range<const R> { return ranges::end(r_); }
        constexpr bool empty() requires requires { ranges::empty(r_); } { return ranges::empty(r_); }
        constexpr bool empty() const requires requires { ranges::empty(r_); } { return ranges::empty(r_); }
        constexpr auto size() requires sized_range<R> { return ranges::size(r_); }
        constexpr auto size() const requires sized_range<const R> { return ranges::size(r_); }
        constexpr auto data() requires contiguous_range<R> { return ranges::data(r_); }
        constexpr auto data() const requires contiguous_range<const R> { return ranges::data(r_); }
    }
}

constexpr owning_view(R&& t);

Effects: Initializes r_ with std::move(t).

26.7.7 As rvalue view

26.7.7.1 Overview

as_rvalue_view presents a view of an underlying sequence with the same behavior as the underlying sequence except that its elements are rvalues. Some generic algorithms can be called with a as_rvalue_view to replace copying with moving.

The name views::as_rvalue denotes a range adaptor object (26.7.2). Let E be an expression and let T be decltype((E)). The expression views::as_rvalue(E) is expression-equivalent to:
(2.1) — views::all(E) if same_as<range_rvalue_reference_t<T>, range_reference_t<T>> is true.

(2.2) — Otherwise, as_rvalue_view(E).

3 [Example 1:
vector<string> words = {"the", "quick", "brown", "fox", "ate", "a", "pterodactyl"};
vector<string> new_words;
ranges::copy(words | views::as_rvalue, back_inserter(new_words));
// moves each string from words into new_words
— end example]

26.7.7.2 Class template as_rvalue_view

namespace std::ranges {
  template<view V>
  requires input_range<V>
  class as_rvalue_view : public view_interface<as_rvalue_view<V>> {
    V base_ = V(); // exposition only

    public:
      as_rvalue_view() requires default_initializable<V> = default;
      constexpr explicit as_rvalue_view(V base);

      constexpr V base() const & requires copy_constructible<V> { return base_; }
      constexpr V base() && { return std::move(base_); }

      constexpr auto begin() requires (!simple_view<V>)
      { return move_iterator(ranges::begin(base_)); }
      constexpr auto begin() const requires range<const V>
      { return move_iterator(ranges::begin(base_)); }

      constexpr auto end() requires (!simple_view<V>)
      { if constexpr (common_range<V>)
          return move_iterator(ranges::end(base_));
        } else {
          return move_sentinel(ranges::end(base_));
        }
      }
      constexpr auto end() const requires range<const V>
      { if constexpr (common_range<const V>)
          return move_iterator(ranges::end(base_));
        } else {
          return move_sentinel(ranges::end(base_));
        }

      constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
      constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }
    }

    template<class R>
    as_rvalue_view(R&&) -> as_rvalue_view<views::all_t<R>>;
  }

  constexpr explicit as_rvalue_view(V base);
}  

Effects: Initializes base_ with std::move(base).

26.7.8 Filter view

26.7.8.1 Overview

filter_view presents a view of the elements of an underlying sequence that satisfy a predicate.

2 The name views::filter denotes a range adaptor object (26.7.2). Given subexpressions E and P, the expression views::filter(E, P) is expression-equivalent to filter_view(E, P).

3 [Example 1:
vector<int> is{ 0, 1, 2, 3, 4, 5, 6 };  
auto evens = views::filter(is, [] (int i) { return 0 == i % 2; });  
for (int i : evens)
    cout << i << ' '; // prints 0 2 4 6
— end example]

26.7.8.2 Class template filter_view

namespace std::ranges {

    template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
    class filter_view : public view_interface<filter_view<V, Pred>> {
        private:
            V base_ = V(); // exposition only
            movable-box<Pred> pred_; // exposition only

            // 26.7.8.3, class filter_view::iterator
            class iterator; // exposition only

            // 26.7.8.4, class filter_view::sentinel
        class sentinel; // exposition only

        public:

            filter_view() requires default_initializable<V> && default_initializable<Pred> = default;
            constexpr filter_view(V base, Pred pred);

            constexpr const Pred& pred() const; // exposition only
            constexpr iterator begin();  // exposition only
            constexpr auto end() {
                if constexpr (common_range<V>)
                    return iterator{*this, ranges::end(base_)};
                else
                    return sentinel{*this};
            }

        };

        template<class R, class Pred>
        filter_view(R&&, Pred) -> filter_view<views::all_t<R>, Pred>;
    }

    constexpr filter_view(V base, Pred pred);

    Effects: Initializes base_ with std::move(base) and initializes pred_ with std::move(pred).

    constexpr const Pred& pred() const;

    Effects: Equivalent to: return *pred_;  // exposition only

    constexpr iterator begin();  // exposition only

    Preconditions: pred_.has_value() is true.

    Returns: {*this, ranges::find_if(base_, ref(*pred_))}.

    Remarks: In order to provide the amortized constant time complexity required by the range concept when filter_view models forward_range, this function caches the result within the filter_view for use on subsequent calls.

26.7.8.3 Class filter_view::iterator

namespace std::ranges {

    template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
    class filter_view<V, Pred>::iterator {

§ 26.7.8.3
private:
    iterator_t<V> current_ = iterator_t<V>(); // exposition only
    filter_view* parent_ = nullptr; // exposition only

public:
    using iterator_concept = see below; // not always present
    using iterator_category = see below; // not always present
    using value_type = range_value_t<V>;
    using difference_type = range_difference_t<V>;

    iterator() requires default_initializable<iterator_t<V>> = default;
    constexpr iterator(filter_view& parent, iterator_t<V> current);
    constexpr const iterator_t<V>& base() const & noexcept;
    constexpr iterator_t<V> base() &&;
    constexpr range_reference_t<V> operator*() const;
    constexpr iterator_t<V> operator->() const requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;
    constexpr iterator& operator++();
    constexpr void operator++(int);
    constexpr iterator operator++(int) requires forward_range<V>;
    constexpr iterator operator--() requires bidirectional_range<V>;
    constexpr iterator operator--(int) requires bidirectional_range<V>;

    friend constexpr bool operator==(const iterator& x, const iterator& y)
        requires equality_comparable<iterator_t<V>>;
    friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
        noexcept(noexcept(ranges::iter_move(i.current_)));
    friend constexpr void iter_swap(const iterator& x, const iterator& y)
        noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
        requires indirectly_swappable<iterator_t<V>>;
};

1 Modification of the element a filter_view::iterator denotes is permitted, but results in undefined behavior if the resulting value does not satisfy the filter predicate.

2 iterator::iterator_concept is defined as follows:

(2.1) If V models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(2.2) Otherwise, if V models forward_range, then iterator_concept denotes forward_iterator_tag.
(2.3) Otherwise, iterator_concept denotes input_iterator_tag.

3 The member typedef-name iterator_category is defined if and only if V models forward_range. In that case, iterator::iterator_category is defined as follows:

(3.1) Let C denote the type iterator_traits<iterator_t<V>>::iterator_category.
(3.2) If C models derived_from<bidirectional_iterator_tag>, then iterator_category denotes bi-directional_iterator_tag.
(3.3) Otherwise, if C models derived_from<forward_iterator_tag>, then iterator_category denotes forward_iterator_tag.
(3.4) Otherwise, iterator_category denotes C.

4 constexpr iterator(filter_view& parent, iterator_t<V> current);

   Effects: Initializes current_ with std::move(current) and parent_ with addressof(parent).

5 constexpr const iterator_t<V>& base() const & noexcept;

   Effects: Equivalent to: return current_;
constexpr iterator_t<V> base() &&;
Effects: Equivalent to: return std::move(current_);

constexpr range_reference_t<V> operator*() const;
Effects: Equivalent to: return *current_;

constexpr iterator_t<V> operator->() const
requires has-arrow<iterator_t<V>> && copyable<iterator_t<V>>;
Effects: Equivalent to: return current_;

constexpr iterator& operator++();
Effects: Equivalent to:
current_ = ranges::find_if(std::move(++current_), ranges::end(parent_->base_),
  ref(*parent_->pred_));
return *this;

constexpr void operator++(int);

constexpr iterator operator++(int) requires forward_range<V>;
Effects: Equivalent to:
  auto tmp = *this;
  +++this;
  return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;
Effects: Equivalent to:
do
  --current_; while (!invoke(*parent_->pred_, *current_));
return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;
Effects: Equivalent to:
  auto tmp = *this;
  --*this;
  return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires equality_comparable<iterator_t<V>>;
Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr range_rvalue_reference_t<V> iter_move(const iterator& i)
noexcept(noexcept(ranges::iter_move(i.current_)));
Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
requires indirectly_swappable<iterator_t<V>>;
Effects: Equivalent to ranges::iter_swap(x.current_, y.current_).

26.7.8.4 Class filter_view::sentinel

namespace std::ranges {
template<input_range V, indirect_unary_predicate<iterator_t<V>> Pred>
requires view<V> && is_object_v<Pred>
class filter_view<V, Pred>::sentinel {
  private:
    sentinel_t<V> end_ = sentinel_t<V>();
    // exposition only
}
public:
    sentinel() = default;
    constexpr explicit sentinel(filter_view& parent);

    constexpr sentinel_t<V> base() const;

    friend constexpr bool operator==(const iterator& x, const sentinel& y);
};

constexpr explicit sentinel(filter_view& parent);
1 Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel_t<V> base() const;
2 Effects: Equivalent to: return end_;

friend constexpr bool operator==(const iterator& x, const sentinel& y);
3 Effects: Equivalent to: return x.current_ == y.end_;

26.7.9 Transform view

26.7.9.1 Overview

transform_view presents a view of an underlying sequence after applying a transformation function to each element.

The name views::transform denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::transform(E, F) is expression-equivalent to transform_view(E, F).

[Example 1:]

vector<int> is{ 0, 1, 2, 3, 4 };  
auto squares = views::transform(is, [](int i) { return i * i; });  
for (int i : squares)
    cout << i << ' ';  // prints 0 1 4 9 16

—end example—

26.7.9.2 Class template transform_view

namespace std::ranges {
    template<input_range V, move_constructible F>
    requires view<V> && is_object_v<F> &&
    regular_invocable<F&, range_reference_t<V>> &&
    can_reference<invoke_result_t<F&, range_reference_t<V>>>>
    class transform_view : public view_interface<transform_view<V, F>> {
    private:
        // 26.7.9.3, class template transform_view::iterator
        template<bool> struct iterator;  // exposition only

        // 26.7.9.4, class template transform_view::sentinel
        template<bool> struct sentinel;  // exposition only

        V base_ = V();  // exposition only
        movable-box<F> fun_;  // exposition only

    public:
        transform_view() requires default_initializable<V> && default_initializable<F> = default;
        constexpr transform_view(V base, F fun);

        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }

        constexpr iterator<false> begin();
        constexpr iterator<true> begin() const
            requires range<const V> & &
                regular_invocable<const F&, range_reference_t<const V>>;

§ 26.7.9.2 1163
namespace std::ranges {

    };

    template<class R, class F>
    transform_view(R&&, F) -> transform_view<views::all_t<R>, F>;
    constexpr transform_view(V base, F fun);
    Effects: Initializes base_ with std::move(base) and fun_ with std::move(fun).
    constexpr iterator<false> begin();
    Effects: Equivalent to:
        return iterator<false>{*this, ranges::begin(base_)};
    constexpr iterator<true> begin() const
        requires range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;
    Effects: Equivalent to:
        return iterator<true>{*this, ranges::begin(base_)};
    constexpr sentinel<false> end();
    Effects: Equivalent to:
        return sentinel<false>{ranges::end(base_)};
    constexpr iterator<false> end() requires common_range<V>;
    Effects: Equivalent to:
        return iterator<false>{*this, ranges::end(base_)};
    constexpr sentinel<true> end() const
        requires range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;
    Effects: Equivalent to:
        return sentinel<true>{ranges::end(base_)};
    constexpr iterator<true> end() const
        requires common_range<const V> &&
        regular_invocable<const F&, range_reference_t<const V>>;
    Effects: Equivalent to:
        return iterator<true>{*this, ranges::end(base_)};

26.7.9.3 Class template transform_view::iterator [range.transform.iterator]
    namespace std::ranges {
        template<input_range V, move_constructible F>
        requires view<V> && is_object_v<F> &&
        regular_invocable<F&, range_reference_t<V>> &&
        can_reference<invoke_result_t<F&, range_reference_t<V>>>;
        template<bool Const>
        class transform_view<V, F>::iterator {

§ 26.7.9.3 1164
private:
using Parent = maybe-const<Const, transform_view>;             // exposition only
using Base = maybe-const<Const, V>;
// exposition only
iterator_t<Base> current_ = iterator_t<Base>();              // exposition only
Parent* parent_ = nullptr;                                    // exposition only

public:
using iterator_concept = see below;                            // not always present
using iterator_category = see below;
using value_type = remove_cvref_t<invoke_result_t<
maybe-const<Const, F> &, range_reference_t<Base>>>
using difference_type = range_difference_t<Base>;

iterator() requires default_initializable<iterator_t<Base>> = default;
constexpr iterator(Parent& parent, iterator_t<Base> current);
constexpr iterator(iterator<Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

constexpr const iterator_t<Base>& base() const & noexcept;
constexpr iterator_t<Base> base() &&;

friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires equality_comparable<iterator_t<Base>>;
friend constexpr bool operator<(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y)
  requires random_access_range<Base>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y)
  requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

§ 26.7.9.3 1165
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;
);
}

iterator::iterator_concept is defined as follows:

1. If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
2. Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
3. Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.
4. Otherwise, iterator_concept denotes input_iterator_tag.

The member typedef-name iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows: Let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.

1. If is_reference_v<invoke_result_t<maybe-const<Const, F>&, range_reference_t<Base>>> is true, then
   - If C models derived_from<contiguous_iterator_tag>, iterator_category denotes random_access_iterator_tag;
   - Otherwise, iterator_category denotes C.
2. Otherwise, iterator_category denotes input_iterator_tag.

constexpr iterator(Parent& parent, iterator_t<Base> current);

Effects: Initializes current_ with std::move(current) and parent_ with addressof(parent).

constexpr iterator(iterator<Const> i) requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

Effects: Initializes current_ with std::move(i.current_) and parent_ with i.parent_.

```
26.7.10 Take view

26.7.10.1 Overview

take_view produces a view of the first \( N \) elements from another view, or all the elements if the adapted view contains fewer than \( N \).

2 The name \( \text{views::take} \) denotes a range adaptor object (26.7.2). Let \( E \) and \( F \) be expressions, let \( T \) be \( \text{remove_cvref_t<}\text{decltype((E))}> \), and let \( B \) be \( \text{range_difference_t<}\text{decltype((E))}> \). If \( \text{decltype((F))} \) does not model \( \text{convertible_to<D>} \), \( \text{views::take(E, F)} \) is ill-formed. Otherwise, the expression \( \text{views::take(E, F)} \) is expression-equivalent to:

(2.1) — If \( T \) is a specialization of \( \text{ranges::empty_view} \) (26.6.2.2), then \((\text{void})F, \text{decay-copy}(E))\), except that the evaluations of \( E \) and \( F \) are indeterminately sequenced.

(2.2) — Otherwise, if \( T \) models \( \text{random_access_range} \) and \( \text{sized_range} \) and is a specialization of \( \text{span} \) (24.7.2.2), \( \text{basic_string_view} \) (23.3), or \( \text{ranges::subrange} \) (26.5.4), then \( U(\text{ranges::begin}(E), \text{ranges::begin}(E) + \text{std::min<D>}(\text{ranges::distance}(E), F)) \), except that \( E \) is evaluated only once, where \( U \) is a type determined as follows:

(2.2.1) — if \( T \) is a specialization of \( \text{span} \), then \( U \) is \( \text{span<typename T::element_type>} \);

(2.2.2) — otherwise, if \( T \) is a specialization of \( \text{basic_string_view} \), then \( U \) is \( T \);

(2.2.3) — otherwise, \( T \) is a specialization of \( \text{ranges::subrange} \), and \( U \) is \( \text{ranges::subrange<}\text{iterator_\-t}<T>\)\);

(2.3) — otherwise, if \( T \) is a specialization of \( \text{ranges::iota_view} \) (26.6.4.2) that models \( \text{random_access_range} \) and \( \text{sized_range} \), then \( \text{ranges::iota_view}(*\text{ranges::begin}(E), *(\text{ranges::begin}(E) + \text{std::min<D>>(\text{ranges::distance}(E), F)))} \), except that \( E \) is evaluated only once.

(2.4) — Otherwise, if \( T \) is a specialization of \( \text{ranges::repeat_view} \) (26.6.5.2):

(2.4.1) — if \( T \) models \( \text{sized_range} \), then

\( \text{views::repeat(*E.value_, std::min<D>>(\text{ranges::distance}(E), F))} \)

except that \( E \) is evaluated only once;

(2.4.2) — otherwise, \( \text{views::repeat(*E.value_, static_cast<D>>(F))} \).

(2.5) — Otherwise, \( \text{ranges::take(E, F)} \).

3 [Example 1:

\[
\begin{align*}
\text{vector<int> is\{}0,1,2,3,4,5,6,7,8,9\}; \\
\text{for (int i : is | views::take(5))} \\
\quad \text{cout } \ll i \ll \text{'} ; // \text{prints 0 1 2 3 4}
\end{align*}
\]

—end example]

26.7.10.2 Class template take_view

namespace std::ranges {

    template<view V>
    class take_view : public view_interface<take_view<V>> {

26.7.11 Take while view

26.7.11.1 Overview

1 Given a unary predicate pred and a view r, take_while_view produces a view of the range [ranges::begin(r), ranges::find_if_not(r, pred)].
The name `views::take_while` denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression `views::take_while(E, F)` is expression-equivalent to `take_while_view(E, F).

Example 1:

```cpp
class sentinel {
  template<bool> class;
};

class template `take_while_view`

namespace std::ranges {
  template<view V, class Pred>
  requires input_range<V> & is_object_v<Pred> &
  indirect_unary_predicate<const Pred, iterator_t<V>>
  class `take_while_view` : public view_interface<`take_while_view`<V, Pred>> { }

  template<Bool> class sentinel {
    // exposition only
  };

  V base_; /* exposition only */
  movable-box<Pred> pred_; /* exposition only */

public:
  `take_while_view`() requires default_initializable<V> && default_initializable<Pred> = default;
  constexpr `take_while_view`(V base, Pred pred);

  constexpr V base() const & requires copy_constructible<V> { return base_; }
  constexpr V base() && { return std::move(base_); }

  constexpr const Pred& pred() const;

  constexpr auto begin() requires (!simple_view<V>)
  { return ranges::begin(base_); }

  constexpr auto begin() const requires range<const V> &&
  indirect_unary_predicate<const Pred, iterator_t<const V>>
  { return ranges::begin(base_); }

  constexpr auto end() requires (!simple_view<V>)
  { return sentinel<false>(ranges::end(base_), addressof(*pred_)); }

  constexpr auto end() const requires range<const V> &&
  indirect_unary_predicate<const Pred, iterator_t<const V>>
  { return sentinel<true>(ranges::end(base_), addressof(*pred_)); }

};

template<class R, class Pred>
`take_while_view`(R&&, Pred) -> `take_while_view`<views::all_t<R>, Pred>;

`take_while_view`(V base, Pred pred);

Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;

Effects: Equivalent to: return *pred_;
26.7.11.3 Class template take_while_view::sentinel

```cpp
namespace std::ranges {
    template<view V, class Pred>
        requires input_range<V> && is_object_v<Pred> &&
            indirect_unary_predicate<const Pred, iterator_t<V>>
    template<bool Const>
        class take_while_view<V, Pred>::sentinel {
            using Base = maybe-const<Const, V>;
            // exposition only

            sentinel_t<Base> end_ = sentinel_t<Base>();
            // exposition only
            const Pred* pred_ = nullptr;
            // exposition only

            public:
                sentinel() = default;
                constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);

            constexpr sentinel(sentinel<!Const> s) requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;
                constexpr sentinel_t<Base> base() const { return end_; }

                friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

            template<bool OtherConst = !Const>
                requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
            friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x, const sentinel& y);

        }

class sentinel {
    sentinel_t<Base> end_, pred_;

    public:
        sentinel() = default;
        constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
    
        constexpr sentinel(!Const) s) requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

        constexpr sentinel_t<Base> base() const { return end_; }

        friend constexpr bool operator==(const iterator_t<Base>& x, const sentinel& y);

        template<bool OtherConst = !Const>
            requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
        friend constexpr bool operator==(const iterator_t<maybe-const<OtherConst, V>>& x, const sentinel& y);

} constexpr explicit sentinel(sentinel_t<Base> end, const Pred* pred);
```

1. **Effects**: Initializes `end_` with `end` and `pred_` with `pred`.

2. **Effects**: Initializes `end_` with `std::move(s.end_)` and `pred_` with `s.pred_`.

3. **Effects**: Equivalent to: `return y.end_ == x || !invoke(*y.pred_, *x);`

26.7.12 Drop view

26.7.12.1 Overview

`drop_view` produces a view excluding the first `N` elements from another view, or an empty range if the adapted view contains fewer than `N` elements.

2. The name `views::drop` denotes a range adaptor object (26.7.2). Let `E` and `F` be expressions, let `T` be `remove_cvref_t<decltype((E))>`, and let `D` be `range_difference_t<decltype((E))>`. If `decltype((F))` does not model `convertible_to<D>`, `views::drop(E, F)` is ill-formed. Otherwise, the expression `views::drop(E, F)` is expression-equivalent to:

1. If `T` is a specialization of `ranges::empty_view` (26.6.2.2), then `((void)F, decay-copy(E))`, except that the evaluations of `E` and `F` are indeterminately sequenced.

2. Otherwise, if `T` models `random_access_range` and `sized_range` and is

   a specialization of `span` (24.7.2.2),

   a specialization of `basic_string_view` (23.3),

   a specialization of `ranges::iota_view` (26.6.4.2), or
— a specialization of ranges::subrange (26.5.4) where T::StoreSize is false,
then U(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::end(E)), except
that E is evaluated only once, where U is span<typename T::element_type> if T is a specialization of
span and T otherwise.

— Otherwise, if T is a specialization of ranges::subrange (26.5.4) that models random_access_range
and sized_range, then T(ranges::begin(E) + std::min<D>(ranges::distance(E), F), ranges::
end(E), to_unsigned_like(ranges::distance(E) - std::min<D>(ranges::distance(E), F)))
except that E and F are each evaluated only once.

— Otherwise, if T is a specialization of ranges::repeat_view (26.6.5.2):

(2.4.1) if T models sized_range, then
views::repeat(*E.value_, ranges::distance(E) - std::min<D>(ranges::distance(E), F))
except that E is evaluated only once;

(2.4.2) otherwise, ((void)F, decay_copy(E)), except that the evaluations of E and F are indeterminately
sequenced.

— Otherwise, ranges::drop_view(E, F).

Example 1:

```cpp
auto ints = views::iota(0) | views::take(10);
for (auto i : ints | views::drop(5)) {
    cout << i << " "; // prints 5 6 7 8 9
}
```

26.7.12.2 Class template drop_view

namespace std::ranges {

            return s < c ? 0 : s - c;
        }
    }
```
private:
    V base_ = V(); // exposition only
    range_difference_t<V> count_ = 0; // exposition only
};

template<class R>
    drop_view(R&&, range_difference_t<R>) -> drop_view<views::all_t<R>>;

constexpr drop_view(V base, range_difference_t<V> count);

1  Preconditions: count >= 0 is true.
2  Effects: Initializes base_ with std::move(base) and count_ with count.

constexpr auto begin()
    requires (! (simple_view<V> &&
                 random_access_range<const V> && sized_range<const V>));
constexpr auto begin() const
    requires random_access_range<const V> && sized_range<const V>;

3  Returns: ranges::next(ranges::begin(base_), count_, ranges::end(base_)).
4  Remarks: In order to provide the amortized constant-time complexity required by the range concept when drop_view models forward_range, the first overload caches the result within the drop_view for use on subsequent calls.

[Note 1: Without this, applying a reverse_view over a drop_view would have quadratic iteration complexity.
—end note]

26.7.13 Drop while view

26.7.13.1 Overview

1 Given a unary predicate pred and a view r, drop_while_view produces a view of the range [ranges::find_if_not(r, pred), ranges::end(r)].
2 The name views::drop_while denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::drop_while(E, F) is expression-equivalent to drop_while_view(E, F).

3 [Example 1:
    constexpr auto source = " 	 	 	 hello there"sv;
    auto is_invisible = [](const auto x) { return x == ' ' || x == '\t'; };
    auto skip_ws = views::drop_while(source, is_invisible);
    for (auto c : skip_ws) {
        cout << c;
        // prints hello there with no leading space
    }
    —end example]

26.7.13.2 Class template drop_while_view

namespace std::ranges {
    template<class V, class Pred>
        requires input_range<V> && is_object_v<Pred> &&
                indirect_unary_predicate(const Pred, iterator_t<V>)
    class drop_while_view : public view_interface<drop_while_view<V, Pred>> {
        public:
            drop_while_view() requires default_initializable<V> && default_initializable<Pred> = default;
            constexpr drop_while_view(V base, Pred pred);

            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr const Pred& pred() const;

            constexpr auto begin();

            constexpr auto end() { return ranges::end(base_); }
}
private:
  V base_ = V();  // exposition only
  movable-box<Pred> pred_;  // exposition only
};

template<class R, class Pred>
drop_while_view(R&&, Pred) -> drop_while_view<views::all_t<R>, Pred>;
}

constexpr drop_while_view(V base, Pred pred);

1 Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;

2 Effects: Equivalent to: return *pred_;

constexpr auto begin();

3 Preconditions: pred_.has_value() is true.

Returns: ranges::find_if_not(base_, cref(*pred_)).

4 Remarks: In order to provide the amortized constant-time complexity required by the range concept
when drop_while_view models forward_range, the first call caches the result within the drop_while_view
for use on subsequent calls.

[Note 1: Without this, applying a reverse_view over a drop_while_view would have quadratic iteration
complexity. — end note]

26.7.14 Join view [range.join]

26.7.14.1 Overview [range.join.overview]

1 join_view flattens a view of ranges into a view.

2 The name views::join denotes a range adaptor object (26.7.2). Given a subexpression E, the expression
views::join(E) is expression-equivalent to join_view<views::all_t<decltype((E))>>{E}.

[Example 1: vector<string> ss{"hello", " ", "world", "!"};
for (char ch : ss | views::join)
  cout << ch;  // prints hello world!
—end example]

26.7.14.2 Class template join_view [range.join.view]

namespace std::ranges {
  template<input_range V>
  requires view<V> && input_range<range_reference_t<V>>
  class join_view : public view_interface<join_view<V>> {
    private:
      using InnerRng = range_reference_t<V>;  // exposition only

      // 26.7.14.3, class template join_view::iterator
      template<bool Const>
      struct iterator;  // exposition only

      // 26.7.14.4, class template join_view::sentinel
      template<bool Const>
      struct sentinel;  // exposition only

      V base_ = V();  // exposition only

      non-propagating-cache<remove_cv_t<InnerRng>> inner_;  // exposition only, present only

    public:
      join_view() requires default_initializable<V> = default;
      constexpr explicit join_view(V base);

      § 26.7.14.2 1176
constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr auto begin() {
  constexpr bool use_const = simple_view<V> &&
      is_reference_v<InnerRng>;
  return iterator<use_const>(*this, ranges::begin(base_));
}

operator--();
operator--(int)
  requires ref-is-glvalue && bidirectional_range<Base> &&
  bidirectional_range<range_reference_t<Base>> &&
  common_range<range_reference_t<Base>>;
friend constexpr bool operator==(const iterator& x, const iterator& y)
  requires ref-is-glvalue && equality_comparable<iterator_t<Base>> &&
  equality_comparable<iterator_t<range_reference_t<Base>>>;

friend constexpr decltype(auto) iter_move(const iterator& i)
noexcept(noexcept(ranges::iter_move(*i.inner_))) {
  return ranges::iter_move(*i.inner_);
}

friend constexpr void iter_swap(const iterator& x, const iterator& y)
noexcept(noexcept(ranges::iter_swap(*x.inner_, *y.inner_)))
  requires indirectly_swappable<InnerIter>;
}

---

1 iterator::iterator_concept is defined as follows:

(1.1) If ref-is-glvalue is true, Base models bidirectional_range, and range_reference_t<Base> models both bidirectional_range and common_range, then iterator_concept denotes bidirectional_iterator_tag.

(1.2) Otherwise, if ref-is-glvalue is true and Base and range_reference_t<Base> each model forward_range, then iterator_concept denotes forward_iterator_tag.

(1.3) Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if ref-is-glvalue is true, Base models forward_range, and range_reference_t<Base> models forward_range. In that case, iterator::iterator_category is defined as follows:

(2.1) Let OUTERC denote iterator_traits<iterator_t<Base>>::iterator_category, and let INNERC denote iterator_traits<iterator_t<range_reference_t<Base>>>::iterator_category.
If `OUTERC` and `INNERC` each model `derived_from<bidirectional_iterator_tag>` and range reference `<Base>` models `common_range`, `iterator_category` denotes `bidirectional_iterator_tag`.

Otherwise, if `OUTERC` and `INNERC` each model `derived_from<forward_iterator_tag>`, `iterator_category` denotes `forward_iterator_tag`.

Otherwise, `iterator_category` denotes `input_iterator_tag`.

`iterator::difference_type` denotes the type:

```cpp
common_type_t<
    range_difference_t<Base>,
    range_difference_t<range_reference_t<Base>>>
```

`join_view` iterators use the `satisfy` function to skip over empty inner ranges.

```cpp
constexpr void satisfy();
```

**Effects:** Equivalent to:

```cpp
auto update_inner = [this](const iterator_t<Base>& x) -> auto&& {
    if constexpr (ref_is_glvalue) // x is a reference
        return *x;
    else
        return parent_->inner_.emplace_dref(x);
};
```

```cpp
for (; outer_ != ranges::end(parent_->base_); ++outer_) {
    auto& inner = update_inner(outer_);
    inner_ = ranges::begin(inner);
    if (*inner_ != ranges::end(inner))
        return;
} if constexpr (ref_is_glvalue)
    inner_.reset();
```

```cpp
constexpr iterator(Parent& parent, OuterIter outer);
```

**Effects:** Initializes `outer_` with `std::move(outer)` and `parent_` with `addressof(parent)`; then calls `satisfy()`.

```cpp
constexpr iterator(iterator<!Const> i)
requires Const &
    convertible_to<iterator_t<W>, OuterIter> &&
    convertible_to<iterator_t<InnerRng>, InnerIter>;
```

**Effects:** Initializes `outer_` with `std::move(i.outer_)`, `inner_` with `std::move(i.inner_)`, and `parent_` with `i.parent_`.

```cpp
constexpr InnerIter operator->() const
requires has_arrow<InnerIter> && copyable<InnerIter>;
```

**Effects:** Equivalent to: `return *inner_`.

```cpp
constexpr iterator& operator++();
```

Let `inner-range` be:

(9.1) If `ref_is_glvalue` is true, `*outer_`.

(9.2) Otherwise, `*parent_`->`inner_`.

**Effects:** Equivalent to:

```cpp
auto& inner_rng = inner-range;
if (++inner_ == ranges::end(inner_rng)) {
    ++outer_;
    satisfy();
} return *this;
```
constexpr void operator++(int);  

**Effects:** Equivalent to: `***this`. 

constexpr iterator operator++(int)  
requires ref-is-glvalue &\& forward_range<Base> &\&  
forward_range<range_reference_t<Base>>;  

**Effects:** Equivalent to:  
```
auto tmp = *this;
***this;
return tmp;
``` 

constexpr iterator& operator--()  
requires ref-is-glvalue &\& bidirectional_range<Base> &\&  
bidirectional_range<range_reference_t<Base>> &\&  
common_range<range_reference_t<Base>>;  

**Effects:** Equivalent to:  
```
if (outer_ == ranges::end(parent_->base_))
  inner_ = ranges::end(*--outer_);
while (*inner_ == ranges::begin(*outer_))
  *inner_ = ranges::end(*--outer_);
--*inner_;
return *this;
``` 

constexpr iterator operator--(int)  
requires ref-is-glvalue &\& bidirectional_range<Base> &\&  
bidirectional_range<range_reference_t<Base>> &\&  
common_range<range_reference_t<Base>>;  

**Effects:** Equivalent to:  
```
auto tmp = *this;
--*this;
return tmp;
``` 

friend constexpr bool operator==(const iterator& x, const iterator& y)  
requires ref-is-glvalue &\& equality_comparable<iterator_t<Base>> &\&  
equality_comparable<iterator_t<range_reference_t<Base>>>;  

**Effects:** Equivalent to:  
```
return x.outer_ == y.outer_ &\& x.inner_ == y.inner_;
``` 

friend constexpr void iter_swap(const iterator& x, const iterator& y)  
noexcept(noexcept(ranges::iter_swap(*x.inner_, *y.inner_)))  
requires indirectly_swappable<InnerIter>;  

**Effects:** Equivalent to:  
```
return ranges::iter_swap(*x.inner_, *y.inner_);
```
template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
};

constexpr explicit sentinel(Parent& parent);

Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel(s sentinel<!Const> s)
requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes end_ with std::move(s.end_).

template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

Effects: Equivalent to: return x.outer_ == y.end_

26.7.15 Join with view

26.7.15.1 Overview

join_with_view takes a view and a delimiter, and flattens the view, inserting every element of the delimiter in between elements of the view. The delimiter can be a single element or a view of elements.

The name views::join_with denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::join_with(E, F) is expression-equivalent to join_with_view(E, F).

[Example 1:

```cpp
class View { public: using T = int; iterator begin() { return begin_; } iterator end() { return end_; } }; View view; View view2; auto result = view | views::join_with(view2, -1);
```

The above prints: `result` with `join_with_view`]

requires indirectly_swappable<InnerIter, PatternIter> {  
visit(ranges::iter_swap, x.inner_it_, y.inner_it_);  
}  
}

1 iterator::iterator_concept is defined as follows:

(1.1) — If \(\text{ref-is-glvalue}\) is true, \(\text{Base}\) models bidirectional_range, and \(\text{InnerBase}\) and \(\text{PatternBase}\) each model bidirectional-common, then \(\text{iterator\_concept}\) denotes bidirectional_iterator_tag.

(1.2) — Otherwise, if \(\text{ref-is-glvalue}\) is true and \(\text{Base}\) and \(\text{InnerBase}\) each model forward_range, then \(\text{iterator\_concept}\) denotes forward_iterator_tag.

(1.3) — Otherwise, \(\text{iterator\_concept}\) denotes input_iterator_tag.

2 The member typedef-name \(\text{iterator\_category}\) is defined if and only if \(\text{ref-is-glvalue}\) is true, and \(\text{Base}\) and \(\text{InnerBase}\) each model forward_range. In that case, \(\text{iterator\_concept}\) is defined as follows:

(2.1) — Let \(\text{OUTERC}\) denote iterator_traits<OuterIter>::iterator_category, let \(\text{INNERC}\) denote iterator_traits<InnerIter>::iterator_category, and let \(\text{PATTERNC}\) denote iterator_traits<PatternIter>::iterator_category.

(2.2) — If \(\text{is_reference_v<common_reference_t<\text{iter_reference_t<InnerIter>}, \text{iter_reference_t<PatternIter>>>>}\) is false, \(\text{iterator\_category}\) denotes input_iterator_tag.

(2.3) — Otherwise, if \(\text{OUTERC, INNERC, and PATTERNC}\) each model derived_from<bidirectional_iterator_category> and \(\text{InnerBase}\) and \(\text{PatternBase}\) each model common_range, \(\text{iterator\_category}\) denotes bidirectional_iterator_tag.

(2.4) — Otherwise, if \(\text{OUTERC, INNERC, and PATTERNC}\) each model derived_from<forward_iterator_tag>, \(\text{iterator\_category}\) denotes forward_iterator_tag.

(2.5) — Otherwise, \(\text{iterator\_category}\) denotes input_iterator_tag.

3 iterator::value_type denotes the type:
\[
\text{common\_type_t<\text{iter\_value_t<InnerIter>, \text{iter\_value_t<PatternIter>}>}
\]

4 iterator::difference_type denotes the type:
\[
\text{common\_type_t<}
\text{iter\_difference_t<OuterIter>,}
\text{iter\_difference_t<InnerIter>,}
\text{iter\_difference_t<PatternIter>}>}
\]

constexpr auto&& update-inner(const OuterIter& x);

Effects: Equivalent to:
\[
\text{if constexpr (\text{ref-is-glvalue}) return *x; else return parent_\_->inner\_\_.emplace\_deref(x);}
\]

constexpr auto&& get-inner(const OuterIter& x);

Effects: Equivalent to:
\[
\text{if constexpr (\text{ref-is-glvalue}) return *x; else return *parent_\_->inner_ ;}
\]

constexpr void satisfy();

Effects: Equivalent to:
while (true) {
    if (inner_it_.index() == 0) {
        if (std::get<0>(inner_it_) != ranges::end(parent_->pattern_))
            break;
        auto& inner = update-inner(outer_it_);
        inner_it_.emplace<1>(ranges::begin(inner));
    } else {
        auto& inner = get-inner(outer_it_);
        if (std::get<1>(inner_it_) != ranges::end(inner))
            break;
        if (++outer_it_ == ranges::end(parent_->base_)) {
            if constexpr (ref-is-glvalue)

26.7.15.4 Class template join_with_view::sentinel

namespace std::ranges {
  template<input_range V, forward_range Pattern>
  requires view<V> && input_range<range_reference_t<V>>
    && view<Pattern> && compatible-joinable-ranges<range_reference_t<V>, Pattern>
  template<bool Const>
  class join_with_view<V, Pattern>::sentinel {
    using Parent = maybe-const<Const, join_with_view>; // exposition only
    using Base = maybe-const<Const, V>; // exposition only
    sentinel_t<Base> end = sentinel_t<Base>(); // exposition only

    constexpr explicit sentinel(Parent& parent); // exposition only
  }

public:
  sentinel() = default;

§ 26.7.15.4
constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
  friend constexpr bool operator==(const iterator_t<OtherConst>& x, const sentinel& y);
}

constexpr explicit sentinel(Parent& parent);

Effects: Initializes end_ with ranges::end(parent.base_).

constexpr sentinel(sentinel<!Const> s)
  requires Const && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes end_ with std::move(s.end_).

template<bool OtherConst>
  requires sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>;
  friend constexpr bool operator==(const iterator_t<OtherConst>& x, const sentinel& y);

Effects: Equivalent to: return x.outer_it_ == y.end;

26.7.16 Lazy split view

26.7.16.1 Overview

lazy_split_view takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter can be a single element or a view of elements.

The name views::lazy_split denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::lazy_split(E, F) is expression-equivalent to lazy_split_view(E, F).

[Example 1:

```cpp
string str{"the quick brown fox"};
for (auto word : str | views::lazy_split(' ')) {
  for (char ch : word)
    cout << ch;
  cout << '*';
}
// The above prints the*quick*brown*fox*
```
— end example]

26.7.16.2 Class template lazy_split_view

namespace std::ranges {
  template<auto> struct require-constant;
    // exposition only

  template<class R>
    concept tiny-range =
      sized_range<R> &&
      requires { typename require-constant<remove_reference_t<R>::size>(); } &&
      (remove_reference_t<R>::size() <= 1);

  template<input_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
    indirectly_comparable<iterator_t<V>, iterator_t<Pattern>>, ranges::equal_to &&
    (forward_range<V> || tiny_range<Pattern>)
    class lazy_split_view : public view_interface<lazy_split_view<V, Pattern>> { 
      private:
        V base_ = V(); // exposition only
        Pattern pattern_ = Pattern(); // exposition only
        non-propagating-cache<iterator_t<V>> current_; // exposition only, present only
    // if !forward_range<V>
template< bool > struct outer_iterator;  // exposition only

template< bool > struct inner_iterator;  // exposition only

public:
  lazy_split_view()
    requires default_initializable<V> && default_initializable<Pattern> = default;
    constexpr lazy_split_view(V base, Pattern pattern);

  template<input_range R>

    constexpr lazy_split_view(R&& r, range_value_t<R> e);

  constexpr V base() const & requires copy_constructible<V> { return
    base_; }
  constexpr V base() && { return std::move(base_); }

  constexpr auto begin() {
    if constexpr (forward_range<V>) {
      return outer_iterator<simple_view<V> && simple_view<Pattern>>
        {*this, ranges::begin(base_)};
    } else {
      current_ = ranges::begin(base_);
      return outer_iterator<false>{*this};
    }
  }

  constexpr auto begin() const requires forward_range<V> && forward_range<const V> {
    return outer_iterator<true>{*this, ranges::begin(base_)};
  }

  constexpr auto end() requires forward_range<V> && common_range<V> {
    return outer_iterator<simple_view<V> && simple_view<Pattern>>
      {*this, ranges::end(base_)};
  }

  constexpr auto end() const {
    if constexpr (forward_range<V> && forward_range<const V> && common_range<const V>)
      return outer_iterator<true>{*this, ranges::end(base_)};
    else
      return default_sentinel;
  }

  template<class R, class P>
    lazy_split_view(R&&, P&&) -> lazy_split_view<views::all_t<R>, views::all_t<P>>;

  template<input_range R>
    lazy_split_view(R&&, range_value_t<R>)
      -> lazy_split_view<views::all_t<R>, single_view<range_value_t<R>>>;

  constexpr lazy_split_view(V base, Pattern pattern);

Effects: Initializes base_ with std::move(base), and pattern_ with std::move(pattern).

template<input_range R>
  requires constructible_from<V, views::all_t<R>> &&
    constructible_from<Pattern, single_view<range_value_t<R>>>
  constexpr lazy_split_view(R&& r, range_value_t<R> e);

Effects: Initializes base_ with views::all(std::forward<R>(r)), and pattern_ with views::single(std::move(e)).
26.7.16.3 Class template lazy_split_view::outer-iterator

namespace std::ranges {
  template<input_range V, forward_range Pattern>
  requires view<V> && view<Pattern> &&
  indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to> &&
  (forward_range<V> || tiny-range<Pattern>)
  template<bool Const>
  struct lazy_split_view<V, Pattern>::outer-iterator {
    private:
      using Parent = maybe-const<Const, lazy_split_view>;  // exposition only
      using Base = maybe-const<Const, V>;  // exposition only
      Parent* parent_ = nullptr;  // exposition only
      iterator_t<Base> current_ = iterator_t<Base>();  // exposition only, present only
      // if V models forward_range
      bool trailing_empty_ = false;  // exposition only

    public:
      using iterator_concept =
        conditional_t<forward_range<Base>, forward_iterator_tag, input_iterator_tag>;
      using iterator_category = input_iterator_tag;  // present only if Base
      // models forward_range
      outer-iterator() = default;
      constexpr explicit outer-iterator(Parent& parent)
        requires (!forward_range<Base>);
      constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
        requires forward_range<Base>;
      constexpr outer-iterator(outer-iterator<!Const> i)
        requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

      constexpr value_type operator*() const;
      constexpr outer-iterator& operator++();
      constexpr decltype(auto) operator++(int) {
        if constexpr (forward_range<Base>) {
          auto tmp = *this;
          +++this;
          return tmp;
        } else
          +++this;
      }

      friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y)
        requires forward_range<Base>;

      friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
    };
  }
}

1 Many of the specifications in 26.7.16 refer to the notional member current of outer-iterator. current is equivalent to current_ if V models forward_range, and *parent_ -> current_ otherwise.

constexpr explicit outer-iterator(Parent& parent)
  requires (!forward_range<Base>);

2 Effects: Initializes parent_ with addressof(parent).
constexpr outer-iterator(Parent& parent, iterator_t<Base> current)
requires forward_range<Base>;
3 Effects: Initializes parent_ with addressof(parent) and current_ with std::move(current).

costexpr outer-iterator(const outer-iterator<!Const> i)
requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
4 Effects: Initializes parent_ with i.parent_ and current_ with std::move(i.current_).

costexpr value_type operator*() const;
5 Effects: Equivalent to: return value_type{*this};

costexpr outer-iterator& operator++();
6 Effects: Equivalent to:
  
  const auto end = ranges::end(parent_->base_);
  if (current == end) { 
    trailing_empty_ = false;
    return *this;
  }
  const auto [pbegin, pend] = subrange(parent_->pattern_);
  if (pbegin == pend) ++current;
  else if constexpr (tiny-range<Pattern>) {
    current = ranges::find(std::move(current), end, *pbegin);
    if (current != end) {
      ++current;
      if (current == end)
        trailing_empty_ = true;
    }
  }
  else {
    do {
      auto [b, p] = ranges::mismatch(current, end, pbegin, pend);
      if (p == pend) {
        current = b;
        if (current == end)
          trailing_empty_ = true;
      } // The pattern matched; skip it
    } while (++current != end);
  }
  return *this;
friend constexpr bool operator==(const outer-iterator& x, const outer-iterator& y)
requires forward_range<Base>;
7 Effects: Equivalent to:
  return x.current_ == y.current_ && x.trailing_empty_ == y.trailing_empty_;
friend constexpr bool operator==(const outer-iterator& x, default_sentinel_t);
8 Effects: Equivalent to:
  return x.current_ == ranges::end(x.parent_->base_) && !x.trailing_empty_;

26.7.16.4 Class lazy_split_view::outer-iterator::value_type

namespace std::ranges {
  template<input_range V, forward_range Pattern>
  requires view<V> && view<Pattern> &&
    indirectly_comparable<iterator_t<V>, iterator_t<Pattern>>, ranges::equal_to &&
    (forward_range<V> || tiny-range<Pattern>)
  template<bool Const>
  struct lazy_split_view<V, Pattern>::outer-iterator<Const>::value_type :
    view_interface<value_type> {
    private:

            // exposition only
            outer_iterator<Const> i_ = outer_iterator<Const>();
            // exposition only
            bool incremented_ = false;
            // exposition only
        public:
            using iterator_concept = typename outer_iterator<Const>::iterator_concept;
            using iterator_category = see below;   // present only if Base
            using value_type = range_value_t<Base>;
            using difference_type = range_difference_t<Base>;

            inner_iterator() = default;
            constexpr explicit inner_iterator(outer_iterator<Const> i);

            constexpr const iterator_t<Base>& base() const & noexcept;
            constexpr iterator_t<Base> base() && requires forward_range<V>;

            constexpr decltype(auto) operator*() const { return *i_.current; }

            constexpr inner_iterator& operator++();
            constexpr decltype(auto) operator++(int) {
                if constexpr (forward_range<Base>) {
                    auto tmp = *this;
                    +++this;
                    return tmp;
                } else
                    +++this;
            }

            friend constexpr bool operator==(const inner_iterator& x, const inner_iterator& y) requires forward_range<Base>;

        } // struct lazy_split_view<V, Pattern>::inner_iterator
    } // template lazy_split_view
};

§ 26.7.16.5
friend constexpr decltype(auto) iter_move(const inner_iterator& i) noexcept(noexcept(ranges::iter_move(i.i_.current))) {
    return ranges::iter_move(i.i_.current);
}

friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y) noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current))) requires indirectly_swappable<iterator_t<Base>>;
}

1 If Base does not model forward_range there is no member iterator_category. Otherwise, the typedef-name iterator_category denotes:

(1.1) — forward_iterator_tag if iterator_traits<iterator_t<Base>>::iterator_category models derived_from<forward_iterator_tag>;
(1.2) — otherwise, iterator_traits<iterator_t<Base>>::iterator_category.

constexpr explicit inner_iterator(outter_iterator<Const> i);

Effects: Initializes i_ with std::move(i).

constexpr const iterator_t<Base>& base() const & noexcept;

Effects: Equivalent to: return i_.current;

constexpr iterator_t<Base> base() && requires forward_range<V>;

Effects: Equivalent to: return std::move(i_.current);

        if (++pcur == pend) return true;
    } while (++cur != end);
    return false;
}
friend constexpr void iter_swap(const inner_iterator& x, const inner_iterator& y)
    noexcept(noexcept(ranges::iter_swap(x.i_.current, y.i_.current)))
    requires indirectly_swappable<iterator_t<Base>>;

Effects: Equivalent to ranges::iter_swap(x.i_.current, y.i_.current).

26.7.17 Split View

26.7.17.1 Overview

split_view takes a view and a delimiter, and splits the view into subranges on the delimiter. The delimiter
can be a single element or a view of elements.

The name views::split denotes a range adaptor object (26.7.2). Given subexpressions E and F, the
expression views::split(E, F) is expression-equivalent to split_view(E, F).

[Example 1:

```cpp
string str("the quick brown fox");
for (string_view word : views::split(str, ' ')) {
    cout << word << 'e';
}
// The above prints the*quick*brown*fox*
end example]

26.7.17.2 Class template split_view

namespace std::ranges {
    template<forward_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
    indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
    class split_view : public view_interface<split_view<V, Pattern>> {
    private:
        V base_ = V(); // exposition only
        Pattern pattern_ = Pattern(); // exposition only

        // 26.7.17.3, class split_view::iterator
        struct iterator;
        // exposition only

        // 26.7.17.4, class split_view::sentinel
        struct sentinel;

split_view(R&&, range_value_t<R>)
    -> split_view<views::all_t<R>, single_view<range_value_t<R>>>;

constexpr split_view(V base, Pattern pattern);

Effects: Initializes base_ with std::move(base), and pattern_ with std::move(pattern).

template<forward_range R>
requires constructible_from<V, views::all_t<R>> &&
    constructible_from<Pattern, single_view<range_value_t<R>>>;
constexpr split_view(R&& r, range_value_t<R> e);

Effects: Initializes base_ with views::all(std::forward<R>(r)), and pattern_ with views::
single(std::move(e)).

constexpr iterator begin();

Returns: {*this, ranges::begin(base_), find-next(ranges::begin(base_))}.

Remarks: In order to provide the amortized constant time complexity required by the range concept,
this function caches the result within the split_view for use on subsequent calls.

constexpr subrange<iterator_t<V>> find-next(iterator_t<V> it);

Effects: Equivalent to:
        auto [b, e] = ranges::search(subrange(it, ranges::end(base_)), pattern_);
        if (b != ranges::end(base_) && ranges::empty(pattern_)) {
            ++b;
            ++e;
        }
        return {b, e};

26.7.17.3 Class split_view::iterator

namespace std::ranges {
    template<forward_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
        indirectly_comparable<iterator_t<V>, iterator_t<Pattern>, ranges::equal_to>
class split_view<V, Pattern>::iterator {

    constexpr iterator& operator++();
    constexpr iterator operator++(int);

    friend constexpr bool operator==(const iterator& x, const iterator& y);
};
}
constexpr iterator(split_view& parent, iterator_t<V> current, subrange<iterator_t<V>> next);

**Effects:** Initializes `parent_` with `addressof(parent)`, `cur_` with `std::move(current)`, and `next_` with `std::move(next)`.

constexpr iterator_t<V> base() const;

**Effects:** Equivalent to `return cur_`.

constexpr value_type operator*() const;

**Effects:** Equivalent to `return {cur_, next_.begin()}`.

constexpr iterator& operator++();

**Effects:** Equivalent to:

```cpp
cur_ = next_.begin();
if (cur_ != ranges::end(parent_->base_)) {
    cur_ = next_.end();
    if (cur_ == ranges::end(parent_->base_)) {
        trailing_empty_ = true;
        next_ = {cur_, cur_};
    } else {
        next_ = parent_->find-next(cur_);
    }
} else {
    trailing_empty_ = false;
}
return *this;
```

constexpr iterator operator++(int);

**Effects:** Equivalent to:

```cpp
auto tmp = *this;
++*this;
return tmp;
```

class split_view::sentinel

namespace std::ranges {
    template<forward_range V, forward_range Pattern>
    requires view<V> && view<Pattern> &&
    indirectly_comparable<iterator_t<V>, iterator_t<Pattern>>, ranges::equal_to
    struct split_view<V, Pattern>::sentinel {

            friend constexpr bool operator==(const iterator& x, const sentinel& y);
        };
    }

    constexpr explicit sentinel(split_view& parent);

    **Effects:** Initializes `end_` with `ranges::end(parent.base_)`.

    friend constexpr bool operator==(const iterator& x, const sentinel& y);

    **Effects:** Equivalent to: `return x.cur_ == y.end_ && !x.trailing_empty_;

§ 26.7.17.4
26.7.18 Counted view

A counted view presents a view of the elements of the counted range \( 25.3.1 \) \( i + [0, n) \) for an iterator \( i \) and non-negative integer \( n \).

The name \( \text{views}::\text{counted} \) denotes a customization point object \( 16.3.3.3.5 \). Let \( E \) and \( F \) be expressions, let \( T \) be \( \text{decay}_t\langle \text{dtype}(E)\rangle \), and let \( D \) be \( \text{iter}\_\text{difference}_t\langle T \rangle \). If \( \text{dtype}(F) \) does not model \( \text{convertible}\_t\langle D \rangle \), \( \text{views}::\text{counted}(E, F) \) is ill-formed.

\[ \text{Note 1: This case can result in substitution failure when } \text{views}::\text{counted}(E, F) \text{ appears in the immediate context of a template instantiation. — end note} \]

Otherwise, \( \text{views}::\text{counted}(E, F) \) is expression-equivalent to:

\( 26.7.19 \) Common view

26.7.19.1 Overview

\( \text{common_view} \) takes a view which has different types for its iterator and sentinel and turns it into a view of the same elements with an iterator and sentinel of the same type.

\[ \text{Note 1: common_view} \text{ is useful for calling legacy algorithms that expect a range's iterator and sentinel types to be the same. — end note} \]

The name \( \text{views}::\text{common} \) denotes a range adaptor object \( 26.7.2 \). Given a subexpression \( E \), the expression \( \text{views}::\text{common}(E) \) is expression-equivalent to:

\( 26.7.19.2 \) Class template \text{common_view}

namespace std::ranges {
    template<view V>
    requires (!\text{common}\_range\langle V \rangle \&\& \text{copyable}\langle \text{iterator}_t\langle V \rangle \rangle)
    class common_view : public view\_interface<common_view\langle V \rangle> {
        private:
            V base_ = V(); // exposition only

        public:
            common_view() requires default\_initializable\langle V \rangle = default;

            constexpr explicit common_view(V r);

            constexpr V base() const \& requires \text{copy}\_\text{constructible}\langle V \rangle { return base_; }
            constexpr V base() \&\& { return std::move(base_); }

    }
}

\[ \text{Example 1:} \]

```cpp
// Legacy algorithm:
template<class ForwardIterator>
size_t count(ForwardIterator first, ForwardIterator last);
template<forward_range R>
void my_algo(R&& r) {
    auto&& common = views::common(r);
    auto cnt = count(common.begin(), common.end());
    // ...
}
```

\( 26.7.19.2 \) Class template \text{common_view}

namespace std::ranges {
    template<view V>
    requires (!\text{common}\_range\langle V \rangle \&\& \text{copyable}\langle \text{iterator}_t\langle V \rangle \rangle)
    class common_view : public view\_interface<common_view\langle V \rangle> {
        private:
            V base_ = V(); // exposition only

        public:
            common_view() requires default\_initializable\langle V \rangle = default;

            constexpr explicit common_view(V r);

            constexpr V base() const \& requires \text{copy}\_\text{constructible}\langle V \rangle { return base_; }
            constexpr V base() \&\& { return std::move(base_); }

    }
}
constexpr auto begin() {
    if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_);
    else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::begin(base_));
}

consexpr auto begin() const requires range<const V> {
    if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_);
    else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::begin(base_));
}

consexpr auto end() {
    if constexpr (random_access_range<V> && sized_range<V>)
        return ranges::begin(base_) + ranges::distance(base_);
    else
        return common_iterator<iterator_t<V>, sentinel_t<V>>(ranges::end(base_));
}

consexpr auto end() const requires range<const V> {
    if constexpr (random_access_range<const V> && sized_range<const V>)
        return ranges::begin(base_) + ranges::distance(base_);
    else
        return common_iterator<iterator_t<const V>, sentinel_t<const V>>(ranges::end(base_));
}

consexpr auto size() requires sized_range<V> {
    return ranges::size(base_);
}

consexpr auto size() const requires sized_range<const V> {
    return ranges::size(base_);
};

template<class R>
common_view(R&&) -> common_view<views::all_t<R>>;

consexpr explicit common_view(V base);

Effects: Initializes \texttt{base}\_ with \texttt{std::move(base)}.

## 26.7.20 Reverse view

### 26.7.20.1 Overview

**reverse_view** takes a bidirectional view and produces another view that iterates the same elements in reverse order.

The name **views::reverse** denotes a range adaptor object (26.7.2). Given a subexpression \(E\), the expression **\(\text{views::reverse}(E)\)** is expression-equivalent to:

\begin{enumerate}
\item If the type of \(E\) is a (possibly cv-qualified) specialization of **reverse_view**, equivalent to \(E.\text{base}()\). \hfill (2.1)
\item Otherwise, if the type of \(E\) is \(\text{cv subrange<reverse_iterator<I>, reverse_iterator<I>, K>}\) for some iterator type \(I\) and value \(K\) of type **subrange_kind**, \hfill (2.2)
\begin{enumerate}
\item if \(K\) is **subrange_kind::sized**, equivalent to:
\begin{verbatim}
subrange<I, I, K>(E.end().base(), E.begin().base(), E.size())
\end{verbatim} \hfill (2.2.1)
\item otherwise, equivalent to:
\begin{verbatim}
subrange<I, I, K>(E.end().base(), E.begin().base())
\end{verbatim} \hfill (2.2.2)
\end{enumerate}
\end{enumerate}

However, in either case \(E\) is evaluated only once.

(2.3) Otherwise, equivalent to **reverse_view**\(E\).
Example 1:

```cpp
vector<int> is {0,1,2,3,4};
for (int i : is | views::reverse)
    cout << i << ' '; // prints 4 3 2 1 0

--- end example
```

26.7.20.2 Class template reverse_view

```cpp
namespace std::ranges {
    template<class V>
    requires bidirectional_range<V>
    class reverse_view : public view_interface<reverse_view<V>> {
        private:
            V base_ = V(); // exposition only

        public:
            reverse_view() requires default_initializable<V> = default;
            constexpr explicit reverse_view(V r);
            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }
            constexpr reverse_iterator<iterator_t<V>> begin() requires common_range<V>;
            constexpr auto begin() const requires common_range<const V>;
            constexpr reverse_iterator<iterator_t<V>> end()
                requires common_range<const V>;
            constexpr auto end() const requires common_range<const V>;
            constexpr auto size() requires sized_range<V> {
                return ranges::size(base_);
            }
            constexpr auto size() const requires sized_range<const V> {
                return ranges::size(base_);
            }
    };
    template<class R>
    reverse_view(R&&) -> reverse_view<views::all_t<R>>;
}
```

1. **Effects:** Initializes `base_` with `std::move(base)`.

2. **Returns:**

    ```cpp
    make_reverse_iterator(ranges::next(ranges::begin(base_), ranges::end(base_)))
    ```

3. **Remarks:** In order to provide the amortized constant time complexity required by the range concept, this function caches the result within the reverse_view for use on subsequent calls.

4. **Effects:** Equivalent to: `return make_reverse_iterator(ranges::end(base_));`

5. **Effects:** Equivalent to: `return make_reverse_iterator(ranges::begin(base_));`
26.7.21 As const view

26.7.21.1 Overview

1 `as_const_view` presents a view of an underlying sequence as constant. That is, the elements of an `as_const_view` cannot be modified.

2 The name `views::as_const` denotes a range adaptor object (26.7.2). Let `E` be an expression, let `T` be `decltype((E))`, and let `U` be `remove_cvref_t<T>`. The expression `views::as_const(E)` is expression-equivalent to:

- If `views::all_t<T>` models `constant_range`, then `views::all(E)`.
- Otherwise, if `U` denotes `span<X, Extent>` for some type `X` and some extent `Extent`, then `span<const X, Extent>(E)`.
- Otherwise, if `E` is an lvalue, `const U` models `constant_range`, and `U` does not model `view`, then `ref_view(static_cast<const U&>(E))`.
- Otherwise, `as_const_view(E)`.

3 **[Example 1:**

```cpp
template<constant_range R>
void cant_touch_this(R&&);

vector<char> hammer = {'m', 'c'};
span<char> beat = hammer;
cant_touch_this(views::as_const(beat));  // will not modify the elements of `hammer`
```

--- end example]

26.7.21.2 Class template as_const_view

```cpp
namespace std::ranges {
    template<view V>
    requires input_range<V>
    class as_const_view : public view_interface<as_const_view<V>> {
        V base_ = V();  // exposition only

        public:
        as_const_view() requires default_initializable<V> = default;
        constexpr explicit as_const_view(V base);
        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }
        constexpr auto begin() requires (!simple_view<V>) { return ranges::cbegin(base_); }
        constexpr auto begin() const requires range<const V> { return ranges::cbegin(base_); }
        constexpr auto end() requires (!simple_view<V>) { return ranges::cend(base_); }
        constexpr auto end() const requires range<const V> { return ranges::cend(base_); }
        constexpr auto size() requires sized_range<V> { return ranges::size(base_); }
        constexpr auto size() const requires sized_range<const V> { return ranges::size(base_); }
    };

template<class R>
    as_const_view(R&&) -> as_const_view<views::all_t<R>>;
}
```

1 **Effects:** Initializes `base_` with `std::move(base)`.

26.7.22 Elements view

26.7.22.1 Overview

1 `elements_view` takes a view of tuple-like values and a `size_t`, and produces a view with a value-type of the `N`th element of the adapted view’s value-type.
The name `views::elements<N>` denotes a range adaptor object (26.7.2). Given a subexpression `E` and constant expression `N`, the expression `views::elements<N>(E)` is expression-equivalent to `elements_view<views::all_t<decltype((E))>, N>(E)`.

**Example 1:**

```cpp
auto historical_figures = map{
    pair("Lovelace"sv, 1815),
    {"Turing"sv, 1912},
    {"Babbage"sv, 1791},
    {"Hamilton"sv, 1936}
};

auto names = historical_figures | views::elements<0>;
for (auto& name : names) {
    cout << name << ' ' << // prints Babbage Hamilton Lovelace Turing
}  
```

**Example 2:**

```cpp
auto birth_years = historical_figures | views::elements<1>;
for (auto& born : birth_years) {
    cout << born << ' ' << // prints 1791 1936 1815 1912
}  
```

---

keys_view is an alias for `elements_view<R, 0>`, and is useful for extracting keys from associative containers.

**Example 2:**

```cpp
auto names = historical_figures | views::keys;
for (auto& name : names) {
    cout << name << ' ' << // prints Babbage Hamilton Lovelace Turing
}  
```

---

values_view is an alias for `elements_view<R, 1>`, and is useful for extracting values from associative containers.

**Example 3:**

```cpp
auto is_even = [](const auto x) { return x % 2 == 0; };
cout << ranges::count_if(historical_figures | views::values, is_even);  // prints 2
```

---

26.7.22.2 Class template elements_view

```cpp
namespace std::ranges {
    template<class T, size_t N>
    concept has-tuple-element = // exposition only
        tuple-like<T> && N < tuple_size_v<T>;

    template<class T, size_t N>
    concept returnable-element = // exposition only
        is_reference_v<T> || move_constructible<tuple_element_t<N, T>>;

    template<input_range V, size_t N>
    requires view<V> && has-tuple-element<range_value_t<V>, N> &&
        has-tuple-element<remove_reference_t<range_reference_t<V>>, N> &&
        returnable-element<range_reference_t<V>, N>
    class elements_view : public view_interface<elements_view<V, N>> {
        public:
            elements_view() requires default_initializable<V> = default;
            constexpr explicit elements_view(V base);

            constexpr V base() const & requires copy_constructible<V> { return base_; }
            constexpr V base() && { return std::move(base_); }

            constexpr auto begin() requires (!simple_view<V>)
                { return iterator(false)(ranges::begin(base_)); }
```

§ 26.7.22.2
constexpr auto begin() const requires range<const V>
{ return iterator<true>(ranges::begin(base_)); }

customexpr auto end() requires (!simple_view<V> && !common_range<V>)

26.7.23 Zip view

26.7.23.1 Overview

zip_view takes any number of views and produces a view of tuples of references to the corresponding elements of the constituent views.

The name views::zip denotes a customization point object (16.3.3.3.5). Given a pack of subexpressions Es..., the expression views::zip(Es...) is expression-equivalent to

(2.1) — auto(views::empty<tuple<>>) if Es is an empty pack,
(2.2) — otherwise, zip_view<views::all_t<decltype((Es))>...>(Es...)...

[Example 1:]
vector v = {1, 2};
list l = {'a', 'b', 'c'};

auto z = views::zip(v, l);
range_reference_t<decltype(z)> f = z.front(); // f is a tuple<int, char>
// that refers to the first element of v and l
for (auto&& [x, y] : z) {
    cout << '(' << x << ', ' << y << ')' << endl; // prints (1, a) (2, b)
} —end example—

26.7.23.2 Class template zip_view

namespace std::ranges {
    template<class... Rs>
    concept zip_is_common = // exposition only
        (sizeof...(Rs) == 1 && (common_range<Rs> && ...)) ||
        (! (bidirectional_range<Rs> && ...) && (common_range<Rs> && ...)) ||
        ((random_access_range<Rs> && ...) && (sized_range<Rs> && ...));

    template<input_range... Views>
    requires (view<Views> && ...) && (sizeof...(Views) > 0)
    class zip_view : public view_interface<zip_view<Views...>> {
        tuple<Views...> views_; // exposition only

        // 26.7.23.3, class template zip_view::iterator
        template<bool> class iterator; // exposition only

        // 26.7.23.4, class template zip_view::sentinel
        template<bool> class sentinel; // exposition only

    public:
        zip_view() = default;
        constexpr explicit zip_view(Views... views);

        constexpr auto begin() requires (! (simple_view<Views> && ...)) {
            return iterator<false>(tuple-transform(ranges::begin, views_));
        }
        constexpr auto begin() const requires (range<const Views> && ...) {
            return iterator<true>(tuple-transform(ranges::begin, views_));
        }

        constexpr auto end() requires (! (simple_view<Views> && ...)) {
            if constexpr (! zip_is_common<Views...>) {
                return sentinel<false>(tuple-transform(ranges::end, views_));
            } else if constexpr ((random_access_range<Views> && ...)) {
                return begin() + iter_difference_t<iterator<false>>(size());
            } else {
                return iterator<false>(tuple-transform(ranges::end, views_));
            }
        }

        constexpr auto end() const requires (range<const Views> && ...) {
            if constexpr (! zip_is_common<const Views...>) {
                return sentinel<true>(tuple-transform(ranges::end, views_));
            } else if constexpr ((random_access_range<const Views> && ...)) {
                return begin() + iter_difference_t<iterator<true>>(size());
            } else {
                return iterator<true>(tuple-transform(ranges::end, views_));
            }
        }

        constexpr auto size() requires (sized_range<Views> && ...); // exposition only
        constexpr auto size() const requires (sized_range<const Views> && ...); // exposition only
    };

    template<class... Rs>
    zip_view(Rs&&...) -> zip_view<views::all_t<Rs>...>;
}
Two `zip_view` objects have the same underlying sequence if and only if the corresponding elements of `views_` are equal (18.2) and have the same underlying sequence.

[Note 1: In particular, comparison of iterators obtained from `zip_view` objects that do not have the same underlying sequence is not required to produce meaningful results (25.3.4.11). — end note]

conestexpr explicit zip_view(Views... views);

Effects: Initializes `views_` with `std::move(views)`.

conestexpr auto size() requires (sized_range<Views> && ...);
conestexpr auto size() const requires (sized_range<const Views> && ...);

Effects: Equivalent to:

```
return apply([](auto... sizes) {
  using CT = make_unsigned_like_t<common_type_t<decltype(sizes)...>>;
  return ranges::min({CT(sizes)...});
}, tuple_transform(ranges::size, views_));
```

### 26.7.23.3 Class template `zip_view::iterator`

```cpp
namespace std::ranges {
  template<bool Const, class... Views>
  concept all-random-access = // exposition only
    (random_access_range<maybe-const<Const, Views>> && ...);

  template<bool Const, class... Views>
  concept all-bidirectional = // exposition only
    (bidirectional_range<maybe-const<Const, Views>> && ...);

  template<bool Const, class... Views>
  concept all-forward = // exposition only
    (forward_range<maybe-const<Const, Views>> && ...);

  template<input_range... Views>
  requires (view<Views> && ...) && (sizeof...(Views) > 0)
  template<bool Const>
  class zip_view<Views...>::iterator {
    tuple<iterator_t<maybe-const<Const, Views>>...> current_; // exposition only
    constexpr explicit iterator(tuple<iterator_t<maybe-const<Const, Views>>...>);

    public:
      using iterator_category = input_iterator_tag; // not always present
      using iterator_concept = see below;
      using value_type = tuple<range_value_t<maybe-const<Const, Views>>...>;
      using difference_type = common_type_t<range_difference_t<maybe-const<Const, Views>>...>;

      iterator() = default;
      constexpr iterator(iterator<!Const> i)
        requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

      constexpr auto operator*() const;
      constexpr iterator& operator++();
      constexpr void operator++(int);
      constexpr iterator& operator++(int) requires all-forward<Const, Views...>;

      constexpr iterator& operator--() requires all-bidirectional<Const, Views...>;
      constexpr iterator& operator--(int) requires all-bidirectional<Const, Views...>;

      constexpr iterator& operator+=(difference_type x)
        requires all-random-access<Const, Views...>;
      constexpr iterator& operator-=(difference_type x)
        requires all-random-access<Const, Views...>;

      constexpr auto operator[](difference_type n) const
        requires all-random-access<Const, Views...>;
  }
}
```
friend constexpr bool operator==(const iterator& x, const iterator& y) requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires all-random-access<Const, Views...>;

friend constexpr iterator operator+(const iterator& i, difference_type n) requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i) requires all-random-access<Const, Views...>;
friend constexpr iterator operator-(const iterator& i, difference_type n) requires all-random-access<Const, Views...>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>, iterator_t<maybe-const<Const, Views>>> && ...);

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below) requires (indirectly_swappable<iterator_t<maybe-const<Const, Views>>> && ...);

1 iterator::iterator_concept is defined as follows:

(1.1) If all-random-access<Const, Views...> is modeled, then iterator_concept denotes random_access_iterator_tag.
(1.2) Otherwise, if all-bidirectional<Const, Views...> is modeled, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) Otherwise, if all-forward<Const, Views...> is modeled, then iterator_concept denotes forward_iterator_tag.
(1.4) Otherwise, iterator_concept denotes input_iterator_tag.

2 iterator::iterator_category is present if and only if all-forward<Const, Views...> is modeled.

3 If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr explicit iterator(tuple<iterator_t<maybe-const<Const, Views>>>... current);

Effects: Initializes current_ with std::move(current).

constexpr iterator(iterator<!Const> i) requires Const && (convertible_to<iterator_t<Views>, iterator_t<const Views>> && ...);

Effects: Initializes current_ with std::move(i.current_).

constexpr auto operator*() const;

Effects: Equivalent to:
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();

Effects: Equivalent to:
tuple-for-each([](auto& i) { ++i; }, current_);
return *this;

constexpr void operator++(int);

Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires all-forward<Const, Views...>;

Effects: Equivalent to +++this.

auto tmp = *this;
+++this;
return tmp;

constexpr iterator operator--() requires all-bidirectional<Const, Views...>;

**Effects**: Equivalent to:

tuple-for-each([[](auto i) { --i; }, current_);
return *this;

constexpr iterator operator--(int) requires all-bidirectional<Const, Views...>;

**Effects**: Equivalent to:

auto tmp = *this;
--*this;
return tmp;

constexpr iterator operator+=(difference_type x) requires all-random-access<Const, Views...>;

**Effects**: Equivalent to:

tuple-for-each([&]<class I>(I& i) { i += iter_difference_t<I>(x); }, current_);
return *this;

constexpr iterator operator-=(difference_type x) requires all-random-access<Const, Views...>;

**Effects**: Equivalent to:

tuple-for-each([&]<class I>(I& i) { i -= iter_difference_t<I>(x); }, current_);
return *this;

constexpr auto operator[](difference_type n) const requires all-random-access<Const, Views...>;

**Effects**: Equivalent to:

return tuple-transform([&]<class I>(I& i) -> decltype(auto) {
    return i[iter_difference_t<I>(n)];
}, current_);

friend constexpr bool operator==(const iterator& x, const iterator& y) requires (equality_comparable<iterator_t<maybe-const<Const, Views>>> && ...);

**Returns**: 

(15.1) — x.current_ == y.current_ if all-bidirectional<Const, Views...> is true.

(15.2) — Otherwise, true if there exists an integer 0 ≤ i < sizeof...(Views) such that bool(std::get<i>(x.current_) == std::get<i>(y.current_)) is true.

[Note 1: This allows zip_view to model common_range when all constituent views model common_range. —end note]

(15.3) — Otherwise, false.

friend constexpr auto operator==>(const iterator& x, const iterator& y) requires all-random-access<Const, Views...>;

**Returns**: x.current_ == y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n) requires all-random-access<Const, Views...>;
friend constexpr iterator operator+(difference_type n, const iterator& i) requires all-random-access<Const, Views...>;

**Effects**: Equivalent to:

auto r = i;
r += n;
return r;
friend constexpr iterator operator-(const iterator& i, difference_type n)
requires all-random-access<Const, Views...>;

18 Effects: Equivalent to:
    auto r = i;
    r -= n;
    return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
requires (sized_sentinel_for<iterator_t<maybe-const<Const, Views>>>,
    iterator_t<maybe-const<Const, Views>>> & & ...);
Let \(DIST(i)\) be \(\text{difference_type} (\text{std}::\text{get<i>} (x.\text{current}_i) - \text{std}::\text{get<i>} (y.\text{current}_i))\).
Returns: The value with the smallest absolute value among \(DIST(n)\) for all integers \(0 \leq n < \text{sizeof...}(\text{Views})\).

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
19 Effects: Equivalent to:
    return \text{tuple-transform}(\text{ranges}::\text{iter_move}, i.\text{current}_i);

20 Remarks: The exception specification is equivalent to:
    (\text{noexcept(\text{ranges}::\text{iter_move}(\text{declval<\text{const iterator}_t<\text{maybe}\text{-\text{const}}<\text{Const}, \text{Views}}>> & & ...})) & & ...) & &
    (\text{is\text{-\text{nothrow\text{-\text{move\text{-\text{constructible}}}}}_v<\text{range\text{-\text{reference}_t<\text{maybe\text{-\text{const}}<\text{Const}, \text{Views}}>>> & & ...})

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
requires (indirectly\text{-\text{swappable}<\text{iterator}_t<\text{maybe\text{-\text{const}}<\text{Const, Views}}>>> & & ...);
23 Effects: For every integer \(0 \leq i < \text{sizeof...}(\text{Views})\), performs:
    \text{ranges}::\text{iter_swap}(\text{std}::\text{get<i>} (l.\text{current}_i), \text{std}::\text{get<i>} (r.\text{current}_i))

24 Remarks: The exception specification is equivalent to the logical AND of the following expressions:
    \text{noexcept(\text{ranges}::\text{iter_swap}(\text{std}::\text{get<i>} (l.\text{current}_i), \text{std}::\text{get<i>} (r.\text{current}_i))))
for every integer \(0 \leq i < \text{sizeof...}(\text{Views})\).

### 26.7.23.4 Class template \text{zip\text{-\text{view}}::sentinel} \[\text{range.zip.sentinel}\]

namespace std::ranges {
    template<input_range... Views>
    requires (view<Views> & & ...) & & (sizeof...(Views) > 0)
    template<bool Const>
    class zip_view<Views...>::sentinel {
        tuple<sentinel_t<\text{maybe\text{-\text{const}}<\text{Const, Views}}>>... end; // exposition only
        constexpr explicit sentinel(tuple<sentinel_t<\text{maybe\text{-\text{const}}<\text{Const, Views}}>>... end); // exposition only
    public:
        sentinel() = default;
        constexpr sentinel(sentinel<\text{sentinel}<\text{Const}> i)
            requires Const & & (convertible_to_to<\text{sentinel}_t<\text{Views}>, \text{sentinel}_t<\text{Const Views}> & & ...);
    template<bool OtherConst>
        requires (sentinel_for<\text{sentinel}_t<\text{maybe\text{-\text{const}}<\text{Const}, Views}>>,

            iterator_t<maybe-const<OtherConst, Views>>> && ...)
   friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);

Returns: true if there exists an integer 0 ≤ i < sizeof...(Views) such that bool(std::get<i>(x.current_) == std::get<i>(y.end_)) is true. Otherwise, false.

template<bool OtherConst>
   requires (sized_sentinel_for<sentinel_t<maybe-const<Const, Views>>,
            iterator_t<maybe-const<OtherConst, Views>>> && ...)
   friend constexpr common_type_t<range_difference_t<maybe-const<OtherConst, Views>>...>
      operator-(const sentinel& y, const iterator<OtherConst>& x);

Effects: Equivalent to return -(x - y);

26.7.24 Zip transform view

26.7.24.1 Overview

zip_transform_view takes an invocable object and any number of views and produces a view whose Mth element is the result of applying the invocable object to the Mth elements of all views.

The name views::zip_transform denotes a customization point object (16.3.3.3.5). Let F be a subexpression, and let Es... be a pack of subexpressions.

(2.1) — If Es is an empty pack, let FD be decay_t<decltype(F)>. (2.1.1) — If move_constructible<FD> && regular_invocable<FD&> is false, or if decay_t<invoke_result_t<FD&>> is not an object type, views::zip_transform(F, Es...) is ill-formed.

(2.1.2) — Otherwise, the expression views::zip_transform(F, Es...) is expression-equivalent to ((void)F, auto(views::empty<decay_t<invoke_result_t<FD&>>>))

(2.2) — Otherwise, the expression views::zip_transform(F, Es...) is expression-equivalent to zip_transform_view(F, Es...).
for (auto i : std::views::zip_transform(plus(), v1, v2)) {
    cout << i << ' ' << // prints 5 7
} // end example

26.7.24.2 Class template zip_transform_view  

namespace std::ranges {
    template<move_constructible F, input_range... Views>
    requires (view<Views> && ... && (sizeof...(Views) > 0) && is_object_v<F> &&

};

The member typedef-name iterator::iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows:

(1.1) — If
    invoke_result_t<\maybe-const<Const, F>>& range_reference_t<\maybe-const<Const, Views>>...>

is not a reference, iterator_category denotes input_iterator_tag.

(1.2) — Otherwise, let Cs denote the pack of types iterator_traits<iterator_t<\maybe-const<Const,
Views>>>::iterator_category....

(1.2.1) — If (derived_from<Cs, random_access_iterator_tag> && ...) is true, iterator_category denotes random_access_iterator_tag.

(1.2.2) — Otherwise, if (derived_from<Cs, bidirectional_iterator_tag> && ...) is true, iterator_category denotes bidirectional_iterator_tag.

(1.2.3) — Otherwise, if (derived_from<Cs, forward_iterator_tag> && ...) is true, iterator_category denotes forward_iterator_tag.

(1.2.4) — Otherwise, iterator_category denotes input_iterator_tag.

constexpr iterator(Parent& parent, zisperator<Const> inner);

Effects: Initializes parent_ with addressof(parent) and inner_ with std::move(inner).

constexpr iterator(iterator<false> i) 
requires Const && convertible_to<ziperator<false>, zisperator<Const>>;

Effects: Initializes parent_ with i, parent_ and inner_ with std::move(i.inner_).

constexpr decltype(auto) operator*() const noexcept;

Effects: Equivalent to:
    return apply([&](const auto&... iters) -> decltype(auto) {
        return invoke(*parent_->fun_, *iters...);
    }, inner_.current_);

Remarks: Let Is be the pack 0, 1, ..., (sizeof...(Views)-1). The exception specification is equivalent to: noexcept(invoke(*parent_->fun_, *std::get<Is>(inner_.current_)...)).

constexpr iterator& operator++();

Effects: Equivalent to:
    ++inner_;
    return *this;

constexpr void operator++(int);

Effects: Equivalent to: +++this.

constexpr iterator operator++(int) requires forward_range<Base>;

Effects: Equivalent to:
    auto tmp = *this;
    +++this;
    return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Effects: Equivalent to:
    --inner_;
    return *this;
constexpr iterator operator--(int) requires bidirectional_range<Base>;

**Effects:** Equivalent to:
- auto tmp = *this;
- --*this;
- return tmp;

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;

**Effects:** Equivalent to:
- inner_ += x;
- return *this;

constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

**Effects:** Equivalent to:
- inner_ -= x;
- return *this;

constexpr decltype(auto) operator[](difference_type n) const requires random_access_range<Base>;

**Effects:** Equivalent to:
- return apply([&]<class... Is>(const Is&... iters) -> decltype(auto) {
  return invoke(*parent_->fun_, iters[iter_difference_t<Is>(n)]...);
}, inner_.current_);

friend constexpr bool operator==(const iterator& x, const iterator& y) requires equality_comparable<ziperator<Const>>;
friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires random_access_range<Base>;

Let op be the operator.

**Effects:** Equivalent to: return x.inner_ op y.inner_;

friend constexpr iterator operator+(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i) requires random_access_range<Base>;

**Effects:** Equivalent to: return iterator(*i.parent_, i.inner_ + n);

friend constexpr iterator operator-(const iterator& i, difference_type n) requires random_access_range<Base>;

**Effects:** Equivalent to: return iterator(*i.parent_, i.inner_ - n);

friend constexpr difference_type operator-=(const iterator& x, const iterator& y) requires sized_sentinel_for<ziperator<Const>, ziperator<Const>>;

**Effects:** Equivalent to: return x.inner_ - y.inner_;

friend constexpr auto iter_move(const iterator& i) noexcept(see below);
friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
  requires indirectly_swappable<iterator_t<Base>>;
  
1 iterator::iterator_concept is defined as follows:
(1.1) — If \texttt{Base} models \texttt{random_access_range}, then \texttt{iterator\_concept} denotes \texttt{random_access\_iterator\_tag}.

(1.2) — Otherwise, if \texttt{Base} models \texttt{bidirectional\_range}, then \texttt{iterator\_concept} denotes \texttt{bidirectional\_iterator\_tag}.

(1.3) — Otherwise, \texttt{iterator\_concept} denotes \texttt{forward\_iterator\_tag}.

2 If the invocation of any non-const member function of \texttt{iterator} exits via an exception, the \texttt{iterator} acquires a singular value.

```cpp
constexpr iterator (iterator_t<Base> first, sentinel_t<Base> last);
```

3 \textit{Postconditions:} \texttt{current[0]} == \texttt{first} is true, and for every integer \(1 \leq i < N\), \texttt{current[i]} == \texttt{ranges::next(current[i-1], 1, last)} is true.

```cpp
constexpr iterator (as-sentinel, iterator_t<Base> first, iterator_t<Base> last);
```

4 \textit{Postconditions:} If \texttt{Base} does not model \texttt{bidirectional\_range}, each element of \texttt{current} is equal to \texttt{last}. Otherwise, \texttt{current[N-1]} == \texttt{last} is true, and for every integer \(0 \leq i < (N-1)\), \texttt{current[i]} == \texttt{ranges::prev(current[i+1], 1, first)} is true.

```cpp
constexpr iterator (iterator<!Const> i) requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;
```

5 \textit{Effects:} Initializes each element of \texttt{current} with the corresponding element of \texttt{i}.current as an \texttt{xvalue}.

```cpp
constexpr auto operator*() const;
```

6 \textit{Effects:} Equivalent to:

```cpp
return tuple-transform([](auto& i) -> decltype(auto) { return *i; }, current_);
```

```cpp
constexpr iterator& operator++();
```

7 \textit{Preconditions:} \texttt{current.back()} is incrementable.

8 \textit{Postconditions:} Each element of \texttt{current} is equal to \texttt{ranges::next(i)}, where \texttt{i} is the value of that element before the call.

9 \textit{Returns:} \texttt{*this}.

```cpp
constexpr iterator operator++(int);
```

10 \textit{Effects:} Equivalent to:

```cpp
auto tmp = *this;
+++this;
return tmp;
```

```cpp
constexpr iterator& operator--() requires bidirectional_range<Base>;
```

11 \textit{Preconditions:} \texttt{current.front()} is decrementable.

12 \textit{Postconditions:} Each element of \texttt{current} is equal to \texttt{ranges::prev(i)}, where \texttt{i} is the value of that element before the call.

13 \textit{Returns:} \texttt{*this}.

```cpp
constexpr iterator operator--(int) requires bidirectional_range<Base>;
```

14 \textit{Effects:} Equivalent to:

```cpp
auto tmp = *this;
---*this;
return tmp;
```

```cpp
constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
```

15 \textit{Preconditions:} \texttt{current.back()} + \texttt{x} has well-defined behavior.

16 \textit{Postconditions:} Each element of \texttt{current} is equal to \texttt{i + x}, where \texttt{i} is the value of that element before the call.
Returns: 
\*this.

```cpp
constexpr iterator& operator-=(difference_type x) 
requires random_access_range<Base>;
```

Preconditions: `current_.front() - x` has well-defined behavior.

Postconditions: Each element of `current_` is equal to `i - x`, where `i` is the value of that element before the call.

Returns: 
\*this.

```cpp
constexpr auto operator[](difference_type n) const 
requires random_access_range<Base>;
```

Effects: Equivalent to:
```cpp
return tuple-transform([&](auto& i) -> decltype(auto) { return i[n]; }, current_);
```

friend constexpr bool operator==(const iterator& x, const iterator& y);

Returns: 
\x

```cpp
friend constexpr bool operator<(const iterator& x, const iterator& y) 
requires random_access_range<Base>;
```

Returns: 
`x.current_.back() < y.current_.back()`.

friend constexpr bool operator>(const iterator& x, const iterator& y) 
requires random_access_range<Base>;

Effects: Equivalent to:
```cpp
return y < x;
```

friend constexpr auto operator<=>(const iterator& x, const iterator& y) 
requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;

Returns: 
`x.current_.back() <=> y.current_.back()`.

friend constexpr iterator operator+(const iterator& i, difference_type n) 
requires random_access_range<Base>;

friend constexpr iterator operator+(difference_type n, const iterator& i) 
requires random_access_range<Base>;

Effects: Equivalent to:
```cpp
auto r = i;
 r += n;
return r;
```

friend constexpr iterator operator-(const iterator& i, difference_type n) 
requires random_access_range<Base>;

Effects: Equivalent to:
```cpp
auto r = i;
 r -= n;
return r;
```

friend constexpr difference_type operator-(const iterator& x, const iterator& y) 
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

Effects: Equivalent to:
```cpp
return x.current_.back() - y.current_.back();
```
friend constexpr auto iter_move(const iterator& i) noexcept(see below);

Effects: Equivalent to: return tuple-transform(ranges::iter_move, i.current_);

Remarks: The exception specification is equivalent to:

noexcept(ranges::iter_move(declval<const iterator_t<Base>&>())) && is_nothrow_move_constructible_v<range_rvalue_reference_t<Base>>

friend constexpr void iter_swap(const iterator& l, const iterator& r) noexcept(see below)
requires indirectly_swappable<iterator_t<Base>>;

Preconditions: None of the iterators in l.current_ is equal to an iterator in r.current_.

Effects: For every integer 0 ≤ i < N, performs ranges::iter_swap(l.current_[i], r.current_[i]).

Remarks: The exception specification is equivalent to:

noexcept(ranges::iter_swap(declval<iterator_t<Base>>(), declval<iterator_t<Base>>()))

§ 26.7.25.4 Class template adjacent_view::sentinel

operator-(const iterator<OtherConst>& x, const sentinel& y);

Effects: Equivalent to: return x.current_.back() - y.end;

template<bool OtherConst>
requires sized_sentinel_for<sentinel_t<Base>, iterator_t<maybe-const<OtherConst, V>>>
friend constexpr range_difference_t<maybe-const<OtherConst, V>>
operator-(const sentinel& y, const iterator<OtherConst>& x);

Effects: Equivalent to: return y.end_ - x.current_.back;

26.7.26 Adjacent transform view

26.7.26.1 Overview

adjacent_transform_view takes an invocable object and a view and produces a view whose \(M^{th}\) element is the result of applying the invocable object to the \(M^{th}\) through \((M + N - 1)^{th}\) elements of the original view. If the original view has fewer than \(N\) elements, the resulting view is empty.

The name views::adjacent_transform\(N\) denotes a range adaptor object (26.7.2). Given subexpressions \(E\) and \(F\) and a constant expression \(N\):

1. If \(N\) is equal to \(0\), views::adjacent_transform\(N\)(\(E, F\)) is expression-equivalent to ((\(void\)E), views::zip_transform(\(F\))), except that the evaluations of \(E\) and \(F\) are indeterminately sequenced.

2. Otherwise, the expression views::adjacent_transform\(N\)(\(E, F\)) is expression-equivalent to adjacent_transform_view<views::all_t decltype((E)), decay_t decltype((F)), \(N\)>(\(E, F\)).

[Example 1:]

```cpp
class vector { /* implementation */ };

for (auto i : v | views::adjacent_transform<2>(std::multiplies())) {
    cout << i << ' '; // prints 2 6 12
}
```

26.7.26.2 Class template adjacent_transform_view

```cpp
namespace std::ranges {
    template<forward_range V, move_constructible F, size_t N>
    requires view<V> && (N > 0) && is_object_v<F> &&
    regular_invocable<F&, REPEAT(range_reference_t<V>, N)...> &&
    can-reference<invoke_result_t<F&,
    REPEAT(range_reference_t<V>, N)...>>
    class adjacent_transform_view : public view_interface<adjacent_transform_view<V, F, N>> {
        movable-box<F> fun_; // exposition only
        adjacent_view<V, N> inner_; // exposition only
        using InnerView = adjacent_view<V, N>;// exposition only
        template<bool Const>
        using inner_iterator = iterator_t<maybe-const<Const, InnerView>>; // exposition only
        template<bool Const>

}, inner_.current_);

Remarks: Let \( I_0, I_1, \ldots, I_{N-1} \). The exception specification is equivalent to:

```cpp
noexcept(invoke(*parent_->fun_, std::get<Is>(inner_.current_)...))
```

constexpr iterator& operator++();

Effects: Equivalent to:

```cpp
++inner_;  
return *this;
```

constexpr iterator operator++(int);

Effects: Equivalent to:

```cpp
auto tmp = *this;  
+++this;  
return tmp;
```

constexpr iterator& operator--() requires bidirectional_range<Base>;

Effects: Equivalent to:

```cpp
--inner_;  
return *this;
```

constexpr iterator operator--(int) requires bidirectional_range<Base>;

Effects: Equivalent to:

```cpp
auto tmp = *this;  
---this;  
return tmp;
```

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;

Effects: Equivalent to:

```cpp
inner_ += x;  
return *this;
```

constexpr iterator& operator-=(difference_type x) requires random_access_range<Base>;

Effects: Equivalent to:

```cpp
inner_ -= x;  
return *this;
```

constexpr decltype(auto) operator[](difference_type n) const requires random_access_range<Base>;

Effects: Equivalent to:

```cpp
return apply([&](const auto&... iters) -> decltype(auto) {
    return invoke(*parent_->fun_, iters[n]...);
}, inner_.current_);
```

friend constexpr bool operator==(const iterator& x, const iterator& y);
friend constexpr bool operator<(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator>(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;
friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<inner_iterator<Const>>;

Let \( op \) be the operator.

Effects: Equivalent to:

```cpp
return x.inner_ op y.inner_;```
friend constexpr iterator operator+(const iterator& i, difference_type n)  
  requires random_access_range<Base>;  
  Effects: Equivalent to: return iterator(*i.parent_, i.inner_ + n);  
friend constexpr iterator operator-(const iterator& i, difference_type n)  
  requires random_access_range<Base>;  
  Effects: Equivalent to: return iterator(*i.parent_, i.inner_ - n);  
friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
  requires sized_sentinel_for<inner_iterator<Const>, inner_iterator<Const>>;  
  Effects: Equivalent to: return x.inner_ - y.inner_;  

26.7.26.4 Class template adjacent_transform_view::sentinel

```cpp
namespace std::ranges {
  template<forward_range V, move_constructible F, size_t N>
  requires view<V> && (N > 0) && is_object_v<F> &&

    requires sized_sentinel_for<inner-sentinel<Const>, inner_iterator<OtherConst>>
    friend constexpr range_difference_t<maybe_const<OtherConst, InnerView>>
    operator-(const sentinel& x, const iterator<OtherConst>& y);
  };

  constexpr explicit sentinel(inner-sentinel<Const> inner);  
  Effects: Initializes inner_ with inner.
  constexpr sentinel(sentinel<!Const> i)  
    requires Const && convertible_to<inner-sentinel<false>, inner-sentinel<Const>>;
  Effects: Initializes inner_ with std::move(i.inner_).
  template<bool OtherConst>
  requires sentinel_for<inner-sentinel<Const>, inner_iterator<OtherConst>>
  friend constexpr bool operator==(const iterator<OtherConst>& x, const sentinel& y);
  Effects: Equivalent to return x.inner_ == y.inner_;  
```
template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const iterator<OtherConst>& x, const sentinel& y);

template<bool OtherConst>
  requires sized_sentinel_for<inner-sentinel<Const>, inner-iterator<OtherConst>>
friend constexpr range_difference_t<maybe-const<OtherConst, InnerView>>
  operator-(const sentinel& x, const iterator<OtherConst>& y);

Effects: Equivalent to return x.inner_ - y.inner_;

26.7.27 Chunk view

26.7.27.1 Overview

chunk_view takes a view and a number N and produces a range of views that are N-sized non-overlapping successive chunks of the elements of the original view, in order. The last view in the range can have fewer than N elements.

The name views::chunk denotes a range adaptor object (26.7.2). Given subexpressions E and N, the expression views::chunk(E, N) is expression-equivalent to chunk_view(E, N).

[Example 1:]

```cpp
vector v = {1, 2, 3, 4, 5};

for (auto r : v | views::chunk(2)) {
  cout << '[';
  auto sep = "";
  for (auto i : r) {
    cout << sep << i;
    sep = ", ";
  }
  cout << "];
}
// The above prints [1, 2] [3, 4] [5]
```

—end example—

26.7.27.2 Class template chunk_view for input ranges

namespace std::ranges {

  template<class I>
  constexpr I div-ceil(I num, I denom) {
    I r = num / denom;
    if (num % denom)
      ++r;
    return r;
  }

  template<view V>
  requires input_range<V>
  class chunk_view : public view_interface<chunk_view<V>> {
    V base_;          // exposition only
    range_difference_t<V> n_;     // exposition only
    range_difference_t<V> remainder_ = 0;     // exposition only
    non-propagating-cache<iterator_t<V>> current_; // exposition only

    // 26.7.27.3, class chunk_view::outer-iterator
    class outer-iterator;            // exposition only

    // 26.7.27.3, class chunk_view::inner-iterator
    class inner-iterator;            // exposition only

    public:
      constexpr explicit chunk_view(V base, range_difference_t<V> n);
constexpr V base() const & requires copy_constructible<V> { return base_; }
constexpr V base() && { return std::move(base_); }

constexpr outer_iterator begin();
constexpr default_sentinel_t end() const noexcept;
constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;

};

template<class R>
chunk_view(R&&, range_difference_t<R>) -> chunk_view<views::all_t<R>>;

constexpr explicit chunk_view(V base, range_difference_t<V> n);

Preconditions: n > 0 is true.
Effects: Initializes base_ with std::move(base) and n_ with n.

constexpr outer_iterator begin();

Effects: Equivalent to:
current_ = ranges::begin(base_);
remainder_ = n;
return outer_iterator(*this);

constexpr default_sentinel_t end() const noexcept;

Returns: default_sentinel.

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;

Effects: Equivalent to:
return to_unsigned_like(div_ceil(ranges::distance(base_), n_));

26.7.27.3 Class chunk_view::outer_iterator
[range.chunk.outer.iter]

namespace std::ranges {

  requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;
};

iterator::iterator_concept is defined as follows:

(1.1) If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
(1.2) Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) Otherwise, iterator_concept denotes forward_iterator_tag.

constexpr iterator(Parent* parent, iterator_t<Base> current,
  range_difference_t<Base> missing = 0);

Effects: Initializes current with current, end with ranges::end(parent->base_), n with parent->n_, and missing with missing.

constexpr iterator(iterator<!Const> i)
  requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>
  && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes current with std::move(i.current_), end with std::move(i.end_), n with i.n_, and missing with i.missing_.

constexpr iterator_t<Base> base() const;

Returns: current_

constexpr value_type operator*() const;

Preconditions: current_ != end_ is true.

Returns: views::take(subrange(current_, end_), n_).

constexpr iterator& operator++();

Preconditions: current_ != end_ is true.
8 Effects: Equivalent to:
   missing_ = ranges::advance(current_, n_, end_);
   return *this;

constexpr iterator operator++(int);

9 Effects: Equivalent to:
   auto tmp = *this;
   +++this;
   return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

10 Effects: Equivalent to:
   ranges::advance(current_, missing_ - n_);
   missing_ = 0;
   return *this;

constexpr iterator& operator--(int) requires bidirectional_range<Base>;

11 Effects: Equivalent to:
   auto tmp = *this;
   --*this;
   return tmp;

constexpr iterator& operator+=(difference_type x)
   requires random_access_range<Base>;

12 Preconditions: If x is positive, ranges::distance(current_, end_) > n_ * (x - 1) is true.
   [Note 1: If x is negative, the Effects paragraph implies a precondition. — end note]

Effects: Equivalent to:
   if (x > 0) {
      missing_ = ranges::advance(current_, n_ * x, end_);
   } else if (x < 0) {
      ranges::advance(current_, n_ * x + missing_);
      missing_ = 0;
   }
   return *this;

constexpr iterator& operator=(difference_type x)
   requires random_access_range<Base>;

14 Effects: Equivalent to: return *this += -x;

constexpr value_type operator[] (difference_type n) const
   requires random_access_range<Base>;

15 Returns: *(*this + n).

friend constexpr bool operator==(const iterator& x, const iterator& y);
16 Returns: x.current_ == y.current_.

friend constexpr bool operator==(const iterator& x, default_sentinel_t);
17 Returns: x.current_ == x.end_.

friend constexpr bool operator<(const iterator& x, const iterator& y)
   requires random_access_range<Base>;
18 Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)
   requires random_access_range<Base>;
19 Effects: Equivalent to: return y < x;

§ 26.7.27.7 1234
friend constexpr bool operator<=(const iterator& x, const iterator& y)  
requires random_access_range<Base>;  

Effects: Equivalent to: return !(y < x);  

friend constexpr bool operator>=(const iterator& x, const iterator& y)  
requires random_access_range<Base>;  

Effects: Equivalent to: return !(x < y);  

friend constexpr auto operator<=>(const iterator& x, const iterator& y)  
requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;  

Returns: x.current_ <=> y.current_.  

friend constexpr iterator operator+(const iterator& i, difference_type n)  
requires random_access_range<Base>;  

friend constexpr iterator operator+(difference_type n, const iterator& i)  
requires random_access_range<Base>;  

Effects: Equivalent to:  
auto r = i;  
r += n;  
return r;  

friend constexpr iterator operator-(const iterator& i, difference_type n)  
requires random_access_range<Base>;  

Effects: Equivalent to:  
auto r = i;  
r -= n;  
return r;  

friend constexpr difference_type operator-(const iterator& x, const iterator& y)  
requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;  

Returns: (x.current_ - y.current_ + x.missing_ - y.missing_) / x.n_.  

friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)  
requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;  

Returns: div-ceil(x.end_ - x.current_, x.n_).  

friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)  
requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;  

Effects: Equivalent to: return -(y - x);  

26.7.28 Slide view  

26.7.28.1 Overview  

slide_view takes a view and a number N and produces a view whose \(M^{th}\) element is a view over the \(M^{th}\) through \((M + N - 1)^{th}\) elements of the original view. If the original view has fewer than \(N\) elements, the resulting view is empty.  

The name views::slide denotes a range adaptor object (26.7.2). Given subexpressions \(E\) and \(N\), the expression views::slide\((E, N)\) is expression-equivalent to slide_view\((E, N)\).  

[Example 1:  
vector v = \{1, 2, 3, 4\};  

for (auto i : v | views::slide(2)) {  
cout << '[' << i[0] << ',' << i[1] << ']' << endl; // prints [1, 2] [2, 3] [3, 4]  
}  
— end example]
26.7.28.2 Class template `slide_view`  [range.slide.view]

```cpp
namespace std::ranges {
    template<class V>
    concept slide-caches-nothing = random_access_range<V> && sized_range<V>;    // exposition only

template<class V>
    concept slide-caches-last = !slide-caches-nothing<V> && bidirectional_range<V> && common_range<V>;     // exposition only

template<class V>
    concept slide-caches-first = !slide-caches-nothing<V> && !slide-caches-last<V>;                     // exposition only

template<forward_range V>
    requires view<V>
    class slide_view : public view_interface<slide_view<V>> {
        V base_;  // exposition only
        range_difference_t<V> n_;    // exposition only

        // 26.7.28.3, class template slide_view::iterator
        template<bool> class iterator;  // exposition only

        // 26.7.28.4, class slide_view::sentinel
        class sentinel;                  // exposition only

        public:
            constexpr explicit slide_view(V base, range_difference_t<V> n);

            constexpr auto begin()
                requires (!simple-view<V> && slide-caches-nothing<const V>));
            constexpr auto begin() const requires slide-caches-nothing<const V>;

            constexpr auto end()
                requires (!simple-view<V> && slide-caches-nothing<const V>));
            constexpr auto end() const requires slide-caches-nothing<const V>;
            constexpr auto size() requires sized_range<V>;
            constexpr auto size() const requires sized_range<const V>;
    };

    template<class R>
    slide_view(R&&, range_difference_t<R>) -> slide_view<views::all_t<R>>;
}
```

- **Preconditions:** `n > 0` is true.
- **Effects:** Initializes `base_` with `std::move(base)` and `n_` with `n`.
- **Returns:**
  1. If `V` models `slide-caches-first`,
     - `iterator<false>(ranges::begin(base_),
       ranges::next(ranges::begin(base_), n_ - 1, ranges::end(base_)), n_)`
  2. Otherwise, `iterator<false>(ranges::begin(base_), n_)`.

- **Remarks:** In order to provide the amortized constant-time complexity required by the `range` concept, this function caches the result within the `slide_view` for use on subsequent calls when `V` models `slide-caches-first`.
constexpr auto begin() const requires slide-caches-nothing<const V>;

Returns: iterator<true>(ranges::begin(base_), n_).

constexpr auto end() requires (! (simple-view<V> && slide-caches-nothing<const V>));

Returns:

(6.1) — If V models slide-caches-nothing,
    iterator<false>(ranges::begin(base_) + range_difference_t<V>(size()), n_)

(6.2) — Otherwise, if V models slide-caches-last,
    iterator<false>(ranges::prev(ranges::end(base_), n_ - 1, ranges::begin(base_)), n_)

(6.3) — Otherwise, if V models common_range,
    iterator<false>(ranges::end(base_), ranges::end(base_), n_)

(6.4) — Otherwise, sentinel(ranges::end(base_)).

Remarks: In order to provide the amortized constant-time complexity required by the range concept, this function caches the result within the slide_view for use on subsequent calls when V models slide-caches-last.

constexpr auto end() const requires slide-caches-nothing<const V>;

Returns: begin() + range_difference_t<const V>(size()).

constexpr auto size() requires sized_range<V>;
constexpr auto size() const requires sized_range<const V>;

Effects: Equivalent to:

auto sz = ranges::distance(base_) - n_ + 1;
if (sz < 0) sz = 0;
return to_unsigned_like(sz);

26.7.28.3 Class template slide_view::iterator

namespace std::ranges {

template<forward_range V>
requires view<V>
template<bool Const>
class slide_view<V>::iterator {

public:
using iterator_category = input_iterator_tag;

friend constexpr iterator operator-(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

1 iterator::iterator_concept is defined as follows:

— If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
— Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
— Otherwise, iterator_concept denotes forward_iterator_tag.

2 If the invocation of any non-const member function of iterator exits via an exception, the iterator acquires a singular value.

constexpr iterator (iterator_t<Base> current, range_difference_t<Base> n)
requires !slide-caches-first<Base>;

Effects: Initializes current_ with current and n_ with n.

constexpr iterator (iterator_t<Base> current, iterator_t<Base> last_ele,
range_difference_t<Base> n)
requires slide-caches-first<Base>;

Effects: Initializes current_ with current, last_ele_ with last_ele, and n_ with n.

constexpr iterator (iterator<!Const> i)
requires Const && convertible_to<iterator_t<V>, iterator_t<Base>>;

Effects: Initializes current_ with std::move(i.current_) and n_ with i.n_.

[Note 1: iterator<true> can only be formed when Base models slide-caches-nothing, in which case last_ele is not present. — end note]
constexpr auto operator*() const;
   Returns: views::counted(current_, n_).

constexpr iterator& operator++();
   Preconditions: current_ and last_ele_ (if present) are incrementable.
   Postconditions: current_ and last_ele_ (if present) are each equal to ranges::next(i), where i is the value of that data member before the call.
   Returns: *this.

constexpr iterator operator++(int);
   Effects: Equivalent to:
   auto tmp = *this;
   +++this;
   return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;
   Preconditions: current_ and last_ele_ (if present) are decrementable.
   Postconditions: current_ and last_ele_ (if present) are each equal to ranges::prev(i), where i is the value of that data member before the call.
   Returns: *this.

constexpr iterator operator--(int) requires bidirectional_range<Base>;
   Effects: Equivalent to:
   auto tmp = *this;
   ---this;
   return tmp;

constexpr iterator& operator+=(difference_type x) requires random_access_range<Base>;
   Preconditions: current_ + x and last_ele_ + x (if last_ele_ is present) have well-defined behavior.
   Postconditions: current_ and last_ele_ (if present) are each equal to i + x, where i is the value of that data member before the call.
   Returns: *this.

constexpr iterator& operator=(difference_type x) requires random_access_range<Base>;
   Preconditions: current_ - x and last_ele_ - x (if last_ele_ is present) have well-defined behavior.
   Postconditions: current_ and last_ele_ (if present) are each equal to i - x, where i is the value of that data member before the call.
   Returns: *this.

constexpr auto operator[](difference_type n) const
   requires random_access_range<Base>;
   Effects: Equivalent to: return views::counted(current_ + n, n_);

friend constexpr bool operator==(const iterator& x, const iterator& y);
   Returns: If last_ele_ is present, x.last_ele_ == y.last_ele_; otherwise, x.current_ == y.current_.

friend constexpr bool operator<(const iterator& x, const iterator& y)
   requires random_access_range<Base>;
   Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)
   requires random_access_range<Base>;
   Effects: Equivalent to: return y < x;
friend constexpr bool operator<=(const iterator& x, const iterator& y) requires random_access_range<Base>;  

Effects: Equivalent to: return !(y < x);

friend constexpr bool operator>=(const iterator& x, const iterator& y) requires random_access_range<Base>;  

Effects: Equivalent to: return !(x < y);

friend constexpr auto operator<=>(const iterator& x, const iterator& y) requires random_access_range<Base> && three_way_comparable<iterator_t<Base>>;  

Returns: x.current_ <=> y.current_.

friend constexpr iterator operator+(const iterator& i, difference_type n) requires random_access_range<Base>;
friend constexpr iterator operator+(difference_type n, const iterator& i) requires random_access_range<Base>;

Effects: Equivalent to:
auto r = i;
r += n;
return r;

friend constexpr iterator operator-(const iterator& i, difference_type n) requires random_access_range<Base>;

Effects: Equivalent to:
auto r = i;
r -= n;
return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y) requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;  

Returns: If last_ele_ is present, x.last_ele_ - y.last_ele_; otherwise, x.current_ - y.current_.

§ 26.7.28.4 Class slide_view::sentinel

namespace std::ranges {
    template<forward_range V>
    requires view<V>
    class slide_view<V>::sentinel {
        sentinel_t<V> end_ = sentinel_t<V>(); // exposition only
        constexpr explicit sentinel(sentinel_t<V> end); // exposition only

    public:
        sentinel() = default;

        friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

        friend constexpr range_difference_t<V>
        operator-(const iterator<false>& x, const sentinel& y)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

        friend constexpr range_difference_t<V>
        operator-(const sentinel& y, const iterator<false>& x)
        requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;
    }
    }

[Note 1: sentinel is used only when slide-caches-first<V> is true. — end note]

customexpr explicit sentinel(sentinel_t<V> end);

Effects: Initializes end_ with end.
friend constexpr bool operator==(const iterator<false>& x, const sentinel& y);

Returns: x.last_ele_ == y.end_.

friend constexpr range_difference_t<V>
operator-(const iterator<false>& x, const sentinel& y)
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

Returns: x.last_ele_ - y.end_.

friend constexpr range_difference_t<V>
operator-(const sentinel& y, const iterator<false>& x)
requires sized_sentinel_for<sentinel_t<V>, iterator_t<V>>;

Returns: y.end_ - x.last_ele_.

26.7.29 Chunk by view

26.7.29.1 Overview

chunk_by_view takes a view and a predicate, and splits the view into subranges between each pair of adjacent elements for which the predicate returns false.

The name views::chunk_by denotes a range adaptor object (26.7.2). Given subexpressions E and F, the expression views::chunk_by(E, F) is expression-equivalent to chunk_by_view(E, F).

[Example 1:

```cpp
vector v = {1, 2, 2, 3, 0, 4, 5, 2};
for (auto r : v | views::chunk_by(ranges::less_equal{})) {
    cout << '[';
    auto sep = "";
    for (auto i : r) {
        cout << sep << i;
        sep = ", ";
    }
    cout << "] ";
}
// The above prints [1, 2, 2, 3] [0, 4, 5] [2]
```
—end example]

26.7.29.2 Class template chunk_by_view

namespace std::ranges {
    template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
    requires view<V> && is_object_v<Pred>
    class chunk_by_view : public view_interface<chunk_by_view<V, Pred>> {
        V base_ = V();  // exposition only
        movable-box<Pred> pred_;
        // exposition only

        // 26.7.29.3, class chunk_by_view::iterator
        class iterator;
        // exposition only

    public:
        chunk_by_view() requires default_initializable<V> && default_initializable<Pred> = default;
        constexpr explicit chunk_by_view(V base, Pred pred) = default;

        constexpr V base() const & requires copy_constructible<V> { return base_; }
        constexpr V base() && { return std::move(base_); }

        constexpr const Pred& pred() const;

        constexpr iterator begin();
        constexpr auto end();

        constexpr iterator_t<V> find_next(iterator_t<V>);  // exposition only
        constexpr iterator_t<V> find_prev(iterator_t<V>);  // exposition only

        requires bidirectional_range<V>;
    }
template<class R, class Pred>
    chunk_by_view(R&&, Pred) -> chunk_by_view<views::all_t<R>, Pred>;

constexpr explicit chunk_by_view(V base, Pred pred);

1 Effects: Initializes base_ with std::move(base) and pred_ with std::move(pred).

constexpr const Pred& pred() const;

2 Effects: Equivalent to: return *pred_;

constexpr iterator begin();

3 Preconditions: pred_.has_value() is true.

4 Returns: iterator(*this, ranges::begin(base_), find-next(ranges::begin(base_))).

5 Remarks: In order to provide the amortized constant-time complexity required by the range concept,
this function caches the result within the chunk_by_view for use on subsequent calls.

constexpr auto end();

6 Effects: Equivalent to:
    if constexpr (common_range<V>) {
        return iterator(*this, ranges::end(base_), ranges::end(base_));
    } else {
        return default_sentinel;
    }

constexpr iterator_t<V> find-next(iterator_t<V> current);

7 Preconditions: pred_.has_value() is true.

8 Returns:
    ranges::next(ranges::adjacent_find(current, ranges::end(base_), not_fn(ref(*pred_))),
                 1, ranges::end(base_))

constexpr iterator_t<V> find-prev(iterator_t<V> current) requires bidirectional_range<V>;

9 Preconditions:
    (9.1) current is not equal to ranges::begin(base_).
    (9.2) pred_.has_value() is true.

10 Returns: An iterator i in the range [ranges::begin(base_), current) such that:
    (10.1) ranges::adjacent_find(i, current, not_fn(ref(*pred_))) is equal to current; and
    (10.2) if i is not equal to ranges::begin(base_), then bool:invoke(*pred_, *ranges::prev(i),
                    *i)) is false.

26.7.29.3 Class chunk_by_view::iterator

namespace std::ranges {
    template<forward_range V, indirect_binary_predicate<iterator_t<V>, iterator_t<V>> Pred>
        requires view<V> && is_object_v<Pred>
    class chunk_by_view<V, Pred>::iterator {
        chunk_by_view* parent_ = nullptr; // exposition only
        iterator_t<V> current_ = iterator_t<V>(); // exposition only
        iterator_t<V> next_ = iterator_t<V>(); // exposition only

        constexpr iterator(chunk_by_view& parent, iterator_t<V> current, // exposition only
                              iterator_t<V> next);

        public:
            using value_type = subrange<iterator_t<V>>;
            using difference_type = range_difference_t<V>;
            using iterator_category = input_iterator_tag;
        }
}

§ 26.7.29.3
using iterator_concept = see below;

iterator() = default;

constexpr value_type operator*() const;
constexpr iterator& operator++();
constexpr iterator operator++(int);

constexpr iterator& operator--() requires bidirectional_range<V>;
constexpr iterator operator--(int) requires bidirectional_range<V>;

friend constexpr bool operator==(const iterator& x, const iterator& y);  
friend constexpr bool operator==(const iterator& x, default_sentinel_t);
};

1 iterator::iterator_concept is defined as follows:
(1.1)  — If V models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.2)  — Otherwise, iterator_concept denotes forward_iterator_tag.

constexpr iterator(chunk_by_view& parent, iterator_t<V> current, iterator_t<V> next);

Effects: Initializes parent_ with addressof(parent), current_ with current, and next_ with next.

constexpr value_type operator*() const;

Preconditions: current_ is not equal to next_.

Returns: subrange(current_, next_).

constexpr iterator& operator++();

Preconditions: current_ is not equal to next_.

Effects: Equivalent to:

  current_ = next_;  
  next_ = parent_->find-next(current_);  
  return *this;

constexpr iterator operator++(int);

Effects: Equivalent to:

  auto tmp = *this;  
  ++*this;  
  return tmp;

constexpr iterator& operator--() requires bidirectional_range<V>;

Effects: Equivalent to:

  next_ = current_;  
  current_ = parent_->find-prev(next_);  
  return *this;

constexpr iterator operator--(int) requires bidirectional_range<V>;

Effects: Equivalent to:

  auto tmp = *this;  
  --*this;  
  return tmp;

friend constexpr bool operator==(const iterator& x, const iterator& y);

Returns: x.current_ == y.current_.

friend constexpr bool operator==(const iterator& x, default_sentinel_t);

Returns: x.current_ == x.next_.

§ 26.7.29.3
26.7.30 Stride view [range.stride]

26.7.30.1 Overview [range.stride.overview]

1 `stride_view` presents a view of an underlying sequence, advancing over `n` elements at a time, as opposed to the usual single-step succession.

2 The name `views::stride` denotes a range adaptor object (26.7.2). Given subexpressions `E` and `N`, the expression `views::stride(E, N)` is expression-equivalent to `stride_view(E, N).

3 [Example 1:]

```cpp
auto input = views::iota(0, 12) | views::stride(3);
ranges::copy(input, ostream_iterator<int>(cout, " "); // prints 0 3 6 9
ranges::copy(input | views::reverse, ostream_iterator<int>(cout, " "); // prints 9 6 3 0
```

—end example—

friend constexpr void iter_swap(const iterator& x, const iterator& y)
   noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))
   requires indirectly_swappable<iterator_t<Base>>;

1 iterator::iterator_concept is defined as follows:
(1.1) — If Base models random_access_range, then iterator_concept denotes random_access_iterator_tag.
(1.2) — Otherwise, if Base models bidirectional_range, then iterator_concept denotes bidirectional_iterator_tag.
(1.3) — Otherwise, if Base models forward_range, then iterator_concept denotes forward_iterator_tag.
(1.4) — Otherwise, iterator_concept denotes input_iterator_tag.

2 The member typedef-name iterator_category is defined if and only if Base models forward_range. In that case, iterator::iterator_category is defined as follows:
(2.1) — Let C denote the type iterator_traits<iterator_t<Base>>::iterator_category.
(2.2) — If C models derived_from<random_access_iterator_tag>, then iterator_category denotes random_access_iterator_tag.
(2.3) — Otherwise, iterator_category denotes C.
constexpr iterator (Parent* parent, iterator_t<Base> current, range_difference_t<Base> missing = 0);

Effects: Initializes current with std::move(current), end with ranges::end(parent->base_), stride with parent->stride_, and missing with missing.

constexpr iterator (iterator<!Const> i) requires Const && convertible_to<iterator_t<V>, iterator_t<Base>> && convertible_to<sentinel_t<V>, sentinel_t<Base>>;

Effects: Initializes current with std::move(i.current_), end with std::move(i.end_), stride_ with i.stride_, and missing_ with i.missing_.

constexpr iterator_t<Base> base() &&;

Returns: std::move(current_).

constexpr const iterator_t<Base>& base() const & noexcept;

Returns: current_.

constexpr iterator& operator++();

Preconditions: current_ != end_ is true.

Effects: Equivalent to:

missing_ = ranges::advance(current_, stride_, end_);
return *this;

constexpr void operator++(int);

Effects: Equivalent to: +++this;

constexpr iterator operator++(int) requires forward_range<Base>;

Effects: Equivalent to:

auto tmp = *this;
+++this;
return tmp;

constexpr iterator& operator--() requires bidirectional_range<Base>;

Effects: Equivalent to:

ranges::advance(current_, missing_ - stride_);
missing_ = 0;
return *this;

constexpr iterator operator--(int) requires bidirectional_range<Base>;

Effects: Equivalent to:

auto tmp = *this;
---*this;
return tmp;

constexpr iterator& operator+=(difference_type n) requires random_access_range<Base>;

Preconditions: If n is positive, ranges::distance(current_, end_) > stride_ * (n - 1) is true.

[Note 1: If n is negative, the Effects paragraph implies a precondition. — end note]

Effects: Equivalent to:

if (n > 0) {
    missing_ = ranges::advance(current_, stride_ * n, end_);
} else if (n < 0) {
    ranges::advance(current_, stride_ * n + missing_);
    missing_ = 0;
}
return *this;

§ 26.7.30.3
constexpr iterator operator-=(difference_type x)
    requires random_access_range<Base>;

    Effects: Equivalent to: return *this += -x;

friend constexpr bool operator==(const iterator& x, default_sentinel_t);

    Returns: x.current_ == x.end_.

friend constexpr bool operator==(const iterator& x, const iterator& y)
    requires equality_comparable<iterator_t<Base>>;

    Returns: x.current_ == y.current_.

friend constexpr bool operator<(const iterator& x, const iterator& y)
    requires random_access_range<Base>;

    Returns: x.current_ < y.current_.

friend constexpr bool operator>(const iterator& x, const iterator& y)
    requires random_access_range<Base>;

    Effects: Equivalent to: return y < x;

friend constexpr bool operator<=(const iterator& x, const iterator& y)

        return r;

friend constexpr difference_type operator-(const iterator& x, const iterator& y)
    requires sized_sentinel_for<iterator_t<Base>, iterator_t<Base>>;

    Returns: Let \(N\) be \((x.current_ - y.current_)\).

    (25.1) If \(Base\) models forward_range, \((N + x.missing_ - y.missing_) / x.stride_\).
    (25.2) Otherwise, if \(N\) is negative, \(-\text{div-ceil}(-N, x.stride_)\).
    (25.3) Otherwise, \text{div-ceil}(N, x.stride_).

friend constexpr difference_type operator-(default_sentinel_t y, const iterator& x)
    requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

    Returns: \text{div-ceil}(x.end_ - x.current_, x.stride_).
friend constexpr difference_type operator-(const iterator& x, default_sentinel_t y)  
requires sized_sentinel_for<sentinel_t<Base>, iterator_t<Base>>;

27  Effects: Equivalent to: return -(y - x);

friend constexpr range_rvalue_reference_t<Base> iter_move(const iterator& i)  
noexcept(noexcept(ranges::iter_move(i.current_)));  

28  Effects: Equivalent to: return ranges::iter_move(i.current_);

friend constexpr void iter_swap(const iterator& x, const iterator& y)  
noexcept(noexcept(ranges::iter_swap(x.current_, y.current_)))  
requires indirectly_swappable<iterator_t<Base>>;

29  Effects: Equivalent to: ranges::iter_swap(x.current_, y.current_);

26.7.31 Cartesian product view

26.7.31.1 Overview

cartesian_product_view takes any non-zero number of ranges \( n \) and produces a view of tuples calculated by the \( n \)-ary cartesian product of the provided ranges.

The name views::cartesian_product denotes a customization point object (16.3.3.5). Given a pack of subexpressions \( E_s \), the expression views::cartesian_product\( (E_s...) \) is expression-equivalent to

\[
\text{(2.1)} \quad \text{views::single(tuple(\())} \
\text{if } E_s \text{ is an empty pack,}
\]

\[
\text{(2.2)} \quad \text{otherwise, cartesian_product_view<views::all_t<typename((E_s))>...>(E_s...).}
\]

3 [Example 1]:

```cpp
template<auto& v { 0, 1, 2 }>
for (auto&& [a, b, c] : views::cartesian_product(v, v, v)) {
    cout << a << ' ' << b << ' ' << c << '
';
}  
// The above prints
// 0 0 0
// 0 0 1
// 0 0 2
// 0 1 0
// 0 1 1
// ...
```

—end example]  

26.7.31.2 Class template cartesian_product_view

namespace std::ranges {

    template<auto& v { 0, 1, 2 }>
    for (auto&& [a, b, c] : views::cartesian_product(v, v, v)) {
        cout << a << ' ' << b << ' ' << c << '
';
    }  
    // The above prints
    // 0 0 0
    // 0 0 1
    // 0 0 2
    // 0 1 0
    // 0 1 1
    // ...

```cpp
template<auto& v { 0, 1, 2 }>
```
template<class... Vs>
concept cartesian-product-is-sized = // exposition only
(sized_range<Vs> && ...);

template<bool Const, template<class> class FirstSent, class First, class... Vs>
concept cartesian-is-sized-sentinel = // exposition only
(sized_sentinel_for<FirstSent<maybe-const<Const, First>>, iterator_t<maybe-const<Const, First>>> && ...
&& (sized_range<maybe-const<Const, Vs>>
&& sized_sentinel_for(iterator_t<maybe-const<Const, Vs>>, iterator_t<maybe-const<Const, Vs>>>));

template<class... Vs>
constexpr explicit cartesian_product_view(First first_base, Vs... bases) {
    constexpr cartesian_product_view() = default;
    constexpr cartesian_product_view(First first_base, Vs... bases) {
        bases_ = std::move(first_base), std::move(bases)...;

        requires (simple-view<First> || ... || !simple-view<Vs>);
        iterator<false> begin() const
            requires (range<const First> && ... && range<const Vs>);
        iterator<false> end()
            requires ((!simple-view<First> || ... || !simple-view<Vs>) &&
            cartesian-product-is-common<First, Vs...>);
        constexpr default_sentinel_t end() const noexcept;

        constexpr see below size()
            requires cartesian-product-is-sized<First, Vs...>;
        constexpr see below size() const
            requires cartesian-product-is-sized<const First, const Vs...>;
    };

template<class... Vs>
cartesian_product_view(Vs&&...) -> cartesian_product_view<all_t<Vs>...>;
}

Effects: Initializes bases_ with std::move(first_base), std::move(bases)....

constexpr iterator<false> begin()
    requires (simple-view<First> || ... || !simple-view<Vs>);

Effects: Equivalent to:
    return iterator<false>(*this, tuple-transform(ranges::begin, bases_));
constexpr iterator<true> begin() const
requires (range<const First> && ... && range<const Vs>);

Effects: Equivalent to:
return iterator<true>(*this, tuple-transform(ranges::begin, bases_));

constexpr iterator<false> end()
requires (ranges::empty(rng) for any rng among the underlying ranges except the first one and false otherwise; and cartesian-product-is-common<First, Vs...>);

constexpr iterator<true> end() const
requires cartesian-product-is-common<const First, const Vs...>;

Effects: Equivalent to:
return iterator<is-const>(*this, tuple-transform([[](auto& rng){ return begin-or-first-end(rng); }, bases_));

Let:

— is-const be true for the const-qualified overload, and false otherwise;
— is-empty be true if the expression ranges::empty(rng) is true for any rng among the underlying ranges except the first one and false otherwise; and
— begin-or-first-end(rng) be expression-equivalent to is-empty ? ranges::begin(rng) : cartesian-common-arg-end(rng) if rng is the first underlying range and ranges::begin(rng) otherwise.

Effects: Equivalent to:
iterator<is-const> it(*this, tuple-transform(
  [](auto& rng){ return begin-or-first-end(rng); }, bases_));
return it;

constexpr default_sentinel_t end() const noexcept;

Returns: default_sentinel.

constexpr see below size()
requires cartesian-product-is-sized<First, Vs...>;
constexpr see below size() const
requires cartesian-product-is-sized<const First, const Vs...>;

The return type is an implementation-defined unsigned-integer-like type.

Recommended practice: The return type should be the smallest unsigned-integer-like type that is sufficiently wide to store the product of the maximum sizes of all the underlying ranges, if such a type exists.

Let p be the product of the sizes of all the ranges in bases_.

Preconditions: p can be represented by the return type.

Returns: p.

26.7.31.3 Class template cartesian_product_view::iterator

namespace std::ranges {

constexpr difference_type distance-from(const Tuple& t) const;

Let:

1. scaled-size(N) be the product of static_cast<difference_type>(ranges::size(std::get<N>(parent_->bases_))) and scaled-size(N + 1) if N ≤ sizeof...(Vs), otherwise static_cast<difference_type>(1);
2. scaled-distance(N) be the product of static_cast<difference_type>(std::get<N>(current_) - std::get<N>(t)) and scaled-size(N + 1); and
3. scaled-sum be the sum of scaled-distance(N) for every integer 0 ≤ N ≤ sizeof...(Vs).

Preconditions: scaled-sum can be represented by difference_type.

Returns: scaled-sum.

castexpr iterator(Parent& parent, tuple<iterator_t<maybe-const<Const, First>>, iterator_t<maybe-const<Const, Vs>>...> current);

Effects: Initializes parent_ with addressof(parent) and current_ with std::move(current).
constexpr iterator (iterator<!Const> i) requires Const && (convertible_to<iterator_t<First>, iterator_t<const First>> && ... && convertible_to<iterator_t<Vs>, iterator_t<const Vs>>);

Effects: Initializes parent_ with i, parent_ and current_ with std::move(i.current_).

constexpr auto operator*() const;
Effects: Equivalent to:
return tuple_transform([](auto& i) -> decltype(auto) { return *i; }, current_);

constexpr iterator& operator++();
Effects: Equivalent to:
next();
return *this;

constexpr void operator++(int);
Effects: Equivalent to +++this.

constexpr iterator operator++(int) requires forward_range<maybe-const<Const, First>>;
Effects: Equivalent to:
auto tmp = *this;
***this;
return tmp;

constexpr iterator& operator--();
requires cartesian-product-is-bidirectional<Const, First, Vs...>;
Effects: Equivalent to:
prev();
return *this;

constexpr iterator operator--(int)
requires cartesian-product-is-bidirectional<Const, First, Vs...>;
Effects: Equivalent to:
auto tmp = *this;
---*this;
return tmp;

constexpr iterator& operator+=(difference_type x)
requires cartesian-product-is-random-access<Const, First, Vs...>;

Let orig be the value of *this before the call.
Let ret be:

(18.1) If x > 0, the value of *this had next been called x times.
(18.2) Otherwise, if x < 0, the value of *this had prev been called \(-x\) times.
(18.3) Otherwise, orig.

Preconditions: x is in the range \([ranges::distance(*this, ranges::begin(*parent_)),
ranges::distance(*this, ranges::end(*parent_))].\)
Effects: Sets the value of *this to ret.
Returns: *this.
Complexity: Constant.

constexpr iterator& operator-=(difference_type x)
requires cartesian-product-is-random-access<Const, First, Vs...>;

Effects: Equivalent to:
*this += -x;
return *this;
constexpr reference operator[](difference_type n) const
requires cartesian-product-is-random-access<Const, First, Vs...>;

Effects: Equivalent to: return *(*(this) + n);

friend constexpr bool operator==(const iterator& x, const iterator& y)
requires equality_comparable<iterator_t<maybe-const<Const, First>>>;

Effects: Equivalent to: return x.current_ == y.current_;

friend constexpr bool operator==(const iterator& x, default_sentinel_t);

Returns: true if std::get<0>(x.current_) == ranges::end(std::get<0>(x.parent_->bases_))
is true for any integer 0 ≤ i ≤ sizeof...(Vs); otherwise, false.

friend constexpr auto operator<=>(const iterator& x, const iterator& y)
requires all-random-access<Const, First, Vs...>;

Effects: Equivalent to: return x.current_ <=> y.current_;

friend constexpr iterator operator+(const iterator& x, difference_type y)
requires cartesian-product-is-random-access<Const, First, Vs...>;

Effects: Equivalent to: return iterator(x) += y;

friend constexpr iterator operator+(difference_type x, const iterator& y)
requires cartesian-product-is-random-access<Const, First, Vs...>;

Effects: Equivalent to: return y + x;

friend constexpr iterator operator-(const iterator& x, difference_type y)
requires cartesian-product-is-random-access<Const, First, Vs...>;

Effects: Equivalent to: return iterator(x) -= y;

friend constexpr difference_type operator-(const iterator& i, default_sentinel_t)
requires cartesian-is-sized-sentinel<Const, iterator_t, First, Vs...>;

Let end-tuple be an object of a type that is a specialization of tuple, such that:
(32.1) std::get<0>(end-tuple) has the same value as ranges::end(std::get<0>(i.parent_->bases_));
(32.2) std::get<N>(end-tuple) has the same value as ranges::begin(std::get<N>(i.parent_->bases_)) for every integer 1 ≤ N ≤ sizeof...(Vs).

Effects: Equivalent to: return i.distance-from(end-tuple);

friend constexpr difference_type operator-(default_sentinel_t s, const iterator& i)
requires cartesian-is-sized-sentinel<Const, sentinel_t, First, Vs...>;

Effects: Equivalent to: return -(i - s);

friend constexpr void iter_swap(const iterator& l, const iterator& r)
requires (indirectly_swappable<iterator_t<maybe-const<Const, First>>> && ...
indirectly_swappable<iterator_t<maybe-const<Const, Vs>>>);

Effects: For every integer 0 ≤ i ≤ sizeof...(Vs), performs:
§ 26.7.31.3
ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))

Remarks: The exception specification is equivalent to the logical AND of the following expressions:

— noexcept(ranges::iter_swap(std::get<i>(l.current_), std::get<i>(r.current_))) for every integer $0 \leq i \leq \text{sizeof...}(V\text{s})$.

26.8 Range generators

26.8.1 Overview

Class template generator presents a view of the elements yielded by the evaluation of a coroutine.

A generator generates a sequence of elements by repeatedly resuming the coroutine from which it was returned. Elements of the sequence are produced by the coroutine each time a co_yield statement is evaluated. When the co_yield statement is of the form co_yield elements_of(r), each element of the range $r$ is successively produced as an element of the sequence.

[Example 1:]

generator<int> ints(int start = 0) {
  while (true)
    co_yield start++;
}

generator<int> ints(int start = 0) {
  while (true)
    co_yield start++;
}
void f() {
  for (auto i : ints() | views::take(3))
    cout << i << ' '; // prints 0 1 2
}

— end example —

26.8.2 Header <generator> synopsis

namespace std {
  // 26.8.3, class template generator
template<class Ref, class V = void, class Allocator = void>
  class generator;
}

26.8.3 Class template generator

namespace std {
  template<class Ref, class V = void, class Allocator = void>
  class generator : public ranges::view_interface<generator<Ref, V, Allocator>> {
private:
  using value = conditional_t<is_void_v<V>, remove_cvref_t<Ref>, V>; // exposition only
  using reference = conditional_t<is_void_v<V>, Ref&&, Ref>; // exposition only

  // 26.8.6, class generator::iterator
class iterator; // exposition only

public:
  using yielded = conditional_t<is_reference_v<reference>, reference, const reference&>;

  // 26.8.5, class generator::promise_type
class promise_type;

  generator(const generator&) = delete;
  generator(generator&& other) noexcept;

  ~generator();

  generator& operator=(generator other) noexcept;

  iterator begin();
  default_sentinel_t end() const noexcept;
}

§ 26.8.3
private:
    coroutine_handle<promise_type> coroutine_ = nullptr; // exposition only
    unique_ptr<stack<coroutine_handle<>>> active_; // exposition only
};

Mandates:
(1.1) — If Allocator is not void, allocator_traits<Allocator>::pointer is a pointer type.
(1.2) — value is a cv-unqualified object type.
(1.3) — reference is either a reference type, or a cv-unqualified object type that models copy_constructible.
(1.4) — Let RRef denote remove_reference_t<reference>&& if reference is a reference type, and reference otherwise. Each of:
    (1.4.1) — common_reference_with<reference&&, value&&>,
    (1.4.2) — common_reference_with<reference&&, RRef&&>, and
    (1.4.3) — common_reference_with<RRef&&, const value&>
    is modeled.

[Note 1: These requirements ensure the exposition-only iterator type can model indirectly_readable and thus input_iterator. — end note]

2 If Allocator is not void, it shall meet the Cpp17Allocator requirements.

3 Specializations of generator model view and input_range.

4 The behavior of a program that adds a specialization for generator is undefined.

26.8.4 Members [coro.generation.members]

generator(generator&& other) noexcept;
1 Effects: Initializes coroutine_with with exchange(other.coroutine_, {}) and active_with exchange( other.active_, nullptr).
2 [Note 1: Iterators previously obtained from other are not invalidated; they become iterators into *this. — end note]

~generator();
3 Effects: Equivalent to:
    if (coroutine_) {
        coroutine_.destroy();
    }
4 [Note 2: Ownership of recursively yielded generators is held in awaitable objects in the coroutine frame of the yielding generator, so destroying the root generator effectively destroys the entire stack of yielded generators. — end note]

generator& operator=(generator other) noexcept;
5 Effects: Equivalent to:
    swap(coroutine_, other.coroutine_);
    swap(active_, other.active_);
6 Returns: *this.
7 [Note 3: Iterators previously obtained from other are not invalidated; they become iterators into *this. — end note]

iterator begin();
8 Preconditions: coroutine_ refers to a coroutine suspended at its initial suspend point (9.5.4).
9 Effects: Pushes coroutine_ into *active_, then evaluates coroutine_.resume().
10 Returns: An iterator object whose member coroutine_ refers to the same coroutine as does coroutine_.
11 [Note 4: A program that calls begin more than once on the same generator has undefined behavior. — end note]
default_sentinel_t end() const noexcept;

Returns: default_sentinel.

26.8.5 Class generator::promise_type

namespace std {
    template<class Ref, class V, class Allocator>
    class generator<Ref, V, Allocator>::promise_type {
        public:
            generator get_return_object() noexcept;
            suspend_always initial_suspend() const noexcept { return {}; }
            auto final_suspend() noexcept;
            suspend_always yield_value(yielded val) noexcept;
            auto yield_value(const remove_reference_t<yielded>& lval)
                requires is_rvalue_reference_v<yielded> &&
                constructible_from<remove_cvref_t<yielded>>, const remove_reference_t<yielded>&;}
            template<class R2, class V2, class Alloc2, class Unused>
                requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
                auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
            template<ranges::input_range R, class Alloc>
                requires convertible_to<ranges::range_reference_t<R>, yielded>
                auto yield_value(ranges::elements_of<R, Alloc> r) noexcept;
        void await_transform() = delete;
        void return_void() const noexcept {};
        void unhandled_exception();
        void* operator new(size_t size)
            requires same_as<Allocator, void> || default_initializable<Allocator>;
        template<class Alloc, class... Args>
            requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
            void* operator new(size_t size, allocator_arg_t, const Alloc& alloc, const Args&...);
        template<class This, class Alloc, class... Args>
            requires same_as<Allocator, void> || convertible_to<const Alloc&, Allocator>
            void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
                                const Args&...);
        void operator delete(void* pointer, size_t size) noexcept;
        private:
            add_pointer_t<yielded> value_ = nullptr;  // exposition only
            exception_ptr except_;  // exposition only
        }
    }
    generator get_return_object() noexcept;

Returns: A generator object whose member coroutine_ is coroutine_handle<promise_type>::
    from_promise(*this), and whose member active_ points to an empty stack.

auto final_suspend() noexcept;

Preconditions: A handle referring to the coroutine whose promise object is *this is at the top of
    *active_ of some generator object x. This function is called by that coroutine upon reaching its final
    suspend point (9.5.4).

Returns: An awaitable object of unspecified type (7.6.2.4) whose member functions arrange for the
calling coroutine to be suspended, pop the coroutine handle from the top of *x.active_, and resume
execution of the coroutine referred to by \( \text{x.active_.} \rightarrow \text{top()} \) if \( \text{x.active_} \) is not empty. If it is empty, control flow returns to the current coroutine caller or resumer (9.5.4).

```c++
suspend_always yield_value(yielded val) noexcept;
```

**Effects**: Equivalent to \( \text{value_} = \text{addressof(val)} \).

**Returns**: \{\}

```c++
auto yield_value(const remove_reference_t<yielded>& lval)
requires is_rvalue_reference_v<yielded> && constructible_from<remove_cvref_t<yielded>, const remove_reference_t<yielded>&>;
```

**Preconditions**: A handle referring to the coroutine whose promise object is \( \text{*this} \) is at the top of \( \text{x.active_} \) of some \text{generator} object.

**Returns**: An awaitable object of an unspecified type (7.6.2.4) that stores an object of type \( \text{remove_cvref_t<yielded>} \) direct-non-list-initialized with \( \text{lval} \), whose member functions arrange for \( \text{value_} \) to point to that stored object and then suspend the coroutine.

**Throws**: Any exception thrown by the initialization of the stored object.

**Remarks**: A \text{yield-expression} that calls this function has type \text{void} (7.6.17).

```c++
template<class R2, class V2, class Alloc2, class Unused>
requires same_as<typename generator<R2, V2, Alloc2>::yielded, yielded>
auto yield_value(ranges::elements_of<generator<R2, V2, Alloc2>&&, Unused> g) noexcept;
```

**Preconditions**: A handle referring to the coroutine whose promise object is \( \text{*this} \) is at the top of \( \text{x.active_} \) of some \text{generator} object \( \text{x} \). The coroutine referred to by \( \text{g.range.coroutine_} \) is suspended at its initial suspend point.

**Returns**: An awaitable object of an unspecified type (7.6.2.4) into which \( \text{g.range} \) is moved, whose member \text{await_ready} returns \text{false}, whose member \text{await_suspend} pushes \( \text{g.range.coroutine_} \) into \( \text{x.active_} \) and resumes execution of the coroutine referred to by \( \text{g.range.coroutine_} \), and whose member \text{await_resume} evaluates \text{rethrow_exception(except_)} if bool(except_) is true. If bool(except_) is false, the \text{await_resume} member has no effects.

**Remarks**: A \text{yield-expression} that calls this function has type \text{void} (7.6.17).

```c++
template<ranges::input_range R, class Alloc>
requires convertible_to<ranges::range_reference_t<R>, yielded>
auto yield_value(ranges::elements_of<R, Alloc> r) noexcept;
```

**Effects**: Equivalent to:

```c++
auto nested = [] (allocator_arg_t, Alloc, ranges::iterator_t<R> i, ranges::sentinel_t<R> s)
-> generator<yielded, ranges::range_value_t<R>, Alloc> {
  for (; i != s; ++i) {
    co_yield static_cast<yielded>(*i);
  }
};
return yield_value(ranges::elements_of(nested(
  allocator_arg, r.allocator, ranges::begin(r.range), ranges::end(r.range))));
```

[Note 1: A \text{yield-expression} that calls this function has type \text{void} (7.6.17). — end note]

```c++
void unhandled_exception();
```

**Preconditions**: A handle referring to the coroutine whose promise object is \( \text{*this} \) is at the top of \( \text{x.active_} \) of some \text{generator} object \( \text{x} \).

**Effects**: If the handle referring to the coroutine whose promise object is \( \text{*this} \) is the sole element of \( \text{x.active_} \), equivalent to throw, otherwise, assigns \text{current_exception()} to except_.

```c++
void* operator new(size_t size)
requires same_as<Allocator, void> || default_initializable<Allocator>;
```

**Preconditions**: A handle referring to the coroutine whose promise object is \( \text{*this} \) is at the top of \( \text{x.active_} \) of some \text{generator} object \( \text{x} \).

**Effects**: Equivalent to throw, otherwise, assigns \text{current_exception()} to except_.
template<class This, class Alloc, class... Args>
requires same_as<Alloc, void> || convertible_to<const Alloc&, Alloc>
void* operator new(size_t size, const This&, allocator_arg_t, const Alloc& alloc,
const Args&...);

Let A be
— Allocator, if it is not void,
— Alloc for the overloads with a template parameter Alloc, or
— allocator<void> otherwise.

Let B be allocator_traits<A>::template rebind_alloc<U> where U is an unspecified type whose size and alignment are both __STDCPP_DEFAULT_NEW_ALIGNMENT__.

Mandates: allocator_traits<B>::pointer is a pointer type.

Effects: Initializes an allocator b of type B with A(alloc), for the overloads with a function parameter alloc, and with A() otherwise. Uses b to allocate storage for the smallest array of U sufficient to provide storage for a coroutine state of size size, and unspecified additional state necessary to ensure that operator delete can later deallocate this memory block with an allocator equal to b.

Returns: A pointer to the allocated storage.

void operator delete(void* pointer, size_t size) noexcept;

Preconditions: pointer was returned from an invocation of one of the above overloads of operator new with a size argument equal to size.

Effects: Deallocates the storage pointed to by pointer using an allocator equivalent to that used to allocate it.

26.8.6 Class generator::iterator

namespace std {
    template<class Ref, class V, class Allocator>
    class generator<Ref, V, Allocator>::iterator {
    public:
        using value_type = value;
        using difference_type = ptrdiff_t;

        iterator(iterator&& other) noexcept;
        iterator& operator=(iterator&& other) noexcept;

        reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
        iterator& operator++();
        void operator++(int);

        friend bool operator==(const iterator& i, default_sentinel_t);
    }

    iterator(iterator&& other) noexcept;
    Effects: Initializes coroutine_ with exchange(other.coroutine_, {}). 
    iterator& operator=(iterator&& other) noexcept;
    Effects: Equivalent to coroutine_ = exchange(other.coroutine_, {}). 
    Returns: *this.

    reference operator*() const noexcept(is_nothrow_copy_constructible_v<reference>);
    Preconditions: For some generator object x, coroutine_ is in *x.active_ and x.active_->top() refers to a suspended coroutine with promise object p.
    Effects: Equivalent to: return static_cast<reference>(*p.value);
iterator& operator++();

Preconditions: For some generator object \( x \), \( \text{coroutine} \) is in \( *x.\text{active}_. \)

Effects: Equivalent to \( x.\text{active}_->\text{top}().\text{resume}() \).

Returns: \*this.

void operator++(int);

Effects: Equivalent to +++this.

friend bool operator==(const iterator& i, default_sentinel_t);

Effects: Equivalent to: return i.coroutine_.done();
27 Algorithms library

27.1 General

1 This Clause describes components that C++ programs may use to perform algorithmic operations on containers (Clause 24) and other sequences.

2 The following subclauses describe components for non-modifying sequence operations, mutating sequence operations, sorting and related operations, and algorithms from the ISO C library, as summarized in Table 94.

Table 94: Algorithms library summary

<table>

27.2 Algorithms requirements

1 All of the algorithms are separated from the particular implementations of data structures and are parameterized by iterator types. Because of this, they can work with program-defined data structures, as long as these data structures have iterator types satisfying the assumptions on the algorithms.

2 The entities defined in the std::ranges namespace in this Clause are not found by argument-dependent name lookup (6.5.4). When found by unqualified (6.5.3) name lookup for the postfix-expression in a function call (7.6.1.3), they inhibit argument-dependent name lookup.

[Example 1:

```cpp
void foo() {
    using namespace std::ranges;
    std::vector<int> vec{1, 2, 3};
    find(begin(vec), end(vec), 2); // #1
}
```

The function call expression at #1 invokes std::ranges::find, not std::find, despite that (a) the iterator type returned from begin(vec) and end(vec) may be associated with namespace std and (b) std::find is more specialized (13.7.7.3) than std::ranges::find since the former requires its first two parameters to have the same type. — end example]

3 For purposes of determining the existence of data races, algorithms shall not modify objects referenced through an iterator argument unless the specification requires such modification.

4 Throughout this Clause, where the template parameters are not constrained, the names of template parameters are used to express type requirements.

(4.1) — If an algorithm’s Effects element specifies that a value pointed to by any iterator passed as an argument is modified, then the type of that argument shall meet the requirements of a mutable iterator (25.3).

(4.2) — If an algorithm’s template parameter is named InputIterator, InputIterator1, or InputIterator2, the template argument shall meet the Cpp17InputIterator requirements (25.3.5.3).

(4.3) — If an algorithm’s template parameter is named OutputIterator, OutputIterator1, or OutputIterator2, the template argument shall meet the Cpp17OutputIterator requirements (25.3.5.4).

(4.4) — If an algorithm’s template parameter is named ForwardIterator, ForwardIterator1, ForwardIterator2, or NoThrowForwardIterator, the template argument shall meet the Cpp17ForwardIterator requirements (25.3.5.5).
requirements (25.3.5.5) if it is required to be a mutable iterator, or model forward_iterator (25.3.4.11) otherwise.

(4.5) — If an algorithm’s template parameter is named NoThrowForwardIterator, the template argument is also required to have the property that no exceptions are thrown from increment, assignment, or comparison of, or indirection through, valid iterators.

(4.6) — If an algorithm’s template parameter is named BidirectionalIterator, BidirectionalIterator1, or BidirectionalIterator2, the template argument shall meet the Cpp17BidirectionalIterator requirements (25.3.5.6) if it is required to be a mutable iterator, or model bidirectional_iterator (25.3.4.12) otherwise.

(4.7) — If an algorithm’s template parameter is named RandomAccessIterator, RandomAccessIterator1, or RandomAccessIterator2, the template argument shall meet the Cpp17RandomAccessIterator requirements (25.3.5.7) if it is required to be a mutable iterator, or model random_access_iterator (25.3.4.13) otherwise.

[Note 1: These requirements do not affect iterator arguments that are constrained, for which iterator category and mutability requirements are expressed explicitly. — end note]

Both in-place and copying versions are provided for certain algorithms. When such a version is provided for algorithm it is called algorithm_copy. Algorithms that take predicates end with the suffix _if (which follows the suffix _copy).

When not otherwise constrained, the Predicate parameter is used whenever an algorithm expects a function object (22.10) that, when applied to the result of dereferencing the corresponding iterator, returns a value testable as true. If an algorithm takes Predicate pred as its argument and first as its iterator argument with value type T, the expression pred(*first) shall be well-formed and the type decltype(pred(*first)) shall model boolean-testable (18.5.2). The function object pred shall not apply any non-constant function through its argument. Given a glvalue u of type (possibly const) T that designates the same object as *first, pred(u) shall be a valid expression that is equal to pred(*first).

When not otherwise constrained, the BinaryPredicate parameter is used whenever an algorithm expects a function object that, when applied to the result of dereferencing two corresponding iterators or to dereferencing an iterator and type T when T is part of the signature, returns a value testable as true. If an algorithm takes BinaryPredicate binary_pred as its argument and first1 and first2 as its iterator arguments with respective value types T1 and T2, the expression binary_pred(*first1, *first2) shall be well-formed and the type decltype(binary_pred(*first1, *first2)) shall model boolean-testable. Unless otherwise specified, BinaryPredicate always takes the first iterator’s value_type as its first argument, that is, in those cases when T value is part of the signature, the expression binary_pred(*first1, value) shall be well-formed and the type decltype(binary_pred(*first1, value)) shall model boolean-testable. BinaryPredicate shall not apply any non-constant function through any of its arguments. Given a glvalue u of type (possibly const) T1 that designates the same object as *first1, and a glvalue v of type (possibly const) T2 that designates the same object as *first2, binary_pred(u, *first2), binary_pred(*first1, v), and binary_pred(u, v) shall each be a valid expression that is equal to binary_pred(*first1, *first2), and binary_pred(u, value) shall be a valid expression that is equal to binary_pred(*first1, value).

The parameters UnaryOperation, BinaryOperation, BinaryOperation1, and BinaryOperation2 are used whenever an algorithm expects a function object (22.10).

[Note 2: Unless otherwise specified, algorithms that take function objects as arguments can copy those function objects freely. If object identity is important, a wrapper class that points to a non-copied implementation object such as reference_wrapper<T> (22.10.6), or some equivalent solution, can be used. — end note]

When the description of an algorithm gives an expression such as *first == value for a condition, the expression shall evaluate to either true or false in boolean contexts.

In the description of the algorithms, operator + is used for some of the iterator categories for which it does not have to be defined. In these cases the semantics of a + n are the same as those of

\[
\begin{align*}
\text{auto tmp = a;} \\
\text{for (; n < 0; ++n) --tmp;} \\
\text{for (; n > 0; --n) ++tmp;} \\
\text{return tmp;} \\
\end{align*}
\]

219) The decision whether to include a copying version was usually based on complexity considerations. When the cost of doing the operation dominates the cost of copy, the copying version is not included. For example, sort_copy is not included because the cost of sorting is much more significant, and users can invoke copy followed by sort.
Similarly, operator - is used for some combinations of iterators and sentinel types for which it does not have to be defined. If \([a, b)\) denotes a range, the semantics of \(b - a\) in these cases are the same as those of

\[
\text{iter\_difference\_t<typename(a)> n = 0;}
\]
\[
\text{for (auto tmp = a; tmp != b; ++tmp) ++n; return n;}
\]

and if \([b, a)\) denotes a range, the same as those of

\[
\text{iter\_difference\_t<typename(b)> n = 0;}
\]
\[
\text{for (auto tmp = b; tmp != a; ++tmp) --n; return n;}
\]

12 In the description of the algorithms, given an iterator \(a\) whose difference type is \(D\), and an expression \(n\) of integer-like type other than \(cv\ D\), the semantics of \(a + n\) and \(a - n\) are, respectively, those of \(a + D(n)\) and \(a - D(n)\).

13 In the description of algorithm return values, a sentinel value \(s\) denoting the end of a range \([i, s)\) is sometimes returned where an iterator is expected. In these cases, the semantics are as if the sentinel is converted into an iterator using \(\text{ranges::next(i, s)}\).

14 Overloads of algorithms that take \(range\) arguments (26.4.2) behave as if they are implemented by calling \(\text{ranges::begin}\) and \(\text{ranges::end}\) on the \(range(s)\) and dispatching to the overload in namespace \(\text{ranges}\) that takes separate iterator and sentinel arguments.

15 The well-formedness and behavior of a call to an algorithm with an explicitly-specified template argument list is unspecified, except where explicitly stated otherwise.

[Note 3: Consequently, an implementation can declare an algorithm with different template parameters than those presented. — end note]

27.3 Parallel algorithms

27.3.1 Preamble

Subclause 27.3 describes components that C++ programs may use to perform operations on containers and other sequences in parallel.

A parallel algorithm is a function template listed in this document with a template parameter named \(\text{ExecutionPolicy}\).

Parallel algorithms access objects indirectly accessible via their arguments by invoking the following functions:

- All operations of the categories of the iterators that the algorithm is instantiated with.
- Operations on those sequence elements that are required by its specification.
- User-provided function objects to be applied during the execution of the algorithm, if required by the specification.
- Operations on those function objects required by the specification.

[Note 1: See 27.2. — end note]

These functions are herein called element access functions.

[Example 1: The \(\text{sort}\) function may invoke the following element access functions:

- Operations of the random-access iterator of the actual template argument (as per 25.3.5.7), as implied by the name of the template parameter \(\text{RandomAccessIterator}\).
- The \(\text{swap}\) function on the elements of the sequence (as per the preconditions specified in 27.8.2.1).
- The user-provided \(\text{Compare}\) function object.

— end example]

A standard library function is \(\text{vectorization-unsafe}\) if it is specified to synchronize with another function invocation, or another function invocation is specified to synchronize with it, and if it is not a memory allocation or deallocation function.

[Note 2: Implementations must ensure that internal synchronization inside standard library functions does not prevent forward progress when those functions are executed by threads of execution with weakly parallel forward progress guarantees. — end note]

[Example 2:

\[
\text{int x = 0;}
\]
```cpp
std::mutex m;
void f() {
    int a[] = {1,2};
    std::for_each(std::execution::par_unseq, std::begin(a), std::end(a), [&] (int) {
        std::lock_guard<mutex> guard(m);
        // incorrect: lock_guard constructor calls m.lock()
        ++x;
    });
}
```

The above program may result in two consecutive calls to `m.lock()` on the same thread of execution (which may deadlock), because the applications of the function object are not guaranteed to run on different threads of execution.  

--- end example ---

### 27.3.2 Requirements on user-provided function objects [algorithms.parallel.user]

1 Unless otherwise specified, function objects passed into parallel algorithms as objects of type `Predicate`, `BinaryPredicate`, `Compare`, `UnaryOperation`, `BinaryOperation`, `BinaryOperation1`, and the operators used by the analogous overloads to these parallel algorithms that are formed by an invocation with the specified default predicate or operation (where applicable) shall not directly or indirectly modify objects via their arguments, nor shall they rely on the identity of the provided objects.

### 27.3.3 Effect of execution policies on algorithm execution [algorithms.parallel.exec]

1 Parallel algorithms have template parameters named `ExecutionPolicy` (22.12) which describe the manner in which the execution of these algorithms may be parallelized and the manner in which they apply the element access functions.

2 If an object is modified by an element access function, the algorithm will perform no other unsynchronized accesses to that object. The modifying element access functions are those which are specified as modifying the object.

   [Note 1: For example, `swap`, `++`, `--`, `@=`, and assignments modify the object. For the assignment and `@=` operators, only the left argument is modified. — end note]

3 Unless otherwise stated, implementations may make arbitrary copies of elements (with type `T`) from sequences where `is_trivially_copy_constructible_v<T>` and `is_trivially_destructible_v<T>` are `true`.

   [Note 2: This implies that user-supplied function objects cannot rely on object identity of arguments for such input sequences. If object identity of the arguments to these function objects is important, a wrapping iterator that returns a non-copied implementation object such as `reference_wrapper<T>` (22.10.6), or some equivalent solution, can be used. — end note]

4 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::sequenced_policy` all occur in the calling thread of execution.

   [Note 3: The invocations are not interleaved; see 6.9.1. — end note]

5 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::unsequenced_policy` are permitted to execute in an unordered fashion in the calling thread of execution, unsequenced with respect to one another in the calling thread of execution.

   [Note 4: This means that multiple function object invocations can be interleaved on a single thread of execution, which overrides the usual guarantee from 6.9.1 that function executions do not overlap with one another. — end note]

6 The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `execution::unsequenced_policy` algorithm.

   [Note 5: Because `execution::unsequenced_policy` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock. — end note]

7 The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `execution::parallel_policy` are permitted to execute either in the invoking thread of execution or in a thread of execution implicitly created by the library to support parallel algorithm execution. If the threads of execution created by the `thread` (33.4.3) or `jthread` (33.4.4) provide concurrent forward progress guarantees (6.9.2.3), then a thread of execution implicitly created by the library will provide parallel forward progress guarantees; otherwise, the provided forward progress guarantee is implementation-defined. Any such invocations executing in the same thread of execution are indeterminately sequenced with respect to each other.

   [Note 6: It is the caller’s responsibility to ensure that the invocation does not introduce data races or deadlocks. — end note]
**Example 1:**
```cpp
type a[] = {0,1};
std::vector<int> v;
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int i) {
    v.push_back(i*2+1);
    // incorrect: data race
});
```

The program above has a data race because of the unsynchronized access to the container `v`. — end example

**Example 2:**
```cpp
type a[] = {1,2};
std::atomic<int> x{0};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    x.fetch_add(1, std::memory_order::relaxed);
    // spin wait for another iteration to change the value of x
    while (x.load(std::memory_order::relaxed) == 1) { }
    // incorrect: assumes execution order
});
```

The above example depends on the order of execution of the iterations, and will not terminate if both iterations are executed sequentially on the same thread of execution. — end example

**Example 3:**
```cpp
int x = 0;
std::mutex m;
int a[] = {1,2};
std::for_each(std::execution::par, std::begin(a), std::end(a), [&](int) {
    std::lock_guard<mutex> guard(m);
    ++x;
});
```

The above example synchronizes access to object `x` ensuring that it is incremented correctly. — end example

1. The invocations of element access functions in parallel algorithms invoked with an execution policy object of type `std::execution::par` are permitted to execute in an unordered fashion in unspecified threads of execution, and unsequenced with respect to one another within each thread of execution. These threads of execution are either the invoking thread of execution or threads of execution implicitly created by the library; the latter will provide weakly parallel forward progress guarantees.

2. The behavior of a program is undefined if it invokes a vectorization-unsafe standard library function from user code called from a `std::execution::par` algorithm.

3. Because `std::execution::par` allows the execution of element access functions to be interleaved on a single thread of execution, blocking synchronization, including the use of mutexes, risks deadlock.

4. If an invocation of a parallel algorithm uses threads of execution implicitly created by the library, then the invoking thread of execution will either
   - temporarily block with forward progress guarantee delegation (6.9.2.3) on the completion of these library-managed threads of execution, or
   - eventually execute an element access function;

   the thread of execution will continue to do so until the algorithm is finished.

5. The semantics of parallel algorithms invoked with an execution policy object of implementation-defined type are implementation-defined.
27.3.4 Parallel algorithm exceptions

[algorithms.parallel.exceptions]

1. During the execution of a parallel algorithm, if temporary memory resources are required for parallelization and none are available, the algorithm throws a `bad_alloc` exception.

2. During the execution of a parallel algorithm, if the invocation of an element access function exits via an uncaught exception, the behavior is determined by the `ExecutionPolicy`.

27.3.5 ExecutionPolicy algorithm overloads

[algorithms.parallel.overloads]

1. Parallel algorithms are algorithm overloads. Each parallel algorithm overload has an additional template type parameter named `ExecutionPolicy`, which is the first template parameter. Additionally, each parallel algorithm overload has an additional function parameter of type `ExecutionPolicy&&`, which is the first function parameter.

[Note 1: Not all algorithms have parallel algorithm overloads. — end note]

2. Unless otherwise specified, the semantics of `ExecutionPolicy` algorithm overloads are identical to their overloads without.

3. Unless otherwise specified, the complexity requirements of `ExecutionPolicy` algorithm overloads are relaxed from the complexity requirements of the overloads without as follows: when the guarantee says “at most `expr`” or “exactly `expr`” and does not specify the number of assignments or swaps, and `expr` is not already expressed with $O()$ notation, the complexity of the algorithm shall be $O(expr)$.

4. Parallel algorithms shall not participate in overload resolution unless `is_execution_policy_v<remove_cvref_t<ExecutionPolicy>>` is true.

27.4 Header <algorithm> synopsis

[algorithm.syn]

```cpp
#include <initializer_list>  // see 17.10.2

Non-modifying sequence operations

27.6.1 All of

Let \( E \) be:

\[
\begin{align*}
(1.1) & \quad \text{pred}(\ast i) \quad \text{for the overloads in namespace std;}
\end{align*}
\]
\[
\begin{align*}
(1.2) & \quad \text{invoke(pred, invoke(proj, \ast i)) \quad for the overloads in namespace ranges.}
\end{align*}
\]

Returns: \text{false} if \( E \) is \text{false} for some iterator \( i \) in the range \([\text{first}, \text{last})\), and \text{true} otherwise.

Complexity: At most last - first applications of the predicate and any projection.
27.6.2 Any of

```cpp
template<class InputIterator, class Predicate>
constexpr bool any_of(InputIterator first, InputIterator last, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool any_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
            indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::any_of(I first, S last, Pred pred, Proj proj = {});
```

```cpp
template<input_range R, class Proj = identity,
            indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::any_of(R&& r, Pred pred, Proj proj = {});
```

1. Let $E$ be:
   1.1. $\text{pred}(\ast i)$ for the overloads in namespace `std`;
   1.2. $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, \ast i))$ for the overloads in namespace `ranges`.

2. **Returns**: true if $E$ is true for some iterator $i$ in the range `[first, last)`, and false otherwise.

3. **Complexity**: At most $\text{last} - \text{first}$ applications of the predicate and any projection.

27.6.3 None of

```cpp
template<class InputIterator, class Predicate>
constexpr bool none_of(InputIterator first, InputIterator last, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool none_of(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
             Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, class Proj = identity,
            indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::none_of(I first, S last, Pred pred, Proj proj = {});
```

```cpp
template<input_range R, class Proj = identity,
            indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::none_of(R&& r, Pred pred, Proj proj = {});
```

1. Let $E$ be:
   1.1. $\text{pred}(\ast i)$ for the overloads in namespace `std`;
   1.2. $\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, \ast i))$ for the overloads in namespace `ranges`.

2. **Returns**: false if $E$ is true for some iterator $i$ in the range `[first, last)`, and true otherwise.

3. **Complexity**: At most last - first applications of the predicate and any projection.

27.6.4 Contains

```cpp
template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>;
constexpr bool ranges::contains(I first, S last, const T& value, Proj proj = {});
```

```cpp
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>;
constexpr bool ranges::contains(R&& r, const T& value, Proj proj = {});
```

1. **Returns**: `ranges::find(std::move(first), last, value, proj) != last`.

```cpp
template<forward_iterator I1, sentinel_for<I1> S1,
         forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>;
constexpr bool ranges::contains_subrange(I1 first1, S1 last1, I2 first2, S2 last2,
                                        Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>;
constexpr bool ranges::contains_subrange(R1&& r1, R2&& r2, Pred pred = {}),
```

§ 27.6.4
27.6.5 For each

template<class InputIterator, class Function>
constexpr Function for_each(InputIterator first, InputIterator last, Function f);

Preconditions: Function meets the Cpp17MoveConstructible requirements (Table 32).

[Note 1: Function need not meet the requirements of Cpp17CopyConstructible (Table 33). — end note]

Effects: Applies f to the result of dereferencing every iterator in the range [first, last), starting from first and proceeding to last - 1.

[Note 2: If the type of first meets the requirements of a mutable iterator, f can apply non-constant functions through the dereferenced iterator. — end note]

Returns: f.

Complexity: Applies f exactly last - first times.

Remarks: If f returns a result, the result is ignored.

§ 27.6.5 1310
Effects: Applies \( f \) to the result of dereferencing every iterator in the range \([\text{first}, \text{first} + n)\) in order.

[Note 8: If the type of \( \text{first} \) meets the requirements of a movable iterator, \( f \) can apply non-constant functions through the dereferenced iterator. — end note]

Returns: \( \text{first} + n \).

Remarks: If \( f \) returns a result, the result is ignored.

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Size, class Function>
ForwardIterator for_each_n(ExecutionPolicy&& exec, ForwardIterator first, Size n, Function f);
```

Mandates: The type \( \text{Size} \) is convertible to an integral type (7.3.9, 11.4.8).

Preconditions: \( n \geq 0 \) is true. Function meets the Cpp17CopyConstructible requirements.

Effects: Applies \( f \) to the result of dereferencing every iterator in the range \([\text{first}, \text{first} + n)\).

[Note 9: If the type of \( \text{first} \) meets the requirements of a movable iterator, \( f \) can apply non-constant functions through the dereferenced iterator. — end note]

Returns: \( \text{first} + n \).

Remarks: If \( f \) returns a result, the result is ignored. Implementations do not have the freedom granted under 27.3.3 to make arbitrary copies of elements from the input sequence.

```cpp
template<input_iterator I, class Proj = identity, indirectly_unary_invocable<projected<I, Proj>> Fun>
constexpr ranges::for_each_n_result<I, Fun>
ranges::for_each_n(I first, iter_difference_t<I> n, Fun f, Proj proj = {});
```

Preconditions: \( n \geq 0 \) is true.

Effects: Calls \( \text{invoke}(f, \text{invoke}(proj, *i)) \) for every iterator \( i \) in the range \([\text{first}, \text{first} + n)\) in order.

[Note 10: If the result of \( \text{invoke}(proj, *i) \) is a mutable reference, \( f \) can apply non-constant functions. — end note]

Returns: \{\text{first} + n, std::move(f)\}.

Remarks: If \( f \) returns a result, the result is ignored.

[Note 11: The overload in namespace ranges requires \( \text{Fun} \) to model copy_constructible. — end note]

### 27.6.6 Find

```cpp
template<class InputIterator, class T>
constexpr InputIterator find(InputIterator first, InputIterator last, const T& value);

template<class ExecutionPolicy, class InputIterator, class T>
InputIterator find(ExecutionPolicy&& exec, InputIterator first, InputIterator last, const T& value);

template<class InputIterator, class Predicate>
constexpr InputIterator find_if(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class InputIterator, class Predicate>
InputIterator find_if(ExecutionPolicy&& exec, InputIterator first, InputIterator last, Predicate pred);

template<class InputIterator, class Predicate>
constexpr InputIterator find_if_not(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class InputIterator, class Predicate>
InputIterator find_if_not(ExecutionPolicy&& exec, InputIterator first, InputIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_invocable<ranges::equal_to, projected<I, Proj>, const T*>
constexpr I ranges::find(I first, S last, const T& value, Proj proj = {});
```
template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>constexpr borrowed_iterator_t<R>
ranges::find(R&& r, const T& value, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>constexpr I ranges::find_if(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity, indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>constexpr borrowed_iterator_t<R>
ranges::find_if(R&& r, Pred pred, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>constexpr subrange<I> ranges::find_last(I first, S last, const T& value, Proj proj = {});

template<input_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>constexpr borrowed_subrange_t<R>ranges::find_last(R&& r, const T& value, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>constexpr subrange<I> ranges::find_last_if(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity, indirect_unary Predicate<projected<iterator_t<R>, Proj>> Pred>constexpr borrowed_subrange_t<R>ranges::find_last_if(R&& r, Pred pred, Proj proj = {});

Let E be:

(1.1) *i == value for find;
(1.2) pred(*i) == false for find_if;
(1.3) pred(*i) == false for find_if_not;
(1.4) bool:invoke(proj, *i) == value for ranges::find;
(1.5) bool:invoke(pred, invoke(proj, *i)) for ranges::find_if;
(1.6) bool(!invoke(pred, invoke(proj, *i))) for ranges::find_if_not.

Returns: Let i be the last iterator in the range [first, last) for which E is true. Returns {i, last}, or {last, last} if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate and any projection.

27.6.7 Find last

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>constexpr subrange<I> ranges::find_last(I first, S last, const T& value, Proj proj = {});

template<forward_range R, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T*>constexpr borrowed_subrange_t<R>ranges::find_last(R&& r, const T& value, Proj proj = {});

template<forward_iterator I, sentinel_for<I> S, class Proj = identity, indirect_unary Predicate<projected<iterator_t<R>, Proj>> Pred>constexpr subrange<I> ranges::find_last_if(I first, S last, Pred pred, Proj proj = {});

template<forward_range R, class Proj = identity, indirect_unary Predicate<projected<iterator_t<R>, Proj>> Pred>constexpr borrowed_subrange_t<R>ranges::find_last_if(R&& r, Pred pred, Proj proj = {});

Let E be:

(1.1) bool:invoke(proj, *i) == value for ranges::find_last;
(1.2) bool:invoke(pred, invoke(proj, *i)) for ranges::find_last_if;
(1.3) bool(!invoke(pred, invoke(proj, *i))) for ranges::find_last_if_not.

Returns: Let i be the last iterator in the range [first, last) for which E is true. Returns {i, last}, or {last, last} if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate and projection.
27.6.8 Find end

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);
```

```cpp
template<class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
constexpr ForwardIterator1
find_end(ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
         class BinaryPredicate>
ForwardIterator1
find_end(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        BinaryPredicate pred);
```

```cpp
template<forward_iterator I1, sentinel_for<I1> S1,
         forward_iterator I2, sentinel_for<I2> S2,
         class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::find_end(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
                 Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<forward_range R1, forward_range R2,
         class Pred = ranges::equal_to, class Proj1 = identity,
         class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::find_end(R1&& r1, R2&& r2, Pred pred = {},
                 Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let:

1. **pred** be `equal_to{}` for the overloads with no parameter `pred`;
2. **E** be:
   1. **(1.1)** `pred(*(*(i + n) + first2 + n))` for the overloads in namespace `std`;
   2. **(1.2)** `invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n)))` for the overloads in namespace `ranges`;
   3. **(1.3)** `i` be `last1` if `(first2, last2)` is empty, or if `(last2 - first2) > (last1 - first1)` is true, or if there is no iterator in the range `[first1, last1 - (last2 - first2)]` such that for every non-negative integer `n < (last2 - first2)`, `E` is true. Otherwise `i` is the last such iterator in `[first1, last1 - (last2 - first2))`.

Returns:

1. **(2.1)** `i` for the overloads in namespace `std`.
2. **(2.2)** `{i, i + (i == last1 ? 0 : last2 - first2)}` for the overloads in namespace `ranges`.

Complexity: At most `(last2 - first2) * (last1 - first1 - (last2 - first2) + 1)` applications of the corresponding predicate and any projections.

27.6.9 Find first

```cpp
template<class InputIterator, class ForwardIterator>
constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
              InputIterator first2, InputIterator last2);
```
Let E be:

- \(i == j\) for the overloads with no parameter `pred`;
- \(\text{pred}(i, j) != \text{false}\) for the overloads with a parameter `pred` and no parameter `proj1`;
- \(\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj1}, i), \text{invoke}(\text{proj2}, j)))\) for the overloads with parameters `pred` and `proj1`.

### Effects: Finds an element that matches one of a set of values.

### Returns: The first iterator \(i\) in the range \([\text{first1}, \text{last1})\) such that for some iterator \(j\) in the range \([\text{first2}, \text{last2})\) \(E\) holds. Returns `last1` if \([\text{first2}, \text{last2})\) is empty or if no such iterator is found.

### Complexity: At most \((\text{last1}-\text{first1}) \times (\text{last2}-\text{first2})\) applications of the corresponding predicate and any projections.

#### 27.6.10 Adjacent find

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
adjacent_find(ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
adjacent_find(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last);
```

```cpp
template<class InputIterator, class ForwardIterator, class BinaryPredicate>
constexpr InputIterator
find_first_of(InputIterator first1, InputIterator last1,
ForwardIterator first2, ForwardIterator last2,
BinaryPredicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
ForwardIterator1
find_first_of(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
BinaryPredicate pred);
```

```cpp
template<class InputIterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2,
class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr I1 ranges::find_first_of(I1 first1, S1 last1, I2 first2, S2 last2,
Pred pred = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<input_range R1, forward_range R2,
class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_iterator_t<R1>
ranges::find_first_of(R1&& r1, R2&& r2,
Pred pred = {},
Proj1 proj1 = {}, Proj2 proj2 = {});
```
Let $E$ be:

1. $i == *(i + 1)$ for the overloads with no parameter $\text{pred}$;
2. $\text{pred}(i, *(i + 1)) != \text{false}$ for the overloads with a parameter $\text{pred}$ and no parameter $\text{proj}$;
3. $\text{bool}(\text{invoke}(\text{pred}, \text{invoke}(\text{proj}, i), \text{invoke}(\text{proj}, *(i + 1))))$ for the overloads with both parameters $\text{pred}$ and $\text{proj}$.

1. **Returns**: The first iterator $i$ such that both $i$ and $i + 1$ are in the range $[\text{first}, \text{last})$ for which $E$ holds. Returns $\text{last}$ if no such iterator is found.
2. **Complexity**: For the overloads with no $\text{ExecutionPolicy}$, exactly

$$\min((i - \text{first}) + 1, (\text{last} - \text{first}) - 1)$$

applications of the corresponding predicate, where $i$ is $\text{adjacent\_find}$'s return value. For the overloads with an $\text{ExecutionPolicy}$, $O(\text{last} - \text{first})$ applications of the corresponding predicate, and no more than twice as many applications of any projection.

### 27.6.11 Count

```
27.6.11 1315
```
template<input_range R, class Proj = identity,
instyle Unary_Predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr range_difference_t<R>
ranges::count_if(R&& r, Pred pred, Proj proj = {});

Let \( E \) be:

(1.1) \( *i == \text{value} \) for the overloads with no parameter \( \text{pred} \) or \( \text{proj} \);

(1.2) \( \text{pred}(*i) \neq \text{false} \) for the overloads with a parameter \( \text{pred} \) but no parameter \( \text{proj} \);

(1.3) \( \text{invoke} \text{proj}(\text{proj}, *i) == \text{value} \) for the overloads with a parameter \( \text{proj} \) but no parameter \( \text{pred} \);

(1.4) \( \text{bool}(\text{invoke} \text{proj}, \text{invoke} \text{proj}(\text{proj}, *i))) \) for the overloads with both parameters \( \text{proj} \) and \( \text{pred} \).

Effects: Returns the number of iterators \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

Complexity: Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

### 27.6.12 Mismatch

```cpp
template<class InputIterator1, class InputIterator2, class BinaryPredicate>
constexpr pair<InputIterator1, InputIterator2>
mismatch(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, BinaryPredicate pred);
```

§ 27.6.12 1316
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, 
    class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
    requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
    constexpr ranges::mismatch_result<I1, I2>
    ranges::mismatch(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {},
    Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, 
    class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
    requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
    constexpr ranges::mismatch_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::mismatch(R1&& r1, R2&& r2, Pred pred = {},
    Proj1 proj1 = {}, Proj2 proj2 = {});

Let last2 be first2 + (last1 - first1)
for the overloads with no parameter last2 or r2.

Let E be:
(2.1) !(*(first1 + n) == *(first2 + n)) for the overloads with no parameter pred;
(2.2) pred(*(first1 + n), *(first2 + n)) == false for the overloads with a parameter pred and
no parameter proj1;
(2.3) !invoke(pred, invoke(proj1, *(first1 + n)), invoke(proj2, *(first2 + n))) for the
overloads with both parameters pred and proj1.

Let N be min(last1 - first1, last2 - first2).

Returns: \{ first1 + n, first2 + n \}, where n is the smallest integer in \[0, N\) such that E holds,
or N if no such integer exists.

Complexity: At most N applications of the corresponding predicate and any projections.

27.6.13 Equal [alg.equal]

template<class InputIterator1, class InputIterator2>
    constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
    bool equal(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2);

template<class InputIterator1, class InputIterator2, 
    class BinaryPredicate>
    constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
    class BinaryPredicate>
    bool equal(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, BinaryPredicate pred);

template<class InputIterator1, class InputIterator2, 
    class BinaryPredicate>
    constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
    bool equal(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, 
    class BinaryPredicate>
    constexpr bool equal(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2, InputIterator2 last2, BinaryPredicate pred);}
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,  
class BinaryPredicate>
bool equal(ExecutionPolicy&& exec,  
    ForwardIterator1 first1, ForwardIterator1 last1,  
    ForwardIterator2 first2, ForwardIterator2 last2,  
    BinaryPredicate pred);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,  
class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>  
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>  
constexpr bool ranges::equal(I1 first1, S1 last1, I2 first2, S2 last2,  
    Pred pred = {},  
    Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to,  
class Proj1 = identity, class Proj2 = identity>  
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>  
constexpr bool ranges::equal(R1&& r1, R2&& r2, Pred pred = {},  
    Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let:

— (1.1) last2 be first2 + (last1 - first1) for the overloads with no parameter last2 or r2;
— (1.2) pred be equal_to{} for the overloads with no parameter pred;
— (1.3) E be:
  — (1.3.1) pred(*i, *(first2 + (i - first1))) for the overloads with no parameter proj1;
  — (1.3.2) invoke(pred, invoke(proj1, *i), invoke(proj2, *(first2 + (i - first1)))) for the overloads with parameter proj1.

Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if E holds for every iterator i in the range [first1,last1). Otherwise, returns false.

Complexity: If
— (3.1) the types of first1, last1, first2, and last2 meet the Cpp17RandomAccessIterator requirements (25.3.5.7) and last1 - first1 != last2 - first2 for the overloads in namespace std;
— (3.2) the types of first1, last1, first2, and last2 pairwise model sized_sentinel_for (25.3.4.8) and last1 - first1 != last2 - first2 for the first overload in namespace ranges,
— (3.3) R1 and R2 each model sized_range and ranges::distance(r1) != ranges::distance(r2) for the second overload in namespace ranges,

then no applications of the corresponding predicate and each projection; otherwise,
— (3.4) For the overloads with no ExecutionPolicy, at most min(last1 - first1, last2 - first2) applications of the corresponding predicate and any projections.
— (3.5) For the overloads with an ExecutionPolicy, $\Theta$(min(last1 - first1, last2 - first2)) applications of the corresponding predicate.

27.6.14 Is permutation

[alg.is.permutation]
Let last2 be first2 + (last1 - first1) for the overloads with no parameter named last2, and let pred be equal_to{} for the overloads with no parameter pred.

**Mandates:** ForwardIterator1 and ForwardIterator2 have the same value type.

**Preconditions:** The comparison function is an equivalence relation.

**Returns:** If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin, pred) returns true; otherwise, returns false.

**Complexity:** No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2, pred) would return true; otherwise, at worst \( \Theta(N^2) \), where \( N \) has the value last1 - first1.

Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), bounded by [pfirst, plast), such that ranges::equal(first1, last1, pfirst, plast, pred, proj1, proj2) returns true; otherwise, returns false.

**Complexity:** No applications of the corresponding predicate and projections if:

- for the first overload,
  - S1 and I1 model sized_sentinel_for<S1, I1>,
  - S2 and I2 model sized_sentinel_for<S2, I2>, and
- last1 - first1 != last2 - first2;

- for the second overload, R1 and R2 each model sized_range, and ranges::distance(r1) != ranges::distance(r2).

Otherwise, exactly last1 - first1 applications of the corresponding predicate and projections if ranges::equal(first1, last1, first2, last2, pred, proj1, proj2) would return true; otherwise, at worst \( \Theta(N^2) \), where \( N \) has the value last1 - first1.

### 27.6.15 Search

Returns: If last1 - first1 != last2 - first2, return false. Otherwise return true if there exists a permutation of the elements in the range [first2, last2), beginning with ForwardIterator2 begin, such that equal(first1, last1, begin, pred) returns true; otherwise, returns false.

**Complexity:** No applications of the corresponding predicate if ForwardIterator1 and ForwardIterator2 meet the requirements of random access iterators and last1 - first1 != last2 - first2. Otherwise, exactly last1 - first1 applications of the corresponding predicate if equal(first1, last1, first2, last2, pred) would return true; otherwise, at worst \( \Theta(N^2) \), where \( N \) has the value last1 - first1.
template<class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
constexpr ForwardIterator1
search(ForwardIterator1 first1, ForwardIterator1 last1,
     ForwardIterator2 first2, ForwardIterator2 last2,
     BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryPredicate>
ForwardIterator1
search(ExecutionPolicy&& exec,
      ForwardIterator1 first1, ForwardIterator1 last1,
      ForwardIterator2 first2, ForwardIterator2 last2,
      BinaryPredicate pred);

1 Returns: The first iterator i in the range [first1, last1 - (last2-first2)) such that for every non-negative integer n less than last2 - first2 the following corresponding conditions hold: *(i + n) == *(first2 + n), pred(*(i + n), *(first2 + n)) != false. Returns first1 if [first2, last2) is empty, otherwise returns last1 if no such iterator is found.

2 Complexity: At most (last1 - first1) * (last2 - first2) applications of the corresponding predicate.

template<forward_iterator I1, sentinel_for<I1> S1, forward_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr subrange<I1>
ranges::search(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<forward_range R1, forward_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr borrowed_subrange_t<R1>
ranges::search(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

3 Returns:
(3.1) {i, i + (last2 - first2)}, where i is the first iterator in the range [first1, last1 - (last2 - first2)) such that for every non-negative integer n less than last2 - first2 the condition
bool(invoke(pred, invoke(proj1, *(i + n)), invoke(proj2, *(first2 + n))))

is true.
(3.2) Returns {last1, last1} if no such iterator exists.

4 Complexity: At most (last1 - first1) * (last2 - first2) applications of the corresponding predicate and projections.

template<class ForwardIterator, class Size, class T>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
         Size count, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator
search_n(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last,
         Size count, const T& value);

template<class ForwardIterator, class Size, class T, class BinaryPredicate>
constexpr ForwardIterator
search_n(ForwardIterator first, ForwardIterator last,
         Size count, const T& value, BinaryPredicate pred);
template<class ExecutionPolicy, class ForwardIterator, class Size, class T, class BinaryPredicate>
ForwardIterator
search_n(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Size count, const T& value, BinaryPredicate pred);

Mandates: The type Size is convertible to an integral type (7.3.9, 11.4.8).

Returns: The first iterator \( i \) in the range \([first, last - count)\) such that for every non-negative integer \( n \) less than \( count \) the following corresponding conditions hold: \( *(i + n) == value, \) pred\((*(i + n), value) != false \). Returns last if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate.

template<forward_iterator I, sentinel_for<I> S, class T, class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<I, const T*, Pred, Proj>
constexpr subrange<I>
ranges::search_n(I first, S last, iter_difference_t<I> count, const T& value, Pred pred = {}, Proj proj = {});

template<forward_range R, class T, class Pred = ranges::equal_to, class Proj = identity>
requires indirectly_comparable<iterator_t<R>, const T*, Pred, Proj>
constexpr borrowed_subrange_t<R>
ranges::search_n(R&& r, range_difference_t<R> count, const T& value, Pred pred = {}, Proj proj = {});

Returns: \( \{i, i + count\} \) where \( i \) is the first iterator in the range \([first, last - count)\) such that for every non-negative integer \( n \) less than \( count \), the following condition holds: invoke\(\) pred, invoke\(\) proj, \( *(i + n)\), value\). Returns \( \{last, last\} \) if no such iterator is found.

Complexity: At most last - first applications of the corresponding predicate and projection.

template<class ForwardIterator, class Searcher>
constexpr ForwardIterator
search(ForwardIterator first, ForwardIterator last, const Searcher& searcher);

Effects: Equivalent to: return searcher(first, last).first;

Remarks: Searcher need not meet the Cpp17CopyConstructible requirements.

27.6.16 Starts with

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::starts_with(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Returns:
ranges::mismatch(std::move(first1), last1, std::move(first2), last2, pred, proj1, proj2).in2 == last2

27.6.17 Ends with

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires (forward_iterator<I1> || sized_sentinel_for<S1, I1>) &&
(forward_iterator<I2> || sized_sentinel_for<S2, I2>) &&
indirectly_comparable<I1, I2, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(I1 first1, S1 last1, I2 first2, S2 last2, Pred pred = {}),

§ 27.6.17 1321
Let $N_1$ be $last_1 - first_1$ and $N_2$ be $last_2 - first_2$.

Returns: false if $N_1 < N_2$, otherwise

```cpp
ranges::equal(std::move(first1) + (N1 - N2), last1, std::move(first2), last2, pred, proj1, proj2)
```

template<input_range R1, input_range R2, class Pred = ranges::equal_to, class Proj1 = identity, class Proj2 = identity>
requires (forward_range<R1> || sized_range<R1>) && (forward_range<R2> || sized_range<R2>) && indirectly_comparable<iterator_t<R1>, iterator_t<R2>, Pred, Proj1, Proj2>
constexpr bool ranges::ends_with(R1&& r1, R2&& r2, Pred pred = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let $N_1$ be $ranges::distance(r1)$ and $N_2$ be $ranges::distance(r2)$.

Returns: false if $N_1 < N_2$, otherwise

```cpp
ranges::equal(ranges::drop_view(ranges::ref_view(r1), N1 - N2), r2, pred, proj1, proj2)
```

27.6.18 Fold

```cpp
template<input_iterator I, sentinel_for<I> S, class T, indirectly-binary-left-foldable<T, I> F>
constexpr auto ranges::fold_left(I first, S last, T init, F f);
template<input_range R, class T, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
constexpr auto ranges::fold_left(R&& r, T init, F f);
```

1 Returns:

```cpp
ranges::fold_left_with_iter(std::move(first), last, std::move(init), f).value
```

```cpp
template<input_iterator I, sentinel_for<I> S, indirectly-binary-left-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr auto ranges::fold_left_first(I first, S last, F f);
template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr auto ranges::fold_left_first(R&& r, F f);
```

2 Returns:

```cpp
ranges::fold_left_first_with_iter(std::move(first), last, f).value
```

```cpp
template<bidirectional_iterator I, sentinel_for<I> S, class T, indirectly-binary-right-foldable<T, I> F>
constexpr auto ranges::fold_right(I first, S last, T init, F f);
template<bidirectional_range R, indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr auto ranges::fold_right_last(R&& r, T init, F f);
```

3 Effects: Equivalent to:

```cpp
using U = decay_t<invoke_result_t<F&, iter_reference_t<I>, T>>;
if (first == last)
    return U(std::move(init));
I tail = ranges::next(first, last);
U accum = invoke(f, *--tail, std::move(init));
while (first != tail)
    accum = invoke(f, *--tail, std::move(accum));
return accum;
```

```cpp
template<bidirectional_iterator I, sentinel_for<I> S, indirectly-binary-right-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr auto ranges::fold_right_last(I first, S last, F f);
template<bidirectional_range R, indirectly-binary-right-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
```
constexpr auto ranges::fold_right_last(R&& r, F f);

Let \( U \) be \( \text{decltype(ranges::fold_right(first, last, iter_value_t<I>(*first), f))} \).

**Effects:** Equivalent to:

```c++
if (first == last)
    return optional<U>();
I tail = ranges::prev(ranges::next(first, std::move(last)));
return optional<U>(in_place,
    ranges::fold_right(std::move(first), tail, iter_value_t<I>(*tail), std::move(f)));
```

template<input_iterator I, sentinel_for<I> S, class T, indirectly-binary-left-foldable<T, I> F>
constexpr see below ranges::fold_left_with_iter(I first, S last, T init, F f);

template<input_range R, class T, indirectly-binary-left-foldable<T, iterator_t<R>> F>
constexpr see below ranges::fold_left_with_iter(R&& r, T init, F f);

Let \( U \) be \( \text{decay_t<invoke_result_t<F&, T, iter_reference_t<I>>>} \).

**Effects:** Equivalent to:

```c++
if (first == last)
    return {std::move(first), U(std::move(init))};
U accum = invoke(f, std::move(init), *first);
for (++first; first != last; ++first)
    accum = invoke(f, std::move(accum), *first);
return {std::move(first), std::move(accum)};
```

**Remarks:** The return type is \( \text{fold_left_with_iter_result<I, U>} \) for the first overload and \( \text{fold_left_with_iter_result<borrowed_iterator_t<R>, U>} \) for the second overload.

template<input_iterator I, sentinel_for<I> S, indirectly-binary-left-foldable<iter_value_t<I>, I> F>
requires constructible_from<iter_value_t<I>, iter_reference_t<I>>
constexpr see below ranges::fold_left_first_with_iter(I first, S last, F f);

template<input_range R, indirectly-binary-left-foldable<range_value_t<R>, iterator_t<R>> F>
requires constructible_from<range_value_t<R>, range_reference_t<R>>
constexpr see below ranges::fold_left_first_with_iter(R&& r, F f);

Let \( U \) be \( \text{decltype(ranges::fold_left(std::move(first), last, iter_value_t<I>(*first), f))} \)

**Effects:** Equivalent to:

```c++
if (first == last)
    return {std::move(first), optional<U>()};
optional<U> init(in_place, *first);
for (++first; first != last; ++first)
    *init = invoke(f, std::move(*init), *first);
return {std::move(first), std::move(init)};
```

**Remarks:** The return type is \( \text{fold_left_first_with_iter_result<I, optional<U>} \) for the first overload and \( \text{fold_left_first_with_iter_result<borrowed_iterator_t<R>, optional<U>} \) for the second overload.

### 27.7 Mutating sequence operations [alg.modifying.operations]

#### 27.7.1 Copy [alg.copy]

```c++
template<class InputIterator, class OutputIterator>
constexpr OutputIterator copy(InputIterator first, InputIterator last, OutputIterator result);
```

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_result<I, O> ranges::copy(I first, S last, O result);
template<input_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>
constexpr ranges::copy_result<borrowed_iterator_t<R>, O> ranges::copy(R&& r, O result);

Let \( N = \text{last} - \text{first} \).

**Preconditions:** result is not in the range \([\text{first}, \text{last})\).

**Effects:** Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result}, \text{result} + N)\) starting from \(\text{first}\) and proceeding to \(\text{last}\). For each non-negative integer \( n < N \), performs \(*\text{(result + n)} = *(\text{first} + n)\).

**Returns:**
- \(\text{result} + N\) for the overload in namespace std.
- \{last, result + N\} for the overloads in namespace ranges.

**Complexity:** Exactly \( N \) assignments.

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2 copy(ExecutionPolicy&& policy,
        ForwardIterator1 first, ForwardIterator1 last,
        ForwardIterator2 result);
```

**Preconditions:** The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) do not overlap.

**Effects:** Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result}, \text{result} + (\text{last} - \text{first}))\). For each non-negative integer \( n < (\text{last} - \text{first}) \), performs \(*\text{(result + n)} = *(\text{first} + n)\).

**Returns:** \(\text{result} + (\text{last} - \text{first})\).

**Complexity:** Exactly \(\text{last} - \text{first}\) assignments.

```cpp
template<class InputIterator, class Size, class OutputIterator>
constexpr OutputIterator copy_n(InputIterator first, Size n,
        OutputIterator result);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class Size, class ForwardIterator2>
ForwardIterator2 copy_n(ExecutionPolicy&& exec,
        ForwardIterator1 first, Size n,
        ForwardIterator2 result);
```

```cpp
template<input_iterator I, weakly_incrementable O>
requires indirectly_copyable<I, O>
constexpr ranges::copy_n_result<I, O>
ranges::copy_n(I first, iter_difference_t<I> n, O result);
```

Let \( N = \max(0, n) \).

**Mandates:** The type \( \text{Size} \) is convertible to an integral type (7.3.9, 11.4.8).

**Effects:** For each non-negative integer \( i < N \), performs \(*\text{(result + i)} = *(\text{first} + i)\).

**Returns:**
- \(\text{result} + N\) for the overloads in namespace std.
- \{first + N, result + N\} for the overload in namespace ranges.

**Complexity:** Exactly \( N \) assignments.

```cpp
template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator copy_if(InputIterator first, InputIterator last,
        OutputIterator result, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
    class Predicate>
ForwardIterator2 copy_if(ExecutionPolicy&& exec,
        ForwardIterator1 first, ForwardIterator1 last,
        ForwardIterator2 result, Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity,
    indirect_unary_predicate<projected<I, Proj>> Pred>
requires indirectly_copyable<I, O>
```
Let \( E \) be:

- \( (15.1) \) \( \text{bool(pred(*i))} \) for the overloads in namespace `std`;
- \( (15.2) \) \( \text{bool(invoke(pred, invoke(proj, *i)))} \) for the overloads in namespace `ranges`,

and \( N \) be the number of iterators \( i \) in the range \([\text{first}, \text{last})\) for which the condition \( E \) holds.

**Preconditions:** The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + (\text{last} - \text{first}))\) do not overlap.

**[Note 1:** For the overload with an `ExecutionPolicy`, there might be a performance cost if `iterator_traits<ForwardIterator>::value_type` is not `Cpp17MoveConstructible` (Table 32). **end note**]

**Effects:** Copies all of the elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) is true.

**Returns:**
- \( (18.1) \) \( \text{result} + N \) for the overloads in namespace `std`.
- \( (18.2) \) \( \{\text{last}, \text{result} + N\} \) for the overloads in namespace `ranges`.

**Complexity:** Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

**Remarks:** Stable \([16.4.6.8]\).

Let \( N = \text{last} - \text{first} \).

**Preconditions:** \( \text{result} \) is not in the range \([\text{first}, \text{last}]\).

**Effects:** Copies elements in the range \([\text{first}, \text{last})\) into the range \([\text{result} - N, \text{result})\) starting from \( \text{last} - 1 \) and proceeding to \( \text{first} \).

For each positive integer \( n \leq N \), performs \( *(\text{result} - n) = *(\text{last} - n) \).

**Returns:**
- \( (24.1) \) \( \text{result} - N \) for the overload in namespace `std`.
- \( (24.2) \) \( \{\text{last}, \text{result} - N\} \) for the overloads in namespace `ranges`.

**Complexity:** Exactly \( N \) assignments.

### 27.7.2 Move

**[alg.move]**

**template<class InputIterator, class OutputIterator>**

```cpp
constexpr OutputIterator move(InputIterator first, InputIterator last, OutputIterator result);
```

\( \text{copy_backward} \) can be used instead of \( \text{copy} \) when \( \text{last} \) is in the range \([\text{result} - N, \text{result})\).
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O>
requires indirectly_movable<I, O>
constexpr ranges::move_result<I, O>
ranges::move(I first, S last, O result);

template<input_range R, weakly_incrementable O>
requires indirectly_movable<iterator_t<R>, O>
constexpr ranges::move_result<borrowed_iterator_t<R>, O>
ranges::move(R&& r, O result);

Let $E$ be

1. $\text{std::move}(*(\text{first} + n))$ for the overload in namespace std;
2. $\text{ranges::iter_move}((\text{first} + n))$ for the overloads in namespace ranges.

Let $N$ be $\text{last} - \text{first}$.

- **Preconditions:** $\text{result}$ is not in the range $[\text{first}, \text{last}]$.
- **Effects:** Moves elements in the range $[\text{first}, \text{last})$ into the range $[\text{result}, \text{result} + N]$ starting from $\text{first}$ and proceeding to $\text{last}$. For each non-negative integer $n < N$, performs $*(\text{result} + n) = E$.
- **Returns:**
  - $\text{result} + N$ for the overload in namespace std.
  - $\{\text{last}, \text{result} + N\}$ for the overloads in namespace ranges.
- **Complexity:** Exactly $N$ assignments.

Let $N$ be $\text{last} - \text{first}$.

- **Preconditions:** The ranges $[\text{first}, \text{last})$ and $[\text{result}, \text{result} + N)$ do not overlap.
- **Effects:** Moves elements in the range $[\text{first}, \text{last})$ into the range $[\text{result}, \text{result} + N)$. For each non-negative integer $n < N$, performs $*(\text{result} + n) = \text{std::move}(*(\text{first} + n))$.
- **Returns:** $\text{result} + N$.
- **Complexity:** Exactly $N$ assignments.

Let $E$ be

1. $\text{std::move}(*(\text{last} - n))$ for the overload in namespace std;
2. $\text{ranges::iter_move}((\text{last} - n))$ for the overloads in namespace ranges.

Let $N$ be $\text{last} - \text{first}$.

- **Preconditions:** $\text{result}$ is not in the range $[\text{first}, \text{last}]$.
- **Effects:** Moves elements in the range $[\text{first}, \text{last})$ into the range $[\text{result} - N, \text{result})$ starting from $\text{last} - 1$ and proceeding to $\text{first}$.
- **Returns:**
  - $\text{result} + N$ for the overload in namespace std.
  - $\{\text{last}, \text{result} + N\}$ for the overloads in namespace ranges.
- **Complexity:** Exactly $N$ assignments.

221) move_backward can be used instead of move when last is in the range $[\text{result} - N, \text{result})$. 

§ 27.7.2
14

Returns:

— result - N for the overload in namespace std.
— {last, result - N} for the overloads in namespace ranges.

Complexity: Exactly N assignments.

27.7.3 Swap [alg.swap]

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr ForwardIterator2
swap_ranges(ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
ForwardIterator2
swap_ranges(ExecutionPolicy&& exec,
            ForwardIterator1 first1, ForwardIterator1 last1,
            ForwardIterator2 first2);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2>
requires indirectly_swappable<I1, I2>
constexpr ranges::swap_ranges_result<I1, I2>
ranges::swap_ranges(I1 first1, S1 last1, I2 first2, S2 last2);
```

1 Let:
(1.1) last2 be first2 + (last1 - first1) for the overloads with no parameter named last2;
(1.2) M be min(last1 - first1, last2 - first2).

2 Preconditions: The two ranges [first1, last1) and [first2, last2) do not overlap. For the overloads in namespace std, *(first1 + n) is swappable with (16.4.4.3) *(first2 + n).

3 Effects: For each non-negative integer n < M performs:
(3.1) swap(*first1 + n), *(first2 + n)) for the overloads in namespace std;
(3.2) ranges::iter_swap(first1 + n, first2 + n) for the overloads in namespace ranges.

4 Returns:
(4.1) last2 for the overloads in namespace std.
(4.2) {first1 + M, first2 + M} for the overloads in namespace ranges.

Complexity: Exactly M swaps.

```cpp
template<class ForwardIterator1, class ForwardIterator2>
constexpr void iter_swap(ForwardIterator1 a, ForwardIterator2 b);
```

6 Preconditions: a and b are dereferenceable. *a is swappable with (16.4.4.3) *b.

7 Effects: As if by swap(*a, *b).

27.7.4 Transform [alg.transform]

```cpp
template<class InputIterator, class OutputIterator, 
class UnaryOperation>
constexpr OutputIterator
transform(InputIterator first1, InputIterator last1, 
          OutputIterator result, UnaryOperation op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, 
class UnaryOperation>
ForwardIterator2
transform(ExecutionPolicy&& exec,
          ForwardIterator1 first1, ForwardIterator1 last1, 
          ForwardIterator2 result, UnaryOperation op);
```
Let:

1. \( \text{last2} \) be \( \text{first2} + (\text{last1} - \text{first1}) \) for the overloads with parameter \( \text{first2} \) but no parameter \( \text{last2} \);
2. \( N \) be \( \text{last1} - \text{first1} \) for unary transforms, or \( \min(\text{last1} - \text{first1}, \text{last2} - \text{first2}) \) for binary transforms;
3. \( E \) be
   1. \( \text{op}(\text{first1} + (i - \text{result})) \) for unary transforms defined in namespace std;
   2. \( \text{binary_op}(\text{first1} + (i - \text{result}), \text{first2} + (i - \text{result})) \) for binary transforms defined in namespace std;
   3. \( \text{invoke} \) \( \text{op} \), \( \text{invoke} \) \( \text{proj} \), \( \text{op}(\text{first1} + (i - \text{result})) \) for unary transforms defined in namespace ranges;
   4. \( \text{invoke} \) \( \text{binary_op} \), \( \text{invoke} \) \( \text{proj} \), \( \text{binary_op}(\text{first1} + (i - \text{result}), \text{first2} + (i - \text{result})) \) for binary transforms defined in namespace ranges.

2. **Preconditions:** \( \text{op} \) and \( \text{binary_op} \) do not invalidate iterators or subranges, nor modify elements in the ranges
   1. \([\text{first1}, \text{first1} + N] \),
   2. \([\text{first2}, \text{first2} + N] \), and
(2.3) \[ \text{result, result + N}. \] \[ \text{result, result + N}. \]

Effects: Assigns through every iterator \( i \) in the range \( \text{result, result + N} \) a new corresponding value equal to \( E \).

Returns:

(4.1) \( \text{result + N} \) for the overloads defined in namespace std.

(4.2) \( \{\text{first1 + N, result + N}\} \) for unary transforms defined in namespace ranges.

(4.3) \( \{\text{first1 + N, first2 + N, result + N}\} \) for binary transforms defined in namespace ranges.

Complexity: Exactly \( N \) applications of \( \text{op} \) or \( \text{binary\_op} \), and any projections. This requirement also applies to the overload with an ExecutionPolicy.

Remarks: \text{result} may be equal to \text{first1} or \text{first2}.

27.7.5 Replace

\[ \text{alg.replace} \]

\begin{verbatim}
template<class ForwardIterator, class T>
constexpr void replace(ForwardIterator first, ForwardIterator last,  
                        const T& old_value, const T& new_value);

template<class ExecutionPolicy, class ForwardIterator, class T>
void replace(ExecutionPolicy&& exec,  
             ForwardIterator first, ForwardIterator last,  
             const T& old_value, const T& new_value);

template<class ForwardIterator, class Predicate, class T>
constexpr void replace_if(ForwardIterator first, ForwardIterator last,  
                          Predicate pred, const T& new_value);

template<class ExecutionPolicy, class ForwardIterator, class Predicate, class T>
void replace_if(ExecutionPolicy&& exec,  
                ForwardIterator first, ForwardIterator last,  
                Predicate pred, const T& new_value);

template<input_iterator I, sentinel_for<I> S, class T1, class T2, class Proj = identity>  
    requires indirectly_writable<I, const T2&> &&  
    indirect_binary_predicate<int, projected<I, Proj>, const T1*>  
    constexpr I ranges::replace(I first, S last, const T1& old_value, const T2& new_value, Proj proj = {});

template<input_range R, class T1, class T2, class Proj = identity>  
    requires indirectly_writable<iterator_t<R>, const T2&> &&  
    indirect_binary_predicate<int, projected<iterator_t<R>, Proj>, const T1*>  
    constexpr borrowed_iterator_t<R> ranges::replace(R&& r, const T1& old_value, const T2& new_value, Proj proj = {});

template<input_iterator I, sentinel_for<I> S, class T, class Proj = identity,  
          indirect_unary_predicate<int, projected<I, Proj>> Pred>  
    requires indirectly_writable<I, const T2&>  
    constexpr I ranges::replace_if(I first, S last, Pred pred, const T2& new_value, Proj proj = {});

template<input_range R, class T, class Proj = identity,  
          indirect_unary_predicate<int, projected<iterator_t<R>, Proj>> Pred>  
    requires indirectly_writable<iterator_t<R>, const T2&>  
    constexpr borrowed_iterator_t<R> ranges::replace_if(R&& r, Pred pred, const T2& new_value, Proj proj = {});

\end{verbatim}

Let \( E \) be

\begin{align*}
(1.1) & \quad \text{bool(*i == old_value) for replace;}
(1.2) & \quad \text{bool(pred(*i)) for replace_if;}
(1.3) & \quad \text{bool(invoke(proj, *i) == old_value) for ranges::replace;}
(1.4) & \quad \text{bool(invoke(pred, invoke(proj, *i))) for ranges::replace_if.}
\end{align*}

\footnote{The use of fully closed ranges is intentional.}
Mandates: new_value is writable (25.3.1) to first.

Effects: Substitutes elements referred by the iterator i in the range [first, last) with new_value, when E is true.

Returns: last for the overloads in namespace ranges.

Complexity: Exactly last - first applications of the corresponding predicate and any projection.

Let E be

(6.1) \[ \text{bool}(*\text{(first} + (i - \text{result})) == \text{old_value}) \text{ for replace_copy;} \]

(6.2) \[ \text{bool}(\text{pred}(\text{*\text{(first} + (i - \text{result}))})) \text{ for replace_copy_if;} \]
bool(invoke(proj, *(first + (i - result))) == old_value) for ranges::replace_copy;

bool(invoke(pred, invoke(proj, *(first + (i - result)))) for ranges::replace_copy_if.

Mandates: The results of the expressions *first and new_value are writable (25.3.1) to result.

Preconditions: The ranges [first,last) and [result, result + (last - first)) do not overlap.

Effects: Assigns through every iterator i in the range [result, result + (last - first)) a new corresponding value

result + (last - first) for the overloads in namespace std.

Complexity: Exactly last - first applications of the corresponding predicate and any projection.

27.7.6 Fill

template<class ForwardIterator, class T>
constexpr void fill(ForwardIterator first, ForwardIterator last, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class T>
void fill(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, const T& value);

template<class OutputIterator, class Size, class T>
constexpr OutputIterator fill_n(OutputIterator first, Size n, const T& value);

template<class ExecutionPolicy, class ForwardIterator, class Size, class T>
ForwardIterator fill_n(ExecutionPolicy&& exec,
ForwardIterator first, Size n, const T& value);

Let N be max(0, n) for the fill_n algorithms, and last - first for the fill algorithms.

Mandates: The expression value is writable (25.3.1) to the output iterator. The type Size is convertible to an integral type (7.3.9, 11.4.8).

Effects: Assigns value through all the iterators in the range [first, first + N).

Returns: first + N.

Complexity: Exactly N assignments.

27.7.7 Generate

template<class ForwardIterator, class Generator>
constexpr void generate(ForwardIterator first, ForwardIterator last, Generator gen);

template<class ExecutionPolicy, class ForwardIterator, class Generator>
void generate(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator last, Generator gen);

template<class OutputIterator, class Size, class Generator>
constexpr OutputIterator generate_n(OutputIterator first, Size n, Generator gen);

template<class ExecutionPolicy, class ForwardIterator, class Size, class Generator>
ForwardIterator generate_n(ExecutionPolicy&& exec,
ForwardIterator first, Size n, Generator gen);
template<input_or_output_iterator O, sentinel_for<O> S, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate(O first, S last, F gen);

template<class R, copy_constructible F>
requires invocable<F&> && output_range<R, invoke_result_t<F&>>
constexpr borrowed_iterator_t<R> ranges::generate(R&& r, F gen);

template<input_or_output_iterator O, copy_constructible F>
requires invocable<F&> && indirectly_writable<O, invoke_result_t<F&>>
constexpr O ranges::generate_n(O first, iter_difference_t<O> n, F gen);

Let \( N \) be \( \max(0, n) \) for the \( \text{generate}_n \) algorithms, and \( \text{last} - \text{first} \) for the \( \text{generate} \) algorithms.

**Mandates:** Size is convertible to an integral type (7.3.9, 11.4.8).

**Effects:** Assigns the result of successive evaluations of \( \text{gen}() \) through each iterator in the range \([\text{first}, \text{first} + N)\).

**Returns:** \( \text{first} + N \).

**Complexity:** Exactly \( N \) evaluations of \( \text{gen}() \) and assignments.

### 27.7.8 Remove

[alg.remove]

\[
\text{template<class ForwardIterator, class T>}
\text{constexpr ForwardIterator remove(ForwardIterator first, ForwardIterator last, const T& value);}\
\text{template<class ExecutionPolicy, class ForwardIterator, class T>}
\text{ForwardIterator remove(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, const T& value);}\
\text{template<class ForwardIterator, class Predicate>}
\text{constexpr ForwardIterator remove_if(ForwardIterator first, ForwardIterator last, Predicate pred);}\
\text{template<class ExecutionPolicy, class ForwardIterator, class Predicate>}
\text{ForwardIterator remove_if(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, Predicate pred);}\
\text{template<permutable I, sentinel_for<I> S, class T, class Proj = identity>
requires indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T>*>
constexpr subrange<I> ranges::remove(I first, S last, const T& value, Proj proj = {});}\
\text{template<forward_range R, class T, class Proj = identity>
requires permutable<iterator_t<R>> &&
indirect_binary_predicate<ranges::equal_to, projected<iterator_t<R>, Proj>, const T>*>
constexpr borrowed_subrange_t<R> ranges::remove(R&& r, const T& value, Proj proj = {});}\
\text{template<permutable I, sentinel_for<I> S, class T, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I> ranges::remove_if(I first, S last, Pred pred, Proj proj = {});}\
\text{template<forward_range R, class T, class Proj = identity,
indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::remove_if(R&& r, Pred pred, Proj proj = {});}\
\]

Let \( E \) be

(1.1) \( \text{bool(*i == value)} \) for remove;
(1.2) \( \text{bool(pred(*i))} \) for remove_if;
(1.3) \( \text{bool(invoke(proj, *i) == value)} \) for ranges::remove;
(1.4) \( \text{bool(invoke(pred, invoke(proj, *i)))} \) for ranges::remove_if.

**Preconditions:** For the algorithms in namespace std, the type of \(*\text{first}\) meets the \text{Cpp17MoveAssignable} requirements (Table 34).
**Effects:** Eliminates all the elements referred to by iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

**Returns:** Let \( j \) be the end of the resulting range. Returns:

- \( j \) for the overloads in namespace `std`.
- \( \{j, \text{last}\} \) for the overloads in namespace `ranges`.

**Complexity:** Exactly \( \text{last} - \text{first} \) applications of the corresponding predicate and any projection.

**Remarks:** Stable (16.4.6.8).

[Note 1: Each element in the range \([\text{ret}, \text{last})\), where \( \text{ret} \) is the returned value, has a valid but unspecified state, because the algorithms can eliminate elements by moving from elements that were originally in that range. — end note]

```cpp
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
remove_copy(InputIterator first, InputIterator last,
OutputIterator result, const T& value);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class T>
ForwardIterator2
remove_copy(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, const T& value);
```

```cpp
template<class InputIterator, class OutputIterator, class Predicate>
constexpr OutputIterator
remove_copy_if(InputIterator first, InputIterator last,
OutputIterator result, Predicate pred);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class Predicate>
ForwardIterator2
remove_copy_if(ExecutionPolicy&& exec,
ForwardIterator1 first, ForwardIterator1 last,
ForwardIterator2 result, Predicate pred);
```

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class T,
class Proj = identity>
requires indirectly_copyable<I, O> &&
indirect_binary_predicate<ranges::equal_to, projected<I, Proj>, const T*>
constexpr ranges::remove_copy_result<I, O>
ranges::remove_copy(I first, S last, O result, const T& value, Proj proj = {});
```

```cpp
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Proj = identity>
requires indirectly_copyable<I, O> &&
indirect_unary_predicate<projected<I, Proj>, Pred>
constexpr ranges::remove_copy_if_result<I, O>
ranges::remove_copy_if(I first, S last, O result, Pred pred, Proj proj = {});
```

Let \( E \) be

- \( \text{bool}(i == \text{value}) \) for `remove_copy`;
- \( \text{bool}(	ext{pred}(i)) \) for `remove_copy_if`;
- \( \text{bool}(	ext{invoke(proj, } i \text{)} == \text{value}) \) for `ranges::remove_copy`;
- \( \text{bool}(	ext{invoke(pred, invoke(proj, } i \text{)))) \) for `ranges::remove_copy_if`.

§ 27.7.8 1333
Let $N$ be the number of elements in $[\text{first}, \text{last})$ for which $E$ is false.

**Mandates:** $\text{first}$ is writable (25.3.1) to result.

**Preconditions:** The ranges $[\text{first}, \text{last})$ and $[\text{result.result + (last - first)}]$ do not overlap.

[Note 2: For the overloads with an ExecutionPolicy, there might be a performance cost if $\text{iterator_traits<ForwardIterator>::value_type}$ does not meet the Cpp17MoveConstructible (Table 32) requirements. —end note]

**Effects:** Copies all the elements referred to by the iterator $i$ in the range $[\text{first}, \text{last})$ for which $E$ is false.

**Returns:**

- $\text{result + N}$, for the algorithms in namespace std.
- $\{\text{last, result + N}\}$, for the algorithms in namespace ranges.

**Complexity:** Exactly $\text{last - first}$ applications of the corresponding predicate and any projection.

**Remarks:** Stable (16.4.6.8).

### 27.7.9 Unique

```cpp
// [alg.unique]

template<class ForwardIterator>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator unique(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class BinaryPredicate>
constexpr ForwardIterator unique(ForwardIterator first, ForwardIterator last, BinaryPredicate pred);

template<class ExecutionPolicy, class ForwardIterator, class BinaryPredicate>
ForwardIterator unique(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, BinaryPredicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity, indirect_equivalence_relation<projected<I, Proj>> C = ranges::equal_to>
constexpr subrange<I> ranges::unique(I first, S last, C comp = {}, Proj proj = {});

template<forward_range R, class Proj = identity, indirect_equivalence_relation<projected<iterator_t<R>, Proj>> C = ranges::equal_to>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::unique(R&& r, C comp = {}, Proj proj = {});
```

1. Let $\text{pred}$ be $\text{equal_to{}}$ for the overloads with no parameter $\text{pred}$, and let $E$ be

   - $\text{bool(\text{pred}(\star(i - 1), \star i))}$ for the overloads in namespace std;
   - $\text{bool(invoke(comp, invoke(proj, \star(i - 1)), invoke(proj, \star i)))}$ for the overloads in namespace ranges.

2. **Preconditions:** For the overloads in namespace std, $\text{pred}$ is an equivalence relation and the type of $\text{first}$ meets the Cpp17MoveAssignable requirements (Table 34).

3. **Effects:** For a nonempty range, eliminates all but the first element from every consecutive group of equivalent elements referred to by the iterator $i$ in the range $[\text{first + 1, last})$ for which $E$ is true.

4. **Returns:** Let $j$ be the end of the resulting range. Returns:

   - $j$ for the overloads in namespace std.
   - $\{j, \text{last}\}$ for the overloads in namespace ranges.

5. **Complexity:** For nonempty ranges, exactly $(\text{last - first}) - 1$ applications of the corresponding predicate and no more than twice as many applications of any projection.
Let \( \text{pred} \) be \( \text{equal}\_\text{to} \) for the overloads in namespace \( \text{std} \) with no parameter \( \text{pred} \), and let \( E \) be:

(6.1) \[ \text{bool}(\text{pred}(\ast i, \ast(i - 1))) \]

(6.2) \[ \text{bool}(<\text{comp}, \text{invoke}(<\text{proj}, \ast i), \text{invoke}(<\text{proj}, \ast(i - 1)))) \]

**Mandates:** \( \ast \text{first} \) is writable (25.3.1) to \( \text{result} \).

**Preconditions:**

(8.1) The ranges \([\text{first}, \text{last})\) and \([\text{result}.\text{result} + (\text{last} - \text{first}))\) do not overlap.

(8.2) For the overloads in namespace \( \text{std} \):

(8.2.1) The comparison function is an equivalence relation.

(8.2.2) For the overloads with no \( \text{ExecutionPolicy} \), let \( T \) be the value type of \( \text{InputIterator} \). If \( \text{InputIterator} \) models \( \text{forward}\_\text{iterator} \) (25.3.4.11), then there are no additional requirements for \( T \). Otherwise, if \( \text{OutputIterator} \) meets the \( \text{Cpp17ForwardIterator} \) requirements and its value type is the same as \( T \), then \( T \) meets the \( \text{Cpp17CopyAssignable} \) (Table 35) requirements. Otherwise, \( T \) meets both the \( \text{Cpp17CopyConstructible} \) (Table 33) and \( \text{Cpp17CopyAssignable} \) requirements.

[Note 1: For the overloads with an \( \text{ExecutionPolicy} \), there might be a performance cost if the value type of \( \text{ForwardIterator} \) does not meet both the \( \text{Cpp17CopyConstructible} \) and \( \text{Cpp17CopyAssignable} \) requirements. — end note]

**Effects:** Copies only the first element from every consecutive group of equal elements referred to by the iterator \( i \) in the range \([\text{first}, \text{last})\) for which \( E \) holds.

**Returns:**

(10.1) \( \text{result} + N \) for the overloads in namespace \( \text{std} \).
— \{(last, result + N)\} for the overloads in namespace \texttt{ranges}.

\textit{Complexity}: Exactly last - first - 1 applications of the corresponding predicate and no more than twice as many applications of any projection.

### 27.7.10 Reverse

\[\text{reverse}(\text{first}, \text{last})\]

\texttt{template<class BidirectionalIterator>}
\begin{verbatim}
constexpr void reverse(BidirectionalIterator first, BidirectionalIterator last);
\end{verbatim}

\texttt{template<class ExecutionPolicy, class BidirectionalIterator>}
\begin{verbatim}
void reverse(ExecutionPolicy&& exec, BidirectionalIterator first, BidirectionalIterator last);
\end{verbatim}

\texttt{template<bidirectional_iterator I, sentinel_for<I> S>}
\begin{verbatim}
constexpr I ranges::reverse(I first, S last);
\end{verbatim}

\texttt{template<bidirectional_range R>}
\begin{verbatim}
constexpr borrowed_iterator_t<R> ranges::reverse(R&& r);
\end{verbatim}

\textbf{Preconditions}: For the overloads in namespace \texttt{std}, \texttt{BidirectionalIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.4.4.3).

\textbf{Effects}: For each non-negative integer \(i < (\text{last} - \text{first}) / 2\), applies \texttt{std::iter_swap}, or \texttt{ranges::iter_swap} for the overloads in namespace \texttt{ranges}, to all pairs of iterators \(\text{first} + i\), \((\text{last} - i) - 1\).

\textbf{Returns}: last for the overloads in namespace \texttt{ranges}.

\textbf{Complexity}: Exactly \((\text{last} - \text{first})/2\) swaps.

\texttt{template<class BidirectionalIterator, class OutputIterator>}
\begin{verbatim}
constexpr OutputIterator reverse_copy(BidirectionalIterator first, BidirectionalIterator last, OutputIterator result);
\end{verbatim}

\texttt{template<class ExecutionPolicy, class BidirectionalIterator, class ForwardIterator>}
\begin{verbatim}
ForwardIterator reverse_copy(ExecutionPolicy&& exec, BidirectionalIterator first, BidirectionalIterator last, ForwardIterator result);
\end{verbatim}

\texttt{template<bidirectional_iterator I, sentinel_for<I> S, weakly_incrementable O>}
\begin{verbatim}
requires indirectly_copyable<I, O>

constexpr ranges::reverse_copy_result<I, O> ranges::reverse_copy(I first, S last, O result);
\end{verbatim}

\texttt{template<bidirectional_range R, weakly_incrementable O>}
\begin{verbatim}
requires indirectly_copyable<iterator_t<R>, O>

constexpr ranges::reverse_copy_result<borrowed_iterator_t<R>, O> ranges::reverse_copy(R&& r, O result);
\end{verbatim}

\textbf{Let} \(N = \text{last} - \text{first}\).

\textbf{Preconditions}: The ranges \([\text{first}, \text{last})\) and \([\text{result}, \text{result} + N)\) do not overlap.

\textbf{Effects}: Copies the range \([\text{first}, \text{last})\) to the range \([\text{result}, \text{result} + N)\) such that for every non-negative integer \(i < N\) the following assignment takes place: \(*(\text{result} + N - 1 - i) = *(\text{first} + i)\).

\textbf{Returns}:

\textbf{(8.1)} \(\text{result} + N\) for the overloads in namespace \texttt{std}.

\textbf{(8.2)} \(\{(last, result + N)\}\) for the overloads in namespace \texttt{ranges}.

\textbf{Complexity}: Exactly \(N\) assignments.

### 27.7.11 Rotate

\[\text{rotate}(\text{first}, \text{last})\]

\texttt{template<class ForwardIterator>}
\begin{verbatim}
constexpr ForwardIterator
\end{verbatim}

\section*{§ 27.7.11}

1336
rotate(ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
rotate(ExecutionPolicy&& exec,
ForwardIterator first, ForwardIterator middle, ForwardIterator last);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::rotate(I first, I middle, S last);

1 Preconditions: [first, middle) and [middle, last) are valid ranges. For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable requirements (16.4.1.3), and the type of *first meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

2 Effects: For each non-negative integer \( i < (last - first) \), places the element from the position \( first + i \) into position \( first + (i + (last - middle)) \% (last - first) \).

[Note 1: This is a left rotate. — end note]

Returns:
(3.1) — first + (last - middle) for the overloads in namespace std.
(3.2) — {first + (last - middle), last} for the overload in namespace ranges.

Complexity: At most \( last - first \) swaps.

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::rotate(R&& r, iterator_t<R> middle);

5 Effects: Equivalent to: return ranges::rotate(ranges::begin(r), middle, ranges::end(r));

template<class ForwardIterator, class OutputIterator>
constexpr OutputIterator
rotate_copy(ForwardIterator first, ForwardIterator middle, ForwardIterator last,
OutputIterator result);

6 Let \( N \) be \( last - first \).

7 Preconditions: [first, middle) and [middle, last) are valid ranges. The ranges [first, last) and [result, result + N) do not overlap.

8 Effects: Copies the range [first, last) to the range [result, result + N) such that for each non-negative integer \( i < N \) the following assignment takes place: \( *(result + i) = *(first + (i + (middle - first)) \% N) \).

9 Returns:
(9.1) — result + N for the overloads in namespace std.
(9.2) — {last, result + N} for the overload in namespace ranges.

Complexity: Exactly \( N \) assignments.

template<forward_range R, weakly_incrementable O>
requires indirectly_copyable<iterator_t<R>, O>>
constexpr ranges::rotate_copy_result<borrowed_iterator_t<R>, O> ranges::rotate_copy(R&& r, iterator_t<R> middle, O result);

11 Effects: Equivalent to:
return ranges::rotate_copy(ranges::begin(r), middle, ranges::end(r), std::move(result));
27.7.12 Sample [alg.random.sample]

```
template<class PopulationIterator, class SampleIterator,  
   class Distance, class UniformRandomBitGenerator>  
SampleIterator sample(PopulationIterator first, PopulationIterator last,  
   SampleIterator out, Distance n,  
   UniformRandomBitGenerator&& g);
```

```
template<input_iterator I, sentinel_for<I> S, weakly_incrementable O, class Gen>  
requires (forward_iterator<I> || random_access_iterator<O>) &&  
indirectly_copyable<I, O> &&  
uniform_random_bit_generator<remove_reference_t<Gen>>  
O ranges::sample(I first, S last, O out, iter_difference_t<I> n, Gen&& g);
```

```
template<input_range R, weakly_incrementable O, class Gen>  
requires (forward_range<R> || random_access_iterator<O>) &&  
indirectly_copyable<iterator_t<R>, O> &&  
uniform_random_bit_generator<remove_reference_t<Gen>>  
O ranges::sample(R&& r, O out, range_difference_t<R> n, Gen&& g);
```

1 *Mandates:* For the overload in namespace `std`, `Distance` is an integer type and `*first` is writable (25.3.1) to `out`.

2 *Preconditions:* `out` is not in the range `[first, last)`. For the overload in namespace `std`:

   1. `PopulationIterator` meets the `Cpp17InputIterator` requirements (25.3.5.3).
   2. `SampleIterator` meets the `Cpp17OutputIterator` requirements (25.3.5.4).
   3. `SampleIterator` meets the `Cpp17RandomAccessIterator` requirements (25.3.5.7) unless `PopulationIterator` models `forward_iterator` (25.3.4.11).
   4. `uniform_random_bit_generator<remove_reference_t<Gen>>` meets the requirements of a uniform random bit generator type (28.5.3.3).

3 *Effects:* Copies `min(last - first, n)` elements (the `sample`) from `[first, last)` (the `population`) to `out` such that each possible sample has equal probability of appearance.

   [Note 1: Algorithms that obtain such effects include selection sampling and reservoir sampling. — end note]

4 *Returns:* The end of the resulting sample range.

5 *Complexity:* $\Theta(last - first)$.

6 *Remarks:*

   1. For the overload in namespace `std`, stable if and only if `PopulationIterator` models `forward_iterator`. For the first overload in namespace `ranges`, stable if and only if `I` models `forward_iterator`.

   2. To the extent that the implementation of this function makes use of random numbers, the object `g` serves as the implementation’s source of randomness.

27.7.13 Shuffle [alg.random.shuffle]

```
template<class RandomAccessIterator, class UniformRandomBitGenerator>  
void shuffle(RandomAccessIterator first,  
   RandomAccessIterator last,  
   UniformRandomBitGenerator&& g);
```

```
template<random_access_iterator I, sentinel_for<I> S, class Gen>  
requires permutable<I> &&  
uniform_random_bit_generator<remove_reference_t<Gen>>  
I ranges::shuffle(I first, S last, Gen&& g);
```

```
template<random_access_range R, class Gen>  
requires permutable<iterator_t<R>> &&  
uniform_random_bit_generator<remove_reference_t<Gen>>  
borrowed_iterator_t<R> ranges::shuffle(R&& r, Gen&& g);
```

1 *Preconditions:* For the overload in namespace `std`:

   1. `RandomAccessIterator` meets the `Cpp17ValueSwappable` requirements (16.4.4.3).
The type `remove_reference_t<UniformRandomBitGenerator>` meets the uniform random bit generator (28.5.3.3) requirements.

**Effects:** Permutates the elements in the range `[first, last)` such that each possible permutation of those elements has equal probability of appearance.

**Returns:** `last` for the overloads in namespace `ranges`.

**Complexity:** Exactly `(last - first) - 1` swaps.

**Remarks:** To the extent that the implementation of this function makes use of random numbers, the object referenced by `g` shall serve as the implementation’s source of randomness.

### 27.7.14 Shift

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
shift_left(ForwardIterator first, ForwardIterator last,
          typename iterator_traits<ForwardIterator>::difference_type n);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_left(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
          typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_left(I first, S last, iter_difference_t<I> n);

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_left(R&& r, range_difference_t<R> n)
```

**Preconditions:** `n >= 0` is true. For the overloads in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements.

**Effects:** If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + n + i` into position `first + i` for each non-negative integer `i < (last - first) - n`. For the overloads without an `ExecutionPolicy` template parameter, does so in order starting from `i = 0` and proceeding to `i = (last - first) - n - 1`.

**Returns:** Let `NEW_LAST` be `first + (last - first - n)` if `n < last - first`, otherwise `first`.

1. `NEW_LAST` for the overloads in namespace `std`.
2. `{first, NEW_LAST}` for the overloads in namespace `ranges`.

**Complexity:** At most `(last - first) - n` assignments.

```cpp
template<class ForwardIterator>
constexpr ForwardIterator
shift_right(ForwardIterator first, ForwardIterator last,
            typename iterator_traits<ForwardIterator>::difference_type n);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator
shift_right(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last,
            typename iterator_traits<ForwardIterator>::difference_type n);

template<permutable I, sentinel_for<I> S>
constexpr subrange<I> ranges::shift_right(I first, S last, iter_difference_t<I> n);

template<forward_range R>
requires permutable<iterator_t<R>>
constexpr borrowed_subrange_t<R> ranges::shift_right(R&& r, range_difference_t<R> n)
```

**Preconditions:** `n >= 0` is true. For the overloads in namespace `std`, the type of `*first` meets the `Cpp17MoveAssignable` requirements, and `ForwardIterator` meets the `Cpp17BidirectionalIterator` requirements (25.3.5.6) or the `Cpp17ValueSwappable` requirements.

**Effects:** If `n == 0` or `n >= last - first`, does nothing. Otherwise, moves the element from position `first + i` into position `first + n + i` for each non-negative integer `i < (last - first) - n`. Does so in order starting from `i = (last - first) - n - 1` and proceeding to `i = 0` if:
© ISO/IEC N4928

(6.1) for the overload in namespace std without an ExecutionPolicy template parameter, Forward-Iterator meets the Cpp17BidirectionalIterator requirements.

(6.2) for the overloads in namespace ranges, I models bidirectional_iterator.

7 Returns: Let NEW_FIRST be first + n if n < last - first, otherwise last.

(7.1) for the overloads in namespace std.

(7.2) {NEW_FIRST, last} for the overloads in namespace ranges.

Complexity: At most (last - first) - n assignments or swaps.

27.8 Sorting and related operations [alg.sorting]

27.8.1 General [alg.sorting.general]

1 The operations in 27.8 defined directly in namespace std have two versions: one that takes a function object of type Compare and one that uses an operator<.

2 Compare is a function object type (22.10) that meets the requirements for a template parameter named BinaryPredicate (27.2). The return value of the function call operation applied to an object of type Compare, when converted to bool, yields true if the first argument of the call is less than the second, and false otherwise. Compare comp is used throughout for algorithms assuming an ordering relation.

3 For all algorithms that take Compare, there is a version that uses operator< instead. That is, comp(*i, *j) != false defaults to *i < *j != false. For algorithms other than those described in 27.8.4, comp shall induce a strict weak ordering on the values.

4 The term strict refers to the requirement of an irreflexive relation (!comp(x, x) for all x), and the term weak to requirements that are not as strong as those for a total ordering, but stronger than those for a partial ordering. If we define equiv(a, b) as !comp(a, b) && !comp(b, a), then the requirements are that comp and equiv both be transitive relations:

(4.1) — comp(a, b) && comp(b, c) implies comp(a, c)
(4.2) — equiv(a, b) && equiv(b, c) implies equiv(a, c)

[Note 1: Under these conditions, it can be shown that

(4.3) — equiv is an equivalence relation,
(4.4) — comp induces a well-defined relation on the equivalence classes determined by equiv, and
(4.5) — the induced relation is a strict total ordering.

—end note]

5 A sequence is sorted with respect to a comp and proj for a comparator and projection comp and proj if for every iterator i pointing to the sequence and every non-negative integer n such that i + n is a valid iterator pointing to an element of the sequence,

bool(invoke(comp, invoke(proj, *(i + n)), invoke(proj, *i)))

is false.

6 A sequence is sorted with respect to a comparator comp for a comparator comp if it is sorted with respect to comp and identity{} (the identity projection).

7 A sequence [start, finish] is partitioned with respect to an expression f(e) if there exists an integer n such that for all 0 <= i < (finish - start), f(*{start + i}) is true if and only if i < n.

8 In the descriptions of the functions that deal with ordering relationships we frequently use a notion of equivalence to describe concepts such as stability. The equivalence to which we refer is not necessarily an operator==, but an equivalence relation induced by the strict weak ordering. That is, two elements a and b are considered equivalent if and only if !(a < b) && !(b < a).

27.8.2 Sorting [alg.sort]

27.8.2.1 sort [sort]

template<class RandomAccessIterator>
constexpr void sort(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void sort(ExecutionPolicy&& exec,
RandomAccessIterator first, RandomAccessIterator last);
### 27.8.2.2 stable_sort

**template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>**

- constexpr void stable_sort(I first, S last, Comp comp = {}, Proj proj = {});

**template<random_access_range R, class Comp = ranges::less, class Proj = identity>**

- constexpr borrowed_iterator_t<R> stable_sort(R&& r, Comp comp = {}, Proj proj = {});

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

**Preconditions:** For the overloads in namespace `std`, `RandomAccessIterator` meets the `Cpp17Value-Swappable` requirements ([16.4.4.3](#16.4.4.3)) and the type of `*first` meets the `Cpp17MoveConstructible` ([Table 32](#32)) and `Cpp17MoveAssignable` ([Table 34](#34)) requirements.

**Effects:** Sorts the elements in the range `[first, last)` with respect to `comp` and `proj`.

**Returns:** last for the overloads in namespace `ranges`.

**Complexity:** Let `N` be `last - first`. $\mathcal{O}(N \log N)$ comparisons and projections.

---

**§ 27.8.2.2 1341**
Remarks: Stable (16.4.6.8).

27.8.2.3 partial_sort

```cpp
template<class RandomAccessIterator>
constexpr void partial_sort(RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator>
void partial_sort(ExecutionPolicy&& exec,
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void partial_sort(RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);
```

```cpp
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void partial_sort(ExecutionPolicy&& exec,
    RandomAccessIterator first,
    RandomAccessIterator middle,
    RandomAccessIterator last,
    Compare comp);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
    ranges::partial_sort(I first, I middle, S last, Comp comp = {}, Proj proj = {});
```

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

2 Preconditions: [first, middle) and [middle, last) are valid ranges. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

3 Effects: Places the first middle - first elements from the range [first, last) as sorted with respect to comp and proj into the range [first, middle). The rest of the elements in the range [middle, last) are placed in an unspecified order.

4 Returns: last for the overload in namespace ranges.

5 Complexity: Approximately (last - first) * log(middle - first) comparisons, and twice as many projections.

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::partial_sort(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

6 Effects: Equivalent to:

```cpp
    return ranges::partial_sort(ranges::begin(r), middle, ranges::end(r), comp, proj);
```

§ 27.8.2.4 partial_sort_copy

```cpp
template<class InputIterator, class RandomAccessIterator>
constexpr RandomAccessIterator
    partial_sort_copy(InputIterator first, InputIterator last,
        RandomAccessIterator result_first,
        RandomAccessIterator result_last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator>
    RandomAccessIterator
    partial_sort_copy(ExecutionPolicy&& exec,
        ForwardIterator first, ForwardIterator last,
        RandomAccessIterator result_first,
```
template<class InputIterator, class RandomAccessIterator, 
class Compare>
    constexpr RandomAccessIterator partial_sort_copy(InputIterator first, InputIterator last, 
    RandomAccessIterator result_first, 
    RandomAccessIterator result_last, 
    Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class RandomAccessIterator, 
class Compare>
    RandomAccessIterator partial_sort_copy(ExecutionPolicy&& exec, 
    ForwardIterator first, ForwardIterator last, 
    RandomAccessIterator result_first, 
    RandomAccessIterator result_last, 
    Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, random_access_iterator I2, sentinel_for<I2> S2, 
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
    requires indirectly_copyable<I1, I2> && sortable<I2, Comp, Proj2> && 
    indirect_strict_weak_order<Comp, projected<I1, Proj1>, projected<I2, Proj2>>
    constexpr ranges::partial_sort_copy_result<I1, I2>
    ranges::partial_sort_copy(I1 first, S1 last, I2 result_first, S2 result_last, 
    Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, random_access_range R2, class Comp = ranges::less, 
class Proj1 = identity, class Proj2 = identity>
    requires indirectly_copyable<iterator_t<R1>, iterator_t<R2>> && 
    sortable<iterator_t<R2>, Comp, Proj2> && 
    indirect_strict_weak_order<Comp, projected<iterator_t<R1>, Proj1>, 
    projected<iterator_t<R2>, Proj2>>
    constexpr ranges::partial_sort_copy_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>>
    ranges::partial_sort_copy(R1&& r, R2&& result_r, Comp comp = {}, 
    Proj1 proj1 = {}, Proj2 proj2 = {});

Let \( N \) be \( \min(last - first, result_last - result_first) \). Let \( \text{comp} \) be \text{less}\{\}, and \( \text{proj1} \) and \( \text{proj2} \) be \text{identity}\{\} for the overloads with no parameters by those names.

Mandates: For the overloads in namespace \text{std}, the expression \(*\text{first}\) is writable (25.3.1) to \( \text{result}_-\text{first} \).

Preconditions: For the overloads in namespace \text{std}, RandomAccessIterator meets the \text{Cpp17Value-Swappable} requirements (16.4.4.3), the type of \(*\text{result}_-\text{first}\) meets the \text{Cpp17MoveConstructible} (Table 32) and \text{Cpp17MoveAssignable} (Table 34) requirements.

For iterators \( a_1 \) and \( b_1 \) in \([\text{first}, \text{last})\), and iterators \( x_2 \) and \( y_2 \) in \([\text{result}_-\text{first}, \text{result}_-\text{last})\), after evaluating the assignment \(*y_2 = \ast b_1\), let \( E \) be the value of

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj1}, \ast a_1), \text{invoke}(\text{proj2}, \ast y_2))).
\]

Then, after evaluating the assignment \(*x_2 = \ast a_1\), \( E \) is equal to

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj2}, \ast x_2), \text{invoke}(\text{proj2}, \ast y_2))).
\]

[Note 1: Writing a value from the input range into the output range does not affect how it is ordered by \text{comp} and \text{proj1} or \text{proj2}. — end note]

Effects: Places the first \( N \) elements as sorted with respect to \text{comp} and \text{proj2} into the range \([\text{result}_-\text{first}, \text{result}_-\text{first} + N)\).

Returns:

- \( \text{result}_-\text{first} + N \) for the overloads in namespace \text{std}.
- \{\text{last}, \text{result}_-\text{first} + N\} for the overloads in namespace \text{ranges}.

Complexity: Approximately \((\text{last} - \text{first}) \ast \log N\) comparisons, and twice as many projections.
27.8.2.5  is_sorted

```cpp
template<class ForwardIterator>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last);
```

**Effects:** Equivalent to: `return is_sorted_until(first, last) == last;`

```cpp
template<class ExecutionPolicy, class ForwardIterator>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last);
```

**Effects:** Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last) == last;
```

```cpp
template<class ForwardIterator, class Compare>
constexpr bool is_sorted(ForwardIterator first, ForwardIterator last,
                         Compare comp);
```

**Effects:** Equivalent to:

```
return is_sorted_until(first, last, comp) == last;
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class Compare>
bool is_sorted(ExecutionPolicy&& exec,
               ForwardIterator first, ForwardIterator last,
               Compare comp);
```

**Effects:** Equivalent to:

```
return is_sorted_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;
```

```cpp
template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
         indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_sorted_until(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<forward_range R, class Proj = identity,
         indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R> ranges::is_sorted_until(R&& r, Comp comp = {}, Proj proj = {});
```

Let `comp` be `less{}` and `proj` be `identity{}` for the overloads with no parameters by those names.

**Returns:** The last iterator `i` in `[first, last]` for which the range `[first, i)` is sorted with respect to `comp` and `proj`. 

§ 27.8.2.5
Complexity: Linear.

27.8.3 Nth element

template<class RandomAccessIterator>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr void nth_element(RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
void nth_element(ExecutionPolicy&& exec, RandomAccessIterator first, RandomAccessIterator nth, RandomAccessIterator last, Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::nth_element(I first, I nth, S last, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

2 Preconditions: [first, nth) and [nth, last) are valid ranges. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3), and the type of *first meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

3 Effects: After nth_element the element in the position pointed to by nth is the element that would be in that position if the whole range were sorted with respect to comp and proj, unless nth == last. Also for every iterator i in the range [first, nth) and every iterator j in the range [nth, last) it holds that: bool(invoke(comp, invoke(proj, *j), invoke(proj, *i))) is false.

4 Returns: last for the overload in namespace ranges.

5 Complexity: For the overloads with no ExecutionPolicy, linear on average. For the overloads with an ExecutionPolicy, \(O(N)\) applications of the predicate, and \(O(N \log N)\) swaps, where \(N = last - first\).

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::nth_element(R&& r, iterator_t<R> nth, Comp comp = {}, Proj proj = {});

6 Effects: Equivalent to:

\[
\text{return ranges::nth_element(ranges::begin(r), nth, ranges::end(r), comp, proj);}
\]

27.8.4 Binary search

27.8.4.1 General

All of the algorithms in 27.8.4 are versions of binary search and assume that the sequence being searched is partitioned with respect to an expression formed by binding the search key to an argument of the comparison function. They work on non-random access iterators minimizing the number of comparisons, which will be logarithmic for all types of iterators. They are especially appropriate for random access iterators, because these algorithms do a logarithmic number of steps through the data structure. For non-random access iterators they execute a linear number of steps.

27.8.4.2 lower_bound

template<class ForwardIterator, class T>
constexpr ForwardIterator

lower_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator lower_bound(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::lower_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R> ranges::lower_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression
   bool(invoke(comp, invoke(proj, e), value)).
3 Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
   range [first, i), bool(invoke(comp, invoke(proj, *j), value)) is true.
4 Complexity: At most log₂(last - first) + Θ(1) comparisons and projections.

27.8.4.3 upper_bound

template<class ForwardIterator, class T>
constexpr ForwardIterator upper_bound(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr ForwardIterator upper_bound(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::upper_bound(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity, indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R> ranges::upper_bound(R&& r, const T& value, Comp comp = {}, Proj proj = {});

1 Let comp be less{} and proj be identity{} for overloads with no parameters by those names.
2 Preconditions: The elements e of [first, last) are partitioned with respect to the expression
   !bool(invoke(comp, value, invoke(proj, e))).
3 Returns: The furthermost iterator i in the range [first, last) such that for every iterator j in the
   range [first, i), !bool(invoke(comp, value, invoke(proj, *j))) is true.
4 Complexity: At most log₂(last - first) + Θ(1) comparisons and projections.

27.8.4.4 equal_range

template<class ForwardIterator, class T>
constexpr pair<ForwardIterator, ForwardIterator> equal_range(ForwardIterator first, ForwardIterator last, const T& value);

§ 27.8.4.4

1346
template<class ForwardIterator, class T, class Compare>
constexpr pair<ForwardIterator, ForwardIterator>
equal_range(ForwardIterator first,
            ForwardIterator last, const T& value,
            Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr subrange<I>
ranges::equal_range(I first, S last, const T& value, Comp comp = {}, Proj proj = {});

template<forward_range R, class T, class Proj = identity,
indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_subrange_t<R>
ranges::equal_range(R&& r, const T& value, Comp comp = {}, Proj proj = {});

Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 Preconditions: The elements `e` of `[first, last)` are partitioned with respect to the expressions
`bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 Returns:

3.1 For the overloads in namespace `std`:

   `{lower_bound(first, last, value, comp),
    upper_bound(first, last, value, comp)}`

3.2 For the overloads in namespace `ranges`:

   `{ranges::lower_bound(first, last, value, comp, proj),
    ranges::upper_bound(first, last, value, comp, proj)}`

4 Complexity: At most \(2 \times \log_2(last - first) + \mathcal{O}(1)\) comparisons and projections.

27.8.4.5 `binary_search` [binary.search]

template<class ForwardIterator, class T>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last, const T& value);

template<class ForwardIterator, class T, class Compare>
constexpr bool
binary_search(ForwardIterator first, ForwardIterator last, const T& value, Compare comp);

template<forward_iterator I, sentinel_for<I> S, class T, class Proj = identity,
indirect_strict_weak_order<const T*, projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(I first, S last, const T& value, Comp comp = {},
                                       Proj proj = {});

template<forward_range R, class T, class Proj = identity,
indirect_strict_weak_order<const T*, projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::binary_search(R&& r, const T& value, Comp comp = {}, Proj proj = {});

Let `comp` be `less{}` and `proj` be `identity{}` for overloads with no parameters by those names.

2 Preconditions: The elements `e` of `[first, last)` are partitioned with respect to the expressions
`bool(invoke(comp, invoke(proj, e), value))` and `!bool(invoke(comp, value, invoke(proj, e)))`. Also, for all elements `e` of `[first, last)`, `bool(comp(e, value))` implies `!bool(comp(value, e))` for the overloads in namespace `std`.

3 Returns: `true` if and only if for some iterator `i` in the range `[first, last)`, `!bool(invoke(comp, invoke(proj, *i), value)) && !bool(invoke(comp, value, invoke(proj, *i)))` is true.

4 Complexity: At most \(\log_2(last - first) + \mathcal{O}(1)\) comparisons and projections.
27.8.5 Partitions

```cpp
template<class InputIterator, class Predicate>
constexpr bool is_partitioned(InputIterator first, InputIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
bool is_partitioned(ExecutionPolicy&& exec,
                    ForwardIterator first, ForwardIterator last, Predicate pred);

template<input_iterator I, sentinel_for<I> S, class Proj = identity,
           indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr bool ranges::is_partitioned(I first, S last, Pred pred, Proj proj = {});

template<input_range R, class Proj = identity,
           indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr bool ranges::is_partitioned(R&& r, Pred pred, Proj proj = {});

1  Let proj be identity{} for the overloads with no parameter named proj.

2  Returns: true if and only if the elements e of [first, last) are partitioned with respect to the expression bool(invoke(pred, invoke(proj, e))).

3  Complexity: Linear. At most last - first applications of pred and proj.

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition(ForwardIterator first, ForwardIterator last, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class Predicate>
ForwardIterator
partition(ExecutionPolicy&& exec,
           ForwardIterator first, ForwardIterator last, Predicate pred);

template<permutable I, sentinel_for<I> S, class Proj = identity,
          indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr subrange<I>
ranges::partition(I first, S last, Pred pred, Proj proj = {});

template<forward_range R, class Proj = identity,
          indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
borrowed_subrange_t<R>
ranges::partition(R&& r, Pred pred, Proj proj = {});

4  Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(pred, invoke(proj, x))).

5  Preconditions: For the overloads in namespace std, ForwardIterator meets the Cpp17ValueSwappable requirements (16.4.4.3).

6  Effects: Places all the elements e in [first, last) that satisfy E(e) before all the elements that do not.

7  Returns: Let i be an iterator such that E(*j) is true for every iterator j in [first, i) and false for every iterator j in [i, last). Returns:

   - i for the overloads in namespace std.
   - {i, last} for the overloads in namespace ranges.

8  Complexity: Let N = last - first:

   - For the overload with no ExecutionPolicy, exactly N applications of the predicate and projection. At most N/2 swaps if the type of first meets the Cpp17BidirectionalIterator requirements for the overloads in namespace std or models bidirectional_iterator for the overloads in namespace ranges, and at most N swaps otherwise.

   - For the overload with an ExecutionPolicy, \( O(N \log N) \) swaps and \( O(N) \) applications of the predicate.

template<class BidirectionalIterator, class Predicate>
stable_partition(BidirectionalIterator first, BidirectionalIterator last, Predicate pred);
```
template<class ExecutionPolicy, class BidirectionalIterator, class Predicate>

BidirectionalIterator
stable_partition(ExecutionPolicy&& exec,
   BidirectionalIterator first, BidirectionalIterator last, Predicate pred);

template<bidirectional_iterator I, sentinel_for<I> S, class Proj = identity,
   indirect_unary_predicate<projected<I, Proj>> Pred>
requires permutable<I>
 subrange<I> ranges::stable_partition(I first, S last, Pred pred, Proj proj = {});

template<bidirectional_range R, class Proj = identity,
   indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
requires permutable<iterator_t<R>>
borrowed_subrange_t<R> ranges::stable_partition(R&& r, Pred pred, Proj proj = {});

9
Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(
pred, invoke(proj, x))).

10
Preconditions: For the overloads in namespace std, BidirectionalIterator meets the Cpp17Value-
Swappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 32)
and Cpp17MoveAssignable (Table 34) requirements.

11
Effects: Places all the elements e in [first, last) that satisfy E(e) before all the elements that do not.
The relative order of the elements in both groups is preserved.

12
Returns: Let i be an iterator such that for every iterator j in [i, last), E(*j) is true, and for every
iterator j in the range [i, last), E(*j) is false. Returns:

(12.1) i for the overloads in namespace std.
(12.2) {i, last} for the overloads in namespace ranges.

13
Complexity: Let N = last - first:

(13.1) For the overloads with no ExecutionPolicy, at most N log₂ N swaps, but only Θ(N) swaps if
there is enough extra memory. Exactly N applications of the predicate and projection.

(13.2) For the overload with an ExecutionPolicy, Θ(N log N) swaps and Θ(N) applications of the
predicate.

template<class InputIterator, class OutputIterator1, class OutputIterator2, class Predicate>
constexpr pair<OutputIterator1, OutputIterator2>
partition_copy(InputIterator first, InputIterator last,
   OutputIterator1 out_true, OutputIterator2 out_false, Predicate pred);

template<class ExecutionPolicy, class ForwardIterator, class ForwardIterator1, class ForwardIterator2, class Predicate>
pair<ForwardIterator1, ForwardIterator2>
partition_copy(ExecutionPolicy&& exec,
   ForwardIterator first, ForwardIterator last,
   ForwardIterator1 out_true, ForwardIterator2 out_false, Predicate pred);

template<input_iterator I, sentinel_for<I> S, weakly_incrementable O1, weakly_incrementable O2,
   class Proj = identity, indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr ranges::partition_copy_result<I, O1, O2>
ranges::partition_copy(I first, S last, O1 out_true, O2 out_false, Pred pred,
   Proj proj = {});

template<input_range R, weakly_incrementable O1, weakly_incrementable O2,
   class Proj = identity,
   indirect_unary_predicate<projected<iterator_t<R>, Proj>> Pred>
constexpr ranges::partition_copy_result<borrowed_iterator_t<R>, O1, O2>
ranges::partition_copy(R&& r, O1 out_true, O2 out_false, Pred pred, Proj proj = {});

14
Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(
pred, invoke(proj, x))).

15
Mandates: For the overloads in namespace std, the expression *first is writable (25.3.1) to out_true
and out_false.
Preconditions: The input range and output ranges do not overlap.

[Note 1: For the overload with an ExecutionPolicy, there might be a performance cost if first's value type does not meet the Cpp17CopyConstructible requirements. — end note]

Effects: For each iterator i in [first,last), copies *i to the output range beginning with out_true if E(*i) is true, or to the output range beginning with out_false otherwise.

Returns: Let o1 be the end of the output range beginning at out_true, and o2 the end of the output range beginning at out_false. Returns

— {o1, o2} for the overloads in namespace std.
— {last, o1, o2} for the overloads in namespace ranges.

Complexity: Exactly last - first applications of pred and proj.

template<class ForwardIterator, class Predicate>
constexpr ForwardIterator
partition_point(ForwardIterator first, ForwardIterator last, Predicate pred);

template<forward_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_unary_predicate<projected<I, Proj>> Pred>
constexpr I ranges::partition_point(I first, S last, Pred pred, Proj proj = {});

template<forward_range R, class Proj = identity,
indirect_unary_predicate<iterator_t<R>, Proj>> Pred>
constexpr borrowed_iterator_t<R>
ranges::partition_point(R&& r, Pred pred, Proj proj = {});

Let proj be identity{} for the overloads with no parameter named proj and let E(x) be bool(invoke(pred, invoke(proj, x))).

Preconditions: The elements e of [first,last) are partitioned with respect to E(e).

Returns: An iterator mid such that E(*i) is true for all iterators i in [first,mid), and false for all iterators i in [mid,last).

Complexity: θ(log(last - first)) applications of pred and proj.

27.8.6 Merge

template<class InputIterator1, class InputIterator2,
class OutputIterator>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator
merge(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result);

template<class InputIterator1, class InputIterator2,
class OutputIterator, class Compare>
constexpr OutputIterator
merge(InputIterator1 first1, InputIterator1 last1,
InputIterator2 first2, InputIterator2 last2,
OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
merge(ExecutionPolicy&& exec,
ForwardIterator1 first1, ForwardIterator1 last1,
ForwardIterator2 first2, ForwardIterator2 last2,
ForwardIterator result, Compare comp);
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2, weakly_incrementable O, class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::merge_result<I1, I2, O>
ranges::merge(I1 first1, S1 last1, I2 first2, S2 last2, O result,
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});

Let N be (last1 - first1) + (last2 - first2). Let comp be less{}, proj1 be identity{}, and proj2 be identity{}, for the overloads with no parameters by those names.

Preconditions: The ranges [first1, last1) and [first2, last2) are sorted with respect to comp and proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.

Effects: Copies all the elements of the two ranges [first1, last1) and [first2, last2) into the range [result, result_last), where result_last is result + N. If an element \(a\) precedes \(b\) in an input range, \(a\) is copied into the output range before \(b\). If \(e1\) is an element of [first1, last1) and \(e2\) of [first2, last2), \(e2\) is copied into the output range before \(e1\) if and only if bool(invoke(comp, invoke(proj2, e2), invoke(proj1, e1))) is true.

Returns:

(4.1) — result_last for the overloads in namespace std.

(4.2) — {last1, last2, result_last} for the overloads in namespace ranges.

Complexity:

(5.1) — For the overloads with no ExecutionPolicy, at most \(N - 1\) comparisons and applications of each projection.

(5.2) — For the overloads with an ExecutionPolicy, \(\Theta(N)\) comparisons.

Remarks: Stable (16.4.6.8).

template<class BidirectionalIterator>
void inplace_merge(BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last);

template<class ExecutionPolicy, class BidirectionalIterator>
void inplace_merge(ExecutionPolicy&& exec,
                    BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last);

template<class BidirectionalIterator, class Compare>
void inplace_merge(BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last, Compare comp);

template<class ExecutionPolicy, class BidirectionalIterator, class Compare>
void inplace_merge(ExecutionPolicy&& exec,
                    BidirectionalIterator first,
                    BidirectionalIterator middle,
                    BidirectionalIterator last, Compare comp);

template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
requires sortable<I, Comp, Proj>
I ranges::inplace_merge(I first, I middle, S last, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.
Preconditions: \([\text{first}, \text{middle})\) and \([\text{middle}, \text{last})\) are valid ranges sorted with respect to \emph{comp} and \emph{proj}. For the overloads in namespace \emph{std}, \emph{BidirectionalIterator} meets the \emph{Cpp17ValueSwappable} requirements (16.4.4.3) and the type of \*first meets the \emph{Cpp17MoveConstructible} (Table 32) and \emph{Cpp17MoveAssignable} (Table 34) requirements.

Effects: Merges two sorted consecutive ranges \([\text{first}, \text{middle})\) and \([\text{middle}, \text{last})\), putting the result of the merge into the range \([\text{first}, \text{last})\). The resulting range is sorted with respect to \emph{comp} and \emph{proj}.

Returns: last for the overload in namespace \emph{ranges}.

Complexity: Let \(N = \text{last} - \text{first}\):

1. For the overloads with no \emph{ExecutionPolicy}, and if enough additional memory is available, exactly \(N - 1\) comparisons.
2. Otherwise, \(\Theta(N \log N)\) comparisons.

In either case, twice as many projections as comparisons.

Remarks: Stable (16.4.6.8).

```cpp
template<bidirectional_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
borrowed_iterator_t<R>
ranges::inplace_merge(R&& r, iterator_t<R> middle, Comp comp = {}, Proj proj = {});
```

27.8.7 Set operations on sorted structures [alg.set.operations]

27.8.7.1 General [alg.set.operations.general]

Subclause 27.8.7 defines all the basic set operations on sorted structures. They also work with \emph{multisets} (24.4.7) containing multiple copies of equivalent elements. The semantics of the set operations are generalized to \emph{multisets} in a standard way by defining \emph{set_union} to contain the maximum number of occurrences of every element, \emph{set_intersection} to contain the minimum, and so on.

27.8.7.2 includes [includes]

```cpp
template<class InputIterator1, class InputIterator2>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
            InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool includes(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool includes(InputIterator1 first1, InputIterator1 last1,
            InputIterator2 first2, InputIterator2 last2,
            Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool includes(ExecutionPolicy&& exec,
        ForwardIterator1 first1, ForwardIterator1 last1,
        ForwardIterator2 first2, ForwardIterator2 last2,
        Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
class Proj1 = identity, class Proj2 = identity,
indirect_strict_weak_order<projected<I1, Proj1>,
projected<I2, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(I1 first1, S1 last1, I2 first2, S2 last2, Comp comp = {},
        Proj1 proj1 = {}, Proj2 proj2 = {});

template<input_range R1, input_range R2, class Proj1 = identity,
class Proj2 = identity,
indirect_strict_weak_order<projected<iterator_t<R1>, Proj1>,
projected<iterator_t<R2>, Proj2>> Comp = ranges::less>
constexpr bool ranges::includes(R1&& r1, R2&& r2, Comp comp = {});
```
Let \( \text{comp} \) be \text{less}\{\}, \( \text{proj1} \) be \text{identity}\{\}, and \( \text{proj2} \) be \text{identity}\{\}, for the overloads with no parameters by those names.

**Preconditions:** The ranges \([\text{first1, last1})\) and \([\text{first2, last2})\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively.

**Returns:** \text{true} if and only if \( \text{first2, last2} \) is a subsequence of \( \text{first1, last1} \).

(Note 1: A sequence \( S \) is a subsequence of another sequence \( T \) if \( S \) can be obtained from \( T \) by removing some, all, or none of \( T \)'s elements and keeping the remaining elements in the same order. — end note)

**Complexity:** At most \( 2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1 \) comparisons and applications of each projection.

27.8.7.3 set_union

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2,
         OutputIterator result);
```

```cpp
template<class ExecutionPolicy, class InputIterator1, class InputIterator2, class OutputIterator>
OutputIterator
set_union(ExecutionPolicy&& exec,
         InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2,
         OutputIterator result);
```

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator
set_union(InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2,
         OutputIterator result, Compare comp);
```

```cpp
template<class ExecutionPolicy, class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
OutputIterator
set_union(ExecutionPolicy&& exec,
         InputIterator1 first1, InputIterator1 last1,
         InputIterator2 first2, InputIterator2 last2,
         OutputIterator result, Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
           weakly_incrementable O, class Comp = ranges::less,
           class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<I1, I2, O>
ranges::set_union(I1 first1, S1 last1, I2 first2, S2 last2, O result, Comp comp = {},
                  Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<input_range R1, input_range R2, weakly_incrementable O,
           class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<input_iterator_t<R1>, input_iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_union_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_union(R1&& r1, R2&& r2, O result, Comp comp = {},
                  Proj1 proj1 = {}, Proj2 proj2 = {});
```

Let \( \text{comp} \) be \text{less}\{\}, and \( \text{proj1} \) and \( \text{proj2} \) be \text{identity}\{\} for the overloads with no parameters by those names.

**Preconditions:** The ranges \([\text{first1, last1})\) and \([\text{first2, last2})\) are sorted with respect to \( \text{comp} \) and \( \text{proj1} \) or \( \text{proj2} \), respectively. The resulting range does not overlap with either of the original ranges.

**Effects:** Constructs a sorted union of the elements from the two ranges; that is, the set of elements that are present in one or both of the ranges.

**Returns:** Let \( \text{result_last} \) be the end of the constructed range. Returns
— result_last for the overloads in namespace std.

— {last1, last2, result_last} for the overloads in namespace ranges.

Complexity: At most \(2 \ast ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons and applications of each projection.

Remarks: Stable (16.4.6.8). If \([\text{first1}, \text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \(n\) elements that are equivalent to them, then all \(m\) elements from the first range are copied to the output range, in order, and then the final \(\max(n - m, 0)\) elements from the second range are copied to the output range, in order.

27.8.7.4 set_intersection

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator set_intersection(InputIterator1 first1, InputIterator1 last1,
                                InputIterator2 first2, InputIterator2 last2,
                                OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
                                class ForwardIterator>
ForwardIterator set_intersection(ExecutionPolicy&& exec,
                                ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2,
                                ForwardIterator result);
```

```cpp
template<class InputIterator1, class InputIterator2, class OutputIterator, class Compare>
constexpr OutputIterator set_intersection(InputIterator1 first1, InputIterator1 last1,
                                InputIterator2 first2, InputIterator2 last2,
                                OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
                                class ForwardIterator, class Compare>
ForwardIterator set_intersection(ExecutionPolicy&& exec,
                                ForwardIterator1 first1, ForwardIterator1 last1,
                                ForwardIterator2 first2, ForwardIterator2 last2,
                                ForwardIterator result, Compare comp);
```

```cpp
template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
 weakly_incrementable O, class Comp = ranges::less,
 class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<I1, I2, O>
ranges::set_intersection(I1 first1, S1 last1, I2 first2, S2 last2, O result,
                                Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

```cpp
template<input_range R1, input_range R2, weakly_incrementable O,
 class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_intersection_result<borrowed_iterator_t<R1>, borrowed_iterator_t<R2>, O>
ranges::set_intersection(R1&& r1, R2&& r2, O result,
                                Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});
```

1. Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by those names.

2. Preconditions: The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \(\text{comp}\) and \(\text{proj1}\) or \(\text{proj2}\), respectively. The resulting range does not overlap with either of the original ranges.

3. Effects: Constructs a sorted intersection of the elements from the two ranges; that is, the set of elements that are present in both of the ranges.

4. Returns: Let result_last be the end of the constructed range. Returns

— result_last for the overloads in namespace std.
— \{last1, last2, result_last\} for the overloads in namespace \texttt{ranges}.

\textbf{Complexity:} At most \(2 \times ((\text{last1} - \text{first1}) + (\text{last2} - \text{first2})) - 1\) comparisons and applications of each projection.

\textbf{Remarks:} Stable (16.4.6.8). If \([\text{first1}, \text{last1})\) contains \(m\) elements that are equivalent to each other and \([\text{first2}, \text{last2})\) contains \(n\) elements that are equivalent to them, the first \(\min(m, n)\) elements are copied from the first range to the output range, in order.

\texttt{27.8.7.5 \texttt{set_difference}}

\texttt{template<class InputIterator1, class InputIterator2,\
class OutputIterator>\
constexpr OutputIterator\
\texttt{set_difference(InputIterator1 first1, InputIterator1 last1,\

OutputIterator result);}\
\texttt{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,\
class ForwardIterator>\
ForwardIterator\
\texttt{set_difference(ExecutionPolicy&& exec,\
ForwardIterator1 first1, ForwardIterator1 last1,\
ForwardIterator2 first2, ForwardIterator2 last2,\
ForwardIterator result);}\
\texttt{template<class InputIterator1, class InputIterator2,\
class OutputIterator, class Compare>\
constexpr OutputIterator\
\texttt{set_difference(InputIterator1 first1, InputIterator1 last1,\
InputIterator2 first2, InputIterator2 last2,\
OutputIterator result, Compare comp);}\
\texttt{template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,\
class ForwardIterator, class Compare>\
ForwardIterator\
\texttt{set_difference(ExecutionPolicy&& exec,\
ForwardIterator1 first1, ForwardIterator1 last1,\
ForwardIterator2 first2, ForwardIterator2 last2,\
ForwardIterator result, Compare comp);}\
\texttt{template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,\
weakly_incrementable O, class Comp = ranges::less,\
class Proj1 = identity, class Proj2 = identity>\
\texttt{requires mergeable<I1, I2, O, Comp, Proj1, Proj2>\
constexpr ranges::set_difference_result<I1, I2, O>\
ranges::set_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,\
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});}\
\texttt{template<input_range R1, input_range R2, weakly_incrementable O,\
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>\
\texttt{requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>\
constexpr ranges::set_difference_result<borrowed_iterator_t<R1>, O>\
ranges::set_difference(R1&& r1, R2&& r2, O result,\
Comp comp = {}, Proj1 proj1 = {}, Proj2 proj2 = {});}\

Let \(\text{comp}\) be \texttt{less{}}{}, and \(\text{proj1}\) and \(\text{proj2}\) be \texttt{identity{}}{} for the overloads with no parameters by those names.

\textbf{Preconditions:} The ranges \([\text{first1}, \text{last1})\) and \([\text{first2}, \text{last2})\) are sorted with respect to \(\text{comp}\) and \(\text{proj1}\) or \(\text{proj2}\), respectively. The resulting range does not overlap with either of the original ranges.

\textbf{Effects:} Copies the elements of the range \([\text{first1}, \text{last1})\) which are not present in the range \([\text{first2}, \text{last2})\) to the range beginning at \texttt{result}. The elements in the constructed range are sorted.

\textbf{Returns:} Let \texttt{result_last} be the end of the constructed range. Returns

— \texttt{result_last} for the overloads in namespace \texttt{std}.

— \{\texttt{last1}, \texttt{result_last}\} for the overloads in namespace \texttt{ranges}.
5 Complexity: At most $2 \times (\text{last1} - \text{first1}) + (\text{last2} - \text{first2}) - 1$ comparisons and applications of each projection.

6 Remarks: If $[\text{first1}, \text{last1})$ contains $m$ elements that are equivalent to each other and $[\text{first2}, \text{last2})$ contains $n$ elements that are equivalent to them, the last $\max(m - n, 0)$ elements from $[\text{first1}, \text{last1})$ are copied to the output range, in order.

27.8.7.6 set_symmetric_difference

template<class InputIterator1, class InputIterator2, class OutputIterator>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
  InputIterator2 first2, InputIterator2 last2,
  OutputIterator result);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
  ForwardIterator1 first1, ForwardIterator1 last1,
  ForwardIterator2 first2, ForwardIterator2 last2,
  ForwardIterator result);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr OutputIterator
set_symmetric_difference(InputIterator1 first1, InputIterator1 last1,
  InputIterator2 first2, InputIterator2 last2,
  OutputIterator result, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2,
class ForwardIterator, class Compare>
ForwardIterator
set_symmetric_difference(ExecutionPolicy&& exec,
  ForwardIterator1 first1, ForwardIterator1 last1,
  ForwardIterator2 first2, ForwardIterator2 last2,
  ForwardIterator result, Compare comp);

template<input_iterator I1, sentinel_for<I1> S1, input_iterator I2, sentinel_for<I2> S2,
weakly_incrementable O, class Comp = ranges::less,
class Proj1 = identity, class Proj2 = identity>
requires mergeable<I1, I2, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<I1, I2, O>
ranges::set_symmetric_difference(I1 first1, S1 last1, I2 first2, S2 last2, O result,
  Comp comp = {}, Proj1 proj1 = {},
  Proj2 proj2 = {});

template<input_range R1, input_range R2, weakly_incrementable O,
class Comp = ranges::less, class Proj1 = identity, class Proj2 = identity>
requires mergeable<iterator_t<R1>, iterator_t<R2>, O, Comp, Proj1, Proj2>
constexpr ranges::set_symmetric_difference_result<borrowed_iterator_t<R1>,
borrowed_iterator_t<R2>, O>
ranges::set_symmetric_difference(R1&& r1, R2&& r2, O result, Comp comp = {},
  Proj1 proj1 = {}, Proj2 proj2 = {});

1 Let comp be less{}, and proj1 and proj2 be identity{} for the overloads with no parameters by those names.

2 Preconditions: The ranges $[\text{first1}, \text{last1})$ and $[\text{first2}, \text{last2})$ are sorted with respect to comp and proj1 or proj2, respectively. The resulting range does not overlap with either of the original ranges.

3 Effects: Copies the elements of the range $[\text{first1}, \text{last1})$ that are not present in the range $[\text{first2}, \text{last2})$, and the elements of the range $[\text{first2}, \text{last2})$ that are not present in the range $[\text{first1}, \text{last1})$ to the range beginning at result. The elements in the constructed range are sorted.

4 Returns: Let result_last be the end of the constructed range. Returns

(4.1) — result_last for the overloads in namespace std.
— {last1, last2, result_last} for the overloads in namespace ranges.

Complexity: At most \(2 \times ((last1 - first1) + (last2 - first2)) - 1\) comparisons and applications of each projection.

Remarks: Stable (16.4.6.8). If \([first1, last1]\) contains \(m\) elements that are equivalent to each other and \([first2, last2]\) contains \(n\) elements that are equivalent to them, then \(|m - n|\) of those elements shall be copied to the output range: the last \(m - n\) of these elements from \([first1, last1]\) if \(m > n\), and the last \(n - m\) of these elements from \([first2, last2]\) if \(m < n\). In either case, the elements are copied in order.

27.8.8 Heap operations

27.8.8.1 General

1 A random access range \([a, b)\) is a heap with respect to \(\text{comp}\) and \(\text{proj}\) for a comparator and projection \(\text{comp}\) and \(\text{proj}\) if its elements are organized such that:

(1.1) With \(N = b - a\), for all \(0 < i < N\), \(\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, a[\lfloor \frac{i}{2} \rfloor]), \text{invoke}(\text{proj}, a[i])))\) is false.

(1.2) \(\ast a\) may be removed by \(\text{pop_heap}\), or a new element added by \(\text{push_heap}\), in \(O(\log N)\) time.

2 These properties make heaps useful as priority queues.

3 \(\text{make_heap}\) converts a range into a heap and \(\text{sort_heap}\) turns a heap into a sorted sequence.

27.8.8.2 push_heap

```cpp
template<class RandomAccessIterator>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void push_heap(RandomAccessIterator first, RandomAccessIterator last,
                         Compare comp);
```

```cpp
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr I
ranges::push_heap(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::push_heap(R&& r, Comp comp = {}, Proj proj = {});
```

1 Let \(\text{comp}\) be \(\text{less}\{\}\) and \(\text{proj}\) be \(\text{identity}\{\}\) for the overloads with no parameters by those names.

2 Preconditions: The range \([first, last - 1)\) is a valid heap with respect to \(\text{comp}\) and \(\text{proj}\). For the overloads in namespace \(\text{std}\), the type of \(*\text{first}\) meets the \(\text{Cpp17MoveConstructible}\) requirements (Table 32) and the \(\text{Cpp17MoveAssignab}\)le requirements (Table 34).

3 Effects: Places the value in the location \(last - 1\) into the resulting heap \([first, last)\).

4 Returns: last for the overloads in namespace \(\text{ranges}\).

5 Complexity: At most \(\log(last - first)\) comparisons and twice as many projections.

27.8.8.3 pop_heap

```cpp
template<class RandomAccessIterator>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last);
```

```cpp
template<class RandomAccessIterator, class Compare>
constexpr void pop_heap(RandomAccessIterator first, RandomAccessIterator last,
                        Compare comp);
```
template<random_access_iterator I, sentinel_for<I> S, class Comp = ranges::less, class Proj = identity>
    requires sortable<I, Comp, Proj>
constexpr I
    ranges::pop_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Comp = ranges::less, class Proj = identity>
    requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
    ranges::pop_heap(R&& r, Comp comp = {}, Proj proj = {});
template<random_access_range R, class Comp = ranges::less, class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
constexpr borrowed_iterator_t<R>
ranges::sort_heap(R&& r, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Preconditions: The range [first, last) is a valid heap with respect to comp and proj. For the overloads in namespace std, RandomAccessIterator meets the Cpp17ValueSwappable requirements (16.4.4.3) and the type of *first meets the Cpp17MoveConstructible (Table 32) and Cpp17MoveAssignable (Table 34) requirements.

Effects: Sorts elements in the heap [first, last) with respect to comp and proj.

Returns: last for the overloads in namespace ranges.

Complexity: At most 2N log N comparisons, where N = last - first, and twice as many projections.

27.8.8.6 is_heap

template<class RandomAccessIterator>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last);

Effects: Equivalent to: return is_heap_until(first, last) == last;

template<class ExecutionPolicy, class RandomAccessIterator>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);

Effects: Equivalent to:
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last) == last;

template<class RandomAccessIterator, class Compare>
constexpr bool is_heap(RandomAccessIterator first, RandomAccessIterator last,
Compare comp);

Effects: Equivalent to:
return is_heap_until(first, last, comp) == last;

template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
bool is_heap(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last,
Compare comp);

Effects: Equivalent to:
return is_heap_until(std::forward<ExecutionPolicy>(exec), first, last, comp) == last;

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr bool ranges::is_heap(R&& r, Comp comp = {}, Proj proj = {});

Effects: Equivalent to: return ranges::is_heap_until(first, last, comp, proj) == last;

template<class RandomAccessIterator>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last);

template<class ExecutionPolicy, class RandomAccessIterator>
RandomAccessIterator
is_heap_until(ExecutionPolicy&& exec,
             RandomAccessIterator first, RandomAccessIterator last);

template<class RandomAccessIterator, class Compare>
constexpr RandomAccessIterator
is_heap_until(RandomAccessIterator first, RandomAccessIterator last,
Compare comp);
template<class ExecutionPolicy, class RandomAccessIterator, class Compare>
RandomAccessIterator
  is_heap_until(ExecutionPolicy&& exec,
               RandomAccessIterator first, RandomAccessIterator last,
               Compare comp);

template<random_access_iterator I, sentinel_for<I> S, class Proj = identity,
          indirect_strict_weak_order<projected<I, Proj>> Comp = ranges::less>
constexpr I ranges::is_heap_until(I first, S last, Comp comp = {}, Proj proj = {});

template<random_access_range R, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
constexpr borrowed_iterator_t<R>
  ranges::is_heap_until(R&& r, Comp comp = {}, Proj proj = {});

Let comp be less{} and proj be identity{} for the overloads with no parameters by those names.

Returns: The last iterator i in [first, last) for which the range [first, i) is a heap with respect to
comp and proj.

Complexity: Linear.

27.8.9 Minimum and maximum

 template<class T>
 constexpr const T& min(const T& a, const T& b);

 template<class T, class Compare>
 constexpr const T& min(const T& a, const T& b, Compare comp);

 template<class T, class Proj = identity,
          indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
 constexpr const T& ranges::min(const T& a, const T& b, Comp comp = {}, Proj proj = {});

 Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 30).

 Returns: The smaller value. Returns the first argument when the arguments are equivalent.

 Complexity: Exactly one comparison and two applications of the projection, if any.

 Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

 template<class T>
 constexpr T min(initializer_list<T> r);

 template<class T, class Compare>
 constexpr T min(initializer_list<T> r, Compare comp);

 template<copyable T, class Proj = identity,
          indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
 constexpr T ranges::min(initializer_list<T> r, Comp comp = {}, Proj proj = {});

 template<input_range R, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
 requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
 constexpr range_value_t<R>
  ranges::min(R&& r, Comp comp = {}, Proj proj = {});

 Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
(Table 30).

 Returns: The smallest value in the input range. Returns a copy of the leftmost element when several
elements are equivalent to the smallest.

 Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
projection, if any.

 Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.
template<class T>
constexpr const T& max(const T& a, const T& b);

template<class T, class Compare>
constexpr const T& max(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr const T& ranges::max(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 30).

Returns: The larger value. Returns the first argument when the arguments are equivalent.

Complexity: Exactly one comparison and two applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr T max(initializer_list<T> r);

template<class T, class Compare>
constexpr T max(initializer_list<T> r, Compare comp);

template<copyable T, class Proj = identity,
indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr T ranges::max(initializer_list<T> r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, T meets the Cpp17LessThanComparable requirements
(Table 30).

Returns: The largest value in the input range. Returns a copy of the leftmost element when several
elements are equivalent to the largest.

Complexity: Exactly ranges::distance(r) - 1 comparisons and twice as many applications of the
projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b);

template<class T, class Compare>
constexpr pair<const T&, const T&> minmax(const T& a, const T& b, Compare comp);

template<class T, class Proj = identity,
indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<const T&>
ranges::minmax(const T& a, const T& b, Comp comp = {}, Proj proj = {});

Preconditions: For the first form, T meets the Cpp17LessThanComparable requirements (Table 30).

Returns: {b, a} if b is smaller than a, and {a, b} otherwise.

Complexity: Exactly one comparison and two applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class T>
constexpr pair<T, T> minmax(initializer_list<T> t);

template<class T, class Compare>
constexpr pair<T, T> minmax(initializer_list<T> t, Compare comp);
template<copyable T, class Proj = identity,
         indirect_strict_weak_order<projected<const T*, Proj>> Comp = ranges::less>
constexpr ranges::minmax_result<T>
ranges::minmax(initializer_list<T> r, Comp comp = {}, Proj proj = {});

template<input_range R, class Proj = identity,
          indirect_strict_weak_order<projected<iterator_t<R>, Proj>> Comp = ranges::less>
requires indirectly_copyable_storable<iterator_t<R>, range_value_t<R>>
constexpr ranges::minmax_result<range_value_t<R>>
ranges::minmax(R&& r, Comp comp = {}, Proj proj = {});

Preconditions: ranges::distance(r) > 0. For the overloads in namespace std, T meets the Cpp17-
CopyConstructible requirements. For the first form, type T meets the Cpp17LessThanComparable
requirements (Table 30).

Returns: Let X be the return type. Returns X{x, y}, where x is a copy of the leftmost element with
the smallest value and y a copy of the rightmost element with the largest value in the input range.

Complexity: At most (3/2)\text{ranges::distance(r)} applications of the corresponding predicate and twice
as many applications of the projection, if any.

Remarks: An invocation may explicitly specify an argument for the template parameter T of the
overloads in namespace std.

template<class ForwardIterator>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator min_element(ExecutionPolicy&& exec,
                         ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator min_element(ForwardIterator first, ForwardIterator last,
                                         Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator min_element(ExecutionPolicy&& exec,
                           ForwardIterator first, ForwardIterator last, Compare comp);

Let comp be \text{less{}} and proj be \text{identity{}} for the overloads with no parameters by those names.

Returns: The first iterator i in the range [first, last) such that for every iterator j in the range
[first, last),
bool:invoke(comp, invoke(proj, *j), invoke(proj, *i)))
is false. Returns last if first == last.

Complexity: Exactly \max(last - first - 1, 0) comparisons and twice as many projections.

template<class ForwardIterator>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last);

template<class ExecutionPolicy, class ForwardIterator>
ForwardIterator max_element(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last);

template<class ForwardIterator, class Compare>
constexpr ForwardIterator max_element(ForwardIterator first, ForwardIterator last,
                                        Compare comp);

template<class ExecutionPolicy, class ForwardIterator, class Compare>
ForwardIterator max_element(ExecutionPolicy&& exec,
                            ForwardIterator first, ForwardIterator last,

§ 27.8.9
Let \( \text{comp} \) be less{} and \( \text{proj} \) be identity{} for the overloads with no parameters by those names.

**Returns:** The first iterator \( i \) in the range \([\text{first}, \text{last})\) such that for every iterator \( j \) in the range \([\text{first}, \text{last})\):

\[
\text{bool}(\text{invoke}(\text{comp}, \text{invoke}(\text{proj}, *i), \text{invoke}(\text{proj}, *j)))
\]

is false. Returns \( \text{last} \) if \( \text{first} == \text{last} \).

**Complexity:** Exactly \( \max(\text{last} - \text{first} - 1, 0) \) comparisons and twice as many projections.

Let \( \text{comp} \) be less{} and \( \text{proj} \) be identity{} for the overloads with no parameters by those names.

**Returns:** \{first, first\} if \([\text{first}, \text{last})\) is empty, otherwise \( \langle m, M \rangle \), where \( m \) is the first iterator in \([\text{first}, \text{last})\) such that no iterator in the range refers to a smaller element, and where \( M \) is the last iterator\(^{223} \) in \([\text{first}, \text{last})\) such that no iterator in the range refers to a larger element.

**Complexity:** Let \( N \) be \( \text{last} - \text{first} \). At most \( \max(\lfloor \frac{3}{2}(N - 1) \rfloor, 0) \) comparisons and twice as many applications of the projection, if any.

### 27.8.10 Bounded value

\[\text{alg.clamp}\]

Let \( \text{comp} \) be less{} for the overloads with no parameter \( \text{comp} \), and let \( \text{proj} \) be identity{} for the overloads with no parameter \( \text{proj} \).

---

\(^{223}\) This behavior intentionally differs from max_element.
Preconditions: bool(invoke(comp, invoke(proj, hi), invoke(proj, lo))) is false. For the first form, type T meets the Cpp17LessThanComparable requirements (Table 30).

Returns: lo if bool(invoke(comp, invoke(proj, v), invoke(proj, lo))) is true, hi if bool(invoke(comp, invoke(proj, hi), invoke(proj, v))) is true, otherwise v.

[Note 1: If NaN is avoided, T can be a floating-point type. — end note]

Complexity: At most two comparisons and three applications of the projection.

27.8.11 Lexicographical comparison

template<class InputIterator1, class InputIterator2>
constexpr bool lexicographical_compare(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>
bool lexicographical_compare(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2);

template<class InputIterator1, class InputIterator2, class Compare>
constexpr bool lexicographical_compare(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, InputIterator2 last2, Compare comp);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class Compare>
bool lexicographical_compare(ExecutionPolicy&& exec, ForwardIterator1 first1, ForwardIterator1 last1, ForwardIterator2 first2, ForwardIterator2 last2, Compare comp);

returns:
true if and only if the sequence of elements defined by the range [first1, last1) is lexicographically less than the sequence of elements defined by the range [first2, last2).

Complexity: At most 2 min(last1 - first1, last2 - first2) applications of the corresponding comparison and each projection, if any.

Remarks: If two sequences have the same number of elements and their corresponding elements (if any) are equivalent, then neither sequence is lexicographically less than the other. If one sequence is a proper prefix of the other, then the shorter sequence is lexicographically less than the longer sequence. Otherwise, the lexicographical comparison of the sequences yields the same result as the comparison of the first corresponding pair of elements that are not equivalent.

[Example 1: ranges::lexicographical_compare(I1, S1, I2, S2, Comp proj1, Proj2) can be implemented as:
for ( ; first1 != last1 && first2 != last2 ; ++first1, (void) ++first2) {
    if (invoke(comp, invoke(proj1, *first1), invoke(proj2, *first2))) return true;
if (invoke(comp, invoke(proj2, *first2), invoke(proj1, *first1))) return false;
}
return first1 == last1 && first2 != last2;
—end example

[Note 1: An empty sequence is lexicographically less than any non-empty sequence, but not less than any empty sequence. — end note]

27.8.12 Three-way comparison algorithms [alg.three.way]

```cpp
template<class InputIterator1, class InputIterator2, class Cmp>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
    InputIterator2 b2, InputIterator2 e2,
    Cmp comp)
-> decltype(comp(*b1, *b2));
```

1 Let \( N \) be \( \min(e1 - b1, e2 - b2) \). Let \( E(n) \) be \( \text{comp}((b1 + n, * (b2 + n))) \).

2 \textbf{Mandates:} \texttt{decltype(comp(*b1, *b2))} is a comparison category type.

3 \textbf{Returns:} \( E(i) \), where \( i \) is the smallest integer in \([0, N)\) such that \( E(i) \neq 0 \) is \texttt{true}, or \((e1 - b1) <= (e2 - b2)\) if no such integer exists.

4 \textbf{Complexity:} At most \( N \) applications of \texttt{comp}.

```cpp
template<class InputIterator1, class InputIterator2>
constexpr auto
lexicographical_compare_three_way(InputIterator1 b1, InputIterator1 e1,
    InputIterator2 b2, InputIterator2 e2);
```

5 \textbf{Effects:} Equivalent to:

```
return lexicographical_compare_three_way(b1, e1, b2, e2, compare_three_way());
```

27.8.13 Permutation generators [alg.permutation.generators]

```cpp
template<class BidirectionalIterator>
constexpr bool next_permutation(BidirectionalIterator first,
    BidirectionalIterator last);
```

```cpp
template<class BidirectionalIterator, class Compare>
constexpr bool next_permutation(BidirectionalIterator first,
    BidirectionalIterator last, Compare comp);
```

```cpp
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
    class Proj = identity>
requires sortable<I, Comp, Proj>
constexpr ranges::next_permutation_result<I>
ranges::next_permutation(I first, S last, Comp comp = {}, Proj proj = {});
```

1 Let \texttt{comp} be \texttt{less{}} and \texttt{proj} be \texttt{identity{}} for overloads with no parameters by those names.

2 \textbf{Preconditions:} For the overloads in namespace \texttt{std}, \texttt{BidirectionalIterator} meets the \texttt{Cpp17ValueSwappable} requirements (16.4.4.3).

3 \textbf{Effects:} Takes a sequence defined by the range \([\texttt{first}, \texttt{last})\) and transforms it into the next permutation. The next permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \texttt{comp} and \texttt{proj}. If no such permutation exists, transforms the sequence into the first permutation; that is, the ascendingly-sorted one.

4 \textbf{Returns:} Let \( B \) be \texttt{true} if a next permutation was found and otherwise \texttt{false}. Returns:

- \( B \) for the overloads in namespace \texttt{std}.
- \{ \texttt{last, B} \} for the overloads in namespace \texttt{ranges}.

§ 27.8.13 1365
Complexity: At most \((\text{last} - \text{first}) / 2\) swaps.

```cpp
template<class BidirectionalIterator>
constexpr bool prev_permutation(BidirectionalIterator first,
                                 BidirectionalIterator last);
```

```cpp
template<class BidirectionalIterator, class Compare>
constexpr bool prev_permutation(BidirectionalIterator first,
                                 BidirectionalIterator last, Compare comp);
```

```cpp
template<bidirectional_iterator I, sentinel_for<I> S, class Comp = ranges::less,
         class Proj = identity>
requires sortable<I, Comp, Proj>
ranges::prev_permutation_result<I>
ranges::prev_permutation(I first, S last, Comp comp = {}, Proj proj = {});
```

```cpp
template<bidirectional_range R, class Comp = ranges::less,
         class Proj = identity>
requires sortable<iterator_t<R>, Comp, Proj>
ranges::prev_permutation_result<borrowed_iterator_t<R>>
ranges::prev_permutation(R&& r, Comp comp = {}, Proj proj = {});
```

Let \(\text{comp}\) be \text{less}\{} and \(\text{proj}\) be \text{identity}\{} for overloads with no parameters by those names.

Preconditions: For the overloads in namespace \text{std}, \text{BidirectionalIterator} meets the \text{Cpp17Value-Swappable} requirements (16.4.4.3).

Effects: Takes a sequence defined by the range \([\text{first}, \text{last})\) and transforms it into the previous permutation. The previous permutation is found by assuming that the set of all permutations is lexicographically sorted with respect to \(\text{comp}\) and \(\text{proj}\). If no such permutation exists, transforms the sequence into the last permutation; that is, the descendingly-sorted one.

Returns: Let \(\mathbf{B}\) be \text{true} if a previous permutation was found and otherwise \text{false}. Returns:

- \(\mathbf{B}\) for the overloads in namespace \text{std}.
- \{ \text{last, B} \} for the overloads in namespace \text{ranges}.

Complexity: At most \((\text{last} - \text{first}) / 2\) swaps.

27.9 Header <numeric> synopsis

```cpp
namespace std {

// 27.10.3, accumulate
template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);

// 27.10.4, reduce
template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::value_type
reduce(InputIterator first, InputIterator last);

// see 27.3.5
ForwardIterator first, ForwardIterator last);
```

```cpp
template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init,
                   BinaryOperation binary_op);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type
reduce(ExecutionPolicy&& exec,
       ForwardIterator first, ForwardIterator last);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, T init);
```

```cpp
template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec,
         ForwardIterator first, ForwardIterator last, T init, BinaryOperation binary_op);
```

// 27.10.16, midpoint
template<class T>
constexpr T midpoint(T a, T b) noexcept;
template<class T>
constexpr T* midpoint(T* a, T* b);

27.10 Generalized numeric operations [numeric.ops]
27.10.1 General [numeric.ops.general]
[Note 1: The use of closed ranges as well as semi-open ranges to specify requirements throughout 27.10 is intentional. — end note]

27.10.2 Definitions [numerics.defns]
1 Define GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ...,aN) as follows:

(1.1) — a1 when N is 1, otherwise
(1.2) — op(GENERALIZED_NONCOMMUTATIVE_SUM(op, a1, ..., aK),
GENERALIZED_NONCOMMUTATIVE_SUM(op, aM, ..., aN)) for any K where 1 < K + 1 = M ≤ N.

2 Define GENERALIZED_SUM(op, a1, ..., aN) as GENERALIZED_NONCOMMUTATIVE_SUM(op, b1, ..., bN),
where b1, ..., bN may be any permutation of a1, ..., aN.

27.10.3 Accumulate [accumulate]

template<class InputIterator, class T>
constexpr T accumulate(InputIterator first, InputIterator last, T init);

1 Preconditions: T meets the Cpp17CopyConstructible (Table 33) and Cpp17CopyAssignable (Table 35) requirements. In the range [first, last], binary_op neither modifies elements nor invalidates iterators or subranges.

2 Effects: Computes its result by initializing the accumulator acc with the initial value init and then modifies it with acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) for every iterator i in the range [first, last) in order.

27.10.4 Reduce [reduce]

template<class InputIterator>
constexpr typename iterator_traits<InputIterator>::value_type reduce(InputIterator first, InputIterator last);

1 Effects: Equivalent to:
return reduce(first, last, typename iterator_traits<InputIterator>::value_type());

template<class ExecutionPolicy, class ForwardIterator>
typename iterator_traits<ForwardIterator>::value_type reduce(ExecutionPolicy& exec,
ForwardIterator first, ForwardIterator last);

2 Effects: Equivalent to:
return reduce(std::forward<ExecutionPolicy>(exec), first, last,
typename iterator_traits<ForwardIterator>::value_type());

template<class InputIterator, class T>
constexpr T reduce(InputIterator first, InputIterator last, T init);

3 Effects: Equivalent to:
return reduce(first, last, init, plus<>());

224) The use of fully closed ranges is intentional.
225) accumulate is similar to the APL reduction operator and Common Lisp reduce function, but it avoids the difficulty of defining the result of reduction on an empty sequence by always requiring an initial value.
template<class ExecutionPolicy, class ForwardIterator, class T>
T reduce(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, T init);

Effects: Equivalent to:
          return reduce(std::forward<ExecutionPolicy>(exec), first, last, init, plus<>());

template<class InputIterator, class T, class BinaryOperation>
constexpr T reduce(InputIterator first, InputIterator last, T init, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator, class T, class BinaryOperation>
T reduce(ExecutionPolicy&& exec, ForwardIterator first, ForwardIterator last, T init, BinaryOperation binary_op);

Mandates: All of
(5.1) — binary_op(init, *first),
(5.2) — binary_op(*first, init),
(5.3) — binary_op(init, init), and
(5.4) — binary_op(*first, *first)
are convertible to T.

Preconditions:
(6.1) — T meets the Cpp17MoveConstructible (Table 32) requirements.
(6.2) — binary_op neither invalidates iterators or subranges, nor modifies elements in the range [first, last].

Returns: GENERALIZED_SUM(binary_op, init, *i, ...) for every i in [first, last).

Complexity: \(O(last - first)\) applications of binary_op.

[Note 1: The difference between reduce and accumulate is that reduce applies binary_op in an unspecified order, which yields a nondeterministic result for non-associative or non-commutative binary_op such as floating-point addition. — end note]

27.10.5 Inner product [inner.product]

template<class InputIterator1, class InputIterator2, class T>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, T init);

template<class InputIterator1, class InputIterator2, class T, class BinaryOperation1, class BinaryOperation2>
constexpr T inner_product(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, T init,
BinaryOperation1 binary_op1, BinaryOperation2 binary_op2);

Preconditions: T meets the Cpp17CopyConstructible (Table 33) and Cpp17CopyAssignable (Table 35) requirements. In the ranges [first1, last1] and [first2, first2 + (last1 - first1)] binary_op1 and binary_op2 neither modifies elements nor invalidates iterators or subranges.

Effects: Computes its result by initializing the accumulator acc with the initial value init and then modifying it with acc = std::move(acc) + (*i1) * (*i2) or acc = binary_op1(std::move(acc), binary_op2(*i1, *i2)) for every iterator i1 in the range [first1, last1] and iterator i2 in the range [first2, first2 + (last1 - first1)] in order.

27.10.6 Transform reduce [transform.reduce]

template<class InputIterator1, class InputIterator2, class T>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1, InputIterator2 first2, T init);

Effects: Equivalent to:

\[226\) The use of fully closed ranges is intentional.
return transform_reduce(first1, last1, first2, init, plus<>(), multiplies<>());

template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T>
T transform_reduce(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2,
    T init);

Effects: Equivalent to:
return transform_reduce(std::forward<ExecutionPolicy>(exec),
    first1, last1, first2, init, plus<>(), multiplies<>());

template<class InputIterator1, class InputIterator2, class T,
    class BinaryOperation1, class BinaryOperation2>
constexpr T transform_reduce(InputIterator1 first1, InputIterator1 last1,
    InputIterator2 first2,
    T init,
    BinaryOperation1 binary_op1,
    BinaryOperation2 binary_op2);

template<class ExecutionPolicy,
    class ForwardIterator1, class ForwardIterator2, class T,
    class BinaryOperation1, class BinaryOperation2>
T transform_reduce(ExecutionPolicy&& exec,
    ForwardIterator1 first1, ForwardIterator1 last1,
    ForwardIterator2 first2,
    T init,
    BinaryOperation1 binary_op1,
    BinaryOperation2 binary_op2);

Mandates: All of
(3.1) — binary_op1(init, init),
(3.2) — binary_op1(init, binary_op2(*first1, *first2)),
(3.3) — binary_op1(binary_op2(*first1, *first2), init), and
(3.4) — binary_op1(binary_op2(*first1, *first2), binary_op2(*first1, *first2))
are convertible to T.

Preconditions:
(4.1) — T meets the C++17MoveConstructible (Table 32) requirements.
(4.2) — Neither binary_op1 nor binary_op2 invalidates subranges, nor modifies elements in the ranges
[first1, last1] and [first2, first2 + (last1 - first1)].

Returns:
GENERALIZED_SUM(binary_op1, init, binary_op2(*i, *(first2 + (i - first1))), ...)
for every iterator i in [first1, last1).

Complexity: Θ(last1 - first1) applications each of binary_op1 and binary_op2.

template<class InputIterator, class T,
    class BinaryOperation, class UnaryOperation>
constexpr T transform_reduce(InputIterator first, InputIterator last, T init,
    BinaryOperation binary_op, UnaryOperation unary_op);

template<class ExecutionPolicy,
    class ForwardIterator, class T,
    class BinaryOperation, class UnaryOperation>
T transform_reduce(ExecutionPolicy&& exec,
    ForwardIterator first, ForwardIterator last,
    T init, BinaryOperation binary_op, UnaryOperation unary_op);

Mandates: All of
(7.1) — binary_op1(init, init),
(7.2) — binary_op1(init, unary_op(*first)),

§ 27.10.6
— binary_op(unary_op(*first), init), and
— binary_op(unary_op(*first), unary_op(*first))
are convertible to T.

**Preconditions:**
— T meets the Cpp17MoveConstructible (Table 32) requirements.
— Neither unary_op nor binary_op invalidates subranges, nor modifies elements in the range [first, last].

**Returns:**
GENERALIZED_SUM(binary_op, init, unary_op(*i), ...)
for every iterator i in [first, last).

**Complexity:** \( \Theta((last - first) \text{ applications each of unary_op and binary_op.} \)

**Note 1:** transform_reduce does not apply unary_op to init. — end note

### 27.10.7 Partial sum

```cpp
template<class InputIterator, class OutputIterator>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last, OutputIterator result);

template<class InputIterator, class OutputIterator, class BinaryOperation>
constexpr OutputIterator
partial_sum(InputIterator first, InputIterator last, OutputIterator result, BinaryOperation binary_op);
```

**Mandates:** InputIterator’s value type is constructible from *first. The result of the expression std::move(acc) + *i or binary_op(std::move(acc), *i) is implicitly convertible to InputIterator’s value type. acc is writable (25.3.1) to result.

**Preconditions:** In the ranges [first, last] and [result, result + (last - first)] binary_op neither modifies elements nor invalidates iterators or subranges.\(^\text{227}\)

**Effects:** For a non-empty range, the function creates an accumulator acc whose type is InputIterator’s value type, initializes it with *first, and assigns the result to *result. For every iterator i in [first + 1, last) in order, acc is then modified by acc = std::move(acc) + *i or acc = binary_op(std::move(acc), *i) and the result is assigned to *(result + (i - first)).

**Returns:** result + (last - first).

**Complexity:** Exactly \( (last - first) - 1 \) applications of the binary operation.

**Remarks:** result may be equal to first.

### 27.10.8 Exclusive scan

```cpp
template<class InputIterator, class OutputIterator, class T>
constexpr OutputIterator
exclusive_scan(InputIterator first, InputIterator last, OutputIterator result, T init);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class T>
ForwardIterator2
exclusive_scan(ExecutionPolicy&& exec, ForwardIterator1 first, ForwardIterator1 last, ForwardIterator2 result, T init);
```

**Effects:** Equivalent to:
return exclusive_scan(first, last, result, init, plus<>());

**Effects:** Equivalent to:
return exclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, init, plus<>());

\(^{227}\) The use of fully closed ranges is intentional.
template<class InputIterator, class OutputIterator, class T, class BinaryOperation>  
constexpr OutputIterator exclusive_scan(InputIterator first, InputIterator last,  
OutputIterator result, T init, BinaryOperation binary_op);

template<class ExecutionPolicy,  
class ForwardIterator1, class ForwardIterator2, class T, class BinaryOperation>  
ForwardIterator2 exclusive_scan(ExecutionPolicy&& exec,  
ForwardIterator1 first, ForwardIterator1 last,  
ForwardIterator2 result, T init, BinaryOperation binary_op);

Mandates: All of
(3.1) — binary_op(init, init),
(3.2) — binary_op(init, *first), and
(3.3) — binary_op(*first, *first)
are convertible to T.

Preconditions:
(4.1) — T meets the Cpp17MoveConstructible (Table 32) requirements.
(4.2) — binary_op neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result.result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of:

\[
\text{GENERALIZED\_NONCOMMUTATIVE\_SUM}(
\text{binary\_op}, \text{init}, \ast(\text{first} + 0), \ast(\text{first} + 1), \ldots, \ast(\text{first} + K - 1))
\]

Returns: The end of the resulting range beginning at result.

Complexity: \(\Theta(last - first)\) applications of binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between exclusive_scan and inclusive_scan is that exclusive_scan excludes the \(i^{th}\) input element from the \(i^{th}\) sum. If binary_op is not mathematically associative, the behavior of exclusive_scan can be nondeterministic. — end note]

27.10.9 Inclusive scan

template<class InputIterator, class OutputIterator>  
constexpr OutputIterator inclusive_scan(InputIterator first, InputIterator last,  
OutputIterator result);

Effects: Equivalent to:

return inclusive_scan(first, last, result, plus<>());

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2>  
ForwardIterator2 inclusive_scan(ExecutionPolicy&& exec,  
ForwardIterator1 first, ForwardIterator1 last,  
ForwardIterator2 result);

Effects: Equivalent to:

return inclusive_scan(std::forward<ExecutionPolicy>(exec), first, last, result, plus<>());

template<class InputIterator, class OutputIterator, class BinaryOperation>  
constexpr OutputIterator inclusive_scan(InputIterator first, InputIterator last,  
OutputIterator result, BinaryOperation binary_op);

template<class ExecutionPolicy, class ForwardIterator1, class ForwardIterator2, class BinaryOperation>  
ForwardIterator2 inclusive_scan(ExecutionPolicy&& exec,  
ForwardIterator1 first, ForwardIterator1 last,  
ForwardIterator2 result, BinaryOperation binary_op);
template<class InputIterator, class OutputIterator, class BinaryOperation, class T>
constexpr OutputIterator
inclusive_scan(InputIterator first, InputIterator last, 
OutputIterator result, BinaryOperation binary_op, T init);

template<class ExecutionPolicy, 
class ForwardIterator1, class ForwardIterator2, class BinaryOperation, class T>
ForwardIterator2
inclusive_scan(ExecutionPolicy&& exec, 
ForwardIterator1 first, ForwardIterator1 last, 
ForwardIterator2 result, BinaryOperation binary_op, T init);

Let U be the value type of decltype(first).

Mandates: If init is provided, all of
(4.1) — binary_op(init, init),
(4.2) — binary_op(init, *first), and
(4.3) — binary_op(*first, *first)
are convertible to T; otherwise, binary_op(*first, *first) is convertible to U.

Preconditions:
(5.1) — If init is provided, T meets the Cpp17MoveConstructible (Table 32) requirements; otherwise, U meets the Cpp17MoveConstructible requirements.
(5.2) — binary_op neither invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of
(6.1) — GENERALIZED_NONCOMMUTATIVE_SUM( 
    binary_op, init, *(first + 0), *(first + 1), ..., *(first + K))
if init is provided, or
(6.2) — GENERALIZED_NONCOMMUTATIVE_SUM( 
    binary_op, *(first + 0), *(first + 1), ..., *(first + K))
otherwise.

Returns: The end of the resulting range beginning at result.

Complexity: \(O(last - first)\) applications of binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between exclusive_scan and inclusive_scan is that inclusive_scan includes the \(i^{th}\) input element in the \(i^{th}\) sum. If binary_op is not mathematically associative, the behavior of inclusive_scan can be nondeterministic. — end note]

27.10.10 Transform exclusive scan

[transform.exclusive.scan]
(1.3)  — binary_op(unary_op(*first), unary_op(*first))

are convertible to T.

2 Preconditions:
(2.1)  — T meets the Cpp17MoveConstructible (Table 32) requirements.
(2.2)  — Neither unary_op nor binary_op invalidates iterators or subranges, nor modifies elements in the
ranges [first, last] or [result, result + (last - first)].

3 Effects: For each integer K in [0, last - first] assigns through result + K the value of:

\[
\text{GENERALIZED_NONCOMMUTATIVE_SUM} \\
\text{binary_op, init,} \\
\text{unary_op(*((first + 0)), unary_op(*((first + 1)), ..., unary_op(*((first + K - 1)))}
\]

4 Returns: The end of the resulting range beginning at result.
5 Complexity: \(O(last - first)\) applications each of unary_op and binary_op.
6 Remarks: result may be equal to first.
7 [Note 1: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_exclusive_scan excludes the i-th input element from the i-th sum. If binary_op is not mathematically associative, the behavior of transform_exclusive_scan can be nondeterministic. transform_exclusive_scan does not apply unary_op to init. — end note]
are convertible to T; otherwise, binary_op(unary_op(*first), unary_op(*first)) is convertible to U.

3

Preconditions:

(3.1) If init is provided, T meets the Cpp17MoveConstructible (Table 32) requirements; otherwise, U meets the Cpp17MoveConstructible requirements.

(3.2) Neither unary_op nor binary_op invalidates iterators or subranges, nor modifies elements in the ranges [first, last] or [result, result + (last - first)].

Effects: For each integer K in [0, last - first) assigns through result + K the value of

(4.1) GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op, init,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))
) if init is provided, or

(4.2) GENERALIZED_NONCOMMUTATIVE_SUM(
    binary_op,
    unary_op(*(first + 0)), unary_op(*(first + 1)), ..., unary_op(*(first + K))
) otherwise.

Returns: The end of the resulting range beginning at result.

Complexity: \(O(last - first)\) applications each of unary_op and binary_op.

Remarks: result may be equal to first.

[Note 1: The difference between transform_exclusive_scan and transform_inclusive_scan is that transform_inclusive_scan includes the \(i\)th input element in the \(i\)th sum. If binary_op is not mathematically associative, the behavior of transform_inclusive_scan can be nondeterministic. transform_inclusive_scan does not apply unary_op to init. — end note]
— For the overloads with no ExecutionPolicy, $T$ meets the Cpp17MoveAssignable (Table 34) requirements.

— For all overloads, in the ranges $[\text{first}, \text{last}]$ and $[\text{result.result + (last - first)}, \text{binary_op}]$ neither modifies elements nor invalidates iterators or subranges.\(^{228}\)

**Effects:** For the overloads with no ExecutionPolicy and a non-empty range, the function creates an accumulator acc of type $T$, initializes it with $\ast\text{first}$, and assigns the result to $\ast\text{result}$. For every iterator $i$ in $[\text{first} + 1, \text{last})$ in order, creates an object val whose type is $T$, initializes it with $\ast i$, computes $\text{binary_op}(\text{val}, \text{std::move(acc)})$, assigns the result to $\ast (\text{result + (i - first)})$, and move assigns from val to acc.

For the overloads with an ExecutionPolicy and a non-empty range, performs $\ast\text{result} = \ast\text{first}$. Then, for every $d$ in $[1, \text{last} - \text{first} - 1]$, performs $\ast (\text{result + d}) = \text{binary_op}((\text{first + d}), *(\text{first + (d - 1)}))$.

**Returns:** result + (last - first).

**Complexity:** Exactly (last - first) - 1 applications of the binary operation.

**Remarks:** For the overloads with no ExecutionPolicy, result may be equal to first. For the overloads with an ExecutionPolicy, the ranges $[\text{first}, \text{last})$ and $[\text{result.result + (last - first)}]$ shall not overlap.

### 27.10.13 Iota

**Template:**

```cpp
template<class ForwardIterator, class T>
constexpr void iota(ForwardIterator first, ForwardIterator last, T value);
```

**Mandates:** $T$ is convertible to ForwardIterator’s value type. The expression $\ast\ast\text{val}$, where val has type $T$, is well-formed.

**Effects:** For each element referred to by the iterator $i$ in the range $[\text{first}, \text{last})$, assigns $\ast i = \text{value}$ and increments value as if by $\ast\ast\text{value}$.

**Complexity:** Exactly last - first increments and assignments.

```cpp
template<input_or_output_iterator O, sentinel_for<O> S, weakly_incrementable T>
requires indirectly_writable<O, const T&>
constexpr ranges::iota_result<O, T> ranges::iota(O first, S last, T value);
```

**Effects:** Equivalent to:

```cpp
while (first != last) {
    *first = as_const(value);
    ++first;
    ++value;
}
```

**Returns:** Zero when $m$ and $n$ are both zero. Otherwise, returns the greatest common divisor of $|m|$ and $|n|$.

**Throws:** Nothing.

\(^{228}\) The use of fully closed ranges is intentional.
27.10.15 Least common multiple

template<class M, class N>
constexpr common_type_t<M, N> lcm(M m, N n);

1 Mandates: \( \mathbb{M} \) and \( \mathbb{N} \) both are integer types other than \( \mathbf{cv bool} \).

2 Preconditions: \( |m| \) and \( |n| \) are representable as a value of \( \text{common
type}_t<\mathbb{M}, \mathbb{N}> \). The least common multiple of \( |m| \) and \( |n| \) is representable as a value of type \( \text{common
type}_t<\mathbb{M}, \mathbb{N}> \).

3 Returns: Zero when either \( m \) or \( n \) is zero. Otherwise, returns the least common multiple of \( |m| \) and \( |n| \).

4 Throws: Nothing.

27.10.16 Midpoint

template<class T>
constexpr T midpoint(T a, T b) noexcept;

1 Constraints: \( T \) is an arithmetic type other than \( \mathbf{bool} \).

2 Returns: Half the sum of \( a \) and \( b \). If \( T \) is an integer type and the sum is odd, the result is rounded towards \( a \).

3 Remarks: No overflow occurs. If \( T \) is a floating-point type, at most one inexact operation occurs.

template<class T>
constexpr T* midpoint(T* a, T* b);

4 Constraints: \( T \) is an object type.

5 Mandates: \( T \) is a complete type.

6 Preconditions: \( a \) and \( b \) point to, respectively, elements \( i \) and \( j \) of the same array object \( x \).

[Note 1: As specified in 6.8.4, an object that is not an array element is considered to belong to a single-element array for this purpose and a pointer past the last element of an array of \( n \) elements is considered to be equivalent to a pointer to a hypothetical array element \( n \) for this purpose. — end note]

7 Returns: A pointer to array element \( i + \frac{j-1}{2} \) of \( x \), where the result of the division is truncated towards zero.

27.11 Specialized <memory> algorithms

27.11.1 General

1 The contents specified in 27.11 are declared in the header \(<\text{memory}> \) (20.2.2).

2 Unless otherwise specified, if an exception is thrown in the following algorithms, objects constructed by a placement \textit{new-expression} (7.6.2.8) are destroyed in an unspecified order before allowing the exception to propagate.

[Note 1: When invoked on ranges of potentially-overlapping subobjects (6.7.2), the algorithms specified in 27.11 result in undefined behavior. — end note]

4 Some algorithms specified in 27.11 make use of the exposition-only function \textit{voidify}:

\[
\text{template<class T>}
\text{constexpr void* voidify(T& obj) noexcept} \{
\text{return const_cast<volatile void*>(addressof(obj))};
\}
\]

27.11.2 Special memory concepts

1 Some algorithms in this subclause are constrained with the following exposition-only concepts:

\[
\text{template<class I>}
\text{concept nothrow-input-iterator = // exposition only}
\text{input_iterator<I> &&}
\text{is_lvalue_reference_v<iter_reference_t<I>> &&}
\text{same_as<remove_cvref_t<iter_reference_t<I>>, iter_value_t<I>>>};
\]

A type \( I \) models \textit{nothrow-input-iterator} only if no exceptions are thrown from increment, copy construction, move construction, copy assignment, move assignment, or indirection through valid iterators.
Note 1: This concept allows some input_iterator (25.3.4.9) operations to throw exceptions. — end note

```
template<class S, class I>
concept noexcept-sentinel-for = sentinel_for<S, I>; // exposition only
```

Types S and I model noexcept-sentinel-for only if no exceptions are thrown from copy construction, move construction, copy assignment, move assignment, or comparisons between valid values of type I and S.

Note 2: This concept allows some sentinel_for (25.3.4.7) operations to throw exceptions. — end note

```
template<class R>
concept noexcept-input-range = // exposition only
  range<R> &&
  noexcept-input-iterator<iterator_t<R>> &&
  noexcept-sentinel-for<sentinel_t<R>, iterator_t<R>>;
```

A type R models noexcept-input-range only if no exceptions are thrown from calls to ranges::begin and ranges::end on an object of type R.

```
template<class I>
concept noexcept-forward-iterator = // exposition only
  noexcept-input-iterator<I> &&
  forward_iterator<I> &&
  noexcept-sentinel-for<I, I>;
```

Note 3: This concept allows some forward_iterator (25.3.4.11) operations to throw exceptions. — end note

```
template<class R>
concept noexcept-forward-range = // exposition only
  noexcept-input-range<R> &&
  noexcept-forward-iterator<iterator_t<R>>;
```

### 27.11.3 uninitialized_default_construct

```
template<class NoThrowForwardIterator>
void uninitialized_default_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);
```

**Effects:** Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first))
  typename iterator_traits<NoThrowForwardIterator>::value_type;
```

```
namespace ranges {
  template<nothrow-forward-iterator I, noexcept-sentinel-for<I> S>
  requires default_initializable<iter_value_t<I>>
  I uninitialized_default_construct(I first, S last);
  template<nothrow-forward-range R>
  requires default_initializable<range_value_t<R>>
  borrowed_iterator_t<R> uninitialized_default_construct(R&& r);
}
```

**Effects:** Equivalent to:

```
for (; first != last; ++first)
  ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>;
  return first;
```

```
template<class NoThrowForwardIterator, class Size>
NoThrowForwardIterator uninitialized_default_construct_n(NoThrowForwardIterator first, Size n);
```

**Effects:** Equivalent to:

```
for (; n > 0; (void)++first, --n)
  ::new (voidify(*first))
  typename iterator_traits<NoThrowForwardIterator>::value_type;
  return first;
```
namespace ranges {
    template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_default_construct_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
        return uninitialized_default_construct(counted_iterator(first, n),
                                             default_sentinel).base();

27.11.4 uninitialized_value_construct [uninitialized.construct.value]

template<class NoThrowForwardIterator>
void uninitialized_value_construct(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
        for (; first != last; ++first)
            ::new (voidify(*first))
        typename iterator_traits<NoThrowForwardIterator>::value_type();

namespace ranges {
    template<nothrow-forward-iterator I, nothrow-sentinel-for<I> S>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct(I first, S last);
    template<nothrow-forward-range R>
    requires default_initializable<range_value_t<R>>
    borrowed_iterator_t<R> uninitialized_value_construct(R&& r);
}

Effects: Equivalent to:
        for (; first != last; ++first)
            ::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>();
        return first;

namespace ranges {
    template<nothrow-forward-iterator I>
    requires default_initializable<iter_value_t<I>>
    I uninitialized_value_construct_n(I first, iter_difference_t<I> n);
}

Effects: Equivalent to:
        return uninitialized_value_construct(counted_iterator(first, n),
                                             default_sentinel).base();

27.11.5 uninitialized_copy [uninitialized.copy]

template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_copy(InputIterator first, InputIterator last,
                                          NoThrowForwardIterator result);

Preconditions: result + [0, (last - first)) does not overlap with [first, last).

Effects: Equivalent to:
        for (; first != last; ++result, (void) ++first)
            ::new (voidify(*result))
        typename iterator_traits<NoThrowForwardIterator>::value_type(*first);

Returns: result.
namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
             nothrow-forward_iterator O, nothrow-sentinel_for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_result<I, O>
    uninitialized_copy(I ifirst, S1 ilast, O ofirst, S2 olast);
    template<input_range IR, nothrow-forward-range OR>
    requires constructible_from<range_value_t<OR>, range_reference_t<IR>>
    uninitialized_copy_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
    uninitialized_copy(IR&& in_range, OR&& out_range);
}

4 Preconditions: [ofirst, olast) does not overlap with [ifirst, ilast).
5 Effects: Equivalent to:
   for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
       ::new (voidify(*ofirst)) remove_reference_t<iter_reference_t<O>>(*ifirst);
   return {std::move(ifirst), ofirst};

6 Preconditions: result + [0, n) does not overlap with first + [0, n).
7 Effects: Equivalent to:
   for ( ; n > 0; ++result, (void)++first, --n)
       ::new (voidify(*result))
           typename iterator_traits<NoThrowForwardIterator>::value_type(*first);
8 Returns: result.

namespace ranges {
    template<input_iterator I, nothrow-forward_iterator O, nothrow-sentinel_for<O> S>
    requires constructible_from<iter_value_t<O>, iter_reference_t<I>>
    uninitialized_copy_n_result<I, O>
    uninitialized_copy_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

9 Preconditions: [ofirst, olast) does not overlap with ifirst + [0, n).
10 Effects: Equivalent to:
   auto t = uninitialized_copy(counted_iterator(std::move(ifirst), n),
                                default_sentinel, ofirst, olast);
   return {std::move(t.in).base(), t.out};

§ 27.11.6 uninitialized_move [uninitialized.move]

template<class InputIterator, class NoThrowForwardIterator>
NoThrowForwardIterator uninitialized_move(InputIterator first, InputIterator last,
                                           NoThrowForwardIterator result);
1 Preconditions: result + [0, (last - first)) does not overlap with [first, last).
2 Effects: Equivalent to:
   for (; first != last; (void)++result, ++first)
       ::new (voidify(*result))
           typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
   return result;

namespace ranges {
    template<input_iterator I, sentinel_for<I> S1,
             nothrow-forward_iterator O, nothrow-sentinel_for<O> S2>
    requires constructible_from<iter_value_t<O>, iter_rvalue_reference_t<I>>
    uninitialized_move_result<I, O>
    uninitialized_move(I ifirst, S1 ilast, O ofirst, S2 olast);
}
template<input_range IR, noexcept-forward-range OR>
uninitialized_move_result<borrowed_iterator_t<IR>, borrowed_iterator_t<OR>>
uninitialized_move(IR&& in_range, OR&& out_range);

Preconditions: [ofirst, olast) does not overlap with [ifirst, ilast).

Effects: Equivalent to:
for (; ifirst != ilast && ofirst != olast; ++ofirst, (void)++ifirst)
::new (voidify(*ofirst))
remove_reference_t<iter_reference_t<OR>>(ranges::iter_move(ifirst));
return {std::move(ifirst), ofirst};

[Note 1: If an exception is thrown, some objects in the range [ifirst, ilast) are left in a valid, but unspecified state. — end note]

template<class InputIterator, class Size, class NoThrowForwardIterator>
pair<InputIterator, NoThrowForwardIterator>
uninitialized_move_n(InputIterator first, Size n, NoThrowForwardIterator result);

Preconditions: result + [0, n) does not overlap with first + [0, n).

Effects: Equivalent to:
for (; n > 0; ++result, (void) ++first, --n)
::new (voidify(*result))
typename iterator_traits<NoThrowForwardIterator>::value_type(std::move(*first));
return {first, result};

namespace ranges {
  template<input_iterator I, noexcept-forward_iterator O, noexcept-sentinel_for<O> S>
  requires constructible_from<iter_value_t<I>, iter_rvalue_reference_t<I>>
  uninitialized_move_n_result<I, O>
  uninitialized_move_n(I ifirst, iter_difference_t<I> n, O ofirst, S olast);
}

Preconditions: [ofirst, olast) does not overlap with ifirst + [0, n).

Effects: Equivalent to:
auto t = uninitialized_move(counted_iterator(std::move(ifirst), n), default_sentinel, ofirst, olast);
return {std::move(t.in).base(), t.out};

[Note 2: If an exception is thrown, some objects in the range ifirst + [0, n) are left in a valid but unspecified state. — end note]

27.11.7 uninitialized_fill

template<class NoThrowForwardIterator, class T>
void uninitialized_fill(NoThrowForwardIterator first, NoThrowForwardIterator last, const T& x);

Effects: Equivalent to:
for (; first != last; ++first)
::new (voidify(*first))
typename iterator_traits<NoThrowForwardIterator>::value_type(x);

namespace ranges {
  template<nothrow-forward-iterator I, noexcept-sentinel_for<I> S, class T>
  requires constructible_from<iter_value_t<I>, const T&>
  I uninitialized_fill(I ifirst, S last, const T& x);
  template<nothrow-forward-range R, class T>
  requires constructible_from<range_value_t<R>, const T&>
  borrowed_iterator_t<R> uninitialized_fill(R&& r, const T& x);
}

Effects: Equivalent to:
for (; first != last; ++first)
::new (voidify(*first)) remove_reference_t<iter_reference_t<I>>(x);

§ 27.11.7
return first;

template<class NoThrowForwardIterator, class Size, class T>
NoThrowForwardIterator uninitialized_fill_n(NoThrowForwardIterator first, Size n, const T& x);

Effects: Equivalent to:
   for (; n--; ++first)
      ::new (voidify(*first))
         typename iterator_traits<NoThrowForwardIterator>::value_type(x);
   return first;

namespace ranges {
    template<nothrow-forward_iterator I, class T>
    requires constructible_from<iter_value_t<I>, const T&>
    I uninitialized_fill_n(I first, iter_difference_t<I> n, const T& x);
}

Effects: Equivalent to:
   return uninitialized_fill(counted_iterator(first, n), default_sentinel, x).base();

27.11.8 construct_at

   template<class T, class... Args>
   constexpr T* construct_at(T* location, Args&&... args);

namespace ranges {
    template<class T, class... Args>
    constexpr T* construct_at(T* location, Args&&... args);
}

Constraints: The expression ::new (declval<volatile*>()) T(declval<Args>()...) is well-formed when treated as an unevaluated operand (7.2.3).

Effects: Equivalent to:
   return ::new (voidify(*location)) T(std::forward<Args>(args)...);

27.11.9 destroy

   template<class T>
   constexpr void destroy_at(T* location);

namespace ranges {
    template<destructible T>
    constexpr void destroy_at(T* location) noexcept;
}

Effects:
   — If T is an array type, equivalent to destroy(begin(*location), end(*location)).
   — Otherwise, equivalent to location->~T().

   template<class NoThrowForwardIterator>
   constexpr void destroy(NoThrowForwardIterator first, NoThrowForwardIterator last);

Effects: Equivalent to:
   for (; first != last; ++first)
      destroy_at(addressof(*first));

namespace ranges {
    template<nothrow-input-iterator I, nothrow-sentinel_for<I> S>
    requires destructible<iter_value_t<I>>
    constexpr I destroy(I first, S last) noexcept;
    template<nothrow-input-range R>
    requires destructible<range_value_t<R>>
    constexpr borrowed_iterator_t<R> destroy(R&& r) noexcept;
}

Effects: Equivalent to:
for (; first != last; ++first)
    destroy_at(addressof(*first));
return first;

template<class NoThrowForwardIterator, class Size>
constexpr NoThrowForwardIterator destroy_n(NoThrowForwardIterator first, Size n);

Effects: Equivalent to:
for (; n > 0; (void)++first, --n)
    destroy_at(addressof(*first));
return first;

namespace ranges {
    template<nothrow-input_iterator I>
    requires destructible<iter_value_t<I>>
    constexpr I destroy_n(I first, iter_difference_t<I> n) noexcept;
}

Effects: Equivalent to:
return destroy(counted_iterator(std::move(first), n), default_sentinel).base();

27.12 C library algorithms
[alg.c.library]

Note 1: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note

void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              c-compare-pred* compar);
void* bsearch(const void* key, const void* base, size_t nmemb, size_t size,
              compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size,
           c-compare-pred* compar);
void qsort(void* base, size_t nmemb, size_t size, compare-pred* compar);

Preconditions: For qsort, the objects in the array pointed to by base are of trivially copyable type.

Effects: These functions have the semantics specified in the C standard library.

Throws: Any exception thrown by compar (16.4.6.13).

See also: ISO C 7.22.5
28  Numerics library

28.1  General

1 This Clause describes components that C++ programs may use to perform seminumerical operations.

2 The following subclauses describe components for complex number types, random number generation, numeric (n-at-a-time) arrays, generalized numeric algorithms, and mathematical constants and functions for floating-point types, as summarized in Table 95.

Table 95: Numerics library summary

<table>
<thead>
<tr>
<th>Subclause</th>
<th>Header</th>
</tr>
</thead>
<tbody>

</tr>
<tr>
<td>28.7</td>
<td>Mathematical functions for floating-point types</td>
</tr>
<tr>
<td>28.8</td>
<td>Numbers</td>
</tr>
</tbody>
</table>

28.2 Numeric type requirements

1 The complex and valarray components are parameterized by the type of information they contain and manipulate. A C++ program shall instantiate these components only with a numeric type. A numeric type is a cv-unqualified object type T that meets the Cpp17DefaultConstructible, Cpp17CopyConstructible, Cpp17CopyAssignable, and Cpp17Destructible requirements (16.4.4.2).

2 If any operation on T throws an exception the effects are undefined.

3 In addition, many member and related functions of valarray<T> can be successfully instantiated and will exhibit well-defined behavior if and only if T meets additional requirements specified for each such member or related function.

4 [Example 1: It is valid to instantiate valarray<complex>, but operator() will not be successfully instantiated for valarray<complex> operands, since complex does not have any ordering operators. — end example]

28.3 The floating-point environment

28.3.1 Header <cfenv> synopsis

```c
#define FE_ALL_EXCEPT see below
#define FE_DIVBYZERO see below  // optional
#define FE_INEXACT see below  // optional
#define FE_INVALID see below  // optional

int fesetenv(const fenv_t* penv);
int feupdateenv(const fenv_t* penv);

1 The contents and meaning of the header `<cfenv>` are the same as the C standard library header `<fenv.h>`.

[Note 1: This document does not require an implementation to support the FENV_ACCESS pragma; it is implementation-defined (15.9) whether the pragma is supported. As a consequence, it is implementation-defined whether these functions can be used to test floating-point status flags, set floating-point control modes, or run under non-default mode settings. If the pragma is used to enable control over the floating-point environment, this document does not specify the effect on floating-point evaluation in constant expressions. — end note]

See also: ISO C 7.6

28.3.2 Threads

1 The floating-point environment has thread storage duration (6.7.5.3). The initial state for a thread’s floating-point environment is the state of the floating-point environment of the thread that constructs the corresponding thread object (33.4.3) or jthread object (33.4.4) at the time it constructed the object.

[Note 1: That is, the child thread gets the floating-point state of the parent thread at the time of the child’s creation. — end note]

2 A separate floating-point environment is maintained for each thread. Each function accesses the environment corresponding to its calling thread.

28.4 Complex numbers

28.4.1 General

1 The header `<complex>` defines a class template, and numerous functions for representing and manipulating complex numbers.

2 The effect of instantiating the template `complex` for any type that is not a cv-unqualified floating-point type (6.8.2) is unspecified. Specializations of `complex` for cv-unqualified floating-point types are trivially-copyable literal types (6.8.1).

3 If the result of a function is not mathematically defined or not in the range of representable values for its type, the behavior is undefined.

4 If z is an lvalue of type `cv complex<T>` then:

(4.1) — the expression `reinterpret_cast<cv T(&)[2]>(z)` is well-formed,

(4.2) — `reinterpret_cast<cv T(&)[2]>(z)[0]` designates the real part of z, and

(4.3) — `reinterpret_cast<cv T(&)[2]>(z)[1]` designates the imaginary part of z.

Moreover, if a is an expression of type `cv complex<T*>` and the expression `a[i]` is well-defined for an integer expression i, then:

(4.4) — `reinterpret_cast<cv T*>(a)[2*i]` designates the real part of `a[i]`, and

(4.5) — `reinterpret_cast<cv T*>(a)[2*i + 1]` designates the imaginary part of `a[i].`

28.4.2 Header `<complex>` synopsis

namespace std {
    // 28.4.3, class template complex

    inline namespace complex_literals {
        constexpr complex<long double> operator"il(long double);
        constexpr complex<long double> operator"il(unsigned long long);
        constexpr complex<double> operator"i(long double);
        constexpr complex<double> operator"i(unsigned long long);
        constexpr complex<float> operator"if(long double);
        constexpr complex<float> operator"if(unsigned long long);
    }
}

28.4.3 Class template complex

namespace std {
    template<class T> class complex {
        public:
            using value_type = T;
            constexpr complex(const T& re = T(), const T& im = T());
            constexpr complex(const complex&) = default;
            template<class X> constexpr explicit (see below) complex(const complex<X>&);
            constexpr T real() const;
            constexpr void real(T);
            constexpr T imag() const;
            constexpr void imag(T);
            constexpr complex& operator= (const T&);
            constexpr complex& operator+=(const T&);
            constexpr complex& operator-=(const T&);
            constexpr complex& operator*=(const T&);
            constexpr complex& operator/=(const T&);
            template<class X> constexpr complex& operator= (const complex<X>&);
            template<class X> constexpr complex& operator+=(const complex<X>&);
            template<class X> constexpr complex& operator-=(const complex<X>&);
            template<class X> constexpr complex& operator*=(const complex<X>&);
            template<class X> constexpr complex& operator/=(const complex<X>&);
    };
}

1 The class complex describes an object that can store the Cartesian components, real() and imag(), of a complex number.

28.4.4 Member functions

constexpr complex(const T& re = T(), const T& im = T());

1 Postconditions: real() == re && imag() == im is true.

template<class X> constexpr explicit (see below) complex(const complex<X>& other);

2 Effects: Initializes the real part with other.real() and the imaginary part with other.imag().

Remarks: The expression inside explicit evaluates to false if and only if the floating-point conversion rank of T is greater than or equal to the floating-point conversion rank of X.

constexpr T real() const;

4 Returns: The value of the real component.
constexpr void real(T val);
   Effects: Assigns val to the real component.

constexpr T imag() const;
   Returns: The value of the imaginary component.

constexpr void imag(T val);
   Effects: Assigns val to the imaginary component.

28.4.5 Member operators

constexpr complex& operator+=(const T& rhs);
   Effects: Adds the scalar value rhs to the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.
   Returns: *this.

constexpr complex& operator-=(const T& rhs);
   Effects: Subtracts the scalar value rhs from the real part of the complex value *this and stores the result in the real part of *this, leaving the imaginary part unchanged.
   Returns: *this.

constexpr complex& operator*=(const T& rhs);
   Effects: Multiplies the scalar value rhs by the complex value *this and stores the result in *this.
   Returns: *this.

constexpr complex& operator/=(const T& rhs);
   Effects: Divides the scalar value rhs into the complex value *this and stores the result in *this.
   Returns: *this.

template<class X> constexpr complex& operator+=(const complex<X>& rhs);
   Effects: Adds the complex value rhs to the complex value *this and stores the sum in *this.
   Returns: *this.

template<class X> constexpr complex& operator-=(const complex<X>& rhs);
   Effects: Subtracts the complex value rhs from the complex value *this and stores the difference in *this.
   Returns: *this.

template<class X> constexpr complex& operator*=(const complex<X>& rhs);
   Effects: Multiplies the complex value rhs by the complex value *this and stores the product in *this.
   Returns: *this.

template<class X> constexpr complex& operator/=(const complex<X>& rhs);
   Effects: Divides the complex value rhs into the complex value *this and stores the quotient in *this.
   Returns: *this.

28.4.6 Non-member operations

template<class T> constexpr complex<T> operator+(const complex<T>& lhs);
   Returns: complex<T>(lhs).

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const complex<T>& rhs);

template<class T> constexpr complex<T> operator+(const complex<T>& lhs, const T& rhs);

template<class T> constexpr complex<T> operator+(const T& lhs, const complex<T>& rhs);

template<class T> constexpr complex<T> operator-=(const complex<T>& lhs);  
   Returns: complex<T>(lhs) += rhs.
template<class T> constexpr complex<T> operator-(const complex<T>& lhs);

Returns: complex<T>(-lhs.real(), -lhs.imag()).

template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator-(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator-(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) -= rhs.

template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr complex<T> operator*(const complex<T>& lhs, const T& rhs);
template<class T> constexpr complex<T> operator*(const T& lhs, const complex<T>& rhs);

Returns: complex<T>(lhs) *= rhs.

template<class T> constexpr bool operator==(const complex<T>& lhs, const complex<T>& rhs);
template<class T> constexpr bool operator==(const complex<T>& lhs, const T& rhs);

Returns: lhs.real() == rhs.real() && lhs.imag() == rhs.imag().

Remarks: The imaginary part is assumed to be T(), or 0.0, for the T arguments.

template<class T, class charT, class traits>
basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, complex<T>& x);

Preconditions: The input values are convertible to T.

Effects: Extracts a complex number x of the form: u, (u), or (u,v), where u is the real part and v is the imaginary part (31.7.5.3).

If bad input is encountered, calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)).

Returns: is.

Remarks: This extraction is performed as a series of simpler extractions. Therefore, the skipping of whitespace is specified to be the same for each of the simpler extractions.

template<class T, class charT, class traits>
basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& o, const complex<T>& x);

Effects: Inserts the complex number x onto the stream o as if it were implemented as follows:

basic_ostringstream<charT, traits> s;
s.flags(o.flags());
s.imbue(o.getloc());
s.precision(o.precision());
s << '(' << x.real() << ',' << x.imag() << ')';
return o << s.str();

[Note 1: In a locale in which comma is used as a decimal point character, the use of comma as a field separator can be ambiguous. Inserting showpoint into the output stream forces all outputs to show an explicit decimal point character; as a result, all inserted sequences of complex numbers can be extracted unambiguously. — end note]
template<class T> T arg(const complex<T>& x);
    Returns: The phase angle of x, or atan2(imag(x), real(x)).

template<class T> constexpr T norm(const complex<T>& x);
    Returns: The squared magnitude of x.

template<class T> complex<T> conj(const complex<T>& x);
    Returns: The complex conjugate of x.

template<class T> complex<T> proj(const complex<T>& x);
    Returns: The projection of x onto the Riemann sphere.
    Remarks: Behaves the same as the C function cproj. See also: ISO C 7.3.9.5

template<class T> complex<T> polar(const T& rho, const T& theta = T());
    Preconditions: rho is non-negative and non-NaN. theta is finite.
    Returns: The complex value corresponding to a complex number whose magnitude is rho and whose
    phase angle is theta.

28.4.8 Transcendentals [complex.transcendentals]

template<class T> complex<T> acos(const complex<T>& x);
    Returns: The complex arc cosine of x.
    Remarks: Behaves the same as the C function cacos. See also: ISO C 7.3.5.1

template<class T> complex<T> asin(const complex<T>& x);
    Returns: The complex arc sine of x.
    Remarks: Behaves the same as the C function casin. See also: ISO C 7.3.5.2

template<class T> complex<T> atan(const complex<T>& x);
    Returns: The complex arc tangent of x.
    Remarks: Behaves the same as the C function catan. See also: ISO C 7.3.5.3

template<class T> complex<T> acosh(const complex<T>& x);
    Returns: The complex arc hyperbolic cosine of x.
    Remarks: Behaves the same as the C function cacosh. See also: ISO C 7.3.6.1

template<class T> complex<T> asinh(const complex<T>& x);
    Returns: The complex arc hyperbolic sine of x.
    Remarks: Behaves the same as the C function casinh. See also: ISO C 7.3.6.2

template<class T> complex<T> atanh(const complex<T>& x);
    Returns: The complex arc hyperbolic tangent of x.
    Remarks: Behaves the same as the C function catanh. See also: ISO C 7.3.6.3

template<class T> complex<T> cos(const complex<T>& x);

template<class T> complex<T> cosh(const complex<T>& x);
    Returns: The complex hyperbolic cosine of x.

template<class T> complex<T> exp(const complex<T>& x);
    Returns: The complex base-e exponential of x.

template<class T> complex<T> log(const complex<T>& x);
    Returns: The complex natural (base-e) logarithm of x. For all x, imag(log(x)) lies in the interval
    \([-\pi, \pi]\).
17 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> log10(const complex<T>& x);

Returns: The complex common (base-10) logarithm of x, defined as log(x) / log(10).

18 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> pow(const complex<T>& x, const complex<T>& y);
template<class T> complex<T> pow(const complex<T>& x, const T& y);
template<class T> complex<T> pow(const T& x, const complex<T>& y);

Returns: The complex power of base x raised to the yth power, defined as exp(y * log(x)). The value returned for pow(0, 0) is implementation-defined.

19 Remarks: The branch cuts are along the negative real axis.

template<class T> complex<T> sin(const complex<T>& x);

Returns: The complex sine of x.

template<class T> complex<T> sinh(const complex<T>& x);

Returns: The complex hyperbolic sine of x.

template<class T> complex<T> sqrt(const complex<T>& x);

Returns: The complex square root of x, in the range of the right half-plane.

20 [Note 2: The semantics of this function are intended to be the same in C++ as they are for csqrt in C. — end note]

Remarks: The branch cuts are along the negative real axis.

21 Remarks: The branch cuts are along the negative real axis.

22 Remarks: The branch cuts are along the negative real axis.

23 Remarks: The branch cuts are along the negative real axis.

24 Remarks: The branch cuts are along the negative real axis.

25 Remarks: The branch cuts are along the negative real axis.

26 Remarks: The branch cuts are along the negative real axis.

27 Remarks: The branch cuts are along the negative real axis.

28.4.9 Additional overloads

The following function templates shall have additional overloads:

arg norm
cnj proj
imag real

where norm, cnj, imag, and real are constexpr overloads.

2 The additional overloads shall be sufficient to ensure:

\( \text{(2.1)} \)

— If the argument has a floating-point type \( T \), then it is effectively cast to complex\(<T>\).

\( \text{(2.2)} \)

— Otherwise, if the argument has integer type, then it is effectively cast to complex<\text{double}>

2 Function template pow has additional overloads sufficient to ensure, for a call with one argument of type complex<\text{T1}> and the other argument of type T2 or complex<\text{T2}>, both arguments are effectively cast to complex<\text{common_type_t}<\text{T1}, \text{T2}>>. If \text{common_type_t}<\text{T1}, \text{T2}>> is not well-formed, then the program is ill-formed.

28.4.10 Suffixes for complex number literals

This subclause describes literal suffixes for constructing complex number literals. The suffixes \( i \), \( il \), and \( if \) create complex numbers of the types complex<\text{double}>, complex<long double>, and complex<float> respectively, with their imaginary part denoted by the given literal number and the real part being zero.

constexpr complex<long double> operator""il(long double d);
constexpr complex<long double> operator""il(unsigned long long d);

Returns: complex<long double>{0.0L, static_cast<long double>(d)}. 

§ 28.4.10 1393
constexpr complex<double> operator"i(long double d);  
constexpr complex<double> operator"i(unsigned long long d);  

Returns: complex<double>{0.0, static_cast<double>(d)}.

constexpr complex<float> operator"if(long double d);  
constexpr complex<float> operator"if(unsigned long long d);  

Returns: complex<float>{0.0f, static_cast<float>(d)}.

28.5 Random number generation [rand]

28.5.1 General [rand.general]

1 Subclause 28.5 defines a facility for generating (pseudo-)random numbers.

2 In addition to a few utilities, four categories of entities are described: uniform random bit generators, random number engines, random number engine adaptors, and random number distributions. These categorizations are applicable to types that meet the corresponding requirements, to objects instantiated from such types, and to templates producing such types when instantiated.

[Note 1: These entities are specified in such a way as to permit the binding of any uniform random bit generator object e as the argument to any random number distribution object d, thus producing a zero-argument function object such as given by bind(d,e). — end note]

3 Each of the entities specified in 28.5 has an associated arithmetic type (6.8.2) identified as result_type. With T as the result_type thus associated with such an entity, that entity is characterized:

(3.1) as boolean or equivalently as boolean-valued, if T is bool;
(3.2) otherwise as integral or equivalently as integer-valued, if numeric_limits<T>::is_integer is true;
(3.3) otherwise as floating-point or equivalently as real-valued.

If integral-valued, an entity may optionally be further characterized as signed or unsigned, according to numeric_limits<T>::is_signed.

4 Unless otherwise specified, all descriptions of calculations in 28.5 use mathematical real numbers.

5 Throughout 28.5, the operators bitand, bitor, and xor denote the respective conventional bitwise operations. Further:

(5.1) the operator rshift denotes a bitwise right shift with zero-valued bits appearing in the high bits of the result, and
(5.2) the operator lshift, denotes a bitwise left shift with zero-valued bits appearing in the low bits of the result, and whose result is always taken modulo 2^w.

28.5.2 Header <random> synopsis [rand.synopsis]

#include <initializer_list>    // see 17.10.2

template<class IntType = int>
class poisson_distribution;
28.5.3 Requirements

28.5.3.1 General requirements

1 Throughout this subclause 28.5, the effect of instantiating a template:

1.1 that has a template type parameter named Sseq is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of seed sequence (28.5.3.2).

1.2 that has a template type parameter named URBG is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of uniform random bit generator (28.5.3.3).
— that has a template type parameter named `Engine` is undefined unless the corresponding template argument is cv-unqualified and meets the requirements of random number engine (28.5.3.4).

— that has a template type parameter named `RealType` is undefined unless the corresponding template argument is cv-unqualified and is one of `float`, `double`, or `long double`.

— that has a template type parameter named `IntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `short`, `int`, `long`, `long long`, `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

— that has a template type parameter named `UIntType` is undefined unless the corresponding template argument is cv-unqualified and is one of `unsigned short`, `unsigned int`, `unsigned long`, or `unsigned long long`.

2 Throughout this subclause 28.5, phrases of the form “x is an iterator of a specific kind” shall be interpreted as equivalent to the more formal requirement that “x is a value of a type meeting the requirements of the specified iterator type”.

3 Throughout this subclause 28.5, any constructor that can be called with a single argument and that meets a requirement specified in this subclause shall be declared `explicit`.

### 28.5.3.2 Seed sequence requirements

A seed sequence is an object that consumes a sequence of integer-valued data and produces a requested number of unsigned integer values \( i, 0 \leq i < 2^{32} \), based on the consumed data.

[Note 1: Such an object provides a mechanism to avoid replication of streams of random variates. This can be useful, for example, in applications requiring large numbers of random number engines. — end note]

2 A class \( S \) meets the requirements of a seed sequence if the expressions shown in Table 96 are valid and have the indicated semantics, and if \( S \) also meets all other requirements of this subclause 28.5.3.2. In that Table and throughout this subclause:

(2.1) \( T \) is the type named by \( S \)'s associated `result_type`;

(2.2) \( q \) is a value of type \( S \) and \( r \) is a value of type \( S \) or `const S`;

(2.3) \( ib \) and \( ie \) are input iterators with an unsigned integer `value_type` of at least 32 bits;

(2.4) \( rb \) and \( re \) are mutable random access iterators with an unsigned integer `value_type` of at least 32 bits;

(2.5) \( ob \) is an output iterator; and

(2.6) \( il \) is a value of type `initializer_list<T>`.

#### Table 96: Seed sequence requirements

<table>
<thead>
<tr>
<th>Expression</th>

28.5.3.3 Uniform random bit generator requirements

1 A uniform random bit generator $g$ of type $G$ is a function object returning unsigned integer values such that each value in the range of possible results has (ideally) equal probability of being returned.

[Note 1: The degree to which $g$'s results approximate the ideal is often determined statistically. — end note]

```cpp
template<class G>
concept uniform_random_bit_generator =
  invocable<G&> && unsigned_integral<invoke_result_t<G&>> &&
  requires {
    { G::min() } -> same_as<invoke_result_t<G&>>;
    { G::max() } -> same_as<invoke_result_t<G&>>;
    requires bool_constant<(G::min() < G::max())>::value;
  };
```

2 Let $g$ be an object of type $G$. $G$ models uniform_random_bit_generator only if

(2.1) $G::min() <= g()$,  
(2.2) $g() <= G::max()$, and  
(2.3) $g()$ has amortized constant complexity.

3 A class $G$ meets the uniform random bit generator requirements if $G$ models uniform_random_bit_generator, invoke_result_t<$G&>$ is an unsigned integer type (6.8.2), and $G$ provides a nested typedef-name result_type that denotes the same type as invoke_result_t<$G&>$.

28.5.3.4 Random number engine requirements

1 A random number engine (commonly shortened to engine) $e$ of type $E$ is a uniform random bit generator that additionally meets the requirements (e.g., for seeding and for input/output) specified in this subclause.

2 At any given time, $e$ has a state $e_i$ for some integer $i \geq 0$. Upon construction, $e$ has an initial state $e_0$. An engine's state may be established via a constructor, a seed function, assignment, or a suitable operator>>.

3 $E$'s specification shall define:

(3.1) the size of $E$'s state in multiples of the size of result_type, given as an integral constant expression;
(3.2) the transition algorithm $TA$ by which $e$'s state $e_i$ is advanced to its successor state $e_{i+1}$; and
(3.3) the generation algorithm $GA$ by which an engine's state is mapped to a value of type result_type.
A class $E$ that meets the requirements of a uniform random bit generator (28.5.3.3) also meets the requirements of a random number engine if the expressions shown in Table 97 are valid and have the indicated semantics, and if $E$ also meets all other requirements of this subclause 28.5.3.4. In that Table and throughout this subclause:

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Pre/post-condition</th>
<th>Complexity</th>
</tr>
</thead>
<tbody>
<tr>
<td>$E()$</td>
<td>Creates an engine with the same initial state as all other default-constructed engines of type $E$.</td>
<td>$O$(size of state)</td>
<td></td>
</tr>
<tr>
<td>$E(x)$</td>
<td>Creates an engine that compares equal to $x$.</td>
<td>$O$(size of state)</td>
<td></td>
</tr>
<tr>
<td>$E(s)$</td>
<td>Creates an engine with initial state determined by $s$.</td>
<td>$O$(size of state)</td>
<td></td>
</tr>
<tr>
<td>$E(q)$</td>
<td>Creates an engine with an initial state that depends on a sequence produced by one call to $q$.generate.</td>
<td>same as complexity of $q$.generate called on a sequence whose length is size of state</td>
<td></td>
</tr>
<tr>

<td>void Postconditions: $e == E(q)$.</td>
<td>same as $E(q)$</td>
<td></td>
</tr>
<tr>
<td>$e()$</td>
<td>$T$ Advances $e$'s state $e_i$ to $e_i + 1 = TA(e_i)$ and returns $GA(e_i)$.</td>
<td>per 28.5.3.3</td>
<td></td>
</tr>
<tr>
<td>$e.discard(z)$</td>
<td>void Advances $e$'s state $e_i$ to $e_i + z$ by any means equivalent to $z$ consecutive calls $e()$.</td>
<td>no worse than the complexity of $z$ consecutive calls $e()$</td>
<td></td>
</tr>
<tr>
<td>$x == y$</td>
<td>bool This operator is an equivalence relation. With $S_x$ and $S_y$ as the infinite sequences of values that would be generated by repeated future calls to $x()$ and $y()$, respectively, returns true if $S_x = S_y$; else returns false.</td>
<td>$O$(size of state)</td>
<td></td>
</tr>
<tr>
<td>$x != y$</td>
<td>bool !(x == y).</td>
<td>$O$(size of state)</td>
<td></td>
</tr>
</tbody>
</table>

230) This constructor (as well as the subsequent corresponding seed() function) can be particularly useful to applications requiring a large number of independent random sequences.

231) This operation is common in user code, and can often be implemented in an engine-specific manner so as to provide significant performance improvements over an equivalent naive loop that makes $z$ consecutive calls $e()$.

<td>With os.fmtflags set to ios_base::dec</td>
<td>ios_base::left and the fill character set to the space character, writes to os the textual representation of x's current state. In the output, adjacent numbers are separated by one or more space characters. <strong>Postconditions:</strong> The os.fmtflags and fill character are unchanged.</td>
</tr>
<tr>
<td>is &gt;&gt; v</td>
<td>reference to the type of is</td>
<td>With is.fmtflags set to ios_base::dec, sets v's state as determined by reading its textual representation from is. If bad input is encountered, ensures that v's state is unchanged by the operation and calls is.setstate(ios_base::failbit) (which may throw ios_base::failure (31.5.4.4)). If a textual representation written via os &lt;&lt; x was subsequently read via is &gt;&gt; v, then x == v provided that there have been no intervening invocations of x or of v. <strong>Preconditions:</strong> is provides a textual representation that was previously written using an output stream whose imbued locale was the same as that of is, and whose type's template specialization arguments charT and traits were respectively the same as those of is. <strong>Postconditions:</strong> The is.fmtflags are unchanged.</td>
<td>$\mathcal{O}(\text{size of state})$</td>
</tr>
</tbody>
</table>

5 E shall meet the *Cpp17CopyConstructible* (Table 33) and *Cpp17CopyAssignable* (Table 35) requirements. These operations shall each be of complexity no worse than $\mathcal{O}(\text{size of state})$.

28.5.3.5 Random number engine adaptor requirements  

1 A random number engine adaptor (commonly shortened to adaptor) a of type A is a random number engine that takes values produced by some other random number engine, and applies an algorithm to those values in order to deliver a sequence of values with different randomness properties. An engine b of type B adapted in this way is termed a base engine in this context. The expression a.base() shall be valid and shall return a const reference to a's base engine.

2 The requirements of a random number engine type shall be interpreted as follows with respect to a random number engine adaptor type.

A::A();

3 **Effects:** The base engine is initialized as if by its default constructor.

bool operator==(const A& a1, const A& a2);

4 **Returns:** true if a1's base engine is equal to a2's base engine. Otherwise returns false.
A::A(result_type s);
5  Effects: The base engine is initialized with s.

template<class Sseq> A::A(Sseq & q);
6  Effects: The base engine is initialized with q.

void seed();
7  Effects: With b as the base engine, invokes b.seed().

void seed(result_type s);
8  Effects: With b as the base engine, invokes b.seed(s).

template<class Sseq> void seed(Sseq & q);
9  Effects: With b as the base engine, invokes b.seed(q).

A shall also meet the following additional requirements:

(10.1) — The complexity of each function shall not exceed the complexity of the corresponding function applied to the base engine.
(10.2) — The state of A shall include the state of its base engine. The size of A’s state shall be no less than the size of the base engine.
(10.3) — Copying A’s state (e.g., during copy construction or copy assignment) shall include copying the state of the base engine of A.
(10.4) — The textual representation of A shall include the textual representation of its base engine.

28.5.3.6 Random number distribution requirements [rand.req.dist]

A random number distribution (commonly shortened to distribution) d of type D is a function object returning values that are distributed according to an associated mathematical probability density function p(z) or according to an associated discrete probability function P(z_i). A distribution’s specification identifies its associated probability function p(z) or P(z_i).

An associated probability function is typically expressed using certain externally-supplied quantities known as the parameters of the distribution. Such distribution parameters are identified in this context by writing, for example, p(z | a, b) or P(z_i | a, b), to name specific parameters, or by writing, for example, p(z | {p}) or P(z_i | {p}), to denote a distribution’s parameters p taken as a whole.

A class D meets the requirements of a random number distribution if the expressions shown in Table 98 are valid and have the indicated semantics, and if D and its associated types also meet all other requirements of this subclause 28.5.3.6. In that Table and throughout this subclause,

<table>
<thead>
<tr>

<td>{p}) or P(z_i</td>
</tr>
<tr>
<td>d(g,p)</td>
<td>T</td>
<td>The sequence of numbers returned by successive invocations with the same objects g and p is randomly distributed according to the associated p(z</td>
<td>{p}) or P(z_i</td>
</tr>
<tr>
<td>x.min()</td>
<td>T</td>
<td>Returns glb.</td>
<td>constant</td>
</tr>
<tr>
<td>x.max()</td>
<td>T</td>
<td>Returns lub.</td>
<td>constant</td>
</tr>
<tr>
<td>x == y</td>
<td>bool</td>
<td>This operator is an equivalence relation. Returns true if x.param() == y.param() and S_1 = S_2, where S_1 and S_2 are the infinite sequences of values that would be generated, respectively, by repeated future calls to x(g1) and y(g2) whenever g1 == g2. Otherwise returns false.</td>
<td>constant</td>
</tr>
<tr>
<td>x != y</td>
<td>bool</td>
<td>!(x == y).</td>
<td>same as x == y.</td>
</tr>
<tr>
<td>os ‘&lt;&lt;’ x</td>
<td>reference to the type of os</td>
<td>Writes to os a textual representation for the parameters and the additional internal data of x. Postconditions: The os.fmtflags and fill character are unchanged.</td>
<td></td>
</tr>
</tbody>
</table>

§ 28.5.3.6
<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Pre/post-condition</th>
<th>Complexity</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>is &gt;&gt; d</code></td>
<td>reference to the type of <code>is</code></td>
<td>Restores from <code>is</code> the parameters and additional internal data of the lvalue <code>d</code>. If bad input is encountered, ensures that <code>d</code> is unchanged by the operation and calls <code>is.setstate(ios_base::failbit)</code> (which may throw <code>ios_base::failure</code> (31.5.4.4)).</td>
<td></td>
</tr>
</tbody>
</table>

**Preconditions**: `is` provides a textual representation that was previously written using an `os` whose imbued locale and whose type's template specialization arguments `charT` and `traits` were the same as those of `is`.  
**Postconditions**: The `is.fmtflags` are unchanged.

4 D shall meet the *Cpp17CopyConstructible* (Table 33) and *Cpp17CopyAssignable* (Table 35) requirements.

5 The sequence of numbers produced by repeated invocations of `d(g)` shall be independent of any invocation of `os << d` or of any `const` member function of D between any of the invocations of `d(g)`.

6 If a textual representation is written using `os << x` and that representation is restored into the same or a different object `y` of the same type using `is >> y`, repeated invocations of `y(g)` shall produce the same sequence of numbers as would repeated invocations of `x(g)`.

7 It is unspecified whether `D::param_type` is declared as a (nested) `class` or via a `typedef`. In this subclause 28.5, declarations of `D::param_type` are in the form of `typedef`s for convenience of exposition only.

8 P shall meet the *Cpp17CopyConstructible* (Table 33), *Cpp17CopyAssignable* (Table 35), and *Cpp17Equality-Comparable* (Table 29) requirements.

9 For each of the constructors of D taking arguments corresponding to parameters of the distribution, P shall have a corresponding constructor subject to the same requirements and taking arguments identical in number, type, and default values. Moreover, for each of the member functions of D that return values corresponding to parameters of the distribution, P shall have a corresponding member function with the identical name, type, and semantics.

10 P shall have a declaration of the form  
   ```cpp
   using distribution_type = D;
   ```

### 28.5.4 Random number engine class templates

#### 28.5.4.1 General

1 Each type instantiated from a class template specified in 28.5.4 meets the requirements of a random number engine (28.5.3.4) type.

2 Except where specified otherwise, the complexity of each function specified in 28.5.4 is constant.

3 Except where specified otherwise, no function described in 28.5.4 throws an exception.

4 Every function described in 28.5.4 that has a function parameter `q` of type `Sseq&` for a template type parameter named `Sseq` that is different from type `seed_seq` throws what and when the invocation of `q.generate` throws.

5 Descriptions are provided in 28.5.4 only for engine operations that are not described in 28.5.3.4 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.
Each template specified in 28.5.4 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

For every random number engine and for every random number engine adaptor X defined in 28.5.4 and in 28.5.5:

1. if the constructor
   
   \[
   \text{template<class Sseq> explicit X(Sseq & q);} \\
   \text{is called with a type Sseq that does not qualify as a seed sequence, then this constructor shall not} \\
   \text{participate in overload resolution;}
   \]

2. if the member function
   
   \[
   \text{template<class Sseq> void seed(Sseq & q);} \\
   \text{is called with a type Sseq that does not qualify as a seed sequence, then this function shall not} \\
   \text{participate in overload resolution.}
   \]

The extent to which an implementation determines that a type cannot be a seed sequence is unspecified, except that as a minimum a type shall not qualify as a seed sequence if it is implicitly convertible to X::result_type.

### 28.5.4.2 Class template linear_congruential_engine

A linear_congruential_engine random number engine produces unsigned integer random numbers. The state \( x_i \) of a linear_congruential_engine object \( x \) is of size 1 and consists of a single integer. The transition algorithm is a modular linear function of the form \( TA(x_i) = (a \cdot x_i + c) \mod m \); the generation algorithm is \( GA(x_i) = x_i + 1 \).

```cpp
namespace std {

template<class UIntType, UIntType a, UIntType c, UIntType m>
class linear_congruential_engine {
public:

using result_type = UIntType;

// engine characteristics
static constexpr result_type multiplier = a;
static constexpr result_type increment = c;
static constexpr result_type modulus = m;
static constexpr result_type min() { return c == 0u ? 1u: 0u; }
static constexpr result_type max() { return m - 1u; }
static constexpr result_type default_seed = 1u;

// constructors and seeding functions
linear_congruential_engine() : linear_congruential_engine(default_seed) {} 
explicit linear_congruential_engine(result_type s);
template<class Sseq> explicit linear_congruential_engine(Sseq& q);
void seed(result_type s = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const linear_congruential_engine& x,
const linear_congruential_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const linear_congruential_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, linear_congruential_engine& x);
```
2 If the template parameter \( m \) is 0, the modulus \( m \) used throughout this subclause 28.5.4.2 is numeric_limits<result_type>::max() plus 1.

[Note 1: \( m \) need not be representable as a value of type result_type. — end note]

3 If the template parameter \( m \) is not 0, the following relations shall hold: \( a < m \) and \( c < m \).

4 The textual representation consists of the value of \( x_i \).

\[
\text{explicit linear_congruential_engine(result_type s);} \\
\text{template<class Sseq> explicit linear_congruential_engine(Sseq& q);} \\
\text{Effects: With } k = \left\lceil \frac{\log_m m}{32} \right\rceil \text{ and } a \text{ an array (or equivalent) of length } k + 3, \text{ invokes } q.generate(a + 0, a + k + 3) \text{ and then computes } S = \left( \sum_{j=0}^{k-1} d_j + 3 \cdot 2^{32j} \right) \text{ mod } m. \text{ If } c \text{ mod } m \text{ is 0 and } S \text{ is 0, sets the engine's state to 1, else sets the engine's state to } S.
\]

28.5.4.3 Class template mersenne_twister_engine

A mersenne_twister_engine random number engine produces unsigned integer random numbers in the closed interval \([0, 2^w - 1]\). The state \( x_i \) of a mersenne_twister_engine object \( x \) is of size \( n \) and consists of a sequence \( X \) of \( n \) values of the type delivered by \( x \); all subscripts applied to \( X \) are to be taken modulo \( n \).

2 The transition algorithm employs a twisted generalized feedback shift register defined by shift values \( n \) and \( m \), a twist value \( r \), and a conditional xor-mask \( a \). To improve the uniformity of the result, the bits of the raw shift register are additionally tempered (i.e., scrambled) according to a bit-scrambling matrix defined by values \( u, d, s, b, t, c, \) and \( \ell \).

The state transition is performed as follows:

1. Concatenate the upper \( w - r \) bits of \( X_{i-n} \) with the lower \( r \) bits of \( X_{i+1-n} \) to obtain an unsigned integer value \( Y \).
2. With \( \alpha = a \cdot (Y \text{ bitand } 1) \), set \( X_{i+m-n} = X_{i+m-n} \text{ xor } (Y \text{ rshift } 1) \text{ xor } \alpha \).

The sequence \( X \) is initialized with the help of an initialization multiplier \( f \).

3 The generation algorithm determines the unsigned integer values \( z_1, z_2, z_3, z_4 \) as follows, then delivers \( z_4 \) as its result:

\[
\text{namespace std { } }
\text{template<class UIntType, size_t w, size_t n, size_t m, size_t r, UIntType a, size_t u, UIntType d, size_t s, UIntType b, size_t t, UIntType c, size_t l, UIntType f> class mersenne_twister_engine { } public: } \\
\text{// types } \\
\text{using result_type = UIntType; } \\
\text{// engine characteristics } \\
\text{static constexpr size_t word_size = w; } \\
\text{static constexpr size_t state_size = n; } \\
\text{static constexpr size_t shift_size = m; } \\
\text{static constexpr size_t mask_bits = r; }
\]

232) The name of this engine refers, in part, to a property of its period: For properly-selected values of the parameters, the period is closely related to a large Mersenne prime number.
static constexpr UIntType xor_mask = a;
static constexpr size_t tempering_u = u;
static constexpr UIntType tempering_d = d;
static constexpr size_t tempering_s = s;
static constexpr UIntType tempering_b = b;
static constexpr size_t tempering_t = t;
static constexpr UIntType tempering_c = c;
static constexpr size_t tempering_l = l;
static constexpr UIntType initialization_multiplier = f;
static constexpr result_type min() { return 0; }
static constexpr result_type max() { return \(2^w - 1\); }
static constexpr result_type default_seed = 5489u;

// constructors and seeding functions
mersenne_twister_engine() : mersenne_twister_engine(default_seed) {}
explicit mersenne_twister_engine(result_type value);
template<class Sseq> explicit mersenne_twister_engine(Sseq& q);
void seed(result_type value = default_seed);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const mersenne_twister_engine& x, const mersenne_twister_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const mersenne_twister_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, mersenne_twister_engine& x);

The following relations shall hold: 
\[0 < m, m \leq n, 2u < w, u \leq w, s \leq w, t \leq w, l \leq w, w \leq \text{numeric_limits<UIntType>::digits}, a \leq (1u<<w) - 1u, b \leq (1u<<w) - 1u, c \leq (1u<<w) - 1u, d \leq (1u<<w) - 1u, \text{and} f \leq (1u<<w) - 1u.\]

The textual representation of \(x_i\) consists of the values of \(X_{i-n}, \ldots, X_{i-1}\), in that order.

Effects: Sets \(X_{-n}\) to value \(\mod 2^w\). Then, iteratively for \(i = 1 - n, \ldots, -1\), sets \(X_i\) to 
\[
\left[ f \cdot (X_{i-1} \text{ xor } (X_{i-1} \text{ rshift } (w - 2))) + i \mod n \right] \mod 2^w.
\]

Complexity: \(O(n)\).

template<class Sseq> explicit mersenne_twister_engine(Sseq& q);

Effects: With \(k = \lceil w/32 \rceil\) and \(a\) an array (or equivalent) of length \(n \cdot k\), invokes \(q.generate(a + 0, a + n \cdot k)\) and then, iteratively for \(i = -n, \ldots, -1\), sets \(X_i\) to 
\[
\left( \sum_{j=0}^{k-1} a_{k(i+n)+j} \cdot 2^{32j} \right) \mod 2^w.
\]
Finally, if the most significant \(w - r\) bits of \(X_{-n}\) are zero, and if each of the other resulting \(X_i\) is 0, changes \(X_{-n}\) to \(2^w - 1\).
Let \( Y = X_i - s - X_i - r - c \).

Set \( X_i \) to \( y = Y \mod m \). Set \( c \) to 1 if \( Y < 0 \), otherwise set \( c \) to 0.

[Note 1: This algorithm corresponds to a modular linear function of the form \( TA(x_i) = (a \cdot x_i) \mod b \), where \( b \) is of the form \( m^r - m^s + 1 \) and \( a = b - (b - 1)/m \). — end note]

The generation algorithm is given by \( GA(x_i) = y \), where \( y \) is the value produced as a result of advancing the engine’s state as described above.

```cpp
namespace std {
    template<class UIntType, size_t w, size_t s, size_t r>
    class subtract_with_carry_engine {
        public:
            // types
            using result_type = UIntType;

            // engine characteristics
            static constexpr size_t word_size = w;
            static constexpr size_t short_lag = s;
            static constexpr size_t long_lag = r;
            static constexpr result_type min() { return 0; }
            static constexpr result_type max() { return m - 1; }
            static constexpr result_type default_seed = 19780503u;

            // constructors and seeding functions
            subtract_with_carry_engine() : subtract_with_carry_engine(default_seed) {}
            explicit subtract_with_carry_engine(result_type value);
            template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);
            void seed(result_type value = default_seed);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const subtract_with_carry_engine& x, const subtract_with_carry_engine& y);

            // generating functions
            result_type operator()();
            void discard(unsigned long long z);

            // inserters and extractors
            template<class charT, class traits>
                friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const subtract_with_carry_engine& x);
                template<class charT, class traits>
                    friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, subtract_with_carry_engine& x);
    }
}
```

The following relations shall hold: \( 0u < s, s < r, 0 < w, \) and \( w \leq \text{numeric_limits<UIntType>::digits} \).

5 The textual representation consists of the values of \( X_{i-r}, \ldots, X_{i-1} \), in that order, followed by \( c \).

7 Effects: Sets the values of \( X_{i-r}, \ldots, X_{i-1} \), in that order, as specified below. If \( X_{i-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

To set the values \( X_k \), first construct \( e \), a `linear_congruential_engine` object, as if by the following definition:

```cpp
    linear_congruential_engine<result_type, 40014u, 0u, 2147483563u> e(value == 0u ? default_seed : value);
```

Then, to set each \( X_k \), obtain new values \( z_0, \ldots, z_{n-1} \) from \( n = \lceil w/32 \rceil \) successive invocations of \( e \). Set \( X_k \) to \( \left( \sum_{j=0}^{n-1} z_j \cdot 2^{32j} \right) \mod m \).

8 Complexity: Exactly \( n \cdot r \) invocations of \( e \).
template<class Sseq> explicit subtract_with_carry_engine(Sseq& q);

Effects: With \( k = \left\lceil w/32 \right\rceil \) and \( a \) an array (or equivalent) of length \( r \cdot k \), invokes \( q.generate(a + 0, a + r \cdot k) \) and then, iteratively for \( i = -r, \ldots, -1 \), sets \( X_i \) to \( \left( \sum_{j=0}^{k-1} a_{k+i+r+j} \cdot 2^{32j} \right) \mod m \). If \( X_{-1} \) is then 0, sets \( c \) to 1; otherwise sets \( c \) to 0.

28.5.5 Random number engine adaptor class templates

28.5.5.1 In general

1 Each type instantiated from a class template specified in this subclause 28.5.5 meets the requirements of a random number engine adaptor (28.5.3.5) type.

2 Except where specified otherwise, the complexity of each function specified in this subclause 28.5.5 is constant.

3 Except where specified otherwise, no function described in this subclause 28.5.5 throws an exception.

4 Every function described in this subclause 28.5.5 that has a function parameter \( q \) of type \( Sseq\& \) for a template type parameter named \( Sseq \) that is different from type \( seed_seq \) throws what and when the invocation of \( q.generate \) throws.

5 Descriptions are provided in this subclause 28.5.5 only for adaptor operations that are not described in subclause 28.5.3.5 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

6 Each template specified in this subclause 28.5.5 requires one or more relationships, involving the value(s) of its non-type template parameter(s), to hold. A program instantiating any of these templates is ill-formed if any such required relationship fails to hold.

28.5.5.2 Class template discard_block_engine

A discard_block_engine random number engine adaptor produces random numbers selected from those produced by some base engine \( e \). The state \( x_i \) of a discard_block_engine engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \) and an additional integer \( n \). The size of the state is the size of \( e \)'s state plus 1.

The transition algorithm discards all but \( r > 0 \) values from each block of \( p \geq r \) values delivered by \( e \). The state transition is performed as follows: If \( n \geq r \), advance the state of \( e \) from \( e_i \) to \( e_i + p - r \) and set \( n \) to 0. In any case, then increment \( n \) and advance \( e \)'s then-current state \( e_j \) to \( e_{j+1} \).

The generation algorithm yields the value returned by the last invocation of \( e() \) while advancing \( e \)'s state as described above.

```cpp
namespace std {
    template<class Engine, size_t p, size_t r>
    class discard_block_engine {
        public:
            // types
            using result_type = typename Engine::result_type;

            // engine characteristics
            static constexpr size_t block_size = p;
            static constexpr size_t used_block = r;
            static constexpr result_type min() { return Engine::min(); }
            static constexpr result_type max() { return Engine::max(); }

            // constructors and seeding functions
            discard_block_engine();
            explicit discard_block_engine(const Engine& e);
            explicit discard_block_engine(Engine&& e);
            explicit discard_block_engine(result_type s);
            template<class Sseq> explicit discard_block_engine(Sseq& q);
            void seed();
            void seed(result_type s);
            template<class Sseq> void seed(Sseq& q);

            // equality operators
            friend bool operator==(const discard_block_engine& x, const discard_block_engine& y);
```
The following relations shall hold: \( 0 < r \) and \( r \leq p \).

The textual representation consists of the textual representation of \( e \) followed by the value of \( n \).

In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor sets \( n \) to 0.

28.5.5.3 Class template independent_bits_engine

An independent_bits_engine random number engine adaptor combines random numbers that are produced by some base engine \( e \), so as to produce random numbers with a specified number of bits \( w \). The state \( x_i \) of an independent_bits_engine engine adaptor object \( x \) consists of the state \( e_i \) of its base engine \( e \); the size of the state is the size of \( e \)'s state.

The transition and generation algorithms are described in terms of the following integral constants:

1. Let \( R = e.\text{max}() - e.\text{min}() + 1 \) and \( m = \lceil \log_2 R \rceil \).
2. With \( n \) as determined below, let \( w_0 = \lceil w/n \rceil \), \( n_0 = n - w \bmod n \), \( y_0 = 2^{w_0} \lceil R/2^{w_0} \rceil \), and \( y_1 = 2^{w_0+1} \lceil R/2^{w_0+1} \rceil \).
3. Let \( n = \lceil w/m \rceil \) if and only if the relation \( R - y_0 \leq \lfloor y_0/n \rfloor \) holds as a result. Otherwise let \( n = 1 + \lceil w/m \rceil \).

[Note 1: The relation \( w = n_0 w_0 + (n - n_0)(w_0 + 1) \) always holds. — end note]

The transition algorithm is carried out by invoking \( e() \) as often as needed to obtain \( n_0 \) values less than \( y_0 + e.\text{min}() \) and \( n - n_0 \) values less than \( y_1 + e.\text{min}() \).

The generation algorithm uses the values produced while advancing the state as described above to yield a quantity \( S \) obtained as if by the following algorithm:

\[
\begin{align*}
S &= 0; \\
\text{for } (k = 0; k \neq n_0; k += 1) \{ \\
    &\quad \text{do } u = e() - e.\text{min}(); \text{ while } (u \geq y_0); \\
    &\quad S = 2^{w_0} \cdot S + u \bmod 2^{w_0}; \\
\} \\
\text{for } (k = n_0; k \neq n; k += 1) \{ \\
    &\quad \text{do } u = e() - e.\text{min}(); \text{ while } (u \geq y_1); \\
    &\quad S = 2^{w_0+1} \cdot S + u \bmod 2^{w_0+1}; \\
\}
\end{align*}
\]

template<class Engine, size_t w, class UIntType>
class independent_bits_engine {
public:
\[28.5.5.3\]

§ 28.5.5.3

1409
static constexpr result_type max() { return 2^w - 1; }

// constructors and seeding functions
independent_bits_engine();
explicit independent_bits_engine(const Engine& e);
explicit independent_bits_engine(Engine&& e);
explicit independent_bits_engine(result_type s);
template<class Sseq> explicit independent_bits_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const independent_bits_engine& x, const independent_bits_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const independent_bits_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, independent_bits_engine& x);

private:
   Engine e; // exposition only
};

The following relations shall hold: 0 < w and w <= numeric_limits<result_type>::digits.

The textual representation consists of the textual representation of e.

### 28.5.5.4 Class template shuffle_order_engine

A shuffle_order_engine random number engine adaptor produces the same random numbers that are
produced by some base engine e, but delivers them in a different sequence. The state x of a shuffle_order_engine
engine adaptor object x consists of the state e of its base engine e, an additional value Y of the
type delivered by e, and an additional sequence V of k values also of the type delivered by e. The size of
the state is the size of e’s state plus k + 1.

The transition algorithm permutes the values produced by e. The state transition is performed as follows:

1. Calculate an integer \( j = \left\lfloor \frac{k(Y - e_{\min})}{e_{\max} - e_{\min} + 1} \right\rfloor \).
2. Set Y to \( V_j \) and then set \( V_j \) to e().

The generation algorithm yields the last value of Y produced while advancing e’s state as described above.

```cpp
namespace std {
    template<class Engine, size_t k>
    class shuffle_order_engine {
    public:
        // types
        using result_type = typename Engine::result_type;

        // engine characteristics
        static constexpr size_t table_size = k;
        static constexpr result_type min() { return Engine::min(); }
        static constexpr result_type max() { return Engine::max(); }
    }
}
```
// constructors and seeding functions
shuffle_order_engine();
explicit shuffle_order_engine(const Engine& e);
explicit shuffle_order_engine(Engine&& e);
explicit shuffle_order_engine(result_type s);
template<class Sseq> explicit shuffle_order_engine(Sseq& q);
void seed();
void seed(result_type s);
template<class Sseq> void seed(Sseq& q);

// equality operators
friend bool operator==(const shuffle_order_engine& x, const shuffle_order_engine& y);

// generating functions
result_type operator()();
void discard(unsigned long long z);

// property functions
const Engine& base() const noexcept { return e; }

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const shuffle_order_engine& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, shuffle_order_engine& x);

private:
    Engine e;        // exposition only
    result_type V[k]; // exposition only
    result_type Y;   // exposition only
};

4 The following relation shall hold: 0 < k.
5 The textual representation consists of the textual representation of e, followed by the k values of V, followed by the value of Y.
6 In addition to its behavior pursuant to subclause 28.5.3.5, each constructor that is not a copy constructor initializes V[0], ..., V[k-1] and Y, in that order, with values returned by successive invocations of e().

28.5.6 Engines and engine adaptors with predefined parameters [rand.predef]

using minstd_rand0 =
    linear_congruential_engine<uint_fast32_t, 16'807, 0, 2'147'483'647>;
1 Required behavior: The 10000th consecutive invocation of a default-constructed object of type minstd_rand0 produces the value 1043618065.

using minstd_rand =
    linear_congruential_engine<uint_fast32_t, 48'271, 0, 2'147'483'647>;
2 Required behavior: The 10000th consecutive invocation of a default-constructed object of type minstd_rand produces the value 399268537.

using mt19937 =
    mersenne_twister_engine<uint_fast32_t, 32, 624, 397, 31,
    0x9908b0df, 11, 0x8ffффff, 7, 0x9d2c'5680, 15, 0xiefc6'0000, 18, 1'812'433'253>;
3 Required behavior: The 10000th consecutive invocation of a default-constructed object of type mt19937 produces the value 4123659995.

using mt19937_64 =
    mersenne_twister_engine<uint_fast64_t, 64, 312, 156, 31,
    0xb502'6f5a'a966'19e9, 29, 0x5555'5555'5555'5555, 17,

§ 28.5.6
Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type \texttt{mt19937\_64} produces the value 9981545732273789042.

using \texttt{ranlux24\_base} = \
\begin{verbatim}
subtract\_with\_carry\_engine\lt uint\_fast32\_t, 24, 10, 24;\end{verbatim}
\end{verbatim}

Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type \texttt{ranlux24\_base} produces the value 7937952.

using \texttt{ranlux48\_base} = \
\begin{verbatim}
subtract\_with\_carry\_engine\lt uint\_fast64\_t, 48, 5, 12;\end{verbatim}
\end{verbatim}

Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type \texttt{ranlux48\_base} produces the value 61839128582725.

using \texttt{ranlux24 = discard\_block\_engine\lt ranlux24\_base, 223, 23;}

Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type \texttt{ranlux24} produces the value 9901578.

using \texttt{ranlux48 = discard\_block\_engine\lt ranlux48\_base, 389, 11;}

Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type \texttt{ranlux48} produces the value 249142670248501.

using \texttt{knuth\_b = shuffle\_order\_engine\lt minstd\_rand0, 256;}

Required behavior: The 10000\textsuperscript{th} consecutive invocation of a default-constructed object of type \texttt{knuth\_b} produces the value 1112339016.

using \texttt{default\_random\_engine} = \texttt{implementation\_defined;}

Remarks: The choice of engine type named by this \texttt{typedef} is implementation-defined.

\begin{verbatim}
[Note 1: The implementation can select this type on the basis of performance, size, quality, or any combination of such factors, so as to provide at least acceptable engine behavior for relatively casual, inexpert, and/or lightweight use. Because different implementations can select different underlying engine types, code that uses this \texttt{typedef} need not generate identical sequences across implementations. —end note]
\end{verbatim}

28.5.7 Class \texttt{random\_device} \[rand.device\]

A \texttt{random\_device} uniform random bit generator produces nondeterministic random numbers.

If implementation limitations prevent generating nondeterministic random numbers, the implementation may employ a random number engine.

```cpp
namespace std {
  class random_device {
    public:
      // types
      using result_type = unsigned int;

      // generator characteristics
      static constexpr result_type min() { return numeric_limits<result_type>::min(); }
      static constexpr result_type max() { return numeric_limits<result_type>::max(); }

      // constructors
      random_device() : random_device(implementation-defined) {}
      explicit random_device(const string& token);

      // generating functions
      result_type operator()();

      // property functions
      double entropy() const noexcept;

      // no copy functions
      random_device(const random_device&) = delete;
```
void operator=(const random_device&) = delete;
}
}

explicit random_device(const string& token);

3 Throws: A value of an implementation-defined type derived from exception if the random_device cannot be initialized.

4 Remarks: The semantics of the token parameter and the token value used by the default constructor are implementation-defined.233

}  

double entropy() const noexcept;

5 Returns: If the implementation employs a random number engine, returns 0.0. Otherwise, returns an entropy estimate234 for the random numbers returned by operator(), in the range min() to log₂(max() + 1).

result_type operator()();

6 Returns: A nondeterministic random value, uniformly distributed between min() and max() (inclusive). It is implementation-defined how these values are generated.

7 Throws: A value of an implementation-defined type derived from exception if a random number cannot be obtained.

28.5.8 Utilities [rand.util]

28.5.8.1 Class seed_seq [rand.util.seedseq]

namespace std {

class seed_seq {
  public:
    // types
    using result_type = uint_least32_t;

    // constructors
    seed_seq() noexcept;
    template<class T>
      seed_seq(initializer_list<T> il);
    template<class InputIterator>
      seed_seq(InputIterator begin, InputIterator end);

    // generating functions
    template<class RandomAccessIterator>
      void generate(RandomAccessIterator begin, RandomAccessIterator end);

    // property functions
    size_t size() const noexcept;
    template<class OutputIterator>
      void param(OutputIterator dest) const;

    // no copy functions
    seed_seq(const seed_seq&) = delete;
    void operator=(const seed_seq&) = delete;

  private:
    vector<result_type> v;  // exposition only
  
  }

seed_seq() noexcept;

1 Postconditions: v.empty() is true.

233) The parameter is intended to allow an implementation to differentiate between different sources of randomness.

234) If a device has \( n \) states whose respective probabilities are \( P_0, \ldots, P_{n-1} \), the device entropy \( S \) is defined as \( S = - \sum_{i=0}^{n-1} P_i \cdot \log P_i \).
template<class T>
    seed_seq(initializer_list<T> il);

Constraints: T is an integer type.

Effects: Same as seed_seq(il.begin(), il.end()).

template<class InputIterator>
    seed_seq(InputIterator begin, InputIterator end);

Mandates: iterator_traits<InputIterator>::value_type is an integer type.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3).

Effects: Initializes v by the following algorithm:

   for (InputIterator s = begin; s != end; ++s)
       v.push_back((*s) mod 2^32);

template<class RandomAccessIterator>
    void generate(RandomAccessIterator begin, RandomAccessIterator end);

Mandates: iterator_traits<RandomAccessIterator>::value_type is an unsigned integer type capable of accommodating 32-bit quantities.

Preconditions: RandomAccessIterator meets the Cpp17RandomAccessIterator requirements (25.3.5.7) and the requirements of a mutable iterator.

Effects: Does nothing if begin == end. Otherwise, with s = v.size() and n = end - begin, fills the supplied range [begin,end) according to the following algorithm in which each operation is to be carried out modulo $2^{32}$, each indexing operator applied to begin is to be taken modulo n, and $T(x)$ is defined as $x \oplus (x \uparrow 27)$:

   — By way of initialization, set each element of the range to the value 0x8b8b8b8b. Additionally, for use in subsequent steps, let $p = (n - t)/2$ and let $q = p + t$, where

   $$ t = (n \geq 623) \cdot 11 : (n \geq 68) \cdot 7 : (n \geq 39) \cdot 5 : (n \geq 7) \cdot 3 : (n - 1)/2; $$

   — With $m$ as the larger of $s + 1$ and $n$, transform the elements of the range: iteratively for $k = 0, \ldots, m - 1$, calculate values

   $$ r_1 = 1664525 \cdot T(begin[k] \oplus begin[k + p] \oplus begin[k - 1]) $$
   $$ r_2 = r_1 + \begin{cases} 
   s & , k = 0 \\
   k \bmod n \oplus v[k - 1] & , 0 < k \leq s \\
   k \bmod n & , s < k
   \end{cases} $$

   and, in order, increment begin[k + p] by $r_1$, increment begin[k + q] by $r_2$, and set begin[k] to $r_2$.

   — Transform the elements of the range again, beginning where the previous step ended: iteratively for $k = m, \ldots, m + n - 1$, calculate values

   $$ r_3 = 1566083941 \cdot T(begin[k] + begin[k + p] + begin[k - 1]) $$
   $$ r_4 = r_3 - (k \bmod n) $$

   and, in order, update begin[k + p] by xoring it with $r_3$, update begin[k + q] by xoring it with $r_4$, and set begin[k] to $r_4$.

Throws: What and when RandomAccessIterator operations of begin and end throw.

size_t size() const noexcept;

Returns: The number of 32-bit units that would be returned by a call to param().

Complexity: Constant time.

template<class OutputIterator>
    void param(OutputIterator dest) const;

Mandates: Values of type result_type are writable (25.3.1) to dest.

Preconditions: OutputIterator meets the Cpp17OutputIterator requirements (25.3.5.4).
Effects: Copies the sequence of prepared 32-bit units to the given destination, as if by executing the following statement:

```cpp
copy(v.begin(), v.end(), dest);
```

Throws: What and when `OutputIterator` operations of `dest` throw.

### 28.5.8.2 Function template `generate_canonical` [rand.util.canonical]

```cpp
template<class RealType, size_t bits, class URBG>
RealType generate_canonical(URBG& g);
```

**Effects:** Invokes `g()` `k` times to obtain values `g_0, \ldots, g_{k-1}`, respectively. Calculates a quantity

\[ S = \sum_{i=0}^{k-1} (g_i - g\text{.min}) \cdot R^i \]

using arithmetic of type `RealType`.

**Returns:** `S/R^k`.

*[Note 1: \(0 \leq S/R^k < 1\) — end note]*

**Throws:** What and when `g` throws.

**Complexity:** Exactly `k = \max(1, \lceil b/\log_2 R \rceil)` invocations of `g`, where `b`\(^{235}\) is the lesser of `numeric_limits<RealType>::digits` and `bits`, and `R` is the value of `g\text{.max}() - g\text{.min}() + 1`.

*[Note 2: If the values `g_i` produced by `g` are uniformly distributed, the instantiation’s results are distributed as uniformly as possible. Obtaining a value in this way can be a useful step in the process of transforming a value generated by a uniform random bit generator into a value that can be delivered by a random number distribution. — end note]*

### 28.5.9 Random number distribution class templates [rand.dist]

#### 28.5.9.1 In general [rand.dist.general]

Each type instantiated from a class template specified in this subclause 28.5.9 meets the requirements of a random number distribution (28.5.3.6) type.

Descriptions are provided in this subclause 28.5.9 only for distribution operations that are not described in 28.5.3.6 or for operations where there is additional semantic information. In particular, declarations for copy constructors, for copy assignment operators, for streaming operators, and for equality and inequality operators are not shown in the synopses.

The algorithms for producing each of the specified distributions are implementation-defined.

The value of each probability density function `p(z)` and of each discrete probability function `P(z_i)` specified in this subclause is 0 everywhere outside its stated domain.

#### 28.5.9.2 Uniform distributions [rand.dist.uni]

##### 28.5.9.2.1 Class template `uniform_int_distribution` [rand.dist.uni.int]

A `uniform_int_distribution` random number distribution produces random integers `i, a \leq i \leq b`, distributed according to the constant discrete probability function

\[ P(i \mid a, b) = 1/(b - a + 1) \]

```cpp
namespace std {
    template<class IntType = int>
    class uniform_int_distribution {
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;
```
// constructors and reset functions
uniform_int_distribution() : uniform_int_distribution(0) {}  
explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());  
explicit uniform_int_distribution(const param_type& parm);  
void reset();

// equality operators
friend bool operator==(const uniform_int_distribution& x, const uniform_int_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const uniform_int_distribution& x);

explicit uniform_int_distribution(IntType a, IntType b = numeric_limits<IntType>::max());

Preconditions: a ≤ b.

Remarks: a and b correspond to the respective parameters of the distribution.

result_type a() const;
Returns: The value of the a parameter with which the object was constructed.

result_type b() const;
Returns: The value of the b parameter with which the object was constructed.

28.5.9.2.2 Class template uniform_real_distribution [rand.dist.uni.real]

A uniform_real_distribution random number distribution produces random numbers x, a ≤ x < b,
distributed according to the constant probability density function

\[ p(x \mid a, b) = \frac{1}{b - a} . \]

[Note 1: This implies that p(x \mid a, b) is undefined when a == b. — end note]

namespace std {
    template<class RealType = double>
    class uniform_real_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructors and reset functions
        uniform_real_distribution() : uniform_real_distribution(0.0) {}  
        explicit uniform_real_distribution(RealType a, RealType b = 1.0);
        explicit uniform_real_distribution(const param_type& parm);
    }
void reset();

// equality operators
friend bool operator==(const uniform_real_distribution& x, const uniform_real_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);

template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
result_type a() const;
result_type b() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const uniform_real_distribution& x);

template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, uniform_real_distribution& x);

explicit uniform_real_distribution(RealType a, RealType b = 1.0);

2 Preconditions: a ≤ b and b - a ≤ numeric_limits<RealType>::max().

3 Remarks: a and b correspond to the respective parameters of the distribution.

result_type a() const;
4 Returns: The value of the a parameter with which the object was constructed.

result_type b() const;
5 Returns: The value of the b parameter with which the object was constructed.

28.5.9.3 Bernoulli distributions

28.5.9.3.1 Class bernoulli_distribution

1 A bernoulli_distribution random number distribution produces bool values b distributed according to
the discrete probability function

\[
P(b|p) = \begin{cases} 
p & \text{if } b = \text{true}, \\
1 - p & \text{if } b = \text{false}. 
\end{cases}
\]

namespace std {
  class bernoulli_distribution {
  public:
    // types
    using result_type = bool;
    using param_type = unspecified;

    // constructors and reset functions
    bernoulli_distribution() : bernoulli_distribution(0.5) {} 
    explicit bernoulli_distribution(double p);
    explicit bernoulli_distribution(const param_type& parm);
    void reset();
  }
friend bool operator==(const bernoulli_distribution& x, const bernoulli_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const bernoulli_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, bernoulli_distribution& x);

explicit bernoulli_distribution(double p);

Preconditions: 0 ≤ p ≤ 1.
Remarks: p corresponds to the parameter of the distribution.

double p() const;

Returns: The value of the p parameter with which the object was constructed.

§ 28.5.9.3.2 Class template binomial_distribution [rand.dist.bern.bin]
A binomial_distribution random number distribution produces integer values i ≥ 0 distributed according to the discrete probability function

\[ P(i \mid t, p) = \binom{t}{i} \cdot p^i \cdot (1 - p)^{t-i}. \n\]
// property functions
IntType t() const;
double p() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const binomial_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, binomial_distribution& x);

explicit binomial_distribution(IntType t, double p = 0.5);

// Preconditions: 0 ≤ p ≤ 1 and 0 ≤ t.

// Remarks: t and p correspond to the respective parameters of the distribution.

IntType t() const;
Returns: The value of the t parameter with which the object was constructed.

double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.3.3 Class template geometric_distribution
[rand.dist.bern.geo]
A geometric_distribution random number distribution produces integer values \(i \geq 0\) distributed according to the discrete probability function
\[
P(i \mid p) = p \cdot (1 - p)^i.
\]

namespace std {
    template<class IntType = int>
    class geometric_distribution {
    public:
        // types
        using result_type = IntType;
        using param_type = unspecified;

        // constructors and reset functions
        geometric_distribution() : geometric_distribution(0.5) {}
        explicit geometric_distribution(double p);
        explicit geometric_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const geometric_distribution& x, const geometric_distribution& y);

        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

        // property functions
        double p() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };
}
explicit geometric_distribution(double p);

2 Preconditions: \(0 < p < 1\).

3 Remarks: \(p\) corresponds to the parameter of the distribution.

doUBLE p() const;

4 Returns: The value of the \(p\) parameter with which the object was constructed.

28.5.9.3.4 Class template negative_binomial_distribution

A negative_binomial_distribution random number distribution produces random integers \(i \geq 0\) distributed according to the discrete probability function

\[
P(i \mid k, p) = \binom{k + i - 1}{i} \cdot p^k \cdot (1 - p)^i.
\]

[Note 1: This implies that \(P(i \mid k, p)\) is undefined when \(p == 1\). – end note]
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, negative_binomial_distribution& x);
};
explicit negative_binomial_distribution(IntType k, double p = 0.5);

Preconditions: 0 < p ≤ 1 and 0 < k.
Remarks: k and p correspond to the respective parameters of the distribution.

IntType k() const;
Returns: The value of the k parameter with which the object was constructed.

double p() const;
Returns: The value of the p parameter with which the object was constructed.

28.5.9.4 Poisson distributions

28.5.9.4.1 Class template poisson_distribution

A poisson_distribution random number distribution produces integer values \( i \geq 0 \) distributed according to the discrete probability function

\[
P(i | \mu) = \frac{e^{-\mu} \mu^i}{i!}.
\]

The distribution parameter \( \mu \) is also known as this distribution’s mean.

template<class IntType = int>
class poisson_distribution
{
public:
    // types
    using result_type = IntType;
    using param_type = unspecified;

    // constructors and reset functions
    poisson_distribution() : poisson_distribution(1.0) {} // 1
    explicit poisson_distribution(double mean);
    explicit poisson_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const poisson_distribution& x, const poisson_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    double mean() const;
    param_type param() const;
    void param(const param_type& parm); // 1
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const poisson_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, poisson_distribution& x);
};
explicit poisson_distribution(double mean);

Preconditions: $0 < \text{mean}$.

Remarks: \text{mean} corresponds to the parameter of the distribution.

double mean() const;

Returns: The value of the \text{mean} parameter with which the object was constructed.

28.5.9.4.2 Class template exponential_distribution

An \text{exponential_distribution} random number distribution produces random numbers $x > 0$ distributed according to the probability density function

$$p(x | \lambda) = \lambda e^{-\lambda x}.$$
28.5.9.4.3 Class template `gamma_distribution`  

1 A `gamma_distribution` random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x | \alpha, \beta) = \frac{e^{-x/\beta}}{\beta^\alpha \cdot \Gamma(\alpha)} \cdot x^{\alpha-1}.
\]

namespace std {
    template<class RealType = double>
    class gamma_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructors and reset functions
            gamma_distribution() : gamma_distribution(1.0) {}  
            explicit gamma_distribution(RealType alpha, RealType beta = 1.0);
            explicit gamma_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const gamma_distribution& x, const gamma_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType alpha() const;
            RealType beta() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const gamma_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, gamma_distribution& x);
    };

    explicit gamma_distribution(RealType alpha, RealType beta = 1.0);

2 Preconditions: \( 0 < \alpha \) and \( 0 < \beta \).

3 Remarks: \( \alpha \) and \( \beta \) correspond to the parameters of the distribution.

RealType alpha() const;
4 Returns: The value of the \( \alpha \) parameter with which the object was constructed.

RealType beta() const;
5 Returns: The value of the \( \beta \) parameter with which the object was constructed.
28.5.9.4.4 Class template weibull_distribution

A `weibull_distribution` random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x \mid a, b) = \frac{a}{b} \cdot \left(\frac{x}{b}\right)^{a-1} \cdot \exp\left(-\left(\frac{x}{b}\right)^a\right).
\]

```cpp
namespace std {
    template<class RealType = double>
    class weibull_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        weibull_distribution() : weibull_distribution(1.0) {};
        explicit weibull_distribution(RealType a, RealType b = 1.0);
        explicit weibull_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const weibull_distribution& x, const weibull_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType a() const;
        RealType b() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const weibull_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, weibull_distribution& x);
    };
}
```

Preconditions: \( 0 < a \) and \( 0 < b \).

Remarks: \( a \) and \( b \) correspond to the respective parameters of the distribution.

RealType a() const;

Returns: The value of the \( a \) parameter with which the object was constructed.

RealType b() const;

Returns: The value of the \( b \) parameter with which the object was constructed.
28.5.9.4.5 Class template extreme_value_distribution [rand.dist.pois.extreme]

An `extreme_value_distribution` random number distribution produces random numbers \( x \) distributed according to the probability density function\(^{236}\)

\[
p(x | a, b) = \frac{1}{b} \cdot \exp \left( \frac{a - x}{b} - \exp \left( \frac{a - x}{b} \right) \right).
\]

namespace std {
    template<class RealType = double>
    class extreme_value_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            extreme_value_distribution() : extreme_value_distribution(0.0) {}
            explicit extreme_value_distribution(RealType a, RealType b = 1.0);
            explicit extreme_value_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const extreme_value_distribution& x,
                                  const extreme_value_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType a() const;
            RealType b() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const extreme_value_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, extreme_value_distribution& x);
    };
}

explicit extreme_value_distribution(RealType a, RealType b = 1.0);

2 Preconditions: 0 < b.

3 Remarks: \( a \) and \( b \) correspond to the respective parameters of the distribution.

RealType a() const;

4 Returns: The value of the \( a \) parameter with which the object was constructed.

RealType b() const;

5 Returns: The value of the \( b \) parameter with which the object was constructed.

\(^{236}\) The distribution corresponding to this probability density function is also known (with a possible change of variable) as the Gumbel Type I, the log-Weibull, or the Fisher-Tippett Type I distribution.
28.5.9.5 Normal distributions

28.5.9.5.1 Class template normal_distribution

A normal_distribution random number distribution produces random numbers \( x \) distributed according to the probability density function

\[
p(x | \mu, \sigma) = \frac{1}{\sigma \sqrt{2\pi}} \exp\left(-\frac{(x - \mu)^2}{2\sigma^2}\right).
\]

The distribution parameters \( \mu \) and \( \sigma \) are also known as this distribution’s mean and standard deviation.

namespace std {
    template<class RealType = double>
    class normal_distribution {
        public:
        // types
        using result_type = RealType;
        using param_type = unspecified;
        
        // constructors and reset functions
        normal_distribution() : normal_distribution(0.0) {};
        explicit normal_distribution(RealType mean, RealType stddev = 1.0);
        explicit normal_distribution(const param_type& parm);
        void reset();
        
        // equality operators
        friend bool operator==(const normal_distribution& x, const normal_distribution& y);
        
        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);
        
        // property functions
        RealType mean() const;
        RealType stddev() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
        
        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const normal_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, normal_distribution& x);
    };
}

explicit normal_distribution(RealType mean, RealType stddev = 1.0);

Preconditions: \( 0 < \text{stddev} \).

Remarks: mean and stddev correspond to the respective parameters of the distribution.

RealType mean() const;

Returns: The value of the mean parameter with which the object was constructed.

RealType stddev() const;

Returns: The value of the stddev parameter with which the object was constructed.
28.5.9.5.2 Class template lognormal_distribution

A lognormal_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function

\[
p(x \mid m, s) = \frac{1}{s \sqrt{2\pi}} \cdot \exp\left(-\frac{(\ln x - m)^2}{2s^2}\right).
\]

namespace std {
    template<class RealType = double>
    class lognormal_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            lognormal_distribution() : lognormal_distribution(0.0) {}
            explicit lognormal_distribution(RealType m, RealType s = 1.0);
            explicit lognormal_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const lognormal_distribution& x, const lognormal_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType m() const;
            RealType s() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const lognormal_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, lognormal_distribution& x);
    };
}

explicit lognormal_distribution(RealType m, RealType s = 1.0);

1 A lognormal_distribution random number distribution produces random numbers \( x > 0 \) distributed according to the probability density function.

2 Preconditions: \( 0 < s \).

3 Remarks: \( m \) and \( s \) correspond to the respective parameters of the distribution.

4 Returns: The value of the \( m \) parameter with which the object was constructed.

5 Returns: The value of the \( s \) parameter with which the object was constructed.
28.5.9.5.3 Class template \texttt{chi\_squared\_distribution} \[\text{rand.dist.norm.chisq}\]

A \texttt{chi\_squared\_distribution} random number distribution produces random numbers \(x > 0\) distributed according to the probability density function

\[
p(x \mid n) = \frac{x^{(n/2)-1} \cdot e^{-x/2}}{\Gamma(n/2) \cdot 2^{n/2}}.
\]

namespace std {
    template<class RealType = double>
    class \texttt{chi\_squared\_distribution} {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            \texttt{chi\_squared\_distribution}() : \texttt{chi\_squared\_distribution}(1.0) {}\par
            explicit \texttt{chi\_squared\_distribution}(RealType n);
            explicit \texttt{chi\_squared\_distribution}(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const \texttt{chi\_squared\_distribution}& x, const \texttt{chi\_squared\_distribution}& y);

                operator>>(basic_istream<charT, traits>& is, \texttt{chi\_squared\_distribution}& x);
    }

    explicit \texttt{chi\_squared\_distribution}(RealType n);

    \textit{Preconditions:} \(0 < n\).

    \textit{Remarks:} \(n\) corresponds to the parameter of the distribution.

    RealType n() const;

    \textit{Returns:} The value of the \(n\) parameter with which the object was constructed.

28.5.9.5.4 Class template \texttt{cauchy\_distribution} \[\text{rand.dist.norm.cauchy}\]

A \texttt{cauchy\_distribution} random number distribution produces random numbers \(x\) distributed according to the probability density function

\[
p(x \mid a, b) = \left( \pi b \left(1 + \left(\frac{x - a}{b}\right)^2\right) \right)^{-1}.
\]
namespace std {
    template<class RealType = double>
    class cauchy_distribution {
public:
    // types
    using result_type = RealType;
    using param_type = unspecified;

    // constructor and reset functions
    cauchy_distribution() : cauchy_distribution(0.0) {}  
    explicit cauchy_distribution(RealType a, RealType b = 1.0);
    explicit cauchy_distribution(const param_type& parm);
    void reset();

    // equality operators
    friend bool operator==(const cauchy_distribution& x, const cauchy_distribution& y);

    // generating functions
    template<class URBG>
    result_type operator()(URBG& g);
    template<class URBG>
    result_type operator()(URBG& g, const param_type& parm);

    // property functions
    RealType a() const;
    RealType b() const;
    param_type param() const;
    void param(const param_type& parm);
    result_type min() const;
    result_type max() const;

    // inserters and extractors
    template<class charT, class traits>
    friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const cauchy_distribution& x);
    template<class charT, class traits>
    friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, cauchy_distribution& x);
    }

    explicit cauchy_distribution(RealType a, RealType b = 1.0);

    Preconditions: 0 < b.

    Remarks: a and b correspond to the respective parameters of the distribution.

    RealType a() const;
    Returns: The value of the a parameter with which the object was constructed.

    RealType b() const;
    Returns: The value of the b parameter with which the object was constructed.

28.5.9.5.5 Class template fisher_f_distribution

A fisher_f_distribution random number distribution produces random numbers \( x \geq 0 \) distributed according to the probability density function

\[
p(x \mid m, n) = \frac{\Gamma((m + n)/2)}{\Gamma(m/2) \Gamma(n/2)} \cdot \left(\frac{m}{n}\right)^{m/2} \cdot x^{(m/2)-1} \cdot \left(1 + \frac{m}{n} x\right)^{-(m+n)/2}.
\]
namespace std {
    template<class RealType = double>
    class fisher_f_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        fisher_f_distribution() : fisher_f_distribution(1.0) {}
        explicit fisher_f_distribution(RealType m, RealType n = 1.0);
        explicit fisher_f_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const fisher_f_distribution& x, const fisher_f_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        RealType m() const;
        RealType n() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;

        // inserters and extractors
        template<class charT, class traits>
        friend basic_ostream<charT, traits>&
        operator<<(basic_ostream<charT, traits>& os, const fisher_f_distribution& x);
        template<class charT, class traits>
        friend basic_istream<charT, traits>&
        operator>>(basic_istream<charT, traits>& is, fisher_f_distribution& x);
    }
}

explicit fisher_f_distribution(RealType m, RealType n = 1);

Preconditions: 0 < m and 0 < n.

Remarks: m and n correspond to the respective parameters of the distribution.

RealType m() const;
Returns: The value of the m parameter with which the object was constructed.

RealType n() const;
Returns: The value of the n parameter with which the object was constructed.

28.5.9.5.6 Class template student_t_distribution [rand.dist.norm.t]
A student_t_distribution random number distribution produces random numbers x distributed according to the probability density function
\[ p(x \mid n) = \frac{1}{\sqrt{n \pi}} \cdot \frac{\Gamma\left((n + 1)/2\right)}{\Gamma(n/2)} \cdot \left(1 + \frac{x^2}{n}\right)^{-\left(n+1\right)/2}. \]
namespace std {
    template<class RealType = double>
    class student_t_distribution {
        public:
            // types
            using result_type = RealType;
            using param_type = unspecified;

            // constructor and reset functions
            student_t_distribution() : student_t_distribution(1.0) {}
            explicit student_t_distribution(RealType n);
            explicit student_t_distribution(const param_type& parm);
            void reset();

            // equality operators
            friend bool operator==(const student_t_distribution& x, const student_t_distribution& y);

            // generating functions
            template<class URBG>
            result_type operator()(URBG& g);
            template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);

            // property functions
            RealType n() const;
            param_type param() const;
            void param(const param_type& parm);
            result_type min() const;
            result_type max() const;

            // inserters and extractors
            template<class charT, class traits>
            friend basic_ostream<charT, traits>&
            operator<<(basic_ostream<charT, traits>& os, const student_t_distribution& x);
            template<class charT, class traits>
            friend basic_istream<charT, traits>&
            operator>>(basic_istream<charT, traits>& is, student_t_distribution& x);
    };
}

explicit student_t_distribution(RealType n);
2
3
Preconditions: 0 < n.
Remarks: n corresponds to the parameter of the distribution.

RealType n() const;
4
Returns: The value of the n parameter with which the object was constructed.

28.5.9.6 Sampling distributions

28.5.9.6.1 Class template discrete_distribution

1 A discrete_distribution random number distribution produces random integers \( i, 0 \leq i < n \), distributed according to the discrete probability function

\[
P(i | p_0, \ldots, p_{n-1}) = p_i.
\]

2 Unless specified otherwise, the distribution parameters are calculated as: \( p_k = w_k / S \) for \( k = 0, \ldots, n - 1 \), in which the values \( w_k \), commonly known as the weights, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \( 0 < S = w_0 + \cdots + w_{n-1} \).
// types
using result_type = IntType;
using param_type = unspecified;

// constructor and reset functions
discrete_distribution();
template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);
discrete_distribution(initializer_list<
    double> wl);
template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);
explicit discrete_distribution(const param_type& parm);
void reset();

// equality operators
friend bool operator==(const discrete_distribution& x, const discrete_distribution& y);

// generating functions
template<class URBG>
result_type operator()(URBG& g);
template<class URBG>
result_type operator()(URBG& g, const param_type& parm);

// property functions
vector<double> probabilities() const;
param_type param() const;
void param(const param_type& parm);
result_type min() const;
result_type max() const;

// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
    operator<<(basic_ostream<charT, traits>& os, const discrete_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
    operator>>(basic_istream<charT, traits>& is, discrete_distribution& x);

Effects: Constructs a discrete_distribution object with \( n = 1 \) and \( p_0 = 1 \).

[Note 1: Such an object will always deliver the value 0. —end note]

template<class InputIterator>
discrete_distribution(InputIterator firstW, InputIterator lastW);

Mandates: is_convertible_v<iterator_traits<InputIterator>::value_type, double> is true.

Preconditions: InputIterator meets the Cpp17InputIterator requirements (25.3.5.3). If firstW == lastW, let \( n = 1 \) and \( w_0 = 1 \). Otherwise, \([\text{firstW}, \text{lastW}]\) forms a sequence \( w \) of length \( n > 0 \).

Effects: Constructs a discrete_distribution object with probabilities given by the formula above.

discrete_distribution(initializer_list<double> wl);

Effects: Same as discrete_distribution(wl.begin(), wl.end()).

template<class UnaryOperation>
discrete_distribution(size_t nw, double xmin, double xmax, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (xmax - xmin)/n \) holds.
Effects: Constructs a `discrete_distribution` object with probabilities given by the formula above, using the following values: If \(w_0 = 0\), let \(w_0 = 1\). Otherwise, let \(w_k = \text{fw}(\text{xmin} + k \cdot \delta + \delta/2)\) for \(k = 0, \ldots, n - 1\).

Complexity: The number of invocations of \(\text{fw}\) does not exceed \(n\).

vector<double> probabilities() const;

Returns: A `vector<double>` whose `size` member returns \(n\) and whose `operator[]` member returns \(p_k\) when invoked with argument \(k\) for \(k = 0, \ldots, n - 1\).

### 28.5.9.6.2 Class template `piecewise_constant_distribution` [rand.dist.samp.pconst]

A `piecewise_constant_distribution` random number distribution produces random numbers \(x, b_0 \leq x < b_n\), uniformly distributed over each subinterval \([b_i, b_{i+1})\) according to the probability density function

\[ p(x \mid b_0, \ldots, b_n, \rho_0, \ldots, \rho_{n-1}) = \rho_i \text{ , for } b_i \leq x < b_{i+1}. \]

The \(n + 1\) distribution parameters \(b_i\), also known as this distribution's *interval boundaries*, shall satisfy the relation \(b_i < b_{i+1}\) for \(i = 0, \ldots, n - 1\). Unless specified otherwise, the remaining \(n\) distribution parameters are calculated as:

\[ \rho_k = \frac{w_k}{S \cdot (b_{k+1} - b_k)} \text{ for } k = 0, \ldots, n - 1, \]

in which the values \(w_k\), commonly known as the *weights*, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold: \(0 < S = w_0 + \cdots + w_{n-1}\).

```cpp
namespace std {
    template<class RealType = double>
    class piecewise_constant_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;

        // constructor and reset functions
        piecewise_constant_distribution();
        template<class InputIteratorB, class InputIteratorW>
        piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB, InputIteratorW firstW);
        template<class UnaryOperation>
        piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);
        template<class UnaryOperation>
        piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
        explicit piecewise_constant_distribution(const param_type& parm);
        void reset();

        // equality operators
        friend bool operator==(const piecewise_constant_distribution& x, const piecewise_constant_distribution& y);

        // generating functions
        template<class URBG>
        result_type operator()(URBG& g);
        template<class URBG>
        result_type operator()(URBG& g, const param_type& parm);

        // property functions
        vector<result_type> intervals() const;
        vector<result_type> densities() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
    };
```
// inserters and extractors
template<class charT, class traits>
friend basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const piecewise_constant_distribution& x);
template<class charT, class traits>
friend basic_istream<charT, traits>&
operator>>(basic_istream<charT, traits>& is, piecewise_constant_distribution& x);

piecewise_constant_distribution();

Effects: Constructs a piecewise_constant_distribution object with n = 1, ρ₀ = 1, b₀ = 0, and
b₁ = 1.

template<class InputIteratorB, class InputIteratorW>
piecewise_constant_distribution(InputIteratorB firstB, InputIteratorB lastB,
InputIteratorW firstW);

Mandates: Both of

(4.1) — is_convertible_v<iterator_traits<InputIteratorB>::value_type, double>
(4.2) — is_convertible_v<iterator_traits<InputIteratorW>::value_type, double>

are true.

Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements
(25.3.5.3). If firstB == lastB or ++firstB == lastB, let n = 1, w₀ = 1, b₀ = 0, and b₁ = 1.
Otherwise, [firstB, lastB] forms a sequence b of length n + 1, the length of the sequence w starting
from firstW is at least n, and any wb for k ≥ n are ignored by the distribution.

Effects: Constructs a piecewise_constant_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_constant_distribution(initializer_list<RealType> bl, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated
from the following values: If bl.size() < 2, let n = 1, w₀ = 1, b₀ = 0, and b₁ = 1. Otherwise, let
[bl.begin(), bl.end()) form a sequence b₀,...,bₙ, and let wb = fw((bₙ₊₁+bₙ)/2) for k = 0,...,n − 1.

Complexity: The number of invocations of fw does not exceed n.

template<class UnaryOperation>
piecewise_constant_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: If nw = 0, let n = 1, otherwise let n = nw. The relation 0 < δ = (xmax − xmin)/n holds.

Effects: Constructs a piecewise_constant_distribution object with parameters taken or calculated
from the following values: Let bₖ = xmin + k·δ for k = 0,...,n, and wb = fw(bₖ+δ/2) for k = 0,...,n − 1.

Complexity: The number of invocations of fw does not exceed n.

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns n + 1 and whose operator[] member
returns bₖ when invoked with argument k for k = 0,...,n.

vector<result_type> densities() const;

Returns: A vector<result_type> whose size member returns n and whose operator[] member
returns pb when invoked with argument k for k = 0,...,n − 1.

28.5.9.6.3 Class template piecewise_linear_distribution

A piecewise_linear_distribution random number distribution produces random numbers x, b₀ ≤ x < bₙ,
distributed over each subinterval [bᵢ, bᵢ₊₁) according to the probability density function

\[ p(x \mid b₀, \ldots, bₙ, p₀, \ldots, pₙ) = pᵢ \cdot \frac{bᵢ₊₁ - x}{bᵢ₊₁ - bᵢ} + pᵢ₊₁ \cdot \frac{x - bᵢ}{bᵢ₊₁ - bᵢ}, \text{ for } bᵢ ≤ x < bᵢ₊₁. \]
The \( n + 1 \) distribution parameters \( b_i \), also known as this distribution’s interval boundaries, shall satisfy the relation \( b_i < b_{i+1} \) for \( i = 0, \ldots, n - 1 \). Unless specified otherwise, the remaining \( n + 1 \) distribution parameters are calculated as \( \rho_k = w_k / S \) for \( k = 0, \ldots, n \), in which the values \( w_k \), commonly known as the weights at boundaries, shall be non-negative, non-NaN, and non-infinity. Moreover, the following relation shall hold:

\[
0 < S = \frac{1}{2} \sum_{k=0}^{n-1} (w_k + w_{k+1}) \cdot (b_{k+1} - b_k).
\]

namespace std {
    template<class RealType = double>
    class piecewise_linear_distribution {
    public:
        // types
        using result_type = RealType;
        using param_type = unspecified;
        // constructor and reset functions
        piecewise_linear_distribution();
        template<class InputIteratorB, class InputIteratorW>
            piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
                                           InputIteratorW firstW);
        template<class UnaryOperation>
            piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);
        template<class UnaryOperation>
            piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);
        explicit piecewise_linear_distribution(const param_type& parm);
        void reset();
        // equality operators
        friend bool operator==(const piecewise_linear_distribution& x,
                               const piecewise_linear_distribution& y);
        // generating functions
        template<class URBG>
            result_type operator()(URBG& g);
        template<class URBG>
            result_type operator()(URBG& g, const param_type& parm);
        // property functions
        vector<result_type> intervals() const;
        vector<result_type> densities() const;
        param_type param() const;
        void param(const param_type& parm);
        result_type min() const;
        result_type max() const;
        // inserters and extractors
        template<class charT, class traits>
            friend basic_ostream<charT, traits>& operator<<(basic_ostream<charT, traits>& os, const piecewise_linear_distribution& x);
        template<class charT, class traits>
            friend basic_istream<charT, traits>& operator>>(basic_istream<charT, traits>& is, piecewise_linear_distribution& x);
    }
}

Effects: Constructs a piecewise_linear_distribution object with \( n = 1 \), \( \rho_0 = \rho_1 = 1 \), \( b_0 = 0 \), and \( b_1 = 1 \).
template<class InputIteratorB, class InputIteratorW>
piecewise_linear_distribution(InputIteratorB firstB, InputIteratorB lastB,
InputIteratorW firstW);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: InputIteratorB and InputIteratorW each meet the Cpp17InputIterator requirements (25.3.5.3). If firstB == lastB or ++firstB == lastB, let n = 1, \( \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1. \) Otherwise, \([\text{firstB}, \text{lastB}]\) forms a sequence \( b \) of length \( n+1 \), the length of the sequence \( w \) starting from \( \text{firstW} \) is at least \( n+1 \), and any \( w_k \) for \( k \geq n+1 \) are ignored by the distribution.

Effects: Constructs a piecewise_linear_distribution object with parameters as specified above.

template<class UnaryOperation>
piecewise_linear_distribution(initializer_list<RealType> bl, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated from the following values: If \( \text{bl.size()} < 2 \), let \( n = 1, \rho_0 = \rho_1 = 1, b_0 = 0, \) and \( b_1 = 1 \). Otherwise, let \( [\text{bl.begin()}, \text{bl.end()}] \) form a sequence \( b_0, \ldots, b_n \), and let \( w_k = fw(b_k) \) for \( k = 0, \ldots, n \).

Complexity: The number of invocations of \( fw \) does not exceed \( n+1 \).

template<class UnaryOperation>
piecewise_linear_distribution(size_t nw, RealType xmin, RealType xmax, UnaryOperation fw);

Mandates: is_invocable_r_v<double, UnaryOperation&, double> is true.

Preconditions: If \( nw = 0 \), let \( n = 1 \), otherwise let \( n = nw \). The relation \( 0 < \delta = (\text{xmax} - \text{xmin})/n \) holds.

Effects: Constructs a piecewise_linear_distribution object with parameters taken or calculated from the following values: Let \( b_k = \text{xmin} + k \cdot \delta \) for \( k = 0, \ldots, n \), and \( w_k = fw(b_k) \) for \( k = 0, \ldots, n \).

Complexity: The number of invocations of \( fw \) does not exceed \( n+1 \).

vector<result_type> intervals() const;

Returns: A vector<result_type> whose size member returns \( n+1 \) and whose operator[] member returns \( b_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n \).

vector<result_type> densities() const;

Returns: A vector<result_type> whose size member returns \( n \) and whose operator[] member returns \( p_k \) when invoked with argument \( k \) for \( k = 0, \ldots, n \).

28.5.10 Low-quality random number generation [c.math.rand]

[Note 1: The header <cstdlib> (17.2.2) declares the functions described in this subclause. — end note]

int rand();
void srand(unsigned int seed);

Effects: The rand and srand functions have the semantics specified in the C standard library.

Remarks: The implementation may specify that particular library functions may call rand. It is implementation-defined whether the rand function may introduce data races (16.4.6.10).

[Note 2: The other random number generation facilities in this document (28.5) are often preferable to rand, because rand’s underlying algorithm is unspecified. Use of rand therefore continues to be non-portable, with unpredictable and oft-questionable quality and performance. — end note]

template<class T> valarray<T> log (const valarray<T>&);  

template<class T> valarray<T> log10(const valarray<T>&);
The header `<valarray>` defines five class templates (`valarray`, `slice_array`, `gslice_array`, `mask_array`, and `indirect_array`), two classes (`slice` and `gslice`), and a series of related function templates for representing and manipulating arrays of values.

The `valarray` array classes are defined to be free of certain forms of aliasing, thus allowing operations on these classes to be optimized.

Any function returning a `valarray<T>` is permitted to return an object of another type, provided all the const member functions of `valarray<T>` are also applicable to this type. This return type shall not add more than two levels of template nesting over the most deeply nested argument type.\(^{237}\)

Implementations introducing such replacement types shall provide additional functions and operators as follows:

1. for every function taking a `const valarray<T>&` other than `begin` and `end` (28.6.10), identical functions taking the replacement types shall be added;
2. for every function taking two `const valarray<T>&` arguments, identical functions taking every combination of `const valarray<T>&` and replacement types shall be added.

In particular, an implementation shall allow a `valarray<T>` to be constructed from such replacement types and shall allow assignments and compound assignments of such types to `valarray<T>`, `slice_array<T>`, `gslice_array<T>`, `mask_array<T>` and `indirect_array<T>` objects.

These library functions are permitted to throw a `bad_alloc` (17.6.4.1) exception if there are not sufficient resources available to carry out the operation. Note that the exception is not mandated.

### 28.6.2 Class template valarray

#### Overview

```cpp
namespace std {
    template<class T> class valarray {
        using value_type = T;

        // 28.6.2.2, construct/destroy
        valarray();
        explicit valarray(size_t);  
        valarray(const T&, size_t);  
        valarray(const T*, size_t);  
        valarray(const valarray&);  
        valarray(valarray&&) noexcept;
        valarray(const slice_array<T>&);
        valarray(const gslice_array<T>&);
        valarray(const mask_array<T>&);
        valarray(const indirect_array<T>&);
        valarray(initializer_list<T>);
        ~valarray();
    }
}
```

\(^{237}\) Annex B recommends a minimum number of recursively nested template instantiations. This requirement thus indirectly suggests a minimum allowable complexity for valarray expressions.
// 28.6.2.3, assignment
valarray& operator=(const valarray&);
valarray& operator=(valarray&&) noexcept;
valarray& operator=(initializer_list<T>);
valarray& operator=(const T&);
valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

valarray& operator*= (const valarray&);
valarray& operator/= (const valarray&);
valarray& operator%= (const valarray&);
valarray& operator+= (const valarray&);
valarray& operator-= (const valarray&);
valarray& operator^= (const valarray&);
valarray& operator|= (const valarray&);
valarray& operator&= (const valarray&);
valarray& operator<<=(const valarray&);
valarray& operator>>=(const valarray&);

// 28.6.2.8, member functions
void swap(valarray&) noexcept;

valarray shift (int) const;
valarray cshift(int) const;
The class template \texttt{valarray} is a one-dimensional smart array, with elements numbered sequentially from zero. It is a representation of the mathematical concept of an ordered set of values. For convenience, an object of type \texttt{valarray} is referred to as an “array” throughout the remainder of 28.6. The illusion of higher dimensionality may be produced by the familiar idiom of computed indices, together with the powerful subsetting capabilities provided by the generalized subscript operators.\textsuperscript{238}

### 28.6.2.2 Constructors [valarray.cons]

\begin{itemize}
\item \texttt{valarray();}
\begin{flushleft}
\textit{Effects:} Constructs a \texttt{valarray} that has zero length.\textsuperscript{239}
\end{flushleft}
\item \texttt{explicit valarray(size_t n);}
\begin{flushleft}
\textit{Effects:} Constructs a \texttt{valarray} that has length \texttt{n}. Each element of the array is value-initialized (9.4).
\end{flushleft}
\item \texttt{valarray(const T& v, size_t n);}
\begin{flushleft}
\textit{Effects:} Constructs a \texttt{valarray} that has length \texttt{n}. Each element of the array is initialized with \texttt{v}.
\end{flushleft}
\item \texttt{valarray(const T* p, size_t n);}
\begin{flushleft}
\textit{Preconditions:} \([p, p+n)\) is a valid range.
\textit{Effects:} Constructs a \texttt{valarray} that has length \texttt{n}. The values of the elements of the array are initialized with the first \texttt{n} values pointed to by the first argument.\textsuperscript{240}
\end{flushleft}
\item \texttt{valarray(const valarray& v);}  
\begin{flushleft}
\textit{Effects:} Constructs a \texttt{valarray} that has the same length as \texttt{v}. The elements are initialized with the values of the corresponding elements of \texttt{v}.\textsuperscript{241}
\end{flushleft}
\item \texttt{valarray(valarray&& v) noexcept;}  
\begin{flushleft}
\textit{Effects:} Constructs a \texttt{valarray} that has the same length as \texttt{v}. The elements are initialized with the values of the corresponding elements of \texttt{v}.
\end{flushleft}
\item \texttt{valarray(initializer_list<T> il);}  
\begin{flushleft}
\textit{Effects:} Equivalent to \texttt{valarray(il.begin(), il.size()).}
\end{flushleft}
\item \texttt{valarray(const slice_array<T>&);}  
\item \texttt{valarray(const gslice_array<T>&);}  
\item \texttt{valarray(const mask_array<T>&);}  
\item \texttt{valarray(const indirect_array<T>&);}  
\item These conversion constructors convert one of the four reference templates to a \texttt{valarray}.
\item \texttt{~valarray();}
\begin{flushleft}
\textit{Effects:} The destructor is applied to every element of \texttt{*this}; an implementation may return all allocated memory.
\end{flushleft}
\end{itemize}

\textsuperscript{238} The intent is to specify an array template that has the minimum functionality necessary to address aliasing ambiguities and the proliferation of temporary objects. Thus, the \texttt{valarray} template is neither a matrix class nor a field class. However, it is a very useful building block for designing such classes.

\textsuperscript{239} This default constructor is essential, since arrays of \texttt{valarray} can be useful. After initialization, the length of an empty array can be increased with the \texttt{resize} member function.

\textsuperscript{240} This constructor is the preferred method for converting a C array to a \texttt{valarray} object.

\textsuperscript{241} This copy constructor creates a distinct array rather than an alias. Implementations in which arrays share storage are permitted, but they would need to implement a copy-on-reference mechanism to ensure that arrays are conceptually distinct.
28.6.2.3 Assignment

valarray& operator=(const valarray& v);

Effects: Each element of the *this array is assigned the value of the corresponding element of v. If the length of v is not equal to the length of *this, resizes *this to make the two arrays the same length, as if by calling resize(v.size()), before performing the assignment.

Postconditions: size() == v.size().

Returns: *this.

valarray& operator=(valarray&& v) noexcept;

Effects: *this obtains the value of v. The value of v after the assignment is not specified.

Returns: *this.

Complexity: Linear.

valarray& operator=(initializer_list<T> il);

Effects: Equivalent to: return *this = valarray(il);

valarray& operator=(const T& v);

Effects: Assigns v to each element of *this.

Returns: *this.

valarray& operator=(const slice_array<T>&);
valarray& operator=(const gslice_array<T>&);
valarray& operator=(const mask_array<T>&);
valarray& operator=(const indirect_array<T>&);

Preconditions: The length of the array to which the argument refers equals size(). The value of an element in the left-hand side of a valarray assignment operator does not depend on the value of another element in that left-hand side.

These operators allow the results of a generalized subscripting operation to be assigned directly to a valarray.

28.6.2.4 Element access

const T& operator[](size_t n) const;
T& operator[](size_t n);

Preconditions: n < size() is true.

Returns: A reference to the corresponding element of the array.

[Note 1: The expression a[i] = q, a[i]) == q evaluates to true for any non-constant valarray<T> a, any T q, and for any size_t i such that the value of i is less than the length of a. — end note]

Remarks: The expression addressof(a[i+j]) == addressof(a[i]) + j evaluates to true for all size_t i and size_t j such that i+j < a.size().

The expression addressof(a[i]) != addressof(b[j]) evaluates to true for any two arrays a and b and for any size_t i and size_t j such that i < a.size() and j < b.size().

[Note 2: This property indicates an absence of aliasing and can be used to advantage by optimizing compilers. Compilers can take advantage of inlining, constant propagation, loop fusion, tracking of pointers obtained from operator new, and other techniques to generate efficient valarrays. — end note]

The reference returned by the subscript operator for an array shall be valid until the member function resize(size_t, T) (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

28.6.2.5 Subset operations

The member operator[] is overloaded to provide several ways to select sequences of elements from among those controlled by *this. Each of these operations returns a subset of the array. The const-qualified versions return this subset as a new valarray object. The non-const versions return a class template object which has reference semantics to the original array, working in conjunction with various overloads of operator=
and other assigning operators to allow selective replacement (slicing) of the controlled sequence. In each case the selected element(s) shall exist.

valarray operator[](slice slicearr) const;

2 Returns: A valarray containing those elements of the controlled sequence designated by slicearr.
[Example 1:]
   const valarray<char> v0("abcdefgijklmnop", 16);
   //v0[slice(2, 5, 3)] returns valarray<char>("cfilo", 5)
   —end example]

slice_array<T> operator[](slice slicearr);

3 Returns: An object that holds references to elements of the controlled sequence selected by slicearr.
[Example 2:]
   valarray<char> v0("abcdefgijklmnop", 16);
   valarray<char> v1("ABCDE", 5);
   v0[slice(2, 5, 3)] = v1;
   //v0 == valarray<char>("abAdeBghCjkDmnEp", 16);
   —end example]

valarray operator[](const gslice& gslicearr) const;

4 Returns: A valarray containing those elements of the controlled sequence designated by gslicearr.
[Example 3:]
   const valarray<char> v0("abcdefgijklmnop", 16);
   const size_t lv[] = { 2, 3 };  
   const size_t dv[] = { 7, 2 };  
   const valarray<size_t> len(lv, 2), str(dv, 2);
   //v0[gslice(3, len, str)] returns
   //valarray<char>("dfhkmn", 6)
   —end example]

gslice_array<T> operator[](const gslice& gslicearr);

5 Returns: An object that holds references to elements of the controlled sequence selected by gslicearr.
[Example 4:]
   valarray<char> v0("abcdefgijklmnop", 16);
   valarray<char> v1("ABCDEFG", 6);
   const size_t lv[] = { 2, 3 };  
   const size_t dv[] = { 7, 2 };  
   const valarray<size_t> len(lv, 2), str(dv, 2);
   v0[gslice(3, len, str)] = v1;
   //v0 == valarray<char>("abcAeBgCijDlEnFp", 16)
   —end example]

valarray operator[](const valarray<bool>& boolarr) const;

6 Returns: A valarray containing those elements of the controlled sequence designated by boolarr.
[Example 5:]
   const valarray<char> v0("abcdefgijklmnop", 16);
   const bool vb[] = { false, false, true, true, false, true };  
   //v0[valarray<bool>(vb, 6)] returns
   //valarray<char>("cdf", 3)
   —end example]

mask_array<T> operator[](const valarray<bool>& boolarr);

7 Returns: An object that holds references to elements of the controlled sequence selected by boolarr.
[Example 6:]
   valarray<char> v0("abcdefgijklmnop", 16);
valarray<
<
char>
>
 v1("ABC", 3);
const bool vb[] = { false, false, true, true, false, true };
v0[valarray<
<
bool>
>(vb, 6)] = v1;
// v0 == valarray<
<
char>
>("abABeGhijklmnop", 16)

—end example

valarray operator[](const valarray<
size_t>
>& indarr) const;

Returns: A valarray containing those elements of the controlled sequence designated by indarr.

[Example 7]:
const valarray<
<
char>
> v0("abcdefghiklmnop", 16);
const size_t vi[] = { 7, 5, 2, 3, 8 };
// v0[valarray<
size_t
>(vi, 5)] returns
// valarray<
char
>("hfcdi", 5)

—end example

indirect_array<T> operator[](const valarray<
size_t>
>& indarr);

Returns: An object that holds references to elements of the controlled sequence selected by indarr.

[Example 8]:
valarray<
char
> v0("abcdefghiklmnop", 16);
valarray<
char
> v1("ABCDE", 5);
const size_t vi[] = { 7, 5, 2, 3, 8 };
v0[valarray<
size_t
>(vi, 5)] = v1;
// v0 == valarray<
char
>("abCDeBgAEjklmnop", 16)

—end example

28.6.2.6 Unary operators

valarray operator+( ) const;
valarray operator-( ) const;
valarray operator-( ) const;
valarray<
bool
> operator!( ) const;

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T (bool for operator!) or which may be unambiguously implicitly converted to type T (bool for operator!).

Returns: A valarray whose length is size(). Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array.

28.6.2.7 Compound assignment

valarray& operator*= (const valarray& v);
valarray& operator/= (const valarray& v);
valarray& operator%= (const valarray& v);
valarray& operator+= (const valarray& v);
valarray& operator-= (const valarray& v);
valarray& operator^= (const valarray& v);
valarray& operator&= (const valarray& v);
valarray& operator|= (const valarray& v);
valarray& operator<<= (const valarray& v);
valarray& operator>>= (const valarray& v);

Mandates: The indicated operator can be applied to two operands of type T.

Preconditions: size() == v.size() is true.
The value of an element in the left-hand side of a valarray compound assignment operator does not depend on the value of another element in that left hand side.

Effects: Each of these operators performs the indicated operation on each of the elements of *this and the corresponding element of v.

Returns: *this.
Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers.

```cpp
valarray& operator*= (const T& v);
valarray& operator/= (const T& v);
valarray& operator%= (const T& v);
valarray& operator+= (const T& v);
valarray& operator-= (const T& v);
valarray& operator^= (const T& v);
valarray& operator&= (const T& v);
valarray& operator|= (const T& v);
valarray& operator<<=(const T& v);
valarray& operator>>=(const T& v);
```

Mandates: The indicated operator can be applied to two operands of type T.

Effects: Each of these operators applies the indicated operation to each element of *this and v.

Remarks: The appearance of an array on the left-hand side of a compound assignment does not invalidate references or pointers to the elements of the array.

28.6.2.8 Member functions

```cpp
void swap(valarray& v) noexcept;
```

Effects: *this obtains the value of v. v obtains the value of *this.

Complexity: Constant.

```cpp
size_t size() const;
```

Returns: The number of elements in the array.

Complexity: Constant time.

```cpp
T sum() const;
```

Mandates: operator+= can be applied to operands of type T.

Preconditions: size() > 0 is true.

Returns: The sum of all the elements of the array. If the array has length 1, returns the value of element 0. Otherwise, the returned value is calculated by applying operator+= to a copy of an element of the array and all other elements of the array in an unspecified order.

```cpp
T min() const;
```

Preconditions: size() > 0 is true.

Returns: The minimum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

```cpp
T max() const;
```

Preconditions: size() > 0 is true.

Returns: The maximum value contained in *this. For an array of length 1, the value of element 0 is returned. For all other array lengths, the determination is made using operator<.

```cpp
valarray shift(int n) const;
```

Returns: A valarray of length size(), each of whose elements I is (*this)[I + n] if I + n is non-negative and less than size(), otherwise T().

[Note 1: If element zero is taken as the leftmost element, a positive value of n shifts the elements left n places, with zero fill. — end note]

[Example 1: If the argument has the value −2, the first two elements of the result will be value-initialized (9.4); the third element of the result will be assigned the value of the first element of *this; etc. — end example]
valarray cshift(int n) const;

Returns: A valarray of length size() that is a circular shift of *this. If element zero is taken as the leftmost element, a non-negative value of n shifts the elements circularly left n places and a negative value of n shifts the elements circularly right −n places.

valarray apply(T func(T)) const;
valarray apply(T func(const T&)) const;

Returns: A valarray whose length is size(). Each element of the returned array is assigned the value returned by applying the argument function to the corresponding element of *this.

void resize(size_t sz, T c = T());

Effects: Changes the length of the *this array to sz and then assigns to each element the value of the second argument. Resizing invalidates all pointers and references to elements in the array.

28.6.3 valarray non-member operations

28.6.3.1 Binary operators

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Preconditions: The argument arrays have the same length.

Returns: A valarray whose length is equal to the lengths of the argument arrays. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.

§ 28.6.3.1
template<class T> valarray<T> operator& (const typename valarray<T>::value_type&, const valarray<T>&);  

template<class T> valarray<T> operator| (const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<T> operator| (const typename valarray<T>::value_type&, const valarray<T>&);  

template<class T> valarray<T> operator<< (const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<T> operator>> (const valarray<T>&, const typename valarray<T>::value_type&);  

Mandates: The indicated operator can be applied to operands of type T and returns a value of type T or which can be unambiguously implicitly converted to T.

Returns: A valarray whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array argument and the non-array argument.

28.6.3.2 Logical operators [valarray.comparison]  

template<class T> valarray<bool> operator==(const valarray<T>&, const valarray<T>&);  

template<class T> valarray<bool> operator==(const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<bool> operator!=(const valarray<T>&, const valarray<T>&);  

template<class T> valarray<bool> operator!=(const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<bool> operator< (const valarray<T>&, const valarray<T>&);  

template<class T> valarray<bool> operator< (const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<bool> operator> (const valarray<T>&, const valarray<T>&);  

template<class T> valarray<bool> operator> (const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<bool> operator<= (const valarray<T>&, const valarray<T>&);  

template<class T> valarray<bool> operator<= (const valarray<T>&, const typename valarray<T>::value_type&);  

template<class T> valarray<bool> operator>= (const valarray<T>&, const valarray<T>&);  

template<class T> valarray<bool> operator>= (const valarray<T>&, const typename valarray<T>::value_type&);  

Mandates: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.

Preconditions: The two array arguments have the same length.

Returns: A valarray<bool> whose length is equal to the length of the array arguments. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding elements of the argument arrays.
template<class T> valarray<bool> operator&&(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<bool> operator&&(const typename valarray<T>::value_type&, const valarray<T>&);

Mandates: The indicated operator can be applied to operands of type T and returns a value of type bool or which can be unambiguously implicitly converted to bool.

Returns: A valarray<bool> whose length is equal to the length of the array argument. Each element of the returned array is initialized with the result of applying the indicated operator to the corresponding element of the array and the non-array argument.

28.6.3.3 Transcendentals
[ valarray.transcend ]

template<class T> valarray<T> abs (const valarray<T>&);

template<class T> valarray<T> acos (const valarray<T>&);

template<class T> valarray<T> asin (const valarray<T>&);

template<class T> valarray<T> atan (const valarray<T>&);

template<class T> valarray<T> atan2(const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> atan2(const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> atan2(const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> cos (const valarray<T>&);

template<class T> valarray<T> cosh (const valarray<T>&);

template<class T> valarray<T> exp (const valarray<T>&);

template<class T> valarray<T> log (const valarray<T>&);

template<class T> valarray<T> log10(const valarray<T>&);

template<class T> valarray<T> pow (const valarray<T>&, const valarray<T>&);

template<class T> valarray<T> pow (const valarray<T>&, const typename valarray<T>::value_type&);

template<class T> valarray<T> pow (const typename valarray<T>::value_type&, const valarray<T>&);

template<class T> valarray<T> sin (const valarray<T>&);

template<class T> valarray<T> sinh (const valarray<T>&);

template<class T> valarray<T> sqrt (const valarray<T>&);

template<class T> valarray<T> tan (const valarray<T>&);

template<class T> valarray<T> tanh (const valarray<T>&);

Mandates: A unique function with the indicated name can be applied (unqualified) to an operand of type T. This function returns a value of type T or which can be unambiguously implicitly converted to type T.

28.6.3.4 Specialized algorithms
[ valarray.special ]

template<class T> void swap(valarray<T>& x, valarray<T>& y) noexcept;

Effects: Equivalent to x.swap(y).

28.6.4 Class slice
[ class.slice ]

28.6.4.1 Overview
[ class.slice.overview ]

namespace std {
    class slice {
        public:
            slice();
            slice(size_t, size_t, size_t);
            slice(const slice&);

            size_t start() const;
            size_t size() const;
            size_t stride() const;

            friend bool operator==(const slice& x, const slice& y);
        
    };
}

§ 28.6.4.1 1448
The slice class represents a BLAS-like slice from an array. Such a slice is specified by a starting index, a length, and a stride.\footnote{BLAS stands for Basic Linear Algebra Subprograms. C++ programs can instantiate this class. See, for example, Dongarra, Du Croz, Duff, and Hammerling: A set of Level 3 Basic Linear Algebra Subprograms; Technical Report MCS-P1-0888, Argonne National Laboratory (USA), Mathematics and Computer Science Division, August, 1988.}

### 28.6.4.2 Constructors

```cpp
slice();
slice(size_t start, size_t length, size_t stride);
```

The default constructor is equivalent to `slice(0, 0, 0)`. A default constructor is provided only to permit the declaration of arrays of slices. The constructor with arguments for a slice takes a start, length, and stride parameter.

**Example 1**: `slice(3, 8, 2)` constructs a slice which selects elements 3, 5, 7, …, 17 from an array. — end example

### 28.6.4.3 Access functions

```cpp
size_t start() const;
size_t size() const;
size_t stride() const;
```

*Returns*: The start, length, or stride specified by a slice object.

**Complexity**: Constant time.

### 28.6.4.4 Operators

```cpp
friend bool operator==(const slice& x, const slice& y);
```

**Effects**: Equivalent to:

```cpp
return x.start() == y.start() && x.size() == y.size() && x.stride() == y.stride();
```

### 28.6.5 Class template slice_array

### 28.6.5.1 Overview

```cpp
namespace std {
  template<class T> class slice_array {
    public:
      using value_type = T;
      void operator= (const valarray<T>&) const;
      void operator*= (const valarray<T>&) const;
      void operator/= (const valarray<T>&) const;
      void operator%= (const valarray<T>&) const;
      void operator+= (const valarray<T>&) const;
      void operator-= (const valarray<T>&) const;
      void operator^= (const valarray<T>&) const;
      void operator&= (const valarray<T>&) const;
      void operator|= (const valarray<T>&) const;
      void operator<<=(const valarray<T>&) const;
      void operator>>=(const valarray<T>&) const;
      slice_array(const slice_array&);
      ~slice_array();
      const slice_array& operator=(const slice_array&) const;
      void operator=(const T&) const;
      slice_array() = delete; // as implied by declaring copy constructor above
    }
  }
}
```

This template is a helper template used by the slice subscript operator

```cpp
slice_array<T> valarray<T>::operator[] (slice);
```
It has reference semantics to a subset of an array specified by a \texttt{slice} object.

\[\text{Example 1: The expression } a[slice(1, 5, 3)] = b; \text{ has the effect of assigning the elements of } b \text{ to a slice of the elements in } a. \text{ For the slice shown, the elements selected from } a \text{ are } 1, 4, \ldots, 13. \quad \text{— end example}\]

\subsection*{28.6.5.2 Assignment} \quad \texttt{slice.arr.assign}

\begin{verbatim}
void operator=(const valarray<T>&) const;
const slice_array& operator=(const slice_array&) const;
\end{verbatim}

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the \texttt{valarray<T>} object to which the \texttt{slice_array} object refers.

\subsection*{28.6.5.3 Compound assignment} \quad \texttt{slice.arr.comp.assign}

\begin{verbatim}
void operator*= (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
\end{verbatim}

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the \texttt{valarray<T>} object to which the \texttt{slice_array} object refers.

\subsection*{28.6.5.4 Fill function} \quad \texttt{slice.arr.fill}

\begin{verbatim}
void operator=(const T&) const;
\end{verbatim}

This function has reference semantics, assigning the value of its argument to the elements of the \texttt{valarray<T>} object to which the \texttt{slice_array} object refers.

\subsection*{28.6.6 The \texttt{gslice} class} \quad \texttt{class.gslice}

\subsection*{28.6.6.1 Overview} \quad \texttt{class.gslice.overview}

\begin{verbatim}
namespace std {
    class gslice {
    public:
        gslice();
        gslice(size_t s, const valarray<size_t>& l, const valarray<size_t>& d);

        size_t start() const;
        valarray<size_t> size() const;
        valarray<size_t> stride() const;
    };
}
\end{verbatim}

This class represents a generalized slice out of an array. A \texttt{gslice} is defined by a starting offset \( (s) \), a set of lengths \( (l_j) \), and a set of strides \( (d_j) \). The number of lengths shall equal the number of strides.

A \texttt{gslice} represents a mapping from a set of indices \( (i_j) \), equal in number to the number of strides, to a single index \( k \). It is useful for building multidimensional array classes using the \texttt{valarray} template, which is one-dimensional. The set of one-dimensional index values specified by a \texttt{gslice} are

\[ k = s + \sum_i i_j d_j \]

where the multidimensional indices \( i_j \) range in value from 0 to \( l_j - 1 \).

\[\text{Example 1: The gslice specification}\]

\begin{verbatim}
start = 3
length = {2, 4, 3}
stride = {19, 4, 1}
\end{verbatim}
yields the sequence of one-dimensional indices

\[ k = 3 + (0, 1) \times 19 + (0, 1, 2, 3) \times 4 + (0, 1, 2) \times 1 \]

which are ordered as shown in the following table:

\[
\begin{array}{c}
(i_0, i_1, i_2, k) = \\
(0, 0, 0, 3), \\
(0, 0, 1, 4), \\
(0, 0, 2, 5), \\
(0, 1, 0, 7), \\
(0, 1, 1, 8), \\
(0, 1, 2, 9), \\
(0, 2, 0, 11), \\
(0, 2, 1, 12), \\
(0, 2, 2, 13), \\
(0, 3, 0, 15), \\
(0, 3, 1, 16), \\
(0, 3, 2, 17), \\
(1, 0, 0, 22), \\
(1, 0, 1, 23), \\
\ldots \\
(1, 3, 2, 36)
\end{array}
\]

That is, the highest-ordered index turns fastest. —end example]

It is possible to have degenerate generalized slices in which an address is repeated.

[Example 2: If the stride parameters in the previous example are changed to \{1, 1, 1\}, the first few elements of the resulting sequence of indices will be

\[
\begin{array}{c}
(0, 0, 0, 3), \\
(0, 0, 1, 4), \\
(0, 0, 2, 5), \\
(0, 1, 0, 4), \\
(0, 1, 1, 5), \\
(0, 1, 2, 6), \\
\ldots
\end{array}
\]

—end example]

If a degenerate slice is used as the argument to the non-\texttt{const} version of \texttt{operator[]} (\texttt{const gslice&}), the behavior is undefined.

28.6.6.2 Constructors

\texttt{gslice();}
\texttt{gslice(size_t start, const valarray\langle size_t\rangle& lengths,}
\texttt{const valarray\langle size_t\rangle& strides);}

The default constructor is equivalent to \texttt{gslice(0, valarray\langle size_t\rangle(), valarray\langle size_t\rangle());}

The constructor with arguments builds a \texttt{gslice} based on a specification of start, lengths, and strides, as explained in the previous subclause.

28.6.6.3 Access functions

\texttt{size_t start() const;}
\texttt{valarray\langle size_t\rangle size() const;}
\texttt{valarray\langle size_t\rangle stride() const;}

1 Returns: The representation of the start, lengths, or strides specified for the \texttt{gslice}.

2 Complexity: \texttt{start()} is constant time. \texttt{size()} and \texttt{stride()} are linear in the number of strides.
28.6.7 Class template gslice_array

28.6.7.1 Overview

```cpp
namespace std {
    template<class T> class gslice_array {
        public:
            using value_type = T;
            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%= (const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^= (const valarray<T>&) const;
            void operator&= (const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<<=(const valarray<T>&) const;
            void operator>>=(const valarray<T>&) const;
            gslice_array(const gslice_array&);
            ~gslice_array();
            const gslice_array& operator=(const gslice_array&) const;
            void operator=(const T&) const;
        gslice_array() = delete;  // as implied by declaring copy constructor above
    };
}
```

1 This template is a helper template used by the `gslice` subscript operator:

```cpp
gslice_array<T> valarray<T>::operator[](const gslice&);
```

2 It has reference semantics to a subset of an array specified by a `gslice` object. Thus, the expression `a[gslice(1, length, stride)] = b` has the effect of assigning the elements of `b` to a generalized slice of the elements in `a`.

28.6.7.2 Assignment

```cpp
void operator=(const valarray<T>&) const;
const gslice_array& operator=(const gslice_array&) const;
```

These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `gslice_array` refers.

28.6.7.3 Compound assignment

```cpp
void operator%% (const valarray<T>&) const;
void operator%/= (const valarray<T>&) const;
void operator%/= (const valarray<T>&) const;
void operator%+= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
```

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `gslice_array` object refers.

28.6.7.4 Fill function

```cpp
void operator=(const T&) const;
```

This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `gslice_array` object refers.
28.6.8 Class template mask_array

28.6.8.1 Overview

```cpp
namespace std {
    template<class T> class mask_array {
    public:
        using value_type = T;
        void operator= (const valarray<T>&) const;
        void operator*= (const valarray<T>&) const;
        void operator/= (const valarray<T>&) const;
        void operator%= (const valarray<T>&) const;
        void operator+= (const valarray<T>&) const;
        void operator-= (const valarray<T>&) const;
        void operator^= (const valarray<T>&) const;
        void operator&= (const valarray<T>&) const;
        void operator|= (const valarray<T>&) const;
        void operator<<=(const valarray<T>&) const;
        void operator>>=(const valarray<T>&) const;
        mask_array(const mask_array&);
        ~mask_array();
        const mask_array& operator=(const mask_array&) const;
        void operator=(const T&) const;
        mask_array() = delete; // as implied by declaring copy constructor above
    }
```

1 This template is a helper template used by the mask subscript operator:

```cpp
mask_array<T> valarray<T>::operator[](const valarray<bool>&);
```

2 It has reference semantics to a subset of an array specified by a boolean mask. Thus, the expression `a[mask] = b;` has the effect of assigning the elements of `b` to the masked elements in `a` (those for which the corresponding element in `mask` is `true`).

28.6.8.2 Assignment

```cpp
void operator=(const valarray<T>&) const;
const mask_array& operator=(const mask_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.8.3 Compound assignment

```cpp
void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator^= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<<=(const valarray<T>&) const;
void operator>>=(const valarray<T>&) const;
```

1 These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the `valarray<T>` object to which the `mask_array` object refers.

28.6.8.4 Fill function

```cpp
void operator=(const T&) const;
```

1 This function has reference semantics, assigning the value of its argument to the elements of the `valarray<T>` object to which the `mask_array` object refers.
28.6.9 Class template indirect_array

28.6.9.1 Overview

```cpp
namespace std {
    template<class T> class indirect_array {
        public:
            using value_type = T;
            void operator= (const valarray<T>&) const;
            void operator*= (const valarray<T>&) const;
            void operator/= (const valarray<T>&) const;
            void operator%= (const valarray<T>&) const;
            void operator+= (const valarray<T>&) const;
            void operator-= (const valarray<T>&) const;
            void operator^= (const valarray<T>&) const;
            void operator&= (const valarray<T>&) const;
            void operator|= (const valarray<T>&) const;
            void operator<-(const valarray<T>&) const;
            void operator>=(const valarray<T>&) const;

            indirect_array(const indirect_array&);
            indirect_array();
            const indirect_array& operator=(const indirect_array&) const;
            void operator=(const T&) const;
            indirect_array() = delete; // as implied by declaring copy constructor above
    };
}
```

1 This template is a helper template used by the indirect subscript operator

```cpp```
indirect_array<T> valarray<T>::operator[](const valarray< size_t >&);
```

It has reference semantics to a subset of an array specified by an indirect_array. Thus, the expression `a[indirect] = b;` has the effect of assigning the elements of `b` to the elements in `a` whose indices appear in indirect.

28.6.9.2 Assignment

```cpp```
void operator=(const valarray<T>&) const;
const indirect_array& operator=(const indirect_array&) const;
```

1 These assignment operators have reference semantics, assigning the values of the argument array elements to selected elements of the valarray<T> object to which it refers.

2 If the indirect_array specifies an element in the valarray<T> object to which it refers more than once, the behavior is undefined.

3 Example 1:

```cpp```
    int addr[] = {2, 3, 1, 4, 4};
    valarray< size_t > indirect(addr, 5);
    valarray<double> a(0., 10), b(1., 5);
    a[indirect] = b;
```result in undefined behavior since element 4 is specified twice in the indirection. — end example]

28.6.9.3 Compound assignment

```cpp```
void operator== (const valarray<T>&) const;
void operator/= (const valarray<T>&) const;
void operator%= (const valarray<T>&) const;
void operator+= (const valarray<T>&) const;
void operator-= (const valarray<T>&) const;
void operator&= (const valarray<T>&) const;
void operator|= (const valarray<T>&) const;
void operator<-(const valarray<T>&) const;
void operator>=(const valarray<T>&) const;
```

§ 28.6.9.3 1454
void operator>>(const valarray<T>&) const;

These compound assignments have reference semantics, applying the indicated operation to the elements of the argument array and selected elements of the \emph{valarray<T>} object to which the \emph{indirect_array} object refers.

If the \emph{indirect_array} specifies an element in the \emph{valarray<T>} object to which it refers more than once, the behavior is undefined.

28.6.9.4 Fill function

\begin{verbatim}
void operator=(const T&) const;
\end{verbatim}

This function has reference semantics, assigning the value of its argument to the elements of the \emph{valarray<T>} object to which the \emph{indirect_array} object refers.

28.6.10 \emph{valarray} range access

In the \emph{begin} and \emph{end} function templates that follow, \emph{unspecified1} is a type that meets the requirements of a mutable \emph{Cpp17RandomAccessIterator} (25.3.5.7) and models \emph{contiguous_iterator} (25.3.4.14), whose \emph{value_type} is the template parameter \emph{T} and whose \emph{reference} type is \emph{T&}. \emph{unspecified2} is a type that meets the requirements of a constant \emph{Cpp17RandomAccessIterator} and models \emph{contiguous_iterator}, whose \emph{value_type} is the template parameter \emph{T} and whose \emph{reference} type is \emph{const T&}.

The iterators returned by \emph{begin} and \emph{end} for an array are guaranteed to be valid until the member function \emph{resize(size_t, T)} (28.6.2.8) is called for that array or until the lifetime of that array ends, whichever happens first.

\begin{verbatim}
template<class T> unspecified1 begin(valarray<T>& v);
template<class T> unspecified2 begin(const valarray<T>& v);
\end{verbatim}

\textbf{Returns:} An iterator referencing the first value in the array.

\begin{verbatim}
template<class T> unspecified1 end(valarray<T>& v);
template<class T> unspecified2 end(const valarray<T>& v);
\end{verbatim}

\textbf{Returns:} An iterator referencing one past the last value in the array.

long double sph_neumannl(unsigned n, long double x);
}

1 The contents and meaning of the header `<math.h>` are the same as the C standard library header `<math.h>`, with the addition of a three-dimensional hypotenuse function (28.7.3), a linear interpolation function (28.7.4), and the mathematical special functions described in 28.7.6.

[Note 1: Several functions have additional overloads in this document, but they have the same behavior as in the C standard library (16.2). — end note]

2 For each function with at least one parameter of type `floating-point-type`, the implementation provides an overload for each cv-unqualified floating-point type (6.8.2) where all uses of `floating-point-type` in the function signature are replaced with that floating-point type.

3 For each function with at least one parameter of type `floating-point-type` other than `abs`, the implementation also provides additional overloads sufficient to ensure that, if every argument corresponding to a `floating-point-type` parameter has arithmetic type, then every such argument is effectively cast to the floating-point type with the greatest floating-point conversion rank and greatest floating-point conversion subrank among the types of
all such arguments, where arguments of integer type are considered to have the same floating-point conversion
rank as double. If no such floating-point type with the greatest rank and subrank exists, then overload
resolution does not result in a usable candidate (12.2.1) from the overloads provided by the implementation.

See also: ISO C 7.12

28.7.2 Absolute values

constexpr int abs(int j);
constexpr long int abs(long int j);
constexpr long long int abs(long long int j);

Effects: These functions have the semantics specified in the C standard library for the functions abs,
labs, and llabs, respectively.

Remarks: If abs is called with an argument of type X for which is_unsigned_v<X> is true and if X
cannot be converted to int by integral promotion (7.3.7), the program is ill-formed.

constexpr floating-point-type abs(floating-point-type x);

Returns: The absolute value of x.

See also: ISO C 7.12.7.2, 7.22.6.1

28.7.3 Three-dimensional hypotenuse

floating-point-type hypot(floating-point-type x, floating-point-type y, floating-point-type z);

Returns: √x² + y² + z².

28.7.4 Linear interpolation

constexpr floating-point-type lerp(floating-point-type a, floating-point-type b, floating-point-type t) noexcept;

Returns: a + t(b - a).

Remarks: Let r be the value returned. If isfinite(a) && isfinite(b), then:

(2.1) — If t == 0, then r == a.
(2.2) — If t == 1, then r == b.
(2.3) — If t >= 0 && t <= 1, then isfinite(r).
(2.4) — If isfinite(t) && a == b, then r == a.
(2.5) — If isfinite(t) || !isnan(t) && b-a != 0, then !isnan(r).

Let CMP(x,y) be 1 if x > y, -1 if x < y, and 0 otherwise. For any t1 and t2, the product of
CMP(lerp(a, b, t2), lerp(a, b, t1)), CMP(t2, t1), and CMP(b, a) is non-negative.

28.7.5 Classification / comparison functions

The classification / comparison functions behave the same as the C macros with the corresponding names
defined in the C standard library.

See also: ISO C 7.12.3, 7.12.4

28.7.6 Mathematical special functions

28.7.6.1 General

If any argument value to any of the functions specified in 28.7.6 is a NaN (Not a Number), the function shall
return a NaN but it shall not report a domain error. Otherwise, the function shall report a domain error for
just those argument values for which:

(1.1) — the function description’s Returns: element explicitly specifies a domain and those argument values fall
outside the specified domain, or
(1.2) — the corresponding mathematical function value has a nonzero imaginary component, or
Unless otherwise specified, each function is defined for all finite values, for negative infinity, and for positive infinity.

28.7.6.2 Associated Laguerre polynomials

\[ L_n^m(x) = (-1)^m \frac{d^m}{dx^m} L_{n+m}(x) , \quad \text{for} \ x \geq 0, \]

where \( n = n \), \( m = m \), and \( x = x \).

Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \) or if \( m \geq 128 \).

28.7.6.3 Associated Legendre functions

\[ P_l^m(x) = (1 - x^2)^{m/2} \frac{d^m}{dx^m} P_l(x) , \quad \text{for} \ |x| \leq 1, \]

where \( l = l \), \( m = m \), and \( x = x \).

Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).

28.7.6.4 Beta function

\[ B(x, y) = \frac{\Gamma(x) \Gamma(y)}{\Gamma(x + y)} , \quad \text{for} \ x > 0, \ y > 0, \]

where \( x = x \) and \( y = y \).

28.7.6.5 Complete elliptic integral of the first kind

\[ K(k) = F(k, \pi/2) , \quad \text{for} \ |k| \leq 1, \]

where \( k = k \).

243) A mathematical function is mathematically defined for a given set of argument values (a) if it is explicitly defined for that set of argument values, or (b) if its limiting value exists and does not depend on the direction of approach.
28.7.6.6 Complete elliptic integral of the second kind

```
floating-point-type comp_ellint_2(floating-point-type k);
float comp_ellint_2f(float k);
long double comp_ellint_2l(long double k);
```

**Effects:** These functions compute the complete elliptic integral of the second kind of their respective arguments \( k \).

**Returns:**

\[ E(k) = E(k, \pi/2), \quad \text{for} \ |k| \leq 1, \]

where \( k \) is \( k \).

See also 28.7.6.13.

28.7.6.7 Complete elliptic integral of the third kind

```
floating-point-type comp_ellint_3(floating-point-type k, floating-point-type nu);
float comp_ellint_3f(float k, float nu);
long double comp_ellint_3l(long double k, long double nu);
```

**Effects:** These functions compute the complete elliptic integral of the third kind of their respective arguments \( k \) and \( \nu \).

**Returns:**

\[ \Pi(\nu, k) = \Pi(\nu, k, \pi/2), \quad \text{for} \ |k| \leq 1, \]

where \( k \) is \( k \) and \( \nu \) is \( \nu \).

See also 28.7.6.14.

28.7.6.8 Regular modified cylindrical Bessel functions

```
floating-point-type cyl_bessel_i(floating-point-type nu, floating-point-type x);
float cyl_bessel_if(float nu, float x);
long double cyl_bessel_il(long double nu, long double x);
```

**Effects:** These functions compute the regular modified cylindrical Bessel functions of their respective arguments \( \nu \) and \( x \).

**Returns:**

\[ I_\nu(x) = i^{-\nu}J_\nu(ix) = \sum_{k=0}^{\infty} \frac{(x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for} \ x \geq 0, \]

where \( \nu \) is \( \nu \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( \nu \geq 128 \).

See also 28.7.6.9.

28.7.6.9 Cylindrical Bessel functions of the first kind

```
floating-point-type cyl_bessel_j(floating-point-type nu, floating-point-type x);
float cyl_bessel_jf(float nu, float x);
long double cyl_bessel_jl(long double nu, long double x);
```

**Effects:** These functions compute the cylindrical Bessel functions of the first kind of their respective arguments \( \nu \) and \( x \).

**Returns:**

\[ J_\nu(x) = \sum_{k=0}^{\infty} \frac{(-1)^k (x/2)^{\nu+2k}}{k! \Gamma(\nu + k + 1)}, \quad \text{for} \ x \geq 0, \]

where \( \nu \) is \( \nu \) and \( x \) is \( x \).

**Remarks:** The effect of calling each of these functions is implementation-defined if \( \nu \geq 128 \).
28.7.6.10 Irregular modified cylindrical Bessel functions

```c
floating-point-type cyl_bessel_k(floating-point-type nu, floating-point-type x);
float cyl_bessel_kf(float nu, float x);
long double cyl_bessel_kl(long double nu, long double x);
```

**Effects:** These functions compute the irregular modified cylindrical Bessel functions of their respective arguments `nu` and `x`.

```latex
K_{\nu}(x) = (\pi/2)^{\nu+1}(J_{\nu}(ix) + iN_{\nu}(ix)) = \begin{cases} 
\dfrac{\pi}{2} \dfrac{1_{-\nu}(x) - 1_{\nu}(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\
\dfrac{\pi}{2} \lim_{\mu \to \nu} \dfrac{1_{-\mu}(x) - 1_{\mu}(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu 
\end{cases}
```

where `\nu` is `nu` and `x` is `x`.

**Remarks:** The effect of calling each of these functions is implementation-defined if `nu >= 128`.

See also 28.7.6.8, 28.7.6.9, 28.7.6.11.

28.7.6.11 Cylindrical Neumann functions

```c
floating-point-type cyl_neumann(floating-point-type nu, floating-point-type x);
float cyl_neumannf(float nu, float x);
long double cyl_neumannl(long double nu, long double x);
```

**Effects:** These functions compute the cylindrical Neumann functions, also known as the cylindrical Bessel functions of the second kind, of their respective arguments `nu` and `x`.

```latex
N_{\nu}(x) = \begin{cases} 
\dfrac{J_{\nu}(x) \cos \nu \pi - J_{-\nu}(x)}{\sin \nu \pi}, & \text{for } x \geq 0 \text{ and non-integral } \nu \\
\lim_{\mu \to \nu} \dfrac{J_{\mu}(x) \cos \mu \pi - J_{-\mu}(x)}{\sin \mu \pi}, & \text{for } x \geq 0 \text{ and integral } \nu 
\end{cases}
```

where `\nu` is `nu` and `x` is `x`.

**Remarks:** The effect of calling each of these functions is implementation-defined if `nu >= 128`.

See also 28.7.6.9.

28.7.6.12 Incomplete elliptic integral of the first kind

```c
floating-point-type ellint_1(floating-point-type k, floating-point-type phi);
float ellint_1f(float k, float phi);
long double ellint_1l(long double k, long double phi);
```

**Effects:** These functions compute the incomplete elliptic integral of the first kind of their respective arguments `k` and `phi` (phi measured in radians).

```latex
F(k, \phi) = \int_{0}^{\phi} \dfrac{d\theta}{\sqrt{1 - k^2 \sin^2 \theta}}, \text{ for } |k| \leq 1,
```

where `k` is `k` and `phi` is `phi`.

28.7.6.13 Incomplete elliptic integral of the second kind

```c
floating-point-type ellint_2(floating-point-type k, floating-point-type phi);
float ellint_2f(float k, float phi);
long double ellint_2l(long double k, long double phi);
```

**Effects:** These functions compute the incomplete elliptic integral of the second kind of their respective arguments `k` and `phi` (phi measured in radians).

```latex
E(k, \phi) = \int_{0}^{\phi} \sqrt{1 - k^2 \sin^2 \theta} d\theta, \text{ for } |k| \leq 1,
```

where `k` is `k` and `phi` is `phi`. 
28.7.6.14 Incomplete elliptic integral of the third kind

floating-point-type ellint_3(floating-point-type k, floating-point-type nu, floating-point-type phi);
float ellint_3f(float k, float nu, float phi);
long double ellint_3l(long double k, long double nu, long double phi);

Effects: These functions compute the incomplete elliptic integral of the third kind of their respective arguments k, nu, and phi (phi measured in radians).

Returns:
\[ \Pi(\nu,k,\phi) = \int_{0}^{\phi} \frac{d\theta}{(1 - \nu \sin^2 \theta)\sqrt{1 - k^2 \sin^2 \theta}} \], for \( |k| \leq 1 \),

where \( \nu \) is nu, \( k \) is k, and \( \phi \) is phi.

28.7.6.15 Exponential integral

floating-point-type expint(floating-point-type x);
float expintf(float x);
long double expintl(long double x);

Effects: These functions compute the exponential integral of their respective arguments x.

Returns:
\[ Ei(x) = - \int_{-\infty}^{x} \frac{e^{-t}}{t} \, dt \]

where \( x \) is x.

28.7.6.16 Hermite polynomials

floating-point-type hermite(unsigned n, floating-point-type x);
float hermitef(unsigned n, float x);
long double hermitel(unsigned n, long double x);

Effects: These functions compute the Hermite polynomials of their respective arguments n and x.

Returns:
\[ H_n(x) = (-1)^n e^{x^2} \frac{d^n}{dx^n} e^{-x^2} \]

where \( n \) is n and \( x \) is x.

Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

28.7.6.17 Laguerre polynomials

floating-point-type laguerre(unsigned n, floating-point-type x);
float laguerref(unsigned n, float x);
long double laguerrel(unsigned n, long double x);

Effects: These functions compute the Laguerre polynomials of their respective arguments n and x.

Returns:
\[ L_n(x) = \frac{e^x}{n!} \frac{d^n}{dx^n} (x^n e^{-x}) \], for \( x \geq 0 \),

where \( n \) is n and \( x \) is x.

Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

28.7.6.18 Legendre polynomials

floating-point-type legendre(unsigned l, floating-point-type x);
float legendref(unsigned l, float x);
long double legendrel(unsigned l, long double x);

Effects: These functions compute the Legendre polynomials of their respective arguments l and x.

Returns:
\[ P_l(x) = \frac{1}{2^l l!} \frac{d^l}{dx^l} (x^2 - 1)^l \], for \( |x| \leq 1 \),

where \( l \) is l and \( x \) is x.

Remarks: The effect of calling each of these functions is implementation-defined if \( l \geq 128 \).
28.7.6.19 Riemann zeta function

```
float riemann_zetaf(float x);
long double riemann_zetal(long double x);
```

1. **Effects:** These functions compute the Riemann zeta function of their respective arguments x.

\[ \zeta(x) = \begin{cases} 
\sum_{k=1}^{\infty} k^{-x}, & \text{for } x > 1 \\
\frac{1}{2^{1-x}} \sum_{k=1}^{\infty} (-1)^{k-1} k^{-x}, & \text{for } 0 \leq x \leq 1 \\
2^x \pi^{x-1} \sin\left(\frac{x\pi}{2}\right) \Gamma(1-x) \zeta(1-x), & \text{for } x < 0
\end{cases} \]

where x is \( x \).

28.7.6.20 Spherical Bessel functions of the first kind

```
float sph_besself(unsigned n, float x);
long double sph_bessell(unsigned n, long double x);
```

1. **Effects:** These functions compute the spherical Bessel functions of the first kind of their respective arguments n and x.

\[ j_n(x) = \frac{(\pi/2x)^{1/2} J_{n+1/2}(x)}{x}, \text{ for } x \geq 0, \]

where n is n and x is x.

2. **Remarks:** The effect of calling each of these functions is implementation-defined if n >= 128.

3. See also 28.7.6.9.

28.7.6.21 Spherical associated Legendre functions

```
float sph_legendref(unsigned l, unsigned m, float theta);
long double sph_legendrel(unsigned l, unsigned m, long double theta);
```

1. **Effects:** These functions compute the spherical associated Legendre functions of their respective arguments l, m, and theta (theta measured in radians).

\[ Y^m_l(\theta, \phi) = (-1)^m \left[ \frac{(2\ell + 1) (\ell - m)!}{4\pi (\ell + m)!} \right]^{1/2} P^m_\ell(\cos \theta) e^{im\phi} \text{, for } |m| \leq \ell, \]

where

\[ P^m_\ell(\cos \theta) \]

and l is l, m is m, and \( \theta \) is theta.

2. **Remarks:** The effect of calling each of these functions is implementation-defined if l >= 128.

3. See also 28.7.6.3.

28.7.6.22 Spherical Neumann functions

```
float sph_neumannf(unsigned n, float x);
long double sph_neumannl(unsigned n, long double x);
```

1. **Effects:** These functions compute the spherical Neumann functions, also known as the spherical Bessel functions of the second kind, of their respective arguments n and x.

\[ n_n(x) = (\pi/2x)^{1/2} N_{n+1/2}(x), \text{ for } x \geq 0, \]

§ 28.7.6.22
where \( n \) is \( n \) and \( x \) is \( x \).

3 Remarks: The effect of calling each of these functions is implementation-defined if \( n \geq 128 \).

4 See also 28.7.6.11.

28.8 Numbers

28.8.1 Header <numbers> synopsis

```cpp
namespace std::numbers {

    inline constexpr double phi = phi_v<double>;
}
```

28.8.2 Mathematical constants

1 The library-defined partial specializations of mathematical constant variable templates are initialized with the nearest representable values of \( e \), \( \log_2 e \), \( \log_{10} e \), \( \pi \), \( \frac{1}{\sqrt{2}} \), \( \frac{1}{\sqrt{3}} \), \( \ln 2 \), \( \ln 10 \), \( \sqrt{2} \), \( \sqrt{3} \), \( \frac{1}{\sqrt{2}} \), the Euler-Mascheroni \( \gamma \) constant, and the golden ratio \( \phi \) constant \( \frac{1 + \sqrt{5}}{2} \), respectively.

2 Pursuant to 16.4.5.2.1, a program may partially or explicitly specialize a mathematical constant variable template provided that the specialization depends on a program-defined type.

3 A program that instantiates a primary template of a mathematical constant variable template is ill-formed.
29 Time library

29.1 General

This Clause describes the chrono library (29.2) and various C functions (29.14) that provide generally useful time utilities, as summarized in Table 99.

29.3  Cpp17Clock requirements

A clock is a bundle consisting of a duration, a time_point, and a function now() to get the current time_point. The origin of the clock’s time_point is referred to as the clock’s epoch. A clock shall meet the requirements in Table 100.

In Table 100 C1 and C2 denote clock types. t1 and t2 are values returned by C1::now() where the call returning t1 happens before (6.9.2) the call returning t2 and both of these calls occur before C1::time_point::max().

[Note 1: This means C1 did not wrap around between t1 and t2. — end note]

Table 100: Cpp17Clock requirements

<table>
<thead>
<tr>
<th>Expression</th>
<th>Return type</th>
<th>Operational semantics</th>
</tr>
</thead>
<tbody>
<tr>
<td>C1::rep</td>
<td>An arithmetic type or a class emulating an arithmetic type</td>
<td>The representation type of C1::duration.</td>
</tr>
<tr>
<td>C1::period</td>
<td>a specialization of ratio</td>
<td>The tick period of the clock in seconds.</td>
</tr>
<tr>
<td>C1::duration</td>
<td>chrono::duration&lt; C1::rep, C1::period &gt;</td>
<td>The duration type of the clock.</td>
</tr>
<tr>
<td>C1::time_point</td>
<td>chrono::time_point&lt; C1 &gt; or</td>
<td>The time_point type of the clock. C1 and C2 shall refer to the same epoch.</td>
</tr>
<tr>
<td></td>
<td>chrono::time_point&lt; C2, C1::duration &gt;</td>
<td></td>
</tr>
<tr>
<td>C1::is_steady</td>
<td>const bool</td>
<td>true if t1 &lt;= t2 is always true and the time between clock ticks is constant, otherwise false.</td>
</tr>
<tr>
<td>C1::now()</td>
<td>C1::time_point</td>
<td>Returns a time_point object representing the current point in time.</td>
</tr>
</tbody>
</table>

[Note 2: The relative difference in durations between those reported by a given clock and the SI definition is a measure of the quality of implementation. — end note]

A type TC meets the Cpp17TrivialClock requirements if:

(4.1) TC meets the Cpp17Clock requirements,
(4.2) the types TC::rep, TC::duration, and TC::time_point meet the Cpp17EqualityComparable (Table 29) and Cpp17LessThanComparable (Table 30) and Cpp17Swappable (16.4.4.3) requirements and the requirements of numeric types (28.2),

[Note 3: This means, in particular, that operations on these types will not throw exceptions. — end note]

(4.3) the function TC::now() does not throw exceptions, and
(4.4) the type TC::time_point::clock meets the Cpp17TrivialClock requirements, recursively.
29.4 Time-related traits

29.4.1 treat_as_floating_point

template<class Rep> struct treat_as_floating_point : is_floating_point<Rep> { }

The duration template uses the treat_as_floating_point trait to help determine if a duration object can be converted to another duration with a different tick period. If treat_as_floating_point_v<Rep> is true, then implicit conversions are allowed among durations. Otherwise, the implicit convertibility depends on the tick periods of the durations.

[Note 1: The intention of this trait is to indicate whether a given class behaves like a floating-point type, and thus allows division of one value by another with acceptable loss of precision. If treat_as_floating_point_v<Rep> is false, Rep will be treated as if it behaved like an integral type for the purpose of these conversions. — end note]

29.4.2 duration_values

template<class Rep>
struct duration_values {
  public:
    static constexpr Rep zero() noexcept;
    static constexpr Rep min() noexcept;
    static constexpr Rep max() noexcept;
};

The duration template uses the duration_values trait to construct special values of the duration's representation (Rep). This is done because the representation can be a class type with behavior that requires some other implementation to return these special values. In that case, the author of that class type should specialize duration_values to return the indicated values.

static constexpr Rep zero() noexcept;

Returns: Rep(0).

[Note 1: Rep(0) is specified instead of Rep() because Rep() can have some other meaning, such as an uninitialized value. — end note]

Remarks: The value returned shall be the additive identity.

static constexpr Rep min() noexcept;

Returns: numeric_limits<Rep>::lowest().

Remarks: The value returned shall compare less than or equal to zero().

static constexpr Rep max() noexcept;

Returns: numeric_limits<Rep>::max().

Remarks: The value returned shall compare greater than zero().

29.4.3 Specializations of common_type

template<class Rep1, class Period1, class Rep2, class Period2>
struct common_type<chrono::duration<Rep1, Period1>, chrono::duration<Rep2, Period2>> {
  using type = chrono::duration<common_type_t<Rep1, Rep2>, see below>;
};

The period of the duration indicated by this specialization of common_type is the greatest common divisor of Period1 and Period2.

[Note 1: This can be computed by forming a ratio of the greatest common divisor of Period1::num and Period2::num and the least common multiple of Period1::den and Period2::den. — end note]

[Note 2: The typedef name type is a synonym for the duration with the largest tick period possible where both duration arguments will convert to it without requiring a division operation. The representation of this type is intended to be able to hold any value resulting from this conversion with no truncation error, although floating-point durations can have round-off errors. — end note]

template<class Clock, class Duration1, class Duration2>
struct common_type<chrono::time_point<Clock, Duration1>, chrono::time_point<Clock, Duration2>> {
  using type = chrono::time_point<Clock, common_type_t<Duration1, Duration2>>;
}
The common type of two `time_point` types is a `time_point` with the same clock as the two types and the common type of their two durations.

### 29.4.4 Class template `is_clock`  

```cpp
template<class T> struct is_clock;
```

1. `is_clock` is a `Cpp17UnaryTypeTrait` (21.3.2) with a base characteristic of `true_type` if `T` meets the `Cpp17Clock` requirements (29.3), otherwise `false_type`. For the purposes of the specification of this trait, the extent to which an implementation determines that a type cannot meet the `Cpp17Clock` requirements is unspecified, except that as a minimum a type `T` shall not qualify as a `Cpp17Clock` unless it meets all of the following conditions:

1.1. — the qualified-ids `T::rep`, `T::period`, `T::duration`, and `T::time_point` are valid and each denotes a type (13.10.3),

1.2. — the expression `T::is_steady` is well-formed when treated as an unevaluated operand (7.2.3),

1.3. — the expression `T::now()` is well-formed when treated as an unevaluated operand.

2. The behavior of a program that adds specializations for `is_clock` is undefined.

### 29.5 Class template `duration`  

#### 29.5.1 General  

A `duration` type measures time between two points in time (`time_points`). A `duration` has a representation which holds a count of ticks and a tick period. The tick period is the amount of time which occurs from one tick to the next, in units of seconds. It is expressed as a rational constant using the template `ratio`.

```cpp
namespace std::chrono {
    template<class Rep, class Period = ratio<1>>
    class duration {
        public:
            using rep = Rep;
            using period = typename Period::type;

        private:
            rep rep_;     // exposition only

        public:
            // 29.5.2, construct/copy/destroy
            constexpr duration() = default;
            template<class Rep2>
                constexpr explicit duration(const Rep2& r);
            template<class Rep2, class Period2>
                constexpr duration(const duration<Rep2, Period2>& d);
            ~duration() = default;
            duration(const duration&) = default;
            duration& operator=(const duration&);

            // 29.5.3, observer
            constexpr rep count() const;

            // 29.5.4, arithmetic
            constexpr common_type_t<duration> operator+() const;
            constexpr common_type_t<duration> operator-() const;
            constexpr duration& operator++();
            constexpr duration& operator--();
            constexpr duration operator++(int);
            constexpr duration operator--(int);
            constexpr duration& operator+=(const duration& d);
            constexpr duration& operator-=(const duration& d);
```
constexpr duration& operator*=(const rep& rhs);
constexpr duration& operator/=(const rep& rhs);
constexpr duration& operator%=(const rep& rhs);
constexpr duration& operator%=(const duration& rhs);

// 29.5.5, special values
static constexpr duration zero() noexcept;
static constexpr duration min() noexcept;
static constexpr duration max() noexcept;
);}

2 Rep shall be an arithmetic type or a class emulating an arithmetic type. If duration is instantiated with a
duration type as the argument for the template parameter Rep, the program is ill-formed.
3 If Period is not a specialization of ratio, the program is ill-formed. If Period::num is not positive, the
program is ill-formed.
4 Members of duration do not throw exceptions other than those thrown by the indicated operations on their
representations.
5 The defaulted copy constructor of duration shall be a constexpr function if and only if the required initialization
of the member rep_, for copy and move, respectively, would satisfy the requirements for a constexpr function.
6 [Example 1:
duration<long, ratio<60>> d0; // holds a count of minutes using a long
duration<long, milli> d1; // holds a count of milliseconds using a long
duration<double, ratio<1, 30>> d2; // holds a count with a tick period of 1/30 of a second
  // (30 Hz) using a double
— end example]

29.5.2 Constructors

template<class Rep2>
constexpr explicit duration(const Rep2& r);

1 Constraints: is_convertible_v<const Rep2&, rep> is true and
   (1.1) — treat_as_floating_point_v<rep> is true or
   (1.2) — treat_as_floating_point_v<Rep2> is false.
   [Example 1:
duration<int, milli> d(3); // OK
duration<int, milli> d(3.5); // error
— end example]
2 Effects: Initializes rep_ with r.

template<class Rep2, class Period2>
constexpr duration(const duration<Rep2, Period2>& d);

3 Constraints: No overflow is induced in the conversion and treat_as_floating_point_v<rep> is
ture or both ratio_divide<Period2, period>::den is 1 and treat_as_floating_point_v<Rep2>
is false.

[Note 1: This requirement prevents implicit truncation error when converting between integral-based duration
types. Such a construction could easily lead to confusion about the value of the duration. — end note]

[Example 2:
duration<int, milli> ms(3);
duration<int, micro> us = ms; // OK
duration<int, milli> ms2 = us; // error
— end example]
4 Effects: Initializes rep_ with duration_cast<duration>(d).count().

§ 29.5.2 1486
29.5.3 Observer

```cpp
constexpr rep count() const;
Returns: rep_
```

29.5.4 Arithmetic

```cpp
constexpr common_type_t<duration> operator+() const;
Returns: common_type_t<duration>(*this).

constexpr common_type_t<duration> operator-() const;
Returns: common_type_t<duration>(-rep_).

constexpr duration& operator++();
Effects: Equivalent to: ++rep_.
Returns: *this.

constexpr duration operator++(int);
Effects: Equivalent to: return duration(rep_++);

constexpr duration& operator--();
Effects: Equivalent to: --rep_.
Returns: *this.

constexpr duration operator--(int);
Effects: Equivalent to: return duration(rep--);

constexpr duration& operator+=(const duration& d);
Effects: Equivalent to: rep_ += d.count().
Returns: *this.

constexpr duration& operator-=(const duration& d);
Effects: Equivalent to: rep_ -= d.count().
Returns: *this.

constexpr duration& operator*=(const rep& rhs);
Effects: Equivalent to: rep_ *= rhs.
Returns: *this.

constexpr duration& operator/=(const rep& rhs);
Effects: Equivalent to: rep_ /= rhs.
Returns: *this.

constexpr duration& operator%=(const rep& rhs);
Effects: Equivalent to: rep_ %= rhs.
Returns: *this.

constexpr duration& operator%=(const duration& rhs);
Effects: Equivalent to: rep_ %= rhs.count().
Returns: *this.
```

29.5.5 Special values

```cpp
static constexpr duration zero() noexcept;
Returns: duration(duration_values<rep>::zero()).
```
static constexpr duration min() noexcept;
\[\text{Returns: } \text{duration(duration_values<rep>::min())} \]

static constexpr duration max() noexcept;
\[\text{Returns: } \text{duration(duration_values<rep>::max())} \]

### 29.5.6 Non-member arithmetic

In the function descriptions that follow, unless stated otherwise, let CD represent the return type of the function.

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator+(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
\[\text{Returns: } CD(CD(lhs).count() + CD(rhs).count()) \]

```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator-(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
\[\text{Returns: } CD(CD(lhs).count() - CD(rhs).count()) \]
```

```cpp
template<class Rep1, class Period, class Rep2>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const duration<Rep1, Period>& d, const Rep2& s);
\[\text{Constraints: } \text{is_convertible_v<const Rep2&, common_type_t<Rep1, Rep2>> is true.} \]
\[\text{Returns: } CD(CD(d).count() * s) \]

```

```cpp
template<class Rep1, class Rep2, class Period>
constexpr duration<common_type_t<Rep1, Rep2>, Period>
operator*(const Rep1& s, const duration<Rep2, Period>& d);
\[\text{Constraints: } \text{is_convertible_v<const Rep1&, common_type_t<Rep1, Rep2>> is true.} \]
\[\text{Returns: } d * s \]
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator/(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
\[\text{Returns: } CD(CD(lhs).count() / CD(rhs).count()) \]
```

```cpp
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr common_type_t<duration<Rep1, Period1>, duration<Rep2, Period2>>
operator%(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
\[\text{Returns: } CD(CD(lhs).count() % CD(rhs).count()) \]
```

§ 29.5.6
29.5.7 Comparisons

In the function descriptions that follow, CT represents common_type_t<A, B>, where A and B are the types of the two arguments to the function.

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator==(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
// Returns: CT(lhs).count() == CT(rhs).count().
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
// Returns: CT(lhs).count() < CT(rhs).count().
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
// Returns: rhs < lhs.
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator<=(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
// Returns: !(rhs < lhs).
```

```
template<class Rep1, class Period1, class Rep2, class Period2>
constexpr bool operator>=(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
// Returns: !(lhs < rhs).
```

```
requires three_way_comparable<typename CT::rep>
constexpr auto operator<=>(const duration<Rep1, Period1>& lhs, const duration<Rep2, Period2>& rhs);
// Returns: CT(lhs).count() <=> CT(rhs).count().
```

29.5.8 Conversions

```
template<class ToDuration, class Rep, class Period>
constexpr ToDuration duration_cast(const duration<Rep, Period>& d);
// Constraints: ToDuration is a specialization of duration.
// Returns: Let CF be ratio_divide<Period, typename ToDuration::period>, and CR be common_type<typename ToDuration::rep, Rep, intmax_t>::type.
// (2.1) If CF::num == 1 and CF::den == 1, returns
ToDuration(static_cast<typename ToDuration::rep>(d.count()))
// (2.2) otherwise, if CF::num != 1 and CF::den == 1, returns
ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num)))
// (2.3) otherwise, if CF::num == 1 and CF::den != 1, returns
ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) / static_cast<CR>(CF::den)))
// (2.4) otherwise, returns
ToDuration(static_cast<typename ToDuration::rep>(
    static_cast<CR>(d.count()) * static_cast<CR>(CF::num) / static_cast<CR>(CF::den)))
```

[Note 1: This function does not use any implicit conversions; all conversions are done with static_cast. It avoids multiplications and divisions when it is known at compile time that one or more arguments is 1. Intermediate computations are carried out in the widest representation and only converted to the destination representation at the final step. — end note]
template<
class ToDuration, class Rep, class Period>
constexpr ToDuration floor(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The greatest result t representable in ToDuration for which t <= d.

template<
class ToDuration, class Rep, class Period>
constexpr ToDuration ceil(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration.

Returns: The least result t representable in ToDuration for which t >= d.

template<
class ToDuration, class Rep, class Period>
constexpr ToDuration round(const duration<Rep, Period>& d);

Constraints: ToDuration is a specialization of duration and treat_as_floating_point_v<typename
ToDuration::rep> is false.

Returns: The value of ToDuration that is closest to d. If there are two closest values, then return the
value t for which t % 2 == 0.

29.5.9 Suffixes for duration literals

This subclause describes literal suffixes for constructing duration literals. The suffixes h, min, s, ms, us, ns
denote duration values of the corresponding types hours, minutes, seconds, milliseconds, microseconds,
and nanoseconds respectively if they are applied to integer-literals.

If any of these suffixes are applied to a floating-point-literal the result is a chrono::duration literal with an
unspecified floating-point representation.

If any of these suffixes are applied to an integer-literal and the resulting chrono::duration value cannot be
represented in the result type because of overflow, the program is ill-formed.

[Example 1: The following code shows some duration literals.

```
using namespace std::chrono_literals;
auto constexpr aday=24h;
auto constexpr lesson=45min;
auto constexpr halfanhour=0.5h;
```

—end example]

constexpr chrono::hours operator"h(unsigned long long hours);
constexpr chrono::duration<unspecialized, ratio<3600, 1>> operator"h(long double hours);

Returns: A duration literal representing hours hours.

constexpr chrono::minutes operator"min(unsigned long long minutes);
constexpr chrono::duration<unspecialized, ratio<60, 1>> operator"min(long double minutes);

Returns: A duration literal representing minutes minutes.

constexpr chrono::seconds operator"s(unsigned long long sec);
constexpr chrono::duration<unspecialized> operator"s(long double sec);

Returns: A duration literal representing sec seconds.

[Note 1: The same suffix s is used for basic_string but there is no conflict, since duration suffixes apply to
numbers and string literal suffixes apply to character array literals. —end note]

constexpr chrono::milliseconds operator"ms(unsigned long long msec);
constexpr chrono::duration<unspecialized, milli> operator"ms(long double msec);

Returns: A duration literal representing msec milliseconds.

constexpr chrono::microseconds operator"us(unsigned long long usec);
constexpr chrono::duration<unspecialized, micro> operator"us(long double usec);

Returns: A duration literal representing usec microseconds.

constexpr chrono::nanoseconds operator"ns(unsigned long long nsec);
constexpr chrono::duration<unspecified, nano> operator"ns(long double nsec);

Returns: A duration literal representing nsec nanoseconds.

29.5.10 Algorithms

template<class Rep, class Period>
constexpr duration<Rep, Period> abs(duration<Rep, Period> d);

Constraints: numeric_limits<Rep>::is_signed is true.

Returns: If d >= d.zero(), return d, otherwise return -d.

29.5.11 I/O

template<class charT, class traits, class Rep, class Period>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const duration<Rep, Period>& d);

Effects: Inserts the duration d onto the stream os as if it were implemented as follows:

basic_ostringstream<charT, traits> s;
s.flags(os.flags());
s.imbue(os.getloc());
s.precision(os.precision());
s << d.count() << units-suffix;
return os << s.str();

where units-suffix depends on the type Period::type as follows:

- If Period::type is atto, units-suffix is "as".
- Otherwise, if Period::type is femto, units-suffix is "fs".
- Otherwise, if Period::type is pico, units-suffix is "ps".
- Otherwise, if Period::type is nano, units-suffix is "ns".
- Otherwise, if Period::type is micro, it is implementation-defined whether units-suffix is "µs" ("\u00b5\u0073") or "us".
- Otherwise, if Period::type is milli, units-suffix is "ms".
- Otherwise, if Period::type is centi, units-suffix is "cs".
- Otherwise, if Period::type is deci, units-suffix is "ds".
- Otherwise, if Period::type is ratio<1>, units-suffix is "s".
- Otherwise, if Period::type is deca, units-suffix is "das".
- Otherwise, if Period::type is hecto, units-suffix is "hs".
- Otherwise, if Period::type is kilo, units-suffix is "ks".
- Otherwise, if Period::type is mega, units-suffix is "Ms".
- Otherwise, if Period::type is giga, units-suffix is "Gs".
- Otherwise, if Period::type is tera, units-suffix is "Ts".
- Otherwise, if Period::type is peta, units-suffix is "Ps".
- Otherwise, if Period::type is exa, units-suffix is "Es".
- Otherwise, if Period::type is ratio<60>, units-suffix is "min".
- Otherwise, if Period::type is ratio<3600>, units-suffix is "h".
- Otherwise, if Period::type is ratio<86400>, units-suffix is "d".
- Otherwise, if Period::type::den == 1, units-suffix is "[num]s".
- Otherwise, units-suffix is "[num/den]s".

In the list above, the use of num and den refers to the static data members of Period::type, which are converted to arrays of charT using a decimal conversion with no leading zeroes.

Returns: os.
template<class charT, class traits, class Rep, class Period, class Alloc = allocator<charT>>
    basic_istream<charT, traits>&
    from_stream(basic_istream<charT, traits>& is, const charT* fmt,
                duration<Rep, Period>& d,
                basic_string<charT, traits, Alloc>* abbrev = nullptr,
                minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the duration d using the format flags given in the
NTCTS fmt as specified in 29.13. If the parse fails to decode a valid duration, is.setstate(ios_base::failbit)
is called and d is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev
is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset
is non-null.

Returns: is.

29.6  Class template time_point

29.6.1  General

namespace std::chrono {
    template<class Clock, class Duration = typename Clock::duration>
    class time_point {
public:
        using clock = Clock;
        using duration = Duration;
        using rep = typename duration::rep;
        using period = typename duration::period;

private:
        duration d_; // exposition only

public:
    // 29.6.2, construct
    constexpr time_point(); // has value epoch
    constexpr explicit time_point(const duration& d); // same as time_point() + d
    template<class Duration2>
        constexpr time_point(const time_point<clock, Duration2>& t);

    // 29.6.3, observer
    constexpr duration time_since_epoch() const;

    // 29.6.4, arithmetic
    constexpr time_point& operator++();
    constexpr time_point operator++(int);
    constexpr time_point& operator--();
    constexpr time_point operator--(int);
    constexpr time_point& operator+=(const duration& d);
    constexpr time_point& operator-=(const duration& d);

    // 29.6.5, special values
    static constexpr time_point min() noexcept;
    static constexpr time_point max() noexcept;
    }
}

1 If Duration is not a specialization of duration, the program is ill-formed.

29.6.2  Constructors

constexpr time_point();

Effects: Initializes d_ with duration::zero(). Such a time_point object represents the epoch.

constexpr explicit time_point(const duration& d);

Effects: Initializes d_ with d. Such a time_point object represents the epoch + d.

§ 29.6.2
template<class Duration2>
  constexpr time_point(const time_point<clock, Duration2>& t);

  Constraints: is_convertible_v<Duration2, duration> is true.
  Effects: Initializes d_ with t.time_since_epoch().

29.6.3 Observer

constexpr duration time_since_epoch() const;

  Returns: d_.

29.6.4 Arithmetic

constexpr time_point& operator++();

  Effects: Equivalent to: ++d_.
  Returns: *this.

constexpr time_point& operator++(int);

  Effects: Equivalent to: return time_point{d_++};

constexpr time_point& operator--();

  Effects: Equivalent to: --d_.
  Returns: *this.

constexpr time_point& operator--(int);

  Effects: Equivalent to: return time_point{d_--};

constexpr time_point& operator+=(const duration& d);

  Effects: Equivalent to: d_ += d.
  Returns: *this.

constexpr time_point& operator-=(const duration& d);

  Effects: Equivalent to: d_ -= d.
  Returns: *this.

29.6.5 Special values

static constexpr time_point min() noexcept;

  Returns: time_point(duration::min()).

static constexpr time_point max() noexcept;

  Returns: time_point(duration::max()).

29.6.6 Non-member arithmetic

template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>> operator+(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

  Returns: CT(lhs.time_since_epoch() + rhs), where CT is the type of the return value.

template<class Rep1, class Period1, class Clock, class Duration2>
  constexpr time_point<Clock, common_type_t<duration<Rep1, Period1>, Duration2>>
  operator+(const duration<Rep1, Period1>& lhs, const time_point<Clock, Duration2>& rhs);

  Returns: rhs + lhs.

template<class Clock, class Duration1, class Rep2, class Period2>
  constexpr time_point<Clock, common_type_t<Duration1, duration<Rep2, Period2>>> operator-(const time_point<Clock, Duration1>& lhs, const duration<Rep2, Period2>& rhs);

  Returns: CT(lhs.time_since_epoch() - rhs), where CT is the type of the return value.
template<class Clock, class Duration1, class Duration2>
constexpr common_type_t<Duration1, Duration2>
operator-(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() - rhs.time_since_epoch().

29.6.7 Comparisons

template<class Clock, class Duration1, class Duration2>
constexpr bool operator==(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() == rhs.time_since_epoch().

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: rhs < lhs.

template<class Clock, class Duration1, class Duration2>
constexpr bool operator<=(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: !(rhs < lhs).

template<class Clock, class Duration1, class Duration2>
constexpr bool operator>=(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: !(lhs < rhs).

template<class Clock, class Duration1, class Duration2>
constexpr auto operator<=>(const time_point<Clock, Duration1>& lhs, const time_point<Clock, Duration2>& rhs);

Returns: lhs.time_since_epoch() <=> rhs.time_since_epoch().

29.6.8 Conversions

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> time_point_cast(const time_point<Clock, Duration>& t);

Constraints: ToDuration is a specialization of duration.

Returns:

time_point<Clock, ToDuration>(duration_cast<ToDuration>(t.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> floor(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(floor<ToDuration>(tp.time_since_epoch()))

template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> ceil(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration.

Returns: time_point<Clock, ToDuration>(ceil<ToDuration>(tp.time_since_epoch()))

§ 29.6.8 1494
template<class ToDuration, class Clock, class Duration>
constexpr time_point<Clock, ToDuration> round(const time_point<Clock, Duration>& tp);

Constraints: ToDuration is a specialization of duration, and treat_as_floating_point_v<typename ToDuration::rep> is false.

Returns: time_point<Clock, ToDuration>(round<ToDuration>(tp.time_since_epoch())).

29.7 Clocks

29.7.1 General

The types defined in 29.7 meet the Cpp17TrivialClock requirements (29.3) unless otherwise specified.

29.7.2 Class system_clock

29.7.2.1 Overview

namespace std::chrono {
   class system_clock {
      public:
         using rep = see below;
         using period = ratio<unspecified, unspecified>;
         using duration = chrono::duration<rep, period>;
         using time_point = chrono::time_point<system_clock>;
         static constexpr bool is_steady = unspecified;

         static time_point now() noexcept;

         // mapping to/from C type time_t
         static time_t to_time_t (const time_point& t) noexcept;
         static time_point from_time_t(time_t t) noexcept;
   };
}

Objects of type system_clock represent wall clock time from the system-wide realtime clock. Objects of type sys_time<Duration> measure time since 1970-01-01 00:00:00 UTC excluding leap seconds. This measure is commonly referred to as Unix time. This measure facilitates an efficient mapping between sys_time and calendar types (29.8).

[Example 1:
sys_seconds{sys_days{1970y/January/1}}.time_since_epoch() is 0s.
sys_seconds{sys_days{2000y/January/1}}.time_since_epoch() is 946'684'800s, which is 10'957 * 86'400s.
—end example]

29.7.2.2 Members

using system_clock::rep = unspecified;

Constraints: system_clock::duration::min() < system_clock::duration::zero() is true.
[Note 1: This implies that rep is a signed type. — end note]

static time_t to_time_t(const time_point& t) noexcept;

Returns: A time_t object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

static time_point from_time_t(time_t t) noexcept;

Returns: A time_point object that represents the same point in time as t when both values are restricted to the coarser of the precisions of time_t and time_point. It is implementation-defined whether values are rounded or truncated to the required precision.

29.7.2.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const sys_time<Duration>& tp);

Constraints: treat_as_floating_point_v<typename Duration::rep> is false, and Duration{1} < days{1} is true.

Effects: Equivalent to:

   return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), tp);

Example 1:

   cout << sys_seconds{0s} << '
';  // 1970-01-01 00:00:00
   cout << sys_seconds{946'684'800s} << '
'; // 2000-01-01 00:00:00
   cout << sys_seconds{946'688'523s} << '
'; // 2000-01-01 01:02:03

—end example

In contrast to sys_time, which does not take leap seconds into account, utc_clock and its associated
time_point, utc_time, count time, including leap seconds, since 1970-01-01 00:00:00 UTC.

Note 1: The UTC time standard began on 1972-01-01 00:00:10 TAI. To measure time since this epoch instead, one
can add/subtract the constant sys_days{1972y/1/1} − sys_days{1970y/1/1} (63'072'000s) from the utc_time.
—end note

§ 29.7.3.1 1496
Example 1:

\[
\text{clock\_cast<utc\_clock>(sys\_seconds\{sys\_days\{1970y\/January/1\}\})\_.time\_since\_epoch() \text{ is } 0s.}
\]

\[
\text{clock\_cast<utc\_clock>(sys\_seconds\{sys\_days\{2000y\/January/1\}\})\_.time\_since\_epoch() \text{ is } 946'684'822s,}
\]

which is \(10'957 \times 86'400s + 22s\).

—end example

2 \text{utc\_clock \text{is not a } Cpp17TrivialClock \text{unless the implementation can guarantee that utc\_clock::now()}}

\text{does not propagate an exception.}

[Note 2: noexcept(from\_sys(system\_clock::now())) is false. —end note]

29.7.3.2 Member functions

\text{static time\_point now();}

\text{Returns: from\_sys(system\_clock::now()), or a more accurate value of utc\_time.}

\text{template<class Duration>}

\text{static sys\_time<common\_type\_t<Duration, seconds>>}

\text{to\_sys(const utc\_time<Duration>& t);}  

\text{Returns: A sys\_time t, such that from\_sys(t) == u if such a mapping exists. Otherwise u represents a time\_point during a positive leap second insertion, the conversion counts that leap second as not inserted, and the last representable value of sys\_time prior to the insertion of the leap second is returned.}

\text{template<class Duration>}

\text{static utc\_time<common\_type\_t<Duration, seconds>>}

\text{from\_sys(const sys\_time<Duration>& t);}  

\text{Returns: A utc\_time u, such that u.time\_since\_epoch() - t.time\_since\_epoch() is equal to the sum of leap seconds that were inserted between t and 1970-01-01. If t is exactly the date of leap second insertion, then the conversion counts that leap second as inserted.}

[Example 1:]

\[
\text{auto t = sys\_days\{July/1/2015\} - 2ns;}
\]

\[
\text{auto u = utc\_clock::from\_sys(t);}
\]

\[
\text{assert(u.time\_since\_epoch() - t.time\_since\_epoch() == 25s);}
\]

\[
\text{t += 1ns;}
\]

\[
\text{u = utc\_clock::from\_sys(t);}
\]

\[
\text{assert(u.time\_since\_epoch() - t.time\_since\_epoch() == 25s);}
\]

\[
\text{t += 1ns;}
\]

\[
\text{u = utc\_clock::from\_sys(t);}
\]

\[
\text{assert(u.time\_since\_epoch() - t.time\_since\_epoch() == 26s);}
\]

\[
\text{t += 1ns;}
\]

\[
\text{u = utc\_clock::from\_sys(t);}
\]

\[
\text{assert(u.time\_since\_epoch() - t.time\_since\_epoch() == 26s);}
\]

—end example

29.7.3.3 Non-member functions

\text{template<class charT, class traits, class Duration>}

\text{basic\_ostream<charT, traits>&}

\text{operator<<(basic\_ostream<charT, traits>& os, const utc\_time<Duration>& t);}  

\text{Effects: Equivalent to:}

\[
\text{return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);}  
\]

[Example 1:]

\[
\text{auto t = sys\_days\{July/1/2015\} - 500ms;}
\]

\[
\text{auto u = clock\_cast<utc\_clock>(t);}
\]

\[

§ 29.7.3.3 1497
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>

basic_istream<charT, traits>&

from_stream(basic_istream<charT, traits>& is, const charT* fmt,

utc_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,

minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the utc_time tp using the format flags given in

the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit)

is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

struct leap_second_info {

  bool is_leap_second;

  seconds elapsed;
};

The type leap_second_info has data members and special members specified above. It has no base
classes or members other than those specified.

template<class Duration>

leap_second_info get_leap_second_info(const utc_time<Duration>& ut);

Returns: A leap_second_info lsi, where lsi.is_leap_second is true if ut is during a positive leap
second insertion, and otherwise false. lsi.elapsed is the sum of leap seconds between 1970-01-01
and ut. If lsi.is_leap_second is true, the leap second referred to by ut is included in the sum.

29.7.4 Class tai_clock

29.7.4.1 Overview

namespace std::chrono {

class tai_clock {

public:

  using rep = a signed arithmetic type;

  using period = ratio<unspecified, unspecified>;

  using duration = chrono::duration<rep, period>;

  using time_point = chrono::time_point<tai_clock>;

  static constexpr bool is_steady = unspecified;

  static time_point now();

  template<class Duration>

  static utc_time<common_type_t<Duration, seconds>>

  to_utc(const tai_time<Duration>& ut) noexcept;

  template<class Duration>

  static tai_time<common_type_t<Duration, seconds>>

  from_utc(const utc_time<Duration>& ut) noexcept;
};
}

The clock tai_clock measures seconds since 1958-01-01 00:00:00 and is offset 10s ahead of UTC at this
date. That is, 1958-01-01 00:00:00 TAI is equivalent to 1957-12-31 23:59:50 UTC. Leap seconds are not
inserted into TAI. Therefore every time a leap second is inserted into UTC, UTC shifts another second with
respect to TAI. For example by 2000-01-01 there had been 22 positive and 0 negative leap seconds inserted
so 2000-01-01 00:00:00 UTC is equivalent to 2000-01-01 00:00:32 TAI (22s plus the initial 10s offset).

§ 29.7.4.1 1498
tai_clock is not a Cpp17TrivialClock unless the implementation can guarantee that tai_clock::now() does not propagate an exception.

[Note 1: noexcept(from_utc(utc_clock::now())) is false. —end note]

29.7.4.2 Member functions

static time_point now();

Returns: from_utc(utc_clock::now()), or a more accurate value of tai_time.

template<class Duration>
static utc_time<common_type_t<Duration, seconds>>
to_utc(const tai_time<Duration>& t) noexcept;

Returns:

utc_time<common_type_t<Duration, seconds>>(t.time_since_epoch()) - 378691210s

[Note 1:

378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s
—end note]

template<class Duration>
static tai_time<common_type_t<Duration, seconds>>
from_utc(const utc_time<Duration>& t) noexcept;

Returns:

378691210s == sys_days{1970y/January/1} - sys_days{1958y/January/1} + 10s

—end note]

29.7.4.3 Non-member functions

template<class charT, class traits, class Duration>
basic_ostream<charT, traits>&
operator<<(basic_ostream<charT, traits>& os, const tai_time<Duration>& t);

Effects: Equivalent to:

return os << format(os.getloc(), STATICALLY_WIDEN<charT>("{:L%F %T}"), t);

[Example 1:

auto st = sys_days{2000y/January/1};
auto tt = clock_cast<tai_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, tt);

Produces this output:

2000-01-01 00:00:00 UTC == 2000-01-01 00:00:32 TAI
—end example]

template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
tai_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);

Effects: Attempts to parse the input stream is into the tai_time tp using the format flags given in the NTCCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.
29.7.5 Class gps_clock

29.7.5.1 Overview

namespace std::chrono {
    class gps_clock {
    public:
        using rep = a signed arithmetic type;
        using period = ratio<unspecified, unspecified>;
        using duration = chrono::duration<rep, period>;
        using time_point = chrono::time_point<gps_clock>;
        static constexpr bool is_steady = unspecified;
        static time_point now();
        template<class Duration>
        static utc_time<common_type_t<Duration, seconds>>
to_utc(const gps_time<Duration>&) noexcept;
        template<class Duration>
        static gps_time<common_type_t<Duration, seconds>>
        from_utc(const utc_time<Duration>&) noexcept;
    }
}

1 The clock gps_clock measures seconds since the first Sunday of January, 1980 00:00:00 UTC. Leap seconds are not inserted into GPS. Therefore every time a leap second is inserted into UTC, UTC shifts another second with respect to GPS. Aside from the offset from 1958y/January/1 to 1980y/January/Sunday[1], GPS is behind TAI by 19s due to the 10s offset between 1958 and 1970 and the additional 9 leap seconds inserted between 1970 and 1980.

2 gps_clock is not a Cpp17TrivialClock unless the implementation can guarantee that gps_clock::now() does not propagate an exception.

    [Note 1: noexcept(from_utc(utc_clock::now())) is false. — end note]

29.7.5.2 Member functions

static time_point now();

1 Returns: from_utc(utc_clock::now()), or a more accurate value of gps_time.

    template<class Duration>
    static utc_time<common_type_t<Duration, seconds>>
to_utc(const gps_time<Duration>& t) noexcept;

2 Returns:

    utc_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} + 315964809s

    [Note 1:
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    — end note]

    template<class Duration>
    static gps_time<common_type_t<Duration, seconds>>
    from_utc(const utc_time<Duration>& t) noexcept;

3 Returns:

    gps_time<common_type_t<Duration, seconds>>{t.time_since_epoch()} - 315964809s

    [Note 2:
    315964809s == sys_days{1980y/January/Sunday[1]} - sys_days{1970y/January/1} + 9s
    — end note]

29.7.5.3 Non-member functions

    template<class charT, class traits, class Duration>
    basic_ostream<charT, traits>&

§ 29.7.5.3 1500
operator<<(basic_ostream<charT, traits>& os, const gps_time<Duration>& t);

Effects: Equivalent to:

```
return os << format(os.getloc(), "{:L%F %T}"), t);
```

[Example 1:]

```
auto st = sys_days{2000y/January/1};
auto gt = clock_cast<gps_clock>(st);
cout << format("{0:%F %T %Z} == {1:%F %T %Z}\n", st, gt);
```

Produces this output:

```
2000-01-01 00:00:00 UTC == 2000-01-01 00:00:13 GPS
```

—end example—

```
template<class charT, class traits, class Duration, class Alloc = allocator<charT>>
basic_istream<charT, traits>&
from_stream(basic_istream<charT, traits>& is, const charT* fmt,
gps_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr,
minutes* offset = nullptr);
```

Effects: Attempts to parse the input stream is into the gps_time tp using the format flags given in the NTCTS fmt as specified in 29.13. If the parse fails to decode a valid date, is.setstate(ios_base::failbit) is called and tp is not modified. If %Z is used and successfully parsed, that value will be assigned to *abbrev if abbrev is non-null. If %z (or a modified variant) is used and successfully parsed, that value will be assigned to *offset if offset is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to tp.

Returns: is.

### 29.7.6 Type file_clock

#### 29.7.6.1 Overview

```
namespace std::chrono {
    using file_clock = see below;
}
```

file_clock is an alias for a type meeting the Cpp17TrivialClock requirements (29.3), and using a signed arithmetic type for file_clock::rep. file_clock is used to create the time_point system used for file_time_type (31.12). Its epoch is unspecified, and noexcept(file_clock::now()) is true.

[Note 1: The type that file_clock denotes can be in a different namespace than std::chrono, such as std::filesystem. —end note]

#### 29.7.6.2 Member functions

The type denoted by file_clock provides precisely one of the following two sets of static member functions:

```
template<class Duration>
static sys_time<see below>
to_sys(const file_time<Duration>&);
```

```
template<class Duration>
static utc_time<see below>
to_utc(const file_time<Duration>&);
```

or:

```
template<class Duration>
static utc_time<see below>
to_utc(const file_time<Duration>&);
```

These member functions shall provide time_point conversions consistent with those specified by utc_clock, tai_clock, and gps_clock. The Duration of the resultant time_point is computed from the Duration of the input time_point.
29.7.6.3 Non-member functions

\texttt{template<class charT, class traits, class Duration>}
\begin{verbatim}
  basic_ostream<charT, traits>&
  operator<<(basic_ostream<charT, traits>& os, const file_time<Duration>& t);
\end{verbatim}

\textbf{Effects:} Equivalent to:
\begin{verbatim}
  return os << format(os.getloc(), STATICALLY-WIDEN<charT>("{:L%F %T}"), t);
\end{verbatim}

\texttt{template<class charT, class traits, class Duration, class Alloc = allocator<charT>>}
\begin{verbatim}
  basic_istream<charT, traits>&
  from_stream(basic_istream<charT, traits>& is, const charT* fmt, file_time<Duration>& tp, basic_string<charT, traits, Alloc>* abbrev = nullptr, minutes* offset = nullptr);
\end{verbatim}

\textbf{Effects:} Attempts to parse the input stream \texttt{is} into the \texttt{file_time} \texttt{tp} using the format flags given in the NTCTS \texttt{fmt} as specified in 29.13. If the parse fails to decode a valid date, \texttt{is.setstate(ios_base::failbit)} is called and \texttt{tp} is not modified. If \%Z is used and successfully parsed, that value will be assigned to \*\texttt{abbrev} if \texttt{abbrev} is non-null. If \%z (or a modified variant) is used and successfully parsed, that value will be assigned to \*\texttt{offset} if \texttt{offset} is non-null. Additionally, the parsed offset will be subtracted from the successfully parsed timestamp prior to assigning that difference to \texttt{tp}.

\textbf{Returns:} \texttt{is}.

29.7.7 Class \texttt{steady\_clock}

\begin{verbatim}
namespace std::chrono {
  class steady\_clock {
    public:
      using rep = unspecified;
      using period = ratio<unspecified, unspecified>;
      using duration = std::chrono\::duration<rep, period>;
      using time_point = std::chrono\::time_point<unspecified, duration>;
      static constexpr bool is_steady = true;

      static time_point now() noexcept;
    }
  }
\end{verbatim}

1 Objects of class \texttt{steady\_clock} represent clocks for which values of \texttt{time\_point} never decrease as physical time advances and for which values of \texttt{time\_point} advance at a steady rate relative to real time. That is, the clock may not be adjusted.

29.7.8 Class \texttt{high\_resolution\_clock}

\begin{verbatim}
namespace std::chrono {
  class high\_resolution\_clock {
    public:
